UNDEGRADE = All OOS TMS links, OOS DLIs, and OOS NLIs were unconditionally restored on a specific side to maintain the highest call capacity.

UPDATE PIC ROUTING TABLE = MSCU peripheral controller (PC) was updated to SM translation table.

UPDATE STATUS ONLY = Could not perform physical removal of the PC because the MSCU was OOS, so updated status only of PC. If the PC is the CMP, the MSCU may not be OOS.

UNEQUIPPED UNIT ERROR REPORT = Received error on an unequipped unit.
Unit modifier. Valid value(s):

<table>
<thead>
<tr>
<th>'b' =</th>
<th>'c' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>NLI or DLI</td>
<td>ONTC</td>
</tr>
<tr>
<td>LI, MI, TMS, or NC</td>
<td>ONTCCOM</td>
</tr>
<tr>
<td>Any other unit identifier or parameter 'a' is</td>
<td>(blank)</td>
</tr>
<tr>
<td>QLPS QUADRUPEX FAIL</td>
<td></td>
</tr>
</tbody>
</table>

= Unit identity [unit name and member number(s)] implicated by error. Valid unit names are:

- AM = Administrative module.
- CLNK = Communication link.
- CMP = Communication module processor.
- DLI = Dual link interface.
- FPC = Foundation peripheral controller.
- ISMQLNK = Inter-switching module communication link using QLPS.
- LI = Link interface (CM 1 only).
- MHQPIPE = Message handler to QLPS pipe.
- MI = Message interface.
- MMP = Module message processor.
- MSCU = Message switch control unit.
- MSGS = Message switch complex.
- NC = Network clock.
- NLI = Network link interface.
- ONTC = Office network timing complex hardware.
- ONTCCOM = Common office network timing complex hardware.
- PPC = Pump peripheral controller.
- QGL = QLPS to QGP link.
- QGP = QLPS gateway processor.
- QGPQPIPE = QGP to QLPS pipe.
- QLNK = Switching module to AM communication link using QLPS.
- QLPS = Quad link packet switch.
- TMS = Time-multiplexed switch. Valid value(s):

f = Time of the event, in the form hours:minutes:seconds.tenths of seconds.
g = First part of recovery action sequence is the action (refer to variable 'a' for values) to be performed on a unit. If only one action occurred, it may be treated as variable 'a'. Else it will be a subset of variable 'a'.
h = Second part of recovery action sequence is the unit (refer to variable 'b' for values) that the action was performed on. There may be more than one action taken to recover the unit having trouble.
i = AM side.
j = Switching module (SM).
k = ONTC side.
l = MMP. Valid value(s):
   0 = Even.
   1 = Odd.
m = MSGS side.
n = CMP number.
o = Active module controller/time slot interchanger (MCTSI) side.
p = QLPS network.
q = MMP number.
s = QGP number.
\( t \) = QGL number.

\( u \) = QLPS number.

Note: Since more than one NLI could be removed simultaneously, the NLI number has been deleted.

\( v \) = Far end SM.

\( w \) = Far end active MCTSI side.

4. ACTION TO BE TAKEN

If the REPT:TRBL message is unalarmed, no immediate action is needed (this message is reporting automatic recovery actions which should result in the affected units being returned to service). If the message is alarmed, automatic recovery may or may not be successful in restoring the affected units to service; if the affected units remain OOS, refer to the Corrective Maintenance manual, specifically to the section entitled "ANALYZE COMMUNICATION MODULE PROBLEMS", for detailed repair procedures.

Also, note the following special cases:

<table>
<thead>
<tr>
<th>If ( 'a' ) =</th>
<th>Action:</th>
</tr>
</thead>
</table>
| DEGRADE        | Automatic DLI diagnostics may have been scheduled if "both" TMS links on this ONTC side have failed in an SM, automatic TMS diagnostics may not be activated due to potential service impact.  
Automatic NLI diagnostics may have been scheduled if "both" TMS links on this ONTC side have failed in an SM-2000, automatic TMS diagnostics may not be activated due to potential service impact.  
Automatic NLI diagnostics may have been scheduled if the "single" TMS link on this ONTC side has failed in an EXM-2000, automatic TMS diagnostics may not be activated due to potential service impact.  
To isolate the problem, manual action will have to be used to diagnose the ONTC which is in the DEGRADED state. This can be done by using the DGN:ONTC input message.  
**NOTE:** ONTC diagnostics use the standby FPC as a helper unit. Therefore, it may be best to wait for a low-traffic period. Also, diagnosing the ONTC causes all DLIs and NLIs to be diagnosed; if this is not desired, then run the ONTCCOM diagnostics and run DLI or NLI diagnostics (for the DLIs or NLIs which have the out of service TMS links) separately. Once the manually initiated diagnostics have been executed, the resulting receive-only printer (ROP) trouble locating procedure (TLP) report will detail the circuit packs that should be replaced. Refer to Corrective Maintenance Procedures manual, "Clear Diagnostic Failures in Hardware (Units/Circuits)". |
| TMS CALL PROCESSING AUDIT | The recovery action was triggered by excessive continuity failures during network path set-up. If the problem persists after the specified automatic network reconfigurations, manual actions should be used to reconfigure units used in the affected network paths. The units affected could include the active major ONTC, the module controller/time slot interchangers (MCTSI) of SMs, and the host digital facility interfaces (HDFIs), remote digital facility interfaces (RDFIs) and umbilical facilities of remote SMs (RSMs). Refer to the REPT:PTRACE output |
5. ALARMS

Depending on the units and the actions, the alarms can be either critical, major, minor, or none.

.

2. REASON FOR OUTPUT

To report that an error has been detected in the communication module (CM) and to summarize the actions already taken to recover.

This message is related to one of three message classes, depending upon the unit identified by variable 'b'. If the unit is associated with the office network and timing complex (ONTC), the message class will be ONTC. If the unit is a communication link (CLNK), quad link packet switch PIPE (QPIPE), QLPS communication link (QLNK), or inter-switching module QLPS communication link (ISMQLNK), the message class will be CLNK. If the unit is associated with a message switch [communication module processor (CMP), foundation peripheral controller (FPC), module message processor (MMP), QLPS gateway processor (QGP), message switch control unit (MSCU), or pump peripheral controller (PPC)], the message class will be MSGS.

3. VARIABLE FIELD DEFINITIONS

NEXT RECORD = This message is a subsequent report. If blank, this message is a new report.

a = The most important action taken on a unit during the recovery sequence. Valid value(s):
   (blank) = This is a subsequent report.
   ABORT DIAGNOSTIC = Any running or waiting diagnostics were terminated.
   ABORT DLI DIAGNOSTICS = Any running or waiting diagnostics for one or more dual link interfaces (DLIs) on the specified ONTC side were terminated.
   ABORT NLI DIAGNOSTICS = Any running or waiting diagnostics for one or more network link interfaces (NLIs) on the specified ONTC side were terminated.
   ABORT QLPS DIAGNOSTICS = Terminated any running or waiting diagnostics of quad-link packet switch (QLPS) unit specified.
   ABORT RECOVERY = All remaining recovery actions were aborted. Usually caused by an error on the same unit.
   ALLOW HDWCHKS = Hardware checks for this unit were turned on.
   AUDIT = CLNK or QLNK audit in directed mode for data of requested switching module (SM) was run.
   CDAL ERROR FLAG RESET = Reset "error reported" flag of the control and diagnostic access link (CDAL) and reconnected CDAL to in-service ONTCs.
   CHANGE STATUS MAJOR = This was a single recovery sequence in which the major unit was immediately taken out-of-service, while at the same time the minor unit was quickly changed to become the new major unit.
CONDITIONAL DLI RESTORE = One or more DLIs were scheduled to be diagnosed on the specified side and then restored if the diagnostic results were "all tests passed (ATP)."

CONDITIONAL NLI RESTORE = One or more NLIs were scheduled to be diagnosed on the specified side and then restored if the diagnostic results were all tests passed (ATP).

CONDITIONAL QLPS RESTORE = Scheduled out-of-service (OOS) QLPS unit for diagnostics and then restored if diagnostics were ATP.

CONDITIONAL RESTORE = The OOS unit was scheduled to be diagnosed and restored if the diagnostic results were ATP.

CONFIG CLOCK AND SYNC TO SIDE 0 = Timing to ONTC side 0 was configured.

CONFIG CLOCK AND SYNC TO SIDE 1 = Timing to ONTC side 1 was configured.

CONTINUE = Continuation of a report trouble message.

CRITICAL RESTORE = The specific unit was restored without harming any stable phone calls. For ONTC recovery, the critical restoration was done when the ONTCs were secondarily implicated or when the ONTCs were simplex and a critical fault occurred.

DE-ELEVATE UNIT = The active unit was put into the standby state.

DEFERRED CONDITIONAL RESTORE = An automatic request to conditionally restore the unit to active or standby was placed on the deferred maintenance queue.

DEFERRED UNCONDITIONAL RESTORE = An automatic request to unconditionally restore the unit to active or standby was placed on the deferred maintenance queue.

DEGRADE = One or more time multiplexed switch (TMS) links on the specified ONTC side were removed from service. Refer to the master control center (MCC) TMS 0 & 1 SUMMARY page.

DEGRADE 100 PERCENT = All TMS links, DLIs, and NLIs on the specified ONTC side were removed.

DELAY FOR KERNEL LEVEL LOCKOUT = A real time delay in fault recovery is taken to avoid escalation due to a kernel level lockout.

DIAGNOSE = Proper circuit operation was verified and tested.

DMA REQUEST = Direct memory access was requested.

DUPLEX FAIL = Both sets of duplicated hardware became inoperable.

ELEVATE = The standby unit was put into the active state.

ERROR REPORT = An error was received on a unit.

ERROR TYPE RECLASSIFIED CRITICAL = A non-critical error was reclassified to critical because of a failure that was encountered during the non-critical error recovery sequence. The critical error recovery sequence has been entered.

HARD SWITCH = Fault recovery switched the units with possible loss of transient calls.

HASH CHECK, FI TO ACTIVE = Full initialization of the unit to active occurred with a pump of phase 2 and phase 3 hash-sums.

HASH CHECK, FI TO STANDBY = Full initialization of the unit to standby occurred with a pump of phase 2 and phase 3 hash-sums.

IMPlicate = Indicated unit is being implicated for removal.

INHIBIT HDWCHKS = Hardware checks for this unit were turned off.

INITIALIZE = Circuitry was programmed to initial known state.

LEVEL 2 RESTART = The administrative module (AM) is requesting a restart of level 2 communication protocol on the indicated QLNK.

LEVEL 3 RESTART = The AM is requesting a restart of level 3 link establishment protocol for the indicated QLNK.

MMP TIMING REMOVAL = ONTC was removed due to MMP synchronization difficulty. Requires manual diagnostics of the ONTC to be executed with the message interface bus (MIB) demand phase of the diagnostics.
NC OSCILLATOR RECOVERY = ONTC network clock (NC) oscillator fault recovery occurred. Refer to MCC NETWORK CLOCK page (CM 2 only) and REPT:ONTC-NC output messages with the same event number as the REPT:TRBL output message.

NC REFERENCE CONFIGURE = ONTC NC reference fault recovery occurred. Refer to either MCC MI/NC 0 & 1 page (CM 1 only) or to MCC NETWORK CLOCK page (CM 2 only) and REPT:ONTC-NC messages with the same event number as the REPT:TRBL output message.

NO ACTION = Autonomous recovery was performed in CM only with no additional action in AM.

NO FAIL RESTORE = The specific unit was restored unconditionally and completed the restoration sequence even if all units could not be completely restored.

NO PUMP, FI TO ACTIVE = Full initialization of the unit to active occurred without a pump.

NO PUMP, FI TO STANDBY = Full initialization of the unit to standby occurred without a pump.

NO PUMP, PGI TO ACTIVE = Purging initialization of the unit to active occurred without a pump.

NO PUMP, PGI TO STANDBY = Purging initialization of the unit to standby occurred without a pump.

NON CRITICAL ERROR CLEANUP = Hardware checks were allowed on the unit after a non-critical error caused the hardware checks to be inhibited.

NORMALIZE = Communication link normalization was requested to optimally arrange CLNK configurations.

ODD PUMP, FI TO ACTIVE = Full initialization of the unit to active occurred with a pump of phase 2, phase 3 and office-dependent data hash-sums, and office-dependent data.

ODD PUMP, FI TO STANDBY = Full initialization of the unit to standby occurred with a pump of phase 2, phase 3 and office-dependent data hash-sums, and office-dependent data.

OUT-OF-SERVICE UNIT CLEANUP = An error on an OOS unit was received.

POST-MORTEM = A post-mortem dump was requested because the specified unit reported a critical error. This is only a request, it does not mean that the post-mortem can be or will be dumped.

POWER PUMP, FI TO ACTIVE = Full initialization of the unit to active occurred with a pump of phase 2, phase 3 and office dependent data hash-sums, office dependent data, phase 2 text and data, phase 3 text and data, and a memory clear of the unit.

POWER PUMP, FI TO STANDBY = Full initialization of the unit to standby occurred with a pump of phase 2, phase 3 and office dependent data hash-sums, office dependent data, phase 2 text and data, phase 3 text and data, and a memory clear of the unit.

QGP ERROR REPORT = The QGP has detected errors on the indicated QLNK and is initiating autonomous recovery actions.

QGP RECEIVED DISCONNECT = The QGP has detected a disconnect request from the far end on the indicated QLNK.

QLPS QUAD FAIL = All units on QLPS networks 0 and 1 have failed. No QLPS connectivity to any endpoint.

QUADRUPLEX FAIL = The unit specified quadruplex failed.

RECOUPLE = Fault recovery of the MSCU without initializing it or its children.

REFRESH = Circuitry was reprogrammed to reflect current software states.

REMOVE = Unit was isolated from rest of system. If the unit is a QLNK, the AM has removed the link from service and temporarily disabled autonomous recovery action.

REMOVE DLI = One or more DLIs were removed from the specified ONTC side. Begin scanning DLIs that were removed by referring to MCC TMS 0 & 1 SUMMARY page.

REMOVE NLI = One or more NLIs were removed from the specified ONTC side. Begin scanning NLIs that were removed by referring to MCC TMS 0 & 1 SUMMARY page.

REMOVE QGL = Removed from service a QLPS gateway link (QGL) on the specified MSGS side. Refer to MCC QLPS network 0 & 1 SUMMARY page.

REMOVE QLPS = Removed from service a QLPS on the specified ONTC side. Refer to MCC QLPS
REMOVE QTMSLNK = Removed from service one or more QLPS time multiplex switch links (QTMSLNK) on the specified ONTC side. Refer to MCC QLPS network 0 & 1 SUMMARY page.

REPORT NETWORK CLOCK = Reported reference integrity from NC. Refer to REPT:NC output message with the same event number as the REPT:TRBL output message.

RESCHEDULE = Continuation of a report trouble message resulting from RESCHEDULE RECOVERY action.

RESCHEDULE RECOVERY = All remaining recovery actions are rescheduled. Usually caused by an error on a parent unit.

RESTART = Fault recovery initialized the unit.

RESTART = An OOS unit was unconditionally restored to active or standby state.

RESTART DLI = One or more OOS DLIs was unconditionally restored. Recovery done when both DLIs to one or more SMs are faulty. Begin scanning which DLIs were restored by referring to MCC TMS 0 & 1 SUMMARY page.

RESTART NLI = One or more OOS NLIs was unconditionally restored. Recovery done when NLIs to one or more SMs are faulty. Begin scanning which NLIs were restored by referring to MCC TMS 0 & 1 SUMMARY page.

RESTORE TO ACTIVE = An OOS unit was restored to the active state.

RESTORE TO STANDBY = An OOS unit was restored to the standby state.

SET NETWORK CLOCK MODE = Set NC mode to NORM mode, FAST mode, or HOLD mode.

SM ERROR REPORT = The SM/message handler (MH) has detected errors on the indicated QLNK link and is initiating autonomous recovery actions.

SM INITIATED LEVEL 2 RESTART = The SM has initiated a restart of level 2 communication protocol on the indicated QLNK/ISMQLNK.

SM INITIATED LEVEL 3 RESTART = The SM has initiated a restart of level 3 link establishment protocol for the indicated QLNK/ISMQLNK.

SM INITIATED REMOVE = The SM has removed the QLNK/ISMQLNK from service, and has temporarily disabled autonomous recovery actions.

SM RECEIVED DISCONNECT = The SM/MH has detected a disconnect request from the far end on the indicated QLNK/ISMQLNK.

SOFT SWITCH = Fault recovery of switched units without losing transient calls.

START = Start of a report trouble message.

STOP RECOVERY = All remaining recovery actions were stopped. Usually caused by a manual request to force a parent unit.

SWITCH = Switched active/standby relationship of duplicated units, or, for CLNK, switched logical link assignment.

SWITCH THEN REMOVE = The units were switched and then the standby (formerly active) unit was removed.

TMS CALL PROCESSING AUDIT = Check of PCD and AM verses time multiplexed switch (TMS) firmware. It runs every hour or on demand based on e-bit continuity errors.

TMS FABRIC UPDATE = The TMS fabric random access memory was configured for stable calls after a restoration of the ONTC, DLI, NLI or TMS link.

TMS FABRIC UPDATE CLEANUP = A continuation of ONTC recovery after the TMS completed the fabric update. The recovery sequence was completed with a common office network timing complex (ONTCCOM) removal and an ONTCCOM conditional restoration.

UNDEGRADE = All OOS TMS links, OOS DLIs, and OOS NLIs were unconditionally restored on a specific side to maintain the highest call capacity.

UPDATE PIC ROUTING TABLE = MSCU peripheral controller (PC) was updated to SM translation table.

UPDATE STATUS ONLY = Could not perform physical removal of the PC because the MSCU was
OOS, so updated status only of PC. If the PC is the CMP, the MSCU may not be OOS.

**UNEQUIPPED UNIT ERROR REPORT** = Received error on an unequipped unit.

**b**

Unit modifier. Valid value(s):

**c**

= Unit identity [unit name and member number(s)] implicated by error. Valid unit names are:

- **AM** = Administrative module.
- **CLNK** = Communication link.

## 4. ACTIONS TO BE TAKEN

If the REPT:TRBL message is unalarmed, no immediate action is needed (this message is reporting automatic recovery actions which should result in the affected units being returned to service). If the message is alarmed, automatic recovery may or may not be successful in restoring the affected units to service; if the affected units remain OOS, refer to the Corrective Maintenance manual, specifically to the section entitled "ANALYZE COMMUNICATION MODULE PROBLEMS", for detailed repair procedures.

Also, note the following special cases:

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEGRADE</td>
<td>Automatic DLI diagnostics may have been scheduled if &quot;both&quot; TMS links on this ONTC side have failed in an SM, automatic TMS diagnostics may not be activated due to potential service impact.</td>
</tr>
</tbody>
</table>

  Automatic NLI diagnostics may have been scheduled if "both" TMS links on this ONTC side have failed in an SM-2000, automatic TMS diagnostics may not be activated due to potential service impact.

  Automatic NLI diagnostics may have been scheduled if the "single" TMS link on this ONTC side have failed in an EXM-2000, automatic TMS diagnostics may not be activated due to potential service impact.

  To isolate the problem, manual action will have to be used to diagnose the ONTC which is in the DEGRADED state. This can be done by using the DGN:ONTC input message.

  ONTC diagnostics use the standby FPC as a helper unit. Therefore, it may be best to wait for a low-traffic period. Also, diagnosing the ONTC causes all DLIs and NLIs to be diagnosed; if this is not desired, then run the ONTCCOM diagnostics and run DLI or NLI diagnostics (for the DLIs or NLIs which have the out of service TMS links) separately.

  Once the manually initiated diagnostics have been executed, the resulting read-only printer (ROP) trouble locating
TMS CALL PROCESSING AUDIT

The recovery action was triggered by excessive continuity failures during network path set-up. If the problem persists after the specified automatic network reconfigurations, manual actions should be used to reconfigure units used in the affected network paths. The units affected could include the active major ONTC, the module controller/time slot interchangers (MCTSI) of SMs, and the host digital facility interfaces (HDFIs), remote digital facility interfaces (RDFIs) and umbilical facilities of remote SMs (RSMs). Refer to the REPT:PTRACE output message for network path details for each e-bit continuity failure.

5. ALARMS

Depending on the units and the actions, the alarms can be either critical, major, minor, or none.

6. REFERENCES

Message Class: CLNK, MSGS, ONTC
Application: 5
Type: Output

1. FORMAT

REPT TRBL, [a][ b][ c], [NEXT RECORD,] EVENT=d
   ERROR=e
   TIME=ff:ff:ff.f [xy]
RECOVERY ACTIONS:
   [g | h]
   .
   .
   .

2. REASON FOR OUTPUT

To report that an error has been detected in the communication module (CM) and to summarize the actions already taken to recover.

This message is related to one of three message classes, depending upon the unit identified by variable 'b'. If the unit is associated with the office network and timing complex (ONTC), the message class will be ONTC. If the unit is a communication link (CLNK), quad link packet switch PIPE (QPIPE), QLPS communication link (QLNK), or inter-switching module QLPS communication link (ISMQLNK), the message class will be CLNK. If the unit is associated with a message switch [communication module processor (CMP), foundation peripheral controller (FPC), module message processor (MMP), QLPS gateway processor (QGP), message switch control unit (MSCU), or pump peripheral controller (PPC)], the message class will be MSGS.

3. VARIABLE FIELD DEFINITIONS

NEXT RECORD = This message is a subsequent report. If blank, this message is a new report.

a = The most important action taken on a unit during the recovery sequence. Valid value(s):
   (blank) = This is a subsequent report.
   ABORT DIAGNOSTIC = Any running or waiting diagnostics were terminated.
   ABORT DLI DIAGNOSTICS = Any running or waiting diagnostics for one or more dual link interfaces (DLIs) on the specified time-multiplexed switch fabric pair (TMSFP) were terminated.
   ABORT NLI DIAGNOSTICS = Any running or waiting diagnostics for one or more network link interfaces (NLIs) on the specified TMSFP were terminated.
   ABORT QLPS DIAGNOSTICS = Terminated any running or waiting diagnostics of quad-link packet switch (QLPS) unit specified.
   ABORT RECOVERY = All remaining recovery actions were aborted. Usually caused by an error on the same unit.
   ALLOW HDWCHKS = Hardware checks for this unit were turned on.
   AUDIT = CLNK or QLNK audit in directed mode for data of requested switching module (SM) was run.
   CDAL ERROR FLAG RESET = Reset "error reported" flag of the control and diagnostic access link (CDAL) and reconnected CDAL to in-service ONTCs.
   CHANGE STATUS MAJOR = This was a single recovery sequence in which the major unit was immediately taken out-of-service, while at the same time the minor unit was quickly
changed to become the new major unit.

**CONDITIONAL DLI RESTORE** = One or more DLIs were scheduled to be diagnosed on the specified TMSFP and then restored if the diagnostic results were "all tests passed (ATP)."

**CONDITIONAL NLI RESTORE** = One or more NLIs were scheduled to be diagnosed on the specified TMSFP and then restored if the diagnostic results were all tests passed (ATP).

**CONDITIONAL QLPS RESTORE** = Scheduled out-of-service (OOS) QLPS unit for diagnostics and then restored if diagnostics were ATP.

**CONDITIONAL RESTORE** = The OOS unit was scheduled to be diagnosed and restored if the diagnostic results were ATP.

**CONFIG CLOCK AND SYNC TO SIDE 0** = Timing to ONTC side 0 was configured.

**CONFIG CLOCK AND SYNC TO SIDE 1** = Timing to ONTC side 1 was configured.

**CONTINUE** = Continuation of a report trouble message.

**CRITICAL RESTORE** = The specific unit was restored without harming any stable phone calls. For ONTC recovery, the critical restoration was done when the ONTCs were secondarily implicated or when the ONTCs were simplex and a critical fault occurred.

**DE-ELEVATE UNIT** = The active unit was put into the standby state.

**DEFERRED CONDITIONAL RESTORE** = An automatic request to conditionally restore the unit to active or standby was placed on the deferred maintenance queue.

**DEFERRED UNCONDITIONAL RESTORE** = An automatic request to unconditionally restore the unit to active or standby was placed on the deferred maintenance queue.

**DEGRADE** = One or more time multiplexed switch (TMS) links on the specified ONTC side or TMSFP were removed from service. Refer to the master control center (MCC) TMSFP x TMSLNK SUMMARY page (where x is 0, 1, 2, or 3).

**DEGRADE 100 PERCENT** = All TMS links, DLIs, and NLIs on the specified ONTC side or TMSFP were removed.

**DELAY FOR KERNEL LEVEL LOCKOUT** = A real time delay in fault recovery is taken to avoid escalation due to a kernel level lockout.

**DIAGNOSE** = Proper circuit operation was verified and tested.

**DMA REQUEST** = Direct memory access was requested.

**DUPLEX FAIL** = Both sets of duplicated hardware became inoperable.

**ELEVATE** = The standby unit was put into the active state.

**ERROR REPORT** = An error was received on a unit.

**ERROR TYPE RECLASSIFIED CRITICAL** = A non-critical error was reclassified to critical because of a failure that was encountered during the non-critical error recovery sequence. The critical error recovery sequence has been entered.

**HARD SWITCH** = Fault recovery switched the units with possible loss of transient calls.

**HASH CHECK, FI TO ACTIVE** = Full initialization of the unit to active occurred with a pump of phase 2 and phase 3 hash-sums.

**HASH CHECK, FI TO STANDBY** = Full initialization of the unit to standby occurred with a pump of phase 2 and phase 3 hash-sums.

**IMPlicate** = Indicated unit is being implicated for removal.

**INHIBIT HDWCHKS** = Hardware checks for this unit were turned off.

**INITIALIZE** = Circuitry was programmed to initial known state.

**LEVEL 2 RESTART** = The administrative module (AM) is requesting a restart of level 2 communication protocol on the indicated QLNK.

**LEVEL 3 RESTART** = The AM is requesting a restart of level 3 link establishment protocol for the indicated QLNK.

**MMP TIMING REMOVAL** = ONTC was removed due to MMP synchronization difficulty. Requires manual diagnostics of the ONTC to be executed with the message interface bus
(MIB) demand phase of the diagnostics.

NC OSCILLATOR RECOVERY = ONTC network clock (NC) oscillator fault recovery occurred. Refer to MCC NETWORK CLOCK page (CM 2 only) and REPT:ONTC-NC output messages with the same event number as the REPT:TRBL output message.

NC REFERENCE CONFIGURE = ONTC NC reference fault recovery occurred. Refer to either MCC MI/NC 0 & 1 page (CM 1 only) or to MCC NETWORK CLOCK page (CM 2 only) and REPT:ONTC-NC messages with the same event number as the REPT:TRBL output message.

NO ACTION = Autonomous recovery was performed in CM only with no additional action in AM.

NO FAIL RESTORE = The specific unit was restored unconditionally and completed the restoration sequence even if all units could not be completely restored.

NO PUMP, FI TO ACTIVE = Full initialization of the unit to active occurred without a pump.

NO PUMP, FI TO STANDBY = Full initialization of the unit to standby occurred without a pump.

NO PUMP, PGI TO STANDBY = Purging initialization of the unit to standby occurred without a pump.

NON CRITICAL ERROR CLEANUP = Hardware checks were allowed on the unit after a non-critical error caused the hardware checks to be inhibited.

NORMALIZE = Communication link normalization was requested to optimally arrange CLNK configurations.

ODD PUMP, FI TO ACTIVE = Full initialization of the unit to active occurred with a pump of phase 2, phase 3 and office-dependent data hash-sums, and office-dependent data.

ODD PUMP, FI TO STANDBY = Full initialization of the unit to standby occurred with a pump of phase 2, phase 3 and office-dependent data hash-sums, and office-dependent data.

OUT-OF-SERVICE UNIT CLEANUP = An error on an OOS unit was received.

POST-MORTEM = A post-mortem dump was requested because the specified unit reported a critical error. This is only a request, it does not mean that the post-mortem can be or will be dumped.

POWER PUMP, FI TO ACTIVE = Full initialization of the unit to active occurred with a pump of phase 2, phase 3 and office dependent data hash-sums, office dependent data, phase 2 text and data, phase 3 text and data, and a memory clear of the unit.

POWER PUMP, FI TO STANDBY = Full initialization of the unit to standby occurred with a pump of phase 2, phase 3 and office dependent data hash-sums, office dependent data, phase 2 text and data, phase 3 text and data, and a memory clear of the unit.

QGP ERROR REPORT = The QGP has detected errors on the indicated QLNK and is initiating autonomous recovery actions.

QGP RECEIVED DISCONNECT = The QGP has detected a disconnect request from the far end on the indicated QLNK.

QLPS QUAD FAIL = All units on QLPS networks 0 and 1 have failed. No QLPS connectivity to any endpoint.

QUADRUPLEX FAIL = The unit specified quadruplex failed.

RECOUPLE = Fault recovery of the MSCU without initializing it or its children.

REFRESH = Circuitry was reprogrammed to reflect current software states.

REMOVE = Unit was isolated from rest of system. If the unit is a QLNK, the AM has removed the link from service and temporarily disabled autonomous recovery action.

REMOVE DLI = One or more DLIs were removed from the specified TMSFP. Begin scanning DLIs that were removed by referring to MCC TMSFP x TMSLNK SUMMARY page (where x is 0, 1, 2, or 3).

REMOVE NLI = One or more NLIs were removed from the specified TMSFP. Begin scanning NLIs that were removed by referring to MCC TMSFP x TMSLNK SUMMARY page (where x is 0, 1, 2, or 3).
REMOVE QGL = Removed from service a QLPS gateway link (QGL) on the specified MSGS side. Refer to MCC QLPS network 0 & 1 SUMMARY page.

REMOVE QLPS = Removed from service a QLPS on the specified ONTC side. Refer to MCC QLPS network 0 & 1 SUMMARY page.

REMOVE QTMSLNK = Removed from service one or more QLPS time multiplex switch links (QTMSLNK) on the specified ONTC side. Refer to MCC QLPS network 0 & 1 SUMMARY page.

REPORT NETWORK CLOCK = Reported reference integrity from NC. Refer to REPT:NC output message with the same event number as the REPT:TRBL output message.

RESCHEDULE = Continuation of a report trouble message resulting from RESCHEDULE RECOVERY action.

RESCHEDULE RECOVERY = All remaining recovery actions are rescheduled. Usually caused by an error on a parent unit.

RESTART = Fault recovery initialized the unit.

RESTORE = An OOS unit was unconditionally restored to active or standby state.

RESTORE DLI = One or more OOS DLIs was unconditionally restored. Recovery done when both DLIs to one or more SMs are faulty. Begin scanning which DLIs were restored by referring to MCC TMSFP x TMSLNK SUMMARY page (where x is 0, 1, 2, or 3).

RESTORE NLI = One or more OOS NLIs was unconditionally restored. Recovery done when NLIs to one or more SMs are faulty. Begin scanning which NLIs were restored by referring to MCC TMSFP x TMSLNK SUMMARY page (where x is 0, 1, 2, or 3).

RESTORE TO ACTIVE = An OOS unit was restored to the active state.

RESTORE TO STANDBY = An OOS unit was restored to the standby state.

SET NETWORK CLOCK MODE = Set NC mode to NORM mode, FAST mode, or HOLD mode.

SM ERROR REPORT = The SM/message handler (MH) has detected errors on the indicated QLNK link and is initiating autonomous recovery actions.

SM INITIATED LEVEL 2 RESTART = The SM has initiated a restart of level 2 communication protocol on the indicated QLNK/ISMQLNK.

SM INITIATED LEVEL 3 RESTART = The SM has initiated a restart of level 3 link establishment protocol for the indicated QLNK/ISMQLNK.

SM INITIATED REMOVE = The SM has removed the QLNK/ISMQLNK from service, and has temporarily disabled autonomous recovery actions.

SM RECEIVED DISCONNECT = The SM/MH has detected a disconnect request from the far end on the indicated QLNK/ISMQLNK.

SOFT SWITCH = Fault recovery of switched units without losing transient calls.

START = Start of a report trouble message.

STOP RECOVERY = All remaining recovery actions were stopped. Usually caused by a manual request to force a parent unit.

SWITCH = Switched active/standby relationship of duplicated units, or, for CLNK, switched logical link assignment.

SWITCH THEN REMOVE = The units were switched and then the standby (formerly active) unit was removed.

TMS CALL PROCESSING AUDIT = Check of PCD and AM verses time multiplexed switch (TMS) firmware. It runs every hour or on demand based on e-bit continuity errors.

TMS FABRIC UPDATE = The TMS fabric random access memory was configured for stable calls after a restoration of the ONTC, DLI, NLI or TMS link.

TMS FABRIC UPDATE CLEANUP = A continuation of ONTC recovery after the TMS completed the fabric update. The recovery sequence was completed with a common office network timing complex (ONTCCOM) removal and an ONTCCOM conditional restoration.

TMSFP0 DUPLEX FAILURE = The TMSFP0 on ONTC side 0 and the TMSFP0 on ONTC side 1 have failed. Unlike TMSFP1, TMSFP2, and TMSFP3, which only carry bearer time
slots, TMSFP0 carries bearer and control time slots.

**UNDEGRADE**
= All OOS TMS links, OOS DLIs, and OOS NLIs were unconditionally restored on a specific side to maintain the highest call capacity.

**UPDATE PIC ROUTING TABLE**
= MSCU peripheral controller (PC) was updated to SM translation table.

**UPDATE STATUS ONLY**
= Could not perform physical removal of the PC because the MSCU was OOS, so updated status only of PC. If the PC is the CMP, the MSCU may not be OOS.

**UNEQUIPPED UNIT ERROR REPORT**
= Received error on an unequipped unit.

### Unit Modifier (b)

- **b** = Unit modifier. Valid value(s):

<table>
<thead>
<tr>
<th>If 'b' =</th>
<th>'b' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>NLI or DLI</td>
<td>ONTC</td>
</tr>
<tr>
<td>LI, MI, TMS, or NC</td>
<td>ONTCCOM</td>
</tr>
<tr>
<td>Any other unit identifier or parameter 'a' is</td>
<td>QLPS QUADRUPLEX FAIL</td>
</tr>
<tr>
<td>QLPS QUADRUPLEX FAIL</td>
<td>(blank)</td>
</tr>
</tbody>
</table>

### Unit Identity (c)

- **c** = Unit identity [unit name and member number(s)] implicated by error. Valid unit names are:
  - AM = Administrative module.
  - CLNK = Communication link.
  - CMP = Communication module processor.
  - DLI = Dual link interface.
  - FPC = Foundation peripheral controller.
  - ISMQLNK = Inter-switching module communication link using QLPS.
  - LI = Link interface (CM 1 only).
  - MHQPIPE = Message handler to QLPS pipe.
  - MI = Message interface.
  - MMP = Module message processor.
  - MSCU = Message switch control unit.
  - MSGS = Message switch complex.
  - NC = Network clock.
  - NLI = Network link interface.
  - ONTC = Office network timing complex hardware.
  - ONTCCOM = Common office network timing complex hardware.
  - PPC = Pump peripheral controller.
  - QGL = QLPS to QGP link.
  - QGP = QLPS gateway processor.
  - QGPQPIPE = QGP to QLPS pipe.
  - QLNK = Switching module to AM communication link using QLPS.
  - QLPS = Quad link packet switch.
  - QPHPPIPE = QPH and QLPS pipe.
  - TMS = Time-multiplexed switch.
  - TMSFP = Time-multiplexed switch fabric pair.

**Valid value(s):**

- AM=i
- CLNK=j-k-l-m
- CMP=m-n
- DLI=j-k
- FPC=m
- ISMQLNK=j-o-p-k-v-w

f = Time of the event, in the form hours:minutes:seconds.tenths of seconds.

g = First part of recovery action sequence is the action (refer to variable 'a' for values) to be performed on a unit. If only one action occurred, it may be treated as variable 'a'. Else it will be a subset of variable 'a'.

h = Second part of recovery action sequence is the unit (refer to variable 'b' for values) that the action was performed on. There may be more than one action taken to recover the unit having trouble.

i = AM side.

j = Switching module (SM).
k = ONTC side.

l = MMP. Valid value(s):
0 = Even.
1 = Odd.

m = MSGS side.

n = CMP number.

o = Active module controller/time slot interchanger (MCTSI) side.

p = QLPS network.

q = MMP number.

s = QGP number.

t = QGL number.
u = QLPS number.

**NOTE:** Since more than one NLI could be removed simultaneously, the NLI number has been deleted.

v = Far end SM.

w = Far end active MCTSI side.

x = CM3 resident error source event. Left blank for CM2 or when the error is AM for CM3. Valid values:

```
MSGS IP RESIDENT EVENT=
MSGS AP RESIDENT EVENT=
ONTC IP RESIDENT EVENT=
ONTC AP RESIDENT EVENT=
```

y = CM3 resident event number. Left blank for CM2.

z = Packet switch unit (PSU) number.

a\(^1\) = PSU shelf.

b\(^1\) = Quad-link protocol handler (QPH) channel group number.

c\(^1\) = Time-multiplexed switch fabric pair number.

### 4. ACTIONS TO BE TAKEN

If the REPT:TRBL message is unalarmed, no immediate action is needed (this message is reporting automatic recovery actions which should result in the affected units being returned to service). If the message is alarmed, automatic recovery may or may not be successful in restoring the affected units to service; if the affected units remain OOS, refer to the Corrective Maintenance manual, specifically to the section entitled "ANALYZE COMMUNICATION MODULE PROBLEMS", for detailed repair procedures. Also, note the following special cases:
<table>
<thead>
<tr>
<th>If 's' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEGRADE</td>
<td>Automatic DLI diagnostics may have been scheduled if &quot;both&quot; TMS links on this ONTC side have failed in an SM, automatic TMS diagnostics may not be activated due to potential service impact.</td>
</tr>
<tr>
<td></td>
<td>Automatic NLI diagnostics may have been scheduled if &quot;both&quot; TMS links on this ONTC side have failed in an SM-2000, automatic TMS diagnostics may not be activated due to potential service impact.</td>
</tr>
<tr>
<td></td>
<td>Automatic NLI diagnostics may have been scheduled if the &quot;single&quot; TMS link on this ONTC side have failed in an EXM-2000, automatic TMS diagnostics may not be activated due to potential service impact.</td>
</tr>
<tr>
<td></td>
<td>To isolate the problem, manual action will have to be used to diagnose the ONTC which is in the DEGRADED state. This can be done by using the DGN:ONTC input message.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> ONTC diagnostics use the standby FPC as a helper unit. Therefore, it may be best to wait for a low-traffic period. Also, diagnosing the ONTC causes all DLIs and NLIs to be diagnosed; if this is not desired, then run the ONTCCOM diagnostics and run DLI or NLI diagnostics (for the DLIs or NLIs which have the out of service TMS links) separately. Once the manually initiated diagnostics have been executed, the resulting read-only printer (ROP) trouble locating procedure (TLP) report will detail the circuit packs that should be replaced. Refer to Corrective Maintenance Procedures manual, &quot;Clear Diagnostic Failures in Hardware (Units/Circuits)&quot;.</td>
</tr>
<tr>
<td>TMS CALL PROCESSING AUDIT</td>
<td>The recovery action was triggered by excessive continuity failures during network path set-up. If the problem persists after the specified automatic network reconfigurations, manual actions should be used to reconfigure units used in the affected network paths. The units affected could include the active major ONTC, the module controller/line slot interchangers (MCTSI) of SMs, and the host digital facility interfaces (HDFIs), remote digital facility interfaces (RDFIs) and umbilical facilities of remote SMs (RSMs). Refer to the REPT:PTRACE output message for network path details for each e-bit continuity failure.</td>
</tr>
</tbody>
</table>

5. ALARMS

Depending on the units and the actions, the alarms can be either critical, major, minor, or none.

REPT:TRBL-AQUEST

Software Release: 5E14 and later
Message Class: TLWS
Application: 5
Type: Output

1. FORMAT

REPT TRBL AQEST=a AQ=b-c d

2. REASON FOR OUTPUT

To report per-call test failure while transmitting an Autoquote quotation, or to report that the local modem has failed to establish working connection with the remote modem/printer connected to a leased hotel line while the hotel line is under maintenance.

3. VARIABLE FIELD DEFINITIONS

AQ = Autoquote digital subscriber line (DSL).
AQEST = Autoquote hotel/motel establishment.
a = Directory (telephone) number of AQEST.
b = AQ group ID.
c = AQ relative DSL number.
d = Text describing the event that occurred. Valid value(s):
HANDSHAKE PROBLEM = While doing maintenance on Autoquote leased line, the switch repeatedly failed to connect with the remote modem/printer.
PER-CALL TEST FAILURE = The operational software failed to perform per-call test before transmitting an Autoquote quotation.

4. ACTION TO BE TAKEN

If per-call test failure is reported repeatedly on the same Autoquote DSL or hotel leased line, run the TST:OSPS input message to manually diagnose the fault.

If the handshake problem is reported, the hotel site printer may be out-of-paper or switched off for a long time, or the modem/printer is faulty.

The handshake problem may also be due to a local modem. This situation can be isolated by using the TST:OSPS input message with a different AQ DSL from the one specified in the REPT:TRBL output message.

5. ALARMS

None.

6. REFERENCES

Input Message(s):
TST:OSPS
REPT:TRBL-DLD

Software Release: 5E14 and later
Message Class: LINE
Application: 5
Type: Output

1. FORMAT

REPT TRBL DATA LINK DSL a b [CH c]
   d [d] [d] [d] [d]

2. REASON FOR OUTPUT

To report that a data link digital subscriber line (DSL) port has been automatically or manually removed from service.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Valid value(s):
   AP=f-e
   AQ=f-e
   DASC=f-e
   EIS=g-h
   HOBICR=f-e
   HOBICV=f-e
   HOBIS=f-e
   MISLNK=f-e
   OAPF=i
   OAPO=j
   RAS=f-e
   RTRS=f-e
   XDB=f-e

b = Valid value(s):
   LCEN=l-m-n-k

c = Channel identifier. Valid value(s):
   B1
   B2
   D

d = Primary port status of the data link channel. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information, and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.
e = Relative link (member) number.
f = Data link (group) number.
g = EIS identifier (ID) on which the CPDL terminates.
h = External data link member number relative to the EIS.
i = Force management center number.
j = Operator service center number.
k = Line card number.
l = Switching module (SM) number.
m = Integrated services line unit number.
n = Line group controller number.

4. ACTION TO BE TAKEN

Determine if the data link was removed from service automatically due to hardware problems with the associated T-interface or terminal adapter (TA). For DASC data links, the DASC computer could be at fault. Attempt to restore the data link to service by using the RST:DATALINK input message. For an AP data link with a basic rate interface (BRI) status of IS AUTO, the path between the application processor and the BRI data pad may be out-of-service.

5. ALARMS

Major or minor.

[3] REPT TRBL, GSM ESCALATION GSM=a
   FULL INIT PREEMPTED
   TIME: bb:bb:bb

2. REASON FOR OUTPUT

All formats will only be output when the GSM ESCALATION field on RC/V View 8.15 (CCS OFFICE PARAMETER) has been set to Y(ES).

Format 1 is output when all common channel signaling (CCS) message transport (CMT) on a HOST global switch module (GSM) has been lost due to reasons other than QPHPIPE manual removal. The recovery action associated with the event will be included in the output.

Format 2 is output when CCS signaling link (CCSLK) availability is lost to the ECP adjacent point code (APC), or if CCSLK availability is lost to all of other APCs due to reasons other than CCSLK manual removal or remote/local blocking. The recovery action associated with the event will be included in the output.

Format 3 is output when automatic fault software recovery in a digital cellular switch (DCS) GSM is preempted from performing a automatic full initialization to preserve current CCS functionality.

3. VARIABLE FIELD DEFINITIONS

a = GSM number.

b = Approximate time of recovery in the form hours:minutes:seconds.

c = Recovery actions. Valid value(s):
ALL OOSF-PH = All the QPHPIPEs, CCSLKs or the MD Link is out of service family equipment due to no available PH.
CCSLK REMOVE/RESTORE = A removal and restoration has been attempted for all out of service CCSLKs that have not been manually removed from service or are blocked.
MAINTENANCE BUSY = Independent fault recovery is in-progress. Periodic checks of the level of CCS functionality is continued.
MCTSI SWITCH = A MCTSI switch has been attempted.
MD LINK REMOVE/RESTORE = A removal and restoration has been attempted of the MD Link.
PSUCOM SWITCH = A PSUCOM switch has been attempted.
QPHPIPE REMOVE/RESTORE = A removal and restoration has been attempted for all QPHPIPEs that have not been manually removed from service.

4. ACTIONS TO BE TAKEN

Begin manual check of CCS status to determine if manual intervention is needed.

5. ALARMS

Major.

Other Manual(s):
235-200-116  Signaling Gateway Common Channel Signaling
REPT:TRBL-MELNK-A

Software Release: 5E14 only
Message Class: SM
Application: 5
Type: Output

1. FORMAT

REPT TRBL, a MELNK=b–c–d, EVENT=e [f]
   ERROR=g TIME=hh:hh:hh.h
   RECOVERY ACTIONS:
   i j
   . .
   . .
   . .

2. REASON FOR OUTPUT

To report that an error or recovery timeout has been detected on a module controller/time slot interchange (MCTSI)-based ethernet link (MELNK) and to summarize the actions already taken to recover.

3. VARIABLE FIELD DEFINITIONS

a = The initial action taken on the specified MELNK during the recovery sequence. Valid values are:
   ALLOW AUTONOMOUS RECOVERY = The MELNK was left in a state that will allow it to come up if
   the cause of the failure can be resolved without fault recovery intervention. If the
   MELNK does not recover by itself within a short period of time, further recovery
   actions will be initiated.
   DEGRADE = One or more (but not all) MELNK ports were removed from service.
   NO ACTION = No recovery action was performed on the MELNK.
   REFRESH = The MELNK status in the message handler (MH) was updated to agree with the
   status in the switching module processor (SMP).
   REMOVE = The MELNK was removed from service.
   RESTART = Fault recovery software in the MH removed the MELNK and then immediately
   initiated an MELNK restore.
   RESTORE = Fault recovery software in the SMP initiated an MELNK restore.
   VERIFY = Fault recovery software in the SMP initiated an MEPIPE/MELNK status audit to
   verify data consistency between the SMP and MH.

b = Switching module (SM) number.

c = MCTSI-based ethernet pipe (MEPIPE) number.

d = MELNK number.

e = Event number.

f = Text identifier showing order of record. Valid values are:
   FIRST RECORD = First record of continuing list.
   LAST RECORD = Last record of continuing list.
   NEXT RECORD = Next record of continuing list.
4. ACTIONS TO BE TAKEN

Automatic recovery actions may or may not be successful in restoring the MELNK to service. If the MELNK remains out-of-service (OOS), refer to the “Maintenance” section of the Long Distance Platform document (235-200-110) for a detailed procedure for clearing MEPIPE/MELNK problems.

5. ALARMS

A minor alarm indicates that an error has occurred but either the MELNK has recovered or fault recovery is still
performing actions in an effort to recover it. A major alarm indicates that initial fault recovery attempts have failed to restore the MELNK to service. While fault recovery will continue to make periodic attempts to recover the MELNK, manual action will probably be required. For example, it may be necessary to resolve a problem with the far end system or repair/restore an OOS MCTSI.

      verify data consistency between the SMP and MH.

b = Switching module (SM) number.

c = MCTSI-based ethernet pipe (MEPIPE) number.

d = MELNK number.

e = Event number.

f = Text identifier showing order of record. Valid value(s):
   FIRST RECORD = First record of continuing list.
   LAST RECORD = Last record of continuing list.
   NEXT RECORD = Next record of continuing list.
Error types. The error that was discovered by software. Valid value(s):
APPLICATION LAYER 4 EVENT
EXCESSIVE NUMBER OF FAULTS
EXCESSIVE OUT-OF-DATE EVENTS
EXCESSIVE PROTOCOL ERRORS
EXCESSIVE UNEXPECTED EVENTS
FAR END REMOVE
LOOPBACK TO FAR END FAILED
MELNK FAILED AFTER MCTSI SWITCH
MH AUDIT REQUESTED RECOVERY
PROTOCOL TIMEOUT
RECOVERY DUE TO MH OSR
RECOVERY FAILED
RECOVERY TIMEOUT
STATUS INCONSISTENCY
TIMEOUT ESTABLISHING MELNK

Time of the event, in the form hours:minutes:seconds.tenths of seconds.

The recovery action performed on the unit described in field 'j'. More than one action may be taken in order to recover the MELNK having trouble. The first action/unit pair shown here will be the same MELNK action as in field 'a'. Valid values are:
ALLOW AUTONOMOUS RECOVERY = The unit was left in a state that would allow it to come up if the cause of the failure can be resolved without fault recovery intervention. If the unit does not recover by itself within a short period of time, further recovery actions will be initiated.
DEGRADE = One or more (but not all) MELNK ports were removed from service.
IMPlicate = Fault recovery software in the SMP implicated the specified unit as a possible cause of the failure.
INITIALIZE = Fault recovery software in the SMP initialized the specified unit.
NO ACTION = No recovery action was performed on the unit.
REFRESH = The unit status in the MH was updated to agree with the status in the SMP.
REMOVE = The unit was removed from service.
RESTART = Fault recovery software in the MH removed the unit and then immediately initiated a restore.
RESTORE = Fault recovery software in the SMP initiated a restore.
SWITCH = Fault recovery software in the SMP requested a switch.
VERIFY = Fault recovery software in the SMP initiated an MEPIPE/MELNK status audit to verify data consistency between the SMP and MH.

The unit upon which the recovery action specified in field 'i' was performed. In addition to performing actions on the specified MELNK, recovery may also be performed on the parent MEPIPE, the MH, or the MCTSI.

4. ACTIONS TO BE TAKEN

Automatic recovery actions may or may not be successful in restoring the MELNK to service. If the MELNK remains out-of-service (OOS), refer to the "Maintenance" section of the 5ESS®-2000 Switch Long Distance Platform document (235-200-110) for a detailed procedure for clearing MEPIPE/MELNK problems.
5. ALARMS

A minor alarm indicates that an error has occurred but either the MELNK has recovered or fault recovery is still performing actions in an effort to recover it. A major alarm indicates that initial fault recovery attempts have failed to restore the MELNK to service. While fault recovery will continue to make periodic attempts to recover the MELNK, manual action will probably be required. For example, it may be necessary to resolve a problem with the far end system or repair/restore an OOS MCTSI.

   ERROR=f TIME=gg:gg:gg.g
   RECOVERY ACTIONS:
      h i
      . .
      . .

2. REASON FOR OUTPUT

To report that an error or recovery timeout has been detected on a module controller/time slot interchange (MCTSI)-based ethernet pipe (MEPIPE) and to summarize the actions already taken to recover.

3. VARIABLE FIELD DEFINITIONS

a = The initial action taken on the specified MEPIPE during the recovery sequence. Valid values are:
   ALLOW AUTONOMOUS RECOVERY = The MEPIPE was left in a state that will allow it to come up if the cause of the failure can be resolved without fault recovery intervention. If the MEPIPE does not recover by itself within a short period of time, further recovery actions will be initiated.
   BEGIN LONG TERM RECOVERY = All attempts to recover the MEPIPE and/or child MCTSI-based ethernet links (MELNKs) have failed. Periodic attempts will be made to restore them to service, but manual intervention may be required (e.g. to restore an out-of-service [OOS] MCTSI side or correct a problem that is external to the switch.)
   NO ACTION = No recovery action was performed on the MEPIPE.
   REFRESH = The MEPIPE status in the message handler (MH) was changed to agree with the status in the switching module processor (SMP).
   REMOVE = The MEPIPE was removed from service.
   RESTART = Fault recovery software in the MH removed the MEPIPE and then immediately initiated an MEPIPE restore.
   RESTORE = Fault recovery software in the SMP initiated an MEPIPE restore.
   VERIFY = Fault recovery software in the SMP initiated an MEPIPE/MELNK status audit to verify data consistency between the SMP and MH.

b = Switching module (SM) number.

c = MEPIPE number.

d = Event number.

e = Text identifier showing order of record. Valid values are:
   FIRST RECORD = First record of continuing list.
   LAST RECORD = Last record of continuing list.
   NEXT RECORD = Next record of continuing list.

Error types. The error that was discovered by software. Valid values are:

- EXCESSIVE L1 ERRORS
- EXCESSIVE NUMBER OF FAULTS
- EXCESSIVE OUT-OF-DATE EVENTS
- EXCESSIVE UNEXPECTED EVENTS
- INVALID MH DATA
- LOOPBACK TO HUB FAILED
- LOOPBACK TO MATE HUB FAILED
- MH AUDIT REQUESTED RECOVERY
- POST RECOVERY CLEANUP
- RECOVERY DUE TO MH OSR
- RECOVERY FAILED
- RECOVERY TIMEOUT
- STATUS INCONSISTENCY

Time of the event, in the form hours:minutes:seconds.tenths of seconds.

The recovery action performed on the unit described in field 'i'. More than one action may be taken to recover the MEPIPE and/or MELNK(s) having trouble. The first action/unit pair shown here will be the same MEPIPE action as in field 'a'. Valid values are:

- ALLOW AUTONOMOUS RECOVERY = The unit was left in a state that will allow it to come up if the cause of the failure can be resolved without fault recovery intervention. If the unit does not recover by itself within a short period of time, further recovery actions will be initiated.
- BEGIN LONG TERM RECOVERY = All attempts to recover the unit have failed. Periodic attempts will be made to restore service, but manual intervention may be required.
- IMPlicate = Fault recovery software in the SMP implicated the specified unit as a possible cause of the failure.
- INITIALIZE = Fault recovery software in the SMP initialized the specified unit.
- NO ACTION = No recovery action was performed on the unit.
- REFRESH = The unit status in the MH was changed to agree with the status in the SMP.
- REMOVE = The unit was removed from service.
- RESTART = Fault recovery software in the MH removed the unit and then immediately initiated a restore.
- RESTORE = Fault recovery software in the SMP initiated a restore.
- SWITCH = Fault recovery software in the SMP requested a switch.
- VERIFY = Fault recovery software in the SMP initiated an MEPIPE/MELNK status audit to verify data consistency between the SMP and MH.

The unit upon which the recovery action specified in field 'h' was performed. In addition to performing actions on the specified MEPIPE, recovery may also be performed on the MH, the MCTSI, or child MELNK(s) of the reported unit identifiers.

4. ACTIONS TO BE TAKEN

Automatic recovery actions may or may not be successful in restoring the MEPIPE and child MELNK(s) to service. If the affected units remain OOS, refer to the "Maintenance" section of the Long Distance Platform document (235-200-110) for a detailed procedure for clearing MEPIPE/MELNK problems.

5. ALARMS
A minor alarm indicates that an error has occurred but either the MEPIPE and child MELNK(s) have recovered or fault recovery is still performing actions in an effort to recover them. A major alarm indicates that initial fault recovery attempts have failed to restore the MEPIPE/MELNK(s) to service. While fault recovery will continue to make periodic attempts to recover them, manual action will probably be required. For example, it may be necessary to resolve a problem with the ethernet hub or repair/restore an OOS MCTSI.

1204 (SM MELNK STATUS)
1190 (MCTSI STATUS)
REPT:TRBL-ONTC

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

`REPT TRBL a ONTC=b SM=c REFER TO SM EVENT=d, AM EVENT=e`

2. REASON FOR OUTPUT

A switching module (SM) detected an error on a communication module (CM) hardware unit. This invokes fault recovery actions in both the SM and the administrative module (AM), and corresponding output messages from both the SM (with an SM event number) and the AM (with an AM event number). The purpose of this message is to correlate these SM and AM messages using the event numbers.

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>

Type: Output

1. FORMAT

REPT TRBL OSPS COIN TEST FAILURE
   COIN-DN a COIN TKGMN=b-c ANNCH=d-e

2. REASON FOR OUTPUT

This message is used for reporting trouble when a coin telephone test call fails. A coin test call is any call made from a coin phone to the coin test call number. Failure can occur if hardware is bad or if the coin test caller allows the call to time out.

3. VARIABLE FIELD DEFINITIONS

a = Coin phone directory number.
b = Coin trunk group.
c = Trunk group member number.
d = Switching module number with announcement unit.
e = Port number of the announcement unit.

4. ACTION TO BE TAKEN

Check messages for patterns of problems (for example, numerous messages with the same ANNCH could indicate a bad RAF or SAS board).

5. ALARMS

None.

6. REFERENCES

[3] REPT TRBL REMOVE DLI=a-g h i REASON=j EVENT=d

[4] REPT TRBL REMOVE NLI=a-k-g i REASON=j EVENT=d

2. REASON FOR OUTPUT

Format 1 is used to report the reason for the automatic removal of a module controller/time slot interchange unit (MCTSI).

Format 2 is used to report the reason for the automatic removal of an external timing reference (SMREF).

Format 3 is used to report the reason for the automatic removal of a dual link interface (DLI) associated with a transmission rate conversion unit model-3 (TRCU3).

Format 4 is used to report the reason for the automatic removal of a network link interface (NLI) associated with a TRCU-3.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Module control unit number.
c  = Reason for the removal. Valid value(s):
AUTISS-FR  = Automatic time slot switching fault recovery detected an error.
CACHE-ERR  = Faults detected in cache circuitry have forced the MCTSI to run slow with cache disabled. The corresponding MCTSI is being removed.
CI-ERR     = Control interface error was detected; the corresponding MCTSI is being removed.
CORBT-ERR  = Correctable bit errors have been detected which have forced the MCTSI to run slow with "correct on the fly" enabled. The corresponding MCTSI is being removed.
DLI-CLK-LOST = Dual link interface lost clock resulting in the loss of the current contents of the time slot interchanger control memories.
DLI-INTERFACE = An error was detected at the interface between an MCTSI and a dual link interface (DLI).
GSM-ESCALATION = This event occurred because the minimally acceptable CCS functionality on a GSM became unavailable.
MH-ERR = One of the message handlers detected an error.
NLI-BG-SEL-CHK = The network link interface (NLI) time slot interchange (TSI) background select check detected an error which implicated this MCTSI.
PI-COMM-LOST = One of the packet interface subunits has lost communication with the module controller; the corresponding MCTSI is being removed.
PI-RECOVERY = MCTSIs were switched due to a software problem attributed to the packet interface (PI) subunit, but as the problems have not reappeared, the error may really be due to a hardware fault. This is a deferred remove, so a REPT:SM-HWLVL output message including the text "MP SANITY-TIMER PI-RECOVERY" should have been seen prior to this indicating the recognition of the problem and the MCTSI switch because of it.
PI-FAULT = Other software has detected a problem implicating a packet interface subunit of the MCTSI. These errors include packet switch unit common control (PSUCOM) arbiter timer timeout errors, and loss of communication with large numbers of packet switch unit protocol handler (PSUPH) circuits.
PSU-RECOVERY = MCTSIs were switched due to a software problem attributed to the packet switching unit (PSU), but as the problems have not reappeared, the error may really be due to a hardware fault. This is a deferred remove, so a REPT:SM-HWLVL output message including the text "MP SANITY-TIMER PSU-RECOVERY" should have been seen prior to this indicating the recognition of the problem and the MCTSI switch because of it.
PUMP-HW-ERR = The pump hardware self test has failed; therefore, the corresponding MCTSI is being removed.
SW-ERROR = MCTSIs were switched due to a problem attributed to software, but as the problems have not reappeared, the error may really be due to a hardware fault.

d = Event number.
e = External reference number.
f = Reason for the removal. Valid value(s):
FAULT = An external reference fault was detected.
SMREF-BG-ERR = An external reference background check detected an error that implicated this external reference.
g = Link interface (LI) side identifier.
h = DLI path identifier. Valid value(s):
  LINK A
  LINK B
i = Location qualifier. Valid value(s):
  HOST = Located in the communications module (CM).
  REMOTE = Located in the SM.
j = Reason for the removal. Valid value(s):
  TRCU3-TCTS-CHK = A TRCU3 control time-slot failed background tests.
k = NLI path identifier.
4. ACTIONS TO BE TAKEN

Monitor the progress of the recovery action. Use the information presented in the report for analysis.

If variable 'c' is DLI-CLK-LOST, the MCTSI will automatically be restored unconditionally. Otherwise, it will automatically be restored conditionally.

5. ALARMS

Major, minor, or none.

Application: AEWNC
Type: Output

1. FORMAT

REPT TRBL RPCU a
RPCU ID
-------------------
b
[ a ]
[ . ]
[ . ]
[ . ]

2. REASON FOR OUTPUT

To report a change in alarm status for a radio port controller unit (RPCU).

3. VARIABLE FIELD DEFINITIONS

a = Type of change that occurred to the RPCU.
CHANNELS OOS = The specified RPCU(s) are in an alarm condition.
CLEARED = The alarm state for the specified RPCU(s) has been cleared.

b = Alarmed RPCU.

4. ACTION TO BE TAKEN

When a CHANNELS OOS message is printed, the associated failing digital subscriber lines (DSLs) should be diagnosed, repaired and restored. To identify the failing DSLs, either use Poke 904 on the MCC’s 107 (Circuit Limit Page) with the RPCU listed in the REPT TRBL RPCU message or manually run OP:LIST,RPCU with the alarmed RPCU. This will print the port status of the DSLs assigned to that RPCU. For further information on the OOS states and appropriate recovery actions refer to APP:PORT-STATUS output message appendix.

5. ALARMS

The circuit limit alarm will be set if this is a "CHANNELS OOS" message.

- **e** = Event number.
- **f** = Recovery action. Valid value(s):
  - **ANALYSIS ONLY** = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have been not reached a threshold for actions.
  - **RMV** = The failing PCTFI circuit was removed from service.
- **g** = External logical circuit name.
- **h** = Number of recent failures of this type recorded against this circuit, in decimal.
- **i** = Error count threshold, above which the recovery action will become stronger, in decimal.
- **j** = Time slot number that had the most entries in the FIFO, in hexadecimal.
- **k** = Total number of entries in the FIFO for time slot ‘j’, in hexadecimal.
- **l** = Total number of time slots on the high-runner time slot interchange (TSI) link with entries in the FIFO, in hexadecimal.
- **m** = Contents of the current internal fault recovery error counter, in hexadecimal.
- **n** = Total number of failures reported on unlinked timeslots, in hexadecimal.
- **o** = SP number, in hexadecimal.
4. ACTIONS TO BE TAKEN

Monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected.

5. ALARMS

None.

6. REFERENCES

Output Message(s):

   ABT:TRIB

MCC Display Page(s):

   1431 (PLTU Tributary Status Page)
REPT:TRK-SUM

Software Release: 5E14 and later
Message Class: TRK
Application: 5
Type: Output

1. FORMAT

REPT TRK a b SUM
c MEMBERS WERE SUCCESSFULLY d
e MEMBERS FAILED TO BE f
g MEMBERS FAILED BUSY
h MEMBERS STATUS UNKNOWN
[ i B CHANNELS AFFECTED]

2. REASON FOR OUTPUT

To print a summary report for the RMV:TRK and RST:TRK input messages.

3. VARIABLE FIELD DEFINITIONS

a = Type of summary. Valid value(s):
   RMV = Summary of the trunks that were removed.
   RST = Summary of the trunks that were restored.

b = Type of trunk. Valid value(s):
   DEN = The trunks that were requested were specified by their digital equipment number.
   NEN = The trunks that were requested were specified by their networking equipment number.
   OIUE = The trunks that were requested were specified by their optical interface unit equipment number.
   PLTEN = The trunks that were requested were specified by their peripheral control and timing (PCT) line and trunk unit (PLTU) equipment number.
   PRIGRP = The trunks that were requested were specified by their primary rate interface (PRI) group number.
   TEN = The trunks that were requested were specified by their trunk equipment number.
   TG = The trunks that were requested were specified by their trunk group.

c = The number of trunks that were successfully removed or restored.

d = Type of successful request. Valid value(s):
   REMOVED = The trunk members were successfully removed.
The trunk members were successfully restored.

= The number of trunks that were unsuccessfully removed or restored.

f = Type of unsuccessful request. Valid value(s):

REMOVED = The trunk members were unsuccessfully removed.

RESTORED = The trunk members were unsuccessfully restored.

g = The number of busy trunks that were unsuccessfully removed or restored. Because the member was busy, no action was taken.

h = The number of trunks whose status is unknown.

i = The number of PRI B-channels affected by the removal or restoration of a PRI group. If this report is for a PRI group removal, this number indicates the number of B-channels that should have had the OOS MTCE DCHOOS port status applied to them. If this report is for a PRI group restoration, this number indicates the number of B-channels that should of had the OOS MTCE DCHOOS port status deleted from them.

4. ACTIONS TO BE TAKEN

   .
   .

2. REASON FOR OUTPUT

To respond to a maintenance service request from a digital service unit (DSU) subtending circuit on the transmission test facility common (TTFCOM) board.

3. VARIABLE FIELD DEFINITIONS

a = Switching module(SM) number.
b = Global digital service unit number.
c = Service group number.
d = Digital service unit board number.
e = Event number.
f = Error type. Valid value(s):
   DSC CLOCK FAILURE = There are problems with the distribution of the 4 Mhz clock or the 8 KHz sync to the DSU subtending circuit (DSC).
   DSC DETECTED TS PARITY ERROR = The DSC detected a parity error on data received from the DSU common board.
   DSC FLT REPORTED, NONE FOUND = A DSC fault was indicated on the DSU common board, but no bits are set in the DSC fault register.
   DSC INTERNAL FAILURE = An internal failure was detected on the DSC.
   DSC TSSR FAILURE INDICATION = There was a failure pertaining to the time slot select register (TSSR) on the DSC.
   NO DSC PARITY ERROR FOUND = A DSC parity error was indicated on the DSU common board, but no bits are set in the DSC parity error register.

g = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
h = DSU common board error source register (ESR).
i = DSU common board DSC fault register.
j = DSU common board DSC parity error register.
k = DSU common board parity register for DSU common board time slots 16-31.
l = DSU common board parity register for DSU common board time slots 0-15.
m = Software copy of the DSU common board ESR mask register. The mask register cannot be read.
n = Software copy of the DSU common board DSC fault mask register. The mask register cannot be read.
o = Software copy of the DSU common board DSC parity error mask register. The mask register cannot be read.
p = Fault register on the failing DSU subtending circuit.
q = Parity register for the data coming to the DSU subtending circuit on DSU time slots 16-31.
r = Parity register for the data coming to the DSU subtending circuit on DSU time slots 0-15.
s = Current decimal number of recent failures of this type recorded.
t = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN
None. The report is provided for long-term error analysis.

5. ALARMS
None.

   TTFCOM=a-b-c-d h i
   .
   .
   [j] . . .
   .
   .

2. REASON FOR OUTPUT

To indicate that terminal maintenance detected a failure on a transmission test facility (TTF) circuit and reported the error to peripheral fault recovery.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Global digital service unit number (0-7).
c = Service group number (0 or 1).
d = Digital service unit board number (0-7).
e = Event number.
f = Error type. Valid value(s):
   TTF COMMUNICATION FAILURE = Terminal maintenance was notified of communication failure with the TTF hardware.
   TTF INVALID OPERATION = Terminal maintenance sent a request to a TTF function and the reply had no meaning.
   TTF NOT OK RESPONSE = Terminal maintenance received a reply from a TTF function indicating that the TTF firmware was not able to complete the request.
   TTF TIME OUT ERROR = Terminal maintenance sent a request to a TTF function and no reply was received.
   TTF UNEXPECTED ERROR = Terminal maintenance received an unexpected reply from a TTF junction.
g = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is provided.
   REPORT TO TERMINAL MAINT = Terminal maintenance has been notified of the failure.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

UN-CONDITIONAL RST PREEMPT = The failing circuit was unconditionally removed and restored. No diagnostic was scheduled.

h = Decimal number of recent failures of this type recorded.
i = Error count threshold, above which the circuit will be conditionally restored.
j = Register dump, in hexadecimal.

4. ACTION TO BE TAKEN

Use the Corrective Maintenance Manual to determine what action should be taken with the faulty unit and with any receive-only printer (ROP) output.

REPT:TTY

Software Release: 5E14 and later
Message Class: MAINT, MAIPR
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT TTY a {ERROR b [c] [COMPLETED CODE d] | UNIDENTIFIED RESPONSE WD1=e WD2=f}

__________________________________________________________________

[2] REPT TYY a STARTED

__________________________________________________________________

[3] REPT TTY a STOPPED

__________________________________________________________________

2. REASON FOR OUTPUT

Format 1 reports a teletypewriter (TTY) related software or hardware error.

Format 2 reports that the TTY has changed state from STBY to ACT. A TTY will change to ACT state when data terminal ready (DTR) is on.

Format 3 reports that the TTY has changed state from ACT to STBY. A TTY will change to STBY state when DTR is off.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.

c = Character string giving more information about the error identified in variable ‘b’. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual for additional explanation.

d = Hardware error type in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.

e = First word of an unidentified completion report.

f = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

The error message in Format 1 indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

The messages in Formats 2 and 3 indicate that the TTY has changed states. An active TTY will change state to STBY if powered off and a standby TTY will change state to ACT when powered up. No action is necessary.
5. ALARMS

Format 1 has an alarm level of INFO. Formats 2 and 3 have alarm levels of VAR. This is a variable alarm to be determined by the client process. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

__________________________________________________________________
[2] REPT TTYC a CODE VERSION X'f
__________________________________________________________________
[3] REPT TTYC a FLASH RAM VERSION X'g
__________________________________________________________________

2. REASON FOR OUTPUT

Format 1 reports a teletypewriter controller (TTYC) related software or hardware error.

Format 2 is an informational message. It is output during the restoration of the unit.

Format 3 is an informational message. It is output prior to the update of flash random access memory (RAM) on the unit as requested by diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.
c = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.
d = First word of an unidentifiable completion report.
e = Second word of an unidentifiable completion report.
f = Peripheral controller pump code version.
g = Peripheral controller flash RAM version.

4. ACTION TO BE TAKEN

These error messages indicate error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service. No action is necessary for the messages in Formats 2 and 3 unless the controller and/or its subdevices are not acting normal, or could not be restored. Contact the service organization with the code version and/or flash RAM that were used.

5. ALARMS
None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

     DSC FLT REPORTED, NONE FOUND = A DSC fault is indicated on the DSU common board, but no bits are set in the DSC fault register.
     DSC INTERNAL FAILURE = An internal failure is detected on the DSC.
     DSC TSSR FAILURE INDICATION = There is a failure pertaining to the time slot select register (TSSR) on the DSC.
     NO DSC PARITY ERROR FOUND = A DSC parity error is indicated on the DSU common board, but no bits are set in the DSC parity error register.

   g  
   = Recovery action. Valid value(s):
     ANALYSIS ONLY = A post mortem report is generated.
     ASSERT TO SYSTEM INTEGRITY = Software failure has been detected and system integrity has been notified.
     INITIALIZE = The failing circuit has been reinitialized.
     RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
     RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

h = DSU common board error source register (ESR).
i = DSU common board DSC fault register.
j = DSU common board DSC parity error register.
k = DSU common board parity register for DSU common board time slots.
l = DSU common board parity register for DSU common board time slots.
m = Software copy of the DSU common board ESR mask register. The mask register cannot be read.
n = Software copy of the DSU common board DSC fault mask register. The mask register cannot be read.
o = Software copy of the DSU common board DSC parity error mask register. The mask register cannot be read.
p = Fault register on the failing DSU subtending circuit.
q = Parity register for the data coming to the DSU subtending circuit on DSU time slots 16-31.
r = Parity register for the data coming to the DSU subtending circuit on DSU time slots 0-15.
s = External logical circuit name.
Note: Up to two logical circuit names, error counts, and error thresholds (variables ‘s’-‘u’) may be printed.
t = Current decimal number of recent failures of this type recorded.
u = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

1. FORMAT

REPT UCONF=a-b-c-d TRBL PICB CONTROL FAILURE EVENT=e
   f RECOVERY ACTION g
   h i j k
   l m n o

2. REASON FOR OUTPUT

To respond to a peripheral interface control bus (PICB) control failure interrupt on the universal conference (UCONF) circuit board.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Global digital service unit number.
c = Service group number.
d = Digital service unit board number.
e = Event number.
f = Error type. Valid value(s):
   PER DETECTED BAD ADDRESS
   SOFTWARE BAD ADDRESS ERROR

g = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is provided.
   RMV = The failing circuit will be removed from service. Intervention is required to change
         the state of the circuit. A message from the maintenance request administrator
         (MRA) will be printed after the circuit is removed.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be
                      printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
                  will be printed with the results of the diagnostic.

h = Indication of whether the fault was transient or hard, as determined by the module controller fault recovery.
i = System PICB number in hexadecimal that was being written when the failure occurred.
j = Read/write (uppermost) bit and address in hexadecimal to which the control interface (CI) was writing when the failure occurred.
k = Data being written to the periphery by the CI.
1 = Contents of the CI error source register.

Note: Up to two logical circuit names, error counts, and error thresholds (variables 'm'-'o') may be printed.

m = External logical circuit name.

n = Current decimal number of recent failures of this type recorded.

o = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

REPT:UDPC

Software Release: 5E14 and later
Message Class: SWM01
Application: 5,CNI
Type: Output

1. FORMAT

REPT:UDPC
  MESSAGE FROM OPC a CONTAINS UNKNOWN DPC b

2. REASON FOR OUTPUT

This output will be printed when a common channel signaling 7 (CCS7) message is received and is to be routed (that is, transferred) to an unknown destination point code (UDPC). Note that a minor alarm is associated with this message.

The output will occur only at a number 2 signaling transfer point (2STP) when that 2STP does not have routing data to the destination point code of the received message. The message can be any CCS7 signaling message for which there is no message transfer point (MTP) routing data. The output will be directed to the standard output and the maintenance output class. If they are the same device, only one printout will occur.

3. VARIABLE FIELD DEFINITIONS

a = The origination point code (OPC) of the message.
b = The destination point code (DPC) of the message.

4. ACTION TO BE TAKEN

None.

5. ALARMS

Minor.

[13] REPT ULARP ATTEMPTING TO RE-EXECUTE

[14] REPT ULARP CRAFT INIT COMPLETED

[15] REPT ULARP UPDATE FAILED a

[16] REPT ULARP ADOPT FAILED a b
2. REASON FOR OUTPUT

To report error information or actions as the result of ULARP child process or run message execution.

3. VARIABLE FIELD DEFINITIONS

a = Record name.
b = Terminated process ID.

4. ACTION TO BE TAKEN

If Formats 4, 11-14 are printed, no action is required.

If Formats 1-2, 15 are printed, data base access problems are indicated. Contact your technical assistance organization.

If Format 9 is printed, use the OP:LOG input message to read the logfile ULARP and find the error report with the same record ID number. Using the record name from the OP:LOG output message, get the equipment configuration data base (ECD) record with recent change and verify (RC/V). First make sure the record contains correct information. Then check that a file exists with the pathname that is in the record, and that is executable. If the file does not exist, copy in a correct version.

If a large number of PRMs with this step number and function code are printed, then the UNIX® shell may not be working. Check for the existence of the file /bin/sh. If it exists, it should have 755 permissions. If the file does not exist, copy in a correct version. If the reason for the message failure is not apparent, contact your technical assistance center.

Once the cause of the problem has been solved, enter the INIT:ULARP input message. This will cause ULARP to re-execute the run message(s) that failed.

If Format 3 is printed, enter an INIT:ULARP input message. If the error is repeated, contact your technical assistance center.

If Formats 5 or 16 or 17 are printed, use the OP:LOG input message to read the logfile ULARP and find the error report with the same utility ID number. Using the record name from the OP:LOG output message, get the ECD record with RC/V. First make sure the record contains correct information. Then check that a file exists with the pathname that is in the record, and that is executable. If the file does not exist, copy in a correct version. Once the cause of the problem has been solved, enter the INIT:ULARP input message. This will cause ULARP to re-execute the process(es) that failed.

If Formats 6 or 10 are printed, use the OP:LOG input message to read the logfile ULARPLOG and find the error report with the same utility id. Using the record name from the OP:LOG output message, get the ECD record with RC/V. Make sure the record contains correct information, because there could be something wrong with the parameters passed to the process. If the reason for the process failure is not apparent, contact your technical assistance center. After the problem has been resolved, enter the INIT:ULARP input message to re-execute the
process.

If Format 7 is printed, use the OP:LOG input message to read the logfile ULARPLOG and find the error report with the same record id number. Using the record name from the OP:LOG output message, get the ECD record with RC/V. First make sure that the record contains the correct information. Then check that a file exists with the pathname that is in the record, and that it is executable. If the file does not exist, copy in a correct version. After the information in the data base record has been corrected, the process may be started by entering the INIT:ULARP input message.

If Format 8 is printed, use RC/V. to examine the ULARP records in the full configuration ECD. For each ULARP child process, check that a file exists, and that it is executable. After replacing the erroneous files or repairing the ECD records, reboot in full configuration. If that procedure is not successful, bootstrap on backup root, and follow normal procedures for restoring the primary root file system.

If Format 18 is printed, no action is required. Ularp has discovered a child that has died but it failed to receive the death of child signal. Ularp is now restarting the process.

If Format 19 is printed, no action is required. A child of ULARP died while the system was in disk-independent operation and no execution was attempted for the child.

5. ALARMS

None.

[1] REPT UNIX INIT ERRNO a CHANID b [c]

[2] REPT UNIX INIT CANNOT MOUNT d ERRNO f

[3] REPT UNIX INIT CANNOT MOUNT d READ ONLY MOUNTING e ERRNO f

2. REASON FOR OUTPUT

To report a UNIX® initialization process-related error.

Format 1 indicates the process is failing to bring up a terminal. The device name will not be present if the process is failing before it has learned the name from the equipment configuration database (ECD).

Format 2 indicates the process is failing to mount a file system.

Format 3 indicates the process is failing to mount a file system in a read-only mode, and is now attempting to mount the primary/backup file system.

3. VARIABLE FIELD DEFINITIONS

a = Errors associated with the UNIX® initialization process. Valid value(s):
0x11 = INIT could not add the ECD segments to its address space.
0x12 = INIT could not attach to the ECD.
0x13 = INIT could not read the ECD org record.
0x21 = INIT could not read the unit control block (UCB) record for the maintenance teletypewriter (MTTY).
0x22 = INIT could not read the ciopt record for the emergency action interface (EAI).
0x23 = INIT could not read the eaopt record for the EAI.
0x31 = INIT could not set up a cursor to step through the records in the ECD.
0x32 = INIT could not get a database record.
0x33 = INIT was passed a bad channel ID.
0x41 = INIT could not read the mdct record for the device.
0x42 = INIT could not read the getty record for the device.
0x43 = INIT could not read the UCB record for the device.
0x44 = INIT could not read the ciopt record for the device.
0x45 = INIT could not read the ttopt record for the device.
0x46 = The device type in the mdct record for the device is bad.
0x47 = The transmission speed in the ttopt record for the device is bad.
0x51 = INIT could not start ULARP.
0x52 = INIT could not start the appropriate getty.
0x53 = INIT could not open the device file.
b = The channel ID sent to the INIT process.

c = The name of the device. INIT will print this only if it has found a logdev record for the channel ID.

d = The name of the file system.

e = The name of the primary/backup file system.

f = System error number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

For Format 1, if error code 0x11, 0x12, 0x31, or 0x32 is printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. If error code 0x13, 0x21, 0x22-0x33, or 0x41-0x47 is printed, check the appropriate record(s) in the ECD. If error code 0x51 or 0x52 is printed, check the appropriate process to make sure that it exists and is executable. If error code 0x53 is printed, create the appropriate device file.

For Format 2, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Critical alarm. Take immediate action as indicated in the report. If needed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

1. FORMAT

REPT UTD=a-b-c-d TRBL DSU DSC SERV REQ FAILURE e
  f RECOVERY ACTION g
  h i j k l m n o p q r
  s t u

2. REASON FOR OUTPUT

To respond to a maintenance service request from a digital service unit (DSU) subtending circuit on the universal tone decoder (UTD) board.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Local digital service unit (DSU) number.
c = Service group number.
d = DSU board position number.
e = Event number.
f = Error type. Valid value(s):
  DSC CLOCK FAILURE = There are problems with the distribution of the 4MHz clock or the 8 KHz sync to the DSU subtending circuit (DSC).
  DSC DETECTED TS PARITY ERROR = The DSC detected a parity error on data received from the DSU common board.
  DSC FLT REPORTED, NONE FOUND = A DSC fault is indicated on the DSU common board, but no bits are set in the DSC fault register.
  DSC INTERNAL FAILURE = An internal failure is detected on the DSC.
  DSC TSSR FAILURE INDICATION = There is a failure pertaining to the time slot select register (TSSR) on the DSC.
  NO DSC PARITY ERROR FOUND = A DSC parity error is indicated on the DSU common board, but no bits are set in the DSC parity error register.

g = Recovery action. Valid value(s):
  ANALYSIS ONLY = A post mortem report is generated.
  ASSERT TO SYSTEM INTEGRITY = Software failure has been detected and system integrity has been notified.
  INITIALIZE = The failing circuit has been reinitialized.
  RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
  RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

h = DSU common board error source register (ESR).
i = DSU common board DSC fault register.
j = DSU common board DSC parity error register.
k = DSU common board parity register for DSU common board time slots 16-31.
l = DSU common board parity register for DSU common board time slots 0-15.
m = Software copy of the DSU common board ESR mask register. The mask register cannot be read.
n = Software copy of the DSU common board DSC fault mask register. The mask register cannot be read.
o = Software copy of the DSU common board DSC parity error mask register. The mask register cannot be read.
p = Fault register on the failing DSU subtending circuit.
q = Parity register for the data coming to the DSU subtending circuit on DSU time slots 16-31.
r = Parity register for the data coming to the DSU subtending circuit on DSU time slots 0-15.

Note: Up to two logical circuit names, error counts, and error thresholds (variables 's'-u') may be printed.

s = External logical circuit name.
t = Current decimal number of recent failures of this type recorded.
u = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

The report is provided for long-term error analysis.

5. ALARMS

None.

  f  RECOVERY ACTION g
  h  i  j  k
  l  m  n  o

2. REASON FOR OUTPUT

To respond to a peripheral interface control bus (PICB) control failure interrupt on the universal tone decoder (UTD) board.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
c  = Service group number.
d  = DSU board position number (applies only to systems with a switching module).
e  = Event number.
f  = Error type. Valid value(s):
    PER DETECTED BAD ADDRESS
    SOFTWARE BAD ADDRESS ERROR

g  = Recovery action. Valid value(s):
    ANALYSIS ONLY  = A post mortem report is provided.
    RMV          = The failing circuit will be removed from service. Intervention is required to change
                    the state of the circuit. A message from the maintenance request administrator
                    (MRA) will be printed after the circuit is removed.
    RST AUTO CAMFON = The failing circuit will be diagnosed when it is available. A message will be
                      printed with the results of the diagnostic.
    RST PREEMPT   = The failing circuit was preempted and a diagnostic was scheduled. A message
                    will be printed with the results of the diagnostic.

h  = Indication of whether the fault was transient or hard, as determined by the module controller fault
    recovery.
i  = System PICB number in hexadecimal that was being written when the failure occurred.
j  = Read/write (uppermost) bit and address in hexadecimal to which the control interface (CI) was
    writing when the failure occurred.
k  = Data being written to the periphery by the CI.
1 = Contents of the CI error source register.

Note: Up to three logical circuit names, error counts, and error thresholds (variable 'm-o') may be printed.

m = External logical circuit name.
n = Current decimal number of recent failures of this type recorded.
o = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

RLS:TM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RLS TM a COMPL

2. REASON FOR OUTPUT

To specify a trunk or line that is disconnected from a monitor or a talk and monitor connection.

3. VARIABLE FIELD DEFINITIONS

a = Trunk or line number, where a three-digit trunk group number and a three-digit group member number is given or a seven-digit directory number is given.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

None.
RLS:TRUNK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RLS TRUNK TGRP a TKMN b c d

2. REASON FOR OUTPUT

To respond to a RLS:TRUNK input request to release a trunk group and member that were being held off-hook and out of service.

3. VARIABLE FIELD DEFINITIONS

TKGMN = Trunk group member number.
a = Trunk group (TG) being released.
b = Trunk group member being released.
c = Indicator of whether the trunk is being held. Valid value(s):
   HELED = Trunk is being held off-hook and out of service.
   NOT HELD = Trunk is not being held off-hook and out of service.
d = Output message termination report. Valid value(s):
   COMPLETED = Trunk group and member are released.
   INPUT ERROR = Invalid trunk group or member.
   NO MATCH = Trunk group and member are not being held.
   SYSTEM ERROR = System processing error.

4. ACTION TO BE TAKEN

If input message RLS:TRUNK has failed, try the message again. Also try input message OP:TRUNK to verify that the trunk group and member are being held off-hook and out of service.

The office dependent data (ODD) may be checked for errors in the data base.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV AIUCOM=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an RMV:AIUCOM input request to remove the access interface unit common data and control controller (COMDAC) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = AIU number.
c = COMDAC number.
d = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action has successfully completed.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
e = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

An unconditional removal of access interface unit common data and control controller while the mate is in an out-of-service (OOS) state will cause a critical alarm.

RMV:ALINK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RMV ALINK=a-b-c-d-e f [g]

2. REASON FOR OUTPUT

To report the result of executing a RMV:ALINK input message to remove a line unit model 2 (LU2) or a line unit model 3 (LU3) A-link from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Line unit number.
c = Grid number.
d = Board number.
e = Line unit A-link number.
f = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination is immediate. Consistency of hardware and data is questionable.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

   g = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

None.

RMV:ASC

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RMV ASC= a b [c]

2. REASON FOR OUTPUT

Indicates the result of an RMV:ASC input message to remove a remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was complete.
COMPLETED = Request has successfully completed.
NOT STARTED = Requested action had not begun.
STOPPED = Requested action was terminated before a normal completion.

c = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

Output Appendix(es):

APP:MAINT-RESP

Other Manual(s):
235-105-110 System Maintenance Requirements and Tools
RMV:BICCCADN

Software Release: 5E16(1) and later
Message Class: TRK
Application: 5
Type: Output

1. FORMAT

RMV BICCCADN BGMN=a-b&&c d
[e]
[CADN CICS = f]
[CALLS KILLED = g]
[CALLS REMAINING = h]
[CICS EXCLUDED = i]

2. REASON FOR OUTPUT

To report the results of a removal from service of a bearer-independent call control (BICC) call instance code (CIC) block as requested with a RMV:BICCCADN input message.

3. VARIABLE FIELD DEFINITIONS

a = BICC group number.
b = CIC of the first member of the BICC block.
c = CIC of the last member of the BICC block.
d = Report field. Valid value(s):
   BLOCKING SEND PROBLEM = Cannot send blocking to the far end.
   CAMPON TIMEOUT = The campon timer expired.
   COMPLETED = The request completed successfully.
   STARTED = The request has started.
   SYSTEM ERROR = A system error was encountered.

e = Action to be taken after the campon timer expires. Valid value(s):
   BACKOUT REQUESTED = The user has selected the BACKOUT option.
   NO BACKOUT REQUESTED = The user has not selected the BACKOUT option.
   KILL REQUESTED = The user has selected the KILL option.

f = Number of CICs put to CADN after the completion of the RMV:BICCCADN operation.
g = Number of calls killed after the completion of the RMV:BICCCADN operation.
h = Number of calls remaining active after the completion of the RMV:BICCCADN operation.
i = Number of CICs excluded from the RMV:BICCCADN operation.

4. ACTIONS TO BE TAKEN

If the BICC CIC block was taken out-of-service (OOS) automatically, it is probably a hardware or transmission problem. Identify and correct the problem.
If the trouble persists and cannot be identified, notify the far-end office so that similar action can be taken.

Software Release: 5E14 only
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] RMV CCSLK SET=a MEMBER=b STATE=c d
   SM=e OPC=f [g]

[2] RMV CCSLK SET=a d
   SM=e OPC=f [g]

2. REASON FOR OUTPUT

To confirm the request to remove a common channel signaling (CCS) signaling link from service.

Format 1 is the output message indicating that a removal of a CCS link has occurred.

Format 2 is the output message indicating that an attempted removal of multiple unequipped CCS link has occurred.

3. VARIABLE FIELD DEFINITIONS

a = Link set number.
b = Link member number or range of link members.
c = Link state. Valid value(s):
   BLK = Blocks all traffic from using a link(s).
   DACT = This link is deactivated.
   INH = All traffic is inhibited from this link except for test and maintenance traffic.
d = Termination status. Valid value(s):
   COMPLETED = Request was successfully completed.
   STARTED = Request was successfully started.
   STOPPED = Request was terminated before normal completion.
   SUCCESS = Processing of request was successful.
e = CCS global switching module (GSM) number.
f = Originating point codes (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.
g Additional information qualifying the termination status. Valid value(s):
   ALL SPECIFIED LINKS UNEQUIPPED = All of the specified links are unequipped.
   DATABASE ERROR = Inconsistencies in retrieving data from the database caused by corrupt data.
   DATABASE FAIL = Unsuccessful static data access.
   DPC WOULD BE LOST = Local inhibit denied because a DPC would be lost.
   ERROR = Error in software.
FAR END DENIAL = Local inhibit denied because of far end denial.
FAR END INACCESS = Local inhibiting not possible because far end is inaccessible.
LINK ALREADY IN REQUESTED STATE = Received link inhibit or blocking request, but link is already inhibited.
LINK ALREADY OOS = Received link deactivation request, but link is already manually deactivated.
LINK BUSY = Link is being acted upon by some other request.
LINK UNEQUIPPED = The link is unequipped.
MESSAGE TIMEOUT = Timed out waiting for a message.
OOS LIMIT EXCEEDED = Conditional request to deactivate the link is denied because either more than 50% of the links in the linkset are already out of service, or completion of the request would result in more than 50% of the links being OOS. In these cases, the UCL option is required for successful deactivation of the link, since deactivating the link makes it less likely that automatic recovery can return the linkset to 50% or more active links.
OOS-DL = The signaling data link is out of service.
OOSF-PH = The parent PH channel group is unassigned.
REMAINING SPECIFIED LINKS UNEQUIPPED = Remaining links are unequipped.
REQUEST LATER = Request again later.
RESRC = There was a lack of resources required to complete action.
SYSTEM FAILURE = System failure.
T14 NO LIA FROM FAR END = T14 timer expired, no link inhibit acknowledgement (LIA) received, local inhibit denied.
UNSUCCESSFUL = Failure in integrated services port administration.

c = Termination status. Valid value(s):  
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
d = Additional information qualifying the termination status.

4. ACTIONS TO BE TAKEN

If unexpected results occur, refer to the documents listed in the REFERENCES section.

5. ALARMS

None.

1240/50 (MSGS STATUS for CM3)
RMV:CPE

Software Release: 5E14 and later
Message Class: CP
Application: 5
Type: Output

1. FORMAT

RMV CPE a [TEI=f][UCL] i

2. REASON FOR OUTPUT

To report the result of the manual removal of customer premises equipment (CPE) from service. This message is in response to a RMV:CPE input message.

Either custom multi-point (MP) or standard interface terminals can be removed from service. The CPE will only stay out-of-service (OOS) while layer 2 is maintained with the CPE. If the CPE drops layer 2 and then re-establishes it, the CPE will return to an in-service (IS) state.

3. VARIABLE FIELD DEFINITIONS

a = Equipment number or identifier. Valid value(s):
   
   AIUEN=d-p-q-r
   DN=s
   ILEN=b-j-k-l
   INEN=b-t-k-l
   LCEN=b-c-d-e
   LCKEN=b-c-m-n-o
   MLHG=g-h
   PKTDN=s

b = Switching module (SM) number.

c = Integrated services line unit (ISLU) or ISLU version 2 (ISLU2) in which the DSL exists.

d = Line group controller (LGC) in the ISLU/ISLU2 in which the DSL exists.

e = Line card (LC) of the ISLU line group controller to which the DSL connects.

f = TEI that identifies the particular CPE on the specified LCEN/LCKEN.

g = Multi-line hunt group number of the subscriber associated with the CPE.

h = Multi-line hunt member number of the subscriber associated with the CPE.

i = Result (completion code) of the remove request. Valid value(s):
   
   CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) was unable to respond. Retry the request later.
   COMPLETED = The specified CPE has been removed to an OOS state.
   CPE ALREADY OOS = CPE is already out-of-service.
   CPE BUSY = The request to remove the CPE on the DSL conditionally failed, because the CPE was busy. Wait for the CPE to become idle or remove the CPE unconditionally.
   CPE NOT BOUND = The DN, PKTDN, MLHG and/or LCEN/LCKEN combined with TEI specified is
not bound to a terminal on the multipoint DSL.

CPE PREEMPT FAILED = Failed to remove CPE unconditionally.
DATABASE ERROR = Internal error during database reading.
DSL BUSY = The DSL remained busy.
DSL OOS = Removing a CPE while the DSL is OOS is not possible.
DUP REQUEST = Removing a CPE has already been requested.
INPUT ERROR = Some data entered in the input request was invalid or incorrect.
INVALID DN = The circuit or packet directory number entered was most likely invalid or incorrect.
INVALID ON PP INTERFACE = This operation is an invalid operation on custom interface single point DSL. RMV:CPE is allowed on standard and custom multipoint interface DSLs only.
INVALID PORT = The line could not be located in the database. The line identifier used in the input request was most likely invalid or incorrect.
INVALID TEI PORT = The line where the TEI resided could not be located in the database. The terminal endpoint identifier used in the input request was most likely invalid or incorrect.
MLHG ACCESS DN = The DN entered was an access DN for the uniform call distribution (UCD), linear hunt, or multi-position hunt (MUPH) multiline hunt group. This DN does not uniquely identify a line.
MP ACCESS DN = The directory number entered is a uniform call distribution multi-line hunt group line for modem pooling and as such cannot be used by specifying its DN. A line card equipment number or MLHG and member number must be specified. To obtain the line card equipment number and/or multi-line hunt group and member number, use recent change/verify (RC/V) for the DN or refer to office records.
NO ACK FROM FIP CPE = No acknowledge from FIP's CPE.
NO DATABASE MATCH = Internal database error. The desired tuple could not be found.
NO PARTY EXISTS = The specified party does not exist on a DSL.
NO PROCESS = An attempt to create a process failed; possible cause is a busy system. Retry the request later.
NON-DSL/INVALID DSL TYPE = The line is not a DSL or the type of DSL is incorrect.
NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.
NOT PRIMARY DN OR MLHG = The DN or MLHG specified is for a key-system CPE and is not the primary DN for any key-system CPE. A primary DN is required to identify the specific CPE to be removed. Refer to RC/V or office records to determine the primary DNs or MLHG and member numbers.
PROCESS TIMEOUT = Internal time-out during processing; request aborted.
SM UNAVAILABLE = The input request could not be completed because a needed switching module (SM) was unable to respond. Retry the request later.
SYSTEM BUSY = The system's processing capability limit was reached or a system resource was unavailable. Retry the request later.
SYSTEM ERROR = System error occurred, making it impossible to continue processing request.
TEI NOT FOUND = The CPE could not be located in the database. The TEI identifier used in the input request was most likely invalid or incorrect.
TST MP IN PROGRESS = TEST modem pool in progress, CPE can not been removed at this time.
UNASSIGNED PORT = The port referred to was unassigned.

j = IDCU number.
k = Remote terminal (RT) number.
l = RT line number.
m = Line group number.
n = Line board number.
o = Line circuit number.
p = Access interface unit (AIU)
q = AIU pack number.
r = AIU circuit number.
s = Circuit or packet directory number associated with the CPE to be removed.
t = Digital network unit - synchronous optical network (SONET) (DNU-S) number.

4. ACTIONS TO BE TAKEN

To restore the CPE, use the RST:CPE input message. To get the current status of a CPE, use the OP:CPE input message.

5. ALARMS

None.

160 (TRUNK AND LINE MAINTENANCE)
RMV:CU

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

RMV:CU a [b [c]]

2. REASON FOR OUTPUT

To report the result of executing a RMV:CU input message to remove a control unit (CU) from service.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Termination status. Valid value(s):
   ABORTED = Removal abnormally terminated due to a system error or a fault in the remove process.
   COMPLETED = Control unit removed.
   STOPPED = Removal denied by the system or stopped manually.

c = If 'b' = STOPPED, reason the remove was stopped.
   1 = Invalid unit name. Only the CU can be removed.
   5 = Removal denied by system.
   6 = Remove manually stopped.

4. ACTION TO BE TAKEN

If the remove was denied by the system, try switching CUs. If the result is ABORTED, determine what is wrong with the system. Interpret the REPT:CURSTRMV output message if one occurred.

5. ALARMS

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Application: 5
Type: Output

1. FORMAT

RMV DATALINK [DN a] [b] [c] [d] e
[f] [f] [f] [f] [f] [g] [g] [g] [g] [g]
[h] [h] [h] [h] [h]
.
.
.

2. REASON FOR OUTPUT

To respond to a request to remove the specified data link from service by adding the specified status to the port
identified. Both the status requested to be added and the full status resulting from the removal attempt are identified
in the message. This message may be in response to a RMV:DATALINK input message or may be generated
automatically.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms
shown in the format.

= Telephone number of the data link.
b = Channel identifier: D, B1, or B2. Used only for digital subscriber line (DSL) data links.
c = Valid value(s):
   AP=i-j
   AQ=i-j
   DASC=i-j
   EIS=k-l
   HOBICR=i-j
   HOBICV=i-j
   HOBIS=i-j
   MISLNK=i-j
   OAPF=m
   OAPO=n
   RAS=i-j
   RTRS=i-j
   XDB=i-j
d = Valid value(s):
   ILEN=q-u-v-w
   INEN=q-a\textsuperscript{1}-v-w
   LCEN=q-r-s-t
   LCKEN=q-r-x-y-z
e = The result (completion code) of the removal request. Valid value(s):
CAMPON FAIL = The request to camp on the trunk or data link failed.
CAMPON NOT ALLOWED = The ability to camp-on was not allowed on the data link specified. It must therefore be removed by specifying the UCL option.
CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) was unable to respond. Retry the request later.
COMPLETED = The specified status was successfully added to the port. Resulting port status is indicated.
DUP REQUEST = Line already out of service for the specified reason.
INPUT ERROR = Some data entered in the input request was invalid or incorrect.
INV PORT = The data link could not be located in the database. The data link identifier used in the input request was most likely invalid or incorrect.
INV PORT TYPE = The port specified is not a data link and therefore cannot be changed using this input request. Determine the port's type, OP:CONV input message may help, and use the input request appropriate for its type.
INV STATUS = An invalid status for the data link was specified in the input request.
NO PROCESS = An attempt to create a process failed. Possibly caused by the system's being busy. Retry the request later.
PORT BUSY = The data link remained busy for the camp-on period, or an in-progress camp-on was terminated. This report may also indicate that a conditional removal of an AQ, HOBICR HOBICV, HOBIS, or XDB data link has been rejected because fewer than 50% of the equipped data links of the same type would remain in service after the removal, or that a conditional removal of a DASC, MISLNK, RAS, or RTRS data link is denied because it mate duplex data link is out of service.
PROCESS TIMEOUT = Internal time-out, during processing request, aborted.
SM UNAVAILABLE = The input request could not be completed because a needed SM was unable to respond. Retry the request later.
STATUS CONFLICT = Status to be added conflicts with the existing status on the data link.
SYSTEM BUSY = The system's processing capability limit was reached, or a system resource was unavailable. Retry the request later.
SYSTEM ERROR = System error occurred making it impossible to continue processing request.

f = Status added to the data link which effected its removal from service. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

g = Resulting primary status in effect on the data link. This status is the most restrictive to call processing currently on the data link. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

h = Pending statuses (0-3) in effect on the data link type, if any. (Less restrictive than the primary status.) Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.

i = Data link (group) number.

j = Relative link (member) number.

k = External data link (member) number relative to the EIS.

l = EIS identifier (ID) on which the CPDL terminates.

m = Force management center number.
n = Operator service center number of the OAPO (1-32).
q = Switching module (SM) number.
r = Integrated services line unit number.
s = Line group controller number.
t = Line card number.
u = IDCU number.
v = Remote terminal (RT) number.
w = RT line number.
x = Line group number.
y = Line board number.
z = Line circuit number.
a = Digital network unit - synchronous optical network (SONET) (DNU-S) number.

4. ACTION TO BE TAKEN

If the data link was removed automatically, it should be determined if a hardware problem exists on that data link, and if so, it should be corrected.

To remove a data link, use the RMV:DATALINK input message. To restore a data link, refer to the RST:DATALINK input message. To get the current status of a data link, refer to the OP:STATUS input message. To get a list of all data links with a specified status, refer to the OP:LIST input message.

5. ALARMS

None.

Output Appendix(es):

APP:PORT-STATUS
RMV:DCI

**Software Release:** 5E14 and later  
**Message Class:** MAINT, MAIPR  
**Application:** 5,3B  
**Type: Output**

1. **FORMAT**

   [1] RMV DCI a COMPLETED

   [2] RMV DCI a ABORTED [b] [c]

   [3] RMV DCI a STOPPED d

   [4] RMV DCI a TASK e MSG STARTED

   [5] RMV DCI a STOPPED MESSAGE IN PROGRESS

   [6] RMV DCI a STOPPED MESSAGE COMPLETE

2. **REASON FOR OUTPUT**

   These messages report the disposition of a request to remove a dual serial channel/computer interconnect (DCI) from service.

   Format 1 reports that the removal attempt was successful.

   Formats 2 and 3 report that the removal has failed.

   Formats 4, 5, and 6 report the status of the request in diagnostics.

   Format 4 reports that the request has begun and provides the task number.

   Format 5 reports that the request has stopped and more output messages will follow.

   Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. **VARIABLE FIELD DEFINITIONS**

   a = Member number.

   b = Type of error. Valid value(s):

   X'1' = Remove process error.
   X'2' = Driver error.
   [NULL] = Remove denied by driver or configuration control (CONFIG).

   c = Error code. Valid value(s):
Refer to the APP:DCI-F appendix in the Appendixes section of the Output Messages manual.

Refer to the APP:DCI-A appendix in the Appendixes section of the Output Messages manual.

d = Error code. Refer to the APP:DCI-G appendix in the Appendixes section of the Output Messages manual.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

5. ALARMS

The pudrv subsystem generated messages have no alarm.

The cft subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The diag subsystem generated messages have automatically generated alarms; action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

RMV:DFC

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

RMV DFC a b [c] [d]

2. REASON FOR OUTPUT

To report the disposition of a request to remove a disk file controller (DFC) from service. The removal request is either automatic, as a result of excessive errors, or manual. A manual DFC removal attempt can fail (ABORTED or STOPPED) or be successful (COMPLETED). An automatic removal is always successful.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Termination status. Valid value(s):
   ABORTED = Remove aborted.
   COMPLETED = Unit removed.
   STOPPED = Remove stopped.

c If 'b' = ABORTED, type of error. Valid value(s):
   1 = Remove process error.
   2 = Driver error.
   [NULL] = Remove denied by driver or CONFIG.

d = Error code.

<table>
<thead>

</tr>
</tbody>
</table>

c If variable 'b' = STOPPED, error code. Refer to the APP:DFC-H appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

5. ALARMS

None.

6. REFERENCES

Input Message(s):
RMV:DFI

**Software Release:** 5E14 and later
**Message Class:** SM
**Application:** 5
**Type:** Output

1. FORMAT

RMV DFI=a-b-c d [e]

2. REASON FOR OUTPUT

To report the result of executing a RMV:DFI input message to remove a digital facility interface (DFI) from service.

DFI containing packet pipe (PP) or packet pipe member (PPM) can not be removed conditionally. Doing so may result in the DFI being marked as degraded. An unconditional (UCL) remove command is needed to completely remove DFI with PP or PPM.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line/trunk unit number.
c = DFI number.
d = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

e = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the References section of this message.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

RMV:DFI
OP:NAILUP
RMV:DFIH

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV DFIH=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an RMV:DFIH input message to remove a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RISLU digital line and trunk unit (DLTU) number.
c = DFIH number.
d = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
e = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

In the case of automatic removal from service of a DFIH circuit due to fault recovery actions, refer to the receive-only printer (ROP) for results of automatic diagnostics (DGN:DFIH output messages) and repair the faulty circuit.

If unexpected results occur, refer to the Corrective Maintenance Manual.

5. ALARMS

A critical alarm results when either an RISLU common control (CC) or common data (CD) duplex failure occurs as the result of an unconditional removal of a DFIH.

A major alarm results when the RMV:DFIH output message reports either success or failure of a manual remove request that resulted in camping-on for removal of the DFIH.

1. FORMAT

RMV DFTAC=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of executing RMV:DFTAC input message to remove the distributing frame test access circuit (DFTAC) from service, or as a result of a recovery action taking the unit out of service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group.
d = Circuit number.
e = Termination status. Valid value(s):
   ABORTED = The removing process was purged. Further output showing data recovery by audits may follow.
   COMPLETED = Successful completion.
   NOT_STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).
f = Reason for termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

RMV:DLI

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RMV DLI=a-b c [d]

2. REASON FOR OUTPUT

To indicate the result of a manual or automatic input message to remove a switching module’s (SM) dual link interface (DLI) circuit from service.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Office network and timing complex(ONTC) side that the DLI is on.
c = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   NOT_STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.
d = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the variable 'd' field should give some indication as to why the request failed. Check DLI MCC pages or OP:CFGSTAT output to verify that the DLI was in a valid state to perform the request.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV DNUSCC=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an attempt to remove a digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Common controller number.
d = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was successfully completed.
   IN PROGRESS = Requested action is in progress.
   NOT_STARTED = Requested action was not started.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

  = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

An automatic unconditional removal of a DNUSCC while the mate DNUSCC is in an out-of-service (OOS) state will cause a critical alarm.

1. FORMAT

RMV DNUSCD=a-b-c-d e [f]

2. REASON FOR OUTPUT

Indicates the result of an attempt to remove a digital networking unit - synchronous optical network (DNU-S) common data (DNUSCD) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Data group number.
d = Common data number.
e = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was successfully completed.
   IN PROGRESS = Requested action is in progress.
   NOT STARTED = Requested action was not started.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

f = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

An automatic unconditional removal of a DNUSCD in a DNU-S data group while the mate DNUSCD is in an out-of-service (OOS) state causes a critical alarm.

Software Release: 5E14 and later
Message Class: SMCONFG
Application: 5
Type: Output

1. FORMAT

RMV DNUSEOC=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of a RMV:IDCUEOC input command that removes a remote terminal (RT) embedded operations channel (EOC) circuit from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = RT number.
d = EOC number.
e = Termination report. Valid values are:
   ABORTED = Immediate termination. A process has been purged and cleanup will be done by audits.
   COMPLETED = Requested action was successfully completed.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

f = Additional information qualifying the termination report. This information can be found in the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

Critical = EOC removal while its mate is out of service (duplex failure).
Major = EOC failure due to the removal of the path while its mate is out of service (duplex failure)
Minor = EOC removal while its mate is in service (simplex operation).

1510 (DNUS STATUS)
RMV:FAC

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV FAC=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of an RMV:FAC input message to remove a remote switching module (RSM) facility (FAC) or a trunk FAC from service.

An RSM FAC can be a host-remote facility between a host switching module (HSM) and an RSM, or a remote facility between two RSMs. A trunk FAC is an inter-office trunk. This message also prints when a carrier group alarm (CGA) causes the FAC to be removed.

FAC containing packet pipe (PP) or packet pipe member (PPM) can not be removed conditionally. Doing so may result in the FAC being marked as degraded. An unconditional (UCL) remove command is needed to remove FAC with PP or PPM.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line and trunk unit (DLTU) number.
c = RSM digital facilities interface (RDFI), inter-RSM communication link digital facilities interface (CDFI), or inter-office trunk digital facilities interface (DFI) number.
d = FAC number. The FAC number is the T1 facility number on an RDFI, CDFI, or DFI.
e = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

f = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, execute the OP:OFFNORM-SM input message.

e = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   OP:OFFNORM-SM
   RMV:GDXCON

Output Appendix(es):
APP:MAINT-RESP

Other Manual(s):
235-105-220  Corrective Maintenance
235-105-250  System Recovery
RMV: GQPPIPE

Software Release: 5E16(2) and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] RMV GQPPIPE=a-b-c-d-e SERV=f STOPPED g

[2] RMV GQPPIPE=a-b-c-d-e SERV=f STATE=h COMPLETED

2. REASON FOR OUTPUT

Format 1 reports that the general quad-link packet switch protocol handler (GQPH) QPIPE removal request cannot be processed by the global switching module (GSM).

Format 2 reports that the GQPH QPIPE removal was completed.

3. VARIABLE FIELD DEFINITIONS

a = GSM number.
b = Packet switch unit (PSU) number.
c = PSU shelf number.
d = GQPH channel group number.
e = Quad-link packet switch (QLPS) network number.
f = Service type. For packet trunking, the value is SIP.
g = Reason for failure. Valid value(s):
   DATABASE ERROR = GQPH QPIPE removal processing halted due to a database error.
   GQPH PIPE UNEQUIPPED = The GQPH QPIPE specified in the input message is unequipped in the ODD.
   GQPH QPIPE ALREADY DACT = The specified GQPH QPIPE is already manually removed.
   ISPA UNSUCCESSFUL = An ISPA terminal process required to attempt the GQPH QPIPE removal could not be created due to system load (retry later).
   MAINTENANCE BUSY = The GQPH QPIPE port is owned by another maintenance process, which may result in a state transition (retry later).
   MESSAGE TIMEOUT = Response from GQPH did not arrive within a timeout interval monitored by the controlling ISPA terminal process.

h = Resultant state. Valid value(s):
   OOS-DACT = The GQPH QPIPE has been manually removed.
   OOS-GQPHLB (with pending OOS-DACT state) = The GQPH loop back test fails (The removal action may be completed even though the state is OOS-GQPHLB).
   OOSF-PH (with pending OOS-DACT state) = The GQPH channel group is unassigned (due to a manual or fault recovery removal of a PH33, when there was no spare PH33...
available on the shelf).

4. ACTIONS TO BE TAKEN

For failures reported in Format 1 output, no further action is required, if the GQPH QPIPE is already manually removed. If ODD data problems are noted, they should be resolved according to local practices. All other failures indicate high system load, so the input request should simply be retried later.

No action need be taken for Format 2 outputs, as the desired GQPH QPIPE removal was accomplished.

5. ALARMS

None.

RMV:GRID

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RMV GRID=a-b-c d [e]

2. REASON FOR OUTPUT

To report the result of executing a RMV:GRID input message to remove a gated diode crosspoint grid (GRID) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Service group number.
d = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

e = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

To describe the result of the RMV:ISLUHLSC input message that was issued to remove an integrated services line unit (ISLU) high level service circuit from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = ISLU number.
c = ISLU service group number.
d = High level service circuit number.
e = Termination report. Valid value(s):
  ABORTED = Immediate termination.
  COMPLETED = Successful completion.
  NOT STARTED = Action has not begun.
  STOPPED = Terminated before normal completion.

f = Information that qualifies the above termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance manual.

5. ALARMS

None.

1. FORMAT

RMV ISMNAIL RECOVERY DLT=a-b MATEDLT=c-d e

2. REASON FOR OUTPUT

To inform the user that an inter-switching module (SM) nailup (ISMNAIL) has been automatically removed from service when no "hard fault" has been identified, which can cause the disruption in packet transport between two SMs.

Only three types of ISMNAIL removals are reported. The first deals with isolated recovery, where the loss of level 2 protocol has been detected. The second also deals with isolated recovery, where the protocol handler (PH) quality is too poor to facilitate reliable packet transport. In these two cases, automatic ISMNAIL restorations will be forthcoming. The third deals with automatic recoveries. If repeated attempts have been unsuccessful, the ISMNAIL will be removed to an out-of-service trouble analysis (OOS TBLA) state to prevent excessive automatic recoveries.

It should be noted that ISMNAIL recoveries associated with SM initializations/isolations or hardware faults will not be explicitly reported to avoid excessive reports to the receive-only printer (ROP). The user has been notified already about the root cause of the problem.

3. VARIABLE FIELD DEFINITIONS

a = SM number (may be the SM associated with either end of the ISMNAIL).
b = Data link terminal (DLT) number (1-160) associated with the SM.
c = Mate SM number (the other SM associated with the ISMNAIL).
d = DLT number associated with the mate SM.
e = Valid value(s):

- **LEVEL 2 PROTOCOL LOSS** = A reliable point-to-point transmission (level 2 protocol) on the ISMNAIL can not be maintained, despite local recovery attempts. There is no associated SM/hardware recovery that can account for the disruption. The problem was detected on the DLT number associated with the source SM.

- **PH QUALITY PROBLEM** = The ISMNAIL has been subjected to excessive local recoveries or receipt of errored frames and reliable level 2 transmissions are impossible. The problem was detected on the DLT number associated with the source SM.

- **TROUBLE ANALYSIS** = Despite repeated automatic recovery attempts, the ISMNAIL is not capable of reliably supporting packet transport between two SMs. However, no "hard fault" can be found that would prevent it from doing so. Thus, the ISMNAIL has been placed in the trouble analysis (OOS TBLA) state and the user is being notified to take action.

4. ACTION TO BE TAKEN

If the ISMNAIL has been removed due to level 2 protocol/PH quality problems, then do not take any direct actions as
automatic ISMNAIL recovery will be scheduled. Automatic ISMNAIL reconfiguration may stabilize the situation if alternate hardware resources are utilized, but repeated recoveries on the same ISMNAIL requires attention. The problem could be related to intermittent PH or packet switch unit (PSU) hardware problems, or intermittent faults in the ISMNAIL transmission path (especially noise on host-to-remote T1 umbilicals). Remove/diagnose suspected marginal hardware.

If the ISMNAIL is removed to an OOS-TBLA state, then repeated automatic recoveries have been attempted with no success. Marginal hardware problems, as the condition is persistent (and the same hardware may be affecting other circuit-switched traffic). In extremely heavy traffic conditions, common time multiplexed switch (TMS) timeslots may be unavailable for ISMNAIL usage. If so, then periodic restorations, using the RST:ISMNAIL command, may alleviate the problem. If the user does not identify the root cause of the problem and manually restore the ISMNAIL, the next automatic restoration attempt will take place at 3:30 AM (which may result in a repetition of the recovery events).

5. ALARMS

When an ISMNAIL is removed due to level 2 protocol/PH quality problems, no alarm is issued as automatic recovery will be pending.

When an ISMNAIL is removed to the OOS TBLA state, then this output will be issued with either a minor alarm or major alarm. If more then 50% of the ISMNAILs between a given pair of SMs are operational, then this output is issued with a minor alarm. If 50% or fewer of the ISMNAILs between a given pair of SMs are operational, then this output is issued with a major alarm. Whenever an ISMNAIL is removed to the OOS TBLA state, repeated automatic restoration attempts have failed and intervention is necessary.

Input Message(s):

RST:ISMNAIL

Output Message(s):

RST:ISMNAIL
RMV:ISMNAIL-SD

Software Release: 5E14 and later
Message Class: CP
Application: 5
Type: Output

1. FORMAT

RMV ISMNAIL DLT=a-b MATEDLT=c-d e [f]

2. REASON FOR OUTPUT

To respond to an RMV:ISMNAIL input message and indicate the success or failure of the inter-SM (switching module) nailup (ISMNAIL) removal request.

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>SM number that is the SM associated with either end of the ISMNAIL.</td>
</tr>
<tr>
<td>b</td>
<td>Data link terminal (DLT) number associated with the SM.</td>
</tr>
<tr>
<td>c</td>
<td>Mate SM number that is the other SM associated with ISMNAIL.</td>
</tr>
<tr>
<td>d</td>
<td>DLT number associated with the mate SM.</td>
</tr>
<tr>
<td>e</td>
<td>Termination report. Valid value(s): COMPLETED = Request completed successfully. FAILURE = Request was terminated before a normal completion.</td>
</tr>
<tr>
<td>f</td>
<td>Additional data qualifying the termination of the request, specifically. Valid value(s): DATABASE PROBLEM = Problem occurred while attempting to access critical data (accompanying ASSERT should provide more details). INVALID NAILUP SPECIFIED = An invalid nailup was specified in the input request. LACK OF MESSAGE RESOURCE = Message resources were not available in the administration module (AM), and the craft request could not be forwarded to the SM for execution. LAST ISMNAIL BETWEEN SM’S = The conditional removal of the last ISMNAIL between a pair of SMs is denied as it affect packet traffic. To remove the last nailup, the UCL option must be used. NOT OWNER OF PORT = Could not gain ownership of the port to honor request (retry is advisable). SM IN MINMODE = SM is in MINMODE, and, therefore, cannot support ISMNAILs. SM ISOLATED = SM is isolated, and requested action cannot be honored. TIMEOUT = Timeout occurred.</td>
</tr>
</tbody>
</table>

Note: For failed removals, the ISMNAIL may be left in a state, which will allow a successful automatic restoration at some later time; use OP:ST-ISMNAIL to determine current status associated with the affected ISMNAIL.

4. ACTION TO BE TAKEN

No further action is necessary, if the request completed successfully.
If the termination report is FAILURE, the 'r' field should give a reason as to why the request failed.

5. ALARMS

None.

Type: Output

1. FORMAT

RMV LDSUCOM=a-b-c d [e]

2. REASON FOR OUTPUT

To report the result of executing a RMV:LDSUCOM input message to remove a local digital service unit common (LDSUCOM) board from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Local digital service unit number.
c = Service group number.
d = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

e = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

None.

6. REFERENCES

   [t] [u] [u] [u] [u] v [v] [v] [v] [v]
   . [w] [w] [w] [w] [w] [w] [w] [w]
   . .
   .
   .
   [PER a1/a1 b1:b1:b1 c1 d1 [e] f]

2. REASON FOR OUTPUT

To report the removal of a line from service by the addition of the indicated status to the port(s) specified. Both the status added and the full resulting status for the port(s) are identified in the message. The removal of a digital subscriber line (DSL) will result in the status of all affected channels of the DSL’s being reported in the output message.

This message may be in response to a RMV:LINE input message or may be generated automatically.

3. VARIABLE FIELD DEFINITIONS

+ = Indicates party line, custom multipoint interface DSL or standard interface multi-user DSL.

a = Telephone number.

b = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

c = Channel identifier (D, B1, or B2) originally specified in the remove request. Used only for DSL lines.

d = Equipment number or identifier. Valid value(s):

<tr>
<td>h</td>
<td>Line card number.</td>
</tr>
</tbody>
</table>
j = Grid number.
k = Switch board number.
l = Switch number.
m = Level number.
n = Digital carrier line unit.
o = Remote terminal (RT) number.
p = RT line number.
q = Multi-line hunt group number.
r = Hunt group member number.
s = The result (completion code) of the removal request. Valid value(s):
   CAMPON FAIL = An unconditional removal may have been issued for the camped-on trunk or line
                 or its family of equipment. Verify current line or trunk status.
   CAMPON NOT ALLOWED = The ability to camp-on is not allowed on the line specified. It must
                        therefore be removed by using the UCL option.
   CMP UNAVAILABLE = The input request could not be completed because a needed communication
                     module (CM) was unable to respond. Retry the request later.
   COMPL-RCV DELETE = The specified status was successfully added to the indicated line because it
                      was deleted from the database by recent change/verify (RC/V).
   COMPLETED = The specified status was successfully added to the port. Resulting port status is
                indicated.
   COMPLETED, TRUNKS REMAIN = The request completed successfully but some or all ports may
                               be defined as trunks. Use RMV:TRK message for the trunk ports.
   DUP REQUEST = This input request is already being processed or the line is already out-of-service
                  for the specified reason.
   INPUT ERROR = Some data entered in the input request was invalid or incorrect.
   INV PORT = The line could not be located in the data base. The line identifier used in the input
             request was most likely invalid or incorrect.
   INV PORT TYPE = The port specified is not a line and cannot be changed using this input request.
                   Determine the port's type (OP:CONV may help), and use the appropriate input
                   request.
   INV STATUS = An invalid status for the line was used in the input request.
   MLHG ACCESS DN = The DN entered is a uniform call distribution (UCD), multi-position hunt
                    (MUPH) multi-line hunt group line, or linear hunt line and as such cannot be
                    removed by specifying its DN. An equipment number (that is, LEN, SLEN) or MLHG
                    and member number must be specified. To obtain the line's equipment number
                    and/or multi-line hunt group and member number, use RC/V for the DN or refer to
                    office records.
   MP ACCESS DN = The DN entered is a uniform call distribution multi-line hunt group line for modem
                 pooling and cannot be removed by specifying its DN. An equipment number (that is,
                 LEN, SLEN, LCEN) or MLHG and member number must be specified. To obtain
                 the line's equipment number and/or multi-line hunt group and member number, use
                 recent change/verify (RC/V) for the DN or refer to office records.
   NAILUP RMV DENIED = The port in question is nailed-up and removal is denied. Use the UCL
                      parameter to do an unconditional removal.
NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

NO PROCESS = An attempt to create a process failed. Possibly caused by the system’s being busy. Retry the request later.

NOT PRIMARY DN OR MLHG = The DN or MLHG specified is not identified as the primary DN or MLHG and member on any line. It therefore cannot be used to identify which equipment is to be removed from service. Refer to RC/V or office records to determine the primary DN(s) or MLHG and member numbers.

PORT BUSY = The line remained busy for the camp-on period or an in-progress camp-on was terminated.

PORT PROV IN PROGRESS = The line or trunk is in the process of being provisioned. Retry the request later.

PROCESS TIMEOUT = Internal time-out during processing request.

SM UNAVAILABLE = The input request could not be completed because a needed SM was unable to respond. Retry the request later.

STATUS CONFLICT = Status to be added conflicts with the existing status on the line.

SYSTEM BUSY = The system’s processing capability limit was reached or a system resource was unavailable. Retry the request later.

SYSTEM ERROR = System error occurred making it impossible to continue processing request.

\[ t \] = Channel identifier; D, B1, or B2. Used only for DSL lines.

\[ u \] = Status that was requested to be added to the line. The first subfield indicates the basic state; the second subfield indicates the qualifier; the third subfield indicates the operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the line. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual.

\[ v \] = Resulting primary status in effect on the line. This status is the most restrictive to call processing currently on the line. The first subfield indicates basic state; the second subfield indicates the qualifier; the third subfield indicates the operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the line. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

\[ w \] = Pending statuses (0-3) in effect on the line, if any. (Less restrictive than the primary status.) The first subfield indicates basic state; the second subfield indicates the qualifier; the third subfield indicates the operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the line. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.

\[ x \] = IDCU number.

\[ y \] = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.

\[ z \] = RT line number or PUB43801 channel.

\[ a^1 \] = Timestamp date, in the form month/day.

\[ b^1 \] = Timestamp, in the form hour:minute:second.

\[ c^1 \] = Protocol detecting the error. Valid value(s):
**LAPB/SLP** = Link access protocol type B.
**LAPD** = Link access protocol type D.
**Q.931** = Q.931 ISDN call control protocol.
**UNKNOWN** = Unknown protocol being used.
**X.25** = X.25 public data network access protocol.
**X.75** = X.75 public data network gateway protocol.
**X.75P** = X.75' public data network gateway protocol.

\[d^1\] = Protocol state for the network side of the interface when error was detected.
\[e^1\] = Protocol state for the network side of the interface for the X.25 or X.75' or X.75 permanent virtual circuit or virtual circuit associated with the detected error.
\[f^1\] = The frame/packet/message type that was received or transmitted when the error was detected.
\[g^1\] = Line group number.
\[h^1\] = Line board number.
\[i^1\] = Line circuit number.
\[j^1\] = Access interface unit (AIU) number.
\[k^1\] = AIU pack number.
\[l^1\] = AIU circuit number.
\[m^1\] = Digital network unit - synchronous optical network (SONET) (DNU-S) number.
\[n^1\] = Virtual analog line number.
\[o^1\] = Virtual BRI line number.

### 4. ACTIONS TO BE TAKEN

If the line was removed automatically, determine if a hardware problem exists on that line, and if so, take corrective action.

### 5. ALARMS

Minor. Indicates the line was removed because a hard fault was detected and should be rectified.

RMV:LN

Software Release: 5E14 and later
Message Class: DGN
Application: 5,CNI
Type: Output

1. FORMAT

RMV LNa b c [d] [e]

2. REASON FOR OUTPUT

To report the status of a request to remove a link node (LN) from service. The removal request is either automatic, a result of excessive errors, or manual. A manual LN removal attempt with the RMV:LN input message is conditional upon having the signaling link not in service and can fail (ABORTED or STOPPED) or be successful (COMPLETED). An LN removal can also be reported in response to other input messages listed in the reference section. An automatic removal is unconditional and can only be SUCCESSFUL.

3. VARIABLE FIELD DEFINITIONS

a = Ring node (RN) group number.
b = Ring node member number.
c = Terminal status. Valid value(s):
   ABORTED = Remove aborted.
   COMPLETED = Unit removed.
   STOPPED = Remove stopped.

d, e = Valid value(s):

<table>
<thead>
<tr>
<th>&quot;c&quot; =</th>
<th>&quot;d&quot; =</th>
<th>&quot;e&quot; =</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED</td>

</tr>
<tr>
<td>ABORTED</td>
<td>1 = Remove process error</td>
<td>Error code. Refer to the &quot;Error Codes Generated by the IMSRMVST Process&quot; exhibit of the APP:CNI appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
<tr>
<td>ABORTED</td>
<td>2 = Driver error.</td>
<td></td>
</tr>
<tr>
<td>STOPPED</td>
<td>Error code. Refer to the &quot;Reason for a Remove or Restore Request Being Stopped&quot; exhibit of the APP:CNI appendix in the Appendixes section of the Output Messages manual.</td>
<td></td>
</tr>
</tbody>
</table>

4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again. Note that removal of a ring node is prohibited while the associated signaling link is in service. Refer to the CHG:SLK input message.

5. ALARMS
None.

RMV:MHD

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] RMV MHD a COMPLETED

[2] RMV MHD a ABORTED [b] [c]

[3] RMV MHD a STOPPED d

[4] RMV MHD a TASK e MSG STARTED

[5] RMV MHD a STOPPED MESSAGE IN PROGRESS

[6] RMV MHD a STOPPED MESSAGE COMPLETED

2. REASON FOR OUTPUT

These messages report the disposition of a request to remove a moving head disk (MHD) from service.

Format 1 reports that the removal was successful.

Formats 2 and 3 report that the removal failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
X'1' = Remove process error.
X'2' = Driver error.
[NULL] = Remove denied by driver or configuration control (CONFIG).

c = Error code.

</tbody>
</table>
4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

5. ALARMS

The pudrv subsystem generated messages have no alarm.

The cft subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The diag subsystem generated messages have automatically generated alarms; action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

RMV:MMP

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RMV MMP=a-b c [d]

2. REASON FOR OUTPUT

To acknowledge a request from fault recovery or a manual request to remove the specified module message processor (MMP) from service.

3. VARIABLE FIELD DEFINITIONS

a = Message switch side.
b = MMP identification number.
c = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion.

d = Additional information qualifying the termination report (variable 'c').

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

RMV:MSCU
Software Release: 5E14 and later
Message Class: MSGS
Application: 5
Type: Output

1. FORMAT

RMV MSCU=a b [c]

2. REASON FOR OUTPUT

To report the results of a request to remove the specified message switch control unit (MSCU).

3. VARIABLE FIELD DEFINITIONS

a = MSCU side.
b = Termination report. Valid value(s):
  ABORTED = Requested action was terminated before completion and the termination was not graceful.
  COMPLETED = Request was successfully completed.
  NOT_STARTED = Requested action was not begun.
  STOPPED = Request was terminated before a normal completion. Termination was graceful.
c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, variable ‘c’ should give some indication as to why the request failed. Use MSGS Master Control Center (MCC) pages or the OP:CFGSTAT input message to verify that the MSCU was in a valid state to perform the request.

RMV:NCOSC

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RMV NCOSC a b [c]

2. REASON FOR OUTPUT

This message is in response to the RMV:NCOSC input message.

3. VARIABLE FIELD DEFINITIONS

NCOSC = Network clock 2 oscillator.
a = Network clock side.
b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   IN PROGRESS = Request was received and action is in progress.
   STOPPED = Request was terminated before a normal completion due to hardware failure, data inconsistency or another system problem.
c = Additional data qualifying the terminated field.

4. ACTION TO BE TAKEN

No action is necessary if the request completed successfully. If the request failed, the variable 'c' should give some indication as to why the request failed. Check the network clock (NC) MCC page or the OP:CFGSTAT output message to verify that the NC was in a valid state to perform the request. Also, check the receive-only printer (ROP) for error messages using the REPT:NC output messages that may indicate problems or system reconfigurations.

Note: A request to remove the last good oscillator will not be allowed; however, the oscillator states may be manipulated by the use of the SET:FRC-NCOSC input message.

STOPPED = Requested action was terminated before a normal completion due to hardware failure, data inconsistency, or another problem.

\(e\) = Additional data qualifying the termination field.

4. ACTIONS TO BE TAKEN

No action is necessary if the request completed successfully. If the request failed, the variable \(e\) should give some indication as to why the request failed. Check network clock MCC pages or the OP-CFGSTAT output message to
verify that the network clock was in a valid state to perform the request. Check the read-only printer (ROP) for error messages using the REPT:NC output messages that may indicate problems or system reconfigurations. If problems persist with a reference, they may be diagnosed by using the DGN:NC input message.

5. ALARMS

Major.

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RMV NLI=a-b-c d [e]

2. REASON FOR OUTPUT

To report the result of a request to remove from service a network link interface (NLI) in a switching module (SM).

Note: If the resulting QLPS configuration is not optimal after the removal, an automatic reconfiguration (switch) of the QLPS occurs.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = NLI number.
c = Office network and timing complex (ONTC) side number that the NLI is on.
d = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   NOT STARTED = Requested action was not begun.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a correct state.

e = Additional data qualifying the termination status.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the System Maintenance Requirements and Tools, Corrective Maintenance Procedures and the System Recovery Procedures manuals.

5. ALARMS

None.

RMV:OC3

- **Software Release:** 5E16(1) and later
- **Message Class:** SM
- **Application:** 5
- **Type:** Output

1. **FORMAT**

   RMV OC3=a-b-c-d-e f [g]

2. **REASON FOR OUTPUT**

   Indicates the result of an attempt to remove an optical carrier - level 3 (OC3) link from service.

   This message may be in response to a RMV:OC3 input message or may be generated automatically.

3. **VARIABLE FIELD DEFINITIONS**

   - **a** = Switching module (SM) number.
   - **b** = Optical interface unit (OIU) number.
   - **c** = Protection group (PG) number.
   - **d** = OC3 number.
   - **e** = Side number.
   - **f** = Termination status. Valid value(s):
     - ABORTED = The requested action was terminated before completion, and the termination was not graceful.
     - COMPLETED = The requested action has successfully completed.
     - IN PROGRESS = The requested action is in progress.
     - NOT STARTED = The requested action has not begun.
     - STOPPED = The requested action terminated before a normal completion.
   - **g** = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. **ACTIONS TO BE TAKEN**

   If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. **ALARMS**

   If this report is in response to an automatic removal, the possible alarms include:
   - *C Critical = A duplex failure of an OC3 has occurred.
   - **Major = A simplex failure of an OC3 has occurred.

6. **REFERENCES**

   Input Message(s):
RMV:OC3C

**Software Release:** 5E16(2) and later  
**Message Class:** SM  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   RMV OC3C=a-b-c-d-e f [g]

2. **REASON FOR OUTPUT**

   To report the result of an attempt to remove an optical carrier - level 3 concatenated (OC3C) facility from service.

   This message may be in response to a RMV:OC3C input message or may be generated automatically.

3. **VARIABLE FIELD DEFINITIONS**

   a = Switching module (SM) number.  
   b = Optical interface unit (OIU) number.  
   c = Protection group (PG) number.  
   d = OC3C number.  
   e = Side number.  
   f = Termination status. Valid value(s):
      
      **ABORTED** = The requested action was terminated before completion, and the termination was not graceful.  
      **COMPLETED** = The requested action has successfully completed.  
      **IN PROGRESS** = The requested action is in progress.  
      **NOT STARTED** = The requested action has not begun.  
      **STOPPED** = The requested action terminated before a normal completion.

   g = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. **ACTIONS TO BE TAKEN**

   If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. **ALARMS**

   If this report is in response to an automatic removal, the possible alarms include:
   
   *C Critical = A duplex failure of an OC3C has occurred.  
   **Major = A simplex failure of an OC3C has occurred.

1490  OIU STATUS
RMV:ONTC

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RMV ONTC=a b [c]

2. REASON FOR OUTPUT

To acknowledge a request to remove the specified office network and timing complex (ONTC) from service.

3. VARIABLE FIELD DEFINITIONS

a = ONTC side.
b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   STOPPED = Request was terminated before a normal completion due to hardware failure, data inconsistency, etc.

c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the request failed, variable ‘c’ should give some indication as to why the request failed. Check ONTC MCC pages or the OP:CFGSTAT output message to verify that the ONTC was in a valid state to perform the request.

5. ALARMS

None.

RMV:ONTCCOM

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RMV ONTCCOM=a b [c]

2. REASON FOR OUTPUT

To respond to a manual request to remove the specified office network and timing complex common unit (ONTCCOM).

3. VARIABLE FIELD DEFINITIONS

a = ONTCCOM side.

b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   NOT STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

   c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, variable ‘c’ should give some indication as to why the request failed. Check ONTC MCC pages or the OP:CFGSTAT output message to verify that the ONTC was in a valid state to perform the request.

5. ALARMS

1211 (NETWORK CLOCK)
RMV:OSPSPORT
Software Release: 5E14 and later
Message Class: LINE, RSB
Application: 5
Type: Output

1. FORMAT

RMV OSPSPORT [a] [PKT] [b] [c] d
   [e] [e] [e] [e] [e] f [f] [f] [f] [f]
   [g] [g] [g] [g] [g] .
   .
   .

2. REASON FOR OUTPUT

To respond to a request to remove the specified Operator Services Position System (OSPS) port (OSPSPORT) from service by adding the specified status to the port identified. Both the status requested to be added and the full status resulting from the removal attempt are identified in the message. This message may be in response to a RMV:OSPSPORT input message or may be generated automatically.

When an autoquote mate analog (AQM) OSPSPORT is removed from service, its associated autoquote (AQ) data link is also removed from service.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Channel identifier: D, B1, or B2. Used only for digital subscriber line (DSL) OSPSPORTs.

b = Valid value(s):
   AQEST=h
   AQM=i-j
   BST=k-l
   OPT=k-l
   XDPF=m
   XDPO=k

c = Valid value(s):
   LCEN=n-o-p-q
   LCKEN=n-o-v-w-x
   TEN=n-r-s-t-u

d = The result (completion code) of the removal request. Valid value(s):
   CAMPON FAIL = The request to camp on the OSPSPORT failed.
   CAMPON NOT ALLOWED = The ability to camp on is not allowed on the OSPSPORT specified. It must therefore be removed by specifying the UCL option.
   CMP UNAVAILABLE = The input request could not be completed because a needed communications module (CM) was unable to respond. Retry the request later.
   COMPLETED = The specified status was successfully added to the port. Resulting port status is
indicated.

**DUP REQUEST** = Line already out of service for the specified reason.

**INPUT ERROR** = Some data entered in the input request was invalid or incorrect.

**INV PORT** = The OSPSPORT could not be located in the database. The OSPSPORT identifier used in the input request was most likely invalid or incorrect.

**INV PORT TYPE** = The port specified is not an OSPSPORT and therefore cannot be changed using the specified input request. Determine the port’s type (the OP:CONV input message may help) and use the input request appropriate for its type.

**INV STATUS** = An invalid status for the OSPSPORT was specified in the input request.

**NO PROCESS** = An attempt to create a process failed. Possibly caused by the system’s being busy. Retry the request later.

**PORT BUSY** = The OSPSPORT remained busy for the camp-on period or an in-progress camp-on was terminated. This report may also indicate that an AQM removal request was rejected because fewer than 50% of the associated autoquote data links would remain in service after the removal.

**PROCESS TIMEOUT** = Internal time-out during processing request aborted.

**SM UNAVAILABLE** = The input request could not be completed because a needed SM was unable to respond. Retry the request later.

**STATUS CONFLICT** = Status to be added conflicts with the existing status on the OSPSPORT.

**SYSTEM BUSY** = The system’s processing capability limit was reached or a system resource was unavailable. Retry the request later.

**SYSTEM ERROR** = System error occurred making it impossible to continue processing request.

e = Status added to the OSPSPORT which effected its removal from service. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a description of the status subfields.

f = Resulting primary status in effect on the OSPSPORT. This status is the most restrictive to call processing currently on the OSPSPORT. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

g = Pending statuses in effect on the OSPSPORT, if any (Less restrictive than the primary status). Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.

h = Telephone number.

i = Data link (group) number.

j = Relative link (member) number.

k = Operator service center number.

l = Relative position number.

m = Force management center number.

n = Switching module (SM) number.

o = Integrated services line unit number.

p = Line group controller number.

q = Line card number.
4. ACTION TO BE TAKEN

If the OSPSPORT is removed automatically, determine if a hardware problem exists on that OSPSPORT, and if so, take corrective action.

To remove an OSPSPORT, use the RMV:OSPSPORT input message. To restore an OSPSPORT, use the RST:OSPSPORT input message. To get the current status of an OSPSPORT, use the OP:STATUS input message. To get a list of all OSPSPORTs with a specified status, use the OP:LIST input message.

PSU SHELF
PSU NETWORK
RMV:PSUCOM-B

**Software Release:** 5E16(1) and later
**Message Class:** SM
**Application:** 5
**Type:** Output

1. **FORMAT**

   \[ \text{RMV PSUCOM=b-c-d[-e] f [g]} \]

2. **REASON FOR OUTPUT**

   Indicates the result of an RMV:PSU input message to remove a packet switch unit (PSU) common controller (COM) from service.

3. **VARIABLE FIELD DEFINITIONS**

   - **b** = Switching module (SM) number.
   - **c** = PSU number.
   - **d** = Shelf number.
   - **e** = Protocol handler number.
   - **f** = Termination status. Valid value(s):
     - **ABORTED** = Requested action was terminated before completion, and the termination was not graceful.
     - **COMPLETED** = Request has successfully completed.
     - **STOPPED** = Requested action was terminated before a normal completion. Termination was graceful.
     - **NOT-STARTED** = Requested action was not started.
   - **g** = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. **ACTIONS TO BE TAKEN**

   If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the Corrective Maintenance and System Recovery manuals.

5. **ALARMS**

   A critical alarm indicates PSUCOM removal while mate is out-of-service (duplex failure). A major alarm indicates PSUCOM removal (simplex operation) or, PSUPH removal.

6. **REFERENCES**

RMV:PSUPH-A

Software Release: 5E14 - 5E15
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV PSUPH=b-c-d[-e] f [g]

2. REASON FOR OUTPUT

Indicates the result of an RMV:PSU input message to remove a packet switch unit (PSU) protocol handler (PH) from service.

3. VARIABLE FIELD DEFINITIONS

b = Switching module (SM) number.
c = PSU number.
d = Shelf number.
e = Protocol handler number.
f = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
   NOT-STARTED = Requested action was not started.

   g = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

A critical alarm indicates PSUCOM removal while mate is out-of-service (duplex failure). A major alarm indicates PSUCOM removal (simplex operation) or, PSUPH removal.

RMV:PSUPIDB

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV PSUPIDB=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of a RMV:PSUPIDB input message to remove the packet switch unit (PSU) peripheral interface data bus (PIDB) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = PSU number.
c = PSU shelf number.
d = PIDB number.
e = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action could not be entertained for one of the following reasons:
   - There exists an active (ACT) PSU PIDB having a relative position higher than this PIDB.
   - PIDB position 0 relative to the PSUCOM can not be removed.
   - PIDB is in requested state.
   - At least one PSUCOM is busy.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
   - There could be a resource problem such that all links on the PIDB in question can not be moved to another available PIDB.
   - Because of some other failure the removal stopped.

f = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

Retry the command later if the response is other than COMPLETED.

5. ALARMS

None.

RMV:PSUSHELF

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV PSUSHELF=a-b-c-d e

2. REASON FOR OUTPUT

To report the result of a RMV:PSUSHELF input message to remove a packet switch unit (PSU) shelf side from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number (SM).

b = PSU number.

c = PSU shelf side to be removed.

d = PSU shelf number to be removed.

e = Termination status. Valid values are:
   ABORTED = Request aborted.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action could not be entertained for one of the following reasons:
                  - The request was to remove the ACT PSU shelf side and the mate
                    side was not out of service (OOS).
                  - Shelf side is in requested state.

RMV:QGP

Software Release: 5E14 and later
Message Class: MSGS
Application: 5
Type: Output

1. FORMAT

RMV QGP=a-b c [d]

2. REASON FOR OUTPUT

To report the result of a request to remove the specified quad-link gateway processor (QGP) from service.

Note: As part of the QGP reconfiguration the quad-link packet switch (QLPS) may have been switched also.

3. VARIABLE FIELD DEFINITIONS

a = Message switch side number.
b = QGP number.
c = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

d = Additional information qualifying the termination status.

RMV:QLPS

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RMV QLPS=a-b c [d]

2. REASON FOR OUTPUT

To report the result of a request to remove the specified quad-link packet switch (QLPS) from service.

Note: If the resulting QLPS configuration is not optimal after the removal, an automatic reconfiguration (switch) of the QLPS occurs.

3. VARIABLE FIELD DEFINITIONS

a = Office network and timing complex (ONTC) side number.
b = QLPS network number.
c = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
d = Additional information qualifying the termination status.

4. ACTION TO BE TAKEN

MCC Display Page(s):
1209 (ONT 0 & 1)
1380/1 (QLPS NETWORK 0/1 STATUS)
RMV:QPHPIPE

Software Release: 5E15 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

[1] \text{RMV QPHPIPE=a-b-c-d-e OPC=f STOPPED g}

[2] \text{RMV QPHPIPE QPH=a-b-c-d-e OPC=f STATE=h COMPLETED}

2. REASON FOR OUTPUT

Format 1 reports that the quad-link packet switch protocol handler (QPH) QPIPE removal request cannot be processed by the global switching module (GSM).

Format 2 reports that the QPH QPIPE removal was completed.

3. VARIABLE FIELD DEFINITIONS

\begin{itemize}
\item[a] = GSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
\item[b] = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
\item[c] = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
\item[d] = QPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
\item[e] = Quad-link packet switch (QLPS) network number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
\item[f] = OPC (9-digit primary originating point code associated with the GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for a description of ANSI and AT&T/UNITEL formats.
\item[g] = Reason for failure. Valid value(s):
  \begin{itemize}
  \item DATABASE ERROR = QPH QPIPE removal processing halted due to a database error.
  \item MESSAGE TIMEOUT = Response from QPH did not arrive within a timeout interval monitored by the controlling ISPA terminal process.
  \item QPH PIPE UNEQUIPPED = The QPH QPIPE specified in the input message is unequipped in the ODD.
  \item QPH QPIPE ALREADY DACT = The specified QPH QPIPE is already manually removed.
  \item ISPA UNSUCCESSFUL = An ISPA terminal process required to attempt the QPH QPIPE removal could not be created due to system load (retry later).
  \item MAINTENANCE BUSY = The QPH QPIPE port is owned by another maintenance process, which may result in a state transition (retry later).
  \item QPH QPIPE UNEQUIPPED = The removal processing halted because the QPH QPIPE is unequipped.
  \end{itemize}
\end{itemize}
= Resultant state. Valid value(s):
OOS-DACT  = The QPH QPIPE has been manually removed.
OOS-FE-PH (with pending OOS-DACT state) = The QPH channel group is unassigned (due to a manual or fault recovery removal of a PH22, when there was no spare PH22 available on the shelf).

4. ACTIONS TO BE TAKEN

For failures reported in Format 1 output, no further action is required, if the QPH QPIPE is already manually removed. If ODD data problems are noted, they should be resolved according to local practices. All other failures indicate high system load, so the input request should simply be retried later.

No action need be taken for Format 2 outputs, as the desired QPH QPIPE removal was accomplished.

5. ALARMS

None.

RMV: RAF

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV RAF=a-b c [d]

2. REASON FOR OUTPUT

To report the results of removing a recorded announcement function (RAF) unit from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RAF unit number.
c = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion and the termination was immediate and was not graceful.
COMPLETED = Request has successfully completed.
NOT_STARTED = Requested action has not begun.
STOPPED = Requested action was terminated gracefully before a normal completion.
d = Additional data qualifying the termination report (variable ‘c’). Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

</tr>
</thead>
</table>
| Refer to the APP:IOP-H appendix in the Appendixes section of the Output Messages manual.
Refer to the APP:IOP-G appendix in the Appendixes section of the Output Messages manual.

d = Error code. Refer to the APP:IOP-I appendix in the Appendixes section of the Output Messages manual.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

5. ALARMS

The "pudrv" subsystem generated messages have no alarm.

The "cft" subsystem messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem messages have automatically-generated alarms; action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Other Manual(s):

235-105-220  Corrective Maintenance
1. **FORMAT**

RMV RPCNa 0 b [c] [d]

2. **REASON FOR OUTPUT**

To report the status of a request to remove a ring peripheral controller node (RPCN) from service. The removal request is either automatic, a result of excessive errors, or manual. A manual RPCN removal attempt is conditional upon having adequate traffic handling capacity and can fail (ABORTED or STOPPED) or be successful (COMPLETED). An automatic removal is unconditional and can only be successful.

3. **VARIABLE FIELD DEFINITIONS**

   a = Ring node (RN) group number.

   b = Terminal status. Valid value(s):
       ABORTED = Remove aborted.
       COMPLETED = Unit removed.
       STOPPED = Remove stopped.

   c = Valid value(s):

<table>
<thead>
<tr>
<th>If 'b' =</th>
<th>'c' =</th>
</tr>
</thead>
</table>
   | ABORTED | Type of error. Valid value(s):
          | 1 = Remove process error.
          | 2 = Driver error. |
   | STOPPED | Error code; refer to the "Reason for a Remove or Restore Request Being Stopped" exhibit of the APP:CNI appendix in the Appendixes section of the Output Messages manual. |

   d = Error code. Valid value(s):

<table>
<thead>
<tr>
<th>If 'c' =</th>
<th>'d' =</th>

MCC Display Page(s):

118 (CNI FRAME AND CCS LINK STATUS)
RMV:RRCLK

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV RRCLK=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an RMV:RRCLK input message to remove a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RISLU number.
c = RRCLK side.
d = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

 e = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

In the case of automatic removal from service of an RRCLK circuit due to fault recovery actions, refer to the receive-only printer (ROP) for results of automatic diagnostics (DGN:RRCLK output messages) and repair the faulty circuit.

If unexpected results occur, refer to the Corrective Maintenance manual.

5. ALARMS

A critical alarm results when an RISLU duplex failure occurs as the result of an unconditional removal of an RRCLK side.

Type: Output

1. FORMAT

RMV RT EOC=a-b c [d]

2. REASON FOR OUTPUT

To report the result of a RMV:RT-EOC input message that removes a remote terminal (RT) embedded operations channel (EOC) circuit from service.

3. VARIABLE FIELD DEFINITIONS

a = Site identification number.
b = EOC number.
c = Termination report. Valid value(s):
   ABORTED = Immediate termination. A process has been purged and cleanup will be done by audits.
   COMPLETED = Requested action was successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
d = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

A critical alarm indicates EOC removal while its mate is out of service (duplex failure). A major alarm indicates EOC failure due to the removal of the path while its mate is out of service (duplex failure). A minor alarm indicates EOC removal while its mate is in service (simplex operation).

</table>

For diagnostic remove process, refer to the APP:DFC-G appendix in the Appendixes section of the Output Messages manual.

For driver/Disk removal process, refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If the remove did not complete successfully, correct the source of trouble and attempt the removal again. If the error condition persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

OMDB key 308 has a VAR (variable) alarm. There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

OMDB key 601 has a MAJ (major) alarm. If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

   STATE=d PCRGRP=e-f-g PSUPH=e-f-h-i SHELF-CHGRP=h-j
   NEAR ENDPT=k FAR ENDPT=l

2. REASON FOR OUTPUT

To report the result of executing a RMV:SCTP input message to remove a stream control transmission protocol (SCTP) endpoint or association from service.

The remove input messages have the ability to add a unconditional (UCL) qualifier to the input message line to insure the traffic does not get shut down unintentionally.

Format 1 provides the status of the ENDPOINT after the remove input message is finished.

Format 2 provides the status of the ASSOCIATION when the input is for a specific association.

3. VARIABLE FIELD DEFINITIONS

a = Endpoint name to be removed from service. This is a character string (≤20) that is provisioned on RC/V View 33.19 (SCTP NEAR END POINT).

b = Association number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Request's termination status. Valid value(s):
   COMPLETED = Command is successfully executed.
   COMPLETED-ASSC SHUTDOWN IN PROGRESS = Command is accepted and shutdown is in progress.
   DENIED-UCL REQUIRED = The endpoint is either in-service or partial-service or the association is either established or degraded. This endpoint/association can only be removed unconditionally (UCL). Retry the request with UCL.
   FAILED-TIMED OUT WAITING FOR SM = The AM timed out waiting for response from the SM.
   FAILED-UNEXPECTED MESSAGE IN AM = An unexpected message was received in the AM.
   STOPPED-ASSOCIATION RESOURCE BUSY = Association is busy.
   STOPPED-DATABASE ACCESS ERROR = Database access error.
   STOPPED-NEAR ENDPOINT RESOURCE BUSY = Near endpoint is busy.
   STOPPED-NOT PART OF AN ASSOCIATION SET = Association is not part of an established association Set.
   STOPPED-PREEMPTED = Command was preempted by other manual command.
   STOPPED-PROCESSOR GROUP RESOURCE BUSY = Processor group is busy or another endpoint or association job is in progress.
STOPPED-PROCESSOR GROUP UNAVAILABLE = Processor group is unavailable.
STOPPED-REQUESTED STATE = Already in requested state.
STOPPED-SELECTIVE INIT = Command blocked because SM is in selective initialization.
STOPPED-SYSTEM ERROR A system error occurred making it impossible to continue processing the request.
STOPPED-TIMED OUT = Timed out waiting to get ownership of resource.

d = Status of endpoint or association at termination of request. Refer to the APP:SCTP appendix in the Appendixes section of the output message manual for an explanation of the SCTP statuses.
e = Switching module (SM) number.
f = Packet switch unit (PSU) number.
g = Processor group number.
h = PSU shelf number.
i = Protocol handler number.
j = Channel group (CHGRP) number.
k = SCTP near endpoint name for association.
l = SCTP far endpoint name for association.

Type: Output

1. FORMAT

RMV:SDFI=a-b-c d [e]

2. REASON FOR OUTPUT

To report the removal of a SLC® 96 digital facility interface (SDFI) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital carrier line unit (DCLU) number.
c = SDFI number.
d = Termination status. Valid value(s):
   ABORTED = The action requested was unsuccessful, and the termination was not graceful. Hardware states are not reliable.
   COMPLETED = The action completed successfully.
   STOPPED = The action terminated before a normal completion but the termination was graceful. Hardware states are reliable.
e = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

235-105-220 Corrective Maintenance
235-105-250 System Recovery
RMV:SDL

Software Release: 5E14 and later
Message Class: MAINT, MAIPR
Application: 5,3B
Type: Output

1. FORMAT

[1] RMV SDL a COMPLETED

[2] RMV SDL a ABORTED [b] [c]

[3] RMV SDL a STOPPED d

[4] RMV SDL a TASK e MSG STARTED

[5] RMV SDL a STOPPED MESSAGE IN PROGRESS

[6] RMV SDL a STOPPED MESSAGE COMPLETE

2. REASON FOR OUTPUT

To report the disposition of a request to remove a synchronous data link (SDL) from service.

Format 1 reports that the removal attempt was successful.

Formats 2 and 3 report that the removal has failed.

Formats 4 - 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
   X’1 = Remove process error.
   X’2 = Driver error.
   [NULL] = Remove denied by driver or configuration control (CONFIG).

c = Error code.

If ‘b’ =

X’1

Refer to the APP:IOP-H appendix in the Appendixes section of the Output Messages manual.
X.2 Refer to the APP:IOP-G appendix in the Appendixes section of the Output Messages manual.

d = Error code. Refer to the APP:IOP-I appendix in the Appendixes section of the Output Messages Manual.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

5. ALARMS

The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV SFI=a-b-c-d e [f]

2. REASON FOR OUTPUT

Indicates the result of an attempt to remove a digital networking unit - synchronous optical network (DNU-S) synchronous transport signal electrical interface (STSX-1) facility interface (SFI) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Data group number.
d = STSX-1 facility interface number.
e = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was successfully completed.
   IN PROGRESS = Requested action is in progress.
   NOT STARTED = Requested action was not started.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

f = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

An automatic unconditional removal of an SFI in a DNU-S data group while the mate SFI is in an out-of-service (OOS) state will cause a critical alarm.

RMV:TMSFP

Software Release: 5E16(2) and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RMV TMSFP=a-b c [d]

2. REASON FOR OUTPUT

To acknowledge a request to remove the specified time multiplexed switch (TMS) fabric pair (TMSFP) from service.

3. VARIABLE FIELD DEFINITIONS

- **a** = Office network and timing complex (ONTC) side.
- **b** = TMS fabric pair number.
- **c** = Termination report. Valid value(s):
  - ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
  - COMPLETED = Request completed successfully.
  - NOT_STARTED = Requested action could not begin.
  - STOPPED = Request was terminated before a normal completion due to hardware failure, data inconsistency, and so forth.

- **d** = Additional data qualifying the termination field. Refer to the APP:CM-OM-REASON appendix in the Appendices section of the Output Messages manual for a list of these reasons and their meanings.

4. ACTIONS TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the variable ‘d’ should give some indication as to why the request failed. Check the appropriate MCC pages or OP:CFGSTAT output message to verify that the associated units were in a valid state to perform the request.

5. ALARMS

None.

RMV:TRIB

Software Release: 5E15 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RMV TRIB=a-b-c-d e [f]

2. REASON FOR OUTPUT

Indicates the result of executing the RMV:TRIB command to remove a PCT (Peripheral Control and Timing) link tributary (TRIB) from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = PLTU (PCT Line and Trunk Unit) number.
c = PCT Facility Interface number.
d = PCT Tributary number.
e = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was successfully completed.
   NOT STARTED = Requested action was not started.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

f = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

Automatic removals of TRIBs generate a minor alarm when the first TRIB on an PCT link is removed, a major alarm when the removal of the TRIB results in more than 24 but not more than 128 DS0s out-of-service on a PCT link, and a critical alarm when the removal of the TRIB results in more than 128 of the DS0s out-of-service on a PCT link.

[3] RMV TRK [PRIGRP=j1|TKGMN=a-b&c|TG=k1] [CH=l1]  z

2. REASON FOR OUTPUT

To report the removal from service of an analog, digital trunk or an X.25 access on T1 (XAT) port. This resulted from adding the indicated status to the trunk specified.

Format 1 indicates removal of analog or digital trunks. Format 2 indicate removal of XAT ports. Format 3 indicates the start and/or end of a group or range removal. This message may be in response to a RMV:TRK input message or may be generated automatically. Both the status added and the full resulting status for the trunk are identified in the message. The status information in the left half (column) of the message is the status that was to be added. The status in the right half (column) of the message is the status in effect on the trunk at the completion of the attempt to remove the port. Logical test ports (LTPs) are identified with the corresponding logical test port numbers.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number.

b = Trunk group member number or lower limit of a range of trunk member number.

c = Upper limit of a range of trunk member number.

d = Trunk unit number.

e = Service group number.

f = Channel board number.
g = Circuit number.

h = The result of the removal request. Valid value(s):
   CAMPON FAIL = A camp-on connection could not be established or maintained. The failure was due to lack of system resources or a higher priority occurring that needed control of the port. Retry the request later.
   CAMPON NOT ALLOWED = The ability to camp-on is not allowed on the trunk specified. It must, therefore, be removed by using the UCL option.
   CMP UNAVAILABLE = The input request could not be completed because a needed communications module (CM) was unable to respond. Retry the request later.
   COMPL-AML EXC = The requested status was added to the port since this was a manual request. However the automatic maintenance limit (AML) was exceeded in doing so.
   COMPL-SWITCH FAIL = The requested status was successfully added to this D-channel backup primary rate interface (DCBU PRI) while a switch-over was in progress. The switch-over failed, and the PRI does not have an active D-channel for signalling.
   COMPL-SWITCH IP = The requested status was successfully added to the active D-channel of a DCBU PRI. Signalling for the PRI is lost on this D-channel, and a switch-over to the standby D-channel is in progress. Additional output messages will follow to indicate the result of the switch-over attempt.
   COMPL-RCV DELETE = The requested status was successfully added to the indicated trunk because it was deleted from the database by recent change/verify (RC/V).
   COMPLETED = The specified status was successfully added to the port. Resulting port status is indicated.
   COMPLETED,LINES REMAIN = The request completed successfully but some or all ports may be defined as lines. Use RMV:LINE message for the line ports.
   COMPLETED-PVC OOO = The X.75' or X.75 trunk that was removed from service is provisioned for permanent virtual circuits (PVCs). The PVCs on the OOS trunk are reset out-of-order (OOO).
   DATABASE ERROR = The indicated port status could not be added to the trunk because static data associated with the trunk could not be updated. This error can occur if customer originated recent changes (CORCs) are inhibited or if the office database editor (ODBE) is being used to update data associated with the trunk.
   DENIED-AML EXC = The indicated status was not added to the port since the request was automatic and the AML would have been exceeded had the status been added.
   DENIED-PSML EXC = The indicated status was not added to the packet switching trunk port because the packet switching maintenance limit (PSML) would have been exceeded. The PSML is set to 25% of the trunk group size. Use the UCL option to override the PSML check.
   DENIED-SDL REQUIRES UCL The request was denied because requests to change the status of a signalling data link (SDL) port are not recommended and must have the UCL option applied (unless the parent CCS signaling link is DACT).
   DUP REQUEST = Port already out-of-service (OOS) with specified state (primary or pending).
   INPUT ERROR = Some data entered in the input request was invalid or incorrect.
   INV EQUIPMENT = The request was for equipment that does not exist or was not assigned.
   INV HARDWARE = The request did not match the hardware type of the port.
   INV PORT = The port could not be located in the database. The port identifier used in the input request was most likely invalid or incorrect.
   INV PORT TYPE = The specified port is not a trunk.
   INV STATUS = An invalid status for the port was specified in the input request. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Message manual to determine valid states for each port type.
   NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs.
Reenter DN with NPA.

**NO PROCESS**

*An attempt to create a process failed. This was possibly caused by the system’s being busy. Retry the request later.*

**PORT BUSY**

*The line or trunk was still traffic busy at the end of the campon interval. Use the "UCL" option to ensure a successful removal.*

**PROCESS TIMEOUT**

*Internal time-out while processing the request.*

**REQUEST FAILED**

*A system error occurred making it impossible to continue processing the request.*

**RESOURCE FAILURE**

*The indicated port status could not be added to the trunk because of a temporary resource shortage. Either a process could not be created or a storage buffer was full because the system is busy. Retry the request later.*

**SM UNAVAILABLE**

*The input request could not be completed because a needed switching module (SM) was unable to respond. Retry the request later.*

**STATUS CONFLICT**

*Status to be added conflicts with the existing status on the port.*

**SYSTEM BUSY**

*The system's processing capability limit has been reached or a system resource was unavailable. Retry the request later.*

**SYSTEM ERROR**

*A system error occurred making it impossible to continue processing the request.*

**UCD|MUPH MLHG**

*The DN entered is a multi-line hunt group channel and as such cannot be removed by specifying its DN. An equipment number (that is, DEN) or MLHG and member number must be specified. To obtain the channel equipment number and/or multi-line hunt group and member number, use RC/V for the DN or refer to office records.*

---

**i**

*Status that was requested to be added to the trunk. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.*

**j**

*Resulting primary status in effect on the trunk. This status is the most restrictive to call processing currently on the trunk. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.*

**k**

*Pending statuses in effect on the trunk, if any. A trunk may have from zero to three pending statuses, all of which would be listed on subsequent lines of this message. Pending statuses are less restrictive than the primary status. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.*

**l**

*Digital line and trunk unit (DLTU) number.*

**m**

*Digital facility interface number.*

**n**

*Channel number.*

**o**

*SM number.*
p = Packet switch B-channel directory number.
q = MLHG number.
r = MLHG member number.
s = Digital carrier line unit number.
t = Remote terminal number.
u = Remote terminal line number.
v = Valid value(s):
   DEN=o-l-m-n
   ILEN=o-m^1-t-u
   INEN=o-n^1-t-u
   LTP=o-w
   NEN=o-n^1-o^1-w^1-p^1-q^1-x^1-r^1
   PSUEN=o-s^1-t^1-u^1-v^1
   RAF=o-x-y
   SAS=o-x-y
   SLEN=o-s-t-u
   TEN=o-d-e-f-g
w = Logical test port number.
x = RAF or SAS unit number.
y = RAF or SAS announcement channel number.
z = Status report. Valid value(s):
   COMPLETED = Remove processing for the trunk group, PRI group, or range of trunks has completed.
   DATABASE ERROR = An internal error occurred while attempting to access the trunk group or PRI group data. Repeat the request if desired.
   DENIED-PRI D CH TG = The request to remove the entire trunk group or range of trunks has been denied because the trunk group contains PRI D-channels.
   DENIED-OSPS-PRI D CH TG = The request to remove the entire trunk group or range of trunks has been denied because the trunk group contains operator services position system (OSPS) PRI D-channels.
   INVALID PRI GROUP = The PRI group specified in the input request was invalid. Verify that the correct group number was specified.
   NO CHANNELS ASSIGNED = The PRI group specified does not have any channels assigned to it.
   STARTED = Request was received and action has started.
   TG INVALID = The trunk group specified in the input request was invalid. Verify that the correct group number was specified.

a^1 = Timestamp date, in the form month/day.
b^1 = Timestamp, in the form hour:minute:second.
c^1 = Protocol detecting the error. Valid value(s):
   LAPB/SLP = Link access protocol type B.
LAPD = Link access protocol type D.
Q.931 = Q.931 ISDN call control protocol.
X.25 = X.25 public data network access protocol.
X.75P = X.75' public data network gateway protocol.
X.75 = X.75 public data network gateway protocol.
UNKNOWN = Unknown protocol being used.

d¹ = Protocol state for the network side of the interface when error was detected.
e¹ = Protocol state for the network side of the interface for the X.25 or X.75' or X.75 permanent virtual
circuit or virtual circuit associated with the detected error.
f¹ = The frame/packet/message type that was received or transmitted when the error was detected.
g¹ = Protocol error record. Refer to the Protocol Error Record Descriptions manual for additional
information about a specific PER.
h¹ = Identifying number of the FGB carrier, which can be up to 4 digits. If present, this variable
indicates a direct trunk to a carrier.
i¹ = Identifying number of the FGD carrier, which can be up to 4 digits. If present, this variable
indicates a direct trunk to a carrier.
j¹ = PRI group number.
k¹ = Trunk group number.
l¹ = Channels on the PRI being removed. Valid value(s):
  B = All B-channels of the PRI.
  D = D-channel of the PRI or both D-channels if the PRI is equipped with a backup
      D-channel.
m¹ = IDCU number.
n¹ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
o¹ = Data group number.
p¹ = Synchronous transport signal (STS) number.
q¹ = Virtual tributary group number.
r¹ = Digital signal level 0 (DS0).
s¹ = PSU unit number.
t¹ = PSU shelf number.
u¹ = PSU channel group number.
v¹ = PSU channel group member number.
w¹ = SONET termination equipment (STE) number.
x<sup>1</sup>  = Virtual tributary member number.

4. ACTIONS TO BE TAKEN

If the trunk was taken OOS automatically, it is probably a hardware or transmission problem. Identify and correct the problem. If the trouble persists and cannot be identified, notify the far-end office so that similar action can be taken.

To add an OOS status to a trunk, use input message RMV:TRK. To delete an OOS status from a trunk, use input message RST:TRK. To get the current status of a trunk, use input message OP:STATUS. To get a list of trunks in a specific OOS state, use input message OP:LIST.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the removal from service of an analog, digital trunk or an X.25 access on T1 (XAT) port. This resulted
from adding the indicated status to the trunk specified.

Format 1 indicates removal of analog or digital trunks. Format 2 indicate removal of XAT ports. Format 3 indicates
the start and/or end of a group or range removal. This message may be in response to a RMV:TRK input message
or may be generated automatically. Both the status added and the full resulting status for the trunk are identified
in the message. The status information in the left half (column) of the message is the status that was to be added. The
status in the right half (column) of the message is the status in effect on the trunk at the completion of the attempt
to remove the port. Logical test ports (LTPs) are identified with the corresponding logical test port numbers.

3. VARIABLE FIELD DEFINITIONS

a  = Trunk group or bearer independent call control (BICC) group number.
b  = Trunk group member number or normalized call instance code (CIC), or lower limit of a range of
   trunk group member numbers or normalized CICs.
c  = Upper limit of a range of trunk group member numbers or normalized CICs.
d  = Trunk unit number.
e  = Service group number.
f = Channel board number.

g = Circuit number.

h = The result of the removal request. Valid value(s):

CAMPON FAIL = A camp-on connection could not be established or maintained. The failure was due to lack of system resources or a higher priority occurring that needed control of the port. Retry the request later.

CAMPON NOT ALLOWED = The ability to camp-on is not allowed on the trunk specified. It must, therefore, be removed by using the UCL option.

CMP UNAVAILABLE = The input request could not be completed because a needed communications module (CM) was unable to respond. Retry the request later.

COMPL-AML EXC = The requested status was added to the port since this was a manual request. However the automatic maintenance limit (AML) was exceeded in doing so.

COMPL-SPRING FAIL = The requested status was successfully added to this D-channel backup primary rate interface (DCBU PRI) while a switch-over was in progress. The switch-over failed, and the PRI does not have an active D-channel for signalling.

COMPL-SPRING IP = The requested status was successfully added to the active D-channel of a DCBU PRI. Signalling for the PRI is lost on this D-channel, and a switch-over to the standby D-channel is in progress. Additional output messages will follow to indicate the result of the switch-over attempt.

COMPL-SPRING DELETE = The requested status was successfully added to the indicated trunk because it was deleted from the database by recent change/verify (RC/V).

COMPLETED = The specified status was successfully added to the port. Resulting port status is indicated.

COMPLETED, LINES REMAIN = The request completed successfully but some or all ports may be defined as lines. Use RMV:LINE message for the line ports.

COMPLETED-PVC OOO = The X.75’ or X.75 trunk that was removed from service is provisioned for permanent virtual circuits (PVCs). The PVCs on the OOS trunk are reset out-of-order (OOO).

DATABASE ERROR = The indicated port status could not be added to the trunk because static data associated with the trunk could not be updated. This error can occur if customer originated recent changes (CORCs) are inhibited or if the office database editor (ODBE) is being used to update data associated with the trunk.

DENIED-AML EXC = The indicated status was not added to the port since the request was automatic and the AML would have been exceeded had the status been added.

DENIED-PSML EXC = The indicated status was not added to the packet switching trunk port because the packet switching maintenance limit (PSML) would have been exceeded. The PSML is set to 25% of the trunk group size. Use the UCL option to override the PSML check.

DENIED-SLD Requires UCL = The request was denied because requests to change the status of a signalling data link (SDL) port are not recommended and must have the UCL option applied (unless the parent CCS signaling link is DACT).

DUP REQUEST = Port already out-of-service (OOS) with specified state (primary or pending).

INPUT ERROR = Some data entered in the input request was invalid or incorrect.

INV EQUIPMENT = The request was for equipment that does not exist or was not assigned.

INV HARDWARE = The request did not match the hardware type of the port.

INV PORT = The port could not be located in the database. The port identifier used in the input request was most likely invalid or incorrect.

INV PORT TYPE = The specified port is not a trunk.

INV STATUS = An invalid status for the port was specified in the input request. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Message manual to determine valid states for each port type.
NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

NO PROCESS = An attempt to create a process failed. This was possibly caused by the system's being busy. Retry the request later.

PORT BUSY = The line or trunk was still traffic busy at the end of the campon interval. Use the "UCL" option to ensure a successful removal.

PORT PROV IN PROGRESS = The line or trunk is in the process of being provisioned. Retry the request later.

PROCESS TIMEOUT = Internal time-out while processing the request.

REQUEST FAILED = A System error occurred making it impossible to continue processing the request.

RESOURCE FAILURE = The indicated port status could not be added to the trunk because of a temporary resource shortage. Either a process could not be created or a storage buffer was full because the system is busy. Retry the request later.

SM UNAVAILABLE = The input request could not be completed because a needed switching module (SM) was unable to respond. Retry the request later.

STATUS CONFLICT = Status to be added conflicts with the existing status on the port.

SYSTEM BUSY = The system's processing capability limit has been reached or a system resource was unavailable. Retry the request later.

SYSTEM ERROR = A system error occurred making it impossible to continue processing the request.

UCD|MUPH MLHG = The DN entered is a multi-line hunt group channel and as such cannot be removed by specifying its DN. An equipment number (that is, DEN) or MLHG and member number must be specified. To obtain the channel equipment number and/or multi-line hunt group and member number, use RC/V for the DN or refer to office records.

i = Status that was requested to be added to the trunk. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

j = Resulting primary status in effect on the trunk. This status is the most restrictive to call processing currently on the trunk. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

k = Pending statuses in effect on the trunk, if any. A trunk may have from zero to three pending statuses, all of which would be listed on subsequent lines of this message. Pending statuses are less restrictive than the primary status. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.

l = Digital line and trunk unit (DLTU) number.

m = Digital facility interface number.

n = Channel number.
= SM number.

p = Packet switch B-channel directory number.

q = MLHG number.

r = MLHG member number.

s = Digital carrier line unit number.

t = Remote terminal number.

u = Remote terminal line number.

v = Valid value(s):

DEN=o-l-m-n
ILEN=o-m^1-t-u
INEN=o-n^1-t-u
LTP=o-w

RAF=o-x-y
SAS=o-x-y
SLEN=o-s-t-u
TEN=o-d-e-f-g
VNAR=o-c^2
VTRK=o-d^2-e^2

w = Logical test port number.

x = RAF or SAS unit number.

y = RAF or SAS announcement channel number.

z = Status report. Valid value(s):

COMPLETED = Remove processing for the trunk group, PRI group, or range of trunks has completed.

DATABASE ERROR = An internal error occurred while attempting to access the trunk group or PRI group data. Repeat the request if desired.

DENIED-PRI D CH TG = The request to remove the entire trunk group or range of trunks has been denied because the trunk group contains PRI D-channels.

DENIED-OSPS-PRI D CH TG = The request to remove the entire trunk group or range of trunks has been denied because the trunk group contains operator services position system (OSPS) PRI D-channels.

INVALID PRI GROUP = The PRI group specified in the input request was invalid. Verify that the correct group number was specified.

NO CHANNELS ASSIGNED = The PRI group specified does not have any channels assigned to it.

STARTED = Request was received and action has started.

TG INVALID = The trunk group specified in the input request was invalid. Verify that the correct group number was specified.
a = Timestamp date, in the form month/day.

b = Timestamp, in the form hour:minute:second.

c = Protocol detecting the error. Valid value(s):
   LAPB/SLP = Link access protocol type B.
   LAPD = Link access protocol type D.
   Q.931 = Q.931 ISDN call control protocol.
   X.25 = X.25 public data network access protocol.
   X.75P = X.75' public data network gateway protocol.
   X.75 = X.75 public data network gateway protocol.
   UNKNOWN = Unknown protocol being used.

d = Protocol state for the network side of the interface when error was detected.

e = Protocol state for the network side of the interface for the X.25 or X.75' or X.75 permanent virtual circuit or virtual circuit associated with the detected error.

f = The frame/packet/message type that was received or transmitted when the error was detected.

g = Protocol error record. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

h = Identifying number of the FGB carrier, which can be up to 4 digits. If present, this variable indicates a direct trunk to a carrier.

i = Identifying number of the FGD carrier, which can be up to 4 digits. If present, this variable indicates a direct trunk to a carrier.

j = PRI group number.

k = Trunk group number.

l = Channels on the PRI being removed. Valid value(s):
   B = All B-channels of the PRI.
   D = D-channel of the PRI or both D-channels if the PRI is equipped with a backup D-channel.

m = IDCU number.

n = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

o = Data group number.

p = Synchronous transport signal (STS) number.

q = Virtual tributary group number.

r = Digital signal level 0 (DS0).

s = PSU unit number.

t = PSU shelf number.
4. ACTIONS TO BE TAKEN

If the trunk was taken OOS automatically, it is probably a hardware or transmission problem. Identify and correct the problem. If the trouble persists and cannot be identified, notify the far-end office so that similar action can be taken.

To add an OOS status to a trunk, use input message RMV:TRK. To delete an OOS status from a trunk, use input message RST:TRK. To get the current status of a trunk, use input message OP:STATUS. To get a list of trunks in a specific OOS state, use input message OP:LIST.

2. REASON FOR OUTPUT

To report the removal from service of an analog, digital trunk or an X.25 access on T1 (XAT) port. This resulted from adding the indicated status to the trunk specified.

Format 1 indicates removal of analog or digital trunks.

Format 2 indicate removal of XAT ports.

Format 3 indicates the start and/or end of a group or range removal.

This message may be in response to a RMV:TRK input message or may be generated automatically.

Both the status added and the full resulting status for the trunk are identified in the message. The status information in the left half (column) of the message is the status that was to be added. The status in the right half (column) of the message is the status in effect on the trunk at the completion of the attempt to remove the port.

Logical test ports (LTPs) are identified with the corresponding logical test port numbers.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group or bearer independent call control (BICC) group number.

b = Trunk group member number or normalized call instance code (CIC), or lower limit of a range of trunk group member numbers or normalized CICs.

c = Upper limit of a range of trunk group member numbers or normalized CICs.

d = Trunk unit number.
e = Service group number.
f = Channel board number.
g = Circuit number.
h = The result of the removal request. Valid value(s):
   
   CAMPON FAIL = A camp-on connection could not be established or maintained. The failure was due to lack of system resources or a higher priority occurring that needed control of the port. Retry the request later.
   
   CAMPON NOT ALLOWED = The ability to camp-on is not allowed on the trunk specified. It must, therefore, be removed by using the UCL option.
   
   CMP UNAVAILABLE = The input request could not be completed because a needed communications module (CM) was unable to respond. Retry the request later.
   
   COMPL-AML EXC = The requested status was added to the port since this was a manual request. However the automatic maintenance limit (AML) was exceeded in doing so.
   
   COMPL-SWITCH FAIL = The requested status was successfully added to this D-channel backup primary rate interface (DCBU PRI) while a switch-over was in progress. The switch-over failed, and the PRI does not have an active D-channel for signalling.
   
   COMPL-SWITCH IP = The requested status was successfully added to the active D-channel of a DCBU PRI. Signalling for the PRI is lost on this D-channel, and a switch-over to the standby D-channel is in progress. Additional output messages will follow to indicate the result of the switch-over attempt.
   
   COMPL-RCV DELETE = The requested status was successfully added to the indicated trunk because it was deleted from the database by recent change/verify (RC/V).
   
   COMPLETED = The specified status was successfully added to the port. Resulting port status is indicated.
   
   COMPLETED, LINES REMAIN = The request completed successfully but some or all ports may be defined as lines. Use RMV:LINE message for the line ports.
   
   COMPLETED-PVC OOO = The X.75' or X.75 trunk that was removed from service is provisioned for permanent virtual circuits (PVCs). The PVCs on the OOS trunk are reset out-of-order (OOO).
   
   DATABASE ERROR = The indicated port status could not be added to the trunk because static data associated with the trunk could not be updated. This error can occur if customer originated recent changes (CORCs) are inhibited or if the office database editor (ODBE) is being used to update data associated with the trunk.
   
   DENIED-AML EXC = The indicated status was not added to the port since the request was automatic and the AML would have been exceeded had the status been added.
   
   DENIED-PSML EXC = The indicated status was not added to the packet switching trunk port because the packet switching maintenance limit (PSML) would have been exceeded. The PSML is set to 25% of the trunk group size. Use the UCL option to override the PSML check.
   
   DENIED-SDL REQUIRES UCL The request was denied because requests to change the status of a signalling data link (SDL) port are not recommended and must have the UCL option applied (unless the parent CCS signaling link is DACT).
   
   DUP REQUEST = Port already out-of-service (OOS) with specified state (primary or pending).
   
   INPUT ERROR = Some data entered in the input request was invalid or incorrect.
   
   INV EQUIPMENT = The request was for equipment that does not exist or was not assigned.
   
   INV HARDWARE = The request did not match the hardware type of the port.
   
   INV PORT = The port could not be located in the database. The port identifier used in the input request was most likely invalid or incorrect.
   
   INV PORT TYPE = The specified port is not a trunk.
INV STATUS = An invalid status for the port was specified in the input request. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Message manual to determine valid states for each port type.

NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs.

NO PROCESS = An attempt to create a process failed. This was possibly caused by the system's being busy. Retry the request later.

PORT BUSY = The line or trunk was still traffic busy at the end of the campon interval. Use the "UCL" option to ensure a successful removal.

PORT PROV IN PROGRESS = The line or trunk is in the process of being provisioned. Retry the request later.

PROCESS TIMEOUT = Internal time-out while processing the request.

REQUEST FAILED = A System error occurred making it impossible to continue processing the request.

RESOURCE FAILURE = The indicated port status could not be added to the trunk because of a temporary resource shortage. Either a process could not be created or a storage buffer was full because the system is busy. Retry the request later.

SM UNAVAILABLE = The input request could not be completed because a needed switching module (SM) was unable to respond. Retry the request later.

STATUS CONFLICT = Status to be added conflicts with the existing status on the port.

SYSTEM BUSY = The system's processing capability limit has been reached or a system resource was unavailable. Retry the request later.

SYSTEM ERROR = A system error occurred making it impossible to continue processing the request.

UCD|MUPH MLHG = The DN entered is a multi-line hunt group channel and as such cannot be removed by specifying its DN. An equipment number (that is, DEN) or MLHG and member number must be specified. To obtain the channel equipment number and/or multi-line hunt group and member number, use RC/V for the DN or refer to office records.

i = Status that was requested to be added to the trunk. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

j = Resulting primary status in effect on the trunk. This status is the most restrictive to call processing currently on the trunk. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

k = Pending statuses in effect on the trunk, if any. A trunk may have from zero to three pending statuses, all of which would be listed on subsequent lines of this message. Pending statuses are less restrictive than the primary status. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.

l = Digital line and trunk unit (DLTU) number.
m = Digital facility interface number.

n = Channel number.

o = SM number.

p = Packet switch B-channel directory number.

q = MLHG number.

r = MLHG member number.

s = Digital carrier line unit number.

t = Remote terminal number.

u = Remote terminal line number.

v = Valid value(s):

\[\text{ATMPP} = o - s^1 - k^2 - l^2\]
\[\text{DEN} = o - l - m - n\]
\[\text{ILEN} = o - m^1 - t - u\]
\[\text{INEN} = o - n^1 - t - u\]
\[\text{LTF} = o - w\]
\[\text{NEN} = o - n^1 - o^1 - w^1 - p^1 - q^1 - x^1 - r^1\]
\[\text{OIUEN} = o - e^2 - f^2 - g^2 - h^2 - q^1 - x^1 - b^2\]
\[\text{PLTEN} = o - y^1 - z^1 - a^2 - b^2\]
\[\text{PSUEN} = o - s^1 - t^1 - u^1 - v^1\]
\[\text{RAF} = o - x - y\]
\[\text{SAS} = o - x - y\]
\[\text{SLEN} = o - s - t - u\]
\[\text{TEN} = o - d - e - f - g\]
\[\text{VTRK} = o - c^2 - d^2\]

w = Logical test port number.

x = RAF or SAS unit number.

y = RAF or SAS announcement channel number.

z = Status report. Valid value(s):

\[\text{COMPLETED} = \text{Remove processing for the trunk group, PRI group, or range of trunks has completed.}\]
\[\text{DATABASE ERROR} = \text{An internal error occurred while attempting to access the trunk group or PRI group data. Repeat the request if desired.}\]
\[\text{DENIED-PRI D CH TG} = \text{The request to remove the entire trunk group or range of trunks has been denied because the trunk group contains PRI D-channels.}\]
\[\text{DENIED-OSPS-PRI D CH TG} = \text{The request to remove the entire trunk group or range of trunks has been denied because the trunk group contains operator services position system (OSPS) PRI D-channels.}\]
\[\text{INVALID PRI GROUP} = \text{The PRI group specified in the input request was invalid. Verify that the correct group number was specified.}\]
\[\text{NO CHANNELS ASSIGNED} = \text{The PRI group specified does not have any channels assigned to it.}\]
STARTED = Request was received and action has started.
TG INVALID = The trunk group specified in the input request was invalid. Verify that the correct group number was specified.

a^1 = Timestamp date, in the form month/day.
b^1 = Timestamp, in the form hour:minute:second.
c^1 = Protocol detecting the error. Valid value(s):
   LAPB/SLP = Link access protocol type B.
   LAPD = Link access protocol type D.
   Q.931 = Q.931 ISDN call control protocol.
   X.25 = X.25 public data network access protocol.
   X.75P = X.75' public data network gateway protocol.
   X.75 = X.75 public data network gateway protocol.
   UNKNOWN = Unknown protocol being used.

d^1 = Protocol state for the network side of the interface when error was detected.
e^1 = Protocol state for the network side of the interface for the X.25 or X.75' or X.75 permanent virtual circuit or virtual circuit associated with the detected error.
f^1 = The frame/packet/message type that was received or transmitted when the error was detected.
g^1 = Protocol error record. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.
h^1 = Identifying number of the FGB carrier, which can be up to 4 digits. If present, this variable indicates a direct trunk to a carrier.
i^1 = Identifying number of the FGD carrier, which can be up to 4 digits. If present, this variable indicates a direct trunk to a carrier.
j^1 = PRI group number.
k^1 = Trunk group number.
l^1 = Channels on the PRI being removed. Valid value(s):
   B = All B-channels of the PRI.
   D = D-channel of the PRI or both D-channels if the PRI is equipped with a backup D-channel.
m^1 = IDCU number.
n^1 = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
o^1 = Data group number.
p^1 = Synchronous transport signal (STS) number.
q^1 = Virtual tributary group number.
r^1 = Digital signal level 0 (DS0).
4. ACTIONS TO BE TAKEN

If the trunk was taken OOS automatically, it is probably a hardware or transmission problem. Identify and correct the problem. If the trouble persists and cannot be identified, notify the far-end office so that similar action can be taken. To add an OOS status to a trunk, use input message RMV:TRK. To delete an OOS status from a trunk, use input message RST:TRK. To get the current status of a trunk, use input message OP:STATUS. To get a list of trunks in a specific OOS state, use input message OP:LIST.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

OP:LIST
OP:STATUS
RMV:TRK
RMV:TTFCOM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RMV TTFCOM=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of executing a RMV:TTFCOM input message to remove a transmission test facility common (TTFCOM) circuit from service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Global digital service unit number.

c = Service group number.

d = Board number.

e = Termination status. Valid value(s):
  ABORTED = Immediate termination.
  COMPLETED = Successful completion.
  COMPLETED-CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
  NOT STARTED = Action has not begun.
  STOPPED = Terminated before normal completion.

f = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the References section of this message.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

Software Release: 5E14 and later
Message Class: MAINT,MAIPR
Application: 5,3B
Type: Output

1. FORMAT

[1] RMV TTY a COMPLETED

[2] RMV TTY a ABORTED [b] [c]

[3] RMV TTY a STOPPED d

[4] RMV TTY a TASK e MSG STARTED

[5] RMV TTY a STOPPED MESSAGE IN PROGRESS

[6] RMV TTY a STOPPED MESSAGE COMPLETE

2. REASON FOR OUTPUT

To report the disposition of a request to remove a teletypewriter (TTY) from service.

Format 1 reports that the removal attempt was successful.

Formats 2 and 3 report that the removal has failed.

Formats 4 - 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
   X'1' = Remove process error.
   X'2' = Driver error.
   [NULL] = Remove denied by driver or configuration control (CONFIG).

c = Error code.

If 'b' = X'1'

Reference the APP:IOP-H appendix in the Appendixes section of the Output Messages manual.
d = Error code. Refer to the APP:IOP-I appendix in the Appendixes section of the Output Messages manual.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

5. ALARMS

The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

RST AIULP=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an RST:AIULP input request to restore the access interface unit (AIU) line pack (LP) to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = AIU number.
c = LP number.
d = Termination status. Valid value(s):
   ABORTED    = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED  = Requested action has successfully completed.
   STOPPED    = Requested action was terminated before a normal completion. Termination was graceful.

 e = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

None.

RST:ALINK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST ALINK=a-b-c-d-e f [g]

2. REASON FOR OUTPUT

To report the result of executing a RST:ALINK input message to restore a line unit model 2 (LU2) or a line unit model 3 (LU3) A-link to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Line unit number.
c = Grid number.
d = Board number.
e = Line unit A-link number.
f = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination is immediate. Consistency of hardware and data is questionable.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

[g] = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

None.

RST:ALIT

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST ALIT=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of executing a RST:ALIT input message to restore an automatic line insulation test (ALIT) circuit to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = Metallic service unit board number.
e = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

f = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.
No alarm = No effect.
*Minor = Small reduction in traffic capability.
**Major = A problem exists and is denying customer service or causing a 25-50% reduction in traffic capability.
*C Critical = A problem exists and is denying customer service or causing at least a 50% reduction in traffic capability.

Input Message(s):

RST:ALIT

Output Appendix(es):

APP: MAINT-RESP
RST:ASC

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST ASC=a b [c]

2. REASON FOR OUTPUT

Indicates the result of an RST:ASC input message to restore a remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC) to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before the process gracefully completed.
   COMPLETED = Request has gracefully completed.
   NOT STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before a normal completion.

c = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   RST:ASC

Output Appendix(es):

   APP:MAINT-RESP

Other Manual(s):

   235-105-110  System Maintenance Requirements and Tools
RST:BICCCADN

Software Release: 5E16(1) and later
Message Class: TRK
Application: 5
Type: Output

1. FORMAT

RST BICCCADN  BGMN=a-b&&c d
[CICS RESTORED FROM CADN = e]
[CICS EXCLUDED = f]

2. REASON FOR OUTPUT

To report the results of a restoration to service of a bearer-independent call control (BICC) call instance code (CIC) block as requested in a RST:BICCCADN input message. Only those BICC CIC members that are initially in the OOS CADN state are considered part of the RST:BICCCADN input message and CIC members in any other state are excluded.

3. VARIABLE FIELD DEFINITIONS

a = BICC group number.
b = CIC of the first member of the BICC block.
c = CIC of the last member of the BICC block.
d = The type of error encountered. Valid value(s):
   COMPLETED = The request successfully completed.
   STARTED = The request was started.
   SYSTEM ERROR = A system error was encountered.
   UNBLOCKING SEND PROBLEM = Cannot send unblocking to far end.
e = The number of CICs restored to IS that were initially OOS CADN.
f = The number of CICs that were excluded during the restoration. The sum of variable ‘e’ and variable ‘f’ must be 128.

4. ACTIONS TO BE TAKEN

If the BICC CIC block was taken OOS automatically, it is probably a hardware or transmission problem. Identify and correct the problem. If the trouble persists and cannot be identified, notify the far-end office so that similar action can be taken.

5. ALARMS

None.

2. REASON FOR OUTPUT

To confirm a technician request to restore service to a common channel signaling (CCS) signaling link.

3. VARIABLE FIELD DEFINITIONS

   a  = Link set number.
   b  = Link member number.
   c  = Link state. Valid value(s):
        BLK  = The block status was removed from this link.
        DACT = The deactivate status was removed from this link.
        INH  = The inhibit status was removed from this link.
   d  = Termination status. Valid value(s):
        COMPLETED = Request was successfully completed.
        FAILED   = Processing of request failed.
        STOPPED  = Request was terminated before normal completion.
        SUCCESS  = Request was processed successfully.
   e  = CCS global switching module (GSM) number.
   f  = Originating point codes (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.
   g  = Additional information qualifying the termination status. Valid value(s):
        CGA-DL  = The signaling data link is out-of-service due to carrier group alarm.
        DATABASE ERROR = Inconsistencies in retrieving data from the database caused by corrupt data.
        DATABASE FAIL = Unsuccessful static data access.
        ERROR    = Error in software.
        LINK ALREADY IN REQUESTED STATE = The link is already in the state requested by the RST-CCSLK input message.
        LINK ALREADY ACT = Received link activation request, but link is already active.
        LINK BUSY = Link is being acted upon by some other request.
        LINK NOT IN VALID STATE FOR ACTION = The current state of the link does not allow the request to be processed.
        LINK UNEQUIPPED = The link is unequipped.
        LKER-L1 = Level 1 MTP failure (no network time slot available).
LKER-L2 = Level 2 MTP failure (level two failed alignment).
LKER-L3 = Level 3 MTP failure (the link test failed).
MESSAGE TIMEOUT = Timed out waiting for a message.
OOS-DL = The signaling data link is out-of-service.
OOSF-PH = The parent PH channel group unassigned.
REQUEST LATER = Request again later.
RESRC = There was a lack of resources required to complete action.
STRM FAILURE = Failure in signaling traffic and route management.
SYSTEM FAILURE = System failure.
T12 NO LUA FROM FAR END = T12 timer expired, no link uninhibit acknowledgement (LUA) received, local uninhibit denied.
UNSUCCESSFUL = Failure in integrated services port administration.

Note: The PSUPH and EN will be printed only if the signaling link is restored to active.

h = SM number of packet switch unit (PSU).
i = Unit number of PSU in SM.
j = Shelf number in PSU.
k = PH number on shelf.
l = SM number of the synchronous data link (SDL) data facility interface (DFI).
m = Digital line and trunk unit (DLTU) number of the SDL.
n = DFI number of the SDL.
o = Channel number of the SDL.
p = SM number of the SDL.
q = Digital network unit - synchronous optical network (SONET) (DNU-S) number of the SDL.
r = Data group number of the SDL.
s = DNU-S SONET terminating equipment (STE) number of the SDL.
t = DNU-S synchronous transport signal (STS) number of the SDL.
u = DNU-S virtual tributary 1.5 group (VTGRP) number of the SDL.
v = DNU-S virtual tributary 1.5 member (VTGRM) number of the SDL.
w = DNU-S virtual tributary 1.5 channel number of the SDL.
x = Optical interface unit (OIU) number of the SDL.
y = OIU protection group (PG) number of the SDL.
z = OIU OC-3 STE number of the SDL.
a¹ = OIU STS level 1 (STS-1) number of the SDL.
b^1 = OIU virtual tributary group number of the SDL.

c^1 = OIU virtual tributary group member number of the SDL.

2. REASON FOR OUTPUT

To confirm the request to restore service to a common channel signaling (CCS) signaling link.

Format 1 is the output message indicating that the restoration of a CCS link has occurred.

Format 2 is the output message indicating that the attempted restoration of multiple unequipped CCS links has occurred.

3. VARIABLE FIELD DEFINITIONS

a = Link set number.

b = Link member number.

c = Link state. Valid value(s):
   BLK = The block status was removed from this link.
   DACT = The deactivate status was removed from this link.
   INH = The inhibit status was removed from this link.

d = Termination status. Valid value(s):
   COMPLETED = Request was successfully completed.
   FAILED = Processing of request failed.
   STOPPED = Request was terminated before normal completion.
   SUCCESS = Request was processed successfully.

e = CCS global switching module (GSM) number.

f = Originating point codes (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.

g = Additional information qualifying the termination status. Valid value(s):
   ALL SPECIFIED LINKS UNEQUIPPED = All of the specified links are unequipped.
   CGA-DL = The signaling data link is out-of-service due to carrier group alarm.
   CMT LOST AND OPID 682 ACTIVE = The global SM has lost CCS message transport (CMT) connectivity to all provisioned NGSMs/NGSM-2000s and the SS7 response to PSU...
isolation feature is active.

DATABASE ERROR = Inconsistencies in retrieving data from the database caused by corrupt data.
DATABASE FAIL = Unsuccessful static data access.
ERROR = Error in software.
LINK ALREADY IN REQUESTED STATE = The link is already in the state requested by the RST-CCSLK input message.
LINK ALREADY ACT = Received link activation request, but link is already active.
LINK BUSY = Link is being acted upon by some other request.
LINK NOT IN VALID STATE FOR ACTION = The current state of the link does not allow the request to be processed.
LINK UNEQUIPPED = The link is unequipped.
LKER-L1 = Level 1 MTP failure (no network time slot available).
LKER-L2 = Level 2 MTP failure (level two failed alignment).
LKER-L3 = Level 3 MTP failure (the link test failed).
MESSAGE TIMEOUT = Timed out waiting for a message.
OOS-DL = The signaling data link is out-of-service.
OOSF-PH = The parent PH channel group unassigned.
REMAINING SPECIFIED LINKS UNEQUIPPED = Remaining links are unequipped.
REQUEST LATER = Request again later.
RESRC = There was a lack of resources required to complete action.
STRM FAILURE = Failure in signaling traffic and route management.
SYSTEM FAILURE = System failure.
T12 NO LUA FROM FAR END = T12 timer expired, no link uninhibit acknowledgement (LUA) received, local uninhibit denied.
UNSUCCESSFUL = Failure in integrated services port administration.

The PSUPH may not print in its entirety when the link is not assigned to a physical PH (for example, it is OOSF-PH). The EN may not print in its entirety if the SM where the EN resides is not the GSM and is inaccessible to the GSM so the data cannot be obtained.

h = SM number of packet switch unit (PSU).

i = Unit number of PSU in SM.

j = Shelf number in PSU.

k = PH number on shelf.

l = Access type. Valid value(s):

DEN=n-o-p-q
NEN=r-s-t-u-v-w-x-y
OIUEN=z-a^1-b^1-c^1-d^1-e^1-f^1-g^1
SDEN=n-o-p-q
SNEN=r-s-t-u-v-w-x-y

n = SM number.

o = Digital line and trunk unit (DLTU) number of the SDL.

p = DFI number of the SDL.
q = DFI channel number of the single DS0 for 56/64KB SDLs or the first DS0 channel number of the DFI T1 facility for 1536KB SDLs.

r = SM number of digital network unit - synchronous optical network (DNU-S) number.

s = DNU-S number of the SDL.

t = DNU-S data group number of the SDL.

u = DNU-S SONET terminating equipment (STE) number of the SDL.

v = DNU-S synchronous transport signal (STS) number of the SDL.

w = DNU-S virtual tributary 1.5 group (VTGRP) number of the SDL.

x = DNU-S virtual tributary 1.5 member (VTGRM) number of the SDL.

y = DNU-S VT1.5 channel number of the single DS0 for 56/64KB SDLs or the first DS0 channel number of the digital signal level 1 facility (DS1SFAC) for 1536KB SDLs.

z = SM number of the OIU.

a¹ = OIU number of the DSL.

b¹ = OIU protection group number of the SDL.

c¹ = OIU OC-3 SONET STE number of the SDL.

d¹ = OIU STS level 1 (STS-1) number of the SDL.

e¹ = OIU virtual tributary group number of the SDL.

f¹ = OIU virtual tributary member number of the SDL.

g¹ = OIU channel number of the SDL.

2. REASON FOR OUTPUT

To report the result of executing a RST:CDI input message to restore the control data interface (CDI) of a trunk unit to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Trunk unit number.

c = Service group number.

d = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

  e = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.

No alarm = No effect.

*Minor = Small reduction in traffic capability.

**Major = A problem exists and is denying customer service or causing a 25-50% reduction in traffic capability.

*C Critical = A problem exists and is denying customer service or causing at least a 50% reduction in traffic capability.

RST:CLNK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST CLNK{=a-b-c-d | ALL} e [f]

2. REASON FOR OUTPUT

To report on an attempt to restore one or all communication links (CLNKs) to an available state (that is, 'hardware available', 'active', or 'ready for level 2').

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Office network and timing complex (ONT) side.
c = Module message processor (MMP) type. Valid value(s):
   0 = Alpha.
   1 = Beta.
d = Message switch (MSGS) side.
e = Termination report. Valid value(s):
   ABORTED = Requested action was terminated abnormally. Hardware and software status is questionable.
   COMPLETED = Completed normally.
   NOT_STARTED = Requested action not attempted.
   STOPPED = Requested action was terminated normally before completion. Hardware and software status is consistent.

f = Optional additional qualifying data.

4. ACTION TO BE TAKEN

Refer to the Corrective Maintenance manual.

5. ALARMS

None.

(CLNK SUMMARY)
RST:CMP

Software Release: 5E14 and later
Message Class: MSGS
Application: 5
Type: Output

1. FORMAT

RST CMP=a-b c [d]

2. REASON FOR OUTPUT

To report the results of a request to restore the specified communication module processor (CMP) to service.

3. VARIABLE FIELD DEFINITIONS

a = Message switch side number.
b = CMP number.
c = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was not graceful.
   COMPLETED = Request was successfully completed.
   NOT Started = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
d = Additional data qualifying the termination field.

4. ACTIONS TO BE TAKEN

If unexpected results occur, refer to the System Recovery manual.

1240/50 (MSGS STATUS for CM3)
RST:CPE
Software Release: 5E14 and later
Message Class: CP
Application: 5
Type: Output

1. FORMAT

RST CPE a [TEI=f] i

2. REASON FOR OUTPUT

To report the result of the manual restoration of a customer premises equipment (CPE) to service. This message is in response to a RST:CPE input message. The RST:CPE message can only be used to restore an already out-of-service (OOS) custom multi-point or standard interface terminal. This message will only be printed if a manual request to restore the OOS CPE is received. If the CPE goes back into service because it drops and then re-establishes layer 2, no message will be printed.

3. VARIABLE FIELD DEFINITIONS

a  = Equipment number or identifier. Valid value(s):
   AIUEN=d-p-q-r
   DN=s
   ILEN=b-j-k-l
   INEN=b-t-k-l
   LCEN=b-c-d-e
   LCKEN=b-c-m-n-o
   MLHG=g-h
   PKTDN=s

b  = Switching module (SM) number.

c  = Integrated services line unit (ISLU) or ISLU version 2 (ISLU2) in which the DSL exists.

d  = Line group controller (LGC) in the ISLU/ISLU2 in which the DSL exists.

e  = Line card (LC) of the ISLU line group controller to which the DSL connects.

f  = Terminal endpoint identifier that identifies the particular CPE on the specified LCEN/LCKEN.

g  = Multi-line hunt group number of the subscriber associated with the CPE.

h  = Multi-line hunt member number of the subscriber associated with the CPE.

i  = Result (completion code) of the restoration request. Valid value(s):
   ALREADY IS  = CPE is already in service.
   AUTO CPE RESTORE FAILED = Failed to restore CPE automatically.
   CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) was unable to respond. Retry the request later.
   COMPLETED = The specified CPE has been restored to an in-service (IS) state.
   CPE ALREADY IS = CPE is already in service.
   CPE BUSY = The request to restore the CPE on the DSL failed due to some other maintenance activity on the CPE or DSL on which the CPE was to have been
restored.

**CPE NOT BOUND** = The DN, PKTDN, MLHG and/or LCEN/LCKEN combined with TEI specified is not bound to a terminal on the multipoint DSL.

**DATA BASE ERROR** = Internal error during database reading.

**DSL BUSY** = The DSL remained busy.

**DSL OOS** = The DSL is OOS. It must be restored to service using the RST:LINE input message before any CPE on the DSL can be restored.

**DUP REQUEST** = Restoration of the CPE has already been requested.

**INPUT ERROR** = Some data entered in the input request was invalid or incorrect.

**INVALID DN** = The circuit or packet directory number entered was most likely invalid or incorrect.

**INVALID ON PP INTERFACE** = This operation is an invalid operation on single point DSL.

**INVALID PORT** = The line could not be located in the database. The line identifier used in the input request was most likely invalid or incorrect.

**INVALID TEI PORT** = The line on which the TEI resides could not be located in the database. The terminal endpoint identifier used in the input request was most likely invalid or incorrect.

**MLHG ACCESS DN** = The DN entered was an access DN for the uniform call distribution (UCD), linear hunt, or multi-position hunt (MUPH) multi-line hunt group. This DN does not uniquely identify a line.

**MP ACCESS DN** = The directory number entered is a uniform call distribution multi-line hunt group line for modem pooling and as such cannot be used by specifying its DN. A line card equipment number or MLHG and member number must be specified. To obtain the line card equipment number and/or multi-line hunt group and member number, use recent change/verify (RC/V) for the DN or refer to office records.

**NO ACK FROM FIP CPE** = No acknowledgment was received from FIP's CPE.

**NO DATA BASE MATCH** = Internal database error. The desired tuple could not be found.

**NO PARTY EXISTS** = The specified party does not exist on a DSL.

**NO PROCESS** = An attempt to create a process failed; possible cause is a busy system. Retry the request later.

**NON-DSL/INVALID DSL TYPE** = The line is not a DSL or the type of DSL is incorrect.

**NON-UNIQUE NXX DN** = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

**NOT PRIMARY DN OR MLHG** = The DN or MLHG specified is for a key-system CPE and is not the primary DN for any key-system CPE. A primary DN is required to identify the specific CPE to be restored. Refer to RC/V or office records to determine the primary DNs or MLHG and member numbers.

**PROCESS TIMEOUT** = Internal time-out during processing; request aborted.

**SM UNAVAILABLE** = The input request could not be completed because a needed switching module (SM) was unable to respond. Retry the request later.

**SYSTEM BUSY** = The system's processing capability limit was reached or a system resource was unavailable. Retry the request later.

**SYSTEM ERROR** = System error occurred, making it impossible to continue processing request.

**TEI NOT FOUND** = The CPE could not be located in the database. The TEI identifier used in the input request was most likely invalid or incorrect.

**UNASSIGNED PORT** = The port referred to was unassigned.

\[j\] = IDCU number.

\[k\] = Remote terminal (RT) number.

\[l\] = RT line number.
4. ACTIONS TO BE TAKEN

To remove a CPE, use the RMV:CPE input message. To restore a CPE, use the RST:CPE input message. To get the current status of a CPE, use the OP:CPE input message. If the DSL is OOS, the DSL can be restored using the RST:LINE input message.

5. ALARMS

None.

RST:CU

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

RST CU a b [c]

2. REASON FOR OUTPUT

To report the status of executing a request to restore a control unit (CU) to standby status.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Request status. Valid value(s):
   ABORTED = Restoration abnormally terminated due to a system error or a fault in the restore process.
   COMPLETED = Restoration successfully completed.
   IN PROGRESS = Restoration is in progress.
   STOPPED = Restoration denied by the system or stopped manually.
c = Reason the restore was stopped. Valid value(s):
   1 = Invalid unit name. Only the CU can be restored.
   2 = CU is not out of service (OOS).
   3 = The mate CU must be ACTIVE or INIT.
   4 = Diagnostic test failures for the CU.
   5 = Expanded main memory (EMM) straps do not match on both CU's.
   6 = The restore was terminated because of a system request (manual or automatic).

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'c' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Remove the CU. If 'c' = ABORTED, determine what is wrong with the system. Interpret the REPT:CURSTRMV output message if one occurred.</td>
</tr>
<tr>
<td>4</td>
<td>Fix the CU or restore it unconditionally.</td>
</tr>
<tr>
<td>5</td>
<td>Fix the EMM straps.</td>
</tr>
</tbody>
</table>

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

RST:DATALINK

Software Release: 5E14 and later
Message Class: LINE, RSB
Application: 5
Type: Output

1. FORMAT

RST DATALINK [DN a] [b] [c] [d] e
[f] [f] [f] [f] [f] g [g] [g] [g] [g]
[h] [h] [h] [h] [h] [h]

2. REASON FOR OUTPUT

To respond to a request to restore the specified data link to service by deleting the specified status from the port identified. Both the status requested to be deleted and the full status resulting from the restoration attempt are identified in the message. This message may be in response to a RST:DATALINK input message or may be generated automatically.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Telephone number of the data link.
b = Channel identifier: D, B1, or B2. Used only for digital subscriber line (DSL) data links.
c = Valid value(s):
   AP=i-j
   AQ=i-j
   DASC=i-j
   EIS=k-l
   HOBICR=i-j
   HOBICY=i-j
   HOBIS=i-j
   MISLNK=i-j
   OAPF=m
   OAPO=n
   RAS=i-j
   RTRS=i-j
   XDB=i-j

d = Valid value(s):
   ILEN=q-u-v-w
   INEN=q-a^l-v-w
   LCEN=q-r-s-t
   LCKEN=q-r-x-y-z

e = The result (completion code) of the removal request. Valid value(s):
CAMPON FAIL = The request to camp on the trunk or data link failed.
CAMPON NOT ALLOWED = The ability to camp on is not allowed on the data link specified. It must therefore be removed by specifying the UCL option.
CMP UNAVAILABLE = The input request could not be completed because a needed communications module (CM) was unable to respond. Retry the request later.
COMPLETED = The specified status was successfully added to the port. Resulting port status is indicated.
DUP REQUEST = Line already out of service for the specified reason.
INPUT ERROR = Some data entered in the input request was invalid or incorrect.
INV PORT = The data link could not be located in the database. The data link identifier used in the input request was most likely invalid or incorrect.
INV PORT TYPE = The port specified is not a data link and therefore can not be changed using the specified input request. Determine the port's type, OP:CONV input message may help, and use the input request appropriate for its type.
INV STATUS = An invalid status for the data link was specified in the input request.
NO PROCESS = An attempt to create a process failed. Possibly caused by the system's being busy. Retry the request later.
NO STATUS MATCH = The data link was out-of-service (OOS), but not for any of the reasons specified (refer to variable 'f'). No change was made to the status of the data link.
PORT BUSY = The data link remained busy for the camp-on period or an in-progress camp-on was terminated.
PROCESS TIMEOUT = Internal time-out, during processing request, aborted.
SM UNAVAILABLE = The input request could not be completed because a needed SM is unable to respond. Retry the request later.
STATUS CONFLICT = Status to be added conflicts with the existing status on the data link.
SYSTEM BUSY = The system's processing capability limit was reached, or a system resource was unavailable. Retry the request later.
SYSTEM ERROR = System error occurred making it impossible to continue processing request.

f = The status to be deleted from the data link. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

g = The resulting primary status in effect on the data link. This status is the most restrictive to call processing currently on the data link. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

h = The pending statuses (0-3) in effect on the data link, if any. (Less restrictive than the primary status.) Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.

i = Data link (group) number.

j = Relative link (member) number.

k = EIS identifier (ID) on which the CPDL terminates.

l = External data link (member) number relative to the EIS.

m = Force management center number of the OAPF.

n = Operator service center number of the OAPO.

q = Switching module (SM) number.
4. ACTION TO BE TAKEN

If the data link is not in service, identify the OOS condition for the primary status currently in effect and determine the appropriate recovery steps. To get a list of all data links or a group of data links with a specified status, refer to the OP:LIST input message.

5. ALARMS

None.

1. FORMAT

[1] RST DCI a COMPLETED
__________________________________________________________________

[2] RST DCI a ABORTED [b] [c]
__________________________________________________________________

[3] RST DCI a STOPPED d
__________________________________________________________________

[4] RST DCI a TASK e MSG STARTED
__________________________________________________________________

[5] RST DCI a STOPPED MESSAGE IN PROGRESS
__________________________________________________________________

[6] RST DCI a STOPPED MESSAGE COMPLETE
__________________________________________________________________

2. REASON FOR OUTPUT

These messages report the disposition of a request to restore a dual serial channel/computer interconnect (DCI) to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
  X'1' = Restore process error.
  X'2' = Driver error.
  [NULL] = Restoration denied by driver or configuration control (CONFIG).

c = Error code. Valid value(s):

<table>
<thead>
<tr>
<th>If 'b' =</th>
<th>Explanation:</th>
</tr>
</thead>
</table>

Copyright ©2003 Lucent Technologies
4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

5. ALARMS

The pudrv subsystem generated messages have no alarm.

The cft subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The diag subsystem generated messages have automatically generated alarms; action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

RST:DFC

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

RST DFC a b [c] [d]

2. REASON FOR OUTPUT

To report the status of a request to restore a disk file controller (DFC) to service.

If the restore process was invoked using the RST DFC poke on the DFC status page during disk-independent operation (DIOP) mode, a REPT:DKDIP output message precedes the actual output message line.

3. VARIABLE FIELD DEFINITIONS

a = DFC Member number.

b = Status of request. Valid value(s):
   ABORTED = Restore aborted.
   COMPLETED = Unit restored.
   ERROR = Encountered an error, restore aborted.
   IN PROGRESS = Unit is being initialized.
   NOT STARTED = The restore not started.
   STARTED = The restore was started by DKDIP.
   STOPPED = Unit failed diagnosis.

If 'b' = 'c' = 'd' = ABORTED, not STARTED, ERROR, or STOPPED, and if the input message is started using the RST DFC poke on the DFC status page, then

One of the following DKDIP error codes. Valid value(s):
   f09 = Failed to get the unit control block (UCB) of the unit by name.
   f18 = Unit is not out-of-service (OOS).
   f1e = Failed to open the device.
   f20 = Refer to the DKDRV error report on the receive-only printer (ROP).
   f57 = Message to driver port failed.
   f60 = Message reception failure.
   f63 = Process timed out waiting for message.
   f67 = Failed to close special device file.
   ffe = Aborted due to phase 1.

Error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td>f18 = Unit is not out-of-service (OOS).</td>
<td>For a DFC driver error (c = 2), refer to</td>
<td></td>
</tr>
</tbody>
</table>
4. ACTION TO BE TAKEN

If the restore did not complete successfully, correct the source of trouble and attempt the restore again. If the error condition persists, contact the next level of technical assistance.

5. ALARMS

OMDB key 308 has a VAR (variable) alarm. There is fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

OMDB key 601 has a MAJ (major) alarm. If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

e = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.

No alarm = No effect.
*Minor = Small reduction in traffic capability.
**Major = A problem exists and is denying customer service or causing a 25-50% reduction in traffic capability.
*C Critical = A problem exists and is denying customer service or causing at least a 50% reduction in traffic capability.

6. REFERENCES

Input Message(s):
RST:DFIH

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RST DFIH=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an RST:DFIH input message to restore a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH) to service. This output message will also occur due to automatic fault recovery actions.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RISLU digital line and trunk unit (DLTU) number.
c = DFIH number.
d = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
e = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance manual.

5. ALARMS

A major alarm will occur if an automatic restore-to-service is stopped due to failing diagnostics.

6. REFERENCES

Input Message(s):

   RST:DFIH

RST:DFTAC

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST DFTAC=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of executing RST:DFTAC input message to restore the distributing frame test access circuit (DFTAC) to active status, or as the result of a recovery action to remove, diagnose, and restore the circuit to service if the diagnostic successfully executes.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group.
d = Circuit number.
e = Termination status. Valid value(s):
   ABORTED = The restoring process was purged. Further output showing data recovery by audits may follow.
   COMPLETED = Successful completion.
   NOT STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

f = Reason for termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

Minor alarm if a recovery requested RST:DFTAC fails.

6. REFERENCES

Input Message(s):

RST:DIST

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST DIST=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of executing a RST:DIST input message to restore a distribute point board (DIST) to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = Distribute point board number.
e = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

f = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the References section of this message.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.

No alarm = No effect.
*Minor = Small reduction in traffic capability.
**Major = A problem exists and is denying customer service or causing a 25-50% reduction in traffic capability.
*C Critical = A problem exists and is denying customer service or causing at least a 50% reduction in traffic capability.

RST:DLI

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RST DLI={a|a&&b}–c d [e]

2. REASON FOR OUTPUT

To indicate the result of a restore request (either manual or automatic) for a dual link interface (DLI) or range of DLIs.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number; also the lower limit of a range of DLIs to be restored.
b = Upper limit of a range of DLIs that were diagnosed.
c = ONTC side that the DLI is on.
d = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   NOT STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

e = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the ‘e’ field should give some indication as to why the request failed. Check DLI MCC pages or OP:CFGSTAT output to verify that the DLI was in a valid state to perform the request.

5. ALARMS

None.

**RST:DNUSCC**

Software Release: 5E14 and later  
Message Class: SM  
Application: 5  
Type: Output

1. FORMAT

RST DNUSCC=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an attempt to restore a digital networking unit - synchronous optical network (SONET) (DNU-S) common controller (DNUSCC) to service.

3. VARIABLE FIELD DEFINITIONS

a  
= Switching module (SM) number.

b  
= DNU-S number.

c  
= Common controller number.

d  
= Termination status. Valid value(s):

- **ABORTED** = Requested action was terminated before completion, and the termination was not graceful.
- **COMPLETED** = Requested action was successfully completed.
- **IN PROGRESS** = Requested action is in progress.
- **NOT STARTED** = Requested action was not started.
- **STOPPED** = Requested action was terminated before a normal completion. Termination was graceful.

e  
= Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

Failure of an automatic restoration of the first DNUSCC in a DNU-S will cause a major alarm. Failure of an automatic restoration of a DNUSCC while the mate DNUSCC is in an out-of-service (OOS) state will cause a critical alarm.

RST:DUI

Software Release: 5E14 and later
Message Class: MAINT, MAIPR
Application: 5,3B
Type: Output

1. FORMAT

[1]   RST DUI a COMPLETED

[2]   RST DUI a ABORTED [b] [c]

[3]   RST DUI a STOPPED d

[4]   RST DUI a TASK e MSG STARTED

[5]   RST DUI a STOPPED MESSAGE IN PROGRESS

[6]   RST DUI a STOPPED MESSAGE COMPLETE

2. REASON FOR OUTPUT

To report the final disposition of a request to restore a direct user interface (DUI) subdevice to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4 - 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
  X'1' = Restore process error.
  X'2' = Driver error.
  [NULL] = Restoration denied by the input/output (IO) driver or configuration control (CONFIG).

c = Error code.

| If 'b' = | Explanation: |
Refer to the APP:IOP-H appendix in the Appendixes section of the Output Messages manual.

Refer to the APP:IOP-G appendix in the Appendixes section of the Output Messages manual.

d = Error code. Refer to the APP:IOP-I appendix in the Appendixes section of the Output Messages manual.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the restoration was aborted or stopped, clear the source of trouble and attempt the restoration again.

5. ALARMS

The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

To report the result of executing a RST:GDSF input message to restore a global digital services function (GDSF) circuit to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = GDSF number.
c = Termination status. Valid value(s):
  ABORTED = Immediate termination.
  COMPLETED = Successful completion.
  NOT STARTED = Action has not begun.
  STOPPED = Terminated before normal completion.
d = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.

No alarm = No effect.
*Minor = A RST of a GDSF has failed due to a problem. On an SM with more than one GDSF, a minor alarm will be reported when 50% or less of the GDSFs on a particular SM are OOS.
**Major = A RST of a GDSF has failed due to a problem. A major alarm is reported if an SM that is equipped with only one GDSF and that GDSF is OOS or more than 50% of the GDSFs on a particular SM are OOS.
*C Critical = A RST of a GDSF has failed due to a problem. A critical alarm is reported for an SM that has more than one GDSF and all the GDSFs are OOS.

[2] RST GQPHPIPE=a-b-c-d-e SERV=f STATE=ACT SUCCESS
[3] RST GQPHPIPE=a-b-c-d-e SERV=f STATE=h FAILED
[i] ________________________________________________________

2. REASON FOR OUTPUT

Format 1 reports that the quad-link packet switch protocol handler (GQPH) QPIPE restore request cannot be processed by the global switching module (GSM) for the reason specified.

Format 2 reports the successful restore of a GQPH QPIPE.

Format 3 indicates a GQPH QPIPE restore has been attempted, but failed (usually due to hardware outages).

3. VARIABLE FIELD DEFINITIONS

a = GSM number.
b = Packet switch unit (PSU) number.
c = PSU shelf number.
d = GQPH channel group number.
e = Quad-link packet switch (QLPS) network number.
f = Service type. For packet trunking, the value is SIP.
g = Reason for failure. Valid value(s):
  BOTH GQPH QPIPES MUST BE EQUIPPED = Both GQPH QPIPES on a particular GQPH must be provisioned, before either can be restored.
  DATABASE ERROR = GQPH QPIPE restoration process halted due to a database error.
  GQPH PIPE UNEQUIPPED = The restoration process halted because the GQPH QPIPE is unequipped.
  GQPH QPIPE ALREADY ACT = The GQPH QPIPE restoration request was not accepted, as it is already ACT (and message transport would be disrupted, if it was restored again).
  ISPA UNSUCCESSFUL = An ISPA terminal process required to attempt the GQPH QPIPE restoration could not be created due to system load (retry later).
  MAINTENANCE BUSY = The GQPH QPIPE port is owned by another maintenance process, which may result in a state transition (retry later).
  MESSAGE TIMEOUT = Response from GQPH did not arrive within a timeout interval monitored by the controlling ISPA terminal process.
<table>
<thead>
<tr>
<th>State:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>OOS-LVL1-PATH</td>
<td>The GQPH QPIPE is OOS because a TSI-GQPH path could not be established during a GQPH QPIPE restore attempt (probably due to database read failures or other resource problems). SMP-controlled periodic retries or external events will attempt to automatically recover the GQPH QPIPE.</td>
</tr>
<tr>
<td>OOS-LVL1-FRAME</td>
<td>The GQPH QPIPE is OOS because the network processor's circuitry on the PH has detected framing errors (probably due to undetected QLPS network hardware errors or TSI faults). A local loopback test (at the PH) has passed, but framing errors persisted when the GQPH QPIPE was reconnected to the QLPS network/TSI. SMP-controlled periodic retries or external events will attempt to automatically recover the GQPH QPIPE, or a transition to a more stable OOS state will occur as hardware errors are detected by fault recovery.</td>
</tr>
<tr>
<td>OOS-QLPSLB</td>
<td>The GQPH QPIPE has level 1 resources available (its associated TSI-GQPH path is established, and the GQPH NP channel is activated, including a local loopback test in the PH), and periodic attempts to pass a loopback test to the ACT QLPS are scheduled. GQPH-controlled periodic retries or external events will attempt to automatically recover the GQPH QPIPE, or a transition to a more stable OOS state will occur as hardware errors are detected by fault recovery.</td>
</tr>
<tr>
<td>OOS-GQPHLB</td>
<td>The GQPH QPIPE is OOS, as a local loopback test (at the PH) was performed and failed, indicating the problem is within the resident PH hardware. Another source of this status is the inability of the network processor to be activated (a hardware failure). An automatic GQPH switch was requested, but no STBY spare PH33 is available on the same shelf; the GQPH remains in-service, as the mate GQPH QPIPE is ACT. A spare PH33 on the same shelf must be restored, or the faulty PH containing the OOS-GQPHLB GQPH QPIPE must be manually removed/repaired, to recover the GQPH QPIPE.</td>
</tr>
<tr>
<td>OOS-ACT</td>
<td>The GQPH QPIPE has been manually activated.</td>
</tr>
<tr>
<td>OOSF-PH</td>
<td>The GQPH is OOS due to &quot;family-of-equipment&quot; reasons because the channel group associated with this GQPH QPIPE is unassigned (due to a manual or fault recovery removal of a PH33 when there was no STBY spare PH33 available on the same shelf). Automatic attempts to restore the affected GQPH QPIPE will occur when a PH33 is repaired and/or restored and the parent GQPH channel group is reassigned.</td>
</tr>
<tr>
<td>OOSF-CM</td>
<td>The GQPH QPIPE is OOS due to &quot;family-of-equipment&quot; reasons associated with a parent TMSLNK/QTMSLNK outage (communication module or CM hardware). Automatic attempts to restore the affected GQPH QPIPE will occur when the OOS TMSLNK/QTMSLNK is repaired and/or restored. Note that OOS-LVL1-PATH, OOS-GQPHLB, OOS-DACT and OOSF-PH are of higher priority (as they reflect local conditions associated with the GQPH endpoint), and an OOSF-CM state will not be reported in this case, even if parent TMSLNK/QTMSLNK hardware is OOS.</td>
</tr>
</tbody>
</table>
Failure cases. Value value(s):

<table>
<thead>
<tr>
<th>State:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>GQPH QPIPE OOS FE PH</td>
<td>The GQPH QPIPE restore failed because the associated channel group is unassigned. If the GQPH QPIPE possessed a pending OOS-DACT state, it will have been deleted by the restore request (even though the physical restore is impossible).</td>
</tr>
<tr>
<td>TSI-GQPH PATH NOT ESTABLISHED</td>
<td>If the TSI-PH path cannot be established, the restore will be halted and the GQPH QPIPE port status will be marked OOS-LVL1-PATH.</td>
</tr>
<tr>
<td>GQPH CHANNEL FAILURE</td>
<td>If the local GQPH loopback test (looped at the network processor's output) or the channel activation fails for some other reason, the restore will be halted, causing status to transition to OOS-GQPHLB.</td>
</tr>
<tr>
<td>QLPS LOOPBACK FAILURE</td>
<td>If the QLPS loopback test fails (and parent CM hardware is functional), the GQPH QPIPE state will transition to the OOS-QLPSLB state.</td>
</tr>
<tr>
<td>FRAME FAILURE</td>
<td>If frame errors are detected at the PH network processor's circuit (and parent CM hardware is functional), the GQPH QPIPE state will transition to the OOS-LVL1-FRAME state.</td>
</tr>
<tr>
<td>GQPH QPIPE OOS FE CM</td>
<td>If the QLPS loopback test fails or frame errors are detected (and parent TMSLNK/QTMSLNK or grand-parent CM hardware is OOS), the GQPH QPIPE state will transition to the OOSF-CM state.</td>
</tr>
<tr>
<td>SM MIN-MODE</td>
<td>The SM is operating in MIN-MODE, and the resultant state is OOS-DACT.</td>
</tr>
</tbody>
</table>

4. ACTIONS TO BE TAKEN

For failures reported in Format 1 output, no further action is required, if the GQPH QPIPE is already ACT or if only one GQPH QPIPE is equipped on a GQPH channel group. If ODD problems are noted, they should be resolved according to local practices. All other failures indicate high system load, so the input request should simply be retried later.

No action is required for Format 2 outputs, as the restore was successful.

Failures indicated by Format 3 outputs should be addressed by corrective maintenance procedures.

5. ALARMS

None.

[6] RST HSD a STOPPED MESSAGE COMPLETE

2. REASON FOR OUTPUT

To report the disposition of a request to restore a high-speed synchronous data link (HSD) to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4 - 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
   X'1' = Restore process error.
   X'2' = Driver error.
   [NULL] = Restore denied by driver or configuration control (CONFIG).

c = Error code.

| X'1' | Explanation: Refer to the APP:IOP-H appendix in the Appendixes section of the Output Messages manual. |
d = Error code. Refer to the APP:IOP-I appendix in the Appendixes section of the Output Messages manual.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

5. ALARMS

The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

To indicate the result of a RST:IDCUEOC input message that restores an integrated digital carrier unit (IDCU) remote terminal (RT) embedded operations channel (EOC) circuit to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = IDCU number.
c = RT number.
d = EOC number.
e = Termination report. Valid values are:
  ABORTED = Immediate termination. A process has been purged and cleanup will be done by audits.
  COMPLETED = Requested action was successfully completed.
  NOT STARTED = Requested action has not begun.
  STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

f = Additional information qualifying the termination report. This information can be found in the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: MAINT,MAIPR
Application: 5,3B
Type: Output

1. FORMAT

[1] RST IOP a COMPLETED

[2] RST IOP a ABORTED [b] [c]

[3] RST IOP a STOPPED d

[4] RST IOP a TASK e MSG STARTED

[5] RST IOP a STOPPED MESSAGE IN PROGRESS

[6] RST IOP a STOPPED MESSAGE COMPLETE

2. REASON FOR OUTPUT

To report the disposition of a request to restore the input/output processor (IOP) to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4 - 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
   X'1' = Restore process error.
   X'2' = Driver error.
   [NULL] = Restore denied by driver or configuration control (CONFIG).

c = Error code.

| X'1' | Explanation: Refer to the APP:IOP-H appendix in the Appendixes section of the Output Messages manual. |
Refer to the APP:IOP-G appendix in the Appendixes section of the Output Messages manual.

\[ \text{d} = \text{Error code, refer to the APP:IOP-I appendix in the Appendixes section of the Output Messages manual.} \]

\[ \text{e} = \text{Diagnostic task number assigned to the request.} \]

4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

5. ALARMS

The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

MCC Display Page(s):

170x,171x (ISLU)
RST:ISMNAIL

Software Release: 5E14 and later
Message Class: CP
Application: 5
Type: Output

1. FORMAT

RST ISMNAEL DLT=a-b MATEDLT=c-d e [f]

2. REASON FOR OUTPUT

To respond to an RST:ISMNAIL input message and indicate the success or failure of the inter-SM (switching module) nailup (ISMNAIL) restoration request.

3. VARIABLE FIELD DEFINITIONS

   a = SM number which is the SM associated with either end of the ISMNAIL.

   b = Data link terminal (DLT) number (1-160) associated with the SM.

   c = Mate SM number, which is the other SM associated with ISMNAIL.

   d = DLT number (1-160) associated with the mate SM.

   e = Termination report. Valid value(s):

       COMPLETED = Request completed successfully.

       FAILURE = Request was terminated before a normal completion.

   f = Additional data qualifying the termination of the request. Valid value(s):

       DATABASE PROBLEM = Problem occurred while attempting to access critical data (accompanying ASSERT should provide more details).

       HARDWARE PROBLEM = ISMNAIL restoration impossible due to associated hardware [protocol handler (PH), dual/network link interface (DLI/NLI), time multiplexed switch link (TMSLNK)] problem.

       INVALID NAILUP SPECIFIED = An invalid nailup was specified in the input request.

       LACK OF MESSAGE RESOURCE = Message resources were not available in the administrative module (AM), and craft request could not be forwarded to the SM for execution.

       LEVEL 2 PROTOCOL = Level 2 protocol could not be established for the designated ISMNAIL.

       NO TMS/PIDB TIMESLOT = No time multiplexed switch (TMS) or peripheral interface data bus (PIDB) timeslot was available to establish the ISMNAIL (possibly temporary blocking).

       NOT OWNER OF PORT = Could not gain ownership of the port to honor request (retry is advisable).

       SM IN MINMODE = SM is in MINMODE, and, therefore, cannot support ISMNAILs.

       SM ISOLATED = SM is isolated, and requested action cannot be honored.

       TIMEOUT = timeout occurred.

Note: For many failed restorations, the ISMNAIL may be left in a state, which will allow a successful automatic restoration at some later time; use OP:ST-ISMNAIL to determine current status associated with the affected ISMNAIL.
4. ACTION TO BE TAKEN

No further action is necessary, if the request completed successfully.

If the termination report is FAILURE, the 'f' field will give a reason as to why the request failed.

5. ALARMS

None.

235-600-500  Asserts Manual
RST:ISTF

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RST ISTF=a-b c [d]

2. REASON FOR OUTPUT

To report the results of executing an RST:ISTF input message to restore an integrated services test function (ISTF) unit to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = ISTF unit number.
c = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate and was not graceful.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated gracefully before a normal completion.

d = Additional data qualifying the termination report (variable ‘c’). Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

A major indicates all ISTFs on this SM are out-of-service. A minor indicates there is a small reduction in traffic capability.

Type: Output

1. FORMAT

RST IWGFAC=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an RST:IWGFAC input request to restore the inter-working gateway facility (IWGFAC) to service. This file was created for the newest release. Additional information will be included as it is made available.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

b = Inter-working gateway (IWG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

c = Inter-working gateway facility (IWGFAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

d = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action has successfully completed.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

e = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.

Application: 5
Type: Output

1. FORMAT

RST IWGLI=a-b-c-d e [f]

2. REASON FOR OUTPUT

Indicates the result of an RST:IWGLI input request to restore the inter-working gateway link interface (IWGLI) to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

b = Inter-working gateway (IWG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

c = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

d = Inter-working gateway link interface (IWGLI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

e = Termination status. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Requested action has successfully completed.
NOT_STARTED = Requested action was not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

f = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

RST:LDSF

**Software Release:** 5E14 and later  
**Message Class:** SM  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   RST LDSF=a-b c [d]

2. **REASON FOR OUTPUT**

   To report the result of executing a RST:LDSF input message to restore a local digital service function (LDSF) circuit to service.

3. **VARIABLE FIELD DEFINITIONS**

   a = Switching module (SM) number.  
   b = LDSF number.  
   c = Termination status. Valid value(s):
      - ABORTED = Immediate termination.
      - COMPLETED = Successful completion.
      - NOT STARTED = Action has not begun.
      - STOPPED = Terminated before normal completion.
   d = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. **ACTION TO BE TAKEN**

   If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. **ALARMS**

   If a RST message fails, an alarm will indicate the effect to the office.  
   - No alarm = No effect.  
   - *Minor = Small reduction in traffic capability.  
   - **Major = A problem exists and is denying customer service or causing a 25-50 percent reduction in traffic capability.  
   - *C Critical = A problem exists and is denying customer service or causing at least a 50 percent reduction in traffic capability.

RST:LINE

Software Release: 5E14 and later
Message Class: LINE, RSB
Application: 5
Type: Output

1. FORMAT

RST LINE [DN a+b][+][ c] d [MLHG=q-r] s
[t] u [u] [u] [u] [u] v [v] [v] [v] [v]
\[w [w] [w] [w] [w]\]
\[w [w] [w] [w] [w]\]
\[w [w] [w] [w] [w]\]
\[w [w] [w] [w] [w]\]

2. REASON FOR OUTPUT

To report the restoration of a line to service by displaying the indicated status for the line specified. Both the previous status and final resulting status for the line are identified in the message. The restoration of a digital subscriber line (DSL) will result in the status of all affected channels of the DSL's being reported in the output message. This message may be in response to a RST:LINE input message or may be generated automatically.

3. VARIABLE FIELD DEFINITIONS

+ = Indicates that the line is a party line, a custom multipoint interface DSL or a standard interface multi-user DSL.
a = Telephone number of the line.
b = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.
c = Channel identifier (D, B1, or B2) originally specified in the restoration request. Used only for DSL lines.
d = Equipment number or identifier. Valid value(s):
   AIUEN=e-d1-e1-f1
   ILEN=e-x-y-z
   INEN=e-g1-y-z
   LCEN=e-f-g-h
   LCKEN=e-f-a1-b1-c1
   LEN=e-i-j-k-l-m
   SLEN=e-n-o-p
   VANA=e-h1
   VBRI=e-i1
e = Switching module (SM) number.
f = Line unit number.
g = Line group controller number.
h = Line card number.
i  = Line unit number.

j  = Grid number.

k  = Switch board number.

l  = Switch number.

m  = Level number.

n  = Digital carrier line unit.

o  = Remote terminal (RT).

p  = RT line.

q  = Multi-line hunt group number.

r  = Hunt group member number.

s  = The result (completion code) of the restoration request. Valid value(s):

ALREADY IS = The line was already in service; therefore, the status specified in the input message to delete from the line could not be deleted. No change was made to the status of the line.

CAMPON FAIL = The request to camp on the line failed.

CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) was unable to respond. Retry the request later.

COMPLETED = The specified status was successfully added to the port. Resulting status is indicated.

COMPLETED, TRUNKS REMAIN = The request completed successfully but some ports may be defined as trunks. Use RST:TRK message for the trunk ports.

DUP REQUEST = This input request is already being processed.

INPUT ERROR = Some data entered in the input request was invalid or incorrect.

INV PORT = The line could not be located in the database. The line identifier used in the input request was most likely invalid or incorrect.

MLHG ACCESS DN = The DN entered is a uniform call distribution (UCD), multi-position hunt (MUPH) multi-line hunt group line, or linear hunt line, and as such cannot be removed by specifying its DN. An equipment number (that is, LEN, SLEN) or MLHG and member number must be specified. To obtain the line's equipment number and/or multi-line hunt group and member number, use RC/V for the DN or refer to office records.

MP ACCESS DN = The DN entered is a uniform call distribution multi-line hunt group line for modem pooling and as such cannot be restored by specifying its DN. An equipment number (that is, LEN, SLEN, LCEN) or MLHG and member number must be specified. To obtain the line's equipment number and/or multi-line hunt group and member number, refer to office records for the DN.

NO MATCH = The status specified in the request to delete did not exist on the line.

NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

NO PROCESS = An attempt to create a process failed. Possibly caused by the system's being busy. Retry the request later.

NO STATUS MATCH = The line was out-of-service, but not for any of the reasons specified (refer to variable 'k'). No change was made to the status of the line.

PORT BUSY = The line remained busy for the campon period or an in-progress campon was
terminated.
PORT PROV IN PROGRESS = The line or trunk is in the process of being provisioned. Retry the request later.
PROCESS TIMEOUT = Internal time-out during processing request aborted.
SMUN AVAILABLE = The input request could not be completed because a needed SM was unable to respond. Retry the request later.
STATUS CONFLICT = The trunk was not able to be restored to service since a port status inconsistency would have resulted by placing the trunk in service (IS). The trunk was left in the indicated out-of-service (OOS) state. For example, attempting to restore a circuit switched B-channel while the associated D-channel is OOS is not allowed.
SYSTEM BUSY = The system's processing capability limit was reached or a system resource was unavailable. Retry the request later.
SYSTEM ERROR = System error occurred, making it impossible to continue processing request.

t = Channel identifier; D, B1, or B2. Used only for DSL lines.

u = Status that was requested to be deleted from the line. If more than one status was deleted, all are identified on subsequent lines in the same column. The first subfield indicates the basic state; the second subfield indicates the qualifier; the third subfield indicates the operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the line status. Refer to appendix APP:PORT-STATUS in the Appendixes section of the Output Messages manual for a description of status subfields.

v = Resulting primary status in effect on the line. This status is the most restrictive to call processing. The first subfield indicates the basic state; the second subfield indicates the qualifier; the third subfield indicates the operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the line status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

w = Pending statuses (0-3) in effect on the line, if any. (Less restrictive than the primary status.) The first subfield indicates the basic state; the second subfield indicates the qualifier; the third subfield indicates the operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the line status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.

x = IDCU number.
y = Remote terminal (RT) or IDCU facility (IFAC) number.
z = RT line number or IFAC channel.
a1 = Line group number.
b1 = Line board number.
c1 = Line circuit number.
d1 = Access interface unit (AIU) number.
e1 = AIU pack number.
f<sup>1</sup> = AIU circuit number.
g<sup>1</sup> = Digital network unit - synchronous optical network (SONET) (DNU-S) number.
h<sup>1</sup> = Virtual analog line number.
i<sup>1</sup> = Virtual BRI line number.

4. ACTIONS TO BE TAKEN

None. Refer to the message output for pertinent status and information, and implement requested action based on the information received, if necessary.

5. ALARMS

None.

Type: Output

1. FORMAT

[1] RST LNa b c [d] [e]
__________________________________________________________________
[2] RST LNa b c
   f
__________________________________________________________________

2. REASON FOR OUTPUT

To report the status of a request to restore the link node (LN) to service. This message may also be printed due to a successful LN restart using the INIT:LN input message.

3. VARIABLE FIELD DEFINITIONS

a = Ring node (RN) group number.
b = Ring node member number.
c = Termination status. Valid value(s):
   ABORTED = Restoration aborted.
   COMPLETED = Unit restored.
   IN PROGRESS = Restore in progress.
   NOT STARTED = Restore not started.
   STOPPED = Restoration stopped.
d = Valid value(s):

<table>
<thead>
<tr>
<th>'c' =</th>
<th>'d' =</th>
</tr>
</thead>
</table>
| ABORTED | Type of error. Valid value(s):
|        | (1) Remove process error. |
|        | (2) Driver error. |
| STOPPED | Error code. Refer to the "Reason for a Remove or Restore Request Being Stopped" exhibit of the APP:CNI appendix in the Appendixes section of the Output Messages manual. |

e = Error code. Valid value(s):

<table>
<thead>
<tr>
<th>'d' =</th>
<th>'e' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Refer to the &quot;Error Codes Generated by the IMSRMVRST Process&quot; exhibit of the APP:CNI appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
<tr>
<td>2</td>
<td>Refer to the &quot;Error Codes Returned to the IMSRMVRST Process by the IMS Driver&quot; exhibit of the APP:CNI appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
</tbody>
</table>

f = Reason input message was not started. Valid value(s):
CAN NOT ACCESS GENERIC SPEC FILE
CAN NOT GET MIRA'S PROCESS ID NUMBER
CAN NOT GET NODE'S UCB FROM ECD
CAN NOT SEND A MESSAGE TO IMS USER
IMS INITIALIZATION IN PROGRESS
INTERVAL TIMER CAN NOT BE ALLOCATED
INVALID ACTION REQUEST
INVALID PERMISSION ACTION
INVALID PERMISSION MESSAGE
NODE HAS INVALID MAJOR STATE
NODE HAS INVALID MINOR STATE
NODE NOT FOUND IN ECD
NODE NOT IN ACTIVE RING
PERMISSION REQUEST FAILED
PERMISSION RESPONSE TIME OUT
PERMISSION TO RESTORE NODE HAS BEEN DENIED
REMOVE OF NODE FAILED
REMOVE OF NODE WAS DENIED
REMOVE REQUEST FAILED
RESTORE REQUEST ALREADY IN PROGRESS
RESTORE REQUEST NOT ACCEPTED BY MIRA
RESTORE SUCCESSFULLY QUEUED WITH MIRA
UNKNOWN RESTORE RESULT

4. ACTION TO BE TAKEN

For Format 1, if the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

For Format 2, if the 'c' field indicates NOT STARTED, use the 'f' field to determine why the request was not honored.

<table>
<thead>
<tr>
<th>'f' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESTORE REQUEST ALREADY IN PROGRESS</td>
<td>Wait until previous restore request is finished, then resubmit the restore request.</td>
</tr>
<tr>
<td>NODE NOT FOUND IN ECD or CAN NOT GET NODE'S UCB FROM ECD</td>
<td>Verify node is equipped, then resubmit the restore request.</td>
</tr>
<tr>
<td>NODE NOT IN ACTIVE RING</td>
<td>Include node in active ring, then resubmit the restore request.</td>
</tr>
<tr>
<td>IMS INITIALIZATION IN PROGRESS</td>
<td>Wait for initialization to complete, then resubmit the restore request.</td>
</tr>
<tr>
<td>CAN NOT GET MIRA'S PROCESS ID NUMBER OR RESTORE REQUEST NOT ACCEPTED BY MIRA</td>
<td>Verify MIRA is working correctly, then resubmit the restore request.</td>
</tr>
<tr>
<td>CAN NOT ACCESS GENERIC SPEC FILE</td>
<td>Verify generic spec file exists, then resubmit the restore request.</td>
</tr>
</tbody>
</table>

For all other values of 'f' where the 'c' field is NOT STARTED or ABORTED restore the node using RST:LN. If the node is restored successfully, resubmit the original restore request.

5. ALARMS

None.

  - NOT STARTED = Action has not begun.
  - STOPPED = Terminated before normal completion.
- \(f\) = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.

- No alarm = No effect.
- *Minor = Small reduction in traffic capability.
- **Major = A problem exists and is denying customer service or causing a 25-50% reduction in traffic capability.
- *C Critical = A problem exists and is denying customer service or causing at least a 50% reduction in traffic capability.

Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST MCTSI=a-b c [d]

2. REASON FOR OUTPUT

To report the result of executing a RST:MCTSI input message to restore a module controller/time-slot interchange unit (MCTSI) to service.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Module control unit number.
c  = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   FAULT-STATUS UNKNOWN = Error was detected during central processor intervention transmission to SM.
   NOT STARTED = Action has not begun.
   STATUS UNKNOWN = The central processor intervention request was sent to the SM and no response was received.
   STOPPED = Terminated before normal completion.
   STOPPED OVERRIDEN BY HIGHER REQUEST = Fault recovery needed the MCTSI for troubleshooting.
   TIMEOUT = Message acknowledgement timeout with message interface (MI).

d  = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

<table>

RST:MHD

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. FORMAT

RST MHD a b [c] [d] e

WARNING:
MHD f {PRIMARY | BACKUP} BBOOT PARTITION INVALID
The indicated BBOOT partition (PRIMARY or BACKUP) on the specified
disk was found to be marked invalid.
The data in that partition is questionable and cannot be guaranteed
to boot.
However, the data is still being copied to the destination disk and
the indicated BBOOT partition on the destination disk will also be
marked invalid.

2. REASON FOR OUTPUT

To report the disposition of a request to restore a moving head disk (MHD) to service, whether bootstrap or manual.
The MHD was initially in the out-of-service (OOS) state.

If the restore process was invoked using the RST MHD poke on the DFC status page during disk independent
operation (DIOP) mode, a REPT DKDIP MESSAGE message precedes the actual output message line.

3. VARIABLE FIELD DEFINITIONS

a = MHD Member number.
b = Disposition of the request. Valid value(s):
ABORTED = Restore aborted or was terminated.
COMPLETED = Unit restored to service.
ERROR = Encountered an error, restore aborted.
IN PROGRESS = MHD a is being initialized. If MHD a has an active mate, data will be copied from
the active mate to MHD a.
NOT STARTED = The restore was not started.
STARTED = The restore was started by DKDIP.
STOPPED = Unit failed diagnosis.

<table>
<thead>
<tr>
<th>&quot;c&quot;</th>
<th>&quot;d&quot;</th>
</tr>
</thead>
</table>
| NOT STARTED
ABORTED, ERROR,
STOPPED, and if the input
message is started using
the RST MHD poke on
One of the following error codes. Valid value(s):
09 = Failed to get the unit control block (UCB) of the
unit by name.
0C = ugucbm() failed.
0F = DIOP restore not allowed: mate MHD is active. |

Error code. Refer to the APP:SYSERR appendix in the Appendixes section of
the Output Messages manual.
the DFC status page, then:

\[ f12 = \text{DIOP restore not allowed: MHD is marked essential.} \]
\[ f18 = \text{Unit is not out-of-service (OOS).} \]
\[ f1e = \text{Failed to open the device.} \]
\[ f20 = \text{Refer to the DKDRV error report on the ROP.} \]
\[ f57 = \text{Message to the driver port failed.} \]
\[ f60 = \text{Message reception failure.} \]
\[ f63 = \text{Process timed out waiting for message.} \]
\[ f67 = \text{Failed to close special device file.} \]
\[ ffe = \text{Aborted due to phase 1.} \]

**Error Code**

**ABORTED**

Type of error. Valid value(s):

1 = Diagnostic restore process error.
2 = DFC driver restore process error.
[NULL] = Bootstrap restore failure.

Error code.

For a diagnostic restore process error ('c' = 1), refer to the APP:DFC-G appendix in the Appendixes section of the Output Messages manual.

For a DFC driver error ('c' = 2), refer to the APP:DFC-A appendix in the Appendixes section of the manual.

**STOPPED**

Error code. Refer to the APP:DFC-H appendix in the Appendixes section of the Output Messages manual.

**e**

If 'b' equals **IN PROGRESS**, no message or one of the following status messages. Valid value(s):

APPLICATION DID NOT RESPOND = Application did not request to abort the restore. The disk to disk copy is being started.

MHD f SINGLE BLOCK READ RETRY {WORKED|FAILED}
START DISK BLOCK = g {END|FAILING} DISK BLOCK = h

**f**

= Member number.

**g**

= First relative physical disk block number of a range that could not be read.

**h**

= Last relative physical disk block number. When read with a range of blocks, the read failed. When read with single blocks, the reads were successful.

MHD f {READ | WRITE} FAILED PARTITION = i  OFFSET = j  DISK BLOCK = k

**i**

= Partition number for the failed I/O.

**j**

= Start block number within the partition of the failure.

**k**

= Relative physical disk block for the failed I/O. The read or write job specified by the data could not be successfully performed.

Note: A relative physical block number is a physical block number of the disk which may have been adjusted by disk defect management. In order to use it in the defect table, this number may need to be readjusted.

### 4. ACTION TO BE TAKEN

If restore is stopped, correct the source of trouble and attempt to restore again.
5. ALARMS

None. This alarm is either a manually requested report or is automatically generated.

### 4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

### 5. ALARMS

The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
X'1' = Restore process error.
X'2' = Driver error.
=NULL] = Restoration denied by the input/output driver (IODRV) or configuration control (CONFIG).

c = Error code. Valid value(s):

d = Reason the restore stopped. Refer to the APP:IOP-I appendix in the Appendixes section of the
Output Messages manual.

<table>
<thead>
<tr>
<th>'b'</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'1</td>
<td>Refer to the APP:IOP-H appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
<tr>
<td>X'2</td>
<td>Refer to the APP:IOP-G appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
</tbody>
</table>

\( e \) = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again. AR “ALARMS The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

5. ALARMS

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

**Software Release**: 5E14 and later  
**Message Class**: MTCE  
**Application**: 5  
**Type**: Output

1. **FORMAT**

RST MTIB=a b c

2. **REASON FOR OUTPUT**

To report the result of executing the RST:MTIB input message to restore the metallic test interconnect bus (MTIB) to active status, or as the result of a recovery action to remove, diagnose, and restore the circuit to service if the diagnostic successfully executes.

3. **VARIABLE FIELD DEFINITIONS**

a  = MTIB number.

b  = Termination status. Valid value(s):
   - ABORTED = Immediate termination.
   - COMPLETED = Successful completion.
   - COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   - NOT STARTED = Action has not begun.
   - STOPPED = Terminated before normal completion.

c  = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. **ACTION TO BE TAKEN**

The user must retire the major alarm and repair the faulty board prior to restoring this circuit back to service.

5. **ALARMS**

A major alarm occurs if a recovery requested RST:MTIB fails.

6. **REFERENCES**

Input Message(s):

Other Manual(s):

235-105-220  Corrective Maintenance
RST:NCOSC-A

Software Release: 5E14 only
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST NCOSC a b [c]

2. REASON FOR OUTPUT

To respond to the RST:NCOSC input message. No diagnostics are run on a network clock 2; oscillator (NCOSC) unit.

Note: Under normal conditions an oscillator may only be restored to service if it has been powered up for a minimum of one hour for a medium-stability oscillator (TN1284/TN1286) or 16 hours for a high-stability oscillator (TN1283/TN1285).

3. VARIABLE FIELD DEFINITIONS

   a = Network clock side.
   b = Termination report. Valid value(s):
      ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
      COMPLETED = Request completed successfully.
      IN PROGRESS = Request was received and action is in progress.
      STOPPED = Request was terminated before a normal completion due to hardware failure, data inconsistency, or another system problem.
   c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

No action is necessary if the request completed successfully. If the request failed, the variable 'c' should give some indication as to why the request failed. Check the network clock MCC page or the OP:CFGSTAT output message to verify that the NC was in a valid state to perform the request. Check the receive-only printer (ROP) for error messages using the REPT:NC output messages that may indicate problems or system reconfigurations. If the attempt is made to restore an oscillator to service before the completion of the warmup period, then a REPT:NC-NWP output message will be printed to the ROP. If the oscillator must be used in order to keep the ONTC operational, then it may be used by setting to a forced condition with the SET:FRC-NCOSC input message.

5. ALARMS

None.

RST:ONTC

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RST ONTC=a b [c]

2. REASON FOR OUTPUT

To acknowledge a request to restore the specified office network and timing complex (ONTC) to service.

3. VARIABLE FIELD DEFINITIONS

a = ONTC side.

b = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
COMPLETED = Request completed successfully.
NOT_STARTED = Requested action could not begin.
STOPPED = Request was terminated before a normal completion due to manual request, hardware failure, or data inconsistency.

c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, variable 'c' should give some indication as to why the request failed. Check ONTC MCC pages or the OP:CFGSTAT output message to verify that the system was in a valid state to perform the request.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

OP:CFGSTAT
OP:DMQ
RST:ONTC

Output Message(s):

OP:CFGSTAT
OP:DMQ-CM
RST:ONTCCOM
Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RST ONTCCOM=a b [c]

2. REASON FOR OUTPUT

To acknowledge a request, either manual or automatic, to restore a specified office network timing common unit (ONTCCOM) to service.

3. VARIABLE FIELD DEFINITIONS

a = ONTCCOM side.

b = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
COMPLETED = Request completed successfully.
NOT STARTED = Requested action could not begin.
STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

C = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in two cases:

- In response to a manual request. In this case no further action is necessary if the request completed successfully. If the request failed, variable 'c' should give some indication as to why the request failed. Check ONTCCOM MCC pages or the OP:CFGSTAT output message to verify that the system was in a valid state to perform the request.

- In response to a fault recovery action. In this case no action is necessary if the request completed successfully. If the request failed, a message with a major alarm will be printed to alert craft to that fact. Normal troubleshooting techniques should be used to isolate and repair the problem.

5. ALARMS

A major alarm occurs if an automatically requested ONTC conditional restore fails.

RST OSCXC a b [c]

2. REASON FOR OUTPUT

To respond to the RST:OSCXC input message. No diagnostics are run on a network clock 2 oscillator cross-couple (OSCXC) unit.

3. VARIABLE FIELD DEFINITIONS

a = Network clock 2 side.

b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   IN PROGRESS = Request was received and action is in progress.
   STOPPED = Request was terminated before a normal completion due to hardware failure, data inconsistency, or another system problem.

c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

No action is necessary if the request completed successfully. If the request failed, the variable 'c' should give some indication as to why the request failed. Check the network clock (NC) MCC page or the OP:CFGSTAT output message to verify that the NC was in a valid state to perform the request. Check the receive-only printer (ROP) for error messages using the REPT:NC output messages that may indicate problems or system reconfigurations.

5. ALARMS

None.

OP:CFGSTAT
REPT:NC
MCC Display Page(s):

(NETWORK CLOCK)
RST:OSPSPORT

Software Release: 5E14 and later
Message Class: LINE, RSB
Application: 5
Type: Output

1. FORMAT

RST OSPSPORT [a] [PKT] [b] [c] d
   [e] [e] [e] [e] [e] f [f] [f] [f] [f]
   [g] [g] [g] [g] [g]

2. REASON FOR OUTPUT

To respond to a request to restore the specified Operator Services Position System port (OSPSPORT) to service by
deleting specified status from the port identified. Both the status requested to be deleted and the full status resulting
from the restoration attempt are identified in the message. This message may be in response to a RST:OSPSPORT
input message or may be generated automatically.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms
shown in the format.

PKT = Packet-switched logical link (or service) on a D-channel. Used only for the packet-switched
D-channel of a DSL.

a = Channel identifier: D, B1, or B2. Used only for digital subscriber line (DSL) OSPSPORTs.

b = One of the following. Valid value(s):

AQEST=h
AQM=l-i
BST=k-l
OPT=k-l
XDPF=m
XDPO=k

C = One of the following. Valid value(s):

LCEN=n-o-p-q
LCEN=n-o-v-w-x
LEN=n-r-s-t-u

d = The result (completion code) of the removal request. Valid value(s):
CAMPON FAIL = The request to camp on the OSPSPORT failed.
CAMPON NOT ALLOWED = The ability to camp on is not allowed on the OSPSPORT specified. It
must therefore be removed by specifying the UCL option.
CMP UNAVAILABLE = The input request could not be completed because a needed
communications module (CM) was unable to respond. Retry the request later.
COMPLETED = The specified status was successfully added to the port. Resulting port status is
indicated.
DUP REQUEST = Line already out-of-service (OOS) for the specified reason.
INPUT ERROR = Some data entered in the input request was invalid or incorrect.
INV PORT = The OSPSPORT could not be located in the database. The OSPSPORT identifier used in the input request was most likely invalid or incorrect.

INV PORT TYPE = The port specified is not an OSPSPORT and therefore cannot be changed using the specified input request. Determine the port's type, OP:CONV input message may help, and use the input request appropriate for its type.

INV STATUS = An invalid status for the OSPSPORT was specified in the input request.

NO PROCESS = An attempt to create a process failed. Possibly caused by the system's being busy. Retry the request later.

PORT BUSY = The OSPSPORT remained busy for the camp-on period or an in-progress camp-on was terminated.

PROCESS TIMEOUT = Internal time-out during processing request aborted.

SM UNAVAILABLE = The input request could not be completed because a needed SM was unable to respond. Retry the request later.

STATUS CONFLICT = Status to be added conflicts with the existing status on the OSPSPORT.

SYSTEM BUSY = The system's processing capability limit was reached or a system resource was unavailable. Retry the request later.

SYSTEM ERROR = System error occurred making it impossible to continue processing request.

e = The status to be deleted from the OSPSPORT. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a description.

f = The resulting primary status in effect on the OSPSPORT. This status is the most restrictive to call processing currently on the OSPSPORT. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

g = The pending statuses (0-3) in effect on the OSPSPORT, if any. (Less restrictive than the primary status.) Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.

h = Telephone number.

i = Data link (group) number of the associated autoquote data link.

j = Relative link (member) number of the associated autoquote data link.

k = Operator service center number.

l = Relative position number.

m = Force management center number of the XDPF.

n = Switching module (SM) number.

o = ISLU number.

p = Line group controller number.

q = Line card number.

r = Trunk unit number.

s = Service group number.

t = Channel board number.
4. ACTION TO BE TAKEN

If the OSPSPORT is not in-service, identify the OOS condition for the primary status currently in effect and determine the appropriate recovery steps. To get a list of all OSPSPORTs or a group of OSPSPORTs with a specified status, refer to the OP:LIST input message.

5. ALARMS

RST:PCTDX

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RST_PCTDX=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an RST:PCTDX input request to restore the peripheral control and timing data exchanger (PCTDX) to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

b = Peripheral control and timing data exchanger unit (PDXU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

c = Peripheral control and timing data exchanger (PCTDX) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

d = Termination status. Valid value(s):

  ABORTED = Requested action was terminated before completion, and the termination was not graceful.

  COMPLETED = Requested action has successfully completed.

  NOT_STARTED = Requested action was not begun.

  STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

e = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

If an autonomous RST message fails, an alarm will indicate the effect to the office.

RST:PLTLK
Software Release: 5E15 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RST PLTLK=a-b-c-d e [f]

2. REASON FOR OUTPUT

Indicates the result of executing a RST:PLTLK command to restore a PCT (Peripheral Control and Timing) line and trunk unit link to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = PLTU (PCT Line and Trunk Unit) number.
c = PCT Facility Interface number.
d = PCT Facility Interface side number.
e = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was successfully completed.
   NOT_STARTED = Requested action was not started.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

f = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

RST:PMU

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST PMU=a-b-c f [g]

2. REASON FOR OUTPUT

To report the result of executing a RST:PMU input message to restore a precision measurement unit (PMU) to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Directly connected test unit number.
c = Circuit number.
f = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

g = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.

No alarm = No effect.
Minor = Small reduction in traffic capability.
Major = A problem exists and is denying customer service or causing a 25-50% reduction in traffic capability.
Critical = A problem exists and is denying customer service or causing at least a 50% reduction in traffic capability.

RST:PPC

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST PPC=a b [c] EVENT=d

2. REASON FOR OUTPUT

To acknowledge a request to restore the specified pump peripheral controller (PPC) to service.

3. VARIABLE FIELD DEFINITIONS

a = PPC number (0 or 1).

b = Termination report. Valid value(s):
- ABORTED = Requested action is terminated before a normal completion and the consistency of hardware states or data is questionable.
- COMPLETED = Request action is terminated after completion.
- NOT_STARTED = Requested action has not begun.
- STOPPED = Requested action is terminated before a normal completion but consistency of hardware states and data is reliable.

c = Additional information qualifying the termination report.

d = Event number.

4. ACTION TO BE TAKEN

[3] RST PSUCOM=b-c-d f o h
   p:
   q [r]

2. REASON FOR OUTPUT

Indicates the result of an RST:PSU input message to restore a packet switching unit common controller (COM) to service.

Format 1 is the result of a restore request.

Format 2 and Format 3 are used for PSUCOM non-volatile memory (NVMEM) modification report.

Format 2 reports a list of version identifiers associated with the firmware and hardware images of the control fanout (CF) and packet fanout (PF) of the PSUCOM.

3. VARIABLE FIELD DEFINITIONS

b = Switching module (SM) number.
c = Packet switching interface unit number.
d = Service group number.
e = Protocol handler number.
f = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   IN PROGRESS = Restore request is in progress.
   NOT STARTED = Requested action was not started.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
g = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual. If Format 1 is associated with an NVMEM request, please refer to the APP:NVMEM-REAS appendix.

h = NVMEM version query status. Refer to the APP:NVMEM-REAS appendix in the Appendixes section of the Output Messages manual for valid values.

i = PSU image type. Valid value(s):
  CF3 FW = Control fanout model 3 (CF3) firmware (FW) image.
  CF3 HW = CF3 hardware (HW) image.
  PF3 FW = PF3 FW image.
  PF3 HW = PF3 HW image.

j = PSUCOM shelf number.

k = Version identifier associated with the factory-programmed FW/HW image.

l = Version identifier associated with the writable FW/HW image.

m = Version identifier associated with the last booted, currently running FW/HW image. This is the image selected from the last reset.

n = Version identifier associated with the optional data region (ODR) image resident on SMP.

o = Text identifier showing order of record. Valid value(s):
  FIRST = First record of continuing list.
  LAST = Last record of list.
  NEXT = Next record of continuing list.
  NO RECORD AVAILABLE FOR THIS REQUEST = Used by NVMEM requests. Indicates that no offnormal records were found.

p = Header for NVMEM supplementary data. Valid value(s):
  ATTRIBUTE = Attribute of the image header information.
  STIMULUS = Stimulus for NVMEM errors encountered.

q = NVMEM supplementary information reason. Refer to the Supplementary Data Reasons table in the APP:NVMEM-REAS appendix in the Appendixes section of the Output Messages manual.

r = Data supplementing reason. The first hexadecimal number represents the specific circuit packs that are failing. A definition of the bitmap is in the APP:NVMEM-REAS appendix. If more hexadecimal dumps are displayed, contact technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the References section of this message.

If the output is related to an NVMEM request, please refer to the APP:NVMEM-REAS appendix for more details.

RST:QGP

Software Release: 5E14 and later
Message Class: MSGS
Application: 5
Type: Output

1. FORMAT

RST QGP=a-b c [d]

2. REASON FOR OUTPUT

To report the result of a request to restore the specified quad-link gateway processor (QGP) to service.

Note: As part of the QGP reconfiguration the quat-link packet switch (QLPS) may have been switched also.

3. VARIABLE FIELD DEFINITIONS

a = Message switch side number.
b = QGP number.
c = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
d = Additional information qualifying the termination status.

RST:QLPS

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RST QLPS=a-b c [d]

2. REASON FOR OUTPUT

To report the result of a request to restore the specified quad-link packet switch (QLPS) from service.

Note: If the resulting QLPS configuration is not optimal after the restoration, an automatic reconfiguration (switch) of the QLPS occurs.

3. VARIABLE FIELD DEFINITIONS

a = Office network and timing complex (ONTC) side number.
b = QLPS network number.
c = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
d = Additional information qualifying the termination status.

1209 (ONT 0 & 1)
1380/1 (QLPS NETWORK 0/1 STATUS)
RST:QPHPIPE
Software Release: 5E15 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

[1] RST QPHPIPE=a-b-c-d-e OPC=f STOPPED g

[2] RST QPHPIPE=a-b-c-d-e OPC=f STATE=ACT SUCCESS

[3] RST QPHPIPE=a-b-c-d-e OPC=f STATE=h FAILED i

2. REASON FOR OUTPUT

Format 1 reports that the quad-link packet switch protocol handler (QPH) QPIPE restore request cannot be processed by the global switching module (GSM) for the reason specified.

Format 2 reports the successful restore of a QPH QPIPE.

Format 3 indicates a QPH QPIPE restore has been attempted, but failed (usually due to hardware outages).

3. VARIABLE FIELD DEFINITIONS

a = GSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

b = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

d = QPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

e = Quad-link packet switch (QLPS) network number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

f = OPC (9-digit primary originating point code associated with the GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for a description of ANSI and AT&T/UNITEL formats.

g = Reason for failure. Valid value(s):
DATABASE ERROR = QPH QPIPE restoration process halted due to a database error.
MESSAGE TIMEOUT = Response from QPH did not arrive within a timeout interval monitored by the controlling ISPA terminal process.
BOTH QPH QPIPES MUST BE EQUIPPED = Both QPH QPIPEs on a particular QPH must be provisioned, before either can be restored.
QPH QPIPE ALREADY ACT = The QPH QPIPE restoration request was not accepted, as it is already ACT (and message transport would be disrupted, if it was restored again).
ISPA UNSUCCESSFUL = An ISPA terminal process required to attempt the QPH QPIPE restoral could not be created due to system load (retry later).

MAINTENANCE BUSY = The QPH QPIPE port is owned by another maintenance process, which may result in a state transition (retry later).

QPH QPIPE UNEQUIPPED = The restoral process halted because the QPH QPIPE is unequipped.

= Resultant state. Valid value(s):

OS-LVL1-PATH = The QPH QPIPE is OOS because a TSI-QPH path could not be established during a QPH QPIPE restore attempt (probably due to database read failures or other resource problems).

SMP-controlled periodic retries or external events will attempt to automatically recover such a QPH QPIPE.

OOS-LVL1-FRAME = The QPH QPIPE is OOS because SPORT circuitry on the PH has detected framing errors (probably due to undetected QLPS network hardware errors or TSI faults). A local loopback test (at the PH) has passed, but framing errors persisted when the QPH QPIPE was reconnected to the QLPS network/TSI.

SMP-controlled periodic retries or external events will attempt to automatically recover such a QPH QPIPE, or a transition to a more stable OOS state will occur as hardware errors are detected by fault recovery.

OOS-QLPSLB = The QPH QPIPE has its associated the TSI-QPH path is established, and the QPH SPORT channel is activated (including a local loopback test in the PH), and periodic attempts to pass a loopback test to the ACT QLPS are scheduled. However, the QPH QPIPE is still OOS, as the QLPS loopback test has not yet passed (probably due to undetected QLPS network or TSI faults).

QPH-controlled periodic retries or external events will attempt to automatically recover such a QPH QPIPE, or a transition to a more stable OOS state will occur as hardware errors are detected by fault recovery.

OOS-QPHLB = The QPH QPIPE is OOS, as a local loopback test (at the PH) was performed and failed, indicating the problem is within the resident PH hardware. Another source of this status is the inability of the SPORT to be activated (a hardware failure). An automatic QPH switch was requested, but no STBY spare PH22 is available on the same shelf; the QPH remains in-service, as the mate QPH QPIPE is ACT.

A spare PH22 on the same shelf must be restored, or the faulty PH containing the OOS-QPHLB QPH QPIPE must be manually removed/repaired, to recover the QPH QPIPE.

OOS-DACT = The QPH QPIPE has been manually deactivated (removed from service).

Exit from this state requires a manual QPH QPIPE restore (or occurs during a full GSM initialization).

OOSF-PH = The QPH is OOS due to "family-of-equipment" reasons because the channel group associated with this QPH QPIPE is unassigned (due to a manual or fault recovery removal of a PH22, when there was no STBY spare PH22 available on the same shelf).

Automatic attempts to restore the affected QPH QPIPE will occur, when a PH22 is repaired and/or restored, and the parent QPH channel group is reassigned.

OOSF-CM = The QPH QPIPE is OOS due to "family-of-equipment" reasons associated with a parent TMSLNK/QTMSLNK outage (communication module or CM hardware).

Automatic attempts to restore the affected QPH QPIPE will occur, when the OOS
TMSLNK/QTMSLNK is repaired and/or restored. 

Note that OOS-LVL1-PATH, OOS-QPHLB, OOS-DACT and OOSF-PH are of higher priority (as they reflect local conditions associated with the QPH endpoint), and an OOSF-CM state will not be reported in this case, even if parent TMSLNK/QTMSLNK hardware is OOS.

Failure cases. Valid value(s):

QPH QPIPE OOS FE PH = The QPH QPIPE restore failed because the associated channel group is unassigned. If the QPH QPIPE possessed a pending OOS-DACT state, it will have been deleted by the restore request (even though the physical restore is impossible).

TSI-QPH PATH NOT ESTABLISHED = If the TSI-PH path cannot be established, the restore will be halted, and the QPH QPIPE port status will be marked OOS-LVL1-PATH.

QPH CHANNEL FAILURE = If the local QPH loopback test (looped at the SPORT output), or the SPORT channel activation fails for some other reason, the restore will be halted, causing status to transition to OOS-QPHLB.

QLPS LOOPBACK FAILURE = If the QLPS loopback test fails (and parent CM hardware is functional), the QPH QPIPE state will transition to the OOS-QLPSLB state.

FRAME FAILURE = If frame errors are detected at the PH SPORT circuit (and parent CM hardware is functional), the QPH QPIPE state will transition to the OOS-LVL1-FRAME state.

QPH QPIPE OOS FE CM = If the QLPS loopback test fails or frame errors are detected (and parent TMSLNK/QTMSLNK or grand-parent CM hardware is OOS), the QPH QPIPE state will transition to the OOSF-CM state.

SM MIN-MODE = The SM is operating in MIN-MODE, and the resultant state is OOS-DACT.

4. ACTIONS TO BE TAKEN

For failures reported in Format 1 output, no further action is required, if the QPH QPIPE is already ACT or if only one QPH QPIPE is equipped on a QPH channel group. If ODD problems are noted, they should be resolved according to local practices. All other failures indicate high system load, so the input request should simply be retried later.

No action is required for Format 2 outputs, as the restore was successful.

Failures indicated by Format 3 should be addressed by corrective maintenance procedures. Refer to the 235-200-116 for additional information.

5. ALARMS

None.

[6] RST ROP a STOPPED MESSAGE COMPLETE

2. REASON FOR OUTPUT

To report the disposition of a request to restore a receive-only printer (ROP) to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4 - 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
X’1 = Restore process error.
X’2 = Driver error.
[NULL] = Restore denied by driver or configuration control (CONFIG).

c = Error code. Valid value(s):
For restore process error (‘b’ = X’1), refer to the APP:IOP-H appendix in the Appendixes section of the Output Messages manual.
For driver error ('b' = X'2), refer to the APP:IOP-G appendix in the Appendixes section of the Output Messages manual.

\[d\] = Error code, refer to the APP:IOP-I appendix in the Appendixes section of the Output Messages manual.

\[e\] = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

5. ALARMS

The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

118 (CNI FRAME AND CCS LINK STATUS)
RST:RRCLK

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

RST RRCLK=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an RST:RRCLK input message to restore a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK) to service. This output message can also result from automatic fault recovery actions.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RISLU number.
c = RRCLK side.
d = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

e = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to Manual 235-105-220, Corrective Maintenance.

5. ALARMS

A major alarm will result if an automatic restore-to-service is stopped due to diagnostic failures.

Message Class: SMCONFG
Application: 5
Type: Output

1. FORMAT

RST RT EOC=a-b c [d]

2. REASON FOR OUTPUT

To report the result of a RST:RT-EOC input message that restores a remote terminal (RT) embedded operations channel (EOC) circuit to service.

3. VARIABLE FIELD DEFINITIONS

a = Site identification number.
b = EOC number.
c = Termination report. Valid value(s):
   ABORTED = Immediate termination. A process has been purged and cleanup will be done by audits.
   COMPLETED = Requested action was successfully completed.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

d = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

RST:RVPT

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST RVPT=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of executing RST:RVPT input message to restore the revertive pulsing transceiver (RVPT) to active status, or as the result of a recovery action to remove, diagnose, and restore the circuit to service if the diagnostic successfully executes.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Unit number.
c = Service group.
d = Circuit number.
e = Termination status. Valid value(s):
   ABORTED = The restoring process was purged. Further output showing data recovery by audits may follow.
   COMPLETED = Successful completion.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion. (Process gracefully terminated.)

f = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

Major alarm if a recovery requested RST:RVPT fails.

RST:S96-STOPPED

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST S96 STOPPED CAMPON TIMEOUT

2. REASON FOR OUTPUT

To report a failure of a restoration of a line associated with a SLC® 96 carrier shelf or shelf group.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTIONS TO BE TAKEN

Enter the OP:LIST,LINES,OOS,FE message at the master control center (MCC) or supplemental trunk and line workstation.

Look for any SLC®96 line equipment numbers (SLENs) that are out-of-service maintenance family of equipment manual (OOS MTCE FE MAN). For example, SLEN a-b-c-d OOS MTCE FE MAN (Where 'a' equals the SM number, 'b' equals the DCLU number, 'c' equals the RT number, and 'd' equals the Port). Determine if the shelf associated with this line is in service, and if so, restore the port manually (RST:LINE,SLEN).

RST:SBUS

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

   RST SBUS a b [c] [d]

2. REASON FOR OUTPUT

   To report the status of a request to restore a small computer system interface (SCSI) bus (SBUS) to service.

   If the restore process was invoked using the RST SBUS poke on the DFC status page during disk independent operation (DIOP) mode, a "REPT DKDIP MESSAGE" precedes the actual output message line.

3. VARIABLE FIELD DEFINITIONS

   a  = SBUS member number.

   b  = Disposition of the request. Valid value(s):
       ABORTED  = Restore aborted.
       COMPLETED = Unit restored.
       ERROR    = Encountered an error, restore aborted.
       IN PROGRESS = Unit is being initialized.
       NOT STARTED = The restore is not started.
       STOPPED  = Restore stopped.

   If 'b' = 'c' = 'd' = ABORTED, ERROR, NOT STARTED, STOPPED, and if the input message was started using the RST SBUS poke on the DFC status page, then:

   One of the following error codes:
   f09 = Failed to get the UCB of the unit by name.
   f18 = Unit is not out-of-service (OOS).
   f1e = Failed to open the device.
   f20 = Refer to DKDRV error report on the receive only printer (ROP).
   f57 = Message to the driver port failed.
   f60 = Message reception failure.
   f63 = Process timed out waiting for message.
   f67 = Failed to close special device file.
   ffe = Aborted due to phase 1.

   Error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

   ABORTED

   Type of error:
   1 = Diagnostic restore process error.
   2 = DFC driver restore process error.
   [NULL] = Bootstrap restore failure.

   Error code:
   For a diagnostic restore process error ('c' = 1), refer to the APP:DFC-G appendix in the Appendixes section of the Output Messages manual.

   For a DFC driver error ('c' = 2), refer to the APP:DFC-A appendix in the Appendixes section of the Output Messages manual.
4. ACTION TO BE TAKEN

If restore did not complete successfully, correct the source of trouble and attempt to restore again. If the error condition persists, contact the next level of technical support.

5. ALARMS

OMDB key 308 has a variable (VAR) alarm. There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

OMDB key 601 has a major (MAJ) alarm. If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

(DFCE STATUS PAGE)
RST:SCAN

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST SCAN=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of executing a RST:SCAN input message to restore a scan point board (SCAN) to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit number.
c = Service group number.
d = Scan point board number.
e = Termination status. Valid value(s):
  ABORTED = Immediate termination.
  COMPLETED = Successful completion.
  COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
  NOT STARTED = Action has not begun.
  STOPPED = Terminated before normal completion.

f = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the References section of this message.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.
No alarm = No effect.
*Minor = Small reduction in traffic capability.
**Major = A problem exists and is denying customer service or causing a 25-50% reduction in traffic capability.
*C Critical = A problem exists and is denying customer service or causing at least a 50% reduction in traffic capability.

Type: Output

1. FORMAT

[1] RST SCC a COMPLETED

[2] RST SCC a ABORTED [b] [c]

[3] RST SCC a STOPPED d

[4] RST SCC a TASK e MSG STARTED

[5] RST SCC a STOPPED MESSAGE IN PROGRESS

[6] RST SCC a STOPPED MESSAGE COMPLETE

2. REASON FOR OUTPUT

To report the disposition of a request to restore a Switching Control Center (SCC) to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4 - 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
X'1' = Restore process error.
X'2' = Driver error.
[NULL] = Restore denied by driver or configuration control (CONFIG).

c = Error code.

For restore process error ('b' = X'1'), refer to the APP:IOP-H appendix in the Appendixes section of the Output Messages manual.
For driver error (‘b’ = X’2), refer to the APP:IOP-G appendix in the Appendixes section of the Output Messages manual.

d = Error code, refer to the APP:IOP-I appendix in the Appendixes section of the Output Messages manual.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

5. ALARMS

The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

RST:SCTP

Software Release: 5E16(2) and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

[1] RST SCTP ENDPT=a c
    STATE=d PCRGRP=e-f-g PSUPH=e-f-h-i SHELF-CHGRP=h-j

[2] RST SCTP ASSOC=b c
    STATE=d PCRGRP=e-f-g PSUPH=e-f-h-i SHELF-CHGRP=h-j
    NEAR ENDPT=k FAR ENDPT=l

2. REASON FOR OUTPUT

To report the result of executing a RST:SCTP input message to restore a stream control transmission protocol (SCTP) endpoint or association from service.

Format 1 provides the status of the ENDPOINT after the restore input message is finished.

Format 2 provides the status of the ASSOCIATION when the input is for a specific association.

3. VARIABLE FIELD DEFINITIONS

a = Endpoint name to be restored to service. This is a character string (≤20) that is provisioned on RC/V View 33.19 (SCTP NEAR END POINT).

b = Association number to be restored to service. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Request's termination status. Valid value(s):
    COMPLETED = Command is successfully executed.
    FAILED-TIMED OUT WAITING FOR SM = The AM timed out waiting for response from the SM
    FAILED-UNEXPECTED MESSAGE IN AM = An unexpected message was received in the AM.
    STOPPED-ASSOCIATION RESOURCE BUSY = Association is busy.
    STOPPED-PROCESSOR GROUP RESOURCE BUSY = Processor group is busy or another endpoint
    or association job is in progress.
    STOPPED-PROCESSOR GROUP UNAVAILABLE = Processor group is unavailable.
    STOPPED-REQUESTED STATE = Already in requested state.
    STOPPED-SELECTIVE INIT = Command blocked because SM is in selective Initialization.
    STOPPED-SYSTEM ERROR = A system error occurred making it impossible to continue processing
the request.

STOPPED-TIMED OUT = Timed out waiting to get ownership of resource.
TIMED OUT-COMMAND IN PROGRESS = Time out occurred. Command is still in progress.

d = Status of endpoint or association at termination of request. Refer to the APP:SCTP appendix in the Appendixes section of the output message manual for an explanation of the SCTP statuses.

e = Switching module (SM) number.
f = Packet switch unit (PSU) number.
g = Processor group number.
h = PSU shelf number.
i = Protocol handler number.
j = Channel group (CHGRP) number.
k = New SCTP near endpoint name.
l = New SCTP far endpoint name.

a = Member number.

b = Type of error. Valid value(s):
   X'1' = Restore process error.
   X'2' = Driver error.
   [NULL] = Restore denied by driver or configuration control (CONFIG).

c = Error code.

For restore process error ('b' = X'1'), refer to the APP:IOP-H appendix in the Appendixes section of the Output Messages manual.
For driver error ('b' = X'2), refer to the APP:IOP-G appendix in the Appendixes section of the Output Messages manual.

d = Error code, refer to the APP:IOP-I appendix in the Appendixes section of the Output Messages manual.

e = Diagnostic task number assigned to the request.

4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

5. ALARMS

The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

| e     | Termination status. Valid value(s):  
| ABORTED | Requested action was terminated before completion, and the termination was not graceful.  
| COMPLETED | Requested action was successfully completed.  
| IN PROGRESS | Requested action is in progress.  
| NOT STARTED | Requested action was not started.  
| STOPPED | Requested action was terminated before a normal completion. Termination was graceful. |
| f     | Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual. |

4. **ACTION TO BE TAKEN**

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. **ALARMS**

Failure of an automatic restoration of the first SFI in a DNU-S data group will cause a major alarm. Failure of an automatic restoration of an SFI while the mate SFI is in an out-of-service (OOS) state will cause a critical alarm.

RST:SLIM
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST SLIM=a-b-c-d e [f]

2. REASON FOR OUTPUT

To report the result of executing a RST:SLIM input message to restore a subscriber line instrument measurement (SLIM) board to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit number.
c = Service group number.
d = SLIM board number.
e = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

f = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the References section of this message.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.
No alarm = No effect
*Minor = Small reduction in traffic capability
**Major = A problem exists and is denying customer service or causing a 25-50% reduction in traffic capability.
*C Critical = A problem exists and is denying customer service or causing at least a 50% reduction in traffic capability.

RST:TEN

Output Appendix(es):

APP:MAINT-RESP
RST:TMSFP

Software Release: 5E16(2) and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RST TMSFP=a-b c [d]

2. REASON FOR OUTPUT

To acknowledge a request to restore a time multiplexed switch (TMS) fabric pair (TMSFP) to service.

3. VARIABLE FIELD DEFINITIONS

a = Office network and timing complex (ONTC) side.
b = TMS fabric pair number.
c = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   NOT_STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion due to manual request, hardware failure, or data inconsistency.

d = Additional data qualifying the termination field. Refer to the APP:CM-OM-REASON appendix in the Appendixes section of the Output Messages manual for a list of these reasons and their meanings.

4. ACTIONS TO BE TAKEN

No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the variable 'd' should give some indication as to why the request failed. Check the appropriate MCC pages or OP:CFGSTAT output message to verify that the associated units were in a valid state to perform the request.

5. ALARMS

None.

Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RST TMSLNK=a-{b|b&&c} d [e]

2. REASON FOR OUTPUT

To acknowledge a manual request to restore a specific time multiplex switch link (TMSLNK) or a range of TMSLNKs to service.

3. VARIABLE FIELD DEFINITIONS

a = Office network and timing complex (ONTC) side the TMSLNKs are on.

b = Specific TMS link restored. If specified as a range ('b' to 'c'), variable 'b' was the first TMSLNK in the range.

C = The last TMS link to be restored in the range between variable 'b' and including variable 'c'.

d = Termination report. Valid value(s):

   COMPLETED = Request completed successfully.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

No further action is necessary if the request completed successfully. If the termination report is not completed, variable 'e' should give some indication as to why the request failed. Check TMS link MCC pages or the OP:CFGSTAT output message to verify that the system was in a valid state to perform the request.

5. ALARMS

RST:TMSLNK-B

Software Release: 5E16(2) and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

RST TMSLNK=a[-b]-c[&&d] e [f]

2. REASON FOR OUTPUT

To acknowledge a manual request to restore a specific time multiplex switch link (TMSLNK) or a range of TMSLNKs to service.

3. VARIABLE FIELD DEFINITIONS

a = Office network and timing complex (ONTC) side the TMSLNKs are on.

b = Time multiplexed switch fabric pair (TMSFP) number. For CM2 offices, this parameter is not displayed as part of the TMS link identification, since it is always 0. For CM3 offices, this parameter is always displayed, since it is required to identify a TMSLNK.

c = Specific TMS link restored. If specified as a range ('c' to 'd'), variable 'c' was the first TMSLNK in the range.

d = The last TMS link to be restored in the range between variable 'c' and including variable 'd'.

e = Termination report. Valid value(s):
   COMPLETED = Request completed successfully.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

f = Additional data qualifying the termination field.

4. ACTIONS TO BE TAKEN

No further action is necessary if the request completed successfully. If the termination report is not completed, variable 'f' should give some indication as to why the request failed. Check TMS link MCC pages or the OP:CFGSTAT output message to verify that the system was in a valid state to perform the request.

5. ALARMS

   .
   .
   .

[3] RST TRK [PRIGRP=r|TKGMN=a-b&&c|TG=a] [CH=w] z

2. REASON FOR OUTPUT

To show that a trunk has been restored to service by deleting the indicated status from the specified trunk. Format 1 shows a restoration attempt of digital or analog trunks. Format 2 shows a restoration attempt of X.25 access on T1 (XAT). Format 3 indicates the start and/or end of a group or range restoration. This message may be in response to a RST:TRK input message or may be generated automatically. The status information in the left half (column) of the message format is the status that was to be deleted. The status in the right half (column) of the message is the status in effect at the completion of the attempt to restore the port. Logical test ports (LTP) are identified with the corresponding logical test port numbers.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Trunk group number.
b = Trunk group member number, or lower limit of a range of trunk member number.
c = Upper limit of a range of trunk member number.
d = SM number.
e = Digital line and trunk unit (DLTU) number.
f = The digital facility interface number.
g = Channel number.
h = IDCU number.
i = Remote terminal (RT) number.
j = RT line number.
k = LTP number.
l = RAF or SAS unit number.
m = RAF or SAS announcement channel number.
n = The result of the restoration request. Valid value(s):
ALREADY IS  = The trunk was already in service. Therefore, the status specified in the input message could not be deleted from the trunk. No change was made to the status of the trunk.
CAMPON FAIL = The request to camp on the trunk failed.
CHAN ACTIVATION FAIL = The packet switching trunk was not restored to service because the protocol handler (PH) channel could not be activated. This failure was caused by an internal software and/or hardware error. An attempt will be made periodically (approximately every three minutes) to restore the trunk to service automatically.
CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) is unable to respond. Retry the request later.
COMPLETED = The specified status was successfully added to the trunk. Resulting status is indicated.
COMPLETED,LINES REMAIN = The request completed successfully but some or all ports may be defined as lines. Use RST:LINE message for the line ports.
COMPL-PH SWITCHED = The restore was successful, but a PH switch was required.
COMPL-RST FAIL = The specified status was added to this D-channel backup primary rate interface (DCBU PRI) D-channel while a restoration was in progress. The restoration has failed.
COMPL-RST SUCCESS = The restoration of a DCBU PRI D-channel completed successfully. The PRI now has an active D-channel for signalling.
COMPL-SWITCH SUCCESS = Switch-over to the standby D-channel of a DCBU PRI has been completed successfully. The PRI now has an active D-channel for signalling.
DATABASE ERROR = The specified port status could not be deleted from the trunk because static data associated with the trunk could not be updated. This error can occur if customer originated recent changes (CORCs) are inhibited or if the office database editor (ODBE) is being used to update data associated with the trunk.
DENIED-HARDWARE OOS = The trunk could not be restored to service because the associated hardware was out-of-service (OOS). The supplementary information field of the port status indicates the piece of hardware that was OOS.
DENIED-PRI RST IP = The trunk could not be restored to service because the trunk specified is a PRI D-channel on a PRI that is in the process of being automatically restored. Wait for the D-channel restore to complete before attempting to restore this trunk.
DENIED-RESET INPROG = The specified port status could not be deleted from the trunk because the trunk is in the process of being reset. Use the UCL option to manually override this restriction.
DENIED-SDL REQUIRES UCL = The request was denied because requests to the status of a DEN or NEN supporting an signalling data link (SDL) port are not recommended and must have the UCL option applied.
FAILED-LINK LVL FAILURE = The packet switching trunk was not restored to service could not be established with the far-end switch. Supplementary information field of the trunk
port status indicates why level 2 did not come up.

**INPUT ERROR** = Some data entered in the input request was invalid or incorrect.

**INV EQUIPMENT** = The request was for equipment that does not exist or is not assigned.

**INV HARDWARE** = The request does not match the hardware type of the port.

**INV PORT** = The trunk could not be located in the database. The trunk identifier used in the input request was most likely invalid or incorrect.

**INV PORT TYPE** = The specified port is not a trunk.

**INV STATUS** = The status specified is not valid. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual to determine valid states for each port type.

**NAILUP FAILED** = The packet switching trunk was not restored to service because a nailed-up path could not be established between the digital facility interface (DFI) circuit and the protocol handler (PH) circuit. The failure in establishing the nailed-up path was caused by the internal software and/or hardware error. An attempt will be made periodically (approximately every three minutes) to restore the trunk to service automatically.

**NO MATCH** = The status specified in the input request to delete a status did not exist on the trunk.

**NON-UNIQUE NXX DN** = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

**NO PROCESS** = An attempt to create a process failed. This may possibly have been caused by the system's being busy. Retry the request later.

**NO STATUS MATCH** = The trunk was OOS, but not for any of the reasons specified (refer to variable 'o'). No change was made to the status of the trunk.

**OCU LBK TST FAILED** = The packet switching trunk was not restored to service because the operational digital loopback test with the termination point at the office channel unit (OCU) failed. The digital loopback test requires an integrated services transmission function (ISTF) or global digital services function (GDSF) unit to be operational. An attempt will be made periodically (approximately every three minutes) to restore the trunk to service automatically. Use the "UCL" option on the RST:TRK input message to bypass the OCU loopback test.

**PH ACT TST FAILED** = The PH channel was not restored to service as the test run within the PH on channel activation or channel refresh failed. An attempt was made to switch to a different PH of the same type but no spare PH is available or the soft switch of this PH type is not allowed. The status was changed to OOS-FE-PSIU and the PH may be degraded.

**PH LBK TST FAILED** = The packet switching trunk was not restored to service because the operational digital loopback test within the PH failed. An attempt will be made to switch to a different PH, and if no spare is available, then the trunk status will be changed to OOS-FE-PSIU. If a spare PH is available, then the trunk will be restored to service in a few minutes.

**PORT BUSY** = The trunk remained busy for the campon period or an in-progress campon was terminated.

**PROCESS TIMEOUT** = Internal time-out during processing request aborted.

**REQUEST FAILED** = A system error occurred making it impossible to continue processing the request.

**RESOURCE FAILURE** = The specified port status could not be deleted from the trunk because of a temporary resource shortage. Either a process could not be created or a storage buffer was full because the system is busy. Retry the request later.

**RST IN PROGRESS** = The specified status was successfully deleted from the trunk. Restoration of a DCBU PRI D-channel is in progress. Additional messages will follow to indicate the result of the restoration attempt.

**SM UNAVAILABLE** = The input request could not be completed because a needed switching
module (SM) is unable to respond. Retry the request later.

**STATUS CONFLICT** = The trunk was not able to be restored to service since a port status inconsistency would have resulted by placing the trunk in service (IS). The trunk was left in the indicated OOS state. For example, attempting to restore a circuit switched B-channel while the associated D-channel is OOS is not allowed.

**SYSTEM BUSY** = The systems processing capability has been reached or a system resource was unavailable. Retry the request later.

**SYSTEM ERROR** = A system error occurred making it impossible to continue processing the request.

**TEST FAILED** = The operational test performed on the trunk failed. No status change was made.

**UCD|MUPH MLHG** = The DN entered was a multi-line hunt group channel and as such cannot be restored by specifying its DN. An equipment number (that is, DEN) or MLHG and member number must be specified. To obtain the equipment number and/or multi-line hunt group and member number, refer to office records for the DN.

-o = Status that was requested to be deleted from the trunk. If more than one status was deleted, all are identified on subsequent lines in the same column. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the trunk status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a description of a trunk status and its subfields.

-p = Resulting primary status in effect on the trunk. This status is the most restrictive to call processing currently on the trunk. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status subfields.

-q = Pending statuses in effect on the trunk. A trunk may have from zero to three pending statuses, all of which are listed on subsequent lines of this message. Pending statuses are less restrictive than the primary status. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status subfields and the status hierarchy.

-r = PRI group number.

-s = Directory number.

-t = Multi-line hunt group number.

-u = Multi-line hunt group member number.

-v = Valid value(s):

- DEN=d-e-f-g
- ILEN=d-h-i-j
- INEN=d-a^1-l-j
- LTP=d-k
- NEN=d-a^1-b^1-o^1-c^1-d^1-p^1-e^1
- PSUEN=d-k^1-l^1-m^1-n^1
RAF=d-l-m
SAS=d-l-m
SLEN=d-f^1-i-j
TEN=d-g^1-h^1-i^1-j^1

w = Channels on the PRI being restored. Valid value(s):
D = D-channel of the PRI or both D-channels if the PRI is equipped with a backup
    D-channel.
B = All B-channels of the PRI.

x = Identifying number of the FGB carrier, which can be up to 4 digits. If shown, this variable indicates
    a direct trunk to a carrier.

y = Identifying number of the FGD carrier, which can be up to 4 digits. If shown, this variable indicates
    a direct trunk to a carrier.

z = Status report. Valid value(s):
COMPLETED = Restore processing for the trunk group, PRI group, or range of trunks has
            completed.
DATABASE ERROR = An internal error occurred while attempting to access the trunk group or PRI
                 group data. Repeat the request if desired.
INVALID PRI GROUP = The PRI group specified in the input request was invalid. Verify that the
                correct group number was specified.
NO CHANNELS ASSIGNED = The PRI group specified does not have any channels assigned to it.
STARTED = Request was received and action has started.
TG INVALID = The trunk group specified in the input request was invalid. Verify that the correct
             group number was specified.

a = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
b = Data group number.
c = Synchronous transport signal (STS) number.
d = Virtual tributary group number.
e = Digital signal level 0 (DS0).
f = Digital carrier line unit number.
g = Trunk unit number.
h = Service group number.
i = Channel board number.
j = Circuit number.
k = PSU unit number.
l = PSU shelf number.
m = PSU channel group number.
n\textsuperscript{1} = PSU channel group member number.

c\textsuperscript{1} = SONET termination equipment (STE) number.

p\textsuperscript{1} = Virtual tributary member number.

2. REASON FOR OUTPUT

To show that a trunk has been restored to service by deleting the indicated status from the specified trunk.

Format 1 shows a restoration attempt of digital or analog trunks. Format 2 shows a restoration attempt of X.25 access on T1 (XAT). Format 3 indicates the start and/or end of a group or range restoration. This message may be in response to a RST:TRK input message or may be generated automatically. The status information in the left half (column) of the message format is the status that was to be deleted. The status in the right half (column) of the message is the status in effect at the completion of the attempt to restore the port. Logical test ports (LTP) are identified with the corresponding logical test port numbers.

3. VARIABLE FIELD DEFINITIONS

Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Trunk group or bearer independent call control (BICC) group number.

b = Trunk group member number or normalized call instance code (CIC), or lower limit of a range of trunk group member numbers or normalized CICs.

c = Upper limit of a range of trunk group member numbers or normalized CICs.

d = SM number.

e = Digital line and trunk unit (DLTU) number.

f = The digital facility interface number.
g = Channel number.
h = IDCU number.
i = Remote terminal (RT) number.
j = RT line number.
k = LTP number.
l = RAF or SAS unit number.
m = RAF or SAS announcement channel number.

n = The result of the restoration request. Valid value(s):
   ALREADY IS = The trunk was already in service. Therefore, the status specified in the input
                  message could not be deleted from the trunk. No change was made to the status of
                  the trunk.
   CAMPON FAIL = The request to camp on the trunk failed.
   CHAN ACTIVATION FAIL = The packet switching trunk was not restored to service because the
                           protocol handler (PH) channel could not be activated. This failure was caused by an
                           internal software and/or hardware error. An attempt will be made periodically
                           (approximately every three minutes) to restore the trunk to service automatically.
   CMP UNAVAILABLE = The input request could not be completed because a needed communication
                      module (CM) is unable to respond. Retry the request later.
   COMPLETED = The specified status was successfully added to the trunk. Resulting status is
                indicated.
   COMPLETED,LINES REMAIN = The request completed successfully but some or all ports may be
                            defined as lines. Use RST:LINE message for the line ports.
   COMPL-PH SWITCHED = The restore was successful, but a PH switch was required.
   COMPL-RST FAIL = The specified status was added to this D-channel backup primary rate
                     interface (DCBU PRI) D-channel while a restoration was in progress. The
                     restoration has failed.
   COMPL-RST SUCCESS = The restoration of a DCBU PRI D-channel completed successfully. The
                        PRI now has an active D-channel for signalling.
   COMPL-SWITCH SUCCESS = Switch-over to the standby D-channel of a DCBU PRI has been
                          completed successfully. The PRI now has an active D-channel for signalling.
   DATABASE ERROR = The specified port status could not be deleted from the trunk because static
                     data associated with the trunk could not be updated. This error can occur if
                     customer originated recent changes (CORCs) are inhibited or if the office database
                     editor (ODBE) is being used to update data associated with the trunk.
   DENIED-HARDWARE OOS = The trunk could not be restored to service because the associated
                          hardware was out-of-service (OOS). The supplementary information field of the
                          port status indicates the piece of hardware that was OOS.
   DENIED-PRI RST IP = The trunk could not be restored to service because the trunk specified is a
                      PRI D-channel on a PRI that is in the process of being automatically restored. Wait
                      for the D-channel restore to complete before attempting to restore this trunk.
   DENIED-RESET INPROG = The specified port status could not be deleted from the trunk because
                         the trunk is in the process of being reset. Use the UCL option to manually override
                         this restriction.
   DENIED-SDL REQUIRES UCL = The request was denied because requests the status of a DEN or
                            NEN supporting an signalling data link (SDL) port are not recommended and must
                            have the UCL option applied.
FAILED-LINK LVL FAILURE = The packet switching trunk was not restored to service could not be established with the far-end switch. Supplementary information field of the trunk port status indicates why level 2 did not come up.

INPUT ERROR = Some data entered in the input request was invalid or incorrect.
INV EQUIPMENT = The request was for equipment that does not exist or is not assigned.
INV HARDWARE = The request does not match the hardware type of the port.
INV PORT = The trunk could not be located in the database. The trunk identifier used in the input request was most likely invalid or incorrect.
INV PORT TYPE = The specified port is not a trunk.
INV STATUS = The status specified is not valid. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual to determine valid states for each port type.

NAILUP FAILED = The packet switching trunk was not restored to service because a nailed-up path could not be established between the digital facility interface (DFI) circuit and the protocol handler (PH) circuit. The failure in establishing the nailed-up path was caused by the internal software and/or hardware error. An attempt will be made periodically (approximately every three minutes) to restore the trunk to service automatically.

NO MATCH = The status specified in the input request to delete a status did not exist on the trunk.
NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.
NO PROCESS = An attempt to create a process failed. This may possibly have been caused by the system's being busy. Retry the request later.
NO STATUS MATCH = The trunk was OOS, but not for any of the reasons specified (refer to variable 'o'). No change was made to the status of the trunk.

OCU LBK TST FAILED = The packet switching trunk was not restored to service because the operational digital loopback test with the termination point at the office channel unit (OCU) failed. The digital loopback test requires an integrated services transmission function (ISTF) or global digital services function (GDSF) unit to be operational. An attempt will be made periodically (approximately every three minutes) to restore the trunk to service automatically. Use the "UCL" option on the RST:TRK input message to bypass the OCU loopback test.

PH ACT TST FAILED = The PH channel was not restored to service as the test run within the PH on channel activation or channel refresh failed. An attempt was made to switch to a different PH of the same type but no spare PH is available or the soft switch of this PH type is not allowed. The status was changed to OOS-FE-PSIU and the PH may be degraded.

PH BIST TST FAILED = The PH channel was not restored to service as the BIST test run within the PH failed. An attempt was made to switch to a different PH of the same type but no spare PH is available or the soft switch of this PH type is not allowed. The status was changed to OOS-FE-BIST and the PH may be degraded.

PH LBK TST FAILED = The packet switching trunk was not restored to service because the operational digital loopback test within the PH failed. An attempt will be made to switch to a different PH, and if no spare is available, then the trunk status will be changed to OOS-FE-PSIU. If a spare PH is available, then the trunk will be restored to service in a few minutes.

PORT BUSY = The trunk remained busy for the campon period or an in-progress campon was terminated.
PORT PROV IN PROGRESS = The line or trunk is in the process of being provisioned. Retry the request later.
PROCESS TIMEOUT = Internal time-out during processing request aborted.
REQUEST FAILED = A system error occurred making it impossible to continue processing the
request.

**RESOURCE FAILURE** = The specified port status could not be deleted from the trunk because of a temporary resource shortage. Either a process could not be created or a storage buffer was full because the system is busy. Retry the request later.

**RST IN PROGRESS** = The specified status was successfully deleted from the trunk. Restoration of a DCBU PRI D-channel is in progress. Additional messages will follow to indicate the result of the restoration attempt.

**SM UNAVAILABLE** = The input request could not be completed because a needed switching module (SM) is unable to respond. Retry the request later.

**STATUS CONFLICT** = The trunk was not able to be restored to service since a port status inconsistency would have resulted by placing the trunk in-service (IS). The trunk was left in the indicated OOS state. For example, attempting to restore a circuit switched B-channel while the associated D-channel is OOS is not allowed.

**SYSTEM BUSY** = The systems processing capability has been reached or a system resource was unavailable. Retry the request later.

**SYSTEM ERROR** = A system error occurred making it impossible to continue processing the request.

**TEST FAILED** = The operational test performed on the trunk failed. No status change was made.

**UCD|MUPH MLHG** = The DN entered was a multi-line hunt group channel and as such cannot be restored by specifying its DN. An equipment number (that is, DEN) or MLHG and member number must be specified. To obtain the equipment number and/or multi-line hunt group and member number, refer to office records for the DN.

---

o = Status that was requested to be deleted from the trunk. If more than one status was deleted, all are identified on subsequent lines in the same column. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the trunk status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a description of a trunk status and its subfields.

p = Resulting primary status in effect on the trunk. This status is the most restrictive to call processing currently on the trunk. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status subfields.

q = Pending statuses in effect on the trunk. A trunk may have from zero to three pending statuses, all of which are listed on subsequent lines of this message. Pending statuses are less restrictive than the primary status. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status subfields and the status hierarchy.

r = PRI group number.

s = Directory number.

t = Multi-line hunt group number.

u = Multi-line hunt group member number.
v

Valid value(s):
DEN=d-e-f-g
ILEN=d-h-i-j
INEN=d-a^1-i-j

w

Channels on the PRI being restored. Valid value(s):
D = D-channel of the PRI or both D-channels if the PRI is equipped with a backup D-channel.
B = All B-channels of the PRI.

x

Identifying number of the FGB carrier, which can be up to 4 digits. If shown, this variable indicates a direct trunk to a carrier.

y

Identifying number of the FGD carrier, which can be up to 4 digits. If shown, this variable indicates a direct trunk to a carrier.

z

Status report. Valid value(s):
COMPLETED = Restore processing for the trunk group, PRI group, or range of trunks has completed.
DATABASE ERROR = An internal error occurred while attempting to access the trunk group or PRI group data. Repeat the request if desired.
INVALID PRI GROUP = The PRI group specified in the input request was invalid. Verify that the correct group number was specified.
NO CHANNELS ASSIGNED = The PRI group specified does not have any channels assigned to it.
STARTED = Request was received and action has started.
TG INVALID = The trunk group specified in the input request was invalid. Verify that the correct group number was specified.

a^1

Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

b^1

Data group number.

c^1

Synchronous transport signal (STS) number.

d^1

Virtual tributary group number.

e^1

Digital signal level 0 (DS0).

f^1

Digital carrier line unit number.
g\textsuperscript{1} = Trunk unit number.

h\textsuperscript{1} = Service group number.

i\textsuperscript{1} = Channel board number.

j\textsuperscript{1} = Circuit number.

k\textsuperscript{1} = PSU unit number.

l\textsuperscript{1} = PSU shelf number.

m\textsuperscript{1} = PSU channel group number.

n\textsuperscript{1} = PSU channel group member number.

o\textsuperscript{1} = SONET termination equipment (STE) number.

p\textsuperscript{1} = Virtual tributary member number.

q\textsuperscript{1} = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

r\textsuperscript{1} = PCT facility interface (PCTFI) number.

s\textsuperscript{1} = Tributary number.

t\textsuperscript{1} = Channel number.

u\textsuperscript{1} = Virtual network announcement resource number.

v\textsuperscript{1} = Virtual trunk facility number.

w\textsuperscript{1} = Virtual trunk channel number.

x\textsuperscript{1} = Optical interface unit (OIU) number.

y\textsuperscript{1} = Protection group number.

z\textsuperscript{1} = STM-1 number.

a\textsuperscript{2} = High order virtual container number.

b\textsuperscript{2} = Low order virtual container group number.

c\textsuperscript{2} = Low order virtual container member number.

2. REASON FOR OUTPUT

To show that a trunk has been restored to service by deleting the indicated status from the specified trunk.

Format 1 shows a restoration attempt of digital or analog trunks.

Format 2 shows a restoration attempt of X.25 access on T1 (XAT).

Format 3 indicates the start and/or end of a group or range restoration.

This message may be in response to a RST:TRK input message or may be generated automatically.

The status information in the left half (column) of the message format is the status that was to be deleted. The status in the right half (column) of the message is the status in effect at the completion of the attempt to restore the port.

Logical test ports (LTP) are identified with the corresponding logical test port numbers.

3. VARIABLE FIELD DEFINITIONS

Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Trunk group or bearer independent call control (BICC) group number.
b = Trunk group member number or normalized call instance code (CIC), or lower limit of a range of trunk group member numbers or normalized CICs.
c = Upper limit of a range of trunk group member numbers or normalized CICs.
d = SM number.
e = Digital line and trunk unit (DLTU) number.
f = The digital facility interface number.
g = Channel number.
h = IDCU number.
i = Remote terminal (RT) number.
j = RT line number.
k = LTP number.
l = RAF or SAS unit number.
m = RAF or SAS announcement channel number.
n = The result of the restoration request. Valid value(s):

ALREADY IS = The trunk was already in service. Therefore, the status specified in the input message could not be deleted from the trunk. No change was made to the status of the trunk.
CAMP ON FAIL = The request to camp on the trunk failed.
CHAN ACTIVATION FAIL = The packet switching trunk was not restored to service because the protocol handler (PH) channel could not be activated. This failure was caused by an internal software and/or hardware error. An attempt will be made periodically (approximately every three minutes) to restore the trunk to service automatically.
CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) is unable to respond. Retry the request later.
COMPLETED = The specified status was successfully added to the trunk. Resulting status is indicated.
COMPLETED,LINES REMAIN = The request completed successfully but some or all ports may be defined as lines. Use RST:LINE message for the line ports.
COMPL-PH SWITCHED = The restore was successful, but a PH switch was required.
COMPL-RST FAIL = The specified status was added to this D-channel backup primary rate interface (DCBU PRI) D-channel while a restoration was in progress. The restoration has failed.
COMPL-RST SUCCESS = The restoration of a DCBU PRI D-channel completed successfully. The PRI now has an active D-channel for signalling.
COMPL-SWITCH SUCCESS = Switch-over to the standby D-channel of a DCBU PRI has been completed successfully. The PRI now has an active D-channel for signalling.
DATABASE ERROR = The specified port status could not be deleted from the trunk because static data associated with the trunk could not be updated. This error can occur if customer originated recent changes (CORCs) are inhibited or if the office database editor (ODBE) is being used to update data associated with the trunk.
DENIED-HARDWARE OOS = The trunk could not be restored to service because the associated hardware was out-of-service (OOS). The supplementary information field of the port status indicates the piece of hardware that was OOS.
DENIED-PRI RST INPROG = The trunk could not be restored to service because the trunk specified is a PRI D-channel on a PRI that is in the process of being automatically restored. Wait for the D-channel restore to complete before attempting to restore this trunk.
DENIED-RESET INPROG = The specified port status could not be deleted from the trunk because the trunk is in the process of being reset. Use the UCL option to manually override this restriction.
DENIED-SDL REQUIRES UCL = The request was denied because requests the status of a DEN or NEN supporting an signalling data link (SDL) port are not recommended and must have the UCL option applied.

FAILED-LINK LVL FAILURE = The packet switching trunk was not restored to service could not be established with the far-end switch. Supplementary information field of the trunk port status indicates why level 2 did not come up.

INPUT ERROR = Some data entered in the input request was invalid or incorrect.

INV EQUIPMENT = The request was for equipment that does not exist or is not assigned.

INV HARDWARE = The request does not match the hardware type of the port.

INV PORT = The trunk could not be located in the database. The trunk identifier used in the input request was most likely invalid or incorrect.

INV PORT TYPE = The specified port is not a trunk.

INV STATUS = The status specified is not valid. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual to determine valid states for each port type.

NAILUP FAILED = The packet switching trunk was not restored to service because a nailed-up path could not be established between the digital facility interface (DFI) circuit and the protocol handler (PH) circuit. The failure in establishing the nailed-up path was caused by the internal software and/or hardware error. An attempt will be made periodically (approximately every three minutes) to restore the trunk to service automatically.

NO MATCH = The status specified in the input request to delete a status did not exist on the trunk.

NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

NO PROCESS = An attempt to create a process failed. This may possibly have been caused by the system’s being busy. Retry the request later.

NO STATUS MATCH = The trunk was OOS, but not for any of the reasons specified (refer to variable ‘o’). No change was made to the status of the trunk.

OCU LBK TST FAILED = The packet switching trunk was not restored to service because the operational digital loopback test with the termination point at the office channel unit (OCU) failed. The digital loopback test requires an integrated services transmission function (ISTF) or global digital services function (GDSF) unit to be operational. An attempt will be made periodically (approximately every three minutes) to restore the trunk to service automatically. Use the "UCL" option on the RST:TRK input message to bypass the OCU loopback test.

PH ACT TST FAILED = The PH channel was not restored to service as the test run within the PH on channel activation or channel refresh failed. An attempt was made to switch to a different PH of the same type but no spare PH is available or the soft switch of this PH type is not allowed. The status was changed to OOS-FE-PSIU and the PH may be degraded.

PH BIST TST FAILED = The PH channel was not restored to service as the BIST test run within the PH failed. An attempt was made to switch to a different PH of the same type but no spare PH is available or the soft switch of this PH type is not allowed. The status was changed to OOS-FE-BIST and the PH may be degraded.

PH LBK TST FAILED = The packet switching trunk was not restored to service because the operational digital loopback test within the PH failed. An attempt will be made to switch to a different PH, and if no spare is available, then the trunk status will be changed to OOS-FE-PSIU. If a spare PH is available, then the trunk will be restored to service in a few minutes.

PORT BUSY = The trunk remained busy for the campon period or an in-progress campon was terminated.

PORT PROV IN PROGRESS = The line or trunk is in the process of being provisioned. Retry the
PROCESS TIMEOUT = Internal time-out during processing request aborted.
REQUEST FAILED = A system error occurred making it impossible to continue processing the request.
RESOURCE FAILURE = The specified port status could not be deleted from the trunk because of a temporary resource shortage. Either a process could not be created or a storage buffer was full because the system is busy. Retry the request later.
RST IN PROGRESS = The specified status was successfully deleted from the trunk. Restoration of a DCBU PRI D-channel is in progress. Additional messages will follow to indicate the result of the restoration attempt.
SM UNAVAILABLE = The input request could not be completed because a needed switching module (SM) is unable to respond. Retry the request later.
STATUS CONFLICT = The trunk was not able to be restored to service since a port status inconsistency would have resulted by placing the trunk in-service (IS). The trunk was left in the indicated OOS state. For example, attempting to restore a circuit switched B-channel while the associated D-channel is OOS is not allowed.
SYSTEM BUSY = The systems processing capability has been reached or a system resource was unavailable. Retry the request later.
SYSTEM ERROR = A system error occurred making it impossible to continue processing the request.
TEST FAILED = The operational test performed on the trunk failed. No status change was made.
UCD|MUPH MLHG = The DN entered was a multi-line hunt group channel and as such cannot be restored by specifying its DN. An equipment number (that is, DEN) or MLHG and member number must be specified. To obtain the equipment number and/or multi-line hunt group and member number, refer to office records for the DN.

- o = Status that was requested to be deleted from the trunk. If more than one status was deleted, all are identified on subsequent lines in the same column. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the trunk status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a description of a trunk status and its subfields.

- p = Resulting primary status in effect on the trunk. This status is the most restrictive to call processing currently on the trunk. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status subfields.

- q = Pending statuses in effect on the trunk. A trunk may have from zero to three pending statuses, all of which are listed on subsequent lines of this message. Pending statuses are less restrictive than the primary status. The first subfield indicates basic state; the second subfield indicates qualifier; the third subfield indicates operational restrictions; the fourth subfield indicates supplementary information; and the fifth subfield indicates the mode of the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status subfields and the status hierarchy.

- r = PRI group number.

- s = Directory number.

- t = Multi-line hunt group number.
u = Multi-line hunt group member number.

v = Valid value(s):

- ATMPP=d-k\(^1\)-c\(^2\)-d\(^2\)
- DEN=d-e-f-g
- ILEN=d-h-i-j
- INEN=d-a\(^1\)-i-j
- LTP=d-k
- NEN=d-a\(^1\)-b\(^1\)-o\(^1\)-c\(^1\)-d\(^1\)-p\(^1\)-e\(^1\)
- OIUE=d-w\(^1\)-x\(^1\)-y\(^1\)-z\(^1\)-d\(^1\)-p\(^1\)-t\(^1\)
- PLTEN=d-q\(^1\)-r\(^1\)-s\(^1\)-t\(^1\)
- PSUEN=d-k\(^1\)-l\(^1\)-m\(^1\)-n\(^1\)
- RAF=d-l-m
- SAS=d-l-m
- SLEN=d-f\(^1\)-i-j
- TEN=d-g\(^1\)-h\(^1\)-i\(^1\)-j\(^1\)
- VTRK=d-u\(^1\)-v\(^1\)

w = Channels on the PRI being restored. Valid value(s):
- D = D-channel of the PRI or both D-channels if the PRI is equipped with a backup D-channel.
- B = All B-channels of the PRI.

x = Identifying number of the FGB carrier, which can be up to 4 digits. If shown, this variable indicates a direct trunk to a carrier.

y = Identifying number of the FGD carrier, which can be up to 4 digits. If shown, this variable indicates a direct trunk to a carrier.

z = Status report. Valid value(s):
- COMPLETED = Restore processing for the trunk group, PRI group, or range of trunks has completed.
- DATABASE ERROR = An internal error occurred while attempting to access the trunk group or PRI group data. Repeat the request if desired.
- INVALID PRI GROUP = The PRI group specified in the input request was invalid. Verify that the correct group number was specified.
- NO CHANNELS ASSIGNED = The PRI group specified does not have any channels assigned to it.
- STARTED = Request was received and action has started.
- TG INVALID = The trunk group specified in the input request was invalid. Verify that the correct group number was specified.

a\(^1\) = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

b\(^1\) = Data group number.

c\(^1\) = Synchronous transport signal (STS) number.

d\(^1\) = Virtual tributary group number.

e\(^1\) = Digital signal level 0 (DS0).
f^1 = Digital carrier line unit number.
g^1 = Trunk unit number.
h^1 = Service group number.
i^1 = Channel board number.
j^1 = Circuit number.
k^1 = PSU unit number.
l^1 = PSU shelf number.
m^1 = PSU channel group number.
n^1 = PSU channel group member number.
o^1 = SONET termination equipment (STE) number.
p^1 = Virtual tributary member number.
q^1 = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.
r^1 = PCT facility interface (PCTFI) number.
s^1 = Tributary number.
t^1 = Channel number.
u^1 = Virtual trunk facility number.
v^1 = Virtual trunk channel number.
w^1 = Optical interface unit (OIU) number.
x^1 = Protection group number.
y^1 = OC-3 STE number.
z^1 = STS level 1 (STS-1) number.
a^2 = Low order virtual container group number.
b^2 = Low order virtual container member number.
c^2 = Link number.
d^2 = Virtual connection identifier (VCID) number.

4. ACTIONS TO BE TAKEN
None.

5. ALARMS
None.

RST:TTFCOM
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RST TTFCOM=a-b-c d [e]

2. REASON FOR OUTPUT

To report the result of executing a RST:TTFCOM input message to restore a transmission test facility common (TTFCOM) circuit to service.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Global digital service unit number.
c = Service group number.
d = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.
e = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

If a RST message fails, an alarm will indicate the effect to the office.
No alarm = No effect
* Minor = Small reduction in traffic capability
** Major = A problem exists and is denying customer service or causing a 25-50% reduction in traffic capability.
*C Critical = A problem exists and is denying customer service or causing at least a 50% reduction in traffic capability.

RST:TTY

Software Release: 5E14 and later
Message Class: MAINT, MAIPR
Application: 5,3B
Type: Output

1. FORMAT

[1] RST TTY a COMPLETED

[2] RST TTY a ABORTED [b] [c]

[3] RST TTY a STOPPED d

[4] RST TTY a TASK e MSG STARTED

[5] RST TTY a STOPPED MESSAGE IN PROGRESS

[6] RST TTY a STOPPED MESSAGE COMPLETE

2. REASON FOR OUTPUT

To report the disposition of a request to restore a teletypewriter (TTY) to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4 - 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Type of error. Valid value(s):
X'1' = Restore process error.
X'2' = Driver error.
[NUL] = Restore denied by driver or configuration control (CONFIG).

c = Error code.

<table>
<thead>
<tr>
<th>b</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'1'</td>
<td>Refer to the APP: IOP-H appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
</tbody>
</table>
d = Error code. Refer to the APP:IOP-I appendix in the Appendixes section of the Output Messages manual.

e = Diagnostic task number associated with the request.

4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

5. ALARMS

The "pudrv" subsystem generated messages have no alarms.

The "cft" subsystem generated messages have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

The "diag" subsystem generated messages have an automatically-generated alarm. Action may or may not be required.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Type: Output

1. FORMAT

RST VT1FAC=a-b-c-d-e-f-g h [i]

2. REASON FOR OUTPUT

Indicates the result of an attempt to restore a digital networking unit - synchronous optical network (DNU-S) virtual tributary level 1 facility (VT1FAC) to service.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Digital Networking Unit - SONET (DNU-S) number.
c  = Data group (DG) number.
d  = SONET Termination Equipment (STE) facility number.
e  = Synchronous Transport Signal (STS) facility number.
f  = Virtual tributary group (VTG) number.
g  = Virtual tributary member (VTM) number.
h  = Termination status. Valid value(s):
    ABORTED     = Requested action was terminated before completion, and the termination was not graceful.
    COMPLETED   = Requested action was successfully completed.
    NOT_STARTED = Requested action was not started.
    STOPPED     = Requested action was terminated before a normal completion. Termination was graceful.

i = Additional information qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

None.

100. RSTRT
RSTRT:RPC

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

RSTRT RPC ERR
    PIO CMD a IN RSTRT RPC FAILED, RPCNb 0

2. REASON FOR OUTPUT

To report that, during a restart of the ring peripheral controller (RPC), a program I/O was sent to the node processor of an RPC after the channel is properly reinitialized. The RPC restart is part of RPC fault recovery action.

3. VARIABLE FIELD DEFINITIONS

a = Program I/O message, in hexadecimal. Valid value(s):
    2e = Restart an RPC by reinitializing RTX.
    26 = Command an RPC to retry an AM direct memory access (DMA).
    36 = Command an RPC to clear an AM DMA.

b = Ring node (RN) group number.

4. ACTION TO BE TAKEN

Run diagnostics to see if there is any problem with the hardware.

5. ALARMS

None.

Type: Output

1. FORMAT

SCHED BKUP a
[b[, ERRNO = c]]

2. REASON FOR OUTPUT

To report the result of the SCHED: BKUP input message.

3. VARIABLE FIELD DEFINITIONS

a = Status. Valid value(s):
   ABORTED
   COMPLETED
   IN PROGRESS
   NOT STARTED
   STARTED
   STOPPED
   WARNING

b = Message. Valid value(s):
   AUTOMATED SYSTEM BACKUPS ARE INHIBITED - SCHEDULED BACKUPS WILL NOT EXECUTE
   = An automated system backup is being scheduled while backups are currently inhibited. Even though the backup will continue to be scheduled, the backup will not execute as long as backups are inhibited.
   Investigate the reason for automated system backups being inhibited. If backups need to be allowed, execute the ALW: AUTOBKUP input message.
   BACKUP OPTION FILE CANNOT BE SPECIFIED AS A PATHNAME = The SCHED: BKUP filename (FN) parameter appears to be input as a full or relative pathname. Re-execute SCHED: BKUP with the backup option file specified by the file name.
   BACKUP OPTION FILE DOES NOT EXIST = Either the default backup option file (bkup.opts) or the backup option file specified in the input message does not exist in the /no5text/bkup/autobkup directory. Verify that the backup option file name specified in the input message is correct and that the backup option file exists in the /no5text/bkup/autobkup directory with read permission. If the file does not exist, execute SET: BKUP to create the backup option file. Re-execute SCHED: BKUP with the correct backup option file name.
   CANNOT SCHEDULE BACKUP WITHIN 8 HOURS OF A CURRENTLY SCHEDULED BACKUP = The backup specified by the SCHED: BKUP input message parameters cannot be scheduled within 8 hours of an existing backup. Verify that correct values, for the DAY and TIME parameters, were specified in the input message. If the input message is correct, execute OP: BKUP to obtain a list of all scheduled backups, execute CLR: BKUP to unschedule the backup that conflicts with the input message, and re-execute SCHED: BKUP to schedule the new backup.
FAILED TO ALLOCATE INTERNAL MEMORY = An internal process error occurred while attempting to allocate memory. Re-execute the SCHED:BKUP input message.

FAILED TO (CLOSE|OPEN|STAT|WRITE|FSEEK IN) CRON TABLE FILE = An attempt to access the system cron table file has failed. Interpret the system error number and verify that the cron file, /unixa/spool/cron/crontabs/root, exists with read/write permission.

FAILED TO (CLOSE|OPEN|STAT|WRITE|FSEEK IN) SCHEDULE FILE = An attempt to access the automated system backup schedule file has failed. Interpret the system error number and verify that the schedule file, /no5text/bkup/autobkup/.bkup_sched, exists with read/write permission.

FAILED TO OPEN BACKUP OPTION FILE = Either the default backup option file (bkup.opts) or the backup option file input in the input message cannot be accessed. Verify that the backup option file name specified in the input message is correct and that the backup option file exists in the /no5text/bkup/autobkup directory with read permission. If the file does not exist, execute SET:BKUP to create the backup option file. Re-execute SCHED:BKUP with the correct backup option file name.

FAILED TO RE-INITIALIZE CRON DAEMON PROCESS = The cron daemon process could not be re-initialized after a new backup entry was added to the system cron table file. Prompt the cron daemon process to read the modified cron table file by executing the crontab command. For additional information, refer to the crontab manual page in 235-700-200 UNIX® RTR Operating System Reference Manual.

FSIZE FAILED ON CRON TABLE FILE = The size of the system cron table file could not be determined. Interpret the system error number and verify that the cron file, /unixa/spool/cron/crontabs/root, exists with read permission.

INVALID BACKUP OPTION FILE - ALL VOLUMES REQUIRED FOR 'VOL' KEYWORD = Either the default backup option file (bkup.opts) or the backup option file specified in the input message specified a beginning of tape (BOT) backup but the volume keyword does not specify all the required volume identifiers (AMTEXT, AMODD, SMTEXT, SMODD) for a full office backup. Remove the corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file by executing SET:BKUP and re-execute SCHED:BKUP.

INVALID BACKUP OPTION FILE - BAD TAPE DEVICE FILE FOR 'DEST' KEYWORD = Either the default backup option file (bkup.opts) or the backup option file specified in the input message specifies an invalid tape special device file (for example, /dev/mf08) for the destination keyword. Verify that the tape special device file is specified as a full pathname, is a record type special device file, and has read/write permissions set for owner and group only. Read/write permissions cannot be set for others and execute permissions cannot be set for the owner, group, and others.

Correct the problem with the tape special device file and re-execute SCHED:BKUP or remove the corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file by executing SET:BKUP and re-execute SCHED:BKUP.

INVALID BACKUP OPTION FILE - CANNOT SPECIFY TAPE SIZE FOR DISK BACKUP = Either the default backup option file (bkup.opts) or the backup option file specified in the input message is for a system backup disk or base disk pair backup partitions and an invalid option, tape size (TPSIZE), is set. Remove the corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file by executing SET:BKUP and re-execute SCHED:BKUP.

INVALID BACKUP OPTION FILE - DISK DEVICE NOT SPECIFIED FOR 'DEST' KEYWORD = Either the default backup option file (bkup.opts) or the backup option file specified in the input message specifies an invalid disk device for the destination keyword. Remove the corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file by executing SET:BKUP and re-execute SCHED:BKUP.
INVALID BACKUP OPTION FILE - DUPLICATE '{AMTEXT|AMODD|SMTEXT|SMODD|NA}' OPTION FOR 'VOL' KEYWORD

= A duplicate volume identifier option was detected for the volume keyword in either
the default backup option file (bkup.opts) or the backup option file specified in the
input message. Remove the corrupt backup option file with CLR:FILESYS,FILE,
create a new backup option file by executing SET:BKUP and re-execute
SCHED: BKUP.

INVALID BACKUP OPTION FILE - DUPLICATE '{TYPE|DEST|PSESS|PVOL|SESS|VOL|TPSIZE}' KEYWORD

= A duplicate keyword was detected in either the default backup option file
(bkup.opts) or the backup option file specified in the input message. Remove the
corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file
by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - ILLEGAL KEYWORD

= An invalid keyword was detected in
either the default backup option file (bkup.opts) or the backup option file specified
in the input message. Remove the corrupt backup option file with
CLR:FILESYS,FILE, create a new backup option file by executing SET: BKUP and
re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - INVALID OPTION FOR '{TYPE|DEST|PSESS|PVOL|SESS|VOL|TPSIZE}' KEYWORD

= An invalid option was detected for the specified keyword in either the default
backup option file (bkup.opts) or the backup option file specified in the input
message. Remove the corrupt backup option file with CLR:FILESYS,FILE, create a
new backup option file by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - MISSING '{TYPE|DEST|PSESS|PVOL|SESS|VOL|TPSIZE}' KEYWORD

= A missing keyword was detected in either the default backup option file
(bkup.ops) or the backup option file specified in the input message. Remove the
corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file
by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - 'NA' OPTION REQUIRED FOR '{PSESS|PVOL|SESS|VOL}' KEYWORD

= Either the default backup option file (bkup.opts) or the backup option file specified
in the input message does not specify 'not applicable' (NA) for the keyword. If the
backup option file specified a BOT backup, the positioning session (PSESS), and
positioning volume (PVOL) keywords must be 'NA'. If the backup option file
specified an end of data (EOD) tape backup, the session (SESS), positioning
session (PSESS), and positioning volume (PVOL) keywords must be 'NA'. If the
backup option file specified a software disk backup, the session (SESS), volume
(VOL), positioning session (PSESS), and positioning volume (PVOL) keywords
must be 'NA'. Remove the corrupt backup option file with CLR:FILESYS,FILE,
create a new backup option file by executing SET: BKUP and re-execute
SCHED: BKUP.

INVALID BACKUP OPTION FILE - NO TAPE SIZE SPECIFIED FOR TAPE BACKUP

= Either the default backup option file (bkup.opts) or the backup option file specified
in the input message is for a tape backup and an expected option, TPSIZE, is not set.
Remove the corrupt backup option file with CLR:FILESYS,FILE, create a new
backup option file by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - NO VOLUME OPTION SPECIFIED FOR 'VOL' KEYWORD

= Either the default backup option file (bkup.opts) or the backup option file specified
in the input message specified a BOT, append (APPEND) to tape, or end of data
(EOD) tape backup, but no volume identifiers (AMTEXT, AMODD, SMTEXT,
SMODD) were listed for the keyword. Remove the corrupt backup option file with
CLR:FILESYS,FILE, create a new backup option file by executing SET: BKUP and
re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - SESSION NUMBER REQUIRED FOR '{PSESS|SESS}' KEYWORD
- Either the default backup option file (bkup.opts) or the backup option file specified in the input message specified an APPEND backup, but does not specify a session number for the keyword. Remove the corrupt backup option file with CLR:FILESYS, FILE, create a new backup option file by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - TAPE DEVICE NOT SPECIFIED FOR 'DEST' KEYWORD
- Either the default backup option file (bkup.opts) or the backup option file specified in the input message does not specify a tape special device file pathname for the destination keyword. Remove the corrupt backup option file with CLR:FILESYS, FILE, create a new backup option file by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - TOO MANY VOLUMES SPECIFIED FOR 'VOL' KEYWORD
- Either the default backup option file (bkup.opts) or the backup option file specified in the input message specifies too many volume identifiers (AMTEXT, AMODD, SMTEXT, SMODD) for the keyword. Remove the corrupt backup option file with CLR:FILESYS, FILE, create a new backup option file by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - VALUE '1' REQUIRED FOR 'SESS' KEYWORD
- Either the default backup option file (bkup.opts) or the backup option file specified in the input message is for a BOT backup but the session keyword is not set to 1. Remove the corrupt backup option file with CLR:FILESYS, FILE, create a new backup option file by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - VALUES FOR 'PSESS' AND 'PVOL' OUT OF RANGE
- Either the default backup option file (bkup.opts) or the backup option file specified in the input message specifies values for the tape positioning session and volume keywords that would attempt to append data past last possible session/volume on a multi-volume tape. Remove the corrupt backup option file with CLR:FILESYS, FILE, create a new backup option file by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - VOLUME NUMBER REQUIRED FOR 'PVOL' KEYWORD
- Either the default backup option file (bkup.opts) or the backup option file specified in the input message specified an append to tape backup, but does not specify a volume number for the tape positioning volume keyword. Remove the corrupt backup option file with CLR:FILESYS, FILE, create a new backup option file by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID BACKUP OPTION FILE - VOLUMES AND 'NA' SPECIFIED FOR 'VOL' KEYWORD
- Either the default backup option file (bkup.opts) or the backup option file specified in the input message specifies volume identifiers (AMTEXT, AMODD, SMTEXT, SMODD) and NA for the keyword. Remove the corrupt backup option file with CLR:FILESYS, FILE, create a new backup option file by executing SET: BKUP and re-execute SCHED: BKUP.

INVALID TIME OF DAY SPECIFIED
- An invalid time of day (TIME) parameter was specified in the input message. Refer to the SCHED: BKUP input message manual page for the correct format and values for the time of day parameter and re-execute SCHED: BKUP.

NO AUTOMATED SYSTEM BACKUPS TO BE SCHEDULED
- The SCHED: BKUP: ALL input message was executed and there are no backups, listed in the automated system backup schedule file, to be added to the system cron table file.

NOT ENOUGH SPACE IN CRON FILE FOR BACKUP ENTRY
- The backup specified by the SCHED: BKUP input message parameters cannot be scheduled because the
system cron table file does not have enough contiguous disk space allocated for a new backup entry. Change the cron table file mode from contiguous to regular and prompt the cron daemon process to read the cron table file by executing the crontab command on the cron file. Re-execute SCHED: BKUP. For additional information, refer to the crontab manual page in 235-700-200 UNIX® RTR Operating System Reference Manual.

OUT OF RANGE DAY OF (MONTH | WEEK) SPECIFIED = An invalid day of month or week (DAY) parameter was specified in the input message. Refer to the SCHED: BKUP input message manual page for the correct format and values for the day of month or week parameter and re-execute SCHED: BKUP.

THE SPECIFIED BACKUP IS ALREADY SCHEDULED = The backup specified by the SCHED: BKUP input message parameters is already scheduled. Execute the OP: BKUP input message to obtain a list of all scheduled backups and verify that the correct SCHED: BKUP input parameters were entered. If needed, re-execute SCHED: BKUP with the correct input parameters.

= System error code. Refer to the APP: SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If an error message is output, refer to the message description in the VARIABLE FIELD DEFINITIONS section of this manual page. If the problem cannot be resolved, refer to the TECHNICAL ASSISTANCE portion of the Output Messages Manual INTRODUCTION section.

If a SCHED:BKUP completed message is output, the OP:BKUP input message may be executed to verify that the backup specified in the SCHED:BKUP input message was scheduled.

5. ALARMS

None.

Type: Output

1. FORMAT

[1]  SCHED ECDAUD COMPLETED

[2]  SCHED ECDAUD ABORTED - SYSTEM ERROR a

2. REASON FOR OUTPUT

To report the termination status of the SCHED:ECDAUD input message.

Format 1 indicates successful execution. No action is necessary. Format 2 indicates that an internal error has occurred. Refer to variable 'a' for more information.

3. VARIABLE FIELD DEFINITIONS

a = System error number. Valid value(s):
1 = Cannot open audit rule file - /lla/ECDAUD/ecdaud.rules.
2 = Cannot attach to ECD database.
3 = Unable to kill running audit, check PID in /lla/ECDAUD/.ecdaud.id.
4 = Bad rule in rule file (/lla/ECDAUD/ecdaud.rules).
5 = Unable to audit data (/lla/ECDAUD/ecdaud.rules).
6 = Failure in reading ECD database.
7 = Cannot open audit rule file - /lla/ECDAUD/hwchk.rules.
8 = Failed to obtain current status.
9 = Internal system error.
10 = Database partition greater than 80% full, remove unused files.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request of the SCHED:ECDAUD input message. No further action is necessary.

5. ALARMS

Minor if system error was encountered.

SET ALINK=a-b-c-d-e f [g]

2. REASON FOR OUTPUT

To report the results of a previous SET:ALINK input message for a line unit model 2 (LU2) or a line unit model 3 (LU3).

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Line unit number.
c  = Grid number.
d  = Grid board number.
e  = Link number.
f  = Termination report. Valid value(s):
   ABORTED    = Requested action was terminated before completion, and the termination is immediate. Consistency of hardware and data is questionable.
   COMPLETED  = Requested action was terminated after successful completion.
   NOT STARTED = Requested action was terminated before a normal completion but hardware status and data are consistent.
g  = Additional information qualifying the termination report.

Input Message(s):

     SET:ALINK
SET:ALMMDE
Software Release: 5E14 and later
Message Class: BPSC
Application: 5
Type: Output

1. FORMAT

[1] SET ALMMDE=a c

__________________________________________________________________

[2] SET ALMMDE=a RBPSC SM=b c

__________________________________________________________________

[3] SET ALMMDE=a RAS SITE=d c

__________________________________________________________________

2. REASON FOR OUTPUT

To provide a termination report in response to a request to set the host or remote site alarm retire mode (ALMMDE) to either automatic or manual. Format 1 is for the local office. Format 2 is for remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) sites with the alarm output option. Format 3 is for remote peripheral sites with a remote alarm section (RAS).

3. VARIABLE FIELD DEFINITIONS

a  = New alarm retire mode. Valid value(s):
  AUTO = Automatic retire mode. At the local office, audible alarms will retire automatically in eight seconds or when manually retired--whichever occurs first. At an RSM, ORM, TRM, or remote peripheral site, audible alarms will retire automatically in five seconds to five minutes or when manually retired--whichever occurs first.
  MAN = Manual retire mode. At the local office, critical and major audibles will sound until manually retired. At a control/display terminal, use the alarm retire function key to retire alarms. At RSM, ORM, TRM, or remote peripheral sites, the critical, major, and minor audibles will sound until manually retired by pressing the alarm retire button on the remote alarm and status panel.

b  = Switching module (SM) number.

c  = Termination report. Valid value(s):
  ABORTED
  COMPLETED
  NOT STARTED

d  = Remote peripheral site number.

4. ACTION TO BE TAKEN

None.

5. ALARMS
None.

1400 (RSM BLDG/PWR ALARMS)
1420 (RAS ALARMS)
SET:ARC

Software Release: 5E14 and later
Message Class: ADMN
Application: 5
Type: Output

1. FORMAT

SET ARC OFFICE=a TYPE=b TRAFFIC=c RTNANN=d  e

2. REASON FOR OUTPUT

To respond to input message SET:ARC which adds (sets) or modifies an alternate route cancellation (ARC) control.

3. VARIABLE FIELD DEFINITIONS

a = Office name.

b = Control type to be modified or installed. Valid value(s):
   CANF = Cancel from. Cancels calls that terminate in a given adjacent office but could not complete with the direct route. This control restricts traffic from overflowing to its alternate.
   CANT = Cancel to. Causes traffic to skip its alternate route through the given office. This control forces calls that do not terminate at the given office to skip the direct trunk groups to that office.

c = Type of traffic subjected to the control. Valid value(s):
   ALL = All levels of precedence.
   RTN = Traffic at routine level.

d = Announcement treatment if blocking occurs for routine (RTN) traffic only (refer to variable 'c').
   Valid value(s):
   EANN1 = Emergency announcement 1.
   EANN2 = Emergency announcement 2.
   NCA = No circuit announcement.
   Note: For precedence calls, (that is, flash override, flash, immediate, priority) the announcement treatment is always the blocked precedence announcement.

e = Termination report. Valid value(s):
   ABORTED = Command aborted. System error encountered.
   COMPLETED = Command successfully completed.
   FAILED-PARAMETER = Command failed. Input parameter error.

4. ACTION TO BE TAKEN

If the termination status is COMPLETED, the message is confirmation of a request from a SET:ARC input message.

If the termination status is FAILED-PARAMETER, check for the validity of input parameters and reinitiate the corrected request.
If the termination status is **ABORTED**, reinitiate the request after the system error has been recovered. This termination could result because the system audits have found errors in the ARC control and corrective action is in progress.

5. **ALARMS**

None.

SET:BKUP

Software Release: 5E15 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

SET BKUP a
[b[, ERRNO = c]]

2. REASON FOR OUTPUT

To report the result of the SET:BKUP input message.

The backup option file created by SET:BKUP will be used as input to the automated system backup process and will remain in existence, in the /no5text/bkup/autobkup directory, until it is manually removed.

3. VARIABLE FIELD DEFINITIONS

a = Status. Valid value(s):
   ABORTED
   COMPLETED
   NOT STARTED
   STARTED

b = Message. Valid value(s):
   BACKUP OPTION FILE CANNOT BE SPECIFIED AS A HIDDEN FILE = The backup option filename was specified as a hidden file beginning with a dot '. '. Backup option files must not be hidden files. Re-execute SET:BKUP specifying a valid backup option filename.
   BACKUP OPTION FILE CANNOT BE SPECIFIED AS A PATHNAME = The SET:BKUP filename (FN) parameter appears to be input as a full or relative pathname. Re-execute SET:BKUP with the backup option file specified by the file name.
   CANNOT SPECIFY 'TPSIZE' KEYWORD FOR DISK BACKUP = The TPSIZE option is invalid when backing up to a system backup disk or base disk pair backup partitions. Re-execute SET:BKUP without the TPSIZE option specified.
   FAILED TO CREATE AUTOBKUP DIRECTORY = The system() system call failed to execute the UNIX® mkdir input message to create the /no5text/bkup/autobkup directory.
      Verify that the UNIX® mkdir process file exists and has execute permission.
      Execute the UNIX® mkdir input message manually to determine if the process is functioning properly.
      Manually create the /no5text/bkup/autobkup directory if it does not exist, and re-execute SET:BKUP.
   FAILED TO (OPEN|CLOSE) BACKUP OPTION FILE = An attempt to access the backup option file has failed. Interpret the system error number, verify that the /no5text file system is not low on space and verify that the /no5text/bkup/autobkup directory exists with read/write permissions.
   FAILED TO STAT DESTINATION TAPE DEVICE FILE = The stat() system call failed to obtain status for the tape special device file specified by the destination parameter in the
input message. Interpret the system error number and verify that the specified tape special device file exists. Re-execute SET:BKUP with the correct tape special device file specified in the input message.

**INVALID DESTINATION DISK DEVICE SPECIFIED** = The character string specified by the destination input message parameter is not a valid backup disk destination device string. Refer to the SET:BKUP input message manual page for the correct disk destination strings and re-execute SET:BKUP.

**INVALID DESTINATION TAPE DEVICE FILE SPECIFIED** = The character string specified by the destination input message parameter does not represent a valid tape special device file. Verify that the tape special device file is specified as a full pathname, is a record type special device file, and has read/write permissions set for owner and group only. Read/write permissions cannot be set for others and execute permissions cannot be set for the owner, group, and others. Re-execute SET:BKUP with a valid tape special device file specified in the input message.

**OUT OF RANGE BACKUP SESSION NUMBER SPECIFIED** = An out of range backup session number input message parameter was input. Refer to the SET:BKUP input message manual page for the correct range of values for the SESS parameter and re-execute SET:BKUP.

**OUT OF RANGE TAPE POSITIONING SESSION NUMBER SPECIFIED** = An out of range tape positioning session number input message parameter was input. Refer to the SET:BKUP input message manual page for the correct range of values for the PSESS parameter and re-execute SET:BKUP.

**OUT OF RANGE TAPE POSITIONING VOLUME NUMBER SPECIFIED** = An out of range tape positioning volume number input message parameter was input. Refer to the SET:BKUP input message manual page for the correct range of values for the PVOL parameter and re-execute SET:BKUP.

**WILL NOT OVERWRITE EXISTING BACKUP OPTION FILE** = Either the default backup option file (bkup.opts) or the backup option file input in the input message already exists in the /no5text/bkup/autobkup directory. Re-execute SET:BKUP with a new backup option file name specified for the filename (FN) parameter or execute CLR:FILESYS,FILE to remove the existing backup option file and re-execute SET:BKUP to create a new backup option file.

\[ c \] = System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

### 4. ACTIONS TO BE TAKEN

If an error message is output, refer to the message description in the VARIABLE FIELD DEFINITIONS section of this manual page. If the problem cannot be resolved, refer to the TECHNICAL ASSISTANCE portion of the Output Messages Manual INTRODUCTION section.

If a SET:BKUP completed message is output, the OP:BKUP:FN input message may be executed to display the content of the backup option file.

### 5. ALARMS

None.

Message Class: ADMN
Application: 5
Type: Output

1. FORMAT

SET CGAP CODE=a PREFIX=b DOM={ALL|c} GAP=d ANN=e f

2. REASON FOR OUTPUT

To report the addition or modification of a call gapping code control.

3. VARIABLE FIELD DEFINITIONS

ALL = The code control was applied to all domains.

a = Destination code (the dialing number) gapped, or a string of dashes if not applicable.

b = Access prefix gapped. If the carrier is not specified, the prefix field will be blank or contain ".-". The access prefix only applies to feature group D carriers.

c = Switching domain list.

d = Gap interval. Valid value(s):
   .0 = No control was applied, but measurements were collected.
   .1 = 0.10 sec.
   .12 = 0.12 sec.
   .14 = 0.14 sec.
   .16 = 0.16 sec.
   .18 = 0.18 sec.
   .2 = 0.20 sec.
   .25 = 0.25 sec.
   .36 = 0.36 sec.
   .5 = 0.50 sec.
   .6 = 0.60 sec.
   .75 = 0.75 sec.
   1 = 1.0 sec.
   1.6 = 1.6 sec.
   2 = 2.0 sec.
   3 = 3.0 sec.
   5 = 5.0 sec.
   6 = 6.0 sec.
   9 = 9.0 sec.
   10 = 10.0 sec.
   12 = 12.0 sec.
   15 = 15.0 sec.
   20 = 20.0 sec.
   30 = 30.0 sec.
   45 = 45.0 sec.
   60 = 60.0 sec.
   75 = 75.0 sec.
100 = 100.0 sec.
120 = 120.0 sec.
150 = 150.0 sec.
300 = 300.0 sec.
450 = 450.0 sec.
600 = 600.0 sec.
INF = Infinity, block all but one call.

e = Announcement (ANN) treatment if blocking occurred. Valid value(s):
   EANN1 = Emergency announcement 1.
   EANN2 = Emergency announcement 2.
   NCA = "NO CIRCUIT" announcement.

f = Termination report. Valid value(s):
   ABORTED = Message aborted. System error encountered.
   COMPLETED = Message successfully completed.
   FAILED-OVERFLOW = Message failed. Maximum control limit reached.
   FAILED-PARAMETER = Message failed. Input parameter error.

4. ACTION TO BE TAKEN

No action is needed for an automatically generated request from the Remote Network Management Center (RNMC). These messages are to be treated as information-only messages. For manually generated requests, the following actions will apply.

<table>
<thead>
<tr>
<th>'f'</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED</td>
<td>Re-initiate the request after the system error has been recovered.</td>
</tr>
<tr>
<td>COMPLETED</td>
<td>The message is confirmation of a request from an input message or from the RNMC.</td>
</tr>
<tr>
<td>FAILED-OVERFLOW</td>
<td>Refer to the Feature Description manual for the maximum allowable controls and reinitiate the corrected request.</td>
</tr>
<tr>
<td>FAILED-PARAMETER</td>
<td>Check for the validity of input parameters and reinitiate the corrected request.</td>
</tr>
</tbody>
</table>

5. ALARMS

None.

Output Message(s):

OP:CLK
SET:DCC

Software Release: 5E14 and later
Message Class: ADMN
Application: 5
Type: Output

1. FORMAT

SET DCC CODE a GAP b TRAFFIC c ANN d e

2. REASON FOR OUTPUT

To report the addition or modification of a destination code cancellation (DCC) control.

3. VARIABLE FIELD DEFINITIONS

a = Destination code.

b = Gap interval. Valid value(s):
   0 = No control but collect measurements.
   PT1 = 0.10 sec.
   PT25 = 0.25 sec.
   PT5 = 0.50 sec.
   1 = 1.0 sec.
   2 = 2.0 sec.
   5 = 5.0 sec.
   10 = 10.0 sec.
   15 = 15.0 sec.
   30 = 30.0 sec.
   60 = 1.0 min.
   120 = 2.0 min.
   300 = 5.0 min.
   600 = 10 min.
   INF = Infinity, block all but one call.

c = Traffic type subjected to the control. Valid value(s):
   ALL = All levels of precedence.
   RTN = Traffic at routine level.

d = Announcement treatment if blocking occurs. Valid value(s):
   EANN1 = Emergency announcement 1.
   EANN2 = Emergency announcement 2.
   ICA = Isolated code announcement.
   NCA = No circuit announcement.

e = Termination report. Valid value(s):
   ABORTED = Command aborted. System error encountered.
   COMPLETED = Command successfully completed.
   FAILED-OVERFLOW = Command failed. Maximum control limit reached.
   FAILED-PARAMETER = Command failed. Input parameter error.
4. ACTION TO BE TAKEN

If the termination status is COMPLETED, the message is confirmation of a request from a SET:DCC input message.

If the termination status is FAILED-PARAMETER, check for the validity of the input parameters and reinitiate the corrected request.

If the termination status is ABORTED, reinitiate the request after the system error has been recovered.

If the termination status is FAILED-OVERFLOW, refer to the Technical Specification Volume 2 manual, for maximum allowable controls and reinitiate the request when resources become available.

MCC Display Page(s):
109 (OVERLOAD)
129 (DSN EXCEPTION)
SET:ESA

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

SET ESA
   a
   [PRIMARY ESA: APID=b STATE=c HEALTH=d]
   [SECONDARY ESA: APID=b STATE=c HEALTH=d]

2. REASON FOR OUTPUT

Response to the SET:ESA input message that reports the results of the requested action and current status of the primary and secondary enhanced 911 emergency service adjuncts (ESAs). This message could also indicate that the request has timed out.

3. VARIABLE FIELD DEFINITIONS

a
   = Informational text describing results of requested action. Valid value(s):
   FORCED ACTIVE REQUEST COMPLETED = The request to make an ESA forced active has completed. The current status will be printed.
   FORCED ACTIVE REQUEST DENIED = The request to make the inactive ESA forced active has been denied. This can only happen if the other ESA is already forced active. The force on that ESA must be cleared before another request can be done. The current status will be printed.
   MANUAL SWITCH COMPLETED = The request to make an ESA active has completed. The current status will be printed.
   MANUAL SWITCH REQUEST DENIED = The request to make an ESA active was not done. The current status will be printed.
   NO INFORMATION TEXT = The informational text was not set correctly in the message. This should be reported as a problem.
   REQUEST HAS TIMED OUT = The request for information has timed out and no information will be printed.
   REQUESTED ESA IS ALREADY ACTIVE = The ESA to be made active was already active. The current status will be printed.
   REQUESTED ESA IS ALREADY FORCED ACTIVE = The ESA to be made active was already in the force active state. The current status will be printed.
   SWITCH DENIED - NO ESA TO SWITCH TO = This should only be returned in a rare window condition when the secondary ESA is removed using RC/V and a manual request to make the secondary ESA active are done simultaneously. The current status will be printed.

b
   = Applications processor identifier (APID) of the ESA. If the APID for the ESA (GLE911APID or GLE911SEC office parameters) is 0, no data for that ESA will be printed.

c
   = Current state of the ESA. Valid value(s):
   ACTIVE = The ESA is active and receiving queries.
   FORCED = The ESA is in the forced active state and is receiving queries and cannot be switched to inactive until the force has been removed.
INACTIVE = The ESA is not active and is not currently receiving queries.

CURRENT = Current health value of the ESA. Valid value(s):
- COMM LOST = The switch is not currently able to send queries to the ESA.
- CRITICAL = The ESA has a critical alarm.
- MAJOR = The ESA has a major alarm.
- MINOR = The ESA has a minor alarm.
- NORMAL = The ESA is functioning normally with no alarms.
- UNKNOWN = The health status of the ESA is unknown.

4. ACTION TO BE TAKEN

This message is printed in response to a SET:ESA input message. The actions to be taken will vary depending upon the informational text value.

The following informational text values indicate that the operation requested was completed or caused no change. No further actions are required for these responses.

FORCED ACTIVE REQUEST COMPLETED
MANUAL SWITCH COMPLETED
REQUESTED ESA IS ALREADY ACTIVE
REQUESTED ESA IS ALREADY FORCED ACTIVE

If the informational text value is FORCED ACTIVE REQUEST DENIED, the other ESA is already forced active. The force on that ESA must be cleared before another request can be done. To clear the force use the CLR:ESA input message with the FRC option.

If the informational text value is MANUAL SWITCH REQUEST DENIED, the request to make an ESA active was not done. This can be because the other ESA is forced active or is healthier. To complete the request, the force must be cleared, or the health of this ESA must be improved.

If the informational text value is REQUEST HAS TIMED OUT, retry the request later.

The informational text value SWITCH DENIED - NO ESA TO SWITCH TO, should only be returned in a rare window condition when the secondary ESA is removed using RC/V and a manual request to make the secondary ESA active are done simultaneously. If the secondary ESA was removed in error, it should be re-inserted using RC/V.

If the informational text value is NO INFORMATION TEXT, report this as a problem.

5. ALARMS

SET:FRC-MSCU

Software Release: 5E14 and later
Message Class: MSGS
Application: 5
Type: Output

1. FORMAT

SET FRC MSCU=a b [c]

2. REASON FOR OUTPUT

To acknowledge a request to force the specified message switch control unit (MSCU) active.

3. VARIABLE FIELD DEFINITIONS

a  = MSCU side.
b  = Termination report. Valid value(s):
   COMPLETED = Request completed successfully.
   STOPPED   = Request was terminated before a normal completion due to manual request,
                hardware failure, data inconsistency, etc.

   c  = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request
completed successfully. If the termination report is not COMPLETED, variable 'c' should give some indication as to
why the request failed. Check MSCU MCC pages or the OP:CFGSTAT output message to verify that the system
was in a valid state to perform the request.

5. ALARMS

None.

6. REFERENCES

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

SET FRC NCOSC a [b]

2. REASON FOR OUTPUT

This message is a response to the SET:FRC-NCOSC input message.

3. VARIABLE FIELD DEFINITIONS

NCOSC = Network clock oscillator.

a = Network clock side.

b = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
COMPLETED = Request completed successfully.
IN PROGRESS = Request was received and action is in progress.
STOPPED = Request was terminated before a normal completion due to hardware failure, data inconsistency, or another problem.

c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

No action is necessary if the request completed successfully. If the request failed, the variable 'c' should give some indication as to why the request failed. Check network clock MCC pages or the OP:CFGSTAT output message to verify that the NC was in a valid state to perform the request. Check the receive-only printer (ROP) for error messages using the REPT:NC output messages that may indicate problems or system reconfigurations.

1. FORMAT

SET FRC TRCU3=a-b-c f d [e]

2. REASON FOR OUTPUT

To acknowledge a request to force the specified transmission rate conversion unit - model III (TRCU3) path and side active.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = TRCU3 path (TRCUPATH). This is the TRCUPATH connecting host and remote TRCU3 circuits.
c = Side. This is the side of the communications module (CM), which the function pack is connected, that is desired to be forced active.
d = Termination report. Valid value(s):
   COMPLETED = Request completed successfully.
   NOT STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion due to a failure.
e = Additional data qualifying the termination field.
f = Location. Valid value(s):
   HOST = Refers to the TRCU3 at the host location which connects to the CM.
   REMOTE = Refers to the TRCU3 at the remote location which is connected to the optically remoted (switching) module (ORM).

   FOR a UNTIL b

[2] SET HPRI - HIGH PRIORITY TERMINAL FEATURE CANNOT BE ACTIVATED
   IT IS CURRENTLY ACTIVE FOR a UNTIL b

[3] SET HPRI - HIGH PRIORITY TERMINAL FEATURE ACTIVATION FAILED WITH c

2. REASON FOR OUTPUT

To respond to SET:HPRI input command.

Format 1 is printed when the feature is successfully activated. The terminal on which feature is active and the time when it will be deactivated is also provided.

Format 2 is printed when the feature could not be activated because the feature is already active from a previous request for a terminal. The terminal tty name on which feature is active and the time when it will be deactivated is also provided.

Format 3 is printed when the feature could not be activated because of an internal error code. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

3. VARIABLE FIELD DEFINITIONS

a  = The terminal TTY name.

b  = Date and Time when feature will be deactivated.

c  = Internal error code. Possible values are:
   3  = An invalid terminal name was received.
   4  = Unable to successfully activate feature. Message failed.

4. ACTION TO BE TAKEN

For Format 3, if the input command has failed, try it again later.

Type: Output

1. FORMAT

SET ISOL SM=a[-b] c [d]

2. REASON FOR OUTPUT

To acknowledge a request to isolate one or more switching modules (SMs).

3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = Upper limit of SMs in the range from variable 'a' to variable 'b' inclusive.

c = Termination report. Valid value(s):
   ABORTED = Requested action is terminated before a normal completion and the consistency of hardware states or data is questionable.
   COMPLETED = Request action is terminated after completion. If the host switching module (HSM) for a remote switching module (RSM) was isolated prior to the latest request, then the RSM will not be fully isolated (T1 link only) until the HSM is cleared from isolation.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action is terminated before a normal completion but consistency of hardware states and data is reliable.

d = Additional information qualifying the termination report. This may describe that no separation of an RSM in a multimodule RSM took place.

4. ACTION TO BE TAKEN

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   CLR:ISOL-SM
   SET:ISOL-SM
SET:LUCHAN

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

SET LUCHAN=a-b-c-d-e f [g]

2. REASON FOR OUTPUT

To report the results of a previous SET:LUCHAN input message.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Service group number.
d = Channel board number.
e = Circuit number.
f = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination is immediate. Consistency of hardware and data is questionable.
   COMPLETED = Requested action is terminated after successful completion.
   NOT STARTED = Requested action is terminated before a normal completion but hardware status and data are consistent.

  g = Additional information qualifying the termination report.

4. ACTION TO BE TAKEN

If the termination report (variable 'f') is COMPLETED, no action is required. If it is NOT STARTED, analyze the variable 'g' to determine the cause. If it is ABORTED, determine the cause from the other SM related messages on the receive-only printer (ROP).

3. VARIABLE FIELD DEFINITIONS

a  = Package. Valid value(s):
   ASPTF  = Advanced services platform toll free counts.
   BICCMES  = Bearer independent call control measurements.
   BNP  = Basic number portability measurements.
   CCS  = Common channel signaling general service measurements.
   CCSP  = Common channel signaling special service measurements.
   CGAP  = Code control.
   CLCT  = Network management control counts.
   CLDIR  = Call direction.
   DLYR  = Delayed readiness.
   EON5  = End office nodal phase 5.
   GETSHPC  = Government emergency telecommunications service high probability of call completion.
   HPCBICC  = High probability of call completion BICC group.
   HPCTG  = High probability of call completion trunk group.
   IECSSST  = Inter-exchange carrier start signal timeout counts.
   IECSTG  = Inter-exchange carrier shared trunk group counts.
   IMA  = Additional ineffective machine attempts.
   LN  = Leased network action point.
   LNCU  = Leased network office-wide measurements for critical users.
   LNNODE  = Leased network node-to-node measurements.
   MLNC  = Failure to match and no circuit.
   NS  = Number services.
   OVRLD  = Overload or congestion control.
   RRC  = Manual reroute trunk group controls.
   SDN  = Action control point for software defined networks.
   SVC  = Critical service circuit.
   TGFLAG  = Trunk group flags.
   TGMEAS  = Basic trunk group measurements.
   WBTGMEAS  = Wideband trunk group measurements.

b  = Termination status. Valid value(s):

Copyright ©2003 Lucent Technologies
ABORTED = Command aborted. System error encountered.
COMPLETED = Command successfully completed.
FAILED PARAMETER = Command failed. Input parameter error.
FEATURE NOT AVAILABLE = Command aborted. Feature not installed.

SET: MCCSTAT

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

SET:MCCSTAT:PG=aaaaaa;{OK|RL|NG}

2. REASON FOR OUTPUT

To inform the user that information for the switching module (SM) master control center (MCC) display has been requested.

3. VARIABLE FIELD DEFINITIONS

a = SM MCC page name.
NG = Requested unit does not exist.
OK = Information requested.
RL = Request will be made later.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

IM/OM Reference(s):

None.
SET:MCTSI

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

SET MCTSI=a b

2. REASON FOR OUTPUT

To provide the result of the SET:MCTSI input message.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Results of the input message. Valid value(s):
COMPLETED = Force was applied or a force was in effect.
STOPPED FAULT-STATUS UNKNOWN = Error detected during central processor intervention (CPI) transmission.
STOPPED STATUS UNKNOWN = The message was sent to the SM and no response was received.
STOPPED TIMEOUT = The message interface (MI) was unable to process the request.

4. ACTION TO BE TAKEN

For "STOPPED FAULT-STATUS UNKNOWN", refer to the Master Control Center (MCC) pages listed in the References to determine the status. If repeating the input message fails to help, then run diagnostics on the office network and timing complex (ONTC) and module controller/time slot interchange (MCTSI) to determine the problem.

For "STOPPED STATUS UNKNOWN", refer to MCC pages listed in the references to determine status. Repeat the input message if necessary.

For "STOPPED TIMEOUT", refer to MCC pages listed in the references to determine status. Repeat the input message if necessary.

Type: Output

1. FORMAT

SET MWI DN=a FNAME=b c

2. REASON FOR OUTPUT

To report the result of a message waiting indicator (MWI) activation request in response to a SET:MWI input message. If the request could not be processed, the message should be tried again later.

3. VARIABLE FIELD DEFINITIONS

a = Seven-digit DN.
b = Message Service System (MSS) feature name.
c = Result of the MWI activation request. Valid value(s):
   INVALID DN = The directory number (DN) entered was not found in the office dialing plan.
   INVALID FEATURE = The feature name entered or defaulted is one of the following error cases.
       Valid value(s):
       - No MSS feature on DN entered.
       - MSS feature not active.
       - MSS feature does not have MWI option.
       - Feature name entered is not an MSS feature.

MWI ACTIVATED = The MWI has been successfully activated.
RETRY LATER: ODD BACKUP IN PROGRESS = Office-dependent data (ODD) backup is in progress. No MWI activations or deactivations are allowed during an ODD backup.
RETRY LATER: RESOURCES UNAVAILABLE = Switch resources were not available to allow processing of the request.
UNASSIGNED VISUAL MWI = A visual MWI indicator was not assigned for the DN that is requesting MWI activation or deactivation.

Message Class: TLWSRSP
Application: 5
Type: Output

1. FORMAT

SET PB
   ID TYPE   STATUS
   a   b     c

2. REASON FOR OUTPUT

To print the results of the SET:PB input message requesting that 101 test line calls cannot terminate at this trunk line work station (TLWS) or centralized trunk test unit (CTTU).

3. VARIABLE FIELD DEFINITIONS

a = Trunk work station (TWS) ID number.

b = Type of trunk work station. Valid value(s):
   CTTU = Centralized trunk test unit (CTTU).
   LOCAL = TLWS with local talk and monitor (T&M) phone.
   REMOTE = TLWS with remote T&M phone.

c = Action taken. Valid value(s):
   INVALID ID NUMBER = The TWS ID number is not known to the system. For TLWS positions, this means there is no TLWSR tuple for the position. For CTTU, there is no CTTU position.
   NOT POSITION BUSY = The TWS position has been marked as busy.
   POSITION BUSY = The TWS position already marked as busy.

SET RCACCESS {SUCCEEDED|FAILED} {LOGIN "a|TTY "b"|AUTHLOGIN "c"|RCSECGRP "d"} ACCESS "e"
["f"]

2. REASON FOR OUTPUT

To respond to the SET:RCACCESS input message to set the recent change (RCV) access abilities for the specified terminal (TTY) associated with the 3B processor, the specified login id (LOGIN) associated with the administrative services module (ASM), or an Authority Management Login (AUTHLOGIN), to a Recent Change Security Group (RCSECGRP).

3. VARIABLE FIELD DEFINITIONS

a = Name of a login id assigned on the ASM in the office.
b = Name of a terminal associated with the 3B in the office.
c = Name of an Authority Management Login in the office.
d = Name of a RCSECGRP in the office.
e = The access string that was input in the set:rcaccess message.
f = Information or Error Message. Valid values:
   CANNOT ACCESS DATABASE = Unable to open database. Try again later.
   FEATURE IS NOT PURCHASED = SFID 595 has not been purchase or activated.
   CANNOT GET PASSWORD FILE FROM ASM = The password file could not be copied from the ASM.
   CANNOT FIND ASM ROOT = The /rclog/.secasmroot on the AM is missing or not readable.
   CANNOT WRITE TEMPORARY FILE = Failed to write file.
   CANNOT MOVE FILE TO ASM = Failed to move file to ASM.
   CANNOT REMOVE PERMISSIONS WHEN THERE ARE NONE = User attempted to remove permissions from a LOGIN, TTY or AUTHLOGIN that has the specified permissions already inhibited.
   CANNOT WRITE SECURITY FILE = Failed to write file.
   CANNOT COPY FILE TO ASM = Failed to copy the file to the ASM.
   INTERNAL ERROR IN RCgetac = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
   EXPECTING CLASS NUMBER AFTER <character> = The ACCESS specified expected a class number after the <character>.
   EXPECTING + - OR CLASS NUMBER AT START = The ACCESS parameter must begin with a plus sign, minus sign or class number.
   CLASS NUMBER IS TOO LARGE = The ACCESS parameter specified contains a class number that exceeds the maximum class number allowed.
   EXPECTING DIGIT . - OR , AFTER <character> = The ACCESS parameter expected a
digit, period, dash, or comma after the character specified.

**EXPECTING VIEW NUMBER AFTER** <character> = The ACCESS parameter expected a view number after the character specified.

**VIEW NUMBER IS TOO LARGE** = The ACCESS parameter specified contains a view number that exceeds the maximum view number allowed.

**EXPECTING DIGIT - OR , AFTER** <character> = The ACCESS parameter expected a digit, dash, or comma after the character specified.

**EXPECTING DIGIT . OR , AFTER** <character> = The ACCESS parameter expected a digit, period, or comma after the character specified.

**EXPECTING DIGIT OR , AFTER** <character> = The ACCESS parameter expected a digit or comma after the character specified.

**IN A RANGE IN ONE CLASS** (%d), **BOTH OR NEITHER MUST SPECIFY VIEW** = The ACCESS parameter requires that both parts of a range must be classes or both must be views.

**IN A RANGE, FIRST CLASS** (%d) **CANNOT EXCEED SECOND** (%d) = The ACCESS parameter requires that for a range the first class may not be larger than the second.

**IN A RANGE IN ONE CLASS, FIRST VIEW** (%d.%d) **CANNOT EXCEED SECOND** (%d.%d) = The ACCESS parameter requires that for a range the first view may not be larger than the second.

**CANNOT SPECIFY CLASS** <class number> **AND ALSO VIEWS IN IT** = The ACCESS parameter can not have a class specified, and also views of that same class.

**CLASS** <class number> **IS SPECIFIED MORE THAN ONCE,** = The ACCESS parameter can not have a class specified more than once.

**VIEW** <class number>.<view number> **IS SPECIFIED MORE THAN ONCE** = The ACCESS parameter can not have a view specified more than once.

**FAILED TO WRITE AM FILE** = The writing of a file has failed.

**CANNOT OPEN ASM PASSWORD FILE** = The password file copied from the ASM could not be opened.

**LOGIN IS NOT A VALID ASM LOGIN** = The LOGIN specified is not a valid ASM login.

**EMPTY TTY NAME** = No TTY was specified

**INVALID TTY NAME** = The TTY specified is not valid in the office.

**INVALID AUTHORITY MANAGEMENT LOGIN** = The Authority Management Login (AUTHLOGIN) specified is not valid.

**EMPTY SECURITY GROUP NAME** = No RCSECGRP name was given.

**SECURITY GROUP NAME IS TOO LONG (LIMIT 8 CHARS)** = The RCSECGRP parameter is limited to 8 characters.

**GROUP NAME CHARSWILL BE ALPHANUMERIC, . - OR _** = Only alphanumeric, period, dash, or underscore is allowed in the RCSECGRP name.

**GROUP NAME \\NONE\\ IS NOT ALLOWED** = The groupname "NONE" is not allowed please specify another.

**CANNOT ACCESS DATABASE TO CHECK FOR ASM** = Failed to open the Database. Try again later.

**ASM IS NOT ACCESSIBLE** = The AM can not communicate with the ASM.

235-118-251 \textit{Recent Change Procedures}
SET:RCLK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

SET RCLK=a-b c [d]

2. REASON FOR OUTPUT

To acknowledge a request to the input message SET:RCLK for setting the mode of the remote clock (RCLK) to the specified mode of operation.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = RCLK side.

c = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination is immediate. Consistency of hardware and data is questionable.
   COMPLETED = Requested action completed successfully.
   NOT STARTED = Requested action had not begun.
   STOPPED = Requested action is terminated before a normal completion, but consistency of hardware status and data is reliable.

d = Additional information qualifying the termination report.

4. ACTION TO BE TAKEN

If the termination report (variable 'c') is COMPLETED, no action is required. If it is NOT STARTED, analyze variable 'd' to determine the cause. If it is STOPPED, determine the cause from the remote clock (RCLK) messages on the receive-only printer (ROP).

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   SET: RCLK
SET:RCSECGRP

Software Release: 5E15 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

```plaintext
SET RCSECGRP "a" {SUCCEEDED|FAILED} {LOGIN "b" | TTY "c" | AUTHLOGIN "d"} 
["e"]
```

2. REASON FOR OUTPUT

To respond to the SET:RCSECGRP input message to assign the recent change (RCV) access abilities for the specified terminal (TTY) associated with the 3B processor, the specified login id (LOGIN) associated with the administrative services module (ASM), or an Authority Management Login (AUTHLOGIN), to a Recent Change Security Group (RCSECGRP).

3. VARIABLE FIELD DEFINITIONS

- **a** = Name of a RCSECGRP in the office.
- **b** = Name of a login id assigned on the ASM in the office.
- **c** = Name of a terminal associated with the 3B in the office.
- **d** = Name of an Authority Management Login in the office.
- **e** = Information or Error Message. Valid values:
  - CANNOT ACCESS DATABASE = Unable to open database. Try again later.
  - FEATURE IS NOT PURCHASED = SFID 595 has not been purchased or activated.
  - CANNOT GET PASSWORD FILE FROM ASM = The attempt to copy the password file from the ASM has failed.
  - CANNOT FIND ASM ROOT = The /rclog/.secasmroot on the AM is missing or not readable.
  - CANNOT WRITE TEMPORARY FILE = Failed to write file.
  - CANNOT MOVE FILE TO ASM = Failed to move file to ASM.
  - CANNOT COPY FILE TO ASM = Failed to copy the file to the ASM.
  - INTERNAL ERROR IN RCgetac = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
  - WARNING - MOVED GROUP = The TTY, LOGIN, AUTHLOGIN has been removed from its former RCSECGRP and placed in the new one specified.
  - FAILED TO WRITE AM FILE = The writing of a file has failed.
  - CANNOT OPEN ASM PASSWORD FILE = The password file copied from the ASM could not be opened.
  - LOGIN IS NOT A VALID ASM LOGIN = The LOGIN specified is not a valid ASM login.
  - EMPTY TTY NAME = No TTY was specified
  - INVALID TTY NAME = The TTY specified is not valid in the office.
  - INVALID AUTHORITY MANAGEMENT LOGIN = The Authority Management Login (AUTHLOGIN) specified is not valid.
  - EMPTY SECURITY GROUP NAME = No RCSECGRP name was given.
  - SECURITY GROUP NAME IS TOO LONG (LIMIT 8 CHAR) = The RCSECGRP parameter is limited to 8 characters.
  - GROUP NAME CHAR MUST BE ALPHANUMERIC, . - OR _ = Only alphanumeric, period, dash,
or underscore is allowed in the RCSECGRP name.

GROUP NAME \
NONE\ IS NOT ALLOWED = The groupname \"NONE\" is not allowed please specify another.

CANNOT ACCESS DATABASE TO CHECK FOR ASM = Failed to open the Database. Try again later.

ASM IS NOT ACCESSIBLE = The AM can not communicate with the ASM.

DRPCT=e ARPCT=f CICR=g PRR=h PIIT=i  
DL={ALL|k k k k k } DLTYPE=l  
VIARR=c[c][c][c][c][c][c]

2. REASON FOR OUTPUT

To report the adding or changing of a manual reroute (RR) trunk group control (TGC).

3. VARIABLE FIELD DEFINITIONS

ALL = Trunk group control was applied to all domains. (This option is only valid if variable ‘l’ = INC.)

a = Trunk group number.

b = Hunting algorithm. Valid value(s):
   ORD = Ordered.
   RGLR = Regular.
   SPRY = Spray.

c = An ordered list of one to seven trunk group numbers representing the out-of-chain trunk groups.

d = Congestion signal ignored. Spray reroutes to trunk groups are allowed even when congestion signals have been received for those trunk groups. Valid value(s):
   N = No.
   Y = Yes.

e = Direct route percentage of traffic controlled. Valid value(s):
   0 = No control, but collect measurements.
   12PT5 = 12.5%.
   25 = 25%.
   37PT5 = 37.5%.
   50 = 50%.
   62PT5 = 62.5%.
   75 = 75%.
   87PT5 = 87.5%.
   100 = 100%, block all direct route traffic.

f = Alternate route percentage of traffic controlled. Valid value(s):
   0 = No control but collect measurements.
   12PT5 = 12.5%.
   25 = 25%.
   37PT5 = 37.5%.
50 = 50%.
62PT5 = 62.5%.
75 = 75%.
87PT5 = 87.5%
100 = 100%, block all alternate route traffic.

g = Cancelled in-chain return option. Valid value(s):
N = No.
Y = Yes.

h = Indicates whether calls were rerouted that had been previously rerouted. Valid value(s):
N = No.
Y = Yes.

i = Indicates whether calls were rerouted that had originated internationally. Valid value(s):
N = No.
Y = Yes.

j = Termination status. Valid value(s):
ABORTED = Message aborted. System error encountered.
COMPLETED = Message successfully completed.
FAILED-OVERFLOW = Message failed. Maximum control limit reached.
FAILED-PARAMETER = Message failed. Input parameter error.

k = Switching domain list.

l = Switching domain list type. Valid value(s):
EXC = Exclude (Domains not in the list were controlled).
INC = Include (Domains in the list were controlled).

4. ACTION TO BE TAKEN

No action is needed for an automatically generated request from the Engineering and Administrative Data Acquisition System/network management (EADAS/NM). For manually generated requests, the following actions will apply.

<table>
<thead>
<tr>
<th>If 'j' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED</td>
<td>Reinitiate request.</td>
</tr>
<tr>
<td>COMPLETED</td>
<td>The message is confirmation of a request from an input message.</td>
</tr>
<tr>
<td>FAILED-OVERFLOW</td>
<td>Refer to the Feature Description manual for maximum allowable controls.</td>
</tr>
<tr>
<td>FAILED-PARAMETER</td>
<td>Check for the validity of input parameters and reinitiate the corrected request.</td>
</tr>
</tbody>
</table>

4. ACTION TO BE TAKEN

If the termination status is ABT or STOPPED, try the SET:TRACE input message again. If the termination status is COMPL, no action is required.

5. ALARMS

None.

OP: TRACE
REPT: TRACE
SET:TRAP

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] SET TRAP
   MTRP: SET TRAP COMPL; ID ASSIGNED; ID = a

__________________________________________________________________

[2] SET TRAP
   MTRP: SET TRAP FAILED; (b|c)

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to a SET:TRAP input message.

Format 1 prints when the SET:TRAP input message has been processed successfully. The trap identification number is given so that it may be used later in other message trap input messages to identify this particular trap.

Format 2 prints when the processing of the SET:TRAP input message has failed for the reason being displayed.

Note: The successful processing of the SET:TRAP input message does not guarantee that the trap can be started successfully. It depends on whether a set of conditions (such as, the status of the link nodes) can be satisfied when it is time to start the trap. Diagnostics will be printed if a trap cannot be started successfully.

3. VARIABLE FIELD DEFINITIONS

a = Trap identification number.
b = Reason SET:TRAP input message failed (refer to the ACTION TO BE TAKEN section of this manual page for detailed explanation). Valid value(s):
   ALL NODES ARE EITHER OOS OR OCCUPIED
   ALL NODES ARE OCCUPIED
   ALL NODES ARE OOS
   LINKS NOT SAME TYPE
   LINK SET NOT EQUIPPED
   LINK TYPE NOT S6 OR S7
   NO ID ASSIGNED
   NO RESRC (DISK SPACE EXHAUSTED)
   NO RESRC (MAX_SIMTRP REACHED)
   NO RESRC (MT_TBL ENTRY UNAVAIL)
   TRAP NEEDS TOO MANY ATTRIBUTES
   TRAPPING ON MORE THAN xx LINKS
   Note: xx = Maximum number of links allowed to be trapped on at any time.
c = Reason SET:TRAP input message failed (internal error condition). Valid value(s):
   CAN'T GET LN TBL
   INVALID LINK TYPE
   INVALID LNKTAG
4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, if any of the reasons in variable ‘c’ are printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

<table>
<thead>
<tr>
<th>Problem</th>
<th>Causes/Action</th>
</tr>
</thead>
</table>
| NO RESRC (DISK SPACE EXHAUSTED) | Cause: The fixed size disk file is full of trap results.  
  Action: Retrieve desired trap results before attempting any of the following.  
  - Use STOP:TRAP input message to re-initialize the disk file (all trap results will be lost).  
  - Enable overwrite (OVRWT) option (older trap results will be gradually lost). |
| NO RESRC (MT_TBL ENTRY UNAVAIL) | Cause: All trap entries are occupied in the message trap database.  
  Action: Retrieve desired trap results, then attempt to use STOP:TRAP input message to remove any unwanted traps. |
| NO RESRC (MAX_SIMTRP REACHED) | Cause: Maximum number of simultaneous traps on the message trap system has been reached.  
  Action: Attempt any of the following:  
  - Use STOP:TRAP input message to stop any unwanted active or inhibited trap.  
  - Use STOP:TRAP input message to remove any unwanted pending trap. |
| LINKS NOT SAME TYPE | Cause: Links given in the SET:TRAP input message must be either all S6 links or all S7 links. |
| LINK SET NOT EQUIPPED | Cause: Link set given in the SET:TRAP input message is not equipped. |
| LINK TYPE NOT S6 OR S7 | Cause: Links given in the SET:TRAP input message must be either all S6 links or all S7 links. |
| TRAP NEEDS TOO MANY ATTRIBUTES | Cause: Input parameters are transformed into trap attributes that will be used by the link nodes to perform message matching. Real-time concerns at link nodes impose a limit on the number of attributes that can be used for trapping. The number of attributes generated from the parameters given in the SET:TRAP input message exceeds that limit.  
  Action: Reduce the number of input parameters given in the SET:TRAP input message. |
| TRAPPING ON MORE THAN xx LINKS | Cause: Maximum number of links that can have trap on at any time has been reached (including the link(s) given in this SET:TRAP input message).  
  Action: Attempt any of the followings:  
  - Retry SET:TRAP input message with fewer links.  
  - Use STOP:TRAP input message to stop any unwanted active or inhibited trap. |
| ALL NODES ARE OOS | Cause: All the link nodes of the links specified in the SET:TRAP input message are out of service. |
| ALL NODES ARE OCCUPIED | Cause: All the links specified in the SET:TRAP input message are occupied by other traps. |
| ALL NODES ARE EITHER OOS OR OCCUPIED | Cause: Message is self-explanatory. Refer to previous two items. |
| NO ID ASSIGNED | Cause: Processing difficulties. |
5. ALARMS

None.

235-190-120 Common Channel Signaling Services Features
SET:TROVRD

Software Release: 5E14 and later
Message Class: ADMN
Application: 5
Type: Output

1. FORMAT

SET TROVRD a

2. REASON FOR OUTPUT

To report the overriding of all trunk reservation (TR) per-trunk-group inhibits. This is a response to the SET:TROVRD input message.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
   ABORTED = Command aborted. System error encountered.
   COMPLETED = TR inhibits have been overridden.

4. ACTION TO BE TAKEN

No action is needed for an automatically generated request from the remote network management center (RNMC). For manually generated requests, the following actions will apply.

If the termination status is COMPLETED, the message is confirmation of a request from an input message.

If the termination status is ABORTED, reinitiate the request.

5. ALARMS

None.

RAF PORT n-b\textsuperscript{l}-c\textsuperscript{l}
TEN=n-d\textsuperscript{l}-e\textsuperscript{l}-f\textsuperscript{l}-g\textsuperscript{l}

\textbf{l} = Outpulse results. Valid value(s):
- FAILED OUTPULSING
- OUTPULSE DIGITS WERE CLEARED
- OUTPULSE DIGITS WERE SET
- OUTPULSING IN PROGRESS
- SUCCESSFUL COMPLETION OF OUTPULSING
- SUCCESSFUL COMPLETION OF OUTPULSING/VPA FAILED

\textbf{n} = Switching module (SM) number.

\textbf{o} = Talk and monitor (T&M) phone type as defined by TLWSR tuple. Valid value(s):
- H = The T&M phone is ON-HOLD (metallic connections).
- M = The T&M phone is in the MONITOR mode (listen-only).
- N = No T&M phone in the connection.
- T = The T&M phone is in the TALK mode (listen and talk).

\textbf{p} = Error message. Refer to the APP:TLWS appendix in theAppendixes section of the Output Messages Manual for an explanation of TLWS error responses.

\textbf{y} = Digital line and trunk unit (DLTU) number.

\textbf{z} = Digital facility interface (DFI) number.

\textbf{a\textsuperscript{l}} = Channel number.

\textbf{b\textsuperscript{l}} = RAF unit number.

\textbf{c\textsuperscript{l}} = RAF channel number.

\textbf{d\textsuperscript{l}} = Trunk unit number.

\textbf{e\textsuperscript{l}} = Service group number.

\textbf{f\textsuperscript{l}} = Channel board number.

\textbf{g\textsuperscript{l}} = Circuit number.

\textbf{h\textsuperscript{l}} = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

\textbf{i\textsuperscript{l}} = Data group (DG) number.

\textbf{j\textsuperscript{l}} = Synchronous transport signal (STS) facility number.

\textbf{k\textsuperscript{l}} = SONET termination equipment (STE) facility number.

\textbf{l\textsuperscript{l}} = Digital signal level 0 (DS0) number.

[3] SET WSPHONE TEST POSITION a-h
   ACCESS=g                           T&M=i
   DN=b[-c]                j
   p[=l]
   [E=q]

2. REASON FOR OUTPUT

To indicate that the talk and monitor (T&M) phone has been added into the current testing configuration at the trunk and line work station (TLWS) test position (TP) or that the mode of the T&M phone has been changed.

3. VARIABLE FIELD DEFINITIONS

E  = Error.

a  = TP number.

b  = Telephone number entered.

c  = Member number of the line time slot bridging (LT SB) line. For LT SB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

d  = Line equipment number. Valid value(s):

  AIUEN=n-e
  AP=r
  ILEN=n-j
  INEN=n-t
LCEN=n-o-s\textsuperscript{1}\text{-}q
LCKEN=n-o-s\textsuperscript{1}\text{-}c\textsuperscript{2}\text{-}d\textsuperscript{2}
LEN=n-o-r-s-t-u
SLEN=n-v-w-x

\begin{itemize}
\item[e] Multi-line hunt group number.
\item[f] Hunt group member number.
\item[g] Valid value(s):
\begin{itemize}
\item[AC1 JACK] Connection to the AC jack number 1.
\item[AC2 JACK] Connection to the AC jack number 2.
\item[CAMPED ON] Line or trunk is camped on.
\item[CPE TESTS] Test customer premises equipment.
\item[DC1 JACK] Connection to the DC jack number 1.
\item[DC2 JACK] Connection to the DC jack number 2.
\item[DIG TRANS] Connection to digital transmission equipment.
\item[IN PROGRESS] Test or test setup is in progress.
\item[METALLIC] Connection to metallic measurement equipment.
\item[MONITOR B\&I] Monitor a busy or idle line/trunk.
\item[MONITOR BUSY] Monitor a busy line/trunk.
\item[SEIZED] Line or trunk is seized.
\item[SUPERVISION] Supervisory test running.
\item[TRANSMISSION] Connection to transmission equipment.
\end{itemize}
\item[i] Trunk group number.
\item[j] Trunk member number.
\item[k] Trunk equipment number. Valid value(s):
\begin{itemize}
\item[DEN=n-y-z-a\textsuperscript{1}]
\item[INEN=n-t\textsuperscript{1}\text{-}k\textsuperscript{1}\text{-}l\textsuperscript{1}]
\item[NEN=n-t\textsuperscript{1}\text{-}u\textsuperscript{1}\text{-}v\textsuperscript{1}\text{-}h\textsuperscript{2}\text{-}i\textsuperscript{2}\text{-}x\textsuperscript{1}]
\item[PSUEN=n-y\textsuperscript{1}\text{-}z\textsuperscript{1}\text{-}a\textsuperscript{2}\text{-}b\textsuperscript{2}]
\item[RAF PORT n-b\textsuperscript{1}\text{-}c\textsuperscript{1}]
\item[TEN=n-d\textsuperscript{1}\text{-}e\textsuperscript{1}\text{-}f\textsuperscript{1}\text{-}g\textsuperscript{1}]
\end{itemize}
\item[l] Phone number of the T&M phone when the phone is remote.
\item[m] Relative link (member) number of the AP.
\item[n] Switching module (SM) number.
\item[o] Line unit number.
\item[p] Type of T&M phone. Valid value(s):
\begin{itemize}
\item[NO T&M PHONE] There is no T&M phone populated for this ID in the database (TLWSR tuple).
\item[REMOTE T&M PHONE] The T&M phone populated for this ID in the database is remote.
\item[LOCAL T&M PHONE] The T&M phone populated for this ID in the database is local.
\end{itemize}
\end{itemize}
q = Line card number.

r = Grid number.

s = Switch board number (LU1, LU2, or LU3).

t = Switch number.

u = Level number.

v = Digital carrier line unit number.

w = Remote terminal (RT) number.

x = RT line number.

y = Digital line and trunk unit (DLTU) number.

z = Digital facility interface (DFI) number.

a = Channel number.

b = RAF unit number.

c = RAF channel number.

d = Trunk unit number.

e = Service group number.

f = Channel board number.

g = Circuit number.

h = TLWSR tuple identification.

i = The mode of the T&M phone in the test connection. Valid value(s):
H = The T&M phone is ON-HOLD (metallic connections).
M = The T&M phone is in the MONITOR mode (listen-only).
N = No T&M phone in the connection.
T = The T&M phone is in the TALK mode (listen and talk).

j = IDCU number.

k = RT number or IDCU digital signal level 1 (DS1) serving PUB43801 number.

l = RT line number or PUB43801 channel.

q = Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

r = Data link (group) number of the AP.

s = Line group number.

t = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
4. ACTIONS TO BE TAKEN

None. No action is required.

103. SND
SND:BICCMSG-A
Software Release: 5E15 only
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

[1] SND BICCMSG {BG=a|BGMN=a-b[&c]},MSG=d STARTED

[2] SND BICCMSG {BG=a|BGMN=a-b[&c]},MSG=d e

[3] SND BICCMSG {BG=a|BGMN=a-b[&c]},MSG=d
   SM=f LAUNCHED SUCCESSFULLY FOR i BLOCKS
   [DENIED BGMNS DISCOVERED IN j BLOCKS]

[4] SND BICCMSG {BG=a|BGMN=a-b[&c]},MSG=d
   SM=f DENIED FOR BGMNS IN k & l:
   [g],[g],[g],[g]
   [g],[g],[g],[g]
   [g],[g],[g],[g]
   [THERE WERE MORE MEMBERS DENIED PROCESSING]

[5] SND BICCMSG {BG=a|BGMN=a-b[&c]},MSG=d
   SM=f h

[6] SND BICCMSG {BG=a|BGMN=a-b[&c]},MSG=d COMPLETED

2. REASON FOR OUTPUT

To report on the processing of the SND:BICCMSG input message. Each output message will echo the parameters
of the input message.

Format 1 will be printed to indicate that the request was received, the input values were checked, no problems were
found and request processing has begun.

Format 2 will be printed when a problem (other indicators described in the variable field definitions section below)
existed that prevented the switching module(s) [SM(s)] from launching the request.

Format 3 will be printed to indicate that the SM(s) launched the request to (un)block the BICC member(s) in the
message.

Format 4 will be printed when some or all of the BICC group members were denied processing. The reason for
denial of processing is that the BICC group members were in any one of the following states:

   OOS,MTCE,CCSINIT
   OOS,AUDIT

Format 5 will be printed when a problem (other indicators described in the variable field definitions section below)
existed that was specific to an SM.

Format 6 will be printed to indicate that the input message has been accepted and all involved SM(s) received and completed the request.

3. VARIABLE FIELD DEFINITIONS

a  = BICC group number.
b  = BICC group member number. If a range was used, this will be the lower range value.
c  = BICC group member number. This is only used with a range and will be the upper range value.
d  = Message type. Valid value(s):
    BLOCK
    UNBLOCK

e  = Per-request status. Valid value(s):
    CNI INACCESSIBLE = The common network interface (CNI) is inaccessible.
    DPC CONGESTION = The destination point code (DPC) is accessible, but is partially congested and can only accept certain CCS messages. SND:BICCMSG is not allowed access.
    DPC INACCESSIBLE = The DPC is completely blocked from use by any feature.
    NOT ALL SMs REACHED = The message was sent to all of the SMs in the office but not all received it.
    TIME OUT = Five seconds have elapsed and the SM has not acknowledged receiving the SND:BICCMSG request.

f  = SM number.
g  = BICC group member number that was denied processing.
h  = Per-SM status. Valid value(s):
    CMT INACCESSIBLE = The common channel signaling (CCS) message transport (CMT) is inaccessible.
    CMT OVERLOAD = The CMT is in the overload state.
    CNI OVERLOAD = The CNI is in the overload state.
    SM INACCESSIBLE = The SM was inaccessible (that is, it could not receive the request).

i  = Number of block(s) containing successful launched request for its members.
j  = Number of block(s) containing denied members.
k  = BICC group member number. This is the lower range value of the denied members.
l  = BICC group member number. This is the upper range value of the denied members.

4. ACTIONS TO BE TAKEN

None.

5. ALARMS
None.

3. VARIABLE FIELD DEFINITIONS

a = BICC group number.

b = BICC group member number. If a range was used, this will be the lower range value.

c = BICC group member number. This is only used with a range and will be the upper range value.

d = Message type. Valid value(s):

   BLOCK
   UNBLOCK

e = Per-request status. Valid value(s):

   CNI INACCESSIBLE = The common network interface (CNI) is inaccessible.
   DPC CONGESTION = The destination point code (DPC) is accessible, but is partially congested and can only accept certain CCS messages. SND:BICCMSG is not allowed access.
   DPC INACCESSIBLE = The DPC is completely blocked from use by any feature.
   NOT ALL SMs REACHED = The message was sent to all of the SMs in the office but not all received it.
   USER PART UNAVAILABLE = Far End User Part is unavailable. It may either be inaccessible, unequipped or unknown at present time.

f = SM number.

g = BICC group member number that was denied processing.

h = Per-SM status. Valid value(s):

   CMT INACCESSIBLE = The common channel signaling (CCS) message transport (CMT) is inaccessible.
   CMT OVERLOAD = The CMT is in the overload state.
   CNI OVERLOAD = The CNI is in the overload state.
   TIME OUT = Five seconds have elapsed and the SM has not acknowledged receiving the SND:BICCMSG request.
   SM INACCESSIBLE = The SM was inaccessible (that is, it could not receive the request).

i = Number of block(s) containing successful launched request for its members.

j = Number of block(s) containing denied members.

k = BICC group member number. This is the lower range value of the denied members.

l = BICC group member number. This is the upper range value of the denied members.

4. ACTIONS TO BE TAKEN

None.
5. ALARMS

None.

2. REASON FOR OUTPUT

To provide the results of the proxy database maintenance action resulting from a ST:DBPROXY input message. Format 2 is generated when variable 'a' is equal to either "SIZEREPORT" or "SIZEREPORTALL". In addition, both formats will be produced automatically when the system determines the amount of used space in a particular database has reached the warning level.

3. VARIABLE FIELD DEFINITIONS

a  = Action performed on the proxy database. Valid value(s):
   OFFLINE = Brings the proxy database server offline.
   ONLINE  = Brings the proxy database server online.
   RELCOMPARE = Determines if the data in a relation is the same in both the switch ODD and the proxy database.
   RELOADALL = Reloads all databases from the switch ODDs.
   RELOAD = Reloads the specified database from the switch ODD.
   REMOVEALL = Removes all databases from the proxy database.
   REMOVE = Removes the specified database from the proxy database.
   RESIZE = Changes the maximum size of the specified database.
   RESTART = Restarts the proxy database server.
   SIZEREPORTALL = Gives the current and maximum size of all databases.
   SIZEREPORT = Gives the current and maximum size of the specified database.
   STATUS = Gives the status of the proxy database server.

b  = Database.

c  = SM number.

d  = Status of proxy database maintenance action. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = Request has successfully completed.
IN PROGRESS = The proxy database maintenance action continues.

NOT STARTED = Requested action has not begun.

STOPPED = The proxy database maintenance action has stopped.

= Status message. Valid value(s):
ACTION WAS INTERRUPTED = A currently running action has been interrupted and stopped.
ANOTHER PROCESS HAS THE PROXY DB DATABASE FILE OPEN = Database file cannot be modified due to another process having it open.
ANOTHER PROXY DB RECOVERY ACTION IS IN PROGRESS = A recovery request is being ignored since a recovery request is already in progress.
ANOTHER PROXY DB RELATION COMPARE IS ALREADY IN PROGRESS - TRY LATER = Another relation compare action is currently executing. Wait until the current relation compare has completed and then try again.
CANNOT ATTEMPT A RECOVERY NOW = Unable to execute a recovery action at this time.
CANNOT COMMUNICATE WITH PROXY DB CONTROL PROCESS = The maintenance request could not be sent to the proxy DB control process on the administrative services module (ASM).
CANNOT CREATE TERMINAL PROCESS = Unable to create a terminal process for the specified action.
DATA IN SWITCH ODD AND PROXY DB IS DIFFERENT IN RELATION = The relation compare action has determined that the data contained in the relation specified in variable 'r' is different in the switch ODD and the proxy database for the specified database.
DATA IN SWITCH ODD AND PROXY DB IS EQUAL IN RELATION = The relation compare action has determined that the data contained in the relation specified in variable 'r' is the same in the switch ODD and the proxy database for the specified database.
DATABASE SPECIFIED IN PARAMETER 'DB' IS NOT VALID FOR THIS ACTION = The database specified is not valid for this action.
DD READ FAILED = The read of a DD key has failed.
DID NOT RECEIVE ACKNOWLEDGMENT FROM PROXY DB CONTROL PROCESS = The maintenance request was sent but no acknowledgement was received from the proxy DB control process on the ASM. If no other status message is received in a few minutes, try the command again.
DID NOT RECEIVE ACKNOWLEDGMENT FROM TERMINAL PROCESS = The terminal process was created but no acknowledgement was received from the terminal process.
INVALID PROXY DB REQUEST = Action received is invalid.
INVALID SM = The SM number specified is not valid.
MAX SIZE CANNOT BE LESS THAN CURRENT SIZE = The maximum size of a database cannot be smaller than the current size of the database.
NO ADDITIONAL PARAMETERS SHOULD BE SPECIFIED FOR THIS ACTION = The specified action does not require any additional parameters.
NO PROXY DATABASES EXIST = No proxy databases exist.
PARAMETER 'DB' IS REQUIRED FOR THIS ACTION = The DB parameter must be specified.
PARAMETER 'MAXSIZE' CAN ONLY BE USED WHEN ACTION=RESIZE = The MAXSIZE parameter is only valid when ACTION is equal to RESIZE.
PARAMETER 'MAXSIZE' IS REQUIRED FOR THIS ACTION = The MAXSIZE parameter must be specified.
PARAMETER 'RELCOMPARE' CAN ONLY BE USED WHEN ACTION=RELCOMPARE = The RELNAME parameter is only valid when ACTION is equal to RELCOMPARE.
PARAMETER 'RELCOMPARE' IS REQUIRED FOR THIS ACTION = The RELNAME parameter must be specified.
PARAMETER 'SM' CAN ONLY BE USED WHEN DB=SM = An SM number can only be specified when DB is equal to SM.
PARAMETER 'SM' IS REQUIRED WHEN DB=SM = SM parameter must be specified when DB is equal to SM.

PROXY DB DATABASE FILE CANNOT BE OPENED = Error in opening a database file.
PROXY DB DATABASE FILE IS IN USE, TRY AGAIN LATER = The specified database is currently being acted on by another maintenance request. Wait a few minutes and try the command again.

PROXY DB INTERNAL ERROR = Internal software error.

PROXY DB IS ALREADY OFFLINE = A ST:DBPROXY,ACTION=OFFLINE request is being ignored since the proxy database server is already off-line.
PROXY DB IS ALREADY ONLINE OR COMING ONLINE = The proxy database server is online or coming online.

PROXY DB IS BEING RELOADED FROM THE SWITCH ODD = The proxy database is being reloaded from the switch Office Dependent Data (ODD).
PROXY DB IS BEING REMOVED = The proxy database is being removed.
PROXY DB IS BEING SYNCHRONIZED WITH THE SWITCH ODD = The proxy database is being synchronized with the switch ODD.

PROXY DB IS DOWN = The proxy database server is down.
PROXY DB IS NORMAL = The proxy database server is normal.
PROXY DB IS NOT ACTIVATED OR IS BEING REMOVED = The proxy database feature is not activated or being removed.
PROXY DB IS NOT ACTIVE = The proxy database is not active.
PROXY DB IS OFFLINE = The proxy database is in the offline state.
PROXY DB IS ONLINE = The proxy database is in the online state.
PROXY DB IS RECOVERING = The proxy database is in the recovery state.
PROXY DB IS RELOADING ONE PROCESSOR WITH THE SWITCH ODD = The proxy database is reloading a single processor from the switch ODD.
PROXY DB IS REMOVING ONE PROCESSOR = The proxy database is removing a single processor from the database.
PROXY DB IS SYNCHRONIZING ONE PROCESSOR WITH THE SWITCH ODD = The proxy database is synchronizing a single processor with the switch ODD.
PROXY DB IS UNAVAILABLE = The proxy database feature is unavailable and cannot be used.
PROXY DB MUST BE OFFLINE TO BE REMOVED = Before a database is removed, the proxy database server must first be taken offline.
PROXY DB MUST BE ONLINE FOR THIS ACTION = The proxy database server must be online to perform the specified action.
PROXY DB MUST BE ONLINE TO RELOAD OR REMOVE AN INDIVIDUAL DATABASE = The proxy database server must be online to reload or remove a single processor's database.

PROXY DB PCT USED HAS REACHED WARNING LEVEL - EXECUTE RESIZE COMMAND = This message is automatically produced by the system when a database has reached the percent used warning level. A ST:DBPROXY format 2 message will immediately follow this message and display the relevant information for the database causing this warning message.

PROXY DB RECOVERY FAILED = A proxy database recovery action has failed.
PROXY DB RELATION COMPARE ACTION TIMED OUT = A previous relation compare action did not receive the relation information from either the switch or the proxy database in the allowed time.

PROXY DB REMOVE IS ALREADY IN PROGRESS = A proxy database remove action is already in progress.
PROXY DB SERVER IS RESTARTING = The proxy database is restarting.
PROXY DB SINGLE PROCESSOR RECOVERY FAILED = The proxy database single processor recovery process has failed.
RELATION DOES NOT EXIST IN THE SPECIFIED DATABASE = The relation name entered is valid but does not exist in the specified database.
RELATION NAME SPECIFIED IN PARAMETER 'RELNAME' IS NOT VALID = An invalid relation name was entered.
SPECIFIED DATABASE DOES NOT EXIST = The database specified does not exist.
UNABLE TO SEND RELATION INFORMATION TO TERMINAL PROCESS = Unable to send relation information message to the terminal process.
UNEXPECTED MESSAGE TYPE RECEIVED = An unexpected message was received when creating a terminal process.

f = Relation name.
g = Page number.
h = Number of pages.
i = Current size of the database, in kilobytes.
j = Maximum size of the database, in kilobytes.
k = Percentage of used space in the database.

4. ACTIONS TO BE TAKEN
For format 2, execute a ST:DBPROXY input message with "ACTION" equal to "RESIZE" to increase the maximum size of the database. This will lower the percent used value.

5. ALARMS
None.

6. REFERENCES
Input Message(s):

ST:DBPROXY
ST:LIB

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ST LIB TEAM a b [c] d

2. REASON FOR OUTPUT

To report the completion status of a manually issued ST:LIB input message.

3. VARIABLE FIELD DEFINITIONS

a = Team number.

b = Central processor (CP) or administrative module (AM) flag. Valid value(s):
N = CP or AM is not reporting.
Y = CP or AM is reporting.

c = Switching module (SM) number. Default is that SM is not reporting.

d = Results. Valid value(s):

COMPLETED
STOPPED - LOAD STILL IN PROGRESS
STOPPED - NO PROGRAM LOADED
STOPPED - PROCESSOR LOADED BY A DIFFERENT TEAM
STOPPED - PROGRAM CLEARED
STOPPED - PROGRAM STARTED
STOPPED - UNABLE TO START PROGRAM

4. ACTION TO BE TAKEN

Since this is a response to a manual request, no action is required. Normally, testing would proceed from this point.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

ST:LIB
ST:MODGRW-RSM
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ST MODGRW RSM a b

2. REASON FOR OUTPUT

To respond to a previously entered ST:MODGRW-RSM request, which copies switching module (SM) redundant relations from the existing SM(s) to a new remote switching module (RSM).

3. VARIABLE FIELD DEFINITIONS

a = RSM number.

b = Termination report. Valid value(s):
ABORTED = The requested action was terminated before completion, and the termination was immediate with consistency of questionable data.
COMPLETED = The requested action was terminated after completion.
NOT STARTED = The requested action could not begin, probably because office-dependent data (ODD) backup was in progress.
STOPPED = The requested action was terminated before a normal completion, and the termination was graceful.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

<td>The size entered for the NRODD growth would exceed the maximum ODD size by 'd' kbytes.</td>
</tr>
<tr>
<td>RECOVERED FROM A PREVIOUS GROWTH ATTEMPT</td>
<td>Parameters have been re-set to a consistent state during this growth from a prior aborted growth. This growth is continuing.</td>
</tr>
<tr>
<td>RECOVERY REQUIRES NRODD GROW OF KBYTES= d</td>
<td>The growth size input is not sufficient to recover data from a prior aborted growth. Input ST:NRODDGRW with kbytes = to...</td>
</tr>
</tbody>
</table>
This will ensure that no data will be lost, and that the parameters are correctly reset.

**RODD BIT MAP IS CORRUPT OR INCONSISTENT** = The control bitmap for the redundant office-dependent data (RODD) being relocated during this growth was found to be inconsistent.

**RUN ST:ODDBST AFTER NRODD GROW OF KBYTES = d** = The amount of memory remaining in the RODD with the input growth size will push the redundant ODD beyond the 4 Meg boundary. Data blocks must be reorganized after a non-redundant growth of 'd' kbytes. After that growth, execute the bitmap salvage technique (BST), ST:ODDBST, to reorganize the data blocks.

**RUN THE BST TO RECLAIM BLOCKIDS** = Run the BST and then re-input this message with the same size kbytes.

**SABM AND/OR RTBM IS CURRENTLY IN USE** = The stand alone billing memory area and/or real time billing memory area is currently in use, probably following an isolation of this SM, or the module controller/time slot interchange (MCTSI)-based ethernet links (MELNK) to the billing collector are down. Wait a few minutes, and then input the growth message again.

**INSUFFICIENT SPARE MEMORY, DEGROW BILLING MEMORY OR GROW PHYSICAL MEMORY** = There is insufficient spare memory to allow for the growth of the office dependent data (ODD). Additional spare memory may be acquired by degrowing the stand alone billing memory (SABM) or real time billing memory (RTBM), or adding additional physical memory.

**UNABLE TO SEIZE RODD DATA BLOCKS** = The redundant memory space was not large enough to accommodate the growth of the non-redundant ODD. Grow the RODD, then grow the NRODD.

\[d\] = The number of kbytes.

\[e\] = The relation ID.

\[f\] = The partition number.

### 4. ACTIONS TO BE TAKEN

All executions should terminate gracefully. If the administrative module (AM) growth process is killed, the SM process will continue until it times out waiting for a message or reply from the AM. The growth should be restarted with a size of zero to bring the system back to a consistent state.

### 5. ALARMS

None.

2. REASON FOR OUTPUT

To provide the status of the non-redundant office-dependent data (NRODD) memory growth resulting from ST:NRODDGRW input message.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) or communications module processor (CMP) number.

b  = Status of non-redundant growth. Valid value(s):
   ABORTED      = Requested action was terminated before completion and the termination was immediate.
   COMPLETED    = Request has successfully completed.
   IN PROGRESS  = The non-redundant office-dependent data (ODD) growth continues.
   NOT STARTED  = Requested action has not begun.
   STARTED      = Parameters have been validated, and the ODD disk file grown. The growth has started on the SM or CMP.
   STOPPED      = The growth has stopped. Parameters have been left in a consistent state.

  = Additional information concerning status. Valid value(s):
  DD BIT DDNREDGRW INCONSISTENT = The data delivery bit for the non-redundant growth cannot be reset.
  DISK PARTITIONS ARE FULL = There is not enough memory on disk after searching the partitions, to accommodate this growth.
  INVALID RELATION ID = e = During the non-redundant growth, an invalid relation ID, 'e', was detected.
  NRODD DATA STRUCTURES ARE CORRUPTED = The NRODD growth has detected an inconsistency in its internal structure, and the growth has aborted. Please try again with the same size.
  NRODD GROWTH PROCESS HAS TIMED OUT = The AM NRODD process has timed out waiting for a message from the SM or CMP.
  NRODD GROWTH SIZE NOT A MULTIPLE OF 16 = The input size to grow the non-redundant ODD was not a multiple of 16 Kilobytes.
  NRODD RELOCATED TO /NO5ODD/SMDATA f = The NRODD file for this SM has been relocated to partition 'f'.
  NRODD SIZE WOULD EXCEED MAXIMUM BY KBYTES = d = The size entered for the NRODD growth would exceed the maximum ODD size by 'd' kbytes.
  RECOVERED FROM A PREVIOUS GROWTH ATTEMPT = Parameters have been re-set to a consistent state during this growth from a prior aborted growth. This growth is continuing.
  RECOVERY REQUIRES NRODD GROW OF KBYTES= d = The growth size input is not sufficient to recover data from a prior aborted growth. Input ST:NRODDGRW with kbytes = to
'd'. This will ensure that no data will be lost, and that the parameters are correctly reset.

RODD BIT MAP IS CORRUPT OR INCONSISTENT = The control bitmap for the redundant office-dependent data (RODD) being relocated during this growth was found to be inconsistent.

RUN ST:ODDBST AFTER NRODD GROW OF KBYTES = d = The amount of memory remaining in the RODD with the input growth size will push the redundant ODD beyond the 4 Meg boundary. Data blocks must be reorganized after a non-redundant growth of 'd' kbytes. After that growth, execute the bitmap salvage technique (BST), ST:ODDBST, to reorganize the data blocks.

RUN THE BST TO RECLAIM BLOCKIDS = Run the BST and then re-input this message with the same size kbytes.

SABM AND/OR RTBM IS CURRENTLY IN USE = The stand alone billing memory area and/or real time billing memory area is currently in use, probably following an isolation of this SM, or the module controller/time slot interchange (MCTSI)-based ethernet links (MELNK) to the billing collector are down. Wait a few minutes, and then input the growth message again.

INSUFFICIENT SPARE MEMORY, DEGROW BILLING MEMORY OR GROW PHYSICAL MEMORY = There is insufficient spare memory to allow for the growth of the office dependent data (ODD). Additional spare memory may be acquired by degrowing the stand alone billing memory (SABM) or real time billing memory (RTBM), or adding additional physical memory.

UNABLE TO SEIZE RODD DATA BLOCKS = The redundant memory space was not large enough to accommodate the growth of the non-redundant ODD. Grow the RODD, then grow the NRODD.

d = The number of kbytes.

e = The relation ID.

f = The partition number.

4. ACTIONS TO BE TAKEN

All executions should terminate gracefully. If the administrative module (AM) growth process is killed, the SM or CMP process will continue until it times out waiting for a message or reply from the AM. The growth should be restarted with a size of zero to bring the system back to a consistent state.

235-105-220  Corrective Maintenance
ST:ODDCREAT-SM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ST ODDCREAT SM a b {c|d SM MEGABYTES OF MEMORY REQUIRED TO PUMP}

2. REASON FOR OUTPUT

To respond to a ST:ODDCREAT-SM input message, which requests the creation of office-dependent data (ODD) for a switching module (SM) that is being added to the switch.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = Termination report. Valid value(s):
   ABORTED = The requested action was terminated before completion, and the termination was
   immediate with consistency of data questionable.
   COMPLETED = The requested action was terminated after completion.
   NOT STARTED = The requested action could not begin, probably because the office-dependent
   data backup was in progress.
   STOPPED = The requested action was terminated before a normal completion, and the
   termination was graceful.

c = Failure type. Valid value(s):
   BOTH UODDSZ AND NRODDSZ MUST BE 999 TO REQUEST DEFAULT SIZES = To request the
   default sizes for the unprotected and nonredundant ODDs, a value of 999 must be
   entered for both the uoddsz and nroddsz parameters.
   CI FILE FOR THE SM CANNOT BE CREATED = Oddcreat was unable to create a CI file in the
   /no5odd/cidata partition. Either the partition was not accessible, or there was not
   enough room in the partition to create the file.
   FAILURE IN COPYING COFF FILE = Oddcreat was unable to copy the unprotected ODD and
   nonredundant ODD sections to the new ODD COFF file for the growth SM/RSM. All
   files have been removed, and oddcreat must be rerun.
   INSUFFICIENT CONTIGUOUS DISK SPACE = There was not enough contiguous disk space in
   the /no5odd/imdata partitions to create the new ODD file.
   NO SMODD DISK PARTITIONS ARE AVAILABLE = There are no SM ODD partitions available for
   ODD files. Mount the necessary partitions, and rerun oddcreat.
   NRODD SIZE MUST BE ON 16K BOUNDARY = The size input for the nonredundant ODD was not
   on a 16k boundary.
   NRODD SIZE SMALLER THAN UODD AND SKELETON ODD ALLOWS = A value was input for the
   size of the nonredundant ODD in the oddcreat input message that was smaller than
   the default size in the skeleton ODD. This is not allowed, so oddcreat was stopped.
   Oddcreat should be rerun with a larger size for the nonredundant ODD.
   NRODDSZ WAS LARGER THAN MAXIMUM NRODD ALLOWED = The size input for the nroddsz field
   was larger than the maximum nonredundant ODD allowed for the software release.
   Rerun oddcreat with a smaller size for the nonredundant ODD.
   RODD MUST BE BACKED UP BEFORE ODDCREAT CAN RUN = The redundant ODD has not been
backed up since the last redundant ODD growth. This backup must be done before oddcreat can be run.

**SM MUST BE SMSGRO TO RUN ODDCREAT** = An attempt to run oddcreat on an SM that was not in the SMSGRO state was attempted. Change the SM to SMSGRO and rerun oddcreat.

**UODD SIZE LARGER THAN SKELETON ODD ALLOWS** = A value was input for the size of the unprotected ODD in the oddcreat input message that was larger than the default size in the skeleton ODD. This is not allowed, so oddcreat was stopped. Oddcreat should be rerun with a smaller size for the unprotected ODD.

**UODD SIZE MUST BE ON 16K BOUNDARY** = The size input for the unprotected ODD was not on a 16k boundary.

**UODDSZ WAS SMALLER THAN MINIMUM UODD ALLOWED** = The size input for the unprotected ODD was smaller than the minimum unprotected ODD allowed for the software release. Retry with a larger size for the unprotected ODD.

**UNABLE TO ACCESS THE SKELETON CI FILE** = Oddcreat was unable to access the skeleton CI file in the /no5odd/cidata partition.

**UNABLE TO ACCESS THE SKELETON ODD FILE** = Oddcreat was unable to access the skeleton ODD file in the /no5odd/cidata partition.

**UNABLE TO CONSTRUCT A FILE PATH NAME** = Oddcreat was unable to construct a pathname to either the CI file or the ODD file for this SM.

**UNABLE TO READ SM’S CI FILE** = Oddcreat was unable to read the critical information file for the new SM.

**UNABLE TO READ THE MODATT RELATION** = Oddcreat was unable to read the tuple in the AM relation RLmodatt for this SM.

**UNABLE TO WRITE TO SM’S CI FILE** = Oddcreat was unable to write to the new SM’s critical information file.

**X IS DEFAULT UODD SIZE IN BYTES** = The value specified is the default size of the unprotected ODD for the specified SM. When running oddcreat on this SM, any value entered for the uoddsz field must be smaller than the specified default size.

**X IS DEFAULT NRODD SIZE IN BYTES** = The value specified is the default size of the nonredundant ODD for the specified SM. When running oddcreat on this SM, any value entered for the nroddsiz field must be larger than the specified default size.

= Memory requirements. The amount of SM memory in megabytes that must be equipped in the SM before the SM can be pumped.

### 4. ACTION TO BE TAKEN

Correct any inappropriate condition noted in the failure type (variable c), as required, and reexecute the ST:ODDCREAT-SM request if needed. Otherwise, no specific action is required.

### 5. ALARMS

None.

### 6. REFERENCES

Input Message(s):
ST:ODDCREAT-SM

Other Manual(s):

235-105-220 Corrective Maintenance
**ST:ODDGRW**

**Software Release:** 5E14 and later  
**Message Class:** ODD  
**Application:** 5  
**Type:** Output

1. **FORMAT**

```plaintext
ST ODDGRW AM a [b]
```

2. **REASON FOR OUTPUT**

To provide the status of administrative module memory growth for office-dependent data (ODD).

3. **VARIABLE FIELD DEFINITIONS**

```plaintext
AM = Administrative module.

a = Status of memory growth. Valid value(s):
   ABORTED = Action was terminated before completion and the termination was immediate with questionable data consistency.
   COMPLETED = Action was terminated after completion.
   NOT STARTED = Action could not begin, probably because an ODD backup was in progress.
   STOPPED = Action was terminated before a normal completion but the termination was graceful.

b = Additional information concerning status. Valid value(s):
   PAS SIZE MUST BE UPDATED BEFORE AM INITIALIZATION = AM ODD Growth was successful. If the 'h_pas_size' parameter from the ECD - BTPARM form has not already been updated, it must be done before an AM initialization can be done. Refer to the "GROW AM ODD MEMORY" procedures from the Routine Operations and Maintenance Procedures manual.
   CANNOT ALLOCATE ENOUGH SPACE FOR AM ODD
   CANNOT MOUNT /dev/no5odd1/
   CANNOT MOUNT /dev/no5odd2/
   CANNOT OPEN AM ODD FILE
   CANNOT UNMOUNT /dev/no5odd1/
   CANNOT UNMOUNT /dev/no5odd2/
   AM ODD GROWTH SIZE NOT A MULTIPLE OF 16 = The input size to grow the AM ODD was not a multiple of 16 Kilobytes.
   FAILED TO COPY ODD CORRECTLY
   FAILED TO UPDATE AM ODD
   FAILED TO UPDATE THE AIMRC FILE
   ODD BACKUP IN PROGRESS
   REQUESTED SIZE LARGER THAN GENERIC MAXIMUM
```

4. **ACTION TO BE TAKEN**

Upon receiving a successful completion message, it must be confirmed that the 'h_pas_size' parameter from the ECD - BTPARM form has been updated. This must be done before an AM initialization can occur. Refer to the "GROW AM ODD MEMORY" procedures from the Routine Operations and Maintenance Procedures manual.
5. ALARMS

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

ST:ODDRM-SM
ST:ODDUPD-MMRSM

Software Release: 5E14 and later
Message Class: ODD
Application: 5
Type: Output

1. FORMAT

ST ODDUPD MMRSM SITES FROM=a TO=b c
[d]

2. REASON FOR OUTPUT

To indicate the result of an ST:ODDUPD input message requesting the update of all multi-module remote switching module (MMRSM) site common office-dependent data (ODD) in all RSMs which are members of the affected MMRSM sites. This activity is related to the remote switching module (RSM) association procedure which is a function of MMRSM growth.

3. VARIABLE FIELD DEFINITIONS

- \(a\) = MMRSM site number from which an RSM was removed (disassociated).
- \(b\) = MMRSM site number to which an RSM was joined (associated).
- \(c\) = Operation completion status. Valid value(s):
  - ABORTED = Operation interrupted, not all data was updated successfully.
  - COMPLETED = Operation completed successfully, data is updated.
  - IN PROGRESS = Operation has not yet completed. This is a five-minute interval status report.
  - NOT STARTED = Operation not started, could not establish communication port or open data access transaction at this time.
  - STOPPED = Operation terminated, no data was changed.
- \(d\) = Supplemental information. Prints only when ‘c’ equals STOPPED. Valid value(s):
  - DATA BASE MANAGER UNABLE TO ACCESS ALL NECESSARY PROCESSORS
  - ILLEGAL CONFIGURATION SPECIFIED
  - INSUFFICIENT ODD MEMORY SPACE TO ACCOMMODATE GROWTH
  - INVALID SITE ID OR MEMBER SPECIFIED
  - INVALID SM TYPE SPECIFIED
  - RSM TO BE MOVED EQP WITH ALM RCLKU, SALGRP OR COMMON MTB OPTION

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED</td>
<td>Some difficulty may be encountered by call processing in routing inter-RSM calls within the MMRSM site while in the stand-alone call processing state. Since these calls cannot be backhauled by the administrative module (AM), they may not be completed. The problem which caused this ODDUPD function not to complete successfully should be resolved AS SOON AS POSSIBLE. The office database editor (ODBE) will have to be used to correct the data.</td>
</tr>
</tbody>
</table>
Technical assistance in using the ODBE should be sought. Usually, an ABORTED status with no accompanying system initialization sequence indicates that the global office parameters, GLralmmod, Glsacp, Glsabm or Gisalgrp, were not updated properly.

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>STOPPED</td>
<td>The 'd' field indicates the reason for termination. Check the RSM &quot;Association&quot; procedure which is part of MMRSM growth for a possible procedural problem. Use the ST:ODDUPD input message to re-initiate the ODDUPD function.</td>
</tr>
<tr>
<td>NOT STARTED</td>
<td>Use the ST:ODDUPD input message to re-initiate the ODDUPD function.</td>
</tr>
</tbody>
</table>

5. ALARMS

None.

6. REFERENCES

Input Message(s):

ST:ODDUPD

Other Manual(s):
235-105-231  Hardware Change Procedures - Growth
ST:OPUMP-CMP

Software Release: 5E14 and later
Message Class: MSGS
Application: 5
Type: Output

1. FORMAT

ST OPUMP CMP=a-b c [d]

2. REASON FOR OUTPUT

To report the result of a ST:OPUMP-CMP input message to download the specified communication module processor (CMP) from the off-line administrative module (AM) disk and perform off-line verification.

3. VARIABLE FIELD DEFINITIONS

a = Message switch side number.
b = CMP number.
c = Termination status. Valid value(s):
   COMPLETED = Request has successfully completed.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
d = Additional information qualifying the termination status.

4. ACTION TO BE TAKEN

If the off-line pump and verify request did not complete investigate possible causes of the failure. Also, check compliance with software release retrofit/update procedures. If errors continue after retrying the input message, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   ST:OPUMP-CMP
   STP:CMP

Other Manual(s):

Where 'x' is the release-specific version of the document.
235-105-24x   Generic Retrofit Procedures
ST:OVERLAY

Software Release: 5E14 and later
Message Class: ODD
Application: 5
Type: Output

1. FORMAT

ST OVERLAY PROD a b

2. REASON FOR OUTPUT

To report the status of one of the following: the termination of a recent change kernel process (RCKP), the termination of a RCKP and overlay with DBdiskrc, or the initialization of a RCKP process from a disk.

3. VARIABLE FIELD DEFINITIONS

a = The product to overlay RCKP. Valid value(s):
   NONE, RCKP TERMINATION = RCKP terminated only. No process initialized as a result of the termination.
   RCKP INITIALIZATION = recent change kernel process.
   RCR INITIALIZATION = pre-software release recent change reapplication process (DBdiskrc).

b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = RCKP or RCR has successfully been initialized using RCKP's freed memory.
   NOT STARTED = Requested action has not begun.

4. ACTION TO BE TAKEN

If the termination report is ABORTED, the program was unable to retrieve the product (DBdiskrc or RCKP) from the disk. If RCR ABORTED, make sure DBdiskrc for pre-software release recent change reapplication (PRERCR) resident on is disk.

If the termination report is COMPLETED, no action is necessary.

If the termination report is NOT STARTED, too many update RC transactions were still running to gracefully terminate a RCKP. Allow time for those transactions to complete and retry later.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

ALW:RC
EXC:RCRMV
INH:RC
ST:OVERLAY
Output Message(s):

EXC: RCMV

Other Manual(s):

Where ‘x’ is the release-specific version of the document.
235-105-24x   Generic Retrofit Procedures
ST:RODDGRW

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ST RODDGRW [SM=a] b [c]

2. REASON FOR OUTPUT

To report the status of the redundant office dependent data (RODD) memory growth resulting from the ST:RODDGRW input message. If the UNIX® RTR operating system process is killed during growth, this message will not appear. There will be an interrupt that will describe the process that was killed as "/noStext/prc/smoddgrw". If this occurs, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. The system, however, should remain stable.

3. VARIABLE FIELD DEFINITIONS

a

= Switching module (SM) number.

b

= Status of redundant memory growth. Valid value(s):

- **ABORTED** = Action was terminated before completion, with the result that data may be inconsistent.
- **COMPLETED** = The RODD growth completed normally. Action was terminated after completion.
- **IN PROGRESS** = The RODD growth execution continues.
- **NOT STARTED** = Action could not begin, possibly because ODD backup (BKUP:ODD), non-redundant ODD growth (ST:NRODDGRW), unprotected ODD growth (ST:UODDGRW), or ODD bitmap salvage technique (ST:ODDBST) was in progress.
- **STOPPED** = Action was terminated before a normal completion but the termination was successful.

c

= Additional information concerning status. Valid value(s):

- **BACKUP MUST BE DONE IMMEDIATELY UPON COMPLETION** = A problem occurred while saving the new RODD size in a state file. A backup of the RODD should be performed immediately in order to prevent loss of growth.
- **RODD GROWTH SIZE NOT A MULTIPLE OF 16** = The input size to grow the redundant ODD was not a multiple of 16 Kilobytes.
- **BAD VALUE FOUND FOR DDREDGRW** = Integrity error in data delivery (DD). Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
- **BROADCAST ERROR** = May indicate a problem with links to a switching module (SM).
- **CAN NOT GROW - TRY BIGGER GROWTH SIZE** = The current RODD size is larger than what the growth will cover; try a larger growth.
- **CASE DEFAULTED** = Internal error; the growth was aborted. Try growth again.
- **COULD NOT UPDATE CI FILE FOR SGRO SM** = Could not read critical information (CI) file for the specified SM; either it doesn't exist, or there is not enough memory equipped for the SM(s) in special growth (SGRO).
- **DBCHECKMEM FAILED** = SM memory checks failed.
- **FAILED TO CREATE OKP PROCESS** = Indicates problem with the operational kernel process.
FAILOD BACKUP IS IN PROGRESS = Retry the growth at a later time.

OSSENDMSG FAILED = Couldn’t send message between AM and SM. Check link status to SM.

RECOVERY FROM PREVIOUS GROWTH FAILED = A previous growth has aborted, and this growth has failed to recover from it. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RODD GROWTH SUCCESSFULLY = Growth completed successfully.

RODD GROWTH DONE = Growth completed successfully.

RODD PARTIALLY COMMITTED – SOME SMS FAILED = Some SM(s) committed the growth, but some SM(s) could not; this will leave inconsistencies in the system.

RODD WILL BE BIGGER THAN GENERIC MAXIMUM = The total size of the RODD will be bigger than the maximum allowed for the software release (4 megabytes). Try to grow by a smaller size.

RUN ST:ODDBST TO RECLAIM RODD BLOCKIDS = Insufficient space exists in the bitmap to continue the growth.

INSUFFICIENT SPARE MEMORY, DEGROW BILLING MEMORY OR GROW PHYSICAL MEMORY = There is insufficient spare memory to allow for the growth of the office dependent data (ODD). Additional spare memory may be acquired by degrowing the stand alone billing memory (SABM) or real time billing memory (RTBM), or adding additional physical memory.

SENDPW PRIMITIVE FAILED = Indicates a problem with the UNIX® RTR operating system in the AM. Try growth again.

SM IN SGRO MUST HAVE MORE MEMORY ALLOCATED = An SM in special grow has insufficient memory for the growth. Either try a smaller growth, or rerun ST:ODDCREAT with a bigger ODD size to increase its memory size.

SM RECOVERY FROM PREVIOUS GROWTH – RODD IS LARGER = Current RODD is larger than backup copy. This message indicates that the growth will decrease the RODD size to match the size on disk (without losing any actual data).

SM RECOVERY FROM PREVIOUS GROWTH – RODD IS SMALLER = Current RODD is smaller than backup copy for the specified SM. This message indicates that the growth is increasing the size to that of the copy on disk.

SM REPORTED ABORTED = An SM indicated that it aborted before completing; this may leave inconsistencies in the system.

SM REPORTED STOPPED = An SM reported that it cannot continue the growth; no inconsistencies will result from this action.

SABM AND/OR RTBM IS CURRENTLY IN USE = The stand alone billing memory area and/or real
time billing memory area is currently in use, probably following an isolation of this SM, or the module controller/time slot interchange (MCTSI)-based ethernet links (MELNK) to the billing collector are down. Wait a few minutes, and then input the growth message again.

**TIMEOUT FROM OKP PROCESS** = Indicates possible communication problem between the operational kernel process (OKP) and one or more SMs.

**UNABLE TO SET UP COMMUNICATION WITH OKP** = Indicates possible communication problem between the *UNIX*® process and the operational kernel process (OKP).

**UNABLE TO SET UP COMMUNICATION WITH CMP** = Indicates possible communication problem between the AM and CMP.

4. **ACTIONS TO BE TAKEN**

All executions should terminate gracefully. Attempt a growth of size 0 to make the SM(s) that failed consistent with the rest of the system.

If any of the following statements appear, assert(s) corresponding to the problem should give more information concerning the type of error encountered.

BAD VALUE FOR DDREDGRW
CASE DEFAULTED
INVALID MESSAGE DETECTED
INVALID RETURN DETECTED
RECOVERY FROM PREVIOUS GROWTH FAILED

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. **ALARMS**

None.

6. **REFERENCES**

Input Message(s):

ST:UODDGRW-A
Software Release: 5E14 - 5E16(1)
Message Class: ODD
Application: 5
Type: Output

1. FORMAT

ST UODDGRW SM=a b [c]

2. REASON FOR OUTPUT

To provide the status of the unprotected (dynamic) office-dependent data (ODD) memory growth resulting from the
input message ST:UODDGRW-SM.

3. VARIABLE FIELD DEFINITIONS

a

= Switching module (SM) number.

b

= Status of unprotected memory growth. Valid value(s):
  ABORTED = Action was terminated before completion and the termination was immediate with
   questionable consistency.
  COMPLETED = The unprotected ODD growth completed normally. Action was terminated after
   completion.
  IN PROGRESS = The unprotected ODD growth execution continues.
  NOT STARTED = Action could not begin, probably because an ODD backup (BKUP:ODD),
    non-redundant ODD growth (ST:NRODDGRW), redundant ODD growth
    (ST:RODDGRW), or ODD bitmap salvage technique (ST:ODDBST) was in
    progress.
  STOPPED = Action was terminated before a normal completion but the termination was
    successful.

c

= Additional information concerning status. Valid value(s):
  DATABASE CONSISTENCY NOT GUARANTEED
  DATABASE LEFT CONSISTENT
  DDUNGRW UPDATED = The data delivery bit for the unprotected ODD growth has been set.
  GLOBAL SYSTEM FAILURE = The failure was due to problems external to the unprotected ODD
    growth.
  GROWTH STARTED = The unprotected ODD growth has finished its setup and has now started the
    actual growth.
  GROWTH UNABLE TO SEIZE NON-REUNDANT ODD DATA BLOCKS = An unexpected
    occupation of memory within the unprotected ODD growth area of the
    non-redundant ODD occurred. The process was unable to continue and returned
    the two ODDS to their previous (before the ST:UODDGRW input message) sizes.
  INCONSISTENT CONTROL ODD BITMAP = The control ODD bitmap was found to have
    inconsistencies.
  INCONSISTENT RELATION ID OR DATA DICTIONARY FOUND = The unprotected ODD growth
    found the SM database to be corrupted.
  INSUFFICIENT NON-REUNDANT ODD SPACE AVAILABLE = The non-redundant ODD memory
    space was not large enough to accommodate the growth of the unprotected ODD.
    To do the unprotected ODD growth, a NON-REUNDANT ODD GROWTH
    (ST:NRODDGRW) must occur first.
INVALID SM NUMBER SPECIFIED = Improper SM specified on the input message (ST:UODDGRW).

PROCESS BLOCKED FROM EXECUTING = Another ODD backup, non-redundant ODD growth, redundant ODD growth, or ODD bitmap salvage technique blocked the unprotected ODD growth from occurring.

RECOVERED FROM A PREVIOUS UODD GROWTH ATTEMPT GROWTH CONTINUES = A previous call to ST:UODDGRW left some SM parameters in an inconsistent state. The function recovers the inconsistent parameters and proceeds with the growth.

SUCCESSFULLY

TIMED OUT WAITING FOR AN SM MESSAGE = The AM unprotected ODD growth process failed to receive a message from the corresponding SM unprotected ODD growth process within the required amount of time.

UNPROTECTED ODD GROWTH DATA STRUCTURES FAULTY OR OVERFLOWED = The unprotected ODD growths internal data structures were found to be inconsistent.

UNPROTECTED ODD GROWTH PROCESS PURGED = The unprotected ODD growth terminated because the SM unprotected ODD growth terminal process was purged.

UODD GROWTH SIZE NOT A MULTIPLE OF 16 = The input size to grow the unprotected ODD was not a multiple of 16 Kilobytes.

4. ACTION TO BE TAKEN

All executions should terminate gracefully. If the administrative module (AM) growth process(es) are killed, this message will not appear. The system however should remain stable. Retry the input message (ST:UODDGRW) and the "RECOVERED FROM A PREVIOUS UODD GROWTH ATTEMPT" message should appear and complete the growth.

If the "INCONSISTENT CONTROL ODD BITMAP" message should appear do not re-schedule the unprotected ODD growth until the MEMMAN audit has finished executing. Refer to the AUD:MEMMAN input message to have the MEMMAN audit manually executed.

If the "GLOBAL SYSTEM FAILURE" message appears, assert(s) corresponding to the problem should give more information concerning the type of error encountered.

Finally, if the "INCONSISTENT RELATION ID OR DATA DICTIONARY FOUND" message appears, Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Message Class: ODD
Application: 5
Type: Output

1. FORMAT

ST UODDGRW (SM=a|CMP=a) b [c]

2. REASON FOR OUTPUT

To provide the status of the unprotected (dynamic) office-dependent data (ODD) memory growth resulting from the input message ST:UODDGRW.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) or communications module processor (CMP) number.

b = Status of unprotected memory growth. Valid value(s):
ABORTED = Action was terminated before completion and the termination was immediate with questionable consistency.
COMPLETED = The unprotected ODD growth completed normally. Action was terminated after completion.
IN PROGRESS = The unprotected ODD growth execution continues.
NOT STARTED = Action could not begin, probably because an ODD backup (BKUP:ODD), non-redundant ODD growth (ST:NRODDGRW), redundant ODD growth (ST:RODDGRW), or ODD bitmap salvage technique (ST:ODDBST) was in progress.
STOPPED = Action was terminated before a normal completion but the termination was successful.

DbUNGRW UPDATED = The data delivery bit for the unprotected ODD growth has been set.
GROWTH STARTED = The unprotected ODD growth has finished its setup and has now started the actual growth.
GROWTH UNABLE TO SEIZE NON-REDUNDANT ODD DATA BLOCKS = An unexpected occupation of memory within the unprotected ODD growth area of the non-redundant ODD occurred. The process was unable to continue and returned the two ODDs to their previous (before the ST:UODDGRW input message) sizes.
INCONSISTENT CONTROL ODD_BITMAP = The control ODD bitmap was found to have inconsistencies.
INCONSISTENT RELATION ID OR DATA DICTIONARY FOUND = The unprotected ODD growth found the SM or CMP database to be corrupted.
INSUFFICIENT NON-REDUNDANT ODD SPACE AVAILABLE = The non-redundant ODD memory space was not large enough to accommodate the growth of the unprotected ODD. To do the unprotected ODD growth, a NON-REDUNDANT ODD GROWTH (ST:NRODDGRW) must occur first.
INVALID SM NUMBER SPECIFIED = Improper SM specified on the input message (ST:UODDGRW).
PROCESS BLOCKED FROM EXECUTING = Another ODD backup, non-redundant ODD growth, redundant ODD growth, or ODD bitmap salvage technique blocked the unprotected ODD growth from occurring.
RECOVERED FROM A PREVIOUS UODD GROWTH ATTEMPT GROWTH CONTINUES = A previous call to ST:UODDGRW left some SM or CMP parameters in an inconsistent state. The function recovers the inconsistent parameters and proceeds with the growth.

NOTE: If the previous growth request was aborted, its growth will be removed. Only the current growth request will increase the unprotected ODD size.

SUCCESSFULLY TIMED OUT WAITING FOR AN SM OR CMP MESSAGE = The AM unprotected ODD growth process failed to receive a message from the corresponding SM or CMP unprotected ODD growth process within the required amount of time.
UNPROTECTED ODD GROWTH DATA STRUCTURES FAULTY OR OVERFLOWED = The unprotected ODD growths internal data structures were found to be inconsistent.
UNPROTECTED ODD GROWTH PROCESS PURGED = The unprotected ODD growth terminated because the SM or CMP unprotected ODD growth terminal process was purged.
UODD GROWTH SIZE NOT A MULTIPLE OF 16 = The input size to grow the unprotected ODD was not a multiple of 16 Kilobytes.

4. ACTIONS TO BE TAKEN

All executions should terminate gracefully. If the administrative module (AM) growth process(es) are killed, this message will not appear. The system however should remain stable. Retry the input message (ST:UODDGRW) and the "RECOVERED FROM A PREVIOUS UODD GROWTH ATTEMPT" message should appear and complete the growth.

If the "INCONSISTENT CONTROL ODD BITMAP" message should appear do not re-schedule the unprotected ODD growth until the MEMMAN audit has finished executing. Refer to the MEMMAN audit in the Audits manual (235-600-400) to have the MEMMAN audit manually executed.

If the "GLOBAL SYSTEM FAILURE" message appears, assert(s) corresponding to the problem should give more information concerning the type of error encountered.

Finally, if the "INCONSISTENT RELATION ID OR DATA DICTIONARY FOUND" message appears, Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

ST:UODDGRW
ST:NRODDGRW
ST:RODDGRW
ST:ODDBST
Other Manuals:
235-105-220  Corrective Maintenance
235-600-400  Audits Manual
ST:UPDMHGTRKG

Software Release: 5E14 and later
Message Class: ODD
Application: 5
Type: Output

1. FORMAT

ST UPDMHGTRKG SITE a b

2. REASON FOR OUTPUT

To indicate the result of an ST:UPDMHGTRKG input message requesting the update of the "cluster" attribute in the office dependent data (ODD) relations, RLRT_MHG and RLRT_TRKG, and update of the RLRTANNGRP relation for a particular multi-module remote switching module (MMRSM) site. This activity is usually related to the remote switching module (RSM) association procedure which is a function of MMRSM growth.

3. VARIABLE FIELD DEFINITIONS

   a  = MMRSM site number for which the update was done.

   b  = Operation completion status. Valid value(s):
       ABORTED  = Operation interrupted, not all data updated.
       COMPLETED = Operation completed successfully.
       IN PROGRESS = Operation has not yet completed. This is a five-minute interval status report.
       NOT STARTED = Operation not started, could not establish communication port at this time.

4. ACTION TO BE TAKEN

If b equals ABORTED, some inefficiency may be encountered by call processing in routing inter-RSM calls within a hunt group in the MMRSM site. However, if the RSM call process is in stand-alone call processing state, calls cannot be backhauled using the AM and may not be completed. The problem which caused this UPDMHGTRKG function not to complete successfully should be resolved as soon as possible. An ABORTED status with no accompanying system initialization sequence indicates that the "cluster" attribute of the RLRT_MHG and/or the RLRT_TRKG office dependent data (ODD) relations were not updated properly, or that the update of the RLRTANNGRP relation did not succeed.

In the case of an ABORTED or NOT STARTED status, use the ST:UPDMHGTRKG input message to re-initiate the ODDUPD function.

5. ALARMS

None.

STOP: BKDISK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

```
STOP BKDISK { ABORTED | IN PROGRESS | COMPLETED }
[ COPY BKDISK NOT RUNNING |
  CANNOT SEND SIGNAL TO COPY BKDISK |
  COPY BKDISK FAILED TO TERMINATE ]
```

2. REASON FOR OUTPUT

To report the progress of the STOP: BKDISK input message, or to indicate a problem.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

If the message indicates COPY: BKDISK is not running, no action is needed. If the message indicates COPY: BKDISK cannot be signaled, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. If the message indicates COPY: BKDISK failed to terminate, initiate the STOP: BKDISK input message again. If the process still fails, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP: OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

STOP:DCI

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] STOP DCI COMPLETED

[2] STOP DCI NOT STARTED

2. REASON FOR OUTPUT

Format 1 reports the termination of the dual serial channel interface (DCI) process in response to a STOP:DCI input message.

Format 2 is the response to a STOP:DCI input message when the dual serial channel interface (DCI process was not running.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

STOP:DCI
STOP:DMQ

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

Refer to the STOP:DMQ output message.

2. REASON FOR OUTPUT

To report that a diagnostic request awaiting execution was removed from the maintenance input request administrator (MIRA) request queue in response to either an automatic stop request or STOP:DMQ input message.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

STOP:DMQ
STOP:ECDAUD

Software Release: 5E14 and later
Message Class: AUDIT
Application: 5
Type: Output

1. FORMAT

[1] STOP ECDAUD COMPLETED

__________________________________________________________________

[2] STOP ECDAUD NOT STARTED
   CONFLICT WITH CURRENT SYSTEM STATUS - NOT RUNNING

__________________________________________________________________

[3] STOP ECDAUD ABORTED - SYSTEM ERROR a

__________________________________________________________________

2. REASON FOR OUTPUT

To report the termination status of the STOP:ECDAUD input message.

Format 1 indicates successful execution. No action is necessary.

Format 2 indicates that no audits were running at the time the input message was entered. The OP:ECDAUD input message can be used to determine the current system status.

Format 3 indicates that an internal error has occurred. Refer to variable 'a' for more information.

3. VARIABLE FIELD DEFINITIONS

a = System error number. Valid value(s):
   1 = Cannot open audit rule file - /lla/ECDAUD/ecdaud.rules.
   2 = Cannot attach to ECD database.
   3 = Unable to kill running audit, check PID in /lla/ECDAUD/.ecdaud.pid
   4 = Bad rule in rule file (/lla/ECDAUD/ecdaud.rules).
   5 = Unable to audit data (/lla/ECDAUD/ecdaud.rules).
   6 = Failure in reading ECD database.
   7 = Cannot open audit rule file - /lla/ECDAUD/hwchk.rules.
   8 = Failed to obtain current status.
   9 = Internal system error.
  10 = Database partition greater than 80% full, remove unused files.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request of the STOP:ECDAUD input message. No further action is necessary.

5. ALARMS

Minor is system error was encountered.

**Application:** 5,3B  
**Type:** Output

1. **FORMAT**

```
STOP EXC ANY (COMPLETED|STOPPED)
[a]
```

2. **REASON FOR OUTPUT**

To report the result of executing a STOP:EXC-ANY or STP:EXC-ANY input message to stop a process.

3. **VARIABLE FIELD DEFINITIONS**

   a = Type of error that may have occurred.

4. **ACTION TO BE TAKEN**

   If any error message is printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. **ALARMS**

   Manual alarm. This is a manually-requested report.

   This is an automatically-generated report.

   Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

**STOP:EXC-USER**

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5,3B  
**Type:** Output

### 1. FORMAT

1. STOP EXC USER COMPLETED

2. STOP EXC USER STOPPED

### 2. REASON FOR OUTPUT

To report the result of executing a STOP:EXC-USER or STP:EXC-USER input message to stop a user process.

**Note:** If the STOP:EXC-USER or STP:EXC-USER input message is used to kill a supervisor process, a "COMPLETED" message will be printed, but the process has not really been killed.

### 3. VARIABLE FIELD DEFINITIONS

- a = Description of the error encountered.

### 4. ACTION TO BE TAKEN

Format 1 indicates success. No action is necessary.

Format 2 indicates the input message has failed. The explanatory text will indicate the error encountered. Refer to the input messages manual for the correct format and reenter the input message, or check the status of the file using the OP:ST-LISTDIR input message if the message indicates that the process or file may not exist as printed. If the message indicates that an invalid signal has been used, refer to the input messages manual for available signals.

If any other error message is printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

### 5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendices section of the Output Messages manual.

Output Message(s):

   LNUPD LN
   OP LNUPD
   REPT LNUPD LN
STOP:OFLBOOT
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] STOP OFLBOOT COMPLETED

[2] STOP OFLBOOT a
   b
   OLBSTATE        LASTATE        FUNCTION        LINE
   c               d              e               f

[3] STOP OFLBOOT STARTED
   TYPE g

[4] STOP OFLBOOT IN PROGRESS

2. REASON FOR OUTPUT

These messages are output to report information regarding the execution of the offline boot feature.

3. VARIABLE FIELD DEFINITIONS

a  = Message type. Valid value(s):
   ABORTED  = Application request to stop the oflboot procedure; devices moved to the off-line side will be restored.
   INFO     = Information dump.
   STOPPED  = Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the off-line side will be restored.
   TERMINATED = Administrative module (AM) software-initiated termination of the oflboot procedure; devices moved to the off-line side will not be restored.

b  = Text line. Valid value(s):
   ABORT IN PROGRESS = Indicates a stop was issued when a stop was already in progress. The first stop could be either manual or software initiated.
   CANNOT INVOKE COMMAND ON OFFLINE SIDE = Printed if STOP:OFLBOOT is invoked on the off-line side.
   ILLEGAL STOP OFLBOOT COMMAND = A second STOP:OFLBOOT command was issued either without the restore option or outside the time limit (one hour) to execute a STOP:OFLBOOT with the RST option.
   STOP FROM OFF-LINE SIDE NOT ALLOWED = Printed if STOP:OFLBOOT is invoked from the off-line side.

c  = Current offline boot state.
d = Previous offline boot state.

e = Name of the function from which the output message originated. This field is used by the AM in diagnosing offline boot problems.

f = Line number in the function 'e' from which the output message originated. This field is used by the AM, in conjunction with field 'e', to diagnose offline boot problems.

g = Abort type, indicates how abort was initiated. Valid value(s):
APPLICATION = Associated with an application-initiated abort.
MANUAL = Associated with a manual STOP:OFLBOOT request.
SOFTWARE = Associated with an AM-initiated termination.

4. ACTION TO BE TAKEN

For Formats 1, 3, and 4, no action needs to be taken.

For Format 2, the action to be taken depends on text line 'b'.

<table>
<thead>
<tr>
<th>'b'</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORT IN PROGRESS</td>
<td>No action is needed; let the first stop run to completion.</td>
</tr>
<tr>
<td>CANNOT INVOKE COMMAND ON OFFLINE SIDE</td>
<td>Execute STOP:OFLBOOT on the on-line side.</td>
</tr>
<tr>
<td>ILLEGAL STOP OFLBOOT COMMAND</td>
<td>If within the 1-hour time limit (from the first STOP:OFLBOOT message), try STOP:OFLBOOT again with the RST option.</td>
</tr>
<tr>
<td>STOP FROM OFF-LINE SIDE NOT ALLOWED</td>
<td>Execute STOP:OFLBOOT on the on-line side.</td>
</tr>
</tbody>
</table>

5. ALARMS

For a minor alarm, take action as indicated in the report. A major alarm may not be service affecting, but take immediate action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

STOP:OFR

Software Release: 5E14 and later
Message Class: OFR
Application: 5
Type: Output

1. FORMAT

STOP OFR ID=a
  STATUS=b

2. REASON FOR OUTPUT

To report the status of the STP:OFR input message which stops on-line office records processing.

3. VARIABLE FIELD DEFINITIONS

a = Identification number.

b = Status of STOP request. Valid value(s):
  PROCESSING CANCELED
  PROCESSING COMPLETED
  REQUEST ID UNKNOWN = Incorrect identification number entered.

4. ACTION TO BE TAKEN

For REQUEST ID UNKNOWN, check input message format and reissue the message.

5. ALARMS

None.

  OP:OFR-FORM
  OP:OFR-STATUS
STOP:RG1AUD

Software Release: 5E14 and later
Message Class: CCS
Application: 5,CNI
Type: Output

1. FORMAT

[1] STOP:RG1AUD a

__________________________________________________________________
[2] STOP RG1AUD COMPL
RING 1 AUDIT WITH RATE=b, DUR=c, PAT=d
HAS BEEN SUCCESSFULLY TERMINATED

__________________________________________________________________
[3] STOP RG1AUD COMPL
RING 1 AUDIT WITH RATE=b, DUR=c, PAT=d AND UCL
HAS BEEN SUCCESSFULLY TERMINATED

2. REASON FOR OUTPUT

Prints in response to a STOP:RG1AUD input message. Format 1 prints when the Ring 1 Audit had been aborted or was not running. Format 2 or 3 prints when the Ring 1 Audit is stopped.

3. VARIABLE FIELD DEFINITIONS

a = Response for a successful input:
   PF = The request was received and will be processed. A printout will follow giving either a termination report or termination report and results of the work initiated by the input message.

   Additional output that can accompany the PF output:
   - STOP RG1AUD STOPPED          RG1AUD NOT RUNNING
   - STOP RG1AUD ABT              PROBLEM WITH IMS DRIVER'S REPLY ACKNOWLEDGEMENT RATE VALUE
   - STOP RG1AUD ABT              PROBLEM WITH IMS DRIVER'S REPLY ACKNOWLEDGEMENT

b = The RATE (LOW, MED, or HIGH) at which the Ring 1 Audit was sending messages.

c = The duration in minutes (1-480) the Ring 1 Audit was set to run for.

d = The test pattern (H‘xxxxxxxx) that was repeated in the Ring 1 Audit messages.

4. ACTIONS TO BE TAKEN

None.
5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a STOP:TRAP input message.

Format 1 prints when ID ALL is specified and there are no active or inhibited traps in the message trap system.

Format 2 prints when ID ALL is specified and there is one or more active or inhibited traps to be stopped. A list of the trap IDs that have been stopped will be displayed.

Format 3 prints when ID ALL is specified and there is one or more active or inhibited traps to be stopped. However, the processing of the STOP:TRAP input message has failed for the reason being printed.

Format 4 prints when one or a list of trap IDs was given along with the ID keyword. Each trap specified will be stopped in the given order. This format will be printed for the traps that have been successfully stopped. One message will be deleted per trap ID stopped.

Format 5 prints when one or a list of trap IDs is given along with the ID keyword. Each trap specified will be stopped in the given order. This format resulted when the processing of a trap had failed for the reason being printed. One message will be deleted per ID failed.

Format 6 prints when RMTID ALL was specified and there were no pending, completed, aborted or terminated traps in the message trap system.

Format 7 prints when RMTID ALL was specified and there was one or more traps to be removed. A list of the trap IDs that have been removed will be displayed.

Format 8 prints when RMTID ALL was specified and there was one or more traps to be removed. However, the processing of the STOP:TRAP input message has failed for to the reason being printed.

Format 9 prints when one or a list of trap IDs was given along with the RMTID keyword. Each trap specified should have been removed in the given order. This format will be printed for the traps that have been successfully removed. One message will be printed per trap ID removed.

Format 10 prints when one or a list of trap IDs was given along with the RMTID keyword. Each trap specified should have been removed in the given order. This format results when the processing of a trap has failed for the reason being printed. One message will be printed per ID failed.
Format 11 prints when the INIT keyword (disk initialization) was specified with Y option. The disk initialization was successful and it had the side effect of inhibiting any active traps as well as removing any aborted, completed or terminated traps. All the trap results are lost.

Format 12 prints when the INIT keyword (disk initialization) was specified with Y option. The disk initialization has failed for the reason being displayed.

Format 13 prints when the INIT keyword (disk initialization) was specified with N option. No action has been taken.

Format 14 prints when the OVRWT keyword (disk file overwrite) was specified with Y option and the processing of the input message was successful.

Format 15 prints when the OVRWT keyword (disk file overwrite) was specified with N option and the processing of the input message was successful.

Format 16 prints when the OVRWT keyword (disk file overwrite) was specified with Y or N option and the processing of the input message has failed. However, the condition should be transient.

3. VARIABLE FIELD DEFINITIONS

  a. Trap identification number.

  b. Reason STOP:TRAP input message failed (internal error condition). Valid value(s):
     - CAN'T GET INDEX
     - INVALID TRAP STATE
     - NO TRAP REMOVED
     - NO TRAP STOPPED

  c. Reason STOP:TRAP input message failed (with ID keyword). Valid value(s):
     - INVALID ID = ID does not belong to any trap.
     - NOT ACT OR INH TRAP = Indicated that only active or inhibited traps may be stopped.

  d. Reason STOP:TRAP input message failed (with RMTID keyword). Valid value(s):
     - ACT TRAP = Cannot remove active traps.
     - INH TRAP = Cannot remove inhibited traps.
     - INVALID ID = ID does not belong to any trap.

4. ACTION TO BE TAKEN

For Formats 1, 2, 4, 6, 7, 9, 11, and 13-15, no action is required.

For Formats 3, 8, and 12, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 5, if any of the reasons in variable 'b' are printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. The reasons in variable 'c' are self-explanatory. Correct the error and try again.

For Formats 8 and 12, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 10, if any of the reasons in variable 'b' are printed, refer to the TECHNICAL ASSISTANCE portion of the
INTRODUCTION section of the Output Messages manual. The reasons in variable 'd' are self-explanatory. Correct the error and try again.

For Format 16, retry in a few minutes.

5. ALARMS

1. FORMAT

STP [a] AIUCOM=b-c-d e [f]

2. REASON FOR OUTPUT

Indicates the result of an STP:AIUCOM input request to stop the current action on the integrated services access interface unit common data and control controller (COMDAC).

3. VARIABLE FIELD DEFINITIONS

a = Action being stopped. Valid value(s):
   DGN = Diagnose.
   RMV = Remove.
   RST = Restore.
   SW = Switch.

b = Switching module (SM) number.

c = AIU number.

d = COMDAC number.

e = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action has successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

f = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

STP:AUTOBKUP

Software Release: 5E15 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

STP AUTOBKUP a
[b[, ERRNO = c]]

2. REASON FOR OUTPUT

To report the result of the STP:AUTOBKUP input message.

3. VARIABLE FIELD DEFINITIONS

a = Status. Valid value(s):

ABORTED
COMPLETED
STARTED
STOPPED

b = Message. Valid value(s):

CANNOT STOP BACKUP, NO BACKUP IN PROGRESS = An attempt was made to stop an automated system backup when no backup was currently in progress.

COULD NOT SEND THE AUTOBKUP PROCESS A SIGTERM SIGNAL = The kill() system call failed to send a SIGTERM signal to the autobkup process.

Attempt to re-execute the STP:AUTOBKUP input message.

If STP:AUTOBKUP fails again, attempt to terminate the autobkup process by executing the following UNIX® input messages from the UNIX® terminal. Execute them in the specified order until the autobkup process terminates. <autobkup PID> refers to the process ID of the autobkup process which can be obtained from the autobkup status file located at /no5text/bkup/autobkup/.autobkupstat.

kill -15 <autobkup PID>
kil -3 <autobkup PID>
kil -9 <autobkup PID>

FAILED TO OPEN PIPE TO THE PS SHELL COMMAND = The popen() system call failed to execute the UNIX® ps input message. Verify that the UNIX® ps process file exists and has execute permission. Execute the UNIX® ps input message manually to determine if the process is functioning properly.

FAILED TO READ OUTPUT FROM PS SHELL COMMAND = An error occurred while attempting to read the output from the UNIX® ps input message which was executed by STP:AUTOBKUP. Execute the UNIX® ps input message manually to determine if the process is functioning properly. Interpret the system error code.

PS COMMAND TIMED OUT = The ps process, executed by STP:AUTOBKUP, took longer than the maximum time allowed to execute. Attempt to re-execute the STP:AUTOBKUP input message.
THE AUTOBKUP PROCESS DID NOT TERMINATE IN THE ALLOTTED TIME = The autobkup process took too long to terminate.

Attempt to re-execute the STP:AUTOBKUP input message.

If STP:AUTOBKUP fails again, attempt to terminate the autobkup process by executing the following UNIX® input messages from the UNIX® terminal. Execute them in the specified order until the autobkup process terminates. <autobkup PID> refers to the process ID of the autobkup process which can be obtained from the autobkup status file located at /no5text/bkup/autobkup/.autobkupstat.

```
kill -15 <autobkup PID>
kill -3  <autobkup PID>
kill -9  <autobkup PID>
```

c = System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

Output Message(s):

OP:BICC
**STP:BICCCQ**

**Software Release:** 5E15 and later  
**Message Class:** CCS  
**Application:** 5  
**Type:** Output

### 1. FORMAT

1. \( \text{STP BICCCQ OFFICE a} \)
2. \( \text{STP BICCCQ OPC=b DPC=c a} \)
3. \( \text{STP BICCCQ BG=d a} \)
4. \( \text{STP BICCCQ BGMN=d-e[&f] a} \)

### 2. REASON FOR OUTPUT

To report the results of a STP:BICCCQ input message request to terminate either an automatic or a manual bearer independent call control (BICC) call instance code (CIC) query originating in this office.

This output message is produced when the STP:BICCCQ input message is accepted and when query processing is actually stopped.

Format 1 reports the stopping of either an automatic or demand office-wide BICC CIC query. Format 2 reports the stopping of a demand BICC CIC query for CICs with a specific OPC-DPC pair. Format 3 reports the stopping of a demand BICC CIC query for CICs in a specific BICC group. Format 4 reports the stopping of a demand BICC CIC query for a CIC with a specific BICC group member number (BGMN) or CICs in a specific BGMN range.

If the PRINT option was specified in the STP:BICCCQ input message, then some of the following reports will be output. Data reported reflects processing until the STP:BICCCQ input message was received.

- For an office-wide request, the accumulated matched, mismatched and undetermined counts for each OPC-DPC processed will be printed (refer to EXC:BICCCQ output message format [2]).
- The incomplete data report (refer to EXC:BICCCQ output message format [5]).
- The summary of accumulated matched, mismatched and undetermined counts (refer to EXC:BICCCQ output message format [9]).

### 3. VARIABLE FIELD DEFINITIONS

- \( a \) = Report status. Valid values:  
  - COMPLETED  
  - STARTED

- \( b \) = Originating point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

- \( c \) = Destination point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.
d = BICC group number.
e = BICC group member number or the lower limit of a range of BICC group member numbers. Refer to the APP:RANGES appendix.
f = The upper limit of a range of BICC group member numbers. Refer to the APP:RANGES appendix.

[1] STP CAMPON a CH=[b] [PKT] d [e] f
__________________________________________________________________
[2] STP CAMPON a [b] [PKT] d [e] f

2. REASON FOR OUTPUT

To report the outcome of a previous request to stop the camp-on on the indicated line, trunk, data link, or operator services position system port (OSPSPORT). This message is in response to the STP:CAMPON input message. Format 1 occurs when the input request is not successfully processed and identifies the specific failure reason. Format 2 occurs when the input request is successfully processed.

If the request to stop a camp-on was entered for a 1-DN line time-slot bridging (LTSB) line with no member number, then an attempt will be made to stop camp-ons on both members of the 1-DN LTSB bridged group. One message will be printed when the input message has completed, unless there is a problem. If there is a problem, a message will be printed for each member. If the request to stop a camp-on was entered for a common DN dual permanent packet B-channel (PPB) DSL with no channel number specified, then an attempt will be made to stop camp-ons on both channels of this DSL. One message will be printed when the input message has completed, unless there is a problem. If there is a problem, a message will be printed for each channel.

3. VARIABLE FIELD DEFINITIONS

+ = Indicates that the line is a party line, a custom multipoint interface DSL or a standard interface multi-user DSL.

a = Equipment number or identifier. Valid value(s):
  AQEST=g
  AQM=h-i
  DN=g [-c] [+] 
  EIS=l-e1
  PKTGDN=g
  TKGMN=j-k
  XDB=h-i

b = Channel identifier. Used only for DSL lines. Valid value(s):
  B1
  B2
  D

c = Member number of the LTSB line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

d = Equipment number or identifier. Valid value(s):
AIUEN=m-x₁-y₁-z₁
DEN=m-n-o-p
ILEN=m-q-r-s
INEN=m-m₁-r-s
LCEN=m-t-u-v
LCKEN=m-t-u-r₁-s₁
LEN=m-t-w-x-y-z
LTP=m-a₁
NEN=m-m₁-n₁-a²-o₁-p₁-b²-q₁
PSUEN=m-t₁-u₁-v₁-w₁
RAF=m-b₁-c₁
SAS=m-b₁-c₁
SLEN=m-d₁-r-s
TEN=m-f₁-g₁-h₁-i₁

e = Equipment number or identifier. Valid value(s):
MLHG=j₁-k₁
PRIGRP=l₁

f = The result of the STP:CAMPON request. Valid value(s):
CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) was unable to respond. Retry the request later.
COMPLETED = The requested camp-on has been stopped. A RMV or RST output message should also print (completion report of PORT BUSY), confirming the camp-on was stopped.
INPUT ERROR = Some data entered in the input request was invalid or incorrect. Verify the input and make the request again.
INVALID PORT = The port identifier used in the input request was invalid.
MLHG ACCESS DN = The DN entered is an access DN for the uniform call distribution (UCD), multi-position hunt (MUPH) multi-line hunt group (MLHG), or linear hunt. This DN does not uniquely identify a line.
MP ACCESS DN = The directory number entered is a uniform call distribution MLHG line for modem pooling and as such cannot be used by specifying its DN. A line card equipment number or MLHG and member number must be specified. To obtain the line card equipment number and/or multi-line hunt group and member number, use recent change/verify (RC/V) for the DN or refer to office records.
NO MATCH = The trunk, line, data link, or OSPSPORT specified was not camped on.
NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.
NO PROCESS = Unable to create a needed process. Request aborted.
NOT PRIMARY DN OR MLHG = The DN or MLHG specified was not identified as the primary DN or MLHG and member on any line. It, therefore, cannot be used to identify which equipment was being camped-on. Refer to RC/V or office records to determine the primary DNs or MLHG and member numbers.
PROCESS TIMEOUT = An internal timeout occurred which prevented further processing. Request has been aborted.
SM UNAVAILABLE = The input request could not be completed because a needed switching module (SM) was unable to respond. Retry the request later.
SYSTEM BUSY = The system was too busy, or a resource failure occurred. Request has been aborted.
SYSTEM ERROR = An internal error has occurred that prevented further processing.
g = Telephone number.

h = Data link group number.

i = Relative link member number.

j = Trunk group number.

k = Trunk member number.

l = EIS identifier (ID) on which the CPDL terminates.

m = SM number.

n = Digital line and trunk unit (DLTU) number.

o = Digital facility interface (DFI) number.

p = Channel number.

q = Integrated digital carrier unit (IDCU) number.

r = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.

s = RT line number or PUB43801 channel.

t = Line unit number.

u = Line group number.

v = Line card number.

w = Grid number.

x = Switch board number.

y = Switch number.

z = Level number.

a^1 = Logical test port number.

b^1 = Recorded announcement facility (RAF)/ service announcement system (SAS) unit number.

c^1 = RAF/SAS announcement channel number.

d^1 = Digital carrier line unit number.

e^1 = External data link (member) number relative to the EIS.

f^1 = Trunk unit number.

g^1 = Service group number.

h^1 = Channel board number.
1 = Circuit number.
2 = Multi-line hunt group number.
3 = Hunt group member number.
4 = PRI group number.
5 = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
6 = Data group number.
7 = Synchronous transport signal (STS) number.
8 = Virtual tributary group number.
9 = Digital signal level 0 (DS0).
10 = Line board number.
11 = Line circuit number.
12 = PSU unit number.
13 = PSU shelf number.
14 = PSU channel group number.
15 = PSU channel group member number.
16 = Access interface unit (AIU) number.
17 = AIU pack number.
18 = AIU circuit number.
19 = SONET termination equipment (STE) number.
20 = Virtual tributary member number.

4. ACTIONS TO BE TAKEN

None. Refer to the message output for pertinent status and information, and take appropriate action based on the information received, if necessary.

5. ALARMS

None.

Type: Output

1. FORMAT

[1] STP CCSCQ OFFICE a

[2] STP CCSCQ OPC=b DPC=c a

[3] STP CCSCQ TG=d a

2. REASON FOR OUTPUT

To report the results of a STP:CCSCQ request to terminate either an automatic or a manual circuit query originating in this office.

Format [1], [2] or [3] messages are produced when the STP:CCSCQ message is accepted and when query processing is actually stopped.

Format 1 reports the stopping of either an automatic or demand common channel signaling (CCS) office-wide circuit query.

Format 2 reports the stopping of a demand CCS circuit query for trunks with a specific OPC/DPC pair.

Format 3 reports the stopping of a demand CCS circuit query for trunks in a specific trunk group.

If PRINT option is specified on the STP:CCSCQ command, then some of the following output reports will print. Data reported reflects processing until the STP:CCSCQ command was received.

- For office request, the accumulated matched, mismatched and undetermined counts for each OPC/DPC processed will be printed (see EXC CCSCQ output format [2]).

- The incomplete data report (see EXC CCSCQ output format [5]).

- The summary of accumulated matched, mismatched and undetermined counts (see EXC CCSCQ output format [3]).

Type: Output

1. FORMAT

STP [a] CDFI=b-c-d e [f]

2. REASON FOR OUTPUT

Indicates the result of a STP:CDFI input message to stop the current action on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.

3. VARIABLE FIELD DEFINITIONS

a = Action being stopped (default is the action currently executing on the CDFI). Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number.

c = Digital line and trunk unit (DLTU) number.

d = CDFI number.

e = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

f = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

Type: Output

1. FORMAT

STP [a] CDI=b-c-d e [f]

2. REASON FOR OUTPUT

To indicate the results of an attempt to stop the current action on the control data interface (CDI) at the specified location.

3. VARIABLE FIELD DEFINITIONS

a  = Action being stopped (default is the action currently executing on the CDI). Valid value(s):
DGN  = Diagnose.
EX  = Exercise.
RMV  = Remove.
RST  = Restore.

b  = Switching module number.

c  = Trunk unit number.

d  = Service group number.

e  = Termination report. Valid value(s):
ABORTED  = Requested action was terminated before completion and the termination was immediate.
COMPLETED  = Request has successfully completed.
COMPLETED-CERTIFIED  = Request has successfully completed and independent certification of resulting hardware status is made.
NOT STARTED  = Requested action has not begin.
STOPPED  = Requested action was terminated before a normal completion.

f  Additional data qualifying the termination report (variable 'e'). Refer to the APP:MAINT-RESP appendix in the Appendixes section of Output Messages manual.

STP:DMQ-SM

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

STP DMQ SM=a COMPLETED [b]

2. REASON FOR OUTPUT

To report the status of a STP:DMQ input request to stop all circuit requests either running or waiting on the deferred maintenance queue (DMQ).

The default is that all circuit requests on the DMQ have been stopped.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.

b  = Additional data qualifying the termination report. Valid value(s):
   NO CIRCUITS FOUND ON QUEUE There were no running or waiting circuit requests found when the command was issued.
   STOP MESSAGES SENT, NOT ALL RESPONSES RECEIVED When the timer on the command expired not all circuits had responded as being stopped. The craft should wait a few minutes and then issue an OP:DMQ,SM=a to verify if any circuits are on the queue. If queue has circuits which are interfering with craft manual operation, another STP:DMQ,SM=a should be entered or craft can stop the circuits using existing STP commands.

b = Switching module (SM) number.

c = Digital line and trunk unit (DLTU) number.

d = RSM digital facilities interface (RDFI), inter-RSM communication link digital facilities interface (CDFI), or inter-office trunk digital facilities interface (DFI) number.

e = FAC number. The FAC number is the T1 facility number on a RDFI, CDFI, or DFI.

f = Termination report. Valid value(s):
   ABORTED = requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

   g = Additional information qualifying the termination report. Refer to APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

Other Manual(s):
235-105-220  Corrective Maintenance
STP:FACR

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] STP FACR COMPLETED
   a PROCESS HAS BEEN TERMINATED

[2] STP FACR COMPLETED
   a PROCESS HAS BEEN SUSPENDED

[3] STP FACR NOT COMPLETED
   a PROCESS DOES NOT EXIST

2. REASON FOR OUTPUT

To report the termination of a feature activation counting and reconciliation (FACR) audit.

Format 1 reports that the FACR audit has been terminated.

Format 2 reports that the FACR audit has been suspended. The audit will be rescheduled to start the next day when initially executed.

Note: The FACR audit will restart with the SM that was being processed when the audit was suspended.

Format 3 reports that no FACR process exists.

3. VARIABLE FIELD DEFINITIONS

   a = Type of FACR audit requested to be executed.

4. ACTIONS TO BE TAKEN

This message is printed out in response to a manual request of the STP:FACR input message. No further action is necessary if the request completed successfully.

5. ALARMS

None.

Output Appendix(es):

APP: MAINT-RESP
STP:LDSUCOM
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

STP [a] LDSUCOM=b-c-d e [f]

2. REASON FOR OUTPUT

To indicate the results of an attempt to stop the current action on the local digital service unit common (LDSUCOM) board at the specified location.

3. VARIABLE FIELD DEFINITIONS

a = Action being stopped (default is the action currently executing on the LDSUCOM board). Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.
   RMV = Remove.
   RST = Restore.

b = Switching module number.

c = Local digital service unit number.

d = Service group number.

e = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = Request has successfully completed.
   COMPLETED-CERTIFIED = Request has successfully completed and independent certification of resulting hardware status is made.
   NOT-STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion.

f = Additional data qualifying the termination report (variable 'e'). Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

- RST: LDSUCOM

Output Appendix(es):

- APP: MAINT-RESP
STP:LIB

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

```
STP LIB TEAM a    b    [c]    d
```

2. REASON FOR OUTPUT

To report the completion status of a manually issued STP:LIB input message.

3. VARIABLE FIELD DEFINITIONS

a = Team number.

b = Administrative module (AM) flag. Valid value(s):
    N = AM is not reporting.
    Y = AM is reporting.

c = Switching module (SM) number. Default is that SM is not reporting.

d = Results. Valid value(s):
    COMPLETED
    STOPPED - CANNOT STOP PROGRAM
    STOPPED - NO PROGRAM LOADED
    STOPPED - PROCESSOR IS LOADED BY A DIFFERENT TEAM
    STOPPED - PROGRAM CLEARED
    STOPPED - PROGRAM IS NOT STARTED
    STOPPED - PROGRAM WILL NOT STOP

4. ACTION TO BE TAKEN

Since this is a response to a manual request, no action is required. Normally, testing would proceed from this point.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

```
STP:LIB
```
STP:LIST

Software Release: 5E14 and later
Message Class: ECHO
Application: 5
Type: Output

1. FORMAT

STP LIST a

2. REASON FOR OUTPUT

To indicate the failure of an input STP:LIST request. This message should not print if the request succeeded; instead the list should stop printing with a termination report of STOPPED.

3. VARIABLE FIELD DEFINITIONS

a = Completion report indicating why the list was not stopped. Valid value(s):
   NO LIST BEING PRINTED = No list was currently printing when the STP:LIST request was received.
   SYSTEM BUSY = A resource failure occurred which prevented completion of the request. Repeat the request.
   SYSTEM ERROR = An internal processing error occurred. Repeat the request.

4. ACTION TO BE TAKEN

None.

5. ALARMS

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

STP LIT COMPLETE a [b] c d e

2. REASON FOR OUTPUT

To indicate that line insulation testing has stopped in response to a STP:LIT input message.

3. VARIABLE FIELD DEFINITIONS

a = Type of testing that was aborted. Valid value(s):
   Q = Automatic line insulation test.
   S = Demand line insulation test.

b = Originator of request. Valid value(s):
   RSB = Repair service bureau requested the stop.
   SCC = Switching control center requested the stop.
   TLWS = Trunk and line work station requested the stop.
   [null] = Originator unknown.

c = Total number of lines attempted to be tested.

d = Number of lines actually tested.

e = Number of lines that failed.

4. ACTION TO BE TAKEN

The purpose of this message is to report the result of the action requested by the corresponding manually requested input message. No specific action is indicated.

5. ALARMS

STP:PCF

**Software Release:** 5E17(1) and later

**Message Class:** TLWS

**Application:** 5

**Type:** Output

1. **FORMAT**

   STP PCF    a

2. **REASON FOR OUTPUT**

   To indicate the failure of a STP:PCF input message request. This report should not print if the request succeeded. Instead, the list should stop printing with a termination report of **STOPPED**.

3. **VARIABLE FIELD DEFINITIONS**

   a = Completion report indicating why the list was not stopped. Valid value(s):
   
   **NO OP:PCF BEING PROCESSED** = No list was currently printing when the STP:PCF input message request was received.
   
   **SYSTEM BUSY** = A resource failure occurred which prevented completion of the request. Repeat the request.
   
   **SYSTEM ERROR** = An internal processing error occurred. Repeat the request.

4. **ACTIONS TO BE TAKEN**

   None.

5. **ALARMS**

   None.

STP:PCTDX

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

STP PCTDX=a-b-c d [e]

2. REASON FOR OUTPUT

Indicates the result of an STP:PCTDX input request to stop the current action on the peripheral control and timing data exchanger (PCTDX).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Peripheral control and timing data exchanger unit (PDXU) number.
c = Peripheral control and timing data exchanger (PCTDX) number.
d = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action has successfully completed.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

e = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

5. ALARMS

**Software Release:** 5E14 and later  
**Message Class:** TLWS,ECHO  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   STP PM a  
   [SES=b cc/cc dd:dd:dd]

2. **REASON FOR OUTPUT**

   To respond to a manual request to stop in-progress protocol monitoring (PM) session(s).

3. **VARIABLE FIELD DEFINITIONS**

   a = Status. Valid value(s):

   - **ABORTED-ATF CLOSE FAILURE** = The PM session was aborted because the American Standard Code for Information Interchange (ASCII) translation file (ATF) could not be closed.
   - **ABORTED-ATF OPEN FAILURE** = The PM session was aborted because the ATF could not be opened.
   - **ABORTED-ATF WRITE FAILURE** = The PM session was aborted because the ATF could not be written to.
   - **ABORTED-COMMUNICATION FAILURE** = An unspecified communication error occurred between the administrative module (AM) and switching module (SM), between the SM and the protocol handler (PH), or between the AM and *UNIX®* operating system.
   - **ABORTED-DATABASE PROBLEM** = The request to manually stop a PM session failed because of an error while reading the database.
   - **ABORTED-INVALID PMCFF FILE** = The PM session was aborted because the protocol monitoring common format file (PMCFF) contents were corrupted, or were missing.
   - **ABORTED-INVALID SESSION ID** = The PM session was aborted because the session identifier did not correspond to a valid session.
   - **ABORTED-PMCFF CLOSE FAILURE** = The PM session was aborted because the PMCFF could not be closed.
   - **ABORTED-PMCFF OPEN FAILURE** = The PM session was aborted because the PMCFF could not be opened.
   - **ABORTED-PMCFF READ FAILURE** = The PM session was aborted because the PMCFF could not be read.
   - **ABORTED-PMCFF WRITE FAILURE** = The PM session was aborted because the PMCFF could not be written to.
   - **ABORTED-TEMPORARY FILE CLOSE FAILURE** = The PM session was aborted because the temporary file created for this session could not be closed.
ABORTED-TEMPORARY FILE OPEN FAILURE = The PM session was aborted because the temporary file created for this session could not be opened.

ABORTED-TEMPORARY FILE READ FAILURE = The PM session was aborted because the temporary file created for this session could not be read.

ABORTED-TEMPORARY FILE WRITE FAILURE = The PM session was aborted because the temporary file created for this session could not be written to.

ABORTED-TRANSLATION FAILURE = The PM session was aborted because the protocol translator was no able to translate this session.

COMPLETED = The stop request has successfully been completed.

CONTINUING-TRANSLATION NOT AVAILABLE = The protocol monitoring session is continuing, but translation of the output into ASCII is not available.

NOT STARTED-CHANNEL MISMATCH = The channel (CH) specified on the input line is not valid for the protocol (PROT) specified on the input line.

NOT STARTED-CHANNEL REQUIRED = The CH option must be specified on the input line, since the directory number or multi-line hunt group is assigned to more than one channel.

NOT STARTED-CMP UNAVAILABLE = The request to manually stop a PM session failed because the communications module (CM) is isolated from the AM.

NOT STARTED-INVALID PORT = The port identifier entered could not be translated and was considered to be invalid.

NOT STARTED-MLHG DN SPECIFIED = The request to verify a PM session failed because a DN for a MLHG or UCD group was specified. Repeat request using MLHG port services identifier option.

NOT STARTED-NO ACTIVE SESSION = The request to manually stop a PM session failed because no active PM sessions exist or because the session number specified did not match an active session number.

NOT STARTED-NON-PRIMARY DN SPECIFIED = The request to verify a PM session failed because the primary DN is required. Repeat request specifying the primary DN.

NOT STARTED-PH UNAVAILABLE = The request to manually stop a PM session failed because the PH is isolated from the SM.

NOT STARTED-SM UNAVAILABLE = The request to manually stop a PM session failed because the SM is isolated from the AM.

NOT STARTED-TRANSIENT STATE = The request to manually stop a PM session cannot be honored at this time. Internal verification of the current session is executing. Repeat later.

b = The value of the session identifier (SES) for this monitoring session (1-100).

c = The current time-stamp for the monitoring session in the format month/day.
= The current time-stamp for the monitoring session in the format hours:minutes:seconds.

STP:RCL

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

STP a RCL=b-c-d-e f [g]

2. REASON FOR OUTPUT

Reports the result of a STP:RCL input message request to stop the maintenance action on a remote communication link (RCL) between inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuits.

3. VARIABLE FIELD DEFINITIONS

a = Action being stopped (default is the action currently executing on the RCL). Valid value(s):
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number.

c = Digital line and trunk (DLTU) number.

d = CDFI number.

e = Facility (FAC) number. The FAC number is the T1 facility number on a CDFI.

f = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

   g = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages.

Input Message(s):

STP: RDFI

Output Appendix(es):

APP: MAINT-RESP
STP:RDTA-A

Software Release: 5E14 only
Message Class: TM
Application: 5
Type: Output

1. FORMAT

[1] STP RDTA SESSION=a b [FP=c]
   [d] [m] [x] [z]
   [INDN=a1 ITAP=b1-c1] [OUTDN=d1 OTAP=e1-f1]
   MODE=g1 [QTS=h1] DURATION=i1

[2] STP RDTA SESSION=a b FP=c

2. REASON FOR OUTPUT

To respond to a manual request to stop an active remote digital test access (RDTA) session or to notify the user of a system-initiated termination of an RDTA session. System-initiated terminations include those sessions that reach the 24-hour expiration deadline (because the UPD:RDTA message has not been used in the last 24 hours) and those that are terminated due to software/hardware errors or a lack of necessary conditions to satisfy the mode of the RDTA session.

Format 1 is used to display all successful RDTA session terminations, whether requested or system-initiated. It also conveys a failure to stop a session if the request has gone so far as to reach the switching module (SM) of the port under test (PUT). The first line shows the session number and the outcome of an attempted session termination along with a failure point number to identify the point in software where failure occurred. The second line describes the PUT in the various port identifications which are applicable to the PUT. The third line shows the output facility information defining routing for the RDTA connection and where the protocol analysis equipment is located.

Acronyms are as follows:
- incoming directory number (INDN)
- incoming test access port (ITAP)
- outgoing DN (OUTDN)
- outgoing test access port (OTAP)

The fourth line shows the type of connection and quarter time-slot, if applicable, along with the total session duration.

Format 2 reports that the STP:RDTA input message failed. This format is used to convey a failure response when the termination request has not yet reached the SM of the PUT.

3. VARIABLE FIELD DEFINITIONS

+ = Assigned to a multipoint interface.

a = Session number given to the requested session. Sessions are numbered sequentially from 1 through 99. At 99, the numbers is recycled starting from 1 again.

b = Automated termination or response to STP:RDTA input message. Valid value(s):
   AM DATA BUT NO SM CONNECTION = The RDTA session was terminated due to an RDTA
session inconsistency. The administrative module (AM) had data pertaining to a session but no physical connection exists in the SM of the PUT.

COMPLETED = The session was successfully stopped due to a manual request.
CORRUPTED DYNAMIC DATA = Dynamic data has been corrupted. Look at read-only printer (ROP) for a related assert to give assistance toward correcting the office dependent data (ODD) problem. Audits correct any RDTA session/data inconsistency.
CORRUPTED STATIC DATA = Static data has been corrupted. Look at ROP for a related assert to give assistance toward correcting the ODD problem. Audits correct any RDTA session/data inconsistency.
DURATION TIMER EXPIRED = The RDTA session was stopped because its duration timer expired.
HALF OF DUPLEX SPLIT WENT DOWN = This means that either the PUT side, connected to the ITAP, or the far end side (connected to the PUT before the split was in place), connected now to the OTAP went down.
HARDWARE TROUBLE = One or more peripherals responded in error. These include such peripherals as the integrated services line unit (ISLU) or the remote integrated services line unit (RISLU) and the packet switching unit (PSU). Investigate the problems seen in the RISLU/ISLU or PSU of the PUT or any problems in the RISLU/ISLU of the TAP(s).
INTERRUPT RECEIVED = The RDTA session preempted or interrupted due to an abnormal event. This abnormal event could be something such as hardware out-of-service, carrier group alarm, and so forth.
MONITORED PATH WAS MOVED = The path which was being monitored was moved. For example, a conference call could have been set up on this monitored path. When a monitored path is moved, the RDTA session monitoring this path is terminated.
PATH ON PUT WENT DOWN = The path which was being monitored ceased to exist, the RDTA session which was monitoring this path must rightfully be removed, since there is no longer a path to monitor. For example, either end could have gone on-hook to end a call when monitoring a basic rate interface (BRI) B-channel.
PROCESS TIMEOUT = An RDTA AM or SM process timed-out after waiting for an SM process to respond. This condition has occurred because of an SM overload condition, an SM isolation, or an internal software error. Since there is no inter-module communication there may or may not be a connection still intact. If the RDTA connection does still exist in the SM of the PUT, it is removed when audits makes a routine pass. A VFY:RDTA may also be performed to query this session. It then schedules an audit if there is an inconsistency.
PUT PATH FAILURE = An attempt to tear down a path to the PUT failed.
RESOURCE FAILURE = Could not obtain the necessary path resources to tear down this connection.
SESSION NOT ACTIVE = The requested RDTA session is not active.
SINGLE PROCESS PURGE = A software process which supports the functionality of an RDTA session connection was purged. Consequently, the entire connection has been torn down. Additional information can be obtained from the ROP by looking for single process purge (SPP) related messages.
SM CONNECTION BUT NO AM DATA = The RDTA session was terminated due to an RDTA session inconsistency. The AM did not have a data entry for the particular session that was taking place in the SM.
SM UNAVAILABLE = One of the SMs required to terminate the RDTA session is isolated.
SYSTEM BUSY = System resources are not available to take down the requested connection. The AM or SM may be in an overload condition.
SYSTEM ERROR = Internal system error occurred while attempting to terminate the requested RDTA session.
TAP PATH FAILURE = An attempt failed to tear down the path either to the ITAP or the OTAP or
both.

c = A fail point number used to relay the specific point in the software at which a failure occurred. This is used purely for debugging purposes.

d = Service group and member numbers. Valid value(s):

<table>
<thead>
<tr>
<th>BST</th>
<th>e-f</th>

<td></td>
</tr>
<tr>
<td>D</td>
<td>D-Channel (default).</td>
</tr>
</tbody>
</table>

a\(^1\) = DN of the output facility where the protocol analyzer is connected to access the test data sent over the PUT to the switch. This direction is known as incoming. Data sent from the analysis equipment for interaction with the PUT originates from INDN for all interactive mode connections excepting the SPLITPH connection.

b\(^1\) = SM number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

c\(^1\) = Logical port number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

d\(^1\) = DN of the output facility where the protocol analyzer is connected to access the test data sent from the switch to the PUT. This direction is known as outgoing. Data sent from the analysis equipment for interaction with the switch originates from OUTDN for the SPLIT and SPLITPH connections.

e\(^1\) = SM number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

f\(^1\) = Logical port number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

g\(^1\) = Connection mode of the RDTA session. Valid value(s):

<table>
<thead>
<tr>
<th>DTAC</th>
<th>Direct test access connection (DTAC). This is an interactive connection on a port that does not have a path set up on it. The PUT is seized and directly connected to an outgoing port terminating at the protocol analysis equipment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MON</td>
<td>Monitor. This is a receive-only connection on a busy circuit. A copy of the transmit and receive data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.</td>
</tr>
<tr>
<td>SPLIT</td>
<td>Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.</td>
</tr>
<tr>
<td>SPLITPH</td>
<td>Simplex split protocol handler (PH) side. This is an interactive connection up on an integrated services digital network (ISDN) channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.</td>
</tr>
</tbody>
</table>
| SPLITPUT| Simplex split PUT side. This is an interactive connection on a busy circuit. The
existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

h\textsuperscript{1} = The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the protocol handler (PH). The valid range is 0, 1, 2 or 3.

i\textsuperscript{1} = This is the total time for which the session has been active in its present state (that is, the time since the start or conversion of the session). The output form, for this length of time, on the output is days (with a space between) hours:minutes:seconds.

j\textsuperscript{1} = Line board number.

k\textsuperscript{1} = Line circuit number.

l\textsuperscript{1} = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

m\textsuperscript{1} = Data group (DG) number.

n\textsuperscript{1} = SONET termination equipment (STE) facility number.

o\textsuperscript{1} = Synchronous transport signal (STS) facility number.

p\textsuperscript{1} = Virtual tributary group (VTG) number.

q\textsuperscript{1} = Virtual tributary member (VTM) number.

r\textsuperscript{1} = Digital signal level 0 (DS0) number.

s\textsuperscript{1} = Line group number.

4. ACTIONS TO BE TAKEN

If the message indicates that the RDTA session was aborted due to an internal software/hardware error, save the printer output. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

    [d] [m] [x] [z]
    [INDN=a\textsuperscript{l} ITAP=b\textsuperscript{l}-c\textsuperscript{l}] [OUTDN=d\textsuperscript{l} OTAP=e\textsuperscript{l}-f\textsuperscript{l}]
    MODE=g\textsuperscript{l} [QTS=h\textsuperscript{l}] DURATION=i\textsuperscript{l}

[2]  STP RDTA SESSION=a b FP=c

2. REASON FOR OUTPUT

To respond to a manual request to stop an active remote digital test access (RDTA) session or to notify the user of a system-initiated termination of an RDTA session. System-initiated terminations include those sessions that reach the 24-hour expiration deadline (because the UPD:RDTA message has not been used in the last 24 hours) and those that are terminated due to software/hardware errors or a lack of necessary conditions to satisfy the mode of the RDTA session.

Format 1 is used to display all successful RDTA session terminations, whether requested or system-initiated. It also conveys a failure to stop a session if the request has gone so far as to reach the switching module (SM) of the port under test (PUT). The first line shows the session number and the outcome of an attempted session termination along with a failure point number to identify the point in software where failure occurred. The second line describes the PUT in the various port identifications which are applicable to the PUT. The third line shows the output facility information defining routing for the RDTA connection and where the protocol analysis equipment is located.

The fourth line shows the type of connection and quarter time-slot, if applicable, along with the total session duration.

Format 2 reports that the STP:RDTA input message failed. This format is used to convey a failure response when the termination request has not yet reached the SM of the PUT.

3. VARIABLE FIELD DEFINITIONS

+ = Assigned to a multipoint interface.

a = Session number given to the requested session. Sessions are numbered sequentially from 1 through 99. At 99, the numbers is recycled starting from 1 again.

b = Automated termination or response to STP:RDTA input message. Valid value(s):

- AM DATA BUT NO SM CONNECTION = The RDTA session was terminated due to an RDTA session inconsistency. The administrative module (AM) had data pertaining to a session but no physical connection exists in the SM of the PUT.
- COMPLETED = The session was successfully stopped due to a manual request.
- CORRUPTED DYNAMIC DATA = Dynamic data has been corrupted. Look at read-only printer (ROP) for a related assert to give assistance toward correcting the office dependent data (ODD) problem. Audits correct any RDTA session/data inconsistency.
- CORRUPTED STATIC DATA = Static data has been corrupted. Look at ROP for a related assert to
give assistance toward correcting the ODD problem. Audits correct any RDTA session/data inconsistency.

   PLTEN=d-t^1-u^1-v^1-w^1
   OIUEN=n-x^1-y^1-z^1-o^1-p^1-q^1-r^1

n = SM number.
o = Digital line and trunk unit (DLTU) number.
p = Digital facility interface number.
q = Digital channel.
r = Integrated digital carrier unit number.
s = Remote terminal number.
t = Channel unit number.
u = Integrated services line unit (ISLU) or access interface unit (AIU) number.
v = Line group controller number.
w = Line card number.
x  = Directory number. Valid value(s):
    DN=y [+]
    PKTDN=y [+]

y  = Seven-digit directory number.

z  = Channel type (for BRI). Valid value(s):
    B1 = B1-Channel.
    D  = D-Channel (default).

a  = DN of the output facility where the protocol analyzer is connected to access the test data sent
    over the PUT to the switch. This direction is known as incoming. Data sent from the analysis
    equipment for interaction with the PUT originates from INDN for all interactive mode connections
    excepting the SPLITPH connection.

b  = SM number of the port which corresponds to the INDN for local access or of the port which
    connects the session switch (where the session is set up) to the network for remote access.

c  = Logical port number of the port which corresponds to the INDN for local access or of the port
    which connects the session switch (where the session is set up) to the network for remote access.

d  = DN of the output facility where the protocol analyzer is connected to access the test data sent
    from the switch to the PUT. This direction is known as outgoing. Data sent from the analysis
    equipment for interaction with the switch originates from OUTDN for the SPLIT and SPLITPH
    connections.

e  = SM number of the port which corresponds to the OUTDN for local access or of the port
    which connects the session switch (where the session is set up) to the network for remote access.

f  = Logical port number of the port which corresponds to the OUTDN for local access or of the port
    which connects the session switch (where the session is set up) to the network for remote access.

g  = Connection mode of the RDTA session. Valid value(s):
    DTAC = Direct test access connection (DTAC). This is an interactive connection on a port
            that does not have a path set up on it. The PUT is seized and directly connected to
            an outgoing port terminating at the protocol analysis equipment.
    MON = Monitor. This is a receive-only connection on a busy circuit. A copy of the transmit
            and receive data being passed over the PUT is transmitted to two individual
            outgoing ports that terminate at the protocol analysis equipment.
    SPLIT = Duplex split. This is an interactive connection on a busy circuit. The existing path
            on the PUT is broken and each half is connected to an outgoing port terminated at
            the protocol analysis equipment. This allows interactive testing of both sides of the
            original path.
    SPLITPH = Simplex split protocol handler (PH) side. This is an interactive connection up on
              an integrated services digital network (ISDN) channel nailed-up to a PH. The
              existing path on the ISDN channel is torn down and the PH associated with the
              channel being tested is directly connected to an outgoing port terminating to the
              protocol analysis equipment.
    SPLITPUT = Simplex split PUT side. This is an interactive connection on a busy circuit. The
              existing path on the PUT is broken and the PUT is directly connected to an
outgoing port terminating to the protocol analysis equipment.

\[ h \] = The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the protocol handler (PH). The valid range is 0,1,2 or 3.

\[ i \] = This is the total time for which the session has been active in its present state (that is, the time since the start or conversion of the session). The output form, for this length of time, on the output is days (with a space between) hours:minutes:seconds.

\[ j \] = Line board number.

\[ k \] = Line circuit number.

\[ l \] = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

\[ m \] = Data group (DG) number.

\[ n \] = SONET termination equipment (STE)

\[ o \] = Synchronous transport signal (STS) facility number.

\[ p \] = Virtual tributary 1.5 group (VTGRP) number.

\[ q \] = Virtual tributary 1.5 member (VTMEM) number.

\[ r \] = Digital signal level 0 (DS0) number.

\[ s \] = Line group number.

\[ t \] = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

\[ u \] = PCT facility interface (PCTFI) number.

\[ v \] = Tributary number.

\[ w \] = Channel number.

\[ x \] = Optical interface unit (OIU) number.

\[ y \] = Protection group (PG) number.

\[ z \] = OC-3 STE number.

4. ACTIONS TO BE TAKEN

If the message indicates that the RDTA session was aborted due to an internal software/hardware error, save the printer output. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

STP:RLI

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

STP [a] RLI=b-c d [e]

2. REASON FOR OUTPUT

To indicate the result of an STP:RLI input message to stop the current maintenance action on a remote switching module (RSM) remote link interface (RLI) circuit.

3. VARIABLE FIELD DEFINITIONS

a  = Action being stopped (default is the action currently executing on the RLI). Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.
   RMV = Remove.
   RST = Restore.

b  = Switching module (SM) number.

c  = RLI number.

d  = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was complete.
   COMPLETED = Request has successfully completed.
   COMPLETED-CERTIFIED = Request has successfully completed, and independent certification of the resulting hardware status was made.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion.

e  = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

1. FORMAT

STP RST TRK {a|PID b UNIQ c}][,UCL] a

2. REASON FOR OUTPUT

To report the stopping of a restore trunk (RST:TRK) request. Each STP:RST request will be followed by RMV TRK output message(s) specifying what status the trunk was put in.

3. VARIABLE FIELD DEFINITIONS

a = Equipment number or identifier. Valid value(s): DEN=d-e-f-g
ILEN=d-h-i-j
INEN=d-k-i-j
NEN=d-k-l-b^1-m-n-c^1-o
PLTEN=d-d^1-e^1-f^1-g^1
PRIGRP=p
PSUEN=d-q-r-s-t
TEN=d-u-v-w-x
TG=y
TKGMN=y-z

b = Task process number associated with the task.

c = A uniqueness qualifier to further identify the task.

d =SM number.

e = Digital line and trunk unit (DLTU) number.

f = Digital facility interface (DFI) number.

g = Channel number.
h = Integrated digital carrier unit (IDCU) number.
i = Remote terminal (RT) number.
j = RT line number.
k = DNU-S number.
l = Data group number.
m = Synchronous transport signal (STS) number.
n = Virtual tributary 1.5 (VT1.5) group number.
o = Digital signal level 0 (DS0) number.
p = Primary rate interface (PRI) number.
q = PSU unit number.
r = PSU shelf number.
s = PSU channel group number.
t = Line group number.
u = Trunk unit number.
v = Service group number.
w = Channel board number.
x = Circuit number.
y = Trunk group number.
z = Trunk member number or lower limit of a range of trunk member number.
a = Status report. Valid value(s):
   COMPLETED = The stopping of a restore for a trunk has completed.
   INPUT ERROR = The identifier input on the command line is incorrect or it does not match what
                  was input on the RST:TRK command.
   JOB NOT ACTIVE = The identifier input does not match any active automatic task administrator
                     (ATA) job.
   STARTED = The stopping of a restore for a trunk has started An assert (TMABTTSK) has
              occurred and will be reported on the ROP.

b = Signal terminating equipment (STE) number.
c = VT1.5 group number.
d = Peripheral control and timing line and trunk unit (PLTU) number.
e = PCT facility interface (PCTFI) number.
f = Tributary number.
g = Channel number.

4. ACTIONS TO BE TAKEN

None, this command is used to undo a RST:TRK command whose identifier was incorrectly entered.

5. ALARMS

None.

STP:SLIM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

   STP [a] SLIM=b-c-d-e f [g]

2. REASON FOR OUTPUT

   To indicate the results of an attempt to stop the current action on the subscriber line instrument measurement (SLIM) board at a specified location.

3. VARIABLE FIELD DEFINITIONS

   a  = Action being stopped. Default is the action currently executing on the SLIM board. Valid value(s):
      DGN   = Diagnose.
      EX    = Exercise.
      RMV   = Remove.
      RST   = Restore.

   b  = Switching module (SM) number.

   c  = Metallic service unit number.

   d  = Service group number.

   e  = SLIM board number.

   f  = Termination report. Valid value(s):
      ABORTED = Requested action was terminated before completion and the termination was immediate.
      COMPLETED = Request has successfully completed.
      COMPLETED-CERTIFIED = Request has successfully completed and independent certification of resulting hardware status is made.
      NOT STARTED = Requested action has not begun.
      STOPPED = Requested action was terminated before a normal completion.

   g  = Additional data qualifying the termination report (variable 'f'). Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

Message Class: Application: 5
Type: Output

1. FORMAT

STP SS7 [a] b

2. REASON FOR OUTPUT

To output the completion report when requested to stop a signaling system 7 (SS7) trunk data request via a STP:SS7 input message.

3. VARIABLE FIELD DEFINITIONS

a = Input parameters of stopped task. See OP:SS7 input manual page for description of possible parameters

b = Completion report. Valid value(s):
   NO SS7 LIST BEING PRINTED = The STP:SS7 request could not be processed because there is no SS7 trunk data request to stop.
   STOPPED = The STP:SS7 request has stopped the output of the SS7 trunk data request identified by variable field 'a'.
   SYSTEM BUSY = The STP:SS7 request could not be processed because the system was too busy or a resource failure occurred. Retry the request later.

1. FORMAT

```plaintext
STP STATUS SCTP [a] b
```

2. REASON FOR OUTPUT

To output the completion report when requested to stop a stream control transmission protocol (SCTP) endpoint or association by a STP:ST-SCTP input message.

3. VARIABLE FIELD DEFINITIONS

- **a** = Input parameters of stopped task. Refer to STP:ST-SCTP input manual page for description of possible parameters.

- **b** = Completion report. Valid value(s):
  - NO NEAREPT LIST INPROG = The **STP:STATUS,SCTP,NEAREPT** request could not be processed because there is no SCTP for near endpoint data request to stop.
  - NO ASSOC LIST INPROG = The **STP:STATUS,SCTP,ASSOC** request could not be processed because there is no SCTP for association data request to stop.
  - STOPPED = The **STP:STATUS,SCTP** request has stopped the output of the SCTP data request identified by variable field 'a'.
  - FAILED - SYSTEM BUSY = The **STP:STATUS,SCTP** request could not be processed because the system was too busy or a resource failure occurred. Retry the request later.

Software Release: 5E15 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

STP [a] TRIB=b-c-d-e f [g]

2. REASON FOR OUTPUT

Indicates the result of a STP:TRIB input request to stop maintenance actions on a PCT (Peripheral Control and Timing) line and trunk unit tributary (TRIB).

3. VARIABLE FIELD DEFINITIONS

a = Action being stopped. Valid value(s):
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number.

c = PLTU (PCT Line and Trunk Unit) number.

d = PCT Facility Interface Number.

e = Tributary number.

f = Termination status. Valid value(s) are:
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was successfully completed.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

   = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

STP:TST-ELS
Software Release: 5E14 and later
Message Class: LINE
Application: 5
Type: Output

1. FORMAT

[1] STP TST ELS DN=a[-p] n
[2] STP TST ELS MLHG=b-c n
[3] STP TST ELS LEN=d-e-f-g[-h[-i]] n
[4] STP TST ELS LCEN=d-k-l-m n
[5] STP TST ELS LCKEN=d-q-r-s[-t] n
[6] STP TST ELS SM=d n
[7] STP TST ELS AIUEN=d-u-v-w n

2. REASON FOR OUTPUT

To report the result of a STP:TST-ELS input message.

Format 1 is printed when the request to stop an electronic loop segregation (ELS) test is related to an individual directory number (DN).

Format 2 is printed when the request to stop an ELS test is related to an individual multi-line hunt group (MLHG).

Format 3 is printed when the request to stop an ELS test is related to an individual line equipment number (LEN).

Format 4 is printed when the request to stop an ELS test is related to an individual line card equipment number (LCEN).

Format 5 is printed when the request to stop an ELS test is related to an individual line circuit equipment number (LCKEN).

Format 6 is printed when the request to stop an ELS test(s) is related to all tests in a given switching module (SM).

Format 7 is printed when the request to stop an ELS test is related to an individual access interface unit equipment number (AIUEN).

3. VARIABLE FIELD DEFINITIONS

a = DN of the line being tested. The directory number will include NPA for non-unique office codes.
b = Hunt group number.
c = Member number.
d = SM number.
e = Line unit number.
f = Grid number.
g = Grid pack number (LU1, LU2, or LU3). Valid value(s):
   ALL = All 64 lines on the grid have been stopped.
h = Switch number. Valid value(s):
   ALL = All 32 lines on the grid board have been stopped.
i = Level number. Valid value(s):
   ALL = The four lines on the specified switch have been stopped.
k = Integrated services line unit (ISLU) number.
l = Line group controller number.
m = Line card number. Valid value(s):
   ALL = If ALL is indicated for variable ‘m’, all 31 lines in the line group have been stopped.
n = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and termination was immediate.
   CMP UNAVAILABLE = The CM is unavailable.
   COMPLETED = Request has successfully completed.
   INPUT ERROR = The input message contained a format error.
   INVALID PORT = The port selected is not valid.
   NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Renter DN with NPA.
   NOT STARTED = Requested action has not begun.
   SM UNAVAILABLE = The SM specified is unavailable.
   SYSTEM BUSY = The system cannot accept the request at this time.
   SYSTEM ERROR = A system error has been detected.
   TEST NOT IN PROGRESS = The test was not running on the specified equipment.
p = Member number of the line time slot bridging (LT SB) line. For LT SB a member number of 1 indicates the lead line and a member number of 2 indicates the associate line.
q = Integrated services line unit-2 (ISLU2) number.
r = Line group number.
s = Line board number. Valid value(s):
   ALL = If ALL is indicated for variable ‘s’, all lines in the line group have been stopped.
t  = Line circuit number. Valid value(s):
   ALL  = If ALL is indicated for variable 't', all lines in the line board have been stopped.

u  = Access interface unit (AIU) equipment number.

v  = AIU pack number.

w  = AIU circuit number. Valid value(s):
   ALL  = If ALL is indicated for variable 'w', all lines in the pack have been stopped.

4. ACTIONS TO BE TAKEN

1. FORMAT

STP TST LEN=a-b-c-d-e-f g [h]

2. REASON FOR OUTPUT

To indicate the results of an attempt to stop the current action on the line equipment number (LEN) unit at the specified location.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Line unit number.
c = Grid number.
d = Grid board number.
e = Grid board switch number.
f = Grid board switch level number.
g = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion.

h = Additional data qualifying the termination report (variable 'g').

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message and refer to the documents listed in the REFERENCES section.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

STP:TST-MP

Software Release: 5E14 and later
Message Class: TLWS
Application: 5
Type: Output

1. FORMAT

STP TST MP a

2. REASON FOR OUTPUT

To print in response to the STP:TST-MP input message and report the result of an attempt to stop a modem pool (MP) test.

3. VARIABLE FIELD DEFINITIONS

a = Result of the attempt to stop the test. Valid value(s):
   COMPLETED = Test was stopped.
   NO MATCH = No test was found to be running on the specified group.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   STP:TST-MP
STP:TST-PATH-A
Software Release: 5E15 - 5E16(1)
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

STP TST PATH [SM=a] [IWG=a-b] [PEN=c-d-e] [BG=f|BGMN=f-g] [OPDN=h]
[OC3=i] [REQNO=q]
{STATUS: NO TEST RUNNING} | {r; s}

2. REASON FOR OUTPUT

The messages in response to STP:TST-PATH input messages.

Format 1 prints out "NO TEST RUNNING" if no matched active test procedures are found or if the request was invalid. No test specific information will be displayed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Inter-working gateway (IWG) unit number.
c = Relative link number.
d = Relative tributary number.
e = DS0 value.
f = BICC group number.
g = BICC group member, normalized CIC.
h = Digits outpulsed for the test call.
i = Optical carrier 3 (OC3) link.
q = The test request number (REQNO). A unique REQNO is assigned to a test procedure when it is first established. This number is useful for associating test result messages that may be distributed widely over time.
r = Operational condition of testing. The testing status consists of test condition and test status.

The test condition, which is delineated from the status string with a colon, indicates the operational condition of the test procedure.

Valid value(s):
- ABORTED = Test could not proceed because the indicated resources could not be obtained. The test procedure has been terminated. Refer to variable 's'.
- COMPLETED = Request completed. The test status follows the test condition indicates the measurement status of the test. Refer to variable 's'.
- ERROR = An unexpected error condition was detected. The test procedure has been prematurely terminated. Refer to variable 's'.
INVALID  = The test request as specified, was invalid for the path to be tested. Refer to variable 's'.
FAILED  = An internal failure has prevented the test procedure from establishing or clearing condition(s) necessary for testing. The test procedure has been terminated. Refer to variable 's'.
STATUS  = The present operational status of the test is presented. The test procedure continues as indicated. Refer to variable 's'.
STOPPED = The test procedure has been terminated in response to a manual request (refer to the STP:TST-PATH input message).

s  = Status of testing. The test status indicates the disposition of testing request. Refer to the TST:TRK output message in the Output Messages manual.

   d: e

[5] STP TST PATH [ATMLBK] PSUEN=a-s-v-w-x
   [RPT=s] [CAMP=u]
   d: e

2. REASON FOR OUTPUT

The messages in response to STP:TST-PATH input messages.

This message only prints if no executing TST:PATH tests requests were identified to be stopped. Any executing TST:PATH test requests which are stopped will print a TST:PATH output message indicating that the test was stopped by request; therefore an additional STP:TST-PATH output message in that case would be redundant and is not printed.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = The test request number or the lower limit of a range of test request numbers. The request number is assigned to a test procedure when it is first established.
c  = The upper limit of a range of test request numbers.
d  = Operational condition of the stop request. Valid value(s):
   ABORTED = Stop request could not proceed for the indicated status condition (refer to variable 'e'). The stop request has terminated; the status of currently executing test
requests is unknown.

**ERROR**

= An unexpected error condition was detected. The stop request has been prematurely terminated for the indicated status condition (refer to variable 'e').

**STATUS**

= Processing of the stop request has completed with the indicated status condition (refer to variable 'e').

\[ e \]

= Status condition of the stop request. Refer to the APP:TEST-ERROR appendix in the Appendixes section of the Output Messages manual for a description of all possible status condition values. Valid value(s):

BAD REQUEST = The request generated an unexpected internal failure during processing. Verify that the request appears valid, and if so, repeat the request. If repeated attempts with this format still produce this response, perhaps a different stop request format may be able to stop the desired executing test.

NO TEST RUNNING = There were no tests currently executing; therefore no tests can be stopped.

REQUEST NOT MATCHED = While there were tests currently executing, none of them matched the stop request sufficiently. No tests were stopped.

\[ f \]

= Optical interface unit (OIU) number.

\[ g \]

= Optical interface unit protection group (OIUPG) number.

\[ h \]

= Peripheral control and timing (PCT) link number (relative to the OIU).

\[ i \]

= PCT time slot (PCTTS) number.

\[ j \]

= Packet group (PKTG) number.

\[ k \]

= Packet group member (PKTGMN) number.

\[ l \]

= Outpulsed directory number (OPDN) of the appropriate test line type at far-end office.

\[ m \]

= Packet switching unit (PSU) number.

\[ n \]

= ATM link unit number.

\[ o \]

= VCID number. VCID is a virtual connection identifier that identifies a PVC on a given PSU ATM link. The special VCID number value of "ALL" indicates that all test requests currently running or pending on any VCID was requested to be stopped.

\[ p \]

= Trunk group number.

\[ q \]

= Trunk member number or lower limit of a range of trunk member numbers.

\[ r \]

= Upper limit of a range of trunk member numbers.

\[ s \]

= Number of times to repeat (RPT) the test being run.

\[ t \]

= Duration (DUR) of the test to be run, in seconds.

\[ u \]

= Camp-on time for the test being run.

\[ v \]

= PSU shelf number.

\[ w \]

= PSU channel number.

STP:TST-TRUNK-A

Software Release: 5E14 only
Message Class: TRK
Application: 5
Type: Output

1. FORMAT

STP TST TRUNK [TKGMN a b] {c} v

2. REASON FOR OUTPUT

To report that the input message STP:TST has been accepted and that the tests on remaining members of the trunk group and/or range of the tests on remaining X.25 access on T1 (XAT) ports from the TST:TRK input message have been canceled.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms used in the format.

a = Trunk group that was being tested.
b = Trunk group member that was the last member to be tested.
c = Valid value(s):

<table>
<thead>
<tr>
<th>TEN</th>
<th>DEN</th>
<th>NEN</th>
<th>PSUEN</th>
</tr>
</thead>
<tbody>
<tr>
<td>d-e-f-g-h</td>
<td>d-i-j-k</td>
<td>d-l-m-n-o-p-q-r</td>
<td>d-s-t-u</td>
</tr>
</tbody>
</table>

d = Switching module (SM) number.
e = Trunk unit number.
f = Service group number.
g = Channel board number.
h = Circuit number.
i = Digital line and trunk unit (DLTU) number.
j = Digital facility interface number.
k = Channel number for DFI-1, and for DFI-2.
l = Digital network unit - synchronous optical network (SONET) (DNU-S) number.
m = Data group (DG) number.
n = Signaling terminal equipment (STE) facility number.
o = Synchronous transport signal (STS) facility number.
p = Virtual tributary group (VTG) number.

q = Virtual tributary member (VTM) number.

r = Digital signal level 0 (DS0) number.

s = Packet switching unit (PSU) community number.

t = PSU channel group number.

u = PSU channel group member number.

v = Termination report. Valid value(s):

COMPLETED = Trunk group testing was stopped.

NO MATCH = No corresponding TST:TRK input message was found.

SYSTEM BUSY = Could not stop test because of busy system, repeat request later.

SYSTEM ERROR = An internal error occurred that would not allow trunk test to be stopped.

    H = The T&M phone is ON-HOLD (metallic connections).
    M = The T&M phone is in the MONITOR mode (listen-only).
    N = No T&M phone in the connection.
    T = The T&M phone is in the TALK mode (listen and talk).

j = IDCU number.
k = RT number or IDCU digital signal level 1 (DS1) serving PUB43801 number.
l = RT line number or PUB43801 channel.
q = Error message. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.
r = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
s = Data group (DG) number.
t = Synchronous transport signal (STS) facility number.
u = SONET termination equipment (STE) facility number.
v = Digital signal level 0 (DS0) number.
w = PSU unit number.
x = PSU shelf number.
y₁ = PSU channel group number.

z₁ = PSU channel group member number.

a² = Line board number.

b² = Line circuit number.

c² = Access interface unit (AIU) number.

d² = AIU line pack number.

e² = AIU line circuit number.

f² = Virtual tributary member (VTM) number.

g² = Digital Signal 1, having a Transfer rate of 1544 Kbps.

h² = Digital Signal 0, having a Transfer rate of 64 Kbps.

i² = Virtual tributary group (VTG) number.

j² = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

k² = PCT facility interface (PCTFI) number.

l² = Tributary number.

m² = Channel number.

n² = Virtual trunk facility number.

o² = Virtual trunk channel number.

p² = Optical interface unit (OIU) number.

q² = Protection group (PG) number.

r² = STS level 1 (STS-1) number.

s² = Virtual tributary 1.5 group (VTGRP) number.

t² = Virtual tributary 1.5 member (VTMEM) number.

u² = OC-3 STE number.

107. SW
SW:AIUCOM

**Software Release:** 5E14 and later
**Message Class:** SM
**Application:** 5
**Type:** Output

1. **FORMAT**

SW AIUCOM=a-b c [d]

2. **REASON FOR OUTPUT**

Indicates the result of an SW:AIUCOM input request to switch access interface unit common data and control controller.

3. **VARIABLE FIELD DEFINITIONS**

   - **a** = Switching module (SM) number.
   - **b** = AIU number.
   - **c** = Termination report. Valid value(s):
     - **ABORTED** = Requested action was terminated before completion, and the termination was not graceful.
     - **COMPLETED** = Requested action has successfully completed.
     - **STOPPED** = Requested action was terminated before a normal completion. Termination was graceful.
   - **d** = Additional information qualifying the termination report.

4. **ACTION TO BE TAKEN**

If unexpected results occur, refer to the Corrective Maintenance manual and the System Recovery manual.

5. **ALARMS**

None.

SW:ASM
Software Release: 5E15 and later
Message Class: SFTW,ASM
Application: 5
Type: Output

1. FORMAT

SW ASM [UCL] a [b]

2. REASON FOR OUTPUT

To acknowledge a SW:ASM input message to switch the standby administrative services module (ASM) to an active state.

3. VARIABLE FIELD DEFINITIONS

a
= Termination report. Valid value(s):
STARTED = Request has been started. The REPT:ASM output message will print the ASM states when the switchover has completed.
NOT STARTED = Requested action could not be started.

b
= Additional data qualifying the termination field. Valid value(s):
HA-ASM IS NOT EQUIPPED = High-Availability ASM (HA-ASM) is not equipped.
CONFLICT WITH CURRENT SYSTEM STATES = The ASMs are not in the correct configuration (active/standby or active/degraded) for a switch.
CONFLICT WITH OPERATIONS IN PROGRESS = Operations occurring on the ASM (such as, software update) preclude its ability to be switched at this time.
NOT PRIMARY NODE = Request was not generated by primary node in a DRM configuration. Only the AM can request an ASM switch.
ASM SYSTEM ERROR = The ASM failed due to an unexpected system error. Review the ASM log files for possible causes.

4. ACTIONS TO BE TAKEN

This message is printed out in response to a manual request to switch the ASMs in a HA-ASM configuration. No further action is necessary if the request was started. The REPT:ASM output message will report ASM state changes initiated by the switch. If the request was not started, variable 'b' should give some indication as to why the request was not performed. Check ASM MCC pages or the ASM GUI to verify that the system was in a valid state to perform the request.

SW:CU

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] SW CU ABORTED a

[2] SW CU b COMPLETED

[3] SW CU NOT STARTED
   CONFLICT WITH CURRENT SYSTEM STATES [c]

2. REASON FOR OUTPUT

To report the status of an SW:CU input message for a softswitch of the control unit (CU).

3. VARIABLE FIELD DEFINITIONS

a = Error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

b = Unit number of CU switched to active.

c = Description of conflict with current system status.

4. ACTION TO BE TAKEN

For Format 1, take action as appropriate for the error condition.

For Format 2, take no action.

For Format 3, determine the conflict with current system status. After the conflict is resolved, retry the CU softswitch.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Input Message(s):

SW:CU
Output Appendix(es):

APP: OMDB-X-REF
APP: SYSERR
SW:DLN

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

SW DLN a

2. REASON FOR OUTPUT

To acknowledge a request to switch the activity of the direct link node (DLN) on the common network interface (CNI) ring. This message is in response to an SW:DLN input message.

3. VARIABLE FIELD DEFINITIONS

a = Termination report. Valid value(s):
    COMPLETED = Requested action was terminated after completion.
    DENIED = Requested action was denied by the CNI software.
    ABORTED = Requested action was terminated before a normal completion. The consistency of DLN hardware states and data are questionable.

4. ACTION TO BE TAKEN

If the termination report (variable ‘a’) is COMPLETED, no action is required. The DLN's have switched ACT and STBY states. If the termination report is DENIED, CNI software could not process the request. Check the DLN states and repeat the request. If the termination report is ABORTED, the standby DLN should be restored and made active. The DLN that was active should be restored to the standby state.

Type: Output

1. FORMAT

SW IDCU=a-b c [d]

2. REASON FOR OUTPUT

To report the result of a SW:IDCU input message that switches integrated digital carrier unit (IDCU) service groups.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = IDCU number.
c = Termination report. Valid value(s):
   ABORTED = Immediate termination. A process has been purged and cleanup will be done by audits.
   COMPLETED = Requested action was successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

d = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

   ```
SW:NC

Software Release: 5E15 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

SW NC a b [c]

2. REASON FOR OUTPUT

To respond to the SW:NC input message.

3. VARIABLE FIELD DEFINITIONS

a = Network clock side.
b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   IN PROGRESS = Request was received and action is in progress.
   STOPPED = Request was terminated before a normal completion due to a hardware failure, data inconsistency, or another system problem.
c = Additional data qualifying the termination field.

4. ACTIONS TO BE TAKEN

No action is necessary if the request completed successfully. If the request failed, the variable 'c' should give some indication as to why the request failed. Check the network clock MCC page or the OP:CFGSTAT output message to verify that the NC was in a valid state to perform the request. Check the ROP for error messages using the REPT:NC output messages that may indicate problems or system reconfigurations.

   c               d             e              f
   ___________________________________________________________________

[3] SW OFLBOOT a
   h i [j] b
   OLBSTATE        LASTATE       FUNCTION       LINE
   c               d             e              f
   ___________________________________________________________________

2. REASON FOR OUTPUT

To report information regarding the execution of the offline boot feature.

3. VARIABLE FIELD DEFINITIONS

a  = Message type. Valid value(s):
   ABORTED  = Application request to stop the oflboot procedure; devices moved to the off-line side will be restored.
   COMPLETED = Indicates off-line side boot has completed.
   INFO     = Information dump.
   STOPPED  = Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the off-line side will be restored.
   TERMINATED = Administrative module (AM) software-initiated termination of the oflboot procedure; devices moved to the off-line side will not be restored.

b  = Text line. Valid value(s):
   1. AIM SWITCH PRECHECKS TIMED OUT = Printed when the timer for application integrity monitor (AIM) SW:OFLBOOT off-line prechecks expires. The precheck results will default to failure.
   2. CANNOT ACCESS ECD = SW:OFLBOOT encountered problems accessing RC/V ECD device information.
   3. CANNOT SEND MESSAGE TO USER PROCESS, PID: = SW:OFLBOOT cannot send a message to the user process identified by its process identifier. Usually the problem is no message buffers are available.
   4. CORRUPT ECD UCB RECORD FOR h i = SW:OFLBOOT encountered inconsistent information about a device from the off-line equipment configuration database.
For example, SW:OFLBOOT accessed the RC/V ECD UCB record for a disk file controller (DFC) and the device type in the unit control block (UCB) record is not DFC. This may indicate that the off-line ECD is corrupt.

5. **INTERNAL DFC TABLE CORRUPT** = Internal data or internal tables have been corrupted.

6. **INTERNAL IOP TABLE CORRUPT** = Internal data or internal tables have been corrupted.

7. **INTERNAL UNITS TABLE CORRUPT** = Internal data or internal tables have been corrupted.

8. **LOW CORE IOPMASK CORRUPT** = Data store in low core has been corrupted.

9. **LOW CORE ORIGSIDE CORRUPT** = Data store in low core has been corrupted.

10. **NO DISK FORCED** = A DFC is not forced.

11. **NO IOP ON THE OFFLINE SIDE** = Indicates that IOP0 and IOP1 are both on the on-line side. The switch will fail because it will not have a maintenance teletypewriter (MTTY) or receive-only printer (ROP) on the other side.

12. **NOT ACTIVE** = Printed if the specified device is not in the ACT state. The incorrect state is given in variable ‘j’.

13. **OFLBOOT NOT IN PROGRESS** = Offline boot is supported but is not in progress at this time.

14. **OFFLINE SYSTEM IS RUNNING IN MINIMUM CONFIGURATION MODE** = Indicates the off-line side is running in minimum configuration mode. There is no AIM process on the off-line side to support offline boot; cannot side switch.

15. **OLBSTATE EXPECTED TO BE AFTERBOOT OR AFTERSW** = SW:OFLBOOT cannot switch due to the fact that OLBSTATE is not AFTERBOOT or AFTERSW. SW:OFLBOOT is valid only immediately after a successful offline boot or side switch.

16. **SWITCH FROM OFF-LINE SIDE NOT ALLOWED** = Printed if SW:OFLBOOT is invoked on the off-line side.

17. **SWITCH FAILED** = Serious errors are encountered during a side switch procedure. Nevertheless, the procedure may be completed if the RETROFIT option was specified. This may mean that operation will continue without call origination. If the RETROFIT option was not specified, the side switch procedure will be terminated. Note however, the system still remains inside the offline boot procedure.

18. **SWITCH OFFLINE SIDE COMPLETE** = The off-line side completed its portion of a side switch. This message may be found in the OLBLOG file.

19. **SWITCH ONLINE SIDE COMPLETE** = The on-line side completed its portion of a side switch. This message will be found only in the OLBLOG file.

20. **UNDERGOING DIAGNOSTICS** = The specified device is undergoing diagnostics.

21. **UNEXPECTED MESSAGE FROM AIM** = Indicates a message has been received unexpectedly from AIM.

\(c\) = Current offline boot state.

\(d\) = Previous offline boot state.

\(e\) = Name of the function from which the output message originated. This field is used by the AM in diagnosing offline boot problems.

\(f\) = Line number in the function ‘e’ from which the output message originated. This field is used by the AM, in conjunction with field ‘e’, to diagnose offline boot problems.

\(g\) = Process identification number.

\(h\) = String giving device type information; control unit (CU), DFC, input/output processor (IOP), moving head disk (MHD), teletypewriter (TTY), teletypewriter controller (TTYC), and dual serial channel (DSCH), for example. Unit names are listed in the APP:MEM-NUM-UNIT Appendix of the Output Messages manual.
i  = Device number. A value of zero, when used with "n", could form DFC0, for example.

j  = Device state.

4. ACTION TO BE TAKEN

4. **ACTION TO BE TAKEN**
   
   This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the request failed, variable ‘b’ should give some indication as to why the request failed. Check ONTCMCC pages or the OP:CFGSTAT output message to verify that the system was in a valid state to perform the request.

2. REASON FOR OUTPUT

To acknowledge a request to switch the activity of the pump peripheral controller (PPC).

3. VARIABLE FIELD DEFINITIONS

a = Termination report. Valid value(s):
   ABORTED = Requested action is terminated before a normal completion and the consistency
             of hardware states or data is questionable.
   COMPLETED = Request action is terminated after completion.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action is terminated before a normal completion but consistency of
              hardware states and data is reliable.

b = Additional information qualifying the termination report.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   SW:PPC
SW:PSALNK

Software Release: 5E16(2) and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

SW PSALNK=a-b-c [d] [e]

2. REASON FOR OUTPUT

To report the results of a request to switch the active/standby states of the channels of a packet switch unit (PSU) asynchronous transfer mode (ATM) link (PSALNK)

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = PSU number.
c = ATM link.
d = Termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.
e = Additional information qualifying the termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.

4. ACTIONS TO BE TAKEN

If the ATM link has a protection channel in service and the response is other than COMPLETED, then check that none of the ATM link's channels:

- Have been manually set to a forced switch (FS) or lock out protection (LP) automatic protection switch (APS) state using SET:PSALNK.
- Are in the manual switch (MS) APS state.
- Are in the signal failure (SF) APS state.
- Are in the unavailable (UNAV) channel state.

If everything seems well, then retry the input message later. If one of the ATM link channels is in the MS APS state, clear (CLR:PSALNK) existent manual switch before retrying input message.

118x (PSU SHELF)
SW:QLPS

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

SW QLPS=a-b c d

2. REASON FOR OUTPUT

To report the result of a manual request to switch quad-link packet switches (QLPSs) in a specific network. This report is also produced if QLPSs are automatically switched as a by-product of some manual reconfiguration of QLPS network elements, a fault in a QLPS network element, or due to periodic normalization of the QLPS network.

3. VARIABLE FIELD DEFINITIONS

a = Office network and timing complex (ONTC) side number. If this output is generated due to a MANUAL switch request, this field reflects the ONTC side in the input request; important information associated with a successful QLPS switch is found in field 'b' (the QLPS network switched) and field 'd' (the resultant QLPS in that network which is now active).

If this output is generated due to an AUTOMATIC action, this field indicates the ONTC side of the resultant active QLPS in the network specified by field 'b'.

b = QLPS network number associated with the QLPS switch.

c = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request completed successfully.
   NOT STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion due, and the termination was graceful.

d = Additional information qualifying the termination status.

SW:RCLK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

SW RCLK=a b [c]

2. REASON FOR OUTPUT

To acknowledge the request to switch the status of active and standby remote clock (RCLK) circuits.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination is immediate. Consistency of hardware and data is questionable.
COMPLETED = Requested action completed successfully.
NOT STARTED = Requested action had not begun.
STOPPED = Requested action is terminated before a normal completion, but consistency of hardware status and data is reliable.

c = Additional information qualifying the termination report.

4. ACTION TO BE TAKEN

If the termination report (variable 'b') is COMPLETED, no action is required. If it is NOT STARTED, analyze variable 'c' to determine the cause. If it is STOPPED, determine the cause from the remote clock (RCLK) messages on the receive-only printer (ROP).

5. ALARMS

Information only.

1880,x,yy (IDCU REMOTE TERMINAL)
SW:SERV

Software Release: 5E16(2) and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

\texttt{SW SERV PCRGRP=a-b PSUPH=a-c-d-e f g} \\
\texttt{[PSUPH=a-c-d-e f]}

2. REASON FOR OUTPUT

To respond to a switch service selection (SW:SERV) input message or as a result of an automatic action that resulted in a processor group, mated pair, switching which is serving and which is non-serving.

This message identifies the processor group (PCRGRP) involved, the specific processors (PSUPH), a maximum of two, the service selection state following the switch and the reason for the switch.

3. VARIABLE FIELD DEFINITIONS

- \texttt{a} = Global services module number.
- \texttt{b} = Processor group number.
- \texttt{c} = Packet switching unit (PSU) number.
- \texttt{d} = PSU shelf number.
- \texttt{e} = Protocol handler (PH) position number.
- \texttt{f} = Current service selection state for the processor identified. Valid value(s):
  - NONSERVING = The processor is not serving but can take over when needed.
  - SERVING = The processor is serving the signaling needs of the processor group.
  - UNAVAILABLE = The processor is unavailable and cannot support any processing activity.
- \texttt{g} = Reason for the switch. Valid value(s):
  - AUTO RMV = A processor was automatically removed resulting in a switch.
  - COMPLETED = The switch of the service selection was denied because the processor specified could not be found. This could be caused by specifying an undefined processor or if the processor's channel group is unassigned. An unassigned channel group occurs when a PH is OOS.
  - ELNK DOWN = The ethernet link on a processor has gone down resulting in a switch.
  - FAILED = The status request has failed due to an unexpected software problem.
  - MAN RMV = A processor was manually removed resulting in a switch.
  - PING FAILURE = Auto ping to the adjacent router has failed or is continuing to fail resulting in a switch.
  - PING RESTORED = Auto ping to the adjacent router has been restored.

4. ACTIONS TO BE TAKEN
None. This message is the result of a switch service selection request.

5. ALARMS

A  = Generated in response to an automatically requested configuration change.
M  = Generated in response to a manually requested configuration change.

{DN=b|MLHG=c-d|TKGMN=e-f|j 1|ICOM=z [WB] [IMT][DN=s] [UNIQ=t]}...
...[TERM=g-h-i] [d1] u
[DN=v
TERM=w-x-y FORWARDED/SERIES COMPLETED TO]
(DN=j|MLHG=k-l|TKGMN=m-n|k 1|ICOM=z [IMT]) [TERM=o-p-q][h1][i1]
TIME rr:rr:rr

2. REASON FOR OUTPUT

To report that a telephone number [either directory number (DN) or telephone number (TN)] marked for nuisance call trace has been dialed, or that an in-progress call trace (IPCT) request has been completed.

If variable ‘u’ contains the keywords “IS CONNECTED TO”, the output message resulted from an in-progress call trace. If variable ‘u’ contains the keywords “DIALED”, the message resulted from a nuisance call trace.

The terminal (TERM) information is included when available. If the trunk is an intermodule trunk (IMT), an IMT flag will be printed after the trunk group member.

For incoming interoffice calls, if the originator’s directory number is available (for example, if Common Channel Signaling System 7 (CCS7) signaling is used), then it will also be provided in the nuisance call trace output messages along with a uniqueness indicator.

If the message resulted from the nuisance call trace of a forwarded or series completed call, it will also contain the originally dialed DN and TERMINAL of the last port to forward or series complete the call. It will also contain the keywords “FORWARDED/SERIES COMPLETED TO” and the keyword “DIALED”.

For IPCT, when the originator or terminator of the call is a conference controller, the keywords “CONF CNTRL” will appear in the output message. If the originating or terminating party is a floating conference controller, that is, no DN available, then the process ID (PID) will be provided in the output message.

3. VARIABLE FIELD DEFINITIONS

WB = The call being traced is a wideband call.

a = Event number.

b = Directory number.

c = Originating multi-line hunt group (MLHG) number.

d = Originating MLHG member number.

e = Originating trunk group (TKG) number.

f = Originating trunk group member number (MN).
g = Originating switching module (SM) number.

h = Originating port number in hexadecimal.

i = Originating primary DN of terminal.

j = Directory number. For nuisance call traces, this is the dialed DN. For in-progress call traces, this is the active DN of the traced terminal.

k = Terminating or trace party MLHG number.

l = Terminating or trace party MLHG member number.

m = Terminating or trace party TKG number.

n = Terminating or trace party trunk group MN.

o = Terminating SM number.

p = Logical port number.

q = Terminating primary DN of terminal.

r = Time the report was prepared, in the form hours:minutes:seconds.

s = Originator's DN.

t = Uniqueness indicator. Valid value(s):
N = DN does not uniquely specify originator's terminal.
Y = DN uniquely specifies originator's terminal.
? = Uniqueness unknown.

u = Keyword identifier. Valid value(s):
DIALED = Used for nuisance call trace messages.
IS CONNECTED TO = Used for in-progress call trace messages.

v = Originally dialed DN for a forwarded or series completed call.

w = SM number for the last port to forward or series-complete the traced call.

x = Port number in hexadecimal of the last port to forward or series-complete the traced call.

y = Primary DN of the last port to forward or series-complete the traced call.

z = Intercom group number.

a^1 = Process number of the originator's PID.

b^1 = SM number of the originator's PID.

c^1 = Uniqueness number of the originator's PID.

d^1 = Indicates type of conference controller of originating party. Valid value(s):
CONFCNTRL = Main conference controller.
CONFCNTRL-A = Associate conference controller.
CONFCNTRL-AF = Associate (floating) conference controller.
CONFCNTRL-F = Main (floating) conference controller.

e^1 = Process number of the terminating or trace party PID.
f^1 = SM number of the terminating or trace party PID.
g^1 = Uniqueness number of the terminating or trace party PID.
h^1 = Indicates type of conference controller of terminating party. Valid value(s):

CONFCNTRL = Main conference controller.
CONFCNTRL-A = Associate conference controller.
CONFCNTRL-AF = Associate (floating) conference controller.
CONFCNTRL-F = Main (floating) conference controller.

i^1 Valid value(s):
HARDHOLD CALL EXIST = A hardhold call also exists on this line.

j^1 = Originator's PID. Valid value(s):

PID=a^1-b^1-c^1

k^1 = PID of the process to be traced. Valid value(s):

PID=e^1-f^1-g^1

2. REASON FOR OUTPUT

To report that a telephone number [either directory number (DN) or telephone number (TN)] marked for nuisance call trace has been dialed, or that an in-progress call trace (IPCT) request has been completed.

If variable 'u' contains the keywords "IS CONNECTED TO", the output message resulted from an in-progress call trace. If variable 'u' contains the keywords "DIALED", the message resulted from a nuisance call trace. The terminal (TERM) information is included when available. If the trunk is an intermodule trunk (IMT), an IMT flag will be printed after the trunk group member. For incoming interoffice calls, if the originator's directory number is available (for example, if common channel signaling system 7 (CCS7) signaling is used), then it will also be provided in the nuisance call trace output messages along with a uniqueness indicator. If the message resulted from the nuisance call trace of a forwarded or series completed call, it will also contain the originally dialed DN and TERM of the last port to forward or series complete the call. It will also contain the keywords "FORWARDED/SERIES COMPLETED TO" and the keyword "DIALED". For IPCT, when the originator or terminator of the call is a conference controller, the keywords "CONF CNTRL" will appear in the output message. If the originating or terminating party is a floating conference controller, that is, no DN available, then the process ID (PID) will be provided in the output message. For a voice telephony over asynchronous transfer mode (ATM) call, the origination point code (OPC) number, destination point code (DPC) number, raw call instance code (RCIC) number, bearer independent call control (BICC) group number, and normalized call instance code (NICC) number values will appear in the output message for the ATM side of the call.

3. VARIABLE FIELD DEFINITIONS

a = Event number.
b = Directory number.
c = Originating multi-line hunt group (MLHG) number.
d = Originating MLHG member number.
e = Originating trunk group (TKG) number.
f = Originating trunk group member number (MN).
g = Originating switching module (SM) number.
h = Originating port number in hexadecimal.
i = Originating primary DN of terminal.
j = Directory number. For nuisance call traces, this is the dialed DN. For in-progress call traces, this is the active DN of the traced terminal.
k = Terminating or trace party MLHG number.
l = Terminating or trace party MLHG member number.
m = Terminating or trace party TKG number.
n = Terminating or trace party trunk group MN.
o = Terminating SM number.
p = Logical port number.
q = Terminating primary DN of terminal.
r = Time the report was prepared, in the form hours:minutes:seconds.
s = Originator's DN.
t = Uniqueness indicator. Valid value(s):

Application: 5
Type: Output

1. FORMAT

TRC IPCT FAILED [EVENT a] REASON b c

2. REASON FOR OUTPUT

To print the error type when an in-progress call trace (IPCT) attempt fails.

3. VARIABLE FIELD DEFINITIONS

a = Event tag of trace that failed.

b = Reason for failure. Valid value(s):
APX SYSTEM PROCESS = Process being traced is an Autoplex® system process. Traces started on these processes are not supported.
BAD MESSAGE = An unexpected message was received by an IPCT process, or the data in the message is invalid.
BAD SM NUMBER = An attempt was made to send a message to an invalid switching module (SM).
COULD NOT CREATE TP = An IPCT terminal process could not be created. This error could be caused by a system overload.
ERROR IN DYNAMIC DATA = An attempt to read dynamic data failed. This error could be the result of an invalid link or an unexpected return code from the DA primitive.
ERROR IN STATIC DATA = An attempt to read static data failed. This could signify an unexpected return code from the DB primitive or an invalid key.
NO CALL FOR GIVEN INPUT = No call was in progress for the requested trace.
NO PORT FOR GIVEN INPUT = Could not convert input to a port. This error can occur either when the input given is invalid or when a directory number (DN) is given and no port is associated with it. Examples of the latter case are uniform call distribution (UCD) multi line hunt groups (MLHG) group DNs and multiple position hunt (MUPH) and integrated services digital network (ISDN) attendant (ISAT) MLHGs sub DNs.
PROCESS IS NOT IN A STABLE STATE = Process being traced is in a transient state. Only processes in a stable state can be traced. Retry trace at a later time.
QUEUING PROCESS = The call being traced is queued. IPCT does not support tracing queued calls.
RESOURCE FAILURE = A message could not be sent between two processes. This error may be caused by system overload.
TIMED OUT = The administrative module (AM) terminal process timed out while waiting for a response from a switching module. Check the status of the switching module on the "Equipped SM Status Summary" Master Control Center (MCC) page.

c = Abbreviated address, not used.

4. ACTION TO BE TAKEN

If the call to be traced is still connected, try the trace again.
5. ALARMS

2. REASON FOR OUTPUT

To print the trace data requested by a utility call trace TRC:UTIL input message. This message describes a 4-wire line (4WLN) connection.

3. VARIABLE FIELD DEFINITIONS

CDFI = Communication digital facility interface.
DEN = Digital equipment number.
EVENT = Variables 'a' and 'b' are event tags linking all messages reporting on the same trace.
HSMALSO = HSM data is also associated with this trace.
PID = Variables 'c', 'd', and 'e' make up the process ID (PID) of the process controlling a traced connection. All messages describing one connection of a call will have the same PID.
RDFI = Remote switching module (RSM) digital facility interface.
TEN = Trunk equipment number.
UTD = Universal tone decoder.
UTG = Universal tone generator.
+ = Multi-party.
a = Event number.
b = Secondary event identifier; associated remote switching module (RSM) or host switching module (HSM) data will have the same value.
c = Process number of the PID.
d = Switching module number of the PID.
e = Uniqueness number of the PID.
f = Termination indicator. Valid value(s):
   N = More messages to be expected.
   Y = End of the trace data.
g = Error indicator. Valid value(s):
   N = No errors were encountered.
   Y = Errors were encountered in collecting the trace data; look for a
       TRC:UTIL-FAILED output message with this same event tag and PID.

i = Directory number (DN).

j = Switching module number.

k = Trunk unit number.

l = Service group.

m = Channel board number.

n = Circuit number.

o = Switching module number.

p = Digital line and trunk unit (DLTU) number.

q = Digital facilities interface number.

r = Circuit number.

s = Switching module number.

t = Local digital service unit number.

u = Service group number.

v = Digital service unit board number.

w = RSM number of the CDFI or RDFI.

x = Digital line trunk unit (DLTU) number.

y = DFI number.

To print the universal conference circuit number, name, and type associated with an active call identified by a utility call trace input request.

3. VARIABLE FIELD DEFINITIONS

EVENT = Variables 'a' and 'b' are event tags linking all messages reporting on the same trace.
GDSF = Global digital services functions.
PID = Variables 'c', 'd', and 'e' make up the process identifier (PID) of the conference circuit process associated with the traced call.
UCONF = Universal conference circuit number.
a = Event number.
b = Secondary event identifier number; associated remote switching module (RSM) or host switching module (HSM) data will have the same value.
c = Process number of the PID.
d = Switching module (SM) number of the PID.
e = Uniqueness number of the PID.
f = Termination (END) indicator. Valid value(s):
    N = More messages to be expected.
    Y = End of the trace data.
g = Error (ERR) indicator. Valid value(s):
    N = No errors were encountered.
    Y = Errors were encountered in collecting the trace data; look for a TRC:UTIL-FAILED output message with this same event tag and PID.
h = SM number.
i = Global digital service unit number.
j = Service group number.
k = Digital service circuit unit board number.

l = GDSF unit number.

m = Conference circuit (CKT) number.

n = Type (TYPE) of conference circuit. Valid value(s):

</tbody>
</table>
NO PACKET DATA = There is no PH data for the packet utility call trace requested.
NO RESPONSE = A message was sent to the SM to start a trace, but the SM did not respond within the allowed time period.
PROCESS IS NOT IN A STABLE STATE = Process being traced is in a transient state. Only processes in stable states can be traced. Retry trace at a later time.
QUEUING PROCESS = The call being traced is queued. UCT does not support tracing queuing processes.
RESOURCE FAILURE = The trace will not complete because a necessary message could not be sent or a timer could not be started, or a data base read failed.
TRACE ALREADY IN PROGRESS = UCT only collects data from one trace at a time. (This error is likely if a second trace is started while another trace is still in progress.)
TRACED PROCESS IS NOT IN CALL = The process that has been traced does not terminate at a line or trunk. Therefore, the data cannot be formatted for the MCC screen. However, it can be dumped by the OP:TRC message if desired.
UNKNOWN DATA REQUESTED = The trace failed due to an unexpected input parameters on an OP:TRC input message.

f = Abbreviated address, not used.

   INCOMPLETE DATA = This indicates that the trace process timed out before it received all the expected trace data.
   INTERNAL ERROR = An unexpected condition was encountered during processing.
   INVALID TRACE REQUEST = The trace request was not valid.
   NO ACTIVE PACKET CALLS = No logical channel number (LCN) packet data found by packet UCT. This signifies that there are no active packet calls.
   NO BICC PROCESS FOR GIVEN INPUT = No bearer independent call control (BICC) process found for given inputs.
   NO CONNECTION SET UP = There is no connection to trace.
   NO PACKET DATA = There is no PH data for the packet utility call trace requested.
NO RESPONSE = A message was sent to the SM to start a trace, but the SM did not respond within the allowed time period.

PROCESS IS NOT IN A STABLE STATE = Process being traced is in a transient state. Only processes in stable states can be traced. Retry trace at a later time.

QUEUING PROCESS = The call being traced is queued. UCT does not support tracing queuing processes.

RESOURCE FAILURE = The trace will not complete because a necessary message could not be sent or a timer could not be started, or a database read failed.

TRACE ALREADY IN PROGRESS = UCT only collects data from one trace at a time. (This error is likely if a second trace is started while another trace is still in progress.)

TRACED PROCESS IS NOT IN CALL = The process that has been traced does not terminate at a line or trunk. Therefore, the data cannot be formatted for the MCC screen. However, it can be dumped by the OP:TRC message if desired.

UNKNOWN DATA REQUESTED = The trace failed due to an unexpected input parameters on an OP:TRC input message.

f = Abbreviated address, not used.

4. ACTIONS TO BE TAKEN

None. This message is the result of a utility call trace.

5. ALARMS

None.

   DS1SFAC=q-r-s-t-u-v-w-x

2. REASON FOR OUTPUT

To print the trace data requested by a utility call trace input message. This message describes the host switching module (HSM) portion of a call involving both an HSM and a remote switching module (RSM).

3. VARIABLE FIELD DEFINITIONS

EVENT = Variables 'a' and 'b' are event tags linking all messages reporting on the same trace.

PID = Variables 'c', 'd', and 'e' make up the process ID (PID) of the process controlling a traced connection. All messages describing one connection of a call will have the same PID.

a = Event number.
b = Secondary event identifier; associated RSM/HSM data will have the same value.
c = Process number of the PID.
d = Switching module number of the PID.
e = Uniqueness number of the PID.
f = Termination indicator. Valid value(s):
   N = More messages should be expected.
   Y = End of the trace data.
g = Error indicator. Valid value(s):
   N = No errors were encountered.
   Y = Errors were encountered in collecting the trace data; look for a TRC:UTIL-FAILED message with this same event tag and process ID.

h = HSM number of HSM's digital facility interface (HDFI).
i  = Digital line/trunk unit (DLTU) number of the HDFI.

j  = HDFI number.

k  = Peripheral interface data bus (PIDB) number or peripheral control timing link time-slot (PCT TS).

l  = Peripheral interface data bus time-slot (TS) or peripheral control timing link (PCT).

m  = Peripheral time-slot (PTS) number.

n  = Source network, control, and timing (SRCNCT) time-slot.

o  = Sink network, control, and timing (SNKNCT) time-slot.

p  = Time multiplexed switch (TMS) time-slot indicator. Valid value(s):
N    = TMS time-slots are not actively used in the call (that is intra-module or peripheral to peripheral call).
Y    = TMS time-slots are actively used in the call (that is inter-module call).

q  = Switch module (SM).

r  = Digital network unit - SONET (DNU-S).

s  = Data group number (DG).

t  = Signaling terminal equipment number x’75 (STE).

u  = Synchronous transport signal number (STS).

v  = Virtual tributary group number (VTG).

w  = Virtual tributary member number (VTM).

x  = Digital signal level 1 number (DS1).

4. ACTIONS TO BE TAKEN

None. This message is the result of a utility call trace.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the status of a traced port, time slot, process, or circuit when the requested trace cannot be completed because no call is in progress.

3. VARIABLE FIELD DEFINITIONS

a = What was traced. Valid value(s):

CKT = Circuit.
PID = Process identifier.
PORT = Line or trunk port.
TIMESLOT = Network time slot.

b = State of PORT. Valid value(s):

IS = In-service
OOS = Out-of-service

c = Qualifier of the port state. Valid value(s):

ABLKD = Abnormally blocked.
BLKD = Blocked.
CADN = Circuit administration.
CUTOVER = Cutover inactive.
DSLINIT = DSL initialization.
FCDOS = Forced out-of-service.
FRCD = Forced.
MKBUSY = Make busy.
MTCE = Maintenance.
PFSRV = Pre/post service.
RC = Unspecified recent change.
STBY = Stand-by.
TBLA = Trouble analysis.
TMT = Traffic management.
UNAS = Unassigned.
WAIT = Wait.

d = Operational restriction. Valid value(s):

BCOOS = Bearer channel out-of-service.
BCMOOS = Bearer channel member out-of-service.
CCSINIT = CCS Initialization.
CONT = Continuity test failure.
DCHOOS = D-channel out-of-service.
DCSINIT = DCS initialization.
DSBLD = Disabled.
FAF = Facility failure.
FE = Family of equipment.
HW = High and wet.
LKDO = Locked out.
INIT = Hardware initialization.
LVL1ERR = Level 1 error.
LVL2ERR = Level 2 error.
LVL3ERR = Level 3 error.
MTBUSY = Maintenance busy.
PLGUP = Plugged up.
PPMFE = PPM family of equipment.
PX = Power cross.
RAP = Recorded announcement.

e = State of CKT. Valid value(s):
   IS = In-service.
   OOS = Out-of-service.
   RING = Used for ringing.

f = Event tag linking all messages reporting on the same trace.

4. ACTION TO BE TAKEN

None. This message is the result of a utility call trace.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a TRC:UTIL input message or a call trace poke. This message describes a line connection from the
directory number through the line unit. It can have five different formats depending on whether a line equipment number (LEN) (Format 1), \textit{SLC}® 96 line equipment number (SLEN) (Format 2), line card equipment number (LCEN) (Formats 3 and 4), or integrated digital carrier unit (IDCU) line equipment number (ILEN) or TR-303 on DNU-S line equipment number (INEN) (Format 5) was traced.

### 3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

- **EVENT**: Variables ‘a’ and ‘b’ are event tags linking all messages reporting on the same trace.
- **HSM ALSO**: Host switching module (HSM) data is also associated with this trace.
- **\***: Indicates a default service directory number.
- **+**: Indicates the directory number is on a party line (if analog) or a multipoint DSL (if ISDN).
- **a**: Primary event identifier number.
- **b**: Secondary event identifier number; associated RSM or HSM data will have the same value.
- **c**: Process number of the PID.
- **d**: Switching module (SM) number.
- **e**: Uniqueness number of the PID.
- **f**: Termination (END) indicator. Valid value(s):
  - N: More messages to be expected.
  - Y: End of the trace data.
- **g**: Error (ERR) indicator. Valid value(s):
  - N: No errors were encountered.
  - Y: Errors were encountered in collecting the trace data; look for a TRC:UTIL-FAILED output message with this same event tag and PID.
- **h**: Directory number of line being traced or MULTIPT or STANDARD. MULTIPT is used for a D-channel trace of a custom BRI with multipoint service. STANDARD is used for a D-channel trace of a standard BRI with multiple users defined.
- **i**: Valid value(s):

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LUCHAN=d-g²-t-u-v</td>
<td></td>
</tr>
<tr>
<td>RVPT=d-f²-t-s</td>
<td></td>
</tr>
<tr>
<td>UTD=d-f²-t-s</td>
<td></td>
</tr>
<tr>
<td>UTG=d-f²-t-s</td>
<td></td>
</tr>
</tbody>
</table>
- **j**: Type of service. Valid value(s):
  - CKT: Circuit. Used for ISDN D-channel traces.
  - CSD: Circuit switched data.
  - CSV: Circuit switched voice.
  - PKT: Packet switched service.
k = Grid number.
l = Switch board number.
m = Switch number.
n = Level number.
o = Group number.
p = Member number.
q = B-link number.
r = Board number.
s = Digital service unit board number.
t = Service group number.
u = Channel board number.
v = Channel circuit number.
w = Digital carrier line unit number.
x = Remote terminal (RT) number.
y = RT line number.
z = High level service circuit number.
a\textsuperscript{l} = RSM number of the CDFI or RDFI.
b\textsuperscript{l} = Digital line trunk unit (DTLU) number.
c\textsuperscript{l} = DFI number.
d\textsuperscript{l} = Position Number.
e\textsuperscript{l} = A-link number.
f\textsuperscript{l} = Digital carrier line unit (DCLU) number.
g\textsuperscript{l} = IDCU line unit number.
h\textsuperscript{l} = DDS path identifier, 1 or 2.
i\textsuperscript{l} = Sub-address (SA) number of a shared DN or MLHG.
j\textsuperscript{l} = Call appearance (CA) number on a multiple call appearance (MCA) terminal.
k\textsuperscript{l} = Line group controller number.
l\textsuperscript{l} = Line card number.
m\(^1\) = Operator service center (OSC) number.

n\(^1\) = Operator position number.

o\(^1\) = SDFI number.

p\(^1\) = RT number or IDCU DS1 serving PUB43801 number.

q\(^1\) = Operator call loop number.

r\(^1\) = Member number of the line time-slot bridging (LT SB) line. For LT SB a member number of ‘1’ represents the lead line and a member number of ‘2’ represents the associate line.

s\(^1\) = Facility time-slot number.

t\(^1\) = Facility identifier.

u\(^1\) = SID number.

v\(^1\) = Channel identifier. Valid value(s):

B1  
B2  
D

w\(^1\) = Protocol handler number.

x\(^1\) = RT line number or PUB43801 channel.

y\(^1\) = Packet switch unit (PSU) number. All messages describing one connection of a call will have the same PID.

z\(^1\) = Time slot number.

a\(^2\) = Primary DN of ISDN terminal.

c\(^2\) = DFIH number.

d\(^2\) = Indicates conference party type. Valid value(s):

CNTRL = Main conference controller.
CNTRL-A = Associate conference controller.

e\(^2\) = Intercom group number.

f\(^2\) = Local digital service unit number.

g\(^2\) = Line unit number.

h\(^2\) = Line board number.

i\(^2\) = RPCU group number. This applies only to wireless centrex.

j\(^2\) = Line group number.

k\(^2\) = Line circuit number.
l² = Digital Network Unit-SONET (DNU-S) number.
m² = Remote digital terminal (RDT) number.
n² = Line number.
ο² = DS1 number.
p² = Data group number.
q² = Common data number.
r² = STS (Synchronous Transport Signal) number.
s² = SFI (STSX-1 Facility Interface) number.

4. ACTION TO BE TAKEN
None. This message is the result of a utility call trace.

5. ALARMS
None.

2. REASON FOR OUTPUT

To respond to a TRC:UTIL input message or a call trace poke. This message describes a line connection from the
directory number through the line unit. It can have five different formats depending on whether a line equipment number (LEN) (Format 1), SLC® 96 line equipment number (SLEN) (Format 2), line card equipment number (LCEN) (Formats 3 and 4), or integrated digital carrier unit (IDCU) line equipment number (ILEN) or TR-303 on DNU-S line equipment number (INEN) (Format 5) was traced.

3. VARIABLE FIELD DEFINITIONS

* = Indicates a default service directory number.

+ = Indicates the directory number is on a party line (if analog) or a multipoint DSL (if ISDN).

a = Primary event identifier number.

b = Secondary event identifier number; associated RSM or HSM data will have the same value.

c = Process number of the PID.

d = Switching module (SM) number.

e = Uniqueness number of the PID.

f = Termination (END) indicator. Valid value(s):

N = More messages to be expected.

Y = End of the trace data.

g = Error (ERR) indicator. Valid value(s):

N = No errors were encountered.

Y = Errors were encountered in collecting the trace data; look for a TRC:UTIL-FAILED output message with this same event tag and PID.

h = Directory number of line being traced or MULTIPT or STANDARD. MULTIPT is used for a D-channel trace of a custom BRI with multipoint service. STANDARD is used for a D-channel trace of a standard BRI with multiple users defined.

i = Valid value(s):

LUCHAN=d-g²-t-u-v
RVPT=d-f²-t-s
UTD=d-f²-t-s
UTG=d-f²-t-s

j = Type of service. Valid value(s):

CKT = Circuit. Used for ISDN D-channel traces.

CSD = Circuit switched data.

CSV = Circuit switched voice.

PKT = Packet switched service.

k = Grid number.

l = Switch board number.
= Switch number.
 = Level number.
 = Group number.
 = Member number.
 = B-link number.
 = Board number.
 = Digital service unit board number.
 = Service group number.
 = Channel board number.
 = Channel circuit number.
 = Digital carrier line unit number.
 = Remote terminal (RT) number.
 = RT line number.
 = High level service circuit number.
 = RSM number of the CDFI or RDFI.
 = Digital line trunk unit (DTLU) number.
 = DFI number.
 = Position Number.
 = A-link number.
 = Digital carrier line unit (DCLU) number.
 = IDCU line unit number.
 = DDS path identifier, 1 or 2.
 = Sub-address (SA) number of a shared DN or MLHG.
 = Call appearance (CA) number on a multiple call appearance (MCA) terminal.
 = Line group controller number.
 = Line card number.
 = Operator service center (OSC) number.
 = Operator position number.
 = SDFI number.
p\(^1\) = RT number or IDCU DS1 serving PUB43801 number.

q\(^1\) = Operator call loop number.

r\(^1\) = Member number of the line time-slot bridging (LTSB) line. For LTSB a member number of ‘1’ represents the lead line and a member number of ‘2’ represents the associate line.

s\(^1\) = Facility time-slot number.

t\(^1\) = Facility identifier.

u\(^1\) = SID number.

v\(^1\) = Channel identifier. Valid value(s):

\[
\begin{align*}
&\text{B1} \\
&\text{B2} \\
&\text{D}
\end{align*}
\]

w\(^1\) = Protocol handler number.

x\(^1\) = RT line number or PUB43801 channel.

y\(^1\) = Packet switch unit (PSU) number. All messages describing one connection of a call will have the same PID.

z\(^1\) = Time slot number.

a\(^2\) = Primary DN of ISDN terminal.

c\(^2\) = DFIH number.

d\(^2\) = Indicates conference party type. Valid value(s):

\[
\begin{align*}
&\text{CNTRL} \quad \text{= Main conference controller.} \\
&\text{CNTRL-A} \quad \text{= Associate conference controller.}
\end{align*}
\]

e\(^2\) = Intercom group number.

f\(^2\) = Local digital service unit number.

g\(^2\) = Line unit number.

h\(^2\) = Line board number.

i\(^2\) = RPCU group number. This applies only to wireless centrex.

j\(^2\) = Line group number.

k\(^2\) = Line circuit number.

l\(^2\) = Digital network unit-SONET (DNU-S) number.

m\(^2\) = Remote digital terminal (RDT) number.
n<sup>2</sup> = Line number.

o<sup>2</sup> = DS1 number.

p<sup>2</sup> = Data group number.

q<sup>2</sup> = Common data number.

r<sup>2</sup> = Synchronous transport signal (STS) number.

s<sup>2</sup> = STSX-1 facility interface (SFI) number.

t<sup>2</sup> = Time multiplexed switch (TMS) active side number.

u<sup>2</sup> = Time multiplexed switch active side fabric pair (TMSFP) number.

4. ACTIONS TO BE TAKEN

None. This message is the result of a utility call trace.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print the trace data requested by a utility call trace input message. This message describes an Operator Services Position System (OSPS) application processor (AP) data link (DL). This message is in response to a TRC:UTIL input message or a call trace poke.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

EVENT = Variables 'a' and 'b' are event tags linking all messages reporting on the same trace.

SHELF = Packet switch unit (PSU) shelf location.

a = Primary event identifier.
b = Secondary event identifier.
c = Process number of the PID.
d = Switching module (SM) number.
e = Uniqueness number of the PID.
f = Termination indicator. Valid value(s):
   N = More messages to be expected.
   Y = End of the trace data.

g = Error indicator. Valid value(s):
   N = No errors were encountered.
   Y = Errors were encountered in collecting the trace data; look for a TRC:UTIL-FAILED output message with this same event tag and PID.
\[ i \] = Line unit number.

\[ j \] = Line group number.

\[ k \] = Line card number.

\[ l \] = Valid value(s):

<table>
<thead>
<tr>
<th>AP=m-n</th>
</tr>
</thead>
<tbody>
<tr>
<td>EIS=z-a^{1}</td>
</tr>
<tr>
<td>HOICV=m-n</td>
</tr>
<tr>
<td>MISLNK=m-n</td>
</tr>
<tr>
<td>OAPF=b^{1}</td>
</tr>
<tr>
<td>OAPO=c^{1}</td>
</tr>
<tr>
<td>XDB=m-n</td>
</tr>
</tbody>
</table>

\[ m \] = Data link (group) number.

\[ n \] = Relative link (member) number.

\[ o \] = Protocol handler number.

\[ p \] = Member number.

\[ q \] = PSU shelf number.

\[ r \] = Time slot number.

\[ s \] = Integrated digital carrier unit (IDCU) number.

\[ t \] = Remote terminal (RT) number or IDCU DS1 serving PUB43801 number.

\[ u \] = RT line number or PUB43801 channel.

\[ v \] = Facility time slot number.

\[ w \] = Facility identifier.

\[ x \] = SLC\textsuperscript{®} identification (SID) number.

\[ y \] = Line pack number.

\[ z \] = EIS identifier (ID) on which the CPDL terminates.

\[ a^{1} \] = External data link (member) number relative to the EIS.

\[ b^{1} \] = Force management center number of the OAPF.

\[ c^{1} \] = Operator service center number of the OAPO.

4. **ACTION TO BE TAKEN**

None. This message is the result of a utility call trace.

TRC UTIL PID EVENT=a b [HSM ALSO] PID c d e END f ERR g
   TYPE=i
   [CONF=h]
   [m] [m] [j] [j]

2. REASON FOR OUTPUT

To report a connection to a process which does not own a port.

3. VARIABLE FIELD DEFINITIONS

CONF = Conference call indicator.
EVENT = Variables 'a' and 'b' are event tags linking all messages reporting on the same trace.
   a = Event number.
   b = Secondary event identifier number; associated remote switching module (RSM) or host switching
      module (HSM) data will have the same value.
   c = Process number of the PID.
   d = Switching module (SM) number of the PID.
   e = Uniqueness number of the PID.
   f = Termination (END) indicator. Valid value(s):
      N = More messages to be expected.
      Y = End of the trace data.

   g = Error (ERR) indicator. Valid value(s):
      N = No errors were encountered.
      Y = Errors were encountered in collecting the trace data. look for a
         TRC:UTIL-FAILED output message with this same event tag and PID.

   h = Indicates conference party type. Valid value(s):
      CNTRL-F = Main (floating) conference controller.
      CNTRL-AF = Associate (floating) conference controller.

   i = Indicates the process ID type. Valid value(s):
      ASP = Advance service platform.
      AUTOLEX = Autoplex® process.
      LINE = Line process.
      MBTP = Monitored bridge terminal process.
PHANTOM = Phantom process.

j = Valid value(s):

\[ \text{CDFI} = k-l-m \]
\[ \text{RDFI} = k-l-m \]

k = RSM number of the CDFI or RDFI.
l = Digital line trunk unit (DLTU) number.
m = DFI number.
n = Valid value(s):

\[ \text{UTD} = o-p-q-r \]
\[ \text{UTG} = o-p-q-r \]

o = Switching module (SM) number.
p = Local digital service unit number.
q = Service group number.
r = Digital service unit board number.

2. REASON FOR OUTPUT
To print the trace data requested by a utility call trace input message. This message describes a trunk (TRK),
inter-module trunk (IMT), recorded announcement function (RAF), or service announcement system (SAS)
connection.

3. VARIABLE FIELD DEFINITIONS

**CKT**
- Trunk used is a circuit switched trunk. Only used for D-channel traces (Format 3).

**a**
- Event number.

**b**
- Secondary event identifier; associated remote switching module (RSM) or host switching module
  (HSM) data will have the same value.

**c**
- Process number of the PID.

**d**
- Switching module (SM) number.

**e**
- Uniqueness number of the PID.

**f**
- Termination (END) indicator. Valid value(s):
  - N = More messages to be expected.
  - Y = End of the trace data.

**g**
- Error (ERR) indicator. Valid value(s):
  - N = No errors were encountered.
  - Y = Errors were encountered in collecting the trace data; look for a
    TRC:UTIL-FAILED output message with this same event tag and PID.

**h**
- Directory number of line being traced.

**i**
- Trunk group number.

**j**
- Member number.

**k**
- Digital networking unit - SONET (DNU-S) number.

**l**
- Trunk unit number.

**m**
- Service group number.

**n**
- Channel board number.

**o**
- Circuit number.

**p**
- Digital line and trunk unit (DLTU) number.

**q**
- Digital facilities interface (DFI) number.

**r**
- Data group (DG) number.

**s**
- Digital carrier line unit (DCLU) number.

**t**
- Remote terminal (RT) number.
u = RT line number.
v = PH number.
w = Synchronous transport signal (STS) number.
x = PSU shelf number.
y = Time slot number.
z = Local digital service unit (LDSU) number.
a = Digital service unit (DSU) board number.
b = RSM number of the CDFI or RDFI.
c = DFI number.
d = Integrated digital carrier unit (IDCU) number.
e = RT number or IDCU DS1 serving PUB43801 number.
\( f \) = RT line number or PUB43801 channel.
\( g \) = Facility time slot number.
\( h \) = Facility identifier.
\( i \) = SID number.
\( j \) = Virtual tributary member (VTM) number.
\( k \) = Digital signal level 0 (DS0) number.
\( l \) = RAF unit number.
\( m \) = RAF channel number.
\( n \) = SAS unit number.
\( o \) = SAS channel number.
\( p \) = The DNU-S facility consists of two digits. The first digit is the data group number and the second digit is the signaling terminal equipment (STE) number.
\( q \) = The PSU unit number.
\( r \) = The PSU channel group number.
\( s \) = The PSU channel group member number.
\( t \) = Indicates conference party type. Valid value(s):
\begin{itemize}
  \item \texttt{CNTRL} = Main conference controller.
  \item \texttt{CNTRL-A} = Associate conference controller.
\end{itemize}
\( u \) = Digital carrier line unit (DCLU) number.
v = SDFI number.
w = DS1 number.
x = Data group (DG) number.
y = Common data number.
z = Virtual tributary group (VTG) number.
a = STSX-1 Facility Interface (SFI) number.
b = Signaling transport equipment (STE) number.

Digital carrier line unit (DCLU) number.

Remote terminal (RT) number.

RT line number.

PH number.

Synchronous transport signal (STS) number.

PSU shelf number.

Time slot number.

Local digital service unit (LDSU) number.

Digital service unit (DSU) board number.

RSM number of the CDFI or RDFI.

DFI number.

Integrated digital carrier unit (IDCU) number.

RT number or IDCU DS1 serving PUB43801 number.

RT line number or PUB43801 channel.

Facility time slot number.

Facility identifier.

SID number.

Virtual tributary member (VTM) number.

Digital signal level 0 (DS0) number.

RAF unit number.

RAF channel number.

SAS unit number.

SAS channel number.

The DNU-S facility consists of two digits. The first digit is the data group number and the second digit is the signaling terminal equipment (STE) number.

The PSU unit number.

The PSU channel group number.

The PSU channel group member number.

Indicates conference party type. Valid value(s):

CNTRL = Main conference controller.
CNTRL-A = Associate conference controller.

u¹ = Digital carrier line unit (DCLU) number.

v¹ = SDFI number.

w¹ = DS1 number.

x¹ = Data group (DG) number.

y¹ = Common data number.

z¹ = Virtual tributary group (VTG) number.

a² = STSX-1 facility interface (SFI) number.

b² = Signaling transport equipment (STE) number.

c² = PCT line and trunk (virtual) unit (PLTU) number.

d² = PCT facility interface (PCTFI) number.

e² = The PCT tributary number.

f² = The PCT channel group number.

g² = The service type. Valid value(s):
13K = Service is CDMA 13K circuit switched voice (CSV).
8K = Service is CDMA 8K CSV.
ACELP = Service is TDMA ACELP vocoder.
C1ASN = Service is CDMA circuit-mode ASYNC 9.6 AUTOPLEX® data trunk (ADT).
C1ASYNC = Service is A5 ASYNC 9.6 KBPS data.
C1CDCP = Service is CDMA packet-mode 9.6 KBPS.
C1FAX = Service is CDMA circuit-mode FAX 9.6 ADT.
C1IP = Service is CDMA packet-mode data IP 14.4 KBPS.
C1PDIP = Service is CDMA packet-mode data IP 9.6 KBPS.
C2ASN = Service is CDMA circuit-mode ASYNC 14.4 ADT.
C2ASYNC = Service is A5 ASYNC 14.4 KBPS data.
C2CDCP = Service is CDMA packet-mode 14.4 KBPS.
C2FAX = Service is CDMA circuit-mode FAX 14.4 ADT.
C2IP = Service is CDMA packet-mode data IP 153.6 KBPS.
C3CDCP = Service is CDMA packet-mode data 153.6 KBPS.
C3FAX = Service is A5 FAX 9.6 KBPS data.
C4FAX = Service is A5 FAX 14.4 KBPS data.
EVRC = Service is CDMA enhanced variable rate CODEC (EVRC) CSV.
IVBST = Service is A2 inter-vendor traffic.
NOSRVTYP = No service type provided.
T1DRS = Service is TDMA circuit-mode 13 ADT.
VSELP = Service is TDMA vect-sum excite line predict (VSELP) vocoder.

h² = The virtual trunk facility number.
i^2 = The virtual trunk channel number.

j^2 = The optical carrier-3 number.

k^2 = The interworking unit number.

4. ACTIONS TO BE TAKEN

None. This message is the result of a utility call trace.

2. REASON FOR OUTPUT

To print the trace data requested by a utility call trace input message. This message describes a trunk (TRK), inter-module trunk (IMT), recorded announcement function (RAF), or service announcement system (SAS) connection.

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKT</td>
<td>= Trunk used is a circuit switched trunk. Only used for D-channel traces (Format 3).</td>
</tr>
<tr>
<td>a</td>
<td>= Event number.</td>
</tr>
<tr>
<td>b</td>
<td>= Secondary event identifier; associated remote switching module (RSM) or host switching module (HSM) data will have the same value.</td>
</tr>
<tr>
<td>c</td>
<td>= Process number of the PID.</td>
</tr>
<tr>
<td>d</td>
<td>= Switching module (SM) number.</td>
</tr>
<tr>
<td>e</td>
<td>= Uniqueness number of the PID.</td>

</tbody>
</table>
| f     | = Termination (END) indicator. Valid value(s):
|       | N = More messages to be expected.
|       | Y = End of the trace data. |
| g     | = Error (ERR) indicator. Valid value(s):
|       | N = No errors were encountered. |
Y = Errors were encountered in collecting the trace data; look for a TRC:UTIL-FAILED output message with this same event tag and PID.

h = Directory number of line being traced.
i = Trunk group number.
j = Member number.
k = Digital networking unit - SONET (DNU-S) number.
l = Trunk unit number.
m = Service group number.
n = Channel board number.
o = Circuit number.
p = Digital line and trunk unit (DLTU) number.
q = Digital facilities interface (DFI) number.
r = Data group (DG) number.
s = Digital carrier line unit (DCLU) number.
t = Remote terminal (RT) number.
u = RT line number.
v = PH number.
w = Synchronous transport signal (STS) number.
x = PSU shelf number.
y = Time slot number.
z = Local digital service unit (LDSU) number.
a¹ = Digital service unit (DSU) board number.
b¹ = RSM number of the CDFI or RDFI.
c¹ = DFI number.
d¹ = Integrated digital carrier unit (IDCU) number.
e¹ = RT number or IDCU DS1 serving PUB43801 number.
f¹ = RT line number or PUB43801 channel.
g¹ = Facility time slot number.
h¹ = Facility identifier.
i¹ = SID number.
j¹ = Virtual tributary member (VTM) number.
k¹ = Digital signal level 0 (DS0) number
l¹ = RAF unit number.
m¹ = RAF channel number.
n¹ = SAS unit number.
o¹ = SAS channel number.
p¹ = The DNU-S facility consists of two digits. The first digit is the data group number and the second
digit is the SONET terminal equipment (STE) number.
q¹ = The PSU unit number.
r¹ = The PSU channel group number.
s¹ = The PSU channel group member number.
t¹ = Indicates conference party type. Valid value(s):
    CNTRL = Main conference controller.
    CNTRL-A = Associate conference controller.
u¹ = Digital carrier line unit (DCLU) number.
v¹ = SDFI number.
w¹ = DS1 number.
x¹ = Data group (DG) number.
y¹ = Common data number.
z¹ = Virtual tributary group (VTG) number.
a² = STSX-1 facility interface (SFI) number.
b² = SONET transport equipment (STE) number.
c² = PCT line and trunk (virtual) unit (PLTU) number.
d² = PCT facility interface (PCTFI) number.
e² = The PCT tributary number.
f² = The PCT channel group number.
g² = The service type. Valid value(s):
    13K = Service is CDMA 13K circuit switched voice (CSV).
    8K = Service is CDMA 8K CSV.
    ACELP = Service is TDMA ACELP vocoder.
C1ASN = Service is CDMA circuit-mode ASYNC 9.6 AUTOPLEX® data trunk (ADT).
C1ASYNC = Service is A5 ASYNC 9.6 KBPS data.
C1CDCP = Service is CDMA packet-mode 9.6 KBPS.
C1FAX = Service is CDMA circuit-mode FAX 9.6 ADT.
C1IP = Service is CDMA packet-mode data IP 14.4 KBPS.
C1PDIP = Service is CDMA packet-mode data IP 9.6 KBPS.
C2ASN = Service is CDMA circuit-mode ASYNC 14.4 ADT.
C2ASYNC = Service is A5 ASYNC 14.4 KBPS data.
C2CDCP = Service is CDMA packet-mode 14.4 KBPS.
C2FAX = Service is CDMA circuit-mode FAX 14.4 ADT.
C3FAX = Service is A5 FAX 9.6 KBPS data.
C4FAX = Service is A5 FAX 14.4 KBPS data.
EVRC = Service is CDMA enhanced variable rate CODEC (EVRC) CSV.
IVBST = Service is A2 inter-vendor traffic.
NOSRVTYP = No service type provided.
PDIP3G1X = Service is 3G1X CDMA packet-mode data IP.
PD3G1XCDPD = Service is 3G1X CDMA packet-mode data CDPD.
SMV = Service is CDMA selectable mode vocoder (SMV).
T1DRS = Service is TDMA circuit-mode 13 ADT.
VSELP = Service is TDMA vect-sum excite line predict (VSELP) vocoder.

\[ h^2 \] = The virtual trunk facility number.
\[ i^2 \] = The virtual trunk channel number.
\[ j^2 \] = The optical carrier-3 number.
\[ k^2 \] = The interworking unit number.
\[ l^2 \] = Optical interface unit (OIU) number.
\[ m^2 \] = Protection group (PG) number.
\[ n^2 \] = STS level 3 (STS3C) number.
\[ o^2 \] = Optical facility interface (OFI) side.
\[ p^2 \] = Packet control function (PCF) ethernet link protocol.
\[ q^2 \] = Packet switch unit (PSU) number.
\[ r^2 \] = Origination point code (OPC) number.
\[ s^2 \] = Destination point code (DPC) number.
\[ t^2 \] = Raw call instance code (RCIC) number.
\[ u^2 \] = Bearer independent call control (BICC) number.
\[ v^2 \] = Normalized call instance code (NCIC) number.
\[ w^2 \] = Bearer independent call control switching module (BICC SM) number.
\[ x^2 \] = Optical carrier - level 3 (OC3C) number.
y = Synchronous transport signal - level 3 (STS3C) number.
z = User datagram protocol (UDP) source port.
a = User datagram protocol (UDP) destination port.
b = Optical interface unit switching module (OIU SM).
c = Bearer network identifier (BNID).
d = Internet protocol (IP) source address.
e = IP destination address.
f = Packet trunk group (PCKT TG).
g = Process number of the session initiation protocol (SIP) PID.
h = SM number of the SIP PID.
i = Uniqueness number of the SIP PID.
j = Local tag (LTAG).
k = Remote tag (RTAG).
l = SIP call identification (CID).

4. ACTIONS TO BE TAKEN

None. This message is the result of a utility call trace.

5. ALARMS

TST:ACPNUM

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

TST ACPNUM=a     APP=b     ANI=c     DATARATE=d 
   [f|g]          [j]          [k]
   [h][i]

2. REASON FOR OUTPUT

To respond to a TST:ACPNUM input message, which requests that a software defined network (SDN) and leased network (LN) query test be performed at an action control point (ACP).

3. VARIABLE FIELD DEFINITIONS

a
  = Ten-digit dialed number returned from the network control point (NCP) in the form NPANXXXXXX.

b
  = Feature application type. Valid value(s):
    LN  = Leased network.
    SDN = Software defined network.

c
  = Ten-digit automatic number identification (ANI) or the calling number, in the form of NPANXXXXXX.

d
  = The data rate used for an integrated services digital network (ISDN) primary rate interface (ISDN-PRI) data call. Only one rate for each request is expected. Valid value(s):
    CLEAR 56K BPS
    CLEAR 64K BPS
    RESTRICTED 64K BPS
    VOICE

e
  = The type of response received from the test query request. Only one type of response for each request is expected. Valid value(s):
    CALL ASSIST RESPONSE = Temporary surrender of call to another NCP.
    CALL HAN DOFF RESPONSE = Control of call has been surrendered to another NCP.
    NCP TRANSFER = NCP cannot respond to a query. NCP requested that the query be transferred to another NCP.
    NETWORK OR CNI FAILURE = Network or common network interface (CNI) failed, query not received by external data base.
    NORMAL RESPONSE = Routing information was provided by external data base.
    P-ABORT RESPONSE = Message was not received by the NCP in proper International Telecommunication Union - Telecommunication, Standardization Sector (ITU-TS) (formerly CCITT) transaction capability application part (TCAP) format.
    PARSING FAILED = Return failure from parsing function.
    PLAY ANNOUNCEMENT = External data base requested that the call be terminated with announcement.
PLAY ANNOUNCEMENT AND COLLECT DIGITS = External data base requested that authorization be prompted for and collected from the caller.
REJECT RESPONSE = Protocol error in the query message to the external data base.
RETURN ERROR RESPONSE = Improper or invalid data in the query message to the external data base.
TIMEOUT ON RESPONSE = A response to the test query was not received within the four-second time limit.
U-ABORT RESPONSE = The message was received by the NCP in proper International Telecommunication Union - Telecommunication, Standardization Sector (ITU-TS) (formerly CCITT) TCAP format, but the contents were not understandable.

f = Ten-digit station identification (SID) for an ISDN-PRI call, in the form of NPANXXXXXX.
g = Single digit specifying the station group designator (SGD).
h = Charging information (if 'e' = NORMAL RESPONSE, CALL HANDOFF RESPONSE or CALL ASSIST RESPONSE). Valid value(s):
   BILL CALL
   NO BILL CALL

i = Abort cause, announcement code, error code, or problem code specifier.

QUOTE TYPE=[l]
PROPERTY NAME=[m]
QUOTE NUMBER=[n]
HOTEL ID=[o]
ACQS MESSAGE FORMAT=[p]
TRUE BILLING NUMBER=[q]
ALW SAB=[r] TO OPER=[s]
COINLINE=[t]
ACQS DACC ALLOW=[u]

2. REASON FOR OUTPUT

To report the results of the manual input (TST:AILS-OLS) that requests that an automated inward line screening (AILS) originating line screening (OLS) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query be performed.

3. VARIABLE FIELD DEFINITIONS

a = Duration of the test in milliseconds. Timing starts when the administrative module (AM) sends the formatted query, and ends when the query response is received from the network.

b = Calling number that was input.

c = AILS software version number that was input.

d = Destination point code that was input.

e = AILS OLS TCAP error code. This field prints out when an error reply was received in response to the test query. Valid value(s):
MISRouted QUERY = The query was routed to the incorrect normal serving site Operator Services Position System (OSPS).
TASK REFUSED = The task was refused because the normal serving site did not have the AILS feature active.
UNEXPECTED INPUT, DATA VALUE = The content of a query parameter was not as expected.

f = The results of a failed test. This field prints out only when the test query was not successful. Valid
value(s):
GARBLED MESSAGE = A response was received but the data in the message was mutilated.
IMS OR CNI RETURNED MSG = The inter-process message switch (IMS) or the common network interface (CNI) returned the message. This result is not expected for AILS OLS CCS7 test queries.
NETWORK CONGESTION = Could not complete the test due to network congestion.
NETWORK FAILURE = Could not complete the test due to failure in the network.
NO TRANSLATION ADDRESS NATURE = No entries exist in routing tables for addresses of this nature.
NO TRANSLATION SPECIFIC ADDRESS = No entries exist in routing tables for this specific address.
SUBSYSTEM CONGESTION = Could not complete the test due to subsystem congestion.
SUBSYSTEM FAILURE = Could not complete the test due to subsystem failure.
TIMEOUT = A response to the test query was not received within the sixteen second time limit.
UNEQUIPPED USER = Could not complete the test due to unequipped user.
UNQUALIFIED = Unknown failure reason.

\( g \) = The originating station type. Valid value(s):
NON-ACQS HOTEL = Non-ACQS hotel station type.
NONCOIN PUBLIC = Noncoin public station type.
OTHER = Other types of originating station.
OTHER TYPES OF ACQS = Other types of ACQS hotel station types.
POST PAID COIN = Post-pay coin station type.
PRE PAID COIN = Pre-pay coin station type.
TRUE ACQS HOTEL = True automated charge quotation system hotel station type.
UNKNOWN = Unknown station type.

\( h \) = The originating line screening screen code. The valid values are 000-999.

\( i \) = The time variance. The time variance is the difference (in hours) between the call serving OSPS and the normal serving site OSPS for this query. If no time variance indicator, 'NONE' will be output.

\( j \) = True hotel indicator. Valid value(s):
NO = Not a true hotel.
NONE = Indicator not received.
YES = A true hotel.

\( k \) = Manual private branch exchange (PBX) indicator. Valid value(s):
NO = Not a manual PBX.
NONE = Indicator not received.
YES = A manual PBX.

\( l \) = ACQS quotation type. Valid value(s):
FAX QUOTE = FAX quote.
NETWORK AUTOQUOTE = Network autoquote.
NONE = Indicator not received.
PRIVATE LINE AUTOQUOTE = Private line autoquote.
VOICE QUOTE = Voice quote.

m = ACQS property name. The ACQS property name is a 3-character string indicating the name of the ACQS establishment or "NONE" if the indicator was not received.

n = ACQS quote number. A 10-digit NANP number or "NONE" if the indicator was not received.

o = ACQS hotel ID. Valid value(s):
   0-4095
   NONE = The indicator was not received.

p = ACQS message format. Valid value(s):
   NONE = Indicator not received.
   OSPS FORMAT = Autoquote message in OSPS format.
   TSPS 1BT2 FORMAT = Autoquote message in TSPS 1BT2 format.
   TSPS PRE-1BT2 FORMAT = Autoquote message in TSPS pre-1BT2 format.

q = True billing number. A 7-digit number or "NONE" if the indicator was not received.

r = Allow subaccount billing indicator. Valid value(s):
   NO = Subaccount billing not allowed.
   NONE = Indicator not received.
   YES = Subaccount billing allowed.

s = To operator indicator. Valid value(s):
   NO = Route to automated treatment.
   NONE = Indicator not received.
   YES = Route to operator.

t = Coinline indicator. Valid value(s):
   NO = Not a coinline.
   NONE = Indicator not received.
   YES = A coinline.

u = ACQS directory assistance call completion (DACC) allowed. Valid value(s):
   NO = ACQS station does not allow DACC calls to use paid billing methods.
   NONE = Indicator not received.
   YES = ACQS station allows DACC calls to use paid billing methods.

4. ACTION TO BE TAKEN

This message is the response to a manual request. It is used as a high-level check on the connection between the call serving OSPS and the normal serving site OSPS or to check out a repeatedly failing query.

5. ALARMS

None.

Type: Output

1. FORMAT

TST ALM - a ALARM TEST IN PROGRESS
  FOR AUDIBLE AND VISUAL ALARM REPORTING

2. REASON FOR OUTPUT

To report that a test of the audible and visual alarm reporting mechanism is in progress. It will cause the appropriate alarm level audibles to sound and the appropriate alarm level visual devices to activate.

3. VARIABLE FIELD DEFINITIONS

a = Alarm level being tested. Valid value(s):
  CRITICAL = The audibles and visuals for critical alarms are being tested.
  MAJOR = The audibles and visuals for major alarms are being tested.
  MINOR = The audibles and visuals for minor alarms are being tested.

4. ACTION TO BE TAKEN

Verify that the appropriate alarm level audible is sounding and that the appropriate alarm level visual devices are working. Then retire the alarm. Check the ROP and daylog for any actual alarmed output messages that might have occurred during the test, since these would have been retired along with the alarm being tested.

5. ALARMS

Critical, major, minor depending upon the alarm being tested.

Type: Output

1. FORMAT

TST ASC=a b [c]

2. REASON FOR OUTPUT

To report the result of a request to perform an in-service functional test of a remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has completed successfully.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before completion, and the termination was graceful.

c = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To respond to a TST:ASP input message, which requests that an R0 advanced services platform (ASP) test query be sent to query the external service control point (SCP) database.

Format 1 displays the response to a play announcement and/or collect digits request, a query failure, a reject, a
return error, or a timeout. Format 2 displays the contents of a normal response message with routing information sent from the SCP.

3. VARIABLE FIELD DEFINITIONS

a = The dialed ASP number.
b = Automatic number identification (ANI).
c = Three-digit absolute local access and transport area (LATA) number.
d = A 3-digit or 4-digit feature group D (FGD) carrier identification which contains the carrier identification of either "10XXX" or "101XXX" sequence dialed by the caller or the carrier code assigned to the caller as presubscribed inter-exchange carrier (PIC) information.
e = Carrier selection. Indicates whether digits (carrier identification) information dialed is equal to the caller's presubscribed carrier information, or indicates the lack of this information. Valid value(s):

    NO 10XXX DIALED UNKNOWN PIC
    NO PRESUBSCRIBED CARRIER INPUT BY CALLER
    PRESUBSCRIBED CARRIER INPUT BY CALLER
    PRESUBSCRIBED CARRIER NOT INPUT BY CALLER
    PRESUBSCRIBED CARRIER ORIGINATION UNKNOWN

f = Nature of number. Valid value(s):

    IEC OPERATOR
    INTERNATIONAL
    INTERNATIONAL OPERATOR
    LEC OPERATOR
    NATIONAL
    NETWORK SPECIFIC
    NOT APPLICABLE

g = The response received from the test query other than a NORMAL RESPONSE. Valid value(s):

    PARSING FAILURE = A return failure from the parsing function.
    PLAY AND COLLECT = External database requested additional information from the caller.
    PLAY ANNOUNCEMENT = External database cannot route the call.
    QUERY FAIL = Network failure, unable to send the query to the external database.
    REJECT = Protocol error in the query message sent to the external database.
    RETURN ERROR = Invalid data in the query message sent to the external database.
    TIMEOUT = A response message was not received at the service switching point (SSP) within the allotted time.

h = The type of error code, problem code specifier or automatic call gap (ACG) indicator received. Valid value(s):

    ACG NOT RECEIVED = ACG component not received.
    ACG RECEIVED = ACG component received.
    BADLY STRUCTURED COMPONENT PORTION = Unrecognized component in the transaction capability application part (TCAP) message.
    BADLY STRUCTURED TRANSACTION PORTION = Unrecognized transaction component in the TCAP message.
DATA UNAVAILABLE = Switch unable to acknowledge SCP request for resource.
DATABASE INITIATED OVERLOAD = SCP instructed SSP to cutback on queries.
DUPLICATE INVOKE ID = Duplicate ID in the TCAP message.
INCORRECT COMPONENT PORTION = Invalid component received in the TCAP message.
INCORRECT INVOKE PARAMETER = Unrecognized parameter in the TCAP message.
INCORRECT RETURN ERROR PARAMETER = Unrecognized parameter in return error message.
INCORRECT RETURN RESULT PARAMETER = Unrecognized transaction portion in the TCAP message.
MISSING CUSTOMER RECORD = Missing customer record.
REPLY OVERDUE = SSP did not receive a response from the SCP in the allotted time.
SERVICE MGMT INITIATED ACG = Manual request made using the SCP to inhibit/allow ASP calls.
UNAVAILABLE NETWORK RESOURCE = SCP was unable to access a resource requested at the SSP.
UNEXPECTED COMPONENT SEQUENCE = Unexpected component in the TCAP message.
UNEXPECTED DATA VALUE = Unexpected data value in the TCAP message.
UNEXPECTED ERROR = Unexpected error in the TCAP message.
UNEXPECTED RETURN ERROR = Unexpected return error message from the SCP.
UNEXPECTED RETURN RESULT = Unexpected return result message from the SCP.
UNRECOGNIZED COMPONENT = Unrecognized component in the TCAP message.
UNRECOGNIZED ERROR = Unrecognized return error in the TCAP message.
UNRECOGNIZED INVOKE CORRELATION ID = Unrecognized correlation ID in the TCAP message.
UNRECOGNIZED OPERATION CODE = Unrecognized operation code in the TCAP message.
UNRECOGNIZED PACKAGE TYPE = Unrecognized package type in the TCAP message.
UNRECOGNIZED RETURN ERROR CORRELATION ID = Unrecognized return error correlation ID in the TCAP message.
UNRECOGNIZED RETURN RESULT CORRELATION ID = Unrecognized return result correlation ID in the TCAP message.
UNRECOGNIZED TRANSACTION ID = Unrecognized transaction ID in the TCAP message.

i = First announcement code.

j = First number of digits to collect.

k = First type (normal/any) of digits to collect. Valid value(s):

   ANY NUMBER OF DIGITS
   NORMAL NUMBER

l = First answer supervision. This field appears only if office is equipped with 5E6 ASP Enhancements. Valid value(s):

   DO NOT SEND ANSWER SUPERVISION
   SEND ANSWER SUPERVISION

m = Second announcement code.

n = Second number of digits to collect.

o = Second type (normal/any) of digits to collect. Valid value(s):
p = Second answer supervision. This field appears only if office is equipped with 5E6 ASP Enhancements. Valid value(s):

DO NOT SEND ANSWER SUPERVISION
SEND ANSWER SUPERVISION

q = ACG gap value.

r = ACG duration value.

s = Controlled number.

t = The automatic call gap (ACG) indicator. Valid value(s):

ACG NOT RECEIVED
ACG RECEIVED
DATABASE INITIATED OVERLOAD
SERVICE MGMT INITIATED ACG

u = Outpulse number

v = Dialed number. This field appears only if office is equipped with 5E6 ASP Enhancements.

2. REASON FOR OUTPUT

To respond to a TST:ASPTQ input message, which requests that a 0.1 advanced services platform (ASP) test query be sent to query the external database service control point (SCP). This output format will be used to display the routing and call processing data for the following responses: analyze route, authorize termination, cancel resource, close, collect information, continue, disconnect, forward call, and send to resource. Analyze route, authorize termination and forward call will also have a part 2 of the message displayed. The data in the ACG, next event list, and send notification components will also be displayed.

Note: To always provide the user with the ability to respond to the PLAY COLLECT DIGITS resource type, Format 1 routing message will always be displayed when the SCP response is send to resource even though the user may have only selected the AMA billing option for display type.

3. VARIABLE FIELD DEFINITIONS

\( a \) = The message type. Valid value(s):

CLOSE = Close.
INFOANAL = Information analyze.
INFOCOLL = Information collected.
NTWKBSY = Network Busy.
OANSWER = Originating answer.
OCLOPNTYBSY = Originating called party busy.
ODISCONNECT = Originating disconnect.
ODTMFENTRD = Originating DTMF entered.
ONOANSWER = Originating no answer.
ORIGAT = Origination attempt.
OTERMRSZD = Originating termination seized.
RESCLR = Resource clear.
TANSWER = Terminating answer.
TBUSY = Terminating busy.
TERMAT = Termination attempt.
TNOANSWER = Terminating no answer.
TRMRSRCAVL = Terminating resource available.

b = Display type. Valid value(s):
AMA = AMA billing display. Send to resource will always display Format 1 routing message, even if AMA option was selected, to handle the case of a PLAY COLLECT DIGITS resource type.
BOTH = AMA and routing display.
RTE = Routing display.

c = Response type. Valid value(s):
ANALYZE ROUTE
AUTHORIZE TERMINATION
CANCEL RESOURCE
CLOSE
COLLECT INFORMATION
CONTINUE
DISCONNECT
FORWARD CALL
OFFER CALL
SEND TO RESOURCE

d = Response time in seconds.

e = Response time in seconds (fraction of a second).

f = Resource type. Valid value(s):
PLAY ANNOUNCEMENT
PLAY COLLECT DIGITS
FLEX PARAMETER BLOCK
* = Indicates invalid value.

g = Disconnect flag. Valid value(s):
PRESENT

h = Interruptible announcement code.

i = Uninterruptible announcement code.

j = Invalid indicator for number of digits to collect. Valid value(s):
* = Indicates invalid range.

k = Number of digits to collect (specific number specified).
Note: This field indicates that the user should initiate another TST:ASPTQ command indicating message type as resource clear. If digits are entered this field will be
used to indicate the number of digits to specify in the collected digits parameter. There is a 3 minute time limit for user input.

1 = Number of digits to collect.

Note: This field indicates that the user should initiate another TST:ASPTQ command indicating message type as as resource clear. If digits are entered, this field is used to determine the number of digits to specify for collected digits or the collected address parameter. There is a 3 minute time limit for user input. Valid value(s):

ANY NUMBER DIGITS = Any number of digits.
NRM NUMBER DIGITS = Normal number of digits.

m = Answer indicator. Valid value(s):
PRESENT

n = Invalid indicator for primary, alternate or second alternate route index. Valid value(s):
* = Indicates invalid range.

o = Primary route index.

p = Primary, alternate, or second alternate wide area telephone service (WATS) indicator. Valid value(s):
NOT WATS
WATS

q = Primary, alternate, or second alternate number outpulsed. Valid value(s):
OUTPL = Outpulse number.
RTE = Routing number.

r = Primary, alternate, or second alternate call treatment. Valid value(s):
NO OVERFLOW NO RETURN
NOT USED
OFF-HOOK QUEUE NO OVERFLOW NO RETURN
OFF-HOOK QUEUE OVERFLOW
OFF-HOOK QUEUE RETURN
OVERFLOW
RETURN
RING-BACK QUEUE NO OVERFLOW NO RETURN
RING-BACK QUEUE OVERFLOW
RING-BACK QUEUE RETURN
* = Invalid value.

s = Alternate route index.

t = Second alternate route index.

u = Invalid indicator for primary, alternate, and second alternate carrier ID. Valid value(s):
* = Indicates invalid range.
v = Primary carrier ID.

w = Primary, alternate, or second alternate carrier selection. Valid value(s):
   NO INDICATION
   NOT PRESUBSCRIBED INPUT BY CALLING PARTY
   PRESUBSCRIBED INPUT BY CALLING PARTY
   PRESUBSCRIBED NO INDICATION
   PRESUBSCRIBED NOT INPUT BY CALLING PARTY
   * = Invalid value.

x = Alternate carrier ID.

y = Second alternate carrier ID.

z = Invalid indicator for global title. Valid value(s):
   * = Indicates value not numeric.

a = Global title.

b = Translation type.

c = Gap type. Valid value(s):
   NAT = National gap interval index.
   PRVT = Private gap interval index.

d = Gap interval index.

e = Gap duration index.

f = Control type. Valid value(s):
   SCP OVERLOAD CONTROLS
   SMS INITIATED CONTROLS
   * = Indicates invalid value. Either both of the controls were set or neither were set.

g = AMP year. Valid value(s):
   CURRENT
   LAST
   NEXT

h = AMP month. Valid value(s):
   JAN = January.
   FEB = February.
   MAR = March.
   APR = April.
   MAY = May.
   JUN = June.
   JUL = July.
   AUG = August.
   SEP = September.
OCT = October.
NOV = November.
DEC = December.

i1 = AMP date.
j1 = AMP hour.
k1 = AMP minutes. Valid value(s):
00
15
30
45

l1 = Echodata.

o1 = Invalid indicator for traveling class mark (TCM). Valid value(s):
  * = Indicates invalid range.

p1 = Traveling class mark.

q1 = Charge party station type.

r1 = Passive leg treatment or control leg treatment. Valid value(s):
  ALERT ON PAT 0 NRM = Alerting on pattern 0 normal.
  ALERT ON PAT 1 DIST INTERGRP = Alerting on pattern 1 distinctive intergroup.
  ALERT ON PAT 2 DIST SPECIAL = Alerting on pattern 2 distinctive special.

s1 = Invalid DN indicator. Valid value(s):
  * = Indicates DN is not numeric or out of range.

t1 = Calling party ID.

u1 = Nature of number for calling party ID or redirecting party ID. Valid value(s):
  APN = Action Pointer Number.
  INTL = Unique international number.
  NA = Not applicable or unknown.
  NAT = Unique national (significant) number.
  NUNQ INT = Non unique international number.
  NUNQ NAT = Non unique national number.
  NUNQ SS = Non unique subscriber number.
  SS = Unique subscriber number.
  TST LINE = Test line test code.
  * = Indicates invalid value.

v1 = Screening indicator for calling party ID or redirecting party ID. Valid value(s):
  NETP = Network provided.
  UPNS = User provided not screened.
  UPPS = User provided passed screening.
= Indicates invalid range.

\( w^1 \) = Presentation restriction indicator for calling party ID or redirecting party ID. Valid value(s):
ALW = Presentation allowed.
REST = Presentation restricted.
UNAV = Number unavailable.
* = Indicates invalid value.

\( x^1 \) = Redirecting party ID.

\( y^1 \) = Called party ID.

\( z^1 \) = Nature of number for called party ID or outpulsed number. Valid value(s):
950+ = 950+ call.
APN = Action Pointer Number.
CUT THRU = No address present cut through to carrier.
INTL = International number.
INTL OPR = International number operator requested.
NA = Not applicable.
NADR OPR = No address present operator requested.
NAT = National (significant) number.
NAT OPR = National number operator requested.
SS = Subscriber number.
SS OPR = Subscriber number operator requested.
TST LINE = Test line test code.
* = Indicates invalid value.

\( a^2 \) = Outpulse number.

\( b^2 \) = Charge number.

\( c^2 \) = Nature of number for charge number. Valid value(s):
APN = Action Pointer Number.
NAT CLD = National number called party ANI.
NAT CLG = National number, calling party ANI.
NOT AVL = ANI not available or not provided.
NOT INCL = Called party ANI not included.
SS CLD = Subscriber number called party ANI.
SS CLG = Subscriber number calling party ANI.
* = Indicates invalid value.

\( d^2 \) = Type of display text information displayed.
Note: Error validation is not provided for display text data.
CALLING PARTY ADDRESS
CALLING PARTY NAME
DATE
FEATURE ADDRESS
ORIGINAL CALLED NAME
REASON
REDIRECTING REASON
= First display text information.

= Second display text information.

= Third display text information.

= User ID type. Valid value(s):
BRI = Basic rate interface.
DN = Directory number.
PFID = Private facility ID.
TGID = Trunk group ID.

= Trunk group ID or private facility ID for the user ID parameter depending upon the user ID type.

= Invalid user ID directory number (DN) indicator. Valid value(s):
* = Indicates DN is not numeric or out of range.

= Directory number for the user ID parameter.

= Invalid user ID service profile ID (SPID) indicator. Valid value(s):
* = Indicates SPID is not numeric or out of range.

= Service profile ID for the user ID parameter.

= Bearer capability. Valid value(s):
SPEECH
3.1KHZ AUDIO
56 KBPS
64 KBPS
* = Indicates invalid value.

= Close cause. Valid value(s):
TERM = Call terminated.
CMPL = Events and reports completed.
UCOMM = Unexpected communication.
ANSW = Called party answered.
CALLFWD = Call forwarded.
* = Indicates invalid value.

= Invalid indicator for next event list requests. Valid value(s):
EMPTY = Indicates that an empty request list was received.
* = Indicates that null affect requests are present.

= Next event list requests. Valid value(s):
OANSWER = Originating answer (null affect).
OCLDPTYBSY = Originating called party busy.
ODCONCALLED = Originating disconnect called.
OODTMFENTRD = Originating dial tone multi-frequency (DTMF) entered.
ONOANSWER = Originating no answer.
OTHERMSZD = Originating termination seized (null affect).
NTWKBSY = Network Busy.
TBUSY = Terminating busy.
TNOANSWER = Terminating no answer.
TRMRSRCAVL = Terminating resource available (null affect).
TANSWER = Terminating answer (null affect).

\( r^2 \) = Invalid indicator for next event list notifications. Valid value(s):
EMPTY = Indicates that an empty notification list was received.
* = Indicates that null affect notifications are present.

\( s^2 \) = Next event list notifications. Valid value(s):
OANSWER = Originating answer.
OCPLDPTYBSY = Originating called party busy (null affect).
ODCONCALLED = Originating disconnect called (null affect).
OODTMFENTRD = Originating dial tone multi-frequency (DTMF) entered (null affect).
ONOANSWER = Originating no answer (null affect).
OTHERMSZD = Originating termination seized.
NTWKBSY = Network Busy (null affect).
TBUSY = Terminating busy (null affect).
TNOANSWER = Terminating no answer (null affect).
TRMRSRCAVL = Terminating resource available.
TANSWER = Terminating answer.

\( t^2 \) = Next event list originating no answer timer (range 1-120 seconds).
\( u^2 \) = Next event list terminating no answer timer (range 1-120 seconds).

\( v^2 \) = Carrier usage ID. Valid value(s):
ALW0VR = Always override.
LATAOVR = Only interLATA override.
* = Indicates invalid value.

\( w^2 \) = Original redirecting reason. Valid value(s):
* = Indicates invalid value.
BSY = User busy.
NOR = No reply.
UNC = Unconditional.
UNK = Unknown/not available.

\( x^2 \) = Redirecting reason. Valid value(s):
* = Indicates invalid value.
BSY = User busy.
NOR = No reply.
UNC = Unconditional.
UNK = Unknown/not available.
= Invalid indicator for redirection count. Valid value(s):
* = Indicates invalid value.

= Redirection count.

= Flex parameter block length (specified in octets).

= Invalid indicator for destination address. Valid value(s):
* = Indicates invalid range or the directory number (DN) is not numeric.

= Destination address.

= Nature of number for destination address. Valid value(s):
NAT = National (significant) number.
* = Indicates invalid value.

= DP converter. Valid value(s):
CONVERSION = Perform DP to DTMF conversion.
NO CONVERSION = No DP to DTMF conversion performed.

= Transaction state. Valid value(s):
CLOSED = The state of the transaction is closed.
OPEN = The state of the transaction is open.

= Extended Ringing. Valid value(s):
PRESENT

= Invalid indicator for collected digits. Valid value(s):
* = Indicates invalid range or value not numeric.

= Collected digits. Valid value(s):
0-9 = Any digit in the range of 0-9.
* = The * digit.
# = The # digit.
S = The ST digit.

= Nature of number for collected digits. Valid value(s):
NA = Not applicable.
* = Indicates invalid value.

= Origination point code. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

= Fourth display text information.

= Fifth display text information.
**4. ACTIONS TO BE TAKEN**

When variable ‘f’ indicates the transaction is open and variable ‘c’ indicates send to resource, the user is expected to initiate another TST:ASPTQ input message indicating the message type as resource clear.

The user has a 3 minute time limit to request this subsequent message. If the user does not initiate another TST:ASPTQ input message within this time period, a close message is automatically sent to the SCP indicating
caller abandon.

Refer to the SET:ASPTQ input message for information to correctly set parameters for this message. Also refer to the field description for variables 'l' and 'm'.

When variable 'e^3' indicates the transaction is OPEN and variable 'c' indicates a response type other than SEND TO RESOURCE, the user is expected to initiate another TST:ASPTQ input message indicating one of the following message types:

- NTWKBSY
- CLOSE
- OANSWER
- OCLDPTYBSY
- ODISCONNECT
- ODTMFENTRD
- ONOANSWER
- OTERMS2D
- TANSWER
- TBUSY
- TNOANSWER
- TRMRSRCAVL

The user has a 3 minute time limit to request any of these subsequent messages. If the user does not initiate another TST:ASPTQ input message within this time period, a close message is automatically sent to the SCP indicating caller abandon.

Refer to the SET:ASPTQ input message for information to correctly set parameters for these messages.

5. ALARMS

2. REASON FOR OUTPUT

To respond to a TST:ASPTQ input message, which requests that a 0.1 advanced services platform (ASP) test query be sent to query the external database service control point (SCP). This output format will be used to display the routing and call processing data for the following responses: analyze route, authorize termination, cancel resource, close, collect information, continue, disconnect, forward call, and send to resource. Analyze route, authorize termination and forward call will also have a part 2 of the message displayed. The data in the ACG, next event list, and send notification components will also be displayed.

NOTE: To always provide the user with the ability to respond to the PLAY COLLECT DIGITS resource type," Format 1 routing message will always be displayed when the SCP response is send to resource even though the user may have only selected the AMA billing option for display type.

3. VARIABLE FIELD DEFINITIONS

a  = The message type. Valid value(s):
  CLOSE = Close.
  INFOANAL = Information analyze.
  INFOCOLL = Information collected.
  NTWKBSY = Network Busy.
  OANSWER = Originating answer.
  OCLDPTYBSY = Originating called party busy.
  ODISCONNECT = Originating disconnect.
  ODTMFENTRD = Originating DTMF entered.
ONOANSWER  = Originating no answer.
ORIGAT      = Origination attempt.
OTERMNZD    = Originating termination seized.
RESCLR      = Resource clear.
TANSWER     = Terminating answer.
TBUSY       = Terminating busy.
TERMAT      = Termination attempt.
TNOANSWER   = Terminating no answer.
TRMRSRCAVL  = Terminating resource available.

b = Display type. Valid value(s):
   AMA = AMA billing display. Send to resource will always display Format 1 routing message, even if AMA option was selected, to handle the case of a PLAY COLLECT DIGITS resource type."
   BOTH = AMA and routing display.
   RTE = Routing display.

c = Response type. Valid value(s):
   ANALYZE ROUTE
   AUTHORIZE TERMINATION
   CANCEL RESOURCE
   CLOSE
   COLLECT INFORMATION
   CONTINUE
   DISCONNECT
   FORWARD CALL
   OFFER CALL
   SEND TO RESOURCE

d = Response time in seconds.

e = Response time in seconds (fraction of a second).

f = Resource type. Valid value(s):
   PLAY ANNOUNCEMENT
   PLAY COLLECT DIGITS
   FLEX PARAMETER BLOCK
   * = Indicates invalid value.

g = Disconnect flag. Valid value(s):
   PRESENT

h = Interruptible announcement code.

i = Uninterruptible announcement code.

j = Invalid indicator for number of digits to collect. Valid value(s):
   * = Indicates invalid range.
k = Number of digits to collect (specific number specified).
Note: This field indicates that the user should initiate another TST:ASPTQ command indicating message type as resource clear. If digits are entered this field will be used to indicate the number of digits to specify in the collected digits parameter. There is a 3 minute time limit for user input.

l = Number of digits to collect.
Note: This field indicates that the user should initiate another TST:ASPTQ command indicating message type as resource clear. If digits are entered, this field is used to determine the number of digits to specify for collected digits or the collected address parameter. There is a 3 minute time limit for user input. Valid value(s):

ANY NUMBER DIGITS = Any number of digits.
NRM NUMBER DIGITS = Normal number of digits.

* = Indicates invalid value.

k³ = Origination point code. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

l³ = Fourth display text information.

m³ = Fifth display text information.

n³ = Sixth display text information.

o³ = Seventh display text information.

p³ = Send to resource connection timer (range 0-300 minutes).

q³ = Invalid generic address indicator. Valid value(s):
* = Indicates generic address is not numeric or out of range.

r³ = First generic address

s³ = Type of address for generic address. Valid value(s):
DIALEDNBR = Dialed number.
DESTNBR = Destination number.
SUPPFAILSCR = Supplemental user provided calling address - failed network screening.
SUPNOTSCR = Supplemental user provided calling address - not screened.
COMPLETNBR = Completion number.
* = Indicates invalid value.

t³ = Nature of address for generic address. Valid value(s):
APN = Action Point Number
INTL = Unique international number.
NA = Not applicable or unknown.
NAT = Unique national (significant) number.
NUNQ INT = Non unique international number.
NUNQ NAT = Non unique national number.
NUNQ SS = Non unique subscriber number.
SS = Unique subscriber number.
TST LINE = Test line test code.
* = Indicates invalid value.

\( u^3 \) = Presentation restriction indicator for generic address. Valid value(s):
   ALW = Presentation allowed.
   REST = Presentation restricted.
   * = Indicates invalid value.

\( v^3 \) = Second generic address
\( w^3 \) = Third generic address
\( x^3 \) = Forth generic address
\( y^3 \) = Fifth generic address
\( z^3 \) = Signaling Platform. Valid value(s):
   0 = Common Network Interface (CNI) Platform
   1 - 192 = Global Switching Module (GSM) Number

4. ACTIONS TO BE TAKEN

When variable \( f^3 \) indicates the transaction is OPEN and variable \( c \) indicates SEND TO RESOURCE, the user is expected to initiate another TST:ASPTQ input message indicating the message type as RESOURCE CLEAR.

The user has a 3 minute time limit to request this subsequent message. If the user does not initiate another TST:ASPTQ input message within this time period, a close message is automatically sent to the SCP indicating caller abandon.

Refer to the SET:ASPTQ input message for information to correctly set parameters for this message. Also refer to the field description for variables \( l \) and \( m \).

When variable \( f^3 \) indicates the transaction is OPEN and variable \( c \) indicates a response type other than SEND TO RESOURCE, the user is expected to initiate another TST:ASPTQ input message indicating one of the following message types:
   NTWKBSY
   CLOSE
   OANSWER
   OCLDPTYBSY
   ODISCONNECT
The user has a 3 minute time limit to request any of these subsequent messages. If the user does not initiate another TST:ASPTQ input message within this time period, a close message is automatically sent to the SCP indicating caller abandon.

Refer to the SET:ASPTQ input message for information to correctly set parameters for these messages.

2. REASON FOR OUTPUT

To respond to a TST:ASPTQ input message that requests an advanced services platform (ASP) 0.1 test query be sent to query the external service control point (SCP) database. This format is used to display automatic message accounting (AMA) billing data which is returned in an ASP response from the SCP.

NOTE: There are 5 AMA digits dialed parameters, however this application only supports 4 in its display of data received from the SCP database.

3. VARIABLE FIELD DEFINITIONS

a = The message type. Valid value(s):
   CLOSE = Close.
   INFOANAL = Information analyzed.
   INFOCOLL = Information collected.
   OANSWER = Originating answer.
   OCLUDPTYBSY = Originating called party busy.
   ODISCONNECT = Originating disconnect.
   ODTMFENTRD = Originating dial tone multi-frequency entered.
   ONOANSWER = Originating no answer.
   ORIGAT = Origination attempt.
   OTERMSZD = Originating termination seized.
   NTWKBSY = Network Busy.
   RESCLR = Resource clear.
   TANSWER = Terminating answer.
   TBUSY = Terminating busy.
   TERMAT = Termination attempt.
   TNOANSWER = Terminating no answer.
   TRMRSRCAVL = Terminating resource available.

b = Display type. Valid value(s):
   AMA = AMA billing display.
   BOTH = AMA and routing display.

c = Response type. Valid value(s):
   ANALYZE ROUTE
   AUTHORIZE TERMINATION
   CLOSE
   COLLECT INFORMATION
   CONTINUE
   DISCONNECT
   FORWARD CALL
   OFFER CALL
   SEND TO RESOURCE

d = Response time in seconds.

e = Response time in seconds (fraction part).

f = Primary call code.
g = Primary service feature ID.

h = Alternate call code.

i = Alternate service feature ID.

j = Second alternate call code.

k = Second alternate service feature ID.

l = Overflow call code.

m = Overflow service feature ID.

n = Invalid indicator. Valid value(s):
   * = Invalid range or directory number (DN) not numeric.

o = First line number. The line number includes a three-digit line number type and the line number. The first, second and third digits identify the line number type. The fourth through \( n \)'th digits identify the line number.

p = Second line number. The line number includes a three-digit line number type and the line number. The first, second and third digits identify the line number type. The fourth through \( n \)'th digits identify the line number.

q = First digits dialed. The digits dialed includes the context identifier and the dialed digits. The first, second and third digits identify the context identifier. The fourth through \( n \)'th digits identify the dialed digits.

r = Second digits dialed. The digits dialed includes the context identifier and the dialed digits. The first, second and third digits identify the context identifier. The fourth through \( n \)'th digits identify the dialed digits.

s = Third digits dialed. The digits dialed includes the context identifier and the dialed digits. The first, second and third digits identify the context identifier. The fourth through \( n \)'th digits identify the dialed digits.

t = Fourth digits dialed. The digits dialed includes the context identifier and the dialed digits. The first, second and third digits identify the context identifier. The fourth through \( n \)'th digits identify the dialed digits.

u = Alternate billing number.

v = Nature of number for alternate billing number. Valid value(s):
   NAT CLD = National number called party ANI.
   NAT CLG = National number, calling party ANI.
   NOT AVL = ANI not available or not provided.
   NOT INCL = Called party ANI not included.
   SS CLD = Subscriber number called party ANI.
   SS CLG = Subscriber number calling party automatic number identification (ANI).
   * = Invalid value.
w = Business customer ID. The business customer ID includes the context identifier and the AMA business customer ID. The first digit is the context identifier. The second through 'n:'th digits are the AMA business customer ID.

x = Service program logic ID.

y = Measure. Valid value(s):
   NOT REC = Connect time not recorded.
   SCP = Connect time recorded, destination SCP.
   SSP = Connect time recorded, destination SSP.
   blank = Variable 'c' is not SEND TO RESOURCE.

z = Invalid indicator for sequence number. Valid value(s):
   * = An invalid range or the directory number (DN) is not numeric.
   blank = Variable 'c' is not SEND TO RESOURCE.

a\(^1\) = Sequence number. This will be blank if variable 'c' is not SEND TO RESOURCE.

b\(^1\) = Transaction state. Valid value(s):
   CLOSED = The state of the transaction is closed.
   OPEN = The state of the transaction is open.

c\(^1\) = Origination point code. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

d\(^1\) = Set Hex AB Indicator. Valid value(s):
   TRUE = One or more parameters in the Bellcore AMA Format (BAF) modules are incorrect.
   FALSE = All BAF module parameters are correct.

e\(^1\) = AMA BAF modules in hex.

4. ACTIONS TO BE TAKEN

When variable 'b\(^1\) indicates the transaction is OPEN, and variable 'c' indicates SEND TO RESOURCE, the user is expected to initiate another TST:ASPTQ input message indicating the message type as RESOURCE CLEAR.

The user has a 3 minute time limit to request this subsequent message. If the user does not initiate another TST:ASPTQ input message within this time period, a close message is automatically sent to the SCP indicating caller abandon.

Refer to the SET:ASPTQ input message for information to correctly set parameters for this message.

When variable 'b\(^1\) indicates the transaction is OPEN and variable 'c' indicates a response type other than SEND TO RESOURCE, the user is expected to initiate another TST:ASPTQ input message indicating one of the following message types:
   CLOSE
   OANSWER
   OCLDPTYBSY
   ODISCONNECT
The user has a 3 minute time limit to request any of these subsequent messages. If the user does not initiate another TST:ASPTQ input message within this time period, a close message is automatically sent to the SCP indicating caller abandon.

Refer to the SET:ASPTQ input message for information to correctly set parameters for these messages.

2. REASON FOR OUTPUT

To respond to a TST:ASPTQ input message that requests an advanced services platform (ASP) 0.1 test query be sent to query the external service control point (SCP) database. This format is used to display automatic message accounting (AMA) billing data which is returned in an ASP response from the SCP.

NOTE: There are 5 AMA digits dialed parameters, however this application only supports 4 in its display of data received from the SCP database.

3. VARIABLE FIELD DEFINITIONS

a  = The message type. Valid value(s):
   CLOSE       = Close.
   INFOANAL    = Information analyzed.
   INFOCOLL    = Information collected.
   OANSWER     = Originating answer.
   OCLDPTYBSY  = Originating called party busy.
   ODISCONNECT = Originating disconnect.
   ODTMFENTRD  = Originating dial tone multi-frequency entered.
   ONOANSWER   = Originating no answer.
   ORIGAT      = Origination attempt.
   OTERMSZD    = Originating termination seized.
   NTWKBSY     = Network Busy.
   RESCLR      = Resource clear.
   TANSWER     = Terminating answer.
   TBUSY       = Terminating busy.
   TERMAT      = Termination attempt.
   TNOANSWER   = Terminating no answer.
   TRMRSRCAVL  = Terminating resource available.

b = Display type. Valid value(s):
   AMA         = AMA billing display.
   BOTH        = AMA and routing display.

c = Response type. Valid value(s):
   ANALYZE ROUTE
   AUTHORIZE TERMINATION
   CLOSE
   COLLECT INFORMATION
   CONTINUE
   DISCONNECT
   FORWARD CALL
   OFFER CALL
   SEND TO RESOURCE

d = Response time in seconds.

e = Response time in seconds (fraction part).

f = Primary call code.
g = Primary service feature ID.

h = Alternate call code.

i = Alternate service feature ID.

j = Second alternate call code.

k = Second alternate service feature ID.

l = Overflow call code.

m = Overflow service feature ID.

n = Invalid indicator. Valid value(s):
   * = Invalid range or directory number (DN) not numeric.

o = First line number. The line number includes a three-digit line number type and the line number. The first, second and third digits identify the line number type. The fourth through \( n \)th digits identify the line number.

p = Second line number. The line number includes a three-digit line number type and the line number. The first, second and third digits identify the line number type. The fourth through \( n \)th digits identify the line number.

q = First digits dialed. The digits dialed includes the context identifier and the dialed digits. The first, second and third digits identify the context identifier. The fourth through \( n \)th digits identify the dialed digits.

r = Second digits dialed. The digits dialed includes the context identifier and the dialed digits. The first, second and third digits identify the context identifier. The fourth through \( n \)th digits identify the dialed digits.

s = Third digits dialed. The digits dialed includes the context identifier and the dialed digits. The first, second and third digits identify the context identifier. The fourth through \( n \)th digits identify the dialed digits.

t = Fourth digits dialed. The digits dialed includes the context identifier and the dialed digits. The first, second and third digits identify the context identifier. The fourth through \( n \)th digits identify the dialed digits.

u = Alternate billing number.

v = Nature of number for alternate billing number. Valid value(s):
   NAT CLD = National number called party ANI.
   NAT CLG = National number, calling party ANI.
   NOT AVL = ANI not available or not provided.
   NOT INCL = Called party ANI not included.
   SS CLD = Subscriber number called party ANI.
   SS CLG = Subscriber number calling party automatic number identification (ANI).
   * = Invalid value.
w = Business customer ID. The business customer ID includes the context identifier and the AMA business customer ID. The first digit is the context identifier. The second through ‘n’th digits are the AMA business customer ID.

x = Service program logic ID.

y = Measure. Valid value(s):
   NOT REC = Connect time not recorded.
   SCP = Connect time recorded, destination SCP.
   SSP = Connect time recorded, destination SSP.
   blank = Variable 'c' is not SEND TO RESOURCE.

z = Invalid indicator for sequence number. Valid value(s):
   * = An invalid range or the directory number (DN) is not numeric.
   blank = Variable 'c' is not SEND TO RESOURCE.

a = Sequence number. This will be blank if variable 'c' is not SEND TO RESOURCE.

b = Transaction state. Valid value(s):
   CLOSED = The state of the transaction is closed.
   OPEN = The state of the transaction is open.

c = Origination point code. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

d = Set Hex AB Indicator. Valid value(s):
   TRUE = One or more parameters in the Bellcore AMA Format (BAF) modules are incorrect.
   FALSE = All BAF module parameters are correct.

e = AMA BAF modules in hex.

f = Signaling Platform. Valid value(s):
   0 = Common Network Interface (CNI) Platform
   1 - 192 = Global Switching Module (GSM) Number

4. ACTIONS TO BE TAKEN

When variable 'b' indicates the transaction is OPEN, and variable 'c' indicates SEND TO RESOURCE, the user is expected to initiate another TST:ASPTQ input message indicating the message type as RESOURCE CLEAR.

The user has a 3 minute time limit to request this subsequent message. If the user does not initiate another TST:ASPTQ input message within this time period, a close message is automatically sent to the SCP indicating caller abandon.

Refer to the SET:ASPTQ input message for information to correctly set parameters for this message.

When variable 'b' indicates the transaction is OPEN and variable 'c' indicates a response type other than SEND TO RESOURCE, the user is expected to initiate another TST:ASPTQ input message indicating one of the following
message types:
CLOSE
OANSWER
OCLDPTYBSY
ODISCONNECT
ODTMFENTRD
ONOANSWER
OTERMSZD
TANSWER
TBUSY
TNOANSWER
TRMRSRCAVL

The user has a 3 minute time limit to request any of these subsequent messages. If the user does not initiate another TST:ASPTQ input message within this time period, a close message is automatically sent to the SCP indicating caller abandon.

Refer to the SET:ASPTQ input message for information to correctly set parameters for these messages.

1. FORMAT

TST ASPTQ FAIL MESSAGE TYPE=a DISPLAY TYPE=b
   OPC=f PLATFORM=g [RESPONSE TIME] [c] [d] [e]

2. REASON FOR OUTPUT

To respond to a TST:ASPTQ input message, that requests an 0.1 advanced services platform (ASP) test query be sent to query the external service control point (SCP) database. This format is used to report that a failure message has been received or a timeout has occurred.

3. VARIABLE FIELD DEFINITIONS

a = Message type. Valid value(s):
   CLOSE = Close.
   INFOANAL = Information analyze.
   INFOCOLL = Information collected.
   OANSWER = Originating answer.
   OCLDPTYBSY = Originating called party busy.
   ODISCONNECT = Originating disconnect.
   ODTMFENTRD = Originating dial tone multi-frequency entered.
   ONOANSWER = Originating no answer.
   ORIGAT = Origination attempt.
   OTERMSZD = Originating termination seized.
   NTWKBSY = Network Busy.
   RESCLR = Resource clear.
   TANSWER = Terminating answer.
   TBUSY = Terminating busy.
   TERMAT = Termination attempt.
   TNOANSWER = Terminating no answer.
   TRMRSRCAVL = Terminating resource available.

b = Display type. Valid value(s):
   AMA = AMA billing display.
   BOTH = AMA and routing display.
   RTE = Routing display.

c = Response time in seconds and fractions of a second.

d = Reason for failure type. Valid value(s):
   ABORT
   FAILED TO FORMAT MESSAGE
   FAILED TO PARSE RESPONSE
FAILED TO SEND MESSAGE TO THE NETWORK
FAR END SUBSYSTEM CONGESTION
FAR END SUBSYSTEM PROHIBITED
FAR END SUBSYSTEM UNEQUIPPED
MESSAGE RETURNED FROM NETWORK INTERFACE
NETWORK CONGESTION
NETWORK FAILURE
NO TRANSLATION FOR GLOBAL TITLE
REJECT
RETURN ERROR
TIMEOUT
TRANSLATION FAILURE OF GLOBAL TITLE
UNABLE TO READ RLDS_APP RELATION

e = Type of error cause, problem code, abort cause, or timeout reason.
For abort causes Valid value(s):
BADLY STRUCTURED TRANSACTION PORTION
INCORRECT TRANSACTION PORTION
PERMISSION TO RELEASE PROBLEM
RESOURCE UNAVAILABLE
UNRECOGNIZED PACKAGE TYPE
UNRECOGNIZED TRANSACTION ID

For error causes Valid value(s):

    RESPONSE TYPE=a                        RESPONSE TIME=b.c
    OPC=f

    DN NOT PORTED = e

2. REASON FOR OUTPUT

To respond to a TST:ASPTQ input message where the message type (MSGTYPE=) in the input message is NPINFOANAL, which requests that a 0.1 advanced services platform (ASP) test query for number portability be sent to query the external database service control point (SCP). Output format one will be used to display the location routing number of the called party specified in the input message if the number is ported and the SCP response type is a valid analyze route. Output format two will be used when the SCP responds with a valid analyze route response type but the called party specified in the input message is not ported or when the SCP responds with a valid continue SCP response type. If the SCP responds with a response type other than analyze route or continue, this output message will not print as the response but the TST:ASPTQ and TST:ASPTQ-AMA output messages will print. If the SCP responds with a response type containing any errors, this output message will not print as the response but the TST:ASPTQ-FAIL output message will print.

3. VARIABLE FIELD DEFINITIONS

a = Response type. Valid value(s):
   ANALYZE_ROUTE
   CONTINUE

b = Response time in seconds.

c = Response time in seconds (fraction of a second).

d = Location routing number.

e = Called party number from the TST:ASPTQ request for number portability.

f = Origination point code. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

4. ACTIONS TO BE TAKEN
None. This message is in response to a manual input request.

5. ALARMS

OPC=[o]   RAO=[p]
q   CG-DIGITS=[r]
CG-DUR=[s]   CG-INTVL=[t]   [u]   [w]

2. REASON FOR OUTPUT

To report the results of the manual request (TST:AT1) that requests that an ANSI® TCAP Type I query be sent to the billing validation database.

3. VARIABLE FIELD DEFINITIONS

a  = The issuer ID of the card number that was queried.
b  = The account number of the card number that was queried.
c  = The personal identification number (PIN) of the card number that was queried.
d  = Duration of the test in milliseconds. Timing starts when the switch receives the input request and ends when the switch receives the result from the network or a timeout.
e  = Calling number, also known as the automatic number identification (ANI), used in the query.
CLG = Identifies a North American numbering plan number.
ICLG = Identifies an international country code or number.

The value NO CALLING NUMBER indicates that no calling number was input.

f  = Translation type number that was input.
g  = Called number, also known as the forward number, used in the query.
CLG = Identifies a North American numbering plan number.
ICLG = Identifies an international country code or number.

The value NO CALLED NUMBER indicates that no called number was input.

h  = Results of a failed test. This field prints out only when the test query was not successful. Valid value(s):
GARbled MESSAGE = A response was received but the data in the message was mutilated.
IMS OR CNI RETURNED MSG = The inter-process message switch (IMS) or the common network interface (CNI) returned the message.
NETWORK CONGESTION = Could not complete the test due to network congestion.
NETWORK FAILURE = Could not complete the test due to failure in the network.
NO TRANSLATION ADDRESS NATURE = No entries exist in the database for addresses of this nature.
NO TRANSLATION SPECIFIC ADDRESS = No entries exist in the database for this specific address.
SUBSYSTEM CONGESTION = Could not complete the test due to subsystem congestion.
SUBSYSTEM FAILURE = Could not complete the test due to subsystem failure.
TIMEOUT = A response to the test query was not received within the five-second time limit.
UNEQUIPPED USER = Could not complete the test due to unequipped user.

i

= AT1 response. Valid value(s):
CCAN SERVICE DENIAL = Service denial on calling card account number (CCAN).
MISROUTE = Misroute.
MISSING CUST REC = Missing customer record.
MISSING GROUP = Missing group.
NO PIN MATCH = No PIN match.
NONPARTICIPATE GRP = Nonparticipating group.
PIN NOT Assigned = No PIN assigned.
RECEIVE REJECT = Received reject message for AT1 query.
RESTRICTED PIN = Restricted PIN.
SPD NONPAYMENT = Service on PIN denial nonpayment.
SPD SERVICE RESTRICTION = Service on PIN denial - service restriction.
SPD THRESHOLD = Service on PIN denial - threshold exceeded.
UNAV NET RESOURCE = Unavailable network resource.
UNRESTRICTED PIN = Unrestricted PIN.
UNXP DATA VALUE = Unexpected data value.
VACANT GROUP = Vacant group.

j

= AT1 record status indicator. Valid value(s):
DEFAULT RECORD = Default record.
STABLE RECORD = Stable record.
TRANSIT RECORD = Transitional record.

k

= Company identifier (ID) number. Identifies the telephone company with which the data is to be associated.

l

= Subaccount number. Number used on a customer’s bill to distinguish various users of a CCAN, each associated with a different PIN.

m

= First inter-local access and transport area (LATA) interexchange carrier (IC) indicator number.

n

= Second IC indicator.

o

= Originating point code number of the billing validation database.

p

= Three-digit revenue accounting office (RAO) number.

q

= Call gap present indicator. Valid value(s):
ACG NOT PRESENT = Automatic call gap component not present.
ACG PRESENT, CORRECT = Automatic call gap component present, has no errors.
ACG PRESENT, IN ERROR = Automatic call gap component present, has errors.
r = Call gap control digits. The digits to which controls are to be applied. For all 10+4 customer account services (CAS)/carrier issuer identification (CCID) 89C and commercial credit cards (CCC), controls will be applied on the first six digits. Controls will be applied on the first 12 digits for all non 10+4 89C cards, and on the first six digits for all non 10+4 CCC. If no automatic call gap (ACG) component is present, "NONE" will be output.

s = The call gap duration - used to determine the length of time for which controls are to be in effect. The following table lists the call gap duration index number received from the database and the corresponding time (in seconds) that the index represents.

<table>
<thead>
<tr>
<th>index</th>
<th>gap duration in seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
<tr>
<td>9</td>
<td>256</td>
</tr>
<tr>
<td>10</td>
<td>512</td>
</tr>
<tr>
<td>11</td>
<td>1024</td>
</tr>
<tr>
<td>12</td>
<td>2048</td>
</tr>
<tr>
<td>13</td>
<td>(block all queries)</td>
</tr>
</tbody>
</table>

The call gap indicator. Valid value(s):

- **DBOVLD** = Database overload.
- **MASS** = Destination mass calling.
- **OUTBND** = Out-of-band.
- **SMS** = Service Management System (SMS) initiated.
- **VACCD** = Vacant code.

w = Carrier identification code (CIC) expansion (CICEXP) indicator. Presence of the CICEXP keyword indicates that the CIC sent by the external database in the response message should be in the four-digit format. Absence of the keyword indicates that the CIC should contain three digits.
4. ACTIONS TO BE TAKEN

This message is the response to a manual request. It is used as a high-level check on connections to a billing validation database, (a database external to the switch), to check out data in the database, or to check out a repeatedly failing query. If variable ‘h’ prints out, then there is a problem with the connection to the database. Otherwise, the response is from the database. If the response from the database is not as expected, contact the database administrator.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

TST BNS=a    DURATION OF TEST=b
    c [d] [e]

2. REASON FOR OUTPUT

To report the results of the manual request (TST:BNS) that a billing number screening (BNS) query test be performed using billing validation application (BVA).

3. VARIABLE FIELD DEFINITIONS

a = Ten-digit billing number that was queried.

b = Duration of the test in milliseconds. Timing starts when the switch receives the input request and ends when the switch receives the result from the network or a timeout occurs.

c = Results of the test. Valid value(s):
CCIS FAILURE-DESTINATION NOT EQUIPPED = A destination in the common channel signaling (CCS) network was not equipped.
CCIS FAILURE-NETWORK BLOCKED = Could not complete test due to network blockage.
CCIS FAILURE-NETWORK OVERLOAD = Could not complete test due to an overload in the network.
CCIS FAILURE-NO ROUTING DATA = Could not route to the database due to an error in or unavailability of routing data in the network.
COIN-PUBLIC = Public coin.
COIN-SEMIPUBLIC = Semipublic coin.
COINLESS-PUBLIC = Public coinless.
DENIED-ALL = Collect and bill to third denied.
DENIED-COLLECT = Collect billing denied.
DENIED-THIRD = Bill to third number denied.
INVALID BNS MESSAGE RECEIVED = A response was received but the data in the message was mutilated.
NO RESTRICTIONS = No billing restrictions.
NON-WORKING NUMBER = Number is not working.
TIMEOUT = A response to the test query was not received within the eight-second time limit.
UNABLE TO PROCESS-DATABASE OVERLOAD = Database was unable to process due to overload.
UNABLE TO PROCESS-MISCELLANEOUS = Database was unable to process.
UNEQUIPPED BNS = NPA-NXX is not equipped for BNS.
UNEQUIPPED NWN = NPA-NXX is not equipped for NWN check - no known restrictions.
UNEQUIPPED PT-NWN = NPA-NXX is not equipped for PT or non-working number (NWN) check - no known restrictions.
UNEQUIPPED PT = NPA-NXX is not equipped for public telephone (PT) check - no known billing restrictions.
VACANT CODE = NPA-NXX is a vacant code.
= Control level value. This field is printed only if a control level has been received in a reply.
Possible control level values are 0 - 7 and refer to the number of queries out of a possible eight that
are being cut back.

= Three-digit revenue accounting office (RAO) number.

4. ACTION TO BE TAKEN

This message is the response to a manual request. It is used as a high-level check on connections to BVA, (a
database external to the switch), to check out data in BVA, or to check out a repeatedly failing query. If variable 'c',
"results of the test," prints out CCIS FAILURE or TIMEOUT, then there is a problem with the connection to the
database. Otherwise, the response is from the database. In this case, the response should be examined to see if it
indicates proper data in BVA. In any case, the BVA administrator should be contacted for assistance.

5. ALARMS

None.

TST: CAS

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

TST CAS=a b DURATION OF TEST=c
d [e] [f]

2. REASON FOR OUTPUT

To report the results of the manual request (TST:CAS) that requests that a customer account services (CAS) query test be performed.

3. VARIABLE FIELD DEFINITIONS

a = The 14-digit customer account services card number that was queried (consists of 10-digit individual account number + 4-digit personal identification number (PIN).

b = The called number that was input. This will be either a 10-digit domestic directory number, a 1- to 3-digit international country code, or 0 (if no called number was input).

c = Duration of the test in milliseconds. Timing starts when the switch receives the input request and ends when the switch receives the result from the network or a timeout occurs.

d = Results of the test. Valid value(s):
ALLOW CALL = The call is allowed.
CCIS FAILURE-DESTINATION NOT EQUIPPED = A destination in the common channel signaling (CCS) network was not equipped.
CCIS FAILURE-NETWORK BLOCKED = Could not complete test due to network blockage.
CCIS FAILURE-NETWORK OVERLOAD = Could not complete test due to an overload in the network.
CCIS FAILURE-NO ROUTING DATA = Could not route to the database due to an error in or unavailability of routing data in the network.
DENY CALL-DOMESTIC = Deny the call because domestic restrictions apply.
DENY CALL-INTERNATIONAL = Deny the call because international restrictions apply.
DENY CALL-INVALID = Deny the call because of an unknown or invalid individual account number.
DENY CALL-PIN = Deny the call because the personal identification number (PIN) is invalid for a known individual account number.
INVALID CAS MESSAGE RECEIVED = A response was received but the data in the message was mutilated.
TIMEOUT = A response to the test query was not received within the eight second time limit.
UNABLE TO PROCESS-DATABASE OVERLOAD = Database was unable to process because of overload.
UNABLE TO PROCESS-MISCELLANEOUS = Database was unable to process for miscellaneous reasons.

e = Control level value. This field is printed only if a control level is received in a reply. The control level may have a value from 0-15, and is used as index into a network management call gapping
control level table which specifies the minimum time interval between queries. The following table lists the call gap interval index number received from the database and the corresponding time (in seconds) that the index represents:

<table>
<thead>
<tr>
<th>index</th>
<th>gap interval in seconds</th>
</tr>
</thead>

2. REASON FOR OUTPUT

To report the results of the manual input (TST:CAS7) that requests that a customer account services (CAS) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query be performed.

3. VARIABLE FIELD DEFINITIONS

ESP DENIED = Enhanced services [namely, voice messaging services (VMS)] are not allowed for this card.

a = Issuer identification number of the commercial credit card (CCC) or telecommunications calling card (89C) number that was input.

b = Individual account number of the CCC or 89C calling card number that was input. This includes a check number, if present.

c = Personal identification number (PIN) that was input.
d = Duration of the test in milliseconds. Timing starts when the administrative module (AM) sends the formatted query, and ends when the query response is received from the network.

e = Called number that was input. The label will print as ICLD= for international numbers or CLD= for all other numbers. If no called number was input, CLD=NO CALLED NUMBER will print.

f = Translation type number that was input.

g = CAS service specifier that was input. The valid values are:
NORMAL = Normal CAS validation.
IVI = CAS inward validation.
SDAP = Speed dial auto provisioning (SDAP) query.
RQV = Rate quote validation.

h = Point code number of the network node that sent the response. If the test query timed out, 'NOT APPLICABLE' is output for the point code.

i = CAS TCAP query reply code or error code. This field prints out when a normal reply was received in response to the test query. Valid value(s):
ALLOW CALL = The card number and PIN have been successfully validated; the call was allowed.
ALLOW CALL - TCS OVERRIDE = The card number and PIN have been successfully validated; any terminating code screening (TCS) restrictions should be overridden, and the call is allowed.
CALLED NUMBER RESTRICTIONS APPLY = The call was denied because called number restrictions applied.
CALLING NUMBER RESTRICTIONS APPLY = The call was denied because calling number restrictions applied.
CARD INELIGIBLE FOR SERVICE = The card was valid but the call should be denied because the service requested was not available for this card.
CL CALL IN PROGRESS = The call was denied because there is already a card limit (CL) call in progress for the particular card number.
CARD UNAVAILABLE FOR PROCESSING = The card was valid but the call should be denied because the card requested was not available for processing.
CREDIT RESTRICTED = The call was denied because the card holder was billing delinquent.
DL BALANCE DEPLETED = The call was denied because the duration limit (DL) card has a depleted duration.
FRAUD RESTRICTED = The call was denied because the card was suspected of fraudulent use.
GATEWAY ERROR = Communication with a CCC vendor was unsuccessful.
INVALID CARD - MISSING RECORD = The call was denied because the card number was invalid, that is, not found in the database.
INVALID CCC RESPONSE = The call was denied because a CCC vendor had indicated that the card was invalid.
INVALID PIN = The call was denied because the PIN was invalid.
INVALID SPEED CODE = The call was denied because the speed dial code sent in the query could not be mapped to a forward number.
MISROUTED QUERY = The card number was not in the range that the database expected to receive.
MISSING PARAMETER = A mandatory parameter was absent from the query.
PL BALANCE DEPLETED = The call was denied because the purchase limit (PL) card has a depleted balance.
SPEED DIALING NOT ALLOWED = The call was denied because the card number is not permitted to make speed dial calls.
task refused = The task was refused because the node could not handle the request at the time (not because the operation was incorrect in any way).

undefined card issuer = The 14-digit card number sent in the query does not exist in the AT&T card validation database.

unexpected input, data value = The content of a query parameter was not as expected.

unexpected parameter = A query parameter was received but not recognized.

vacant code = The database determined that the card number contained in the query was one that has not yet been assigned.

vl balance depleted = The call was denied because the volume limit (VL) card has a depleted balance.

The results of a failed test. This field prints out only when the test query was not successful. Valid value(s):

garbled message = A response was received but the data in the message was mutilated. It is possible that this result may be printed along with a normal response (such as, ALLOW CALL) if the mutilated data is detected after the result has been identified.

IMS or CNI returned msg = The inter-process message switch (IMS) or the common network
interface (CNI) returned the message. This result is not expected for CAS CCS7 test queries.

**NETWORK CONGESTION** = Could not complete the test due to network congestion.

**NETWORK FAILURE** = Could not complete the test due to failure in the network.

**NO TRANSLATION ADDRESS NATURE** = No entries exist in routing tables for addresses of this nature.

**NO TRANSLATION SPECIFIC ADDRESS** = No entries exist in routing tables for this specific address.

**SUBSYSTEM CONGESTION** = Could not complete the test due to subsystem congestion.

**SUBSYSTEM FAILURE** = Could not complete the test due to subsystem failure.

**TIMEOUT** = A response to the test query was not received within the sixteen second time limit.

**UNEQUIPPED USER** = Could not complete the test due to unequipped user.

**UNQUALIFIED** = Unknown failure reason.

\[ l \] = The customer-defined bill segmentation (CDBS) number. If no CDBS number is present, 'NONE' will be output.

\[ m \] = The software defined network (SDN) routing number. If no SDN routing number is present, 'NONE' will be output.

\[ n \] = The CCC authorization code. If no CCC authorization code is present, 'NONE' will be output.

\[ o \] = The call gap present indicator. Valid value(s):

- **ACG NOT PRESENT** = Automatic call gap (ACG) component not present.
- **ACG PRESENT, CORRECT** = Automatic call gap component present, has no errors.
- **ACG PRESENT, IN ERROR** = Automatic call gap component present, has errors.

\[ p \] = The call gap control digits - the digits contained in the ACG component. Controls will be applied on the first 12 digits for 89C cards, and on the first 6 digits for CCC cards. If no ACG component is present, 'NONE' will be output.

\[ q \] = The call gap duration - used to determine the length of time for which controls are to be in effect. The following table lists the call gap duration index number received from the database and the corresponding time (in seconds) that the index represents:

<table>
<thead>
<tr>
<th>index</th>
<th>gap duration in seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
<tr>
<td>9</td>
<td>256</td>
</tr>
<tr>
<td>10</td>
<td>512</td>
</tr>
<tr>
<td>11</td>
<td>1024</td>
</tr>
<tr>
<td>12</td>
<td>2048</td>
</tr>
</tbody>
</table>

If no ACG component is present, 'NONE' will be output.

\[ r \] = The call gap interval - used to determine the time between allowed queries when controls are in effect. The following table lists the call gap interval index number received from the database and the corresponding time (in seconds) that the index represents:
If no ACG component is present, 'NONE' will be output.

s = The call gap control cause. Valid value(s):
  DBOVLD = Database overload. This is the only cause that is considered valid for CAS CCS7. Any other cause returned will result in the ACG component being ignored.
  MASS = Destination mass calling. This result is not expected; controls will not be installed for this case.
  OUTBND = Out of band. This result is not expected; controls will not be installed for this case.
  SMS = Service Management System (SMS) initiated. This result is not expected; controls will not be installed for this case.
  VACCD = Vacant code. This result is not expected; controls will not be installed for this case.

t = The purchase limit (PL) type indicator. Valid value(s):
  EWD = PL call enforced with disconnect.
  EWOD = PL call enforced without disconnect.
  NE = PL call not enforced.
  NONE = Not a PL call.

u = The PL balance number from CAS network control point (NCP); value in cents. If no PL balance, 'NONE' is output.

v = The speed dial code (SDC) sent in the query. If an SDC was not included in the query, 'NONE' is output.

w = The speed dial forward number (SDFN) returned in the reply. If no SDFN is received, 'NONE' is output.

x = The SDFN type. Valid value(s):
  DOMESTIC = The SDFN is a U.S. forward number.
  INTERNATIONAL = The SDFN is an international forward number.

  If no SDFN is received, this field remains blank.

y = The duration limit (DL) type indicator. Valid value(s):
  EWD = DL call enforced with disconnect.
  EWOD = DL call enforced without disconnect.
  NE = DL call not enforced.
  NONE = Not a DL call.
z = The DL duration number from CAS network control point (NCP); value in seconds. If no DL duration, 'NONE' will be output.
a = The volume limit (VL) type indicator. Valid value(s):
E   = VL call enforced.
NE  = VL call not enforced.
NONE = Not a VL call.
b1 = The single limit (SL) type indicator. Valid value(s):
NONE  = Not an SL call.
YES   = SL call.
c1 = The call concurrency indicator. Valid value(s):
MULTIPLE = Multiple call in progress.
NONE    = Not applicable because no PL balance or DL duration was received in reply.
SINGLE  = Single call in progress.
d1 = Calling number. The label will print as ICLG= for international numbers or CLG= for all other numbers. If no calling number was input, CLG=NO CALLING NUMBER will print.
e1 = Language override parameter (LOP) value. The value indicating the language to be used in the announcements or 'NONE' if LOP is not present in the query reply. Refer to RC/V View 8.66 to determine the language corresponding to this value.
f1 = Balance quotation indicator. Valid value(s):
NO    = Not a balance quotation call.
NONE  = Indicator not received - not a balance quotation call.
YES   = Balance quotation call.
g1 = Card rate specifier. The card rate will contain a value of 0-255. 0 is reserved to mean "standard card rates".
h1 = Card product type. The product type is used to indicate what type of product the card is (such as, business, residential, disposable, and so forth). It can have a value from 0-255.
i1 = Is the message sequence number. This is part of the messages that are displayed in the output.
j1 = Total number of messages that are displayed in the output. Up to 5 messages may be required to print the results of the test query (1 for the TST:CAS7 message and up to 4 for the TST:SDAP messages).
k1 = The NANP geographic restriction indicator. Valid value(s):
FULL RESTRICTION = No NANP forward number is accepted.
NO RESTRICTION  = No geographic restrictions exist on NANP forward numbers in the speed dial list.
NONE            = No NANP geographic restriction value received in the reply.
PARTIAL RESTRICTION = Partial restrictions on speed dial NANP forward numbers.
l^1 = The international geographic restriction indicator. Valid value(s):
FULL RESTRICTION = No international forward number is accepted.
NO RESTRICTION = No geographic restrictions exist on international forward numbers in the speed dial list.
NONE = No international geographic restriction value received in the reply.
PARTIAL RESTRICTION = Partial restrictions on speed dial international forward numbers.

m^1 = The allow 900 indicator. Valid value(s):
ALLOWED = 900 forward numbers are allowed in the speed dial list.
NONE = No allow 900 indicator value received in the reply.
NOT ALLOWED = 900 forward numbers are not allowed in the speed dial list.

n^1 = The allow teleconferencing indicator. Valid value(s):
ALLOWED = Teleconferencing forward numbers are allowed in the speed dial list.
NONE = No allow teleconferencing indicator value received in the reply.
NOT ALLOWED = Teleconferencing forward numbers are not allowed in the speed dial list.

o^1 = The allow private network interface (PNI) indicator. Valid value(s):
ALLOWED = PNI forward numbers are allowed in the speed dial list.
NONE = No allow PNI indicator value received in the reply.
NOT ALLOWED = PNI forward numbers are not allowed in the speed dial list.

p^1 = The indicator whether or not a speed dial list was received from the database. Valid value(s):
NO SPEED DIAL LIST = No speed dial list was received in the reply.
SPEED DIAL LIST TO FOLLOW = A speed dial list exists and will appear in a TST:SDAP message to follow.

q^1 = Indicates whether a call is eligible to receive QuietHear service. Valid value(s):
ACTIVE = The call is eligible for QuietHear service.
INACTIVE = The call is not eligible for QuietHear service.
NONE = The QuietHear indicator was not received from the CAS database.

r^1 = Indicates whether the audio logo announcement is to be provided on a call which receives QuietHear service. Valid value(s):
NO = The call is not eligible to receive the audio logo announcement.
NONE = The audio logo indicator was not received from the CAS database.
YES = The call is eligible to receive the audio logo announcement.

s^1 = Indicates whether intercept screening applies on a call. Valid value(s):
NO = The call is not eligible for intercept screening treatment.
NONE = The intercept screening indicator was not received from the CAS database.
YES = The call is eligible for intercept screening treatment.

t^1 = The card type that was input. Valid values:
CIID = Carrier issuer identification card.
INIT = AT&T 14 digit True Choice™ calling card, initial call.
NA = Not applicable. A card type value was not input because the card number is not 14 digits long.
SEQ = AT&T 14 digit True ChoiceTM calling card, sequence call.

4. ACTION TO BE TAKEN

This message is the response to a manual request. It is used as a high-level check on the connection to the CAS database (which is external to the switch), to check out data in the CAS database, or to check out a repeatedly failing query. If variable 'k' (results of a failed test) prints out (with the exception of GARbled MESSAGE), then there is a problem with the connection to the database, and the Engineering Network Administration Center (ENAC) should be contacted for assistance. Otherwise (including GARbled MESSAGE), the response is from the database, and the Operations Network Administration Center (ONAC) should be contacted. The response should be examined to see if it indicates proper data in the CAS database.

5. ALARMS

None.

Type: Output

1. FORMAT

TST CCRD=a    DURATION OF TEST=b
c [d]   [e]

2. REASON FOR OUTPUT

To report the results of the manual request (TST:CCRD) that requests that a calling card (CCRD) query test be performed using billing validation application (BVA).

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>CCRD number that was queried.</td>
</tr>
<tr>
<td>b</td>
<td>Duration of the test in milliseconds. Timing starts when the switch receives the input request and ends when the switch receives the result from the network or a timeout.</td>
</tr>
</tbody>
</table>
| c     | Results of the test. Valid value(s):
|       | CCIS FAILURE-DESTINATION NOT EQUIPPED = A destination in the common channel signaling (CCS) network was unequipped. |
|       | CCIS FAILURE-NETWORK BLOCKED = Could not complete test due to network blockage. |
|       | CCIS FAILURE-NETWORK OVERLOAD = Could not complete test due to an overload in the network. |
|       | CCIS FAILURE-NO ROUTING DATA = Could not route to the database due to an error in or unavailability of routing data in the network. |
|       | INVALID CCRD MESSAGE RECEIVED = A response was received but the data in the message was mutilated. |
|       | NUMBER INVALID = Billing number not valid for CCRD service. |
|       | NUMBER VALID-NO PIN MATCH = No personal identification number (PIN) match for valid CCRD number. |
|       | NUMBER VALID-RESTRICTED PIN MATCH = Restricted PIN match for valid CCRD number. |
|       | NUMBER VALID-SERVICE DENIAL = Service denial in effect for valid CCRD number. |
|       | NUMBER VALID-UNRESTRICTED PIN MATCH = Unrestricted PIN match for valid CCRD number. |
|       | TIMEOUT = A response to the test query was not received within the eight-second time limit. |
|       | UNABLE TO PROCESS-DATABASE OVERLOAD = Database was unable to process because of overload condition. |
|       | UNABLE TO PROCESS-MISCELLANEOUS = Database was unable to process. |
|       | UNEQUIPPED = NPA or revenue accounting office (RAO) not equipped for CCRD service. |
|       | VACANT CODE = NPA or RAO is a vacant code. |
| d     | Control level value received. This field is output only if a control level is received in the reply. Possible values are 0-7 and refer to the number of queries out of a possible eight that are being cut back. |
| e     | Three-digit RAO number. |
4. ACTION TO BE TAKEN

This message is the response to a manual request. It is used as a high-level check on connections to BVA, (a database external to the switch), to check out data in BVA, or to check out a repeatedly failing query. If variable ‘c’ prints out CCIS FAILURE or TIMEOUT, then there is a problem with the connection to the database. Otherwise, the response is from the database. In this case, the response should be examined to see if it indicates proper data in BVA. In any case, the BVA administrator should be contacted for assistance.

5. ALARMS

None.

   [e f INCLUDING THE FOLLOWING]
   [g g g g g]
      . . . .
      . . . .
      . . . .

2. REASON FOR OUTPUT

To display whether Generic Retrofit Selective Initialization (GRSI) may proceed with minimal impact to CCS capability.

3. VARIABLE FIELD DEFINITIONS

a  = The common channel signaling (CCS) GSM number.
b  = The signaling link set number (if applicable) or blank (if not).
c  = Link capacity of signaling link set during GRSI.
d  = Retrofit recommendation. Valid value(s):
   GRSI MAY PROCEED WITH MINIMAL LOSS OF CCS CAPABILITY
   WARNING: BOTH PSU SIDES MUST BE AVAILABLE TO REDUCE CCS DOWNTIME DURING GRSI
   % LINK CAPACITY DURING GRSI MAY CAUSE CONGESTION AFFECTING
   GSM REQUIRES AT LEAST TWO QPHS TO REDUCE CCS CAPABILITY LOSS DURING GRSI
   GSM REQUIRES 2 OR MORE CCS LINKS TO REDUCE CCS CAPABILITY LOSS DURING GRSI
   MUST SPLIT SDL TO NGSM ASSIGNMENT TO REDUCE CCS CAPABILITY LOSS DURING GRSI
   CCS CAPABILITY LOSS CANNOT BE MINIMIZED DURING GRSI AFFECTING

e  = The number of affected clusters, DPCs, or networks.
f  = Affected route type. Valid value(s):
   CLUSTERS
   DPCS
   NETWORKS

g  = An affected cluster, DPC, or network.

4. ACTIONS TO BE TAKEN
Before proceeding with GRSI, assure that the cited recommendations are addressed to minimize loss of CCS capability.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the test results associated with a TST:DSL input message. Also, to report the test results associated with automatic requests (pokes) to test a digital subscriber line (DSL) using the trunk and line work station (TLWS).

The TST:DSL output message will appear in different forms, primarily dependent on the test type selected. Formats 4 through 10 are unique to specific test types, while Formats 1 and 2 are typical for all test types. Format 3 is unique to explicit requests to prematurely terminate a TST:DSL procedure (refer to the STP:TST-DSL input message). If an active test procedure is found, that procedure will acknowledge the stop request. This allows test specific information to be displayed on output (such as the request number of the terminated procedure). If no active test procedure is found, the STP:TST-DSL procedure will generate the resultant output message; therefore, no test specific information will be seen.

The integrated digital carrier unit (IDCU), and digital network unit - synchronous optical network (SONET) (DNU-S) connect a remote digital terminal (RDT) using the TR-303 interface. The RDT equivalent of the integrated services line unit (ISLU) line card (LC) is called a channel unit (CU). Any type of LC, line circuit (LCKT) or RDT CU are collectively referred to as the line termination (LT) throughout this message.

Unless otherwise stated: all references to ISLU include all configurations of the ISLU and the integrated services line unit version 2 (ISLU2). This includes both the remote integrated services line unit (RISLU) and remote integrated services line unit 2 (RISLU2). All references to access interface unit (AIU) include the remote access interface unit (RAIU). Reference to line unit (LU) includes all supported ISDN compatible LUs.
In general, test results will only be presented for tests that normally complete. In other cases, the status string (as in: \( r^1 : s^1 [- t^1] \)) will identify the reason for termination of the test procedure.

The end-of-transmission (EOT) parameter indicates all message sections have been output. Formats that show the EOT parameter as optional can be repeated more that once by a test procedure.

### 3. VARIABLE FIELD DEFINITIONS

**Note:** Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

- **CUR**
  - Current upstream (network termination 1 (NT1) to LT direction) and downstream (LT to NT1 direction) protocol monitoring (PM) counts.
  - The current PM counts are read in the same order as output. The LT (current hour) and CU (current interval) PM counts will vary with the test duration; however, if the DSL is faulty, a significant deviation between the recorded PM counts can result.
  - The deviation in the PM counts is most likely the result of recording block errors (BE) while the PM counts were being read, as throughout testing each frame was intentionally corrupted. This could indicate that the CU and/or LT PM counters are not responding properly or the ability to transmit BEs from the LT or NT1 is faulty. Nominally, the deviation between the printed LT and CU errored second (ES) counters is not likely to be more than 3.

- **EOT**
  - End-of-transmission indicates all message sections have been output and the associated test procedure has terminated. Formats that show the EOT parameter as optional can be repeated more than once by a test procedure.

- **PORT**
  - The global port under test (PUT). When an output message provides test results for an individual DSL channel, the CH parameter will be correlated with the PORT. In other cases, (such as: \( CH=ALL \)) the D-channel PORT will be output.

- **PRV**
  - Previous upstream (NT1 to LT direction) and downstream (LT to NT1 direction) PM counts.
  - The previous PM counts are read in the same order as output. The LT previous hour PM counts are never modified by corrupt cyclic redundancy check (CRC) testing. The CU previous interval PM counts should also be unaffected.

- **+**
  - The DSL has multipoint service.

- **a**
  - Line termination layer 2 interface type as detected in office-dependent data (ODD). Valid value(s):
    - AMI-RU = Alternate mark inversion (AMI) U-interface on a remote LU.
    - AMI-U = AMI U-interface.
    - ANSI-RU = ANSI® U-interface on a remote LU.
    - ANSI-U = ANSI® U-interface.
    - RT = T-interface on a remoted LU.
    - T = T-interface.

- **b**
  - Subscriber directory number (DN) associated with the DSL tested. If a specific subscriber has been specified, that users DN will be output.

- **c**
  - Office equipment number (OEN). Valid value(s):
    - AIUEN=d-e-i-l = AIU equipment number (AIUEN).
LCEN=d-e-h-k = line card equipment number (LCEN).
LCKEN=d-e-h-i-l = line circuit equipment number (LCKEN).
ILEN=d-f-j-m = IDCU line equipment number (ILEN).
INEN=d-g-j-m = integrated digital loop carrier (IDLC) networking line equipment number (INEN).

d = Switching module (SM) number.
e = ISDN LU number.
f = IDCU number.
g = DNU-S number.
h = Line group controller number.
i = Line board/pack number.
j = RDT number.
k = Line card number.
l = Line circuit number.
m = RDT channel unit number.
n = Terminal endpoint identifier (TEI). In general, if a TEI is submitted on input, that TEI will be presented on output. However, if the TEI is invalid and the identifier is not required for testing, it will not be output. If a DN submitted on input is "bound", the TEI output will be the TEI of the customer premises equipment (CPE) "bound" to that user (refer to the TEI parameter in the TST:DSL input message.)
o = DSL channel(s) (CH) tested.

For CRC testing, the 2B+D channels are not tested; however, associated output messages will provide the D-channel PORT name and the CH parameter will be used to identify that PORT.

Note that the CH parameter(s) may not indicate all channels owned by the test procedure. Refer to variable `\text{u}` for that purpose. Valid value(s):
\text{ALL} = All equipped channels.
\text{B} = Any idle B-channel.
\text{B1} = B1-channel.
\text{B2} = B2-channel.
\text{BB} = Both B-channels.
\text{D} = D-channel.

p = SM number associated with the port under test.
q = Port number in hexadecimal.
r = Basic status of port. Valid value(s):
\text{IS} = Port under test is in-service (IS).
\text{OOS} = Port under test is out-of-service (OOS).
Test type performed. Valid value(s):

- **AUTO**
  - The test type was to be determined automatically based on the DSL channel basic/logical type; however, the indicated failure has prevented testing on the associated channel(s).

- **CS**
  - Specifies the digital loop-back (LPBK) testing of circuit-switched (CS) hardware and the associated path and/or loop.

- **CRC**
  - Specifies corrupt CRC testing of the associated ANSI® U-DSL. However, if the test duration (DUR) is zero seconds, a test is not performed. In this case, only the current and previous hour PM counts are read and output. The CRC test does not corrupt normal 2B+D DSL operations.

- **CRC-DWN**
  - Performed a CRC test using the downstream registers of the LT on the U-DSL, reporting only downstream PM results on output.

- **CRC-UP**
  - Performed a CRC test using the upstream registers of the LT on the U-DSL, reporting only upstream PM results on output.

- **MSMTCH**
  - Specifies the detection of a mismatch between the LT and the NT1 or CU, for a ISLU U-DSL.

- **ODPS**
  - Specifies the digital LPBK testing of on-demand packet-switched (ODPS) hardware and the associated path and/or loop.

- **OSPS**
  - Specifies the voice-path analog continuity testing to an Operator Services Position System (OSPS) terminal.

- **PS**
  - Specifies the digital LPBK testing of packet-switched (PS) hardware and the associated path and/or loop.

LPBK termination (TERM) type used during testing. Valid value(s):

- **CPE**
  - The LPBK termination was provided within the CPE. Specifically, within the integrated service digital network (ISDN) telephone or data terminal.

- **CUb2**
  - The LPBK termination was provided within the specified channel unit.

- **EXT**
  - No attempt was made by the switch to set up a LPBK termination. An external (EXT) LPBK termination must be manually applied in this case.

- **LT**
  - The LPBK was provided within the LT. For ISLU the LT is the LC, for ISLU2 and AIU the LT is the LCKT, and for IDCU and DNU-S the LT is the RDT CU.

- **NT1**
  - The LPBK was provided within the NT1 located at the customer end of the 2-wire loop.

- **PH**
  - The LPBK was provided by the protocol handler (PH) on a PH channel that serves the associated DSL channel.

Test duration (DUR) indicates the total duration of the test in seconds. If the test was stopped for a customer service request the duration will reflect the period of time that test data was transmitted (refer to the INT parameter in the TST:DSL input message).

A test duration of zero seconds implies that a test was not performed. In this case, a CRC test request will only read and output the current PM counts.

For CRC testing, the test duration output is the length of time corrupt CRC was transmitted between the LT and the NT1; however, for ISLU and AIU DSLs the duration output will always be greater than the requested test duration. This occurs because starting/stopping the test is dependent upon obtaining control of the embedded operations channel (EOC) and the LU performing the requested action.

Data-rate (RATE) of the CS digital bit stream. See the "RATE" parameter within the TST:DSL input message for extended description. Valid value(s):

- **AUTO**
  - The data rate had not been selected automatically.
64CLR = 64000 bits/sec clear channel (zero-octet allowed).
64RES = 64000 bits/sec restricted (zero-octet suppressed).
56KPS = 56000 bits/sec.

w = The block-size (BLKSZ). The CS digital bit stream is partitioned into segments called blocks, for the purpose of calculating the total errored-blocks (ERBLK). The block-size is the number of bits in each block.

x = Test equipment SM number.

This parameter specifies the location of the high level service circuit (HLSC), integrated services test function (ISTF), global digital services function (GDSF) or PH used as the test source for the test request.

The HLSC equipment number (HLSCEN) and PH equipment number (PHEN) should always indicate the test equipment is located in the same SM as the PUT. However, the ISTF equipment number (ISTFEN) and GDSF equipment number (GDSFEN) will indicate any SM where associated equipment has been populated. The ISTF and GDSF are globally routed resources.

y = Test equipment ISLU unit number.

z = HLSC service group number.

a1 = Test equipment unit number.

This is the HLSC, ISTF, GDSF or PH unit used to evaluate the DSL under test. The PH unit is the logical PH group number.

b1 = test equipment data interface (DI) number.

c1 = Test equipment peripheral interface data buss (PIDB) number.

d1 = Test equipment PIDB channel.

e1 = logical PH channel.

f1 = LT hardware type (LTTYPE) as detected by mismatch test. Valid value(s):
AMI-RU = AMI U-interface on a RISLU.
AMI-U = AMI U-interface on ISLU.
ANSI-RU = ANSI® U-interface on a RISLU.
ANSI-U = ANSI® U-interface on ISLU.
RT = T-interface on a RISLU.
T = T-interface on ISLU.
Z = Z (analog) interface.

g1 = The type of NT1 or CU detected during a mismatch test (NT|CU). Valid value(s):
AMI = An AMI NT1 or CU was detected.
ANSI = An ANSI® NT1 or CU was detected.

h1 = Elapsed time (ET) measured in milliseconds. This is the time taken to read the PM counts from a pair of CUs (CUs 1 & 2, or 3 & 4, or 5 & 6). The time to read PM counts will vary based on factors such as the condition of the loop between the LT and the NT1 and system load. The CUs farthest
from the switch will take more time to read. The ET will be from 5-11 seconds (that is, 5000-11000 msec) for a pair of CUs. If a satellite transmission link is present, the read will take an additional 3 to 5 seconds per pair of CUs (assuming 500 msec round trip delay).

i

= DSL layer 3 interface type (ITYPE). The ITYPE may be qualified with the DSL service class, where significant to testing. Valid value(s):

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PP</td>
<td>Custom point-point/single-point DSL.</td>
</tr>
<tr>
<td>MP</td>
<td>Custom multi-point DSL.</td>
</tr>
<tr>
<td>RMP</td>
<td>Custom restricted multi-point DSL.</td>
</tr>
<tr>
<td>STD</td>
<td>Standard DSL.</td>
</tr>
</tbody>
</table>

j

= Class of service supported on the DSL. This parameter is a qualifier to the ITYPE that will be present when the class of service is significant to the test procedure. Valid value(s):

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DL</td>
<td>The DSL supports a data link (DL)**.</td>
</tr>
<tr>
<td>ISAT</td>
<td>The DSL supports an attendant console terminal.</td>
</tr>
<tr>
<td>OSPS</td>
<td>The DSL supports an OSPS facility**.</td>
</tr>
<tr>
<td>AP</td>
<td>The DSL supports an application processor (AP)**.</td>
</tr>
<tr>
<td>PBRI</td>
<td>The DSL supports a pseudo basic rate interface (BRI). This DSL does not have an active PH channel serving the D-channel. For PS digital testing, the PH is the test source; therefore, PS testing cannot be performed on this D-channel.</td>
</tr>
</tbody>
</table>

** A resident procedure must be disabled prior to testing. That is, the DSL should be removed from service prior to testing (refer to the RMV:LINE or RMV:DATALINK input messages).

k

= Equipped channel units (EQCU). The EQCU parameter is used to indicate the number of channel units equipped on an ANSI® U-DSL when served by the AIU or ISLU. For IDCU and DNU-S, the number of equipped channel units cannot be determined; therefore, the EQCU parameter will not be output.

As many as six CUs may be equipped on an ANSI® U-DSL. The number of channel units equipped is determined by polling each unit over the EOC. If a channel unit can be detected or if the EQCU is NONE, the NT1 is present, has power, and can communicate over the EOC. The CUs must be equipped in pairs; therefore, an odd number for EQCU would indicate that at least one CU does not respond.

If the number of CUs could not be determined, the NT1 may be inoperative. In such cases, the reason for failure will be output in place of the CU count. Valid value(s):

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-6</td>
<td>The number of ANSI® CUs equipped.</td>
</tr>
<tr>
<td>EOC-BSY</td>
<td>The test procedure must own the EOC resource to determine the number of equipped CUs; however, the EOC is currently busy. A concurrent procedure was using the resource (such as, LPBK testing or PM read).</td>
</tr>
<tr>
<td>LINKc²</td>
<td>The LINK beyond CUb² is down (where c² equals b²). That is, the indicated CU was the farthest CU from the switch responding. If the CU is even (2, 4, or 6), layer 1 (U-interface) is down just beyond that CU. If the CU is odd (1, 3, or 5), a carrier system beyond that CU is down. The CU that was detected may be faulty; however, the unit just beyond that CU is a more likely candidate (that is, CUb²+1 or the NT1).</td>
</tr>
<tr>
<td>NONE</td>
<td>No channel units are equipped. That is, the LT is connected directly to the NT1. In this case, the NT1 has responded instead of CU1.</td>
</tr>
<tr>
<td>NR</td>
<td>There was no response from CU1 (or the NT1); therefore, the presence of CU1 is indeterminate. Also, Layer 1 (U-interface) appears to be up at the LT. In this case, the failure may be due to CU1, the LT, or the loop between the LT and CU1.</td>
</tr>
</tbody>
</table>
| NRT  | This has the same meaning as NR; however, the NT1 or some CU appears to be
in a "test mode".

The NT1 or CU is placed in "test mode" by user/customer actions. That is, "test mode" is not initiated by the switch. The "test mode" is activated for local testing of a CU, using the 946A or 950A (or equivalent) test sets.

The purpose of the "test mode" indication is to alert office personnel that results from tests initiated at the switch may be corrupt, as local testing at the NT1 or CU is in progress. There is no way to determine if a "test mode" indication is originating from the NT1 or a CU. A valid "test mode" condition may not be detected when the LT is receiving CRC BEs in the upstream direction (NT1 toward the LT).

Note that not all manufacturers of NT1s and CUs support the "test mode" indication (that is, NTM bit logic 0). Check manufacturer documentation for details.

- **UINTF** = Layer 1 (U-interface) is down at the LT. It is not possible to determine the EQCU given this condition.

- **UNKNOWN** = The number of channel units equipped is not known. This generally indicates an unexpected failure (for example, loss of LU communication).

- **l** = IDCU remote terminal digital signal 1 (RTDS1). The RTDS1 carrier was submitted for use as part of the digital path during testing. If the test has successfully completed, the RTDS1 will be qualified with the DS1 identifier with respect to the IDCU.

- **m** = The RDT DS1 facility used during testing with respect to the IDCU. This parameter will qualify the RTDS1 that was used during testing.

- **n** = The DSL test request number (REQNO). A unique REQNO is assigned to a test procedure when it is first established. It is included in all output messages generated. This number is useful for associating test result messages that may be distributed widely over time, as when performing tests in multi-section modes.

- **o** = Bit error rate (BER). The bit error rate is presented in decimal scientific notation with exponent preceded by "E" (for example, 1.234E-8). The BER represents the total number of errored bits detected divided by the total number of bits sent.

- **p** = Errored blocks (ERBLK). The ERBLK is the number of blocks returned from the LPBK termination during testing, with one or more bit errors. The ERBLK is expressed in decimal scientific notation with the exponent preceded by "E" (for example, 5.600E1 = 5.600 x 10^1 = 56).

- **q** = Packet rate (PKTRATE). The packet rate represents the total number of error-free packets returned from the LPBK termination during packet-type testing, divided by the total number of packets sent. The number is expressed as a percentage.

- **r** = Operational condition of testing. The testing status is comprised of three components. Specifically, the test condition, test status and the status qualifier. The test condition and the test status will always be output. The status qualifier, which is used to add additional resolution to general status strings, is not always required.

The test condition, which is delineated from the status string with a colon, indicates the operational condition of the test procedure for the indicated DSL channel(s). Valid value(s):

- **ABORTED** = Test could not proceed because the indicated resources could not be obtained. The test procedure has been terminated. In general, this condition implies that the
test procedure has affected normal DSL operations. That is, DSL resources may be
owned and testing may have been initiated on one or more DSL channels.

**COMPLETED**
- The test procedure has completed normally.

**ERROR**
- An unexpected error condition was detected. The test procedure has been
  prematurely terminated.

**FAILED**
- An internal failure has prevented the test procedure from establishing or clearing
  condition(s) necessary for digital testing. The test procedure has been terminated.

**INVALID**
- The test request as specified, was invalid for one or more DSL channels to be
tested. In general, normal DSL operations have not been affected on the
  associated DSL channel(s). Testing may continue on selected DSL channels or the
  test procedure may be terminated entirely (refer to the EOT parameter).

**STATUS**
- The present operational status of the test is presented. The test procedure
  continues as indicated.

**STOPPED**
- The test procedure has been terminated in response to a manual request (refer
to the STP:TST-DSL input message) or a customer service request (refer to the
  INT parameter in the TST:DSL input message).

$s^1$
- Status of testing. The following list contains definitions for all possible test statuses. The test
  status indicates the disposition of testing for the indicated channel(s). For general status strings, a
  qualifier will be used to add the required resolution. Valid value(s):

**ALREADY IN CONDITION**
- For LPBK testing, the IDCUT RDT is indicating that the requested
  LPBK state already exists. For CRC testing, the test request has been rejected, as
  the IDCUT RDT is currently performing a CRC test.

  The generic definition as specified by TR-303 for this failure condition is, the
  managed object (that is, the ISDN frame path termination object) is already in the
  condition requested. For detailed information consult vendor-specific RDT manual
  for the operation requested (that is, Operate corrupt CRC test, release ISDN LPBK,
  restore ISDN LPBK).

**ASSOC ENTITY NOT AVAIL**
- The IDCUT RDT is unavailable for LPBK or CRC testing.

  The generic definition as specified by TR-303 for this failure condition is, the
  managed object (ISDN frame path termination object) has an associated entity
  which is unavailable due to the entity being in an improper condition, being busy or
  having failed. For detailed information consult the vendor-specific RDT manual for
  the operation performed (release ISDN LPBK, restore ISDN LPBK, operate corrupt
  CRC test).

**AT LEAST ONE CU EQUIP**
- At least one CU is equipped on this U-DSL.

**ATP**
- The test request completed all tests pass (ATP). That is, the criteria for a passing
  test has been obtained. For example, if this was a CS test the BER and ERBLK are
  zero. For mismatch testing, no mismatch was detected.

**BAD INT FOR REQUEST**
- The test cannot be made interruptible for the specified customer
  requests, given the DSL channels to be tested. For example, if the test request
  included the D-channel, the test procedure cannot be made interruptible for
  customer service originations. That is, the setup request cannot be seen if the
  D-channel is tested (refer to the INT parameter in the TST:DSL input message).

**BAD ISLU TASK REQUEST**
- The ISLU did not recognize the test or operation being requested.

**BAD TERM FOR CH**
- The LPBK termination was not valid for the channel(s) to be tested. For
  example, NT1 terminations are not possible on a T-DSL.

**BAD TERM FOR TEST**
- The LPBK termination was not valid for the test specified. For example,
  the OSPS test type can only use an EXT LPBK termination.

**BAD TEST FOR CH**
- The specified test was invalid for the DSL channel specified. For example,
an OSPS test cannot be performed on the D-channel or B2-channel of a DSL.

BAD TEST FOR PORT = An invalid test configuration or combination of test parameters associated with the DSL port has been requested. For example, a CRC test may only be performed on an ANSI® U-DSL. For IDCU and DNUS, the direction of the CRC test must be specified. The mismatch test is only supported for ISLU DSLs.

BAD TEST REQUEST = An invalid test configuration or combination of test parameters has been detected. For example, an invalid starting termination was specified for a sectionalization (SECT) mode test.

BLOCKED BY LT SPARING A mismatch test could not be run because the ISLU metallic test bus was not available. The bus was in use by LT sparing. This condition exists when trying to gain metallic access to a LT that is in the same half of a line group drawer as an actively spared faulty LT. The phrase, "Same half of a line group (LG) drawer" refers to those line groups that are vertically adjacent (for example, LG0 and LG1 or LG2 and LG3).

BUSY CAMPED ON = A DSL resource required for testing is currently busy. The test procedure will wait for control of the resource, for the specified or defaulted camp-on time.

BY REQUEST = The results are in response to an explicit user request. For example, the test procedure can be terminated by manual request (refer to the STP:TST-DSL input message).

CANNOT RE-GAIN EOC RSC = The test procedure could not regain control of the EOC after waiting a sufficient length of time. This condition may prevent the test from continuing to the next test section and prevent proper DSL idling (for example: removing a LPBK at CU or NT1). This may have disrupted the normal operation of the U-DSL. If necessary, manually restore the DSL to properly condition it for customer service.

This situation can occur when the EOC resource is held by other procedures for too long. Normally, the EOC is only required for a short period of time (less than 25 seconds). There can be several procedures "waiting" to use the EOC at the same time.

CH ACTIVATION = The test procedure failed when attempting to activate the associated DSL channel(s) for testing.

CH TYPE IS CS = The basic/logical type of the associated DSL channel is circuit-switched.

CH TYPE IS PS = The basic/logical type of the associated DSL channel is packet-switched.

CH UNASSIGNED = The office data indicated that associated DSL channel was unequipped.

CMP UNAVAILABLE = The input request could not be processed because the communications module processor (CMP) is unavailable.

CPE NOT BOUND = The CPE specified on input was not bound on the specified DSL.

CPE UNKNOWN = The test request did not sufficiently identify the specific CPE to be used.

CU NOT EQUIPPED = The channel unit that was requested is not equipped.

DATA FOLLOWS = The LT and/or CU PM data follows in tabular format.

DATA FOLLOWS: POSS PM FRZ = The LT and/or CU PM data follows in tabular format; however, a possible PM freeze was scheduled for the LTs and/or the CUs. That is, the current PM counters will be shifted to previous counters and the current counters will be cleared.

Before proceeding to read the PM counts, wait for any in-progress freeze to complete. This ensures that all PM counts have shifted before being read. If a PM read or a LPBK of all channels is in progress at a CU or LT when a freeze is scheduled, no freeze should occur on the U-DSL (that is, no shift in the PM counts).

A PM freeze is scheduled once per hour for the LT and once every PM-report interval (refer to RC/V View 8.1) for the CUs. The freeze operation lasts for about
10 seconds.

DATA FOLLOWS: POSS STUCK PM FRZ = The LT and/or CU PM data follows in tabular format; however, in the SM it appears that a PM freeze operation has been "stuck" active longer than expected. Refer to 'DATA FOLLOWS: POSS PM FRZ' for definition of a PM freeze.

DATABASE PROBLEM = Data required to perform the test could not be read. This may be due to a loss of communications with the associated SM or missing/corrupt office data.

DGR = The CS test results are degraded. That is, the BER is greater than zero, but has not reached the designated failure threshold set by the acceptable bit error rate (refer to the acceptable bit error rate (ABER) parameter in the TST:DSL input message).

DN NOT FOUND = The directory number was not found in the data base.

RT DS1 FACILITY FOR = The RTDS1 facility is invalid for the DSL channel or RDT specified. Observe the qualifier for proper element.

RT DS1 OOS = Testing cannot be performed, as the DS1 supporting the DSL requested is OOS.

DSL RSC BSY = The request could not continue, as the required DSL resources were found to be busy.

EXPECT CU1 TO CU4 = Only CU1 through CU4 are supported for AMI hardware.

FAILED = The requested test has failed. For PS tests at least 98% of the transmitted packets were returned with errors. For CS tests, the BER has exceeded the failure threshold set by the ABER (refer to the ABER parameter in the TST:DSL input message).

FAILED TO UNLOOP = An attempt to remove a LPBK at the associated termination has failed.

For CPE LPBK test procedures that have aborted, testing was not performed, as the DSL specified had a CPE in a LPBK state (from a previous test request). When this condition exists, the test procedure attempts to remove the CPE LPBK before proceeding. In this case, that attempt has failed. If the test procedure has completed, the CPE LPBK termination that was established, could not be removed. That is, the test procedure has left the CPE in a LPBK state.

A CPE LPBK can be removed in several ways. Each time a CPE LPBK test is performed and each time routine port conditioning executes on the associated DSL channel(s), an attempt will be made to remove the "stuck" LPBK. If the DSL is removed from service for greater than 10 minutes or if the CPE is disconnected (unplugged) for 5 seconds, the CPE should drop the LPBK.

FAULT IN LOOP PATH = The data sent out by the test source on the associated DSL channel, was not returned to or recognized by the test source. For a PS test, the test packets were not returned or recognized. For a CS test, the digital bit stream was not returned or recognized.

This failure may indicate that the LPBK at the specified termination point was not established. This may be due to the hardware associated with the LPBK being powered down or unplugged. If an external termination was selected (TERM=EXT), a manual LPBK must be applied prior to testing. This may also be due to the loss of the U-interface (layer 1) somewhere along the loop.

This failure indicates the error rate is too high. This can occur when running a CS BER test at a data rate which exceeds the capabilities of hardware supporting the digital path or loop. For example, the hardware configuration of an SM umbilical or associated digital fanout interface (DFI) can reduce the effective data rate of a DSL B-channel. The configuration of the test equipment SM well as the PUT SM may be suspect.
There is a remote possibility that the test equipment (for example, ISTF, or PH) is faulty. If test equipment is suspect, selectively remove equipment from service and repeat the test to isolate the faulty unit.

This is the expected result when attempting AMI CU LPBK tests, in the absence of CUs (AMI CUs cannot be detected by the switch). For ANSI® U-DSLs, this could indicate that the channel is non-transparent. Non-transparency normally occurs when the U-interface is being restored. When the U-interface is up and the T-interface has been established at the NT1, all channels become transparent to permit layer 2 communication between the CPE and the switch.

The operational/faulty portions of the digital path or transmission loop can be isolated by manually changing the termination point to one closer to the test source. This can be done automatically using SECT or sequence (SEQ) testing modes.

**FCG DETECTED** = The requested test could not be performed because a false cross to ground condition was detected internal to the switch, between the HLSC and the LT. Consider performing diagnostics for the HLSC (refer to the DGN:ISLUHLSC input message) or the metallic-access-network (refer to the DGN:ISLUMAN input message).

**FLB ONLY AT AMI CU1 TO CU4** = On AMI U-DSLs, individual B-channel CU LPBK tests are not allowed. All DSL channels must be placed in LPBK when testing individual DSL channels at AMI CUs.

**HARDWARE** = A hardware problem has been detected. This general status should have a qualifier that implicates specific hardware. For example, a request to activate layer 2 for testing could have failed.

**HARDWARE SWITCHED** = During test execution, the associated unit (refer to qualifier) was switched to a stand-by unit. For example, a logical PH can undergo soft or hard switch during PS LPBK testing. In this case, a different physical PH is now serving the channel(s) under test.

**OFF EQ NUMBER NOT FOUND** = The office equipment number input could not be found in the office data.

**IMPROPER CONDITION** = For CRC testing, this status indicates a failure to properly request an IDCU RDT CRC test. For LPBK testing, this status indicates a failure to properly request the activation or deactivation of a LPBK at the NT1|LT.

The generic definition as specified by TR-303 for this failure condition is, the values of a subset of attributes of the managed object (for example, ISDN frame path termination object) are improper to perform the requested operation. For detailed information consult vendor-specific RDT manual for the operation requested (for example, operate corrupt CRC test, release ISDN LPBK, restore ISDN LPBK).

**INTERRUPTED** = The test procedure has been terminated in response to a processing interrupt. This is the result of another procedure preempting for control of DSL resources. That procedure may have been invoked unconditionally (UCL) and may require control of specific resources (for example, EOC) to properly idle associated channels.

**ISTF|GDSF|PH TEST RESULTS TMO** = The test procedure in the SM timed out waiting for test results from the ISTF or GDSF (for CS testing) or from the PH (for PS testing).

**L1 DOWN AT LT** = The test requested could not be performed, as layer 1 (U-interface) was down between the LT and the first metallic termination. That is, a fault may exist on the loop between the LT and CU1 or the NT1 (if no CUs are present).

This condition can occur with a hardware mismatch, tip/ring faults to ground, or loop resistance that is too high or low. Layer 1 will also be down if CU1 or the NT1 (in the absence of CUs) is powered down or if one of the units (including the LT) is
This condition can also occur if the ANSI® NT1 or CU is in "quiet mode". This mode is activated for specific metallic tests; however, activation should not last longer than 1 to 2 minutes (refer to ANSI® NT1 and CU hardware documentation for details).

Consider performing a mismatch test or various metallic tests to determine the specific characteristics of this loop. Metallic-loop tests are available using Integrated Mechanized Loop Test (IMLT) systems and the TLWS metallic-testing menu 5600.

**L1 DOWN AT NT1|CU|LT** = The test requested was not performed, as Layer 1 (U-interface) was found down somewhere beyond the AMI U-DSL LT. This can be caused by a fault on the loop between the LT and the NT1. Reasons for this condition exist under "L1 DOWN AT LT".

**LPBK SETUP** = An attempt to set up a LPBK at the indicated termination has failed.

**LPBK UNSUPPORTED** = The LPBK termination indicated cannot be provided by the associated unit. Observe the qualifier for unit identifiers.

**LT ALT EOC STUCK ON** = The line termination alternate embedded operations channel (AEOC) is stuck in an activated state. This condition implies a faulty LT and will prevent access to the NT1 or CUs. Consider performing the LT diagnostic.

**LT AND NT1|CU MISMATCH** = A hardware mismatch has been detected. Specifically, the LT circuit pack installed in the ISLU and the electrical characteristics of the first metallic termination (NT1|CU) beyond the LT do not match the U-DSL type (ANSI® |AMI) as defined in the ODD. Determine the U-DSL type as defined in the ODD. Refer to RC/V View 22.7 for ISLU, 22.21 for ISLU2, and 23.2 for both. Also reference the LT type as displayed on the MCC. Refer to MCC Display Page 1720,y,z,x for ISLU or 1730,y,z,x for ISLU2.

**LT LOOP-BACK SETUP FAILED** = A problem was detected in establishing a line termination LPBK. Consider performing the LT diagnostic.

**LT OOS IN ISLU MEMORY** = The line termination has an OOS status in ISLU memory. This is inconsistent with the LT status in SM memory. The requested operation has been terminated. If this condition is chronic, restoring the LT to service (removing it to OOS first if required) should update ISLU memory for the LT.

**LT TYPE TO ODD MISMATCH** = A hardware mismatch has been detected. Specifically, the LT circuit pack installed in the ISLU does not match the U-DSL type (ANSI® |AMI) as defined in the ODD. Determine the U-DSL type as defined in the ODD. Refer to RC/V View 22.7 for ISLU, 22.21 for ISLU2, and 23.2 for both. Also reference the LT type as displayed on the MCC. Refer to MCC Display Page 1720,y,z,x for ISLU or 1730,y,z,x for ISLU2.

**MISSING NT1|CU RSC** = The NT1 or CU resource that the test procedure should own is missing. This indicates the corruption of associated data.

**MLHG ACCESS DN** = The DN submitted, is a multi-line hunt group (MLHG) access DN. This DN, which identifies a group of MLHG member DNs, is not associated with a DSL port; therefore, the DSL to be tested is unknown.

**MP ACCESS DN** = The DN submitted, is a modem pool (MP) access DN. This DN, which identifies a group of MP member DNs, is not associated with a DSL port; therefore, the DSL to be tested is unknown.

**MTCE RSC BSY** = The test has been denied because a needed maintenance resource is temporarily busy. Observe the qualifier for additional resolution.

**NO CH SERVICES** = For user mode testing, the specified user does not subscribe to communication services on the indicated DSL channel. For other cases, the channel to be tested is assigned in the data base; however, the DSL channel has
not been defined.

**NO EOC RSP** = A response has not been received over the EOC from the NT1|CU addressed. Observe the associated qualifier for additional resolution.

**NO RESOURCES** = Resources required by the test procedure are unavailable. Observe the status qualifier for additional resolution. For example, the PH assigned to a pseudo BRI D-channel cannot be used for PS testing.

**NO RESPONSE** = An expected response has not been received. Observe the status qualifier for additional resolution. Examples are a PH that does not respond to layer 2 requests or a CPE (for example, ISDN telephone/modem) that does not respond to requests.

**NO SM RESPONSE** = The test procedure has not received a response from an associated SM. Communications may have been lost during testing. For example, the test procedure may "timeout", while awaiting test results from test equipment.

**NO TESTS RUNNING** = No TST:DSL tests are running. This status is output (in response to a STP:TST-DSL input message), when no TST:DSL procedures are found (in any SM).

**NOT A DSL PORT** = The port specified by (for example: by DN or OEN) is not a DSL. Only DSL ports may be tested using the TST:DSL input message.

**NOT A PRIMARY DN** = The DN that was input was not a primary DN.

**NOT A U-DSL PORT** = The requested test can only be executed on a U-DSL port. For example, the mismatch test can only be performed on an ISLU U-DSL.

**NT1|CU IN TEST MODE SEE UCL** = The test has been terminated, as the NT1 or CU was found to be in "test mode". If testing were to continue, erroneous test results may be returned. The UCL=NTM input parameter can be used to ignore this hardware event. Refer to the ’k1′ = TESTd2 parameter for a definition of "test mode".

**NT1|CU INDETERMINATE** = A mismatch test procedure could not determine if the first termination (NT1|CU) beyond the LT was an AMI or ANSI® termination. The loop may be too long (for example, beyond designed limits) or there may be a metallic-loop fault present.

Perform voltage, resistance, and capacitance metallic tests to determine the specific characteristics of this loop. Metallic-loop tests are available using IMLT systems and the TLWS metallic-testing menu 5600.

**NT1|CU MISMATCH DETECTED** = A mismatch test has determined that the electrical characteristics of the first metallic termination (NT1|CU) beyond the LT does not match the U-DSL type (ANSI® |AMI) defined in the ODD. Determine the U-DSL type as defined in the ODD. Refer to RC/V View 22.7 for ISLU, 22.21 for ISLU2 and 23.2 for both. Also, reference the LT type as displayed on the MCC. Refer to MCC Display Page 1720,y,z,x for ISLU or 1730,y,z,x for ISLU2.

**NT1|CU|LT RSC BSY** = The test procedure has terminated as the NT1, CU or LT resource is currently busy.

**OPEN PATH LT TO TST EQUIP** = The digital path could not be established or has been lost, between the test source and the LT.

**OUT OF SERVICE** = The test procedure has been terminated, as equipment supporting the tested DSL is OOS. Observe the status qualifier for the equipment ID. Proceed by restoring the associated equipment prior to testing.

**PM BUFR SCBSY** = All SM buffers used to retrieve the LT and/or CU PM counts are busy. Retry at a later time.

**PM DATA READ TIMEOUT** = The test procedure timed out waiting for a response to a PM read of the LT|CU counters.

**PM DATA TYPE RCVD** = An invalid PM data type has been received for the LT|CUs. Observe the status qualifier for unit ID. The PM data was expected to be marked as current or previous PM report interval counts. Either no counts were received or invalid data was received by the SM. If this failure is chronic, consider diagnosing the LT and
replacing the defective unit(s) (LT|CU).

**PORT IS BUSY** = The DSL port to be tested is busy. Retry the test request at a later time or consider running the test to unconditionally preempt the existing procedure (refer to the UCL=PRMT parameter in the TST:DSL input message).

**PORT NOT OSPS** = The test procedure has been terminated, as the associated port does not support the required OSPS service. Observe status qualifier for specific facility types supported.

**PORT NOT UNDER TEST** = A TST:DSL procedure was not found on the port specified. This status is output in response to a STP:TST-DSL input request for a specific DSL, when no test procedure is currently in progress.

**PORT STILL BUSY** = The test procedure was terminated, as the port to be tested remained busy beyond the specified or defaulted camp-on period (refer to the CAMP parameter in the TST:DSL input message).

This status will print immediately, if the DSL camp-on list is full. This status is also output, if TST:DSL is requested to preempt another procedure that has an equal or higher processing priority (refer to the UCL=PRMT parameter in the TST:DSL input message). In general, high priority procedures must complete and the test request must be resubmitted at a later time.

**PROCESSING FAILURE** = The IDCU RDT operation could not be performed because of an unspecified processing failure. The status strings 'IMPROPER CONDITION', 'ALREADY IN CONDITION' and 'ASSOC ENTITY NOT AVAIL' are a sub-class of processing failures, which may not be offered by all switch vendors.

The generic definition as specified by TR-303 for this failure condition is, an RT failed in processing an action requested on the managed object (ISDN frame path termination). For detailed information consult the vendor specific RDT manual for the operation performed (release ISDN LPBK, restore ISDN LPBK, operate corrupt CRC test).

**PROTECTED LINE SWITCH** = The test procedure was terminated, as the RDT DS1 in use is currently switched over to the spare/protection DS1.

**PROTECTION|SPARE DS1** = The test procedure was terminated, as the IDCU RDT digital signal 1 (DS1) facility selected is reserved for sparing (for example, protection) operations only.

**PX DETECTED** = A mismatch test procedure could not be run, as a power cross was detected on the tip/ring at the LT.

Perform voltage, resistance, and capacitance metallic tests to determine the specific characteristics of this loop. Metallic-loop tests are available using MLT systems and the TLWS metallic-testing menu 5600.

**REQ SPECIFIC CH WITH UCL** = When TST:DSL is requested to unconditionally preempt another procedure, the DSL channel to be tested must be explicitly identified (refer to the UCL=PRMT parameter in the TST:DSL input message). For example, the testing of "any B-channel" (that is, CH=B) does not identify which of possibly two B-channel procedures should be terminated.

**REQUEST QUEUED** = The requested test was accepted by the system, but it was queued because other jobs are currently running.

**RMV PORT TO OOS** = The specified DSL must be removed from service prior to testing. This is required for DSLs supporting facilities that employ resident procedures which are always in control of associated DSL channels. Examples of such facilities are DLs and APs and OSPS DSLs.

**SM UNAVAILABLE** = The input request could not be processed, as communication with the associated SM is not currently possible.
STOP NOT ALLOWED = The test procedure that is in progress on the DSL cannot be stopped. This status is output in response to a STP:TST-DSL input message, when a CRC test procedure is in progress on an IDCU or DNU-S DSL. The RDT standard does not provide for stopping CRC test procedures.

SYSTEM EXCEPTION = The test procedure has been terminated, as an unexpected error condition has been encountered. For example, an internal interface has returned an unknown failure code. Repeated display of this status could be a program bug.

T OR R LOW RESISTANCE = A mismatch test has detected a low resistance between tip and ring, tip and ground, or ring and ground at the LT as connected to the first metallic termination (NT1|CU).

Perform voltage, resistance, and capacitance metallic tests to determine the specific characteristics of this loop. Metallic-loop tests are available using MLT systems and the TLWS metallic-testing menu 5600.

T OR U INTERFACE DOWN = The test requested could not be performed because Layer 1 (that is, T|U-interface) is down somewhere on the DSL. If the T-interface is down, the CPE, NT1 or LT may be faulty (that is, cannot establish layer 2 protocol). The U-interface may be down due to a fault between the LT and the NT1. If the U-interface is down, the T-interface will also be down. In any case, there will be no response at the CPE.

Proceed by running a mismatch test to obtain additional information. The fault can be sectionalized by using the SECT or SEQ modes of testing to isolate the point on the loop with the U-interface down. Perform voltage, resistance, and capacitance metallic tests on the loop to determine the specific characteristics of any metallic-loop fault that may be present.

T TO R HIGH RESISTANCE = A mismatch test has detected that a high loop resistance exists between tip and ring at the LT, as connected to the first metallic termination (NT1|CU).

Perform voltage, resistance, and capacitance metallic tests to determine the specific characteristics of this loop. Metallic-loop tests are available using MLT systems and the TLWS metallic-testing menu 5600.

TEI UNASSIGNED = The specified TEI is not assigned on the DSL specified. Refer to the OP:CPE input message to obtain a list of active TEIs.

TEI DN CONFLICT = The user (specified by DN) is not bound to a CPE; however, the TEI entered is assigned to a CPE that is bound (to a different DN). In this case, two users have been identified and the test procedure will not arbitrate which users services should be tested. Use the OP:CPE input message to obtain a list of active TEIs and associated CPE binding.

TERMINATION LOST = The LPBK termination was lost during testing. Observe the qualifier for the affected unit ID. For example, the CPE was disconnected (that is, unplugged) during a long duration CPE LPBK test.

TEST EQUIP CNTRL FAILURE = The test equipment did not respond properly to an operational request. For CS LPBK testing, this may indicate a defective ISTF|GDSF circuit.

TEST EQUIP UNAVAIL = The associated test equipment may be in use by another procedure or may be OOS. For the ISTF|TTF|GDSF all logical test ports (LTP) are unavailable. For PS testing only one test may be performed per PH; therefore, the PH may already be testing (on one of 128 PH channels).

For the ISTF|GDSF, this can occur frequently, if resources are in great demand or if the unit or services are incorrectly grown (refer to the Hardware Change Procedures manual for the growth of the DSU2-ISTF|GDSF unit and associated services). The ISTF|GDSF resource is used by various test facilities to evaluate ISDN trunks and lines. Some examples are, IMLT, TLWS manual and automated
trunk testing and the basic rate interface test line (BRITL).

**TEST RSC UNAVAILABLE** = The associated test resource was busy, OOS or non-existent.
Observe the status qualifier for possible resource identification (ID). For example, if the channel under test is a pseudo BRI D-Channel, an active PH channel is not assigned; therefore, PS testing cannot proceed. For mismatch testing the HLSC may be busy or the metallic test buss may be unavailable.

**TESTING BEGINS** = This message indicates that the test procedure has successfully obtained ownership of all required DSL resources. The test procedure now proceeds to obtain control of any required test equipment and to establish all conditions necessary to start testing.

**TIMEOUT FOR RSP** = The testing procedure within the administrative module (AM) timed out waiting for a response. This can occur if the SM becomes isolated during testing or if the associated SM procedure terminates prematurely.

**TIP AND RING REVERSAL** = A mismatch test has detected a tip and ring reversal on an AMI U-DSL.

**UNABLE TO ACCESS LT** = The test procedure could not access the line termination. This could indicate that all communication links connecting the LU are busy or that a database problem exists. Resubmit the request.

**UNEXPECTED NT1|CU RSP** = The NT1 or CU reply for the requested operation was unexpected. The CU and/or LT may be faulty. Consider performing a LT diagnostic. Observe the status qualifier for additional information.

**UNEXPECTED PKTS RcVD** = During a PS LPBK test, the PH received more packets than it transmitted. This can occur on "noisy" transmission loops.

**UNIT TYPE RcvD** = An invalid PM unit type has been received with the requested PM data. The PM data was expected to be marked as having been received from a LT or CU. Observe the status qualifier for expected unit ID. Either no PM data was received from the CUs or invalid data was received from the LT. Consider a LT diagnostic. Resubmit the request.

**USER UNKNOWN** = The test request does not identify a specific DSL user. The DSL user must be identified when performing USER mode tests. That is, when user subscribed communication services are to be tested.

**UTC TO EOC RSP** = The NT1 or CU replied that it was unable to comply with the requested operation. The associated unit may not support the requested operation. Observe the status qualifier for ID of the unit that could not comply.

*Qualifiers to the testing status. The qualifier provides additional resolution for more general status strings. That is, general failures may be associated with specific hardware or events with the status qualifier. The status qualifier can be different for each DSL channel tested. Valid value(s):*

**CPE** = Customer premises equipment.
**CH** = DSL channel.
**CU** = Channel unit.
**DA|TAOPER** = The request is valid for DSL facilities supporting directory assistance operator (DAOPER) or toll assistance operator (TAOPER) service classes.
**DSL** = Digital subscriber line.
**EOC** = Embedded operations channel.
**HLSC** = High-level service circuit.
**ISTF** = Integrated services test function.
**ISTF|PH** = Integrated services test function or protocol handler.
**LT** = Line termination.
**LT&NT1|CU** = Line termination and network termination 1 or just the channel unit.
**LT|ISLU** = Line termination or integrated services line unit.
**LT|NT1|CU** = Line termination, network termination 1 or channel unit.
u\(^1\) = The blocked DSL channel indicator. The test procedure will indicate which of the 2B+D DSL channels are blocked for testing in the "testing begins" output message (Format 2). When this output message is generated, the test procedure has control of the associated DSL channels. If the block channel indicator is not shown, the test procedure does not require the use of any 2B+D DSL channel. Valid value(s):

- **2B+D** = All DSL channels are blocked for testing.
- **D+B1** = The D-channel and B1-channel are blocked for testing.
- **D+B2** = The D-channel and B2-channel are blocked for testing.
- **B1+B2** = Both B-channels are blocked for testing.
- **D** = The D-channel is blocked for testing.
- **B1** = The B1-channel is blocked for testing.
- **B2** = The B2-channel is blocked for testing.

v\(^1\) = The job status. The job status is used to provide general information as relating to all DSL channels under test. That is, the job status will be the same for all DSL channels tested. The job status is used to identify abnormal procedural directives, concurrent maintenance procedures, implied limitations, and so forth. One or more job status strings may be output at the same time, separated by a colon. Valid value(s):

- **ALL DSL RSC BSY** = All of the DSL resources (EOC, NT1, CUs, LT, CRC, PM, etc.) are busy.
- **ATTEMPT INTERRUPT** = Procedures associated with this U-DSL have been preempted, to restore normal DSL operations (refer to job status ‘SENT INTERRUPT’); however, this action has failed to free the EOC. In this case, the DSL is forced into normal operating condition (without EOC control). This may disrupt other test procedures using the NT1 or CUs; however, normal customer service will be restored.
- **B1 LB IP** = A B1-channel LPBK was in progress during this test request.
- **B1,B2 LB IP** = Both B1-channel and B2-channel LPBKS were in progress during this test request.
- **B2 LB IP** = A B2-channel LPBK was in progress during this test request.
- **CRC TST IP** = A CRC test was in progress during this test request.
- **CU FLB IP** = A CU LPBK of all channels (full LPBK) was in progress during this test request. It is not possible to access units (CU|NT1) beyond the associated LPBK termination. For example, if CU PM counts are being read, the PM counts from CUs beyond that termination cannot be retrieved.
- **CU TST IP** = A CU test was in progress during this test request.
- **DLB IP** = A D-channel LPBK was in progress during this test request.
- **EOC BSY** = An EOC resource was busy during this test request.
- **FLB IP** = A LPBK of all channels (full LPBK) was in progress during this test request.
- **ISDN FAIL** = An ISDN FAIL message was received during this test request. This test request was immediately terminated.
- **LT FLB IP** = A LT LPBK of all channels (full LPBK) was in progress during this test request. It is not possible to access units (CU|NT1) beyond the LT.
LT TST IP = A test at the LT was in progress during this test request.

LT|CU PM READ IP = A LT|CU PM read was in progress during this test request.

MMT ATP = An automatically invoked mismatch test has completed with all tests passed. This implies that the LT, as connected to CU1 or the NT1, appears correct. That is, the link between the associated units should support the U-interface (layer 1).

MMT PF = A mismatch test has been automatically invoked. The test results will follow in a subsequent output message (note the 'MMT ATP' or 'MMT RESULTS' job status in that message).

MMT RESULTS = An automatically invoked mismatch test has completed with the indicated status. More detailed results may be obtained by manually invoking the mismatch test.

NT TST IP = The NT1 was in use by another test procedure during this test request.

NT1 FLB IP = A NT1 LPBK of all channels was in progress during this test request.

SENT INTERRUPT = Procedures associated with this U-DSL have been preempted to restore normal DSL operations. This action has been taken because the EOC resource has been unavailable for too long. In this case, procedures that must use the EOC would fail to properly idle the associated DSL channels (for example, to remove a LPBK termination). This will be disruptive to test procedures using the NT1 or CUs.

SSR = The test procedure was stopped by a customer service request. That is, this test was terminated because the customer went off hook or received a voice call. The test request specified that the test procedure should be made interruptible for customer origins and/or terminations (refer to the INT and MDUR parameters in the TST:DSL input message).

TEST MODE = The data presented was obtain while the NT1 or CU was in "test mode". Refer to the 'k1' = TESTd2 parameter for a definition of "test mode".

UCL = The request to perform testing unconditionally has produced the associated result (refer to the UCL parameter in the TST:DSL input message).

w1 = Unit identifier. Valid value(s):

CUb2 = The CU interval PM counts for CUb2 follow on this line. The CU counts are output in pairs (CU1 & CU2, CU3 & CU4, and so forth), in separate messages following the output of LT counts. Note, that the V (verbose) parameter must be specified to obtain CU PM counts.

The BRITE CUs are designed to monitor PM counts on a "PATH" basis. That is, the LT downstream and upstream counts will contain PM counts that have occurred anywhere along the U-DSL. In particular, any CRC error detected by a CU is recorded as a BE at that CU and an error is propagated (by transmitting an invalid CRC) in the same direction (downstream or upstream) as appropriate.

For example, if CU2 is first to detect a downstream CRC error, CU2 will count this as a downstream BE and send an invalid CRC downstream to CU3 (or the NT1 if no CU3 is equipped). In this way, each downstream CU and NT1 will count one BE in the downstream direction. Upon receiving the downstream-invalid CRC, the NT1 will send a FEBE to the LT to indicate the NT1 has detected a BE. Upon receiving the FEBE, the LT will count one BE in the downstream direction. In this example, CU1 would not have counted a BE in the downstream direction. The LT and CU2 through CU6 would have counted one BE in the downstream direction. The LT and the CUs would not have counted a BE in the upstream direction.

LT = Line termination hour upstream and downstream PM counts. When the LT counts are output, only two lines of the output table are required. The CU counts are output in subsequent messages.

The LT downstream PM counts are a record of the far-end block errors (FEBE), as
detected by the NT1. For an ANSI® U-DSL, the NT1 can indicate a FEBE once every superframe (12 milliseconds). For CRC testing, each superframe that is sent (in the downstream direction) should indicate a FEBE. The LT will record one downstream BE for every superframe received from the NT1 indicating a FEBE. In addition, the LT will count an ES or severely errored second (SES) as appropriate.

\[ x^1 \]

= Upstream and downstream PM BE.

The CRC test proceeds by corrupting the CRC for every ANSI® superframe (12 milliseconds). The corrupt superframe is then transmitted downstream (that is, LT toward the NT) and then back upstream (that is, NT toward the LT). This means that the BE PM counters should accumulate at a rate of 83.3 BE per second.

\[ y^1 \]

= Upstream and downstream SES.

An SES occurs when a specific number of BEs occur in one second. For CUs, the allowable number of BEs is fixed at 3 per second. For LTs, the allowable BEs per second is recent changeable (refer to RC/V View 8.1). The CU SES counts and the LT SES counts can only be correlated, if the allowable BEs/sec is the same for each case. The SES and ES should be very nearly equal (within 1 or 2).

\[ z^1 \]

= Upstream and downstream ES.

The ES counter will increment once for approximately every second the test runs. The BE count should be 83.3 times the ES count. The ES and SES should be very nearly equal (within 1 or 2).

\[ a^2 \]

= Status of the PM read.

This is the status for PM reads of the upstream and downstream BE, SES and ES registers for the LT and CUs. Valid value(s):

- **AEOC** = The CU PM counts were not read. The line termination AEOC is stuck in an activated state. This condition indicates a faulty LT. This will prevent any access to the NT1 or CUs. Consider performing the LT diagnostic (For example, refer to the DGN;ISLULC input message).

- **COMP** = The PM counts have been read.

- ***COMP** = The PM counts have been read; however, one or more of the PM counters may have overflowed.

- **CRPT** = The PM counts have been read; however, the associated corruption indication flag (CIF) was marked corrupt. There is no CIF for CUs. In this case, the PM counts do not reflect normal operation on the U-DSL for the period being measured.

Examples of events that will result in marking the current-hour LT PM counts corrupt are: manually clearing the PM counts (refer to the EXC:ALE input message), system initializations, digital LPBK testing of all DSL channels using the LT or CU terminations, corrupt CRC testing, and a loss of layer 1 (U-interface) at the LT or beyond a CU.

- ***CRPT** = Same as CRPT; however, one or more of the PM counters has overflowed.

- **INVOP** = The PM counts have not been read, as an invalid PM operation was requested.

- **LTOOS** = The line termination is marked OOS in the LU memory. No data is read from the LT in this case.

- **NGRSP** = The PM counts have not been read, as the CU response was unexpected or invalid.
NODTA = The PM counts have not been read. No PM data was received.
NORSP = The PM counts have not been read, as the CU has not responded (timeout).
UINTF = The PM counts have not been read, as layer 1 (U-interface) is down at the LT. It is not possible to communicate beyond the LT.
UNEQU = The PM counts have not been read, as the channel unit is unequipped.
UTC = The CU has responded with an unable-to-comply message. This CU does not support the reading of PM counts.

\[ \text{h}^2 \]

= ANSI\textsuperscript{®} CU number.

There can be from 1-6 CUs populated (in pairs).

\[ \text{c}^2 \]

= ANSI\textsuperscript{®} CU LINK number.

Where LINKx is indicated the loop is down beyond CUx.

\[ \text{d}^2 \]

= ANSI\textsuperscript{®} CU TEST number.

Where TESTx is indicates the loop is under test beyond CUx.

4. ACTION TO BE TAKEN

For DSL channels indicating bit error rate faults, retry the test using a different LPBK termination, if appropriate, to help isolate the fault (refer to the MODE=SECT parameter in the TST:DSL input message).

For tests that do not complete, determine the reason for failure and retry the test. Besides defective hardware, improperly populated data can prevent access both to the DSL ports as well as to the test equipment.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the test results associated with a TST:DSL input message. Also, to report the test results associated with automatic requests (pokes) to test a digital subscriber line (DSL) using the trunk and line work station (TLWS).

The TST:DSL output message will appear in different forms, primarily dependent on the test type selected. Formats 4 through 10 are unique to specific test types, while Formats 1 and 2 are typical for all test types. Format 3 is unique to explicit requests to prematurely terminate a TST:DSL procedure (refer to the STP:TST-DSL input message). If an active test procedure is found, that procedure will acknowledge the stop request. This allows test specific information to be displayed on output (such as the request number of the terminated procedure). If no active test procedure is found, the STP:TST-DSL procedure will generate the resultant output message; therefore, no test specific information will be seen.

The integrated digital carrier unit (IDCU), and digital network unit - synchronous optical network (SONET) (DNU-S) connect a remote digital terminal (RDT) using the TR-303 interface. The RDT equivalent of the integrated services line unit (ISLU) line card (LC) is called a channel unit (CU). Any type of LC, line circuit (LCKT) or RDT CU are collectively referred to as the line termination (LT) throughout this message. Unless otherwise stated: all references to ISLU include all configurations of the ISLU and the integrated services line unit version 2 (ISLU2). This includes both the remote integrated services line unit (RISLU) and remote integrated services line unit 2 (RISLU2). All references to access interface unit (AIU) include the remote access interface unit (RAIU). Reference to line unit (LU) includes all supported ISDN compatible LUs.

In general, test results will only be presented for tests that normally complete. In other cases, the status string (as in:
**3. VARIABLE FIELD DEFINITIONS**

**CUR** = Current upstream (network termination 1 (NT1) to LT direction) and downstream (LT to NT1 direction) protocol monitoring (PM) counts.

The current PM counts are read in the same order as output. The LT (current hour) and CU (current interval) PM counts will vary with the test duration; however, if the DSL is faulty, a significant deviation between the recorded PM counts can result.

The deviation in the PM counts is most likely the result of recording block errors (BE) while the PM counts were being read, as throughout testing each frame was intentionally corrupted. This could indicate that the CU and/or LT PM counters are not responding properly or the ability to transmit BEs from the LT or NT1 is faulty. Nominally, the deviation between the printed LT and CU errored second (ES) counters is not likely to be more than 3.

**EOT** = End-of-transmission indicates all message sections have been output and the associated test procedure has terminated. Formats that show the EOT parameter as optional can be repeated more than once by a test procedure.

**PORT** = The global port under test (PUT). When an output message provides test results for an individual DSL channel, the CH parameter will be correlated with the PORT. In other cases, (such as: **CH=ALL**) the D-channel PORT will be output.

**PRV** = Previous upstream (NT1 to LT direction) and downstream (LT to NT1 direction) PM counts.

The previous PM counts are read in the same order as output. The LT previous hour PM counts are never modified by corrupt cyclic redundancy check (CRC) testing. The CU previous interval PM counts should also be unaffected.

**+** = The DSL has multipoint service.

**a** = Line termination layer 2 interface type as detected in office-dependent data (ODD). Valid value(s):
- **AMI-RU** = Alternate mark inversion (AMI) U-interface on a remote LU.
- **AMI-U** = AMI U-interface.
- **ANSI-RU** = ANSI(R) U-interface on a remote LU.
- **ANSI-U** = ANSI U-interface.
- **RT** = T-interface on a remoted LU.
- **T** = T-interface.

**b** = Subscriber directory number (DN) associated with the DSL tested. If a specific subscriber has been specified, that users DN will be output.

**c** = Office equipment number (OEN). Valid value(s):
- **AIUEN** = AIU equipment number (AIUEN).
- **LCEN** = line card equipment number (LCEN).
- **LCKEN** = line circuit equipment number (LCKEN).
- **ILEN** = IDCU line equipment number (ILEN).
- **INEN** = integrated digital loop carrier (IDLC) networking line equipment number (INEN).
d  = Switching module (SM) number.
e  = ISDN LU number.
f  = IDCU number.
g  = DNU-S number.
h  = Line group controller number.
i  = Line board/pack number.
j  = RDT number.
k  = Line card number.
l  = Line circuit number.
m  = RDT channel unit number.
n  = Terminal endpoint identifier (TEI). In general, if a TEI is submitted on input, that TEI will be presented on output. However, if the TEI is invalid and the identifier is not required for testing, it will not be output. If a DN submitted on input is "bound", the TEI output will be the TEI of the customer premises equipment (CPE) "bound" to that user (refer to the TEI parameter in the TST:DSL input message.)
o  = DSL channel(s) (CH) tested. For CRC testing, the 2B+D channels are not tested; however, associated output messages will provide the D-channel PORT name and the CH parameter will be used to identify that PORT. Note that the CH parameter(s) may not indicate all channels owned by the test procedure. Refer to variable 'u' for that purpose. Valid value(s):
   ALL  = All equipped channels.
   B    = Any idle B-channel.
   B1   = B1-channel.
   BB   = Both B-channels.
   D    = D-channel.
p  = SM number associated with the port under test.
q  = Port number in hexadecimal.
r  = Basic status of port. Valid value(s):
   IS   = Port under test is in-service (IS).
   OOS  = Port under test is out-of-service (OOS).
s  = Test type performed. Valid value(s):
   AUTO = The test type was to be determined automatically based on the DSL channel basic/logical type; however, the indicated failure has prevented testing on the associated channel(s).
   CS   = Specifies the digital loop-back (LPBK) testing of circuit-switched (CS) hardware and the associated path and/or loop.
   CRC  = Specifies corrupt CRC testing of the associated ANSI U-DSL. However, if the test duration (DUR) is zero seconds, a test is not performed. In this case, only the
current and previous hour PM counts are read and output. The CRC test does not corrupt normal 2B+D DSL operations.

**CRC-DWN** = Performed a CRC test using the downstream registers of the LT on the U-DSL, reporting only downstream PM results on output.

**CRC-UP** = Performed a CRC test using the upstream registers of the LT on the U-DSL, reporting only upstream PM results on output.

**MSMTCH** = Specifies the detection of a mismatch between the LT and the NT1 or CU, for a ISLU U-DSL.

**ODPS** = Specifies the digital LPBK testing of on-demand packet-switched (ODPS) hardware and the associated path and/or loop.

**OSPS** = Specifies the voice-path analog continuity testing to an Operator Services Position System (OSPS) terminal.

**PS** = Specifies the digital LPBK testing of packet-switched (PS) hardware and the associated path and/or loop.

**t** = The LPBK termination (TERM) type used during testing. Valid value(s):
- **CPE** = The LPBK termination was provided within the CPE. Specifically, within the integrated service digital network (ISDN) telephone or data terminal.
- **CUb²** = The LPBK termination was provided within the specified channel unit.
- **EXT** = No attempt was made by the switch to set up a LPBK termination. An external (EXT) LPBK termination must be manually applied in this case.
- **LT** = The LPBK was provided within the LT. For ISLU the LT is the LC, for ISLU2 and AIU the LT is the LCKT, and for IDCU and DNU-S the LT is the RDT CU.
- **NT1** = The LPBK was provided within the NT1 located at the customer end of the 2-wire loop.
- **PH** = The LPBK was provided by the protocol handler (PH) on a PH channel that serves the associated DSL channel.

**u** = The test duration (DUR) indicates the total duration of the test in seconds. If the test was stopped for a customer service request the duration will reflect the period of time that test data was transmitted (refer to the INT parameter in the TST:DSL input message). A test duration of zero seconds implies that a test was not performed. In this case, a CRC test request will only read and output the current PM counts. For CRC testing, the test duration output is the length of time corrupt CRC was transmitted between the LT and the NT1; however, for ISLU and AIU DSLs the duration output will always be greater than the requested test duration. This occurs because starting/stoping the test is dependent upon obtaining control of the embedded operations channel (EOC) and the LU performing the requested action.

**v** = Data-rate (RATE) of the CS digital bit stream. Refer to the "RATE" parameter within the TST:DSL input message for extended description. Valid value(s):
- **AUTO** = The data rate had not been selected automatically.
- **64CLR** = 64000 bits/sec clear channel (zero-octet allowed).
- **64RES** = 64000 bits/sec restricted (zero-octet suppressed).
- **56KPS** = 56000 bits/sec.

**w** = The block-size (BLKSZ). The CS digital bit stream is partitioned into segments called blocks, for the purpose of calculating the total errored-blocks (ERBLK). The block-size is the number of bits in each block.

**x** = Test equipment SM number. This parameter specifies the location of the high level service circuit (HLSC), integrated services test function (ISTF), global digital services function (GDSF) or PH used
as the test source for the test request. The HLSC equipment number (HLSCEN) and PH equipment number (PHEN) should always indicate the test equipment is located in the same SM as the PUT. However, the ISTF equipment number (ISTFEN) and GDSF equipment number (GDSFEN) will indicate any SM where associated equipment has been populated. The ISTF and GDSF are globally routed resources.

\[ y \] = Test equipment ISLU unit number.

\[ z \] = HLSC service group number.

\[ a \] = Test equipment unit number. This is the HLSC, ISTF, GDSF or PH unit used to evaluate the DSL under test. The PH unit is the logical PH group number.

\[ b \] = test equipment data interface (DI) number.

\[ c \] = Test equipment peripheral interface data buss (PIDB) number.

\[ d \] = Test equipment PIDB channel.

\[ e \] = logical PH channel.

\[ f \] = LT hardware type (LTTYPE) as detected by mismatch test. Valid value(s):

\begin{enumerate}
\item AMI-RU = AMI U-interface on a RISLU.
\item AMI-U = AMI U-interface on ISLU.
\item ANSI-RU = ANSI ANSI U-interface on a RISLU.
\item ANSI-U = ANSI U-interface on ISLU.
\item RT = T-interface on a RISLU.
\item T = T-interface on ISLU.
\item Z = Z (analog) interface.
\end{enumerate}

\[ g \] = The type of NT1 or CU detected during a mismatch test (NT|CU). Valid value(s):

\begin{enumerate}
\item AMI = An AMI NT1 or CU was detected.
\item ANSI = An ANSI NT1 or CU was detected.
\end{enumerate}

\[ h \] = Elapsed time (ET) measured in milliseconds. This is the time taken to read the PM counts from a pair of CUs (CUs 1 & 2, or 3 & 4, or 5 & 6). The time to read PM counts will vary based on factors such as the condition of the loop between the LT and the NT1 and system load. The CUs farthest from the switch will take more time to read. The ET will be from 5-11 seconds (that is, 5000-11000 msec) for a pair of CUs. If a satellite transmission link is present, the read will take an additional 3 to 5 seconds per pair of CUs (assuming 500 msec round trip delay).

\[ i \] = DSL layer 3 interface type (ITYPE). The ITYPE may be qualified with the DSL service class, where significant to testing. Valid value(s):

\begin{enumerate}
\item PP = Custom point-point/single-point DSL.
\item MP = Custom multi-point DSL.
\item RMP = Custom restricted multi-point DSL.
\item STD = Standard DSL.
\end{enumerate}

\[ j \] = Class of service supported on the DSL. This parameter is a qualifier to the ITYPE that will be present when the class of service is significant to the test procedure. Valid value(s):

\begin{enumerate}
\item DL = The DSL supports a data link (DL)**.
\item ISAT = The DSL supports an attendant console terminal.
\end{enumerate}
OSPS = The DSL supports an OSPS facility**.

AP = The DSL supports an application processor (AP)**.

PBRI = The DSL supports a pseudo basic rate interface (BRI). This DSL does not have an active PH channel serving the D-channel. For PS digital testing, the PH is the test source; therefore, PS testing cannot be performed on this D-channel.

** A resident procedure must be disabled prior to testing. That is, the DSL should be removed from service prior to testing (refer to the RMV:LINE or RMV:DATALINK input messages).

k^1 = Equipped channel units (EQCU). The EQCU parameter is used to indicate the number of channel units equipped on an ANSI U-DSL when served by the AIU or ISLU. For IDCU and DNU-S, the number of equipped channel units cannot be determined; therefore, the EQCU parameter will not be output. As many as six CUs may be equipped on an ANSI U-DSL. The number of channel units equipped is determined by polling each unit over the EOC. If a channel unit can be detected or if the EQCU is NONE, the NT1 is present, has power, and can communicate over the EOC. The CUs must be equipped in pairs; therefore, an odd number for EQCU would indicate that at least one CU does not respond. If the number of CUs could not be determined, the NT1 may be inoperative. In such cases, the reason for failure will be output in place of the CU count. Valid value(s):

1–6 = The number of ANSI CUs equipped.

EOC-BSY = The test procedure must own the EOC resource to determine the number of equipped CUs; however, the EOC is currently busy. A concurrent procedure was using the resource (such as, LPBK testing or PM read).

LINKc^2 = The LINK beyond CUB^2 is down (where c^2 equals b^2). That is, the indicated CU was the farthest CU from the switch responding. If the CU is even (2, 4, or 6), layer 1 (U-interface) is down just beyond that CU. If the CU is odd (1, 3, or 5), a carrier system beyond that CU is down. The CU that was detected may be faulty; however, the unit just beyond that CU is a more likely candidate (that is, CUB^2+1 or the NT1).

NONE = No channel units are equipped. That is, the LT is connected directly to the NT1. In this case, the NT1 has responded instead of CU1.

NR = There was no response from CU1 (or the NT1); therefore, the presence of CU1 is indeterminate. Also, Layer 1 (U-interface) appears to be up at the LT. In this case, the failure may be due to CU1, the LT, or the loop between the LT and CU1.

NRT = This has the same meaning as NR; however, the NT1 or some CU appears to be in a "test mode".

TESTd^2 = This has the same meaning as LINKc^2; however, the CU or NT1 is now (or was just prior to the LINK going down) in "test mode". The NT1 or CU is placed in "test mode" by user/customer actions. That is, "test mode" is not initiated by the switch. The "test mode" is activated for local testing of a CU, using the 946A or 950A (or equivalent) test sets. The purpose of the "test mode" indication is to alert office personnel that results from tests initiated at the switch may be corrupt, as local testing at the NT1 or CU is in progress. There is no way to determine if a "test mode" indication is originating from the NT1 or a CU. A valid "test mode" condition may not be detected when the LT is receiving CRC BEs in the upstream direction (NT1 toward the LT). Note that not all manufacturers of NT1s and CUs support the "test mode" indication (that is, NTM bit logic 0). Check manufacturer documentation for details.

UINTF = Layer 1 (U-interface) is down at the LT. It is not possible to determine the EQCU given this condition.

UNKNOWN = The number of channel units equipped is not known. This generally indicates an unexpected failure (for example, loss of LU communication).

11 = IDCU remote terminal digital signal 1 (RTDS1). The RTDS1 carrier was submitted for use as part
of the digital path during testing. If the test has successfully completed, the RTDS1 will be qualified
with the DS1 identifier with respect to the IDCU.

\( m^1 \) = The RDT DS1 facility used during testing with respect to the IDCU. This parameter will qualify
the RTDS1 that was used during testing.

\( n^1 \) = The DSL test request number (REQNO). A unique REQNO is assigned to a test procedure when
it is first established. It is included in all output messages generated. This number is useful for
associating test result messages that may be distributed widely over time, as when performing tests
it multi-section modes.

\( o^1 \) = Bit error rate (BER). The bit error rate is presented in decimal scientific notation with exponent
preceded by "E" (for example, 1.234E-8). The BER represents the total number of errored bits
detected divided by the total number of bits sent.

\( p^1 \) = Errored blocks (ERBLK). The ERBLK is the number of blocks returned from the LPBK termination
during testing, with one or more bit errors. The ERBLK is expressed in decimal scientific notation
with the exponent preceded by "E" (for example, 5.600E1 = 5.600 \times 10^1 = 56).

\( q^1 \) = Packet rate (PKTRATE). The packet rate represents the total number of error-free packets
returned from the LPBK termination during packet-type testing, divided by the total number of
packets sent. The number is expressed as a percentage.

\( r^1 \) = Operational condition of testing. The testing status is comprised of three components.
Specifically, the test condition, test status and the status qualifier. The test condition and the test
status will always be output. The status qualifier, which is used to add additional resolution to
general status strings, is not always required. The test condition, which is delineated from the status
string with a colon, indicates the operational condition of the test procedure for the indicated DSL
channel(s). Valid value(s):

- **ABORTED** = Test could not proceed because the indicated resources could not be obtained.
The test procedure has been terminated. In general, this condition implies that the
test procedure has affected normal DSL operations. That is, DSL resources may be
owned and testing may have been initiated on one or more DSL channels.

- **COMPLETED** = The test procedure has completed normally.

- **ERROR** = An unexpected error condition was detected. The test procedure has been
prematurely terminated.

- **FAILED** = An internal failure has prevented the test procedure from establishing or clearing
condition(s) necessary for digital testing. The test procedure has been terminated.

- **INVALID** = The test request as specified, was invalid for one or more DSL channels to be
tested. In general, normal DSL operations have not been affected on the
associated DSL channel(s). Testing may continue on selected DSL channels or the
test procedure may be terminated entirely (refer to the EOT parameter).

- **STATUS** = The present operational status of the test is presented. The test procedure
continues as indicated.

- **STOPPED** = The test procedure has been terminated in response to a manual request (refer
to the STP:TST-DSL input message) or a customer service request (refer to the
INT parameter in the TST:DSL input message).

\( s^1 \) = Status of testing. The following list contains definitions for all possible test statuses. The test
status indicates the disposition of testing for the indicated channel(s). For general status strings, a
qualifier will be used to add the required resolution. Valid value(s):

- **ALREADY IN CONDITION** = For LPBK testing, the IDCU RDT is indicating that the requested
LPBK state already exists. For CRC testing, the test request has been rejected, as
the IDCU RDT is currently performing a CRC test. The generic definition as specified by TR-303 for this failure condition is, the managed object (that is, the ISDN frame path termination object) is already in the condition requested. For detailed information consult vendor-specific RDT manual for the operation requested (that is, Operate corrupt CRC test, release ISDN LPBK, restore ISDN LPBK).

ASSOC ENTITY NOT AVAIL = The IDCU RDT is unavailable for LPBK or CRC testing. The generic definition as specified by TR-303 for this failure condition is, the managed object (ISDN frame path termination object) has an associated entity which is unavailable due to the entity being in an improper condition, being busy or having failed. For detailed information consult the vendor-specific RDT manual for the operation performed (release ISDN LPBK, restore ISDN LPBK, operate corrupt CRC test).

AT LEAST ONE CU EQUIP = At least one CU is equipped on this U-DSL.

ATP = The test request completed all tests pass (ATP). That is, the criteria for a passing test has been obtained. For example, if this was a CS test the BER and ERBLK are zero. For mismatch testing, no mismatch was detected.

BAD INT FOR REQUEST = The test cannot be made interruptible for the specified customer requests, given the DSL channels to be tested. For example, if the test request included the D-channel, the test procedure cannot be made interruptible for customer service originations. That is, the setup request cannot be seen if the D-channel is tested (refer to the INT parameter in the TST:DSL input message).

BAD ISLU TASK REQUEST = The ISLU did not recognize the test or operation being requested.

BAD TERM FOR CH = The LPBK termination was not valid for the channel(s) to be tested. For example, NT1 terminations are not possible on a T-DSL.

BAD TERM FOR TEST = The LPBK termination was not valid for the test specified. For example, the OSPS test type can only use an EXT LPBK termination.

BAD TEST FOR CH = The specified test was invalid for the DSL channel specified. For example, an OSPS test cannot be performed on the D-channel or B2-channel of a DSL.

BAD TEST FOR PORT = An invalid test configuration or combination of test parameters associated with the DSL port has been requested. For example, a CRC test may only be performed on an ANSI U-DSL. For IDCU and DNUS, the direction of the CRC test must be specified. The mismatch test is only supported for ISLU DSLs.

BAD TEST REQUEST = An invalid test configuration or combination of test parameters has been detected. For example, an invalid starting termination was specified for a sectionalization (SECT) mode test.

BLOCKED BY LT SPARING = A mismatch test could not be run because the ISLU metallic test bus was not available. The bus was in use by LT sparing. This condition exists when trying to gain metallic access to a LT that is in the same half of a line group drawer as an actively spared faulty LT. The phrase, "Same half of a line group (LG) drawer" refers to those line groups that are vertically adjacent (for example, LG0 and LG1 or LG2 and LG3).

BUSY CAMPED ON = A DSL resource required for testing is currently busy. The test procedure will wait for control of the resource, for the specified or defaulted camp-on time.

BY REQUEST = The results are in response to an explicit user request. For example, the test procedure can be terminated by manual request (refer to the STP:TST-DSL input message).

CANNOT RE-GAIN EOC RSC = The test procedure could not regain control of the EOC after waiting a sufficient length of time. This condition may prevent the test from continuing to the next test section and prevent proper DSL idling (for example: removing a LPBK at CU or NT1). This may have disrupted the normal operation of the U-DSL. If necessary, manually restore the DSL to properly condition it for customer service. This situation can occur when the EOC resource is held by other
procedures for too long. Normally, the EOC is only required for a short period of time (less than 25 seconds). There can be several procedures "waiting" to use the EOC at the same time.

CH ACTIVATION = The test procedure failed when attempting to activate the associated DSL channel(s) for testing.

CH TYPE IS CS = The basic/logical type of the associated DSL channel is circuit-switched.

CH TYPE IS PS = The basic/logical type of the associated DSL channel is packet-switched.

CH UNASSIGNED = The office data indicated that associated DSL channel was unequipped.

CMP UNAVAILABLE = The input request could not be processed because the communications module processor (CMP) is unavailable.

CPE NOT BOUND = The CPE specified on input was not bound on the specified DSL.

CPE UNKNOWN = The test request did not sufficiently identify the specific CPE to be used.

CU NOT EQUIPPED = The channel unit that was requested is not equipped.

DATA FOLLOWS = The LT and/or CU PM data follows in tabular format.

DATA FOLLOWS: POSS PM FRZ = The LT and/or CU PM data follows in tabular format; however, a possible PM freeze was scheduled for the LTs and/or the CUs. That is, the current PM counters will be shifted to previous counters and the current counters will be cleared. Before proceeding to read the PM counts, wait for any in-progress freeze to complete. This ensures that all PM counts have shifted before being read. If a PM read or a LPBK of all channels is in progress at a CU or LT when a freeze is scheduled, no freeze should occur on the U-DSL (that is, no shift in the PM counts). A PM freeze is scheduled once per hour for the LT and once every PM-report interval (refer to RC/V View 8.1) for the CUs. The freeze operation lasts for about 10 seconds.

DATA FOLLOWS: POSS STUCK PM FRZ = The LT and/or CU PM data follows in tabular format; however, in the SM it appears that a PM freeze operation has been "stuck" active longer than expected. Refer to 'DATA FOLLOWS: POSS PM FRZ' for definition of a PM freeze.

DATABASE PROBLEM = Data required to perform the test could not be read. This may be due to a loss of communications with the associated SM or missing/corrupt office data.

DGR = The CS test results are degraded. That is, the BER is greater than zero, but has not reached the designated failure threshold set by the acceptable bit error rate (refer to the acceptable bit error rate (ABER) parameter in the TST:DSL input message).

DN NOT FOUND = The directory number was not found in the data base.

RT DS1 FACILITY FOR = The RTDS1 facility is invalid for the DSL channel or RDT specified. Observe the qualifier for proper element.

RT DS1 OOS = Testing cannot be performed, as the DS1 supporting the DSL requested is OOS.

DSL RSC BSY = The request could not continue, as the required DSL resources were found to be busy.

EXPECT CU1 TO CU4 = Only CU1 through CU4 are supported for AMI hardware.

FAILED = The requested test has failed. For PS tests at least 98% of the transmitted packets were returned with errors. For CS tests, the BER has exceeded the failure threshold set by the ABER (refer to the ABER parameter in the TST:DSL input message).

FAILED TO UNLOOP = An attempt to remove a LPBK at the associated termination has failed. For CPE LPBK test procedures that have aborted, testing was not performed, as the DSL specified had a CPE in a LPBK state (from a previous test request). When this condition exists, the test procedure attempts to remove the CPE LPBK before proceeding. In this case, that attempt has failed. If the test procedure has completed, the CPE LPBK termination that was established, could not be removed. That is, the test procedure has left the CPE in a LPBK state. A CPE LPBK can be removed in several ways. Each time a CPE LPBK test is performed and each time
routine port conditioning executes on the associated DSL channel(s), an attempt will be made to remove the “stuck” LPBK. If the DSL is removed from service for greater than 10 minutes or if the CPE is disconnected (unplugged) for 5 seconds, the CPE should drop the LPBK.

**FAULT IN LOOP** = The data sent out by the test source on the associated DSL channel, was not returned to or recognized by the test source. For a PS test, the test packets were not returned or recognized. For a CS test, the digital bit stream was not returned or recognized. This failure may indicate that the LPBK at the specified termination point was not established. This may be due to the hardware associated with the LPBK being powered down or unplugged. If an external termination was selected (TERM=EXT), a manual LPBK must be applied prior to testing. This may also be due to the loss of the U-interface (layer 1) somewhere along the loop. This failure indicates the error rate is too high. This can occur when running a CS BER test at a data rate which exceeds the capabilities of hardware supporting the digital path or loop. For example, the hardware configuration of an SM umbilical or associated digital fanout interface (DFI) can reduce the effective data rate of a DSL B-channel. The configuration of the test equipment SM well as the PUT SM may be suspect. There is a remote possibility that the test equipment (for example, ISTF, or PH) is faulty. If test equipment is suspect, selectively remove equipment from service and repeat the test to isolate the faulty unit. This is the expected result when attempting AMI CU LPBK tests, in the absence of CUs (AMI CUs cannot be detected by the switch). For ANSI U-DSLs, this could indicate that the channel is non-transparent. Non-transparency normally occurs when the U-interface is being restored. When the U-interface is up and the T-interface has been established at the NT1, all channels become transparent to permit layer 2 communication between the CPE and the switch. The operational/faulty portions of the digital path or transmission loop can be isolated by manually changing the termination point to one closer to the test source. This can be done automatically using SECT or sequence (SEQ) testing modes.

**FCG DETECTED** = The requested test could not be performed because a false cross to ground condition was detected internal to the switch, between the HLSC and the LT. Consider performing diagnostics for the HLSC (refer to the DGN:ISLUHLSC input message) or the metallic-access-network (refer to the DGN:ISLUMAN input message).

**FLB ONLY AT AMI CU1 TO CU4** = On AMI U-DSLs, individual B-channel CU LPBK tests are not allowed. All DSL channels must be placed in LPBK when testing individual DSL channels at AMI CUs.

**HARDWARE** = A hardware problem has been detected. This general status should have a qualifier that implicates specific hardware. For example, a request to activate layer 2 for testing could have failed.

**HARDWARE SWITCHED** = During test execution, the associated unit (refer to qualifier) was switched to a stand-by unit. For example, a logical PH can undergo soft or hard switch during PS LPBK testing. In this case, a different physical PH is now serving the channel(s) under test.

**OFF EQ NUMBER NOT FOUND** = The office equipment number input could not be found in the office data.

**IMPROPER CONDITION** = For CRC testing, this status indicates a failure to properly request an IDCU RDT CRC test. For LPBK testing, this status indicates a failure to properly request the activation or deactivation of a LPBK at the NT1|LT. The generic definition as specified by TR-303 for this failure condition is, the values of a subset of attributes of the managed object (for example, ISDN frame path termination object) are improper to perform the requested operation. For detailed information consult vendor-specific RDT manual for the operation requested (for example,
operate corrupt CRC test, release ISDN LPBK, restore ISDN LPBK).

**INTERRUPTED** = The test procedure has been terminated in response to a processing interrupt. This is the result of another procedure preempting for control of DSL resources. That procedure may have been invoked unconditionally (UCL) and may require control of specific resources (for example, EOC) to properly idle associated channels.

**ISTF|GDSF|PH TEST RESULTS TMO** = The test procedure in the SM timed out waiting for test results from the ISTF or GDSF (for CS testing) or from the PH (for PS testing).

**L1 DOWN AT LT** = The test requested could not be performed, as layer 1 (U-interface) was down between the LT and the first metallic termination. That is, a fault may exist on the loop between the LT and CU1 or the NT1 (if no CUs are present). This condition can occur with a hardware mismatch, tip/ring faults to ground, or loop resistance that is too high or low. Layer 1 will also be down if CU1 or the NT1 (in the absence of CUs) is powered down or if one of the units (including the LT) is faulty. This condition can also occur if the ANSI NT1 or CU is in "quiet mode". This mode is activated for specific metallic tests; however, activation should not last longer than 1 to 2 minutes (refer to ANSI NT1 and CU hardware documentation for details). Consider performing a mismatch test or various metallic tests to determine the specific characteristics of this loop. Metallic-loop tests are available using integrated mechanized loop test (IMLT) systems and the TLWS metallic-testing menu 5600.

**L1 DOWN AT NT1|CU|LT** = The test requested was not performed, as Layer 1 (U-interface) was found down somewhere beyond the AMI U-DSL LT. This can be caused by a fault on the loop between the LT and the NT1. Reasons for this condition exist under "**L1 DOWN AT LT**".

**LPBK SETUP** = An attempt to set up a LPBK at the indicated termination has failed.

**LPBK UNSUPPORTED** = The LPBK termination indicated cannot be provided by the associated unit. Observe the qualifier for unit identifiers.

**LT ALT EOC STUCK ON** = The line termination alternate embedded operations channel (AEOC) is stuck in an activated state. This condition implies a faulty LT and will prevent access to the NT1 or CUs. Consider performing the LT diagnostic.

**LT AND NT1|CU MISMATCH** = A hardware mismatch has been detected. Specifically, the LT circuit pack installed in the ISLU and the electrical characteristics of the first metallic termination (NT1|CU) beyond the LT do not match the U-DSL type (ANSI|AMI) as defined in the ODD. Determine the U-DSL type as defined in the ODD. Refer to RC/V View 22.7 for ISLU, 22.21 for ISLU2, and 23.2 for both. Also reference the LT type as displayed on the MCC. Refer to MCC Display Page 1720,y,z,x for ISLU or 1730,y,z,x for ISLU2.

**LT LOOP-BACK SETUP FAILED** = A problem was detected in establishing a line termination LPBK. Consider performing the LT diagnostic.

**LT OOS IN ISLU MEMORY** = The line termination has an OOS status in ISLU memory. This is inconsistent with the LT status in SM memory. The requested operation has been terminated. If this condition is chronic, restoring the LT to service (removing it to OOS first if required) should update ISLU memory for the LT.

**LT TYPE TO ODD MISMATCH** = A hardware mismatch has been detected. Specifically, the LT circuit pack installed in the ISLU does not match the U-DSL type (ANSI|AMI) as defined in the ODD. Determine the U-DSL type as defined in the ODD. Refer to RC/V View 22.7 for ISLU, 22.21 for ISLU2, and 23.2 for both. Also reference the LT type as displayed on the MCC. Refer to MCC Display Page 1720,y,z,x for ISLU or 1730,y,z,x for ISLU2.

**MISSING NT1|CU RSC** = The NT1 or CU resource that the test procedure should own is missing. This indicates the corruption of associated data.

**MLHG ACCESS DN** = The DN submitted, is a multi-line hunt group (MLHG) access DN. This DN,
which identifies a group of MLHG member DNs, is not associated with a DSL port; therefore, the DSL to be tested is unknown.

**MP ACCESS DN** = The DN submitted, is a modem pool (MP) access DN. This DN, which identifies a group of MP member DNs, is not associated with a DSL port; therefore, the DSL to be tested is unknown.

**MTCE RSC BSY** = The test has been denied because a needed maintenance resource is temporarily busy. Observe the qualifier for additional resolution.

**NO CH SERVICES** = For user mode testing, the specified user does not subscribe to communication services on the indicated DSL channel. For other cases, the channel to be tested is assigned in the data base; however, the DSL channel has not been defined.

**NO EOC RSP** = A response has not been received over the EOC from the NT1|CU addressed. Observe the associated qualifier for additional resolution.

**NO RESOURCES** = Resources required by the test procedure are unavailable. Observe the status qualifier for additional resolution. For example, the PH assigned to a pseudo BRI D-channel cannot be used for PS testing.

**NO RESPONSE** = An expected response has not been received. Observe the status qualifier for additional resolution. Examples are a PH that does not respond to layer 2 requests or a CPE (for example, ISDN telephone/modem) that does not respond to requests.

**NO SM RESPONSE** = The test procedure has not received a response from an associated SM. Communications may have been lost during testing. For example, the test procedure may "timeout", while awaiting test results from test equipment.

**NO TESTS RUNNING** = No TST:DSL tests are running. This status is output (in response to a STP:TST-DSL input message), when no TST:DSL procedures are found (in any SM).

**NOT A DSL PORT** = The port specified by (for example: by DN or OEN) is not a DSL. Only DSL ports may be tested using the TST:DSL input message.

**NOT A PRIMARY DN** = The DN that was input was not a primary DN.

**NOT A U-DSL PORT** = The requested test can only be executed on a U-DSL port. For example, the mismatch test can only be performed on an ISLU U-DSL.

**NT1|CU IN TEST MODE SEE UCL** = The test has been terminated, as the NT1 or CU was found to be in "test mode". If testing were to continue, erroneous test results may be returned. The UCL=NTM input parameter can be used to ignore this hardware event. Refer to the "k1" = TESTd2 parameter for a definition of "test mode".

**NT1|CU INDETERMINATE** = A mismatch test procedure could not determine if the first termination (NT1|CU) beyond the LT was an AMI or ANSI termination. The loop may be too long (for example, beyond designed limits) or there may be a metallic-loop fault present. Perform voltage, resistance, and capacitance metallic tests to determine the specific characteristics of this loop. Metallic-loop tests are available using IMLT systems and the TLWS metallic-testing menu 5600.

**NT1|CU MISMATCH DETECTED** = A mismatch test has determined that the electrical characteristics of the first metallic termination (NT1|CU) beyond the LT does not match the U-DSL type (ANSI|AMI) defined in the ODD. Determine the U-DSL type as defined in the ODD. Refer to RC/V View 22.7 for ISLU, 22.21 for ISLU2 and 23.2 for both. Also, reference the LT type as displayed on the MCC. Refer to MCC Display Page 1720,y,z,x for ISLU or 1730,y,z,x for ISLU2.

**NT1|CU|LT RSC BSY** = The test procedure has terminated as the NT1, CU or LT resource is currently busy.

**OPEN PATH LT TO TST EQUIP** = The digital path could not be established or has been lost, between the test source and the LT.

**OUT OF SERVICE** = The test procedure has been terminated, as equipment supporting the tested DSL is OOS. Observe the status qualifier for the equipment ID. Proceed by restoring the associated equipment prior to testing.
PM BUFR SCBSY = All SM buffers used to retrieve the LT and/or CU PM counts are busy. Retry at a later time.

PM DATA READ TIMEOUT = The test procedure timed out waiting for a response to a PM read of the LT|CU counters.

PM DATA TYPE RCVD = An invalid PM data type has been received for the LT|CUs. Observe the status qualifier for unit ID. The PM data was expected to be marked as current or previous PM report interval counts. Either no counts were received or invalid data was received by the SM. If this failure is chronic, consider diagnosing the LT and replacing the defective unit(s) (LT|CU).

PORT IS BUSY = The DSL port to be tested is busy. Retry the test request at a later time or consider running the test to unconditionally preempt the existing procedure (refer to the UCL=PRMT parameter in the TST:DSL input message).

PORT NOT OSPS = The test procedure has been terminated, as the associated port does not support the required OSPS service. Observe status qualifier for specific facility types supported.

PORT NOT UNDER TEST = A TST:DSL procedure was not found on the port specified. This status is output in response to a STP:TST-DSL input request for a specific DSL, when no test procedure is currently in progress.

PORT STILL BUSY = The test procedure was terminated, as the port to be tested remained busy beyond the specified or defaulted camp-on period (refer to the CAMP parameter in the TST:DSL input message). This status will print immediately, if the DSL camp-on list is full. This status is also output, if TST:DSL is requested to preempt another procedure that has an equal or higher processing priority (refer to the UCL=PRMT parameter in the TST:DSL input message). In general, high priority procedures must complete and the test request must be resubmitted at a later time.

PROCESSING FAILURE = The IDCU RDT operation could not be performed because of an unspecified processing failure. The status strings 'IMPROPER CONDITION', 'ALREADY IN CONDITION' and 'ASSOC ENTITY NOT AVAIL' are a sub-class of processing failures, which may not be offered by all switch vendors. The generic definition as specified by TR-303 for this failure condition is, an RT failed in processing an action requested on the managed object (ISDN frame path termination). For detailed information consult the vendor specific RDT manual for the operation performed (release ISDN LPBK, restore ISDN LPBK, operate corrupt CRC test).

PROTECTED LINE SWITCH = The test procedure was terminated, as the RDT DS1 in use is currently switched over to the spare/protection DS1.

PROTECTION|SPARE DS1 = The test procedure was terminated, as the IDCU RDT digital signal 1 (DS1) facility selected is reserved for sparing (for example, protection) operations only.

PX DETECTED = A mismatch test procedure could not be run, as a power cross was detected on the tip/ring at the LT. Perform voltage, resistance, and capacitance metallic tests to determine the specific characteristics of this loop. Metallic-loop tests are available using MLT systems and the TLWS metallic-testing menu 5600.

REQ SPECIFIC CH WITH UCL = When TST:DSL is requested to unconditionally preempt another procedure, the DSL channel to be tested must be explicitly identified (refer to the UCL=PRMT parameter in the TST:DSL input message). For example, the testing of "any B-channel" (that is, CH=B) does not identify which of possibly two B-channel procedures should be terminated.

REQUEST QUEUED = The requested test was accepted by the system, but it was queued because other jobs are currently running.

RMV PORT TO OOS = The specified DSL must be removed from service prior to testing. This is required for DSLs supporting facilities that employ resident procedures which are always in control of associated DSL channels. Examples of such facilities are DLs
and APs and OSPS DSLs.

SM UNAVAILABLE = The input request could not be processed, as communication with the associated SM is not currently possible.

STOP NOT ALLOWED = The test procedure that is in progress on the DSL cannot be stopped. This status is output in response to a STP:TST-DSL input message, when a CRC test procedure is in progress on an IDCU or DNU-S DSL. The RDT standard does not provide for stopping CRC test procedures.

SYSTEM EXCEPTION = The test procedure has been terminated, as an unexpected error condition has been encountered. For example, an internal interface has returned an unknown failure code. Repeated display of this status could be a program bug.

T OR R LOW RESISTANCE = A mismatch test has detected a low resistance between tip and ring, tip and ground, or ring and ground at the LT as connected to the first metallic termination (NT1|CU). Perform voltage, resistance, and capacitance metallic tests to determine the specific characteristics of this loop. Metallic-loop tests are available using MLT systems and the TLWS metallic-testing menu 5600.

T OR U INTERFACE DOWN = The test requested could not be performed because Layer 1 (that is, T|U-interface) is down somewhere on the DSL. If the T-interface is down, the CPE, NT1 or LT may be faulty (that is, cannot establish layer 2 protocol). The U-interface may be down due to a fault between the LT and the NT1. If the U-interface is down, the T-interface will also be down. In any case, there will be no response at the CPE. Proceed by running a mismatch test to obtain additional information. The fault can be sectionalized by using the SECT or SEQ modes of testing to isolate the point on the loop with the U-interface down. Perform voltage, resistance, and capacitance metallic tests on the loop to determine the specific characteristics of any metallic-loop fault that may be present.

T TO R HIGH RESISTANCE = A mismatch test has detected that a high loop resistance exists between tip and ring at the LT, as connected to the first metallic termination (NT1|CU). Perform voltage, resistance, and capacitance metallic tests to determine the specific characteristics of this loop. Metallic-loop tests are available using MLT systems and the TLWS metallic-testing menu 5600.

TEI UNASSIGNED = The specified TEI is not assigned on the DSL specified. Refer to the OP:CPE input message to obtain a list of active TEIs.

TEI DN CONFLICT = The user (specified by DN) is not bound to a CPE; however, the TEI entered is assigned to a CPE that is bound (to a different DN). In this case, two users have been identified and the test procedure will not arbitrate which users services should be tested. Use the OP:CPE input message to obtain a list of active TEIs and associated CPE binding.

TERMINATION LOST = The LPBK termination was lost during testing. Observe the qualifier for the affected unit ID. For example, the CPE was disconnected (that is, unplugged) during a long duration CPE LPBK test.

TEST EQUIP CNTRL FAILURE = The test equipment did not respond properly to an operational request. For CS LPBK testing, this may indicate a defective ISTF|GDSF circuit.

TEST EQUIP UNAVAIL = The associated test equipment may be in use by another procedure or may be OOS. For the ISTF|TTF|GDSF all logical test ports (LTP) are unavailable. For PS testing only one test may be performed per PH; therefore, the PH may already be testing (on one of 128 PH channels). For the ISTF|GDSF, this can occur frequently, if resources are in great demand or if the unit or services are incorrectly grown (refer to the Hardware Change Procedures manual for the growth of the DSU2-ISTF|GDSF unit and associated services). The ISTF|GDSF resource is used by various test facilities to evaluate ISDN trunks and lines. Some examples are, IMLT, TLWS manual and automated trunk testing and the basic rate interface test line (BRITL).

TEST RSC UNAVAILABLE = The associated test resource was busy, OOS or non-existent.
Observe the status qualifier for possible resource identification (ID). For example, if
the channel under test is a pseudo BRI D-Channel, an active PH channel is not
assigned; therefore, PS testing cannot proceed. For mismatch testing the HLSC
may be busy or the metallic test buss may be unavailable.

TESTING BEGINS = This message indicates that the test procedure has successfully obtained
ownership of all required DSL resources. The test procedure now proceeds to
obtain control of any required test equipment and to establish all conditions
necessary to start testing.

TIMEOUT FOR RSP = The testing procedure within the administrative module (AM) timed out
waiting for a response. This can occur if the SM becomes isolated during testing or
if the associated SM procedure terminates prematurely.

TIP AND RING REVERSAL = A mismatch test has detected a tip and ring reversal on an AMI
U-DSL.

UNABLE TO ACCESS LT = The test procedure could not access the line termination. This could
indicate that all communication links connecting the LU are busy or that a database
problem exists. Resubmit the request.

UNEXPECTED NT1|CU RSP = The NT1 or CU reply for the requested operation was unexpected.
The CU and/or LT may be faulty. Consider performing a LT diagnostic. Observe the
status qualifier for additional information.

UNEXPECTED PKTS RCVD = During a PS LPBK test, the PH received more packets than it
transmitted. This can occur on "noisy" transmission loops.

UNIT TYPE RCV'D = An invalid PM unit type has been received with the requested PM data. The
PM data was expected to be marked as having been received from a LT or CU.
Observe the status qualifier for expected unit ID. Either no PM data was received
from the CUs or invalid data was received from the LT. Consider a LT diagnostic.
Resubmit the request.

USER UNKNOWN = The test request does not identify a specific DSL user. The DSL user must be
identified when performing USER mode tests. That is, when user subscribed
communication services are to be tested.

UTC TO EOC RSP = The NT1 or CU replied that it was unable to comply with the requested
operation. The associated unit may not support the requested operation. Observe
the status qualifier for ID of the unit that could not comply.

= Qualifier to the testing status. The qualifier provides additional resolution for more general status
strings. That is, general failures may be associated with specific hardware or events with the status
qualifier. The status qualifier can be different for each DSL channel tested. Valid value(s):

CPE = Customer premises equipment.
CH = DSL channel.
CU = Channel unit.
DA|TAOPER = The request is valid for DSL facilities supporting directory assistance operator
(DAOPER) or toll assistance operator (TAOPER) service classes.
DSL = Digital subscriber line.
EOC = Embedded operations channel.
HLSC = High-level service circuit.
ISTF = Integrated services test function.
ISTF|PH = Integrated services test function or protocol handler.
LT = Line termination.
LT&NT1|CU = Line termination and network termination 1 or just the channel unit.
LT|ISLU = Line termination or integrated services line unit.
LT|NT1|CU = Line termination, network termination 1 or channel unit.
MSMTCH = Mismatch test.
NT1 = Network termination 1.
NT1|CU = Network termination 1 or channel unit.
PH = Protocol handler.
RDT = IDCU remote digital terminal.
RETEST IP = A retest is in progress on the indicated channel(s). This can occur when the test equipment is unavailable.
RL = Retry at a later time.
STDI = The standard BRI interface.

u1 = The blocked DSL channel indicator. The test procedure will indicate which of the 2B+D DSL channels are blocked for testing in the "testing begins" output message (Format 2). When this output message is generated, the test procedure has control of the associated DSL channels. If the block channel indicator is not shown, the test procedure does not require the use of any 2B+D DSL channel. Valid value(s):
2B+D = All DSL channels are blocked for testing.
D+B1 = The D-channel and B1-channel are blocked for testing.
D+B2 = The D-channel and B2-channel are blocked for testing.
B1+B2 = Both B-channels are blocked for testing.
D = The D-channel is blocked for testing.
B1 = The B1-channel is blocked for testing.
B2 = The B2-channel is blocked for testing.

v1 = The job status. The job status is used to provide general information as relating to all DSL channels under test. That is, the job status will be the same for all DSL channels tested. The job status is used to identify abnormal procedural directives, concurrent maintenance procedures, implied limitations, and so forth. One or more job status strings may be output at the same time, separated by a colon. Valid value(s):
ALL DSL RSC BSY = All of the DSL resources (EOC, NT1, CUs, LT, CRC, PM, etc.) are busy.
ATTEMPT INTERRUPT = Procedures associated with this U-DSL have been preempted, to restore normal DSL operations (refer to job status 'SENT INTERRUPT'); however, this action has failed to free the EOC. In this case, the DSL is forced into normal operating condition (without EOC control). This may disrupt other test procedures using the NT1 or CUs; however, normal customer service will be restored.
B1 LB IP = A B1-channel LPBK was in progress during this test request.
B1,B2 LB IP = Both B1-channel and B2-channel LPBKs were in progress during this test request.
B2 LB IP = A B2-channel LPBK was in progress during this test request.
CRC TST IP = A CRC test was in progress during this test request.
CU FLB IP = A CU LPBK of all channels (full LPBK) was in progress during this test request. It is not possible to access units (CU|NT1) beyond the associated LPBK termination. For example, if CU PM counts are being read, the PM counts from CUs beyond that termination cannot be retrieved.
CU TST IP = A CU test was in progress during this test request.
DLB IP = A D-channel LPBK was in progress during this test request.
EOC BSY = An EOC resource was busy during this test request.
FLB IP = A LPBK of all channels (full LPBK) was in progress during this test request.
ISDN FAIL = An ISDN FAIL message was received during this test request. This test request was immediately terminated.
LT FLB IP = A LT LPBK of all channels (full LPBK) was in progress during this test request. It is not possible to access units (CU|NT1) beyond the LT.
LT TST IP = A test at the LT was in progress during this test request.
LT|CU PM READ IP = A LT|CU PM read was in progress during this test request.
MMT ATP = An automatically invoked mismatch test has completed with all tests passed. This implies that the LT, as connected to CU1 or the NT1, appears correct. That is, the link between the associated units should support the U-interface (layer 1).

MMT PF = A mismatch test has been automatically invoked. The test results will follow in a subsequent output message (note the 'MMT ATP' or 'MMT RESULTS' job status in that message).

MMT RESULTS = An automatically invoked mismatch test has completed with the indicated status. More detailed results may be obtained by manually invoking the mismatch test.

NT TST IP = The NT1 was in use by another test procedure during this test request.

NT1 FLB IP = A NT1 LPBK of all channels was in progress during this test request.

SENT INTERRUPT = Procedures associated with this U-DSL have been preempted to restore normal DSL operations. This action has been taken because the EOC resource has been unavailable for too long. In this case, procedures that must use the EOC would fail to properly idle the associated DSL channels (for example, to remove a LPBK termination). This will be disruptive to test procedures using the NT1 or CUs.

SSR = The test procedure was stopped by a customer service request. That is, this test was terminated because the customer went off hook or received a voice call. The test request specified that the test procedure should be made interruptible for customer originations and/or terminations (refer to the INT and MDUR parameters in the TST:DSL input message).

TEST MODE = The data presented was obtain while the NT1 or CU was in "test mode". Refer to the "k1" = TESTd2 parameter for a definition of "test mode".

UCL = The request to perform testing unconditionally has produced the associated result (refer to the UCL parameter in the TST:DSL input message).

w1 = Unit identifier. Valid value(s):

CUb2 = The CU interval PM counts for CUb2 follow on this line. The CU counts are output in pairs (CU1 & CU2, CU3 & CU4, and so forth), in separate messages following the output of LT counts. Note, that the V (verbose) parameter must be specified to obtain CU PM counts. The BRITE CUs are designed to monitor PM counts on a "PATH" basis. That is, the LT downstream and upstream counts will contain PM counts that have occurred anywhere along the U-DSL. In particular, any CRC error detected by a CU is recorded as a BE at that CU and an error is propagated (by transmitting an invalid CRC) in the same direction (downstream or upstream) as appropriate. For example, if CU2 is first to detect a downstream CRC error, CU2 will count this as a downstream BE and send an invalid CRC downstream to CU3 (or the NT1 if no CU3 is equipped). In this way, each downstream CU and NT1 will count one BE in the downstream direction. Upon receiving the downstream-invalid CRC, the NT1 will send a FEBE to the LT to indicate the NT1 has detected a BE. Upon receiving the FEBE, the LT will count one BE in the downstream direction. In this example, CU1 would not have counted a BE in the downstream direction. The LT and the CUs would not have counted a BE in the upstream direction.

LT = Line termination hour upstream and downstream PM counts. When the LT counts are output, only two lines of the output table are required. The CU counts are output in subsequent messages. The LT downstream PM counts are a record of the far-end block errors (FEBE), as detected by the NT1. For an ANSI U-DSL, the NT1 can indicate a FEBE once every superframe (12 milliseconds). For CRC testing, each superframe that is sent (in the downstream direction) should indicate a FEBE. The LT will record one downstream BE for every superframe received from the NT1 indicating a FEBE. In addition, the LT will count an ES or severely errored second (SES) as appropriate.
**x**

- Upstream and downstream PM BE. The CRC test proceeds by corrupting the CRC for every ANSI superframe (12 milliseconds). The corrupt superframe is then transmitted downstream (that is, LT toward the NT) and then back upstream (that is, NT toward the LT). This means that the BE PM counters should accumulate at a rate of 83.3 BE per second.

**y**

- Upstream and downstream SES. An SES occurs when a specific number of BEs occur in one second. For CUs, the allowable number of BEs is fixed at 3 per second. For LTs, the allowable BEs per second is recent changeable (refer to RC/V View 8.1). The CU SES counts and the LT SES counts can only be correlated, if the allowable BEs/sec is the same for each case. The SES and ES should be very nearly equal (within 1 or 2).

**z**

- Upstream and downstream ES. The ES counter will increment once for approximately every second the test runs. The BE count should be 83.3 times the ES count. The ES and SES should be very nearly equal (within 1 or 2).

**a**

- Status of the PM read. This is the status for PM reads of the upstream and downstream BE, SES and ES registers for the LT and CUs. Valid value(s):
  
  **AEOC**
  - The CU PM counts were not read. The line termination AEOC is stuck in an activated state. This condition indicates a faulty LT. This will prevent any access to the NT1 or CUs. Consider performing the LT diagnostic (For example, refer to the DGN:ISULUC input message).

  **COMP**
  - The PM counts have been read.

  ***COMP**
  - The PM counts have been read; however, one or more of the PM counters may have overflowed.

  **CRPT**
  - The PM counts have been read; however, the associated corruption indication flag (CIF) was marked corrupt. There is no CIF for CUs. In this case, the PM counts do not reflect normal operation on the U-DSL for the period being measured. Examples of events that will result in marking the current-hour LT PM counts corrupt are: manually clearing the PM counts (refer to the EXC:ALE input message), system initializations, digital LPBK testing of all DSL channels using the LT or CU terminations, corrupt CRC testing, and a loss of layer 1 (U-interface) at the LT or beyond a CU.

  ***CRPT**
  - Same as CRPT; however, one or more of the PM counters has overflowed.

  **INVOP**
  - The PM counts have not been read, as an invalid PM operation was requested.

  **LTOOS**
  - The line termination is marked OOS in the LU memory. No data is read from the LT in this case.

  **NGRSP**
  - The PM counts have not been read, as the CU response was unexpected or invalid.

  **NODTA**
  - The PM counts have not been read. No PM data was received.

  **NORSP**
  - The PM counts have not been read, as the CU has not responded (timeout).

  **UINTF**
  - The PM counts have not been read, as layer 1 (U-interface) is down at the LT. It is not possible to communicate beyond the LT.

  **UNEQU**
  - The PM counts have not been read, as the channel unit is unequipped.

  **UTC**
  - The CU has responded with an unable-to-comply message. This CU does not support the reading of PM counts.

**b**

- ANSI CU number. There can be from 1-6 CUs populated (in pairs).

**c**

- ANSI CU LINK number. Where LINKx is indicated the loop is down beyond CUx.

**d**

- ANSI CU TEST number. Where TESTx is indicates the loop is under test beyond CUx.
\[ e^2 \] = PSU unit number.

4. ACTIONS TO BE TAKEN

For DSL channels indicating bit error rate faults, retry the test using a different LPBK termination, if appropriate, to help isolate the fault (refer to the MODE=SECT parameter in the TST:DSL input message).

For tests that do not complete, determine the reason for failure and retry the test. Besides defective hardware, improperly populated data can prevent access both to the DSL ports as well as to the test equipment.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of a manual enhanced 911 (E911) test query request, using the TST:E911 input message.

3. VARIABLE FIELD DEFINITIONS

ALT = The alternate option was selected, requesting that the secondary enhanced 911 service adjunct (ESA) be queried.

VERBOSE = Verbose option was selected. The routing information associated with the retrieved emergency service number (ESN) was requested.

a = The ten-digit billing number or calling party number that was queried.

c = The site ID of the ESA that was queried. This field will be blank if the Dual ESA Enhancements secured feature is active in the office, the site ID or ALT is not specified in the input message, and the request times out.

d Result codes. Valid value(s):
  ESA UNAVAILABLE = The test query can not be completed. The ESA application processor (AP) links are out of service (OOS).
  ESN DATA INCONSISTENCY = The ESA has responded with an ESN that is identified as either valid or invalid, yet there is no switch-resident data (RLesentran) for the ESN. This condition will only be identified when the verbose option is used.
  INVALID ESA SITE ID = The test query can not be completed.
  SUCCESSFUL RESPONSE = Response was successful.
  SYSTEM ERROR = The switching module (SM) that hosts the ESA links is unavailable, or none of the other result codes apply.
  TIMEOUT = A response to the test query was not received within the required time limit.

e Validity codes. Valid value(s):
  INVALID ESN = The ESA has responded with an ESN that is identified as invalid.
INVALID DN = The ESA has responded indicating that the billing number or the calling party number specified in the test query was invalid. No ESN was returned.

INVALID NPA = The ESA has responded indicating that the NPA specified in the test query was invalid. No ESN was returned.

INVALID NUMBER GROUP (THOUSANDS) = The ESA has responded indicating that the number group specified in the test query was invalid. No ESN was returned.

INVALID OFFICE CODE = The ESA has responded indicating that the office code specified in the test query was invalid. No ESN was returned.

VALID ESN = The ESA has responded with an ESN that is identified as valid.

VALUE OUT OF RANGE = The ESA has responded with a validity value that is out of range.

ESN value received. This field is output only if an ESN is received in the reply.

Note: Fields 'h'-'p' are output only when the verbose option is used, and when the ESN has been returned from the ESA. These fields contain the contents of the RLesntran tuple associated with the ESN.

h = Primary public safety answering point (PSAP) directory number (DN).
i = First alternate PSAP DN.
j = Second alternate PSAP DN.
k = Selective transfer DN 1.
l = Selective transfer DN 2.
m = Selective transfer DN 3.
n = Selective transfer DN 4.
o = Selective transfer DN 5.
p = Selective transfer DN 6.

[8] TST GRID=a-b-c STOPPED z

[9] TST GRID=a-b-c ABORTED

2. REASON FOR OUTPUT

To report the results of executing a TST:GRID input message to run the fabric exerciser on a line unit model 1 (LU1) grid.

Format 1 is printed when the specified phase(s) have completely executed and all tests passed.

Format 2 is printed when the specified phase(s) have been completed but some tests were not run because path(s) through the grid were busy. The paths were probably busy because calls were active in the grid, A-links, or the mate grid was out of service, other maintenance activities were active in the grid, or channel circuits were out of service.

Format 3 is printed when the specified phase(s) have been completed but no tests were run, probably because the grid is out of service. If this message is printed during the routine exercise (REX) and the grid is in service, the grid
circuit packs are not updated to the latest pack series and should not be tested routinely. The fabric exerciser will proceed if a manual request is entered.

Format 4 is printed when the specified phase(s) have completed and one or more tests have failed.

Format 5 is printed when a phase has been completed. The phase number and the overall result of the individual phase are specified.

Format 6 is printed when a test has failed or certain conditions were found. The appropriate raw data has printed. If the unconditional (UCL) option was specified in the input message, the fabric exerciser will continue to completion. If the UCL option was not specified, the fabric exerciser will not continue except if there is a plant failure.

Format 7 is printed when the trouble location procedure (TLP) option was specified in the input message and a test has failed. An ordered list of equipment where the fault might be located is provided.

Format 8 is printed when the specified phase(s) have normally stopped because of the reason indicated.

Format 9 is printed when the specified phase(s) have abnormally terminated.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Grid number.
d = Execution result of the phase. Valid value(s):
   ATP = All tests passed.
   CATP = Conditional all tests passed.
   NTR = No tests run.
   STF = Some tests failed.
e = Phase number.
   Note: Audit optional messages are identified as phase 4.

f = Failure type. Valid value(s):
   ALINK BUSY = A-link is busy.
   BLINK BUSY = B-link is busy.
   CONTROL TO GRID = There were write or read errors to or from the grid.
   FALSE CROSS = False cross grid (FCG), tip-to-tip short, ring-to-ring short, tip and ring leads are shorted together or to ground, or an internal power source voltage was detected on the A-link or B-link.
   FOREIGN POTENTIAL = Resistive connection to tip and/or ring and/or ground, or a voltage on LEN or loop, usually DC.
   LATCH READ = Crosspoint latch, scanner or firmware failure.
   OFF HOOK RECOGNITION = Scan circuit failed long loop scanner test. Scanner could not detect off-hook on a long loop.
   OPEN XPT = Crosspoint stuck open.
   POWER ALARM = Grid power source (VO or V+) failure, or loss of clock to scan circuit.
   POWER CROSS = Dangerous AC voltage on loop.
   RESOURCE = The high level service circuit (HLSC) may not be reliable, and therefore, test
results are undefined.

**SCANNER CKT** = Line port scanner circuit failure.

**SHORTED XPT** = Crosspoint will not open wet or is stuck closed.

**V+ LOW** = Transient error.

**V+ RESTORED** = Verifies "V+ LOW" was automatically restored.

**XPT LEFT ON** = The crosspoint specified was left closed and automatically cleared. The test will continue unless clear is not successful.

g = Grid number of path component.

h = First stage grid board number. First stage grid board 0 is furthest from the second stage board in a 3-shelf LU and to the left of the second stage board in a 2-shelf LU.

i = First stage grid board switch number.

j = First stage grid board switch level number.

k = A-link number. For LU1, ‘k’ equals A-link numbers 0-15 are on first stage grid board 0 and A-link numbers 16-31 are on first stage grid board 1.

l = Grid B-link output level.

m = Line unit service group.

n = High level service circuit number.

o = Dummy crosspoint output level.

p = Internal software benchmark number.

q = Identification number of floor and aisle.

r = Module type.

s = Cabinet type.

t = Replacement equipment code(s).

u = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the example.

Example of CODE FORM contents:

**CODE**

A[:B]...[:C] [−] D[:E]...[:F]

- = Inter-field delimiter if necessary.

: = Intra-field delimiter.

A = Current minimal accepted equipment code.

B = Current production equipment code (substitutable equipment for code 'A').

C = Additional compatible equipment code(s) (added as space permits)

D = Current minimal approved operating level for equipment code 'A'.

E = Current minimal approved operating level for equipment code 'B'.

F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Example of CODE FORM contents:
1 Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

v = Vertical location in the bay, in inches from the floor to center of the implicated shelf.

w = Horizontal location in the bay, in eighths of an inch from the left-hand corner of the implicated shelf.

x = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ____ = Equipment is part of the circuit under test.

y = Trouble locating procedure (TLP) note number.

z = Reason for early termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

a1 = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

1 Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b1 = Module number.

c1 = Cabinet number.

d1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

4. ACTION TO BE TAKEN

For Formats 1 and 5, no action is required.

For Format 2, restore the appropriate circuits and re-enter the input message.

For Format 3, restore the grid under test, idle the suspected resources, or check the office-dependent data (ODD) for proper equipage of resources and re-enter the input message.

For Format 4, look for the output messages of Formats 6 and 7 and replace the faulty circuit pack(s) or take the appropriate action. If line equipment numbers (LENs) are specified, check line connections to the main distributing frame.

For Format 6, some messages are for failures and others identify certain conditions. Collectively evaluate the output messages of this format along with TLP output messages (Format 7); replacing the faulty circuit pack(s), clearing line wiring problems, or otherwise taking the appropriate action. Failures such as POWER CROSS, FOREIGN
POTENTIAL, and FALSE CROSS may be due to problems in the plant or subscriber lines.

For Format 7, replace the suspected pack(s) one at a time in the order specified. Rerun the fabric exerciser after each substitution until the fault is repaired or the exerciser results change.

For Format 8, identify the reason for the premature termination and take the appropriate action to correct the problem. Then re-enter the input message.

For Format 9, identify the reason for the abortion and take appropriate action to correct the problem. Then re-enter the input message.

5. ALARMS

2. REASON FOR OUTPUT

To respond to the TST:GRIDBD input message to run an exercise program on the cross point paths in a line unit model 2 (LU2) or a line unit model 3 (LU3) grid.

Format 1 prints when all specified phase(s) have completely executed and all tests passed.

Format 2 prints when the paths that could be tested in the specified phase(s) pass all the tests. Not all the path elements were tested, however, because calls were up in the half-grid, channel circuits or A-links were out-of-service, or other maintenance activities were active in the grid.

Format 3 prints when the specified phases have been completed but no tests were run.
Format 4 prints when a phase has been completed. The phase number and the overall result of the individual phase are specified.

Format 5 prints when the specified phase(s) have completed and one or more tests failed.

Format 6 prints when a test failed or certain conditions were found. The appropriate raw data is printed, indicating the location of the fault or condition. If the UCL option was specified in the input message the exercise program generally will continue. If UCL was not specified, Format 4 will also print.

Format 7 prints when the trouble locating procedure (TLP) option was specified in the input message and a test failed. An ordered list of circuit packs where the fault might be is printed.

Format 8 prints when the exercise program terminates because of the reason specified in variable 'g'.

Format 9 prints when the specified phase(s) terminated abnormally.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Grid number.
d = Board number.
e = Execution result of the phase. Valid value(s):
   ATP = All tests passed.
   CATP = Conditional all tests passed.
   NTR = No tests run.
   STF = Some tests failed.
f = Phase number.

NOTE: Audit option messages are identified as phase 4.

g = Failure type. Valid value(s):
   ALINK BUSY = A-link is busy.
   BLINK BUSY = B-link is busy.
   CONTROL TO GRID = There were write or read errors to or from the grid.
   FALSE CROSS = False cross grid (FCG), tip-to-tip short, ring-to-ring short, tip and ring leads are shorted together or to ground, or an internal power source voltage was detected on the A-link or B-link.
   FOREIGN POTENTIAL = Resistive connection to tip and/or ring and/or ground, or a voltage on LEN or loop, usually DC.
   LATCH READ = Crosspoint latch, scanner or firmware failure.
   OFF HOOK RECOGNITION = Scan circuit failed long loop scanner test. Scanner could not detect off-hook on a long loop.
   OPEN XPT = Crosspoint stuck open.
   POWER ALARM = Grid power source (VO or V+) failure, or loss of clock to scan circuit.
   POWER CROSS = Dangerous AC voltage on loop.
   RESOURCE = The high-level service circuit (HLSC) may not be reliable, and therefore test results are undefined.
**SCANNER CKT** = Line port scanner circuit failure.

**SHORTED XPT** = Crosspoint will not open wet or is stuck closed.

**V+ LOW** = Transient error.

**V+ RESTORED** = Verifies "V+ LOW" was automatically restored.

**XPT LEFT ON** = The crosspoint specified was left closed and automatically cleared. The test will continue unless clear is not successful.

- **h** = Text identifier showing order of record. Valid value(s):
  - **FIRST** = First record of continuing list.
  - **LAST** = Last record of list.
  - **NEXT** = Next record of continuing list.

1 Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

- **i** = ALINK number.
- **j** = BLINK number.
- **k** = Service group number.
- **l** = High-level service circuit (HLSC) number.
- **m** = Aisle number.
- **n** = Module type.
- **y** = Module number.
- **o** = Cabinet type.
- **z** = Cabinet number.
- **p** = Circuit pack code.
- **q** = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the example.

Example of CODE FORM contents:

**CODE**

A[:B]...[:C] [-] D[:E]...[:F]

: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.

1 Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.
Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

\( r \) = Vertical location in the bay, computed in inches from the floor to the center of the implicated shelf.

\( s \) = Horizontal location in the bay, computed in eighths of an inch from the left-hand corner of the implicated shelf.

\( t \) = Circuit type. Valid value(s):

- **HPR** = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
- **ONL** = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

\( u \) = Trouble location procedures (TLP) note number.

\( v \) = Reason for early termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

\( w \) = Gridboard first stage switch number.

\( x \) = Gridboard first stage switch input level.

\( a^1 \) = Depth location in the bay, in tenths of an inch, measured left to right in the drawer on the implicated shelf.

## 4. ACTION TO BE TAKEN

For Formats 1, 2, 4, no action is required

For Format 3, restore the grid under test, idle suspected resources, or check ODD for proper equipage of resources and reenter the input.

For Format 5, some messages are for test failures and others identify certain conditions. Look for output messages with Formats 6 and 7. Replace the faulty circuitpack(s) or taking the appropriate action.

For Format 6, replace suspected faulty circuit packs if necessary. In some circumstances, failures such as power cross, foreign potential, and false cross may be cleared without replacing circuit packs. These failures may be caused by problems in the plant or by subscriber lines.

For Format 7, replace suspected packs one at a time in the order specified. Rerun the fabric exerciser after each substitution until the fault is repaired or the exerciser results change.

For Format 8, identify the reason for premature termination and correct the problem. Reenter the input message to verify that the problem is corrected.

For Format 9, identify the reason for the abortion and correct the problem. Reenter the input message to verify that the problem is corrected.

## 5. ALARMS

```plaintext
TST GSMNET GSM=a OPC=b c
NGSM CMT PATH RESULT
d DMH=e h
d TMH=f h
g MD=g h
```

2. **REASON FOR OUTPUT**

To report on the production of status output.

3. **VARIABLE FIELD DEFINITIONS**

- **a** = Global switching module (GSM) specified in the input request, or defaulted to if this is a one GSM provisioned office.
- **b** = Origination point code (OPC) (9-digit primary OPC associated with the HOST/ISLAND GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for additional information.
- **c** = Output report sequence indicator. There will be ten message statuses per output report. Valid values(s):
  - FIRST
  - LAST
  - NEXT
- **d** = Non-global switching module (NGSM) whose test result is being provided. All NGSMs shall be reported in ascending order.
- **e** = CCS message transport (CMT) connectivity is provided via a DIRECT MH.
- **f** = CMT connectivity is provided to the Classic NGSM via a TRANSFER MH provisioned on the indicated SM-2000.
- **g** = CMT connectivity is provided by means of a message delivery link (MD) on the Host GSM.
- **h** = Result. Valid value(s):
  - FAIL = The CMT path is not accessible between the NGSM and GSM.
  - SUCCESS = The NGSM has successfully sent messages to the specified GSM down all 32 SLS Paths.
  - TIMEOUT = The administrative module (AM) has not received a response from the NGSM containing the result within the 10 second window.
  - UNAVAILABLE = The NGSM is not available to the AM while initiating the test.
4. ACTIONS TO BE TAKEN

Report the status of the output.

5. ALARMS

1. FORMAT

TST ICCV=a b c
DURATION OF TEST=d
TTYP=e PC=f
[g] [h] [i]
CDBS=j OPCD=k
l
CDCIND=[m]

2. REASON FOR OUTPUT

To report the results of the manual input (TST:ICCV) that requests that an international credit card validation (ICCV) transaction capabilities application part (TCAP) test query be performed.

3. VARIABLE FIELD DEFINITIONS

a  = Issuer identification number of the telecommunications calling card (89C) number that was input.
b  = Individual account number of the 89C calling card number that was input. This includes a check number, if present.
c  = Personal identification number (PIN) that was input.
d  = Duration of the test in milliseconds. Timing starts when the administrative module (AM) sends the formatted query, and ends when the query response is received from the network.
e  = Translation type that was input.
f  = Point code of the network node that sent the response. If the test query times out, 'NOT APPLICABLE' is output for the point code.
g  = ICCV TCAP query reply code or error code. This field prints out when a normal reply is received in response to the test query. Valid value(s):
ALLOW CALL = Card number and PIN were successfully validated; the call was allowed.
ALLOWED PIN TRIES EXCEEDED = The call was denied because on previous attempts the PIN was incorrectly entered a certain number of times, depending upon each administration.
CALLED NUMBER RESTRICTIONS APPLY = The call was denied because called number restrictions applied.
CREDIT THRESHOLD EXCEEDED = The call was denied because the credit limit of the card has been exceeded.
DATABASE UNAVAILABLE = The database that is required for validating is not available for service.
DUE TO NON-PAYMENT = The call was denied because the bill has not been paid.
ERROR IN MESSAGE FORMAT = The query received by the database was incorrectly formatted.
EXPIRED CARD = The call was denied because the end date of the card has passed.
FRAUD RESTRICTED = The call was denied because the card was restricted by the card issuing administration or card holder to prevent fraudulent use.
INCORRECT PIN = The call was denied because the PIN was invalid.
INVALID CARD NUMBER = The call was denied because the database did not hold a record for it.
MISSING PARAMETER = A mandatory query parameter was absent from the query.
NOT PERMITTED FROM STATION = The call was denied because the card's use was not permitted outside of the issuing administration's network.
UNEXPECTED INPUT - DATA VALUE = One of the values in the validation request contained a value outside the expected range.
UNEXPECTED PARAMETER = The validation request contained a parameter code that was not defined as mandatory or optional for the specified operation.
VOLUME THRESHOLD EXCEEDED = The call was denied because the database determined that the number of calls has exceeded the limit within the specified period.
WRONG CARD ISSUER OR MISROUTED QUERY = Card number was not in the range that the database expected to receive.

h
= The abort cause or reject problem code. This field prints out only when a p-abort, u-abort, invoke problem reject message, or general problem reject message is received in reply to an ICCV TCAP test query. Valid value(s):
P-ABORT - BADLY FORMATTED TRANSACTION PORTION = Transaction portion of the received message did not conform to the encoding rules.
P-ABORT - INCORRECT TRANSACTION PORTION = Elemental structure within the transaction portion of the received message did not conform to the rules for the transaction portion.
P-ABORT - RESOURCE LIMITATION = Sufficient resources were not available.
P-ABORT - UNRECOGNIZED MESSAGE TYPE = TCAP message type was not defined.
P-ABORT - UNRECOGNIZED TRANSACTION ID = A transaction ID was received for which a transaction did not exist at the receiving node.
REJECT - BADLY STRUCTURED COMPONENT = Contents of the component did not conform to the encoding rules.
REJECT - DUPLICATE INVOKE ID = The invoke ID was already in use by a previously invoked operation.
REJECT - INITIATING RELEASE = Requested operation could not be invoked because the dialogue was about to be concluded.
REJECT - MISTYPED COMPONENT = Elemental structure of a component did not conform to the defined structure of that component.
REJECT - MISTYPED PARAMETER = A parameter tag was not one of those associated with the invoked operation.
REJECT - RESOURCE LIMITATION = Sufficient resources were not available to perform the requested operation.
REJECT - UNRECOGNIZED COMPONENT = The component type was not recognized.
REJECT - UNRECOGNIZED OPERATION = The operation code value was not one of those used by the application.
U-ABORT - BADLY STRUCTURED COMPONENT = Contents of the component did not conform to the encoding rules.
U-ABORT - MISTYPED COMPONENT = The elemental structure of a component did not conform to the defined structure of that component.
U-ABORT - UNRECOGNIZED COMPONENT = Component type was not recognized.

i
= The results of a failed test. This field prints out only when the test query was not successful. Valid value(s):
GARBLED MESSAGE = A response was received but the data in the message was mutilated. It is possible that this result may be printed along with a normal response (such as,
ALLOW CALL) if the mutilated data is detected after the result has been identified.

IMS OR CNI RETURNED MSG = The inter-process message switch (IMS) or the common network
interface (CNI) returned the message. This result is not expected for ICCV TCAP
test queries.

NETWORK CONGESTION = Could not complete the test due to network congestion.

NETWORK FAILURE = Could not complete the test due to failure in the network.

NO TRANSLATION ADDRESS NATURE = No entries existed in routing tables for addresses of this
nature.

NO TRANSLATION SPECIFIED ADDRESS = No entries existed in routing tables for this specific
address.

SUBSYSTEM CONGESTION = Could not complete the test due to subsystem congestion.

SUBSYSTEM FAILURE = Could not complete the test due to subsystem failure.

TIMEOUT = A response to the test query was not received within the sixteen second time
limit.

UNEQUIPPED USER = Could not complete the test due to unequipped user.

UNQUALIFIED = Unknown failure reason.

j = Customer-defined billing segmentation (CDBS) number returned in reply received from database. If no CDBS number is returned, 'NONE' will be output.

k = The operation code. This operation code specifies which ICCV features are active in the switch. Each bit of the eight-bit operation code indicates whether the corresponding ICCV feature is applicable or not in the switch. The bits in order form low to high and their associated features are:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Bit Value</th>
<th>Bit Position</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic Validation</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CDM</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>CDBS</td>
<td>4</td>
<td>2</td>
</tr>
<tr>
<td>NOT USED</td>
<td>8</td>
<td>3</td>
</tr>
<tr>
<td>Geographic Restriction</td>
<td>16</td>
<td>4</td>
</tr>
<tr>
<td>NOT USED</td>
<td>32</td>
<td>5</td>
</tr>
<tr>
<td>NOT USED</td>
<td>64</td>
<td>6</td>
</tr>
<tr>
<td>NOT USED</td>
<td>128</td>
<td>7</td>
</tr>
</tbody>
</table>

The operation code is a sum of the bit values of all applicable ICCV features. For example, if basic validation, CDBS and geographic restrictions are active, the operation code will have a value of 21, which is the sum of 1, 4, and 16. For inward calls, only values 1, 5, 17, and 21 are allowed.

l = The called number is the entered number (maximum 15 digits not including prefix). This is either a 10-digit North American numbering plan (NANP) number (that is, NPANXXXXXXX), a 7- to 15-digit international number (that is, CCCCC...XXX), or 'NO CALLED NUMBER' (if no called number was input).

m = The call duration and charge (CDC) indicator. Valid value(s):

NONE = CDC does not apply to call
YES = CDC applies to call

4. ACTION TO BE TAKEN

This message is the response to a manual request. It is used as a high-level check on the connection to the ICCV database (which is external to the switch), to check out data in the ICCV database, or to check out a repeatedly failing query. If variable 'l' prints out (with the exception of GARBLED MESSAGE), then there is a problem with the connection to the database, and the Engineering Network Administration Center (ENAC) should be contacted for
assistance. Otherwise (including garbled message), the response is from the database, and the Network Operations Center (NOC) international console should be contacted. The response should be examined to see if it indicates proper data in the ICCV database.

5. ALARMS

None.

Type: Output

1. FORMAT

TST INWATS=a ONPA=b DURATION OF TEST=c
d [e]

2. REASON FOR OUTPUT

To report the results of the manual request TST:INWATS which requests that an inward wide area telecommunications service (INWATS) query test be performed.

3. VARIABLE FIELD DEFINITIONS

ONPA = Originating numbering plan area.
a = The ten-digit INWATS number that was tested, in the form 800NXXXXXX.
b = The three-digit area code that was tested, simulating where 800 number is originated.
c = Duration of test in milliseconds. Timing starts when the switch receives the input request and ends when the switch receives the result from the network, or times out.
d = Results of the test query. Valid value(s):
BAD INWATS MESSAGE RECEIVED = A reply was received but data in the message was mutilated.
CCIS FAILURE-DESTINATION NOT EQUIPPED = A destination in the common channel signaling (CCS) network is unequipped.
CCIS FAILURE-NETWORK BLOCKED = Could not complete test due to blockage in the network.
CCIS FAILURE-NETWORK OVERLOAD = Could not complete test due to an overload in the network.
CCIS FAILURE-NO ROUTING DATA = Could not route to the destination due to an error in or unavailability of routing data in the network.
INEFFECTIVE ATTEMPT-ALL LINES BUSY = All lines are busy.
INEFFECTIVE ATTEMPT-DATABASE OVERLOAD = Could not complete query of 800 number due to overload of database.
INEFFECTIVE ATTEMPT-INVALID ORIGINATING NPA = The database determined that the input ONPA was not a valid number.
INEFFECTIVE ATTEMPT-NONPURCHASED NPA = The database determined that the ONPA input is not purchased for this 800 number.
INEFFECTIVE ATTEMPT-VACANT LINE NUMBER = A query was sent but the database could not translate it because the line number input was not a valid 800 line number.
INEFFECTIVE ATTEMPT-VACANT NXX = The database determined that the NXX of the 800 number is vacant.
SUCCESS = The 800 number was successfully translated to the number given in field 'e'.
TIMEOUT = A response to the test query was not received within the four-second time limit.
e = Number that the database translated the 800 number into, in the form of NPANXXXXXX.
4. ACTION TO BE TAKEN

Follow the local practice for testing the INWATS databases.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of the manual input (TST:LAC) that requests that a line applications for consumers (LAC) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query be performed.

3. VARIABLE FIELD DEFINITIONS

a = Billing number that was input. For sent-paid queries and billed number screening (BNS) queries, this will be a phone number. For card queries, this will be a 10-digit calling card account number.

b = Personal identification number (PIN) that was input. This is included for calling card queries only.

c = Switch type that was input. Valid value(s):
4ESS = 4ESS\(^{TM}\) switch.
5ETOLL = 5ESS\(^{®}\) toll switch.
OSPS = Operator services position system (OSPS) switch.

d = Duration of the test in milliseconds. Timing starts when the administrative module (AM) sends the formatted query, and ends when the query response is received from the network.

e = Translation type number that was input. This is a number from 0 to 255.

f = Called number that was input. The label will print as ICLD= for international numbers or CLD= for all other numbers. If no called number was input, CLD=None will print.
g = Calling number that was input. The label will print as ICLG= for international numbers or CLG= for all other numbers. If no calling number was input, CLG=NONE will print.

h = Coding standard that was input. If no input was given for coding standard, transfer capability, transfer mode, or transfer rate, then NONE will print. If no input was given for coding standard, but a value was input for one or more of transfer capability, transfer mode, or transfer rate, then CCITT will print. Valid value(s):
  CCITT = International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) standard.
  INTL = Reserved for other international standards.
  NATIONAL = National standard.
  NONE = No input was entered.

i = Transfer capability that was input. If no input was given for coding standard, transfer capability, transfer mode, or transfer rate, then NONE will print. If no input was given for transfer capability, but a value was input for one or more of coding standard, transfer mode, or transfer rate, then SPEECH will print. Valid value(s):
  3.1 kHz AUDIO = 3.1 kHz audio.
  7 kHz AUDIO = 7 kHz audio.
  15 kHz AUDIO = 15 kHz audio.
  DIGITAL = Unrestricted digital information.
  NONE = No input was entered.
  RESTRICTED DIGITAL = Restricted digital information.
  SPEECH = Speech.
  VIDEO = Video.

j = Transfer mode that was input. If no input was given for coding standard, transfer capability, transfer mode, or transfer rate, then NONE will print. If no input was given for transfer mode, but a value was input for one or more of coding standard, transfer capability, or transfer rate, then CIRCUIT will print. Valid value(s):
  CIRCUIT = Circuit mode.
  NONE = No input was entered.
  PACKET = Packet mode.

k = Transfer rate that was input. If no input was given for coding standard, transfer capability, transfer mode, or transfer rate, then NONE will print. If no input was given for transfer rate, but a value was input for one or more of coding standard, transfer capability, or transfer mode, then CHANNEL SIZE will print. Valid value(s):
  64 KBIT = 64 Kbit/second.
  384 KBIT = 384 Kbit/second.
  1536 KBIT = 1536 Kbit/second.
  1920 KBIT = 1920 Kbit/second.
  CHANNEL SIZE = Transfer rate dictated by the size of the channel.
  NONE = No input was entered.

l = Originating line information (OLI) or automatic number identification (ANI) information digits (II) that were input. If OLI data was input, the label will print as OLI=. If II data was input, the label will print as II=. If neither OLI nor II data was input, OLI=NONE will print. Valid value(s):
  800 CALL = Translated 800 call.
AIOD = Automatic input/output dialing (AIOD) listed directory number sent.
ANI FAIL = ANI failure.
COIN = Coin line.
COIN OR NONCOIN = Identified line (coin or noncoin).
COINLESS = Coinless, hospital, or inmate call.
HOTEL = Hotel without room identification.
IDENTIFIED LINE = Identified line with no special treatment.
INTERLATA RESTRICTED = Interlata restricted.
NONE = No input was entered.
ONI = Operator number identified (multiparty).
OPERATOR HANDLED = Operator handled.
OUTWATS = Outbound wide area transport (OUTWATS) line.
RESTRICTED COINLESS = Interlata restricted coinless line.
RESTRICTED HOTEL = Interlata restricted hotel line.
TEST CALL = Test call.
VIRTUAL PRIVATE NET = Virtual private network line.

m = Originating line screening (OLS) value that was input. This is a number from 0 to 999. If no OLS data was input, NONE will print.
n = Originating station type (OST) value that was input. If no OST data was input, NONE will print. Valid value(s):
ACQS = Automatic charge quotation system (ACQS) phone.
ACQS HOTEL = ACQS hotel phone.
NON-ACQS HOTEL = Non-ACQS hotel phone.
NON-COIN PUBLIC = Non-coin public phone.
NONE = No input was entered.
POST-PAY COIN = Post-pay coin phone.
PRE-PAY COIN = Pre-pay coin phone.
UNKNOWN = Unknown station type.

o = Call type value that was input. If no call type was input, NONE will print. Valid value(s):
COLLECT = BNS collect call.
NONE = No input was entered.
SENT PAID = BNS sent paid call.
THIRD = BNS bill to third number call.

p = Carrier selection information (CSI) that was input. If no CSI data was input, NONE will print. Valid value(s):
INPUT BY CALLER = Selected carrier presubscribed and input by calling party.
NO INDICATION = Selected carrier presubscribed and no indication of input by calling party.
NONE = No input was entered.
NOT INPUT = Selected carrier presubscribed and no input by calling party.
NOT PRESUBSCRIBED = Selected carrier not presubscribed and input by calling party.
UNKNOWN = No indication.

q = ‘Response required’ indicator that was input. A value of YES indicates that the 2LAC/NCP must always return a reply in response to the test query. A value of NO indicates that the 2LAC/NCP must only return a reply for deny and error cases. If no value was input, YES will print.
= Network access interrupt (NAI) indicator that was input. A value of **YES** indicates that the 2LAC/NCP should apply NAI processing to the query. A value of **NO** indicates that NAI processing should not be applied. If no value was input, **YES** will print.

s = Line information database (LIDB) indicator that was input. A value of **YES** indicates that the 2LAC/NCP should forward the calling card or BNS information contained within the query to a LIDB for processing. A value of **NO** indicates that the query should not be forwarded to a LIDB. If no input was given for calling card or BNS queries, **YES** will print. For all other calls, this field will always be **NO**.

t = Carrier expansion indicator. If the **CICEXP** keyword was input, then **CICEXP** will print here. If **CICEXP** was not entered, nothing will print.

u = Test query result. Valid value(s):

ALLOW CALL = The call is allowed by the 2LAC/NCP.

CALLED NUMBER RESTRICTIONS APPLY = The call is denied because called number restrictions apply in the 2LAC/NCP.

CALLING NUMBER RESTRICTIONS APPLY = The call is denied because calling number restrictions apply in the 2LAC/NCP.

CREDIT RESTRICTED = The call is denied because the billing number is delinquent in payment.

FRAUD RESTRICTED = The call is denied because the billing number is suspected of fraudulent use.

GARBED MESSAGE = A response was received but the data in the message was mutilated. It is possible that this result may be printed along with a normal response (such as, ALLOW CALL) if the mutilated data is detected after the result has been identified.

GATEWAY ERROR = Communication with a non-AT&T network was unsuccessful.

IMS OR CNI RETURNED MSG = The inter-process message switch (IMS) or the common network interface (CNI) returned the message. This result is not expected for LAC CCS7 test queries.

MISROUTED QUERY = The billing number was not in the range that the 2LAC/NCP expected to receive.

MISSING PARAMETER = A mandatory parameter was absent from the query.

NETWORK CONGESTION = Could not complete the test due to network congestion.

NETWORK FAILURE = Could not complete the test due to failure in the network.

NO TRANSLATION ADDRESS NATURE = No entries exist in routing tables for an address of this nature.

NO TRANSLATION SPECIFIC ADDRESS = No entries exist in routing tables for this specific address.

NONPAYMENT - CALLING PARTY = The call is denied because the calling party is delinquent in payment.

NONPAYMENT - CALLED PARTY = The call is denied because the called party is delinquent in payment.

NONPAYMENT - OTHER PARTY = The call is denied because some other party is delinquent in payment.

P-ABORT - BADLY FORMATTED TRANSACTION PORTION = The transaction portion of the received message did not conform to the encoding rules.

P-ABORT - INCORRECT TRANSACTION PORTION = The elemental structure within the transaction portion of the received message did not conform to the rules for the transaction portion.

P-ABORT - RESOURCE LIMITATION = Sufficient resources were not available.

P-ABORT - UNRECOGNIZED MESSAGE TYPE = The TCAP message type was not defined.

P-ABORT - UNRECOGNIZED TRANSACTION ID = A transaction ID had been received for which a
The transaction did not exist at the receiving node.

REJECT - BADLY STRUCTURED COMPONENT = The contents of the component did not conform to the encoding rules.

REJECT - DUPLICATE INVOKE ID = The invoke ID was already in use by a previously invoked operation.

REJECT - INITIATING RELEASE = The requested operation could not be invoked because the dialogue was about to be concluded.

REJECT - MISTYPED COMPONENT = The elemental structure of a component did not conform to the defined structure of that component.

REJECT - MISTYPED PARAMETER = A parameter tag was not one of those associated with the invoked operation.

REJECT - RESOURCE LIMITATION = Sufficient resources were not available to perform the requested operation.

REJECT - UNRECOGNIZED COMPONENT = The component type was not recognized.

REJECT - UNRECOGNIZED OPERATION = The operation code value was not one of those used by the application.

SUBSYSTEM CONGESTION = Could not complete the test due to subsystem congestion.

SUBSYSTEM FAILURE = Could not complete the test due to subsystem failure.

TASK REFUSED = The task was refused because the node could not handle the request at the time (not because the operation was incorrect in any way).

TIMEOUT = A response to the test query was not received within the time limit. If the entered switch type parameter is OSPS or 4ESS™, this time limit is 20 seconds. For 5ETOLL, this time limit is 4 seconds.

U-ABORT - APPLICATION PROTOCOL VIOLATION = A protocol violation occurred in relation to the allowed sequences of messages defined for the application service element.

U-ABORT - REJECT RECEIVED = An unexpected reject component was received.

U-ABORT - UNKNOWN USER PROBLEM = The cause of the transaction abort request is unknown. This request could be the result of an abort in the application specific entry, or application itself.

UNEQUIPPED USER = Could not complete the test due to unequipped user.

UNEXPECTED INPUT, DATA VALUE = The content of a query parameter was not as expected.

UNEXPECTED PARAMETER = A query parameter was received but not recognized.

UNQUALIFIED = Unknown failure reason.

VACANT CODE = The database determined that the billing number contained in the query was one that has not yet been assigned.

\(v\) = Point code number of the network node that sent the response. If the test query timed out, NOT APPLICABLE is output for the point code.

\(w\) = LIDB BNS response. This field will contain the result of a BNS query if an encapsulated LIDB reply was received from the 2LAC/NCP. If an encapsulated LIDB BNS reply was not received, NONE will print. Valid value(s):

MISROUTE = The billing number was not in the range that

MISSING CUST REC = The billing number was not found in the LIDB.

MISSING GROUP = The group was not found in the LIDB.

NONE = An encapsulated LIDB BNS reply was not received.

NONPARTICIPATE GRP = The LIDB determined that the billing number belongs to a nonparticipating group.

RECEIVE REJECT = The LIDB reply is a reject component.

RECORD FOUND = The billing number was successfully found in the LIDB.

UNAV NET RESOURCE = The query could not be processed because of network resource
 limitations.
UNXP DATA VALUE = The content of a query parameter was not as expected. the LIDB expected to receive.
VACANT GROUP = The LIDB determined that the billing number contained in the query was one that has not yet been assigned.

x = LIDB calling card response. This field will contain the result of a calling card query if an encapsulated LIDB reply was received from the 2LAC/NCP. If an encapsulated LIDB calling card reply was not received, NONE will print. Valid value(s):
CCAN SERVICE DENIAL = The calling card number is denied service.
LSA DENY = The calling card number is denied due to restrictions.
MISROUTE = The calling card number was not in the range that the LIDB expected to receive.
MISSING CUST REC = The calling card number was not found in the LIDB.
MISSING GROUP = The group was not found in the LIDB.
NO PIN MATCH = The calling card number and PIN sent in the query do not belong together.
NONE = An encapsulated LIDB calling card reply was not received.
NONPARTICIPATE GRP = The LIDB determined that the calling card number belongs to a nonparticipating group.
PIN NOT ASSIGNED = The PIN contained in the query has not been assigned to this card number.
RECEIVE REJECT = The LIDB reply is a reject component.
RESTRICTED PIN = The calling card is allowed as long as the called number matches the card number.
SPD NONPAYMENT = The calling card number is denied because it is delinquent in payment.
SPD THRESHOLD = The calling card number is denied because a PIN threshold has been exceeded.
UNAV NET RESOURCE = The query could not be processed because of network resource limitations.
UNRERESTRICTED PIN = The calling card is allowed for all called numbers.
UNXP DATA VALUE = The content of a query parameter was not as expected.
VACANT GROUP = The LIDB determined that the calling card number contained in the query was one that has not yet been assigned.

y = LIDB record status indicator received in an encapsulated LIDB BNS or calling card reply. If the record status indicator is not received in the reply, NONE will print. Valid value(s):
DEFAULT RECORD = The LIDB determined this to be a default record.
NONE = The record status indicator was not received.
STABLE RECORD = The LIDB determined this to be a stable record.
TRANSIT RECORD = The LIDB determined this to be a transitional record.

z = LIDB company identification received in an encapsulated LIDB BNS or calling card reply. This will print as a 4 digit number, or as NONE if this indicator is not received.

a = LIDB BNS collect acceptance indicator received in an encapsulated LIDB BNS reply. If the collect acceptance indicator is not received in the reply, NONE will print. Valid value(s):
ALW COL = Allow all collect calls without verification.
ALWC INTRA = Allow intralata collect calls without verification. Deny interlata collect calls.
LSA DENY = Deny collect calls due to restrictions.
NOCOL = No collect calls are allowed to this number.
NOCOL-C = No collect calls are allowed to this number by customer request.
NONE = The LIDB collect acceptance indicator was not received in the reply.
VFY COL = Verify all collect calls to this number.
VFYC INTRA = Allow intralata collect calls without verification. Verify interlata collect calls.

b1

LIDB BNS third number acceptance indicator received in an encapsulated LIDB BNS reply. If the third number acceptance indicator is not received in the reply, NONE will print. Valid value(s):
ALW 3RD = Allow third number billing without verification.
ALW3 INTRA = Allow intralata third number billing without verification. Deny interlata third number billing.
LSA DENY = Deny third number calls due to restrictions.
NO 3RD = No third number billing to this number.
NO 3RD-C = No third number billing to this number on customer request.
NONE = The LIDB third number acceptance indicator was not received in the reply.
VFY 3RD = Verify third number billing.
VFY3 INTRA = Verify intralata third number billing. Deny interlata third number billing.

Copyright ©2003 Lucent Technologies
AUTO_TP14_NOOP = Automated treatment - provide alerting tone and prompting announcement 14
- no operator access.

\(d^1\) = LIDB BNS service or equipment indicator received in an encapsulated LIDB BNS reply. If the
service or equipment indicator is not received in the reply, NONE will print. Valid value(s):

- NONE = No service or equipment indicator was received in the LIDB reply.
- SRV1 = (1) POTS Line.
- SRV2 = (2) LEC Public - Standard Interface - Postpay Overtime.
- SRV3 = (3) POTS Line - Residential - Message Rate 1.
- SRV4 = (4) POTS Line - Residential - Message Rate 2.
- SRV5 = (5) LEC Semi-Public.
- SRV6 = (6) POTS Line - Business - Flat Rate.
- SRV7 = (7) POTS Line - Business - Message Rate 1.
- SRV8 = (8) Coinless (non-IPP).
- SRV9 = (9) Coinless (IPP).
- SRV10 = (10) LEC Prepaid Telecommunications Card Station.
- SRV12 = (12) LEC Public - Standard Interface - Prepay Overtime.
- SRV13 = (13) LEC Public - Alternate Interface.
- SRV14 = (14) IC Public - Standard Interface.
- SRV15 = (15) IC Public - Alternate Interface.
- SRV16 = (16) POTS Line - Residential - Flat Rate.
- SRV17 = (17) Voice Quote - without tax.
- SRV18 = (18) Voice Quote - with tax.
- SRV19 = (19) IPP - Standard Interface.
- SRV20 = (20) IPP - Alternate Interface.
- SRV21 = (21) Hospital
- SRV22 = (22) Prison (non-IPP).
- SRV23 = (23) Auto Quote - without tax.
- SRV24 = (24) Auto Quote - with tax.
- SRV26 = (26) Centrex Line.
- SRV27 = (27) PBX Line.
- SRV28 = (28) Prison (IPP).
- SRV29 = (29) WATS Line.
- SRV30 = (30) Cellular.
- SRV31 = (31) Pager.
- SRV32 = (32) Personal Communication Service (PCS).
- SRV33 = (33) Feature Group A (FGA).
- SRV34 = (34) Mobile.
- SRV35 = (35) LEC Public - Special Billing - Postpay Overtime.
- SRV36 = (36) LEC Public - Special Billing - Prepay Overtime.
- SRV37 = (37) Public - Incompatible Network Interface.
- SRV38 = (38) Cellular - Rate 1.
- SRV39 = (39) Cellular - Rate 2.
- SRV40 = (40) POTS Line - Business - Single Line
- SRV41 = (41) POTS Line - Business - Multi-Line
- SRV42 = (42) Public - Postpay

\(e^1\) = LIDB BNS intercept indicator received in an encapsulated LIDB BNS reply. If the intercept
indicator is not received in the reply, **NONE** will print. Valid value(s):

- **CHGING** = Being changed; may not be connected yet.
- **CHGNPN** = Changed to nonpublished number.
- **CHGREF** = Changed with referral to new number.
- **DISC** = Disconnected.
- **DISCNR** = Disconnected without referral to new number.
- **NONE** = The intercept indicator was not received in the LIDB reply.
- **NOTCON** = May not be connected yet.
- **NOTINCP** = Not intercepted.
- **NOTINSV** = Not in service for incoming calls.
- **SPECTRMT** = Special intercept treatment required.
- **TDISC** = Temporarily disconnected.
- **TDISCNR** = Temporarily disconnected without referral.
- **TDISCR** = Temporarily disconnected with referral.
- **TNOTINSV** = Temporarily removed from service.
- **VACNUM** = Vacant number.

**f¹** = LIDB subaccount number received in an encapsulated LIDB calling card reply. This will print as a two-digit number, or as **NONE** if a subaccount number was not received in the reply.

**g¹** = First LIDB interexchange carrier indicator received in an encapsulated LIDB BNS or calling card reply. This will print as a two-digit number, or as **NONE** if no interexchange carrier indicators were received in the reply.

**h¹** = Second LIDB interexchange carrier indicator received in an encapsulated LIDB BNS or calling card reply. This will print as a two-digit number if two interexchange carrier indicators were received in the reply. If only one interexchange carrier was received, or if none were received, this field will be blank.

**i¹** = LIDB regional accounting office (RAO) number received in an encapsulated LIDB reply. This will print as a three-digit number, or as **NONE** if an RAO was not received in the reply.

**j¹** = The call gap present indicator. Valid value(s):

- **ACG NOT PRESENT** = Automatic call gap (ACG) component not present.
- **ACG PRESENT, CORRECT** = Automatic call gap component present, has no errors.
- **ACG PRESENT, IN ERROR** = Automatic call gap component present, has errors.

**k¹** = The call gap control digits - the digits contained in the ACG component. If no ACG component is present, **NONE** will be output.

**l¹** = The call gap duration - used to determine the length of time for which controls are to be in effect. The following table lists the call gap duration index number received from the database and the corresponding time (in seconds) that the index represents:

<table>
<thead>
<tr>
<th>index</th>
<th>gap duration in seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
</tbody>
</table>
If no ACG component is present, NONE will be output.

\[ m \]  = The call gap interval - used to determine the time between allowed queries when controls are in effect. The following table lists the call gap interval index number received from the database and the corresponding time (in seconds) that the index represents:

<table>
<thead>
<tr>
<th>index</th>
<th>gap interval in seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>3</td>
<td>6</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>11</td>
</tr>
<tr>
<td>6</td>
<td>16</td>
</tr>
<tr>
<td>7</td>
<td>22</td>
</tr>
<tr>
<td>8</td>
<td>30</td>
</tr>
<tr>
<td>9</td>
<td>42</td>
</tr>
<tr>
<td>10</td>
<td>58</td>
</tr>
<tr>
<td>11</td>
<td>81</td>
</tr>
<tr>
<td>12</td>
<td>112</td>
</tr>
<tr>
<td>13</td>
<td>156</td>
</tr>
<tr>
<td>14</td>
<td>217</td>
</tr>
<tr>
<td>15</td>
<td>300</td>
</tr>
</tbody>
</table>

If no ACG component is present, NONE will be output.

\[ n \]  = The call gap control cause. Valid value(s):
- DBOVLD = Database overload. This is the only cause that is considered valid for LAC CCS7. Any other cause returned will result in the ACG component being ignored.
- MASS = Destination mass calling. This result is not expected; controls will not be installed for this case.
- OUTBND = Out of band. This result is not expected; controls will not be installed for this case.
- SMS = Service Management System (SMS) initiated. This result is not expected; controls will not be installed for this case.
- VACCD = Vacant code. This result is not expected; controls will not be installed for this case.

\[ o \]  = LIDB BNS Account Owner indicator received in an encapsulated LIDB BNS reply.

\[ p \]  = LIDB BNS Billing Service Provider indicator received in an encapsulated LIDB BNS reply.

4. ACTIONS TO BE TAKEN

This message is the response to a manual request. It is used as a high-level check on the connection to the LAC database (which is external to the switch), to check out data in the LAC database, or to check out a repeatedly failing query. The response should be examined to see if it indicates proper data in the LAC database.

5. ALARMS

None.

   P/F tttttttttt tttttttttt

2. REASON FOR OUTPUT

To respond to the TST:LEN input message request to run an exercise program on a specific path through a line unit 1 (LU1), line unit 2 (LU2), or line unit 3 (LU3).

Format 1 prints when requested phases are completed, or a resource or required data was unavailable causing no phases to be run, a manual stop or abort had been entered, or when some phases did not run due to a resource failure after one or more phases began.

Format 2 prints when an event occurred during execution that did not cause termination, but a status report was warranted, or a resource or required data is unavailable, causing no phases to be run. Such events include: failure occurrence and the final summary of each phase. The circuit implicated, implication reason, and failing wire represent the last detected event.

Format 3 prints at the completion of a set of 20 repeats of a phase or groups of phases, or phase termination if the repeat is not a multiple of 20. The circuit implicated, implication reason, and failing wire represent the last detected event.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Line unit (LU) number.
c = LU grid number.
d = LU grid board number.
e = Grid board switch number.
f = Grid board switch level number.
g = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion and the termination was immediate.
COMPLETED = Request has successfully completed.
IN PROGRESS
STOPPED = Requested action was terminated before a normal completion.

h = Phase result. Valid value(s):
ATP = All tests passed.
NTR = No tests run.
STF = Some tests failed.

i = A-link number.

j = B-link number.

k = HLSC number.

l = Phase number.

m = Number of phases that passed.

n = Number of phases that were completed so far.

o = Number of repeats performed so far.

p = Number of repeats requested.

q = Circuit implicated. Valid value(s):
ALINK = Line unit A-link.
BLINK = Line unit B-link.
GRID = Line unit grid.
HLSC = Line unit HLSC.
LEN = Line problem, outside plant.
NONE = There were no circuits implicated.

r = Implication reason. Valid value(s):
ALINK-BLINK MISMATCH = A-link has no access to specified B-link, or the A-link and B-link are not in the same state, such as both OOS or both idle.
ALINK BUSY = A-link is busy.
BLINK BUSY = B-link is busy.
CONTROL TO GRID = Test configuration control not properly executed.
FALSE CROSS = Tip and ring leads are shorted together or to ground, or an internal power source voltage was detected on the A-link or B-link.
FOREIGN POTENTIAL = Dangerous voltage on LEN or loop, usually DC, or resistive connection to tip and/or ring and/or ground.
HLSC BUSY = High-level service circuit (HLSC) is busy.
HLSC ERROR = The HLSC may not be reliable, and therefore test results are undefined.
HOLD STARTED = Marks the beginning of a 15 minute path hold request.
LATCH READ = Crosspoint latch, scanner or firmware failure.
LEN-ALINK MISMATCH = Line has no access to specified A-link.
LEN BUSY = Line is busy or in untestable state (the LEN may be removed from service and the command retried).
LEN UNTESTABLE = Request cannot be run on this type of line equipment (private branch exchange (PBX) or incompatible equipment).

NO FAILURE
OFF HOOK RECOGNITION = Scan circuit failed long loop sensing test.
OPEN PATH = The location of a 'STUCK CLOSED' crosspoint is identified by the test, but not a 'STUCK OPEN'. A break anywhere in the path produces the same 'OPEN PATH' message. To pinpoint a 'STUCK OPEN' crosspoint, identify the crosspoints that open and close properly in the faulty path until the defective one is isolated. The path includes the GDX access pack and all connections between the HLSC and the grid pack. If a crosspoint in the grid is not isolated as a defective 'STUCK OPEN' investigate the other elements in the path.
PAGING FAILURE = Test program failed to be activated.
POWER ALARM = Grid power source failure.
POWER CROSS = Dangerous AC voltage on loop.
PRE-CUTOVER = Cannot access line in pre-cutover state if not in test mode.
SCANNER CKT = Scanner circuit.
SHORTED SCAN XPT = Scan cutoff crosspoint.
SHORTED XPT = Shorted crosspoint.
NOT SPECIFIED
V+ LOW = Transient error.
V+ RESTORED = Verifies "V+ LOW" was automatically restored.
XPT LEFT ON = Crosspoint left on and automatically cleared. The test will continue unless clear is not successful.

s = Failing wire. Valid value(s):
NEITHER = Neither tip nor ring failed.
RING
TIP
TIPRING = Both tip and ring failed.

T = Pass/fail map. Each character represents one phase. Valid value(s):
- = Not requested.
. = Pass.
B = Both tip and ring failures.
O = Other. The failure is described in a previous failure message, the failure does not apply to tip or ring, or detailed knowledge and/or explanation of the phase is needed.
R = Ring failure.
T = Tip failure.

4. ACTION TO BE TAKEN

For Format 1, if NTR, idle any suspected resources and note the output message with Format 2, or check office-dependent data (ODD) for proper equipage of resources, before reentering the input. If ATP, proceed in accordance with local practice. If STF, note the output message with Format 2 or 3 and replace faulty circuit pack(s).

For Formats 2 and 3, idle any suspected resources and replace the suspected faulty circuit pack(s), if necessary.
some circumstances, failures such as power cross or foreign potential may be cleared without replacing circuit packs. These failures may be caused by problems on the outside plant or subscriber lines.

5. ALARMS

None.

Other Manual(s):
235-105-220 Corrective Maintenance
TST:LIDB-BNS

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

TST LIDB BNS=a DURATION OF TEST=b
c  d  e
COMPANY-ID=f  g  h
i  j  k
IC-IND=l  m  OPC=n  RAO=o
p  CG-DIGITS=q
CG-DUR=r  CG-INTVL=s  t  u
DB=v
w  x
OLS=y  OST=z  CT=a
ACCT-OWNER=b  BILL-SVC-PROVIDER=c

2. REASON FOR OUTPUT

To report the results of the manual request from the TST:BNS input message that a billing number screening (BNS) query test be performed using the line information database (LIDB). It is used as a high-level check on connections to a LIDB or a LIDB alternate destination (a database external to the switch), to check out data in the database, or to check out a repeatedly failing query.

3. VARIABLE FIELD DEFINITIONS

a  = Ten-digit billing number that was queried.
b  = Duration of the test in milliseconds. Timing starts when the switch receives the input request and ends when the switch receives the result from the network or a timeout occurs.
c  = Results of a failed test. This field prints out only when the test query was not successful. Valid value(s):
   GARbled MESSAGE = A response was received but the data in the message was mutilated.
   IMS OR CNI RETURNED MSG = The inter-process message switch (IMS) or the common network interface (CNI) returned the message.
   NETWORK CONGESTION = Could not complete the test due to network congestion.
   NETWORK FAILURE = Could not complete the test due to failure in the network.
   NO TRANSLATION ADDRESS NATURE = No entries exist in the database for addresses of this nature.
   NO TRANSLATION SPECIFIC ADDRESS = No entries exist in the database for this specific address.
   SUBSYSTEM CONGESTION = Could not complete the test due to subsystem congestion.
   SUBSYSTEM FAILURE = Could not complete the test due to subsystem failure.
   TIMEOUT = A response to the test query was not received within the eight-second time limit.
   UNEQUIPPED USER = Could not complete the test due to unequipped user.

d  = LIDB BNS response. Valid value(s):
   MISROUTE = Misroute.
MISSING CUST REC = Missing customer record.
MISSING GROUP = Missing group.
NONPARTICIPATE GRP = Nonparticipating group.
RECEIVE REJECT = Received reject message for LIDB BNS query.
RECORD FOUND = LIDB BNS record found.
UNAV NET RESOURCE = Unavailable network resource.
UNXP DATA VALUE = Unexpected data value.
VACANT GROUP = Vacant group.

e = LIDB BNS record status indicator. Valid value(s):
DEFAULT RECORD = Default record.
STABLE RECORD = Stable record.
TRANSIT RECORD = Transitional record.

f = Company identifier (ID) number. Identifies the service provider with which the data is to be associated.

g = Collect number acceptance indicator. Valid value(s):
ALW COL = Allow all collect calls to this number without verification.
ALWC INTRA = Allow without verification all intra local access and transport (LATA) collect calls - reject interLATA.
LSA DENY = The line number services application/network control point (LSA/NCP) denied this call.
NOCOL = No collect calls to this number.
NOCOL-C = No collect calls to this number - customer request.
VFY COL = Verify all collect calls to this number.
VFYC INTRA = Allow without verification all intraLATA collect calls- verify interLATA.

h = Third number acceptance indicator. Valid value(s):
ALW 3RD = Allow without verification third-number billing to this number.
ALW3 INTRA = Allow without verification intraLATA third-number billing - reject interLATA.
LSA DENY = The LSA/NCP denied this call.
NO 3RD = No third-number billing to this number.
NO 3RD-C = No third-number billing to this number - customer request.
VFY 3RD = Verify third-number billing to this number.
VFY3 INTRA = Verify intraLATA third-number billing - reject interLATA.

i = Treatment indicator. Valid value(s):
AUTO-T = Automated treatment - provide alerting tone only.
AUTO-TP = Automated treatment - provide alerting tone and prompting announcement.
OP-STN = Operator treatment - operator handling because of station limitations.
ST-CUST = Special treatment - operator handling at customer request.
ST-HC1 = Special treatment - handicapped 1.
ST-HC2 = Special treatment - handicapped 2.
AUTO_TP2 = Automated treatment - provide alerting tone and prompting announcement 2.
AUTO_TP3 = Automated treatment - provide alerting tone and prompting announcement 3.
OP_FRAUD = Operator treatment - high fraud.
AUTO_T_NOOP = Automated treatment - provide alerting tone only - no operator access.
AUTO_TP4_NOOP = Automated treatment - provide alerting tone and prompting announcement 4 -
no operator access.

**AUTO_TP5_NOOP** = Automated treatment - provide alerting tone and prompting announcement 5 - no operator access.

**AUTO_TP6_NOOP** = Automated treatment - provide alerting tone and prompting announcement 6 - no operator access.

**AUTO_TP7** = Automated treatment - provide alerting tone and prompting announcement 7.

**AUTO_TP8** = Automated treatment - provide alerting tone and prompting announcement 8.

**AUTO_TP9** = Automated treatment - provide alerting tone and prompting announcement 9.

**AUTO_TP10_NOOP** = Automated treatment - provide alerting tone and prompting announcement 10 - no operator access.

**AUTO_TP11_NOOP** = Automated treatment - provide alerting tone and prompting announcement 11 - no operator access.

**AUTO_TP12_NOOP** = Automated treatment - provide alerting tone and prompting announcement 12 - no operator access.

**AUTO_SH1** = Automated treatment - special handling 1.

**AUTO_SH2** = Automated treatment - special handling 2.

**AUTO_SH3** = Automated treatment - special handling 3.

**AUTO_SH4** = Automated treatment - special handling 4.

**AUTO_SH5** = Automated treatment - special handling 5.

**AUTO_TP13** = Automated treatment - provide alerting tone and prompting announcement 13.

**AUTO_TP14_NOOP** = Automated treatment - provide alerting tone and prompting announcement 14 - no operator access.

SRV42 = (42) Public - Postpay

k = Intercept indicator. Valid value(s):
CHGING = Being changed, may not yet be connected.
CHGNPN = Changed to nonpublished number.
CHGREF = Changed with referral to new number.
DISCNR =Disconnected without referral.
DISC = Disconnected, call being taken by.
NOTCON = May not yet be connected.
NOTINCP = Not intercepted.
NOTINSV = Not in service for incoming calls.
SPECTRTM = Special intercept treatment required.
TDISCNR = Temporarily disconnected without referral to new number.
TDISCR = Temporarily disconnected with referral to new number.
TDISC = Temporarily disconnected.
TNOTINSV = Temporarily removed from service, call being taken by.
VACNUM = Vacant number.

l = First interLATA carrier (IC) indicator.
m = Second IC indicator.

n = Originating point code of the LIDB.
o = Three-digit revenue accounting office (RAO) number.
p = Call gap present indicator. Valid value(s):
ACG NOT PRESENT = Automatic call gap component not present.
ACG PRESENT, CORRECT = Automatic call gap component present, has no errors.
ACG PRESENT, INERROR = Automatic call gap component present, has errors.

q = Call gap control digits - digits to which controls are to be applied.
r = The call gap duration - used to determine the length of time for which controls are to be in effect.
The following table lists the call gap duration index number received from the database and the corresponding time (in seconds) that the index represents:
index | gap duration in seconds
---|---
0 | 0
1 | 1
2 | 2
3 | 4
4 | 8
5 | 16
6 | 32
7 | 64
8 | 128
9 | 256
10 | 512
11 | 1024
12 | 2048

The call gap interval - used to determine the time between allowed queries when controls are in effect. The following table lists the call gap interval index number received from the database and the corresponding time (in seconds) that the index represents:

index | gap interval in seconds
---|---
0 | 0
1 | 3
2 | 4
3 | 6
4 | 8
5 | 11
6 | 16
7 | 22
8 | 30
9 | 42
10 | 58
11 | 81
12 | 112
13 | 156
14 | 217
15 | 300

\(s\) = The call gap interval - used to determine the time between allowed queries when controls are in effect. The following table lists the call gap interval index number received from the database and the corresponding time (in seconds) that the index represents:

\(t\) = Call gap indicator. Valid value(s):
- DBOVLD = Database overload.
- MASS = Destination mass calling.
- OUTBND = Out of band.
- SMS = Service Management System (SMS) initiated.
- VACCD = Vacant code.

\(u\) = Carrier identification code (CIC) expansion (CICEXP) indicator. Presence of the CICEXP keyword indicates that the CIC sent by LIDB in the response message should be in the four-digit format. Absence of the keyword indicates that the CIC should contain three digits.

\(v\) = Database indicator. Indicates which database was requested when the manual request was initiated. The possible databases are either the LIDB or the LIDB alternate destination (LALT), which both use the LIDB transaction capability application part (TCAP) interface.

\(w\) = Calling number, also known as the automatic number identification (ANI), used in the query.
- CLG = Identifies a North American numbering plan number.
- ICLG = Identifies an international country code or number.

The value NO CALLING NUMBER indicates that no calling number was input.

\(x\) = Called number, also known as the forward number, used in the query.
CLG = Identifies a North American numbering plan number.
ICLG = Identifies an international country code or number.

The value NO CALLED NUMBER indicates that no called number was input.

y = Originating line screening code (OLS).
z = Originating station type (OST). Valid value(s):
   ACQS = Other ACQS station.
   ACQS HOTEL = Automatic charge quotation service (ACQS) hotel station.
   NON-ACQS HOTEL = Non-ACQS hotel.
   NON-COIN PUBLIC = Non-coin public station.
   NONE = No OST specified on input message.
   OTHER = Other station.
   POST-PAY COIN = Post-paid coin station.
   PRE-PAY COIN = Pre-paid coin station.
   UNKNOWN = Unknown station.

a1 = Call type. Valid value(s):
   COLLECT = Collect.
   NONE = No call type.
   THIRD = Bill to third.
   PAID = Sent-paid.

b1 = Account Owner indicator.

c1 = Billing Service Provider indicator.

4. ACTIONS TO BE TAKEN

This message is the response to a manual request. If variable ‘c’ prints out, then there is a problem with the connection to the database. Otherwise, the response is from the database. In this case, the response should be examined to see if it indicates proper data in the database. Contact the LIDB administrator for assistance.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of the manual request (TST:CCRD) that requests that a calling card (CCRD) query test be performed using the line information database (LIDB) interface. It is used as a high-level check on connections to a LIDB or a LIDB alternate destination (a database external to the switch), to check out data in the database, or to check out a repeatedly failing query.

3. VARIABLE FIELD DEFINITIONS

a = CCRD number that was queried.
b = Calling number, also known as the automatic number identification (ANI), used in the query.
   CLG = Identifies a North American numbering plan number.
   ICLG = Identifies an international country code or number.

The value NO CALLING NUMBER indicates that no calling number was input.
c = Duration of the test in milliseconds. Timing starts when the switch receives the input request and ends when the switch receives the result from the network or a timeout.
d = Results of a failed test. This field prints out only when the test query was not successful. Valid value(s):
   GARbled MESSAGE = A response was received but the data in the message was mutilated.
   IMS OR CNI RETURNED MSG = The inter-process message switch (IMS) or the common network interface (CNI) returned the message.
   NETWORK CONGESTION = Could not complete the test due to network congestion.
   NETWORK FAILURE = Could not complete the test due to failure in the network.
   NO TRANSLATION ADDRESS NATURE = No entries exist in the database for addresses of this nature.
   NO TRANSLATION SPECIFIC ADDRESS = No entries exist in the database for this specific address.
   SUBSYSTEM CONGESTION = Could not complete the test due to subsystem congestion.
   SUBSYSTEM FAILURE = Could not complete the test due to subsystem failure.
   TIMEOUT = A response to the test query was not received within the eight second time limit.
UNEQUIPPED USER = Could not complete the test due to unequipped user.

*= LIDB CCRD response. Valid value(s):
CCAN SERVICE DENIAL = Service denial on calling card account number (CCAN).
LSA DENY = Line number services application/network control point (LSA/NCP) denied this call.
MISROUTE = Misroute.
MISSING CUST REC = Missing customer record.
MISSING GROUP = Missing group.
NO PIN MATCH = No personal identification number (PIN) match.
NONPARTICIPATE GRP = Nonparticipating group.
PIN NOT ASSIGNED = No PIN assigned.
RECEIVE REJECT = Received reject message for LIDB CCRD query.
RESTRICTED PIN = Restricted PIN.
SPD NONPAYMENT = Service on PIN denial - nonpayment.
SPD SERVICE RESTRICTION = Service on PIN denial - service restriction.
SPD THRESHOLD = Service on PIN denial - threshold exceeded.
UNAV NET RESOURCE = Unavailable network resource.
UNRESTRICTED PIN = Unrestricted PIN.
UNXP DATA VALUE = Unexpected data value.
VACANT GROUP = Vacant group.

f = LIDB CCRD record status indicator. Valid value(s):
DEFAULT RECORD = Default record.
STABLE RECORD = Stable record.
TRANSIT RECORD = Transitional record.

g = Company identifier (ID) number that identifies the service provider with which the data is to be associated.

h = Subaccount number used on a customer's bill to distinguish various users of a CCAN, each associated with a different PIN.

i = First inter local access and transport area (LAT A) interLATA carrier (IC) indicator number.

j = Second IC indicator number.

k = Originating point code number of the LIDB.

l = Three-digit revenue accounting office (RAO) number.

m = Call gap present indicator. Valid value(s):
ACG NOT PRESENT = Automatic call gap (ACG) component not present.
ACG PRESENT, CORRECT = ACG component present, has no errors.
ACG PRESENT, IN ERROR = ACG component present, has errors.

n = Call gap control digits to which controls are to be applied.

o = The call gap duration - used to determine the length of time for which controls are to be in effect. The following table lists the call gap duration index number received from the database and the

Call gap indicator. Valid value(s):

- **DBOVLD** = Database overload.
- **MASS** = Destination mass calling.
- **OUTBND** = Out of band.
- **SMS** = Service Management System (SMS) initiated.
- **VACCD** = Vacant code.

Called number, also known as the forward number, used in the query.

- **CLG** = Identifies a North American numbering plan number.
- **ICLG** = Identifies an international country code or number.

The value **NO CALLED NUMBER** indicates that no called number was input.

Carrier identification code (CIC) expansion (CICEXP) indicator. Presence of the CICEXP keyword indicates that the CIC sent by LIDB in the response message should be in the four-digit format. Absence of the keyword indicates that the CIC should contain three digits.

Database indicator. Indicates which database was requested when the manual request was initiated. The possible databases are either the LIDB or the LIDB alternate destination (LALT), which both use the LIDB transaction capability application part (TCAP) interface.
u  = Originating line screening (OLS) code.

v  = Originating station type (OST). Valid value(s):
   ACQS   = Other ACQS station.
   ACQS HOTEL = Automatic charge quotation service (ACQS) hotel station.
   NON-ACQS HOTEL = Non-ACQS hotel.
   NON-COIN PUBLIC = Non-coin public station.
   NONE   = No OST specified on input message.
   OTHER  = Other station.
   POST-PAY COIN = Post-paid coin station.
   PRE-PAY COIN = Pre-paid coin station.
   UNKNOWN = Unknown station.

4. ACTIONS TO BE TAKEN

If variable ‘d’ prints out, then there is a problem with the connection to the database. Otherwise, the response is from the database. In this case, the response should be examined to see if it indicates proper data in the database. Contact the LIDB administrator for assistance.

2. REASON FOR OUTPUT

To report the results of performing electronic loop segregation (ELS) testing on one or more lines. This message is
in response to a TST:LINE-ELS input message or as the result of running the ELS portion of routine exercise in the
verbose mode.

Formats 1, 2, 3 and 4 occur when a single line was requested to be tested. Format 5 occurs when an integrated
SLC® line directory number (DN) or multi-line hunt group (MLHG) number was specified in the input request. Since
ELS is not supported for integrated SLC® lines, no test was run.

Formats 6, 7, 8 and 9 occur when a group of lines were requested to be tested or when routine exercise (REX) is
run in verbose mode. The number of lines which completed the test is given, as is the number of lines which were
skipped (not tested), and the number of lines for which the test was not started. If an ELS test is manually stopped
or aborts, the reason for the termination is identified.

ELS is used primarily to determine whether the line is loaded. A loaded line has load coils at intervals along the line's
outside plant wiring. This information is recorded in office dependent data each time the test is ran (unless the
database is locked). It is later used when setting up a call involving the line to select the balance network in the line
unit which will provide the best transmission quality.

3. VARIABLE FIELD DEFINITIONS

**NOTE:** Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in
the format.

```
+ = Indicates the line is a party line.
a = The directory number of the line which was tested. The directory number will include NPA for non-unique NXX DN.
b = Switching module (SM) number.
c = Line unit number.
d = Grid number.
e = Grid pack number (LU1, LU2, LU3).
f = Switch number.
g = Level number.
h = Multi-line hunt group number.
i = Member number.
j = Termination report. Valid value(s):
   ACTIVATE FAILURE = An error occurred while attempting to setup the test configuration. Verify
   that the line and/or transmission test facility (TTF) or global digital services function
   (GDSF) is equipped correctly.
   CMP UNAVAILABLE = The input request could not be completed because a needed communication
   module (CM) was unable to respond. Retry the request later.
   COMPLETED = The requested ELS test completed. Results of the test are indicated in the output.
   DATABASE ERROR = Database read failed, the release of the digital path failed, or there was recent
   change activity during the database update.
   HARDWARE UNAVAILABLE = The hardware associated with the group of lines specified to test is
   unequipped or out-of-service (OOS). The specific OOS/unequipped circuits are
   grids for analog line units or line groups for integrated services line units.
   INPUT ERROR = The input request was in some manner invalid. Validate the input request and
   correct if necessary.
   INVALID LINE = The single line test was not run because the line specified in the input request to
   test was incorrect/invalid. This could be due to the hardware associated with the
   specified line being unequipped and/or a typographical error when entering the line
   identifier.
   LINE BUSY = The single line test was not run because the line was busy. A busy condition
   could be caused either by customer use (phone call) or by another maintenance
```
action within the switch [trunk and line work station (TLWS) testing, for example].

**NON-UNIQUE NXX DN** = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Renter DN with NPA.

**PROCESS TIMEOUT** = ELS process timed out waiting for a response from either the PC foreground/task or the TTF or GDSF process.

**RELEASE FAILURE** = Cannot release a resource which was allocated to the ELS process while performing the tests.

**RESOURCE FAILURE** = All TTF responders or GDSF guard data guard (GDG) transceivers are busy, the seized TTF responder or GDSF GDG transceiver is bad, or a failure in getting a digital path to the TTF or GDSF occurred.

**STOPPED** = A STP:ELS input message was received which caused the specified ELS test to be terminated before it could complete.

**SYSTEM BUSY** = The test was not run due to failure to obtain a needed resource, most likely caused by too much activity in the switch. Repeat the test request later.

**SYSTEM ERROR** = An unspecified internal error occurred which prevents continuing.

**UNASSIGNED LINE** = The single line test was not run because the line hardware was equipped but no customer (that is, loop) was currently assigned to it.

**UNTESTABLE LINE** = The line was not a testable line. Currently, integrated SLC®96 and digital subscriber lines (DSL) are not ELS testable.

\[ k \]

= Loop type. Valid value(s):

- **LOADED**
- **NORMAL**
- **RANGE EXTENDED**

\[ l \]

= Action taken by the system. Valid value(s):

- **DBLOCKED** = The database was locked and could not be changed. Whether the database is locked for a line is controlled by the ‘CRFTLOCK’ field on the associated recent change line view.
- **DBUPDATED** = The current loaded value in the office dependent database did not agree with the value obtained from the current test. The database and has been updated with the most recent test results.
- **NONE** = The current loaded value in the office dependent database agreed with the value obtained from the current test, or the line was identified as range extended. The database was not changed. The only way to change range extension information for a line is through recent change.

\[ n \]

= Integrated services line unit (ISLU) number.

\[ o \]

= Line group controller number.

\[ p \]

= Line card number.

\[ s \]

= Digital carrier line unit (DCLU) number.

\[ t \]

= Remote terminal (RT) number.

\[ u \]

= RT line number.

\[ v \]

= The number of lines that completed the ELS test and for which either the database was originally correct or updated so that it is now correct.
**w**  = The number of lines that skipped the ELS test. ELS skips lines which are traffic busy, range-extended, user-locked, unassigned, PBX-CO, or OOS.

**x**  = The number of lines for which the ELS test was not started.

**y**  = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

**z**  = Integrated services line unit-2 (ISLU2) number.

**a**\(^1\)  = Line group number.

**b**\(^1\)  = Line board number.

**c**\(^1\)  = Line circuit number.

**d**\(^1\)  = Access interface unit equipment number.

**e**\(^1\)  = AIU pack number.

**f**\(^1\)  = AIU circuit number.

### 4. ACTION TO BE TAKEN

None, if ELS test completes successfully or was stopped by a manual request. If the ELS test was aborted, investigate the reason for failure and if possible, correct.

### 5. ALARMS

None.

```

2. **REASON FOR OUTPUT**

To report the results of a manually initiated (TST:LNP) Operator Services Position System (OSPS) local number portability (LNP) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query.

3. **VARIABLE FIELD DEFINITIONS**

- **a** = The duration of the test query, in milliseconds. Timing starts when the administrative module (AM) sends the formatted query, and ends when the query response is received from the network.

- **b** = The translation type entered with the input command. The translation type is used in the TCAP query to indicate to the signal transfer point (STP) which translation tables should be used to obtain routing information for the query. The translation type is a number from 0 to 255.

- **c** = The billing number entered with the input command. The 10 digit NANP billing number is populated here when available else the word "NONE" will be used.

- **d** = The billing number location route number (LRN) received from the LNP/ network control point (NCP). The 10 digit NANP billing number LRN is populated here when available else the following will be used:
  - **NONE** = No query was sent, this number is not portable.
  - **NOT PORTED** = A reply was received and this number was determined to be not ported.
  - **ERROR - NOT PORTABLE** = A reply was received with a "billing number not portable" error code.

- **e** = The called number entered with the input command. The 10 digit NANP called number is populated here when available else the word "NONE" will be used.

- **f** = The called number LRN received from the LNP/NCP. The 10 digit NANP called number LRN is populated here when available else the following will be used:
  - **NONE** = No query was sent, this number is not portable.
  - **NOT PORTED** = A reply was received and this number was determined to be not ported.
  - **ERROR - NOT PORTABLE** = A reply was received with a "called number not portable" error code.

- **g** = The calling number entered with the input command. The 10 digit NANP calling number is
populated here when available else the word "NONE" will be used.

h = The calling number LRN received from the LNP/NCP. The 10 digit NANP calling number LRN is populated here when available else the following will be used:
  NONE = No query was sent, this number is not portable.
  NOT PORTED = A reply was received and this number was determined to be not ported.
  ERROR - NOT PORTABLE = A reply was received with a "calling number not portable" error code.

i = The billing network switch number (NSN) received from the LNP/NCP. The 6-digit billing NSN is populated here when available else the word "NONE" will be used.

j = The called NSN received from the LNP/NCP. The 6 digit called NSN is populated here when available else the word "NONE" will be used.

k = Point code number of the network node that sent the response. If the test query timed out, 'NOT APPLICABLE' is output for the point code.

l = The call gap present indicator. Valid value(s):
  ACG NOT PRESENT = Automatic call gap (ACG) component not present.
  ACG PRESENT, CORRECT = Automatic call gap component present, has no errors.
  ACG PRESENT, IN ERROR = Automatic call gap component present, has errors.

m = The call gap control digits - the digits contained in the ACG component. Controls will be applied on the first 6 digits for the billing, calling or called number. If no ACG component is present, 'NONE' will be output.

n = The call gap duration - used to determine the length of time for which controls are to be in effect. The following table lists the call gap duration index number received from the database and the corresponding time (in seconds) that the index represents:

<table>
<thead>
<tr>
<th>index</th>
<th>gap duration in seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
<tr>
<td>9</td>
<td>256</td>
</tr>
<tr>
<td>10</td>
<td>512</td>
</tr>
<tr>
<td>11</td>
<td>1024</td>
</tr>
<tr>
<td>12</td>
<td>2048</td>
</tr>
</tbody>
</table>

If no ACG component is present, 'NONE' will be output.

o = The call gap interval - used to determine the time between allowed queries when controls are in effect. The following table lists the call gap interval index number received from the database and the corresponding time (in seconds) that the index represents:

<table>
<thead>
<tr>
<th>index</th>
<th>gap interval in seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>(remove controls)</td>
</tr>
<tr>
<td>1</td>
<td>(maintain current controls)</td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>1.0</td>
</tr>
</tbody>
</table>
If no ACG component is present, 'NONE' will be output.

p = The call gap control cause. Valid value(s):
  DBOVLD = Database overload. This is the only cause that is considered valid for LNP. Any other cause returned will result in the ACG component being ignored.
  MASS = Destination mass calling. This result is not expected; controls will not be installed for this case.
  OUTBND = Out of band. This result is not expected; controls will not be installed for this case.
  SMS = Service management system (SMS) initiated. This result is not expected; controls will not be installed for this case.
  VACCD = Vacant code. This result is not expected; controls will not be installed for this case.

q = LNP TCAP query general reply code or error code. This field prints out when a normal reply was received in response to the test query. Valid value(s):
  SUCCESSFUL REPLY = A successful reply was received.
  UNEXPECTED INPUT, DATA VALUE = The content of a query parameter was not as expected.
  TASK REFUSED = The task was refused because the node could not handle the request at the time (not because the operation was incorrect in any way).
  GATEWAY ERROR = Communication with an LNP database was unsuccessful.
  VACANT CODE = The database determined that the number(s) contained in the query have not been populated.
  MISROUTED QUERY = The number was not in the range the database expected.
  UNEXPECTED PARAMETER = A query parameter was received but not recognized.
  MISSING PARAMETER = A mandatory parameter was absent from the query.

r = The abort cause or reject problem code. This field prints out only when a p-abort, u-abort, invoke problem reject message, or general problem reject message is received in reply to a LNP TCAP test query. Valid value(s):
  P-ABORT - BADLY FORMATTED TRANSACTION PORTION = The transaction portion of the received message did not conform to the encoding rules.
  P-ABORT - INCORRECT TRANSACTION PORTION = The elemental structure within the transaction portion of the received message did not conform to the rules for the transaction portion.
  P-ABORT - RESOURCE LIMITATION = Sufficient resources were not available.
  P-ABORT - UNRECOGNIZED MESSAGE TYPE = The TCAP message type was not defined.
  P-ABORT - UNRECOGNIZED TRANSACTION ID = A transaction ID had been received for which a transaction did not exist at the receiving node.
  REJECT - BADLY STRUCTURED COMPONENT = The contents of the component did not conform to the encoding rules.
  REJECT - DUPLICATE INVOKE ID = The invoke ID was already in use by a previously invoked operation.
  REJECT - INITIATING RELEASE = The requested operation could not be invoked because the
dialogue was about to be concluded.

REJECT - MISTYPED COMPONENT = The elemental structure of a component did not conform to the defined structure of that component.

REJECT - MISTYPED PARAMETER = A parameter tag was not one of those associated with the invoked operation.

REJECT - RESOURCE LIMITATION = Sufficient resources were not available to perform the requested operation.

REJECT - UNRECOGNIZED COMPONENT = The component type was not recognized.

REJECT - UNRECOGNIZED OPERATION = The operation code value was not one of those used by the application.

U-ABORT - APPLICATION PROTOCOL VIOLATION = A protocol violation occurred in relation to the allowed sequences of messages defined for the application service element.

U-ABORT - REJECT RECEIVED = An unexpected reject component was received.

U-ABORT - UNKNOWN USER PROBLEM = The cause of the transaction abort request is unknown. This request could be the result of an abort in the application specific entry, or application itself.

The results of a failed test query. This field prints out only when the test query was not successful.

Valid value(s):

BLOCKED BY AM = The query was blocked by an internal problem on the AM.

GARBLED MESSAGE = A response was received but the data in the message was mutilated. The only fields that are populated are what was known when the query was sent.

IMS OR CNI RETURNED MSG = The inter-process message switch (IMS) or the common network interface (CNI) returned the message. This result is not expected for LNP test queries.

NETWORK CONGESTION = Could not complete the test due to network congestion.

NETWORK FAILURE = Could not complete the test due to failure in the network.

NO TRANSLATION ADDRESS NATURE = No entries exist in routing tables for addresses of this nature.

NO TRANSLATION SPECIFIC ADDRESS = No entries exist in routing tables for this specific address.

SUBSYSTEM CONGESTION = Could not complete the test due to subsystem congestion.

SUBSYSTEM FAILURE = Could not complete the test due to subsystem failure.

TIMEOUT = A response to the test query was not received within the time limit.

UNEQUIPPED USER = Could not complete the test due to unequipped user.

UNQUALIFIED = Unknown failure reason.

4. ACTION TO BE TAKEN

This message is the response to a manual request. It is used as a high-level check on the connection to the LNP database (which is external to the switch), to check out data in the LNP database, or to check out a repeatedly failing query. If variable 'k' (results of a failed test) prints out (with the exception of GARBLED MESSAGE), then there is a problem with the connection to the database, and the Engineering Network Administration Center (ENAC) should be contacted for assistance. Otherwise (including GARBLED MESSAGE), the response is from the database, and the Operations Network Administration Center (ONAC) should be contacted. The response should be examined to see if it indicates proper data in the LNP database.

5. ALARMS

None.

    FWD NBR=i NAT ADDR=g NBR PLAN=h
    FWD OPTS REASON=j

2. REASON FOR OUTPUT

To respond to a TST:MAPTQ input message which requests that a global system for mobile communications (GSM) mobile application part (MAP) test query message be sent to the home location register (HLR).

Format 1 is used when no extended routing information is received from the HLR.

Format 2 is used when a roaming number is received from the HLR.

Format 3 is used when a forwarded to number is received from the HLR.

3. VARIABLE FIELD DEFINITIONS

a = Mobile station international ISDN (MSISDN) number consisting of 10-11 digits. Each digit is in the range of 0-9.

b = Global switching module number (range of 1-192).

c = Response time in seconds and fractions of a second.

d = International mobile subscriber identity (IMSI) consisting of up to 15 characters. The valid values for a character are 0-9, a, b, c, *, and #.

e = North American equal access (NAEA) preferred carrier identification code consisting of either three or four digits. Each digit is in the range of 0-9.

f = Roaming number consisting of up to 15 characters. The valid values for a character are 0-9, a, b, c, *, and #.

g = Nature of address. Valid value(s):
4. ACTIONS TO BE TAKEN

None. This message is in response to a manual input request.

f

2. REASON FOR OUTPUT

To respond to a TST:MAPTQ input message that requests that a global system for mobile communications (GSM) mobile application part (MAP) test query message be sent to the home location register (HLR). The first output format is used to report that a failure message has been received from the HLR. The second output format displays the reason that the test query dialogue was terminated prematurely. The last output format is used when a timeout has occurred or decoding of the response from the HLR has failed.

3. VARIABLE FIELD DEFINITIONS

a = Mobile station international ISDN (MSISDN) number consisting of 10-11 digits. Each digit is in the range of 0-9.
b = Global switching module number.
c = Response time in seconds and fractions of a second.
d = Return error reason. Valid value(s):
   ABSENT SUBSCRIBER = Absent subscriber.
   BEARER SERVICE NOT PROVISIONED = Bearer service not provisioned.
   BUSY SUBSCRIBER = Busy subscriber.
   CALL BARRED = Call barred.
   CUG REJECT = Closed user group reject.
   DATA MISSING = Data missing.
   FACILITY NOT SUPPORTED = Facility not supported.
   FORWARDING VIOLATION = Forwarding violation.
   NO SUBSCRIBER REPLY = No subscriber reply.
   OR NOT ALLOWED = Optimal routing not allowed.
   NUMBER CHANGED = Number changed.
   SYSTEM FAILURE = System failure.
   TELESERVICE NOT PROVISIONED = Teleservice not provisioned.
UNEXPECTED DATA VALUE = Unexpected data value.
UNKNOWN ERROR = Unknown error.
UNKNOWN SUBSCRIBER = Unknown subscriber.
* = Indicates invalid value.

e = Notification error. Valid value(s):
ACN NOT SUPPORTED = Application context name not supported.
APPLICATION TIMER TIMED OUT = Application timer timed out.
ERRONEOUS DATA = Erroneous data.
INTERNAL ERROR = Internal error.
MISSING MANDATORY PARAMETER = Missing mandatory parameter.
NETWORK PROBLEM = Network problem.
OPERATION TIMER TIMED OUT = Operation timer timed out.
REJECT ERROR = Reject error.
SEND ERROR = Send error.
TRANSACTION ABORTED = Transaction aborted.
USER ABANDON = User abandon.
* = Indicates invalid value.

f = Error description. Valid value(s):
ERRONEOUS DATA IN MAP RESPONSE
FAILED PROCESSING MAP RESPONSE
INTERNAL ERROR DECODING MAP RESPONSE
MISSING MANDATORY PARAMETER IN MAP RESPONSE
TIMED OUT WAITING FOR RESPONSE FROM HLR
UNEXPECTED OPERATION IN MAP RESPONSE
UNEXPECTED PARAMETER SEQUENCE IN MAP RESPONSE
UNKNOWN MAP RESPONSE

4. ACTIONS TO BE TAKEN

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to a TST:MP or STP:TST:MP input message and report the outcome of a modem pool (MP) test.

Format 1 reports the result of a test between two modem pool members (MPMs).

Format 2 reports the result of a test when the multi-line hunt group (MLHG) number of the modem pool group (MPG) was specified. Format 2 also reports the result of a test run on a range of MPMs within an MPG.

Format 3 reports the result of a test when the directory number (DN) of the MP access DN was specified (for example, the DN that the analog user would dial to reach an X.25 terminating packet-service through the modem pool). Formats 2 and 3 also report any problems that prevent a test from being run.

Format 4 prints the outcome of the operational and transmission test that has been run on a pair of MPMs. This message will be printed for every test failure.

3. VARIABLE FIELD DEFINITIONS

LCEN = Line card equipment number.
LEN = Line equipment number on a line unit.
a = MLHG number of the MPG involved in this test.
b = Member number of the first MPM involved in this test.
c = Member number of the second MPM involved in this test.
d = Type of test run. Valid value(s):
    ALL = Origination and termination test.
**ORIG** = Origination test.

**TERM** = Termination test.

e = Result of the test. Valid value(s):

**ABT** = Abort. The test was stopped because of some problem not associated with the modem pool member itself (refer to variable ‘f’).

**ATP** = All tests passed.

**COMPL** = Completed. The test has finished, but there is more information to be given (refer to variable ‘f’).

**FAIL** = Failed. The test was run and one of the modem pool members involved was found to be faulty (refer to variable ‘f’).

f = Expanded reason for the result. Valid value(s):

**CANNOT ISOLATE FAULTY MPM** = The pair of modem pool members specified on the output line were tested against a third modem pool member and no conclusion could be reached. The equipment numbers of the DSL and analog line of the modem pool members are printed on the following lines.

**CPE OUT OF SERVICE** = The customer premises equipment (CPE) connected to the multi-point digital subscriber line (DSL) of the modem pool member is currently out-of-service (OOS) and is not available for testing.

**DSL SIDE OF MPM OOS** = The digital subscriber line (DSL) side of the modem pool member is not available for testing. The equipment number of the DSL and analog line of the modem pool member are printed on the following line.

**INTERNAL ERROR RL** = An unexpected error condition was encountered. The test was stopped. Retry later.

**INVALID MPM** = One of the modem pool members specified in the output message is not a legitimate member of the modem pool group. The test was stopped.

**MPM BUSY** = The modem pool member specified on the output line was not available for testing. The equipment numbers of the DSL and analog line of the busy modem pool member are printed on the following line.

**MPM FAULTY** = The modem pool member specified on the following output line is faulty. The equipment numbers of DSL and analog line of the faulty modem pool member are printed.

**MPM OOS** = The analog side of the modem pool member specified on the output line was found to be OOS and could not be automatically restored. The equipment numbers of the DSL and analog line of the OOS modem pool member are printed on the following line.

**NO IDLE MPMS** = There are no idle modem pool members available to test against. They may be busy, OOS or faulty. The test was stopped.

**NOTE:** There should be three in-service (IS) idle modem pool members in a group to isolate the faulty modem pool member.

**SM UNAVAILABLE** = The SM on which the modem pool members reside is not available. The test was stopped.

**TIMED OUT** = The switching module (SM) did not respond to a command from the administrative module (AM) within the allotted time limit. The test was stopped. Retry later.

g = Status of the test. Valid value(s):

**COMPLETED** = Test of the group specified on the command line has finished. No further output will be printed.
INPUT ERROR = The test was stopped for one of three reasons. Valid value(s):
- The two MPMs specified on the command line are not members of the same group, as they must be.
- The two MPMs specified on the command line are the same, as they must not be.
- The highest-numbered MPM in the MPG to be tested is below the range specified on the command line.

INTERNAL ERROR = An unexpected error condition was encountered. The test was stopped. Retry later.
INVALID MLHG = Group specified on the command line is not a legitimate MLHG. The test was stopped.
NOT MAINTAINED = Group specified on the command line is not maintained by the operating company. The test was stopped.
NOT MP ACCESS DN = The DN specified on the command line is not a directory number to access a modem pool. The test was stopped.
SM UNAVAILABLE = SM on which the modem pool members reside is not available. The test was stopped.
STARTED = Test of the group specified on the command line has started. Reports of faulty modem pool members may be forthcoming.
STOPPED = The modem pool test was stopped by manual intervention.
TEST ALREADY IN PROGRESS = There is already a test being run on the modem pool group specified on the command line. The second test was stopped.
TEST NOT RUNNING = An attempt was made to stop a modem pool test that currently was not active.

h = The modem pool access DN of the MPG involved in the test.
i = The possible faulty modem pool member number.
j = Equipment number of the digital subscriber line of MPM on an ISLU. Valid value(s):
   LCEN=l-m-n-o

k = Equipment number of the analog line of MPM. Valid value(s):
   LCEN=l-m-n-o
   LEN=l-n-p-q-r-s

l = SM number.
m = Integrated service line unit number.
n = Line group controller number.
o = Line card number.
p = Grid number.
q = Switch board number.
r = Switch number.
s = Level number.

- RST:CPE
- RST:LINE
- STP:TST-MP
- TST:MP
TST:NCD

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

TST NCD=a DURATION OF TEST=b
c [d] [e]

2. REASON FOR OUTPUT

To report the results of the manual request (TST:NCD) which requested that a network call denial (NCD) query test be performed.

3. VARIABLE FIELD DEFINITIONS

a = Ten-digit billing number that was queried.
b = Duration of test in milliseconds. Timing starts when the switch receives the input request and ends when switch receives the result from the network, or times out.
c = Result of test. Valid value(s):
   CCIS FAILURE-DESTINATION NOT EQUIPPED = A destination in the common channel signaling (CCS) network was unequipped.
   CCIS FAILURE-NETWORK BLOCKED = Could not complete test due to network blockage.
   CCIS FAILURE-NETWORK OVERLOAD = Could not complete test due to an overload in the network.
   CCIS FAILURE-NO ROUTING DATA = Could not route to the data base due to an error in or unavailability of routing data in the network.
   DATABASE OVERLOAD = Could not complete the test due to an NCD/network control point (NCP) data base overload condition.
   INVALID NCD MESSAGE RECEIVED = A response was received but data in the message was mutilated.
   NUMBER ALLOWED = Input billing number is valid for AT&T-C calls.
   NUMBER DENIED = Input billing number is not acceptable for AT&T-C calls.
   TIMEOUT = A response to the test query was not acceptable for AT&T-C calls.
   UNABLE TO PROCESS-MISCELLANEOUS = Database was unable to process.
   UNABLE TO PROCESS-DATABASE OVERLOAD = Database was unable to process due to overload condition.

d = Control level value received. This field is output only if a control level is received in the reply.

Software Release: 5E14 only
Message Class: CCSTST,CCS
Application: 5
Type: Output

1. FORMAT

TST NS800=a  ANI=b  LATA=c  OST=d
  OPC=m
  e  [f]  [g]
  [h]  [l]  [i]  [j]
  [k]

2. REASON FOR OUTPUT

To respond to a TST:NS800 input message, which requests that an 800 number service (NS800) query test be performed.

3. VARIABLE FIELD DEFINITIONS

a = The ten-digit input service switching point (SSP) number that was tested.
b = Ten-digit automatic number identification (ANI) or the calling number.
c = Three-digit local access transport area (LATA) number.
d = The originating station type. This is an optional parameter indicating the calling station type. Valid value(s):
   CCOSAIOD = Automatic identified outward dialing (AIOD) listed directory number (DN) sent.
   CCOSANIF = Automatic number identification failure.
   CCOSCNLES = Coinless, hospital, inmate, etc.
   CCOSCOIN = Coin call.
   CCOSHOTEL = Hotel without room identification.
   CCOSILCNL = InterLATA restricted - coinless line, etc.
   CCOSILHT = InterLATA restricted - hotel line.
   CCOSILRST = InterLATA restricted.
   CCOSLINE = Identified line - no special treatment.
   CCOSNLINE = Identified line (coin or noncoin).
   CCOSONI = Operator number identification (ONI) (multiparty).
   CCOSTEST = Test call.
e = The type of response received from the test query request. Only one type of response for each request is expected. Valid value(s):
   NORMAL RESPONSE = Routing information provided by external database.
   PARSING FAILURE = Return failure from parsing function.
   PLAY ANNOUNCEMENT = External database cannot provide routing information.
   QUERY FAIL = Network fail, query not received by external database.
   REJECT = Protocol error in the query message to the external database.
   RETURN ERROR = Improper or invalid data in the query message to the external database.
   TIMEOUT = A response to the test query was not received within the three second time limit.
\[ f = \text{Error code, problem code specifier or ACG indicator. Valid value(s):} \]
