e² = Number of CAS TCAP replies* received that were not expected. The replies were ignored. They could be late or duplicate responses.

f² = Number of CAS TCAP database replies* received in invalid format. It includes data field values, as well as invalid TCAP format. The reply was dropped and the call received indeterminate treatment.

g² = Number of CAS TCAP replies* received with an automatic call gapping (ACG) component. All CAS SS7 queries to the same destination were gapped according to the received information. The call received appropriate treatment according to the response. Subsequent calls that were cut back due to these gapping controls received indeterminate treatment.

h² = Number of ICCV ITU-TS TCAP "Reject" components* received in response to a card validation query. The call received indeterminate treatment.

i² = Number of ICCV ITU-TS TCAP U-abort or P-abort messages* received. The call received indeterminate treatment.

j² = Number of times the query timer expired before receipt of an ICCV ITU-TS TCAP database reply. The call received indeterminate treatment.

k² = Number of ICCV ITU-TS TCAP queries initiated, then abandoned. The condition occurs if the call is canceled or the class of charge is changed after a query has been sent but before a reply was received. When the reply was received, it was ignored.

l² = Number of ICCV ITU-TS TCAP replies received* that were not expected. The replies were ignored. They could be late or duplicate responses.

m² = Number of ICCV ITU-TS TCAP database replies received* in invalid format. It includes data field values, as well as invalid TCAP format. The reply was dropped and the call received indeterminate treatment.

n² = Number of CAS update-only call disposition messages* (UO-CDMs) that have been sent to the card database.

o² = Number of CAS TCAP request for more balance call disposition messages (RFMB-CDMs)* that have been sent to the card database for purchase limit (PL) and/or duration limit (DL) calls, including RFMB-CDMs sent before setting up the call as well as those sent after the call has been set up.

p² = Number of replies to CAS RFMB-CDMs* received from the card database, regardless of whether the reply is a "grant or a "deny".

q² = Number of ICCV UO-CDMs* that have been sent to the card database.

r² = Total number of virtual card format (VCF) validation queries made.

s² = Total number of VCF validation replies received with an "allow call" response from a VCF
validation query.

\( t^2 \) = Total number of VCF validation replies received with a response of "missing customer record", "invalid PIN", or "vacant code" from a VCF validation query.

\( u^2 \) = Total number of forward number check (FNC) messages sent by the OSPS.

\( v^2 \) = Total number of allow replies received to the FNC query, with a reply code of "Allow Call - Valid Speed Call Number".

\( w^2 \) = Total number of deny replies received to the FNC query, with a reply code of "Deny Call - Invalid Speed Call Number".

\( x^2 \) = Total number of speed dial list (SDL) update requests sent by the OSPS.

\( y^2 \) = Total number of allow replies received in response to the SDL update.

\( z^2 \) = Total number of deny replies received in response to the SDL update.

4. ACTION TO BE TAKEN

None.

The set of variables with '*' represents the measurements collected in the direct link node (DLN). If the office is equipped with the DLN and the variables with '*' are zero, this suggests that the DLN failed to report these variables and these variables are invalid for the reporting period.

5. ALARMS

None.

3. VARIABLE FIELD DEFINITIONS

- **DS1**: Digital signal 1 (DS1) number consisting of the following identifiers ‘c’-‘f’.
- **a**: Time when the report was prepared, in the form hours:minutes:seconds.
- **b**: Status of data. Valid value(s):
  - DATA IS VALID
  - DATA MAY BE INVALID
- **c**: Switching module (SM) number.
- **d**: Digital line and trunk unit (DLTU) number.
- **e**: Digital facility interface (DFI) number.
- **f**: Facility number.
- **g**: Corrupt field indicator: ‘*’ indicates that data for this DS1 may be corrupt, otherwise this field is blank.
- **h**: Number of bursty errored seconds (BES) since the last initialization of the BES performance monitoring (PM) parameter. A BES is a second that contains at least one but less than 320 cyclic redundancy check-6 (CRC-6) code violations (CV).
- **i**: Number of loss of signal (LOS) or bipolar violations (BPV). BPV is the violation of bipolar line coding in which two logically level consecutive pulses occur with the same polarity, excluding the B8ZS coding. LOS is defined as the absence of bipolar code for 100 ms.
- **j**: Number of 10-second intervals that contain at least one change of frame alignment (COFA) event. A COFA event is declared after a loss of frame alignment (LOFA) if the current frame alignment is found to be incorrect.
k = Number of CRC-6 errors since the last CRC-6 PM parameter initialization. The DFI-2 board must be in the extended super frame (ESF) mode for the CRC-6 PM parameters to work. A CRC-6 error occurs when the computed CRC-6 code for the incoming signal does not match the received code.

l = Number of errored seconds (ES) that have occurred since the last ES PM parameter initialization. An ES is a second with at least one CRC-6 CV, LOFA, or slip.

m = Number of failed seconds (FS) since the last initialization of the FS PM parameter. An FS is any second that occurs during a carrier group alarm (CGA) condition on the given DS1.

n = Number of severely errored seconds (SES) since the last initialization of the SES PM parameter. An SES is a second with at least 320 CRC-6 errors, at least one LOFA, or at least one slip.

o = Number of 10-second intervals with at least one slip event since the last initialization of the SLIP PM parameter. A slip event is the insertion or deletion of data bits into or from the data stream and is the direct result of equipment buffer overflow or underflow resulting from improperly timed network equipment.

4. ACTION TO BE TAKEN

None.

  c    d    e    f
    .    .    .
    .    .    .
    .    .    .

2. REASON FOR OUTPUT

To print PART 27 of the most recent 24-hour plant report in response to either a manual or automatic request.

There are four records under each header. The four records represent the four possible CARRIER, PERCENT, and CALLS values associated with each RTE INDEX value. All the records have identical sizes, with the size of the record varying from one to seven lines. Each line in a record represents a different RTE INDEX. Each record has the same set of RTE INDEX values. A maximum of 32 RTE INDEX values exist. If there is no new data to report, then only the headers will be printed.

3. VARIABLE FIELD DEFINITIONS

  a = Time when the report was prepared. In the form hours:minutes:seconds.

  b = Status of data. Valid value(s):
      DATA IS VALID
      DATA MAY BE INVALID

  c = Proportionate bidding (PB) route index.
d = Carrier number associated with the PB route index. Can have up to four carrier numbers per PB route index.

e = Percent of the total calls for that PB route index that were handled by this carrier number. Can have up to four percentages for that PB route index (one for each carrier number).

f = The number of calls handled for that PB route index by this carrier number. Can have up to four call counts for that PB route index (one for each carrier number).

4. ACTION TO BE TAKEN

2. REASON FOR OUTPUT

To print the most recent 24-hour plant report part 29: Operator Services Position System (OSPS) line applications for consumers (LAC) signaling measures and local number portability (LNP) signaling measures, in response to either a manual or automatic request. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.
3. VARIABLE FIELD DEFINITIONS

Note: The set of variables with an asterisk (*) above represents the measurements collected for the direct link node (DLN), if a DLN is present.

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value(s):
DATA IS VALID
DATA MAY BE INVALID

c = The total number of LAC query attempts from the OSPS to a database. This variable is equal to the sum of variables 'd' and 'e'.

d = * The number of LAC queries sent from the OSPS to a database.

e = The number of LAC queries not sent from the OSPS to a database. This variable is equal to the sum of variables 'f', 'g', 'h', and 'i'.

f = * The number of LAC queries not sent because of OSPS hardware problems including administrative module (AM) overload or other internal problems.

g = * The number of LAC queries not sent because a cutback was in effect to accommodate a database overload as indicated by the automatic call gapping (ACG) parameter in the reply.

f^1 = * The number of LNP queries sent.

g^1 = The number of LNP queries not sent. This variable is equal to the sum of variables 'h^1', 'i^1', 'j^1', and 'k^1'.

h^1 = * The number of LNP queries not sent because of OSPS hardware problems including AM overload, CNI ring (including DLN) down, or other internal problems.

i^1 = * The number of LNP queries not sent because a cutback was in effect to accommodate a database overload as indicated by the ACG parameter in the reply.

h = * The number of LAC queries not sent because of common channel signaling (CCS) network problems.

i = * The number of LAC queries not sent because a query ID was not available.

j = * The number of LAC intermediate call disposition messages (CDM) and end CDMs generated.

k = The number of LAC test queries that are initiated by maintenance personnel. This does not include any replies to the test query.

j^1 = * The number of LNP queries not sent because of CCS network problems.

k^1 = * The number of LNP queries not sent because a query ID was not available.

l^1 = The number of LNP test queries that are initiated by maintenance personnel. This does not include any replies to the test query.
l = The total number of LAC abnormal network replies received. These were LAC queries that did not reach the destined database and were returned by the network. This variable is equal to the sum of variables 'm', 'n', 'o', 'p', 'q', 'r', 's', and 't'.

m = The number of ANSI® and transaction capabilities application part (TCAP) replies of no translation data for an address of such nature.

n = The number of ANSI® and TCAP replies of subsystem congestion.

o = The number of ANSI® and TCAP replies of network congestion.

p = The number of ANSI® and TCAP replies of unequipped user.

m1 = The total number of abnormal network LNP replies received. These were LNP queries that did not reach the destined database and were returned by the network. This variable is equal to the sum of variables 'n1', 'o1', 'p1', 'q1', 'r1', 's1', 't1', and 'u1'.

n1 = The number of LNP replies of no translation data for an address of such nature.

o1 = The number of LNP replies of subsystem congestion.

p1 = The number of LNP replies of network congestion.

q1 = The number of LNP replies of unequipped user.

q = The number of ANSI® and TCAP replies of subsystem failure.

r = The number of ANSI® and TCAP replies of no translation data for this specific address.

s = The number of ANSI® and TCAP replies of network failure.

t = The number of TCAP replies of unqualified.

r1 = The number of LNP replies of subsystem failure.

s1 = The number of LNP replies of no translation data for this specific address.

v = The number of times a number 2 line applications for consumers (2LAC) query was initiated and a reply, indeterminate reply, or abnormal reply was not received by the OSPS before the timing parameter was exceeded.

w = The number of 2LAC queries that were initiated then abandoned.

x = The number of LAC unexpected replies received by the OSPS when the OSPS has timed out while waiting for a reply, or a query was not sent but a reply was received.

v1 = The number of LNP queries that were initiated then aborted as a result of the OSPS receiving either a U-abort or P-abort from the network.
\( w^1 \) = * The number LNP queries that timed out because no reply (normal or abnormal) was received before the timing parameter was exceeded.

\( x^1 \) = The number of LNP queries that were initiated then abandoned (canceled by call processing because of caller abandon or operator action).

\( y^1 \) = * The number of unexpected LNP replies received because the OSPS has timed out while waiting for a reply; or, a query was not sent but a reply was received.

\( y \) = * The number of “error in message format” replies received from the 2LAC in TCAP.

\( z \) = * The number of LAC replies that contained an ACG overload indicator component.

\( z^1 \) = * The number of LNP replies received in which the OSPS detected an invalid message format.

\( a^2 \) = * The number of LNP replies that contained an ACG overload indicator component.

\( a^1 \) = The number of calling card reject errors received from a card database.

\( b^1 \) = The number of times a reject error was received in response to a billed number screening (BNS) query.

\( c^1 \) = * The number of attempts that qualify for network access interrupt (NAI) processing and resulted in a query being sent to the 2LAC.

\( d^1 \) = * The number of NAI reject error replies received.

\( b^2 \) = The number of reject error LNP replies received.

\( c^2 \) = The number of LNP replies with a return error other than “not portable.” This includes “unexpected data value”, “task refused”, “missing parameter”, and “unexpected parameter.”

4. ACTION TO BE TAKEN

None.

If the office is equipped with the DLN and this set of variables are zero, this suggests that DLN failed to report these variables and these variables are invalid for the reporting period. These measurements will be scored on the administrative module (AM) if DLN is not present.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print the most recent 24-hour plant report part 30: Operator Services Position System (OSPS) originating line
number screening (OLNS) measures in response to either a manual or automatic request.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for
additional information.

3. VARIABLE FIELD DEFINITIONS

Note: A variable with '*' in the definition represents a measurement that is collected in the direct link node
(DLN) when a DLN is present. If the office is equipped with the DLN and the set of variables with '*' are zero, this suggests that DLN failed to report these variables and these variables are invalid for
the reporting period. These measurements will be scored on the administrative module (AM) if DLN
is not present.

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = *Number of OLNS queries sent
c = Number of OLNS queries attempted but not sent.
d = *Number of OLNS queries not sent to the database because the CNI ring was not available.
e = *Number of OLNS queries not sent because of ACG control cutback.
f = *Number of OLNS queries not sent to the database because of network management control
cutback.
g = *Number of OLNS queries not sent to the database because query ID not available.
**4. ACTIONS TO BE TAKEN**

None.

If the office is equipped with the DLN and this set of variables are zero, this suggests that DLN failed to report these variables and these variables are invalid for the reporting period. These measurements will be scored on the administrative module (AM) if DLN is not present.

### 2. REASON FOR OUTPUT

To print the most recent 24-hour plant report part 40: call mix (CMIX) measurements, in response to either a manual or automatic request.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

### 3. VARIABLE FIELD DEFINITIONS

- `a` = Time when the report was prepared, in the form HH:MM:SS (hours:minutes:seconds).
- `b` = Status of data. Valid value(s):
  - DATA IS VALID
  - DATA MAY BE INVALID
- `c` = Number of originating TDM calls.
d = Number of terminating TDM calls.
e = Number of originating ATM calls.
f = Number of terminating ATM calls.
g = Number of incoming TDM calls.
h = Number of outgoing TDM calls.
i = Number of incoming ATM calls.
j = Number of outgoing ATM calls.
k = Number of incoming IP calls.
l = Number of outgoing IP calls.
m = Number of overflows from TDM Domain.
n = Number of overflows from ATM Domain.
o = Number of successful overflows-to TDM domain.
p = Number of successful overflows-to ATM domain.
q = Number of times TDM transport is internally used for calls.
r = Number of times ATM transport is internally used for calls.
s = Number of TDM calls which switched to ATM domain.
t = Number of ATM calls which switched to TDM domain.
u = Number of overflows-from TDM domain to IP domain.
v = Number of overflows-from IP domain to TDM domain.
w = Number of successful Overflows-To IP domain from TDM domain.
x = Number of successful Overflows-To TDM domain from IP domain.

4. ACTIONS TO BE TAKEN

None.

If a database label is removed, then a manual request will have invalid data.

COUNTS  j  k  l  m
BCLID LOST MSGS  n

2. REASON FOR OUTPUT

To print the most recent hourly plant report.

3. VARIABLE FIELD DEFINITIONS

a = Reporting office identifier.

b = Number of traditional 2-stage international outbound calls where the second stage was processed. This is used by toll offices that have fully coded addressing (FCA). FCA is a common channel signaling single-stage protocol used to route international outbound calls in a uniform and simple manner through the U.S. network towards the international switching centers.

c = Date of the beginning of the report period, in the form month/day/year.
d = Time of the beginning of the report period, in the form hours:minutes:seconds.

e = Date of the end of the report period, in the form month/day/year.

f = Time of the beginning of the report period, in the form hours:minutes:seconds.

g = Date when the report was prepared, in the form month/day/year.

h = Time when the report was prepared, in the form hours:minutes:seconds.

i = Date the data was last initialized, in the form month/day/year.

j = Time the data was last initialized, in the form hours:minutes:seconds.

k = Status of data. Valid value(s):
 DATA IS VALID
 DATA MAY BE INVALID

Note: Variables 'l' through 'x' are service measurements-base counts.

l = Number of originating calls.

m = Number of incoming calls.

n = Number of terminating calls.

o = Number of outgoing calls.

p = Number of intraoffice calls.

q = Number of originating requests.

r = Number of incoming requests.

s = Number of tandem calls.

t = Number of originating-outgoing calls.

u = Number of incoming-terminating calls.

v = Number of centralized automatic message accounting (CAMA) seizures.

w = Number of CAMA operator number identification (ONI) calls.

x = Number of CAMA automatic number identification (ANI) calls.

Note: Variables 'y' and 'z' are service measurements- cutoff calls.

y = Number of switch cutoff calls.

z = Number of facility cutoff calls.

Note: Variables 'a1' through 'i1' are service measurements-billing troubles.

a1 = Number of coin control attempts.
b¹ = Number of stuck coin conditions.

c¹ = Number of automatic message accounting (AMA) recent change entries.

d¹ = Number of AMA entries lost.

e¹ = Number of irregular AMA entries.

f¹ = Number of calls requiring AMA treatment.

g¹ = Number of CAMA free calls.

h¹ = Number of CAMA ANI troubles.

i¹ = Number of CAMA ONI ineffective attempts.

Note: Variables 'j¹' through 'm¹' are "blue box fraud" counts.

j¹ = Number of short supervisory transitions (SSTs) detected.

k¹ = Number of ineffective fraud investigations.

l¹ = Number of calls subjected to fraud investigation.

m¹ = Number of calls determined as fraudulent and terminated.

n¹ = Number of calls for which the end customer receives no bulk customer line identification (BCLID) message because of switch data equipment. This provokes an indication that BCLID messages are being lost due to unavailability of data equipment related to maintenance state.

o¹ = Number of integrated services digital network (ISDN) circuit switched calls (voice and data) which are abnormally terminated due to problems in the ISDN loop.

4. ACTION TO BE TAKEN

### 2. REASON FOR OUTPUT

To print the most recent hourly plant report.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Status of data. Valid value(s):
  - DATA IS VALID
  - DATA MAY BE INVALID
- **c** = Number of switching modules (SMs).
- **d** = Number of errors (resets and interrupts) in the SMs.
- **e** = Number of communication module processors (CMPs).
- **f** = Number of faults [some tests fail (STF) diagnostics] in the CMPs.
\( g \) = Number of errors (hardware interrupts) in the CMPs.

\( h \) = Number of requested auto diagnostics in the CMPs.

\( i \) = CMP maintenance usage excluding diagnostics and message switch control units (MSCU) out-of-service (OOS), (total time either active or standby OOS) in seconds.

\( j \) = CMP duplex maintenance usage (duplex CMP pair OOS) time in seconds. There is no active CMP.

\( k \) = Number of MSCUs.

\( l \) = Number of MSCU faults.

\( m \) = MSCU maintenance usage in seconds.

\( n \) = Number of foundation peripheral controller (FPCs).

\( o \) = Number of foundation peripheral controller/control and diagnostic access link (FPC/CDAL) faults.

\( p \) = FPC maintenance usage in seconds.

\( q \) = Number of pump peripheral controllers (PPCs).

\( r \) = Number of PPC faults.

\( s \) = PPC maintenance usage in seconds.

\( t \) = Number of module message processors (MMPs).

\( u \) = Number of MMP faults.

\( v \) = MMP maintenance usage in seconds.

\( w \) = Number of office network and timing complex common (ONTCCOMs).

\( x \) = Number of ONTCCOM critical faults.

\( y \) = ONTCCOM maintenance usage in seconds.

\( z \) = Number of network clock (NC) references.

\( a^1 \) = Number of NC reference noncritical faults.

\( b^1 \) = Number of NC oscillators.

\( c^1 \) = Number of NC oscillator noncritical faults.

\( d^1 \) = Number of dual link interfaces (DLIs).

\( e^1 \) = Number of DLI faults.

\( f^1 \) = DLI maintenance usage in seconds.

\( g^1 \) = Number of time multiplexed switch links (TMSLNKs).
h\textsuperscript{1} = Number of times the switch maintenance kernel process recognizes any fault on a time multiplexed switch link (TMSLNKS).

i\textsuperscript{1} = Number of communication links (CLNKs).

j\textsuperscript{1} = Number of CLNK errors.

k\textsuperscript{1} = Number of QLPS gateway processors (QGPs).

l\textsuperscript{1} = Number of times the switch maintenance kernel process recognizes any critical fault on a QLPS gateway processor (QGP).

m\textsuperscript{1} = QGP maintenance usage in seconds.

n\textsuperscript{1} = Number of QLPS gateway link (QGL).

o\textsuperscript{1} = Number of times the switch maintenance kernel process recognizes any fault on a QLPS gateway link (QGL).

p\textsuperscript{1} = Number of quad-link packet switches (QLPSs).

q\textsuperscript{1} = Number of times the switch maintenance kernel process recognizes any fault on a quad link packet switch (QLPS).

r\textsuperscript{1} = QLPS maintenance usage in seconds.

s\textsuperscript{1} = Number of QLPS time multiplexed switch link (QTMSLNK).

t\textsuperscript{1} = Number of times the switch maintenance kernel process recognizes any fault on a QTMSLNK.

u\textsuperscript{1} = Number of QLPS PIPEs (QPIPEs).

v\textsuperscript{1} = Number of QPIPE software errors.

w\textsuperscript{1} = Number of QLPS links (QLNK).

x\textsuperscript{1} = Number of QLNK software errors.

2. REASON FOR OUTPUT

To print the most recent hourly plant report.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value(s):

DATA IS VALID
DATA MAY BE INVALID

C = Number of switching modules (SMs).

D = Number of errors (resets and interrupts) in the SMs.

Copyright ©2003 Lucent Technologies
e = Number of communication module processors (CMPs).
f = Number of faults [some tests fail (STF) diagnostics] in the CMPs.
g = Number of errors (hardware interrupts) in the CMPs.
h = Number of requested auto diagnostics in the CMPs.
i = CMP maintenance usage excluding diagnostics and message switch control units (MSCU) out-of-service (OOS), (total time either active or standby OOS) in seconds.
j = CMP duplex maintenance usage (duplex CMP pair OOS) time in seconds. There is no active CMP.
k = Number of MSCUs.
l = Number of MSCU faults.
m = MSCU maintenance usage in seconds.
n = Number of foundation peripheral controller (FPCs).
o = Number of foundation peripheral controller/control and diagnostic access link (FPC/CDAL) faults.
p = FPC maintenance usage in seconds.
q = Number of pump peripheral controllers (PPCs).
r = Number of PPC faults.
s = PPC maintenance usage in seconds.
t = Number of module message processors (MMPs).
u = Number of MMP faults.
v = MMP maintenance usage in seconds.
w = Number of office network and timing complex common (ONTCCOMs).
x = Number of ONTCCOM critical faults.
y = ONTCCOM maintenance usage in seconds.
z = Number of network clock (NC) references.
a = Number of NC reference noncritical faults.
b = Number of NC oscillators.
c = Number of NC oscillator noncritical faults.
d = Number of dual link interfaces (DLIs).
e = Number of DLI faults.
f = DLI maintenance usage in seconds.
\( g^1 \) = Number of time multiplexed switch links (TMSLNKs).

\( h^1 \) = Number of times the switch maintenance kernel process recognizes any fault on a time multiplexed switch link (TMSLNKS).

\( i^1 \) = Number of communication links (CLNKs).

\( j^1 \) = Number of CLNK errors.

\( k^1 \) = Number of QLPS gateway processors (QGPs).

\( l^1 \) = Number of times the switch maintenance kernel process recognizes any critical fault on a QLPS gateway processor (QGP).

\( m^1 \) = QGP maintenance usage in seconds.

\( n^1 \) = Number of QLPS gateway link (QGL).

\( o^1 \) = Number of times the switch maintenance kernel process recognizes any fault on a QLPS gateway link (QGL).

\( p^1 \) = Number of quad-link packet switches (QLPs).

\( q^1 \) = Number of times the switch maintenance kernel process recognizes any fault on a quad link packet switch (QLPS).

\( r^1 \) = QLPS maintenance usage in seconds.

\( s^1 \) = Number of QLPS time multiplexed switch link (QTMSLNK).

\( t^1 \) = Number of times the switch maintenance kernel process recognizes any fault on a QTMSLNK.

\( u^1 \) = Number of QLPS PIPEs (QPIPEs).

\( v^1 \) = Number of QPIPE software errors.

\( w^1 \) = Number of QLPS links (QLNK).

\( x^1 \) = Number of QLNK software errors.

\( y^1 \) = Number of TMS Fabric Pairs (TMSFP).

\( z^1 \) = TMSFP out of service time in seconds.

### 2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles...
on customer service, and to calculate the performance index. The report also contains data regarding originating, incoming, and outgoing calls, customer dialing irregularities and call setup troubles, and reflects the maintenance effect on traffic during the past month.

3. VARIABLE FIELD DEFINITIONS

a = Name of reporting office.
b = Date of the beginning of the report period, in the form month/day/year.
c = Time of the beginning of the report period, in the form hours:minutes:seconds.
d = Date of the end of the report period, in the form month/day/year.
e = Time of the end of the report period, in the form hours:minutes:seconds.
f = Current date when the report was prepared, in the form month/day/year.
g = Current time when the report was prepared, in the form hours:minutes:seconds.
h = Date the data was last initialized, in the form month/day/year.
i = Time the data was last initialized, in the form hours:minutes:seconds.
j = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID

Note: Variables 'k' through 'x' are service measurements (base counts).

k = Number of originating calls.
l = Number of incoming calls.
m = Number of terminating calls.
n = Number of outgoing calls.
o = Number of intraoffice calls.
p = Number of originating requests.
q = Number of incoming requests.
r = Number of tandem calls.
s = Number of originating-outgoing calls.
t = Number of incoming-terminating calls.
u = Number of centralized automatic message accounting (CAMA) seizures.
v = Number of CAMA operator number identification (ONI) calls.
w = Number of CAMA automatic number identification (ANI) calls.
x = Number of traditional two-stage international outbound calls where the second stage was processed. This is used by toll offices that have fully coded addressing.

Variables 'y' through 'c1' are service measurements (cutoff calls).

y = Number of switch cutoff calls.

z = Number of facility cutoff calls.

a1 = Number of gated diode crosspoint (GDX) cutoff calls.

b1 = Number of ISDN circuit switched calls (voice and data) which are abnormally terminated due to problems in the ISDN loop.

c1 = Number of lost nailed up connections. This number represents the accumulated number of connections found out-of-service (OOS) every 15 minutes. Refer to the REPT:NAILUP output message also.

Variables 'd1' through 'l1' are service measurements (billing troubles).

d1 = Number of coin control attempts.

e1 = Number of stuck coin conditions.

f1 = Number of automatic message accounting (AMA) entries.

g1 = Number of AMA entries lost.

h1 = Number of irregular AMA entries.

i1 = Number of calls requiring AMA treatment.

j1 = Number of CAMA free calls.

k1 = Number of CAMA ANI troubles.

l1 = Number of CAMA ONI ineffective attempts.

Variables 'm1' through 'r1' are Real Time Call Detail (RTCD)

m1 = Total number of RTCD records generated by all Originating SM's.

n1 = Total number of RTCD records acknowledged/received at the GBSM from all Originating SM's.

o1 = Total number of RTCD records transmitted out the MHEIB.

p1 = Total number of RTCD records lost due to RTBM overflow.

q1 = Total time (in units of seconds) that the Ethernet link was out-of-service.

r1 = Total number of Long Duration Call (LDC) RTCD records generated by all Originating SM's.

Variables 's1' through 'w1' are blue box fraud counts.
$s^1$ = Number of short supervisory transitions (SST) detected.

t$^1$ = Number of ineffective fraud investigations.

$u^1$ = Number of calls subjected to fraud investigation.

$v^1$ = Number of calls determined to be fraudulent and terminated.

$w^1$ = Number of calls for which the end customer received no bulk customer line identification (BCLID) message because of switch data equipment. This indicates that BCLID messages are being lost due to unavailability of data equipment due to being in maintenance state.

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index. The report also contains data regarding originating, incoming, and outgoing calls, customer dialing irregularities and call setup troubles, and reflects the maintenance effect on traffic during the past month.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared in the form hours:minutes:seconds.

b = Status of data. Valid value(s):
DATA IS VALID
DATA MAY BE INVALID

Note: Variables 'c' through 'a1' are service measurements - ineffective attempts.

c = Number of call setup troubles - connecting.
d = Number of call setup troubles - originating.
e = Number of call setup troubles - incoming.
f = Number of call setup troubles - terminating.
g = Number of call setup troubles - originating-outgoing.
h = Number of call setup troubles - incoming-outgoing.
i = Number of transient calls lost - connecting.
j = Number of false starts - originating.
k = Number of false starts - incoming.
l = Number of permanent signals - originating touch-tone (TT).
m = Number of permanent signals - incoming TT multi-frequency (MF).
n = Number of permanent signals - originating dial pulsing (DP).
o = Number of permanent signals - incoming DP.
p = Number of permanent signals - incoming revertive pulsing (RP).
q = Number of partial dial timeouts - originating MF.
r = Number of partial dial timeouts - incoming MF.
s = Number of partial dial timeouts - originating DP.
\[ t = \text{Number of partial dial timeouts - incoming DP.} \]
\[ u = \text{Number of partial dial timeouts - incoming RP.} \]
\[ v = \text{Number of timeouts and abandons - incoming.} \]
\[ w = \text{Number of vacant codes - incoming.} \]
\[ x = \text{Number of no circuits (trunk) - outgoing.} \]
\[ y = \text{Number of network management (NM) blocked calls - outgoing.} \]
\[ z = \text{Number of no path or service circuits - connecting.} \]
\[ a_1 = \text{Number of abandons from queues - connecting.} \]
\[ b_1 = \text{Number of backward failure messages originated - incoming.} \]
\[ c_1 = \text{Number of signaling network failures - outgoing.} \]
\[ d_1 = \text{Number of unreasonable messages received - incoming.} \]
\[ e_1 = \text{Number of release guards received - outgoing.} \]
\[ f_1 = \text{Number of ineffective machine attempt (IMA) address complete timeouts - outgoing.} \]
\[ g_1 = \text{Number of permanent signal timeouts in the second stage of a traditional 2-stage international outbound call - incoming 2S. This is used by toll offices that have fully coded addressing.} \]
\[ h_1 = \text{Number of partial dial timeouts in the second stage of a traditional 2-stage international outbound call - incoming 2S. This is used by toll offices that have fully coded addressing.} \]
\[ i_1 = \text{Number of vacant codes in the second stage of a traditional 2-stage international outbound call - incoming 2S. This is used by toll offices that have fully coded addressing.} \]

## 2. REASON FOR OUTPUT

To print the most recent monthly plant report.

## 3. VARIABLE FIELD DEFINITIONS

- `a` = Time when the report was prepared, in the form hour:minutes:seconds.
- `b` = Status of data. Valid value(s):  
  - DATA IS VALID  
  - DATA MAY BE INVALID
- `c` = Number of switching modules (SMs).
- `d` = Number of errors (resets and interrupts) in the SMs.
- `e` = Total number of communication module processors (CMPs).
- `f` = Number of faults [some test fail (STF) diagnostics] in the CMPs.
\( g \) = Number of errors (hardware interrupts) in the CMPs.

\( h \) = Number of requested auto diagnostics in the CMPs.

\( i \) = CMP maintenance usage excluding diagnostics and message switch control units (MSCU) out of service (OOS) in seconds.

\( j \) = CMP duplex maintenance usage (duplex CMP pair OOS) in seconds.

\( k \) = Number of MSCUs.

\( l \) = Number of MSCU faults.

\( m \) = MSCU maintenance usage in seconds.

\( n \) = Number of foundation peripheral controllers (FPCs).

\( o \) = Number of foundation peripheral controller/control and diagnostic access link (FPC/CDAL) faults.

\( p \) = FPC maintenance usage in seconds.

\( q \) = Number of pump peripheral controllers (PPCs).

\( r \) = Number of PPC faults.

\( s \) = PPC maintenance usage in seconds.

\( t \) = Number of module message processors (MMPs).

\( u \) = Number of MMP faults.

\( v \) = MMP maintenance usage in seconds.

\( w \) = Number of office network and timing complex common (ONTCCOMs).

\( x \) = Number of ONTCCOM critical faults.

\( y \) = ONTCCOM maintenance usage in seconds.

\( z \) = Number of network clock (NC) references.

\( a^{1} \) = Number of NC reference noncritical faults.

\( b^{1} \) = Number of NC oscillators.

\( c^{1} \) = Number of NC oscillator noncritical faults.

\( d^{1} \) = Number of dual link interfaces (DLIs).

\( e^{1} \) = Number of DLI faults.

\( f^{1} \) = DLI maintenance usage in seconds.

\( g^{1} \) = Number of time multiplexed switch links (TMSLNKS).

\( h^{1} \) = Number of times the switch maintenance kernel process recognizes any fault on a time
multiplexed switch link (TMSLNK).

\[ i^1 = \text{Number of communication links (CLNKs).} \]

\[ j^1 = \text{Number of CLNK errors.} \]

\[ k^1 = \text{Number of QLPS gateway processors (QGPs).} \]

\[ l^1 = \text{Number of times the switch maintenance kernel process recognizes any critical fault on a QLPS gateway processor (QGP).} \]

\[ m^1 = \text{QGP maintenance usage in seconds.} \]

\[ n^1 = \text{Number of QLPS gateway link (QGL).} \]

\[ o^1 = \text{Number of times the switch maintenance kernel process recognizes any fault on a QLPS gateway link (QGL).} \]

\[ p^1 = \text{Number of quad-link packet switches (QLPSs).} \]

\[ q^1 = \text{Number of times the switch maintenance kernel process recognizes any fault on a quad link packet switch (QLPS).} \]

\[ r^1 = \text{QLPS maintenance usage in seconds.} \]

\[ s^1 = \text{Number of QLPS time multiplexed switch link (QTMSLNK).} \]

\[ t^1 = \text{Number of times the switch maintenance kernel process recognizes any fault on a QTMSLNK.} \]

\[ u^1 = \text{Number of QLPS PIPEs (QPIPEs).} \]

\[ v^1 = \text{Number of QPIPE software errors.} \]

\[ w^1 = \text{Number of QLPS links (QLNK).} \]

\[ x^1 = \text{Number of QLNK software errors.} \]

3. VARIABLE FIELD DEFINITIONS
a  = Time when the report was prepared, in the form hours:minutes:seconds.

b  = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID

c  = Number of attempts that encounter a switching system trouble on a first or subsequent trial.

d  = Number of failures to seize an outgoing trunk.

e  = Number of failure attempts to make a line capable of origination following a disconnect.

f  = Administrative module (AM) outage time in seconds.

g  = Number of asserts in the AM.

h  = Total number of audit events in the AM, SMs and active CMP(s).

i  = Number of output messages discarded.

j  = Number of external digital trunk (DS1) slips.

k  = Number of times the errored seconds threshold was reached.

l  = Number of times the tone decoder attachment delay threshold was reached.

m  = Total switching module (SM) outage time in seconds.

n  = Number of asserts in all the SMs.

o  = Number of pumps to all the SMs.

p  = Number of pumped blocks to all the SMs.

q  = Number of resets in all the SM processors.

r  = Number of maintenance interrupts from all the SM peripherals.

s  = Number of peripheral pump requests in all the SM processors.

t  = Number of continuity failures - incoming.

u  = Number of backward failure messages received - outgoing.

v  = Number of group blocking signals transmitted - outgoing.

w  = Number of group blocking acknowledgement signal time outs - incoming.

x  = Number of invalid messages received - incoming.

y  = Number of remote switching module (RSM) remoting facility errored seconds.

z  = Number of RSM remoting facility slips.

a^1 = Number of RSM remoting facility alarms.
h\(^1\) = Number of RSM remoting facility interface troubles.

c\(^1\) = Number of inter-SM time slot mismatches in office.

d\(^1\) = Communication module processor (CMP) outage time in seconds.

e\(^1\) = Total number of audit events in the active CMP(s).

f\(^1\) = Number of asserts in the active CMP(s).

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index. The report also contains data regarding originating, incoming, and outgoing calls, customer dialing irregularities and call setup troubles, and reflects the maintenance effect on traffic during the past month.

3. VARIABLE FIELD DEFINITIONS

a      = Time when the report was prepared, in the form hours:minutes:seconds.
b      = Status of data. Valid value(s):
       DATA IS VALID
       DATA MAY BE VALID

c      = Remote module (RM) number.

Note: Variables ‘d’ through ‘t’ are base measurements:
d = Number of originating calls.
e = Number of incoming calls.
f = Number of outgoing calls.

Note: Variables 'g' through 'n' are service measurements:
g = Number of transient calls lost.
h = Number of connecting call setup troubles.
i = Number of originating call setup troubles.
j = Number of incoming call setup troubles.
k = Number of terminating call setup troubles.
l = Number of outgoing call setup troubles.
m = Number of calls blocked in remote module.
n = Number of calls blocked- administrative module (AM) to RM.

Note: Variables 'o' through 'x' are performance measurements:
o = Number of automatic full initializations.
p = Number of automatic selective initializations.
r = Number of automatic directed audit initializations.
s = Number of automatic single process purges.
t = Number of manual full initializations.
u = Number of manual selective initializations.
v = Number of manual single process purges.
w = Number of seconds in stand-alone.
x = Number of times the RM entered stand-alone.

Note: An output value of 111 indicates a count that will be implemented in future issues and is not currently being taken.

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic monthly report.

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index. The report also contains data regarding originating, incoming, and outgoing calls, customer dialing irregularities and call setup troubles, and reflects the maintenance effect on traffic during the past month. Part 5 of the monthly plant report contains the trunk error analysis (TERA) measurements. Only the first 3 counts for the TERA measurements are kept on a monthly basis. The remainder of the TERA counts are not kept on a monthly basis.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared in the form of hours:minutes:seconds.
b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID
c = Number of all incoming machine detected interoffice irregularities (MDII) detected within an office.
d = Number of all outgoing MDIIs detected within an office.
e = Number of times TERA was deactivated within an office.

IC = InterLATA carrier identifier consisting of identifiers 'c' and 'd'.
c = Feature group identifier (letter B or D).
d = Carrier identifier (number 0 - 9999).
e = Number of incoming call attempts on trunks directly connected to a carrier (trunk class = IC).
f = Number of routed outgoing call attempts on trunks directly connected to a carrier (trunk class = IC).
g = Number of routed outgoing call attempts on trunks connected to a tandem for access-via-tandem calls (trunk class = LTOLL).

h = Number of lines screened by selective carrier denial (SCD).

i = Number of calls blocked by SCD.

j = Number of incoming machine detected interoffice irregularities (MDII) on trunks directly connected to a carrier (trunk class = IC).

k = Number of outgoing MDII on trunks directly connected to a carrier (trunk class = IC).

l = Number of outgoing second start dial (SSD) wink MDII on trunks connected to a tandem for access-via-tandem calls (trunk class = LTOLL).

m = Number of outgoing acknowledgement (ACK) wink MDII on trunks connected to a tandem for access-via-tandem calls (trunk class = LTOLL).

n = Number of incoming integrated services digital network user part (ISUP) MDII on trunks directly connected to a carrier (trunk class = IC).

o = Number of outgoing ISUP MDII on trunks directly connected to a carrier (trunk class = IC).

p = Number of ISUP continuity failures after two attempts at the end office or access tandem (trunk class = IC or LTOLL). A call fails after two successive continuity failures.

q = Number of ISUP initial address messages (IAM) received having a priority other than one.

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index. The report also contains data regarding originating, incoming, and outgoing calls, customer dialing irregularities and call setup troubles, and reflects the maintenance effect on traffic during the past month.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value(s):
DATA IS VALID
DATA MAY BE INVALID

Note: Variables 'j' through 'o' are Operator Services Position System (OSPS) performance measurements.

c = Number of incoming OSPS call attempts for any of the following events:
- A directory-assistance (DA) call was received.
Any automated toll and assistance (T&A) OSPS call (for example, coin, calling card, inward) was received.

Any operator assisted T&A OSPS call was received.

The end of a time and charge call which was routed to an operator.

d = Number of incoming OSPS call attempt failures for any of the following events.

For DA calls:
- Call type determination failed on a DA call.
- Failure to read RC/V View 21.22 (OSPS CALL TYPE) to obtain call queue information on a DA call.
- Failure to read RC/V View 21.7 (OSPS IMMEDIATE INTERFLOW ACTIVATION AND DEACTIVATION) to determine if interflow was active on a DA call.
- Failure to read RC/V View 21.27 (OSPS LISTING SERVICES/C-ACD INTERFLOW DESTINATION) when interflow was active for the DA serving team assigned to receive the incoming call.
- Could not obtain a DASC channel number to send a position seizure message to the DASC on a DA call.
- Failure to interflow a DA call, through reroute, when interflow was active for the serving team assigned to receive the call.

For automatic call distributor (ACD):
- Failure to send route request message to the ACD.
- Failure to receive acknowledgement from the ACD acknowledging that an operator request was received.
- Call processing determined that the call received was a commercial ACD call type but COMMERCIAL ACD in RC/V View 8.30 (OSPS COMMERCIAL ACD PARAMETERS) was set to N.
- Failure of ACD to route a call to an operator for reasons other than the call queue was full.
- Failure to set a system timer to wait for an ACD response to an operator request.
- After a second timeout while waiting for a response from the ACD to an operator request.
- When a system interrupt signal was received while the call was waiting for a response to an operator request from the ACD.

For coin:
- When the back party went on-hook while the call was being routed to an operator on a 1+ coin call that required an operator for initial customer contact.
- When the back party went on-hook while a queue overflow announcement was being played on a 1+ coin call that required an operator for initial customer contact.
- After successfully giving a queue overflow announcement on a 1+ coin call that required an operator for initial customer contact.
- When a failure to allocate coin dynamic data on a coin call occurred.
- When a 0+ coin test call had bad automatic number identification (ANI).

Others:
- Failure to define a path to an operator.
- Failure on an automated calling card service (ACCS) call to release the path to the announcement service circuit on a call that was to be routed to an operator.
- Failure to route to an announcement when a call queue was closed.
- When a call queue was closed.
- Failure to route to level 3 delay announcement.
- When more than 11 digits were received on an inward call.
- When digit analysis failed on a 950, 0+, 0-, or 011+ call.
- When digit analysis failed on an ACCS call being routed to an operator.

\( e \) = Number of times a DA operator attempted to initiate a call to a point external to the switch or a T&A operator initiated a delayed call from BK# SEND or FWD# SEND.

\( f \) = Number of times a DA operator canceled an external call by entering the DIAL or POSREL key or a routing failure occurred on an outgoing call as defined by OUTGOING ATTEMPT.

\( g \) = Number of OSPS calls routed to reorder tone for the following events:
- A rating query failed on an initial automated coin toll service (ACTS) coin call.
- Failure to get a conference circuit on an initial ACTS coin call.
- Failure to route a call to an operator.
- Failure to route a call to a closed queue announcement.

\( h \) = Number of times the ACD successfully removed a queued call for which the back party had gone on-hook.

\( i \) = Operator position maintenance usage in seconds.

\( j \) = Switching module (SM) number.

\( k \) = Number of times the switch attempted to notify the DAS/C about a directory assistance (DA) position seizure.

\( l \) = Number of times the switch failed to notify the DAS/C about a DA position seizure because the level 3 protocol was unavailable or down.

\( m \) = Number of times the switch failed to notify the DAS/C about a DA position seizure because the level 3 protocol buffers were full.

\( n \) = Number of times the switch successfully notified the DAS/C about a DA position seizure. Equal to ATTEMPT - FAILURE - OVFL.

\( o \) = Number of seconds a DAS/C port was found to be in an out-of-service state. Equal to the accumulation of the number of ports found to be in an out-of-service state every 100 seconds multiplied by 100.

Note: Variables 'p' through 'r' are OSPS SM layer 3 protocol measurements. The maximum number of OSPS SMs for which DAS/C measurements are reported is 32.

\( p \) = Number of layer 3 protocol resets.

\( q \) = Number of layer 3 protocol restarts.

\( r \) = Number of layer 3 protocol retransmissions.

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index.

3. VARIABLE FIELD DEFINITIONS

- `a` = Time when the report was prepared, in form hours:minutes:seconds.
- `b` = Status of data. Valid value(s):
  DATA IS VALID
  DATA MAY BE INVALID
- `c` = Number of rating queries attempted. Equal to SENT + NSENT.
- `d` = Number of rating queries sent to the real-time rating service (RTRS) database. Equal to RATEQT SENT + CCQS SENT + T&C SENT + COIN SENT + CL SENT.
e = Number of rating queries not sent to the RTRS database. Equal to HDW + OVRLD + NM + NO-ID + AMBLK.

f = Number of rating queries not sent to the RTRS because of database link hardware problems. This count is not pegged when a test query cannot be sent to RTRS because of link hardware problems.

g = Number of rating queries not sent to the RTRS because of database cutbacks.

i = Number of rating queries not sent to the RTRS because no query identifiers were available.

p = Number of RTRS query replies received that indicated that the database was unable to process the reply.

q = Number of unexpected RTRS query replies received.

r = Number of RTRS query replies received in an invalid format.

s = Number of times that the OSPS switch timed out waiting for a reply from the RTRS database.

t = Number of RTRS query replies received that contained a non-zero overload indicator.

u = Number of rating test queries sent to the RTRS database.

v = Number of RTRS query replies received. Equal to TOTAL SUCCESS + TOTAL FAILURE in section 63: TRFC30 ORTR.

w = Number of rate quote queries sent to the RTRS database.

x = Number of rating query replies received from the RTRS that indicated a rate quote query was not successfully rated.

y = Number of centralized charge quotation system (CCQS) queries sent to the RTRS database.

z = Number of rating query replies received that indicated a CCQS query was not successfully rated. This count also includes replies that were successfully rated but the charges were greater than what hotel billing information system (HOBIS) or hotel billing information center (HOBIC) can receive, that is, 999.99.

a₁ = Number of time and charges (T&C) queries sent to the RTRS database.

b₁ = Number of rating query replies received that indicated a T&C query was not successfully rated.

c₁ = Number of coin rating queries sent to the RTRS database. Equal to OVERALL INIT + OVERALL INTRM + OVERALL EOC in Section 100: TRFC30 OCOIN.

d₁ = Number of coin rating query failures. Equal to POSTPAY IRQF + NON-ACTS IRQF + PREPAY INITIAL SEIZURE FAIL + OVERTIME ICRF + END OF CALL ECRF in Section 100: TRFC30 OCOIN. CL FAILURE.

e₁ = Number of rating query failures. Equal to RATEQT FAILURE + CCQS FAILURE + T&C FAILURE + COIN FAILURE +

f₁ = Number of times that a rating query was cancelled before a reply was received due to an operator or caller action.
= Number of card limit (CL) queries sent to the RTRS database including initial and subsequent queries.

\[ h^1 = \text{Number of CL initial and subsequent RTRS that are not successfully rated.} \]

4. ACTION TO BE TAKEN

None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

\[ \text{OP:TRFC30, VLD} \]

The validity for the administrative module applies to this section.

5. ALARMS

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID

c = Number of times an OSPS call, either operator-assisted or automated, requested a 3-port
   conference circuit. Determination of whether a 3-port or 6-port conference circuit is needed on the
   call depends on the number of parties on the call and whether the call needs to be attached to an
   announcement service circuit.

d = Number of times an OSPS call, either operator-assisted or automated, requested a 6-port
   conference circuit. Determination of whether a 3-port or 6-port conference circuit is needed on the
   call depends on the number of parties on the call and whether the call needs to be attached to an
   announcement service circuit.

e = Number of times when a hardware failure (that is, a circuit was not usable) or communication
   failure prevented OSPS from getting a 3-port conference circuit. The events pegged for this count
   are different from those for 3-PORT CCOFL in Section 10: TRFC30 UCONF.

f = Number of times when a hardware failure (that is, a circuit was not usable) or communication
   failure prevented OSPS from getting a 6-port conference circuit. The events pegged for this count
   are different from those for 6-PORT CCOFL in Section 10: TRFC30 UCONF.

g = Number of REORDER signals sent by the centralized automatic message accounting (CAMA)
   offices in the last 24 hours.

h = Number of times when either of the following events occurred:
   - The OSPS switch is unable to interpret the automatic number identification failure /
     operator number identification (ANIF/ONI) tone received from the CAMA office on a
     transfer CAMA call.
   - The OSPS switch has timed out waiting for the ANIF/ONI tone from the CAMA
     office on a transfer CAMA call.

i = Number of times an operator released a transfer CAMA call from a position. This results in a
   POSITION DISCONNECT signals sent to the CAMA offices.

j = Number of times the OSPS switch received a transfer CAMA call.

k = Total number of transfer CAMA calls served without queuing for position in the last 24 hours.

l = Number of incoming transfer CAMA calls where the back party went on-hook before being
   connected to an operator.

m = Number of times the OSPS switch received a system CAMA ANIF/ONI call.

n = Total number of system CAMA-ONI calls served without queuing for position in the last 24 hours.

o = Number of incoming system CAMA calls where the back party went on-hook before being
   connected to an operator.

p = Number of automatic calling card service (ACCS) calls where the switch timed out after the bong
   tone waiting for the first calling card digit to be entered.

q = Number of initial ACCS calls where the back party went on-hook before entering the first calling
   card digit or while the call was being routed to an announcement service circuit for the playing of the
bong tone and detection of calling card digits.

\[ r = \] Number of potential ACCS calls that were routed to operators.

\[ s = \] Number of ACCS sequence calls initiated, using a local exchange carrier (LEC) calling card, where the back party entered a # sign at the end of an ACCS call or during the ringing of the forward party's phone.

\[ t = \] Number of ACCS sequence calls placed with a LEC calling card where the back party went on-hook during the keying of a new forward number, during routing to the forward party, or during ringing of the forward party's phone.

\[ u = \] Number of screened calls handled by operators. Equal to FAILURE + SUCCESS.

\[ v = \] Number of times an operator cancelled a call on which the back party was screened against one or more classes of charge.

\[ w = \] Number of times an operator floated or externally transferred a call on which the back party was screened against one or more classes of charge.

\[ x = \] Number of transfer CAMA, system CAMA, or ISP calls requiring ONI due to ANI failure.

\[ y = \] Number of transfer CAMA, system CAMA, or ISP calls sent to an operator because ONI was required and because the originating office was without ANI equipment or served multi-party lines.

\[ z = \] Number of transfer CAMA, system CAMA, or ISP calls that were sent to an operator because of ANI failure or because ONI was required. Equal to ANIFAIL + UNEQ.

\[ a^1 = \] Number of times an attempt was made to send a voice quote message to an automatic charge quotation service (ACQS) establishment.

\[ b^1 = \] Number of times the OSPS switch received a rating query reply indicating that a centralized charge quotation system (CCQS) query was successfully rated.

\[ c^1 = \] Number of incoming ISP calls that arrived on ANI-searched screened trunks and there was no originating line screening restriction.

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID
c = Number of attempts to send an autoquote message to an autoquote establishment.

d = Number of printed autoquote calls.

e = Number of times that an autoquote message was not sent to the autoquote establishment and a credit record was created for the following events:
- Automatic charge quotation service (ACQS) message buffer pointers were corrupted which resulted in credit records created for each queued autoquote.
- An autoquote message was queued for longer than the value in field "HOBIS/C TIME" of RC/V View 8.9.
- The ACQS message buffer was full (max 100) and a new message arrived replacing a queued autoquote message.
- Failures occurred during transmitting the message to the autoquote establishment and when trying to reroute the message to a Hotel Billing Information System (HOBIS) or hotel billing information center (HOBIC).

f = Number of autoquote messages successfully rerouted to a HOBIS or HOBIC.

g = Number of autoquote messages that failed because all autoquote digital subscriber lines (DSL) were busy or call processing could not dial up the autoquote establishment because of a lack of software process control blocks (PCB) or process stacks (PS).

h = Number of credited voice quote messages that were not sent to HOBIS or HOBIC due to such events as:
- The ACQS message buffer pointers were corrupted which resulted in credit records created for each queued voice quote message.
- A voice quote message was queued for longer than the value in field "HOBIS/C TIME" of RC/V View 8.9.
- The ACQS message buffer was full (max 100) and a new message arrived replacing a queued voice quote message.
- A failure occurred during transmitting the message to HOBIS or HOBIC.

i = Number of times an operator was successfully requested after a successful rating query at the end of an automated coin call and any of the following events occurred:
- An announcement circuit could not be attached to the call because of AM routing throttling.
- Routing to an announcement circuit failed.

Also includes the number of times any of the following events occurred which resulted in the coin call being routed to an operator:
- The call timed out (10 seconds) on an automated overtime charge-due seizure waiting for confirmation that an announcement circuit had been attached or a routing failure occurred when attempting to attach the announcement circuit and the back party had gone on-hook.
- The call timed out (10 seconds) on an automated end-of-call seizure waiting for confirmation that an announcement circuit had been attached or a routing failure occurred when attempting to attach the circuit.
- An end-of-call seizure was routed to an operator.
- An announcement circuit failure or announcement failure occurred after a circuit was successfully attached on an overtime seizure where the back party had subsequently gone on-hook or on an end-of-call seizure.
\( j \): Number of times any of the following events occurred on a 1+ prepay ACTS coin call during the initial contact:
- Originating call treatment had timed out (10 seconds) waiting for an announcement process to be created.
- The announcement process failed to activate an announcement service circuit.
- Routing to an announcement circuit failed.
- The announcement process informed originating call treatment of an announcement service circuit hardware failure.

\( k \): Number of times any of the following events occurred at the end of the initial period of a coin-sent-paid call and a notification announcement was required:
- A 3-port conference circuit could not be obtained (call proceeded into grace period).
- Call processing could not define a path to the announcement circuit (call was routed to an operator).
- Call processing failed to route to an announcement circuit (call was routed to an operator).
- Call processing was waiting for an announcement circuit to be connected and a software failure or timeout (10 seconds) indication was received (call was idled).

\( l \): Number of times any of the following events occurred after successful rating queries on overtime seizures:
- A 6-port conference circuit could not be obtained (call was consequently routed to an operator if a 3-port conference circuit could be obtained; if not, call proceeded to next overtime period); for pre-paid overtime for coin calls, the call is idled.
- Call processing could not define a path to the announcement circuit (call was consequently idled).
- Call processing failed to route to an announcement circuit (call was consequently routed to an operator).
- Call processing was waiting for an announcement circuit to be connected and a software failure or timeout (10 seconds) indication was received (call was consequently routed to an operator).

\( m \): Number of attempted automated end-of-call seizures regardless of whether an announcement circuit could be attached, a walkaway occurred, or the call was routed to an operator for large charge collection. Large charge means amount due is greater than 5 times LRG CHG THR in RC/V View 8.9.

\( n \): Number of times an overtime seizure occurred for which automation was attempted. This measurement is scored whether or not an announcement circuit was successfully attached.

\( o \): Number of deposits satisfied on fully automated charges-due seizures.

\( p \): Number of initial coin rating queries successfully sent to RTRS.

\( q \): Number of interim coin rating queries successfully sent to RTRS.

\( r \): Number of end-of-call coin rating queries successfully sent to RTRS.

\( s \): Number of automated inward line screening (AILS) queries sent from the call serving OSPS to retrieve originating line screening (OLS) data.
\( t \) = Number of AILS queries sent from the call serving OSPS to retrieve terminating code screening (TCS) data.

\( u \) = Number of AILS replies received in the call serving OSPS returning OLS data. This measure does not include the error replies received in the call serving OSPS.

\( v \) = Number of AILS replies received in the call serving OSPS returning TCS data. This measure does not include the error replies received in the call serving OSPS.

\( w \) = Number of error replies of "task refused" received in the call serving OSPS.

\( x \) = Number of error replies of "misroute" received in the call serving OSPS.

\( y \) = Number of error replies of "unexpected input data value" received in the call serving OSPS.

\( z \) = Number of queries that timed out in the call serving OSPS. This is a measure of the number of queries that actually left the call serving OSPS and became indeterminate (a valid reply was not received) for whatever reason.

\( a^1 \) = Number of AILS queries received in the normal serving OSPS from the call serving OSPS to retrieve OLS data.

\( b^1 \) = Number of AILS queries received in the normal serving OSPS from the call serving OSPS to retrieve TCS data.

\( c^1 \) = Number of AILS replies sent from the normal serving OSPS to the call serving OSPS returning OLS data. This measure does not include the error replies sent to the call serving OSPS.

\( d^1 \) = Number of AILS replies sent from the normal serving OSPS to the call serving OSPS returning TCS data. This measure does not include the error replies sent to the call serving OSPS.

\( e^1 \) = Number of error replies of "task refused" sent from the normal serving OSPS to the call serving OSPS.

\( f^1 \) = Number of error replies of "misroute" sent from the normal serving OSPS to the call serving OSPS.

\( g^1 \) = Number of error replies of "unexpected input data value" sent from the normal serving OSPS to the call serving OSPS.

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index. The report contains data regarding Operator Services Position System (OSPS) interflow toll and assistance (T&A) outgoing B-channel removals, interflow T&A B-channel link time unavailable, interflow T&A outgoing D-channel removals and interflow T&A D-channel link time unavailable during the previous month.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value(s):
DATA IS VALID
DATA MAY BE INVALID

c = Identification number of OSPS destination office.

d = Number of times a B-channel has been removed from service in the past month.

e = Accumulated amount of time the B-channel links were down, in the form hours:minutes:seconds.

f = Number of times a D-channel has been removed from service in the past month.

g = Accumulated amount of time the D-channel links were down, in the form hours:minutes:seconds.

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report. The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index. The report contains data regarding database queries and replies during the previous month.

3. VARIABLE FIELD DEFINITIONS

Note: For variables with a `**`, refer to the 4ACTION TO BE TAKEN section.

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value(s):
DATA IS VALID
DATA MAY BE INVALID

c = Number of LIDB calling card (CCD) queries attempted. Equal to LICCD SENT + NSENT.

d = *Number of LIDB calling card (CCD) queries sent from the OSPS into the common channel signaling (CCS) network. This count excludes test queries.

e = Number of LIDB CCD queries attempted but not sent (total of LICCD: HDW + OVRLD + NM + NO-ID + AMBLK).

f = *Number of LIDB CCD queries not sent because the common network interface (CNI) ring was not available. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

g = *Number of CCD queries not sent because the switch had enforced query cutbacks according to automatic call gapping (ACG) controls received from the database. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

h = *Number of CCD queries not sent because a cutback was in effect to accommodate a network management control measure. Network management cutbacks are implemented for a period of five seconds after a billed number screening (BNS) or calling card query reply indicates network congestion, network failure, subsystem congestion or subsystem failure. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

i = *Number of CCD queries not sent to the database because a LIDB query ID was not available. The switch can handle 256 outstanding LIDB queries. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

j = *Number of CCD queries not sent because:
   - Abnormal administrative module (AM) conditions.
   - Abnormal communication link conditions between the switching module (SM) and AM.
   - Switch data in the AM could not be read to determine the translation type parameter that is to be sent in the query to the signaling system 7 (SS7) network. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

k = Number of LIDB BNS queries attempted. Equal to LIBNS SENT + NSENT.

l = *Number of BNS queries sent from the OSPS into the CCS network. This count excludes test queries.

m = Number of BNS queries attempted but not sent (total of LIBNS: HDW + OVRLD + NM + NO-ID + AMBLK).

n = *Number of BNS queries not sent because the CNI ring was not available. The operator on the call may allow or disallow the call.

o = *Number of BNS queries not sent because the switch had enforced query cutbacks according to
ACG controls received from the database. The operator on the call may allow or disallow the call.

\( p \) = Number of BNS queries not sent because a cutback was in effect to accommodate a network management control measure. Network management cutbacks are implemented for a period of five seconds after a BNS or calling card query reply indicates network congestion, network failure, subsystem congestion, or subsystem failure. The operator on the call may allow or disallow the call.

\( q \) = Number of BNS queries not sent because a query ID was not available. The switch can handle 256 outstanding LIDB queries. The operator on the call may allow or disallow the call.

\( r \) = Number of BNS queries not sent because:
- Abnormal administrative module (AM) conditions.
- Abnormal communication link conditions between the SM and AM.
- Switch data in the AM could not be read to determine the translation type parameter that was to be sent in the query to the signaling system 7 (SS7) network. The operator on the call may allow or disallow the call.

\( s \) = Number of abnormal LIDB CCD replies received. These are queries that do not make it to the destined database and are returned by the network. (Total of LICCD: RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWFA + NWCONG.)

\( t \) = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated no translation for an address of such nature. This resulted in calls’ receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

\( u \) = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated no translation for this specific address. This resulted in calling card denial on the call.

\( v \) = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated subsystem congestion. This resulted in calls’ receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the subsystem congestion response.

\( w \) = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated subsystem failure. This resulted in calls’ receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the subsystem failure response.

\( x \) = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated unequipped user. This resulted in calls’ receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

\( y \) = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated network failure. This resulted in calls’ receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the
network failure response.

\( z \) = *Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated network congestion. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the network congestion response.

\( a \) = *Number of abnormal LIDB BNS replies received. These are queries that do not make it to the destined database and are returned by the network. (Total of LIBNS: RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWFA + NWCONG.)

\( b \) = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated no translation for an address of such nature. The operator on the call may allow or disallow the call.

\( c \) = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated no translation for this specific address. This resulted in billing denial on the call.

\( d \) = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated subsystem congestion. The operator on the call may allow or disallow the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the subsystem congestion response.

\( e \) = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated subsystem failure. The operator on the call may allow or disallow the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the subsystem failure response.

\( f \) = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated unequipped user. The operator on the call may allow or disallow the call.

\( g \) = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated network failure. The operator on the call may allow or disallow the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the network failure response.

\( h \) = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated network congestion. The operator on the call may allow or disallow the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the network congestion response.

\( i \) = Number of LIDB CCD replies received. Total of LICCD: UNEXP + INVFRMT + VLDFRMT. VLDFRMT is printed in section 109: TRFC30 OATQ.

\( j \) = *Number of times an unexpected or duplicate LIDB CCD query reply was received from the database. Replies for which the switch had timed out while waiting for them are also included.

\( k \) = *Number of LIDB CCD replies received in an invalid format where the reply was garbled in some manner or data fields did not conform to correct message syntax. Examples of such cases are:

- The value in the translation ID field was invalid.
- The component sequence ID field was invalid.
The component type ID field was invalid.
- The length of the entire query response was longer than expected.
- The length of the transaction capability application part (TCAP) message was longer than expected.
- The package type identifier field was invalid.
- The message type field was invalid.
- The response was a service message from the SS7 network and the service message type was not recognized.

**l** = Number of times that the OSPS timed out waiting for a LIDB CCD reply to a query from the database (refer to the CC and BNS TIME parameter in RC/V View 8.9). The call receives indeterminate query treatment as specified by parameter QUERY REPLIES TIMEOUT in RC/V View 8.9.

A) = If TIMEOUT indicates “allow”, then the reply is treated as an allow.

D) = If TIMEOUT indicates “deny”, then the reply is treated as a deny.

E) = If TIMEOUT indicates “existing treatment”, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V View 8.9.

**m** = Number of LIDB CCD test queries sent to the CCS network.

**n** = Number of LIDB BNS replies received. Total of LIBNS: UNEXP + INVFRMT + VLDFRMT. VLDFRMT is printed in section 109: TRFC30 OATQ.

**o** = *Number of times an unexpected or duplicate LIDB BNS query reply was received from the database or the switch had timed out while waiting for the reply.

**p** = *Number of LIDB BNS replies received in an invalid format where the reply was garbled in some manner or data fields did not conform to correct message syntax. Examples of such cases are:
- The value in the translation ID field was invalid.
- The component sequence ID field was invalid.
- The component type ID field was invalid.
- The length of the entire query response was longer than expected.
- The length of the TCAP message was longer than expected.
- The package type identifier field was invalid.
- The message type field was invalid.
- The response is a service message from the SS7 network and the service message type was not recognized.

**q** = Number of times that the OSPS timed out waiting for a BNS reply to a query from the database (refer to the CC and BNS TIME parameter in RC/V View 8.9). The call receives indeterminate query treatment as specified by parameter QUERY REPLIES TIMEOUT in RC/V View 8.9.

A) = If TIMEOUT indicates “allow”, then the reply is treated as an allow.

D) = If TIMEOUT indicates “deny”, then the reply is treated as a deny.

E) = If TIMEOUT indicates “existing treatment”, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V View 8.9.

**r** = Number of LIDB BNS test queries sent to the CCS network.

**s** = *Number of BNS or CCD query replies from the database that contained an ACG component. All queries for calls that matched the first six digits of the affected billing number were potentially cutback as specified by the ACG control parameters. This resulted in calls' receiving indeterminate
query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

</tbody>
</table>
| a<sup>2</sup> | Number of 89/CCC queries not sent to the database because of:  
- Abnormal administrative module (AM) conditions.  
- Abnormal communication link conditions between the switching module (SM) and AM.  
- Switch data in the AM could not be read to determine the translation type parameter that is to be sent in the query to the signaling system 7 (SS7) network. This resulted in calls’ receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. |
| b<sup>2</sup> | Number of 89/CCC test queries sent to the CCS network. |
| c<sup>2</sup> | Number of abnormal 89/CCC replies received. These are queries that do not make it to the destined database and are returned by the network. (Total of 89CCC: RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWFA + NWCONG.) |
| d<sup>2</sup> | Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated no translation for an address of such nature. This resulted in calls’ receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. |
e² = *Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated no translation for this specific address. This resulted in calling card denial on the call.

f² = *Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated subsystem congestion. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the subsystem congestion response.

g² = *Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated subsystem failure. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the subsystem failure response.

h² = *Number of times the CCS network returned a service message in response to a 89/CCC query and the response indicated unequipped user. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

i² = *Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated network failure. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the network failure response.

j² = *Number of times the CCS network returned a service message in response to a 89/CCC query and the response indicated network congestion. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the network congestion response.

k² = Number of 89/CCC replies received of all types. Total of 89CCC: UNEXP + INVFRMT + VLDFRMT.

l² = *Number of times an unexpected or duplicate query reply was received from the database. Replies for which the switch had timed out while waiting for them are also included.

m² = *Number of 89/CCC replies received in an invalid format where the reply was garbled in some manner or data fields did not conform to correct message syntax. Examples of such cases are:

- The value in the translation ID field was invalid.
- The component sequence ID field was invalid.
- The component type ID field was invalid.
- The length of the entire query response was longer than expected.
- The length of the TCAP message was longer than expected.
- The package type identifier field was invalid.
- The message type field was invalid.
- The response was a service message from the SS7 network and the service message type was not recognized.
n^2 = Number of times that the OSPS timed out waiting for an 89/CCC reply to a query from the database refer to the QUERY TIMEOUT parameter in RC/V View 27.56. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

o^2 = Number of 89/CCC query replies from the database that contained an ACG component. All queries for calls that matched the first six digits of the affected billing number were potentially cutback as specified by the ACG control parameters. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

p^2 = Number of 10+4 calling card validation replies with a 'PSDI=4' response from the validation database.

q^2 = Number of 89C/CCC card validation replies with a 'PSDI=4' response from the validation database.

4. ACTION TO BE TAKEN

None.

The set of variables with '*' above represents the measurements collected in the direct link node (DLN). If the office is equipped with the DLN and the set of variables with '*' are zero, suggests that the DLN failed to report these variables and these variables are invalid for the reporting period.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report. The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index. The report contains data regarding customer account services (CAS) queries and replies.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID

   c = Number of CAS queries in destination-routed common channel interoffice signaling 6 (DCIS6) format attempted. Equal to SENT + NSENT.

d = Number of calling card queries* in DCIS6 format sent to the CAS database. This excludes test queries.

e = Number of calling card queries in DCIS6 format that were attempted but not sent. Equal to HDW + OVRLD + NM + NO-ID + AMBLK.

f = Number of calling card queries* in DCIS6 format not sent to the CAS database because the common network interface (CNI) ring was not available. This resulted in the call's receiving

Copyright ©2003 Lucent Technologies
indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9 (OSPS OFFICE PARAMETERS).

g = Number of calling card queries* in DCIS6 format not sent to the CAS database because the switch had enforced query cutbacks according to call gapping controls received from the CAS database. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

h = Number of calling card queries* in DCIS6 format not sent to the CAS database because of network management cutbacks. Network management cutbacks are implemented for calling card queries for a period of 5 seconds after a calling card query reply indicates network congestion or network blockage. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

i = Number of calling card queries* in DCIS6 format not sent to the CAS database because a query ID was not available or was out of range due to an internal software error, where the range is 1-128. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

j = Number of calling card queries in DCIS6 format not sent to the CAS database because of abnormal administrative module (AM) conditions or abnormal communication link conditions between the switching module (SM) and AM. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

k = Number of abnormal calling card replies in DCIS6 format. Equal to NRTDG + CONGEST + BLKD + UNEQ.

l = Number of times an calling card query* failed to reach the CAS database because of no routing data in the network. A query reply from the common channel signaling (CCS) network indicated a failure reason of "no routing data". This resulted in call completion denial.

m = Number of times an calling card query* in DCIS6 format failed to reach the CAS database because of network congestion. A query reply from the CCS network indicated a failure reason of "network congestion." The result was cutback of subsequent calling card queries that had the same first three digits in the card account number as the account number that resulted in the network congestion reply. The cutbacks are in effect for a period of 5 seconds. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

n = Number of times an calling card query* in DCIS6 format failed to reach the CAS database because of network blockage. A query reply from the CCS network indicated a failure reason of "network blockage." The result was cutback of subsequent calling card queries that had the same first three digits in the card account number as the account number that resulted in the network blockage reply. The cutbacks are in effect for a period of 5 seconds. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

o = Number of times an calling card query* in DCIS6 format failed to reach the CAS database because the function was not equipped in the network. A query reply from the CCS network indicated a failure reason of "unequipped destination." This occurred when a query was sent to a destination that could not process CAS queries. This resulted in call completion denial.

p = Number of calling card replies received in DCIS6 format. Equal to NPROC + UNEXP + INVFRMT + VFRMT.
q = Number of calling card query replies in DCIS6 format received from the CAS database indicating that the database was unable to process the query. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

r = Number of unexpected or duplicate calling card query replies* received from the CAS database.

s = Number of calling card query replies* in DCIS6 format received from the CAS database containing an invalid response in the message type field or the reply code field. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

t = Number of calling card query replies with a valid DCIS6 format. Equal to $ALCALL + INVDC + VPN + DOMRS + INTRS$ in section 110: TRFC30 OCAS.

u = Number of times the OSPS switch timed out waiting for a reply to a calling card query in DCIS6 format from the CAS database. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

v = Number of calling card replies* in DCIS6 format (received from the CAS database) containing an overload indicator that required the switch to cutback queries to the database. This resulted in CAS query cutbacks according to the call gapping parameters received in the reply. The call was given indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

w = Number of calling card test queries sent to the CCS network.

4. ACTION TO BE TAKEN

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID
c = Number of intercept calls with a class of 0 or a class determination of “automatic number identification (ANI) blank or unassigned number”.
d = Number of intercept calls with a class of 1 or a class determination of “ANI Trouble” denoting customer's line is having problems.
e = Number of intercept calls with a class of 2 or a class determination of “ANI equipment failure to identify line number”.
f = Number of intercept calls with a class of 3 or a class determination of “ANI regular”, a regular intercept call.
g = Number of intercept calls with a class of 5 or a class determination of “concentrator spinoff”.
h = Number of intercept calls with a class of 6 or a class determination of “operator number identification (ONI) regular”.
i = Number of intercept calls with a class of 7 or a class determination of “ONI blank or unassigned number”.
j = Number of intercept calls with a class of 8 or a class determination of "ONI trouble".

k = Number of intercept calls that could not find information in the external information system (EIS) database. The EIS vendor supplies this information to the Operator Services Position System (OSPS) switch. This count may not be supported by all vendors.

l = Number of intercept calls outpulsed for call completion. This count includes the total number of both automated and non-automated intercept call completions after the call has been successfully routed to the forward number and digits outpulsed.

m = Number of intercept calls receiving split referral treatment. It is pegged when an EIS message is received to:
   - Route an intercept call to an automated split referral announcement,
   - Bill for an operator-provided split referral announcement. The EIS vendor supplies this information to the OSPS switch. This count may not be supported by all vendors.

n = Number of operator-assisted intercept calls receiving a verbal quote. The "listing access key" must be depressed to indicate to the EIS that billing applies to the service before sending a valid billing message to OSPS. The EIS vendor supplies this information to the OSPS switch and may not be supported by all vendors.

o = Number of intercept calls successfully routed to an external intercept announcement.

p = Not used.

q = Number of intercept calls receiving toll fraud announcements. The EIS vendor supplies this information to the OSPS switch and may not be supported by all vendors.

VIRTUAL CARD
2. REASON FOR OUTPUT

To print the most recent 24-hour plant report section 23: Operator Services Position System (OSPS) customer account services (CAS) Common Channel Signaling System 7 (CCS7)/international credit card validation (ICCV) signaling measures, in response to either a manual or automatic request.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID
c = Number of CAS transaction capabilities application part (TCAP) database query attempts. Equal to (CAS7): SENT + NSENT.
d = Number of queries* sent from the OSPS to a card database where the query conforms to CAS TCAP signaling protocol. This excludes test queries.
e = Number of CAS TCAP queries not sent. Equal to (CAS7): IPRB + NO-ID + NMBLK + DBCBK.
f = Number of CAS TCAP queries* not sent because of OSPS internal problems (the administrative module (AM) or direct link node (DLN) is in an abnormal state, the common network interface (CNI) is not operational, or data could not be read successfully). The call received indeterminate treatment.
j = Number of ICCV International Telecommunications Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) TCAP database query attempts. Equal to (ICCV): SENT + NSENT.
k = Number of queries* sent from the OSPS to a card database where the query conforms to ICCV ITU-TS TCAP signaling protocol. This excludes test queries.
l = Number of ICCV ITU-TS TCAP queries not sent. Equal to (ICCV): IPRB + NO-ID + NMBLK.
m = Number of ICCV ITU-TS TCAP queries* not sent because of OSPS internal problems (the AM or DLN is in an abnormal state, the CNI is not operational, data could not be read successfully). The call received indeterminate treatment.
g = Number of CAS TCAP queries* not sent because a query ID was not available, or was out of range due to an internal software error. The call received indeterminate treatment.
h = Number of CAS TCAP queries* not sent because a cutback was in effect to accommodate a network management control measure - due to CCS7 network problems. The network management cutbacks are implemented for a period of 5 seconds after CAS CCS7 replies are received indicating network congestion, subsystem congestion, network failure, or subsystem failure. The call received
indeterminate treatment.

\( i \) = Number of CAS TCAP queries* not sent because the switch has enforced query cutbacks according to call gapping controls received from the CAS database. The call received indeterminate treatment.

\( n \) = Number of ICCV ITU-TS TCAP queries* not sent because a query ID was not available, or was out of range due to an internal software error, where the range is 0-455. The call received indeterminate treatment.

\( o \) = Number of ICCV ITU-TS TCAP queries* not sent because a cut back was in effect to accommodate a network management control measure - due to CCS7 network problems. The network management cut backs are implemented for a period of 5 seconds after CAS CCS7 replies are received indicating network congestion, subsystem congestion, network failure, or subsystem failure. The call received indeterminate treatment.

\( p \) = Number of CAS TCAP test queries that are sent by maintenance personnel (this does NOT include any replies to the test queries).

\( q \) = Number of ICCV ITU-TS TCAP test queries that are sent by maintenance personnel (this does NOT include any replies to the test queries).

\( r \) = Number of abnormal CAS TCAP replies received. Equal to (CAS7): RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWCONG + NWFA + UNQUAL.

\( s \) = Number of CAS TCAP unit data service messages* received with a diagnostic reason of "No translation data for an address of such nature". The call received indeterminate treatment.

\( t \) = Number of CAS TCAP unit data service messages* received with a diagnostic reason of "No translation data for this specific address". The call received denial treatment.

\( u \) = Number of CAS TCAP unit data service messages* received with a diagnostic reason of "Subsystem congestion". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

\( v \) = Number of CAS TCAP unit data service messages* received with a diagnostic reason of "Subsystem failure". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

\( w \) = Number of abnormal ICCV ITU-TS TCAP replies received. Equal to (ICCV): RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWCONG + NWFA + UNQUAL.

\( x \) = Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "No translation data for an address of such nature". The call received indeterminate treatment.

\( y \) = Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "No translation data for this specific address". The call received denial treatment.

\( z \) = Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "Subsystem congestion". All subsequent ICCV queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.
a¹ = Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "Subsystem failure". All subsequent ICCV queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

b¹ = Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Unequipped user". The call received denial treatment.

c¹ = Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Network congestion". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

d¹ = Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Network failure". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

e¹ = Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Unqualified". The call received indeterminate treatment.

f¹ = Number of ICCV ITU-TS TCAP unit data service messages* received with the diagnostic reason of "Unequipped user". The call received denial treatment.

g¹ = Number of ICCV ITU-TS TCAP unit data service messages* received with the diagnostic reason of "Network congestion". All subsequent ICCV queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

h¹ = Number of ICCV ITU-TS TCAP unit data service messages* received with the diagnostic reason of "Network failure". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

i¹ = Number of ICCV ITU-TS TCAP unit data service messages* received with the diagnostic reason of "Unqualified". The call received indeterminate treatment.

j¹ = Total number of CAS TCAP return error replies received. Equal to (CAS7): UXDT + NOPARM + UXPARM + MSQRY + TSKREF + VCODE + GATEWAY.

k¹ = Number of CAS TCAP return error replies received with an error code of "Unexpected Input Data Value", signifying that the query contained unexpected data. The call received indeterminate treatment.

l¹ = Number of CAS TCAP return error replies received with an error code of "Missing Parameter", signifying that a mandatory parameter was missing from the query. The call received indeterminate treatment.

m¹ = Number of CAS TCAP return error replies received with an error code of "Unexpected Parameter", signifying that an unrecognized parameter was contained in the query. The call received indeterminate treatment.

n¹ = Number of CAS TCAP return error replies received with an error code of "Misrouted Query", signifying that the database has determined that the card number contained in the query is not within the range expected. The call received indeterminate treatment.
o\textsuperscript{1} = Total number of ICCV ITU-TS TCAP return error replies received. Equal to (ICCV): UXDT + NOPARM + UXPARM + MSQRY + DBUNAV + MSGFMT.

p\textsuperscript{1} = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Unexpected Input Data Value", signifying that the query contained unexpected data. The call received indeterminate treatment.

q\textsuperscript{1} = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Missing Parameter", signifying that a mandatory parameter was missing from the query. The call received indeterminate treatment.

r\textsuperscript{1} = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Unexpected Parameter", signifying that an unrecognized parameter was contained in the query. The call received indeterminate treatment.

s\textsuperscript{1} = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Misrouted Query", signifying that the database has determined that the card number contained in the query is not within the range expected. The call received indeterminate treatment.

t\textsuperscript{1} = Number of CAS TCAP return error replies received with an error code of "Task Refused", signifying that the node could not handle the request at this time. The call received indeterminate treatment.

u\textsuperscript{1} = Number of CAS TCAP return error replies received with an error code of "Vacant Code", signifying that the database has determined that the card number contained in the query has not been assigned. The call is denied.

v\textsuperscript{1} = Number of CAS TCAP return error replies received with an error code of "Gateway Error", signifying that communication with a commercial credit card vendor was unsuccessful. The call received indeterminate treatment.

w\textsuperscript{1} = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Database Unavailable", signifying that the database could not handle the request at this time (not because the operation was incorrect). The call received indeterminate treatment.

x\textsuperscript{1} = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Error in Message Format", signifying that the structure of the query is not what was expected. The call received indeterminate treatment.

y\textsuperscript{1} = Total valid CAS TCAP replies received, regardless of the calling card used. Refer to the OP:TRFC30-OCAS7 output message for further description of this field.

z\textsuperscript{1} = Total valid ICCV ITU-TS TCAP replies received. Refer to the OP:TRFC30-OCAS7 output message for further description of this field.

a\textsuperscript{2} = Number of CAS TCAP "Reject" components* received in response to a card validation query. The call received indeterminate treatment.

b\textsuperscript{2} = Number of CAS TCAP U-abort or P-abort messages* received. The call received indeterminate treatment.

c\textsuperscript{2} = Number of times the query timer expired before receipt of a CAS TCAP database reply. The call received indeterminate treatment.

d\textsuperscript{2} = Number of CAS TCAP queries initiated, then abandoned. The condition occurs if the call
canceled or the class of charge is changed after a query has been sent but before a reply was received. When the reply was received, it was ignored.

e \textsuperscript{2} = \text{Number of CAS TCAP replies* received that were not expected. The replies were ignored. They could be late or duplicate responses.}

f \textsuperscript{2} = \text{Number of CAS TCAP database replies* received in invalid format. It includes data field values, as well as invalid TCAP format. The reply was dropped and the call received indeterminate treatment.}

g \textsuperscript{2} = \text{Number of CAS TCAP replies* received with an automatic call gapping (ACG) component. All CAS SS7 queries to the same destination were gapped according to the received information. The call received appropriate treatment according to the response. Subsequent calls that were cut back due to these gapping controls received indeterminate treatment.}

h \textsuperscript{2} = \text{Number of ICCV ITU-TS TCAP "Reject" components* received in response to a card validation query. The call received indeterminate treatment.}

i \textsuperscript{2} = \text{Number of ICCV ITU-TS TCAP U-abort or P-abort messages* received. The call received indeterminate treatment.}

j \textsuperscript{2} = \text{Number of times the query timer expired before receipt of an ICCV ITU-TS TCAP database reply. The call received indeterminate treatment.}

k \textsuperscript{2} = \text{Number of ICCV ITU-TS TCAP queries initiated, then abandoned. The condition occurs if the call is canceled or the class of charge is changed after a query has been sent but before a reply was received. When the reply was received, it was ignored.}

l \textsuperscript{2} = \text{Number of ICCV ITU-TS TCAP replies received* that were not expected. The replies were ignored. They could be late or duplicate responses.}

m \textsuperscript{2} = \text{Number of ICCV ITU-TS TCAP database replies received* in invalid format. It includes data field values, as well as invalid TCAP format. The reply was dropped and the call received indeterminate treatment.}

n \textsuperscript{2} = \text{Number of CAS update-only call disposition messages* (UO-CDMs) that have been sent to the card database.}

o \textsuperscript{2} = \text{Number of CAS TCAP request for more balance call disposition messages (RFMB-CDMs)* that have been sent to the card database for purchase limit (PL) and/or duration limit (DL) calls, including RFMB-CDMs sent before setting up the call as well as those sent after the call has been set up.}

p \textsuperscript{2} = \text{Number of replies to CAS RFMB-CDMs* received from the card database, regardless of whether the reply is a "grant" or a "deny".}

q \textsuperscript{2} = \text{Number of ICCV UO-CDMs* that have been sent to the card database.}

r \textsuperscript{2} = \text{Total number of virtual card format (VCF) validation queries made.}

s \textsuperscript{2} = \text{Total number of VCF validation replies received with an "allow call" response from a VCF validation query.}

t \textsuperscript{2} = \text{Total number of VCF validation replies received with a response of "missing customer record", "invalid PIN", or "vacant code" from a VCF validation query.}
\[ u^2 \] = Total number of forward number check (FNC) messages sent by the OSPS.

\[ v^2 \] = Total number of allow replies received to the FNC query, with a reply code of “Allow Call - Valid Speed Call Number”.

\[ w^2 \] = Total number of deny replies received to the FNC query, with a reply code of “Deny Call - Invalid Speed Call Number”.

\[ x^2 \] = Total number of speed dial list (SDL) update requests sent by the OSPS.

\[ y^2 \] = Total number of allow replies received in response to the SDL update.

\[ z^2 \] = Total number of deny replies received in response to the SDL update.

4. ACTION TO BE TAKEN

None.

The set of variables with ‘’ represents the measurements collected in the direct link node (DLN). If the office is equipped with the DLN and the variables with ‘’ are zero, this suggests that the DLN failed to report these variables and these variables are invalid for the reporting period.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print the current monthly plant report. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.

The monthly plant report is used to gather information on equipment performance, to evaluate the impact of troubles on customer service, and to calculate the performance index. The report also contains data regarding originating, incoming, and outgoing calls, customer dialing irregularities and call setup troubles, and reflects the maintenance effect on traffic during the past month.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Status of data. Valid value(s):
DATA IS VALID
DATA MAY BE INVALID
c = Number of incoming ISDN user part (ISUP) confusion messages.
d = Number of outgoing ISUP confusion messages.
e = Number of incoming ISUP messages having a cause value = 6 (protocol error class).
f = Number of outgoing ISUP messages having a cause value = 6 (protocol error class).
g = Number of ISUP user-to-user (UUI) parameters discarded due to length considerations, including ISUP length violations.
h = Number of ISUP access transport (ATP) parameters discarded due to length considerations, including ISUP length violations.

2. REASON FOR OUTPUT

To print the current monthly plant report part 29: Operator Services Position System (OSPS) line applications for consumers (OLAC) signaling measures and local number portability (LNP) signaling measures, in response to either a manual or automatic request. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.
3. VARIABLE FIELD DEFINITIONS

Note: The set of variables with an asterisk (*) represents the measurements collected in the direct link node (DLN), if a DLN is present.

- **a**: Time when the report was prepared, in the form hours:minutes:seconds.
- **b**: Status of data. Valid value(s):
  - DATA IS VALID
  - DATA MAY BE INVALID

- **c**: The total number of LAC query attempts from the OSPS to a database. This variable is equal to the sum of variables 'd' and 'e'.

- **d**: The number of LAC queries sent from the OSPS to a database.

- **e**: The number of LAC queries not sent from the OSPS to a database. This variable is equal to the sum of variables 'f', 'g', 'h', and 'i'.

- **f**: The number of LAC queries not sent because of OSPS hardware problems including administrative module (AM) overload or other internal problems.

- **g**: The number of LAC queries not sent because a cutback was in effect to accommodate a database overload as indicated by the automatic call gapping (ACG) parameter in the reply.

- **e\textsuperscript{1}**: The total number of LNP query attempts. This variable is equal to the sum of variables 'f\textsuperscript{1}' and 'g\textsuperscript{1}'.

- **f\textsuperscript{1}**: The number of LNP queries sent.

- **g\textsuperscript{1}**: The number of LNP queries not sent. This variable is equal to the sum of variables 'h\textsuperscript{1}', 'i\textsuperscript{1}', 'j\textsuperscript{1}', and 'k\textsuperscript{1}'.

- **h\textsuperscript{1}**: The number of LNP queries not sent because of OSPS hardware problems including AM overload, CNI ring (including DLN) down, or other internal problems.

- **i\textsuperscript{1}**: The number of LNP queries not sent because a cutback was in effect to accommodate a database overload as indicated by the ACG parameter in the reply.

- **h**: The number of LAC queries not sent because of common channel signaling (CCS) network problems.

- **i**: The number of LAC queries not sent because a query ID was not available.

- **j**: The number of LAC intermediate call disposition messages (CDM) and end CDMs generated.

- **k**: The number of LAC test queries that are initiated by maintenance personnel. This does not include any replies to the test query.

- **j\textsuperscript{1}**: The number of LNP queries not sent because of CCS network problems.

- **k\textsuperscript{1}**: The number of LNP queries not sent because a query ID was not available.

- **l\textsuperscript{1}**: The number of LNP test queries that are initiated by maintenance personnel. This does not include any replies to the test query.
include any replies to the test query.

\[ \begin{align*}

x & = \text{The number of LAC unexpected replies received by the OSPS when the OSPS has timed out while waiting for a reply, or a query was not sent but a reply was received.}
\end{align*} \]
v
1 = * The number of LNP queries that were initiated then aborted as a result of the OSPS receiving either a U-abort or P-abort from the network.

w
1 = * The number LNP queries that timed out because no reply (normal or abnormal) was received before the timing parameter was exceeded.

x
1 = The number of LNP queries that were initiated then abandoned (canceled by call processing because of caller abandon or operator action).

y
1 = * The number of unexpected LNP replies received because the OSPS has timed out while waiting for a reply; or, a query was not sent but a reply was received.

y
 = * The number of "error in message format" replies received from the 2LAC in TCAP.

z
 = * The number of LAC replies that contained an ACG overload indicator component.

z
1 = * The number of LNP replies received in which the OSPS detected an invalid message format.

a
2 = * The number of LNP replies that contained an ACG overload indicator component.

a
1 = The number of calling card reject errors received from a card database.

b
1 = The number of times a reject error was received in response to a billed number screening (BNS) query.

c
1 = * The number of attempts that qualify for network access interrupt (NAI) processing and resulted in a query being sent to the 2LAC.

d
1 = * The number of NAI reject error replies received.

b
2 = The number of reject error LNP replies received.

c
2 = The number of LNP replies with a return error other than "not portable". This includes "unexpected data value", "task refused", "missing parameter", and "unexpected parameter."

4. ACTION TO BE TAKEN

None.

If the office is equipped with the DLN and this set of variables are zero, this suggests that DLN failed to report these variables and these variables are invalid for the reporting period. These measurements will be scored on the administrative module (AM) if DLN is not present.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print the current monthly plant report part 30: Operator Services Position System (OSPS) originating line number screening (OLNS) measures in response to either a manual or automatic request. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

Note: A variable with '*' in the definition represents a measurement that is collected in the direct link node (DLN) when a DLN is present. If the office is equipped with the DLN and the set of variables with '*' are zero, this suggests that DLN failed to report these variables and these variables are invalid for the reporting period. These measurements will be scored on the administrative module (AM) if DLN is not present.

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = *Number of OLNS queries sent
c = Number of OLNS queries attempted but not sent.
d = *Number of OLNS queries not sent to the database because the CNI ring was not available.
e = *Number of OLNS queries not sent because of ACG control cutback.
f = *Number of OLNS queries not sent to the database because of network management control cutback.
g = *Number of OLNS queries not sent to the database because query ID not available.
4. ACTIONS TO BE TAKEN

None.

If the office is equipped with the DLN and this set of variables are zero, this suggests that DLN failed to report these variables and these variables are invalid for the reporting period. These measurements will be scored on the administrative module (AM) if DLN is not present.
5. ALARMS

2. REASON FOR OUTPUT

To print the current monthly plant report part 40. If the report is automatically generated, it is a complete report for the previous month. If it is generated in response to a manual request, it contains only data accumulated since the previous automatic report.

The report contains data regarding call mix measurements generated during the previous month.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in form HH:MM:SS (hours:minutes:seconds).
b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID

c = Number of originating TDM calls.
d = Number of terminating TDM calls.
e = Number of originating ATM calls.
f = Number of terminating ATM calls.
g = Number of incoming TDM calls.
h = Number of outgoing TDM calls.
i = Number of incoming ATM calls.
j = Number of outgoing ATM calls.
k = Number of overflows from TDM Domain.
l = Number of overflows from ATM Domain.
m = Number of successful overflows-to TDM domain.
n = Number of successful overflows-to ATM domain.
o = Number of times TDM transport is internally used for calls.
p = Number of times ATM transport is internally used for calls.
q = Number of TDM calls which switched to ATM domain.
r = Number of ATM calls which switched to TDM domain.

4. ACTIONS TO BE TAKEN
None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

The validity for the administrative module applies to this section.

5. ALARMS

2. REASON FOR OUTPUT

To respond to a manual request to output a list of active protocol monitoring (PM) sessions.

Before a response is made, the information for active PM sessions is verified. If this verification determines that a
session's data has been corrupted, the PM session will abort without printing any session information.

Format 1 displays all pertinent information for active ISDN or CCS PM sessions.

Format 2 displays all pertinent information for active PCF PM sessions.

Format 3 provides the status (that is, aborted, completed, not started) of the request to list active PM sessions.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Protocol handler (PH) channel group number.
c = PH channel member number.
d = Logical port number.
e = The equipment number identifier.
NOTE: If the port is associated with an X.75' trunk or an extended digital subscriber line (EDSL), then the digital equipment number (DEN) and peripheral control and timing line and trunk unit number (PLTEN) is used. If the port is associated with a digital networking unit - synchronous optical network (SONET) (DNU-S) number then the DNU-S networking equipment number (NEN) is used. If the port is associated with an embedded operation channel (EOC) or timeslot management channel (TMC), then the EOC or TMC equipment number is used. Otherwise, the line card equipment number (LCEN), line circuit equipment number (LCKEN), IDLC equipment number (INEN), access interface unit equipment number (AIUEN), packet switching unit equipment number (PSUEN), or integrated digital carrier unit (IDCU) line equipment number (ILEN) is used.

Valid value(s):

- AIUEN=a-y^1-z^1-a^2
- DEN=a-f-g-h
- EOC=a-l-m-o
- ILEN=a-l-m-n
- INEN=a-t^1-m-n
- LCEN=a-i-j-k
- LCKEN=a-p^1-q^1-r^1-s^1
- NEN=a-t^1-u^1-g^2-v^1-w^1-h^2-x^1
- PLTEN=a-j^2-k^2-l^2-m^2
- PSUEN=a-d^2-e^2-f^2-c
- TMC=a-l-m-o

f = Digital line and trunk unit (DLTU) number.
g = Digital facility interface number.
h = Digital channel number.
i = Integrated services line unit number.
j = Line group controller number.
k = Line card number.
l = Integrated digital carrier unit number.
m = Remote terminal (RT) number.
n = RT line number.
o = Primary/protection identifier.
p = Channel (CH) being monitored. Valid value(s):
  - D = D-channel.
  - B1 = B1-channel.
q = Port services identifier.

NOTE: This field will be blank if the port does not have a unique port services identifier.
Valid value(s):

```
DN=r
MLHG=s-t
PKTDN=u
TKGMN=v-w
```

- `r` = The DN associated with a channel of a digital subscriber line (DSL).
- `s` = Multi-line hunt group number.
- `t` = Multi-line hunt group member number.
- `u` = The DN associated with a packet-switched channel of a DSL.
- `v` = Trunk group number.
- `w` = Trunk group member number.
- `x` = Service characteristic identifier of DSL channel. Valid value(s):
  - `ODP` = On-demand packet.
  - `PPD` = Permanent packet D.
  - `PPB` = Permanent packet B.
- `y` = The value of the session identifier (SES) for this monitoring session.
- `z` = The date-stamp of the beginning of the monitoring session, in the form month/day.
- `a` = The time-stamp of the beginning of the monitoring session, in the form hours:minutes:seconds.
- `b` = The current date-stamp for the monitoring session, in the form month/day.
- `c` = The current time-stamp for the monitoring session, in the form hours:minutes:seconds.
- `d` = The offset (OFFSET) for the number of frames that will be recorded after detection of the trigger event.
- `e` = The duration (DUR) for the recording session in seconds.
- `f` = Protocol (PROT) monitored. Valid value(s):
  - `LAPD` = The LAPD protocol.
  - `LAPB` = The LAPB protocol.
  - `Q931` = The Q.931 protocol.
  - `X25` = The X.25 protocol.
  - `X75P` = The X.75’ protocol.
  - `V120` = The V.120 protocol.
  - `TMC` = The TMC protocol.
  - `RLP` = The RLP protocol.
  - `CESHL2` = The CESHL2 protocol.
  - `CESHL3` = The CESHL3 protocol.
  - `ISLP` = The ISLP protocol.
- `g` = Trigger level (TRIGLVL). Valid value(s):
<table>
<thead>
<tr>
<th>Protocol</th>
<th>Trigger Level</th>

</tr>
</tbody>
</table>

**h**

= TRIGVAL that terminated the recording session. Refer to the EXC:PM input manual page for a complete list of trigger values.

**i**

= Specific trigger value that terminated the recording session (a single PER occurring on the channel being recorded). Refer to the 235-600-755 for details.

**j**

= Direction (DIR) of frame/packet/message to triggered on. Valid value(s):

- **RCV** = Triggered on frame/packet/message received by the switch from the customer premises equipment (CPE) or packet data switch network (PDSN).
- **XMT** = Triggered on frame/packet/message transmitted from the switch to the CPE or PDSN.

**k**

= The protocol level recorded (RECLVL). Valid value(s):

- **LEVEL2** = Recorded all layer 2 frames.
- **LEVEL3** = Recorded only the layer 3 packets/messages.

**l**

= State of the protocol monitoring session. Valid value(s):

- **ABORTED** = The session has aborted.
- **DATA RETRIEVAL** = The recording of data has completed and is being processed for output.
- **DURATION TIMEOUT** = The duration timer has fired. Waiting for session output.
- **RECORD COMPLETED** = The session has completed normally.
- **RECORDING** = The session is recording data and the trigger has not yet fired.
- **STOP NO DUMP** = The session has been manually terminated. The collected data will be discarded. No translation or dump of hexadecimal data will occur.
- **STOP WITH DUMP** = The session has been manually terminated with either translation or dump of the output data.
- **TRANSLATING** = The hexadecimal data collected during the session is being translated into an American standard code for information interchange (ASCII) format.
- **TRIGGER FIRED** = The trigger of the session has fired.
- **WAIT DUMP ACK** = A manual request has been made to terminate the session with translation or dump. Awaiting response from the switch.
- **WAIT STOP ACK** = A manual request has been made to terminate the session without translation or dump. Awaiting response from the switch.

**m**

= The ASCII translation file (ATF) name. Contains the ASCII translation of the hexadecimal data output from the protocol monitoring session.
n1 = The protocol monitoring common format file (PMCFF) file name. The intermediate binary file created during the translation of the hexadecimal output of the session into ASCII output. This file is used internally and is not generally available for inspection.

o1 = Status. Valid value(s):
ABORTED - ATF CLOSE FAILURE = The PM session was aborted because the ATF file could not be closed.
ABORTED - ATF OPEN FAILURE = The PM session was aborted because the ATF file could not be opened.
ABORTED - ATF WRITE FAILURE = The PM session was aborted because the ATF file could not be written to.
ABORTED - COMMUNICATION FAILURE = An unspecified communication error occurred between the administrative module (AM) and SM, between the SM and the PH, or between the AM and UNIX® operating system.
ABORTED - DATABASE PROBLEM = The request to verify a PM session failed because an error occurred while reading the database.
ABORTED - INVALID PMCFF FILE = The PM session was aborted because the PMCFF contents were corrupted, or were missing.
ABORTED - INVALID SESSION ID = The PM session was aborted because the session identifier did not correspond to a valid session.
ABORTED - PMCFF CLOSE FAILURE = The PM session was aborted because the PMCFF could not be closed.
ABORTED - PMCFF OPEN FAILURE = The PM session was aborted because the PMCFF could not be opened.
ABORTED - PMCFF READ FAILURE = The PM session was aborted because the PMCFF could not be read.
ABORTED - PMCFF WRITE FAILURE = The PM session was aborted because the PMCFF could not be written to.
ABORTED - TEMPORARY FILE CLOSE FAILURE = The PM session was aborted because the temporary file created for this session could not be closed.
ABORTED - TEMPORARY FILE OPEN FAILURE = The PM session was aborted because the temporary file created for this session could not be opened.
ABORTED - TEMPORARY FILE READ FAILURE = The PM session was aborted because the temporary file created for this session could not be read.
ABORTED - TEMPORARY FILE WRITE FAILURE = The PM session was aborted because the temporary file created for this session could not be written to.
ABORTED - TRANSLATION FAILURE = The PM session was aborted because the protocol translator was not able to translate this session.
COMPLETED = The verification request has successfully been completed.
NOT STARTED - CHANNEL MISMATCH = The CH specified on the input line is not valid for the PROT specified on the input line.
NOT STARTED - CHANNEL REQUIRED = The CH option must be specified on the input line, since the directory number or multi-line hunt group is assigned to more than one channel.
NOT STARTED - CMP UNAVAILABLE = The request to verify a PM session failed because the communications module (CM) was isolated from the AM.
NOT STARTED - INVALID PORT = The port identifier entered could not be translated and was considered to be invalid.
NOT STARTED - MLHG DN SPECIFIED = The request to verify a PM session failed because a DN for a MLHG or UCD group was specified. Repeat request using MLHG port services identifier option.
NOT STARTED - NO ACTIVE SESSION = The request to verify a PM session failed because no active PM sessions existed or because the session number specified did not match
an active session number.

**NOT STARTED - NON-PRIMARY DN SPECIFIED** = The request to verify a PM session failed because the primary DN is required. Repeat request specifying the primary DN.

**NOT STARTED - NON-UNIQUE NXX DN** = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

**NOT STARTED - SM UNAVAILABLE** = The request to verify a PM session failed because the SM was isolated from the AM.

**NOT STARTED - TRANSIENT STATE** = The request to verify a PM session could not be honored. Internal verification of the current session was executing. Repeat later.

\[ p^1 \]
= Integrated service line unit 2 (ISLU2) number.

\[ q^1 \]
= Line group number.

\[ r^1 \]
= Line board number.

\[ s^1 \]
= Line circuit number.

\[ t^1 \]
= Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

\[ u^1 \]
= Data group (DG) number.

\[ v^1 \]
= Synchronous transport signal (STS) facility number.

\[ w^1 \]
= Virtual tributary group (VTG) number.

\[ x^1 \]
= DS0 number.

\[ y^1 \]
= Access interface unit (AIU) number.

\[ z^1 \]
= AIU pack number.

\[ a^2 \]
= AIU circuit number.

\[ b^2 \]
= Type of messages recorded when monitoring LAP D protocol on a frame relay bearer channel.

User can request specifically to monitor either control messages or user data. However, if user data recording is requested, only a summary of the user data frame will be recorded, due to the sheer volume of the user data. The summary of the user data frame will contain the address information and the length of the actual user data frame transmitted or received. Valid value(s):

- **CTRL** = Recorded only control messages. CTRL is the default value.
- **DATA** = recorded only a summary of the transmitted or received user data frame.
- **ALL** = recorded both control messages and a summary of the transmitted or received user data frame.

\[ c^2 \]
= Type of messages or frames recorded when protocol monitoring is on a speech handler or an AUTOPLEX® data trunk. This option can be used with CESHL2 or CESHL3 or RLP protocol. Valid value(s):

- **CTRL** = recorded control frames (S and I) for CESHL2 protocol. Default value for CESHL2 protocol at level 2 recording.
- **TRAF** = recorded UI traffic messages for CESHL3 protocol.
- **IP** = recorded Inter-Processor messages for CESHL3 protocol. Default value for CESHL3 protocol at level 3 recording.
- **RLP** = recorded non-idle RLP frames for RLP protocol. Default value for RLP protocol at level 2 recording.
level 7 recording.

**ALL** = recorded all messages for CESHL2 or CESHL3 or RLP protocol. This will result in recording S, I, XID, and, UI frames for CESHL2 protocol, or UI plus IP frames for CESHL3 protocol, or RLP plus idle frames for RLP protocol.

d
= Packet switching unit (PSU) number
e
= PSU shelf number.
f
= PSU channel group number.
g
= SONET termination equipment (STE) facility number.
h
= Virtual tributary member (VTM) number.
i
= Translator status. Valid value(s):
  NO XLATE = The hexadecimal output for this session will not be translated through the protocol monitoring translator.
  XLATE = The protocol monitoring translator has been invoked for this session. The output will be translated into an ASCII file.

j
= Peripheral control and timing (PCT) line and trunk number (PLTU).
k
= PCT facility interface (PCTFI) number.
l
= Tributary number (T1FAC).
m
= Channel number (CHAN).
n
= IP address field. Valid value is the number between 0-255.

o
= Protocol (PROT) monitored in PCF PM session. Valid value(s):
  A10 = The A10 protocol.
  A11 = The A11 protocol.
  A10A11 = Both the A10 and the A11 protocol.

p
= Trigger level (TRIGLVL) in PCF PM session. Valid value(s):
  A10 = The trigger level is the A10 protocol.
  A11 = The trigger level is the A11 protocol.

q
= The protocol level recorded (RECLVL) in PCF PM session. Valid value(s):
  LEVEL7 = Recorded only the layer 7 packets/messages.

2. REASON FOR OUTPUT

To respond to a manual request to output a list of active protocol monitoring (PM) sessions.

Before a response is made, the information for active PM sessions is verified. If this verification determines that a session's data has been corrupted, the PM session will abort without printing any session information.

Format 1 displays all pertinent information for active ISDN or CCS PM sessions.

Format 2 displays all pertinent information for active PCF PM sessions.

Format 3 provides the status (that is, aborted, completed, not started) of the request to list active PM sessions.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Protocol handler (PH) channel group number.
c = PH channel member number.
d = Logical port number.
e = The equipment number identifier.
NOTE: If the port is associated with an X.75' trunk or an extended digital subscriber line (EDSL), then the digital equipment number (DEN) and peripheral control and timing line and trunk unit number (PLTEN) is used. If the port is associated with a digital networking unit - synchronous optical network (SONET) (DNU-S) number then the DNU-S networking equipment number (NEN) is used. If the port is associated with a optical interface unit (OIU) number, then the OIU equipment number (OIUEN) is used. If the port is associated with an embedded operation channel (EOC) or timeslot management channel (TMC), then the EOC or TMC equipment number is used. Otherwise, the line card equipment number (LCEN), line circuit equipment number (LCKEN), IDLC equipment number (INEN), access interface unit equipment number (AIUEN), packet switching unit equipment number (PSUEN), or integrated digital carrier unit (IDCU) line equipment number (ILEN) is used.

Valid value(s):

- \( \text{AIUEN} = a^1-y^1-z^1-a^2 \)
- \( \text{DEN} = a-f-g-h \)
- \( \text{EOC} = a-l-m-o \)
- \( \text{ILEN} = a-l-m-n \)
- \( \text{INEN} = a-t^1-m-n \)
- \( \text{LCEN} = a-i-j-k \)
- \( \text{LCKEN} = a-p^1-q^1-r^1-s^1 \)
- \( \text{NEN} = a-t^1-u^1-g^2-v^1-w^1-h^2-x^1 \)
- \( \text{OIUEN} = a-r^2-s^2-t^2-v^1-w^1-h^2-x^1 \)
- \( \text{TMC} = a-l-m-o \)
- \( \text{PLTEN} = a-j^2-k^2-l^2-m^2 \)
- \( \text{PSUEN} = a-d^2-e^2-f^2-c \)

- \( f \) = Digital line and trunk unit (DLTU) number.
- \( g \) = Digital facility interface number.
- \( h \) = Digital channel number.
- \( i \) = Integrated services line unit number.
- \( j \) = Line group controller number.
- \( k \) = Line card number.
- \( l \) = Integrated digital carrier unit number.
- \( m \) = Remote terminal (RT) number.
- \( n \) = RT line number.
- \( o \) = Primary/protection identifier.
- \( p \) = Channel (CH) being monitored. Valid value(s):
  - \( D \) = D-channel.
  - \( B1 \) = B1-channel.
  - \( B2 \) = B2-channel.
- \( q \) = Port services identifier.
NOTE: This field will be blank if the port does not have a unique port services identifier.

Valid value(s):

```
DN=r
MLHG=s-t
PKTDN=u
TKGMN=v-w
```

- `r` = The DN associated with a channel of a digital subscriber line (DSL).
- `s` = Multi-line hunt group number.
- `t` = Multi-line hunt group member number.
- `u` = The DN associated with a packet-switched channel of a DSL.
- `v` = Trunk group number.
- `w` = Trunk group member number.
- `x` = Service characteristic identifier of DSL channel. Valid value(s):
  - ODP = On-demand packet.
  - PPD = Permanent packet D.
  - PPB = Permanent packet B.
- `y` = The value of the session identifier (SES) for this monitoring session.
- `z` = The date-stamp of the beginning of the monitoring session, in the form month/day.
- `a` = The time-stamp of the beginning of the monitoring session, in the form hours:minutes:seconds.
- `b` = The current date-stamp for the monitoring session, in the form month/day.
- `c` = The current time-stamp for the monitoring session, in the form hours:minutes:seconds.
- `d` = The offset (OFFSET) for the number of frames that will be recorded after detection of the trigger event.
- `e` = The duration (DUR) for the recording session in seconds.
- `f` = Protocol (PROT) monitored. Valid value(s):
  - LAPD = The LAPD protocol.
  - LAPB = The LAPB protocol.
  - Q931 = The Q.931 protocol.
  - X25 = The X.25 protocol.
  - X75P = The X.75' protocol.
  - V120 = The V.120 protocol.
  - TMC = The TMC protocol.
  - RLP = The RLP protocol.
  - CESHL2 = The CESHL2 protocol.
  - CESHL3 = The CESHL3 protocol.
  - ISLP = The ISLP protocol.
= Trigger level (TRIGLVL). Valid value(s):

LAPD = The trigger level is the LAPD protocol.
LAPB = The trigger level is the LAPB protocol.
Q931 = The trigger level is the Q.931 protocol.
X25  = The trigger level is the X.25 protocol.
X75P = The trigger level is the X.75' protocol.
V120 = The trigger level is the V.120 protocol.
TMC  = The trigger level is the TMC protocol.
IDLC = The trigger level is the IDLC protocol.
ATS  = The trigger level is the automated test system (ATS) protocol.
RLP  = The trigger level is the RLP protocol.
CESHL2 = The trigger level is the CESHL2 protocol.
CESHL3 = The trigger level is the CESHL3 protocol.
ISLP = The trigger level is the ISLP protocol.

= TRIGVAL that terminated the recording session. Refer to the EXC:PM input manual page for a complete list of trigger values.

= Specific trigger value that terminated the recording session (a single PER occurring on the channel being recorded). Refer to the 235-600-755 for details.

= Direction (DIR) of frame/packet/message to triggered on. Valid value(s):

RCV = Triggered on frame/packet/message received by the switch from the customer premises equipment (CPE) or packet data switch network (PDSN).
XMT = Triggered on frame/packet/message transmitted from the switch to the CPE or PDSN.

= The protocol level recorded (RECLVL). Valid value(s):
LEVEL2 = Recorded all layer 2 frames.
LEVEL3 = Recorded only the layer 3 packets/messages.

= State of the protocol monitoring session. Valid value(s):
ABORTED = The session has aborted.
DATA RETRIEVAL = The recording of data has completed and is being processed for output.
DURATION TIMEOUT = The duration timer has fired. Waiting for session output.
RECORD COMPLETED = The session has completed normally.
RECORDING = The session is recording data and the trigger has not yet fired.
STOP NO DUMP = The session has been manually terminated. The collected data will be discarded.  No translation or dump of hexadecimal data will occur.
STOP WITH DUMP = The session has been manually terminated with either translation or dump of the output data.
TRANSLATING = The hexadecimal data collected during the session is being translated into an ASCII format.
TRIGGER FIRED = The trigger of the session has fired.
WAIT DUMP ACK = A manual request has been made to terminate the session with translation or dump. Awaiting response from the switch.
WAIT STOP ACK = A manual request has been made to terminate the session without translation or dump. Awaiting response from the switch.
m\textsuperscript{1} = The ASCII translation file (ATF) name. Contains the ASCII translation of the hexadecimal data output from the protocol monitoring session.

n\textsuperscript{1} = The protocol monitoring common format file (PMCF) file name. The intermediate binary file created during the translation of the hexadecimal output of the session into ASCII output. This file is used internally and is not generally available for inspection.

o\textsuperscript{1} = Status. Valid value(s):

ABORTED - ATF CLOSE FAILURE = The PM session was aborted because the ATF file could not be closed.

ABORTED - ATF OPEN FAILURE = The PM session was aborted because the ATF file could not be opened.

ABORTED - ATF WRITE FAILURE = The PM session was aborted because the ATF file could not be written to.

ABORTED - COMMUNICATION FAILURE = An unspecified communication error occurred between the administrative module (AM) and SM, between the SM and the PH, or between the AM and UNIX\textsuperscript{®} operating system.

ABORTED - DATABASE PROBLEM = The request to verify a PM session failed because an error occurred while reading the database.

ABORTED - INVALID PMCFF FILE = The PM session was aborted because the PMCFF contents were corrupted, or were missing.

ABORTED - INVALID SESSION ID = The PM session was aborted because the session identifier did not correspond to a valid session.

ABORTED - PMCFF CLOSE FAILURE = The PM session was aborted because the PMCFF could not be closed.

ABORTED - PMCFF OPEN FAILURE = The PM session was aborted because the PMCFF could not be opened.

ABORTED - PMCFF READ FAILURE = The PM session was aborted because the PMCFF could not be read.

ABORTED - PMCFF WRITE FAILURE = The PM session was aborted because the PMCFF could not be written to.

ABORTED - TEMPORARY FILE CLOSE FAILURE = The PM session was aborted because the temporary file created for this session could not be closed.

ABORTED - TEMPORARY FILE OPEN FAILURE = The PM session was aborted because the temporary file created for this session could not be opened.

ABORTED - TEMPORARY FILE READ FAILURE = The PM session was aborted because the temporary file created for this session could not be read.

ABORTED - TEMPORARY FILE WRITE FAILURE = The PM session was aborted because the temporary file created for this session could not be written to.

ABORTED - TRANSLATION FAILURE = The PM session was aborted because the protocol translator was not able to translate this session.

COMPLETED = The verification request has successfully been completed.

NOT STARTED - CHANNEL MISMATCH = The CH specified on the input line is not valid for the PROT specified on the input line.

NOT STARTED - CHANNEL REQUIRED = The CH option must be specified on the input line, since the directory number or multi-line hunt group is assigned to more than one channel.

NOT STARTED - CMP UNAVAILABLE = The request to verify a PM session failed because the communications module (CM) was isolated from the AM.

NOT STARTED - INVALID PORT = The port identifier entered could not be translated and was considered to be invalid.

NOT STARTED - MLHG DN SPECIFIED = The request to verify a PM session failed because a DN for a MLHG or UCD group was specified. Repeat request using MLHG port
services identifier option.

**NOT STARTED - NO ACTIVE SESSION** = The request to verify a PM session failed because no active PM sessions existed or because the session number specified did not match an active session number.

**NOT STARTED - NON-PRIMARY DN SPECIFIED** = The request to verify a PM session failed because the primary DN is required. Repeat request specifying the primary DN.

**NOT STARTED - NON-UNIQUE NXX DN** = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

**NOT STARTED - SM UNAVAILABLE** = The request to verify a PM session failed because the SM was isolated from the AM.

**NOT STARTED - TRANSIENT STATE** = The request to verify a PM session could not be honored. Internal verification of the current session was executing. Repeat later.

\[ p^1 \]
= Integrated service line unit 2 (ISLU2) number.

\[ q^1 \]
= Line group number.

\[ r^1 \]
= Line board number.

\[ s^1 \]
= Line circuit number.

\[ t^1 \]
= DNU-S number.

\[ u^1 \]
= Data group (DG) number.

\[ v^1 \]
= Synchronous transport signal (STS) facility number.

\[ w^1 \]
= Virtual tributary group (VTG) number.

\[ x^1 \]
= DS0 number.

\[ y^1 \]
= Access interface unit (AIU) number.

\[ z^1 \]
= AIU pack number.

\[ a^2 \]
= AIU circuit number.

\[ b^2 \]
= Type of messages recorded when monitoring LAP D protocol on a frame relay bearer channel. User can request specifically to monitor either control messages or user data. However, if user data recording is requested, only a summary of the user data frame will be recorded, due to the sheer volume of the user data. The summary of the user data frame will contain the address information and the length of the actual user data frame transmitted or received. Valid value(s):

**CTRL** = Recorded only control messages. CTRL is the default value.

**DATA** = Recorded only a summary of the transmitted or received user data frame.

**ALL** = Recorded both control messages and a summary of the transmitted or received user data frame.

\[ c^2 \]
= Type of messages or frames recorded when protocol monitoring is on a speech handler or an AUTOPLEX® data trunk. This option can be used with CESHL2 or CESHL3 or RLP protocol. Valid value(s):

**CTRL** = Recorded control frames (S and I) for CESHL2 protocol. Default value for CESHL2 protocol at level 2 recording.

**TRAF** = Recorded UI traffic messages for CESHL3 protocol.
IP = Recorded inter-processor messages for CESHL3 protocol. Default value for CESHL3 protocol at level 3 recording.

RLP = Recorded non-idle RLP frames for RLP protocol. Default value for RLP protocol at level 7 recording.

ALL = Recorded all messages for CESHL2 or CESHL3 or RLP protocol. This will result in recording S, I, XID, and, UI frames for CESHL2 protocol, or UI plus IP frames for CESHL3 protocol, or RLP plus idle frames for RLP protocol.

d^2 = Packet switching unit (PSU) number

e^2 = PSU shelf number.

f^2 = PSU channel group number.

g^2 = SONET termination equipment (STE) facility number.

h^2 = Virtual tributary member (VTM) number.

i^2 = Translator status. Valid value(s):
NO XLATE = The hexadecimal output for this session will not be translated through the protocol monitoring translator.
XLATE = The protocol monitoring translator has been invoked for this session. The output will be translated into an American standard code for information interchange (ASCII) file.

j^2 = Peripheral control and timing (PCT) line and trunk unit number (PLTU).

k^2 = PCT facility interface (PCTFI) number.

l^2 = Tributary number (T1FAC).

m^2 = Channel number (CHAN).

n^2 = IP address field. Valid value is the number between 0-255.

o^2 = Protocol (PROT) monitored in PCF PM session. Valid value(s):
A10 = The A10 protocol.
A11 = The A11 protocol.
A10A11 = Both the A10 and the A11 protocol.

p^2 = Trigger level (TRIGLVL) in PCF PM session. Valid value(s):
A10 = The trigger level is the A10 protocol.
A11 = The trigger level is the A11 protocol.

q^2 = The protocol level recorded (RECLVL) in PCF PM session. Valid value(s):
LEVEL7 = Recorded only the layer 7 packets/messages.

r^2 = OIU number.

s^2 = Protection group (PG) number.
\( t^2 \) = OC-3 STE number.

2. REASON FOR OUTPUT

To dump the post mortem buffers of the digital networking unit - synchronous optical network (SONET) (DNU-S) common controller (DNUSCC), after a removal of the DNUSCC or in response to the OP:POSTMORT input message. The output contains the history of the last fifty abnormal events recorded by the DNUSCC resident software.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Common controller number.
d = Event number.
e = Reason action taken. Valid value(s):
   MANUAL = Manual request for the report.
   RECOVERY = Peripheral fault recovery (PFR). The DNUSCC was removed automatically by fault recovery.
   REMOVE = Manual request by the maintenance request administrator (MRA) to remove the DNUSCC.

f = The output buffer number. Valid value(s):

g = The status of the post mortem dump. Valid value(s):
   ACTIVE UNIT FAILED TO RESPOND
   CATASTROPHIC CODE FAILURE
   CORRUPTED POSTMORTEM CONTROL TABLE
   DATA BASE FAILURE
   DIAGNOSTIC OR RECOVERY BLOCKING REQUEST

[2] OP PMCCS q
SES=j kk/kk ll:ll:ll
AM|DLN
SM NUMBERS
    r r r r r r r r

2. REASON FOR OUTPUT

To respond to a manual request to output a list of active CCS protocol monitoring (PM) sessions.

Before a response is made, the information for active PM sessions is verified. If this verification determines that a
session's data has been corrupted, the PM session will abort without printing any session information. Format 1
displays all pertinent information for active PM sessions. Format 2 provides the status (that is, aborted, completed,
not started) of the request to list active PM sessions. It is also used to report the status of the processors involved in
the PM session when the verbose option is requested on the op:pmccs input command.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms
shown in the format.

NO XLATE = The hexadecimal output for this session will NOT be translated through the protocol monitoring
translator. The data will be reported in hexadecimal format on the receive-only-printer (ROP).
XLATE = The protocol monitoring translator has been invoked for this session. The output will be translated
into an American standard code for information interchange (ASCII) file.
AM|DLN = Signifies that the AM or DLN processor is associated with this PM session.
SM NUMBERS = Signifies that SM processors are associated with this PM session.
a = Called party address directory number.
b = Calling party address directory number.
c = Trunk group number. Trunk group used to route the ISUP call associated with this PM session.
d = Trunk group member number. Trunk group member used to route the ISUP call associated with this PM session.
e = Called party translation type.
f = Calling party subsystem number.
g = Called party subsystem number.
h = Location in the TCAP message to match the CALLED/CALLING parameters (SCCP=SCCP Header; TCAP=TCAP data).
i = Number of times this session will be repeated.
j = The value of the session identifier (SES) for this monitoring session.
k = The date-stamp of the beginning of the monitoring session, in the form month/day.
l = The time-stamp of the beginning of the monitoring session, in the form hours:minutes:seconds.
m = The duration (DUR) of the recording session in seconds.
n = Protocol requested for the session.
o = Direction of the first matching message.
p = State of the protocol monitoring session. Valid value(s):
   ABORTED = The session has aborted.
   DATA RETRIEVAL = The recording of data has completed and is being processed for output.
   DURATION TIMEOUT = The duration timer has fired. Waiting for session output.
   RECORDING = The session is recording data and the termination message has has not yet been captured.
   STOP WITH DUMP = The session has been manually terminated with either translation or hexadecimal reporting of the output data.
   TRANSLATING = The hexadecimal data collected during the session is being translated into an ASCII format.

q = Indicates that the session will not repeat due to an abnormal termination.

r = Status. Valid value(s):
   ABORTED - COMMUNICATION FAILURE = An unspecified communication error occurred between the administrative module (AM) and the recording processor (SM, DLN or AM) or the AM and UNIX® operating system.
   ABORTED - DATABASE PROBLEM = The request to start a PM session failed because an error occurred while reading the database.
   ABORTED - INTERNAL FAILURE = The PM session was aborted because an internal failure was encountered.
   RECORDERS ABORTED = List of PM processors that have aborted during a PM session.
**PROCESSORS SCREENING** = List of PM processors that are actively screening messages for this PM session.

**PROCESSOR RECORDING** = Lists the PM processor that is recording data for this PM session.

**RECORDERS INACTIVE DUE TO OVERLOAD** = List of PM processors that have aborted due to a detection of an overload condition.

**ABORTED - INVALID SESSION ID** = The PM session was aborted because the session identifier did not correspond to a valid session.

**COMPLETED** = The verification request has successfully been completed.

**NOT STARTED - NO ACTIVE SESSION** = The request to verify a PM session failed because no active PM sessions existed or because the session number specified did not match an active session number.

**NOT STARTED - TRANSIENT STATE** = The request to verify a PM session could not be honored. Internal verification of the current session was executing. Repeat later.

\[ r \] = SM number(s) associated with this PM session.

OP:PMCR

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] OP_PMCR_ERROR a[,ERRNO = b]

[2] OP_PMCR_INFO a

2. REASON FOR OUTPUT

To report errors encountered during the execution of the processes that comprise the plant measurements common report (PMCR) capability.

3. VARIABLE FIELD DEFINITIONS

\( a \)  

= Four-digit error code. This code consists of a one-digit number that indicates the PMCR process in which the error was detected, a two-digit number that indicates the error type, and a one-digit that is not used.

Process values (first digit). Valid value(s):
1  = PMCR user interface.
2  = PMCR manager.
3  = PMCR collector.
4  = PMCR report generator.

Error type (second and third digits). Valid value(s):
00  = User is not allowed to request scheduled report. This message comes from PMCR user interface as ERROR 1001.
01  = Could not connect to system port.
02  = Could not send or receive message.
03  = Failed ’plib’ call.
04  = Failed ’pl_init’ call.
05  = Failed ’pl_attrec’ call.
06  = Failed ’pl_update’ call.
07  = Failed ’pl_read’ call.
08  = Failed ‘lla_iatt’ call.
09  = Failed ‘lla_irel’ call.
10  = Failed ‘lla_rdget’ call.
11  = Failed ‘lla_opensq’ call.
12  = Failed ‘lla_nextseq’ call.
13  = Could not execute PMCR collector or PMCR report generator.
14  = Could not get equipment configuration database (ECD) segments.
15  = Could not get reporting office name from ECD.
16  = Computation of maintenance usage time for the specified unit resulted in a time greater than 86,400 seconds (one day) or a negative value.
17  = Bad arguments received by PMCR report generator.
= Spool error during output of report.
= No data has been collected to output a retained/demand report. Requesting a
daily retained report should not be attempted until after a scheduled daily report has
been generated. Requesting an hourly retained report should not be attempted until
after a scheduled hourly report has been generated. Demand reports should not be
attempted until at least one hour after a valid scheduled daily report has been
generated.

= PMDB initialization time reset to current time.
= Start time reset to 0.
= Start time reset to current time.
= Change reason for start time and reset time to 0.
= Start time reset to top unit start time.
= Change reason for start time to top unit reason and reset start time to top unit
start time.
= Hour limit exceeded. Time reset to one hour.
= Negative time count. Time reset to 0.
= Day limit exceeded. Time reset to one day.
= Current value (for example, alarm count) is less than count recorded from
previous hour, or previous count was invalid.
= Open of /etc/log/pmcrlog file failed.
= Could not execute pmdbcopy.
= Unrecognized unit control block (UCB) status.
= Failed 'malloc' call.
= Failed 'lla_gtrid' call.
= Plant measurements audit record deleted.

Fourth digit is not used.

= Error code returned by the failing function call. Valid value(s):

<table>
<thead>
<tr>
<th>'a'</th>
<th>'b'</th>
</tr>
</thead>
<tbody>
<tr>
<td>x01x-x03x, x13x-x16x, x181, or x182</td>
<td>Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
<tr>
<td>x04x-x07x</td>
<td>The plant measurements error code number.</td>
</tr>
<tr>
<td>x17x or x183</td>
<td>The value of the bad arguments passed to the function or process.</td>
</tr>
<tr>
<td>x08xx-x12x, x19x, x35x, x36x, or x38x</td>

<tr>
<td>x37x</td>
<td>The deleted audit record.</td>
</tr>
</tbody>
</table>

4. ACTION TO BE TAKEN

For messages 22 through 31, refer to /etc/log/pmcrlog for record name information. These error messages indicate
that the count or time for the unit may not be valid. No further action is needed.

The log file (/etc/log/pmcrlog) is reset every time a scheduled report runs.

<table>
<thead>
<tr>
<th>'a'</th>
<th>Action To Be Taken</th>
</tr>
</thead>
</table>
| x00x | Request output of scheduled reports to be turned on by using OP:PMCR message. Then
     | scheduled hourly reports will be printed at the end of the hour, and daily at the end of the day. |
| x01x | Check port 27, using the OP:ST-PORTS input message, to see if another process has control
     | of the port.                                                                    |
| x02x | Check that the correct OP:PMCR input message was entered. Request output of scheduled
     | reports to be turned on by using the OP:PMCR input message.                     |
| x03x-x07x | Check the usability of the plant measurements database.                         |
| x08x-x12x | Check the usability of the ECD.                                                 |
Check the usability of the PMCR processes.

Check the usability of the ECD.

Check system clock versus last clean report.

Check that the correct OP:PMCR input message was entered.

No action can be taken.

Check that the /etc/log directory has read/write/search permission, that the /etc/log/pmcrlog file (if it exists) has write permission, and that free blocks and i-nodes are available on the file system.

Check that the /prc/pmdbcopy file exists and is executable.

If the error persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Check the usability of the ECD.

No action to be taken.

In all instances, if the error persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

APP:SYSERR
OP:PSC-A

Software Release: 5E16(1) only
Message Class: PRFM
Application: 5
Type: Output

1. FORMAT

[1] OP PSC {ALL|SM=a|OIU=a-b} f

[2] OP PSC OC3=a-b-c-d-e
PSC COUNTS CURR PREV
   g    h

2. REASON FOR OUTPUT

Output (OP) protection switch count (PSC) performance monitoring (PM) counts in response to the OP:PSC input message.

Format 1 displays the initial and final OP:PSC request status.

Format 2 displays the current and previous day protection switch counts for the identified OC3 facility.

3. VARIABLE FIELD DEFINITIONS

ALL = Report PSC counts for OIUs on the entire switch.
CURR = Current day counts.
OC3 = Optical carrier level 3.
OIU = Optical interface unit.
PREV = Previous day counts.
PSC = Protection switch counts.
a = Switching module (SM) number.
b = Optical interface unit (OIU) number.
c = Protection group (PG) number.
d = Optical carrier level 3 (OC3) number.
e = Side number.
f = The result of the request. Valid value(s):
   COMPLETED = The request was successfully completed.
   COMPLETED FACS OOS = The request for protection switch counts completed, but counts for out-of-service facilities were not included in the output report.
   COMPLETED PROT SWITCH = The request for protection switch counts completed, but counts for a protection group or groups on the OIU were not reported due to a protection switch.
FAILED = The data could not be collected for this report.
FAILED OIU OFI OOS = The request for protection switch counts failed because the OFI or OFIs for the requested OIU protection group were out-of-service.
NO MATCH = The specified facility does not exist.
NOT ALLOWED = The requested report is not allowed for the given facility or unit.
SM UNAVAILABLE = The input request could not be processed because communication with the associated SM is not possible.
STARTED = Initial output report.
SYSTEM BUSY = The system’s processing capability has been reached, or a system resource is unavailable. Retry the request later.

g = Current day protection switch counts.
h = Previous day protection switch counts.

235-105-110 System Maintenance Requirements and Tools
**OP:PTRC-A**

**Software Release:** 5E16(1) only  
**Message Class:** PRFM  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   [1] OP_PTRC_STSFA=a-b-c-d-e f [g]  
   EXPECTED:  
   h  
   RECEIVED:  
   i

   [2] OP_PTRC_STS1=a-j-k-l-e f [g]  
   EXPECTED:  
   h  
   RECEIVED:  
   i

2. **REASON FOR OUTPUT**

   This output message is generated in response to the OP:PTRC-STSFA input message. This output message is used for digital networking unit - synchronous optical network (SONET) (DNU-S) and OIU.

   Format 1 is used for DNU-S.

   Format 2 is used for OIU.

   This output message is used to verify that the specified receiving synchronous transport signal (STS) path terminating equipment (PTE) is connected to the intended transmitting STS PTE. The value of the expected and received data will be dumped along with a "MATCH/MISMATCH" status indicating whether the system considers the expected and received data to be in agreement or not.

3. **VARIABLE FIELD DEFINITIONS**

   a = Switching module (SM) number.  
   b = DNU-S number.  
   c = Data group number.  
   d = SONET terminating equipment facility number.  
   e = STS facility number.  
   f = The result of the request. Valid value(s):  
   COMPLETED = The request was successfully completed.  
   FAILED = The data could not be collected for this report.  
   FAILED DNUS CC OOS = The request for PM counts failed because DNU-S common control (CC) was out-of-service. DNU-S duplex failure condition.  
   NO MATCH = The specified facility does not exist or is not a DNU-S facility.
NOT ALLOWED = The requested report is not allowed for the given facility or unit.
OUT OF SERVICE = Either the specified facility or the associated transmission multiplexer (TMUX) is out-of-service.
HARDWARE NOT OPERATIONAL = Either the specified facility or the associated transmission multiplexer (TMUX) is not in an operational state.
TMUX OFF NORMAL = The associated transmission multiplexer (TMUX) is in an off normal condition.
MANUALLY OOS = The facility was manually OOS. When it is AUTO OOS, we have the capability to dump TIDs (for OIU only).
SM UNAVAILABLE = The input request could not be processed because communication with the associated SM is not possible.
SYSTEM BUSY = The system's processing capability has been reached, or a system resource is unavailable. Retry the request later.

\( g \) = Trace status. Valid value(s):
MATCH = The specified receiving STS PTE data matches (agrees with) the intended transmitting STE PTE data.
MISMATCH = The system does not consider the specified receiving STS PTE data to match (does not agree with) the intended transmitting STS PTE data.

\( h \) = Data that this system was expecting from the transmitting STS PTE. The string is included in a pair of square brackets, in order that any leading or tailing spaces in the string can be observed.

\( i \) = Data received from the transmitting STS PTE. The string is included in a pair of square brackets, in order that any leading or tailing spaces in the string can be observed.

\( j \) = Optical interface unit (OIU).

\( k \) = Protection group (PG) number.

\( l \) = Optical carrier-3 (OC3) number.

### 4. ACTIONS TO BE TAKEN

This message is generated in response to the OP:PTRC-STSFAC input message.

In the event a MISMATCH indication is received as shown in variable 'g', first verify that the specified PTE equipment is correct. Next verify that variable 'f' is equal to COMPLETED. If variable 'f' equals COMPLETED, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. If variable 'f' equals COMPLETED status indication, then determine whether the EXPECTED and RECEIVED data strings agree with one another.

If the EXPECTED and RECEIVED data strings do not agree with one another, then the following should be checked: the far end transmitting PTE should be connected to the correct near end receiving PTE, the customer provisionable data being transmitted by the far end transmitting PTE should agree with the near end receiving PTE customer provisionable data. In the latter case, the far end transmitting PTE's data may need to be refreshed. Go to Data Refresh.

If the EXPECTED and RECEIVED data strings do appear to agree with one another, check closely for unusual characters at the end of the string. The problem may be that the either the far end transmitting PTE or the near end receiving PTE is corrupting the data.
If the transmitting data is believed to be correct and the hardware is connected correctly, then it may be that the path data is out-of-date. If that is the case, it may be necessary to refresh this data. Go to Data Refresh.

If the system outputs MISMATCH for variable 'g' and variable 'f' equals COMPLETED, and the EXPECTED and RECEIVED data strings agree with one another, then this indicates a software problem. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Data Refresh:

If it has been determined that the data needs to be refreshed, perform the following operations (only if the far end transmitting PTE is DNU-S equipment): the far end transmitting PTE data can be refreshed by entering the OP:PTRC input message at the far end transmitting PTE. In general the OP:PTRC input message updates the specified PTE’s transmitted data after it dumps the received data. If refreshing the far end transmitting PTE does not have the desired effect, it may be that there is a problem is with the near end receiving PTE equipment, in this case it may be necessary to diagnose the associated near end PTE’s TMUX and SFI equipment.

2. REASON FOR OUTPUT

This output message is generated in response to the OP:PTRC input message. This output message is used for digital networking unit - synchronous optical network (SONET) (DNU-S) and optical interface unit (OIU).

Format 1 is used for DNU-S.
Format 2 is used for OIU.

This output message is used to verify that the specified receiving synchronous transport signal (STS) path terminating equipment (PTE) is connected to the intended transmitting STS PTE. The value of the expected and received data will be dumped along with a "MATCH/MISMATCH" status indicating whether the system considers the expected and received data to be in agreement or not.
3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Data group number.
d = SONET terminating equipment facility number.
e = STS facility number.
f = The result of the request. Valid value(s):
   COMPLETED = The request was successfully completed.
   FAILED = The data could not be collected for this report.
   FAILED DNUS CC OOS = The request for PM counts failed because DNU-S common control (CC) was out-of-service. DNU-S duplex failure condition.
   HARDWARE NOT OPERATIONAL = Either the specified facility or the associated DNU-S transmission multiplexer (TMUX) is not in an operational state.
   NO MATCH = The specified facility does not exist or is not a DNU-S or a OIU facility.
   NOT ALLOWED = The requested report is not allowed for the given facility or unit.
   OUT OF SERVICE = Either the specified facility or the associated DNU-S TMUX is out-of-service.
   SM UNAVAILBLE = The input request could not be processed because communication with the associated SM is not possible.
   SYSTEM BUSY = The system's processing capability has been reached, or a system resource is unavailable. Retry the request later.
   TMUX OFF NORMAL = The associated DNU-S TMUX is in an off normal condition.

g = Trace status. Valid value(s):
   MATCH = The specified receiving STS PTE data matches (agrees with) the intended transmitting STE PTE data.
   MISMATCH = The system does not consider the specified receiving STS PTE data to match (does not agree with) the intended transmitting STS PTE data.

h = Data that this system was expecting from the transmitting STS PTE. The string is included in a pair of square brackets, in order that any leading or tailing spaces in the string can be observed.
i = Data received from the transmitting STS PTE. The string is included in a pair of square brackets, in order that any leading or tailing spaces in the string can be observed.
j = Optical interface unit (OIU).
k = Protection group (PG) number.
l = Optical carrier-3 (OC3) or optical carrier-3 concatenated (OC3C) number.
m = Path trace identifier ASCII byte code (in hexadecimal).

4. ACTIONS TO BE TAKEN

This message is generated in response to the OP:PTRC input message.
In the event a mismatch indication is received as shown in variable ‘g’, first verify that the specified PTE equipment is correct. Next verify that variable ‘f’ is equal to COMPLETED. If variable ‘f’ equals COMPLETED, refer to the technical assistance portion of the introduction section of the Output Messages manual. If variable ‘f’ equals COMPLETED status indication, then determine whether the expected and received data strings agree with one another.

If the expected and received data strings do not agree with one another, then the following should be checked: the far end transmitting PTE should be connected to the correct near end receiving PTE, the customer provisionable data being transmitted by the far end transmitting PTE should agree with the near end receiving PTE customer provisionable data. In the latter case, the far end transmitting PTE's data may need to be refreshed. Go to Data Refresh.

If the expected and received data strings do appear to agree with one another, check closely for unusual characters at the end of the string. The problem may be that the either the far end transmitting PTE or the near end receiving PTE is corrupting the data.

If the transmitting data is believed to be correct and the hardware is connected correctly, then it may be that the path data is out-of-date. If that is the case, it may be necessary to refresh this data. Go to Data Refresh.

If the system outputs mismatch for variable ‘g’ and variable ‘f’ equals COMPLETED, and the expected and received data strings agree with one another, then this indicates a software problem. Refer to the technical assistance portion of the introduction section of the Output Messages manual.

Data Refresh:

If it has been determined that the data needs to be refreshed, perform the following operations (only if the far end transmitting PTE is DNU-S equipment): the far end transmitting PTE data can be refreshed by entering the OP:PTRC input message at the far end transmitting PTE. In general the OP:PTRC input message updates the specified PTE's transmitted data after it dumps the received data. If refreshing the far end transmitting PTE does not have the desired effect, it may be that there is a problem is with the near end receiving PTE equipment, in this case it may be necessary to diagnose the associated near end PTE's TMUX and SFI equipment.

2. REASON FOR OUTPUT

This output message is generated in response to the OP:PTRC-STSFAC input message. This output message is used for digital networking unit - synchronous optical network (SONET) (DNU-S). This output message is used to verify that the specified receiving synchronous transport signal (STS) path terminating equipment (PTE) is connected to the intended transmitting STS PTE. The value of the expected and received data will be dumped along with a "MATCH/MISMATCH" status indicating whether the system considers the expected and received data to be in agreement or not.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Data group number.
d = SONET terminating equipment facility number.
e = STS facility number.
f = The result of the request. Valid value(s):
   COMPLETED = The request was successfully completed.
   FAILED = The data could not be collected for this report.
   FAILED DNUS CC OOS = The request for PM counts failed because DNU-S common control (CC) was out-of-service. DNU-S duplex failure condition.
   NO MATCH = The specified facility does not exist or is not a DNU-S facility.
   NOT ALLOWED = The requested report is not allowed for the given facility or unit.
   OUT OF SERVICE = Either the specified facility or the associated transmission multiplexer (TMUX) is out-of-service.
   HARDWARE NOT OPERATIONAL = Either the specified facility or the associated transmission multiplexer (TMUX) is not in an operational state.
   TMUX OFF NORMAL = The associated transmission multiplexer (TMUX) is in an off normal condition.
   SM UNAVAILABLE = The input request could not be processed because communication with the associated SM is not possible.
   SYSTEM BUSY = The system’s processing capability has been reached, or a system resource is unavailable. Retry the request later.
4. ACTIONS TO BE TAKEN

This message is generated in response to the OP:PTRC-STSFAC input message.

In the event a MISMATCH indication is received in variable "\$g\$1" above, first verify that the specified PTE (STSFAC) equipment is correct. Next verify that variable "\$f\$1" contains a COMPLETED status. If variable "\$f\$1" does not contain a COMPLETED status, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. If variable "\$f\$1" does contain a COMPLETED status indication, then determine whether the EXPECTED and RECEIVED data strings agree with one another.

If the EXPECTED and RECEIVED data strings do not agree with one another, then the following should be checked: the far end transmitting PTE should be connected to the correct near end receiving PTE, the customer provisionable data being transmitted by the far end transmitting PTE should agree with the near end receiving PTE customer provisionable data. In the latter case, the far end transmitting PTE's data may need to be refreshed. Refer to Data Refresh section.

If the EXPECTED and RECEIVED data strings do appear to agree with one another, check closely for unusual characters at the end of the string. The problem may be that the either the far end transmitting PTE or the near end receiving PTE is corrupting the data.

If the transmitting data is believed to be correct and the hardware is connected correctly, then it may be that the path data is out-of-date. If that is the case, it may be necessary to refresh this data. Refer to Data Refresh section.

If the system outputs MISMATCH for variable "\$g\$1" and variable "\$f\$1" contains COMPLETED, and the EXPECTED and RECEIVED data strings do agree with one another, then this indicates a software problem. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Data Refresh: If it has been determined that the data needs to be refreshed, perform the following operations (only if the far end transmitting PTE is DNU-S equipment): the far end transmitting PTE data can be refreshed by entering the OP:PTRC-STSFAC input message at the far end transmitting PTE (STSFAC). In general the OP:PTRC-STSFAC input message updates the specified PTE's transmitted data after it dumps the received data. If refreshing the far end transmitting PTE does not have the desired effect, it may be that there is a problem is with the near end receiving PTE equipment, in this case it may be necessary to diagnose the associated near end PTE's TMUX and SFI equipment.

  .                          .
__________________________________________________________________

[2] OP QNETSTAT QLPSNW= a g LAST RECORD

__________________________________________________________________

2. REASON FOR OUTPUT

To report the configuration status of quad-link packet switch (QLPS) pipes (QPIPEs), QLPS communication links (QLNKs), and inter-switching module QLNKs (ISMQLNKs) and, if requested, the supporting communication module (CM) hardware.

Format 1 is the standard output message format when there are some units for which status must be reported.

Format 2 is the output message format when the status of QLPS network units cannot be reported due to the reason stated in ‘g’.

This output message is printed in response to a manual request for the status of QPIPEs, QLNKs, and ISMQLNKs by the OP:QNETSTAT input message. The request may be for all QPIPEs, QLNKs, and ISMQLNKs that meet specified criteria, or for the status of a specific QPIPE, QLNK, or ISMQLNK and all supporting CM hardware. In addition, this output message may be printed automatically to report that QPIPEs, QLNKs, and/or ISMQLNKs are out-of-service (OOS) despite the availability of all supporting hardware.

QPIPE, QLNK, and ISMQLNK maintenance states may be reported for either or both QLPSs of a network. The status of a QPIPE/QLNK/ISMQLNK associated with a standby parent QLPS indicates whether it is expected to be able to support message traffic if the parent QLPS were to become active.

A QPIPE that is OOS (except for family-of-equipment reasons) under a standby QLPS may have been removed from service due to errors that occurred prior to a QLPS switch. A QLNK or ISMQLNK that is reported to be in the STBY state is expected to become ACTIVE in the event of a QLPS switch (the parent QLPS is STBY). All parent hardware for such a QLNK/ISMQLNK is available, and the level 2 communication protocol is established through the mate (active) QLPS. If level 2 communication is not established through the active QLPS, the status of the QLNK/ISMQLNK through the standby QLPS will be IDLE.

Unless information about a specific ISMQLNK is manually requested, only the status of ISMQLNKs associated with an active QLPS will be reported. If there is no active QLPS for a network, the ISMQLNK status associated with the QLPS on ONTC side 0 will be reported.

The SM-2000 module controller time slot interchanger (MCTSI) side reported as part of the MH QPIPE, QLNK, or ISMQLNK unit identification is always the active MCTSI side at the time this report was generated.

3. VARIABLE FIELD DEFINITIONS
a  = QLPS network number.

b  = Sequence number of message block. Valid value(s):
    FIRST RECORD = First record of continuing list.
    NEXT RECORD = Next record of continuing list.
    LAST RECORD = Last record of list.

c  = Unit identification. Valid value(s):
    ISMQLNK = Inter-switching module (SM) quad-link packet switch (QLPS) communication link.
    MHQPIPE = Pipe from an SM-2000 message handler (MH) to a QLPS.
    MSCU = Message switch control unit.
    NLI = Network link interface.
    ONTCCOM = Office network and timing complex (ONTC) common controller.
    QGL = QLPS gateway processor (QGP) link.
    QGP = QLPS gateway processor.
    QGPQPIPE = QLPS pipe from a QGP to a QLPS.
    QLNK = QLPS communication link between an SM-2000 and the administrative module (AM).
    QLPS = Quad-link packet switch.
    QTMSLNK = QLPS time multiplexed switch link.
    TMSLNK = Time multiplexed switch link.

d  = Maintenance state. Valid value(s):
    ACT = Active.
    DGRD = Degraded (ONTCCOM only).
    IDLE = Idle.
    INIT = Initializing.
    OOS = Out of service.
    STBY = Standby.
    UNAV = Unavailable.

e  = First maintenance state qualifier. Valid value(s):
    AUTO = Due to an automatic action.
    CLRISOL = The SM is clearing manual isolation (either QLPS only or total isolation).
    FAR = Far end pipe failure.
    FARFLT = Far end pipe failure due to fault.
    FARLBK = Far end pipe failure due to loopback test.
    FE = Family of equipment.
    FRCD = Forced.
    L2 = Level 2 is down.
    LE = Link establish message sent.
    LEACK = Link establish acknowledgement sent.
    MAJOR = Major (ONTCCOM only).
    MAN = Due to a manual action.
    MANISOL = Manual isolation.
    MINOR = Minor (ONTCCOM only).
    NEARFLT = Near end pipe failure due to fault.
    NEARLBK = Near end pipe failure due to loopback test.
    PEND = A manual action is pending on a parent which will cause this unit to be removed.
UPD = Routing update in progress.

f  = Second maintenance state qualifier. Valid value(s):
DGN = Unit is being diagnosed.
DFRIP = Duplex/quadruplex failure recovery is in progress.
EX = Unit is being manually exercised.
FE = Family of equipment.
FLT = Fault.
MIP = Maintenance in progress.
PWRALM = Power alarm.
PWROFF = Power off.
REX = Unit is being routinely exercised.
RMV = Unit has been removed.
TBLA = Trouble analysis.
TMP = Temporary.

g = Report completion status. Valid value(s):
DATA INCOMPLETE = Complete data associated with ISMQLNKs could not be obtained. This can occur because an SM-2000 is isolated or initializing, or due to a timeout waiting for a response from the SM-2000.
INVALID REQUEST = Options input were invalid. Verify that the specified network and source QGP are correct.
NO UNITS SELECTED = No units were found that met the specified input criteria (manual requests only).

4. ACTION TO BE TAKEN

Refer to the Corrective Maintenance Procedures manual for information to clear any reported offnormal conditions in the QLPS networks. If this message was printed automatically, any units reported are considered to be offnormal.

5. ALARMS

None.

   ["j"]

2. REASON FOR OUTPUT

To respond to the OP:RCACCESS input message to display the recent change (RCV) access abilities for the
specified terminal (TTY) associated with the 3B processor, the specified login id (LOGIN) associated with the
administrative services module (ASM), an Authority Management Login (AUTHLOGIN), or a Recent Change
Security Group (RCSECGRP).

3. VARIABLE FIELD DEFINITIONS

a = Name of a login id assigned on the ASM in the office.
b = Name of a terminal associated with the 3B in the office.
c = Name of an Authority Management Login in the office. This parameter is associated with a
   secured feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the
   INTRODUCTION section of this manual.
d = Name of a RCSECGRP in the office. This parameter is associated with a secured feature. Refer
   to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.
e = Section number.
f = Total number of sections.
g = RCV Class number or range of classes that are allowed.
h = RCV View or range of views that are allowed with a RCV class. This parameter is associated with
   a secured feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the
   INTRODUCTION section of this manual.
i = The RCV Security group that the LOGIN, AUTHLOGIN OR TTY is a member of and inherits its
RC security permissions from. This parameter is associated with a secured feature. Refer to the
SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.
j = Information or Error Message. Valid values:
DEFAULTED TO TTY PERMISSIONS = The Authority Management Login does not have any RC access permissions of its own. The permissions of a RC session will be the access permissions that are assigned to the TTY that the RC session is being run on.

CANNOT ACCESS DATABASE = Unable to open database. Try again later.

FEATURE IS NOT PURCHASED = SFID 595 has not been purchase or activated.

CANNOT GET PASSWORD FILE FROM ASM =

CANNOT FIND ASM ROOT = The /rclog/secasmroot on the AM is missing or not readable.

INTERNAL ERROR IN RCgetac = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

NO PERMISSIONS = The TTY, LOGIN, AUTHLOGIN or RCSECGRP has all RC permissions inhibited.

CANNOT READ TEMPORARY FILE = The read of a file has failed.

SECURITY GROUP DOES NOT EXIST = The RCSECGRP specified does not exist in the office.

CANNOT OPEN ASM PASSWORD FILE = The password file copied from the ASM could not be opened.

LOGIN IS NOT A VALID ASM LOGIN = The LOGIN specified is not a valid ASM login.

EMPTY TTY NAME = No TTY was specified

INVALID TTY NAME = The TTY specified is not valid in the office.

INVALID AUTHORITY MANAGEMENT LOGIN = The Authority Managment Login (AUTHLOGIN) specified is not valid.

EMPTY SECURITY GROUP NAME = No RCSECGRP name was given.

SECURITY GROUP NAME IS TOO LONG (LIMIT 8 CHARs) = The RCSECGRP parameter is limited to 8 characters.

GROUP NAME CHARs MUST BE ALPHANUMERIC, . - OR _ = Only alphanumeric, period, dash, or underscore is allowed in the RCSECGRP name.

GROUP NAME \NONE\ IS NOT ALLOWED = The groupname "NONE" is not allowed please specify another.

CANNOT ACCESS DATABASE TO CHECK FOR ASM = Failed to open the Database. Try again later.

ASM IS NOT ACCESSIBLE = The AM can not communicate with the ASM.

[2] OP RCSTAT {AM|CMP|SM|RED|CORC} LOG PERCENT FULL=d

[3] OP RCSTAT=e

2. REASON FOR OUTPUT

To report the number of recent changes in one or more switching modules (SMs), one or more communication module processors (CMPs), and/or the administrative module (AM). This message is a response to an OP:RCSTAT-SM input message.

Format 1 will be repeated for each module for which a report was requested. Format 2 which reports the percentage of the log file filled by recent change, will be printed once for each OP:RCSTAT-SM input message entered. All five forms of Format 2 will be printed with each request. Format 3 will be printed once for each OP:RCSTAT-SM input message entered. The order in which the messages are printed is not significant.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = CMP number.
c = Number of recent changes logged.
d = Percentage of the log file filled by recent changes.
e = Termination report. Valid value(s):
   ABORTED = The requested action was terminated before a normal completion and the consistency of hardware states or data was questionable.
   COMPLETED = The requested action was terminated after a normal completion.
   STOPPED = The requested action was terminated before a normal completion but consistency of hardware states and data was reliable.

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to a manual request to output a status report of one or more remote digital test access (RDTA) sessions.

Format 1 is a successful response to a request to gather information on one particular RDTA session. This format will appear on a successful completion when requesting session information by submitting the session number or the port under test (PUT). The first line shows the session number and the successful look-up of session information. The second line describes the PUT in the various port identifications which are applicable to the PUT. The third line shows the output facility information defining routing for the RDTA connection and the location of the protocol analysis equipment. Acronyms are as follows: incoming directory number (INDN), incoming test access port (ITAP), outgoing DN (OUTDN), and outgoing test access port (OTAP). The fourth line shows the type of connection and quarter time-slot, if applicable, along with the total session duration and remaining session time.

Format 2 is used to respond to a request to print status information for all active RDTA sessions. This format will give limited information for up to 24 RDTA sessions (the maximum allowable number of RDTA sessions). A maximum of eight sessions are printed per segment. The first line displays the number of segments which will be displayed as a result of this request and the segment number of the segment which is being printed. To receive more detail, a specific session or PUT identification request should be made. Format 3 is used if there is a failure in getting the status information. The information, as seen by the input message, will be returned along with the reason for failure and a failure point number, used to identify the point in software where failure occurred.

3. VARIABLE FIELD DEFINITIONS

+ = Assigned to a multipoint interface.

a = Session number given to the requested session. Sessions are numbered sequentially from 1
through 99. At 99, the numbers will be recycled starting from 1 again.

b

= Response to OP:RDTA input message. Valid value(s):
CMP UNAVAILABLE = The communications module (CM) containing the PUT, which is needed to retrieve/translate port names, is isolated. This restricts the administrative module (AM) from printing the PUT external identifiers on line 2 of the Format 1 output message. Therefore, this message may also be seen on line 2 of the Format 1 output message in place of these external identifiers.
COMPLETED = Status information successfully found for the requested RDTA session.
CORRUPTED DYNAMIC DATA = Dynamic data has been corrupted. Look at receive-only printer (ROP) for a related assert to give assistance toward correcting the office dependent data (ODD) problem. Audits will correct any RDTA session/data inconsistency. If session data is corrupted for a particular RDTA session and an OP:RDTA request is made for all sessions this message will be seen in the equipment number field of Format 2.
INCOMPLETE PUT = The port could not be located in the database. The port identifier used in the input message was found to be invalid or incorrect.
NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.
SESSION NOT ACTIVE = The requested RDTA session is not active.
SM UNAVAILABLE = The SM containing the PUT, which is needed to retrieve/translate port names, is isolated. This restricts the AM from printing the PUT external identifiers on line 2 of the Format 1 output message. Therefore, this message may also be seen on line 2 of the Format 1 output message in place of these external identifiers.
SYSTEM BUSY = System resources are not available to gather information pertaining to the requested RDTA session. The AM or SM may be in overload condition.
SYSTEM ERROR = Internal system error occurred while generating status information for the requested RDTA session.

= Service group and member numbers. Valid value(s):

<td>B1-Channel.</td>
</tr>
<tr>
<td>D</td>
<td>D-Channel (default).</td>
</tr>
</tbody>
</table>

z   = DN of the output facility where the protocol analyzer is connected to access the test data sent over the PUT to the switch. This direction will be known as incoming. Data sent from the analysis equipment for interaction with the PUT will originate from INDN for all interactive mode connections excepting the SPLITPH connection. 

a   = SM number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access. 

b   = Logical port number of the port which corresponds to INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access. 

c   = DN of the output facility where the protocol analyzer is connected to access the test data sent from the switch to the PUT. This direction will be known as outgoing. Data sent from the analysis equipment for interaction with the switch will originate from OUTDN for the SPLIT and SPLITPH
connections.

d
- SM number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

e
- Logical port number of the port which corresponds to OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

f
- Connection mode of the RDTA session. Valid value(s):
  - DTAC = Direct test access connection (DTAC). This is an interactive connection on a port that does not have a path set up on it. The PUT is seized and directly connected to an outgoing port terminating at the protocol analysis equipment.
  - MON = Monitor. This is a receive-only connection on a busy circuit. A copy of the transmit and receive data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.
  - SPLIT = Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.
  - SPLITPH = Simplex split protocol handler (PH) side. This is an interactive connection on an integrated services digital network (ISDN) channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.
  - SPLITPUT = Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

g
- The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the PH.

h
- This is the total time for which the session has been active in its present state (that is, the time since the start or conversion of the session). The output form is days (with a space between) hours:minutes:seconds.

i
- This is the remaining time for which the session will continue operating before the session will be automatically terminated, in the form days (with a space between) hours:minutes:seconds. If the session has been set for an infinite duration, the time field will be printed as INFINITE. The session may be extended by using the UPD:RDTA input message.

j
- Segment number of the segment currently being printed.

k
- Total number of segments being printed to satisfy one particular OP:RTDA request to retrieve information on all sessions.

l
- Fail point number used to relay the specific point in the software at which a failure occurred. This is used purely for debugging purposes.

m
- Line group number.

n
- Line board number.

o
- Line circuit number.
p = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
q = Data group (DG) number.
r = SONET termination equipment (STE) facility number.
s = Synchronous transport signal (STS) facility number.
t = Virtual tributary group (VTG) number.
u = Virtual tributary member (VTM) number.
v = Digital signal level 0 (DS0) number.

4. ACTIONS TO BE TAKEN

If the completion code indicates a failure in getting the status report, due to an internal software/hardware error, save the printer output. Refer to the TECHNICAL ASSISTANCE section of the INTRODUCTION.

2. REASON FOR OUTPUT

To respond to a manual request to output a status report of one or more remote digital test access (RDTA) sessions.

Format 1 is a successful response to a request to gather information on one particular RDTA session. This format will appear on a successful completion when requesting session information by submitting the session number or the port under test (PUT). The first line shows the session number and the successful look-up of session information. The second line describes the PUT in the various port identifications which are applicable to the PUT. The third line shows the output facility information defining routing for the RDTA connection and the location of the protocol analysis equipment. Acronyms are as follows: incoming directory number (INDN), incoming test access port (ITAP), outgoing DN (OUTDN), and outgoing test access port (OTAP). The fourth line shows the type of connection and quarter time-slot, if applicable, along with the total session duration and remaining session time.

Format 2 is used to respond to a request to print status information for all active RDTA sessions. This format will give limited information for up to 24 RDTA sessions (the maximum allowable number of RDTA sessions). A maximum of eight sessions are printed per segment. The first line displays the number of segments which will be displayed as a result of this request and the segment number of the segment which is being printed. To receive more detail, a specific session or PUT identification request should be made. Format 3 is used if there is a failure in getting the status information. The information, as seen by the input message, will be returned along with the reason for failure and a failure point number, used to identify the point in software where failure occurred.

3. VARIABLE FIELD DEFINITIONS

+ = Assigned to a multipoint interface.

a = Session number given to the requested session. Sessions are numbered sequentially from 1
through 99. At 99, the numbers will be recycled starting from 1 again.

b = Response to OP:RDTA input message. Valid value(s):
CMP UNAVAILABLE = The communications module (CM) containing the PUT, which is needed to retrieve/translate port names, is isolated. This restricts the administrative module (AM) from printing the PUT external identifiers on line 2 of the Format 1 output message. Therefore, this message may also be seen on line 2 of the Format 1 output message in place of these external identifiers.
COMPLETED = Status information successfully found for the requested RDTA session.
CORRUPTED DYNAMIC DATA = Dynamic data has been corrupted. Look at read-only printer (ROP) for a related assert to give assistance toward correcting the office dependent data (ODD) problem. Audits will correct any RDTA session/data inconsistency. If session data is corrupted for a particular RDTA session and an OP:RDTA request is made for all sessions this message will be seen in the equipment number field of Format 2.
INVALID PUT = The port could not be located in the database. The port identifier used in the input message was found to be invalid or incorrect.
NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.
SESSION NOT ACTIVE = The requested RDTA session is not active.
SM UNAVAILABLE = The SM containing the PUT, which is needed to retrieve/translate port names, is isolated. This restricts the AM from printing the PUT external identifiers on line 2 of the Format 1 output message. Therefore, this message may also be seen on line 2 of the Format 1 output message in place of these external identifiers.
SYSTEM BUSY = System resources are not available to gather information pertaining to the requested RDTA session. The AM or SM may be in overload condition.
SYSTEM ERROR = Internal system error occurred while generating status information for the requested RDTA session.

C = Service group and member numbers. Valid value(s):
BST=d-e
MLHG=f-g

o  = Digital facility interface number.

p  = Digital channel

q  = Integrated digital carrier unit number.

r  = Remote terminal number.

s  = Channel unit number.

t  = Integrated services line unit (ISLU) or access interface unit (AIU) number.

u  = Line group controller number.

v  = Line card number.

w  = Directory number. Valid value(s): l. DN=w \{+\} PKTDN=w \{+\}

y  = Channel type (for basic rate interface (BRI)). Valid value(s):
   B\textsuperscript{1} = B1-Channel.
   B\textsuperscript{2} = B2-Channel.
   D = D-Channel (default).

z  = DN of the output facility where the protocol analyzer is connected to access the test data sent over the PUT to the switch. This direction will be known as incoming. Data sent from the analysis equipment for interaction with the PUT will originate from INDN for all interactive mode connections excepting the SPLITPH connection.

a\textsuperscript{1} = SM number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

b\textsuperscript{1} = Logical port number of the port which corresponds to INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

c\textsuperscript{1} = DN of the output facility where the protocol analyzer is connected to access the test data sent from the switch to the PUT. This direction will be known as outgoing. Data sent from the analysis equipment for interaction with the switch will originate from OUTDN for the SPLIT and SPLITPH connections.

d\textsuperscript{1} = SM number of the port which corresponds to the OUTDN for local access or of the port which
connects the session switch (where the session is set up) to the network for remote access.

e = Logical port number of the port which corresponds to OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

f = Connection mode of the RDTA session. Valid value(s):

- **DTAC**
  - Direct test access connection (DTAC). This is an interactive connection on a port that does not have a path set up on it. The PUT is seized and directly connected to an outgoing port terminating at the protocol analysis equipment.

- **MON**
  - Monitor. This is a read-only connection on a busy circuit. A copy of the transmit and receive data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.

- **SPLIT**
  - Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.

- **SPLITPH**
  - Simplex split protocol handler (PH) side. This is an interactive connection on an integrated services digital network (ISDN) channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.

- **SPLITPUT**
  - Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

g = The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the PH.

h = This is the total time for which the session has been active in its present state (that is, the time since the start or conversion of the session). The output form is days (with a space between) hours:minutes:seconds.

i = This is the remaining time for which the session will continue operating before the session will be automatically terminated, in the form days (with a space between) hours:minutes:seconds. If the session has been set for an infinite duration, the time field will be printed as INFINITE. The session may be extended by using the UPD:RDTA input message.

j = Segment number of the segment currently being printed.

k = Total number of segments being printed to satisfy one particular OP:RTDA request to retrieve information on all sessions.

   PLTEN=d-w1-x1-y1-z1
   OIUEN=m-a2-b2-r1-s1-t1-u1-v1

m = SM number.

n = Digital unit number.

o = Digital facility interface number.

p = Digital channel.

q = Integrated digital carrier unit number.

r = Remote terminal number.

s = Channel unit number.

t = Integrated services line unit (ISLU) or access interface unit (AIU) number.

u = Line group controller number.

v = Line card number.

w = Directory number. Valid value(s):
   DN=w[+]
   PKTDN=w[+]

y = Channel type (for basic rate interface (BRI)). Valid value(s):
   B1 = B1-Channel.
   D = D-Channel (default).

z = DN of the output facility where the protocol analyzer is connected to access the test data sent over the PUT to the switch. This direction will be known as incoming. Data sent from the analysis equipment for interaction with the PUT will originate from INDN for all interactive mode connections excepting the SPLITPH connection.

a1 = SM number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

b1 = Logical port number of the port which corresponds to INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

c1 = DN of the output facility where the protocol analyzer is connected to access the test data sent
from the switch to the PUT. This direction will be known as outgoing. Data sent from the analysis
equipment for interaction with the switch will originate from OUTDN for the SPLIT and SPLITPH
c conn ections.

de^1 = SM number of the port which corresponds to the OUTDN for local access or of the port which
connects the session switch (where the session is set up) to the network for remote access.

d^1 = Logical port number of the port which corresponds to OUTDN for local access or of the port which
connects the session switch (where the session is set up) to the network for remote access.

d^1 = Connection mode of the RDTA session. Valid value(s):
  DTAC = Direct test access connection (DTAC). This is an interactive connection on a port
          that does not have a path set up on it. The PUT is seized and directly connected to
          an outgoing port terminating at the protocol analysis equipment.
  MON = Monitor. This is a read-only connection on a busy circuit. A copy of the transmit
          and receive data being passed over the PUT is transmitted to two individual
          outgoing ports that terminate at the protocol analysis equipment.
  SPLIT = Duplex split. This is an interactive connection on a busy circuit. The existing path
          on the PUT is broken and each half is connected to an outgoing port terminated at
          the protocol analysis equipment. This allows interactive testing of both sides of the
          original path.
  SPLITPH = Simplex split protocol handler (PH) side. This is an interactive connection on an
            integrated services digital network (ISDN) channel nailed-up to a PH. The existing
            path on the ISDN channel is torn down and the PH associated with the channel
            being tested is directly connected to an outgoing port terminating to the protocol
            analysis equipment.
  SPLITPUT = Simplex split PUT side. This is an interactive connection on a busy circuit. The
             existing path on the PUT is broken and the PUT is directly connected to an
             outgoing port terminating to the protocol analysis equipment.

g^1 = The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility
pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI
D-channel data, the PUT data, to the PH.

h^1 = This is the total time for which the session has been active in its present state (that is, the time
since the start or conversion of the session). The output form is days (with a space between)
hours:minutes:seconds.

i^1 = This is the remaining time for which the session will continue operating before the session will be
automatically terminated, in the form days (with a space between) hours:minutes:seconds. If the
session has been set for an infinite duration, the time field will be printed as INFINITE. The session
may be extended by using the UPD:RDTA input message.

j^1 = Segment number of the segment currently being printed.

k^1 = Total number of segments being printed to satisfy one particular OP:RTDA request to retrieve
information on all sessions.

l^1 = Fail point number used to relay the specific point in the software at which a failure occurred. This
is used purely for debugging purposes.

m^1 = Line group number.

n^1 = Line board number.
4. ACTIONS TO BE TAKEN

If the completion code indicates a failure in getting the status report, due to an internal software/hardware error, save the printer output. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

[1] OP REG {a=b-c-d | SDFI=b-e-f | DFIH=b-c-g} FAC h i
   j MODE k ALARM [LCA] [RMA] [AIS] o
   [SLIP=p] [OOF=q] [COFA=r] [BPV=s]
   [SES=t] [ES=u] [CRC6=v]

[2] OP REG {a=b-c-d | SDFI=b-e-f | DFIH=b-c-g} FAC 0 w

2. REASON FOR OUTPUT

To report the results of an OP:REG input message.

Format 1 displays the contents of the error registers of the specified hardware unit with a successful termination status. This is used only for T1 error registers on digital facility interfaces (DFIs).

Format 2 displays the reason that the input message could not complete (error termination status).

3. VARIABLE FIELD DEFINITIONS

AIS = Alarm indication signal (AIS) is in effect for this facility.
DFIH = Remote integrated services line unit (RISLU) digital facility interface.
LCA = Local alarm (red) is in effect for this facility.
RMA = Remote alarm (yellow) is in effect for this facility.
SDFI = SLC® digital facility interface.
a = Hardware unit type. Valid value(s):
   DFI = Digital facility interface.
   HDFI = Host digital facility interface.
   RDFI = Remote digital facility interface.

b = Switching module (SM) number.
c = Digital line and trunk unit (DLTU) number.
d = Digital facility interface (DFI) number.
e = Digital carrier line unit (DCLU) number.
f = SLC® digital facility interface (SDFI) number.
g = RISLU digital facility interface number.
h = Facility number.
i = Termination status. Valid value(s):
   COMPLETED = Successful completion.
   DATA MAY BE INVALID = An error was encountered during processing. One or more counts may be invalid.

j = Circuit pack code (ANN or TN number) or microcode number.
k = T1 transmission mode and signaling format. Valid value(s):
  64K = T1 DFI D4 format with 8 bit zero code suppression (B8ZS) and rob-bit signaling.
       (ANN3(B),TN1611)
  B8ZS = T1 DFI remote SM (RSM) format with B8ZS and word-24 signaling
         (ANN5(B),TN1612). RISLUs only: extended framing (FE) format with B8ZS and no word-24 signaling.
         (TN1306,TN1311,TN1304,TN1309)
  D4 = T1 DFI D4 format with zero code suppression (ZCS) and rob-bit signaling.
        (ANN1,ANN3(B),TN1611)
  D464 = T1 DFI D4 format with ZCS and rob-bit signaling. (ANN3(B),TN1611)
  D4D64 = T1 DFI D4 format with B8ZS and digital multiplex interface bit-oriented signaling (DMI-BOS).
         (TN1611)
  D4DNO = T1 DFI D4 format with DMI-BOS (TN1611).
  D4DZ = T1 DFI D4 format with ZCS and DMI-BOS (TN1611).
  D4NO = T1 DFI D4 format with rob-bit signaling. (ANN3(B),TN1611)
  D2BTS = T1 DFI FE format with zero byte time slot interchange (ZBTSI) and DMI-BOS (TN1611 [MC5D226A1]).
  FE = T1 DFI FE format with rob-bit signaling. (ANN3(B),TN1611). RISLUs only: FE format with ZCS and no rob-bit signaling.
       (TN1306,TN1311,TN1304,TN1309)
  FE64 = T1 DFI FE format with ZCS and rob-bit signaling. (ANN3(B),TN1611)
  FE8Z = T1 DFI FE format with B8ZS and rob-bit signaling. (ANN3(B),TN1611). RISLUs only: FE format with B8ZS and no rob-bit signaling.
       (TN1306,TN1311,TN1304,TN1309)
  FEB7 = T1 DFI FE format with ZCS and rob-bit signaling. (ANN3(B),TN1611)
  FED64 = T1 DFI FE format with B8ZS and DMI-BOS (TN1611).
  FEDNO = T1 DFI FE format with DMI-BOS (TN1611).
  FEDZ = T1 DFI FE format with ZCS and DMI-BOS. (TN1611)
  RZBTS = T1 DFI RSM format with ZBTSI and word-24 signaling (TN1612 [MC5D227A1]).
  SLC96_A = SLC®96 A line S-DFI (ANN4).
  SLC96_B = SLC®96 B line S-DFI (ANN4).
  SLC96_C = SLC®96 C line S-DFI (ANN4).
  SLC96_D = SLC®96 D line S-DFI (ANN4).
  SLC96_P = SLC®96 P line S-DFI (ANN4).
  ZBTSI = T1 DFI FE format with ZBTSI and rob-bit signaling. (TN1611 [MC5D226A1])
  ZCS = T1 DFI RSM format with ZCS and word-24 signaling. (ANN5(B),TN1612).
        RISLUs only: FE format with ZCS and no word-24 signaling.
        (TN1306,TN1311,TN1304,TN1309)

o = Status of DFI. Valid value(s):
  ACT = Active.
  OOS = Out of service.
  STBY = Standby.
p = Total slip value (3-digit decimal number). This value is incremented once during a 10 second interval if at least one slip has occurred. Loss of signal will not increment this counter.

q = Number of 10-second intervals in which an out-of-frame error has occurred.

r = Change-of-frame alignment (COFA) count (5-digit decimal number). This value is incremented once during a 10 second interval if at least one COFA has occurred. Loss of signal will not increment this counter.

s = Bipolar violation (BPV) count (5-digit decimal number).

t = Severely errored seconds (SES) count (3-digit decimal number). Gives the total number of one-second intervals which contained at least 320 cyclic redundancy check (CRC-6) errors.

u = Errored seconds (ES) count (5-digit decimal number). Gives the total number of one second intervals which contained at least one CRC-6 error or frame alignment signal.

v = Cyclic redundancy check (CRC-6) count (5-digit decimal number).

w = Error termination status. Valid value(s):
   ANN DFI TYPE INVALID = Invalid circuit pack type.
   DFI DOES NOT EXIST = Specified DFI number does not exist.
   DFI STATE INVALID = DFI must be active or out of service for the message to continue processing. SLC® DFI must be active to continue processing. RISLU DFIH must be active or standby to continue processing.
   SOFTWARE ERROR = Software error.

4. ACTION TO BE TAKEN

Retry OP:REG message when variable 'w' = SOFTWARE ERROR or 'i' = DATA MAY BE INVALID.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

235-105-220 Corrective Maintenance
**OP: RELSPACE**

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   OP: RELSPACE: RELATION = a    PROCESSOR = b[&c]  
   [SIZE IN BYTES = d]  
   [e]  
   [f]

2. **REASON FOR OUTPUT**

To report the size of a relation residing on an operational processor or range of processors, such as the administrative module (AM), the communications module processor (CMP), or switching modules (SMs).

The size of the relation refers to all memory allocated to the relation including head pages, data pages and intermediate data pages. Virtual relations are made up of more than one physical relation and do not directly use any memory pages. Furthermore, two virtual relations may share the same physical relation. Because of this, no size can be calculated for virtual relations.

This message does not report the number of tuples in the relation, nor the amount of space taken up by the tuples in the relation, but only the total amount of memory allocated to the relation at the time of request.

3. **VARIABLE FIELD DEFINITIONS**

   a = Relation name. The relation name will be printed in capital letters matching the relation name dictionary entry exactly as shown in Translations Manual or Dynamic Data Manual.

   b = Processor number, or lower limit of a range of processor numbers.

   c = Upper limit of a range of processor numbers.

   d = Size of the relation, including head pages, data pages and intermediate data pages, expressed in bytes. No value is printed for aborted or stopped requests.

   e = Termination report. Valid value(s):
      ABORTED = Request is aborted due to the reason given in variable ‘f’. No size information is provided for aborted requests.
      COMPLETED = Request completed successfully.
      STOPPED = Request is stopped due to the reason given in variable ‘f’. No size information is provided for stopped requests.

   f = Reason for aborted or stopped request. Valid value(s):
      FAILED TO COMMUNICATE WITH THE AM TERMINAL PROCESS = The AM terminal process is successfully created, but the AM system process can not communicate with it. Check system status and retry request.
      FAILED TO CREATE THE AM TERMINAL PROCESS = The AM system process failed to create the AM terminal process. Check system status and retry request.
      FAILED TO CREATE THE CMP TERMINAL PROCESS = The CMP system process failed to create the CMP terminal process. Check system status and retry request.
FAILED TO CREATE THE SM TERMINAL PROCESS = The SM system process failed to create the SM terminal process. Check system status and retry request.

FAILED TO RECEIVE A MESSAGE FROM THE CMP = The CMP terminal process is successfully created, but it failed to receive a message from the CMP system process. Check system status and retry request.

FAILED TO RECEIVE A MESSAGE FROM THE SM = The SM terminal process is successfully created, but it failed to receive a message from the SM system process. Check system status and retry request.

FAILED TO SEND THE SIZING REQUEST TO THE CMP = The CMP terminal process is successfully created, but the CMP system process is unable to send the sizing request message to it. Check system status and retry request.

FAILED TO SEND THE SIZING REQUEST TO THE SM = The SM terminal process is successfully created, but the SM system process is unable to send the sizing request message to it. Check system status and retry request.

REQUESTED RELATION DOES NOT EXIST ON PROCESSOR = The requested relation and the specified processor are incompatible. One cause of relation/processor incompatibility is a distribution type mismatch. For example, a request that specifies an SM processor and a relation with distribution type logical partitioned (LP) will result in a mismatch because LP relations exist on the AM or the CMP, but not on the SM. Another cause of relation/processor incompatibility is an application mismatch. For example, a request that specifies the CMP and a relation that is distribution LP and used only by an AM application will result in a mismatch because the CMP does not store relations used only by AM applications. Retry the request with new relation or processor(s) specified.

THE AM TERMINAL WAS CREATED IN ERROR AND KILLED = The AM terminal process is created, but it detected a bad reason code and terminated itself. Retry request.

THE HM MESSAGE WAS NOT RECEIVED FROM THE AM = The AM terminal process is successfully created, but it failed to receive a message from the AM system process. Check system status and retry request.

THE REQUESTED PROCESSORS ARE NOT OPERATIONAL = None of the processor(s) specified in the OP:RELSPACE input message are operational. Retry the request with new processor(s) specified.

THE REQUESTED RELATION IS INVALID = The requested relation does not reside on the processor(s) specified in the OP:RELSPACE input message. Retry the request with new processor(s) and/or a new relation specified.

THE REQUESTED RELATION IS VIRTUAL - SEE OP:RELSPACE = The requested relation is a virtual relation and, therefore, can not be sized.

4. ACTION TO BE TAKEN

**OP:REX-DGN-FAB**

**Software Release:** 5E14 and later  
**Message Class:** SM  
**Application:** 5  
**Type:** Output

1. **FORMAT**

```
OP REX (DGN, FAB) [CM | SM = a] BLOCK b OF c
CIRCUIT TYPE NOT STARTED COMPLETED ATP STF CATP NTR STOPPED
   d        e        f    g    h    i        j
```

2. **REASON FOR OUTPUT**

To summarize diagnostic and/or fabric tests of routine exercise (REX) for hardware in the communication module (CM) and all switching modules (SMs) or in the CM or an SM. If required, the data will be printed in more than one block. This summary is printed automatically once a day at 8:00 a.m.

3. **VARIABLE FIELD DEFINITIONS**

- **CM** = The CM based hardware summary is to be printed.
- **SM** = The SM hardware summary is to be printed.

**Note:** If neither of these fields is printed, the CM summary and all SM summaries are to be printed.

- **a** = SM number.
- **b** = Current number of the block of data printed.
- **c** = Total number of blocks of data to be printed.

- **d** = Circuit type tested, such as bootstrapper (BTSR), line unit (LU) or test access circuit (TAC). Only gated diode crosspoint grid (GRID) and GRID board (GRIDBD) prints under circuit type when specifying fabric tests (FAB).

- **e** = Number of circuits for which the test did not start. This field is initialized to the total number of circuits that REX will schedule for a test when an EXC:REX-CM-SM input message is received.

- **f** = Number of circuits with all tests passed (ATP).
- **g** = Number of circuits with some tests failed (STF).
- **h** = Number of circuits with conditionally all tests passed (CATP).
- **i** = Number of circuits for which tests did not run.
- **j** = Number of circuits for which tests stopped or aborted.

**Note:** If a summary for all test types is requested, a full table with a number of data blocks will be provided. This will include a separated table for electronic loop segregation (ELS) tests also. Otherwise, a partial table of summary for the requested test type will be provided. The GRID and GRIDBD circuit types in the table of this message will give the fabric test results. If all variables...
equal zero, no tests have been run since the previous invocation.

</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To provide a summary of the tests skipped and completed during the testing of electronic loop segregation (ELS). This testing was scheduled by routine exercise (REX) in one or all switching modules (SMs). This output message is printed in response to an OP:REX-CM-SM input message. It is also printed automatically at 8:00 a.m. daily.

3. VARIABLE FIELD DEFINITIONS

a = SM number (default is all SMs).

b = Number of lines for which the tests were not started for reasons such as unavailability of resources, failure to release resources, or data base error. This field is initialized to the total number of grids that REX will test after the EXC:REX-CM-SM input message is received.

c = Number of lines for which the tests are completed.

d = Number of lines skipped for reasons such as the lines were unassigned, out of service, or private branch exchange (PBX) lines.

Note: This message follows the OP:REX-DGN-FAB output message, if a summary of all test types (DGN, ELS and FAB) is requested.

```

2. REASON FOR OUTPUT

To provide the status list of routine exercise (REX) for all valid test types in the communication module (CM) and all switching modules (SMs) or in the CM or in a range of SMs. The data for the CM and each SM is given on a separate line of output. Therefore, this message may have many lines of output contained in one or more blocks of data. This output message is printed in response to an OP:REXINH input message.

3. VARIABLE FIELD DEFINITIONS

- **CM** = Data on this line is for the CM.
- **N/A** = Not applicable.
- **SM** = Data on this line is for an SM.
- **a** = Current block number of the data in this output message.
- **b** = Total number of blocks of data in this output message.
- **c** = Status of the test type. Valid value(s):
  - **ALW** = The test type is allowed.
  - **INH** = The test type is inhibited.
  - **IP** = The test type is in progress.
- **d** = Status of the test type. Valid value(s):
  - **ALW** = The test type is allowed.
  - **INH** = The test type is inhibited.
- **e** = Number of the SM whose inhibit status is listed on this line.

[3] OP REXINH NOT STARTED
   INVALID DATA FIELD

[4] OP REXINH NOT STARTED
   RETRY LATER

[5] OP REXINH CANNOT WRITE TO e
   WITH MESSAGE FROM KEY # f

2. REASON FOR OUTPUT

Format 1 is printed in response to an OP:REXINH input message. It also lists the hardware communities for which routine exercises are temporarily inhibited by the INH:REX input message. This message reports if routine exercises are inhibited in the deferred maintenance queue (DMQ) or if the DMQ cannot be accessed as part of temporary REX inhibits. Permanent REX inhibits are established for hardware communities by a field in the equipment configuration database (ECD).

Format 2 could not open temporary file used for sending report data to coordinator of spooler output process (CSOP) - no report is generated.

3. VARIABLE FIELD DEFINITIONS

   a  = Status of the report. Valid value(s):
   COMPLETED  = Entire report has been processed. The last lines of the report follow the
   IN PROGRESS = The report has not yet been completed.

   b  = This field is empty if there are temporary REX inhibited hardware communities or REX is inhibited
   in the DMQ, followed by a list of the temporary REX inhibits. This field is set to NO if there are no
REX inhibited hardware communities and REX is not inhibited in the DMQ.

When the PERM option is specified on the OP:REXINH input message, reports whether permanent REX inhibits exist. Valid value(s):
PERMANENT = There are permanent REX inhibited hardware communities. Followed by a list of the permanent REX inhibited hardware communities.
NO PERMANENT = There are no permanent REX inhibited hardware communities.

c = Unit name.
d = Unit number.

Note: Some units like the bootstrapper (BTSR), remote link interface (RLI), and remote alarm unit (RAU) have no unit number.
e = Temporary output file name.
f = Key associated with writer failure.

2. REASON FOR OUTPUT

To provide status and generic information of specific ring nodes, groups of ring nodes, or the entire ring in general in response to an OP:RING input message.

Format 1 prints a general summary output.

Format 2 prints a detailed summary output. Formats 1 and 2 also provide the status of ring error analysis threshold.

Ring error analysis and recovery (EAR) operates in one of two modes. In the "stable" mode, EAR assumes that all ring failure events are transient in nature. Consequently, on a ring failure, the first recovery action attempted is to restore the ring to the configuration that existed before the ring failure occurred (from EAR level 0). If this fails, EAR will escalate to a recovery action that usually isolates the faulty portion of the ring (from EAR level 1 or 3). EAR will keep track of the number of ring failures that occur. If the failure rate (4) in a given time interval (60 minutes) becomes excessive, EAR will switch its mode of operation to the "quasi-unstable" or seemingly-unstable mode. In this mode, EAR assumes that all ring failure events are not transient in nature. The first recovery action attempted then will usually isolate the faulty portion of the ring (from EAR recovery level 1 or 3). Once in the quasi-unstable mode of operation, EAR will automatically switch back to the stable mode when the ring has remained error free for a 60 minute interval. Formats 1 and 2 indicate 'ERROR THRESHOLD EXCEEDED' when EAR is operating in the quasi-unstable mode.

Formats 3 and 4 print a single ring node output.

Format 5 prints a ring node group output. The output is like formats 3 and 4, but for all the ring nodes in a requested ring node group.

Format 6 prints generic information for a LN ring node. If it is impossible to determine the generic specification file name according to the IUN, for example, the IUN is out of service or the IUN did not respond to generic specification file query request, the generic specification file name will be printed as blank (null) string and the phase 'NOT AVAILABLE' will also be printed. If the generic specification file's contents can not be read the generic specification file name will be printed and the phase 'NOT AVAILABLE' will also be printed.

Format 7 prints generic information for an RPC node.

Format 8 prints the reason the input message was STOPPED.

3. VARIABLE FIELD DEFINITIONS

a = Ring status. Valid value(s):
- ACTIVE
- CONFIGURING
- ISOLATED SEGMENT BISO: b EISO: c
- RING STAT:
b, c  = Ring node name (for example, LN001).

d  = Major state of the ring node.

RING NODE MAJOR STATES

<table>
<thead>
<tr>
<th>Active Nodes</th>
<th>Isolated Nodes</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>NOT APP</td>

<td>u</td>
<td>Unavailable</td>
</tr>
<tr>
<td>.</td>
<td>.</td>
<td>Unequipped</td>
</tr>
</tbody>
</table>

e  = Numeric character representation of the minor node states when requesting OP:RING:DETD.
Valid value(s):
(blank) = Node maintenance mode state AUTO and ring interface hardware state USBL and
node processor hardware state USBL, or node major state is UNEQ.
1 = Node under manual control.
2 = Node processor hardware maintenance state is FLTY or UNTSTD, or ring
interface hardware maintenance state is QUSBL.
4 = Ring interface hardware maintenance state is FLTY or UNTSTD.
3, 5, 6, 7 = Combination of the above definitions.

f  = Ring node group number.

g  = Ring node member number.

h  = Major state of the ring node. Valid value(s):
ACT  = Node is active.
GROW = Node is being physically added to or removed from the ring.
INIT = Node is initializing.
OFL  = Node is off-line and neither restoration nor removal is permitted.
OOS  = Node is out-of-service and unavailable for normal use.
STBY = Node is a ring peripheral controller (RPC) that is running but the ring
configuration is not completed or the ring is down.
UNAV = Unavailable.
UNEQ = Node is unequipped, but an equipment configuration data base (ECD) record
may exist for it.
UNKNOWN MJ = An unknown major state has been encountered.

i  = Maintenance mode state of the ring node. Valid value(s):
AUTO = Node is under automatic control.
MAN = Node is under manual control.
UNKNOWN MN = An unknown maintenance mode state has been encountered.

j  = Ring interface (RI) hardware maintenance state of the ring node. Valid value(s):
FLTY = Ring interface hardware is faulty.
QUSBL = Ring interface hardware is usable if the node is quarantined.
UNKNOWN RI = An unknown ring interface hardware state has been encountered.
UNTSTD = Condition of ring interface hardware is unknown.
USBL = Ring interface hardware is usable.

k = Node processor hardware maintenance state of the ring node. Valid value(s):
FLTY = Node processor hardware is faulty.
UNKNOWN RI = An unknown node processor hardware state has been encountered.
UNTSTD = Condition of node processor hardware is unknown.
USBL = Node processor hardware is usable.

l = Ring position (RP). Valid value(s):
- BISO NODE - BEGINNING OF ISOLATED SEGMENT
- EISO NODE - END OF ISOLATED SEGMENT
- FAILED RANGE FOR PHYS. NODE IDENTIFIER
- IN ACT SEG
- IN ISOL SEG
- RING BEING RECONFIGURED, UNKNOWN RP AT THIS TIME
- RING DOWN, UNKNOWN RP AT THIS TIME
- UNKNOWN RP

m = Interprocess message switch (IMS) generic load number.

n = Ring peripheral controller (RPC) associated with this ring node if this ring node is in ACT or OOS state, and is not in an isolated segment. If this ring node is not in ACT or OOS state, or is in an isolated segment, NONE will be printed.

o = Present load capacity of this ring node presented to AM.

p = Generic specification file (for example RPC.1.0).

q = Type of file. Valid value(s):
b = b16.out load module.
d = Data file common to all nodes.
G = Attached processor (AP) generic specification file.
m = mc68.out load module.
n = Node dependent data file.
v = Optional node dependent data file.
w = rap.out load module.
x = x86.out load module.

r = Address. Valid value(s):

<table>
<thead>
<tr>
<th>'q' =</th>
<th>'r' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>b, x, m, or w</td>
<td>Start execution address, segment and virtual address value, respectively.</td>
</tr>
<tr>
<td>d, n, or v</td>
<td>Location where data is to be written into related processor of this ring node. Segment and virtual address value respectively.</td>
</tr>
<tr>
<td>G</td>
<td>Dummy value is given (field not used).</td>
</tr>
</tbody>
</table>

s = File name.

t = Number of ring nodes linked to this RPC.
u = Reason the input message was stopped. Valid value(s):
- COULD NOT GET A UCB
- PROBLEM WITH IMS DRIVER REPLY
- PROBLEM WITH IMS DRIVER REPLY
- PROBLEM WITH IMS DRIVER REPLY
- PROBLEM WITH IMS DRIVER REPLY
- PROBLEM WITH IMS DRIVER REPLY
- RING STATE CHANGED! ORIG: v. CURR: v.

v = Ring major state. Valid value(s):
- ACTIVE, ISO SEG
- ACTIVE, NO ISO SEG
- BISO/EISO OOS, ISO SEG
- DOWN
- RECONFIGURING
- UNKNOWN

w = Processor associated with this ring node. Valid value(s):
AP = Attached processor.
NP = Node processor.

x = ECD equipped status of enhanced message sampling board. Valid value(s):
NO = Board not equipped.
YES = Board equipped.

1. FORMAT

OP RPC SM=a [RPC b] c

2. REASON FOR OUTPUT

To identify the status of the routine port conditioning (RPC) for a specified SM.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = RPC status. Valid value(s):
   RUNNING
   INHIBITED

c = Completion report. Valid value(s):
   COMPLETED = All items in the requested list have been output.
   INPUT ERROR = The input request was incorrect. It most likely implies that SM entered was invalid.
   NO DATABASE MATCH = Internal data base error. The desired tuple could not be found.
   REQUEST FAILED = An internal query failed which prevented further processing. The request has been aborted.
   SM UNAVAILABLE = The request was for ports on a particular SM that was unable to handle the request. Check the status of the SM and try again.
   SYSTEM BUSY = The system was too busy to perform the request or a system resource failure occurred which prevented the request from being processed.
   SYSTEM ERROR = An unspecified internal system error occurred which prevented further processing. The request has been aborted.
   TIME OUT = An internal query failed which prevented further processing. The request has been aborted.

4. ACTIONS TO BE TAKEN

None. This message is in direct response to an OP:RPC-SM input message.

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to a manual request for radio port controller units (RPCUs) and their alarm level. The list will be broken into separate segments if it is too long.

Format 1 is displayed when there are alarmed RPCUs present on the switching modules (SMs) specified by the input message. Format 2 provides additional information when no alarm data is available.

3. VARIABLE FIELD DEFINITIONS

a = Segment number identifying this portion of the message.
b = The switching module (SM) associated with this message.
c = The total number of segments printed for this message.
d = Type of message printed.
   COMPLETED = The OP:RPCU,ALARM output is complete
   CONTINUED = This output is a continuation of an OP:RPCU input message that has already printed at least one message.
   REQUEST FAILED = The request failed due to unexpected errors.
   REQUEST TIMED-OUT = Timed out waiting for the SM listed in this message to respond with alarm information.
   STARTED = This is the first message for an OP:RPCU input message.
   STOPPED = This message has been stopped by an STP:RPCU input message.
   UNAVAILABLE = The SM indicated is not available.
e = RPCU in an alarm condition.

f = Alarm level for out-of-service (OOS) digital subscriber line (DSL) B-channels on this RPCU.
   CRITICAL = There are 125 or more OOS DSL B-channels.
   MAJOR = There are 24 to 124 OOS DSL B-channels.
   MINOR = There are 5 to 24 OOS DSL B-channels.

g = SM number, or the lower limit of the range of SMs entered on the OP:RPCU input message.

h = Upper limit of the range of SMs entered on the OP:RPCU input message.

i = Report identifying why there is no alarmed RPCU data to print.
   ALREADY IN PROGRESS = An OP:RPCU report is currently being generated.
   NO RPCUS WITH ALARMS FOUND = There are no RPCUs in an alarm condition
   NO SMS WITH RPCUS ENTERED = No RPCUs were found for the SM range specified in the
                              OP:RPCU input message.
   NO SMS WITH RPCUS FOUND = The OP:RPCU input message found no RPCUs.

.  .  .  .
.  .  .  .
.  .  .  .

2. REASON FOR OUTPUT

To respond to the OP:RT-ALM-ALL input message that has requested a summary of the off-normal integrated TR008/TR303 remote terminals (RTs) in the office. TR008 RTs can be the SLC® 96, Series 5 feature package B, and enhanced B. TR303 RTs can be the Series 5 feature package 303G.

3. VARIABLE FIELD DEFINITIONS

a = Sequence of message block. Valid value(s):
   FIRST RECORD
   LAST RECORD
   NEXT RECORD

b = Qualifying information about data in message. Valid value(s):
   DATA MAY BE INCOMPLETE = Data in the message may be incomplete because of communication trouble with a switching module (SM).
   NO ACTIVE ALARMS = There are no active integrated RT alarms, that is, there are no off-normal integrated TR008/TR303 RTs (variable fields ‘c’-‘h’ are blank).

c = SM number.

d = Digital carrier line unit (DCLU) or integrated digital carrier unit (IDCU) number or digital networking unit - synchronous optical network (DNU-S) number.

e = Local RT number.

f = Site identification (SID) number.

Source of alarm. Valid value(s):
   CARRIER LINE = The T1 facility is suspected of being faulty.
   FAR END = The RT is suspected of being faulty or manual action at the RT caused the alarm.
   NEAR END = The equipment at the office is suspected of being faulty or manual action at the office caused the alarm. Given the situation where near end and far end caused alarms, only near end will be reported.
= System alarms that are active for this RT. Valid value(s):
  CRITICAL = At least one critical alarm is active.
  MAJOR = At least one major alarm is active.
  MINOR = At least one minor alarm is active.
  PWR/MISC = Power/miscellaneous alarm is active. Either AC power has been lost at the RT, or a miscellaneous alarm (a door is open, for example) is active at the RT site.

4. ACTIONS TO BE TAKEN

None.

More detailed information about the alarms for a particular RT can be obtained with the OP:RT-ALM-ALL input message.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: PFR_RSP
Application: 5
Type: Output

1. FORMAT

OP RT FAC OFF NORMAL INDICATION IS {SET|Cleared}

2. REASON FOR OUTPUT

To report the status of the option of having the switching module (SM) status indicator updated to off-normal (OFFN) when a remote terminal (RT) T1 facility (FAC) is in an off-normal state. Specifically, if the option is set, the SM status will be updated to "RT PLS" (RT protection line switch) when a T1 facility goes on protection, or to "CKT OOS" (circuit out of service) when a T1 facility goes OOS.

3. VARIABLE FIELD DEFINITIONS

Cleared = The option is cleared for updating the SM status to indicate that a T1 facility is off normal.
Set = The option is set for updating the SM status to indicate that a T1 facility is off normal.

4. ACTIONS TO BE TAKEN

None. If the reported state is not the desired state, set or clear the option using SET:RT-FACOFFN or CLR:RT-FACOFFN, respectively.

5. ALARMS

None.

### 1. FORMAT

```
OP RT PROV a
SID   LRT   UTYPE  INH   DS1  GLOBAL  PORTS  REPT  CLIENT
b  c  d   e  f   g   h   i   j   k
```

### 2. REASON FOR OUTPUT

To report the completion status of an OP:RT-PROV request for status of provisioning an Integrated Digital Carrier Unit (IDCU) or Digital Network Unit SONET (DNU-S) terminated TR303 remote terminal (RT).

This output should not be used when the PROVISION RT field in RC/V View 18.15 (REMOTE TERMINAL) shows N (no). The switch is then not responsible for RT provisioning and does not maintain the data reported.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Completion status. Valid value(s):
  - COMPLETED = The request has been completed.
  - DATABASE READ FAILURE = A database read failed when attempting to complete this request.
  - INVALID REQUEST = The request contained invalid data.
  - RESOURCES UNAVAIL = Retry later. Unavailable system resources for completing the request.
  - TR303 RT NOT FOUND = Either the requested RT does not exist in the database or it is not a TR303 RT.

- **b** = Site identification (SID) number of the RT.

- **c** = Switching module (SM) number.

- **d** = Unit number.

- **e** = Local RT (LRT) number.

- **u** = Unit type (UTYPE).

- **f** = Indicates provisioning is inhibited (INH) or allowed. Provisioning may be inhibited manually using recent change or automatically as a result of a "memory mismatch" alarm reported by the RT. Valid value(s):
  - NO = Provisioning is allowed.
  - YES = Provisioning is inhibited.

- **g** = DS1 provisioning tasks. Valid value(s):
  - NO = No DS1 provisioning task pending.
  - YES = A provisioning task is scheduled within 15 minutes for DS1 data. If immediate provisioning is required, refer to the EXC:RT-PROV input message.

- **h** = Global provisioning tasks. Valid value(s):
NO = No global provisioning task pending.
YES = A provisioning task is scheduled within 15 minutes for global RT data. If immediate provisioning is required, refer to the EXC:RT-PROV input message.

Port provisioning tasks. Valid value(s):
NO = No port provisioning task pending.
YES = A provisioning task is scheduled within 15 minutes for RT port data. If immediate provisioning is required, refer to the EXC:RT-PROV input message.

Provisioning report messages. Valid value(s):
NO = Report messages are inhibited for this entry.
YES = Report messages are allowed for this entry.

The client currently being served by provisioning. Valid value(s):
ALARMS REQUEST = A provisioning task initiated by an alarm.
CRAFT REQUEST = A provisioning task initiated by a craft request.
FULL INIT REQUEST = A provisioning task initiated by an SM full initialization.
MRA REQUEST = A provisioning task initiated by an EOC restoration.
NONE = No preemptable provisioning task is currently running on this RT.
ROUTINE 15 REQUEST = A provisioning task initiated by routine periodic provisioning.
ROUTINE 24 REQUEST = A provisioning task initiated by routine daily provisioning.

4. ACTIONS TO BE TAKEN

The purpose of this message is to report the result of the action requested by the corresponding input message. No specific action is indicated.

5. ALARMS

None.

</tbody>
</table>
| SWITCH RELEASE INHIBITED | The RT is unable to release a protection line switch due to a pin
placed in the switch release inhibit pinjack at the RT.

**SWITCH TO PROT** = A sustained request to switch the specified facility or facilities to the protection line is active.

**TAU COT** = Timeslot assignment unit (TAU) COT alarm.

**TAU RT** = TAU alarm at the RT.

**(message text)** = TR303 RT defined text that reports a problem that has currently existed at the RT.

\[ k \]

= States. Valid value(s):

**ALARM ON** = An alarm condition exists.

**ALARM OFF** = An alarm condition no longer exists.

**REQUESTED** = A switch to protection or far end loop (SET:RT-FAC) sustained request has been entered but cannot be honored.

**Message Class:** PFR,PFR_RSP  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   OP RT SID=a STATUS NOT AVAILABLE

2. **REASON FOR OUTPUT**

   To report the inability to get the status of one of the integrated TR008/TR303 remote terminals (RT) requested by the OP:RT-ALM-ALL or the OP:RT-SID-LRT input message. TR008 RTs can be the SLC® 96, Series 5 feature package B, and enhanced B. TR303 RTs can be the Series 5 feature package 303G.

3. **VARIABLE FIELD DEFINITIONS**

   a = Site identification (SID) number.

4. **ACTIONS TO BE TAKEN**

   The switching module (SM) may have been isolated or having communication problems at the time of the request, so a separate OP:RT-SID-LRT input message for this particular SID may work later. Otherwise, it is possible that the data in the administrative module (AM) is inconsistent with the data in the SM, in which case the AM relation 96SIDLRT should be checked against the SM relations S96EQUIP, RT_MISC and CKTDATA.

__________________________________________________________________

2. REASON FOR OUTPUT

To print a response to the OP:RTRACK input message.

NOTE: History data from a previous execution of Ring Tracker is lost when internal data is initialized at the
beginning of a new Ring Tracker execution. If entry into Ring Tracker is denied due to the presence
of a ring node in the growth state, history data from any previous Ring Tracker execution will be lost.

Format 1 prints when ring tracker mode has never been active.

Format 2 prints when ring tracker mode is not active, but it has been active in the past. Note that when the ring
tracker mode terminates, the stability time for the node isolated at that time is recorded in the node’s isolation
history.

Format 3 prints when ring tracker mode is active and is not operating in half ring mode.

Format 4 prints when ring tracker mode is active and is operating in half ring mode.

3. VARIABLE FIELD DEFINITIONS

a = A date and time recorded when ring tracker mode was started/stopped.

b = A ring node group number.

c = The node’s position in the ring node group.

d = The number of times this node has been isolated.

e = First isolation stability duration in hours, minutes, and seconds (hh:mm:ss). Note that the current
isolated node’s stability time will be blank. A stability time of zero associated with a node indicates
that a working ring could not be established with that node isolated.

f = Second isolation stability duration in hours, minutes, and seconds (hh:mm:ss). Note that the
current isolated node’s stability time will be blank. A stability time of zero associated with a node
indicates that a working ring could not be established with that node isolated.

g = A ring peripheral controller node (RPCN) or link node (LN). Valid value(s):

h = Hour(s) component of the ring tracker current isolation ring stability time.

i = Minute(s) component of the ring tracker current isolation ring stability time.

j = Second(s) component of the ring tracker current isolation ring stability time.

k = Hour(s) component of the ring tracker confidence interval.

l = Minute(s) component of the ring tracker confidence interval.

m = A ring node group number.

n = The node’s position in the ring node group.

4. ACTIONS TO BE TAKEN

2. REASON FOR OUTPUT

Response to a OP:RUTIL input message.

Format 1 indicates a successful completion of the OP:RUTIL input message. Accepted command and put breakpoint in place.

Format 2 indicates an error in the RUTIL process; completion unsuccessful.

3. VARIABLE FIELD DEFINITIONS

a = The group number of the concerned node.
b = The member number of the concerned node.
c = The specified break point number.
d = The address of the given break point.
e = Source of break point implementation. Valid value(s):
   1 = Software implementation of break point.
   2 = Hardware implementation of break point.
f = Status of break point. Valid value(s):
   1 = Break point is disabled.
   2 = Break point is enabled.
g = Number of hits on this break point.
h = Maximum number of hits specified for this break point.
i = Number of break point response messages lost for this break point.
j = The value of the global variable "errno".
k = Abort message. Valid value(s):
   KERNEL RESPONSE TIMEOUT j = The kernel has not responded to the end user process.
   SEND2KERN KERNEL RETURNED ERROR j = The kernel has returned a failing return code.
   SEND2KERN MKNODE() FAILED j = Creating the special file for the kernel has failed.
   SEND2KERN OPEN() FAILED j = Attempting to open the file for kernel processing has failed.

4. ACTIONS TO BE TAKEN

For Format 2, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

OP:SCF-STARTED
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] OP SCF  STARTED

   OP SCF DN a {LEN=b-c-d-e-f-g|SLEN=h-i-j-k} TYPE l  CT m
   .
   .
   OP SCF n

__________________________________________________________________

[2] OP SCF  NO COINS STUCK

__________________________________________________________________

2. REASON FOR OUTPUT

To print (manually requested) a list of lines for which stuck coin failures have been reported since the last automatically printed list. Unlike automatic printings, the list is not cleared after printing.

Format 1 prints when there have been stuck coin failures to report. The first line indicates the start of the list, the second line indicates a line with a stuck coin reported (one output message per coin line), and the third line indicates the end of the list.

Format 2 is printed when there are no stuck coin failures to report.

3. VARIABLE FIELD DEFINITIONS

LEN = Line equipment number of the line.
SLEN = Subscriber loop carrier line equipment number.
a = Directory number of the coin line that has had a stuck coin reported during the last interval.
b = Switching module (SM) number.
c = Line unit number.
d = Grid number.
e = Switch board number.
f = Switch number.
g = Level number.
h = SM number.
i = Digital carrier line unit.
j  = Remote terminal (RT).

k  = RT line.

l  = The type of the stuck coin count. Valid value(s):
    1F   = The count ('m') represents the number of first-try-only failures reported on this
            coin line. This indicates that only first try failures occurred for this coin line.
    1+2F = The count ('m') represents the number of first and second try failures reported on
            this coin line. In this case the count of first-try-only stuck coin failures is not printed.

m  = The count of stuck coin failures reported. The type of count (first-try-only or first and second try
    failures) is given by 'l'. To meet feature specification document (FSD) requirements, only the first
    15 coin failures, for a particular coin line, are recorded between automatic list printings.

n  = Termination status indicating outcome. Valid value(s):
    COMPLETED  = The list of stuck coin lines that contained at least one stuck coin report was
                  successfully printed.
    SYSTEM ERROR = An unexpected error occurred during processing of the list and the printed list is
                    likely to be incomplete. The internal list of stuck coin counts has been zeroed.

4. ACTIONS TO BE TAKEN

Clear the stuck coins.

5. ALARMS

None.

6. REFERENCES

Input Message(s):
    OP: SCF

[1] OP SCF STARTED
   OP SCF DN a LEN=b-c-d-e-f-g TYPE n CT o
   OP SCF DN a SLEN=b-h-i-j TYPE n CT o
   OP SCF DN a LCEN=b-k-l-m TYPE n CT o
   ...
   ...
   OP SCF p

[2] OP SCF NO COINS STUCK

2. REASON FOR OUTPUT

To print (on demand) a list of lines for which stuck coin failures (SCF) have been reported since the last automatically printed list. The list is not zeroed after demand printings (unlike automatic printings).

Format 1 prints when there have been stuck coin failures to report. For every line with a stuck coin failure, one list entry prints.

Format 2 prints when there are no stuck coin failures to report (NO COINS STUCK).

3. VARIABLE FIELD DEFINITIONS

DN = Directory number.
LCEN = Line card equipment number.
LEN = Line equipment number of the line.
SLEN = SLC® line equipment number.
a = Telephone number of the coin line that has had a stuck coin reported during the last interval.
b = Switching module (SM) number.
c = Line unit number.
d = Grid number.
e = Switch board number.
f = Switch number.
g = Level number.
\( h \) = Digital carrier line unit number.

\( i \) = Remote terminal number (RT).

\( j \) = RT line number.

\( k \) = Integrated services line unit number.

\( l \) = Line group number.

\( m \) = Line card number.

\( n \) = The type of the stuck coin count. Valid value(s):
- \( 1F \): The count (variable \( 'q' \)) represents the number of first-try-only failures reported on this coin line. This indicates that only first try failures occurred for this coin line.
- \( 1+2F \): The count (variable \( 'q' \)) represents the number of first and second try failures reported on this coin line. In this case, the count of first-try-only stuck coin failures is not printed.

\( o \) = The count of stuck coin failures reported. The type of count (first-try-only or first and second try failures) is given by variable \( 'p' \). Only the first 15 coin failures, for a particular coin line, are recorded between automatic list printings.

\( p \) = Termination status indicating outcome. Valid value(s):
- \( \text{COMPLETED} \): The list of stuck coin lines that contained at least one stuck coin report was successfully printed.
- \( \text{SYSTEM ERROR} \): An unexpected error occurred during processing of the list and the printed list is likely to be incomplete. The internal list of stuck coin counts has been zeroed.

4. ACTIONS TO BE TAKEN

Clear the stuck coins, if possible. Depending upon the particular problem it is sometimes possible to clear a stuck coin from the trunk and line work station (TLWS). This is done by seizing the line in question and performing coin detect, coin collect, coin return and home totalizer operations. If this does not clear the problem, dispatch a repair person to repair the phone in question. Place particular attention on high and wet dial tone first (DTF) coin lines since attempts are automatically made to clear a stuck coin on these lines.

5. ALARMS

None.

   DUPID f
   INHIBIT: [ccc]
   SCAN PT: [ddd]
   OP SCSD GRPN e b

[4] OP SCSD NOT STARTED
   CONFLICT WITH CURRENT SYSTEM STATUS

2. REASON FOR OUTPUT

To indicate the state and the inhibit status of the scan points on a scanner and signal distributor (SCSD) unit.

Format 1 is used to display the entire SCSD scan map for a unit.

Format 2 is used to display the scan state for a particular logical group. The DUPID will display either 0, 1, or both, depending upon what is defined in the database.

Format 3 indicates the SCSD administration process is not active. No communication with SCSD points is possible.

3. VARIABLE FIELD DEFINITIONS

a  = Member number of SCSD unit.

b  = Termination status. Valid value(s):
   COMPLETED = Action completed.
   FAILED    = Action could not be completed by the SCSD administrator. Possible reasons for failure are:
               - SCSD unit number is invalid.
               - Point number is invalid for the logical group.
               - Logical group name is invalid and either the SCSD unit is out-of-service (OOS), or is in an inactive state to the SCSD administrator.

c  = Inhibit status. Valid value(s):
   0       = Scan point is not inhibited.
1 = Scan point is inhibited.

d = Scan point status. Valid value(s):
0 = Scan point is clear (open).
1 = Scan point is set (closed).

e = Logical group name.

f = Duplex group ID.

4. ACTIONS TO BE TAKEN

Issue the OP:OOS input message to determine if the SCSD unit is listed as OOS. Otherwise, enter recent change and verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the above results are negative, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

Manual alarm. This alarm is a manually requested report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   ______________________________________
[2] OP SILC a

2. REASON FOR OUTPUT

To display total office SILC status. One message can contain up to 32 groups. A maximum of four messages can result since a maximum of 128 trunk groups can exist on the SILC list. This message is in response to the OP:SILC message.

Format 1 displays the termination status of started, continued, or completed.

Format 2 displays the termination status of aborted or failed.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
   ABORTED = Retry the message.
   COMPLETED = Last in a series of these messages.
   CONTINUED = Middle of a series of these messages.
   FAILED = Invalid parameter.
   STARTED = First in a series of these messages.

b = Control type. Valid value(s):
   ALLOWED
   INHIBITED

c = Percent of calls canceled on machine congestion level 1.

d = Percent of calls canceled on machine congestion level 2.

e = Trunk group number.
4. ACTION TO BE TAKEN

If the termination status is aborted, retry input command.
If the termination status is failed, this message is a failure because of an input parameter error.
If the termination status is started, continued, or completed, no further action is required.

5. ALARMS

None.

[4] OP SL {STS1=a-s-t-u-d|STS3C=a-s-t-u-d|VT15=a-s-t-u-d-e-p} COMPLETED
   RECEIVED:f
   EXPECTED:q
   RESULT:r

2. REASON FOR OUTPUT

To respond to a manual request to output the signal labels currently received and expected in the STS path. To respond to a manual request to output the signal labels and VT group size in the VT path.

Format 1 displays the received and expected signal labels for the specified STS-1 facility.

Format 2 displays the received and expected signal labels and VT group size for the specified VT1.5 facility.

Format 3 displays reason for failure of the signal label query.

Format 4 displays the received and expected signal labels for the specified STS-1 facility, STS-3c facility, or VT1.5 facility on an OIU.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
c = Data group (DG) number.
d = STS number.
e = Virtual tributary group (VTG) number.
f = STS signal label received. Valid value(s):
   ASYNC-DS3 = Asynchronous DS3 mapping (4).
   ASYN-DS4NA = Asynchronous DS4 for North America mapping (3 DS3’s to form one 139.264 Mb/s DS4NA) (12).
   ASYNC-FDDI = Asynchronous fiber distributed data interface mapping.
ATM-MAP = ATM mapping.
BYTE-SYNC = Byte observable SYTRAN.
DQDB-MAP = DQDB mapping.
EQ–NONSP = Equipped non-specific payload.
FLOAT–VT = Floating VT mode.
PPPWS = Point-to-point protocol with scrambling.
PPPWOS = Point-to-point protocol without scrambling.
VT–STR–STS = VT structured STS-1 SPE (for OIU).
LOCK–VT = Locked VT mode.
UNEQUIP = Unequipped mode.
UNK–STS–SL = Unknown STS signal label.

= STS signal label expected. Valid value(s):
FLOAT–VT = Floating VT mode.

= VT1.5 signal label received. Valid value(s):
ASYNC–DS1 = Asynchronous DS1 mapping.
BIT–SYNC = Bit synchronous DS1 mapping.
BYTE–SYNC = Byte synchronous DS1 mapping.
EQ–NONSP = Equipped non-specific payload.
UNEQUIP = Unequipped mode.
UNK–VT–SL = Unknown VT signal label.

= VT1.5 signal label expected. Valid value(s):
ASYNC–DS1 = Asynchronous DS1 mapping.

= Received VT group size. Valid value(s):
UNK–VT–SZ = Unknown VT group size.
VT1.5 = Group size of VT1.5.
VT2 = Group size of VT2.
VT3 = Group size of VT3.
VT6 = Group size of VT6.

= Expected VT group size. Valid value(s):
VT1.5 = Group size of VT1.5.

= Invalid data indicator. An asterisk (*) is printed for this field if there is a failure condition on the facility or the parent facility indicating that the reported values may be invalid.

For the DNU–S, a received signal label value of EQ–NONSP will match any legal expected signal label value except UNEQUIP. In this situation, even though the received and expected signal label values are different, the invalid data indicator (variable ‘l’) will not be present.

= A numeric representation of an unknown received signal label value. This field appears only when the received signal label is either RCV=UNK–STS–SL or RCV=UNK–VT–SL.

= Completion report. Valid value(s):
FAILED = Failure for unspecified reason.
FAILED DNU-S = The DNU-S was out-of-service or could not receive or send a message.
NO MATCH = STS/VT facility ID in input message is invalid.
SM UNAVAILABLE = The request was for facilities on a particular SM that was unable to handle the request. Check the status of the SM and try again.
SYSTEM BUSY = No PCBs available, no MCBs available, or no stack available.
TIMEOUT = The DNU-S did not respond in a reasonable timeframe.

= SONET termination equipment (STE) facility number.
= Virtual tributary member (VTM) number.
= OIU STS signal label expected. Valid value(s):
  EQ-NONSP = Equipped nonspecific signal label.
  PPPWS = Point-to-point protocol with scrambling.
  UNEQUIP = Unequipped signal label.
  VT-STR-STS = VT structured STS-1 SPE.

= The result. Valid value(s):
  SL MATCH
  SL MISMATCH

For the OIU, a received signal label value of EQ-NONSP will match any legal expected signal label value except UNEQUIP. In this situation, even though the received and expected signal label values are different, the result will be SL MATCH.

= Optical interfac unit (OIU) number.
= Protection group (PG) number.
= OC3 or OC3C number.

4. ACTIONS TO BE TAKEN
None. The signal label values are read from hardware registers. The values are a direct reflection of the bit pattern currently being received. Execute OP:SL input message again if received and expected values appear inconsistent.

5. ALARMS
None.

2. REASON FOR OUTPUT

To report the status of a signaling link(s) (SLK) in response to an OP:SLK input message.

Note: Each report is preceded and followed by the date and time information in the following format:

NWT c1 d1 e1 f1:g1:h1:i1 j1

For certain reports some nodes are skipped. The range of those skipped are shown in the report with the format:

SLK c d THRU c d b1

Format 1 is the default format.

Format 2 is for Common Channel Signaling System 6 (CCS6) SLK(s) with the RAW option specified in the input
message.

Format 3 is for both CCS6 and Common Channel Signaling System 7 (CCS7) SLK(s) with the ABNORMAL option specified in the input message.

Format 4 is for CCS6 SLK(s) with the FIX option specified in the input message.

Format 5 is for CCS6 SLK(s) with the RAW and FIX options specified in the input message.

Format 6 is for CCS6 SLK(s) with the ABNORMAL and FIX options specified in the input message.

Format 7 is for CCS7 SLK(s) with the FIX option specified in the input message.

Format 8 is for CCS7 SLK(s) with the RAW and FIX options specified in the input message.

Format 9 is for CCS7 SLK(s) with the RAW option specified in the input message.

Format 10 is for CCS7 SLK(s) with the ABNORMAL and FIX options specified in the input message.

Format 11 is for CCS6 and CCS7 SLK(s) with the ROUTING option specified in the input message.

Format 12 is for CCS6 SLK(s) with the ROUTING and FIX options specified in the input message.

Format 13 is for CCS7 SLK(s) with the ROUTING and FIX options specified in the input message.

Format 14 is for CCS6 SLK(s) with the RAW, ROUTING and FIX options specified in the input message.

Format 15 is for CCS7 SLK(s) with the RAW, ROUTING and FIX options specified in the input message.

Format 16 is for CCS6 SLK(s) with the ABNORMAL, ROUTING and FIX options specified in the input message.

Format 17 is for CCS7 SLK(s) with the ABNORMAL, ROUTING and FIX options specified in the input message.

Format 18 is for direct link nodes (DLN).

3. VARIABLE FIELD DEFINITIONS

ALL = Provide information for all SLKs.

a = SLK number or lower limit of a range of link numbers that was selected in the input request.

b = Upper limit of a range of SLK numbers.

c = Group number.

d = Member number.

e = Far end CLLI code.

f = Major state. Valid value(s):
   AVL = Available.
   UNA = Unavailable.
   UNE = Unequipped.

g = Minor state. Valid value(s):
   GROW = Unavailable grow.
IS = In service.
OOS = Out-of-service.
TEST = Unavailable test.

h = Node type. Valid value(s):
6 = CCS6 link.
7 = CCS7 link.
DLN = DLN node.

i = First failure indicator. Valid value(s):

h = Packet acknowledgement timer (50 ticks) = 1 second/20ms per tick.
i = Retransmit queue length in bytes.
j = DLN state. Valid value(s):
   ACT
   OFL
   OOS
   STBY

k = DLN mode. Valid value(s):
   1WAYIN
   1WAYOUT
   2WAY
   GROWTH

m = Ring state. Valid value(s):
   ACT
   Out-of-service

n = Link status. Valid value(s):
   FBA = Active.
   FBC = Congested.
   FBN = Unknown.
   FBO = Out-of-service.

o = Mate link status. Valid value(s):
   FBA = Active.
   FBC = Congested.
   FBN = Unknown.
   FBO = Out-of-service.

p = Pool status. Valid value(s):
   FBA = Active.
   FBN = Unknown.
   FBO = Out-of-service.

q = Combined pool status. Valid value(s):
FBA = Active.
FBN = Unknown.
FBO = Out-of-service.

\( r^2 \) = Pool congestion status. Valid value(s):
FBC = Congested.
FBN = Unknown.
FBN = Not congested.

\( s^2 \) = Combined pool congestion status. Valid value(s):
FBC = Congested.
FBN = Unknown.
FBN = Not congested.

\( t^2 \) = Number of bands allowed.
\( u^2 \) = Number of bands blocked.
\( v^2 \) = Number of bands restricted.
\( w^2 \) = Number of bands unknown.

\( x^2 \) = Internal link state.

\( y^2 \) = Internal link changeover/changeback state. Valid value(s):
0 = Change back idle (link out-of-service).
1 = Change back wait for 6 to complete.
2 = Change back wait for change back acknowledgement (CBA).
3 = Change over idle (link ACT).
4 = Change over wait for 6 and T2 change over acknowledgement (COA)/emergency changeover acknowledgement (ECA).
5 = Change over wait for COA/ECA, T2, or NP out-of-service.
6 = Change over wait for 6.
7 = Change over wait for link or node out-of-service after receiving change over order (COO)/emergency changeover order (ECO).
8 = Change over waiting for retrieval complete message.
9 = Waiting to change back, manual.
10 = Waiting to change over, manual.

\( z^2 \) = Far end manual inhibit state. Valid value(s):
0 = MCO cleared.
1 = Awaiting response from application.
2 = Awaiting far-end response.
3 = Awaiting far-end response.
4 = Waiting for traffic to clear.
5 = MCO processing complete.
6 = Awaiting far-end uninhibit response.
7 = Awaiting far-end uninhibit response (retry).
8 = Awaiting far-end (force) uninhibit response.
9 = Awaiting far-end (force) uninhibit response (retry).
Near end manual inhibit state (refer to variable ‘z’).

Reason nodes were skipped. Valid value(s):
ARE AVL IS OR UNA OR UNEQUIPPED
DID NOT MATCH INPUT CRITERIA
NOT ABNORMAL
NOT AVL
NOT AVL IS
NOT AVL MOOS
NOT AVL OOS
NOT OF TYPE REQUESTED
NOT UNA
NOT UNA GROW
NOT UNA TEST
UNEQUIPPED

Day of week.
Month of year.
Day of month.
Hour in day.
Minute in day.
Second in minute.
Milliseconds in second.
Year (four digit value).
Facility Type. Valid value(s):
1 = Modem
2 = T1FA

Rna of T1FA control node (applies only for DCHN or International Telecommunication Union - Telecommunication, Standardization Sector (ITU-TS) (formerly CCITT) SS7 node types).

Medium. Valid value(s):
1 = Satellite.
2 = Terrestrial.

Error correction mode. Valid value(s):
1 = PCR
2 = Basic.

4. ACTION TO BE TAKEN
None.
5. **ALARMS**

None.

6. **REFERENCES**

2. REASON FOR OUTPUT

To print the signaling link 15-minute machine resource performance report in response to input message OP:SMR.

3. VARIABLE FIELD DEFINITIONS

a = Reporting office CLLI code.
b = Current software release identification.
c = Local date, in the form year-month-day.
d = Local time, in the form hour:minute:second.
e = User defined string [by way of the equipment configuration database (ECD)]. This is the time zone indicator and has a default of "NWT".
f = Network date of beginning of accumulation period, in the form year-month-day.
g = Network time of beginning of accumulation period, in the form hour:minute:second.
h = Network date of ending of accumulation period, in the form year-month-day.
i = Network time of ending of accumulation period, in the form hour:minute:second.
j = The number of 5-minute accumulation periods out of the maximum number of coverage periods for this report; format is 'rrr/sss'.

'aaa' = The number of periods of accumulated data for this report.
'ccc' = The maximum number of periods that can be covered where:

001 <= rrr <= 288 (288 periods equal one day - 24 hours) 001 <= sss <= 288 rrr
\( \leq \text{sss} \)

- \( k \) = Group number of link.
- \( l \) = Member number of link.
- \( m \) = Number of incoming bytes (to a 5ESS® switch).
- \( n \) = Number of outgoing bytes (to network).
- \( o \) = Number of message signal units in to a 5ESS® switch.
- \( p \) = Number of message signal units out to network.
- \( q \) = Declared link failure count.

4. ACTION TO BE TAKEN

If the ABORTED status message is printed, the user may wish to try the OP:SMR input message again.

5. ALARMS

None.

---
2. REASON FOR OUTPUT

To print a common channel interoffice signaling (CCIS) measurement report in response to the OP:SMR input message. The output may be interrupted by other output messages.

3. VARIABLE FIELD DEFINITIONS

a  = Reporting office CLLI code.
b  = Current software release identification.
c  = Local date, in the form year-month-day.
d  = Local time, in the form hour:minute:second.
= User defined string [by way of the equipment configuration database (ECD)]. This is the time zone indicator and has a default of "NWT".

f = Network date of beginning of accumulation period, in the form year-month-day.

g = Network time of beginning of accumulation period, in the form hour:minute:second.

h = Network date of ending of accumulation period, in the form year-month-day.

i = Network time of ending of accumulation period, in the form hour:minute:second.

j = The number of 5-minute accumulation periods out of the maximum number of coverage periods for this report; format is 'h1h1h1/i1i1i1'.

\[ h^1h^1h^1 = \text{The number of periods of accumulated data for this report.} \]
\[ i^1i^1i^1 = \text{The maximum number of periods that can be covered where:} \]
\[ 001 \leq h^1h^1h^1 \leq 288 \quad (288 \text{ periods equal one day - 24 hours}) \]
\[ 001 \leq i^1i^1i^1 \leq 288 \]
\[ h^1h^1h^1 \leq i^1i^1i^1 \]

k = CLLI code plus set member number.

l = Link layer number.

m = Link type. Valid value(s):
A = Signaling link between an end office (EO) and a signaling transfer point (STP) in the same (home) region.
B = Signaling link between a home STP and an STP in a different region.
C = Signaling link between two home STPs.
D = Signaling link between a regional STP and an area STP.
E = Signaling link between an EO and an STP in a different region.
F = Signaling link between EOs.

n = Group number of link in frame.

o = Member number of link in frame.

p = Voice frequency link (VFL) type. Valid value(s):
A = Secondary; only A and E links types have a secondary (A) VFL.
B = Primary.

q = Out-of-service time, in the form minutes:seconds.

r = Cluster number.

s = Cluster type. Valid value(s):
NO_RTE = No Route.
POP = Populated.
UNPOP = Unpopulated.

Note: Any of the following measurements may appear on the report followed by an asterisk ('*') indicating
that the threshold for that measurement has been exceeded. Only links that have at least one measurement whose threshold is exceeded are printed; therefore if no data appears on this report, then no thresholds were exceeded for the report period.

\[ t = \text{Number of signaling units in error.} \]
\[ u = \text{Number of byte retransmission requests.} \]
\[ v = \text{Number of repeated or skipped acknowledgement signal units.} \]
\[ w = \text{Number of automatically initiated changeovers.} \]
\[ x = \text{Number of changeover/changebacks to the same VFL.} \]
\[ y = \text{Number of cyclic redundancy check errors.} \]
\[ z = \text{Number of bytes retransmitted.} \]
\[ a^1 = \text{Number of automatically initiated changeovers.} \]
\[ b^1 = \text{The total number of seconds in error.} \]
\[ c^1 = \text{The proportion of time the link was out of service (count is in 100ths of a percent).} \]
\[ d^1 = \text{Number of times a route set was unavailable.} \]
\[ e^1 = \text{Duration of route set unavailable, in seconds.} \]
\[ f^1 = \text{Current page number.} \]
\[ g^1 = \text{Total number of pages in report.} \]

4. ACTION TO BE TAKEN

None.

5. ALARMS

2. REASON FOR OUTPUT

To report the switch machine performance report (MPR) equipment performance measurements for both the common and the non-common portions of the switch.

3. VARIABLE FIELD DEFINITIONS

a = Report period. Valid value(s):
   15 = 15 minutes
   30 = 30 minutes
   HR = 1 hour
   CDAY = Current day
   LDAY = Last (previous) day

b = Status of the input message. Valid value(s):
   ABT = Aborted.
   COMPL = Completed.
   IN PROG = In progress.
   STARTED = Started.
   STOPPED = Stopped.

c = Local CLLI code of the office.

d = The accumulation period. Valid value(s):
   DAILY
   FIFTEEN MINUTES
   HALF HOURLY
   HOURLY

e = Current software release identification.

f = Local date, in the form year-month-day.

g = Local time, in the form hour:minute:second.

h = Network date at beginning of accumulation period, in the form year-month-day.

i = Network date at beginning of accumulation period, in the form hour:minute:second.

j = Network date at end of accumulation period, in the form year-month-day.

k = Network date at end of accumulation period, in the form hour:minute:second.

l = The number of accumulation periods (one period is 5 minutes) out of the maximum number of coverage periods for this report; format is \( \frac{1^2 l^2 1^2}{m^2 m^2 m^2} \).

\( 1^2 l^2 1^2 \) = The number of periods of accumulated data for this report.

\( m^2 m^2 m^2 \) = The maximum number of periods than can be covered where:

\[ 001 \leq 1^2 l^2 1^2 \leq 288 \] (288 periods equals one day - 24 hours)
\[ 001 \leq m^2m^2 \leq 288 \quad l^2l^2 \leq m^2m^2. \]

- \( m \): The number of common network interface (CNI) level 0 initializations.
- \( n \): The time (in seconds) of variable 'm'.
- \( o \): The number of CNI level 1 initializations.
- \( p \): The time (in seconds) of variable 'o'.
- \( q \): The number of interprocess message switch (IMS) level 0 initializations.
- \( r \): The time (in seconds) of variable 'q'.
- \( s \): The number of IMS level 1A initializations.
- \( t \): The time (in seconds) of variable 's'.
- \( u \): The number of IMS level 1B initializations.
- \( v \): The time (in seconds) of variable 'u'.
- \( w \): The number of CNI level 3 initializations.
- \( x \): The time (in seconds) of variable 'w'.
- \( y \): The number of CNI level 4 initializations.
- \( z \): The time (in seconds) of variable 'y'.
- \( a^1 \): The number of IMS level 3 initializations.
- \( b^1 \): The time (in seconds) of variable 'a^1'.
- \( c^1 \): The number of IMS level 4 initializations.
- \( d^1 \): The time (in seconds) of variable 'c^1'.
- \( e^1 \): The number of times no signal unit processing was occurring.
- \( f^1 \): The interval (in seconds) that no signal unit processing was occurring.
- \( g^1 \): The number of ring peripheral controller (RPC) node errors.
- \( h^1 \): The number of RPC out-of-service auto for RPC node.
- \( i^1 \): The time (in seconds) of variable 'h^1'.
- \( j^1 \): The number of RPC out-of-service manual for RPC node.
- \( k^1 \): The time (in seconds) of variable 'j^1'.
- \( l^1 \): The number of RPC out-of-service configuration for RPC node.
- \( m^1 \): The time (in seconds) of variable 'l^1'.
\[ n^1 \] = The number of link nodes (LNs) for which this output data was collected.
\[ o^1 \] = The number of LN node errors.
\[ p^1 \] = The number of LN out-of-service auto for LN node.
\[ q^1 \] = The time (in seconds) of variable 'p^1'.
\[ r^1 \] = The number of LN out-of-service manual for LN node.
\[ s^1 \] = The time (in seconds) of variable 'r^1'.
\[ t^1 \] = The number of LN out-of-service configuration for LN node.
\[ u^1 \] = The time (in seconds) of variable 't^1'.
\[ v^1 \] = The number of single fault ring errors.
\[ w^1 \] = The time (in seconds) of variable 'v^1'.
\[ x^1 \] = The number of multiple fault ring errors.
\[ y^1 \] = The time (in seconds) of variable 'x^1'.
\[ z^1 \] = The number of times the entire ring went down.
\[ a^2 \] = The time (in seconds) the ring was down.
\[ b^2 \] = The number of nodes isolated manually.
\[ c^2 \] = Duration timer for the number of nodes isolated manually (in seconds).
\[ d^2 \] = The number of ring receive buffer overflows (level 1).
\[ e^2 \] = The number of ring receive buffer overflows (level 2).
\[ f^2 \] = The number of ring receive buffer overflows (level 3).
\[ g^2 \] = The number of link node receive buffer overflows (level 2).
\[ h^2 \] = The number of link node receive buffer overflows (level 3).
\[ i^2 \] = User-defined string [by way of the equipment configuration database (ECD)]. This is the time zone indicator and has a default of "NWT".
\[ j^2 \] = The number of CNI level 2 initializations.
\[ k^2 \] = The time (in seconds) of variable 'j^2'.

4. ACTION TO BE TAKEN

If the aborted (ABT) status message is printed, the user may wish to try the command again.

2. REASON FOR OUTPUT

To print part one of the signaling network performance report in response to input command OP:SMR.

3. VARIABLE FIELD DEFINITIONS

a = Report period. Valid value(s):
   15 = 15 minutes.
   30 = 30 minutes.
   HR = 1 hour.
   CDAY = Current day.
   LDAY = Last (previous) day.

b = Reporting office CLLI code.

c = Accumulation period. Valid value(s):
   DAILY
   FIFTEEN MINUTES
   HALF HOURLY
   HOURLY

""""""

f = Local time-zone time in the form hour:minute:second.

g = User defined string (by the way of the equipment configuration database (ECD)). This is the time zone indicator and has a default of "NWT" within the Continental US.

h = Network time of beginning of accumulation period in the form hour:minute:second.

i = Network date of ending of accumulation period in the form hour:minute:second.

j = Network time of ending of accumulation period in the form year-month-date.

k = Network time of ending of accumulation period in the form hour:minute:second.
\[ l = \text{The number of accumulation periods (one period is 5 minutes) out of the maximum number of coverage periods for this report; format is } i^2 j^2 i^2 / j^2 j^2 j^2 \]

\[ i^2 j^2 i^2 = \text{The number of periods of accumulated data for this report} \]

\[ j^2 j^2 j^2 = \text{The maximum number of periods that can be covered where:} \]

\[ 001 \leq i^2 j^2 i^2 \leq 288 \text{ (288 periods equal one 24-hour day)} \]

\[ 001 \leq j^2 j^2 j^2 \leq 288 \]

\[ i^2 j^2 i^2 \leq j^2 j^2 j^2 . \]

\[ m = \text{Common channel signaling 7 (CCS7) bytes received.} \]

\[ n = \text{CCS7 bytes transmitted.} \]

\[ o = \text{CCS7 routed messages received.} \]

\[ p = \text{CCS7 routed messages transmitted.} \]

\[ q = \text{Embedded CCIS (ECIS) messages received.} \]

\[ r = \text{ECIS messages transmitted.} \]

\[ s = \text{Total number of global title routing messages received.} \]

\[ t = \text{SP node isolations.} \]

\[ u = \text{Duration of SP node isolations (in seconds).} \]

\[ v = \text{SP link set failures.} \]

\[ w = \text{Duration of SP link set failures (in seconds).} \]

\[ x = \text{Level 1 transmit buffer congestion onset.} \]

\[ y = \text{Duration of level 1 transmit buffer congestion (in seconds).} \]

\[ z = \text{Declared failures.} \]

\[ a^{1} = \text{Duration of declared link failures.} \]

\[ b^{1} = \text{Automatic changeovers.} \]

\[ c^{1} = \text{Receive buffer overflow.} \]

\[ d^{1} = \text{Receive buffer overload.} \]

\[ e^{1} = \text{Duration of receive buffer overload (in seconds).} \]

\[ f^{1} = \text{Transmit buffer discard level 1.} \]

\[ g^{1} = \text{Number of alternate link set routing transitions to a lower priority link set.} \]

\[ h^{1} = \text{Duration, in seconds, of alternate link set transitions.} \]

\[ i^{1} = \text{Routing audit failures.} \]

\[ j^{1} = \text{Half-hours with errored second threshold exceeded.} \]
k
  = Half-hours with detected error threshold exceeded.

l
  = Bytes retransmitted.

m
  = Half-hours with automatic changeover threshold exceeded.

n
  = ECIS messages refused, congestion.

o
  = ECIS messages refused, no translation.

p
  = Destination CCIS6 (DCIS) messages refused - congestion.

q
  = DCIS messages refused - no translation.

r
  = Number of priority level 1/2/3 ECIS6 messages dropped due to ring peripheral controller (RPC) congestion.

s
  = Message Signaling service units (MSUs) discarded due to routing data error count.

t
  = Looping CCS7 messages.

u
  = Global title translation refused - blocked.

v
  = Global title translation refused - no translation.

w
  = Messages removed/discarded due to link congestion.

x
  = Number of priority level 1/2/3 messages dropped due to RPC congestion.

y
  = Number of signaling connection control part (SCCP) messages destined for an unknown address (or global title) (link node LN7).

z
  = Number of SCCP messages destined for an unknown address (or global title) type (LN7).

a
  = Number of SCCP messages destined for an unequipped subsystem (LN7).

b
  = Number of SCCP messages destined for a prohibited subsystem (LN7).

c
  = Number of SCCP messages destined for an unknown address (or global title) [office (OFC)].

d
  = Number of SCCP messages destined for an unknown address (or global title) type (OFC).

e
  = Number of SCCP messages destined for an unequipped subsystem (OFC).

f
  = Number of SCCP messages destined for a prohibited subsystem (OFC).

g
  = Current page number.

h
  = Total number of pages of report.

i
  = The number of periods of accumulated data for this report.

j
  = The maximum number of periods that can be covered.

3. VARIABLE FIELD DEFINITIONS

a = Report period. Valid value(s):
   15  = 15 minutes
   30  = 30 minutes
   HR  = 1 hour
CDAY = Current day
LDAY = Last (previous) day

b = Reporting office CLLI code.
c = Accumulation period. Valid value(s):
   DAILY
   FIFTEEN MINUTES
   HALF HOURLY
   HOURLY
d = Current software release identification.
e = Local time-zone, in the form year-month-day.
f = Local time-zone, in the form hour:minute:second.
g = User-defined string [by way of the equipment configuration database (ECD)]. This is the time zone indicator and has a default of "NWT" within the Continental US.
h = Network date of beginning of accumulation period, in the form year-month-day.
i = Network time of beginning of accumulation period, in the form hour:minute:second.
j = Network date of ending of accumulation period, in the form year-month-day.
k = Network time of ending of accumulation period, in the form hour:minute:second.
l = The number of accumulation periods (one period is 5 minutes) out of the maximum number of coverage periods for this report; format is 'c²c²c²/d²d²d²'.
   c²c²c² = The number of periods of accumulated data for this report.
   d²d²d² = The maximum number of periods than can be covered where:
   001 <= c²c²c² <= 288  (288 periods equals one day - 24 hours)  001 <= d²d²d² <= 288
   c²c²c² <= d²d²d²

m = The number of Common Channel Interoffice Signaling System 7 (CCS7) equipped links; this number is not necessarily equal to the number of CCS7 links whose data is printed on this report since links with data measurements of zero are not printed.
n = The total OOS time, in seconds, of all CCS7 links, including those not printed because measurement data was zero.
o = Duration, in seconds, of CCS7 far-end processor outage events observed.
p = Total number of link sets.
q = Emergency restart peg count.
r = Duration, in seconds, of emergency restart.
s = Node isolation peg count.
\( t \) = Duration, in seconds, of node isolation.

\( u \) = Combined link-set failure peg count.

\( v \) = Duration in seconds of link-set failure.

\( w \) = Far-end CLLI code.

\( x \) = Link-layer.

\( y \) = Link type. Valid values are: A, E, F.

\( z \) = Group number of link in frame.

\( a^1 \) = Member number of link in frame.

\( b^1 \) = Peg count for automatic changeover.

\( c^1 \) = Number of times threshold was exceeded for automatic change-over.

\( d^1 \) = Out-of-service time, in the form hours:minutes:seconds.

\( e^1 \) = Peg count for declared link failures.

\( f^1 \) = Duration, in seconds, of declared link failures.

\( g^1 \) = Emergency restart due to far-end processor outage.

\( h^1 \) = Duration of emergency restart due to far end processor outage.

\( i^1 \) = Link interface in processor send mode.

\( j^1 \) = Duration, in seconds, of processor outage.

\( k^1 \) = Far-end processor outage occurred.

\( l^1 \) = Duration of far-end processor outage.

\( m^1 \) = Peg count for data link in error time.

\( n^1 \) = Number of times threshold was exceeded for data link in error time.

\( o^1 \) = Peg count for cyclic redundancy check errors.

\( p^1 \) = Number of times threshold was exceeded for crc check errors.

\( q^1 \) = Peg count for bytes retransmitted.

\( r^1 \) = Number of times threshold was exceeded for byte retransmissions.

\( s^1 \) = MSUs removed due to link congestions.

\( t^1 \) = Peg count for transmit buffer overload - Level 1.

To report the number 2 STP machine performance report (STP MPR) equipment performance measurements for both the common and the non-common portions of the number 2 STP.

3. VARIABLE FIELD DEFINITIONS

a = Termination status of the input message. Valid value(s):
   ABT = Aborted.
   COMPL = Completed.
   IN PROG = In progress.
   STOPPED = Stopped.

b = Local CLLI code of the office.

c = The accumulation period. Valid value(s):
   DAILY
   DAY TO HOUR
HOURLY

d = Current office type and software update.
e = Date when the report was printed.
f = Time when the report was printed.
g = The date of the beginning of the accumulation interval.
h = The time of the beginning of the accumulation interval.
i = The date of the end of the accumulation interval.
j = The time of the end of the accumulation interval.
k = The data validity flag. Valid value(s):
    NO    = Invalid.
    YES   = Valid.

l = The peg count showing the number of occurrences when no signal unit processing was occurring.
m = The interval (in seconds) of the peg counts referenced in variable "l".
n = The number of IMS level 0 initializations.
o = The number of IMS level 1A initializations.
p = The number of IMS level 1B initializations.
q = The number of IMS level 3 initializations.
r = The number of IMS level 4 initializations.
s = The number of CNI level 0 initializations.
t = The number of CNI level 1 initializations.
u = The number of CNI level 3 initializations.
v = The number of CNI level 4 initializations.
w = The number of STP level 0 initializations.
x = The number of STP level 1 initializations.
y = The number of STP level 3 initializations.
z = The number of STP level 4 initializations.
a¹ = The peg count of RPC node errors.
b¹ = The peg count of RPC out of service auto for RPC node.
c¹ = The time (in seconds) of variable "b¹".
\(d^1\) = The peg count of RPC out of service manual for RPC Node.

\(e^1\) = The time (in seconds) of variable ‘\(d^1\)’.

\(f^1\) = The peg count of RPC out of service configuration for RPC node.

\(g^1\) = The time (in seconds) of variable ‘\(f^1\)’.

\(h^1\) = The peg count of LN node errors.

\(i^1\) = The peg count of LN out of service auto for LN node.

\(j^1\) = The time (in seconds) of variable ‘\(i^1\)’.

\(k^1\) = The peg count of LN out of service manual for LN node.

\(l^1\) = The time (in seconds) of variable ‘\(k^1\)’.

\(m^1\) = The peg count of LN out of service configuration for LN node.

\(n^1\) = The time (in seconds) of variable ‘\(m^1\)’.

\(o^1\) = The peg count of single fault ring errors.

\(p^1\) = The time (in seconds) of variable ‘\(n^1\)’.

\(q^1\) = The peg count of multiple fault ring errors.

\(r^1\) = The time (in seconds) of variable ‘\(q^1\)’.

\(s^1\) = The time (in seconds) the ring was down.

4. **ACTION TO BE TAKEN**

If the aborted (ABT) status message is printed, the user may wish to try the input message again.

2. REASON FOR OUTPUT

To print a common channel interoffice signaling (CCIS) measurement report in response to the OP:SMR input message.

3. VARIABLE FIELD DEFINITIONS

b = Reporting office CLLI code.

c = Accumulation period. Valid value(s):
DAILY = Data represents an accumulation period of 24 hours (this is the longest interval).
DAY TO HOUR = Data represents an accumulation period of more than one hour but less than 24 hours.
HOURLY = Data represents an accumulation period of one hour (this is the shortest interval).
d = Current software release.

e = Local time-zone date in mm/dd/yy format.

f = Local time-zone time in hh:mm:ss format.

g = Network date of beginning of accumulation period in mm/dd/yy format.

h = Network time of beginning of accumulation period in hh:mm:ss format.

i = Network date of ending of accumulation period in mm/dd/yy format.

j = Network time of ending of accumulation period in hh:mm:ss format.

k = Validity of data. Valid value(s):
   NO = Data for one or more links is questionable.
   YES = Data for all links is legitimate.

l = Group number of link in frame.

m = Member number.

n = Link protocol. Valid value(s):
   6 = CCIS6
   7 = CCS7

o = Peg count of transient errors (that is, errors which do not result in a node's being removed from service).

p = Peg count of out-of-service time due to faults; this includes all time that a node is automatically removed from service.

q = Duration of time in seconds that a node is out-of-service due to faults.

r = Peg count for manually initiated out-of-service time.

s = Duration of time in seconds that a node is manually out-of-service.

t = Peg count for out-of-service time due to ring reconfiguration that isolates this node.

u = Duration of time in seconds that a node is out-of-service due to a ring reconfiguration.

v = Current page number.

w = Total number of pages of report.

</table>
2. REASON FOR OUTPUT

To print part two of the signaling network performance report in response to input message OP:SMR.

3. VARIABLE FIELD DEFINITIONS

b = Reporting CLLI code.

c = Accumulation period. Valid value(s):
   DAILY = Data represents an accumulation period of 24 hours (this is the longest interval).
   DAY TO HOUR = Data represents an accumulation period of more than one hour but fewer than 24 hours.
   HOURLY = Data represents an accumulation period of one hour (this is the shortest interval).

d = Current software release.

e = Local time-zone date in mm/dd/yy format.

f = Local time-zone time in hh:mm:ss format.

g = Network date of beginning of accumulation period in mm/dd/yy format.

h = Network time of beginning of accumulation period in hh:mm:ss format.

i = Network date of ending of accumulation period in mm/dd/yy format.

j = Network time of ending of accumulation period in hh:mm:ss format.

k = Data validity flag. Valid value(s):
   NO = Data for one or more links is questionable.
   YES = Data for all links is legitimate.

l = Emergency restart peg count.

m = Duration in seconds of emergency restart.

n = Node isolation peg count.

o = Duration in seconds of node isolation.

p = Combined link-set failure peg count.

q = Duration in seconds of combined link-set failure.

r = Current page number.
s = Number of logical pages of report.

t = Far-end CLLI code.

u = Link layer.

v = Link type.

w = Group number of link.

x = Member number.

y = Voice frequency link (VFL) type. Valid value(s):
   A = Secondary. Only A and E links have a secondary VFL.
   B = Primary.

z = Amount of time link is active.

a^1 = Number of times threshold exceeded for signaling units in error.

b^1 = Number of times threshold exceeded for signaling units retransmitted.

c^1 = Peg count for automatic changeover.

d^1 = Number of times threshold exceeded for automatic changeover.

e^1 = Number of times threshold exceeded for repeated and skipped acknowledgment signaling units.

f^1 = Peg count for declared link failures.

g^1 = Duration in seconds of declared link failures.

h^1 = Peg count for transmit buffer overload.

i^1 = Duration in seconds of transmit buffer overload.

j^1 = Peg count for transmit buffer overflow.

k^1 = Number of times threshold exceeded for data link in error time.

l^1 = Number of times threshold exceeded for cyclic redundancy check (CRC) errors.

m^1 = Number of times threshold exceeded for byte retransmissions.

4. ACTION TO BE TAKEN

If the ABORTED status message is printed, the user may wish to try the OP:SMR message again.

5. ALARMS

None.

6. REFERENCES
Input Message(s):

OP : SMR
OP:SMR

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5,CNI  
**Type:** Output

### 1. FORMAT

```
OP SMR a b
```

### 2. REASON FOR OUTPUT

To report the termination status of the signaling management report (SMR) in response to input message OP:SMR.

The body of the report is enclosed by the two OP:SMR messages; the second is called the termination message. Depending on the nature of the report, a report can either be paginated or not paginated. The first message in each group is repeated at the beginning of each page of a multipage report.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Name of the requested report. The name should be at most 16 characters long. Valid value(s):
  - A15MPR15
  - A30MPR30
  - AMPRCDAY
  - AMPRHR
  - AMPRLDAY
  - ASEPR15
  - ASEPR30

  - ASNPR2CDAY
  - ASNPR2HR
  - ASNPR2LDAY
  - NFDISK
  - NFDISKEX
  - NFLPM
  - NFLPMEX
  - RINGEXLPM

- **b** = Message termination code. Valid value(s):
  - ABT = Aborted.
  - COMPL = Completed.
  - IN PROG = In progress.
  - STARTED = Started.
STOPPED = Stopped.

4. ACTION TO BE TAKEN

</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To report software resource measurement (SRM) information for a particular switching module (SM) for the previous 30 minutes.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Software resource identifier.
c = The number of available tuples in the SM.
d = The maximum number of tuples that were in use during any 100-second interval in the previous 30 minutes.
e = The minimum number of tuples that were in use during any 100-second interval in the previous 30 minutes.
f = The average usage of the resource over the previous 30 minutes, based on a 100-second scan cycle.
g = The number of times an attempt was made to obtain an idle tuple of this resource.
h = The number of times an unsuccessful attempt was made to obtain an idle tuple of this resource because all of the tuples were in use.

4. ACTIONS TO BE TAKEN

This information is intended to be used to determine software resource usage in an SM. Software resources are dynamic relations that are used to store information. The performance of an SM is related to the availability of the appropriate software resources. If an SM has too few of a particular resource, the SM will go into resource overload. The information in these reports can be used by engineering and support personnel to determine the appropriate number of tuples for a particular resource. Additional tuples can be added using RC/V View 8.40, Software Resource Engineering (SRE) Incremental Global Parameters.

[3] OP SS7 a [NSEGS=i] c

2. REASON FOR OUTPUT

To print the signaling system 7 (SS7) trunk data collected for an OP:SS7 request.

Format 1 provides the output of SS7 trunk data when the input specifies:
- all possible point codes.
- a single destination point code (DPC).
- a single origination point code (OPC).
- an OPC and DPC pair.
- all the possible point code associated with the global switching module (GSM).
- all the possible point code associated with the common network interface (CNI).
- a single DPC associated with the CNI.
- a single DPC associated with the GSM.

Format 2 provides the output of SS7 trunk data when the input specifies:
- a DPC and/or OPC and a single circuit identification code (CIC), or a CIC range.
- a single SS7 trunk group (TG) number.
- a single trunk group member number (TKGMN), or a trunk group member number range.
- a single CIC or a CIC range associated with the CNI.
- a single CIC or a CIC range associated with the GSM.
- a single DPC with a single CIC or a CIC range associated with the CNI.
- a single DPC with a single CIC or a CIC range associated with the GSM.
Format 3 provides the output of the completion report of an SS7 trunk data request.

3. VARIABLE FIELD DEFINITIONS

a = Input parameters. Refer to the OP:SS7 input message for valid values.

b = Number of this segment in the listing produced. Segments are numbered sequentially starting from one.

c = Completion report. Valid value(s):
CCS NOT AVAILABLE IN OFFICE = The request cannot be processed because the office is not equipped with CCS capability.
CNI NOT PROVISIONED = The request cannot be processed because the office is not equipped with a CNI.
COMPLETED = All of the data has been found and printed.
CONTINUED = Second and subsequent segments of a list too long to be printed in a single segment.
DATABASE ERROR = An internal database failure prevented the SS7 trunk data request from further processing. The request has been aborted.
DPC INVALID = The DPC specified in the input request was invalid. Verify that the correct DPC was specified and is in one of the three accepted formats. Refer to the APP:POINT-CODE appendix
GSM INVALID = The request cannot be processed because the specific GSM is either not a provisioned SM number or is not a global switching module.
NO DATA FOUND = The search was performed as requested, but no data was found for the given input.
OPC GSM OR CNI KEYWORD REQUIRED = The DPC specified in the input request could not be validated because an OPC, GSM, or CNI is required for input with the DPC.
OPC INVALID = The OPC specified in the input request was invalid. Verify that the correct OPC was specified and is in one of three accepted formats. Refer to the APP:POINT-CODE appendix.
OPC REQUIRED = When a DPC with a network value of 236 or 254 is specified, and multiple OPC networks exist in the office, then OPC must be entered.
OPC OR GSM REQUIRED = The DPC specified in the input request could not be validated because an OPC or a GSM is required.
SM INVALID = The input request could not be processed because the specified SM is not provisioned.
STARTED = Indicates the first segment in the list. This does not necessarily imply that additional segments will be produced.
SYSTEM BUSY = Indicates the system was too busy to process the request or a system resource failure occurred. Retry later.
TG INVALID OR NON-SS7 TG = The input request could not be processed because the specified trunk group is not a provisioned SS7 trunk group.

d = SS7 trunk group number found for output.

e = SS7 trunk group member number found for output.

f = Origination point code (OPC) found for output. Refer to the APP:POINT-CODE appendix.

g = Destination point code (DPC) found for output. Refer to the APP:POINT-CODE appendix.
h = Circuit identification code found for output.

i = The total number of segments output for an SS7 trunk data request. No segment count is produced if no segments were printed for the request prior to the output of the completion report.

j = Switching Module (SM) found for output

2. REASON FOR OUTPUT

To print the signaling system 7 (SS7) trunk data collected for an OP:SS7 request.

Format 1 provides the output of SS7 trunk data when the input specifies:
- All possible point codes.
- A single destination point code (DPC).
- A single origination point code (OPC).
- An OPC and DPC pair.
- All the possible point code associated with the global switching module (GSM).
- All the possible point code associated with the common network interface (CNI).
- A single DPC associated with the CNI.
- A single DPC associated with the GSM.
- The system is in CNI to PSU conversion process.

Format 2 provides the output of SS7 trunk data when the input specifies:
- A DPC and/or OPC and a single circuit identification code (CIC), or a CIC range.
- A single SS7 trunk group (TG) number.
- A single trunk group member number (TKGMN), or a trunk group member number range.
- A single CIC or a CIC range associated with the CNI.
- A single CIC or a CIC range associated with the GSM.
- A single DPC with a single CIC or a CIC range associated with the CNI.
- A single DPC with a single CIC or a CIC range associated with the GSM.
- The system is in CNI to PSU conversion process.

Format 3 provides the completion report of a SS7 trunk data OFFICE or SUM request.

Format 4 provides the output of the completion report of an SS7 trunk data request, excluding OFFICE and SUM requests.

3. VARIABLE FIELD DEFINITIONS

a = Input parameters. Refer to the OP:SS7 input message for valid values.

b = Number of this segment in the listing produced. Segments are numbered sequentially starting from one.

c = Completion report. Valid value(s):
CCS NOT AVAILABLE IN OFFICE = The request cannot be processed because the office is not equipped with CCS capability.
CNI NOT PROVISIONED = The request cannot be processed because the office is not equipped with a CNI.
COMPLETED = All of the data has been found and printed.
CONTINUED = Second and subsequent segments of a list too long to be printed in a single segment.
DATABASE ERROR = An internal database failure prevented the SS7 trunk data request from further processing. The request has been aborted.
DPC INVALID = The DPC specified in the input request was invalid. Verify that the correct DPC was specified and is in one of the three accepted formats. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.
GSM INVALID = The request cannot be processed because the specific GSM is either not a provisioned SM number or is not a global switching module.
NO DATA FOUND = The search was performed as requested, but no data was found for the given input.
OPC GSM OR CNI KEYWORD REQUIRED = The DPC specified in the input request could not be validated because an OPC, GSM, or CNI is required for input with the DPC.
OPC INVALID = The OPC specified in the input request was invalid. Verify that the correct OPC was specified and is in one of three accepted formats. Refer to the APP:POINT-CODE appendix.
OPC REQUIRED = When a DPC with a network value of 236 or 254 is specified, and multiple OPC networks exist in the office, then OPC must be entered.
OPC OR GSM REQUIRED = The DPC specified in the input request could not be validated because an OPC or a GSM is required.
SM INVALID = The input request could not be processed because the specified SM is not provisioned.
STARTED = Indicates the first segment in the list. This does not necessarily imply that additional segments will be produced.
SYSTEM BUSY = Indicates the system was too busy to process the request or a system resource failure occurred. Retry later.
TG INVALID OR NON-SS7 TG = The input request could not be processed because the specified trunk group is not a provisioned SS7 trunk group.

d = SS7 trunk group number found for output.
e = SS7 trunk group member number found for output.
f = Origination point code (OPC) found for output. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.
g = Destination point code (DPC) found for output. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.
h = Circuit identification code found for output.
i = The total number of segments output for an SS7 trunk data request. No segment count is produced if no segments were printed for the request prior to the output of the completion report.
j = Switching module (SM) found for output.
k = Platform indicator for the platform total, this will either be CNI or GSM X where X is the SM number.
l = Total ISUP trunks equipped on the indicated platform.
m = Total ISUP trunks equipped in the office.
n = Total ISUP inter/intra module trunks (IMT) equipped in the office.
o = Total non-compliant ISUP IMT equipped in the office. Non-compliant ISUP IMT trunks are trunks that are assigned on SMs that do not reside on the correct SMs according to the DPC. Refer to APP:POINT-CODE Appendix in the Appendixes section of the Output Messages manual for more information.
p = Timestamp which indicates when the summary numbers where last recalculated/verified.

[TIME IN OVERLOAD = m]
[HIGH-LEVEL RECOVERY ACTIONS = n]
[LOW-LEVEL RECOVERY ACTIONS = o]

2. REASON FOR OUTPUT

To respond to a manually requested OP:STATUS input message. It contains summary information of software modes for the specified packet interface (PI) of the module controller time slot interchanger (MCTSI) or packet switching unit protocol handler (PSUPH). If the requested unit is out of service only the information kept in the SM will print. When the unit is unequipped, only that status will be reported. For active PSUPHs, the associated channel group (CHNG) will also be given.

3. VARIABLE FIELD DEFINITIONS

PSUPH = Packet switch unit protocol handler (physical PH).
CHNG = Channel group (logical PH).
MCTSI = Module controller time slot interchanger.
PI = Packet interface.
a = Switching module (SM) number.
b = Packet switching unit (PSU) number.
c = PSU shelf number.
d = PSUPH number.
e = CHNG number.
f = MCTSI side number.
g = Message sequence number.
h = Port processor status. Valid value(s):
   ACT       = Active.
OOS = Out of service.
SPARE = Spare.
STBY = Standby.
UNEQ = Unequipped.

i = Print mode status (ON/OFF).

j = Print mode time remaining of the 48 hours since a CHG:PRNTMODE request. The field will be in hours and minutes (HHMM).

k = Software checks. Valid value(s):
ALW = Allowed.
INH = Inhibited.

l = Overload severity. Valid value(s):
CRIT = Critical.
MAJ = Major.
MIN = Minor.
NORM = Normal.

m = Cumulative time in overload since the last 30-minute traffic report in minute:second format.

n = Number of high-level initializations since 24-hour plant report.

o = Number of low-level initializations since 24-hour plant report.

Note: Variables 'i'-‘o’ and 's’ will be suppressed for units with an UNEQ status. Variables 'l'-‘o’ will be suppressed for units with an OOS status.

p = Image type in the PH. Valid value(s):
ERROR IMAGE = The image contained an error.
NULL IMAGE = No image was loaded.
PH2 GATEWAY IMAGE = X.75’ features on a PH2 were loaded.
PH2 ACCESS IMAGE = All features (other than X.75’) on a PH2 were loaded.
PH3 ISDN IMAGE = All features on a PH3 ISDN AP were loaded.
PH3 CCS IMAGE = All features on a PH3 CCS AP were loaded.
PH4 ISDN IMAGE = All features on a PH4 ISDN were loaded.
PH4 FRPH IMAGE = All features on a PH4 FRPH were loaded.
PHV1 CDMA IMAGE = Software used for PHV CDMA with rom-based DSPs was loaded.
PHV3 RAM-BASED CDMA IMAGE = Software used for PHV3 CDMA with downloadable DSPs was loaded.
PHV3 WITH 8K DSP CDMA IMAGE = Software used for PHV3 CDMA with the 8K DSP algorithm was loaded.
PHV3 WITH 13K DSP CDMA IMAGE = Software used for PHV3 CDMA with the 13K DSP algorithm was loaded.
PHV3 WITH EVRC DSP CDMA IMAGE = Software used for PHV3 CDMA with the EVRC DSP algorithm was loaded.
PHA1A IMAGE = Image used for PHA1A was loaded.
P1 IMAGE = Image used for P1 was loaded.
P12 IMAGE = Image used for P12 was loaded.
q  = Time when the status was requested, in form hour:minute.

r  = Date when the status was requested, in the form month/day/year.

s  = Hardware checks. Valid value(s):
ALW = Allowed.
INH = Inhibited.

 t  = PH/PI resources that are overloaded (up to six). Valid value(s):
NONE = No resource overloaded.
PHCELL = PH Dropped Cell.
PHGPBD = PH General Purpose Buffer Descriptor.
PHLRFD = PH LAN-side Received Frame Descriptor.
PHRT = PH Real-time (based on interject cycles).
PHSRFD = PH SPYDER-side Received Frame Descriptor.
PHSTFD = PH SPYDER-side Transmit Frame Descriptor.
PFIIFO = PI First-in, First-out buffer.
PPIGPBD = PI General Purpose Buffer Descriptor.
PILRFD = PI LAN-side Received Frame Descriptor.
PIRT = PI Real-time (based on interject cycles).

Software Release: 5E15 only
Message Class: CP
Application: 5
Type: Output

1. FORMAT

OP STATUS {PSUPH=a-b-c-d [CHNG=a-b-c-e] | MCTSI=a-f PI} [TIME=gg:gg hh/hh/hh] 
MESSAGE-NO=i 
IMAGE=j [k] [APPL=l] 
STATUS = m 
[PRINT MODE FLAG = n] 
[HWCHK = o] 
[SWCHK = p] 
[OVERLOAD SEVERITY = q] 
[OVERLOAD RESOURCE = r [r] [r] [r] [r] [r]] 
[TIME IN OVERLOAD = s] 
[HIGH-LEVEL RECOVERY ACTIONS = t] 
[LOW-LEVEL RECOVERY ACTIONS = u]

2. REASON FOR OUTPUT

To respond to a manually requested OP:STATUS input message. It contains summary information of software modes for the specified packet interface (PI) of the module controller time slot interchanger (MCTSI) or packet switching unit protocol handler (PSUPH). If the requested unit is out-of-service only the information kept in the SM will print. When the unit is unequipped, only that status will be reported. For active PSUPHs, the associated channel group (CHNG) will also be given.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Packet switching unit (PSU) number.
c = PSU shelf number.
d = PSUPH number.
e = CHNG number.
f = MCTSI side number.
g = Time when the status was requested, in form hour:minute.
h = Date when the status was requested, in the form month/day/year.
i = Message sequence number.
j = Image type in the PI or PH.
k = PH IOP image type, where applicable.
l = PH application or channel group type.
m = Port processor status. Valid value(s):
   ACT = Active.
   OOS = Out-of-service.
   SPARE = Spare.
   STBY = Standby.
   UNEQ = Unequipped.

n = Print mode status (ON/OFF).

o = Hardware checks. Valid value(s):
   ALW = Allowed.
   INH = Inhibited.

p = Software checks. Valid value(s):
   ALW = Allowed.
   INH = Inhibited.

q = Overload severity. Valid value(s):
   CRIT = Critical.
   MAJ = Major.
   MIN = Minor.
   NORM = Normal.

r = PH/PI resources that are overloaded (up to six). Valid value(s):
   NONE = No resource overloaded.
   PHCELL = PH dropped cell.
   PHGPBD = PH general purpose buffer descriptor.
   PHLRFD = PH LAN-side received frame descriptor.
   PHRT = PH real-time (based on interject cycles).
   PHSRFD = PH SPYDER-side received frame descriptor.
   PHSTFD = PH SPYDER-side transmit frame descriptor.
   PIFIFO = PI first-in, first-out buffer.
   PIGPBD = PI general purpose buffer descriptor.
   PILRFD = PI LAN-side received frame descriptor.
   PIRT = PI real-time (based on interject cycles).

s = Cumulative time in overload since the last 30-minute traffic report in minute:second format.

t = Number of high-level initializations since 24-hour plant report.

u = Number of low-level initializations since 24-hour plant report.

Note: Variables 'm'-u will be suppressed for units with an UNEQ status. Variables 'q'-u will be suppressed for units with an OOS status.

**Type:** Output

1. **FORMAT**

   OP  STATUS  AUD  CMP=a-d {PRIM|MATE}  (b OF c)  
   e {ALW|INH}

2. **REASON FOR OUTPUT**

   To respond to an input request to output the status (inhibit and/or allow) of a particular audit or all audits, or the status of the routine audit cycle in the specified communication module processor (CMP).

3. **VARIABLE FIELD DEFINITIONS**

   - **ALW** = The audit or cycle is allowed.
   - **CYCLE** = Routine audit cycle. Application audit ID.
   - **INH** = The audit or cycle is inhibited.
   - **a** = Message switch side.
   - **b** = Current page number.
   - **c** = Total number of pages in report.
   - **d** = CMP number.
   - **e** = Routine audit cycle. Application audit ID. Refer to the APP:AUDITS appendix in the Appendixes section of the Output Messages manual.

4. **ACTION TO BE TAKEN**

   Inhibit or allow the audit if necessary. Refer to the Audits manual for an explanation of the audit ID.

5. **ALARMS**

   None.

6. **REFERENCES**

   **Input Message(s):**
   
   OP:ST-AUD-CMP

   **Output Appendix(es):**
OP:ST-AUD-ENV

Software Release: 5E14 and later
Message Class: AUDT
Application: 5
Type: Output

1. FORMAT

OP STATUS  AUD  ENV=a   (b OF c)
   d        {ALW|INH}
   .        
   .        
   .        

2. REASON FOR OUTPUT

To respond to an input request to output the status (inhibit and/or allow) of a particular audit, or all the audits, or just
the status of the audit cycle in the requested kernel process environment (OKP or SMKP).

3. VARIABLE FIELD DEFINITIONS

ALW        = The audit or cycle is allowed.
CYCLE      = Routine audit cycle. Application audit ID.
INH        = The audit or cycle is inhibited.
a          = Kernel process where the application audit resides. Valid value(s):
   FULL     = Full static office dependent data (SODD) audit.
   INCR     = Incremental static office dependent data (SODD) audit.
   OKP      = Operational kernel process.
   SMKP     = Switch maintenance kernel process.

b          = Current page number.
c          = Total number of pages.
d          = Routine audit cycle. Application audit ID. Refer to the APP:AUDITS appendix in the Appendixes
   section of the Output Messages manual.

4. ACTION TO BE TAKEN

Inhibit or allow the audit if necessary. Refer to the Audits manual for an explanation of the audit ID.

Leaving an audit in the INH status may be unadvisable; this means errors that the audit is designed to detect will be
unreported and/or uncorrected.

```

2. REASON FOR OUTPUT

To output status information on one or more common channel signaling (CCS) links in response to the
OP:STATUS-CCSLK input message. Protocol handler (PSUPH) termination and access equipment number (EN)
data will be provided only for available ccs links.

3. VARIABLE FIELD DEFINITIONS

Note: The PSUPH and EN will be printed only if the link member is AVAIL.

```
a
= Page indicator. Valid value(s):
FIRST = First page of report.
NEXT = Next report page.
LAST = Last page of report associated with this request.
```

```
b
= Switching module (SM) number of packet switching unit (PSU).
```

```
c
= Origination point code (OPC) number associated with the GSM. Refer to the APP:POINT-CODE
appendix in the Appendixes section of the Output Messages manual for interpretation.
```

```
d
= Link set number.
e
= Link member number.
f
= Link type. Valid value(s):
A = link connecting to an adjacent home signaling transfer point.
E = link connecting to an adjacent secondary signaling transfer point.
F = link connecting to an signaling end point.
```

```
g
= State of link member. Valid value(s):
AVAIL = Available (active). Note that the link may still not be capable of carrying traffic due
to inhibited or blocked qualifiers.

CONG1 = Link is congested at level 1.
CONG2 = Link is congested at level 2.
CONG3 = Link is congested at level 3.

NO LINKS FOUND = No links found.

UNAV = Unavailable. Link unavailable for traffic.
UNEQ = Unequipped. No such link set and member combination.

h = Optional information indicating blocking or inhibit status of link or out-of-service status. Valid value(s):
LINH = Locally inhibited.
RINH = Remotely inhibited.
LBLK = Locally blocked.
RBLK = Remotely blocked.

i = Out-of-service status. Valid value(s):
DACT = Deactivated.
ERROR = Error in software.
INIT = The signaling link is on the initialization queue.
LKER–L1 = Level one failure (No network timeslot available).
LKER–L2 = Level two failure (level two failed alignment).
LKER–L3 = Level three failure (the link test failed).
OOS–DL = No signaling data link (SDL) is available for use.
OOSF–PH = Channel group is unassigned.
OOST = The signaling link state is transient.
RSRC = There was a lack of resources required to complete action.
TBI = To be idled (audit recovery).
UNKNOWN = Unknown link.

j = Unit number of PSU in SM.

k = Shelf number in PSU.
l = PH number on shelf.

m = Access type. Valid value(s):
  D = Digital equipment number (DEN), which is a port on a digital facility interface (DFI).
  N = Network equipment number (NEN), which is a port on a digital networking synchronous optical network-Sonet (DNU-S).

n = Valid value(s):
  o-p-q-r (if variable 'm' is "D" which represents a DEN)
  s-t-u-v-w-x-y-z (if variable 'm' is "N" which represents a NEN)

o = SM number of the SDL digital facility interface (DFI).

p = Digital line and trunk unit (DLTU) number of the SDL.

q = DFI number of the SDL.

r = Channel number of the SDL.

s = SM number of the SDL DNU-S.

t = DNU-S number of the SDL.

u = Data group number of the SDL.

v = DNU-S sonet terminating equipment (STE) number of the SDL.

w = DNU-S synchronous transport signal (STS) number of the SDL.

x = DNU-S virtual tributary 1.5 group (VTGRP) number of the SDL.

y = DNU-S virtual tributary 1.5 member (VTGRM) number of the SDL.

z = DNU-S VT1.5 channel number of the SDL.

OUTPUT INCOMPLETE = Error in reading data, which will also produce a corresponding assert.

= Shelf number in PSU.
l
= PH number on shelf.
m
= Access type. Valid value(s):
D
= Digital equipment number (DEN), which is a port on a digital facility interface (DFI).
N
= Network equipment number (NEN), which is a port on a digital networking unit-synchronous optical network (SONET) (DNU-S).
O
= Optical interface unit (OIU) equipment number (OIUEN), which is a port on an OIU.
SD
= Starting DEN, which is the first digital signal level 0 (DS0) port on the digital signal level 1 facility (DS1SFAC) of a DFI for a high-speed signaling link.
SN
= Starting NEN, which is the first DS0 port on the DS1SFAC of a DNU-S for a high-speed signaling link.

n
= Valid value(s):

<table>

1533 CCS LINK SET MEMBER
OP:ST-DISKUSE

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] OP STATUS DISKUSE COMPLETED
   a b

[2] OP STATUS DISKUSE STOPPED
   c DOES NOT EXIST

[3] OP STATUS DISKUSE STOPPED
   TOTAL OR EACH MUST BE SPECIFIED
   IF FN IS A FILE.

[4] OP STATUS DISKUSE STOPPED
   d

2. REASON FOR OUTPUT

To report the result of executing an OP:ST-DISKUSE input message.

3. VARIABLE FIELD DEFINITIONS

a = The total number of blocks in the directory or file. Block size is 512 bytes.
b = Pathname of the directory or file specified in the input message.
c = Pathname of the directory that does not exist.
d = Text explaining why the message was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates success and requires no action.

For Formats 2 and 3, correct any input line errors. The existence of the directory can be confirmed using input message.

For Format 4, if the text is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

OP:ST-DSE

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

OP  STATUS  DSE  a  {ON|OFF}

2. REASON FOR OUTPUT

To print the current status of the trapping and printing of direct signaling events (DSEs) as requested by the OP:ST-DSE input message.

3. VARIABLE FIELD DEFINITIONS

OFF = Indicates that the trap is turned off for the given event and will not be reported.

ON = Indicates that the trap is turned on for the given event and will be reported in the REPT:ACP-APP-SM, REPT:ASP, REPT:DSE, REPT:MS-TRAPPED, REPT:NS or REPT:OSPS-DSE output messages.

a = The event trap for which the status was requested in the input message. Valid value(s):

- AILSGMG = Automated inward line screening (AILS) message received with invalid format reply.
- AILSMRQ = AILS error - misrouted query.
- AILSTOT = AILS query timed out before a reply was received.
- AILSTRF = AILS error - task refused.
- AILSUDV = AILS error - message received with unexpected input data value.
- ASPACGCOMP = Advanced services platform (ASP) service control point (SCP) response or unidirectional message with an automatic call gap (ACG) component received at the switch.
- ASPBADRESP = ASP SCP response message received with invalid data.
- ASPNORTEMSG = ASP reject message, return error, or a play announcement received at the switch from the SCP.
- ASPQRYFAIL = ASP query blocked by network management (NM) ACG, a returned query or conversation received at the switch, or a time out received in call processing.
- ASPSNCOMP = ASP SCP response message with a send notification component received at the switch.
- ASPTNMSG = ASP termination notification message sent from the switch to the SCP.
- CASDBOV = Customer accounts services (CAS) message received indicating database overload.
- CASDUN = CAS message returned - database unable to process.
- CASGMSG = CAS message received garbled.
- CASNLBK = CAS message returned because of network blockage.
- CASNCN = CAS message returned because of network congestion.
- CASNRTE = CAS message returned because of no routing data.
- CASTOUT = CAS message returned because of timeout.
- CASNONEQ = CAS message returned because of unequipped destination.
- CASURPY = CAS message received with an unexpected reply.
- CAS7ABM = CAS common channel signaling 7 (CCS7) abort message received.
- CAS7ACG = CAS CCS7 ACG invoke component received.
CAS7GMG = CAS CCS7 received with invalid format reply.
CAS7GWE = CAS CCS7 error - gateway error.
CAS7MPR = CAS CCS7 error - message received with missing parameter.
CAS7MRQ = CAS CCS7 error - misrouted query.
CAS7NCG = CAS CCS7 message returned because of network congestion.
CAS7NFL = CAS CCS7 message returned because of network failure.
CAS7RCR = CAS CCS7 reject component received.
CAS7SCG = CAS CCS7 message returned because of subsystem congestion.
CAS7SFL = CAS CCS7 message returned because of subsystem failure.
CAS7TAN = CAS CCS7 message returned - no translation data for address of such nature.
CAS7TOT = CAS CCS7 query which timed out before reply received.
CAS7TRF = CAS CCS7 error - task refused.
CAS7TSA = CAS CCS7 message returned - no translation data for this specific address.
CAS7UDV = CAS CCS7 error - message received with unexpected input data value.
CAS7UPR = CAS CCS7 error - message received with unexpected parameter.
CAS7UQD = CAS CCS7 message returned - unqualified.
CAS7URY = CAS CCS7 received with unexpected reply.
CAS7UOR = CAS CCS7 message returned - unequipped user.
CAS7VCD = CAS CCS7 error - vacant code.
CCDDBOV = BVA calling card (CCRD) message received indicating database overload.
CCDDBUN = BVA CCRD message returned because database unable to process.
CCDGMST = BVA CCRD message received garbled.
CCDBLKB = BVA CCRD message returned because of network blockage.
CCDCON = BVA CCRD message returned because of network congestion.
CCDNRTE = BVA CCRD message returned because of no routing data.
CCDNAE = BVA CCRD message returned - unequipped destination.
CCDURPY = BVA CCRD message received with an unexpected reply.
ICCVABM = International credit card validation (ICCV) abort message received.
ICCVDBU = ICCV error - message returned - database unavailable.
ICCVEMF = ICCV error in message format.
ICCVGMG = ICCV received with invalid format reply.
ICCVMPR = ICCV error - message received with missing parameter.
ICCVMRQ = ICCV error - misrouted query.
ICCVNCG = ICCV message returned because of network congestion.
ICCVNFL = ICCV message returned because of network failure.
ICCVRCR = ICCV reject component received.
ICCVSCG = ICCV message returned because of subsystem congestion.
ICCVSFL = ICCV message returned because of subsystem failure.
ICCVTAN = ICCV message returned - no translation data for address of such nature.
ICCVTOT = ICCV query which timed out before reply received.
ICCVTSA = ICCV message returned - no translation data for this specific address.
ICCVUDV = ICCV error - message received with unexpected input data value.
ICCVUPR = ICCV error - message received with unexpected parameter.
ICCVUQD = ICCV message returned - unqualified.
ICCVURY = ICCV received with unexpected reply.
ICCVUOR = ICCV message returned - unequipped user.
INWBLKD = Inward wide area telecommunications service (INWATS) returned blocked.
INWBUSY = INWATS all lines busy.
INWCCBL = INWATS code control blocked.
INWDBOV = INWATS database overload.
INWDBTO = INWATS database timeout.

APP:OMDB-X-REF
OP:ST-GQPHLNK

Software Release: 5E16(2) and later
Message Class: SIP
Application: 5
Type: Output

1. FORMAT

[1] OP STATUS GQPHLNK LINK=a-b-c-d-e-f|QPIPE=a-b-c-d-e|GQPH=a-b-c-d g STOPPED h

[2] OP STATUS GQPHLNK LINK=a-b-c-d-e-f|QPIPE=a-b-c-d-e|GQPH=a-b-c-d g i
   GQPHLNK STATUS
   a-b-c-d-e-f j
   . . . . .
   . . . . .
   . . . . .

2. REASON FOR OUTPUT

Format 1 indicates the general quad-link packet switch protocol handler link (GQPHLNK) status request cannot be processed by the global switching module (GSM) for the reason specified.

Format 2 provides GQPHLNK status output for the requested input scope.

3. VARIABLE FIELD DEFINITIONS

a = GSM number.
b = Packet switch unit (PSU) number.
c = PSU shelf number.
d = GQPH channel group number.
e = Quad-link packet switch (QLPS) network number.
f = Non-global switching module (NGSM) number.
g = Service type. For packet trunking, the value is SIP.
h = Reason for failure. Valid value(s):
   GQPH UNEQUIPPED = The input GQPH channel group specified in the input message (could be part of LINK or QPIPE input) is not provisioned.
   MESSAGE TIMEOUT = Response from GQPH did not arrive within a timeout interval monitored by the controlling SMP process.
   NO EQUIPPED GQPHLNK FOUND = No provisioned GQPHLNK were found for the scope specified in the input message (LINK, QPIPE or GQPH).
   PI RESOURCE PROBLEM = Access to GQPH is not possible due to PI resource problem.
i = Output message sequence number. Valid value(s):
   FIRST
NOTE: Multiple GQPHLNK statuses can be reported per message.

\[ j \] = GQPHLNK status. Valid value(s):

<table>
<thead>
<tr>
<th>State</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>The GQPHLNK is in service and available for general message transport.</td>
</tr>
<tr>
<td>OOS</td>
<td>The GQPHLNK is out of service (unavailable for message routing), while the parent GQPH and MH QPIPEs are ACT. This is most likely a transient state occurring during parent hardware reconfigurations.</td>
</tr>
<tr>
<td>OOSF-GQPHPIPE</td>
<td>The GQPHLNK is OOS for “family-of-equipment” reasons, because the parent GQPH QPIPE on the GSM is OOS. This is a stable OOS state, and an autonomous attempt to restore the GQPHLNK will occur when the parent GQPH QPIPE is successfully restored.</td>
</tr>
<tr>
<td>OOSF-MHPIPE</td>
<td>The GQPHLNK is OOS for “family-of-equipment” reasons, because the parent MH QPIPE on the NGSM-2000 MH is OOS. This is a stable OOS state, and an autonomous attempt to restore the GQPHLNK will occur when the parent MH QPIPE is successfully restored. If both the associated GQPH QPIPE and MH QPIPE are OOS, the OOSF-GQPHPIPE state predominates.</td>
</tr>
</tbody>
</table>

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

OP: ST-GQPHLNK
OP:ST-GQPHPIPE

Software Release: 5E16(2) and later
Message Class: SIP
Application: 5
Type: Output

1. FORMAT

[1] OP STATUS GQPHPIPE QPIPE=a-b-c-d-e|GQPH=a-b-c-d|GSM=a STOPPED NO GQPHPIPE EQUIPPED

[2] OP STATUS GQPHPIPE QPIPE=a-b-c-d-e|GQPH=a-b-c-d|GSM=a SERV=g h
   GQPHPIPE PH     STATUS
   a-b-c-d-e a-b-c-i j
   . . . . . .
   . . . . . .
   . . . . . .

[3] OP STATUS GQPHPIPE QPIPE=a-b-c-d-e SERV=g h
   GQPHPIPE PH     STATUS QTMSLNK NLI
   a-b-c-d-e a-b-c-i j   k   l

[4] OP STATUS GQPHPIPE QPIPE=a-b-c-d-e|GQPH=a-b-c-d|GSM=a SERV=g LAST DATA MAY BE INCOMPLETE

2. REASON FOR OUTPUT

Format 1 indicates the general quad-link packet switch protocol handler (GQPH) QPIPE status request cannot be processed by the global switching module (GSM), because there are no provisioned GQPH QPIPEs associated with the entire input scope requested.

Format 2 provides GQPH QPIPE status output for the requested input scope.

Format 3 provides detailed status of a single GQPH QPIPE (when DETAIL option was specified in the input request).

Format 4 indicates some (but not all) GQPH QPIPE statuses were unavailable (probably due to system load).

3. VARIABLE FIELD DEFINITIONS

a = GSM number.
b = Packet switch unit (PSU) number.
c = PSU shelf number.
d = GQPH channel group number.
e = Quad-link packet switch (QLPS) network number.
g = Service type. For packet trunking, the value is SIP.
h = Output message sequence number. Valid value(s):

- FIRST
- LAST
- NEXT

**NOTE:** Multiple GQPH PIPE statuses can be reported per message.

i = Resident physical PH.

j = GQPH QPIPE status. Valid value(s):

<table>
<thead>
<tr>
<th>State:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNEQ</td>
<td>The GQPH QPIPE is unequipped. This state is only reported if the mate GQPH QPIPE on the same GQPH channel group is provisioned.</td>
</tr>
<tr>
<td>INIT</td>
<td>The GQPH QPIPE will be restored shortly, typically scheduled during a GSM full initialization or as a result of audit recovery. This link will eventually be restored to an active (ACT) state or, if the restore attempt fails, will make a transition to a more specific out-of-service (OOS) state. If the GSM is operating in minimum mode (MIN MODE), the INIT state is permanent until MIN MODE is exited manually.</td>
</tr>
<tr>
<td>ACT</td>
<td>The GQPH QPIPE is functioning normally. A loopback test to the ACT QLPS has passed and child GQPHLNKs may be established.</td>
</tr>
<tr>
<td>OOS-DACT</td>
<td>The GQPH QPIPE has been manually deactivated (removed from service). Exit from this state requires a manual GQPH QPIPE restore (or occurs during a full GSM initialization).</td>
</tr>
<tr>
<td>OOS-LVL1-PATH</td>
<td>The GQPH QPIPE is OOS because a TSI-GQPH path could not be established during a GQPH QPIPE restore attempt (probably due to database read failures or other resource problems). SMP-controlled periodic retries or external events will attempt to automatically recover the GQPH QPIPE.</td>
</tr>
<tr>
<td>OOS-LVL1-FRAME</td>
<td>The GQPH QPIPE is OOS because the network processor's circuitry on the PH has detected framing errors (probably due to undetected QLPS network hardware errors or TSI faults). A local loopback test (at the PH) has passed, but framing errors persisted when the GQPH QPIPE was reconnected to the QLPS network/TSI. SMP-controlled periodic retries or external events will attempt to automatically recover the GQPH QPIPE, or a transition to a more stable OOS state will occur as hardware errors are detected by fault recovery.</td>
</tr>
<tr>
<td>OOS-QLPSLB</td>
<td>The GQPH QPIPE has level 1 resources available (its associated TSI-GQPH path is established, and the GQPH NP channel is activated, including a local loopback test in the PH), and periodic attempts to pass a loopback test to the ACT QLPS are scheduled. GQPH-controlled periodic retries or external events will attempt to automatically recover the GQPH QPIPE, or a transition to a more stable OOS state will occur as hardware errors are detected by fault recovery.</td>
</tr>
<tr>
<td>OOS-GQPHLB</td>
<td>The GQPH QPIPE is OOS as a local loopback test (at the PH) was performed and failed, indicating the problem is within the resident PH hardware. Another source of this status is the inability of the network processor to be activated (a hardware failure). An automatic GQPH switch was requested, but no STBY spare PH33 is available on the same shelf. The GQPH remains in-service as the mate GQPH</td>
</tr>
</tbody>
</table>
QPIPE is ACT.

A spare PH33 on the same shelf must be restored, or the faulty PH containing the OOS-GQPHLB GQPH QPIPE must be manually removed/repairs to recover the GQPH QPIPE.

**OOSF-PH**

The GQPH is OOS due to "family-of-equipment" reasons because the channel group associated with this GQPH QPIPE is unassigned (due to a manual or fault recovery removal of a PH33 when there was no STBY spare PH33 available on the same shelf).

Automatic attempts to restore the affected GQPH QPIPE will occur, when a PH33 is repaired and/or restored, and the parent GQPH channel group is reassigned.

**OOSF-CM**

The GQPH QPIPE is OOS due to "family-of-equipment" reasons associated with a parent TMSLNK/QTMSLNK outage (communication module or CM hardware).

Automatic attempts to restore the affected GQPH QPIPE will occur when the OOS TMSLNK/QTMSLNK is repaired and/or restored.

Note that OOS-LVL1-PATH, OOS-GQPHLB, OOS-DACT and OOSF-PH are of higher priority (as they reflect local conditions associated with the GQPH endpoint), and an OOSF-CM state will not be reported in this case, even if parent TMSLNK/QTMSLNK hardware is OOS.

**UNKNOWN**

The GQPH QPIPE status is not currently available. This is likely due to a maintenance process attempting to reconfigure the GQPH QPIPE when status was requested.

\[ k \] = QLPS time-multiplexed link (QTMSLNK) terminating the identified GQPH QPIPE.

\[ l \] = The primary network link interface (NLI) used to connect the specified GQPH QPIPE.

4. **ACTIONS TO BE TAKEN**

None.

5. **ALARMS**

None.

6. **REFERENCES**

Input Message(s):

\[ OP:ST-GQPHPIPE \]
OP:ST-GSMNET-A

Software Release: 5E14 only
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] OP STATUS GSMNET GSM=a OPC=b STOPPED c

__________________________________________

[2] OP STATUS GSMNET GSM=a OPC=b LAST
    NGSM CMT PATH STATE QUALIFIER
    a MD=a d [e]

__________________________________________

2. REASON FOR OUTPUT

Format 1 indicates the status request cannot be processed by the SM at all.

Format 2 reports valid status output. Note: This output can be a response to an OP:STATUS,GSMNET input message or can be produced automatically on a hourly basis. The CMT PATH specified can currently indicate only intra-SM message delivery (MD) link transport on an ISLAND GSM.

3. VARIABLE FIELD DEFINITIONS

a = GSM (global switching module) specified in the input request.

b = OPC (9-digit originating point code associated with the HOST/ISLAND GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for format of ANSI and AT&T/UNITEL formats.

c = Reasons for failure: NO STATE MATCH = There are no GSM/NGSM pairs matching the state restriction specified on the input command or the default INACC state (not valid for the STATE=ALL or NGSM input option). NOT A GSM = Due to data inconsistencies, the GSM can identify no provisioned NGSM.

d = State: INACC = CCS message transport within the GSM is unavailable. Further qualification is provided by field "e". ACC = CCS message transport within the GSM is available.

e = The most restrictive reason for inaccessibility, currently only:

<table>

a \[=\] GSM for which CMT status is being produced.

b \[=\] 9-digit primary originating point code (OPC) associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

c \[=\] Reason for failure. Valid value(s):

- **NO STATE MATCH** = There are no GSM/NGSM pairs matching the state restriction specified on the input command (not valid for the STATE=ALL or NGSM input option).
- **NOT A GSM** = Due to data inconsistencies, the GSM can identify no provisioned NGSMs.

d \[=\] Output message sequence number. Valid value(s):

FIRST

2. **REASON FOR OUTPUT**

Format 1 indicates CCS message transport (CMT) status associated with a global switching module (GSM) cannot be processed for the reason cited.

Format 2 provides CMT status associated with a specific GSM. This output could be a response to an OP:ST-GSMNET input message (with output restrictions matching input parameters), or it could be produced autonomously on a daily basis to highlight offnormal conditions.

The CMT path specified can be direct message handler (DMH) access to an non-global switching module (NGSM) of SM-2000 hardware type, transfer message handler (TMH) relay to an NGSM (not SM-2000 hardware type), or an intra-GSM message delivery (MD) link. If an NGSM is provisioned with dual TMHs, both paths may appear in the output. Refer to the Signaling Gateway Common Channel Signaling manual, 235-200-116, for a detailed description of possible GSM-NGSM CMT paths.

3. **VARIABLE FIELD DEFINITIONS**

| \(a\) | GSM for which CMT status is being produced. |
| \(b\) | 9-digit primary originating point code (OPC) associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual. |
| \(c\) | Reason for failure. Valid value(s):

- **NO STATE MATCH** = There are no GSM/NGSM pairs matching the state restriction specified on the input command (not valid for the STATE=ALL or NGSM input option).
- **NOT A GSM** = Due to data inconsistencies, the GSM can identify no provisioned NGSMs. |
| \(d\) | Output message sequence number. Valid value(s): |

FIRST
Multiple statuses may be reported per message.

e = NGSM whose status is being provided.

f = NGSM-2000 providing TRANSFER MH functionality.

g = State. Valid value(s):

ACC = The associated NGSM/NGSM-2000 is accessible (such as, there is CCS message transport to the target GSM).

If an NGSM is provisioned with dual TRANSFER MHs, accessibility may be provided by one or both CMT paths.

In HOST GSM environments, accessibility does not indicate the ability to handle high traffic loads (capacity is directly proportional to the number of available QPH channel groups).

DOWN = One TRANSFER MH path to an NGSM (provisioned with dual TRANSFER MHs) is unavailable: further qualification is provided by variable “h”. The mate CMT path is available and the NGSM is accessible.

INACC = The associated NGSM/NGSM-2000 is inaccessible (that is, there is no CCS message transport to the target GSM).

If an NGSM is provisioned with dual TRANSFER MHs, both CMT paths are unavailable (both paths will be listed in the output). Further qualification is provided by variable “h”.

h = The restrictive reason for INACC or DOWN states. Valid value(s):

NGSM UNAV = An NGSM-2000 has both MH QPIPEs removed, or is initializing or operating in MIN MODE.

An NGSM (not an NGSM-2000) is isolated (either manually or automatically), or is initializing or operating in MIN MODE.

TRANSFER MH UNAV = The TRANSFER MH has all QLNKs OOS, either due to manual or automatic action, or the parent NGSM-2000 is undergoing an initialization, or is operating in MIN MODE.

This state is only applicable to an NGSM (NOT a NGSM-2000), and the NGSM UNAV qualifier predominates.

QPHLNK UNAV = For an NGSM-2000, loss of all QPHLNKs between the GSM and the DIRECT MH has been detected; the NGSM-2000 specified can be the GSM itself, if the DIRECT MH is provisioned.

For an NGSM, it cannot access the HOST GSM, as there are no available QPHLNKs between the associated TRANSFER MH and the HOST GSM.

The NGSM UNAV and TRANSFER MH UNAV qualifiers above predominate (where appropriate).

CMT PATH LOST = This is the generic case for CMT failures associated with NGSMs, (NOT NGSM-2000s) if more specific NGSM UNAV, TRANSFER MH UNAV or QPHLNK UNAV qualifier cannot be identified this rare case should only occur when recovery
is taking place.

**MD LINK OOS** = If the NGSM is actually the GSM, the loss of CCS functionality is due to the intra-SM message delivery (MD) link outage. This state is only valid for an ISLAND GSM, when a DIRECT MH is NOT provisioned.

### 4. ACTIONS TO BE TAKEN

For Format 2 outputs, refer to the corrective maintenance procedures in the Signaling Gateway Common Channel Signaling manual, 235-200-116, if INACC or DOWN states are reported.

### 5. ALARMS

None.

OP:ST-ISMNAIL

Software Release: 5E14 and later
Message Class: CP
Application: 5
Type: Output

1. FORMAT

OP STATUS ISMNAIL DLT=a-b MATEDLT=c-d g
[h]
[ PRIMARY  HISTORY1  HISTORY2  HISTORY3 ]
[ DLT=i  k  l  m  n ]
[MATEDLT=j  o  p  q  r ]

2. REASON FOR OUTPUT

To respond to an OP:ST-ISMNAIL input message and indicate the status of a single inter-SM (switching module) nailup (ISMNAIL), utilized to transport packets between SMs.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Data link terminal (DLT) number associated with the SM.
c = Mate SM number.
d = DLT number associated with the mate SM.
g = Termination report. Valid value(s):
  COMPLETED = Request completed successfully.
  FAILURE = Request was terminated before a normal completion.
  [h] = Additional data qualifying the termination of the request. Valid value(s):
  DATABASE PROBLEM = Problem occurred while attempting to access critical data (accompanying ASSERT should provide more details).
  INVALID NAILUP SPECIFIED = An invalid nailup was specified in the input request.
  LACK OF MESSAGE RESOURCE = Message resources were not available in the administration module (AM), and user request could not be forwarded to the SM for execution.
  MESSAGE NOT RECEIVED = Expected message not received by ATA terminal process within designated timeout interval.
  NO OPTION MATCH = None of the ISMNAILs had states corresponding to option specified in the input request.
  SAME SM AND MATESM SPECIFIED = SM and MATESM are the same which is invalid.
  SM IN MINMODE = SM is in MINMODE, and, therefore, cannot support ISMNAILs.
  SM ISOLATED = Both SMs are isolated, and requested action cannot be honored.
  TERMINAL PROCESS NOT CREATED = An automatic task administrator (ATA) terminal process to execute the user request could not be created due to system problems.
  TIMEOUT = Timeout occurred.

Note: For many failed restorations, the ISMNAIL may be left in a state, which will allow a successful automatic restoration at some later time; use OP:ST-ISMNAIL to determine current status.
associated with the affected ISMNAIL.

i = DLT number.

j = Mate DLT number.

k = The primary status for the source port associated with the ISMNAIL; this is the most restrictive status currently on the port. Valid value(s):
IS = In-service (normal operation).
OOS DSBLD = Out-of-service disabled (DSBLD) indicates the ISMNAIL is manually removed.
OOS DSLINIT = Out-of-service initialization (DSLINIT) ISMNAIL will be automatically scheduled for an initialization.
OOS DLI = Out-of-service dual link interface (DLI) ISMNAIL is out-of-service due to a removed DLI on the major office network and timing complex (ONTC).
OOS NLI = Out-of-service network link interface (NLI) ISMNAIL is out-of-service due to a removal of all NLIs on the major office network and timing complex (ONTC).
OOS TMSCONN = Out-of-service time multiplexed switch connectivity; the ISMNAIL is out-of-service due to a TMS interconnectivity problem between the SMs (out-of-service DLI/NLIs or TMSLNKS) at one or more ends of the nailup.
OOS PSU = Out-of-service packet switch unit (PSU) the ISMNAIL is out-of-service because of an out-of-service/degraded PH.
OOS SLAVESM = Master ISM port is out-of-service due to problem in mate slave SM.
OOS MASTRSM = Slave ISM port is out-of-service awaiting a restoration, which must be triggered by the mate master SM.
OOS TBLA = Out-of-service trouble analysis (TBLA) indicates the ISMNAIL is out-of-service for no known hardware reasons, but cannot be restored to service for any reasonable length of time; repeated automatic restorations have been attempted, and maintenance personnel intervention is now required.
OOS TBI = Out-of-service to-be-idled (TBI) indicates the ISMNAIL is on the TBI list due to data corruption discovered by audits; this is a transient state and recovery is automatic.
ISOLATED = No status data could be derived from the SM due to isolation.
UNKNOWN = No status data received from the SM within the allotted timeout interval; valid reasons include unavailability of message resources, high levels of call processing/maintenance activity, or overload.
TRANSIENT = The ISMNAIL is in a transient state, due to maintenance activity.

l = The first pending (history) status for the source port associated with the ISMNAIL; a port can have zero to three pending statuses, in addition to the primary status. Valid value(s):
NO STATUS = No pending (history) status.
OOS DSBLD = The ISMNAIL is manually removed.
OOS DLI = The ISMNAIL is out-of-service due to a removed DLI on the major ONTC.
OOS NLI = The ISMNAIL is out-of-service due to a removal of all NLIs on the major ONTC.
OOS TMSCONN = The ISMNAIL is out-of-service due to a TMS interconnectivity problems between the SMs (out-of-service DLI/NLIs or TMSLNKS) at one or more ends of the nailup.
OOS PSU = The ISMNAIL is out-of-service because of an out-of-service/degraded PH.
OOS SLAVESM = Master ISM port is out-of-service due to problem in mate slave SM.

m = The second pending (history) status for the source port associated with the ISMNAIL.

n = The third pending (history) status for the source port associated with the ISMNAIL.
o = The primary status for the destination port associated with the ISMNAIL. Possible values are the same as listed for variable 'k' above.

p = The first pending (history) status for the destination port associated with the ISMNAIL. Possible values are the same as listed for variable 'l' above.

q = The second pending (history) status for the destination port associated with the ISMNAIL.

r = The third pending (history) status for the destination port associated with the ISMNAIL.

4. ACTION TO BE TAKEN

No further action is necessary, if the request completed successfully.

If the termination report indicates FAILURE, the 'h' field will give some indication as to why the request failed.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

Output Message(s):

STP:ISMNAIL

Other Manual(s):
235-600-500  Asserts Manual
OP:ST-ISMTS
Software Release: 5E14 and later
Message Class: CP
Application: 5
Type: Output

1. FORMAT

OP STATUS ISMTS SM=a b [c]
TOTAL NETWORK SIDE TSIU TIMESLOTS ALLOCATED FOR ISMNAIL=d
TOTAL PSU SHELF 0 PIDB TIMESLOTS ALLOCATED FOR ISMNAIL=e
TOTAL PSU SHELF 1 PIDB TIMESLOTS ALLOCATED FOR ISMNAIL=f
TOTAL PSU SHELF 2 PIDB TIMESLOTS ALLOCATED FOR ISMNAIL=g
TOTAL PSU SHELF 3 PIDB TIMESLOTS ALLOCATED FOR ISMNAIL=h
TOTAL PSU SHELF 4 PIDB TIMESLOTS ALLOCATED FOR ISMNAIL=i
TOTAL PSU SHELF 5 PIDB TIMESLOTS ALLOCATED FOR ISMNAIL=j
TOTAL INTER-CLUSTER LINK TIMESLOTS ALLOCATED FOR ISMNAIL=k

2. REASON FOR OUTPUT

This message is in response to an OP:ST-ISMTS (inter-SM time slot) input message and indicates the number of network side time slot interchange unit (TSIU) timeslots and peripheral interface data bus (PIDB) timeslots utilized by inter-SM nailups (ISMNAIL) used for packet transport between switching modules (SMs).

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Termination report. Valid value(s):
   COMPLETED = Request completed successfully.
   FAILURE = Request was terminated before a normal completion.
c = Additional data qualifying the termination of the request. Valid value(s):
   DATABASE PROBLEM = Problem occurred, while attempting to access critical data (accompanying ASSERT should provide more details).
   PACKAGE NOT LOADED = Integrated services digital network packet (ISDNPCKT) is not loaded in the administrative module (AM), and ISMNAIL requests are invalid.
   SM NOT IN ISM NETWORK = SM requested is not in the ISM network, and, therefore, cannot support ISMNAILs.
d = Total of network side TSIU timeslots allocated for ISMNAIL usage. For a host switching module (HSM), local switching module (LSM), optically remoted module (ORM), trunk remoted module (TRM) this corresponds to the time multiplexed switch (TMS) timeslot usage.
e = Total of packet switch unit (PSU) Shelf 0 peripheral interface data bus (PIDB) timeslots allocated for ISMNAIL usage.
f = Total of PSU Shelf 1 PIDB timeslots allocated for ISMNAIL usage.
g = Total of PSU Shelf 2 PIDB timeslots allocated for ISMNAIL usage.
h = Total of PSU Shelf 3 PIDB timeslots allocated for ISMNAIL usage.
\[ i \] = Total of PSU Shelf 4 PIDB timeslots allocated for ISMNAIL usage.

\[ j \] = Total of PSU Shelf 5 PIDB timeslots allocated for ISMNAIL usage.

\[ k \] = Total of remote switching module (RSM) inter-cluster link (ICL) in a multi-module (MMRSM) cluster timeslots allocated for ISMNAIL usage.

4. ACTION TO BE TAKEN

No further action is necessary, if the request completed successfully.

If the termination report indicates a failure, the 'c' field will give an indication as to why the request failed.

5. ALARMS

None.

OP:ST-LISTDIR

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] OP STATUS LISTDIR {STARTED|IN PROGRESS|COMPLETED} [Total a]
    b c d e f g h i

[2] OP STATUS LISTDIR STOPPED
    j k

2. REASON FOR OUTPUT

To report the result of executing an OP:ST-LISTDIR input message.

STARTED, IN PROGRESS and COMPLETED messages appear when three or more output segments are printed.

STARTED and COMPLETED messages appear when two output segments are printed.

A COMPLETED message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Size in blocks. Printed only on STARTED or COMPLETED messages.

b = Total blocks of disk space the files occupy.

c = Mode file type. Refer to the APP:FILE-TYPE appendix in the Output Messages manual for more information about file types. Valid value(s):
    b = Block.
    c = Character.
    d = Directory.
    p = FIFO.
    - = Ordinary.

d = Permissions. (For example, RWX = read, write and execute.)

e = Links - the number of links to a file.

f = Owner of the file.

g = Size in bytes.

h = Current modification time.

i = Filename.

j = Pathname specified in the input command.
k = Text explaining why the input message was stopped. Valid value(s):

- NOT FOUND
- UNREADABLE
- TOO MANY FILES
- OUT OF MEMORY

4. ACTIONS TO BE TAKEN

Format 1 indicates success and requires no action.

For Format 2, refer to the OP:ST-LISTDIR input message for the correct format and reenter the input message if NOT FOUND is printed.

For all other error messages, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

   b   c-d-e [f]  g-h  i
   [j]

[2] OP STATUS MD [SM=a]  NO MD PATHS

2. REASON FOR OUTPUT

Format 1 prints the status of intra-GSM message delivery (MD) paths in response to the OP:STATUS-MD input message.

Format 2 indicates there are no intra-SM MD paths provisioned in the office or the specified GSM.

3. VARIABLE FIELD DEFINITIONS

a = Page indicator. Valid value(s):
   FIRST = First page of report.
   NEXT  = Next report page.
   LAST  = Last page of report associated with this request.

b = Common channel signaling (CCS) global switching module (GSM) number.

c = Switching module (SM) number of packet switching unit (PSU).

d = Unit number of PSU.

e = Shelf number on PSU.

f = Protocol handler (PH) number in shelf.

g = Channel group number (logical PH number on shelf).

h = Logical channel group member number.

i = Status of the intra-GSM MD path. Valid value(s):
   ACTIVE = Path is in service.
   INITIALIZING = Path is currently initializing or will be automatically scheduled for an initialization shortly.
   OOS-DEACTIVATED = Path is manually deactivated.
   OOS-FAMILY PH = Path is out-of-service due to lack of a PH assignment. In this case, PH (field "f") will be blank.
   OOS-TRANSIENT = Path status is OOS undergoing a transition.
Optional information indicating status reliability. Valid value(s):

- COULD NOT SEND OSDS MESSAGE
- DATA CORRUPTED - INCOMPLETE
- INCOMPLETE
- OSDS TIMEOUT - INCOMPLETE

UNIT MTCE STATE
  c=a-d[-e] f[,]g]
  . . . . . .
  . . . . . .
  . . . . . .
__________________________________________________________________

2. REASON FOR OUTPUT

To provide MCTSI-based ethernet link (MELNK)/MCTSI-based ethernet pipe (MEPIPE) information in response to an OP:ST-MELNK input message.

Format 1 is the standard output report format when there are MELNKs and/or an MEPIPE for which status must be reported.

Format 2 prints when an SM has no MEPIPEs or MELNKs in an off normal condition, or when the OP:STAT-MELNK input command specifies an SM range and no accessible SMs in the range have equipped MELNKs. Specifying the NOPRINT qualifier in the OP:STAT-MELNK input command suppresses printing of this output report format.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Text identifier showing order of record. Valid values are:
  FIRST RECORD = First record of continuing list.
  LAST RECORD = Last record of continuing list.
  NEXT RECORD = Next record of continuing list.
c = Unit type for which maintenance state information is being reported. Valid values are:
  MELNK = Output report line specifies an MELNK number and MELNK maintenance state.
  MEPIPE = Output report line specifies an MEPIPE number and MEPIPE maintenance state.
d = MEPIPE number.
e = MELNK number (present only when field 'c' is MELNK).
f = The current maintenance state of the MELNK/MEPIPE. If field 'c' is MELNK, valid values are:
  ACT = Active - all ports of the MELNK are in service.
  DGR = Degraded - at least one but not all MELNK ports are in service.
  OOS = Out of service.
If field 'c' is MEPIPE, valid values are:

**ACT** = Active - the MEPIPE is capable of supporting MELNK connection establishment.

**INIT** = Initializing.

**OOS** = Out of service.

If field 'c' is MELNK, valid values are:

**FE** = Family of equipment - parent MEPIPE is out of service.

**FLT** = MELNK autonomously removed by fault recovery.

**L2** = Level 2 - no MELNK port is in service.

**LBK** = Loop back attempt to far end failed.

**MAN** = The MELNK is manually removed.

**h** = The completion qualifying reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. **ACTIONS TO BE TAKEN**

None.

5. **ALARMS**

None.

6. **REFERENCES**

Input Message(s):

**OP:ST-MELNK**

MCC Display Page(s):

1204 (MELNK STATUS)
OP:ST-MI-REG

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

OP STATUS MI a REGS EVENT=b
MI OPERATIONAL REGISTERS
  ccddeeff gghhiijj kllmmnn ooppqrr ssttuuvv wwxxyyzz
  a1b1c1d1 e1f1g1h1 j1k10000 00000000 00000000 00000000

2. REASON FOR OUTPUT

To output the specified message interface (MI) operational registers because of an automatic request by office network and timing (ONTC) fault recovery.

Note: The variable fields are contents of control registers, error source registers, mask registers, and status registers printed in hexadecimal bytes. Control and mask registers normally have a value of zero. The following rule is used for the bit contents of all error source and status registers:

0 = No error condition.
1 = An error condition has occurred.

3. VARIABLE FIELD DEFINITIONS

a = MI side.
b = Event number.
c = Contents of control register 1 of the MI.
d = Contents of control register 2 of the MI.
e = Contents of control register 3 on the A link of the MI.
f = Contents of control register 3 on the B link of the MI.
g = Contents of control register 4 on the A link of the MI.
h = Contents of control register 4 on the B link of the MI.
i = Contents of control register 5 on the A link of the MI.
j = Contents of control register 5 on the B link of the MI.
k = Contents of control register 6 on the A link of the MI.
l = Contents of control register 6 on the B link of the MI.
m = Contents of control register 7 of the MI.
n = Contents of control register 8 of the MI.
= Contents of status register 1 of the MI. Valid value(s):
Note: For values of 00-K1, B0-B7 required bits 0-7.
B2 = Test receive time slot counter match circuit.
B3 = Not used.
B4 = Not used.
B5 = Not used.
B6 = Not used.
B7 = Not used.
B1 = Error detected by administrative module intervention (AMI) gate array.
B0 = Test transmit time slot counter match circuit.

= Contents of status register 2 on the A link of the MI. Valid value(s):
B0 = Side 0 PC 0.
B1 = Side 1 PC 0.
B2 = Side 0 PC 1.
B3 = Side 1 PC 1.
B4 = Side 0 PC 2.
B5 = Side 1 PC 2.
B6 = Side 0 PC 3.
B7 = Side 1 peripheral controller (PC) 3.

= Contents of status register 2 on the B link of the MI. Valid value(s):
B0 = Side 0 PC 0.
B1 = Side 1 PC 0.
B2 = Side 0 PC 1.
B3 = Side 1 PC 1.
B4 = Side 0 PC 2.
B5 = Side 1 PC 2.
B6 = Side 0 PC 3.
B7 = Side 1 PC 3.

= Contents of mask register 1 on the A link of the MI.
= Contents of mask register 1 on the B link of the MI.
= Contents of mask register 2 of the MI.
= Contents of mask register 3 on the A link of the MI.
= Contents of mask register 3 on the B link of the MI.
= Contents of mask register 4 on the A link of the MI.
= Contents of mask register 4 on the B link of the MI.
= Contents of mask register 5 on the A link of the MI.
= Contents of mask register 5 on the B link of the MI.
= Contents of mask register for error source register map of the MI.
b\(^1\) = Contents of error source register map. Valid value(s):
B0 = Error flagged in error source register 5.
B1 = Error flagged in error source register 3.
B2 = Comparison parity error.
B3 = MI 1 A or MI 2 A unequipped.
B4 = Error flagged in error source register 1.
B5 = MI 1 B or MI 2 B unequipped.
B6 = Error flagged in error source register 5.
B7 = Error flagged in error source register 2.

c\(^1\) = Contents of error source register 1 on the A link of the MI. Valid value(s):
B0 = Transmit parity error on MIB 0.
B1 = Transmit parity error on MIB 1.
B2 = Transmit parity error on MIB 2.
B3 = Transmit parity error on MIB 3.
B4 = Transmit parity error on MIB 4.
B5 = Transmit parity error on MIB 5.
B6 = Transmit parity error on MIB 6.
B7 = Transmit parity error on message interface bus (MIB) 7.

d\(^1\) = Contents of error source register 1 on the B link of the MI. Valid value(s):
B0 = Transmit parity error on MIB 0.
B1 = Transmit parity error on MIB 1.
B2 = Transmit parity error on MIB 2.
B3 = Transmit parity error on MIB 3.
B4 = Transmit parity error on MIB 4.
B5 = Transmit parity error on MIB 5.
B6 = Transmit parity error on MIB 6.
B7 = Transmit parity error on MIB 7.

e\(^1\) = Contents of error source register 2 of the MI. Valid value(s):
B0 = Invalid parity detected across address of MI CDAL word.
B1 = Invalid parity detected across data field of MI control diagnostic access link (CDAL) word.
B2 = Clock detect error on time slot switch memory counter.
B3 = Parity error detected during read access of time slot switching memory.
B4 = Norm sync pulse sequence error on the B link.
B5 = Transmit 4MHz clock generation on the B link.
B6 = Norm sync pulse sequence error on the A link.
B7 = Transmit clock error on the A link.

f\(^1\) = Contents of error source register 3 on the A link of the MI. Valid value(s):
B0 = Mismatch error on MIB 0.
B1 = Mismatch error on MIB 1.
B2 = Mismatch error on MIB 2.
B3 = Mismatch error on MIB 3.
B4 = Mismatch error on MIB 4.
B5 = Mismatch error on MIB 5.
B6 = Mismatch error on MIB 6.

4. ACTION TO BE TAKEN

When this message is output, the office network and timing complex common portion (ONTCCOM) will be taken out of service and diagnosed. The diagnostic should find the problem and report the defective board. If it does not, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. This output data will be useful to others in correcting the problem.

5. ALARMS

4. ACTION TO BE TAKEN

None. Retain this information and transmit to the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

OP:ST-MI
OP:ST-NGSMNET-A

Software Release: 5E14 only
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] OP STATUS NGSMNET NGSM=a b STOPPED c

[2] OP STATUS NGSMNET NGSM=a LAST
GSM  OPC  CMT PATH  STATE  QUALIFIER
a  d  MD=a  e  [f]

2. REASON FOR OUTPUT

Format 1 indicates the status request cannot be processed by the SM at all.

Format 2 reports the requested status output.

NOTE: The CMT PATH specified can currently indicate only intra-SM message delivery (MD) link transport on an ISLAND GSM.

3. VARIABLE FIELD DEFINITIONS

a  = NGSM specified in the input request.

b  = Output message sequence number. Valid value(s):
    FIRST
    LAST
    NEXT

Multiple statuses may be reported per message.

c  = Reasons for failure. Valid value(s):
    NO STATE MATCH = There are no GSM/NGSM pairs matching the state restriction specified on the input message or the default INACC state (not valid for the STATE=ALL or GSM input option).
    NOT AN NGSM = Due to data inconsistencies, the NGSM can identify no provisioned GSM.

d  = Originating point code (9-digit OPC associated with the GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for format of ANSI and AT&T/UNITEL formats.

e  = State. Valid value(s):
    ACC     = CCS message transport within the GSM is available.
    INACC   = CCS message transport within the GSM is unavailable. Further qualification is provided by variable "e".
f = The most restrictive reason for inaccessibility. Valid value(s):
    MD LINK OOS = The loss of CCS functionality is due to the intra-SM MD link outage.

4. ACTIONS TO BE TAKEN

For Format 2 outputs, refer to the corrective maintenance procedures in the Signaling Gateway Common Channel Signaling manual, 235-200-116, if inaccessibility is reported.

5. ALARMS

None.

  .  .  .  .  .
  .  .  .  .  .
  .  .  .  .  .
  a  g  MD=a  i  j

______________________________

2. REASON FOR OUTPUT

Format 1 indicates CCS message transport (CMT) status associated with a non-global switching module (NGSM) cannot be processed for the reason cited.

Format 2 provides CMT status associated with a specific NGSM, in response to an OP:ST-NGSMNET input message (with output restrictions matching input parameters).

The CMT path specified can be direct message handler (DMH) access to an NGSM of SM-2000 hardware type, transfer message handler (TMH) relay to an NGSM (not SM-2000 hardware type), or an intra-GSM message delivery (MD) link. If an NGSM is provisioned with dual TMHs, both paths may appear in the output.

3. VARIABLE FIELD DEFINITIONS

a = NGSM for which CMT status is being produced.
b = Output message sequence number. Valid value(s):
   FIRST
   LAST
   NEXT

Multiple statuses may be reported per message.
c = Reason for failure. Valid value(s):
   NO STATE MATCH = There are no GSM/NGSM pairs matching the state restriction specified on the input command (not valid for the STATE=ALL or GSM input option).
   NOT A NGSM = Due to data inconsistencies, the NGSM can identify no provisioned GSMs.

Copyright ©2003 Lucent Technologies
d = GSM whose status is being provided.

e = NGSM-SM-2000 providing TRANSFER MH functionality.

f = OPC (9-digit primary originating point code associated with the GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for a description of ANSI and AT&T/UNITEL formats.

g = State. Valid value(s):
  ACC = The associated GSM is accessible (such as, there is CCS message transport to the target NGSM/NGSM-2000). If an NGSM is provisioned with dual TRANSFER MHs, accessibility to the specific GSM may be provided by one or both CMT paths. In HOST GSM environments, accessibility does not indicate the ability to handle high traffic loads (capacity is directly proportional to the number of available QPH channel groups).
  DOWN = One TRANSFER MH path to an NGSM (provisioned with dual TRANSFER MHs) to a specific GSM is unavailable: further qualification is provided by variable "\f5\j\f1". The mate CMT path is available and the GSM is accessible.
  INACC = The associated GSM is inaccessible (that is, there is no CCS message transport to the target NGSM/NGSM-2000). If an NGSM is provisioned with dual TRANSFER MHs, both CMT paths are unavailable (both paths will be listed in the output). Further qualification is provided by variable "\f5\j\f1".

h = Restrictive reason for INACC or DOWN states. Valid value(s):
  GSM UNAV = This state indicates the HOST GSM-2000 is initializing or operating in MIN-MODE.
  TRANSFER MH UNAV = The TRANSFER MH has all QLNKs OOS, either due to manual or automatic action, or the parent NGSM-2000 is undergoing an initialization, or is operating in MIN MODE. This state is only applicable to a specified NGSM (NOT an NGSM-2000); the GSM UNAV qualifier above predominate.
  QPHLNK UNAV = If a NGSM (not an NGSM-2000) cannot is specified, it cannot access the HOST GSM, as there are no available QPHLNKs between the associated TRANSFER MH and the HOST GSM.

For an NGSM-2000, loss of all QPHLNKs between the GSM and the DIRECT MH has been detected; the NGSM-2000 specified can be the GSM itself, if the DIRECT MH is provisioned.

The GSM UNAV and TRANSFER MH UNAV qualifiers above predominates (where appropriate).

  CMT PATH LOST = This is the generic case for CMT failures associated with NGSMs (not NGSM-2000), if the more specific NGSM UNAV, TRANSFER MH UNAV, or QPHLNK UNAV cases cannot be identified. It includes the case when the NGSM specified is operating in SM MIN-MODE.

  MD LINK OOS = If the GSM is actually the specified NGSM, the loss of CCS functionality is due to the intra-SM message delivery (MD) link outage. This state is only valid for an ISLAND GSM, when a DIRECT MH is NOT provisioned.

4. ACTIONS TO BE TAKEN

For Format 2 outputs, refer to the corrective maintenance procedures in the Signaling Gateway Common Channel Signaling manual, 235-200-116, if INACC or DOWN states are reported.
5. ALARMS

None.

OP:ST-LI
OP:ST-MI
OP:ST-PLNT24-A

Software Release: 5E16(1) - 5E16(2)
Message Class: PLNT
Application: 5
Type: Output

1. FORMAT

OP STATUS PLNT24
PART STATUS
a b
. .
. .
. .

2. REASON FOR OUTPUT

To respond to an OP:ST-PLNT24 input message request to report the print status of the parts of the 24-hour plant report. Variables ‘a’ and ‘b’ will be repeated as many times as needed to list all the parts of the 24-hour plant report.

3. VARIABLE FIELD DEFINITIONS

a = Name of report part of the 24-hour plant report. Valid value(s):
PART1 = Service measurements.
PART2 = Equipment performance.
PART3 = Performance measurements.
PART4 = Remote switching module (RSM) maintenance service and performance.
PART5 = Trunk error analysis.
PART6 = Interlata carrier measurements.
PART7 = Network call denial.
PART8 = RSM cluster measurements.
PART9 = Integrated services digital network (ISDN) packet switching office totals.
PART10 = Operator Services Position System (OSPS) processors counts.
PART11 = ISDN office totals.
PART12 = OSPS real-time rating query measures.
PART13 = OSPS facility administration measures.
PART14 = OSPS measurements.
PART15 = OSPS interflow measures.
PART16 = OSPS line information database (LIDB) measures.
PART17 = OSPS customer account service (CAS).
PART18 = Action control point (ACP) for software defined network.
PART19 = Leased network action point.
PART20 = OSPS intercept measures.
PART21 = OSPS customer account services release 3 signaling measures.
PART22 = Machine-detected inter-office irregularity (MDII) trunk group measurements.
PART23 = ISDN user part (ISUP) office totals.
PART24 = DS1 measurements.
PART25 = Static proportionate bidding (PB) measurements.
PART26 = OSPS international credit card validation (ICCV) measures by foreign database.
PART27 = OSPS line applications for consumers (LAC) signaling measures.
PART28 = High speed link measurements.
PART29 = Signaling link performance.
b = The status of the part for read-only printer output. Valid value(s):

ALW = Allowed
INH = Inhibited

4. ACTIONS TO BE TAKEN

If the status report indicates that a desired part is inhibited, simply follow up with the appropriate ALW:PLNT24 request to have the desired part printed automatically.

5. ALARMS

None.

   [PREVIOUS STATE = u1 [u1] [u1] [u1] [u1]]

2. REASON FOR OUTPUT

Format 1 is used to report the current status for a line, trunk, data link, or operator services position system (OSPS) port (OSPSPORT) in response to a status query manually initiated with an OP:STATUS input message. A status query for a digital subscriber line (DSL) which has a DSL scope (the entire DSL is implied) results in a single output message containing the status of all the DSL's channels. Both primary status and any pending statuses (0-3) are listed. The time the primary status went into effect is also printed.

Format 2 is only used to print the status of the two primary rate interface (PRI) D-channels when the PRIGRP = option is specified on the input message and the PRI group has D-channel backup (DCBU).

WARNING: The removal or restoration of a large facility may creating a situation in which the OP:STATUS output may report individual port status indications that are temporarily inconsistent with the current status of the facility.

3. VARIABLE FIELD DEFINITIONS

+ = Indicates the line is a party line, a custom multipoint interface DSL, or a standard interface multi-user DSL.

a = Equipment number or identifier. Valid value(s):
Channel identifier (D, B1, or B2) originally specified in the status query request. Used only for DSL lines.

The primary rate interface (PRI) group of a D- or B-channel in the form. This is an optional field and is only printed if the specified port is a B- or D-channel of a PRI.

Equipment number or identifier. Valid value(s):

```

<td>Internal database error. The desired tuple could not be found.</td>
</tr>
<tr>
<td>NON-UNIQUE NXX DN</td>
<td>A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.</td>
</tr>
</tbody>
</table>
```
NOT PRIMARY DN OR MLHG = The DN or MLHG specified is not identified as the primary DN or MLHG and member on any line. It therefore cannot be used to identify which equipment the status is to be obtained for. Refer to RC/V or office records to determine the primary DNs or MLHG and member numbers.

PROCESS TIMEOUT = An internal timeout occurred during processing. The request has been aborted.

SM UNAVAILABLE = The input request could not be completed because a needed switching module (SM) was unable to respond.

SYSTEM BUSY = The system was too busy or a system resource failure occurred. Retry later.

SYSTEM ERROR = An internal error occurred which prevented further processing. The request has been aborted.

g = Channel identifier; D, B1, or B2. B1 and B2 are used only for DSL lines. D is used for DSL lines and for the primary rate interface D-channel when the PRIGRP= option was specified on the input message.

h = Primary status for the trunk, line, data link, or OSPSPORT. This status is the most restrictive to call processing. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

i = Date and time the primary status of the trunk, line, data link, or OSPSPORT was last updated, in the form: month/day/year  hour:min:second

j = Pending status for the trunk, line, data link, or OSPSPORT. These statuses are less restrictive than the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.

k = Data link (group) number.

1 = Relative link (member) number.

m = Telephone number.

n = Operator service center number.

o = Relative position number.

p = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

q = Force management center number.

r = Trunk group number.

s = Trunk member number.

t = EIS identifier (ID) on which a call processing data link (CPDL) terminates.

u = External data link (member) number relative to the EIS.

v = Multi-line hunt group number.

w = Hunt group member number.

x = Switching module (SM) number.
y = Digital line and trunk unit (DLTU) number.
z = Digital facility interface (DFI) number.
a = DFI channel number.
b = Line unit number.
c = Line group number.
d = Line card number.
e = Line grid number.
f = Switch board number.
g = Switch number.
h = Level number.
i = Digital carrier line unit number.
j = Remote terminal (RT) number.
k = RT line number.
l = Trunk unit number.
m = Service group number.
n = Channel board number.
o = Circuit number.
p = RAF or SAS unit number.
q = RAF or SAS announcement channel number.
r = IDCU number.
s = Identifying number of the FGB carrier, which can be up to 4 digits. If present, this variable indicates a direct trunk to a carrier.
t = Identifying number of the FGD carrier, which can be up to 4 digits. If present, this variable indicates a direct trunk to a carrier.
u = Previous status for the trunk, line, data link, or OSPSPORT. Previous status is only printed if the primary status is IS. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.
v = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
w = Data group number.
x = Synchronous transport signal (STS) number.
y¹ = Virtual tributary group number.
z¹ = Digital signal level 0 (DS0).
a² = Line board number.
b² = Line circuit number.
c² = PSU unit number.
d² = PSU shelf number.
e² = PSU channel group number.
f² = PSU channel group member number.
g² = Line group controller number.
h² = Integrated services line unit (ISLU)/ISLU2 number.
i² = Access interface unit (AIU) number.
j² = AIU pack number.
k² = AIU circuit number.
l² = SONET termination equipment (STE) number.
m² = Virtual tributary member number.

4. ACTIONS TO BE TAKEN

None. Refer to the message output for pertinent status and information, and take appropriate action based on the information received, if necessary.

5. ALARMS

None.

m  = Telephone number.
n  = Operator service center number.
o  = Relative position number.
p  = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.
q  = Force management center number.
r  = Trunk group or bearer independent call control (BICC) group number.
s  = Trunk group member number or normalized call instance code (CIC).
t  = EIS identifier (ID) on which a call processing data link (CPDL) terminates.
u  = External data link (member) number relative to the EIS.
v  = Multi-line hunt group number.
w  = Hunt group member number.
x  = Switching module (SM) number.
y  = Digital line and trunk unit (DLTU) number.
z  = Digital facility interface (DFI) number.
a  = DFI channel number.
b  = Line unit number.
c  = Line group number.
d  = Line card number.
e  = Line grid number.
f  = Switch board number.
g  = Switch number.
h  = Level number.
i  = Digital carrier line unit number.
j  = Remote terminal (RT) number.
k  = RT line number.
l  = Trunk unit number.
m¹ = Service group number.

n¹ = Channel board number.

o¹ = Circuit number.

p¹ = RAF or SAS unit number.

q¹ = RAF or SAS announcement channel number.

r¹ = IDCU number.

s¹ = Identifying number of the FGB carrier, which can be up to 4 digits. If present, this variable indicates a direct trunk to a carrier.

t¹ = Identifying number of the FGD carrier, which can be up to 4 digits. If present, this variable indicates a direct trunk to a carrier.

u¹ = Previous status for the trunk, line, data link, or OSPSPORT. Previous status is only printed if the primary status is IS. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

v¹ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

w¹ = Data group number.

x¹ = Synchronous transport signal (STS) number.

y¹ = Virtual tributary group number.

z¹ = Digital signal level 0 (DS0).

a² = Line board number.

b² = Line circuit number.

c² = PSU unit number.

d² = PSU shelf number.

e² = PSU channel group number.

f² = PSU channel group member number.

g² = Line group controller number.

h² = Integrated services line unit (ISLU)/ISLU2 number.

i² = Access interface unit (AIU) number.

j² = AIU pack number.

k² = AIU circuit number.

l² = SONET termination equipment (STE) number.
\( m^2 \) = Virtual tributary member number.

\( n^2 \) = Peripheral control and timing line and trunk unit (PLTU) number.

\( o^2 \) = PCT facility interface (PCTFI) number.

\( p^2 \) = Tributary number.

\( q^2 \) = Channel number.

4. ACTIONS TO BE TAKEN

None. Refer to the message output for pertinent status and information, and take appropriate action based on the information received, if necessary.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   OP:STATUS

Output Appendix(es):

235-105-110   System Maintenance Requirements and Tools
235-900-341   National ISDN Basic Rate Interface Specification
OP:ST-PORT-C

Software Release: 5E16(1) and later
Message Class: TLWS
Application: 5
Type: Output

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. FORMAT

[1] OP STATUS [a] [b] [PKT] [d] [e] [PRIGRP=c] f
   [g] h [h] [h] [h] [h] ii/ii/ii ii:ii:ii
   [j] [j] [j] [j] [j]

2. REASON FOR OUTPUT

Format 1 is used to report the current status for a line, trunk, data link, or operator services position system (OSPS) port (OSPSPORT) in response to a status query manually initiated with an OP:STATUS input message. A status query for a digital subscriber line (DSL) which has a DSL scope (the entire DSL is implied) results in a single output message containing the status of all the DSL's channels. Both primary status and any pending statuses (0-3) are listed. The time the primary status went into effect is also printed.

Format 2 is only used to print the status of the two primary rate interface (PRI) D-channels when the PRIGRP = option is specified on the input message and the PRI group has D-channel backup (DCBU).

WARNING: The removal or restoration of a large facility may creating a situation in which the OP:STATUS output may report individual port status indications that are temporarily inconsistent with the current status of the facility.

3. VARIABLE FIELD DEFINITIONS

+ = Indicates the line is a party line, a custom multipoint interface DSL, or a standard interface multi-user DSL.

a = Equipment number or identifier. Valid value(s):

Copyright ©2003 Lucent Technologies
**b**

Channel identifier originally specified in the status query request. Used only for DSL lines. Valid value(s):

- B1
- B2
- D

**c**

The primary rate interface (PRI) group of a D- or B-channel in the form. This is an optional field and is only printed if the specified port is a B- or D-channel of a PRI.

**d**

Equipment number or identifier. Valid value(s):

- ATMPP=x-c²-b³-c³
- AIUEN=x-i¹-j¹-k¹
- DEN=x-y-z-a¹
- ILEN=x-r¹-j¹-k¹
- INEN=x-v¹-j¹-k¹
- LCEN=x-h²-g²-d¹
- LCKEN=x-h²-c¹-a²-b²
- LEN=x-b¹-e¹-f¹-g¹-h¹
- NEN=x-v¹-w¹-l²-x¹-y¹-m²-z¹
- OIUIEN=x-r²-s²-t²-u²-y¹-m²-q²
- PLTEN=x-n²-o²-p²-q²
- PSUEN=x-c²-d²-e²-f²
- RAF=x-p¹-q¹
- SAS=x-p¹-q¹
- SLEN=x-i¹-j¹-k¹
- TEN=x-l¹-m¹-n¹-o¹
- VANA=x-x²
VBRI = x - y^2
VTRK = x - z^2 - a^3

e = Equipment number or identifier. Valid value(s):
   ICB = s^1
   ICD = t^1
   MLHG = v - w

f = The result of the port status query. Valid value(s):
   CMP UNAVAILABLE = The input request could not be completed because a needed communication
                   module (CM) was unable to respond.
   COMPLETED = The query has completed successfully. All statuses on the port are indicated.
   INPUT ERROR = The input message contained an undetermined error.
   INV PORT = The trunk, line, data link or OSPSPORT specified in the input query request was
              invalid.
   INV PRI GROUP = The PRI group identifier entered could not be translated and was considered
                 invalid.
   MLHG ACCESS DN = The DN entered is a uniform call distribution (UCD), linear hunt line, or
                    multi-position hunt (MUPH) multi-line hunt group line, and as such cannot be used
                    to obtain the status of the line. An equipment number of MLHG and member
                    number must be specified. To obtain these values use recent change/verify (RC/V)
                    for the DN or refer to office records.
   MP ACCESS DN = The DN entered is a uniform call distribution multi-line hunt group line for modem
                  pooling and as such cannot be used to obtain the status of the line. An equipment
                  number of MLHG and member number must be specified. To obtain these values,
                  use RC/V for the DN or refer to office records.
   NO CHANNELS ASSIGNED = The PRI group specified has no channels assigned to it.
   NO DATABASE MATCH = Internal database error. The desired tuple could not be found.
   NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs.
                        Reenter DN with NPA.
   NOT PRIMARY DN OR MLHG = The DN or MLHG specified is not identified as the primary DN or
                            MLHG and member on any line. It therefore cannot be used to identify which
                            equipment the status is to be obtained for. Refer to RC/V or office records to
                            determine the primary DNs or MLHG and member numbers.
   PROCESS TIMEOUT = An internal timeout occurred during processing. The request has been
                     aborted.
   SM UNAVAILABLE = The input request could not be completed because a needed switching
                module (SM) was unable to respond.
   SYSTEM BUSY = The system was too busy or a system resource failure occurred. Retry later.
   SYSTEM ERROR = An internal error occurred which prevented further processing. The request has
                 been aborted.

g = Channel identifier; D, B1, or B2. B1 and B2 are used only for DSL lines. D is used for DSL lines
   and for the primary rate interface D-channel when the PRIGRP= option was specified on the input
   message.

h = Primary status for the trunk, line, data link, or OSPSPORT. This status is the most restrictive to
call processing. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output
Messages manual for a detailed explanation of the status.
i = Date and time the primary status of the trunk, line, data link, or OSPSPORT was last updated, in
the form: month/day/year  hour:min:second

j = Pending status for the trunk, line, data link, or OSPSPORT. These statuses are less restrictive
than the primary status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of
the Output Messages manual for a detailed explanation of the status and the status hierarchy.

k = Data link (group) number.

l = Relative link (member) number.

m = Telephone number.

n = Operator service center number.

o = Relative position number.

p = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1
represents the lead line and a member number of 2 represents the associate line.

q = Force management center number.

r = Trunk group or bearer independent call control (BICC) group number.

s = Trunk group member number or normalized call instance code (CIC).

t = EIS identifier (ID) on which a call processing data link (CPDL) terminates.

u = External data link (member) number relative to the EIS.

v = Multi-line hunt group number.

w = Hunt group member number.

x = Switching module (SM) number.

y = Digital line and trunk unit (DLTU) number.

z = Digital facility interface (DFI) number.

a¹ = DFI channel number.

b¹ = Line unit number.

c¹ = Line group number.

d¹ = Line card number.

e¹ = Line grid number.

f¹ = Switch board number.

g¹ = Switch number.

h¹ = Level number.

i¹ = Digital carrier line unit number.

   a b
   
   [2] **OP STATUS PORTS STOPPED**
   
   c

2. **REASON FOR OUTPUT**

   To respond to an OP:ST-PORTS input message to output the status of each connected port.

3. **VARIABLE FIELD DEFINITIONS**

   a = Port number.
   
   b = Process ID of the process connected to the port (port owner).
   
   c = Text explaining why the command was stopped.

4. **ACTION TO BE TAKEN**

   Format 1 indicates success and requires no action.

   For Format 2, refer to the input message manual for the correct format and reenter the command. If the text is not self-explanatory, seek technical assistance.

5. **ALARMS**

   None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To output the status of one or more active processes.

Format 1 prints when ALL or ALLTERMS was specified in the input message.

Format 2 prints when ALLKERNS was specified in the input message.

Format 3 prints when PATH was specified in the input message.

Format 4 is printed to indicate that the input message failed.

Note 1: STARTED, IN PROGRESS and COMPLETED messages appear when three or more output segments are printed.

Note 2: STARTED and COMPLETED messages appear when two output segments are printed.

Note 3: A COMPLETED message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Process status flags (in hexadecimal notation).

b = Current priority of the process (in decimal notation).
c = Time spent in the kernel in milliseconds (in decimal notation).
d = Time spent in kernel processes in milliseconds (in decimal notation).
e = Time spent in supervisor processes in milliseconds (in decimal notation).
f = Last character of the control channel (terminal) of the process (alphabetical).
g = Process number of the process (in decimal notation).
h = Utility identification (ID) as given in the specification file for the process.
i = Size (in bytes) of the process (in decimal notation).
j = Bit pattern on which the process is sleeping (in hexadecimal notation).
k = Command line used to invoke the process, including any arguments passed to the process. This is in alphabetical sequence.
l = Execution level for the process (in decimal notation).
m = Real-time clock value for a single or repetitive timeout (in hexadecimal notation).
n = Time interval (in milliseconds) between timeouts for repetitive timeouts (in decimal notation).
o = Process event-flag word (in hexadecimal notation).
p = Process control channel (in hexadecimal notation).
q = Address of the process control block (PCB) segment descriptor entry (in hexadecimal notation).
r = Dispatcher control table index for the process (in decimal notation).
s = Name of the controller or device.
t = Process number of the parent process (in decimal notation).
u = Text explaining why the input message was stopped. Valid value(s):
bad input line: badline
bad read
can't open /dev/kmem
can't open swap device: swapdev
can't open /dmrt/kprc
internal error
internal table exhausted
no /dev/pmem
out of memory
read error
read error /dev/kmem
read error on /dmrt/kprc
warning: can't stat /dmrt/kprc

4. ACTION TO BE TAKEN

If Format 4 or other error message prints, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION
section of the Output Messages manual.

5. ALARMS

None. This alarm is either a manually-requested report or is automatically-generated. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[CHAN 0 ALARM: m          RCV K2K1: o [BABBLING]]
[CHAN 1 ALARM: n          XMT K2K1: q]

2. REASON FOR OUTPUT

To report the status of requested packet switch unit (PSU) ATM links (PSALNK).

When more than one PSU link status report are requested, for instance, without specifying the sm, psu and link in the input message, the report is printed in the short Format 1 and 2. When exactly one PSALNK link status is requested, the report is printed in the long Format 3.

3. VARIABLE FIELD DEFINITIONS

BABBLING = APS babbling occurs when the receiving K1 byte (bit 0-7 in parameter o) are inconsistent for 12 successive frames, starting with the last frame containing previously consistent code, where no 3 consecutive frames contain identical K1 byte.

a = Switching module (SM) number.
a = Packet switch unit (PSU) number.
b = Link number.
c = Termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.
d = Additional information qualifying the termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.
e = PSU link status. Valid value(s):
   ACT = Active. All equipped channels in link are active or standby.
   OFFNORM = Off normal. One channel in a duplex link is out-of-service.
   OOS = Out-of-service. All equipped channels in link are OOS.
f = Channel zero status. Valid value(s):
   ACT = Active.
   OOS = Out-of-service.
   STBY = Standby.
   UNEQ = Unequipped.
g = Channel zero qualifier. Valid value(s):
   AIS = Alarm indication signal.
   FE = Family of equipment.
   LCL = Local.
   RMT = Remote.
h = Automatic protection switch state of channel 0. Valid value(s):
   DNR = Do not revert (only if channel is standby.)
   FS = Forced switch.
   LP = Manual switch.
   NR = No request.
   RMT = Remote forced switch (FS) or remote lock out of protection (LP).
   SD = Signal degrade.
   SF = Signal failure.
   RMT = Unavailable due to far end request.
   TBL = Automatic protection switch (APS) trouble.

**NOTE:** This field is blank if this channel is unequipped, unprovisioned, or out-of-service family (OOSF).

If the PHA associated with the channel number is OOS, the APS field will always be blank.
i = Automatic protection switch state of channel 1. Valid value(s):
   DNR = Do not revert (only if channel is standby.)
   FS = Forced switch.
   MS = Manual switch.
NR = No request (only if channel is active.)
RMT = Remote forced switch (FS).
SD = Signal degrade.
SF = Signal failure.

NOTE: The APS state of this channel (the working channel) is maintained by channel 0 (the protection channel.) Therefore, this field is blank if channel 0 status (refer to variable \(g\)) is unequipped or OOSF, or channel 0's APS state (refer to variable \(h\)) is TBL. This field is also blank if this working channel is OOSF.

SD and SF on channel 1 is reported to and is maintained by channel 0. Therefore, SD or SF, if exists, is not shown if the PSLNK is simplex (channel 0 is unequipped).

\(m\) = A 8-digit hexadecimal number represents a 32-bit bitmap SONET/SDH alarm indicator of channel 0.

NOTE: If the PHA associated with the channel number is out-of-service (OOS), the hexadecimal value will be zero.

Bit field definitions are from left to right. Valid value(s):
Bit 31 = Loss of cell delineation.
Bit 30 = Loss of Signal.
Bit 29 = Out of frame.
Bit 28 = Loss of frame.
Bit 27 = Loss of pointer.
Bit 26 = Out of cell synchronization.
Bit 25 = Receive input side loss of clock. Li "Bit 24" = Signal failure.
Bit 23 = Signal degrade.
Bit 22 = Path alarm indication signal.
Bit 21 = Path remote defect indication.
Bit 20 = Line alarm indication signal.
Bit 19 = Line remote defect indication.
Bit 18-0 = Not used.

The active value for each bit is 1.

\(n\) = A 8-digit hexadecimal number represents a 32-bit bitmap SONET alarm indicator of channel 1. Refer to variable \(m\).

\(o\) = Received APS's K2K1 bytes represented in hexadecimal number.

NOTE: If the PHA associated with the channel number is OOS, the hexadecimal value for the APS fields will always be zero (0000).

When the word BABBLING is displayed to the right of this variable, the K1 byte is not meaningful.

Bit definitions are from left to right. Valid value(s):
Bits 15-12 = Channel number of the channel on protection (of K2 byte).
Bit 11 = Architecture (of K2 byte). Valid value(s):
0 = 1+1. One protection channel for one working channel.
1 = 1:n. One protection channel for n number of working channels.

Bits 10-8 = Line alarm of (of K2 byte). Valid value(s):
7 = Line alarm indication signal.
6 = Line remote defect indication.
5-1 = Not used.
0 = No alarm.

Bits 7-4 = Type of request (of K1 byte). Valid value(s):
    f = Lock out of protection.
    e = Forced switch.
    d = High priority signal failure.
    c = Low priority signal failure.
    b = High priority signal degrade.
    a = Low priority signal degrade.
    9 = Not used.
    8 = Manual switch.
    7 = Not used.
    6 = Wait to restore.
    5 = Not used.
    4 = Exercise.
    3 = Not used.
    2 = Reverse request.
    1 = Do not revert.
    0 = No request.

Bits 3-0 = Channel number for which request is being made (of K1 byte).

q = Transmit APS’s K2K1 byte represented in hexadecimal number. Refer to variable ‘o’ for bit definition.

NOTE: If the PHA associated with the channel number is OOS, the APS field will always be blank.

4. ACTIONS TO BE TAKEN

________________________________________________________

2. REASON FOR OUTPUT

To report the status of requested packet switch unit (PSU) asynchronous transfer mode (ATM) links (PSALNK).

When more than one PSU link status report are requested, for instance, without specifying the sm, psu and link in the input message, the report is printed in the short Format 1 and 2. When exactly one PSALNK link status is requested, the report is printed in the long Format 3.

3. VARIABLE FIELD DEFINITIONS

BABBLING = APS babbling occurs when the receiving K1 byte (bit 0-7 in parameter o) are inconsistent for 12 successive frames, starting with the last frame containing previously consistent code, where no 3 consecutive frames contain identical K1 byte (see variable 'p').

a = Switching module (SM) number.
Packet switch unit (PSU) number.

= Link number.

Termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.

Additional information qualifying the termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.

PSU link status. Valid value(s):
- ACT = Active. All equipped channels in link are active or standby.
- OFFNORM = Off normal. One channel in a duplex link is out-of-service.
- OOS = Out-of-service. All equipped channels in link are OOS.

Channel zero status. Valid value(s):
- ACT = Active.
- OOS = Out-of-service.
- STBY = Standby.
- UNEQ = Unequipped.

Channel zero qualifier. Valid value(s):
- AIS = Alarm indication signal.
- FE = Family of equipment.
- LCL = Local.
- RMT = Remote.

Automatic protection switch state of channel 0. Valid value(s):
- FS = Forced switch.
- LP = Lock out of protection.
- MS = Manual switch.
- NR = No request.
- RMT = Remote forced switch (FS) or remote lock out of protection (LP).
- SD = Signal degrade.
- SF = Signal failure.
- RMT = Unavailable due to far end request.
- TBL = Automatic protection switch (APS) trouble.

NOTE: This field is blank if this channel is unequipped, unprovisioned, or out-of-service family (OOSF).

If the PHA associated with the channel number is OOS, the APS field will always be blank.

Channel one status. Refer to variable 'g'.

Channel one qualifier. Refer to variable 'h'.

Automatic protection switch state of channel 1. Valid value(s):
- DNR = Do not revert (only if channel is standby.)
- FS = Forced switch.
- MS = Manual switch.
NR = No request (only if channel is active.)
RMT = Remote forced switch (FS).
SD = Signal degrade.
SF = Signal failure.

NOTE: The APS state of this channel (the working channel) is maintained by channel 0 (the protection channel.) Therefore, this field is blank if channel 0 status (refer to variable 'g') is unequipped or OOSF, or channel 0's APS state (refer to variable 'h') is TBL. This field is also blank if this working channel is OOSF.

SD and SF on channel 1 is reported to and is maintained by channel 0. Therefore, SD or SF, if exists, is not shown if the PSLNK is simplex (channel 0 is unequipped).

\( m \) = A 8-digit hexadecimal number represents a 32-bit bitmap SONET/SDH alarm indicator of channel 0.

NOTE: If the PHA associated with the channel number is out-of-service (OOS), the hexadecimal value will be zero.

Bit field definitions are from left to right. Valid value(s):

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Loss of cell delineation.</td>
</tr>
<tr>
<td>30</td>
<td>Loss of Signal.</td>
</tr>

<td>Not used.</td>
</tr>
</tbody>
</table>

The active value for each bit is 1.

\( n \) = A 8-digit hexadecimal number represents a 32-bit bitmap SONET alarm indicator of channel 1. Refer to variable 'm'.

\( o \) = Received APS's K2K1 bytes represented in hexadecimal number.

NOTE: If the PHA associated with the channel number is OOS, the hexadecimal value for the APS fields will always be zero (0000).

When the word BABBLING is displayed to the right of this variable, the K1 byte is not meaningful.

Bit definitions are from left to right. Valid value(s):

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>15-12</td>
<td>Channel number of the channel on protection (of K2 byte).</td>
</tr>
</tbody>
</table>
| 11   | Architecture (of K2 byte). Valid value(s):
| 0    | 1+1. One protection channel for one working channel. |
| 1    | 1:n. One protection channel for n number of working channels. |
| 10-8 | Line alarm of (of K2 byte). Valid value(s):      |
7 = Line alarm indication signal.
6 = Line remote defect indication.
5-1 = Not used.
0 = No alarm.

Bits 7-4 = Type of request (of K1 byte). Valid value(s):
f = Lock out of protection.
e = Forced switch.
d = High priority signal failure.
c = Low priority signal failure.
b = High priority signal degrade.
a = Low priority signal degrade.
9 = Not used.
8 = Manual switch.
7 = Not used.
6 = Wait to restore.
5 = Not used.
4 = Exercise.
3 = Not used.
2 = Reverse request.
1 = Do not revert.
0 = No request.

Bits 3-0 = Channel number for which request is being made (of K1 byte).

q = Transmit APS's K2K1 byte represented in hexadecimal number. Refer to variable ‘o’ for bit definition.

NOTE: If the PHA associated with the channel number is OOS, the APS field will always be blank.

r = Connection type of the PSU link. Valid value(s):
PT = Point-to-Point
MP = Point-to-Multipoint
APP = ATM Packet-pipe
GW = ATM Gateway

s = ATM alarm indicator. Valid value(s):
YES = ATM alarm exists.
NO = No ATM alarm.

4. ACTIONS TO BE TAKEN

2. REASON FOR OUTPUT

To report the various status of the ethernet links.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Termination status. Valid value(s):
ABORTED = Requested action has aborted.
COMPLETED = Request has successfully completed.
NOT STARTED = Requested action has not been started.
STOPPED = Requested action has stopped.
c = Additional information qualifying the termination status.
d = Packet switch unit (PSU) number.
e = Packet switch unit ethernet (PSELNK) link number.
f = Packet switch unit link status. Valid value(s):
ACT = Link is active. standby.
OOS = Link is OOS
g = Provisioned link rate. Valid value(s):
100 Mbps = 100 Megabits per second (Mbps).
10 Mbps = 10 Megabits per second (Mbps).

**AUTO SENSING** = PH Ethernet link on the PHE will negotiate with the hub/router for highest speed/rate.

\( h \) = Actual rate of the link. Valid value(s):
- 100 Mbps = 100 Megabits per second (Mbps).
- 10 Mbps = 10 Megabits per second (Mbps).
- **NOT APPLICABLE** = Not applicable (when link is OOS).
- **INVALID RATE** = Invalid rate.

2. REASON FOR OUTPUT

To report the various status of the requested packet switch unit (PSU) link(s) (PSLNKs).

Format 1 reports when more than one PSU link status report are requested (for instance, without specifying the far
end PSU community address in the input message). Format 2 reports when exactly one PSU link status is
requested.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Termination status. Valid value(s):
   ABORTED  = Requested action has aborted.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action has not been started.
   STOPPED = Requested action has stopped.

c  = Additional information qualifying the termination status. Refer to the APP:PSU-RESP appendix in
   the Appendixes section of this Output Messages manual.
d  = Near PSU community address of the PSU link(s).
e  = Far PSU community address of the PSU link(s).
f  = ATM alarm indicator. Valid value(s):
NO = No ATM alarm exists.
YES = ATM alarm exists.

g = PSU link status. Valid value(s):
ACT = Active. All equipped channels in link are active or standby.
OFFNORM = Off normal. One channel in a duplex link is out of service.
OOS = Out of service. Both channels in a duplex link are out of service.

h = Channel 0 status. Valid value(s):
ACT = Active.
ACTF = Active forced due to mate channel becoming unavailable.
STBY = Standby.
OOS = Out of service.
OOSF = Out of service family due to parent circuit is OOS.
UNEQ = Unequipped.
UNAV = Unavailable due to local or remote forced switch (FS) or lock out of protection (LP).

i = Channel 0 status qualifier. Valid value(s):
AIS = Alarm indication signal indicates that synchronous optical network (SONET) or synchronous digital hierarchy (SDH) layer AIS for line (AIS-L) or AIS for path (AIS-P) signal is received. This indicates that both the receive and transmit optical fibers are good but either the far end line terminating equipment (LTE) or the far end path terminating equipment (PTE) is not in normal operational mode.
LCL = Locally detected SONET/SDH layer (line) failure in receive optical fiber.
RMT = Remote failure, also known as remote defect indication (RDI) or far end receive failure (FERF), indicates that SONET/SDH layer RDI for line (RDI-L) or RDI for path (RDI-P) signal is received. This indicates that the receive fiber of the far end LTE or PTE is experiencing LCL condition or is receiving SONET/SDH AIS signal.

j = Automatic protection switch state of channel 0. Valid value(s):
FS = Forced switch.
LP = Lock out of protection.
MS = Manual switch.
NR = No request.
RMT = Remote forced switch (FS) or remote lock out of protection (LP).
SD = Signal degrade.
SF = Signal failure.
TBL = Automatic protection switch (APS) trouble. Reasons for trouble are:
Babbling. = This occurs when the receive K1 byte (bits 0-7 of variable 'p') are inconsistent for 12 successive frames, starting with the last frame containing previously consistent code, where no 3 consecutive frames contain identical K1 byte.
Mismatches. = There are 2 types of mismatches: channel mismatch and mode mismatch.
- Channel mismatch occurs when the channel number in the receive K2 byte (bits 12-15 of variable 'q') is inconsistent with the channel number in the transmit K1 byte (bits 0-3 of variable
Mode mismatch occurs when the mode of operation field in the receive K2 byte (bits 8-10 of variable ‘p’) is inconsistent with the mode of operation field in the transmit K2 byte (bits 8-10 of variable ‘q’) for some internally defined finite time.

Invalid code. = This occurs when one or more fields in the receive K1 and K2 bytes (refer to variable ‘p’) contain undefined values or unexpected values.

Far end signal fail on channel 0. = This occurs when the far end of the PSU link experiences signal fail in the receive direction (refer to variable ‘q’).

Note: This field is blank if this channel is unequipped, unprovisioned, or out of service family (OOSF).

\( k \) = A 8-digit hexadecimal number represents a 32-bit bitmap SONET alarm indicator of channel 0.

Note: If the PHA associated with the channel number is out-of-service (OOS), the hexadecimal value will be zero.

Bit field definitions from left to right are as follows:
- Bit 31 = Loss of cell delineation.
- Bit 30 = Loss of Signal.
- Bit 29 = Loss of frame.
- Bit 28 = Loss of pointer.
- Bit 27 = Receive input side loss of clock.
- Bit 26 = Signal failure.
- Bit 25 = Signal degrade.
- Bit 24 = Path alarm indication signal
- Bit 23 = Path remote defect indication.
- Bit 22 = Line alarm indication signal.
- Bit 21 = Line remote defect indication.
- Bit 20-0 = Not used.

The active value for each bit is 1.

\( l \) = Channel 1 status.

- ACT = Active.
- ACTF = Active forced due to mate channel becoming unavailable.
- STBY = Standby.
- OOS = Out of service.
- OOSF = Out of service family due to parent circuit is OOS.
- UNEQ = Unequipped.
- UNAV = Unavailable due to local or remote forced switch (FS).

\( m \) = Channel 1 status qualifier. Refer to variable ‘l’.

\( n \) = Automatic protection switch state of channel 1. Valid value(s):
- DNR = Do not revert (only if channel is standby.)
FS = Forced switch.
MS = Manual switch.
NR = No request (only if channel is active.)
RMT = Remote forced switch (FS).
SD = Signal degrade.
SF = Signal failure.

Note: The APS state of this channel (the working channel) is maintained by channel 0 (the protection channel.) Therefore, this field is blank if channel 0 status (refer to variable 'h') is unequipped or OOSF, or channel 0's APS state (refer to variable 'j') is TBL. This field is also blank if this working channel is OOSF.

SD and SF on channel 1 is reported to and is maintained by channel 0. Therefore, SD or SF, if exists, is not shown if the PSLNK is simplex (channel 0 is unequipped). The SD and SF conditions are available in bit 8 and bit 9 of variable 'o', respectively.

o = A 8-digit hexadecimal number represents a 32-bit bitmap SONET alarm indicator of channel 1.
   Refer to variable 'k'.

p = Received APS's K2K1 bytes represented in hexadecimal number.
Note: If the PHA associated with the channel number is OOS, the hexadecimal value for the APS fields will always be zero (0000).

When the word BABBLING is displayed to the right of this number, the K1 byte is not meaningful (refer to variable 'j' for definition of K1 babbling.)

Bit definitions from left to right are as follows:

Bits 15-12 = Channel number of the channel on protection (of K2 byte).
Bit 11 = Architecture (of K2 byte). Valid value(s):
0 = 1+1. One protection channel for one working channel.
1 = 1:n. One protection channel for n number of working channels.

Bits 10-8 = Mode of operation (of K2 byte). Valid value(s):
7 = Line alarm indication signal.
6 = Line remote defect indication.
5 = Bidirectional.
4 = Unidirectional.
3-0 = Not used.

Bits 7-4 = Type of request (of K1 byte). Valid value(s):
f = Lock out of protection.
e = Forced switch.
d = High priority signal failure.
c = Low priority signal failure.
b = High priority signal degrade.
a = Low priority signal degrade.
9 = Not used.
8 = Manual switch.
7 = Not used.
6 = Wait to restore.
5 = Not used.
4 = Exercise.
3 = Not used.
2 = Reverse request.
1 = Do not revert.
0 = No request.

Bits 3-0 = Channel number for which request is being made (of K1 byte).

q = Transmit APS's K2K1 byte represented in hexadecimal number. Refer to variable 'p' for bit definition.
Note: If the PHA associated with the channel number is OOS, the APS field will always be blank.

r = Receive K1 babbling indication. Refer to variable 'j' for definition of K1 babbling.
Note: If the PHA associated with the channel number is OOS, the APS field will always be blank.

4. ACTION TO BE TAKEN

If the status of a channel is made unavailable (UNAV) using the SET:PSLNK input message for maintenance purpose, it should be cleared using the CLR:PSLNK input message after maintenance action is completed. Leaving a channel unavailable can adversely impact service if failure, such as signal degrade (SD) or signal fail (SF), occurs on the other channel.

5. ALARMS

  MS   = Manual switch.
  NR   = No request.
  RMT  = Remote forced switch (FS) or remote lock out of protection (LP).
  SD   = Signal degrade.
  SF   = Signal failure.
  TBL  = Automatic protection switch (APS) trouble. Reasons for trouble are:
  Babbling. = This occurs when the receive K1 byte (bits 0-7 of variable \( p \)) are inconsistent for 12 successive frames, starting with the last frame containing previously consistent code, where no 3 consecutive frames contain identical K1 byte.
  Mismatches. = There are 2 types of mismatches: channel mismatch and mode mismatch.
  - Channel mismatch occurs when the channel number in the receive K2 byte (bits 12-15 of variable \( q \)) is inconsistent with the channel
number in the transmit K1 byte (bits 0-3 of variable ‘p’) for some internally defined finite time.

- Mode mismatch occurs when the mode of operation field in the receive K2 byte (bits 8-10 of variable ‘p’) is inconsistent with the mode of operation field in the transmit K2 byte (bits 8-10 of variable ‘q’) for some internally defined finite time.

Invalid code. = This occurs when one or more fields in the receive K1 and K2 bytes (refer to variable ‘p’) contain undefined values or unexpected values.

Far end signal fail on channel 0. = This occurs when the far end of the PSU link experiences signal fail in the receive direction (refer to variable ‘q’).

Note: This field is blank if this channel is unequipped, unprovisioned, or out-of-service family (OOSF).

k = A 8-digit hexadecimal number represents a 32-bit bitmap SONET alarm indicator of channel 0.

Note: If the PHA associated with the channel number is out-of-service (OOS), the hexadecimal value will be zero.

Bit field definitions from left to right are as follows:

Bit 31 = Loss of cell delineation.
Bit 30 = Loss of Signal.
Bit 29 = Loss of frame.
Bit 28 = Loss of pointer.
Bit 27 = Receive input side loss of clock.
Bit 26 = Signal failure.
Bit 25 = Signal degrade.
Bit 24 = Path alarm indication signal
Bit 23 = Path remote defect indication.
Bit 22 = Line alarm indication signal.
Bit 21 = Line remote defect indication.
Bit 20-0 = Not used.

The active value for each bit is 1.

l = Channel 1 status.

ACT = Active.
ACTF = Active forced due to mate channel becoming unavailable.
STBY = Standby.
OOS = Out-of-service.
OOSF = Out-of-service family due to parent circuit is OOS.
UNEQ = Unequipped.
UNAV = Unavailable due to local or remote forced switch (FS).

m = Channel 1 status qualifier. Refer to variable ‘l’.

n = Automatic protection switch state of channel 1. Valid value(s):
DNR = Do not revert (only if channel is standby.)
FS = Forced switch.
MS = Manual switch.
NR = No request (only if channel is active.)
RMT = Remote forced switch (FS).
SD = Signal degrade.
SF = Signal failure.

Note: The APS state of this channel (the working channel) is maintained by channel 0 (the protection channel.) Therefore, this field is blank if channel 0 status (refer to variable 'h') is unequipped or OOSF, or channel 0's APS state (refer to variable 'j') is TBL. This field is also blank if this working channel is OOSF. SD and SF on channel 1 is reported to and is maintained by channel 0. Therefore, SD or SF, if exists, is not shown if the PSLNK is simplex (channel 0 is unequipped). The SD and SF conditions are available in bit 8 and bit 9 of variable 'o', respectively.

\( o \) = A 8-digit hexadecimal number represents a 32-bit bitmap SONET alarm indicator of channel 1. Refer to variable 'k'.

\( p \) = Received APS's K2K1 bytes represented in hexadecimal number.
Note: If the PHA associated with the channel number is OOS, the hexadecimal value for the APS fields will always be zero (0000).

When the word BABBLING is displayed to the right of this number, the K1 byte is not meaningful (refer to variable 'j' for definition of K1 babbling.)

Bit definitions from left to right are as follows:

Bits 15-12 = Channel number of the channel on protection (of K2 byte).
Bit 11 = Architecture (of K2 byte). Valid value(s):
0 = 1+1. One protection channel for one working channel.
1 = 1:n. One protection channel for n number of working channels.

Bits 10-8 = Mode of operation (of K2 byte). Valid value(s):
7 = Line alarm indication signal.
6 = Line remote defect indication.
5 = Bidirectional.
4 = Unidirectional.
3-0 = Not used.

Bits 7-4 = Type of request (of K1 byte). Valid value(s):
f = Lock out of protection.
e = Forced switch.
d = High priority signal failure.
c = Low priority signal failure.
b = High priority signal degrade.
a = Low priority signal degrade.
9 = Not used.
8 = Manual switch.
7 = Not used.
6 = Wait to restore.
5 = Not used.
4 = Exercise.
3 = Not used.
2 = Reverse request.
1 = Do not revert.
0 = No request.

Bits 3-0 = Channel number for which request is being made (of K1 byte).

\( q \) = Transmit APS's K2K1 byte represented in hexadecimal number. Refer to variable 'p' for bit definition.
Note: If the PHA associated with the channel number is OOS, the APS field will always be blank.

\( r \) = Receive K1 babbling indication. Refer to variable 'j' for definition of K1 babbling.
Note: If the PHA associated with the channel number is OOS, the APS field will always be blank.

\( s \) = PSU number

4. ACTIONS TO BE TAKEN

If the status of a channel is made unavailable (UNAV) using the SET:PSLNK input message for maintenance purpose, it should be cleared using the CLR:PSLNK input message after maintenance action is completed. Leaving a channel unavailable can adversely impact service if failure, such as signal degrade (SD) or signal fail (SF), occurs on the other channel.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the various status of the requested packet switch unit (PSU) link(s) (PSLNKs).

Format 2 reports when more than one PSU link status report are requested (for instance, without specifying the far end PSU community address in the input message). Format 1 reports when exactly one PSU link status is requested.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this
Output Messages manual.

c = Additional information qualifying the termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.

d = Near PSU community address of the PSU link(s).

e = Far PSU community address of the PSU link(s).

f = ATM alarm indicator. Valid value(s):
NO = No ATM alarm exists.
YES = ATM alarm exists.

PSU link status. Valid value(s):
ACT = Active. All equipped channels in link are active or standby.
OFFNORM = Off normal. One channel in a duplex link is out-of-service.
OOS = Out-of-service. Both channels in a duplex link are out-of-service.

h = Channel 0 status. Valid value(s):
ACT = Active.
ACTF = Active forced due to mate channel becoming unavailable.
STBY = Standby.
OOS = Out-of-service.
OOSF = Out-of-service family due to parent circuit is OOS.
UNEQ = Unequipped.
UNAV = Unavailable due to local or remote forced switch (FS) or lock out of protection (LP).

i = Channel 0 status qualifier. Valid value(s):
AIS = Alarm indication signal indicates that synchronous optical network (SONET) or synchronous digital hierarchy (SDH) layer AIS for line (AIS-L) or AIS for path (AIS-P) signal is received. This indicates that both the receive and transmit optical fibers are good but either the far end line terminating equipment (LTE) or the far end path terminating equipment (PTE) is not in normal operational mode.
LCL = Locally detected SONET/SDH layer (line) failure in receive optical fiber.
RMT = Remote failure, also know as remote defect indication (RDI) or far end receive failure (FERF), indicates that SONET/SDH layer RDI for line (RDI-L) or RDI for path (RDI-P) signal is received. This indicates that the receive fiber of the far end LTE or PTE is experiencing LCL condition or is receiving SONET/SDH AIS signal.

j = Automatic protection switch state of channel 0. Valid value(s):
FS = Forced switch.
LP = Lock out of protection.
MS = Manual switch.
NR = No request.
RMT = Remote forced switch (FS) or remote lock out of protection (LP).
SD = Signal degrade.
SF = Signal failure.
TBL = Automatic protection switch (APS) trouble. Refer to variable 'r' for the trouble reason.
Note: This field is blank if this channel is unequipped, unprovisioned, or out-of-service family (OOSF).

\[ k \]

A 8-digit hexadecimal number represents a 32-bit bitmap SONET alarm indicator of channel 0.

**NOTE:** If the PHA associated with the channel number is out-of-service (OOS), the hexadecimal value will be zero.

Bit field definitions are from left to right. Valid value(s):
- Bit 31 = Loss of cell delineation.
- Bit 30 = Loss of Signal.
- Bit 29 = Loss of frame.
- Bit 28 = Loss of pointer.
- Bit 27 = Receive input side loss of clock.
- Bit 26 = Signal failure.
- Bit 25 = Signal degrade.
- Bit 24 = Path alarm indication signal
- Bit 23 = Path remote defect indication.
- Bit 22 = Line alarm indication signal.
- Bit 21 = Line remote defect indication.
- Bit 20-0 = Not used.

The active value for each bit is 1.

\[ l \]

Channel 1 status. Valid value(s):
- ACT = Active.
- ACTF = Active forced due to mate channel becoming unavailable.
- STBY = Standby.
- OOS = Out-of-service.
- OOSF = Out-of-service family due to parent circuit is OOS.
- UNEQ = Unequipped.
- UNAV = Unavailable due to local or remote forced switch (FS).

\[ m \]

Channel 1 status qualifier. Refer to variable 'l'.

\[ n \]

Automatic protection switch state of channel 1. Valid value(s):
- DNR = Do not revert (only if channel is standby.)
- FS = Forced switch.
- MS = Manual switch.
- NR = No request (only if channel is active.)
- RMT = Remote forced switch (FS).
- SD = Signal degrade.
- SF = Signal failure.

**NOTE:** The APS state of this channel (the working channel) is maintained by channel 0 (the protection channel.) Therefore, this field is blank if channel 0 status (refer to variable 'h') is unequipped or OOSF, or channel 0's APS state (refer to variable 'j') is TBL. This field is also blank if this working channel is OOSF.

SD and SF on channel 1 is reported to and is maintained by channel 0. Therefore, SD or SF, if exists, is not shown if the PSLNK is simplex (channel 0 is unequipped). The SD and
SF conditions are available in bit 8 and bit 9 of variable ‘o’, respectively.

\[ o \]

= A 8-digit hexadecimal number represents a 32-bit bitmap SONET alarm indicator of channel 1. Refer to variable ‘k’.

\[ p \]

= Received APS’s K2K1 bytes represented in hexadecimal number.

**NOTE:** If the PHA associated with the channel number is OOS, the hexadecimal value for the APS fields will always be zero (0000).

When variable ‘r’ is BABBLING, the K1 byte is not meaningful.

Bit definitions are from left to right. Valid value(s):

- Bits 15-12 = Channel number of the channel on protection (of K2 byte).
- Bit 11 = Architecture (of K2 byte). Valid value(s):
  - 0 = 1+1. One protection channel for one working channel.
  - 1 = 1:n. One protection channel for n number of working channels.
- Bits 10-8 = Mode of operation (of K2 byte). Valid value(s):
  - 7 = Line alarm indication signal.
  - 6 = Line remote defect indication.
  - 5 = Bidirectional.
  - 4 = Unidirectional.
  - 3-0 = Not used.
- Bits 7-4 = Type of request (of K1 byte). Valid value(s):
  - f = Lock out of protection.
  - e = Forced switch.
  - d = High priority signal failure.
  - c = Low priority signal failure.
  - b = High priority signal degrade.
  - a = Low priority signal degrade.
  - 9 = Not used.
  - 8 = Manual switch.
  - 7 = Not used.
  - 6 = Wait to restore.
  - 5 = Not used.
  - 4 = Exercise.
  - 3 = Not used.
  - 2 = Reverse request.
  - 1 = Do not revert.
  - 0 = No request.
- Bits 3-0 = Channel number for which request is being made (of K1 byte).

\[ q \]

= Transmit APS's K2K1 byte represented in hexadecimal number. Refer to variable ‘p’ for bit definition.

**NOTE:** If the PHA associated with the channel number is OOS, the APS field will always be blank.

\[ r \]

= Receive K1 babbling indication. Valid value(s):

- BABBLING = This occurs when the receive K1 byte (bits 0-7 of variable ‘p’) are inconsistent for 12 successive frames, starting with the last frame containing previously consistent code, where no 3 consecutive frames contain identical K1 byte.
MISMATCHES = There are 2 types of mismatches: channel mismatch and mode mismatch.

• Channel mismatch occurs when the channel number in the receive K2 byte (bits 12-15 of variable 'q') is inconsistent with the channel number in the transmit K1 byte (bits 0-3 of variable 'p') for some internally defined finite time.

• Mode mismatch occurs when the mode of operation field in the receive K2 byte (bits 8-10 of variable 'p') is inconsistent with the mode of operation field in the transmit K2 byte (bits 8-10 of variable 'q') for some internally defined finite time.

INVALID CODE = This occurs when one or more fields in the receive K1 and K2 bytes (refer to variable 'p') contain undefined values or unexpected values.

FAR END SIGNAL FAIL ON CHANNEL 0. = This occurs when the far end of the PSU link experiences signal fail in the receive direction (refer to variable 'q').

NOTE: If the PHA associated with the channel number is OOS, the APS field will always be blank.

s = PSU number

4. ACTIONS TO BE TAKEN

If the status of a channel is made unavailable (UNAV) using the SET:PSLNK input message for maintenance purpose, it should be cleared using the CLR:PSLNK input message after maintenance action is completed. Leaving a channel unavailable can adversely impact service if failure, such as signal degrade (SD) or signal fail (SF), occurs on the other channel.

5. ALARMS

None.

QPHLNK STATUS
a-b-c-d-e-f i

2. REASON FOR OUTPUT

Format 1 indicates the quad-link packet switch protocol handler link (QPHLNK) status request cannot be processed by the global switching module (GSM) for the reason specified.

Format 2 provides QPHLNK status output for the requested input scope.

3. VARIABLE FIELD DEFINITIONS

a = GSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

b = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

d = QPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

e = Quad-link packet switch (QLPS) network number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

f = Non-global switching module (NGSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

g = Reason for failure. Valid value(s):
MESSAGE TIMEOUT = Response from QPH did not arrive within a timeout interval monitored by the controlling SMP process.
QPH UNEQUIPPED = The input QPH channel group specified in the input message (could be part of LINK or QPIPE input) is not provisioned.
NO EQUIPPED QPHLNK FOUND = No provisioned QPHLNK were found for the scope specified in the input message (LINK, QPIPE or QPH).
PI RESOURCE PROBLEM = Access to QPH is not possible due to PI resource problem.

h = Output message sequence number (FIRST, NEXT, LAST, noting multiple QPHLNK statuses can
be reported per message)

1 = QPHLNK status:

<table>
<thead>
<tr>
<th>STATE</th>
<th>INTERPRETATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>The QPHLNK is in service and available for CCS message transport.</td>
</tr>
<tr>
<td>OOS</td>
<td>The QPHLNK is out of service (unavailable for message routing), while the parent QPH and MH QPIPEs are ACT. This is most likely a transient state occurring during parent hardware reconfigurations.</td>
</tr>
<tr>
<td>OOSF-QPHPIPE</td>
<td>The QPHLNK is OOS for &quot;family-of-equipment&quot; reasons, because the parent QPH QPIPE on the GSM is OOS. This is a stable OOS state, and an autonomous attempt to restore the QPHLNK will occur when the parent QPH QPIPE is successfully restored.</td>
</tr>
<tr>
<td>OOSF-MHPIPE</td>
<td>The QPHLNK is OOS for &quot;family-of-equipment&quot; reasons, because the parent MH QPIPE on the NGSM-2000 DIRECT MH is OOS. This is a stable OOS state, and an autonomous attempt to restore the QPHLNK will occur when the parent MH QPIPE is successfully restored. If both the associated QPH QPIPE and MH QPIPE are OOS, the OOSF-QPHPIPE state predominates.</td>
</tr>
</tbody>
</table>

   DATA MAY BE INCOMPLETE

2. REASON FOR OUTPUT

Format 1 indicates the quad-link packet switch protocol handler (QPH) QPIPE status request cannot be processed by the global switching module (GSM), because there are no provisioned QPH QPIPEs associated with the entire input scope requested.

Format 2 provides QPH QPIPE status output for the requested input scope. Format 3 provides detailed status of a single QPH QPIPE (when DETAIL option was specified in the input request). Format 4 indicates some (but not all) QPH QPIPE statuses were unavailable (probably due to system load).

3. VARIABLE FIELD DEFINITIONS

a = GSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

b = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

d = QPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

e = Quad-link packet switch (QLPS) network number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
$g = \text{OPC (9-digit primary originating point code associated with the GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for a description of ANSI and AT&T/UNITEL formats.}$

$h = \text{Output message sequence number (FIRST, NEXT, LAST, noting mutiple QPH PIPE statuses can be reported per message).}$

$i = \text{Resident physical PH.}$

$j = \text{QPH QPIPE status:}$

<table>
<thead>
<tr>
<th>STATE</th>
<th>INTERPRETATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNEQ</td>
<td>The QPH QPIPE is unequipped. This state is only reported if the mate QPH QPIPE on the same QPH channel group is provisioned.</td>
</tr>
<tr>
<td>INIT</td>
<td>The QPH QPIPE will be restored shortly, typically scheduled during a GSM full initialization, or as a result of audit recovery. This link will eventually be restored to an ACT state, or, if the restore attempt fails, will make a transition to a more specific out-of-service (OOS) state. If the GSM is operating in minimum mode (MIN MODE), the INIT state is permanent, until MIN MODE is exited manually.</td>
</tr>
<tr>
<td>ACT</td>
<td>The QPH QPIPE is functioning normally. A loopback test to the ACT QLPS has passed and child QPHLNKs may be established.</td>
</tr>
<tr>
<td>OOS-DACT</td>
<td>The QPH QPIPE has been manually deactivated (removed from service). Exit from this state requires a manual QPH QPIPE restore (or occurs during a full GSM initialization).</td>
</tr>
</tbody>
</table>
| OOS-LVL1-PATH | The QPH QPIPE is OOS because a TSI-QPH path could not be established during a QPH QPIPE restore attempt (probably due to database read failures or other resource problems).  
SMP-controlled periodic retries or external events will attempt to automatically recover such a QPH QPIPE. |
| OOS-LVL1-FRAME | The QPH QPIPE is OOS because SPORT circuitry on the PH has detected framing errors (probably due to undetected QLPS network hardware errors or TSI faults). A local loopback test (at the PH) has passed, but framing errors persisted when the QPH QPIPE was reconnected to the QLPS network/TSI.  
SMP-controlled periodic retries or external events will attempt to automatically recover such a QPH QPIPE, or a transition to a more stable OOS state will occur as hardware errors are detected by fault recovery. |
| OOS-QLPSLB | The QPH QPIPE has its associated the TSI-QPH path is established, and the QPH SPORT channel is activated (including a local loopback test in the PH), and periodic attempts to pass a loopback test to the ACT QLPS are scheduled. However, the QPH QPIPE is still OOS, as the QLPS loopback test has not yet passed (probably due to undetected QLPS network or TSI faults). QPH-controlled periodic retries or external events will attempt to automatically recover such a QPH QPIPE, or a transition to a more stable OOS state will occur as hardware errors are detected by fault recovery. |
| OOS-QPHLB | The QPH QPIPE is OOS, as a local loopback test (at the PH) was performed and failed, indicating the problem is within the resident PH hardware. Another source of this status is the inability of the SPORT to be activated (a hardware failure). An automatic QPH switch was requested, but no STBY spare PH22 is available on the same shelf the QPH remains in-service, as the mate QPH QPIPE is ACT. A spare PH22 on the same shelf must be restored, or the faulty PH containing the OOS-QPHLB QPH QPIPE must be manually removed/repai, to recover the QPH QPIPE. |
| OOSF-PH | The QPH is OOS due to "family-of-equipment" reasons because the channel group associated with this QPH QPIPE is unassigned (due to a manual or fault recovery removal of a PH22, when there was no STBY spare PH22 available on the same shelf). Automatic attempts to restore the affected QPH QPIPE will occur, when a PH22 is repaired and/or restored, and the parent QPH channel group is reassigned. |
The QPH QPIPE is OOS due to “family-of-equipment” reasons associated with a parent TMSLNK/QTMSLNK outage (communication module or CM hardware). Automatic attempts to restore the affected QPH QPIPE will occur, when the OOS TMSLNK/QTMSLNK is repaired and/or restored. Note that OOS-LVL1-PATH, OOS-QPHLB, OOS-DACT and OOSF-PH are of higher priority (as they reflect local conditions associated with the QPH endpoint), and an OOSF-CM state will not be reported in this case, even if parent TMSLNK/QTMSLNK hardware is OOS.

The QPH QPIPE status is not currently available. This is likely due to a maintenance process attempting to reconfigure the QPH QPIPE when status was requested.

k = QLPS time-multiplexed link (QTMSLNK) terminating the identified QPH QPIPE. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

l = The primary network link interface (NLI) used to connect the specified QPH QPIPE. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To output status information on one or more near endpoint(s) or the status of one or more association(s) and the associated paths.

Format 1 provides the output for a specific endpoint. If DETAIL is requested then the associations assigned to that Endpoint will also be printed with its detail information.

Format 2 provides the output for all endpoints in the office.

Format 3 provides the output for a specific association with the path status if requested.

Format 4 provides the output for all associations in the office.

Format 5 provides the output for all Associations in the specified association set.

Format 6 is a completion report for all formats where the data is printed in segments. It will be printed after all the data has been reported. If non-zero, a summary segment count is displayed.

Format 7 will be printed for any abnormal conditions encountered during processing of the request. It includes SM specific statuses as well.

In Formats 1-5, the PSUPH and CHGRP information displayed is for the serving PH. If a serving PH was not found, this information is not available.

3. VARIABLE FIELD DEFINITIONS

a = Input parameters. Refer to the OP:ST-SCTP input message for valid values.

b = Number of this segment in the listing produced. Segments are numbered sequentially starting from one. For a completion report (Format 6) this number is a summary count of the total number of segments printed.

c = Completion report. Valid value(s):
COMPLETED = Request has been processed.
CONTINUED = Second and subsequent segments of a list too long to be printed in a single segment.
NO DATA FOUND = The search was performed as requested, but no data was found for the given input.
SM UNAVAILABLE = A specific SM was unavailable.
STARTED = The first segment of a list of one or more segments of data.
STOPPED - DATABASE ACCESS ERROR = Database access error.
STOPPED - SYSTEM ERROR = A system error occurred making it impossible to continue processing the request.
SYSTEM BUSY = Indicates the system was too busy to process the request or a system resource failure occurred. Retry later.
TIMEOUT = Internal time-out while processing the request.
UNEXPECTED MESSAGE RCVD = An unexpected message was received.

d = Near endpoint name. This is a character string (≤20) that is provisioned on RC/V View 33.19 (SCTP NEAR END POINT).
e = Endpoint status. Refer to the APP:SCTP appendix in the Appendixes section of the output message manual for an explanation of the SCTP statuses.
f = Switching module (SM) number.
g = Packet switch unit (PSU) number.
h = Processor group number. Refer to PSUPH for the SM and PSU.
i = PSU shelf number.
j = Channel group (CHGRP) number. Refer to PSUPH for the PSU shelf number.
k = Protocol handler number.
l = Association number.
m = Association set name. This is a character string (≤20) that is provisioned on RC/V View 33.23 (ASSOCIATION SET).
n = Association status. Refer to the APP:SCTP appendix in the Appendixes section of the output message manual for an explanation of the SCTP statuses.
o = Far endpoint name. This is a character string (≤20) that is provisioned on RC/V View 33.21 (SCTP FAR END POINT).
p = Far internal protocol (IP) address.
q = Path status. Valid value(s):
ACTIVE = The path is active.
INACTIVE = The path is inactive.
r = Retransmission timeout (RTO) in milliseconds.
s = Far SCTP port.
t = SM number. This is displayed in Format 7 only if any SM specific abnormal status is being reported.

4. ACTIONS TO BE TAKEN
None.

5. ALARMS

  .      .      .     .    .  
  .      .      .     .    .

[3] OP STATUS SERV {PCRGRP=a-b|PSUPH=a-c-d-e} [SEG f] [g]

2. REASON FOR OUTPUT

To respond to the OP:ST-SERV input message for the service selection status of a processor group or range of processor groups on a global services module (GSM).

This output message reports the auto ping, ethernet link, and the service selection states for each processor found for the processor groups specified on the input request.

Format 1 reports problems with the input request.

Format 2 reports the state information for the processors found.

Format 3 reports the completion of the output for the processor groups requested.

3. VARIABLE FIELD DEFINITIONS

a  = GSM number.  
b  = Processor group number.  
c  = Packet switching unit (PSU) number.  
d  = PSU shelf number.  
e  = PH position number.  
f  = Segment number for a multi-segmented report if the completion code is started or continued. Or it the number of segments reported if the completion code is completed.

g  = Completion code. Valid value(s):
  COMPLETED  = End of report.
  CONTINUED  = Continuing a multi-segmented report.
  DENIED     = The status request has been denied because the processor specified could not
be found. This could be caused by specifying an undefined processor or if the processor's channel group is unassigned. An unassigned channel group occurs when a PH is OOS.

**FAILED** = The status request has failed due to an unexpected software problem.

**GSM UNAVAIL** = The GSM specified is unavailable. Try again later.

**STARTED** = Start of a multi-segmented report.

**SYSTEM BUSY** = The system is busy. Try again later.

**h** = Auto ping status. Valid value(s):
- **DOWN** = Pinging to the adjacent router has failed.
- **UP** = Pinging to the adjacent router is successful.
- **blank** = The ping status is unknown or could not be obtained.

**i** = Ethernet link status. Valid value(s):
- **ACT** = The ethernet link to the adjacent level 2 switch is up.
- **OOS** = The ethernet link to the adjacent level 2 switch is down.
- **blank** = The ethernet link status is unknown or could not be obtained.

**j** = Service selection state for the processor identified. Valid value(s):
- **NONSERVING** = The processor is not serving but can take over when needed.
- **UNAVAILABLE** = The processor is not available and cannot support any signaling activity.
- **SERVING** = The processor is serving the signaling needs of the processor group.
- **blank** = The service selection status is unknown or could not be obtained.

### 4. ACTIONS TO BE TAKEN

None. This message is the result of a service selection status request.

### 5. ALARMS

None.

### 6. REFERENCES

Input Message(s):

OP:ST-SUM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] OP STATUS SUM COMPLETED
   a   b    c
   ____________________________________________________________________

[2] OP STATUS SUM STOPPED
   d
   ____________________________________________________________________

2. REASON FOR OUTPUT

To output the result of executing the OP:ST-SUM input message to calculate the checksum and to report the number of blocks in a file.

Format 1 indicates successful execution of the input message.
Format 2 indicates that the input message failed.

3. VARIABLE FIELD DEFINITIONS

a = 16-bit checksum of a file (in decimal notation).
b = Number of blocks in a file (in decimal notation).
c = Pathname of the file specified in the input message.
d = Text explaining why the input message was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates success and requires no action.

For Format 2, refer to the input message manual for the correct format and reenter the input message. The existence of the file can be confirmed using the OP:ST-LISTDIR input message. If the text is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

### 1. FORMAT

<table>
<thead>
<tr>
<th>SECT</th>
<th>NAME</th>
<th>SIZE</th>
<th>STATUS</th>
<th>SIZE</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>b</td>
<td>c</td>
<td>d</td>
<td>e</td>
<td>f</td>
</tr>
</tbody>
</table>

#### 2. REASON FOR OUTPUT

To respond to an OP:ST-TRFC30 input message request to report the print status of the sections of the 30-minute traffic report.

Variables 'a' through 'f' will be repeated up to 30 times in each message. As many messages will be printed as are needed to list all the sections of the 30-minute traffic report.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Number of a section of the 30-minute traffic report. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual for section numbers.
- **b** = Name of a section of the 30-minute traffic report. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual for section names.
- **c** = The size (in message units) of the section when the output is directed to the receive-only printer (ROP).
- **d** = The status (ALW or INH) of the section for receive-only printer output.
- **e** = The size (in message units) of the section when the output is directed to the traffic channel (TRFCH).
- **f** = The status (ALW or INH) of the section for traffic channel output.

### 4. ACTION TO BE TAKEN

If the status indicates that a desired section is inhibited, and there is room left for it in the allocation (as given by OP:MEASTAT-PRNT), allow it (ALW:TRFC30). If there is not room for it, choose a report (or section of the TRFC30) that is not desired and inhibit it (INH:TRFC30). Follow up with the appropriate ALW:TRFC30 request.

### 5. ALARMS

None.

**Software Release:** 5E14 and later
**Message Class:** ACSR
**Application:** 5
**Type:** Output

1. **FORMAT**

   [1] OP STAT
   ACSR ENQ a
   ACSR DEQ a
   ACSR QUEUE b

   [2] OP STAT
   CORC c

   [3] OP STAT
   ACSR ENQ a
   ACSR DEQ a
   ACSR QUEUE b
   CORC c

2. **REASON FOR OUTPUT**

   To print the status of automatic customer station rearrangement (ACSR) enqueuing and dequeuing, to report if the ACSR queue is full or not, and/or to report if customer originated recent change (CORC) is allowed or inhibited.

3. **VARIABLE FIELD DEFINITIONS**

   a
   
   = ACSR dequeuing/enqueuing status. Valid value(s):
   MANUALLY ALLOWED = Operation is allowed by manual action.
   MANUALLY INHIBITED = Operation is inhibited by manual action.
   RECOVERY = Recovery status.
   SYSTEM ALLOWED = Operation is allowed by system.
   SYSTEM INHIBITED = Operation is inhibited by system.

   b
   
   = ACSR queue status. Valid value(s):
   IS FULL = ACSR queue is full.
   IS NOT FULL = ACSR queue is not full.

   c
   
   = CORC status. Valid value(s):
   ALLOWED = CORC is allowed on the switch.
   INHIBITED = CORC is not allowed on the switch.

4. **ACTION TO BE TAKEN**

   If ACSR is system inhibited, one or more of the following conditions are true:
Recent change is inhibited.
- Recent change is in backout for a SM.
- Recent change log files are full and recent change logging is not inhibited.

If ACSR dequeuing is manually inhibited and dequeuing is desired, allow ACSR dequeuing with the input message ALW:ACSR. (This does not override a system inhibit)

If ACSR enqueuing is manually inhibited and enqueuing is desired, allow ACSR enqueuing with the input message ALW:ACSR. (This does not override a system inhibit)

If the ACSR queue is full, verify that ACSR dequeuing is allowed. If dequeuing is manually inhibited, then allow ACSR dequeuing with the ALW:ACSR input message.

If CORC is inhibited, use MCC page 110 to allow CORC.

5. ALARMS

None.

2. REASON FOR OUTPUT

This message is in response to an OP:STATUS-PS (packet switch unit (PSU) timeslot usage) input message.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = SM type. Valid value(s):
HSM = Host switching module.
LSM = Local switching module.
ORM = Optical remote module.
RSM = Remote switching module.
TRM = Two-mile remote module.

C = Number of network side timeslot interchange unit (TSIU) timeslots allocated for inter-switching module (ISM) nailup usage. For an LSM, HSM, ORM and TRM this corresponds to the time multiplexed switch (TMS) timeslot usage. RSM usage corresponds to the summation of intra-cluster link (ICL) timeslots for multi-module RSMs (MMRSM) within the same cluster and T1 umbilical (UMB) to HSM timeslots allocated for ISM nailups.

d = Number of PSU shelf 0 peripheral interface data bus (PIDB) timeslots allocated for ISM nailup usage.
= Number of PSU shelf 1 PIDB timeslots allocated for ISM nailup usage.

f = Number of PSU shelf 2 PIDB timeslots allocated for ISM nailup usage.

g = Number of PSU shelf 3 PIDB timeslots allocated for ISM nailup usage.

h = Number of PSU shelf 4 PIDB timeslots allocated for ISM nailup usage.

i = Number of ICL timeslots in a MMRSM cluster allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of ICL timeslots be allocated for usage.

j = Number of UMB timeslots allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of TSIU timeslots be allocated for usage.

k = Number of network side TSIU timeslots allocated for internal protocol (IP) trunk nailup usage.

l = Number of PSU shelf 0 PIDB timeslots allocated for IP trunk nailup usage.

m = Number of PSU shelf 1 PIDB timeslots allocated for IP trunk nailup usage.

n = Number of PSU shelf 2 PIDB timeslots allocated for IP trunk nailup usage.

o = Number of PSU shelf 3 PIDB timeslots allocated for IP trunk nailup usage.

p = Number of PSU shelf 4 PIDB timeslots allocated for IP trunk nailup usage.

q = Number of network side TSIU timeslots allocated for X.25 packet switching on a T1 facility (XAT) nailup usage.

r = Number of PSU shelf 0 PIDB timeslots allocated for XAT nailup usage.

s = Number of PSU shelf 1 PIDB timeslots allocated for XAT nailup usage.

t = Number of PSU shelf 2 PIDB timeslots allocated for XAT nailup usage.

u = Number of PSU shelf 3 PIDB timeslots allocated for XAT nailup usage.

v = Number of PSU shelf 4 PIDB timeslots allocated for XAT nailup usage.

w = Number of network side TSIU timeslots allocated for primary rate interface (PRI) nailup usage.

x = Number of PSU shelf 0 PIDB timeslots allocated for PRI nailup usage.

y = Number of PSU shelf 1 PIDB timeslots allocated for PRI nailup usage.

z = Number of PSU shelf 2 PIDB timeslots allocated for PRI nailup usage.

a¹ = Number of PSU shelf 3 PIDB timeslots allocated for PRI nailup usage.

b¹ = Number of PSU shelf 4 PIDB timeslots allocated for PRI nailup usage.

c¹ = Number of network side TSIU timeslots allocated for X.75 trunk nailup usage.

d¹ = Number of PSU shelf 0 PIDB timeslots allocated for X.75 trunk nailup usage.

e¹ = Number of PSU shelf 1 PIDB timeslots allocated for X.75 trunk nailup usage.
f = Number of PSU shelf 2 PIDB timeslots allocated for X.75 trunk nailup usage.
g = Number of PSU shelf 3 PIDB timeslots allocated for X.75 trunk nailup usage.
h = Number of PSU shelf 4 PIDB timeslots allocated for X.75 trunk nailup usage.
i = Number of network side TSIU timeslots allocated for X.75' trunk nailup usage.
j = Number of PSU shelf 0 PIDB timeslots allocated for X.75' trunk nailup usage.
k = Number of PSU shelf 1 PIDB timeslots allocated for X.75' trunk nailup usage.
l = Number of PSU shelf 2 PIDB timeslots allocated for X.75' trunk nailup usage.
m = Number of PSU shelf 3 PIDB timeslots allocated for X.75' trunk nailup usage.
n = Number of PSU shelf 4 PIDB timeslots allocated for X.75' trunk nailup usage.
o = Number of PSU shelf 0 timeslots allocated for BRI semi-permanent D-channel and B-channel usage.
p = Number of PSU shelf 1 timeslots allocated for BRI semi-permanent D-channel and B-channel usage.
q = Number of PSU shelf 2 timeslots allocated for BRI semi-permanent D-channel and B-channel usage.
r = Number of PSU shelf 3 timeslots allocated for BRI semi-permanent D-channel and B-channel usage.
s = Number of PSU shelf 4 timeslots allocated for BRI semi-permanent D-channel and B-channel usage.
t = Number of network side TSIU timeslots allocated for Basic Rate Interface (BRI) semi-permanent D-channel and B-channel usage.
u = Number of PSU shelf 0 PIDB timeslots reserved for the remote digital test access (RDTA) feature.
v = Number of PSU shelf 1 PIDB timeslots reserved for the RDTA feature.
w = Number of PSU shelf 2 PIDB timeslots reserved for the RDTA feature.
x = Number of PSU shelf 3 PIDB timeslots reserved for the RDTA feature.
y = Number of PSU shelf 4 PIDB timeslots reserved for the RDTA feature.
z = Number of network side TSIU timeslots allocated for packet pipe (PP TRK) nailup usage. For an intra-SM packet pipe on an SM, this corresponds to the TMS timeslot usage for the packet pipe members and the packet pipe port. For an intra-SM packet pipe on an SM-2000, no network side TSIU timeslots are used. For an inter-SM packet pipe, the network side TSIU count is the number of network side TSIU timeslots used in the half of the packet pipe that resides on this SM.
a = Number of PSU shelf 0 PIDB timeslots allocated for PP TRK nailup usage.
b = Number of PSU shelf 1 PIDB timeslots allocated for PP TRK nailup usage.
\(c^2\) = Number of PSU shelf 2 PIDB timeslots allocated for PP TRK nailup usage.

\(d^2\) = Number of PSU shelf 3 PIDB timeslots allocated for PP TRK nailup usage.

\(e^2\) = Number of PSU shelf 4 PIDB timeslots allocated for PP TRK nailup usage.

\(f^2\) = Number of PSU shelf 0 PIDB timeslots allocated for speech handler trunk (SH TRK) nailup usage.

\(g^2\) = Number of PSU shelf 1 PIDB timeslots allocated for SH TRK nailup usage.

\(h^2\) = Number of PSU shelf 2 PIDB timeslots allocated for SH TRK nailup usage.

\(i^2\) = Number of PSU shelf 3 PIDB timeslots allocated for SH TRK nailup usage.

\(j^2\) = Number of PSU shelf 4 PIDB timeslots allocated for SH TRK nailup usage.

\(k^2\) = Number of network side TSIU timeslots allocated for common channel signaling (CCS) nailup usage.

\(l^2\) = Number of PSU shelf 0 PIDB timeslots allocated for CCS nailup usage.

\(m^2\) = Number of PSU shelf 1 PIDB timeslots allocated for CCS nailup usage.

\(n^2\) = Number of PSU shelf 2 PIDB timeslots allocated for CCS nailup usage.

\(o^2\) = Number of PSU shelf 3 PIDB timeslots allocated for CCS nailup usage.

\(p^2\) = Number of PSU shelf 4 PIDB timeslots allocated for CCS nailup usage.

\(q^2\) = Total number of network side TSIU timeslots allocated for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, PP TRK, CCS nailup usage, and QPH usage on a given GSM. Use this guideline: on an SM a maximum 190 TSIU timeslots should be allocated for ISDN nailup usage. For an SM-2000 and cellular applications, no guidelines exist.

\(r^2\) = Total number of PSU shelf 0 PIDB timeslots allocated/reserved for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, RDTA, PP TRK, SH TRK, EOC/TMC, ODB, CCS nailup usage, and QPH usage on a given GSM.

\(s^2\) = Total number of PSU shelf 1 PIDB timeslots allocated/reserved for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, RDTA, PP TRK, SH TRK, EOC/TMC, ODB, CCS nailup usage, and QPH usage on a given GSM.

\(t^2\) = Total number of PSU shelf 2 PIDB timeslots allocated/reserved for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, RDTA, PP TRK, SH TRK, EOC/TMC, ODB, CCS nailup usage, and QPH usage on a given GSM.

\(u^2\) = Total number of PSU shelf 3 PIDB timeslots allocated/reserved for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, RDTA, PP TRK, SH TRK, EOC/TMC, ODB, CCS nailup usage, and QPH usage on a given GSM.

\(v^2\) = Total number of PSU shelf 4 PIDB timeslots allocated/reserved for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, RDTA, PP TRK, SH TRK, EOC/TMC, ODB, CCS nailup usage, and QPH usage on a given GSM.

\(w^2\) = Total number of RSM ICL timeslots in a MMRSM cluster allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of ICL timeslots be allocated for usage.
x² = Total number of UMB timeslots allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of TSIU timeslots be allocated for usage.

y² = Number of PSU shelf 0 timeslots allocated for EOC and TMC nailup usage.

z² = Number of PSU shelf 1 timeslots allocated for EOC and TMC nailup usage.

a³ = Number of PSU shelf 2 timeslots allocated for EOC and TMC nailup usage.

b³ = Number of PSU shelf 3 timeslots allocated for EOC and TMC nailup usage.

c³ = Number of PSU shelf 4 timeslots allocated for EOC and TMC nailup usage.

d³ = Number of PSU shelf 0 timeslots allocated for ODB nailup usage.

e³ = Number of PSU shelf 1 timeslots allocated for ODB nailup usage.

f³ = Number of PSU shelf 2 timeslots allocated for ODB nailup usage.

g³ = Number of PSU shelf 3 timeslots allocated for ODB nailup usage.

h³ = Number of PSU shelf 4 timeslots allocated for ODB nailup usage.

i³ = Number of network side TSIU timeslots reserved for QPH usage on a given GSM.

j³ = Number of PSU shelf 0 PIDB timeslots reserved for QPH usage on a given GSM.

k³ = Number of PSU shelf 1 PIDB timeslots reserved for QPH usage on a given GSM.

l³ = Number of PSU shelf 2 PIDB timeslots reserved for QPH usage on a given GSM.

m³ = Number of PSU shelf 3 PIDB timeslots reserved for QPH usage on a given GSM.

n³ = Number of PSU shelf 4 PIDB timeslots reserved for QPH usage on a given GSM.

4. ACTIONS TO BE TAKEN

If the request completed successfully, no action is necessary.

2. REASON FOR OUTPUT

This message is in response to an OP:STATUS-PS (packet switch unit (PSU) timeslot usage) input message.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = SM type. Valid value(s):
  HSM = Host switching module.
  LSM = Local switching module.
  ORM = Optical remote module.
  RSM = Remote switching module.
  TRM = Two-mile remote module.

c = Number of network side timeslot interchange unit (TSIU) timeslots allocated for inter-switching module (ISM) nailup usage. For an LSM, HSM, ORM and TRM this corresponds to the time multiplexed switch (TMS) timeslot usage. RSM usage corresponds to the summation of intra-cluster link (ICL) timeslots for multi-module RSMs (MMRSM) within the same cluster and T1 umbilical (UMB) to HSM timeslots allocated for ISM nailups.

d = Number of PSU shelf 0 peripheral interface data bus (PIDB) timeslots allocated for ISM nailup usage.
= Number of PSU shelf 1 PIDB timeslots allocated for ISM nailup usage.

= Number of PSU shelf 2 PIDB timeslots allocated for ISM nailup usage.

= Number of PSU shelf 3 PIDB timeslots allocated for ISM nailup usage.

= Number of PSU shelf 4 PIDB timeslots allocated for ISM nailup usage.

= Number of ICL timeslots in a MMRSM cluster allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of ICL timeslots be allocated for usage.

= Number of UMB timeslots allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of TSIU timeslots be allocated for usage.

= Number of network side TSIU timeslots allocated for internal protocol (IP) trunk nailup usage.

= Number of PSU shelf 0 PIDB timeslots allocated for IP trunk nailup usage.

= Number of PSU shelf 1 PIDB timeslots allocated for IP trunk nailup usage.

= Number of PSU shelf 2 PIDB timeslots allocated for IP trunk nailup usage.

= Number of PSU shelf 3 PIDB timeslots allocated for IP trunk nailup usage.

= Number of PSU shelf 4 PIDB timeslots allocated for IP trunk nailup usage.

= Number of network side TSIU timeslots allocated for X.25 packet switching on a T1 facility (XAT) nailup usage.

= Number of PSU shelf 0 PIDB timeslots allocated for XAT nailup usage.

= Number of PSU shelf 2 PIDB timeslots allocated for PRI nailup usage.

= Number of PSU shelf 3 PIDB timeslots allocated for PRI nailup usage.

= Number of PSU shelf 4 PIDB timeslots allocated for PRI nailup usage.

= Number of network side TSIU timeslots allocated for X.75 trunk nailup usage.

= Number of PSU shelf 0 PIDB timeslots allocated for X.75 trunk nailup usage.

= Number of PSU shelf 1 PIDB timeslots allocated for X.75 trunk nailup usage.
f^1 = Number of PSU shelf 2 PIDB timeslots allocated for X.75 trunk nailup usage.
g^1 = Number of PSU shelf 3 PIDB timeslots allocated for X.75 trunk nailup usage.
h^1 = Number of PSU shelf 4 PIDB timeslots allocated for X.75 trunk nailup usage.
i^1 = Number of network side TSIU timeslots allocated for X.75' trunk nailup usage.
j^1 = Number of PSU shelf 0 PIDB timeslots allocated for X.75' trunk nailup usage.
k^1 = Number of PSU shelf 1 PIDB timeslots allocated for X.75' trunk nailup usage.
l^1 = Number of PSU shelf 2 PIDB timeslots allocated for X.75' trunk nailup usage.
m^1 = Number of PSU shelf 3 PIDB timeslots allocated for X.75' trunk nailup usage.
n^1 = Number of PSU shelf 4 PIDB timeslots allocated for X.75' trunk nailup usage.
o^1 = Number of network side TSIU timeslots allocated for Basic Rate Interface (BRI) semi-permanent D-channel and B-channel usage.
p^1 = Number of PSU shelf 0 timeslots allocated for BRI semi-permanent D-channel and B-channel usage.
q^1 = Number of PSU shelf 1 timeslots allocated for BRI semi-permanent D-channel and B-channel usage.
r^1 = Number of PSU shelf 2 timeslots allocated for BRI semi-permanent D-channel and B-channel usage.
s^1 = Number of PSU shelf 3 timeslots allocated for BRI semi-permanent D-channel and B-channel usage.
t^1 = Number of PSU shelf 4 timeslots allocated for BRI semi-permanent D-channel and B-channel usage.
u^1 = Number of PSU shelf 0 PIDB timeslots reserved for the remote digital test access (RDTA) feature.
v^1 = Number of PSU shelf 1 PIDB timeslots reserved for the RDTA feature.
w^1 = Number of PSU shelf 2 PIDB timeslots reserved for the RDTA feature.
x^1 = Number of PSU shelf 3 PIDB timeslots reserved for the RDTA feature.
y^1 = Number of PSU shelf 4 PIDB timeslots reserved for the RDTA feature.
z^1 = Number of network side TSIU timeslots allocated for packet pipe (PP TRK) nailup usage. For an intra-SM packet pipe on an SM, this corresponds to the TMS timeslot usage for the packet pipe members and the packet pipe port. For an intra-SM packet pipe on an SM-2000, no network side TSIU timeslots are used. For an inter-SM packet pipe, the network side TSIU count is the number of network side TSIU timeslots used in the half of the packet pipe that resides on this SM.
a^2 = Number of PSU shelf 0 PIDB timeslots allocated for PP TRK nailup usage.
b^2 = Number of PSU shelf 1 PIDB timeslots allocated for PP TRK nailup usage.
c\(^2\) = Number of PSU shelf 2 PIDB timeslots allocated for PP TRK nailup usage.
d\(^2\) = Number of PSU shelf 3 PIDB timeslots allocated for PP TRK nailup usage.
e\(^2\) = Number of PSU shelf 4 PIDB timeslots allocated for PP TRK nailup usage.
f\(^2\) = Number of PSU shelf 0 PIDB timeslots allocated for speech handler trunk (SH TRK) nailup usage.
g\(^2\) = Number of PSU shelf 1 PIDB timeslots allocated for SH TRK nailup usage.
h\(^2\) = Number of PSU shelf 2 PIDB timeslots allocated for SH TRK nailup usage.
i\(^2\) = Number of PSU shelf 3 PIDB timeslots allocated for SH TRK nailup usage.
j\(^2\) = Number of PSU shelf 4 PIDB timeslots allocated for SH TRK nailup usage.
k\(^2\) = Number of network side TSIU timeslots allocated for common channel signaling (CCS) nailup usage.
l\(^2\) = Number of PSU shelf 0 PIDB timeslots allocated for CCS nailup usage.
m\(^2\) = Number of PSU shelf 1 PIDB timeslots allocated for CCS nailup usage.
n\(^2\) = Number of PSU shelf 2 PIDB timeslots allocated for CCS nailup usage.
o\(^2\) = Number of PSU shelf 3 PIDB timeslots allocated for CCS nailup usage.
p\(^2\) = Number of PSU shelf 4 PIDB timeslots allocated for CCS nailup usage.
q\(^2\) = Total number of network side TSIU timeslots allocated for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, PP TRK, CCS nailup usage, and QPH usage on a given GSM. Use this guideline: on an SM a maximum 190 TSIU timeslots should be allocated for ISDN nailup usage. For an SM-2000 and cellular applications, no guidelines exist.
r\(^2\) = Total number of PSU shelf 0 PIDB timeslots allocated/reserved for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, RDTA, PP TRK, SH TRK, EOC/TMC, ODB, CCS nailup usage, and QPH usage on a given GSM.
s\(^2\) = Total number of PSU shelf 1 PIDB timeslots allocated/reserved for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, RDTA, PP TRK, SH TRK, EOC/TMC, ODB, CCS nailup usage, and QPH usage on a given GSM.
t\(^2\) = Total number of PSU shelf 2 PIDB timeslots allocated/reserved for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, RDTA, PP TRK, SH TRK, EOC/TMC, ODB, CCS nailup usage, and QPH usage on a given GSM.
u\(^2\) = Total number of PSU shelf 3 PIDB timeslots allocated/reserved for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, RDTA, PP TRK, SH TRK, EOC/TMC, ODB, CCS nailup usage, and QPH usage on a given GSM.
v\(^2\) = Total number of PSU shelf 4 PIDB timeslots allocated/reserved for ISM, IP trunk, XAT, PRI, X.75, X.75' trunk, BRI, RDTA, PP TRK, SH TRK, EOC/TMC, ODB, CCS nailup usage, and QPH usage on a given GSM.
w\(^2\) = Total number of RSM ICL timeslots in a MMRSM cluster allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of ICL timeslots be allocated for usage.
x² = Total number of UMB timeslots allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of TSIU timeslots be allocated for usage.

y² = Number of PSU shelf 0 timeslots allocated for EOC and TMC nailup usage.

z² = Number of PSU shelf 1 timeslots allocated for EOC and TMC nailup usage.

a³ = Number of PSU shelf 2 timeslots allocated for EOC and TMC nailup usage.

b³ = Number of PSU shelf 3 timeslots allocated for EOC and TMC nailup usage.

c³ = Number of PSU shelf 4 timeslots allocated for EOC and TMC nailup usage.

d³ = Number of PSU shelf 0 timeslots allocated for ODB nailup usage.

e³ = Number of PSU shelf 1 timeslots allocated for ODB nailup usage.

f³ = Number of PSU shelf 2 timeslots allocated for ODB nailup usage.

g³ = Number of PSU shelf 3 timeslots allocated for ODB nailup usage.

h³ = Number of PSU shelf 4 timeslots allocated for ODB nailup usage.

i³ = Number of network side TSIU timeslots reserved for QPH usage on a given GSM.

j³ = Number of PSU shelf 0 PIDB timeslots reserved for QPH usage on a given GSM.

k³ = Number of PSU shelf 1 PIDB timeslots reserved for QPH usage on a given GSM.

l³ = Number of PSU shelf 2 PIDB timeslots reserved for QPH usage on a given GSM.

m³ = Number of PSU shelf 3 PIDB timeslots reserved for QPH usage on a given GSM.

n³ = Number of PSU shelf 4 PIDB timeslots reserved for QPH usage on a given GSM.

2. REASON FOR OUTPUT

The messages are in response to an OP:STATUS-PS (packet switch unit (PSU) timeslot usage) input message.

Format 1 displays the number of peripheral interface data bus (PIDB) or peripheral control and timing (PCT)
timeslots connecting the timeslot interchange unit (TSIU) to the PSU shelf that are allocated to nailed-up or semi-permanent connections by service type. A report per PSU is printed but only if there is a non-zero count for that PSU.

Format 2 displays the number of network-side TSIU, remote switching module (RSM) inter-cluster link (ICL), and RSM umbilical (UMB) timeslots allocated per service type. A TSIU report is printed for the SM even if all counts are zero.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = SM type. Valid value(s):
   HSM = Host switching module.
   LSM = Local switching module.
   ORM = Optical remote module.
   RSM = Remote switching module.
   TRM = Two-mile remote module.

c = Output message segment number.

d = PSU number.

e = Number of PSU shelf 0 PIDB or PCT link timeslots allocated for inter-switching module (ISM) nailup usage.

f = Number of PSU shelf 1 PIDB or PCT link timeslots allocated for ISM nailup usage.

g = Number of PSU shelf 2 PIDB or PCT link timeslots allocated for ISM nailup usage.

h = Number of PSU shelf 3 PIDB or PCT link timeslots allocated for ISM nailup usage.

i = Number of PSU shelf 4 PIDB or PCT link timeslots allocated for ISM nailup usage.

j = Number of PSU shelf 0 PIDB or PCT link timeslots allocated for internal protocol (IP) packet trunk nailup usage.

k = Number of PSU shelf 1 PIDB or PCT link timeslots allocated for IP packet trunk nailup usage.

l = Number of PSU shelf 2 PIDB or PCT link timeslots allocated for IP packet trunk nailup usage.

m = Number of PSU shelf 3 PIDB or PCT link timeslots allocated for IP packet trunk nailup usage.

n = Number of PSU shelf 4 PIDB or PCT link timeslots allocated for IP packet trunk nailup usage.

o = Number of PSU shelf 0 PIDB or PCT link timeslots allocated for X.25 over T1 facility (XAT) nailup usage.

p = Number of PSU shelf 1 PIDB or PCT link timeslots allocated for XAT nailup usage.

q = Number of PSU shelf 2 PIDB or PCT link timeslots allocated for XAT nailup usage.

r = Number of PSU shelf 3 PIDB or PCT link timeslots allocated for XAT nailup usage.

s = Number of PSU shelf 4 PIDB or PCT link timeslots allocated for XAT nailup usage.
\( t \) = Number of PSU shelf 0 PIDB or PCT link timeslots allocated for primary rate interface (PRI) nailup usage.

\( u \) = Number of PSU shelf 1 PIDB or PCT link timeslots allocated for PRI nailup usage.

\( v \) = Number of PSU shelf 2 PIDB or PCT link timeslots allocated for PRI nailup usage.

\( w \) = Number of PSU shelf 3 PIDB or PCT link timeslots allocated for PRI nailup usage.

\( x \) = Number of PSU shelf 4 PIDB or PCT link timeslots allocated for PRI nailup usage.

\( y \) = Number of PSU shelf 0 PIDB or PCT link timeslots allocated for X.75 packet trunk nailup usage.

\( z \) = Number of PSU shelf 1 PIDB or PCT link timeslots allocated for X.75 packet trunk nailup usage.

\( a^1 \) = Number of PSU shelf 2 PIDB or PCT link timeslots allocated for X.75 packet trunk nailup usage.

\( b^1 \) = Number of PSU shelf 3 PIDB or PCT link timeslots allocated for X.75 packet trunk nailup usage.

\( c^1 \) = Number of PSU shelf 4 PIDB or PCT link timeslots allocated for X.75 packet trunk nailup usage.

\( d^1 \) = Number of PSU shelf 0 PIDB or PCT link timeslots allocated for X.75' packet trunk nailup usage.

\( e^1 \) = Number of PSU shelf 1 PIDB or PCT link timeslots allocated for X.75' packet trunk nailup usage.

\( f^1 \) = Number of PSU shelf 2 PIDB or PCT link timeslots allocated for X.75' packet trunk nailup usage.

\( g^1 \) = Number of PSU shelf 3 PIDB or PCT link timeslots allocated for X.75' packet trunk nailup usage.

\( h^1 \) = Number of PSU shelf 4 PIDB or PCT link timeslots allocated for X.75' packet trunk nailup usage.

\( i^1 \) = Number of PSU shelf 0 timeslots allocated for Basic Rate Interface (BRI) B-channel packet and semi-permanent D-channel usage.

\( j^1 \) = Number of PSU shelf 1 timeslots allocated for BRI B-channel packet and semi-permanent D-channel usage.

\( k^1 \) = Number of PSU shelf 2 timeslots allocated for BRI B-channel packet and semi-permanent D-channel usage.

\( l^1 \) = Number of PSU shelf 3 timeslots allocated for BRI B-channel packet and semi-permanent D-channel usage.

\( m^1 \) = Number of PSU shelf 4 timeslots allocated for BRI B-channel packet and semi-permanent D-channel usage.

\( n^1 \) = Number of PSU shelf 0 PIDB or PCT link timeslots reserved for the remote digital test access (RDTA) feature.

\( o^1 \) = Number of PSU shelf 1 PIDB or PCT link timeslots reserved for the RDTA feature.

\( p^1 \) = Number of PSU shelf 2 PIDB or PCT link timeslots reserved for the RDTA feature.

\( q^1 \) = Number of PSU shelf 3 PIDB or PCT link timeslots reserved for the RDTA feature.

\( r^1 \) = Number of PSU shelf 4 PIDB or PCT link timeslots reserved for the RDTA feature.
Number of PSU shelf 0 PIDB or PCT link timeslots allocated for code division multiple access (CDMA) trunking to PSU pipe application (for example, packet pipe (PP), frame relay bearer channel (FRBC), IS41, and so forth) and PSU ATM Pipe trunk usage.

Number of PSU shelf 1 PIDB or PCT link timeslots allocated for CDMA wireless pipe trunk and PSU ATM pipe trunk nailup usage.

Number of PSU shelf 2 PIDB or PCT link timeslots allocated for CDMA wireless pipe trunk and PSU ATM pipe trunk nailup usage.

Number of PSU shelf 3 PIDB or PCT link timeslots allocated for CDMA wireless pipe trunk and PSU ATM pipe trunk nailup usage.

Number of PSU shelf 4 PIDB or PCT link timeslots allocated for CDMA wireless pipe trunk and PSU ATM pipe trunk nailup usage.

Number of PSU shelf 0 PIDB or PCT link timeslots allocated for speech handler trunk (SH TRK) nailup usage.

Number of PSU shelf 1 PIDB or PCT link timeslots allocated for SH TRK nailup usage.

Number of PSU shelf 2 PIDB or PCT link timeslots allocated for SH TRK nailup usage.

Number of PSU shelf 3 PIDB or PCT link timeslots allocated for SH TRK nailup usage.

Number of PSU shelf 4 PIDB or PCT link timeslots allocated for SH TRK nailup usage.

Number of PSU shelf 0 timeslots allocated for embedded operations channel (EOC) and timeslot maintenance channel (TMC) nailup usage.

Number of PSU shelf 1 timeslots allocated for EOC and TMC nailup usage.

Number of PSU shelf 2 timeslots allocated for EOC and TMC nailup usage.

Number of PSU shelf 3 timeslots allocated for EOC and TMC nailup usage.

Number of PSU shelf 4 timeslots allocated for EOC and TMC nailup usage.

Number of PSU shelf 0 timeslots allocated for on-demand B (ODB) nailup usage.

Number of PSU shelf 1 timeslots allocated for ODB nailup usage.

Number of PSU shelf 2 timeslots allocated for ODB nailup usage.

Number of PSU shelf 3 timeslots allocated for ODB nailup usage.

Number of PSU shelf 4 timeslots allocated for ODB nailup usage.

Number of PSU shelf 0 PIDB or PCT link timeslots allocated for common channel signaling (CCS) signaling link nailup usage.

Number of PSU shelf 1 PIDB or PCT link timeslots allocated for CCS signaling link nailup usage.

Number of PSU shelf 2 PIDB or PCT link timeslots allocated for CCS signaling link nailup usage.

Number of PSU shelf 3 PIDB or PCT link timeslots allocated for CCS signaling link nailup usage.
\[ q^2 \] = Number of PSU shelf 4 PIDB or PCT link timeslots allocated for CCS signaling link nailup usage.

\[ r^2 \] = Number of PSU shelf 0 PIDB or PCT link timeslots reserved for quad-link packet switch PH (QPH) usage on a given global switching module (GSM).

\[ s^2 \] = Number of PSU shelf 1 PIDB or PCT link timeslots reserved for QPH usage on a given GSM.

\[ t^2 \] = Number of PSU shelf 2 PIDB or PCT link timeslots reserved for QPH usage on a given GSM.

\[ u^2 \] = Number of PSU shelf 3 PIDB or PCT link timeslots reserved for QPH usage on a given GSM.

\[ v^2 \] = Number of PSU shelf 4 PIDB or PCT link timeslots reserved for QPH usage on a given GSM.

\[ w^2 \] = Sum of all PSU shelf 0 PIDB or PCT link timeslots allocated/reserved across all service types.

\[ x^2 \] = Sum of all PSU shelf 1 PIDB or PCT link timeslots allocated/reserved across all service types.

\[ y^2 \] = Sum of all PSU shelf 2 PIDB or PCT link timeslots allocated/reserved across all service types.

\[ z^2 \] = Sum of all PSU shelf 3 PIDB or PCT link timeslots allocated/reserved across all service types.

\[ a^3 \] = Sum of all PSU shelf 4 PIDB or PCT link timeslots allocated/reserved across all service types.

\[ b^3 \] = Number of network side TSIU timeslots allocated for ISM nailup usage. For an LSM, HSM, ORM and TRM this corresponds to the time multiplexed switch (TMS) timeslot usage. RSM usage corresponds to the summation of link timeslots for multi-module remote switching modules (MMRSM) within the same cluster and T1 UMB to HSM timeslots allocated for ISM nailups.

\[ c^3 \] = Number of ICL timeslots in a MMRSM cluster allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of ICL timeslots be allocated for usage.

\[ d^3 \] = Number of UMB timeslots allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of TSIU timeslots be allocated for usage.

\[ e^3 \] = Number of network side TSIU timeslots allocated for IP packet trunk nailup usage.

\[ f^3 \] = Number of network side TSIU timeslots allocated for X.25 packet switching on an XAT nailup usage.

\[ g^3 \] = Number of network side TSIU timeslots allocated for PRI nailup usage.

\[ h^3 \] = Number of network side TSIU timeslots allocated for X.75 packet trunk nailup usage.

\[ i^3 \] = Number of network side TSIU timeslots allocated for X.75' packet trunk nailup usage.

\[ j^3 \] = Number of network side TSIU timeslots allocated for BRI B-channel packet and semi-permanent D-channel usage.

\[ k^3 \] = Number of network side TSIU timeslots allocated for NxDS0 CMDA or PSU pipe nailup usage. For an intra-SM pipe on a classic SM, this number is the sum of both sides of the path (for example, sum the timeslots used for the DS0-side of the pipe and the timeslots used for the PSU-side of the pipe). For an intra-SM pipe on an SM-2000, no network side TSIU timeslots are used. For an inter-SM pipe, the network side TSIU count is the number of network side TSIU timeslots allocated in the half of the NxDS0 pipe path that resides in that SM.
1 \( \equiv \) Number of network side TSIU timeslots allocated for CCS signaling link nailup usage.

2 \( \equiv \) Number of network side TSIU timeslots reserved for QPH usage on a given GSM.

3 \( \equiv \) Sum of network side TSIU timeslots allocated across service types on an SM. Use this guideline: on a classic SM a maximum of 190 TSIU timeslots should be allocated for ISDN nailup usage. For an SM-2000 and cellular applications, no guidelines exist.

4 \( \equiv \) Total number of RSM ICL timeslots in a MMRSM cluster allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of ICL timeslots be allocated for usage.

5 \( \equiv \) Total number of UMB timeslots allocated for ISM nailup usage. It is recommended that a maximum of 25% of the total number of TSIU timeslots be allocated for usage.

2. REASON FOR OUTPUT

To give device information specific to administrative module (AM) hardware units on communities requested by the OP:STBY input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for AM unit names.

b = Unit number (refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual).

c = Subunit name. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual for AM subunit names.
Messages manual for AM control unit (CU) subunit names.

\( d \) = Subunit number (refer to the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual).

\( e \) = The current maintenance state of the unit. Valid value(s):
- ACT = Active units.
- GROW = Units being grown.
- INIT = Initializing units.
- OFL = Offline units.
- OOS = Out-of-service units.
- STBY = Standby units.
- UNAV = Unavailable units.
- UNEQIP = Unequipped units.

\( f \) = Current inhibit status of the associated error source. Valid value(s):
- ALW = Allowed.
- INH = Inhibited.

\( g \) = Results of the last diagnostic on the unit. Valid value(s):
- ABT = Aborted diagnostics.
- ATP = All tests passed.
- CATP = Conditional all tests passed.
- NTR = No tests were run.
- STF = Some tests failed.

\( h \) = Error number. Valid value(s):
- 9 = Cannot attach to plant measurement library.
- 11 = Cannot open equipment configuration database (ECD)sequence.
- 12 = Cannot sequence unit control blocks (UCBs).

\( i \) = Retry the command later. Valid value(s):
- CAN’T SEQUENCE DATABASE
- CAN’T CREATE FILE IN /tmp
- CAN’T GET DATABASE RECORD ID

\( j \) = Temporary output file name.

\( k \) = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.
Note: The OMDB keys will vary depending on the alarm level of the message.

2. REASON FOR OUTPUT

To respond to the OP:SYSSTAT input message or to report hourly the off-normal conditions corresponding to the Master Control Center (MCC) display pages for system inhibits, administrative module (AM), communication module (CM), communication module processor (CMP) and the switching module (SM) summary pages. In the case of the automatic hourly report, no printout is given if conditions are normal. This message is normally logged, but will also print in response to input message OP:SYSSTAT.

3. VARIABLE FIELD DEFINITIONS

a
    = Record sequence identifier. Valid value(s):
    FIRST  = First record in sequence.
    LAST   = Last record in sequence.
    NEXT   = Second or subsequent record in sequence.

b
    = SM configuration. Valid value(s):
    B  = Basic configuration.
    G  = Signaling configuration.
    L  = Loaded configuration.
    S  = Standard configuration.
    K  = SM-2000 configuration.
    ?  = Unknown configuration. Relation SMCONF needs to be verified.

c
    = Processor with off-normal conditions. Valid value(s):
    AM  = Administrative module.
    CM  = Communication module.
    CMP = Communication module processor.
    HSM = Host switching module.
    LSM = Local switching module.
    ORM = Optical remote switching module.
    RSM = Remote switching module.
    SYS = System-wide conditions.
    TRM = Two-mile optical remote switching module.
    DRM = Distinctive remote switching module.
    ??? = Unknown type of switching module. Relation MODATT needs to be verified.
d = Physical SM number.
e = Active side of SM.
f = Message switch side (MSGs).
g = Physical CMP number.
h = Processor being reported on. Valid value(s):
M = Mate CMP.
P = Primary CMP.
i = Off-normal condition(s) existing in processor ‘c’. Valid value(s):
BACKOUT-RC = Recent change backout has occurred.
BACKOUT-UPD = Program update backout occurred.
BKUP_FAIL = Recent change office-dependent data (ODD) backup has failed.
BLDG/PWR = Non-critical building and power alarms for remote modules and peripheral units. = Call processing restrictions are in effect.
CACHE_DIS = Cache disabled on SM processor.
CALL_CONTROL = Call processing restrictions are in effect.
CGA = Carrier group alarm.
CCS_LNK = Common channel signaling link off-normal.
CKT_LIMIT = One or more circuit groups have exceeded their out-of-service (OOS) limit.
CKT_OOS = One or more circuits are OOS.
CLNK_LOST = All CLNK communication has been lost to this SM or SM-2000.
CLNK_OFFN = The indicated SM has one or more off-normal communication links.
CMP_ISOL = Total service interruption is in effect due to unavailability of the CMP without the stand alone call processing option.
CMP_STALN = The module is in stand-alone call processing due to unavailability of the CMP.
CMTOFFN = Some CMT paths lost on a GSM.
COMM_LOST = Communication lost with AM. Displayed during automatic fault recovery interval. If the SM has QLNKs equipped, CLNK plus QLNK are lost.
CPE_SYNC = Synchronizing customer premises equipment (CPE) lamps and displays.
CRIT_ALM = Critical building and power alarms for remote modules and peripheral units.
D/C_HASH = Disc to core hashsum mismatch.
DATA_SYNC = The module is synchronizing data following an initialization or isolation.
DSL_MAJOR = 30% or more of the digital subscriber lines (DSLs) on this module are out-of-service.
DSL_MINOR = One or more (<30%) of the DSLs on this module are out-of-service.
E911_CRIT = All of the application processor (AP) links to the enhanced 911 service adjunct (ESA) on this module are out-of-service.
FAN/FUSE = Module or remote ISDN line unit remote integrated services line unit (RISLU) fan or fuse alarms.
FORCED = Hardware forces are in effect.
GEN_DIFF = The AM contains a different software release than this module.
HASH_ERR = The memory contains a hashsum error.
HSM_ISOL = Total RSM service interruption is in effect due to unavailability of its HSM without the stand-alone call processing option in the RSM.
HSM_STALN = The RSM is in stand-alone call processing due to unavailability of its HSM.
INHIBITS-AUD = Audit inhibits are in effect.
INHIBITS-HW = Hardware inhibits are in effect.
INHIBITS-MISC = Miscellaneous inhibits are in effect.
INHIBITS-MSG = Message handling inhibits are in effect.
INHIBITS-MTCE = Maintenance inhibits are in effect.
INHIBITS-PUMP = Pump inhibits are in effect.
INHIBITS-RC = Recent change inhibits are in effect.
INHIBITS-SW = Software inhibits are in effect.
INITIALIZING = The module is initializing.
INIT_ISOL = An initialization is pending on an isolated SM.
INIT_PEND = An initialization is pending.
ISDN_RT_RST = Restarting integrated services digital network (ISDN) DSLs, timeslot management control (TMC) data links to IDCU hosted remote terminals (RTs), or embedded operations channel (EOC) data links to IDCU hosted RTs.
ISOLATED = Automatically isolated module without the stand alone call processing option, due to loss of communication with the AM. If the SM has QLNKs equipped, CLNK plus QLNK are lost.
MAN_ISOL = The module has been isolated manually. If the SM has QLNKs equipped, CLNK plus QLNK are lost.
MATE_OOD = Offline memory is out of date.
MATE_PUMP = The offline memory is different from the on-line memory, or it is in the process of updating.
MATE_UPD = Offline memory is being updated from the on-line memory.
MELNKOFFN = MCTSI-Based Ethernet Link off-normal.
MIN_MODE = The module is in minmode.
MISC = System is off-normal due to reasons pertaining to the updating of the software release.
MORE = There are more off-normal conditions than can be listed on this line. These conditions are of less importance than the ones listed.
MSG_CNTL = Output messages are being discarded at the user's request.
NCMTLOST = All CMT paths lost in a non global switching module (NGSM).
NCMTOFFN = Some CMT paths lost in a NGSM.
NIPMP = Non-interfering pump in progress.
NOINTERCP = Intermodule calls can not be made by this module because its links to the active major ONTC are out-of-service.
NO_REQ_PEND = The module has no requests pending.
NORMAL = The module has no off-normal conditions (only printed in response to manual requests).
ODDHSHERR = The ODD memory area contains a hash error.
ODD_WARN = Either the amount of ODD space being used has exceeded the engineering recommendations or the automatic relation engineering reorganization process has failed on one or more relations.
OVERLOAD = A call processing or resource overload condition exists.
POSTINIT = Module is in safe period following a high-level initialization.
POST_CUT = Module is in the post-cutover state.
PRE_CUT = Module is in the pre-cutover state.
PSLNKOFFN = Some PSU link connectivity has been lost. Either one channel of a duplex link is out-of-service, or there is a virtual path alarm on the link.
PSLNKOOS = At least one PSU link has lost connectivity. If it is a simplex link (only one channel equipped), the channel is out-of-service, or both channels of a duplex link are out-of-service.
PTL_STALN = The RSM is in partial stand alone because at least one other RSM in the MMRSM is in stand alone mode.
QLNK_LOST = If QGPs are equipped, all QLNK communication has been lost to this SM-2000. If QGPs are not equipped, all ISMQLNK communication has been lost to this SM-2000.
QLNK_OFFN = Some but not all QLNKs or ISMQLNKs are off-normal to this SM-2000.
QLPS_ISOL = QPIPEs to All networks have been lost to this SM-2000.
QMAN_ISOL = SM-2000 is manually isolated from QLPS network.
QPHOFFN = Some quad-link packet switch protocol handler (QPH) QPHPIPES/QPHLNK lost.
QPIPE_OOS = SM-2000 lost MH QPIPE to a single network.
REQ_PEND = Request to "set" or "inh" the module is pending.
RT_PLS = RT protection line switching status has changed.
SCAN_ON = Non-DSL line and trunk scanning is on. Non-ISDN calls can be originated.
SFT_SWITCH = The CMP is going through a soft switch.
SPEC_GROW = The module is in a special growth state.
STNDALONE = Automatically isolated module with the stand alone call processing option, due to loss of communication with the AM.
SVC_DGRD = Call processing service is degraded due to inability to connect paths between this module and other modules.
SVC_INTR = A partial or total service interruption is in effect.

4. ACTIONS TO BE TAKEN

Verify that the indicated off-normal conditions exist and take corrective action to remove them.

5. ALARMS

None.

To respond to the OP:SYSSTAT input message or to report hourly the off-normal conditions corresponding to the Master Control Center (MCC) display pages for system inhibits, administrative module (AM), communication module (CM), communication module processor (CMP) and the switching module (SM) summary pages.

In the case of the automatic hourly report, no printout is given if conditions are normal.

This message is normally logged, but will also print in response to input message OP:SYSSTAT.

3. VARIABLE FIELD DEFINITIONS

a = Record sequence identifier. Valid value(s):
FIRST = First record in sequence.
LAST = Last record in sequence.
NEXT = Second or subsequent record in sequence.

b = SM configuration. Valid value(s):
B = Basic configuration.
G = Signaling configuration.
L = Loaded configuration.
S = Standard configuration.
K = SM-2000 configuration.
P = 2KPPC configuration.
? = Unknown configuration. Relation SMCONF needs to be verified.

c = Common channel signaling (CCS) global switching module indicator. Valid value(s):
G = CCS global switching module.

d = Processor with off-normal conditions. Valid value(s):
AM = Administrative module.
CM = Communication module.
CMP = Communication module processor.
HSM = Host switching module.
LSM = Local switching module.
ORM = Optical remote switching module.
RSM = Remote switching module.
SYS = System-wide conditions.
TRM = Two-mile optical remote switching module.
DRM = Distinctive remote switching module.
??? = Unknown type of switching module. Relation MODATT needs to be verified.

e = Physical SM number.
f = Active side of SM.
g = Message switch side (MSGS).
h = Physical CMP number.
i = Processor being reported on. Valid value(s):
M = Mate CMP.
P = Primary CMP.

j = Off-normal condition(s) existing in processor ‘d’. Valid value(s):
APSOFFN = OIU has encountered an automatic protection switch (APS) off-normal condition.
BACKOUT-RC = Recent change backout has occurred.
BACKOUT-UPD = Program update backout occurred.
BKUP_FAIL = Recent change office-dependent data (ODD) backup has failed.
BLDG/PWR = Non-critical building and power alarms for remote modules and peripheral units. 
            Call processing restrictions are in effect.
CACHE_DIS = Cache disabled on SM processor.
CALL_CONTROL = Call processing restrictions are in effect.
CGA = Carrier group alarm.
CCS_LNK = Common channel signaling link off-normal.
CKT_LIMIT = One or more circuit groups have exceeded their out-of-service (OOS) limit.
CKT_OOS = One or more circuits are OOS.
CLNK_LOST = All CLNK communication has been lost to this SM or SM-2000.
CLNK_OFFN = The indicated SM has one or more off-normal communication links.
CMP_ISOL = Total service interruption is in effect due to unavailability of the CMP without the 
            stand alone call processing option.
CMP_STALN = The module is in stand-alone call processing due to unavailability of the CMP.
CMTLOSS = All common channel signaling message transport (CMT) paths lost on a global 
          switching module (GSM).
CMTOFFN = Some CMT paths lost on a GSM.
COMM_LOST = Communication lost with AM. Displayed during automatic fault recovery interval. If
            the SM has QLNKs equipped, CLNK plus QLNK are lost.
CPE_SYNC = Synchronizing customer premises equipment (CPE) lamps and displays.
CRIT_ALM = Critical building and power alarms for remote modules and peripheral units.
D/C_HASH = Disc to core hashum mismatch.
DATA_SYNC = The module is synchronizing data following an initialization or isolation.
DSL_MAJOR = 30% or more of the digital subscriber lines (DSLs) on this module are 
            out-of-service.
DSL_MINOR = One or more (<30%) of the DSLs on this module are out-of-service.
E911_CRIT = All of the application processor (AP) links to the enhanced 911 service adjunct
            (ESA) on this module are out-of-service.
FAN/FUSE = Module or remote ISDN line unit remote integrated services line unit (RISLU) fan
            or fuse alarms.
FORCED  = Hardware forces are in effect.
GEN_DIFF = The AM contains a different software release than this module.
HASH_ERR  = The memory contains a hashsum error.
HSM_ISOL  = Total RSM service interruption is in effect due to unavailability of its HSM without
the stand-alone call processing option in the RSM.
HSM_STALN  = The RSM is in stand-alone call processing due to unavailability of its HSM.
INHIBITS-AUD = Audit inhibits are in effect.
INHIBITS-HW = Hardware inhibits are in effect.
INHIBITS-MISC = Miscellaneous inhibits are in effect.
INHIBITS-MSG = Message handling inhibits are in effect.
INHIBITS-MTCE = Maintenance inhibits are in effect.
INHIBITS-PUMP = Pump inhibits are in effect.
INHIBITS-RC  = Recent change inhibits are in effect.
INHIBITS-SW = Software inhibits are in effect.
INITIALIZING = The module is initializing.
INIT_ISOL  = An initialization is pending on an isolated SM.
INIT_PEND  = An initialization is pending.
ISDN_RT_RST = Restarting integrated services digital network (ISDN) DSLs, timeslot management
control (TMC) data links to IDCU hosted remote terminals (RTs), or embedded
operations channel (EOC) data links to IDCU hosted RTs.
ISOLATED  = Automatically isolated module without the stand alone call processing option, due
to loss of communication with the AM. If the SM has QLNKs equipped, CLNK plus
QLNK are lost.
MAN_ISOL  = The module has been isolated manually. If the SM has QLNKs equipped, CLNK
plus QLNK are lost.
MATE_OOD  = Offline memory is out of date.
MATE_PUMP = The offline memory is different from the on-line memory, or it is in the process of
updating.
MATE_UPD  = Offline memory is being updated from the on-line memory.
MELNKOFFN = MCTSI-based ethernet link off-normal.
MIN_MODE  = The module is in minmode.
MGP_ISOL  = Media gateway proxy (MGP) unit is isolated from the packet switching module
(PSM).
MISC  = System is off-normal due to reasons pertaining to the updating of the software
release.
MORE  = There are more off-normal conditions than can be listed on this line. These
conditions are of less importance than the ones listed.
MSG_CNTL = Output messages are being discarded at the user's request.
NCMTLOST = All CMT paths lost in a non global switching module (NGSM).
NCMTOFFN = Some CMT paths lost in a NGSM.
NIPMP = Non-interfering pump in progress.
NOINTERCP = Intermodule calls can not be made by this module because its links to the active
major ONTC are out-of-service.
NO_REQ_PEND = The module has no requests pending.
NORMAL  = The module has no off-normal conditions (only printed in response to manual
requests).
ODDHSHERR = The ODD memory area contains a hash error.
ODD_WARN = Either the amount of ODD space being used has exceeded the engineering
recommendations or the automatic relation engineering reorganization process has
failed on one or more relations.
OVERLOAD  = A call processing or resource overload condition exists.
POSTINIT = Module is in safe period following a high-level initialization.
POST_CUT = Module is in the post-cutover state.
PRE_CUT = Module is in the pre-cutover state.
PSLNKOFFN = Some PSU link connectivity has been lost. Either one channel of a duplex link is
out-of-service, or there is a virtual path alarm on the link.
PSLNKOOS = At least one PSU link has lost connectivity. If it is a simplex link (only one channel
equipped), the channel is out-of-service, or both channels of a duplex link are
out-of-service.
PTL_STALN = The RSM is in partial stand alone because at least one other RSM in the
MMRSM is in stand alone mode.
QLNK_LOST = If QGPs are equipped, all QLNK communication has been lost to this SM-2000. If
QGPs are not equipped, all ISMQLNK communication has been lost to this
SM-2000.
QLNK_OFFN = Some but not all QLNKs or ISMQLNKs are off-normal to this SM-2000.
QLPS_ISOL = QPIPEs to All networks have been lost to this SM-2000.
QMAM_ISOL = SM-2000 is manually isolated from QLPS network.
QPHOFFN = Some quad-link packet switch protocol handler (QPH) QPHPIPE/QPHLNK lost.
QPIPE_OOS = SM-2000 lost MH QPIPE to a single network.
REQ_PEND = Request to "set" or "inh" the module is pending.
RETOFIT = System is off-normal due to reasons pertaining to the updating of the software
release.
RT_PLS = RT protection line switching status has changed.
SCAN_ON = Non-DSL line and trunk scanning is on. Non-ISDN calls can be originated.
SFT_SWTCH = The CMP is going through a soft switch.
SPEC_GROW = The module is in a special growth state.
STNDALONE = Automatically isolated module with the stand alone call processing option, due to
loss of communication with the AM.
SVC_DGRD = Call processing service is degraded due to inability to connect paths between this
module and other modules.
SVC_INTR = A partial or total service interruption is in effect.

4. ACTIONS TO BE TAKEN

Verify that the indicated off-normal conditions exist and take corrective action to remove them.

OP TAG REPORT COMPLETED

2. REASON FOR OUTPUT

To print the returned circuit pack tag that is needed to ship a circuit pack for repair or update of the circuit pack.

3. VARIABLE FIELD DEFINITIONS
a = Two form feeds.
b = Date and time the return tag is generated (mm-dd-yy hh:mm).
c = Office name.
d = Generic number and point load number.
e = Reason for return. Valid value(s):
   DEFECT = To fix the defective circuit pack.
   UPDATE = To update the circuit pack.
f = Equipment status. Valid value(s):
   IN_SERVICE = The equipment status is at the in-service phase.
   INSTALLING = The equipment status is at the installing phase.
   PRE-CUT = The equipment status is at the pre-cut phase.
   [CIRCLE ONE] INSTALLING/PRE-CUT/IN SERVICE = Default when status is unknown. Circle one status shown.
g = 24 hour indicator. Valid value(s):
   NO = The pack was not installed within 24 hours.
   YES = The pack was installed within 24 hours.
   [CIRCLE ONE] YES/NO = Default when the installation time is unknown. Circle one.
h = Source of diagnostic request. Not applicable to UPDATE tag. Valid value(s):
   AUTOMATIC = Automatic diagnostic.
   MANUAL = Manual diagnostic.
   POWER SWITCH = Diagnostic after power restore. Only apply to administrative module (AM) diagnostics.
   REX = Routine exercise.
i = Date and time the diagnostic failed (mm-dd-yy hh:mm). Not applicable to UPDATE tag.
j = Circuit identifier and number. Not applicable to UPDATE tag.
k = Diagnostic phase number. Not applicable to UPDATE tag.
l = Diagnostic segment number. Only applies to communication module (CM) and switching module (SM) diagnostics. Not applicable to UPDATE tag.
m = Diagnostic test number. Not applicable to UPDATE tag.
n = Diagnostic mismatch data of the failing test(s). Not applicable to UPDATE tag.
o = Diagnostic test number. Not applicable to UPDATE tag. Not applicable to CM and SM diagnostics.
p = Diagnostic mismatch data of the failing test(s). Not applicable to UPDATE tag. Not applicable to CM and SM diagnostics.
q = Diagnostic test number. Not applicable to UPDATE tag. Not applicable to CM and SM diagnostics.
r = Diagnostic mismatch data of the failing test(s). Not applicable to UPDATE tag. Not applicable to
CM and SM diagnostics.

s = Diagnostic test number. Not applicable to UPDATE tag. Not applicable to CM and SM diagnostics.

t = Diagnostic mismatch data of the failing test(s). Not applicable to UPDATE tag. Not applicable to CM and SM diagnostics.

u = Diagnostic test number. Not applicable to UPDATE tag. Not applicable to CM and SM diagnostics.

v = Diagnostic mismatch data of the failing test(s). Not applicable to UPDATE tag. Not applicable to CM and SM diagnostics.

w = Circuit pack code.

x = Circuit pack series number.

y = Circuit pack serial number.

4. ACTION TO BE TAKEN

Tear off the return tag output message at the perforations. Fill out the missing information. Secure the tag to the circuit pack. Ship the circuit pack for repair or update.

5. ALARMS

None.

   Type: Output

1. FORMAT

   OP TAG SUMMARY RECORD a of b
c

2. REASON FOR OUTPUT

   To print the diagnostic failure summary list that matches the specified key word(s) in the RCV:M-RTAG tool.

3. VARIABLE FIELD DEFINITIONS

   a = Number of current record.
   b = Number of records that matches the specified key word(s).
   c = List of diagnostic summaries.

4. ACTION TO BE TAKEN

   Use the diagnostic failure summary list to find the specific diagnostic failure to generate the circuit return tag. For additional information, refer to the OP:TAG-REPORT input message for the circuit return tag format.

5. ALARMS

   None.

[3] OP TAG DGN i NOT FOUND
   THE FOLLOWING DGNS ARE AVAILABLE FOR TAGS:
   j   k  STF PH e SEG f TEST g MM h

2. REASON FOR OUTPUT

To dump a circuit pack return tag or a list of failing diagnostics that are available for tags to the receive-only printer (ROP) or trunk and line work station (TLWS).

Format 1 prints when no failing diagnostics are available in the TAGLOG for conversion to circuit pack return tags.

Format 2 prints a circuit pack return tag for the last available failing diagnostics, or for the last failing diagnostics that match the information specified by the input arguments.

Format 3 prints a list of failing diagnostics that are available for conversion to circuit pack return tags.
3. VARIABLE FIELD DEFINITIONS

a = The office base and control number.
b = The date the diagnostic failed.
c = The software release that the switch was running on.
d = The failing equipment and location.
e = The failing phase.
f = The failing segment.
g = The failing test.
h = The failing mismatch field.
i = The arguments specified by the craft.
j = The date stamp for the diagnostic (mmddhhmm where mm=month, dd=day, hh=hour, mm=minute).
k = The failing equipment and its location

4. ACTION TO BE TAKEN

For Format 1, no action is required. When a failing diagnostic is run, it will be logged in the TAGLOG and then the OP:TAG command can be used to produce a circuit pack return tag.

For Format 2, fold and staple the printed tag to a "yellow" tag. Then tie the "yellow" tag to the circuit pack (this includes line cards), and return the pack for repair.

For Format 3, no action is required. This output can be used to determine which arguments should be used to print the desired tag.

5. ALARMS

**2. REASON FOR OUTPUT**

To output TCP/IP routing information that is contained on an SM or PH.

Format 1 is printed in response to an OP:TCPIP:RTDMP input message where an SM is INPUT. Format 2 is printed in response to an OP:TCPIP:RTDMP input message where an CHNG is INPUT. The Route Number pertains to all the row (h-o).

**3. VARIABLE FIELD DEFINITIONS**

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

- a = SM number.
- b = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
- c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
- d = Channel group (CHNG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
- e = Current page number.
f = Total number of pages for this output.

g = The image type of the PH. If not a PH this field will read NULL IMAGE.

h = The route number. The physical position of the route in the route table.

i = The Destination IP Address.

j = The Destination IP Mask.

k = The Gateway IP Address.

l = The route metric.

m = The Interface Number for this route.

n = The Next Route Pointer. If this field has a ENTRY other than 0xffffffff it will point to the next route entry. If the field has 0xffffffff as an entry there is no Next Route.

o = The previous route pointer. If this field has a ENTRY other than 0xffffffff it will point to the previous route entry. If the field has 0xffffffff as an entry there is no Previous Route.

4. ACTIONS TO BE TAKEN

[2] OP TERACNTS TGMN=b-d f CONSEC-CNT i PURGE-CNT j h

[3] OP TERACNTS f CONSEC-CNT i PURGE-CNT j h

2. REASON FOR OUTPUT

To respond to an OP:TERACNTS input message to print the trunk group threshold count (TGCNT) and trunk group member threshold count (TGMNCNT) (Format 1), and the consecutive error count and purge count (PURGE-CNT) of a trunk (Format 2) or universal tone decoder (UTD) (Format 3) on the trunk error analysis (TERA) lists.

3. VARIABLE FIELD DEFINITIONS

ATP-CNT = All tests passed count.
CONSEC-CNT = Consecutive error count.
DEN = Digital trunk equipment number.
ILEN = Integrated digital carrier unit (IDCU) line equipment number.
INEN = IDLC network equipment number.
NEN = DNU-S networking equipment number.
PURGE-CNT = Trunk error analysis purge count.
SLEN = SLC® line equipment number.
TEN = Analog trunk equipment number.
TGNCT = TG count.
TKMNCNT = TKMN count.
UTD = Universal tone decoder.
a = Machine-detected interoffice irregularity (MDII) type. Refer to the APP:MDII appendix in the Appendixes section of the Output Messages manual for a list of MDIIs.
b = Trunk group (TG) number.
c = The number of MDIIs of type ‘a’ that have occurred on the other members of the trunk group since the entry was placed on the trunk error analysis list.

d = Trunk member number (TKMN).

e = The number of MDIIs of type ‘a’ that have occurred on the trunk since the entry was placed on the trunk error analysis list.

f = Trunk or service circuit number. Valid value(s):

- DEN=k-l-m-n
- ILEN=k-o-p-q
- INEN=k-z-p-q
- NEN=k-z-a1-e1-b1-c1-f1-d1
- SLEN=k-r-p-q
- TEN=k-s-t-u-v
- UTD=k-w-x-y

g = Number of ATP-CNT results received on trunk.

h = Reason for termination report indicator. Valid value(s):
- COMPLETED = This message is the last message of requested information.
- CONTINUED = This message is a continuation of requested information.
- INPUT ERROR = There was an input error in specifying the trunk or UTD.
- INV PORT = The trunk port specified was invalid.
- NO MATCH = The information requested was not found.
- PORT UNASSIGNED = The trunk port specified was valid but unassigned.
- SM UNAVAILABLE = The input request could not be completed because a needed switching module (SM) is unable to respond. Retry the request later.
- STARTED = This message is the start of requested output.
- SYSTEM ERROR = An error occurred while accessing information.

i = Number of consecutive MDIIs that have occurred on trunk or UTD.

Note:
For consecutive error counts, the value is not cleared unless the recovery action is taken on the circuit or when an MDII on the circuit is preceded by the successful completion of a call. Also, an entry is not put on the consecutive error list until two consecutive MDIIs have occurred on the trunk or UTD.

j = The maximum number of 2-hour periods a trunk or UTD can remain on the trunk error analysis quick check list before being removed.

k = SM number.

l = Digital line and trunk unit (DLTU) number.

m = Digital facility interface number.

n = Digital facility interface channel number.

o = IDCU number.

p = Remote terminal (RT) number.
q = RT line number.

r = Digital carrier line unit number.

s = Trunk unit number.

t = Service group number.

u = Channel board number.

v = Channel circuit number.

w = Local digital service unit number.

x = Service group number.

y = Digital service circuit unit board number.

z = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

a = Data group (DG).

b = Synchronous transport signal (STS) facility number.

c = Virtual tributary group (VTG) number.

d = Digital signal level 0 (DS0) number.

e = SONET termination equipment (STE) facility number.

f = Virtual tributary member (VTM) number.

2. REASON FOR OUTPUT

To display the status of all trunk group controls (TGCs) or of a given trunk group. This message is in response to the
OP:TGC input message.

Format 1 is for non-reroute controls and Format 2 is for reroute controls. Format 1 and Format 2 display the
termination status of STARTED, CONTINUED, or COMPLETED. Format 3 displays the termination status of
ABORTED-RETRY LATER or FAILED-INVALID PARAMETER.

3. VARIABLE FIELD DEFINITIONS

ALL = Trunk group control was applied to all domains.

a = Termination status. Valid value(s):
ABORTED-RETRY LATER
ABORTED = Termination of message.
COMPLETED = Last in a series of these messages.
CONTINUED = Middle in a series of these messages.
FAILED-INVALID PARAMETER
STARTED = First in a series of these messages.

b = Trunk group number.

c = Non-reroute control type. Valid value(s):
CANF = Manual cancel-from control.
CANT = Manual cancel-to control.
CRO = Manual cancel-reroute overflow control.
SKIP = Manual skip control.

d = Direct route percentage of traffic that was controlled. Valid value(s):
0    = No control was applied but measurements were collected.
12.5 = 12.5%.
25.0 = 25%.
37.5 = 37.5%.
50.0 = 50%.
62.5 = 62.5%.
75.0 = 75%.
87.5 = 87.5%.
100  = 100%, block all direct route traffic.

e = Alternate route percentage of traffic that was controlled. Valid value(s):
0    = No control was applied but measurements were collected.
12.5 = 12.5%.
25.0 = 25%.
37.5 = 37.5%.
50.0 = 50%.
62.5 = 62.5%.
75.0 = 75%.
87.5 = 87.5%.
100  = 100%. All alternate route traffic was blocked.

f = Announcement (ANN) treatment if blocking occurred. Valid value(s):
EANN1 = Emergency announcement 1.
EANN2 = Emergency announcement 2.
NCA   = "NO CIRCUIT" announcement.
NO-ANN = No Announcement.

g-m = Trunk group numbers representing the out-of-chain trunk groups.
n-t = Congestion signals have been received for those trunk groups:
N    = No
Y    = Yes
u = Hunting algorithm. Valid value(s):
   ORD = Ordered.
   RGLR = Regular.
   SPRY = Spray.

v = Cancel in-chain return option. Valid value(s):
   N = No
   Y = Yes

w = Previously-rerouted option. Indicates if calls were rerouted that had been previously rerouted.
   Valid value(s):
   N = No
   Y = Yes

x = Prohibit international inbound turnoff. Indicates if calls were rerouted that had originated internationally. Valid value(s):
   N = No
   Y = Yes

y = Switching domain list type. Valid value(s):
   EXC = Exclude (controls domains are not contained in the list).
   INC = Include (controls domains are contained in the list).

z = Switching domain list.

</tbody>
</table>

**2. REASON FOR OUTPUT**

To display the status of all trunk group controls (TGCs) or of a given trunk group. This message is in response to the OP:TGC input message.

Format 1 is for non-reroute controls and Format 2 is for reroute controls. Format 1 and Format 2 display the termination status of **STARTED**, **CONTINUED**, or **COMPLETED**. Format 3 displays the termination status of **ABORTED-RETRY LATER** or **FAILED-INVALID PARAMETER**.
3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
  ABORTED-RETRY LATER
  ABORTED = Termination of message.
  COMPLETED = Last in a series of these messages.
  CONTINUED = Middle in a series of these messages.
  FAILED-INVALID PARAMETER
  STARTED = First in a series of these messages.

b = Trunk group number.

c = Non-reroute control type. Valid value(s):
  CANF = Manual cancel-from control.
  CANT = Manual cancel-to control.
  CRO = Manual cancel reroute overflow control.
  SKIP = Manual skip control.

d = Percentage of direct route traffic that was controlled.

e = Percentage of alternate route traffic that was controlled.

f = Announcement (ANN) treatment if blocking occurred. Valid value(s):
  EANN1 = Emergency announcement 1.
  EANN2 = Emergency announcement 2.
  NCA = "NO CIRCUIT" announcement.
  NO-ANN = No Announcement.

g–m = Trunk group numbers representing the out-of-chain trunk groups.

h = Congestion signals have been received for those trunk groups. Valid value(s):
  N = No
  Y = Yes

u = Hunting algorithm. Valid value(s):
  ORD = Ordered.
  RGLR = Regular.
  SPRY = Spray.

v = Cancel in-chain return option. Valid value(s):
  N = No
  Y = Yes

w = Previously-rerouted option. Indicates if calls were rerouted that had been previously rerouted.
  Valid value(s):
  N = No
  Y = Yes
= Prohibit international inbound turnoff. Indicates if calls were rerouted that had originated internationally. Valid value(s):
N  = No
Y  = Yes

= Switching domain list type. Valid value(s):
EXC = Exclude (controls domains are not contained in the list).
INC = Include (controls domains are contained in the list).

= Switching domain list.

= Immediate reroute. Valid value(s):
N  = No
Y  = Yes

= Code specific reroute destination. If the destination is not specified, this field will be blank.

= Code specific reroute feature group D carrier. If the carrier is not specified, this field will be blank.

4. ACTIONS TO BE TAKEN

<table>

[3] OP TGC a

2. REASON FOR OUTPUT
To display the status of all trunk group controls (TGCs) or of a given trunk group. This message is in response to the OP:TGC input message.

Format 1 is for non-reroute controls and Format 2 is for reroute controls. Format 1 and Format 2 display the termination status of \textit{STARTED}, \textit{CONTINUED}, or \textit{COMPLETED}. Format 3 displays the termination status of \textit{ABORTED–RETRY LATER} or \textit{FAILED–INVALID PARAMETER}.

\section*{3. VARIABLE FIELD DEFINITIONS}

\begin{itemize}
\item[a] = Termination status. Valid value(s):
\begin{itemize}
\item \textit{ABORTED–RETRY LATER}
\item \textit{ABORTED} = Termination of message.
\item \textit{COMPLETED} = Last in a series of these messages.
\item \textit{CONTINUED} = Middle in a series of these messages.
\item \textit{FAILED–INVALID PARAMETER}
\item \textit{STARTED} = First in a series of these messages.
\end{itemize}

\item[b] = Trunk group number.

\item[c] = Non-reroute control type. Valid value(s):
\begin{itemize}
\item \textit{CANF} = Manual cancel-from control.
\item \textit{CANT} = Manual cancel-to control.
\item \textit{CRO} = Manual cancel reroute overflow control.
\item \textit{SKIP} = Manual skip control.
\end{itemize}

\item[d] = Percentage of direct route traffic to be controlled.

\item[e] = Percentage of alternate route traffic to be controlled.

\item[f] = Announcement (ANN) treatment if blocking occurred. Valid value(s):
\begin{itemize}
\item \textit{EANN1} = Emergency announcement 1.
\item \textit{EANN2} = Emergency announcement 2.
\item \textit{NCA} = "NO CIRCUIT" announcement.
\item \textit{NO–ANN} = No Announcement.
\end{itemize}

\item[g–m] = Trunk group numbers representing the out-of-chain trunk groups.

\item[n–t] = Congestion signals have been received for those trunk groups. Valid value(s):
\begin{itemize}
\item \textit{N} = No
\item \textit{Y} = Yes
\end{itemize}

\item[u] = Hunting algorithm. Valid value(s):
\begin{itemize}
\item \textit{ORD} = Ordered.
\item \textit{RGLR} = Regular.
\item \textit{SPRY} = Spray.
\end{itemize}

\item[v] = Cancel in-chain return option. Valid value(s):
\begin{itemize}
\item \textit{N} = No
\item \textit{Y} = Yes
\end{itemize}
\end{itemize}
Previously-routed option. Indicates if calls were rerouted that had been previously rerouted. Valid value(s):

- **N** = No
- **Y** = Yes

Prohibit international inbound turnoff. Indicates if calls were rerouted that had originated internationally. Valid value(s):

- **N** = No
- **Y** = Yes

Switching domain list type. Valid value(s):

- **EXC** = Exclude (controls domains are not contained in the list).
- **INC** = Include (controls domains are contained in the list).

Switching domain list.

Immediate reroute. Valid value(s):

- **N** = No
- **Y** = Yes

Percentage of direct route hard-to-reach (HTR) traffic to be controlled.

Percentage of alternate route HTR traffic to be controlled.

Code specific reroute (CSRR) destination. If the destination is not specified, this field will be blank.

CSRR feature group D carrier. If the carrier is not specified, this field will be blank.

### 4. ACTIONS TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED</td>
<td>Retry the input message.</td>
</tr>
<tr>
<td>FAILED</td>
<td>This message is a failure because of an input parameter error.</td>
</tr>
<tr>
<td>STARTED, CONTINUED, or COMPLETED</td>
<td>None.</td>
</tr>
</tbody>
</table>

### 5. ALARMS

None.

### 6. REFERENCES

Input Message(s):

- **OP:TGC**

Other Manuals:

- 235-190-115 *Local and Toll System Features*

MCC Display Page(s):
130 NM EXCEPTION
OP:TGCNT

Software Release: 5E14 and later
Message Class: AML, ATL
Application: 5
Type: Output

1. FORMAT

[1] OP TGCNT TG=a  SZ=b  [c]OOS=d   e

[2] OP TGCNT LIST SEGMENT=f  e
TG=a    SZ=b   [c]OOS=d

                      .       .
                      .       .
                      .       .

[3] OP TGCNT LIST CONTAINED g SEGMENTS   e

2. REASON FOR OUTPUT

To respond to the OP:TGCNT input message request to report the state of out-of-service (OOS) trunks in a single trunk group or a range of trunk groups with out-of-service trunks along with the trunk group size. OOS CADN is not counted towards this OOS count.

Format 1 above is used if a single trunk group was requested. If no trunk group number was requested, all trunks groups with out-of-service trunks will be included in output using Format 2 above. If a range of trunk groups was requested, all trunks groups within the specified range with out-of-service trunks will be included in output using Format 2 above. Format 3 is used as a trailer for Format 2 to indicate the end of list, and to indicate total number of segments printed.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number.
b = Trunk group size. The total number of trunks in the trunk group.
c = Invalid indicator. If present as a '*', indicates some trunks in the trunk group did not respond to the request. The switching module (SM) could be down, or not responding to the request.
d = Number of out-of-service trunks in the trunk group.
e = Termination report. Valid value(s):
   COMPLETED = The requested action has been completed. If an TGCNT list was being printed, all segments have been printed.
   CONTINUED = Second and subsequent segments of a list which comprises two or more segments.
   NO ENTRIES IN LIST = The TGCNT list was requested, but no trunk groups have out-of-service trunks.
   STARTED = First in a series of these messages.
   SYSTEM ERROR = An internal error occurred which prevents further processing of the request.
   TG INVALID = The trunk groups specified in the input message does not exist in the office data
f = Segment number of the current segment.
g = The total number of segments in the list.

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Application: 5
Type: Output

1. FORMAT

OP TLPNOTE a RECORD b of c
d

2. REASON FOR OUTPUT

To report the contents of communication module (CM) or switching module (SM) trouble locating procedure (TLP) note file specified in an OP:TLP-NOTE input message.

3. VARIABLE FIELD DEFINITIONS

a = TLP note number.
b = Number of current record.
c = Number of records in specified TLP note.
d = Text of TLP note.

4. ACTION TO BE TAKEN

Use the TLP note instructions in addition to other equipment replacement procedures.

5. ALARMS

None.

   TYPE a
   b
   [c]
   .
   .
   .
   DEFAULT TRANSLATION POINT CODES
   b
   [c]

2. REASON FOR OUTPUT

Format 1 is used when a specific translation type is entered. Format 2 is used when the word "ALL" appears as the translation type.

Note: When the ALL option is used, only equipped translation types are printed, the other translation types will use the default TPCs.

3. VARIABLE FIELD DEFINITIONS

a = The translation type.

b = A translation point code (in decimal notation), or 'UNABLE TO DERIVE TPC'.

c = An optional translation point code (in decimal notation), or not displayed at all.

</table>

2. REASON FOR OUTPUT

To display the status of the trunk reservation (TR) controls. This message is a response to the OP:TR input message.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
ABORTED = Retry message.
COMPLETED = This is the last of a series of messages.
CONTINUED = This is the next of a series of messages.
FAILED PARAMETER = Invalid parameter.
STARTED = This is the first of a series of messages.

b = TR inhibit override status. Valid value(s):
N = TR inhibits remain in effect.
Y = All TR inhibits have been overridden.

c = Trunk group (TG) number.
d = Reservation level 1 (RL1). Number of idle circuits per trunk group reserved.
e = Reservation level 2 (RL2). Number of idle circuits per trunk group reserved.
f = TR control response (RESP) category. This depends on the reservation level and the traffic type to give the proper percentage in the response category

<table>

2. REASON FOR OUTPUT

This output message is in response to an OP:TRAP input message.

For Format 1, if only OP:TRAP is given (in other words, no other keyword has been specified), the status information as detailed in this format will be printed for all existing traps on the message trap system.

For Format 2, if no trap ID was given and "LFORM Y" is specified, the status information as detailed in this format will be printed for all existing traps on the message trap system.

For Format 3, if only a trap ID was given, the status information and any trap results as detailed in this format will be printed for the specified trap.

For Format 4, individual trapped messages, if any, will be displayed in this format. It has the message trap header information and the content of the trapped message in enhanced buffer dump format.

For Format 5, if only OP:TRAP is given (in other words, no other keyword has been specified) and there is no trap on the message trap system, this format will be printed.

For Format 6, if no trap ID was given and DEST is specified, this format will be used to acknowledge the OP:TRAP input message. The trap status information as detailed in Format 1 will be displayed in the specified destination output class.

For Format 7, this format results when only OP:TRAP is given (in other words, no other keyword has been specified) and the processing of the input message has failed for the reason being displayed.

For Format 8, if only a trap ID was given, normally the status information and any trap results as detailed in Format 3 will be printed for the specified trap. In this format, only the trap status information will be printed since no message...
was collected for this trap.

For Format 9, if only a trap ID was given, the status information and any trap results as detailed in Format 3 will be printed for the specified trap. This format serves as a positive acknowledgement to the input message that has been successfully processed to completion.

For Format 10, this format results when a trap ID has been given (other keywords may have been specified as well) and the processing of the input message has failed because of the reason being displayed.

For Format 11, if a trap ID was given and DEST is specified, this format will be used to acknowledge the OP:TRAP input message. The trap status information and any trap results as detailed in Format 3 will be displayed in the specified destination output class.

For Format 12, if a trap ID was given and RTDSP is specified with Y or N option, this format will be printed to acknowledge the input message which has been processed successfully.

For Format 13, if a trap ID was given and LFORM is specified with Y or N option, this format will be printed to acknowledge the input message that has been processed successfully.

For Format 14, if a trap ID was given and LFORM is specified with Y or N option, this format will be printed to acknowledge the input message that has not been processed successfully.

Formats 15 - 25 contain the decoded results of the particular trapped message.

For Format 15, in some ISND7 messages, the names of some fields may be meaningless.

For Format 16, in SCCP messages other than UDT and UDTS, the names of some fields such as MTYPE may be meaningless.

For Format 18, in SNM7 messages with a Message Group of CHM, ECM or MIM the AFFPC field is not present and will not be printed.

For Format 20, when the RF=0, the RC and RTAD are not valid.

For Format 23, NM6 is printed for all messages whose HDGINF field begins with binary 111.

3. VARIABLE FIELD DEFINITIONS

a  = Trap identification number.

b  = Trap state. Valid value(s):
ABT  = Aborted trap.
ACT  = Active trap.
CMP  = Completed trap.
INH  = Inhibited trap.
PND  = Pending trap.
TRM  = Terminated trap.

c  = Termination reason. Valid value(s):
0   = Unspecified
1   = The trap has gone to completion gracefully (due to message count).
2   = The trap has gone to completion gracefully (due to duration).
3   = User initiated STOP;TRAP.
4   = Inhibited for too long; abort trap.
5 = Resource problem at the administrative module (AM).
6 = Frequency of disk write at the AM exceeds threshold.
7 = Disk space exhausted in "no overwrite" mode.
8 = MTRP incore buffers unavailable during disk write.
9 = Common network interface (CNI) level 1 initialization has occurred.
10 = Trap aborted at all concerned link node(s); because of resource or congestion
    problem(s) at link node(s).
11 = All concerned link nodes are out of service (OOS).
12 = All concerned link nodes are either OOS or have aborted the trap.
13 = Problem occurred during status check or audit.

d = Rate of trapping (one out of a specified number of messages).

e = Starting time of trap, in the form hour:minute month/day.

f = Ending time of trap, in the form hour:minute month/day.

G = Real time display. Valid value(s):
    N = No
    Y = Yes

h = Saved collected messages on disk. Valid value(s):
    N = No
    Y = Yes

= Number of trapped messages collected.

j = Length of trapped message in bytes.

k = Link number in group number and member number format.

l = Real time display. Valid value(s):
    N = No
    Y = Yes

m = Rate of trapping. If DEF is output, then a value was not given in the SET:TRAP input message;
    default used.

= Real time display. Valid value(s):
    DEF = a value was not given in the SET:TRAP input message; default used.
    N = No
    Y = Yes

o = Saved collected messages on disk. Valid value(s):
    N = No
    Y = Yes

p = List of link numbers (currently affected by this trap) in group number and member number format.
   If no link is currently affected by this trap, the following will be printed:
NO AFFECTED LINK

\( q \) = Link information given in SET:TRAP input message. Valid value(s):
- **LNKLST** = Link list values were given.
- **LNKR** = Link range value was given.
- **LNKSET** = Link set value was given.

\( r \) = Link information given in SET:TRAP input message (refer to variable 'q')

<table>
<thead>
<tr>
<th>'q' =</th>
<th>'r' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>LNKR</td>
<td>The number of links (next to LNKLST). The list of links in group number and member number format is printed on the next line.</td>
</tr>
<tr>
<td>LNKR</td>
<td>The link range in group number and member number to group number and member number format.</td>
</tr>
<tr>
<td>LNKSET</td>
<td>The link set value.</td>
</tr>
</tbody>
</table>

\( s \) = Duration of trapping, in the form hour, minute. If DEF is output, then a value was not given in the SET:TRAP input message; default used.

\( t \) = Number of trapped messages to be collected. If DEF is output, then a value was not given in the SET:TRAP input message; default used.

\( u \) = Number of minutes to start the trap from the time when the SET:TRAP input message was entered. If IMM is output, then the trap was to be started immediately after the SET:TRAP input message was entered.

\( v \) = Message class number for output of trap information.

\( w \) = Maximum trapped message size (in bytes) that will be saved and displayed.

\( x \) = Keywords of parameters as given in SET:TRAP input message. Valid value(s):
- **MTYPE, OPC, DPC, SOPC, CGT, CGPC, CGSN, CGGT1, CGGT2, CDT, CDPC, CDSN, CDGT1, CDGT2, DMI, DOM, DESA, DESB, BNM, VLN, RFR, RC, RTAD, OFSTB, MODE**

**Note:**
- CGGT1 gives high order 2 bytes of CGGT. CGGT2 gives low order 4 bytes of CGGT.
- CDGT1 gives high order 2 bytes of CDGT. CDGT2 gives low order 4 bytes of CDGT.
- CGGT and CDGT are used in the SET:TRAP input message.

\( y \) = Offset value in hexadecimal.

\( z \) = Bit pattern value in hexadecimal.

<table>
<thead>
<tr>
<th>'x' =</th>
<th>'y' =</th>
<th>'z' =</th>
<th>'a' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTYPE</td>
<td>BAN6, DS6, NM6, ALL6, DCIS, ECIS7, ISDN7, MREG7, MSPEC7, SNM7, SCCP, NM67, ALL7</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MODE</td>
<td>Either IN or OUT.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For further information on the meanings refer to the SET:TRAP input manual.

\( a^1 \) = Bit mask value, in hexadecimal.

**Note:** When there is no input parameter, NO OTHER INPUT PARAMETERS will be used in place of the table containing 'x', 'y', 'z', 'a'.

\( b^1 \) = Destination output class specified in OP:TRAP input message.
c\textsuperscript{1} = Response to failed OP:TRAP input message (no other keyword is specified). Valid value(s):
PREVIOUS OP TRAP IN PROGRESS
RETRY LATER

d\textsuperscript{1} = Response to failed OP:TRAP input message (keyword ID is specified). Valid value(s):
INVALID ID = ID does not belong to any trap
INVALID TRAP STATE = internal error
PND TRAP = pending trap does not have trap results
RETRY LATER = try again later

e\textsuperscript{1} = Long format status display. Valid value(s):
N = No
Y = Yes

f\textsuperscript{1} = Trap ID.

g\textsuperscript{1} = Length of the common channel signaling (CCS) message in bytes.

h\textsuperscript{1} = Group number.

i\textsuperscript{1} = Member number.

j\textsuperscript{1} = Time stamp (for example: Wed Apr 11 19:11:02 1990).

k\textsuperscript{1} = The whole hexadecimal message printed out in 5 words per line for as many lines as needed.

l\textsuperscript{1} = Service indicator of the SIO in decimal.

m\textsuperscript{1} = Destination point code (DPC) in decimal and hexadecimal (network ID, region, cluster).

n\textsuperscript{1} = Origination point code (OPC) in decimal and hexadecimal (network ID, region, cluster).

o\textsuperscript{1} = Signaling link selection.

p\textsuperscript{1} = The symbolic value from the H0/H1 code. Valid value(s):
CBA = Change back acknowledgement signal.
CBD = Change back declaration signal.
COA = Change over acknowledgement signal.
COO = Change over order signal.
ECA = Emergency changeover acknowledgement signal.
ECO = Emergency changeover order signal.
LFU = Link forced uninhibit message.
LIA = Link inhibit acknowledgement message.
LID = Link inhibit denied message.
LIN = Link inhibit message.
LUA = Link uninhibit acknowledgement.
LUN = Link uninhibit message.
RCP = Signaling route set test cluster prohibited signal.
RCR = Signaling route set test cluster restricted signal.
RCT = Signaling route set congestion test signal.
RSP = Signaling route set test prohibited signal.
RSR = Signaling route set test restricted signal.
TCA = Transfer cluster allowed signal.
TCP = Transfer cluster prohibited signal.
TCR = Transfer cluster restricted signal.
TFA = Transfer allowed signal.
TFC = Transferred controlled signal.
TFP = Transfer prohibited signal.
TFR = Transfer restricted signal.

q = The decimal value for the circuit identification code (CIC) field.

r = Message type. Valid value(s):
   CO_AK = Data acknowledgement.
   CO_CA = Connection failure acknowledgement.
   CO_CC = Connection confirm.
   CO_CF = Connection failure.
   CO_CR = Connection request.
   CO_CREF = Connection refused.
   CO_DT1 = Data form 1.
   CO_DT2 = Data form 2.
   CO_EA = Expected data acknowledgement.
   CO_ED = Expected data.
   CO_ERR = Error.
   CO_IT = Inactivity test.
   CO_RLC = Connection released complete.
   CO_RLSD = Connection released.
   CO_RSC = Reset confirmation.
   CO_RSR = Reset request.
   UDT = Unit data.
   UDTS = Unit data service signal.

s = The hexadecimal value for the PCLASS or DGPAR field.

t = Format ID. Valid value(s):
   SBR = Subsystem backup routing.
   SNR = Subsystem normal routing.
   SOG = Subsystem out of service grant.
   SOR = Subsystem out of service request.
   SRT = Subsystem routing status test
   SSA = Subsystem allowed.
   SSP = Subsystem prohibited.
   SST = Subsystem status test.

u = The affected point code in decimal and hexadecim al (network ID, region, cluster).

v = Heading information flag. Valid value(s):
   ADC = Address complete, charge.
   ADI = Address incomplete.
   ANC = Answer, charge.
   BLO = Blocking.
CB1 = Clear back #1.
CB2 = Clear back #2.
CB3 = Clear back #3.
CBK = Crankback.
CFL = Call failure.
CLF = Clear forward.
COP = Confusion.
COT = Continuity.
IAM = Initial address message.
MMUM = Miscellaneous multi-unit message.
MRF = Message refusal.
NTC = National trunk congestion.
NSC = National switching congestion.
RA1 = Reanswer #1.
RA2 = Reanswer #2.
RA3 = Reanswer #3.
RCT = Recycle continuity timer.
RLG = Release guard.
RST = Reset trunk.
SSB = Customer busy (subscriber busy, electrical).
SSD = Second start dial.
UBL = Unblocking.

w^1 = Band number.
x^1 = Trunk number.
y^1 = Domain.
z^1 = Destination A.
a^2 = Destination B.
b^2 = Function number.
c^2 = Return flag.
d^2 = Return code.
e^2 = Return address.
f^2 = Message type for ISDN messages. Valid value(s):
ACM = Address complete.
ANM = Answer.
BLA = Blocking acknowledgement.
CCR = Continuity check request.
CFN = Confusion.
CGB = Circuit group blocking.
CGBA = Circuit group blocking acknowledgement.
CMR = Call modification request.
CMC = Call modification completed.
CMRJ = Call modification reject.

\( g^2 \) = Heading information flag. Valid value(s):
- \( BD1 \) = Broadcast dynamic overload control level 1.
- \( BD2 \) = Broadcast dynamic overload control level 2.
- \( BD3 \) = Broadcast dynamic overload control level 3.
- \( COV \) = Changeover.
- \( DEL \) = Delimiter.
- \( DOC1 \) = Dynamic overload control level 1.
- \( DOC2 \) = Dynamic overload control level 2.
### Dynamic overload control

- **DOC3** = Dynamic overload control level 3
- **DOCO** = Dynamic overload control OFF
- **DOCRE** = Dynamic overload control refusal
- **ELT** = Emergency load transfer
- **ENDOC** = Enable dynamic overload control
- **ESU** = End of status update
- **GSC** = Group signaling congestion
- **IGDOC** = Ignore dynamic overload control
- **LKA** = Link alarm signal
- **LKF** = Link failed
- **LKN** = Link normal
- **LTA** = Load transfer acknowledgement
- **LTR** = Load transfer request
- **MCA** = Manual changeover acknowledgement
- **MCO** = Manual changeover
- **MVT** = Manual voice frequency link transfer
- **PRO** = Processor outage
- **PSC** = Processor signaling congestion
- **RD1** = Remove dynamic overload control level 1
- **RD2** = Remove dynamic overload control level 2
- **RD3** = Remove dynamic overload control level 3
- **RAB** = Request all band status of signaling transfer point (STP)
- **RLK** = Request link status of STP
- **RPB** = Request particular band status of STP
- **RSB** = Reset band
- **TFA** = Transfer allowed
- **TFP** = Transfer prohibited
- **TFR** = Transfer restricted
- **TQU** = Trunk query
- **TSV** = Test standby voice frequency link
- **VLF** = Voice frequency link test failed
- **VLP** = Voice frequency link test passed

### 4. ACTION TO BE TAKEN

- ** Formats 1-6, 8, 9, 11-13, and 15-25, none.**
- ** Format 7, wait at least 1 minute and try again.**
- ** Format 10, if an internal error condition occurs, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual; otherwise, message is self-explanatory.**
- ** Format 14, wait at least 3 minutes and try again.**

### 5. ALARMS

- **SLT** = Signaling link test message
- **SLTA** = Signaling link test message acknowledgement
None.

2. REASON FOR OUTPUT

To respond to a user request for output of the data structures collected by the most recent packet utility call trace snapshot. This message dumps the PORT linkage area (PORTLA), D-channel port block (DPB) for the B-channel, PIDB time slot block (PTSB), and the channel data block (CHDB).

3. VARIABLE FIELD DEFINITIONS

a = Event number.

b = Secondary event identifier; associated remote switching module (RSM) or host switching module (HSM) data will have the same value.

c = Event switching module (SM) type. Valid value(s):
   AMf = Administration module.
   HSM = Host switching module.
   LSM = Local switching module.
   ORM = Optical remote module.
   PIM = Plug in module.
   RSM = Remote switching module.
   TRM = Two-mile remote module.

d = Process number of the PID.

e = Switching module number of the PID.

f = Uniqueness number of the PID.

g = Error indicator. Valid value(s):
   N = No errors were encountered.
   Y = Errors were encountered in collecting the trace data; look for asserts or a TRC:UTIL-ERR output message with this event tag and process ID.
h = Circuit switch or packet switch utility call trace. Valid value(s):
   CKT = B-channel for circuit switch utility call trace.
   PKT = B-channel for packet switch utility call trace.

i = Hex dump of the contents of the PORTLA.

j = Hex dump of the contents of the DPB.

k = Hex dump of the contents of the integrated services line unit (ISLU) PTSB.

l = Hex dump of the contents of the packet switch unit (PSU) PTSB.

m = Hex dump of the contents of the CHDB.

3. VARIABLE FIELD DEFINITIONS

a = Event number.
b = Secondary event identifier; associated remote switching module (RSM) or host switching module (HSM) data will have the same value.
c = Event switching module (SM) type. Valid value(s):
   AM = Administration module.
   HSM = Host switching module.
   LSM = Local switching module.
   ORM = Optical remote module.
   PIM = Plug in module.
   RSM = Remote switching module.
   TRM = Two-mile remote module.
d = Process number of the PID.
e = Switching module number of the PID.
f = Uniqueness number of the PID.
g = Error indicator. Valid value(s):
   N = No errors were encountered.
   Y = Errors were encountered in collecting the trace data; look for asserts or a TRC:UTIL-ERR output message with this event tag and process ID.
h = Hexadecimal dump of the contents of the channel control block common area (CCBCOM), the PC background data.
i = Hexadecimal dump of the contents of the head circuit queuing block linked to the CCBCOM.
j = Hexadecimal dump of the contents of the source channel data block linked to the CCBCOM.

2. REASON FOR OUTPUT

To print the requested data structures collected by the most recent utility call trace snapshot. This message contains
data blocks describing circuits allocated to the traced call connection.

3. VARIABLE FIELD DEFINITIONS

a = Event number.

b = Secondary event identifier; associated remote switching module (RSM) or host switching module
   (HSM) data will have the same value.

c = Event switching module (SM) type. Valid value(s):
   AM = Administration module.
   HSM = Host switching module.
   LSM = Local switching module.
   ORM = Optical remote module.
   PIM = Plug in module.
   RSM = Remote switching module.
   TRM = Two-mile remote module. have the same PID.

d = Process number of the PID.

e = SM number of the PID.

f = Uniqueness number of the PID.

g = Error indicator. Valid value(s):
   N = No errors were encountered.
   Y = Errors were encountered in collecting the trace data; look for a TRC:UTIL-ERR
      message with this same event tag and process ID.
h = The number of circuit data blocks (CDBs) allocated to the process (call connection).

i = The circuit data block in the set linked to the channel control block (CCB). Valid value(s):
   HEAD = The first CDB in the list.
   TAIL = The last CDB in the list.

j = Hexadecimal dump of the contents of the circuit data block.

k = Hexadecimal dump of the contents of the static circuit data.

l = Hexadecimal dump of the contents of the channel relation associated with the circuit.

m = Hexadecimal dump of the contents of the universal tone decoder relation associated with the circuit.

n = Hexadecimal dump of the contents of the head circuit queuing block linked to the CDB.

- **e**: Switching module number of the PID.
- **f**: Uniqueness number of the PID.
- **g**: Error indicator. Valid value(s):
  - N = No errors were encountered.
  - Y = Errors were encountered in collecting the trace data; look for a TRC:UTIL-ERR message with this event tag and process ID.
- **h**: Call record indicator. Valid value(s):
  - LEG1 = Call record for the first leg of the call. This will be the only call record if a plain old telephone service (POTS) call.
  - LEG2 = Call record for the second leg of the call. This will print in the case of multiway or call waiting call.
  - LEG3 = Call record for the third leg of the call. This will print in the case of a multiway call.
  - LEG4 = Call record for the fourth leg of the call. This will print in the case of a multiway call.
LEG5 = Call record for the fifth leg of the call. This will print in the case of a multiway call.

i = Hexadecimal dump of the contents of the call record.

j = Call record message number.

Message Class: TRCE
Application: 5
Type: Output

1. FORMAT

```
OP TRC a [b] [MSG=c] EVENT=d[ PID e] [CHAN f] g END h ERR i
```

2. REASON FOR OUTPUT

To print data structures collected by the most recent utility call trace snapshot. This message is in response to an OP:TRC input message or if data is requested from a break point call trace. There may be from one to six data structures dumped in one message, so the second and third lines may be repeated.

3. VARIABLE FIELD DEFINITIONS

- **a** = The data group classification. This indicates the type of data structures dumped. Refer to variable 'n' for descriptions of the data structures. Valid value(s):
  - **ACCS** = Data associated with operator services position system (OSPS) automated calling card service (ACCS) call. It includes the ACCSDB and QRYDB data structures.
  - **ALCB** = Displays the access line control block. Collected by a packet utility call trace.
  - **APB** = Displays the associated process block.
  - **BST** = Data associated with an OSPS directory assistance (DA) operator position. It includes the POSDB and SPB data structures.
  - **CHAN** = Data associated with the peripheral time slot (channel) and related data structures linking it to a process. It includes the CCBCOM, CQB, CHDB, DS0B, and PTSB data structures. PSU indicates that the data is associated with a packet switching unit (PSU).
  - **CKT** = Data associated with circuits allocated to the traced call connection. It includes the CDBCOM and CHAN data structures.
  - **CLDB** = Displays the call leg data block.
  - **COIN** = Data associated with a toll and assistance (T/A) automated coin call. It displays the COINOT data structure.
  - **CR** = Displays the call record.
  - **CV** = Data associated with an OSPS call vectored (CV) call. It displays the CV_STATE data structure.
  - **DISP** = Data associated with the ISDN display feature. It includes the DISPDB and DISP ATTENDANT data structures.
EIS = Displays the EISCALL, EIS_LNK and EISLKSEL data structures when the call at
the OSPS operator position is associated with an external information system
(EIS).

HLSC = Data associated with the high level service circuit for line connections. It includes
the PCCCBBFG, HLSCR, and HLSCP data structures.

ISDN = Data associated with an integrated services digital network call. It includes the
DALB, DALB ATTENDANT, and PRISTAT data structures.

ISDN2 = Additional data associated with an ISDN call. It includes the TEDB, BRCSDB,
BRCSDB ATTENDANT, ACDPOSDB, and TEILA data structures.

LOOP = Data associated with an OSPS DA operator position. Displays the LOOPDB data
block.

LCN = Displays the LCCB associated with a specified logical channel number. Collected
by a packet utility call trace.

MDB = Displays the model data block.

NTWK = Data associated with the network path. It includes the PHDB(s) and TSDB data
structures

OPT = Data associated with the T/A operator position. It includes the TAPOSDB,
QRYDB and the SPB data structures.

OSPS CR = Displays the OSPS call record.

PKL2DATA = Data associated with a level 2 packet connection. It includes the LLCB and the
DCCB data structures. Collected by a packet utility call trace.

PROC = Data associated with a process and port. Normally used for fault tracing. It
includes the DPB, PCBLA, PORTLA, and LTSBDB data structures.

SHDN = Data associated with a shared directory number or a multiline hunt group
member number call. It includes the ADB, LTMSTAT and the (large) shared call
model data block (SCMDB).

SRVOT = Data associated with an OSPS operator position on a listing services (LS) call for
originating treatment (OT) and EIS interface. It displays the SRVOT data structure.

TALOOP = Data associated with an OSPS T/A operator position. It displays the call loop data
blocks (TALOOPDB) for the traced loop.

TEILA = The terminal equipment identifier linkage area(s) for an ISDN call.

WRLS = Data associated with a wireless call. It includes the APXCTBL, APXFDB and
GPAXDB(s).

b = The logical channel number (LCN) with which the logical channel control block (LCCB) is
associated.

c = Data block message number.

d = The event number, the secondary event identifier, associated remote switching module (RSM) or
host switching module (HSM), and the SM type. Valid value(s):

AM = Administration module.
HSM = Host switching module.
LSM = Local switching module.
ORM = Optical remote module.
PIM = Plug in module.
RSM = Remote switching module.
TRM = Two-mile remote module.

e = The process number of the PID, the SM number of the PID, and uniqueness number of the PID.
f  = Channel type is B1, B2, D, PRI, XAT or TRK (for X.75 or X.75' trunks).

g  = Circuit switch or packet switched utility call trace. Valid value(s):
   CKT  = Circuit switch utility call trace.
   PKT  = Packet switch utility call trace.

h  = Indicates whether this is the end of the data associated with this data block. Valid value(s):
   N     = There is more data to follow with the same data block identifier, event number, and process ID (if available).
   Y     = This is the last message associated with this data block.

i  = Indicates whether errors were encountered in collecting the trace data. Valid value(s):
   N     = There were no errors.
   Y     = Errors were encountered. Look for asserts or a TRC:UTIL-FAILED output message with this event number and process ID (if available).

n  = Indicates the data structure being dumped. Valid value(s):
   ACCSDB  = Automated calling card service data block.
   ACDPOSDB = Automatic call distribution position data block.
   ADB      = Analog data block.
   ALCB     = Access line control block.
   APB      = Associated process block.
   APXCTBL  = Autoplex® call table.
   APXFDB   = Autoplex® feature data block.
   BRCSDDB  = Business and residential customer services data block.
   BRCSDDB ATTENDANT = BRCSDDB for attendants.
   CCBCOM   = Channel control block communication region.
   CDBCOM   = Circuit data block communication region.
   CHAN     = Channel circuit data block.
   CHDB     = Channel data block.
   CLDB     = Call leg data block.
   COINOT   = Automated coin data block.
   CQB      = Circuit queuing block.
   CR       = Call record.
   CV_STATE = Call vectoring data block.
   DALB     = D-channel application linkage block.
   DALB ATTENDANT = DALB for attendants.
   DCCB     = D-channel control block.
   DISPDB   = Display data block.
   DISPDB ATTENDANT = DISPDB for attendants.
   DLTSBDB  = Dynamic line time slot bridging data block.
   DPB      = D-channel port block.
   DS0B     = Digital signal level 0 data block.
   EISCALL  = EIS call data block.
   EIS_LNK  = EIS link message data block.
   EISLSEL  = EIS links selected data block.
   GPAXDB   = General purpose annex data block.
   HLSCP    = Per call test high level service circuit descriptor.
   HLSCR    = Ringing high level service circuit descriptor.
LCCB = Logical channel control block.
LLCB = Logical link control block
LOOPDB = DA operator position call loop data block.
LSCMDB = Large shared call model data block.
LTMSTAT = Logical termination busy file status data block.
MDB = Model data block. The MDB type will be indicated by one of the following labels:
  FM (feature model), NEAR (near model), or CC (call control model).
OSPS CR = OSPS call record.
PCBLA = Process control block linkage area.
PCCCBFG = PC foreground data area.
PHDB = Path data block.
PORTLA = Port linkage area.
POSDB = DA operator position data block.
PRISTAT = PRI group status.
PTSDB = Peripheral interface data bus (PIDB) time slot block.
QRYDB = Query data block.
SCMDB = Shared call model data block.
SPB = Supplementary protocol data block.
SRVOT = OSPS SRVOT data block.
TALOOP = T/A call loop data block.
TAPOSDB = T/A operator position data block.
TEDB = Terminal equipment data block.
TEILA = Terminal endpoint identifier linkage area.
TSDB SOURCE = Source time slot data block linked to PHDB.
TSDB SINK = Sink time slot data block linked to PHDB.

\( o \) = Valid value(s):

<table>
<thead>
<tr>
<th>If 'n' =</th>
<th>'o' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALCB, DCCB, LCCB, or LLCB</td>
<td>Indicates the index.</td>
</tr>
<tr>
<td>APS, CLDB, GPAXDB, MDB, or TEILA</td>
<td>Indicates the order in which the structures were collected.</td>
</tr>
<tr>
<td>CDBCOM</td>
<td>Indicates the number of CDB's allocated to the process (call connection).</td>
</tr>
<tr>
<td>CR</td>
<td>A sequential number used to store the CRs. One CR (CR 1) will be displayed for a POTS call. Up to 5 CR will be displayed in the case of multiway.</td>
</tr>
<tr>
<td>PHDB</td>
<td>Indicates whether this is the first (HEAD) or last (TAIL) PHDB linked to the CCB.</td>
</tr>
<tr>
<td>TSDB</td>
<td>Indicates the number of source TSDB's linked to the PHDB.</td>
</tr>
<tr>
<td>TALOOP</td>
<td>Indicates the loop number of the traced call (1-3).</td>

HLSCP
j...j j...j j...j j...j j...j j...j j...j

2. **REASON FOR OUTPUT**

To print the high level service circuit (HLSC) information collected by the most recent utility call trace snapshot. High level service circuit information is collected for line connections only.

3. **VARIABLE FIELD DEFINITIONS**

a = Event number.
b = Secondary event identifier; associated remote switching module (RSM) or host switching module (HSM) data will have the same value.
c = Event switching module (SM) type. Valid value(s):
   AM = Administration module.
   HSM = Host switching module.
   LSM = Local switching module.
   ORM = Optical remote module.
   PIM = Plug in module.
   RSM = Remote switching module.
   TRM = Two-mile remote module.
d = Process number of the PID.
e = Switching module number of the PID.
f = Uniqueness number of the PID.
g = Error indicator. Valid value(s):
   N = No errors were encountered.
   Y = Errors were encountered in collecting the trace data; look for a TRC:UTIL-ERR message with this event tag and process ID.
h = Hexadecimal dump of the contents of the PC foreground data area.
i = Hexadecimal dump of the contents of the ringing high level service circuit descriptor.
\[ j \] = Hexadecimal dump of the contents of the per call test high level service circuit descriptor.

e = Switching module number of the PID.
f = Uniqueness number of the PID.
g = Error indicator. Valid value(s):
  N = No errors were encountered.
  Y = Errors were encountered in collecting the trace data; look for asserts or a TRC:UTIL-ERR output message with this event tag and process ID.
h = Hexadecimal dump of the contents of the analog data block (ADB).
i = Hexadecimal dump of the contents of the logical termination busy/idle status (LTMSTAT) data block.

   . . . . . . . . . . . . . . . . . . . .

   . . . . . . . . . . . . . . . . . . . .

2. **REASON FOR OUTPUT**

   To print data structures collected by the most recent utility call trace snapshot. This message describes the shared call model data block (SCMDB or LSCMDB) that is associated with a shared directory number (SHDN) or multiline hunt group member number call. This message is in response to an OP:TRC input message.

3. **VARIABLE FIELD DEFINITIONS**

   a  = Event number.

   b  = Secondary event identifier; associated remote switching module (RSM) or host switching module (HSM) data will have the same value.

   c  = Event switching module (SM) type. Valid value(s):

       AM = Administration module.
       HSM = Host switching module.
       LSM = Local switching module.
       ORM = Optical remote module.
       PIM = Plug in module.
       RSM = Remote switching module.
       TRM = Two-mile remote module.

   d  = Process number of the PID.

   e  = Switching module number of the PID.

   f  = Uniqueness number of the PID.

   g  = Error indicator. Valid value(s):

       N = No errors were encountered.
       Y = Errors were encountered in collecting the trace data; look for asserts or a TRC:UTIL-ERR output message with this event tag and process ID.

   h  = Shared call model data block being dumped. Valid value(s):

       LSCMDB = Large shared call model data block.
       SCMDB = Shared call model data block.
Hexadecimal dump of the contents of the shared call model data block (SCMDB) or the large shared call model data block (LSCMDB).

    h  i   j  k  l  m  |  h  i   j  k  l  m
```

2. REASON FOR OUTPUT

To respond to an end user request to output the packet summary collected by the most recent packet utility call trace snapshot. This message dumps the logical channel number (LCN), the destination directory number (DEST DN), the type of call connection (CALL CNT), the destination type (DEST TYPE), destination SM (DEST SM) and the port or trunk (PRT/TRK).

3. VARIABLE FIELD DEFINITIONS

- **a** = Event number.
- **b** = Secondary event identifier; associated remote switching module (RSM) or host switching module (HSM) data will have the same value.
- **c** = Event switching module (SM) type. Valid value(s):
  - AM = Administration module.
  - HSM = Host switching module.
  - LSM = Local switching module.
  - ORM = Optical remote module.
  - PIM = Plug in module.
  - RSM = Remote switching module.
  - TRM = Two-mile remote module.

  - B2
  - D
  - XAT
- **e** = Error indicator. Valid value(s):
  - N = No errors were encountered.
  - Y = Errors were encountered in collecting the trace data.
- **f** = Block number.
g = Total blocks available for display.

h = Logical channel number.

i = Destination dialing number.

j = Call connection. Valid value(s):
PVC = Permanent virtual circuit  
VC  = Virtual call

k = Destination type. Valid value(s):
A_SM = Intra-SM
E_SM = Inter-SM
E_SW = Inter-Switch

l = Destination SM number.

m = Destination port or trunk. Valid value(s):
PRT = For inter SM and intra SM calls, the port on the destination SM will be displayed.
TRK = For inter switch (SW) calls, the trunk group number on the destination SM will be displayed.

4. ACTIONS TO BE TAKEN

<tr>
<td>AISLE</td>
<td>s</td>
</tr>
<tr>
<td>BAY</td>
<td>u</td>
</tr>
<tr>
<td>VERTPOS</td>
<td>w</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

   To print the information about the specified TRCU path (TRCP) or the TRCU3 control time slot (TCTS) number in response to the command "OP:TRCU,(TRCP=sm-path | TCTS=tcts)".

   If the switching module (SM) or/and communications module (CM) is/are isolated from the administrative module (AM), the information about the remote TRCU aisle, bay and vertical position is not available and not reported. The TRCU exists only at the SM of type ORM/EXM2K, and the TCTS exists only with the TRCU path of type TRCU3.

3. VARIABLE FIELD DEFINITIONS

   a = Text string identifier showing order of the TRCU record. It's possible to have up to two different TRCU paths for the same TCTS value and, hence, up to two records printed in a continuing list. Valid values:
   FIRST RECORD = First record of the continuing list.
   LAST RECORD = Last record of the list.

   b = SM number.

   c = TRCU path value.

   y = Control time slot value of this SM for this TRCU PATH.

   d = TCTS value. None for the TRCU or TRCU2 types.

   e = First NLI or DLI pertaining to the TRCU path.

   f Text specifying A-LINK or B-LINK used in the first DLI. None for the NLI.

   g = Second NLI or DLI pertaining to the TRCU path.
Text specifying A-LINK or B-LINK used in the second DLI. None for the NLI.

- Text string of comments, if entered, for the host TRCU.

- Text string of comments, if entered, for the remote TRCU.

- Host TRCU type. Valid values:
  - TRCU = For the TRCU model 1.
  - TRCU2 = For the TRCU model 2.
  - TRCU3 = For the TRCU model 3.

- Remote TRCU type. Valid values:
  - TRCU = For the TRCU model 1.
  - TRCU2 = For the TRCU model 2.
  - TRCU3 = For the TRCU model 3.
  - N/A = during SM growth.

- Host TRCU unit number.

- Remote TRCU unit number. N/A during SM growth.

- Host TRCU circuit number.

- Remote TRCU circuit number. N/A during SM growth.

- Host TRCU change level indicator (CLI).

- Remote TRCU CLI. N/A during SM growth.

- Host TRCU aisle number.

- Remote TRCU aisle number. N/A when the SM is isolated.

- Host TRCU bay number.

- Remote TRCU bay number. N/A when the SM is isolated.

- Host TRCU vertical position number.

- Remote TRCU vertical position number. N/A when the SM is isolated.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of part 1: total office measurements of the 15-minute traffic report.

This provides a quick indication of call volume.

3. VARIABLE FIELD DEFINITIONS

a  = Time when the report was prepared, in the form hours:minutes:seconds.
b  = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID
c  = Number of originating calls. This peg count provides the number of originating requests that result in the system's receipt of at least one digit. Calls that do not normally result in digits being dialed are included upon the determination that no digits are required. On-demand B calls do not peg to this count.
d  = Number of incoming calls. This peg count provides the total number of incoming calls that resulted in the system's receipt of at least one digit. Calls that do not normally result in digits being dialed are included upon determination that no digits are required.
e  = Number of intra-office calls. This peg count provides the number of originating calls intended to complete within the switch. This measurement is incremented upon the system's recognition of the terminating party.
f  = Number of outgoing calls. This peg count provides the number of calls to be sent to the network over a trunk for completion. This measurement is incremented upon the system's recognition that the call will not terminate within the office.
g  = Number of terminating calls. This peg count provides the number of attempts to terminate to a line (including busy lines) within the switch. This measurement is incremented upon the system's recognition of the terminating party. On-demand B calls do not peg to this count.
h  = Number of tandem calls. This peg count provides the number of incoming calls to be sent to the
network for completion (that is, trunk-to-trunk calls). This measurement is incremented upon the system's recognition that the call will not terminate within the office.

\[ i \] = Number of originating dial pulse (DP) requests. This peg count is the number of times the system initiates action leading to a readiness to receive customer dial pulse digits. The measurement is incremented as soon as the particular line requesting service is identified. This count may peg multiple times for an originating attempt if the call is retried because of resource failures.

\[ j \] = Number of originating touch-tone (TT) requests. This peg count provides the number of times the system initiates procedures to place itself in a ready state to receive customer touch-tone service digits, or to process a call for which digits are not required. This measurement is incremented at the time the terminal requesting service is identified. This count may peg multiple times for an originating attempt if the call is retried because of resource failures.

\[ k \] = Number of incoming DP requests. This peg count is the number of times the system initiates action leading to a readiness to receive dial pulse digits. This measurement is incremented as soon as the particular dial pulse trunk requesting service is identified.

\[ l \] = Number of incoming multifrequency (MF) requests. This peg count is the number of times the system initiates action leading to a readiness to receive multifrequency or touch-tone digits from the network or to process a call for which digits are not required. This measurement is incremented as soon as the particular trunk requesting service is identified. This count is a total count.

\[ m \] = Number of incoming revertive pulsing (RP) requests. This peg count is the number of times the system initiates procedures to place itself in a ready state to receive revertive pulse digits from the network. This measurement is incremented as soon as the particular trunk requesting service is identified.

\[ n \] = Number of common channel interoffice signaling number 6 (CCIS6) incoming requests. This peg count is the number of times an incoming or outgoing CCIS6 common channel signaling (CCS) attempt has been made. This event provides a total count of CCIS6 CCS attempts on a per-protocol basis.

\[ o \] = Number of integrated services digital network (ISDN) user part incoming requests. This peg count is the number of times an incoming call attempt request [that is, initial address message (IAM)] was received for a CCS7 ISUP trunk. This event provides a total count of ISUP CCS7 attempts on a per-protocol basis.

\[ p \] = Number of telephone user part (TUP) incoming requests. This count will always generate a zero.

\[ q \] = Number of ISDN originating requests. This peg count is the number of Q.931 originating call SETUP messages received.

\[ r \] = Number of ISDN incoming requests. This peg count is the number of Q.931 incoming call SETUP messages (ISDN incoming requests) received.

\[ s \] = Number of outgoing MF requests. This peg count is the number of outgoing touch-tone and multifrequency requests.

\[ t \] = Number of CCIS6 outgoing requests. This peg count is the number of CCIS6 outgoing requests.

\[ u \] = Number of ISDN user part outgoing requests. This peg count is the number of times an outgoing call attempt request (that is, IAM) was sent for a CCS7 ISUP trunk.

\[ v \] = Number of BICC incoming requests. This peg count is the number of times an incoming call
attempt request [that is, initial address message (IAM)] was received for a BICC group.

\[ w \] = Number of BICC outgoing requests. This peg count is the number of times an outgoing call attempt request (that is, IAM) was sent for a BICC group.

4. ACTIONS TO BE TAKEN

   . . . . . . . . . . . .

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of part 2A: processor performance measurements of the 15-minute traffic report.

This provides a quick indication of switch performance.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = For the switching module (SM), percent of time spent processing jobs other than the two lowest priority jobs in the system.
   For the administrative module (AM), percent occupancy of call processing only.
c = SM number.
d = Number of call processing terminal processes created.
e = Number of dial tone delays (touch-tone service and dial pulse service) exceeding three seconds.
f = Number of calls sent to reorder.
g = Number of calls blocked during overload.
h = Either the total AM percent occupancy, includes both call processing and non-call processing work done in the AM or NA for not used.
i = A threshold value result from reorder count ratio (RCR). RCR value is the result of the third 5 minutes of the 15 minutes interval. System integrity (SI) will report RCR every 5 minutes if it exceeds any of the thresholds. The threshold are set by using the RC/V View 8.1. Defaults the thresholds are set to 0 as for inactive.

SECTION 182: AUTOMATIC CALL DISTRIBUTOR / BRCS MEASUREMENTS

INCOMING
ATMPT FAIL
a b

REORD QOVFL ABAND DELANN DELMUS CCFAIL
c d e f g h

2. REASON FOR OUTPUT

To respond to a request for either an immediate or a scheduled output of section 182: automatic call distributor (ACD)/ business and residential customer services (BRCS) measurements, of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

z = Time when the report was prepared, in the form hours:minutes:seconds.

a = Number of incoming ACD/BRCS call attempts for any event:
- An automatic call distributor (ACD) directory number (DN) call was received.
- A direct agent access (DAA) call was received.
- A queue access dialed call was received.
- An agent intercom call was received.

b = Number of incoming ACD/BRCS call attempt failures for any event:
- Failure in sending an agent route request message to the ACD.
- Failure to receive acknowledgment from the ACD acknowledging that an agent request was received.
- Call processing determined that the call received was an ACD call type but ACD secured feature bit is set to N (NO) in recent change.
- Failure of ACD to route a call to an agent for reasons other than the call queue was full.

- Failure to set a system timer to wait for an ACD response to an agent request.

- After a second time-out while waiting for a response from the ACD to an agent request.

- When system interrupt signal was received while the call was waiting for a response to an agent request from the ACD.

- Failure to route to music.

- Failure to route to an announcement if level 3 delay threshold is exceeded.

c = Number of ACD/BRCS calls routed to reorder tone for event:

- Failure to route a call to a position.

- Failure to route a call to a closed queue announcement.

d = Number of times the ACD tried to queue a call and either a call queue was full or no call queue data blocks (CQDBs) were available to queue the call. The CQDBs are system data blocks allocated to each queued call.

e = Number of times the back party (call originator) had gone on-hook before:

- The ACD successfully removed a queued call.

- Vectored call prior to delivery.

f = Number of times the ACD queued a call and the call was connected to an announcement while the call was in the queue.

g = Number of times the ACD queued a call and the call was connected to music while the call was in the queue.

h = Number of third party call control event messages that were not processed by the switch.

2. REASON FOR OUTPUT

To respond to a request for an immediate output of section 108: integrated services digital network (ISDN), business and residential customer services (BRCS), and automatic customer station rearrangement (ACSR) of the 30-minute traffic report. This response may also appear as part of the regularly scheduled 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- \( a \) = Time when the report was prepared, in the form hours:minutes:seconds.
- \( b \) = ACSR business group identifier.
- \( c \) = Number of ACSR requests.
- \( d \) = Number of successful completions of ACSR moves.
- \( e \) = Number of ACSR moves that exceed 20 minutes from activation to completion.
- \( f \) = Number of times ACSR services are denied because resources are unavailable.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of Section 229: AIU directly-connected peripheral data bus (DPIDB) or peripheral data bus (PIDB) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information. This is the time slot usage measurement of the DPIDB for the access interface unit (AIU), or the PIDB for the expansion access interface unit (EAIU)/multiplex access interface unit (XAIU).

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = PSU Shelf number.
d = AIU number.
e = Number of attempts to seize a DPIDB/PIDB time slot to set up an ODB connection.
f = DPIDB/PIDB time slot usage, in units of hundred call seconds, of a directly connected peripheral interface data bus for the AIU.
g = Number of times that DPIDB/PIDB time slots were not available.

3.2 Parameters

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 218; the access interface unit (AIU) line measurements, of the 30-minute traffic report. A maximum of six lines can be allowed (ALW) or requested (OP) for printing to the ROP.

NOTE: Once the AIU PACK growth procedure is finished and particular AIU is already collected for AIULC section the grown AIU PACK should be automatically taken into collection of the section.

- When the space in the collection buffer is exceeded the new components will not be taken into collection and the following message will be printed on the ROP:

  There is no enough space in TRFC30 buffer.
  Attempt to add the component AIU PACK # into collection failed.

  where # there is AIU PACK number.

- When the ROP budget is exceeded the grown AIU will be taken into collection but it will not be printed automatically on the ROP. The following message will be printed on the ROP:

  Print budget exceeded.
  Attempt to add component AIU # into ROP printing failed.

  where # there is AIU number. To get the grown AIU printed on the ROP the RCV view 13.7 must be used.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = AIU, EAIU, RAIU or XAIU number.
d = Application pack (AP) number.
e = Line card (LC) number.
f = Number of originating requests.
g = Number of times an SM took more than 3 seconds to respond to a SETUP request.
h = Number of terminating paths through the (E/R/X)AIU.
i = Usage count for originating and terminating circuit switched voice and/or data calls in units of hundred-call-seconds (CCS).
j = Number of originating request attempts blocked.
k = Number of terminating request attempts blocked.

3.2 Parameters

</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 46: announcement services measurements for the digital service unit model 2 (DSU2)-recorded announcement function (RAF) and the service announcement system (SAS) circuit types for the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of attempts to access a directory assistance (DA) announcement circuit. This count scores for both RAF and SAS.
c = Number of times a request to use a DA announcement circuit failed because all units were occupied. This count scores for both RAF and SAS.
d = Number of DA DSU2-RAF circuits that were not in service during 100-second scanning.
e = Number of DA DSU2-RAF circuits on ACCS calls in an in-service, non-idle state, or not in an in-service state (including out-of-service and any other maintenance state that a RAF may be in) during 100-second scanning.
f = Number of DA SAS circuits that were not in service during 100-second scanning.
g = Number of DA SAS circuits in an in-service, non-idle state, or not in an in-service state (including out-of-service and any other maintenance state that a SAS may be in) during 100-second scanning.
h = Number of attempts to access a dial through announcement (DTA) announcement service circuit...
on an automated calling card service (ACCS) call, including second attempts to access a circuit if a timeout occurred for the first request. If a request is queued, this count is scored a second time when the request is removed from a queue.

i = Number of times a request to use an announcement circuit on ACCS calls was queued because all circuits were busy.

j = Number of DTA DSU2-RAF circuits on ACCS calls that were not in service during 100-second scanning.

k = Number of DTA DSU2-RAF circuits on ACCS calls in an in-service, non-idle state, or not in an in-service state (including out-of-service and any other maintenance state that a RAF may be in) during 100-second scanning.

l = Number of DTA SAS circuits that were not in service during 100-second scanning.

m = Number of DTA SAS circuits in an in-service, non-idle state, or not in an in-service state (including out-of-service and any other maintenance state that a SAS may be in) during 100-second scanning.

n = Number of attempts to access coin announcement service circuits. Valid events are:
- To give a notification announcement at the end of the initial period on an automated coin call.
- To make an automated coin toll service (ACTS) coin station test call.
- After a successful rating for an overtime charge-due seizure or end-of-call seizure on an automated coin call and having successfully obtained a 6-port conference circuit.
- During initial contact on a 1+ coin ACTS call with good automatic number identification (ANI).
- When the back party went on-hook on a ringback and the end of call charges were to be announced.
- After a successful rating query for a non-free overtime-charge-due seizure or end-of-call seizure, ACTS, operator assisted coin call.
- When coming out of hold on a coin paid ACTS call.

o = Number of times a request to use a coin announcement circuit failed because all circuits were busy.

p = Number of coin DSU2-RAF circuits that were not in service during 100-second scanning.

q = Number of coin DSU2-RAF circuits in an in-service, non-idle state, or not in an in-service state (including out-of-service and any other maintenance state that a RAF may be in) during 100-second scanning.

r = Number of coin SAS circuits that were not in service during 100-second scanning.

s = Number of coin SAS circuits in an in-service, non-idle state, or not in an in-service state (including out-of-service and any other maintenance state that a SAS may be in) during 100-second scanning.
\( t \) = Number of attempts to access the business and residential customer services (BRCS) announcement service circuits.

\( u \) = Number of times a request to use the BRCS announcement service circuit failed because all units were occupied.

\( v \) = Number of DSU2-RAF BRCS circuits that were out-of-service during the 100-second scan.

\( w \) = Number of DSU2-RAF BRCS circuits in an in-service, nonidle state, or not in an in-service state (including out-of-service and any other maintenance state that a RAF may be in) during 100-second scanning.

\( x \) = Number of BRCS SAS circuits that were not in service during 100-second scanning.

\( y \) = Number of BRCS SAS circuits in an in-service, non-idle state, or not in an in-service state (including out-of-service and any other maintenance state that a SAS may be in) during 100-second scanning.

\( z \) = Number of attempts to access the advanced services platform (ASP) announcement service circuits.

\( a^1 \) = Number of times a request to use an ASP announcement service circuit failed because all units were occupied.

\( b^1 \) = Number of DSU2-RAF ASP circuits that were out-of-service during the 100-second scan.

\( c^1 \) = Number of DSU2-RAF ASP circuits in an in-service, nonidle state, or not in an in-service state (including out-of-service and any other maintenance state that a RAF may be in) during 100-second scanning.

\( d^1 \) = Number of ASP SAS circuits that were not in service during 100-second scanning.

\( e^1 \) = Number of ASP SAS circuits in an in-service, non-idle state, or not in an in-service state (including out-of-service and any other maintenance state that a SAS may be in) during 100-second scanning.

\( f^1 \) = Number of attempts to access announcement only channel (AOC) announcement service circuits.

\( g^1 \) = Number of times a request to use an AOC announcement service circuit failed because all circuits were busy.

\( h^1 \) = Number of AOC DSU2-RAF circuits that were not in service during 100-second scanning.

\( i^1 \) = Number of AOC DSU2-RAF circuits in an in-service, non-idle state, or not in an in-service state (including out-of-service and any other maintenance state that a RAF may be in) during 100-second scanning.

\( j^1 \) = Number of AOC SAS circuits that were not in service during 100-second scanning.

\( k^1 \) = Number of AOC SAS circuits in an in-service, non-idle state, or not in an in-service state (including out-of-service and any other maintenance state that a SAS may be in) during 100-second scanning.

<td>.</td>
</tr>
<tr>
<td>.</td>
<td>.</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either a manual or an automatic output of section 59, application processor data link measures (APDL) of the 30-minute traffic report. There are a maximum of three application processor IDs to be printed.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- a = Time, in the form of hours:minutes:seconds.
- b = Application processor identifier (APID).
- c = Percent occupancy of the data link to the specified application processor (AP) and the percent occupancy of the basic rate interface between an AP and an integrated services line unit.

3.2 Parameters

<table>
<thead>
<tr>
<th>Data collection unit</th>
<th>AP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum collection units</td>
<td>99</td>
</tr>
<tr>
<td>Precision</td>
<td>Single</td>

<td>Refer to the OP:TRFC30 input message for additional information.</td>
</tr>
<tr>
<td>Report buffer layout</td>
<td>1 APID (ID); 2 bytes</td>
</tr>
<tr>
<td></td>
<td>2 DLOCC</td>
</tr>
</tbody>
</table>

4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.
The validity for the administrative module (AM) applies to this section.

5. **ALARMS**

None.

6. **REFERENCES**

  .   .    .    .    .
  .   .    .    .    .
```

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of Section 228: AIU packet switching on-demand b-channel of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Switching module (SM) number.
- **c** = AIU, EAIU or XAIU number.
- **d** = Number of attempts to set up an ODB connection to the protocol handler (PH) whether successful or not.
- **e** = DPIDB or PIDB usage, in units of hundred call seconds, of a directly connected peripheral interface data bus for the AIU or a connected peripheral interface data bus for the (E)AIU.
- **f** = Number of attempts to set up the ODB connection to the PH that failed.

3.2 Parameters

<table>
<thead>
<tr>

<td>.</td>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 35 of the 30-minute traffic report. Up to 16 ROUTE-RTESUCC pairs may be output for each pattern identifier.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time, in the form of hours:minutes:seconds.
b = Automatic route section (ARS) pattern identifier.

The ARS pattern ID is the MCRTIDX for each of the pattern groups on RC/V view 10.6 (ARS GROUP SCREENING INDEXES). The PATID is the first route in the route list [RC/V view 10.24 (BRCS MC ROUTE INDEX LIST)]. There is a maximum of six patterns per ARS group.

The key inputs to RC/V view 10.6 and their source RC views are:

ARS group name - RC/V views 1.8 (ANALOG LINE/BRCS ASSIGNMENT), 1.21 (AUTOMATIC ROUTE SELECTION LINE PARAMETERS), 23.8 (DSL/BRCS ASSIGNMENT), or 5.21 (AUTOMATIC ROUTE SELECTION TRUNK PARAMETERS).

ARS route index - RC/V view 9.21 (PRIVATE NETWORK DIALING PLAN) or RC/V view 9.3 [LOCAL DIGIT (OFFICE DIALING)].

ARS screen index - RC/V views 1.8, 1.21, 23.8, or 5.21.

c = Number of attempts to route using ARS pattern.
d = Number of failures to route due to insufficient facility restriction level (FRL).
e = Route number. Each ARS pattern may have a maximum of 16 routes. The route list for each pattern (identified by the MCRTIDX) can be seen on RC/V view 10.24.
3.2 Parameters

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 231 advanced service platform (ASP) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of call processing failures before initial query to the service control point database.
c = Number of call processing failures after initial query to the service control point database.
d = Number of times of resource unavailable before initial query to the service control point database.
e = Number of times of resource unavailable after initial query to the service control point database.
f = Number of times that network management (NM) control blocked a call.
g = Number of signaling failures due to timeout at the service switching point (SSP).
h = Number of times that an invalid command message was returned from the SSP.
i = Number of times that an invalid sequence message was returned from the SSP.
j = Number of times that a return error, reject message, or return query was received.
k = Number of abandons before outpulsing.
l = Number of abandons after outpulsing.
m = Number of times that all inter-local access transport area (LATA) carrier trunks were busy.
n = Number of times that all service provider trunks were busy.
o = Number of ASP calls originating in the SSP for which dialing was complete.
p = Number of ASP calls that have been received from another switch.
q = Number of ASP queries sent to service control point (SCP).
r = Number of normal route response messages received.
s = Number of play announcement messages from SCP.
t = Number of times the serial triggering limit has overflowed or been exhausted.
u = Number of times a termination notification request is received by the SSP.
v¹ = Number of times the SSP sends a response to a request for a termination notification.
w = Number of times the SSP is unable to obtain a non-critical (non-fatal) resource.
x = Number of times the send to resource external [STR(E)] message is received from a local intelligent peripheral (IP).
y = Number of times announcement number included in STR message is undefined.
z = Number of REMOTE STR(E) Messages, pegged whenever a well formed STR(E) message is received for a remote IP.
a¹ = Number of REMOTE IP Timeouts, pegged whenever this SSP (acting as a local SSP) receives indication from the Remote SSP that the Remote IP timed out and this SSP reports this to the SCP with a Resource_Clear message whose ClearCause value is “isdnTimeout”.
b¹ = Number of REMOTE IP Unavailable, pegged whenever this SSP (acting as a local SSP) receives indication from the Remote SSP that the Remote SSP cannot seize an idle B channel to the indicated Remote IP, and when this SSP reports this to the SCP with a Resource_Clear message whose ClearCause value is “channelsBusy”.
c¹ = Number of REMOTE accesses to Local IP, pegged whenever a well formed IAM message is received at this switch (acting in the role of a Remote SSP) for an IP homed on this switch.
d¹ = Number of times when ASP receives a 7-digits Called Party ID and provides final treatment.

4. ACTION TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

2. REASON FOR OUTPUT

To respond to a request for either an immediate or schedule output of section 231 advanced service platform (ASP) of the 30-minute traffic report.

NOTE: The output depends on OFID 1006. If OFID 1006 is switched off then the section 231 (ASP) with single precision counters can be used. For OFID 1006 switched on the section 85 (ASPN) with double precision counters can be used.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of call processing failures before initial query to the service control point database.
c = Number of call processing failures after initial query to the service control point database.
d = Number of times of resource unavailable before initial query to the service control point database.
e = Number of times of resource unavailable after initial query to the service control point database.
f = Number of times that network management (NM) control blocked a call.
g = Number of signaling failures due to timeout at the service switching point (SSP).
h = Number of times that an invalid command message was returned from the SSP.
i = Number of times that an invalid sequence message was returned from the SSP.
j = Number of times that a return error, reject message, or return query was received.
k = Number of abandons before outpulsing.
l = Number of abandons after outpulsing.
m = Number of times that all inter-local access transport area (LATA) carrier trunks were busy.
n = Number of times that all service provider trunks were busy.
o = Number of ASP calls originating in the SSP for which dialing was complete.
p = Number of ASP calls that have been received from another switch.
q = Number of ASP queries sent to service control point (SCP).
r = Number of normal route response messages received.
s = Number of play announcement messages from SCP.
t = Number of times the serial triggering limit has overflowed or been exhausted.
u = Number of times a termination notification request is received by the SSP.
v = Number of times the SSP sends a response to a request for a termination notification.
w = Number of times the SSP is unable to obtain a non-critical (non-fatal) resource.
x = Number of times the send to resource external [STR(E)] message is received from a local intelligent peripheral (IP).
y = Number of times announcement number included in STR message is undefined.
z = Number of remote STR(E) messages, pegged whenever a well formed STR(E) message is received for a remote IP.
a¹ = Number of remote IP timeouts, pegged whenever this SSP (acting as a local SSP) receives indication from the remote SSP that the remote IP timed out and this SSP reports this to the SCP with a "Resource_Clear" message whose clear cause value is "ISDNTimeout".
b¹ = Number of remote IP unavailable messages, pegged whenever this SSP (acting as a local SSP) receives indication from the remote SSP that the remote SSP cannot seize an idle B-channel to the indicated Remote IP, and when this SSP reports this to the SCP with a "Resource_Clear" message whose clear cause value is "ChannelsBusy".
c¹ = Number of remote accesses to the local IP, pegged whenever a well formed initial address
message (IAM) is received at this switch (acting in the role of a remote SSP) for an IP homed on this switch.

\[ d_1 \] = Number of times when ASP receives a 7-digit called party ID and provides final treatment.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 117 advanced service platform large (ASPLG) counts of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of network element services signaling (NESS) register messages from the ISDN CPE that are recognized by the switch as NESS messaging attempts.
c = Number of NESS register messages from the ISDN CPE that were successfully validated in preparation for sending a NESS transaction capabilities application part (TCAP) message.
d = Number of nCAData requests from a service control point (SCP) that are recognized by the switch as NESS TCAP messaging attempts.
e = Number of nCAData requests from an SCP that did result in sending a NESS register message.
f = Number of network management blocked NCAS messages.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or schedule output of section 85: advanced service platform (ASPN) of the 30-minute traffic report.

NOTE: The output depends on OFID 1006. If OFID 1006 is switched off then the section 231 (ASP) with single precision counters can be used. For OFID 1006 switched on the section 85 (ASPN) with double precision counters can be used.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of call processing failures before initial query to the service control point database.
c = Number of call processing failures after initial query to the service control point database.
d = Number of times of resource unavailable before initial query to the service control point database.
e = Number of times of resource unavailable after initial query to the service control point database.

f = Number of times that network management (NM) control blocked a call.

g = Number of signaling failures due to timeout at the service switching point (SSP).

h = Number of times that an invalid command message was returned from the SSP.

i = Number of times that an invalid sequence message was returned from the SSP.

j = Number of times that a return error, reject message, or return query was received.

k = Number of abandons before outpulsing.

l = Number of abandons after outpulsing.

m = Number of times that all inter-local access transport area (LATA) carrier trunks were busy.

n = Number of times that all service provider trunks were busy.

o = Number of ASP calls originating in the SSP for which dialing was complete.

p = Number of ASP calls that have been received from another switch.

q = Number of ASP queries sent to service control point (SCP).

r = Number of normal route response messages received.

s = Number of play announcement messages from SCP.

t = Number of times the serial triggering limit has overflowed or been exhausted.

u = Number of times a termination notification request is received by the SSP.

v\(^1\) = Number of times the SSP sends a response to a request for a termination notification.

w = Number of times the SSP is unable to obtain a non-critical (non-fatal) resource.

x = Number of times the send to resource external [STR(E)] message is received from a local intelligent peripheral (IP).

y = Number of times announcement number included in STR message is undefined.

z = Number of remote STR(E) messages, pegged whenever a well formed STR(E) message is received for a remote IP.

a\(^1\) = Number of remote IP timeouts, pegged whenever this SSP (acting as a local SSP) receives indication from the remote SSP that the remote IP timed out and this SSP reports this to the SCP with a "Resource_Clear" message whose clear cause value is "ISDNTimeout".

b\(^1\) = Number of remote IP unavailable messages, pegged whenever this SSP (acting as a local SSP) receives indication from the remote SSP that the remote SSP cannot seize an idle B-channel to the indicated remote IP, and when this SSP reports this to the SCP with a "Resource_Clear" message whose clear cause value is "ChannelsBusy".

c\(^1\) = Number of remote accesses to the local IP, pegged whenever a well formed initial address
message (IAM) is received at this switch (acting in the role of a remote SSP) for an IP homed on this switch.

\[ d^1 \]

= Number of times when ASP receives a 7-digit called party ID and provides final treatment.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 232 advanced service platform (ASP) toll free (TF) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Number of call processing failures before initial query to the service control point database.
- **c** = Number of call processing failures after initial query to the service control point database.
- **d** = Number of times of resource unavailable before initial query to the service control point database.
e = Number of times of resource unavailable after initial query to the service control point database.
f = Number of times that NM control blocked a call.
g = Number of signaling failures due to timeout at the SSP.
h = Number of times that an invalid command message was returned from the SSP.
i = Number of times that an invalid sequence message was returned from the SSP.
j = Number of times that a return error, reject message, or return query was received.
k = Number of abandons before outpulsing.
l = Number of abandons after outpulsing.
m = Number of times that all inter-LATA carrier trunks were busy.
n = Number of times that all service provider trunks were busy.
o = Number of calls originating in the SSP for which dialing was complete.
p = Number of calls that have been received from another switch.
q = Number of queries sent to SCP.
r = Number of normal route response messages received.
s = Number of play announcement messages from SCP.
t = Number of times the serial triggering limit has overflowed or been exhausted.
u = Number of times a termination notification request is received by the SSP.
v = Number of times the SSP sends a response to a request for a termination notification.
w = Number of times the SSP is unable to obtain a non-critical (non-fatal) resource.
x = Number of times the STR(E) message is received for a local intelligent peripheral (IP).
y = Number of times announcement included in STR message is undefined.
z = Number of REMOTE STR(E) Messages, pegged whenever a well formed STR(E) message is received for a remote IP.

a¹ = Number of REMOTE IP Timeouts, pegged whenever this SSP (acting as a local SSP) receives indication from the Remote SSP that the Remote IP timed out. This is reported to the SCP with a resource_clear message whose clear cause value is "isdnTimeout".

b¹ = Number of REMOTE IP Unavailable, pegged whenever this SSP (acting as a local SSP) receives indication from the Remote SSP that the Remote SSP cannot seize an idle B channel to the indicated Remote IP. This is reported to the SCP with a Resource_Clear message whose clear cause value is "channelsBusy".

c¹ = Number of REMOTE accesses to Local IP, pegged whenever a well formed IAM message is received at this switch (acting in the role of a Remote SSP) for an IP homed on this switch.
\[ d^1 \] = Number of times when TF ASP receives a 7-digits Called Party ID and provides final treatment.

4. ACTION TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 232 advanced service platform (ASP) toll free (TF) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Number of TF call processing failures before initial query to the service control point database.
- **c** = Number of TF call processing failures after initial query to the service control point database.
- **d** = Number of times of resource unavailable before initial query to the service control point database for TF calls.
- **e** = Number of times of resource unavailable after initial query to the service control point database for TF calls.
Number of times that network management (NM) control blocked a TF call.

Number of signaling failures due to timeout at the service switching point (SSP).

Number of times that an invalid command message was returned from the SSP for TF calls.

Number of times that an invalid sequence message was returned from the SSP for TF calls.

Number of times that a return error, reject message, or return query was received for TF calls.

Number of abandons before outpulsing for TF calls.

Number of abandons after outpulsing for TF calls.

Number of times that all inter-LATA carrier trunks were busy for TF calls.

Number of times that all service provider trunks were busy for TF calls.

Number of TF calls originating in the SSP for which dialing was complete.

Number of TF calls that have been received from another switch.

Number of queries sent to SCP.

Number of normal route response messages received for TF calls.

Number of play announcement messages from SCP for TF calls.

Number of times the serial triggering limit has overflowed or been exhausted for TF calls.

Number of times a termination notification request is received by the SSP for TF calls.

Number of times the SSP sends a response to a request for a termination notification for TF calls.

Number of times the SSP is unable to obtain a non-critical (non-fatal) resource for TF calls.

Number of times the send to resource external [STR(E)] message is received for a local intelligent peripheral (IP).

Number of times announcement included in STR message is undefined for TF calls.

Number of remote STR(E) messages, pegged whenever a well formed STR(E) message is received for a remote IP.

Number of remote IP timeouts message, pegged whenever this SSP (acting as a local SSP) receives indication from the remote SSP that the remote IP timed out. This is reported to the SCP with a “Resource_Clear” message whose clear cause value is "ISDNTimeout".

Number of remote IP unavailable messages, pegged whenever this SSP (acting as a local SSP) receives indication from the remote SSP that the remote SSP cannot seize an idle B-channel to the indicated remote IP. This is reported to the SCP with a “Resource_Clear“ message whose clear cause value is "channelsbusy".

Number of remote accesses to local IP, pegged whenever a well formed initial address message (IAM) is received at this switch (acting in the role of a remote SSP) for an IP homed on this switch.
\[ d^1 \] = Number of times when TF ASP receives a 7-digits called party ID and provides final treatment.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 232 advanced service platform (ASP) toll free (TF) of the 30-minute traffic report.

NOTE: The output depends on OFID 1006. If OFID 1006 is switched off then the section 232 (ASPTF) with single precision counters can be used. For OFID 1006 switched on the section 86 (ASPTFN) with double precision counters can be used.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

\begin{align*}
\text{a} & = \text{Time when the report was prepared, in the form hours:minutes:seconds.} \\
\text{b} & = \text{Number of TF call processing failures before initial query to the service control point database.} \\
\text{c} & = \text{Number of TF call processing failures after initial query to the service control point database.} \\
\text{d} & = \text{Number of times of resource unavailable before initial query to the service control point database for TF calls.} \\
\text{e} & = \text{Number of times of resource unavailable after initial query to the service control point database for TF calls.} \\
\text{f} & = \text{Number of times that network management (NM) control blocked a TF call.} \\
\text{g} & = \text{Number of signaling failures due to timeout at the service switching point (SSP).} \\
\text{h} & = \text{Number of times that an invalid command message was returned from the SSP for TF calls.} \\
\text{i} & = \text{Number of times that an invalid sequence message was returned from the SSP for TF calls.} \\
\text{j} & = \text{Number of times that a return error, reject message, or return query was received for TF calls.} \\
\text{k} & = \text{Number of abandons before outpulsing for TF calls.} \\
\text{l} & = \text{Number of abandons after outpulsing for TF calls.} \\
\text{m} & = \text{Number of times that all inter-LATA carrier trunks were busy for TF calls.} \\
\text{n} & = \text{Number of times that all service provider trunks were busy for TF calls.} \\
\text{o} & = \text{Number of TF calls originating in the SSP for which dialing was complete.} \\
\text{p} & = \text{Number of TF calls that have been received from another switch.} \\
\text{q} & = \text{Number of queries sent to SCP.} \\
\text{r} & = \text{Number of normal route response messages received for TF calls.} 
\end{align*}
s = Number of play announcement messages from SCP for TF calls.

t = Number of times the serial triggering limit has overflowed or been exhausted for TF calls.

u = Number of times a termination notification request is received by the SSP for TF calls.

v = Number of times the SSP sends a response to a request for a termination notification for TF calls.

w = Number of times the SSP is unable to obtain a non-critical (non-fatal) resource for TF calls.

x = Number of times the send to resource external [STR(E)] message is received for a local intelligent peripheral (IP).

y = Number of times announcement included in STR message is undefined for TF calls.

z = Number of remote STR(E) messages, pegged whenever a well formed STR(E) message is received for a remote IP.

a = Number of remote IP timeouts message, pegged whenever this SSP (acting as a local SSP) receives indication from the remote SSP that the remote IP timed out. This is reported to the SCP with a "Resource_Clear" message whose clear cause value is "ISDNTimeout".

b = Number of remote IP unavailable messages, pegged whenever this SSP (acting as a local SSP) receives indication from the remote SSP that the remote SSP cannot seize an idle B-channel to the indicated remote IP. This is reported to the SCP with a "Resource_Clear" message whose clear cause value is "channelsbusy".

c = Number of remote accesses to local IP, pegged whenever a well formed initial address message (IAM) is received at this switch (acting in the role of a remote SSP) for an IP homed on this switch.

4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

The validity for the administrative module applies to this section.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 167: asynchronous transfer mode (ATM) link measurements (ATMLNK) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

Selection of components for collection and reporting of this section is administered using RC/V Views 13.7 (MEASUREMENT COLLECTION SELECTIVITY) and 13.8 (MEASUREMENT RANGE SELECTIVITY).

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (1 - 192).

c = Packet switch unit (PSU) number.

d = ATM link number.

e = ATM link type. Valid value(s):
   B = ATM backhaul link.
   P = ATM PSU link using PHA2.

f = Near community address.

= Validity of PM data. Valid value(s):
   N = Data is invalid in the first measurements interval (and may be invalid for up to 3 initial intervals) or after the far end APS switch occurs at the ATM switch.
   Y = Data is valid.

h = Active protocol handler for ATM (PHA) level 1 receive occupancy threshold exceeded seconds (ROT1ES).

i = Active PHA level 2 receive occupancy threshold exceeded seconds (ROT2ES).

j = Average transmit cell count per second for the ATM link. This is the average throughput of the ATM link for active channels.

k = Average receive cell count per second for the ATM link. This is the average throughput of the ATM link for active channels.

l = Peak transmit cell count per second for the ATM link. This is the highest throughput of the ATM link for active channels.

m = Peak receive cell count per second for the ATM link. This is the highest throughput of the ATM link for active channels.

n = Cells discarded due to header error check (HEC) violations.

o = Out of cell delineation anomalies.

p = Cells discarded due to protocol.

q = Operations, Administration and Maintenance (OA&M) cells discarded due to errors.

r = OA&M cells discarded due to invalid values.

s = OA&M cells discarded due to not supported request.

t = ATM adaptation layer type 5 (AAL5) invalid fields [invalid common part indicator (CPI), oversized received software data unit (SDU), length violation].

u = AAL5 incorrect fields [cyclic redundancy check (CRC)-32 violations].

3.2 Parameters
### Data Collection Unit: ATM Link

**Maximum Collection Units:** 46

**Maximum Lines for ROP Output:** 3

**Precision:** Double

**Length:** Variable

**Activation:** Refer to the ALW:TRFC30 and OP:TRFC30 input messages for additional information.

### Report Buffer Layout

1. SM (1 BYTE)
2. PSU (1 BYTE)
3. LINK (1 BYTE)
4. TYPE (1 BYTE)

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 167: asynchronous transfer mode (ATM) link measurements (ATMLNK) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

Selection of components for collection and reporting of this section is administered using RC/V Views 13.7 (MEASUREMENT COLLECTION SELECTIVITY) and 13.8 (MEASUREMENT RANGE SELECTIVITY).
3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Switching module (1 - 192).

c = Packet switch unit (PSU) number.

d = ATM link number.

e = ATM link type. Valid value(s):
   B = ATM backhaul link
   P = ATM PSU link using PHA2

f = Near community address.

g = Validity of PM data. Valid value(s):
   N = Data is invalid in the first measurements interval (and may be invalid for up to 3
      initial intervals) or after the far end APS switch occurs at the ATM switch.
   Y = Data is valid.

h = Active protocol handler for ATM (PHA) level 1 receive occupancy threshold exceeded seconds
   (ROT1ES).

i = Active PHA level 2 receive occupancy threshold exceeded seconds (ROT2ES).

j = Average transmit cell count per second for the ATM link. This is the average throughput of the
   ATM link for active channels.

k = Average receive cell count per second for the ATM link. This is the average throughput of the
   ATM link for active channels.

l = Peak transmit cell count per second for the ATM link. This is the highest throughput of the ATM
   link for active channels.

m = Peak receive cell count per second for the ATM link. This is the highest throughput of the ATM
   link for active channels.

n = Cells discarded due to header error check (HEC) violations.

o = Out of cell delineation anomalies.

p = Cells discarded due to protocol.

q = Operations, Administration and Maintenance (OA&M) cells discarded due to errors.

r = OA&M cells discarded due to invalid values.

s = OA&M cells discarded due to not supported request.

t = ATM adaptation layer type 5 (AAL5) invalid fields [invalid common part indicator (CPI), oversized
   received software data unit (SDU), length violation].
= AAL5 incorrect fields [cyclic redundancy check (CRC)-32 violations].

= Average packet bus occupancy. Valid value(s):

NA = Packet bus data is not available or not applicable for the ATM link. This field is not applicable for PSU2. Packet bus occupancy can be provisioned for a PSU2 using TRFC30 section 165, PSU2 packet bus occupancy measurements. Data for PSU2e is not available during the first several collection cycles after a PHA2 is initialized.

0–100 = Average packet bus occupancy for the ATM link on a PSU2e.

= 95th percentile packet bus percent occupancy. This count indicates packet bus percent occupancy for the ATM link and is computed every 6 seconds. In a TRFC30 collection interval, 95% of the 6 second samples have percent occupancies no greater than the stated output value. For example, an output value of 50 means that 95% of the time the packet bus occupancy was no more than 50%. If the TRFC30 interval was 30 minutes, 300 6 second samples would be taken. When sorted in increasing order, sample 285 contains the 95th percentile value. Valid value(s):

NA = Packet bus data is not available or not applicable for the ATM link. This field is not applicable for PSU2. Packet bus occupancy can be provisioned for a PSU2 using TRFC30 section 165, PSU2 packet bus occupancy measurements. Data for PSU2e is not available during the first several collection cycles after a PHA2 is initialized.

0–100 = 95th percentile packet bus occupancy for the ATM link on a PSU2e.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 249: ATM quality of service (ATMQOS) based on the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

Selection of components for collection and reporting of this section is administered using RC/V views 13.7 and 13.8.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = ATM trunk group number.
c = ATM trunk group member.
d = ATM connection PM direction. Valid value(s):
   I = Incoming.
= Outgoing.

e = Validity of PM data.

f = Virtual path identifier.

g = Virtual channel identifier.

h = Number of transmitted 0+1 user information cells.

i = Number of transmitted 0 user information cells.

j = Number of cell errors.

k = Number of severely errored cell block.

l = Number of 0+1 cells lost.

m = Number of 0 cells lost.

n = Number of cell misinsertion.

o = Number of impaired blocks.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 239 asynchronous transfer mode (ATM) quality of service packet switch unit (PSU)-PSU (ATMQOSPS) for the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

Selection of components for collection and reporting of this section is administered using RC/V Views 13.7 (MEASUREMENT COLLECTION SELECTIVITY) and 13.8 (MEASUREMENT RANGE SELECTIVITY).

With performance monitoring (PM), the senders' connection type determines the path in which outgoing and incoming cells are transmitted and received. If endpoint A of a connection is virtual path connection (VPC) - F4 flow and endpoint B of the connection is virtual channel connection (VCC) - F5 flow, outgoing and incoming cells are carried on different paths. PM sessions on these paths have what is considered to be mixed connections and will only report traffic on the outgoing path.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Near subnetwork.
c = Near community address.
d = Near link.
e = Far subnetwork.
f = Far community address.
g = Connection priority.
h = ATM connection PM direction. Valid value(s):
   I = Incoming.
   O = Outgoing.
i = Performance monitoring session number as seen on RC/V View 22.31 (PSU TO PSU PERFORMANCE MONITORING SESSION).
j = Validity of PM data. Valid value(s):
   N = Data is invalid in the first measurements interval (and may be invalid for up to 3 initial intervals) or after the far end APS switch occurs at the ATM switch.
   Y = Data is valid.
k = Virtual path identifier.
l = Virtual channel identifier. VCI will be NA (not applicable) for VPC routing.
m = Number of transmitted user cells with cell loss priority (CLP) of 0 (high) and cell loss priority of 1 (low). This is the directly counted number of user information cells originated on monitored permanent virtual circuit (PVC). The protocol handler for ATM - version 2 (PHA2) always transmits user information cells with CLP set to high. The ATM network may change the CLP from 0 to 1 (cell tagging) if the traffic on the PVC does not comply with provisioned traffic parameters. This counter can also be determined by TUC0+1 in the performance monitoring forward reports received at the receiving end point.
n = Number of transmitted user cells with CLP set to high (0). Like TUIC0+1 counter, it can be directly counted or can be derived from the performance monitoring forward reports at the receiving end point.
o = Number of errored cells. This counter is incremented if the number of cell errors is less than or equal to the errored cells threshold. If the number of cell errors exceeds the threshold, then the cell block is treated as severely errored cell block (SECB). The threshold parameter can be configured using RC/V View 8.75 (CDMA OFFICE OPTIONS) field CELL EVENTS THRESHOLDS - ERRORED.
p = Number of severely errored cell block. This counter is incremented whenever the number of errored user information cells is greater than threshold for errored cells, number of 0+1 user information cells lost is greater than threshold for lost cells, or number of misinserted cells is greater than the threshold for misinserted cells in a cell block. The SECB counter is used to distinguish burst of cell transfer failures and to exclude these bursts from the cell errors, cells lost, and misinserted cells.
\(q\) = Number of lost 0+1 user information cells. This counter is incremented if the number of cell lost is less than or equal to the lost cells threshold. If the number of cell lost exceeds the threshold, then the cell block is treated as SECB. The threshold parameter can be configured using RC/V View 8.75 (CDMA OFFICE OPTIONS) field CELL EVENTS_THRESHOLDS - LOST.

\(r\) = Number of lost 0 user information cells. This counter is incremented if the number of cell errors is less than or equal to the lost cells threshold.

\(s\) = Number of misinserted 0+1 user information cells. This counter is incremented if the number of cell errors is less than the misinserted cells threshold. If the number of misinserted cells exceeds the threshold then the cell block is treated as SECB. The threshold parameter can be configured using RC/V View 8.75 (CDMA OFFICE OPTIONS) field "CELL EVENTS_THRESHOLDS - MISINSERTED".

\(t\) = Number of impaired blocks. This counter provides the sum of cell blocks containing at least one errored, lost, or misinserted user information cell.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 239 asynchronous transfer mode (ATM) quality of service packet switch unit (PSU)-PSU (ATMQOSPS) for the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

Selection of components for collection and reporting of this section is administered using RC/V Views 13.7 (MEASUREMENT COLLECTION SELECTIVITY) and 13.8 (MEASUREMENT RANGE SELECTIVITY).

With performance monitoring (PM), the senders' connection type determines the path in which outgoing and incoming cells are transmitted and received. If endpoint A of a connection is virtual path connection (VPC) - F4 flow and endpoint B of the connection is virtual channel connection (VCC) - F5 flow, outgoing and incoming cells are carried on different paths. PM sessions on these paths have what is considered to be mixed connections and will only report traffic on the outgoing path.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a  = Time when the report was prepared, in the form hours:minutes:seconds.
b = Near subnetwork.
c = Near community address.
d = Near link.
e = Far subnetwork.
f = Far community address.
g = Application type. Valid value(s):
H = High priority.
L = Low priority.

h = ATM connection PM direction. Valid value(s):
I = Incoming.
O = Outgoing.
i = Performance monitoring session number as seen on RC/V View 22.31 (PSU to PSU performance monitoring session).
j = Validity of PM data. Valid value(s):
N = Data is invalid in the first measurements interval (and may be invalid for up to 3 initial intervals) or after the far end APS switch occurs at the ATM switch.
Y = Data is valid.

k = Virtual path identifier.
l = Virtual channel identifier. VCI will be blank for VPC routing.
m = Number of transmitted user cells with cell loss priority (CLP) of 0 (high) and cell loss priority of 1 (low). This is the directly counted number of user information cells originated on monitored permanent virtual circuit (PVC). The protocol handler for ATM - version 2 (PHA2) always transmits user information cells with CLP set to high. The ATM network may change the CLP from 0 to 1 (cell tagging) if the traffic on the PVC does not comply with provisioned traffic parameters. This counter can also be determined by TUC0+1 in the performance monitoring forward reports received at the receiving end point.

n = Number of transmitted user cells with CLP set to high (0). Like TUIC0+1 counter, it can be directly counted or can be derived from the performance monitoring forward reports at the receiving end point.

o = Number of errored cells. This counter is incremented if the number of cell errors is less than or equal to the errored cells threshold. If the number of cell errors exceeds the threshold, then the cell block is treated as severely errored cell block (SECB). The threshold parameter can be configured using RC/V View 8.75 (CDMA OFFICE OPTIONS) field CELL EVENTS THRESHOLDS - ERRORED.

p = Number of severely errored cell block. This counter is incremented whenever the number of errored user information cells is greater than threshold for errored cells, number of 0+1 user information cells lost is greater than threshold for lost cells, or number of misinserted cells is greater than the threshold for misinserted cells in a cell block. The SECB counter is used to distinguish
burst of cell transfer failures and to exclude these bursts from the cell errors, cells lost, and misinserted cells.

\( q \) = Number of lost 0+1 user information cells. This counter is incremented if the number of cell lost is less than or equal to the lost cells threshold. If the number of cell lost exceeds the threshold, then the cell block is treated as SECB. The threshold parameter can be configured using RC/V View 8.75 (CDMA OFFICE OPTIONS) field CELL EVENTS THRESHOLDS - LOST.

\( r \) = Number of lost 0 user information cells. This counter is incremented if the number of cell errors is less than or equal to the lost cells threshold.

\( s \) = Number of misinserted 0+1 user information cells. This counter is incremented if the number of cell errors is less than the misinserted cells threshold. If the number of misinserted cells exceeds the threshold then the cell block is treated as SECB. The threshold parameter can be configured using RC/V View 8.75 (CDMA OFFICE OPTIONS) field CELL EVENTS THRESHOLDS - MISINSERTED.

\( t \) = Number of impaired blocks. This counter provides the sum of cell blocks containing at least one errored, lost, or misinserted user information cell.

**Type:** Output

1. **FORMAT**

   OP TRFC30 ATTG
   TIME aa:aa:aa

   SECTION 33: ATTENDANT GROUP MEASURES

<table>
<thead>
<tr>
<th>ID</th>
<th>USG</th>
<th>PC</th>
<th>OVFL</th>
<th>INTRAG</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>c</td>
<td>d</td>
<td>e</td>
<td>f</td>
</tr>
</tbody>
</table>

2. **REASON FOR OUTPUT**

   To respond to a request for either an immediate or scheduled output of section 33: attendant group measures (ATTG) of the 30-minute traffic report. Up to five attendant groups may be reported on in a single message.

   Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. **VARIABLE FIELD DEFINITIONS**

   3.1 **Variables**

   a = Time when the report was prepared, in the form hours:minutes:seconds.

   b = Attendant group identifier.

   c = Attendant line usage. This is the total usage (100-second scan) of attendant lines in an attendant group.

   d = Number of successful terminations to and origina tions from an attendant group. This count is made upon recognition of the terminating/originating party by the system.

   e = Number of calls that failed because all lines to an attendant group were busy.

   f = Number of intra-group attempts to attendant, for example, dial 0.

   3.2 **Parameters**

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 80: B-channel negotiation (BCHNEG) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

\( a \) = Time when the report was prepared, in the form hh:mm:ss.

\( b \) = B-channel trunk group number.

\( c \) = Number of SETUP messages sent that offered B-channel negotiation.

\( d \) = Number of channel negotiation requests that were received with indicated B-channel different from the offered channel.

\( e \) = Number of channel negotiation requests that were invalid or failed.

3.2 Parameters

2. REASON FOR OUTPUT

To respond to a request (OP:TRFC30) for either an immediate or scheduled output of section 147: bulk calling line identification (BCLID) of the 30-minute traffic report (TRFC30). The TRFM message class applies to 5E10 and later. The XTRFM message class applies to 5E10 and later.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Business customer identifier (BCID).
c = Number of calls for which complete calling directory number (DN) is transmitted to the customer premises equipment (CPE) (count 1).
d = Number of messages transmitted to BCLID customers' CPE containing the character "P", indicating that the calling party had invoked the privacy feature (count 2).
e = Number of messages transmitted to BCLID customers' CPE containing the character "O", indicating that the calling DN could not be determined (count 3).
f = Number of messages lost (not transmitted to the BCLID customer's application processor) because of data channel overload (count 4).

3.2 Parameters

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 208: bearer link measurements (BEARERLNK) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
c = Bearer network identifier.
d = Total usage for measured SM of all the PCT links used for OIU connections. This is the number of slots across all the PCT links that are traffic busy (in-service and busy) plus maintenance busy (out-of-service) during the scan.
e = Maintenance usage for measured SM of all the PCT links used for OIU connections. This is the number of slots across all the PCT links that are Out-of-Service during the scan.
f = Number of attempts to hunt for an idle slot among PCT links used for OIU connections for measured SM. This is the number of calls that attempted to use this SM to find an ATM bearer path.
g = Number of times overflow occurs when hunting for an idle slot among the PCT links used for OIU connections for measured SM. This is the number of calls that failed to find an idle ATM bearer path on this SM.
h = Total time slots which is a summation of all the maximum engineered time slots (METS) for the protection groups that serve a BNID.

</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 205: bearer independent connection control (BICC) group (BICCG) measurements of the 30-minute traffic report.
3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = BICC group number.

c = Origination point code for BICC group.

Note: The OPC field is shown on the report in alphanumeric format as a string (XXX-XXX-XXX or XXX-XX-X-XXX) but in the TRFC30 buffer is visible as decimal number.

d = Destination point code for BICC group.

Note: The OPC field is shown on the report in alphanumeric format as a string (XXX-XXX-XXX or XXX-XX-X-XXX) but in the TRFC30 buffer is visible as decimal number.

e = Number of members of the BICC group that have in-service status during the interval. The number of members given by the counter is taken once during the collection interval. The sum of INSVC and OOS counters for the BICC group is the total number of members of the BICC group.

f = Number of members of the BICC group that have out-of-service status during the interval. The number of members given by the counter is taken once during the collection interval. The sum of INSVC and OOS counters for the BICC group is the total number of members of the BICC group.

g = Number of times overflow occurs for measured BICC group.

h = Total number of double seizures (glare) encountered for measured BICC group.

i = Number of incoming attempts for the BICC group.

j = Total number of incoming failures for the BICC group.

k = Number of outgoing attempts for the BICC group.

l = Total number of outgoing failures for the BICC group.

m = Total usage reported in hundred-call-seconds (CCS) for the BICC group. This is the number of members that are traffic busy (in-service and busy) plus maintenance busy (out-of-service) during the scan.

n = Maintenance usage reported in CCS for the BICC group. This is the number of members that are OOS during the scan.

o = BICC group incoming traffic usage for the BICC group. This is the number of members that are incoming traffic busy during the scan.

p = BICC group outgoing traffic usage for the BICC group. This is the number of members that are outgoing traffic busy during the scan.

q = Number of calls resulting in an initial address message (IAM) with the redirect capability parameter beginning sent as a result of release link (RL) initiation.
\[ r \] = Number of calls setup as a result of having received a release message with redirection information for the BICC group.

\[ s \] = Number of incoming calls answered.

\[ t \] = Number of outgoing calls answered.

\[ u \] = Number of reroute on release attempts.

### 4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

The validity for the administrative module (AM) applies to this section.

### 5. ALARMS

None.

</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 29: business residential customer feature (BRCF) measures of the 30-minute traffic report. Up to five features may be reported in a message.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Feature identifier name.
c = Number of feature attempts. A call which ultimately executes several constructed features may increment several counters.
d = Number of constructed feature activation or deactivation attempts [by dialed code or time of day (TOD)].
   Note: The ACTV measurement scores for successful activations only by dialed code for the usage sensitive call forwarding feature. Deactivations will not score the ACTV counter.
e = Number of parameter change codes for a constructed feature received by the switch (either directly or via TOD).

3.2 Parameters

2. REASON FOR OUTPUT

To respond to a request for either an immediate or a scheduled output of section 26: business residential customer services (BRCS), of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

\( a \) = Time when the report was prepared, in the form of hours:minutes:seconds.

\( b \) = Number of BRCS customer dialing irregularities. The irregularities include the following:

- Attempts by a line, with any BRCS features assigned, to use a constructed feature
that is not assigned to the line or is not active on the line.

- Attempts by a line to activate or deactivate a constructed feature that is already activated or deactivated or that does not allow activation or deactivation.
- Attempts by a line to change a parameter of a constructed feature where parameter changes are not allowed or where the dialed parameter is invalid [excludes parameters invalid because of BRCS filtering failures (for example, trying to dial features the customer does not have) or directory number screening failures].
- Attempts by a line to add an invalid parameter.

c = Number of call-waiting calls answered.
d = Number of long distance call-waiting distinctive tone calls answered.
e = Number of one-digit plain old telephone service (POTS) speed call attempts. This count does not include individual dialing plan (IDP) 1-digit speed calling. The IDP count can be found in section 31 of the 30-minute traffic report.
f = Number of two-digit speed call attempts. This count does not include IDP 2-digit speed calling. The IDP count can be found in section 31 of the 30-minute traffic report.
g = Number of three-digit speed call attempts. This count is not a preconstructed BRCS attempt. This count does not include IDP 3-digit speed calling. The IDP count can be found in section 31 of the 30-minute traffic report.
h = Number of POTS speed call parameter change attempts.
i = Number of times the time of day (TOD) facility failed to complete its scheduled task within the specified time. This represents a service delay and not a failure.
j = Associated process block overflow count. This is the number of times a request for service must be denied because the APB data structures are exhausted.
  Note: This count is normally zero. If this count is greater than zero, contact your customer support organization. This condition may indicate the need for load balancing the SMs in your office.
k = Auto call back buffer overflow count. This is the number of times an ACB feature cannot provide service because the data buffer used to save ACB data is exhausted.
  Note: This count is normally zero. If this count is greater than zero, contact your customer support organization. This condition may indicate the need for load balancing the SMs in your office.
l = Trunk group reorder or queue overflow count. This is the number of overflows on automatic route selection or private facilities access calls to reorder or that have the potential to queue on private trunk facilities.
m = Simulated facility group (SFG) reorder or queue overflow count. This is the number of overflows on outward wide area telecommunications service calls to reorder or that have the potential to queue for SFGs.
n = Call leg data block overflow count. This is the number of times a request for a CLDB has been denied because the CLDB data structures are exhausted.
  Note: This count is normally zero. If this count is greater than zero, contact your customer support organization. This condition may indicate the need for load balancing the
SMs in your office.

\( o \) = Model data block overflow count. This is the number of times a request for an MDB has been denied because the MDB data structures are exhausted.
Note: This count is normally zero. If this count is greater than zero, contact your customer support organization. This condition may indicate the need for load balancing the SMs in your office.

\( p \) = DN1 total number of attempts to complete a call to the IP.

\( q \) = DN2 total number of attempts to complete a call to the IP.

\( r \) = DN1 total number of attempts to complete a call to the IP that failed either before an answer was received from the IP or because the IP did not originate a disconnect.

\( s \) = DN2 total number of attempts to complete a call to the IP that failed either before an answer was received from the IP or because the IP did not originate a disconnect.

\( t \) = Number of times the switch receives a valid FORWARD option.

\( u \) = Number of times the switch receives a valid ANNOUNCEMENT option.

\( v \) = Number of times the switch receives a valid DROP option, irrespective of the call state (that is, waiting state and held call state) from which the option was applied.

\( w \) = Number of times the switch receives a valid CONFERENCE option, irrespective of the call state (that is, waiting state and held call state) from which the option was applied.

\( x \) = Number of times the switch receives a valid HOLD option.

\( y \) = Number of times the switch receives a valid DROP FIRST option.

\( z \) = Number of times the switch receives a valid DROP LAST option.

\( a^1 \) = Number of times \( T_{\text{default}} \) timed out resulting in the switch applying the default treatment of forwarding the incoming call to the call forwarding don't answer (CFDA) destination.

\( b^1 \) = Number of times \( T_{\text{default}} \) timed out resulting in the switch applying the default treatment of connecting the incoming call to an ANNOUNCEMENT.

\( c^1 \) = Number of times \( T_{\text{default}} \) timed out resulting in the switch applying the default treatment of continuing to provide the AUDIBLE ringing to the incoming call.

\( d^1 \) = Number of attempts to monitor a forwarded call using the Forwarded Call Call Screening (FCCS) feature after Call Screening (CS) alerting has been provided.

\( e^1 \) = Number of FCCS successful activation or deactivation subscriber attempts by access code.

\( f^1 \) = Number of times the forwarded call is not offered for Call Screening monitoring due to unavailability of three port conference circuit.

<td>.</td>
<td>.</td>
<td>.</td>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 128, customer directory number (CDN) counts, of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a  = Time when the report was prepared, in the form hours:minutes:seconds.
b  = Directory number (DN).
c  = Switching module (SM) number.
d  = Total number of terminating attempts to the DN. These may be line-to-line or trunk-to-line calls. Calls which are forwarded to a DN are also treated as terminating calls to the DN. The count is incremented for the DN to which the call terminates when the terminating port is identified on the terminating SM.
e  = Total number of terminating attempts to the DN that resulted in busy tone being returned to the caller. The number of terminating calls which cannot complete because the called DN is busy, or cannot be forwarded because the number of simultaneously forwarded calls, inter-switch or intra-switch, has reached the allowed limit. The count is increment for the DN to which the call terminates.
f  = Total number of terminating calls for which a disconnect signal (on-hook) is received from the originating DN before an off-hook signal is received from the terminating DN, the call is transferred because of the Call Forwarding Don't Answer feature, or the call is picked up by another DN while the terminating DN is ringing. A ringing indication does not have to be returned to the originating DN. The count is incremented for the DN to which the call terminates.
g  = Total number of terminating calls blocked because of system blockage, or RT blockage on an integrated SLC system. This peg count will not be incremented if a peripheral or network path is
unavailable due to all resources being Out-Of-Service (OOS); however, this peg count is incremented for blockages due to an OOS HLSC, LDSU, or GDSU.

\( h \) = Total number of call origination attempts which resulted from the switch receiving at least one dialed digit (0-9,*,#), or the switch determining the destination (that is, identifies the terminating DN) in the case of direct connect service, which requires no dialed digits.

\( i \) = Total number of originating calls blocked because of system blockage, or RT blockage on an integrated SLC® 96 system. This peg count will not be incremented if a peripheral or network path is unavailable due to all resources being out-of-service (OOS); however, this peg count is incremented for blockages due to an OOS HLSC, LDSU, or GDSU. If a blockage occurs during an origination, the switch will continue to retry until the originator abandons the call attempt. The initial attempt to originate and each retry attempt that is blocked, will increment the Originating Blockage peg count.

\( j \) = Total amount of time an individual analog line is busy during a given interval. This number is the sum of the originating usage and terminating usage, and represents the total traffic usage by an individual line based on a 100-second scan cycle. A DN is considered usage busy once, even if the DN is on multiple calls simultaneously. This measurement does not include diagnostics and maintenance usage; however, it does include the time spent dialing and ringing.

### 4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

If the data is checked, check the validity of the corresponding SM.

### 5. ALARMS

None.

</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 126: communication module processor (CMP) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Message switch controller (MSC) side.
c = Communication module processor (CMP) ID.
d = Validity of the CMP. Valid value(s):
0 = Valid.
1 = Invalid.

This is only marked 1 when there is some inconsistency in the collection of the count. The switch detects incomplete and invalid CMP measurements resulting from one of the following conditions:
- Initializations in the CMP and/or AM.
- Any database manager (DBM) read failure in the CMP and/or AM.
- Failure to send poll messages to a CMP.
- Failure to receive data from a CMP.
- Invalid previous report (due to DBM read failure in the CMP and/or AM, failure to send poll messages to a CMP or failure to receive data from a CMP).
= Percent of time spent processing jobs other than the lowest priority work in the system. This count also appears on the OP:TRFC15-PT02B output message.

f = Percent of real time spent doing call processing work. This count also appears on the OP:TRFC15-PT02B output message.

g = Number of base-level cycles, reported in thousands. A message waiting to be processed is queued in one of several CMP buffers. One base level cycle is the servicing by the CMP of each buffer exactly once.

h = Number of base-priority messages sent out of the CMP.

i = Number of base-priority messages received in the CMP.

j = Number of high-priority messages sent out of the CMP.

k = Number of high-priority messages received in the CMP.

l = Number of times the base-priority output queue overflowed. This measurement represents the number of times that the message handler (MSGH) of the communication module processor (CMP) tried to load a message to the message switch control unit (MSCU) and that queue was full. Therefore, the MSGH leaves the message in the application processor's (AP) output queue. The message is not lost unless the AP's output queue fills. When the AP's output queue becomes full, an assert fires. The only time for concern is if the CMP reaches overload or when that assert starts firing.

The measurement is pegged every base level loop of the MSGH which runs every few microseconds. If the MSCU is delayed for some reason (even for a short time), this number could reach a high value quickly.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 27: customer originated recent change (CORC) of the 30-minute traffic report. Up to five switching modules (SMs) may be reported in a single message. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = SM number.

c = Local CORC attempts (count 1). This is the number of CORCs received in an SM that cause a database update only in that SM. This number includes customer parameter changes and time-of-day parameter changes.

d = Local delayed CORCs (count 2). This is the number of local CORC attempts not completed within the specified time limit.

Note: This count is never incremented by the switch since there is no delay for local CORC attempts.

e = Global CORC attempts (count 3). This is the number of CORCs received in an SM that cause data base updates in multiple SMs.

f = Global delayed CORCs (count 4). This is the number of global CORC attempts not completed within the specified time limit.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 5: call type (CT) information of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- \(a\) = Time when the report was prepared, in the form hours:minutes:seconds.
- \(b\) = Originating calls peg count. This is the number of originating requests that result in the system's receipt of at least one digit. Calls that do not normally result in digits being dialed are included upon the determination that no digits are required. On-demand B calls do not peg to this count.
- \(c\) = Originating calls usage count. This is the total office circuit-switched usage generated by scanning originating call records every 100 seconds. With certain features there may be concurrent multiple originating calls on one line (for example, three-way call).
- \(d\) = Number of originating calls no circuit. This overflow count provides the number of originating calls for which a resource (universal conference circuit, trunk groups) failure has been received. When this occurs, companion NOCKT counts of either OUTGOING or INTRAOFF and TERMINAT are also pegged. However, if only the NOCKT (ORIGINAT) count is pegged, originations are experiencing a resource failure before the destination of the call is known. The NOCKT is not pegged for failure to match.
- \(e\) = Incoming calls peg count. This is the total number of incoming calls that resulted in the system's receipt of at least one digit. Calls that do not normally result in digits being dialed are included upon the determination that no digits are required.
- \(f\) = Number of incoming calls no circuit. This overflow count provides the number of incoming calls for
which a resource failure has been received. When this occurs, companion NOCKT counts of either TERMINAT or TANDEM and OUTGOING are also pegged if determination of destination is known.

g = Intra-office calls peg count. This is the number of originating calls intended to complete within the switch. This measurement is made upon the system's recognition of the terminating party.

h = Number of intra-office calls no circuit. This is the number of intra-office calls for which a resource failure (for example, high-level service circuit) has been received. When this occurs, companion NOCKT counts ORIGINAT and TERMINAT are also pegged. The originator is given a reorder tone or a local announcement.

i = Outgoing calls peg count. This is the number of calls to be sent to the network over a trunk for completion. This measurement is made upon the system's recognition that the call will not terminate within the office.

j = Number of outgoing calls no circuit. This overflow count provides the number of outgoing calls for which a final resource failure (for example, final outgoing trunk) has been received. When this occurs, the NOCKT ORIGINAT count will also be pegged for line-originated calls or NOCKT INCOMING and NOCKT TANDEM will also be pegged for incoming trunk-originated calls. The originator is given a reorder tone or a local announcement. This count does not include calls blocked by network management (NM) controls.

k = Terminating calls peg count. This is the number of attempts to terminate to a line (including busy lines) within the switch. This measurement is made upon the system's recognition of the terminating party. On-demand B calls do not peg to this count.

l = Terminating calls usage. This is the total office circuit-switched traffic usage generated by scanning terminating calls every 100 seconds. With certain features there may be concurrent multiple terminating calls on one line (for example, call hold).

m = Number of terminating calls no circuit. This is the number of terminating calls for which a resource failure has been received. When this occurs, companion NOCKT counts of either INCOMING or ORIGINAT and INTRAOFF are also pegged. The originator is given a reorder tone.

n = Tandem calls peg count. This is the number of incoming calls to be sent to the network for completion (that is, trunk-to-trunk calls). This measurement is incremented upon the system's recognition that the call will not terminate within the office.

o = Number of tandem calls no circuit. This overflow count provides the number of tandem calls for which a resource failure (for example, no outgoing trunk available) has been received. When this count is pegged, the NOCKT (INCOMING) and NOCKT (OUTGOING) counters are also pegged.

p = Originating and terminating calls usage. This is the total extended office (including host, remote switching module (RSM) and optically-remote module (ORM) circuit-switched traffic usage (100-second scan) generated by originating and terminating (O+T) calls measured at a single, common point in the system network. The sum of the originating and terminating calls usage will not necessarily equal O+T usage. The O+T usage represents usage on the peripheral interface data buses (PIDBs) to and from the time slot interchange (TSI) and includes usage for occurrences such as false starts, ring/no answer, nailed up time slots, and maintenance. This count includes all line units (LUs), integrated services line units (ISLUs), digital carrier line units (DCLUs), integrated digital carrier units (IDCUs), extended access interface unit ((E)AIUs), and the TR303 on the digital
network unit - SONET (DNU-S).

Note: In the following definitions, "matching loss" refers to a call's failing due to unavailability of network/peripheral path to the intended destination to either an idle line or trunk. The following valid network/peripheral unavailabilities will cause the matching loss:

<table>
<thead>
<tr>
<th>Network/peripheral unavailability</th>
<th>Matching loss</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unavailability of concentrator path (A and/or B links) to an LU.</td>
<td>$q, r, s, u, \text{ and } w$ only</td>
</tr>
<tr>
<td>Unavailability of peripheral interface data bus (PIDB) time slots to an ISLU.</td>
<td>$q, r, s, u, \text{ and } w$ only</td>
</tr>
<tr>
<td>Unavailability of PIDB time slots to a DCLU.</td>
<td>$q, r, s, u, \text{ and } w$ only</td>
</tr>
<tr>
<td>Unavailability of PIDB time slots to an IDCU.</td>
<td>$q, r, s, u, \text{ and } w$ only</td>
</tr>
<tr>
<td>Unavailability of time slots in the TSI to time-multiplexed switch (TMS) to TSI (TSI-TMS-TSI) path.</td>
<td>$q, r, s, t, u, v, \text{ and } w$</td>
</tr>
<tr>
<td>Unavailability of RSM umbilicals and/or inter-RSM communication links (ICLs).</td>
<td>$q, r, s, t, u, v, \text{ and } w$</td>
</tr>
</tbody>
</table>

$q$ = Number of originating line-to-trunk or line-to-line call failures due to matching loss. This peg count is the number of originating line-to-trunk or line-to-line call failures caused by matching loss. This matching loss is due to unavailability of concentrator path (A- and/or B-link) to a line unit (LU), peripheral interface data base (PIDB) time slot to ISLU, PIDB time slot to a DCLU, time slot in the TSI to TMS to TSI path, umbilicals, and/or inter-remote switching module (RSM) communication links (ICLs). At the RSM or multi-module RSM site, this matching loss is caused by umbilicals and ICLs being traffic busy simultaneously, umbilicals being severed and ICLs being busy, ICLs being OOS and umbilicals being traffic busy.

$r$ = Number of incoming trunk-to-line call failures due to matching loss. This peg count is the number of incoming trunk-to-line call failures caused by matching loss. This matching loss is due to unavailability of concentrator path (A- and/or B-link) to an LU, PIDB time slot to ISLU, PIDB time slot to a DCLU, time slot in the TSI to TMS to TSI path, umbilicals time slot.

$s$ = Number of intraoffice line-to-line call failures due to matching loss. This peg count is the number of intra-office line-to-line call failures caused by matching loss. This matching loss is due to unavailability of concentrator path (A- and/or B-link) to an LU, PIDB time slot to ISLU, PIDB time slot to a DCLU, time slot in the TSI to TMS to TSI path, umbilicals, and/or ICLs. At the RSM or multi-module RSM site, this matching loss is caused by umbilicals and ICLs being traffic busy simultaneously, umbilicals being severed and ICLs being busy, ICLs being OOS and umbilicals being traffic busy.

$t$ = Number of outgoing line-to-trunk call failures due to matching loss. This peg count is the number of outgoing line-to-trunk call failures caused by matching loss. This matching loss is due to unavailability of time slot in the TSI to TMS to TSI path and umbilicals time slot.

$u$ = Number of terminating line-to-line or trunk-to-line call failures due to matching loss.

$v$ = Number of tandem trunk-to-trunk call failures due to matching loss. This peg count is the number of tandem trunk-to-trunk call failures caused by matching loss. This matching loss is due to unavailability of time slot in the TSI to TMS to TSI path and umbilicals time slot.

$w$ = Number of first occurrences of matching loss on incoming or terminating trunk-to-Line calls. The calls may or may not fail depending on alternate routing attempts.

</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 222: digital network unit - synchronous optical network (SONET) (DNU-S) - lines of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- a = Time when the report was prepared, in the form hours:minutes:seconds.
- b = Switching module (SM) number.
- c = DNU-S number.
- d = Remote digital terminal (RDT) number.
- e = RDT line number.
- f = Number of times dial tone delay exceeds the 3-second threshold for touch-tone and dial pulse originating non-ISDN calls plus the number of times call setup delay exceeds the 3-second threshold between receipt of a SETUP message and the return of a SETUP acknowledge or call proceeding message for circuit-switched originating ISDN calls.
- g = Number of times the switch initiates action leading to a readiness to receive customer dial pulse or touch-tone service digits or to process a call for which digits are not required; the count is incremented at the time the line requesting service is identified.
- h = Number of times the switch attempts to terminate circuit-switched calls to lines or PBX trunks served by an DNU-S. This count is incremented when the switch identifies the terminating party.
- i = Number of times that service was denied to attempted call originations because of a lack of resources in the switch, RDT, or intervening digital signal level 1 (DS1) facilities.
j = Number of times that service was denied to originating, terminating, or outgoing calls because of a lack of resources in the switch, remote digital terminal (RDT), or intervening DS1 facilities.

k = Traffic usage reported in hundred-call-seconds for the line’s originating, terminating, and outgoing calls or the traffic usage for semi-permanently cross-connected circuits (provisioned B- and D-channels).

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 66: direct link node (DLN) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form of hours:minutes:seconds.
b = The total number of common channel signaling (CCS) messages sent from the DLN to the peripheral interface controller (PIC) through input queue 0.
c = The total number of CCS messages sent to the DLN from the PIC through output queue 0.
d = The total number of CCS messages sent from the DLN to the PIC through input queue 1.
e = The total number of CCS messages sent to the DLN from the PIC through output queue 1.
f = The validity of this section. Valid value(s):
   INVALID
   VALID

g = Percentage of occupancy of the ring receive buffer space used to hold the switch incoming CCS messages prior to processing.
h = Percentage of occupancy of the AP processor being used for CCS call processing.
i = Percentage of occupancy of buffer space used to hold the CCS messages being sent from the DLN to the PIC side 0.
j = Percentage of occupancy of buffer space used to hold the CCS messages being sent from the PIC to the DLN side 0.

k = Percentage of occupancy of buffer space used to hold the CCS messages being sent from the DLN to the PIC side 1.

l = Percentage of occupancy of buffer space used to hold the CCS messages being sent from the PIC to the DLN side 1.

m = Average direct memory access cycle time in milli-seconds. This value is the average message delay for messages transported to or from the PIC-DLN queues.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 66: direct link node (DLN) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form of hours:minutes:seconds.
b = The total number of common channel signaling (CCS) messages sent from the DLN to the peripheral interface controller (PIC) through input queue 0.
c = The total number of CCS messages sent to the DLN from the PIC through output queue 0.
d = The total number of CCS messages sent from the DLN to the PIC through input queue 1.
e = The total number of CCS messages sent to the DLN from the PIC through output queue 1.
f = The validity of this section. Valid value(s):
   INVALID
   VALID

  g = Percentage of occupancy of the ring receive buffer space used to hold the switch incoming CCS messages prior to processing.
h = Percentage of occupancy of the AP processor being used for CCS call processing.
\(i\) = Percentage of occupancy of buffer space used to hold the CCS messages being sent from the DLN to the PIC side 0.

\(j\) = Percentage of occupancy of buffer space used to hold the CCS messages being sent from the PIC to the DLN side 0.

\(k\) = Percentage of occupancy of buffer space used to hold the CCS messages being sent from the DLN to the PIC side 1.

\(l\) = Percentage of occupancy of buffer space used to hold the CCS messages being sent from the PIC to the DLN side 1.

\(m\) = Average direct memory access cycle time in milli-seconds. This value is the average message delay for messages transported to or from the PIC-DLN queues.

\(n\) = The maximum occupancy value experienced during the TRFC30 interval.

\(o\) = The time the maximal occupancy was noted.

### 4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

```
OP:TRFC30,VLD
```

The validity for the administrative module applies to this section.

### 5. ALARMS

None.

<tr>
<td>NCD TREATMENTS:</td>
<td>k</td>
<td>l</td>
<td>m</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 36: direct signaling (DSIG) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Total 800 service [inward wide area telecommunications service (INWATS)] calls.
c = Total 800 service (INWATS) queries sent.
d = Total 800 service (INWATS) success replies.
e = 800 service failure - no reply index available.
f = Direct signaling incoming reorder treatment. This is the number of calls given reorder treatment due to a direct signaling related failure. This failure may occur due to database inquiry time-out, database overload, common channel signaling system 6 (CCS6) domestic failure replies, common channel signaling network blocking, and common network interface failure.
g = Direct signaling vacant code replies. This is the number of calls not completed due to a direct signaling vacant code. An ineffective attempt reply is received in response to the direct signaling message due to vacant XXX code, vacant line number, non-purchased numbering plan area (NPA), and invalid NPA. If the INWATS data base returns an 800 number as the plain old telephone service number in a success reply, this count is pegged.
h = Direct signaling network management (NM) code control blocked calls.
i = Total number of NCD queries.
j = Total number of NCD deny replies received from the NCD/network control point.
k = Calls killed due to NCD screening.
l = Calls killed due to NCD screening after answer supervision detected.
m = Denied calls that were routed to NCD announcement after being killed.

|                            | 12 ANN

4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

The validity for the administrative module (AM) applies to this section.

If direct link node (DLN) is equipped, the validity may be incorrect for the fields 'c', 'e' and 'j'. If DLN is equipped, to determine the validity of 'c', 'e' and 'j', check validity field on section 66 (OP:TRFC30).

5. ALARMS

<tr>
<td>b-c-d-f</td>
<td>b-c-e-m-n</td>
<td>o</td>
<td>g</td>
<td>h</td>
<td>i</td>
<td>j</td>
<td>k</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 77: digital subscriber line (DSL) measurements of the 30-minute traffic report. This includes digital lines off of U and T cards as well as analog lines off of Z cards. A maximum of six lines can be allowed (ALW) or requested (OP) for printing to the read-only printer (ROP).

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Integrated services line unit (ISLU) number.
d = Line group controller (LGC) number.
e = Line board (LB) number (for ISLU2 only).
f = Line card (LC) number.
g = Number of originating requests per DSL (count 1). This is the number of circuit-switched voice and data calls that require an originating path through the ISLU, with or without the directory number digits in the information message for digital ISDN calls. For analog calls on ISLU Z-cards, this peg count is the number of attempts to get an originating path through the ISLU.
h = Number of terminating calls to a DSL (count 2). For analog Z-cards lines, this is the number of terminating paths through the ISLU.
i = Number of times an SM took more than 3 seconds to respond to a SETUP request (count 3). For ISLU Z-cards, this is actually dial tone delay and is the number of times an ISDN SM took more
than 3 seconds to give dial tone after an off-hook.

\( j \)  = Number of originating request attempts blocked (count 4). This is the number of originating attempts (which are retried), before dial tone, due to ISLU path unavailability. A busy condition is not considered an originating block. This count does not include unavailability of a B-channel which is in use by another multipoint customer sharing the same DSL.

\( k \)  = Number of terminating request attempts blocked (count 5). This is the number of terminating calls which fail due to an ISLU terminating path unavailability. When a call is blocked, the originator receives the appropriate failure treatment (that is, reorder). A busy condition is not considered a terminating block. This count does not include unavailability of a B-channel which is in use by another multipoint customer sharing the same DSL.

\( l \)  = Usage count for ISDN originating and terminating circuit switched voice and/or data calls in units of hundred call seconds (CCS) (count 6). If the DSL is equipped with multiple B-channels, this measurement will reflect usage on each B-channel.

\( m \)  = Line group number.

\( n \)  = Line circuit number.

\( o \)  = ISLU type. Valid value(s):
0  = No line circuit type specified.
1  = LCEN type circuit.
2  = LCKEN type circuit.

| . | . | . | . | . | . | . |
| . | . | . | . | . | . | . |
| . | . | . | . | . | . | . |

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 52: common channel signaling (CCS) and integrated services digital network (ISDN) channel group of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = DSLG or channel group number.
d = Packet switch unit (PSU) shelf number.
e = Protocol handler (PH) unit number within the shelf.
f = Type of PH and PH hardware type. This is a string value that represents a unique application and hardware type. Valid value(s):

0 = No members assigned (null).
1 = DSLG. Used for basic DSL applications.
2 = ST7. A CCITT common channel signaling system number 7 (CCITT7) ST data link terminal (DLT).
3 = MDST7. CCITT7 ST DLTs and message delivery (MD) DLTs on the same PH.
5 = MD.
6 = ISM. Inter-SM PH application.
7 = TRK. Inter-switch PH application.
8 = X75P. X.75’ trunk application.
9 = X75. X.75 trunk PH application.
13 = DPRI. PRI D-channel applications.
14 = QPH. Common channel signaling (CCS) QLPS protocol handler (QPH).

\( g \) = Total number of three-second intervals in overload. Overload refers to real-time and/or near exhaustion of software resources. An example of software resources that can reach near exhaustion and, therefore, be reported as overload is the pool of PH buffers used to hold packets.

\( h \) = Processor occupancy percentage based on interject entry rate. The interject end points are:
- Maximum possible interjects over time - the processor “at rest,” no calls, healthy, and 0 percent occupancy.
- Minimum possible interjects over time - the processor with work waiting in every job queue, and 100 percent occupancy.

The reported number is the relative distance the processor was from the end points expressed as a percent (for example, exactly midway over 30 minutes is 50 percent). The actual end points may vary based on PH type.

\( i \) = The number of frames (circuit- or packet-switched) sent and received from the data fanout (DF) side and/or the packet bus side of the PH. This count applies only to ISDN (does not include CCS messages).

\( j \) = The number of circuit-switched packets sent and received from the DF side of the PH. This count includes packets in retransmitted frames. This count applies only to ISDN (does not include X.25, IP packets, packets associated with frames received with errors or CCS messages).

\( k \) = The number of frames discarded by local area network (LAN) in the PH. This count applies only to ISDN.

\( l \) = Total packet switch unit messages incoming to the PH from the packet interface (PI) for CCS on a PSU.

\( m \) = Total packet switch unit messages outgoing from the PH to the PI for CCS on packet PSU.

SM DSLG SHLF PH MSGIN MSGOUT
b c d e l m

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 52: common channel signaling (CCS) and integrated services digital network (ISDN) channel group of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = DSLG or channel group number.
d = Packet switch unit (PSU) shelf number.
e = Protocol handler (PH) unit number within the shelf.
f = Type of PH and PH hardware type. This is a string value that represents a unique application and hardware type. Valid value(s):
   0 = No members assigned (null).
   1 = DSLG. Used for basic DSL applications.
   2 = ST7. A CCITT common channel signaling system number 7 (CCITT7) ST data link terminal (DLT).
   3 = MDST7. CCITT7 ST DLTs and message delivery (MD) DLTs on the same PH.
   5 = MD.
   6 = ISM. Inter-SM PH application.
   7 = TRK. Inter-switch PH application.
   8 = X75P. X.75 trunk application.
= X.75 trunk PH application.
13 = DPRI. PRI D-channel applications.
14 = QPH. Common channel signaling (CCS) QLPS protocol handler (QPH).

= Total number of three-second intervals in overload. Overload refers to real-time and/or near exhaustion of software resources. An example of software resources that can reach near exhaustion and, therefore, be reported as overload is the pool of PH buffers used to hold packets.

= Processor occupancy percentage based on interject entry rate. The interject end points are:

  — Maximum possible interjects over time - the processor “at rest,” no calls, healthy, and 0 percent occupancy.
  
  — Minimum possible interjects over time - the processor with work waiting in every job queue, and 100 percent occupancy.

The reported number is the relative distance the processor was from the end points expressed as a percent (for example, exactly midway over 30 minutes is 50 percent). The actual end points may vary based on PH type.

= The number of frames (circuit- or packet-switched) sent and received from the data fanout (DF) side and/or the packet bus side of the PH. This count applies only to ISDN (does not include CCS messages).

= The number of circuit-switched packets sent and received from the DF side of the PH. This count includes packets in retransmitted frames. This count applies only to ISDN (does not include X.25, IP packets, packets associated with frames received with errors or CCS messages).

= The number of frames discarded by local area network (LAN) in the PH. This count applies only to ISDN.

= This count is the number of messages incoming to the protocol handler (PH) from the SM using the packet interface (PI). The messages incoming to the QLPS protocol handlers (QPH) channel groups are measured.

= This count is the number of messages sent from the PH to the SM using the PI. The messages sent from QPH channel groups are measured.

PRIBLKD = t    PRIPRMT = u

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 47: defense switch network (DSN) office totals of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of incoming precedence calls above routine.
c = Number of terminating precedence calls above routine.
d = Number of outgoing precedence calls above routine.
e = Number of intrasystem precedence calls above routine.
f = Number of tandem precedence calls above routine.
g = Number of originating hot line calls.
h = Number of originating calls denied because of invalid precedence level when the call was placed.
i = Number of originating priority calls.
j = Number of originating immediate calls.
k = Number of originating flash calls.
l = Number of originating flash override calls (most important).
m = Number of priority calls that were unsuccessful in securing an intercenter outgoing trunk during the preempt search after attempting to preempt in all intercenter trunk groups in a polygrid pattern.

n = Number of immediate calls that were unsuccessful in securing an intercenter outgoing trunk during the preempt search after attempting to preempt in all intercenter trunk groups in a polygrid pattern.

o = Number of flash calls that were unsuccessful in securing an intercenter outgoing trunk during the preempt search after attempting to preempt in all intercenter trunk groups in a polygrid pattern.

p = Number of flash override calls that were unsuccessful in securing an intercenter outgoing trunk during the preempt search after attempting to preempt in all intercenter trunk groups in a polygrid pattern.

q = Number of primary intertoll trunks successfully preempted for reuse.

r = Number of precedence overflow of trunk groups above routine.

s = Number of multi-level precedence and preemption (MLPP) on primary rate interface (PRI) calls completed which is pegged on both the originating and terminating switches.

t = Number of calls routed to a blocked precedence announcement or other treatment because a PRI B-channel could not be preempted.

u = Number of MLPP PRI calls preempted by a higher priority call. This count is pegged by the switch indicating the preemption.

4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with the input message OP:TRFC30VLD using the VLD option:

OP:TRFC30,VLD

The validity for the administrative module (AM) applies to this section. The output of section 48 (defense switch network trunk group measures) depends on section 12 (trunk group measures) being allowed for output. Trunk groups allowed for section 12 are also allowed for Section 48.

5. ALARMS

None.

</tr>
</thead>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 148: enhanced 911 (E911) of the 
30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Number of invalid messages, either unexpected or malformed, that the switch received from the 
  E911 service adjunct (ESA).
- **c** = Number of E911 response messages received from the ESA with the validity code parameter set 
  to "INVALID ESN" (invalid emergency service number).
- **d** = Number of invalid E911 response messages received from the ESA with the validity code 
  parameter set to anything other than "OK" or "INVALID ESN".
- **e** = Number of time-outs that occurred while waiting for a response from the ESA for an E911 call 
  origination.
- **f** = Number of E911 calls that were default routed. For the "ESA" configuration, this count reflects 
  calls that used the default ESN for routing when the ESA did not respond. For the "NON-ESA" 
  switch configuration, this count will appear as a zero.
- **g** = Number of E911 query messages that were sent to the ESA for E911 call originations. E911 test 
  query messages are not included in this count.
- **h** = Number of interoffice E911 calls that were originated at the E911 office over a non-dedicated 
  trunk.
- **i** = Number of interoffice E911 calls that were originated at the E911 office over a non-dedicated 
  trunk and were blocked because the choke count for non-dedicated trunk originations was
exceeded [no simulated facilities group (SFG) available].

\( j \) = Number of E911 calls in which time-out occurred prior to the reception of complete automatic number identification (ANI) information [centralized automatic message accounting (CAMA) trunks only]. For other trunks, a zero will print.

\( k \) = Number of interoffice E911 calls in which the ANI information digit received indicated an ANI failure (CAMA trunks only). For CAMA originations, the information digit (I), which gives the class of service, has a value of 2 for ANI failure. For other trunks, a zero will print.

\( l \) = Number of interoffice E911 calls in which the received ANI information did not satisfy ANI format requirements. For CAMA trunks, this implies that an incorrect number of digits was received between the key pulse (KP) and start (ST) digits. For common channel signaling (CCS) originations, the charge (CHG) or calling party number (CPN) parameters were not populated in the incoming initial address message (IAM).

\( m \) = Number of intraoffice E911 calls that were originated locally at the E911 office.

\( n \) = Number of intraoffice E911 calls that were blocked because the choke count for local originations was exceeded (no SFG available).

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 235, customer directory number (ECDN) counts, of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Directory number (DN).
c = Switching module (SM) number.
d = Total number of terminating attempts to the DN. These may be line-to-line or trunk-to-line calls. Calls which are forwarded to a DN are also treated as terminating calls to the DN. The count is incremented for the DN to which the call terminates when the terminating port is identified on the terminating SM.
e = Total number of terminating attempts to the DN that resulted in busy tone being returned to the caller. This measures the number of terminating calls which cannot complete because the called DN is busy, or cannot be forwarded because the number of simultaneously forwarded calls, inter-switch or intra-switch, has reached the allowed limit. The count is incremented for the DN to which the call terminates.
f = Total number of terminating calls for which a disconnect signal (on-hook) is received from the originating DN before an off-hook signal is received from the terminating DN, the call is transferred because of the Call Forwarding Don't Answer feature, or the call is picked up by another DN while the terminating DN is ringing. A ringing indication does not have to be returned to the originating DN. The count is incremented for the DN to which the call terminates.
g = Total number of terminating calls blocked because of system blockage, or RT blockage on an integrated SLC system. This peg count will not be incremented if a peripheral or network path is
unavailable due to all resources being out-of-service (OOS). However, this peg count is incremented for blockages due to an OOS high level service circuit (HLSC), local digital service unit (LDSU), or local digital service unit (GDSU).

\[ h = \text{Total number of call origination attempts which resulted from the switch receiving at least one dialed digit (0-9,*,#), or the switch determining the destination (that is, identifies the terminating DN) in the case of direct connect service, which requires no dialed digits.} \]

\[ i = \text{Total number of originating calls blocked because of system blockage, or RT blockage on an integrated SLC® system. This peg count will not be incremented if a peripheral or network path is unavailable due to all resources being OOS. However, this peg count is incremented for blockages due to an OOS HLSC, LDSU, or GDSU. If a blockage occurs during an origination, the switch will continue to retry until the originator abandons the call attempt. The initial attempt to originate and each retry attempt that is blocked, will increment the originating blockage peg count.} \]

\[ j = \text{Total amount of time an individual analog line is busy during a given interval. This number is the sum of the originating usage and terminating usage, and represents the total traffic usage by an individual line based on a 100-second scan cycle. A DN is considered usage busy once, even if the DN is on multiple calls simultaneously. This measurement does not include diagnostics and maintenance usage. However, it does include the time spent dialing and ringing.} \]

### 4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

The validity for the administrative module applies to this section.
5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 247: executive cellular processor service type (ECPSRVT) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hh:mm:ss.
b = Switching module (SM) number.
c = Packet switching unit (PSU) number (0).
d = Service type. Valid value(s):
   8K = CDMA 8K voice.
   13K = CDMA 13K voice.
   EVRC = CDMA enhanced variable rate coding (EVRC) voice.
   ACELP = TDMA algebraic code excited linear predictive (ACELP) vocoder algorithm voice.
   VSELP = TDMA vector sum excited linear predictive (VSELP) vocoder algorithm voice.
   C1ASN = CDMA data rate set 1 - asynchronous service.
   C2ASN = CDMA data rate set 2 - asynchronous service.
   C1FAX = CDMA data rate set 1 - fax service.
   C2FAX = CDMA data rate set 2 - fax service.
   C1IP = CDMA data rate set 1 - internet protocol service.
   C2IP = CDMA data rate set 2 - IP service.
   C1CDCP = CDMA data rate set 1 - cellular digital packet data service.
   C2CDCP = CDMA data rate set 2 - CDPD service.
   T1DRS = TDMA data rate set 1.
e = Number of 20 millisecond (ms) reverse traffic intervals that occur in which all reverse traffic packets are early, late, or missing.
f = Number of 20 ms reverse traffic intervals that occur for calls that are not in soft handoff in which a low quality traffic packet is fed to the vocoder.
\( g \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are not in soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( h \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are not in soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( i \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are not in soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( j \) = Number of 20 ms reverse traffic intervals that occur for calls that are not in soft handoff.

\( k \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 2-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( l \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 2-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( m \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 2-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( n \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 2-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( o \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 2-way soft handoff.

\( p \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 3-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( q \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 3-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( r \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 3-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( s \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 3-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( t \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 3-way soft handoff.

\( u \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 4-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( v \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 4-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( w \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 4-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( x \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 4-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( y \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 4-way soft handoff.

\( z \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 5-way soft handoff in which a low quality traffic packet is fed to the vocoder.
\( a^1 \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 5-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( b^1 \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 5-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( c^1 \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 5-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( d^1 \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 5-way soft handoff.

\( e^1 \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 6-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( f^1 \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 6-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( g^1 \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 6-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( h^1 \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 6-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( i^1 \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 6-way soft handoff.

### 5-WAY SOFT HAND-OFF CALL INTERVALS
2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 247: executive cellular processor service type (ECPSRVT) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hh:mm:ss.
b = Switching module (SM) number.
c = Packet switching unit (PSU) number.
d = Service type. Valid value(s):
   8K = CDMA 8K voice.
   13K = CDMA 13K voice.
   EVRC = CDMA enhanced variable rate coding (EVRC) voice.
   ACELP = TDMA algebraic code excited linear predictive (ACELP) vocoder algorithm voice.
   VSELP = TDMA vector sum excited linear predictive (VSELP) vocoder algorithm voice.
   C1ASN = CDMA data rate set 1 - asynchronous service.
   C2ASN = CDMA data rate set 2 - asynchronous service.
   C1FAX = CDMA data rate set 1 - fax service.
   C2FAX = CDMA data rate set 2 - fax service.
   C1IP = CDMA data rate set 1 - internet protocol service.
   C2IP = CDMA data rate set 2 - IP service.
   C1CDCP = CDMA data rate set 1 - cellular digital packet data service.
   C2CDCP = CDMA data rate set 2 - CDPD service.
   PDIP1536 = CDMA 3G-1X HSPD IP service.
   PD1536CDP = CDMA 3G-1X HSPD CDPD service.
   T1DRS = TDMA data rate set 1.
e = Number of 20 millisecond (ms) reverse traffic intervals that occur in which all reverse traffic packets are early, late, or missing.
\( f \) = Number of 20 ms reverse traffic intervals that occur for calls that are not in soft handoff in which a low quality traffic packet is fed to the vocoder.

\( g \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are not in soft handoff in which all reverse traffic packets are either early, late, missing or erase.

\( h \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are not in soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( i \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are not in soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( j \) = Number of 20 ms reverse traffic intervals that occur for calls that are not in soft handoff.

\( k \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 2-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( l \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 2-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( m \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 2-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( n \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 2-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( o \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 2-way soft handoff.

\( p \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 3-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( q \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 3-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( r \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 3-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( s \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 3-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( t \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 3-way soft handoff.

\( u \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 4-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( v \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 4-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( w \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 4-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( x \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 4-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( y \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 4-way soft handoff.
\( z \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 5-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( a^1 \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 5-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( b^1 \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 5-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( c^1 \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 5-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( d^1 \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 5-way soft handoff.

\( e^1 \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 6-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( f^1 \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 6-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( g^1 \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 6-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( h^1 \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 6-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( i^1 \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 6-way soft handoff.

4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

If the data is checked, check the validity of the corresponding SM.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 247: executive cellular processor service type (ECPSRVT) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hh:mm:ss.

b = Switching module (SM) number.

c = Packet switching unit (PSU) number.

d = Service type. Valid value(s):
   8K = CDMA 8K voice.
   13K = CDMA 13K voice.
   EVRC = CDMA enhanced variable rate coding (EVRC) voice.
   ACELP = TDMA algebraic code excited linear predictive (ACELP) vocoder algorithm voice.
   VSELP = TDMA vector sum excited linear predictive (VSELP) vocoder algorithm voice.
   C1ASN = CDMA data rate set 1 - asynchronous service.
   C2ASN = CDMA data rate set 2 - asynchronous service.
   C1FAX = CDMA data rate set 1 - fax service.
   C2FAX = CDMA data rate set 2 - fax service.
   C1IP = CDMA data rate set 1 - internet protocol service.
   C2IP = CDMA data rate set 2 - IP service.
   C1CDCP = CDMA data rate set 1 - cellular digital packet data service.
   C2CDCP = CDMA data rate set 2 - CDPD service.
   PD3G1XIP = CDMA 3G-1X HSPD IP service.
   PD3G1XCDP = CDMA 3G-1X HSPD CDPD service.
   T1DRS = TDMA data rate set 1.

e = Number of 20 millisecond (ms) reverse traffic intervals that occur in which all reverse traffic packets are early, late, or missing.
\( f \) = Number of 20 ms reverse traffic intervals that occur for calls that are not in soft handoff in which a low quality traffic packet is fed to the vocoder.

\( g \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are not in soft handoff in which all reverse traffic packets are either early, late, missing or erase.

\( h \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are not in soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( i \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are not in soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( j \) = Number of 20 ms reverse traffic intervals that occur for calls that are not in soft handoff.

\( k \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 2-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( l \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 2-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( m \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 2-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( n \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 2-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( o \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 2-way soft handoff.

\( p \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 3-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( q \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 3-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( r \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 3-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( s \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 3-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( t \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 3-way soft handoff.

\( u \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 4-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\( v \) = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 4-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( w \) = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 4-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( x \) = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 4-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\( y \) = Number of 20 ms reverse traffic intervals that occur for calls that are in 4-way soft handoff.
\[ z \] = Number of 20 ms reverse traffic intervals that occur for calls that are in 5-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\[ a^1 \] = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 5-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\[ b^1 \] = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 5-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\[ c^1 \] = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 5-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\[ d^1 \] = Number of 20 ms reverse traffic intervals that occur for calls that are in 5-way soft handoff.

\[ e^1 \] = Number of 20 ms reverse traffic intervals that occur for calls that are in 6-way soft handoff in which a low quality traffic packet is fed to the vocoder.

\[ f^1 \] = Number of occurrences of a single 20 ms reverse traffic interval for calls that are in 6-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\[ g^1 \] = Number of occurrences of two consecutive 20 ms reverse traffic intervals for calls that are in 6-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\[ h^1 \] = Number of occurrences of more than two consecutive 20 ms reverse traffic intervals for calls that are in 6-way soft handoff in which all reverse traffic packets are either early, late, missing, or erase.

\[ i^1 \] = Number of 20 ms reverse traffic intervals that occur for calls that are in 6-way soft handoff.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 73: integrated services digital network (ISDN) business and residential customer services (BRCS) electronic directory service customers (EDSC) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Customer number.
c = Number of directory query display (DQD) session requests. A session may include multiple displays.
d = Number of successfully obtained display messages from an attached processor during DQD sessions.
e = Number of electronic directory service (EDS) auto call requests. An auto call request does not terminate a directory query session.
f = Number of unsuccessful EDS auto call requests.
g = Number of calling name display (CND) messages not received within a user-specified interval. The default interval is 6 seconds.

j           k           l           m
HPCACGXMT    HPCACGBLK
n           o

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 17: Government Emergency Telephone System High Probability of Call Completion (GETSHPC) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = HPC calls exempted from Network Management Controls.
c = Originating HPC call attempts.
d = Incoming HPC calls.
e = Terminating HPC calls.
f = Outgoing HPC calls.
g = Outgoing HPC calls to IXC's.
h = Outgoing HPC calls to No Circuit.
i = Outgoing HPC IXC calls to No Circuit.
j = HPC trunk group queue attempts.
k = HPC trunk group queue overflow.
l = HPC trunk group queue abandon.
m = HPC trunk group queue timeout.
n = ACG exempted HPC call attempts.
o = ACG blocked HPC call attempts.

4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

The validity for the administrative module applies to this section.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 17: government emergency telephone system (GETS) high probability of call completion (GETSHPC) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = HPC calls exempted from network management controls. This does not include advanced intelligent network (AIN) automatic code gapping (ACG) controls.

c = Originating HPC call attempts. This peg count is the number of origination attempts on lines, private facility trunks, and PRIs served by the measuring switch which the switch recognizes as HPC calls. This count shall be pegged only once per call, independent of the number of times the call attempts to route. (Note that at an originating access tandem, the same physical call may arrive at the AT multiple times as the end office attempts alternate routes and carriers. From the AT’s point of view, the same physical call will be counted as...
multiple incoming HPC calls because the AT has no way to tell that the same physical call has
arrived more than once.)

e = Terminating HPC calls. This peg count is the number of HPC calls, except for those which fail to
complete due to a user busy condition, whose destination is a termination served by the measuring
switch that the switch. This count shall be pegged only once per call leg, and shall be pegged when
the destination address is a valid terminating DN in DNTRAN on the measuring switch, provided
that the call does not fail to complete due to a user busy condition. Note that lines with CFV, CFDA,
or CFBL active are considered valid terminations.

f = Outgoing HPC calls. This peg count is the number of times HPC calls complete over trunks to
points outside the measuring switch that the switch has recognized are HPC calls. This count may
be pegged multiple times per call (for example after receiving a REL indicating network busy and
then finding an idle trunk in the next route chain). For outgoing multifrequency (MF) trunks, it is
pegged whenever an idle trunk is successfully seized without glare having occurred. For outgoing
ISUP trunks, it is pegged whenever an IAM is successfully sent for the trunk without an event such
as glare or COT failure occuring which requires a retry. Note that this count and the following count
will both be pegged when the call completes on a direct trunk to an IXC.

g = Outgoing HPC calls to IXC's. This peg count is the number of times HPC calls complete to an IXC
on a direct trunk from the measuring switch. This count may be pegged multiple times per call (for
example after receiving a REL indicating network busy and then finding an idle trunk in the next
route chain). For outgoing MF trunks, it is pegged whenever an idle trunk is successfully seized
without glare having occurred. For outgoing ISUP trunks, it is pegged whenever an IAM is
successfully sent for the trunk without an event such as glare or COT failure occuring which
requires a retry. Note that this count and the previous count will both be pegged when the call
completes on a direct trunk to an IXC.

h = Outgoing HPC calls to no circuit. This peg count is the number of outgoing HPC calls that receive
final treatment because no idle trunk facility was found to route the call. The term final treatment
means that the switch has no further ability to attempt to complete the call, and will either send it to
tone or announcement, or release it in the backward direction. This count is pegged only once per
call if the call receives final treatment (tone or announcement, or sending a release in the backward
direction) due to a no circuit condition. Note that the call may have successfully seized outgoing
trunks but been released back to continue hunting before ultimately receiving final treatment. Also
note that if all routes have been attempted but the call is to remain alive in order to report the
network busy event to the service control point (SCP) this count will not be pegged at that time. This
count truly means that the call is over from the perspective of the measuring switch. (However, the
physical call may continue to live if it is released in the backward direction to an office which can
react to that release message by attempting an alternate route or itself sending the network busy
message to the SCP). Note that this count and the following count will both be pegged when the call
is destined to route using an IXC (either directly or indirectly).

i = Outgoing HPC IXC calls to no circuit. This peg count is the number of outgoing HPC calls that
would have routed using an IXC but which receive final treatment because no idle trunk facility was
found to route the call. This count is pegged only once per call if the call receives final treatment
(tone or announcement, or sending a release in the backward direction) due to a no circuit
condition. Note that the call may have successfully seized outgoing trunks but been released back
to continue hunting before ultimately receiving final treatment. Also note that if all routes have been
attempted but the call is to remain alive in order to report the network busy event to the SCP, this
count will not be pegged at that time. This count truly means that the call is over from the
perspective of the measuring switch. (However, the physical call may continue to live if it is released
in the backward direction to an office which can react to that release message by attempting an
alternate route or itself sending the network busy message to the SCP). Note that this count and the
previous count will both be pegged when the call is destined to route using an IXC (either directly or indirectly).

\[ j \] = HPC trunk group queue attempts. This peg count is the number of attempts to place an HPC call in a trunk group queue.

\[ k \] = HPC trunk group queue overflow. This overflow count is the number of HPC calls not queued because the HPC queue was full.

\[ l \] = HPC trunk group queue abandon. This peg count is the number of HPC calls that abandoned while in a trunk group queue.

\[ m \] = HPC trunk group queue timeout. This peg count is the number of HPC calls removed from a HPC queue due to time-out treatment.

\[ n \] = ACG exempted HPC call attempts. This measurement is pegged each time an HPC call is exempted from being blocked by an AIN ACG control.

\[ o \] = ACG blocked HPC call attempts. This measurement is pegged each time an HPC call is blocked by an AIN ACG control.

\[ p \] = HPC egress queue attempts. The number of times a GETS call undergoing egress queuing attempts to go into the egress QR.

This measurement counts the number of times that a GETS call attempting to complete to a PF or PRI trunk group attempts to queue in the GETS egress QR. It will not be pegged in cases when the egress queuing OFID indicates that egress queuing is inactive, if the call is not placed in queue because a queue is already assigned to the trunk group, or if the call is not placed in the queue because the trunk group attribute indicates that calls to that trunk group are ineligible to queue in the GETS QR or is restricted by TGSR.

\[ r \] = HPC egress queue overflows. This measurement counts the number of times that a GETS call attempting to complete to a PF or PRI trunk group attempts to queue in the GETS egress QR but can not because the maximum number of calls queued for the target trunk group has already been reached.

\[ s \] = HPC egress queue abandons. This measurement counts the number of times that a GETS call attempting to complete to a PF or PRI trunk group was placed queue in the GETS egress QR, but the originator abandoned the call before the queue timer expired or an idle member was found.

\[ t \] = HPC egress queue timeouts. This measurement counts the number of times that a GETS call attempting to complete to a PF or PRI trunk group was placed in the GETS egress QR, and the queue timer expired before either the caller abandoned or an idle member was found for the call.

\[ u \] = HPC egress QR overflows. This measurement counts the number of times that a GETS call attempting to complete to a PF or PRI trunk group attempts to queue in the egress GETS QR but can not because the maximum number of trunk groups for which the Egress QR is queuing calls has already been reached. This counter shall not be pegged when the maximum number of calls queued per trunk group has been exceeded.

\[ w \] = HPC office QR overflows. This measurement counts the number of times that a GETS call attempting to complete to a public trunk group attempts to queue in the office GETS QR but can not because the maximum number of trunk groups for which the office QR is queuing calls has already been reached. This counter shall not be pegged when the maximum number of calls queued per trunk group has been exceeded.

</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 79: GDX-ES and MTIBS activities of MMSU (GMTIB) counts of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Modular metallic switch unit (MMSU) number.
d = Attempts to seize metallic test interconnection bus (MTIB).
e = Metallic test interconnection bus not available. This overflow count is the number of attempts to seize MTIB that was denied due to lack of resources.
f = Gated diode crosspoint (GDX) not available. This overflow count is the number of attempts to seize a GDX that was denied due to lack of resources.
g = Total usage metallic test interconnection bus on an MMSU unit.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 8: high level service circuits (HLSC) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a  = Time when the report was prepared, in the form hours:minutes:seconds.
b  = Switching module number.
c  = Line unit number.
d  = Number of times an attempt was made to use an HLSC. Multiple attempt counts are pegged for any originating attempt that is unable to reach an HLSC and the subsequent re-attempts.
e  = Sum of traffic and maintenance usage reported in hundred-call-seconds (CCS). This count is reported to the data collection system as a 10-second scan count, but when printed on the receive-only printer and local traffic channel, it is converted to a 100-second scan count value.
f  = Number of times the switch could not obtain an HLSC to run an originating short job (for example, power cross, false cross and ground). Multiple overflow counts may be made for any call that is a short job overflow. In a plain old telephone service (POTS) call, short job overflow does not mean diversion of service (for example, originating short job overflow customers will not be denied but will be queued until HLSC becomes available).
g  = Maintenance usage reported in CCS.
h  = Number of times the switch could not obtain an HLSC to ring a customer line. Ringing overflow will result in the originator receiving a reorder. Applicable NOCKT counts also peg.

## 2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 201: high speed link measurements (HSL) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

## 3. VARIABLE FIELD DEFINITIONS

### 3.1 Variables

- **a**  
  - Time when the report was prepared, in the form hours:minutes:seconds.
- **b**  
  - Line unit number.
- **c**  
  - Signaling link set.
- **d**  
  - Member.
- **e**  
  - Duration in the in-service state.
- **f**  
  - Signaling link alignment failures.
- **g**  
  - SSCOP SD PDUs transmitted (including retransmission).
- **h**  
  - SSCOP SD PDUs retransmitted.
- **i**  
  - SSCOP SD PDU octets transmitted (including retransmissions).
- **j**  
  - SSCOP SD PDU octets retransmitted.
- **k**  
  - SSCOP SD PDUs received.
l = SSCOP SD PDUs octets received.
m = Total SSCOP SD PDUs transmitted (all PDU types).
n = Total SSCOP PDUs received (all PDU types).
o = Total SSCOP PDUs octets transmitted (all PDU types).
p = Total SSCOP PDU octets received (all PDU types).

4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

If the data is checked, check the validity of the corresponding SM.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 244: high speed data (HSPD) trunk group of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Trunk group number.
c = Number of forward burst attempts for rate 19.2 kbps.
d = Number of forward burst blocked for rate 19.2 kbps.
e = Number of reverse burst attempts for rate 19.2 kbps.
f = Number of forward burst attempts for rate 38.4 kbps.
g = Number of forward burst blocked for rate 38.4 kbps.
h = Number of reverse burst attempts for rate 38.4 kbps.
i = Number of forward burst attempts for rate 76.8 kbps.
j = Number of forward burst blocked for rate 76.8 kbps.
k = Number of reverse burst attempts for rate 76.8 kbps.
l = Number of forward burst attempts for rate 153.6 kbps.
m = Number of forward burst blocked for rate 153.6 kbps.
n = Number of reverse burst attempts for rate 153.6 kbps.
o = Number of total forward burst attempts.
p = Number of total forward burst blocked.
q = Number of total reverse burst attempts.
r = Number of total reverse burst blocked.
s = Number of times forward burst attempts and reverse burst attempts were blocked due to all the supplemental channels (SCH) being in use or unavailable to handle a burst on a 3G-1X data protocol handler (DPH).

i = Number of forward burst attempts for rate 76.8 kbps.
j = Number of forward burst blocked for rate 76.8 kbps.
k = Number of reverse burst attempts for rate 76.8 kbps.
l = Number of forward burst attempts for rate 153.6 kbps.
m = Number of forward burst blocked for rate 153.6 kbps.
n = Number of reverse burst attempts for rate 153.6 kbps.
o = Number of total forward burst attempts.
p = Number of total forward burst blocked.
q = Number of total reverse burst attempts.
r = Number of total reverse burst blocked.
s = Number of times forward burst attempts and reverse burst attempts were blocked due to all the supplemental channels (SCH) being in use or unavailable to handle a burst on a 3G-1X data protocol handler (DPH).

</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 6: ineffective attempts (IA) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of originating false starts. This peg count is the number of originating requests for which dial tone was returned and a customer disconnect was received by the system prior to the receipt of digits or determination that digits are not required.
c = Number of originating permanent signals. This peg count is the number of originating requests for which digit receiving has timed out with no digits received.
d = Number of originating partial dials abandoned. This peg count is the number of originating calls for which a disconnect signal was received by the system prior to the receipt of a complete set of expected digits.
e = Number of originating partial dials timed out. This peg count is the number of originating calls for which interdigital timing has been exceeded. After determination of call destination, if the remaining number of expected digits are not received, even if invalid digits are dialed, this measurement will be pegged.
f = Number of originating calls abandoned. This peg count is the number of originating calls for which a complete set of digits was received, but for which an on-hook signal was received prior to call setup completion (ringing or outpulsing requested). This count is usually due to customer action.
g = Number of incoming false starts. This peg count is the number of incoming requests for which an on-hook signal was received prior to receipt of the first digit.
h = Number of incoming permanent signals. This peg count is the number of incoming requests for which digit receiving has timed out with no digits received.
i = Number of incoming partial dials abandoned. This peg count is the number of incoming calls for which a disconnect signal was received by the system prior to the receipt of a complete set of expected digits.

j = Number of incoming partial dials timed out. This peg count is the number of incoming calls for which interdigital timing has been exceeded.

k = Number of incoming calls abandoned. This peg count is the number of incoming calls for which a complete set of expected digits was received, but for which call processing was not completed due to the receipt of a disconnect signal prior to call setup completion. This count is usually due to a customer’s action at the far office.

l = Number of incoming backward fail messages. This peg count indicates the number of times that a backward fail message common channel signaling system number 6 domestic or a release message integrated services digital network user part was sent due to the following reasons: call failure (incoming or outgoing), unequipped circuit identification code (incoming), switching equipment congestion (incoming), circuit group congestion (outgoing), national network congestion (outgoing), or unlocated national number (incoming). The incoming call attempt is considered an IMA.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 72: integrated services digital network (ISDN) business and residential customer services (BRCS) office totals (IBROFC) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Messages with directory numbers sent to customer. Total number of directory number messages (DNMSGS) sent to ISDN or analog station sets. Some of the features that are associated with this count are automatic callback calling (ACBC), customer-originated trace (COT), automatic callback - automatic recall (AC-AR), incoming calling line identification (ICLID), and call party number/billing number (CPN/BN). For particular types of CPN/BN and ICLID features, multiple DN messages will be delivered for shared DN customers.

c = Single calling party number information element containing number private. Number of times a single calling party number (CPN) information element (IE) containing "number private" indication was delivered to calling number delivery (CND) customers.

d = single CPN IE containing number unavailable. Number of times a single CPN IE containing "number unavailable" indication was delivered to CND customers.

e = Single CPN IE containing billing number. Number of times a single CPN IE containing billing number (charge number) was delivered to CND customers.

3.2 Parameters

INVALID INTERLATA CARRIERS:
b [b][b][b][b][b][b][b][b]
ALLOWED INTERLATA CARRIER COUNT: c (LIMIT = 10)

2. REASON FOR OUTPUT

To respond to an ALW:TRFC30, INH:TRFC30, OP:TRFC30, and REPT:TRFC30 input message request for immediate output of up to 10 interLATA carriers (ICs) when one or more of the interLATA carrier identifiers requested is invalid. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a = Allowed interLATA carrier identifier(s) requested.
b = Invalid interLATA carrier identifier(s) requested.
c = Current number of interLATA carriers allowed for output.

4. ACTIONS TO BE TAKEN

An interLATA carrier can be requested again if it was flagged as invalid because of a typing error. If the limit is reached, inhibit an existing IC and input a new IC.

</thead>
<tbody>
<tr>
<td>b</td>
<td>c</td>
<td>d</td>
<td>e</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 164: interLATA carriers (IC) tandem trunks of the 30-minute traffic report. A shared trunk group is a tandem trunk group and a non-shared trunk group is a direct trunk group.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Feature group identifier.
c = InterLATA carrier identifier.
d = Outgoing call attempts. Number of outgoing call attempts on tandem trunks.
e = Trunk overflows. Number of trunk overflows on tandem trunks.
f = Traffic usage. Traffic usage on tandem trunks reported in 100-call-seconds. The traffic usage on shared trunks counter is incremented for the specified carrier.

3.2 Parameters

<table>
<thead>

<td>f</td>
</tr>
<tr>
<td></td>
<td>.</td>
</tr>
<tr>
<td></td>
<td>.</td>
</tr>
<tr>
<td></td>
<td>.</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate output or scheduled output of section 37: intra-remote switching module (RSM) communication links (ICL) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

| a   | = Time when the report was prepared, in the form hours:minutes:seconds. |
| b   | = Text identifier of the remote site.       |
| c   | = Numerical identifier of the remote site.  |
| d   | = Lower member number of the measurement pair. |
| e   | = Higher member number of the measurement pair. |
| f   | = ICL peg count. Number of ICL time slot allocation attempts. If there is only one RSM at the site, there are no ICL measurements. If there are two or more RSMs, there is one set of measurements for each pair. This measurement is pegged one time for each attempt between a pair of RSMs by the terminating process in an intra-module call. No ICL attempt is made if the terminating RSM is in full stand-alone, the terminating party is busy, or any other reason that the terminating terminal process cannot be created. |
| g   | = ICL overflow attempts. Number of unsuccessful time slot allocation attempts. This overflow count is the number of unsuccessful attempts made to allocate an ICL time slot because of lack of resources and is pegged by the terminating process in an intra-module call. No ICL attempt is made if the terminating RSM is in full stand-alone, the terminating party is busy, or any other reason that |
the terminating terminal process cannot be created.

When there is a difference between variable \( g \) and variable \( h \), look at the UMOFL measurement in OP:TRFC30-UTS and/or the measurements in OP:TRFC30-SMS and OP:TRFC30-RSIT. The difference in these measurements represent failed calls.

\( h \) = Back-haul attempt multimodule RSM. Number of successful backhaul attempts. This peg count is incremented when an overflow condition exists on the ICLs, and the path is set up through the host switching module(s). This measurement is pegged by the peripheral control subsystem when attempting to route an intra-multi-module call.

\( i \) = ICL maintenance usage. ICL time slot maintenance usage reported in hundred-call-seconds (CCS). This measurement is the total amount of time the ICL time slots are out of service between each pair of RSMs in the MMRSM and includes nailed-up usage between RSMs over an ICL.

\( j \) = ICL total usage. ICL time slot total usage reported in CCS. This measurement is the total amount of time the ICL time slots between each pair of RSMs are in the active state for intra-RSM calls and includes nailed-up usage between RSMs over an ICL.

### 2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 31: individual dialing plan (IDP) measures of the 30-minute traffic report. Up to five IDP group’s measurements may appear in a single message.

### 3. VARIABLE FIELD DEFINITIONS

#### 3.1 Variables

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = IDP group identifier name. Since the data collection system cannot accept alphabetic characters in any of the data fields, the FID decimal identifier is still used to identify the studied IDP feature. The traffic channel and the ROP prints the IDP feature name and the data of the studied IDP group, but the data collection system prints the FID decimal identifier and the data of the studied IDP group. The FID decimal identifier needs to be cross-referenced to the IDP feature name in the CM relation FACNAME when looking at the IDP data on the data collection system reports.
- **c** = IDP intercom dialing attempts. Number of times the intercom dialing capability is used to interpret digits that are either dialed or are a result of preceding IDP feature use.
- **d** = Number of abbreviated dialing attempts (1 digit).
- **e** = Number of abbreviated dialing attempts (2 digits).
- **f** = Number of abbreviated dialing attempts (3 digits).
- **g** = IDP specify carrier attempts. Number of times the IDP detects a 10XXX code indicating that the specific carrier is requested for either an intercom or abbreviated dialing call. If the IDP detects a
10XXX code, the 101XXX code will also score this count.

h = IDP alternate code treatment (ACT) attempts. Number of ACT attempts.

i = IDP feature code definition attempts. Number of times the IDP detects a feature definition code.

j = IDP private facility access (PFA) code attempts. Number of times the IDP detects a PFA code.

k = IDP dialing plan alternate treatment (PAT) restricted code error treatment. Number of times error treatment is given for a code because of a line's DPAT category. The error treatment can be an announcement, a rerouted call, or a reorder.

l = IDP undefined code error treatment. Number of times error treatment is given in the IDP for an undefined dialed code.

m = IDP primary carrier. Number of times the group primary carrier parameter is used to route a call. The PRIMCAR measurement is incremented during presubscribed intaLATA toll carrier or presubscribed interLATA carrier selection when IDP is active and IDP GPTC or IDP GPIC exists.

n = IDP plain old telephone service (POTS) access attempts. Number of times a POTS access code (with or without dial tone) is detected. The POTS access code is when a call in the dialing plan escapes to a POTS call.

o = Number of IDP parameter change attempts.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 140: integrated digital carrier unit (IDCU) - directly connected peripheral interface data bus (DPIDB) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = IDCU number.
d = Attempts to seize a D PID B time slot. Number of attempts to seize a D PID B time slot to set up an on-demand B-channel (ODB) connection (count 1).
e = Denied attempts to seize a D PID B time slot. Number of attempts to seize a D PID B time slot to set up an ODB connection that were denied because an idle time slot was not available (count 2).
f = Total usage of an IDCU's D PID B time slot. Total usage reported in hundred-call-second (CCS) of an IDCU's D PID B time slots; this includes traffic usage for ODB calls plus the maintenance usage of the time slots (count 3).
g = Maintenance usage of an IDCU's D PID B time slot. Maintenance usage reported in CCS of an IDCU's D PID B time slots; this is the cumulative amount of time that each D PID B time slot was not available to carry traffic and includes maintenance activity for an IDCU that makes D PID BS unavailable for service (count 4).
h = D PID B time slots connected to IDCU. Total number of D PID B time slots connected to an IDCU (count 5).
i = D PID B time slots available for ODB calls. Number of D PID B time slots available for ODB calls; this excludes D PID B time slots used for provisioned B-channels, D-channels, embedded operations
channels (EOC), and time-slot management channels (TMC) (count 6). This quantity is computed based on the data available from the static data base, and the state of a DPIDB being in-service or out-of-service does not affect this number.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 141: integrated digital carrier unit (IDCU) lines of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = IDCU number.
d = Digital remote terminal (RT) number.
e = RT line number.
f = Dial tone delay exceeds 3-second threshold. Number of times dial tone delay exceeds the 3-second threshold for touch-tone and dial pulse originating non-ISDN calls plus the number of times call setup delay exceeds the 3-second threshold between receipt of a SETUP message and the return of a SETUP acknowledge or call proceeding message for circuit-switched originating ISDN calls (count 1).
g = Readiness to receive customer dial pulse or touch-tone service digits. Number of times the switch initiates action leading to a readiness to receive customer dial pulse or touch-tone service digits or to process a call for which digits are not required; the count is incremented at the time the line requesting service is identified (count 2).
h = Circuit-switched calls to lines or private branch exchange trunks termination attempts. Number of times the switch attempts to terminate circuit-switched calls to lines or PBX trunks served by an IDCU; this count is incremented when the switch identifies the terminating party (count 3).
i = Service denied to attempted call originations. Number of times that service was denied to attempted call originations because of a lack of resources in the switch, RT, or intervening digital signal level 1 (DS1) facilities (count 4).

j = Service denied to originating, terminating, or outgoing calls. Number of times that service was denied to originating, terminating, or outgoing calls because of a lack of resources in the switch, remote digital terminal, or intervening DS1 facilities (count 5).

k = Traffic usage for lines originating, terminating, and outgoing calls. Traffic usage reported in hundred-call-seconds for the line's originating, terminating, and outgoing calls or the traffic usage for semi-permanently cross-connected circuits (provisioned B-and D-channels) (count 6).

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 139: integrated digital carrier unit (IDCU) - peripheral interface data bus (PIDB) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = IDCU number.
d = Attempts to terminate circuit-switched calls. Number of times the switch attempts to terminate circuit-switched calls to lines or private branch exchange (PBX) trunks served by an IDCU; this count is incremented when the switch identifies the terminating party; it is incremented only once for each terminating request regardless of the number of retries due to resource failures (count 1).
e = Attempts to terminate a circuit-switched call was blocked. Number of times that an attempt to terminate a circuit-switched call was blocked due to failure to find an idle PIDB time slot (count 2).
f = Total usage of IDCU's PIDB time slot. Total usage reported in hundred-call-seconds (CCS) of an IDCU's PIDB time slots; this includes traffic usage generated by circuit-switched calls for the IDCU's ISDN and non-ISDN lines plus maintenance usage of the time slots (count 3).
g = Traffic usage of IDCU's PIDB time slot. Amount of traffic usage reported in CCS of an IDCU's PIDB time slots generated by circuit-switched calls for the IDCU's ISDN lines (count 4).
h = Maintenance usage of IDCU's PIDBs. Maintenance usage for an IDCU's PIDBs; this is the cumulative length of time that an IDCU's PIDB time slots were not available for traffic because of maintenance activity and includes all maintenance activity for an IDCU that makes PIDBs unavailable for service (count 5).
i  = PIDB time slots connected to IDCU. Total number of PIDB time slots connected to the IDCU (count 6). This quantity is computed based on the data available from the static data base, and the state of a PIDB being in-service or out-of-service does not affect this number.

j  = PIDB time slots available for locally-switched traffic. Number of PIDB time slots available for locally-switched traffic (those calls not nailed up using RC/V view 7.11); this excludes PIDB time slots used for nailed-up circuits (count 7).

   b   c    d    g_1

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output for IP OIU measurements.

Format 1 is printed in response to an OP:TRFC30,IPOIU,PART=1 input message. It is layout of section 259 - IPOIU IP statistics.

Format 2 is printed in response to an OP:TRFC30,IPOIU,PART=2 input message. It is layout of section 260 - IPOIU APS measurements.
3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
c = Office interface unit (OIU) number.
d = Protection group (PG) number.
e = Validity of the data.
f = The total number of input datagrams received from interfaces, including those received in error.
g = The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, and so forth.
h = The number of input datagrams discarded because the IP address in their IP header’s destination field was not a valid address to be received at this entity. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported classes (such as, class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
i = The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (for example, for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting reassembly.
j = The total number of IP datagrams which local IP user-protocols [including internet control message protocol (ICMP)] supplied to IP in requests for transmission. Note that this counter does not include any input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination.
k = The number of IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (for example, for lack of buffer space). Note that this counter would include input datagrams for which this entity was not their final IP destination if any such packets met this (discretionary) discard criterion.
l = The total number of ICMP messages which the entity received. Note that this counter includes all those counted by icmpInErrors.
m = The number of ICMP messages which the entity received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, and so forth).
n = The total number of ICMP messages which this entity attempted to send.
o = The number of ICMP echo (request)messages received.
The number of ICMP echo reply messages received.

The number of ICMP echo (request) messages sent.

The number of ICMP echo reply messages sent.

The number of times the ICMP outbound signaling is discarded.

The total number of UDP datagrams delivered to UDP users.

The total number of UDP datagrams sent from this entity.

The total number of RTP packets received.

Number of times the jitter buffer was under run.

Number of times the jitter buffer was over run.

Duration in seconds for which the working ports have been in signal failure state.

Duration in seconds for which the working ports have been in signal degradation state.

Duration in seconds for which the protection ports have been in signal failure state.

Duration in seconds for which the protection ports have been in signal degradation state.

The k1 bytes being transmitted by the protection ports to the remote port.

The k2 bytes being transmitted by the protection ports to the remote port.

The k1 bytes from the received (SONET) header on the protection ports.

The k2 bytes from the received (SONET) header on the protection ports.

Number of times the APS pair has switched over since last configuration.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 198: intelligent peripheral trunks (IPT) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Trunk group number.
c = Intelligent peripheral (IP) timeout. Number of IP timeout, kept on a per-IP basis, is pegged whenever the SSP detects an ipTimeout condition and reports it to the SCP with a Resource_Clear message whose ClearCause value is "isdnTimeout."
d = IP unavailable. Number of IP trunks that are not unavailable, kept on a per-IP basis, is pegged whenever the SSP can not seize an idle B-channel to the indicated IP, and reports this to the SCP with a Resource_Clear message whose ClearCause value is "channelsBusy."
e = Messages received. Number of "send to resource external" messages received for that IP.
f = Initial address message (IAM) messages received. Number of STOR or STR/E IAM messages received, pegged whenever a well formed IAM message is received for a remote IP.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 143: integrated digital carrier unit (IDCU) per remote terminal (RT) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = IDCU number.
d = RT number.
e = Switch recognizes request for service. Number of times the switch recognizes a request for service (such as, a setup message) from the RT’s locally-switched lines (those lines not nailed up using RC/V view 7.11) or attempts to terminate calls to the RT’s locally-switched lines or private branch exchange (PBX) direct inward dialing (DID) trunks; the count is incremented when the switch identifies the originating or terminating party; the count is incremented only once for each originating or terminating call regardless of retry attempts due to resource failures (count 1).
f = Blocked locally-switched originating calls. Number of times locally-switched originating calls are blocked due to non-availability of an idle digital signal level 1 (DS1) time slot (count 2).
m = Blocked locally-switched terminating calls. Number of times locally-switched terminating calls are blocked due to non-availability of an idle DS1 time slot (count 3).

g = Total usage of RT DS1s. Total usage reported in hundred-call-seconds (CCS) of the RT’s DS1 time slots this includes traffic for locally-switched originating and terminating calls plus the maintenance usage of the DS1 time slots (count 4).

h = Maintenance usage of RT DS1s. Maintenance usage of the DS1 time slots; this is the cumulative length of time that each of an RT’s active DS1 time slots was not available for traffic due to maintenance activity and includes time slots for non-locally switched circuits (any circuit nailed up using RC/V view 7.11), D-channels, provisioned B-channels, embedded operations channels (EOC), and time-slot management channel (TMC); maintenance usage for an out-of-service DS1 is calculated by multiplying the time the facility is not available for service by 24, the number of channels per DS1; the time a DS1 is on protection is not considered in this measurement of maintenance usage (count 5).

i = Time slots on RTs active DS1s. Number of time slots on the RT’s active DS1s. This excludes time slots on the protection DS1, but includes time slots for semi-permanent cross connections (provisioned B-channels, provisioned D-channels), EOCs, and TMCs (count 6).

j = RTs active DS1 time slots locally-switched traffic. Number of the RT’s active DS1 time slots available for locally-switched traffic; this excludes all time slots that are used for semi-permanently cross-connected services, EOCs, and TMCs (count 7).

k = Packets transmitted and received (RTs active and standby EOCs). Number of packets transmitted and received in Information frames (I frames) over the RT’s active and standby EOCs (count 8).

l = Packets transmitted and received (RTs active and standby TMCs). Number of packets transmitted and received in I frames over the RT’s active and standby TMCs (count 9).

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 50: integrated services digital network office totals (ISOFC) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = ISDN originating calls. Number of circuit-switched call SETUP messages (Q.931) from ISDN (U- or T-cards) that include the destination address (block mode), a partial destination address, or are followed by at least one information message containing a dialed digit.
c = ISDN calls usage. Total usage generated by scanning originating ISDN circuit-switched calls every 100 seconds. There may be concurrent multiple originating calls on one line (that is, on more than one channel).
d = ISDN terminating calls. Number of circuit-switched calls identified as ISDN (U- or T-cards) that are to terminate within the office to an ISDN line. The count is made at the determination of the destination to an ISDN line.

For one call to an ISDN station set that has shared call appearances on other station sets, the switch will increment this counter for each station set destination.
e = Terminating ISDN calls usage. Total usage generated by scanning terminating ISDN
circuit-switched calls every 100 seconds. There may be concurrent multiple terminating calls on one line (that is, on more than one channel).

f = ISDN incoming calls. Number of incoming trunk seizures that are terminating to an ISDN line (U- or T-cards). The count is made at the determination of the destination to an ISDN line.

g = ISDN outgoing calls. Number of ISDN (U- or T-cards) originating circuit-switched calls that are leaving the office. The count is incremented at the determination of the destination.

h = Intra-office ISDN calls. Number of ISDN (U- or T-cards) originating circuit-switched calls that are terminating within the office (to ISDN or analog lines). The count is incremented at the determination of the destination.

i = ISDN originating requests. Number of ISDN Q.931 originating call SETUP messages received.

j = ISDN incoming requests. Number of Q.931 incoming call SETUP messages (ISDN incoming requests) received.

k = Incoming ISDN partial dial time-outs. Number of Q.931 call SETUP messages (ISDN incoming requests) received over the primary rate interface (PRI) that did not contain enough digits in the called party number information element (IE) to complete the call.

l = Originating ISDN partial dial time-outs. Number of ISDN originating partial dial time-outs.

m = Originating ISDN permanent signals. Number of ISDN originating permanent signals.

n = Originating and terminating ISDN calls usage. Total extended office (include host, RSM and ORM) ISDN circuit-switched traffic usage generated by originating and terminating (O+T) calls measured at a single, common point in the system network. This count includes all integrated services line units (ISLUs) and access interface units (AIUs).

o = Calling party subaddress received at originating end. Number of calling party subaddress (CgPS) received at originating end. This peg count is incremented any time a CgPS IE is received by the switch.

p = Calling party subaddress delivered to terminating end. Number of CgPS delivered to terminating end. The CgPS will be delivered when it is available at the far end and a user-provided passed screening (UPPS) "public" calling party number (CPN) is being delivered as part of the existing calling party number/billing number (CPN/BN) feature. This is the only time that this count will be pegged.

q = Single number unavailable redirect number IE deliveries. Number of single "number unavailable" redirecting number (RN) IE deliveries. This count will be pegged when a single RN IE is delivered in the terminating SETUP message indicating "number unavailable." If two RN IEs are delivered with either one indicating "number unavailable," this count is not pegged.

r = Single public number (full digits) RN IE deliveries. Number of single "number public (full digits)" RN IE deliveries. This count will be pegged when a single RN IE is delivered in the terminating SETUP message with a "number public (full digits) number." If two RN IEs are delivered with either one indicating "number public (full digits) number," this count is not pegged.

s = Single private number (no digit) RN IE deliveries. Number of single "number private (no digit)" RN IE deliveries. This count will be pegged when a single RN IE is delivered in the terminating SETUP message with a "number private (no digit) number." If two RN IEs are delivered with either one indicating "number private (no digit) number," this count is not pegged.
\( t \) = Two RN IE deliveries. Number of 2 RN IE deliveries. This count will be pegged when 2 RN IEs are delivered in the terminating SETUP message.

\( u \) = Additional call offering (ACO) calls offered. Number of ACO calls offered. This count reflects the number of calls that would not have been offered had ACO not been available.

\( v \) = ACO calls answered. Number of ACO calls answered by the subscriber.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 51: ISDN packet interface (ISPI) measurements of the 30-minute traffic report. If the switch is configured for code division multiple access (CDMA) traffic, refer to the 235-200-100 for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number (which is also packet interface (PI) number); the active SM and the active PI have the same number.
c = PI processor occupancy. Processor occupancy percentage based on interject entry rate (count 1). Occupancy is defined in terms of interjects, which is the processor level at which packets are processed. Two end points are defined:
- Maximum possible interjects over time - the processor "at rest," no calls, healthy, and 0 percent occupancy.
- Minimum possible interjects over time - the processor with work waiting in every job queue, and 100 percent occupancy.
   The reported number is the relative distance the processor was from the end points expressed as a percent.
d = PI time in overload (count 2). Number of 3-second time increments the PI was in an overload condition. Overload refers not only to processor real time, but also to near exhaustion of software resources.
e = Message in. Total packet switch unit messages incoming to the PI.
f = Message out. Total packet switch unit messages outgoing from the PI.

2. REASON FOR OUTPUT

To respond to a request for an immediate or scheduled output of section 120: integrated services digital network (ISDN) user part (ISUP) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of outgoing ISUP messages.
c = Number of incoming ISUP messages.
d = ISUP message types received. Number of times an ISUP message is received during call setup that is considered unreasonable. The definition of unreasonable is when the switch receives a known ISUP message while in a call processing state which did not expect to receive such a message. If such an event occurs during call setup (after receiving/sending an initial address message (IAM) and before in a talking state), the call will be killed and this count pegged. Unreasonable messages are silently ignored once the call reaches the talking state.
e = Release messages sent. Number of ISUP release messages with an abnormal cause value that are sent in the backward direction (for example, sent to the originating office) during call setup. Call setup is defined as the time after receiving an IAM but before sending an address complete message (ACM). An abnormal cause value is any cause other than normal release (cause value =
16). Only the switch where the call failure was detected pegs this count.

- **f** = Blocking messages received. Number of blocked (BLO) messages received on an in-service ISUP trunk.

- **g** = Trunk rehunts restarted detected glare condition. Number of trunk rehunts started for an ISUP trunk because a glare condition was detected on a first call attempt.

- **h** = Trunk rehunts started unsatisfactory response. Number of trunk rehunts started for an ISUP trunk because a continuity test failure was detected on the first call attempt.

- **i** = Trunk rehunts started for any other reason. Number of trunk rehunts started on an ISUP trunk for any reason other than a glare condition or a continuity test failure.

- **j** = Unsuccessful call attempts. Number of unsuccessful call attempts on ISUP trunks. An initial address message (IAM) or a circuit reservation message (CRM) was sent but the call does not attain a talking state and a REL message was received in the backward direction that contains an abnormal REL cause.

  This count pegs for:
  - Any REL (including cause = 17) received before an ACM or ANM.
  - Call attempts that result in a retry (second attempt), that is, COT failure, glare, and unequipped circuit identification code (UCIC) or reset circuit (RSC) message received before ACM.
  - ACM or circuit reservation acknowledgment (CRA) time-outs.

This count does not peg for a busy count if multifrequency interworking is encountered for any part of the call setup, because an ACM is returned when switching from CCS7 to MF signaling.

- **k** = Switch congestion failures. Number of ISUP call failures occurring in this switch caused by switch congestion and resulting in a REL cause=42.

- **l** = No circuit available failures. Number of ISUP call failures occurring in this switch because no outgoing trunk was available resulting in a REL cause=34.

- **m** = Address incomplete failures. Number of ISUP call failures occurring in this switch because analysis of the called party number in the incoming IAM resulted in "address incomplete". This failure results in a REL cause=28.

- **n** = Temporary call failures. Number of ISUP call failures occurring in this switch resulting in a "temporary failure". This failure results in a REL cause=41.

  This count pegs for:
  - Any call setup failure where a release message with cause value = 41 is sent by an incoming ISUP7 trunk.
  - Unsuccessful call attempts where the incoming circuit is not ISUP7 and:
    - Call attempts that result in a retry (second attempt), for example, glare or COT failure detected, unequipped circuit identification code (UCIC), blocking (BLO), reset (RST), or circuit unexpected message received.
    - Address complete message (ACM).

- **o** = Unallocated number failures. Number of ISUP call failures occurring in this switch because
analysis of the called party number in the incoming IAM resulted in an “unallocated number”. This failure results in a REL cause=1.

\[ p \] = busy failures. Number of ISUP call failures occurring in this switch when the called subscriber was busy. This failure results in a REL cause=17.

\[ q \] = Destination out-of-service. Number of ISUP call failures occurring in this switch because the destination was out-of-service. The trunk hunt was completed and termination attempted to the chosen trunk when the point code was out-of-service and there is no alternate route available. This failure results in a REL cause=27.

\[ r \] = ISUP call failures any other reason. Number of ISUP call failures occurring in this switch that result in REL causes other than those listed in ‘k’ through ‘q’.

\[ s \] = Number of calls resulting in an initial address message with redirect capability parameter beging sent as a result of release link initiation.

\[ t \] = Number of calls setup as a result of having received a release message with redirection information message.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 78: junctors and MTBS activities of MMSU module (JMTB) counts of the 30-minute traffic report. These are specified through RC/V Views 13.7 and 13.8. Refer to the Recent Change Reference manual for additional information. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- a = Time when the report was prepared, in the form hours:minutes:seconds.
- b = Switching Module (SM) number.
- c = MMSU Number.
- d = Service group (SG) number.
- e = Shelf number.
- f = Attempts to seize a junctor.
- g = Junctor not available. This overflow count is the number of attempts to seize Junctor that was denied due to lack of resources.
- h = Total usage of junctor.
- i = Attempts to seize metallic test bus (MTB).
- j = MTB not available. This overflow count is the number of attempts to seize a MTB that was denied due to lack of resources.
- k = Total usage of MTB.

2. REASON FOR OUTPUT

To respond to a request (OP:TRFC30) for either an immediate or scheduled output of section 76: local area
signaling services (LASS) of the 30-minute traffic report (TRFC30). Refer to the APP:MEASUREMENTS appendix in
the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of automatic callback (AC) feature access customer requests (ACS).
c = Number of AC feature cancel (CANC) customer requests.
d = Number of AC feature accesses that resulted in immediate call setup (ICS).
e = Number of AC feature accesses that resulted in camp-on (CAMPON) to the called directory
number (DN).
\( f \) = Number of times an AC feature access attempt was unsuccessful due to lack of AC feature processing resources on the originating switch (OVFL).

\( g \) = Number of AC feature access attempts that resulted in long term denial (LTD) being returned to the end user.

\( h \) = Number of AC feature access attempts that resulted in short term denial (STD) being returned to the end user.

\( i \) = Number of AC feature accesses that resulted in timeout (TO) of the feature before ringback can be given to the end user.

\( j \) = Number of times that busy announcement resulted after AC ringback was given (BYRB).

\( k \) = Number of automatic recall (AR) feature ACS.

\( l \) = Number of AR feature CANC customer requests.

\( m \) = Number of AR feature accesses that resulted in ICS.

\( n \) = Number of AR feature accesses that resulted in CAMPON to the called DN.

\( o \) = Number of times an AR feature access attempt was unsuccessful due to lack of AC feature processing resources on the originating switch (OVFL).

\( p \) = Number of AR feature access attempts that resulted in LTD being returned to the end user.

\( q \) = Number of AR feature access attempts that resulted in STD being returned to the end user.

\( r \) = Number of AR feature accesses that resulted in TO of the feature before ringback could be given to the end user.

\( s \) = Number of times that busy announcement resulted after AR ringback was given (BYRB).

\( t \) = Number of successful accesses of the customer originated trace (COT) feature ACS.

\( u \) = Number of times that the calling DN was unavailable (UNAV).

\( v \) = Number of times that the COT feature was denied (DENIED).

\( w \) = Number of times that customers dialed a code to access or cancel the privacy feature (PVACT).

\( x \) = Number of times that customers dialed an access code to activate the calling number display (CND) feature (CNDACT).

\( y \) = Number of times that customers dialed an access code to deactivate the CND feature (CNDDACT).

\( z \) = Number of times the selective call forwarding (SCF) access code was dialed or SCF integrated services digital network (ISDN) feature button was pressed.

\( a^1 \) = Number of attempts to provide SCF.

\( b^1 \) = Number of times the selective call acceptance (SCA) access code was dialed or SCA ISDN feature button was pressed.
c\textsuperscript{1} = Number of successful matches between calling DN and customer DN SCA list while SCA was active.

d\textsuperscript{1} = Number of calls refused for which an announcement was provided because of SCA.

e\textsuperscript{1} = Number of calls rerouted to forward-to-DNs because of SCA.

f\textsuperscript{1} = Number of times the computer access restriction (CAR) access code was dialed or CAR ISDN feature button was pressed.

g\textsuperscript{1} = Number of successful matches between calling DN and customer DN CAR list while CAR was active.

h\textsuperscript{1} = Number of calls refused for which an announcement was provided because of CAR.

i\textsuperscript{1} = Number of calls rerouted to forward-to-DNs because of CAR.

j\textsuperscript{1} = Number of times the selective call rejection (SCR) access code was dialed or SCR ISDN feature button was pressed.

k\textsuperscript{1} = Number of successful matches between calling DN and customer DN SCR list while SCR was active.

l\textsuperscript{1} = Number of times the selective distinctive alert (SDA) access code was dialed or SDA ISDN feature button was pressed.

m\textsuperscript{1} = Number of attempts to provide distinctive ringing or distinctive call waiting due to SDA.

n\textsuperscript{1} = Number of times the name/number privacy (NNP) access code was dialed for the analog calling name (CNAM) delivery feature.

o\textsuperscript{1} = Number of calls for which a complete calling DN was transmitted to the customer premises equipment (CPE).

p\textsuperscript{1} = Number of messages transmitted to bulk calling line identification (BCLID) customers' CPE containing the character "P", indicating that the calling party had invoked the privacy feature.

q\textsuperscript{1} = Number of messages transmitted to BCLID customers' CPE containing the character "O", indicating that the calling DN could not be determined.

r\textsuperscript{1} = Number of messages lost (not transmitted to the BCLID customer's application processor) because of data channel overload.

s\textsuperscript{1} = Number of times the CNAM name privacy (NAP) access code was dialed.

t\textsuperscript{1} = Number of times the CNAM name/number display allowed (NNDA) access code was dialed.

u\textsuperscript{1} = Number of CNAM transaction capabilities application part (TCAP) queries that timed out while the switch was waiting for a response.

v\textsuperscript{1} = Number of CNAM TCAP queries sent from the switch into the common channel signaling (CCS) network.

w\textsuperscript{1} = Number of AC access attempts that were blocked because they tried to terminate to a private number.
x¹ = Number of successful invocations to set privacy of calling name (PCN) name presentation status to allowed.

y¹ = Number of successful invocations to set PCN name presentation status to restricted.

z¹ = Number of PCN denials.

4. ACTION TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30, VLD

The validity for the administrative module applies to this section.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 76: local area signaling services (LASS) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.
3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of automatic callback (AC) feature access customer requests (ACS).
c = Number of AC feature cancel (CANC) customer requests.
d = Number of AC feature accesses that resulted in immediate call setup (ICS).
e = AC camp-on. Number of AC feature accesses that resulted in camp-on (CAMPON) to the called directory number (DN).
f = Unsuccessful AC access attempts. Number of times an AC feature access attempt was unsuccessful due to lack of AC feature processing resources on the originating switch.
g = AC long-term denial (LTD). Number of AC feature access attempts that resulted in LTD being returned to the end user.
h = AC short-term denial (STD). Number of AC feature access attempts that resulted in STD being returned to the end user.
i = AC time-out (TO). Number of AC feature accesses that resulted in TO of the feature before ringback can be given to the end user.
j = AC busy announcement results. Number of times that busy announcement resulted after AC ringback was given.
k = Automatic recall (AR) ACS. Number of customer requests to access the ACS feature.
l = AR cancel. Number of customer requests to cancel the AR feature.
m = AR ICS. Number of AR feature accesses that result in ICS.
n = AR camp-on. Number of AR feature accesses that resulted in camp-on to the called DN.
o = Unsuccessful AR access attempts. Number of times an AR feature access attempt was unsuccessful due to lack of AC feature processing resources on the originating switch.
p = AR LTD. Number of AR feature access attempts that resulted in LTD being returned to the end user.
q = AR STD. Number of AR feature access attempts that resulted in STD being returned to the end user.
r = AR TO Number of AR feature accesses that resulted in TO of the feature before ringback could be given to the end user.
s = AR BYRB. Number of times that busy announcement resulted after AR ringback was given.
t = Customer originated trace (COT) ACS. Number of successful activations of the COT feature.
u = DN unavailable. Number of times that the calling DN was unavailable for the COT feature. This is
normally caused by lack of common channel signaling 7 (CCS7) resources between the originating and terminating office or the trace message buffer being full (capacity 60 messages).

v = COT denied. Number of times the use of the COT feature is denied when activation is attempted by the customer. This is usually due to switch translation.

w = Privacy feature activations. Number of times that customers dialed a code to access or cancel the per call privacy feature.

x = Activate the calling number delivery (CND) feature. Number of times that customers dialed an access code to activate the CND feature.

y = Deactivate the CND feature. Number of times that customers dialed an access code to deactivate the CND feature.

z = Number of times the selective call forwarding (SCF) access code was dialed or SCF integrated services digital network (ISDN) feature button was pressed.

a = Number of attempts to provide SCF.

b = Number of times the selective call acceptance (SCA) access code was dialed or SCA ISDN feature button was pressed.

c = Number of successful matches between calling DN and customer DN SCA list while SCA was active.

d = Number of calls refused for which an announcement was provided because of SCA.

e = Number of calls rerouted to forward-to-DNs because of SCA.

f = Number of times the computer access restriction (CAR) access code was dialed or CAR ISDN feature button was pressed.

g = Number of successful matches between calling DN and customer DN CAR list while CAR was active.

h = Number of calls refused for which an announcement was provided because of CAR.

i = Number of calls rerouted to forward-to-DNs because of CAR.

j = Number of times the selective call rejection (SCR) access code was dialed or SCR ISDN feature button was pressed.

k = Number of successful matches between calling DN and customer DN SCR list while SCR was active.

l = Number of times the selective distinctive alert (SDA) access code was dialed or SDA ISDN feature button was pressed.

m = Number of attempts to provide distinctive ringing or distinctive call waiting due to SDA.

n = Number of times the name/number privacy (NNP) access code was dialed for the analog calling name (CNAM) delivery feature.

o = Number of calls for which a complete calling DN was transmitted to the customer premises equipment (CPE).
\[ p^1 = \text{Number of messages transmitted to bulk calling line identification (BCLID) customers' CPE containing the character "P", indicating that the calling party had invoked the privacy feature.} \]

\[ q^1 = \text{Number of messages transmitted to BCLID customers' CPE containing the character "O", indicating that the calling DN could not be determined.} \]

\[ r^1 = \text{Number of messages lost (not transmitted to the BCLID customer's application processor) because of data channel overload.} \]

\[ s^1 = \text{Number of times the CNAM name privacy (NAP) access code was dialed.} \]

\[ t^1 = \text{Number of times the CNAM name/number display allowed (NNDN) access code was dialed.} \]

\[ u^1 = \text{Number of CNAM transaction capabilities application part (TCAP) queries that timed out while the switch was waiting for a response.} \]

\[ v^1 = \text{Number of CNAM TCAP queries sent from the switch into the common channel signaling (CCS) network.} \]

\[ w^1 = \text{Number of AC access attempts that were blocked because they tried to terminate to a private number.} \]

\[ x^1 = \text{Number of successful invocations to set privacy of calling name (PCN) presentation status to allowed.} \]

\[ y^1 = \text{Number of successful invocations to set PCN presentation status to restricted.} \]

\[ z^1 = \text{Number of PCN denials.} \]

\[ a^2 = \text{Number of times the unidentified call rejection (UCR) activation code is dialed.} \]

\[ b^2 = \text{Number of times the UCR deactivation code is dialed.} \]

\[ c^2 = \text{Number of unsuccessful attempts to activate UCR.} \]

\[ d^2 = \text{Number of unsuccessful attempts to deactivate UCR.} \]

\[ e^2 = \text{Number of times the UCR rejection takes place.} \]

<tr>
<td>.</td>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 145: line group controller (LGC) or line group pack measurements of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Integrated services line unit (ISLU) number.
d = Line group (LG) (controller or pack) number.
e = Line group control (LGC) traffic usage. Traffic usage reported in hundred-call-seconds (CCS). This count is only generated after the LG has been allowed for collection and is in use (count 1).

For each LG with U- or T-cards, the traffic usage measurement will be generated for:
- Circuit-switched calls (voice or data).
- On-demand B-channel (packet-switched) calls.
- Dedicated or nailed-up B-channels.
- Terminal maintenance.

The usage measurement for U- or T-cards will not include:
- Diagnostic maintenance usage.
- D-channel usage.
- Control time slot usage.

For each LG with Z-cards, the usage measurement will include:
- Voice.
- Voice graded data service.
- Terminal maintenance.

The usage measurement for Z-cards will not include:
- Diagnostic maintenance usage.

The maximum circuit-switched value for an LGC is dependent on the number of nailed-up time slots (permanent packet B channel) assigned which could easily vary from one LGC to another. A permanent packet B channel nailup will use up a dedicated time slot on the line interface data bus thereby reducing the number of time slots available for circuit-switched calls.

Generation of the usage count does not begin until the section is allowed for collection using the ALW:TRFC30 input message. Therefore, when comparing usage of one LG to another LG, the following must be considered (the differential may be especially significant if comparing weekly data):

- Length of time a study has been allowed for collection. If one study is allowed for collection before another study is allowed, the LGs on the RISLU/ISLUs on the first study will appear to have higher usage.
- Length of time an (RISLU/ISLU has been a member of a study. If a RISLU/ISLU is added to a study (recent change view 13.6 update) and the study is already allowed for collection, the LGs on the RISLU/ISLU added by the update will appear to have lower usage than the LGs on the (RISLU/ISLUs on the study before the update.
- Length of time LGs have been operational. If a study is allowed for collection and LGs on a RISLU/ISLU on the study are updated to operational and then the study is reallocated for collection, the recently operational LGs will appear to have lower usage than the LGs which were on the study before the second allow input message was entered.

### 3.2 Parameters

<table>

</tbody>
</table>

The ISLU/RISLU to be studied must be populated on view 13.6. Refer to 235-118-245, Numerical Index, for the menu mode recent change documents. These documents provide recent change views and a description of the fields on the view. There are 5 study groups (1 through 5) and each study group can have up to 100 operational ISLU/RISLU members. After the study is set up on view 13.6, it must be activated for collection using the ALW:TRFC30 input message. Count generation and collection will begin on all operational LGCs on the ISLUs/RISLUs which belong to the specified study groups.

The LUs and ISLUs/RISLUs cannot be mixed on the same study group.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 145: line group controller (LGC) or line group pack measurements of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Integrated services line unit (ISLU) number.
d = Line group (LG) (controller or pack) number.
e = Line group control (LGC) traffic usage. Traffic usage reported in hundred-call-seconds (CCS). This count is only generated after the LG has been allowed for collection and is in use (count 1).

For each LG with U- or T-cards, the traffic usage measurement will be generated for:
- Circuit-switched calls (voice or data).
- On-demand B-channel (packet-switched) calls.
- Dedicated or nailed-up B-channels.
- Terminal maintenance.

The usage measurement for U- or T-cards will not include:
- Diagnostic maintenance usage.
- D-channel usage.
- Control time slot usage.

For each LG with Z-cards, the usage measurement will include:
- Voice.
- Voice graded data service.
- Terminal maintenance.

The usage measurement for Z-cards will not include:
- Diagnostic maintenance usage.

The maximum circuit-switched value for an LGC is dependent on the number of nailed-up time slots (permanent packet B channel) assigned which could easily vary from one LGC to another. A permanent packet B channel nailup will use up a dedicated time slot on the line interface data bus thereby reducing the number of time slots available for circuit-switched calls.

Generation of the usage count does not begin until the section is allowed for collection using the ALW:TRFC30 input message. Therefore, when comparing usage of one LG to another LG, the following must be considered (the differential may be especially significant if comparing weekly data):

- Length of time a study has been allowed for collection. If one study is allowed for collection before another study is allowed, the LGs on the RISLU/ISLUs on the first study will appear to have higher usage.

- Length of time an (RISLU/ISLU has been a member of a study. If a RISLU/ISLU is added to a study (recent change view 13.6 update) and the study is already allowed for collection, the LGs on the RISLU/ISLU added by the update will appear to have lower usage than the LGs on the (RISLU/ISLUs on the study before the update.

- Length of time LGs have been operational. If a study is allowed for collection and LGs on a RISLU/ISLU on the study are updated to operational and then the study is reallocated for collection, the recently operational LGs will appear to have lower usage than the LGs which were on the study before the second allow input message was entered.

\[ f \] = Number of originating calls are blocked on group interface data bus (GIDB)/line interface data bus (LIDB). This blocking may take place for originating ISDN BRI or POTS call on given ISLU/ISLU2 line group controller.

\[ g \] = Number of terminating calls are blocked on GIDB/LIDB. This blocking may take place for terminating ISDN BRI or POTS call on given ISLU/ISLU2 line group controller.

\[ h \] = Number of originating call attempts in ISLU or ISLU2. This attempt may take place for originating ISDN BRI or POTS call on given ISLU/ISLU2 line group controller.

\[ i \] = Number of attempts to terminate the call in ISLU or ISLU2. This may be an attempt to termination of ISDN BRI or POTS call on given line group controller.

</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 90: line counts of the 30-minute traffic report.

Only lines with non-zero counts will be printed on the ROP while all records are sent to the data collection system. Automatic line installation tests (LITs) and lines that are being manually tested will not score an attempt but will score usage.

When 20 concentrators are allowed for collection on the RC/V view 13.4, EADAS allocates 7680 bytes [32 (lines per conc) x by 20 (concs) x 12 (bytes)]. Data is collected on the SMs. At the end of the interval data are sent to the AM and put into EADAS. The EADAS buffer is cleaned with zeroes before data is sent from the SMs. It is possible some data will not come to EADAS. Messages may be lost, there is not enough time to send all messages, or there is no data to send because concentrators are not equipped with all lines. In these cases EADAS sends zeroes to OS support system.

It is recommended that this report be directed to a mechanized data collection system. Because of the amount of data collected for output, it is not recommended that this report be directed toward the ROP. The study on the individual lines and the study on the half grids cannot simultaneously study the same line.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Line equipment number (LEN) type.
d = Line unit (LU) number.
e = Concentrator (CONC) number.

</tbody>
</table>

Parameter meanings:

f = Line number (switch and level).

g = Total attempts for originating and terminating lines. Number of times an origination or termination is attempted on a line being studied. Only originations or terminations which require a concentrator path are pegged. If originations are attempted, but blocked and not successful during a report period, the blocked and attempted counts are each incremented by one.

h = Blocked attempts for terminating and originating lines. Number of times blockage occurs on a line being studied. This blockage represents the number of times LU paths were unavailable.

i = Total usage. Traffic usage- pegged once every 100-second interval that line is in use.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 121: leased network (LN) action control point (ACP) of the 30-minute traffic report. This section of the 30-minute traffic report is primarily used for toll switch applications.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

For the variables with "" refer to the ACTION TO BE TAKEN section of this manual page.

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of originating (ORIG) LN/automatic number identification (ANI) services attempts.
c = Number of LN/ANI queries (QUERY) to data base.
d = Number of completed LN/ANI services calls successfully outpulsed (OPLS).
e = Number of failures to obtain ANI on a centralized automatic message accounting (CAMA) trunk.
\[ f = \text{Number of call processing failures - transaction inactive (INATRN)}. \]
\[ g = \text{Number of call processing failures - transaction active (ACTTRN)}. \]
\[ h = \text{Number of transaction capability (TC) signaling failures blocked (BLKD) at switch}. \]
\[ i = \text{Number of TC signaling failures timeouts (TO) at switch}. \]
\[ j = \text{Number of TC signaling failures blocked in common channel signaling (CCS) (CCSBLKD) network}. \]
\[ k = \text{Number of invalid TC message/components (INVMSG)}. \]
\[ l = \text{Number of invalid TC message sequences (INVSEQ) received}}. \]
\[ m = \text{Number of TC return errors (ERROR) received}. \]
\[ n = \text{Number of TC rejects (REJECT) received}. \]
\[ o = \text{Number of TC aborts (ABORT) received}. \]
\[ p = \text{Number of TC terminates (TERM) due to failure}. \]
\[ q = \text{Number of abandons after initial query, before reply (NOREPLY)}. \]
\[ r = \text{Number of abandons after outpulsing before answer (NOANS)}. \]

### 4. ACTIONS TO BE TAKEN
No action is required.

The set of variables with "*" above represents the measurements collected in the direct link node (DLN). If the office is equipped with the DLN and the set of variables with "*" are zero, this suggests that the DLN failed to report these variables and these variables are invalid for the reporting period.

If desired, the validity of this data be be checked by requesting the validity section of the 30-minute traffic report using the input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

The validity for the administrative module (AM) applies to this section.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 11: line unit (LU) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

Variables ‘h’, ‘i’, and ‘j’ are related to the A/B Link & No Path Access Delay and Blockage feature. This is a secured feature. Refer to the SECURED/PROPRIETARY FEATURES section of the INTRODUCTION for further information.

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Line unit number.
d = LU terminating blocking. Number of times a final attempt to terminate a call was unsuccessful because all paths were in a busy state.
e = LU terminating attempts. Number of attempts to terminate a call to an LU.
f = LU total usage. Terminating total usage, reported in hundred-call-seconds (CCS).
g = LU maintenance usage. Maintenance usage, reported in CCS.
h = No idle A-link. Count of both originating and terminating calls with no idle A-link (A-link is blocked or not available). Default value is 0. This is a secured feature (99-5E-3004). Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.
i = No idle B-link. Count of both originating and terminating calls with no idle B-link (B-link is blocked or not available). Default value is 0. This is a secured feature (99-5E-3004). Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with the input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information. If the data is checked, check the validity of the corresponding SM.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or schedule output of section 181: mobile application part (MAP) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = A MAP entity.
c = Number of MAP request messages sent by a given wireless entity. It's defined to be a count of all invoke components sent.
d = Number of MAP request messages sent successfully by a given wireless entity. It's defined to be a count of all invoke components sent by the entity which resulted in receiving an ITU-T TCAP continue or end message.
e = Number of MAP failure messages received by a given wireless entity. It's defined to be a count of all return error components, reject components or abort messages received as a result of MAP request messages sent.
f = Number of MAP failures due to timeout for a given wireless entity. It's pegged, upon expiration of the timer associated with the MAP message. Timeouts for invokes for which no response is expected are not included here, since these will always result in a timeout (for example, ProcessAccessSignalling or LocationReg).

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 192: multiswitch business group (MBG) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = MBG number.
c = Number of termination attempts to a MBG from the public network.
d = Originating call attempts. Number of origination from the members of a MBG when call is directed into the public network. This count does not include MBG individualized dialing plan (IDP) dialed calls.
e = Number of calls routed to a special intercept announcement (SIA) treatment.
g = Number of MBG calls blocked because:
   - Reception of ISUP7 REL message with a cause code value of 54 for outgoing MBG calls.
   - Trunk originated MBG calls include:
     -- TGSR feature originating access restrictions screening.
     -- TGSR feature terminating access restrictions screening.

</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 74: integrated services digital network (ISDN) business and residential customer services (BRCS) message service customer (MGSC) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Customer number. The customer identifier is printed in its decimal form and not by its group name. To activate this section, use RC/V view 24.11 to enter the group name for which measurements are required. Then, at the Switch Control Center (SCC), allow this section using the appropriate form of the ALW:TRFC30 input message. The studied group is cross referenced in the communications module (CM) relation FACNAME to determine the customer identifier that is printed in this section. The decimal number (CUSTID) that correlates to the studied group can be found in the CM relation FACNAME. The number is in a hexadecimal format that has to be converted to decimal.

In CM ODD relation FACNAME, the group name can be found under the attribute NAME. The corresponding hexadecimal form is under attribute FACID. Take the hexadecimal number; convert it to decimal, and use this number to study the group measurements on the ROP, traffic channel, or Data Collection System.

c = Requests for MGS user features. Number of requests for MGS user features including message waiting indicator deactivation, leave word calling, message retrieval display (MRD), printout on demand, and auto call.

d = MRD message segments successfully obtained. Number of successfully obtained message segments from an attached processor during message retrieval display (MRD) sessions.

e = MGS automatic cll requests. Number of attempts to initiate a circuit-switched voice call using the
automatic call capability. An automatic call request does not terminate an MRD session.

\[ f \] = MGS unsuccessful automatic call requests. Number of automatic call requests that failed due to insufficient switch resources of any type.

### 3.2 Parameters

<table>
<thead>
<tr>
<th>Data collection unit</th>
<th>MGS customer</th>
</tr>
</thead>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 185: message handler occupancy for each message handler per each switching module (SM)-2000 of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = SM-2000 number.
c = Message handler number (MH). The integer number associated with a specific message handler on a particular SM-2000.
d = The total number of messages handled by a specific MH per a SM-2000.
e = The base level loop cycles (divided by 1000) executed by a specific MH on a particular SM-2000.
f = Pipe occupancy. This percentage value is calculated by multiplying the total number of bytes received/transmitted by 100 and dividing the result by the max. number/transmitted in 30 minutes. For MH32 this count is N/A and will be displayed as such.
g = Number of collisions per MHEIB pipe. For MH32 this count is N/A and will be displayed as such.
h = The maximum number of message bytes processed per MHEIB over the 6 second interval. For MH32 this count is N/A and will be displayed as such.
i = The number of general messages received by the MH.
j = The number of general messages that are sent by the local SMP.
4. ACTIONS TO BE TAKEN

None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

Check the validity of the corresponding SM.

5. ALARMS

None.

2. **REASON FOR OUTPUT**

To respond to a request for either an immediate or scheduled output of section 185: message handler occupancy for each message handler per each switching module (SM)-2000 of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. **VARIABLE FIELD DEFINITIONS**

3.1 **Variables**

   a = Time when the report was prepared, in the form hours:minutes:seconds.

   b = SM-2000 number.

   c = Message handler (MH) number. The integer number associated with a specific message handler on a particular SM-2000.

   d = The total number of messages handled by a specific MH per SM-2000.

   e = The base level loop cycles (divided by 1000) executed by a specific MH on a particular SM-2000.

   f = Pipe occupancy. This percentage value is calculated by multiplying the total number of bytes received/transmitted by 100 and dividing the result by the max. number/transmitted in 30 minutes. For MH32 this count is N/A and will be displayed as such.

   g = Number of collisions per message handler ethernet interface boards (MHEIB) pipe. For MH32 this count is N/A and will be displayed as such.
h = The maximum number of message bytes processed per MHEIB over the 6 second interval. For MH32 this count is N/A and will be displayed as such.

i = Non-CCS messages received by the MH. This peg count is the number of OSDS messages received from the AM, CMP, DLN, or another SM on MH0. It is the count of messages received from peripheral units on MH1/2.

j = Non-CCS messages sent from the MH. This peg count is the number of OSDS messages sent to the AM, CMP, DLN, or another SM on MH0. It is the count of messages sent to peripheral units on MH1/2.

k = CCS messages received by MH0 (direct MH functionality). This peg count is the number of CCS messages that are received by the MH0 from a quad link processor protocol handler (QPH) destined for the local SMP.

l = CCS messages sent from MH0 (direct MH functionality). This peg count is the number of CCS messages that are sent from the MH0 to a QPH forwarded from the local SMP.

m = CCS messages received by MH0 (transfer MH functionality). This peg count is the number of CCS messages received by MH0 from a QPH, which are destined for another non-global SM (NGSM) (not the local SMP).

n = CCS messages sent from MH0 (transfer MH functionality). This peg count is the number of CCS messages sent from MH0 to a QPH, which are relayed for another NGSM (not the local SMP).

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 177: quad-link packet switching (QLPS) message handler (MH) link occupancy of the 30-minute traffic report. This section is specifically for SM-2000.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Validity of the data.
   0 = Valid.
   1 = Invalid.
d = QLPS network 0 - received in MH. Average occupancy of pipe between the MH and a network 0 QLPS in the receiving direction (QLPS to MH).
e = QLPS network 1 - received in MH. Average occupancy of pipe between the MH and a network 1 QLPS in the receiving direction (QLPS to MH).
f = QLPS network - transmitted from MH. Average occupancy of pipe between the MH and a network 0 QLPS in the sending direction (MH to QLPS).
g = QLPS network 1 - transmitted from MH. Average occupancy of pipe between the MH and a network 1 QLPS in the sending direction (MH to QLPS).
h = QLPS network 0 - received in MH. 95th percentile occupancy of pipe between the MH and a network 0 QLPS in the receiving direction (QLPS to MH).
i = QLPS network 1 - received in MH. 95th percentile occupancy of pipe between the MH and a network 1 QLPS in the receiving direction (QLPS to MH).

j = QLPS network 0 - transmitted from MH. 95th percentile occupancy of pipe between the MH and a network 0 QLPS in the sending direction (MH to QLPS).

k = QLPS network 1 - transmitted from MH. 95th percentile occupancy of pipe between the MH and a network 1 QLPS in the sending direction (MH to QLPS).

<td>.</td>
<td>.</td>
<td>.</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 34 of the 30-minute traffic report. Up to five multi-line hunt groups (MLHGs) may be reported in a single message. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- **a** = Time, in form hours:minutes:seconds.
- **b** = Multi-line hunt group identifier.
- **c** = MLHG directory number termination attempts. Number of terminating attempts to the main DN of the MLHG. This number is made upon system recognition of the destination. For modem pool applications, this count includes the number of terminating attempts to a modem pool access DN (one-stage dialing). These are inbound calls which originate on an analog modem and terminate to an ISDN user.
- **d** = MLHG termination attempts. Number of terminating attempts to an individual DN of the MLHG. This count does not include attempts to the main DN of the hunt group. This count is made upon system recognition of the terminating party.
- **e** = MLHG usage. Usage (100-second scan) of a hunt group. MLHG usage scores for MLH members that are busy, whether the call was originated by a member or a member is terminated to. This count will reflect usage even when integrated services digital network (ISDN) MLHG members are unplugged.
- **f** = MLHG overflows. Number of times a call could not terminate to the hunt group because all active members (position make-busy keys are considered inactive) in the hunt group were busy. For a regular MLHG, this overflow will only peg when the main DN of the MLHG was dialed. A regular MLHG overflow will score for a call to the main DN and TERM DN was dialed.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 18: module message processors (MMP) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Message switch controller (MSC) side.

c = MMP identifier.

d = Validity of the MMP. Valid value(s):
   0 = Valid.
   1 = Invalid.

e = Number of base level cycles (BLCYCs), reported in thousands.

f = Number of messages processed by an MMP.

g = MMP receiver-not-ready messages. Number of messages not sent from a switching module to an MMP. This is due to a full buffer in the MMP but does not constitute a lost call. The message will be transmitted as soon as the MMP buffer clears to a point where the message can be accepted. The message switch may also be in an overload condition.

h = Number of messages sent to message switch control unit (MSCU).

i = Number of messages received from MSCU.

3.2 Parameters
Data collection unit | MMP
---|---
Maximum collection units | 48
Precision | Double
Length | Variable
Activation | Refer to the OP:TRFC30 input message for additional information.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 83: miscellaneous persm measurements of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Automatic message accounting (AMA) billing memory consumed in kilobytes.
d = Number of incoming ISUP7 calls processed after discarding access transport parameter (ATP)/user to user information/unimplemented parameters (UUI) data due to lack of internal resources.
e = Peak network-side timeslot (NTS) occupancy of all 100-second periods during last 30-minutes, in percent.
f = This count, kept on a per-SM basis, is pegged whenever an send to resource external [STR(E)] message contained a request for dial pulse to touch tone conversion, but a universal tone detector (UTD) was unavailable because the per-SM UTD maximum would be exceeded.
g = Number of the Real Time Call Detail (RTCD) records lost because of Real Time Billing Memory (RTBM) overflow per Originating Switching Module (OSM).
h = Total number of the Real Time Call Detail (RTCD) records generated per Originating Switching Module (OSM).
i = Total amount of the Real Time Call Detail (RTCD) data it generates in kilobytes.

<tr>
<td>.</td>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
<tr>
<td>.</td>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 149: time slot measurements (MTSM) of the 30-minute traffic report.

Refer to the APP: MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Originating switching module (SM) number. Refer to the APP: RANGES appendix in the Appendixes section of the Output Messages manual.

c = Terminating SM number. Refer to the APP: RANGES appendix in the Appendixes section of the Output Messages manual.

d = Number of network time slot attempts.

This is a number of times there is the attempt to allocate inter-SM network time slot by given originating SM, originating the call to the terminating SM, regardless if this attempt was successful or not. The attempt for wide-band call, trying to use more than one time slot for the call, is counted as one attempt. This counter is pegged for originating SM only.

If the originating SM is host SM with remote SM(s) connected to it, also the calls originated by remote SMs are contributing to the number of attempts made by Host SM.

If the call is terminated on remote SM, connected to Host SM, this host SM is the terminating SM.

e = Number of network time slot mismatches.
This is the number of times there is an attempt to allocate inter-SM network time slot by given originating SM, originating the call to the terminating SM, but it is not successful due to fact that it is not possible to find the same time slot in NCT links leading from SM originating the call to CM and from CM to terminating SM. This counter is pegged for originating SM only.

If the originating SM is host SM with remote SM(s) connected to it, also the calls originated by remote SMs are contributing to the number of attempts made by host SM.

If the call is terminated on remote SM, connected to host SM, this host SM is the terminating SM.

</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To report that some elements of the specified section (refer to variables ‘a’ and ‘b’) of the 30-minute traffic report had no data collected. For sections that require group identifiers, this message will print for both the requested and the scheduled output of the specified section (b). The APP:TRFC-SECTION input appendix indicates which sections require identifiers.

When allowing a section of the 30-minute traffic report (TRFC30) for reporting at the ROP some sections require identifiers (such as, groups, units) which effectively select what is printed at the ROP. This message will follow the outputting of the data that was found for those sections.

Identifiers are also required when allowing some TRFC30 sections for collection; however, allowing the same sections for ROP requires no identifiers. For those sections that require an identifier when allowing for collection but none when allowing for ROP, this message will replace the OP:TRFC30 output message if all the counts for the specified section are zeros.

Some sections require single identifiers (such as, trunk group number) while other sections require multiple identifiers (such as, switching module (SM), protocol handler and shelf numbers).

Each line of output represents one element (such as, unit or group) identified by one or multiple identifiers.

3. VARIABLE FIELD DEFINITIONS

a = Section number. Refer to APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

b = Section name. Refer to APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

c-f = Element identifier. Refer to APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

Format 1 is to report that some elements of the specified section (refer to variables 'a' and 'b') of the 30-minute traffic report had no data collected. Format 2 is for OP TRFC 30, ATMQPS. Format 3 is for OP TRFC 30, ATMLNK. For sections that require group identifiers, this message will print for both the requested and the scheduled output of the specified section (b). The APP:TRFC-SECTION input appendix indicates which sections require identifiers.

When allowing a section of the 30-minute traffic report (TRFC30) for reporting at the ROP some sections require identifiers (such as, groups, units) which effectively select what is printed at the ROP. This message will follow the outputting of the data that was found for those sections.

Identifiers are also required when allowing some TRFC30 sections for collection; however, allowing the same
sections for ROP requires no identifiers. For those sections that require an identifier when allowing for collection but none when allowing for ROP, this message will replace the OP:TRFC30 output message if all the counts for the specified section are zeros.

Some sections require single identifiers (such as, trunk group number) while other sections require multiple identifiers (such as, switching module (SM), protocol handler and shelf numbers).

Each line of output represents one element (such as, unit or group) identified by one or multiple identifiers.

3. VARIABLE FIELD DEFINITIONS

a = Section number. Refer to APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

b = Section name. Refer to APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

g = Near sub network.

h = Near community address.

i = Near Link.

j = Far sub network.

k = Far community address.

l = Connection priority.

m = ATM connection PM direction. Valid value(s):

I = Incoming.

O = Outgoing.

n = Global switching module (1 - 192).

o = PSU number.

p = ATM link number.

q = ATM link type. Valid value(s):

B = ATM backhaul link.

P = ATM PSU link using PHA2.

2. REASON FOR OUTPUT

Format 1 is to report that some elements of the specified section (refer to variables 'a' and 'b') of the 30-minute traffic report had no data collected. Format 2 is for OP TRFC 30, ATMQOSPS. Format 3 is for OP TRFC 30, ATMLNK. For sections that require group identifiers, this message will print for both the requested and the scheduled output of the specified section (b). The APP:TRFC-SECTION input appendix indicates which sections require identifiers.

When allowing a section of the 30-minute traffic report (TRFC30) for reporting at the ROP some sections require identifiers (such as, groups, units) which effectively select what is printed at the ROP. This message will follow the outputting of the data that was found for those sections.

Identifiers are also required when allowing some TRFC30 sections for collection; however, allowing the same
sections for ROP requires no identifiers. For those sections that require an identifier when allowing for collection but
none when allowing for ROP, this message will replace the OP:TRFC30 output message if all the counts for the
specified section are zeros.

Some sections require single identifiers (such as, trunk group number) while other sections require multiple
identifiers (such as, switching module (SM), protocol handler and shelf numbers).

Each line of output represents one element (such as, unit or group) identified by one or multiple identifiers.

3. VARIABLE FIELD DEFINITIONS

a = Section number. Refer to APP:TRFC-SECTION appendix in the Appendixes section of the Output
    Messages manual.

b = Section name. Refer to APP:TRFC-SECTION appendix in the Appendixes section of the Output
    Messages manual.

c-f = Element identifier. Refer to APP:TRFC-SECTION appendix in the Appendixes section of the
    Output Messages manual.

g = Near sub network.

h = Near community address.

i = Near Link.

j = Far sub network.

k = Far community address.

l = Application type. Valid value(s):
   H = High priority.
   L = Low priority.

m = ATM connection PM direction. Valid value(s):
   I = Incoming.
   O = Outgoing.

n = Global switching module (1 - 192).

o = PSU number.

p = ATM link number.

q = ATM link type. Valid value(s):
   B = ATM backhaul link.
   P = ATM PSU link using PHA2.

```

### 2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 241: number portability (NP) of the 30-minute traffic report.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Number of calls encountering a number portability (NP) trigger that result in an SCP query.
- **c** = Number of NP queries that failed.
- **d** = Number of NP query responses that contained an local routing number (LRN).
- **e** = Number of calls encountering an ISUP release message containing a cause value of ANSI® 26.
- **f** = Number of NP calls terminating to an unallocated number. Query response did not contain an LRN.
- **g** = Number of NP calls terminating to an unallocated number. Query response did contain an LRN.
- **h** = Number of calls for which a QOR is initiated and an Initial Address Message (IAM) is sent.
- **i** = Number of calls for which a QOR is initiated and an IAM is sent, which result in an LNP query being attempted.
- **j** = Number of calls for which a QOR is initiated and an IAM is sent, for which an Address Complete Message (ACM) or Answer Message (ANM) is received (e.g., alerting of far party, or indication that ISUP not used all the way, or indication of user network interaction.

### 4. ACTION TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report.

</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 91: number services (NS) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

For the variables with ‘*’, refer to the ACTION TO BE TAKEN section of this manual page.

- **a**: Time of report preparation, in the form hours:minutes:seconds.
- **c**: NS originating calls. Number of number services calls originating at the switch.
- **d**: NS received calls. Number of NS calls received at an access tandem/service switching point (AT/SSP) from other offices.
- **e**: * NS calls (800 only). Total number of NS service calls (800 only) handled by the switch, including both those received from other offices and those originating at the switch.
- **f**: NS query sent (800 only). Total number of NS 800 service queries sent from the switch to the common channel signaling network.
- **g**: Second stage failures. Number of failures occurring when the first stage of signaling from an equal access end office indicates an SSP call; however, either no second stage is received or the second stage is incomplete.
- **h**: Call processing failures before initial query. Number of NS call terminations due to call processing failure before sending the query to the service control point (SCP).
- **i**: Call processing failures after initial query. Number of NS call terminations due to call processing
failure after sending the initial query to the SCP.

\( j \) = SSP time-outs. Number of SSP time-outs while waiting for a reply from the SCP.

\( k \) = * NM control blocked calls. Number of NS calls blocked by automatic code controls in the AM/direct link mode, by network management (NM) manual code control, or Service Management System (SMS) initiated controls/automatic call gap (ACG) on an NS number.

\( l \) = * Number of invalid command messages from service control point (SCP).

\( m \) = Abandons before SSP seizure. Number of NS calls for which on-hook signals are received from the calling party before the SSP seizes an outgoing trunk.

\( n \) = Abandons after SSP seizure. Number of NS calls for which an on-hook is received from the calling party after the SSP seizes an outgoing trunk, but before the call is answered.

\( o \) = Normal response messages. Number of normal response messages received from the SCP in response to the NS query sent by the SSP.

\( p \) = Play announcement messages. Number of play announcement messages received from the SCP in response to the NS query sent by the SSP.

\( q \) = Other responses. Number of other responses (not normal or play announcement) received from the SCP in response to the NS query sent by the SSP.

### 4. ACTIONS TO BE TAKEN

None.

The set of variables with '*' above represents the measurements collected in the direct link node (DLN). If the office is equipped with the DLN and the set of variables with '*' are zero, this suggests that the DLN failed to report these
variables and these variables are invalid for the report period. The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

The validity for the administrative module applies to this section.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 91: number services (NS) of the 30-minute traffic report.

NOTE: The output depends on OFID 1006. If OFID 1006 is switched off then the section 91 (NS) with single precision counters can be used. For OFID 1006 switched on the section 84 (NSN) with double precision counters can be used.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

NOTE: For the variables with "^", refer to the ACTION TO BE TAKEN section of this manual page.

a = Time of report preparation, in the form hours:minutes:seconds.

c = NS originating calls. Number of number services calls originating at the switch.

d = NS received calls. Number of NS calls received at an access tandem/service switching point (AT/SSP) from other offices.

e = * NS calls (800 only). Total number of NS 800 service calls handled by the switch, including both those received from other offices and those originating at the switch.

f = NS query sent (800 only). Total number of NS 800 service queries sent from the switch to the common channel signaling network.

g = Second stage failures. Number of failures occurring when the first stage of signaling from an equal access end office indicates an SSP call; however, either no second stage is received or the second stage is incomplete.
= Call processing failures before initial query. Number of NS call terminations due to call processing failure before sending the query to the service control point (SCP).

i = Call processing failures after initial query. Number of NS call terminations due to call processing failure after sending the initial query to the SCP.

j = SSP time-outs. Number of SSP time-outs while waiting for a reply from the SCP.

k = * NM control blocked calls. Number of NS calls blocked by automatic code controls in the AM/direct link mode, by network management (NM) manual code control, or Service Management System (SMS) initiated controls/automatic call gap (ACG) on an NS number.

l = * Number of invalid command messages from service control point (SCP).

m = Abandons before SSP seizure. Number of NS calls for which on-hook signals are received from the calling party before the SSP seizes an outgoing trunk.

n = Abandons after SSP seizure. Number of NS calls for which an on-hook is received from the calling party after the SSP seizes an outgoing trunk, but before the call is answered.

o = Normal response messages. Number of normal response messages received from the SCP in response to the NS query sent by the SSP.

p = Play announcement messages. Number of play announcement messages received from the SCP in response to the NS query sent by the SSP.

q = Other responses. Number of other responses (not normal or play announcement) received from the SCP in response to the NS query sent by the SSP.

i = Call processing failures after initial query. Number of NS call terminations due to call processing failure after sending the initial query to the SCP.

j = SSP time-outs. Number of SSP time-outs while waiting for a reply from the SCP.

k = * NM control blocked calls. Number of NS calls blocked by automatic code controls in the AM/direct link mode, by network management (NM) manual code control, or service management system (SMS) initiated controls/automatic call gap (ACG) on an NS number.

l = * Number of invalid command messages from service control point (SCP).

m = Abandons before SSP seizure. Number of NS calls for which on-hook signals are received from the calling party before the SSP seizes an outgoing trunk.

n = Abandons after SSP seizure. Number of NS calls for which an on-hook is received from the calling party after the SSP seizes an outgoing trunk, but before the call is answered.

o = Normal response messages. Number of normal response messages received from the SCP in response to the NS query sent by the SSP.

p = Play announcement messages. Number of play announcement messages received from the SCP in response to the NS query sent by the SSP.

q = Other responses. Number of other responses (not normal or play announcement) received from the SCP in response to the NS query sent by the SSP.

4. ACTIONS TO BE TAKEN

No action is required.
The set of variables with '*' above represents the measurements collected in the direct link node (DLN). If the office is equipped with the DLN and the set of variables with '*' are zero, this suggests that the DLN failed to report these variables and these variables are invalid for the report period.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

The validity for the administrative module applies to this section.

5. ALARMS

None.

.       .       .
.       .       .
.       .       .

2. REASON FOR OUTPUT

To respond to a request for either an immediate or a scheduled output of section 196: Operator Services Position System (OSPS) 800 Access (800A) measures of the 30-minute traffic report. This section collects and prints measurements for each label defined. This section corresponds to RC/V view 27.71.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Measurement label.
c = Number of call attempts for 800 access calls assigned to the index in the 1+800 service designation table.
d = Number of messages (billable calls) for 800 access calls assigned to the index in the 1+800 service designation table.

4. ACTION TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

The validity for the administrative module (AM) applies to this section.

5. ALARMS

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 109: Operator Services Position System (OSPS) American National Standards Institute (ANSI) transaction capabilities application part (TCAP) query (OATQ) measures of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

The variables marked with an asterisk (*) represent the measurements collected in the direct link node (DLN). If the office is not equipped with a DLN then the measurements are collected from the AM. If the office is equipped with the DLN and the set of variables with "*" are zero, this suggests that the DLN failed to report these variables and these variables are invalid for the reporting period.

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = * LIDB calling card queries sent. Number of line information database (LIDB) calling card (CCD) queries sent from the OSPS into the common channel signaling (CCS) network. This count excludes test queries.
c = LIDB CCD queries not sent. Number of LIDB CCD queries attempted but not sent (total of line information database calling card (LICCD): HDW + OVRLD + NM + NO-ID + AMBLK).
d = * LIDB CCD hardware problems. Number of LIDB CCD queries not sent to the database because the common network interface (CNI) ring was not available. This resulted in calls receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.
e = * LIDB CCD database cutbacks. Number of CCD queries not sent because the switch had enforced query cutbacks according to automatic call gapping (ACG) controls received from the database. This resulted in calls receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.
f = * LIDB CCD network management cutbacks. Number of CCD queries not sent to the database because a cutback was in effect to accommodate a network management control measure. Network management cutbacks are implemented for a period of five seconds after a billed number screening (BNS) or calling card query reply indicates network congestion, network failure, subsystem congestion or subsystem failure. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.
g = * LIDB CCD query no ID failures. Number of CCD queries not sent to the database because a LIDB query ID was not available. The switch can handle 256 outstanding LIDB queries. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.
h = * LIDB CCD query AM blocking. Number of CCD queries not sent to the database because of:
Abnormal administrative module (AM) conditions.
- Abnormal communication link conditions between the switching module (SM) and AM.
- Switch data in the AM could not be read to determine the translation type parameter that was to be sent in the query to the signaling system 7 (SS7) network.

This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

i = * LIDB BNS queries sent. Number of BNS queries sent from the OSPS into the CCS network. This count excludes test queries.

j = LIBD BNS query not sent. Number of BNS queries attempted but not sent (total of line information database billed number screening (LIBNS): HDW + OVRLD + NM + NO-ID + AMBLK).

k = * LIDB DNS hardware problems. Number of BNS queries not sent to the database because the CNI ring was not available. Indeterminate treatment applies to the call.

l = * LIDB DNS database cutbacks. Number of BNS queries not sent to the database because the switch had enforced query cutbacks according to ACG controls received from the database. Indeterminate treatment applies to the call.

m = * LIDB BNS network management cutbacks. Number of BNS queries not sent to the database because a cutback was in effect to accommodate a network management control measure. Network management cutbacks are implemented for a period of five seconds after a BNS or calling card query reply indicates network congestion, network failure, subsystem congestion, or subsystem failure. Indeterminate treatment applies to the call.

n = * LIDB BNS query no ID. Number of BNS queries not sent to the database because a LIDB query ID was not available. The switch can handle 256 outstanding LIDB queries. Indeterminate treatment applies to the call.

o = * LIDB BNS query AM blocking. Number of BNS queries not sent to the database because of:
- Abnormal AM conditions.
- Abnormal communication link conditions between the SM and AM.
- Switch data in the AM could not be read to determine the translation type parameter that was to be sent in the query to the Signaling System 7 (SS7) network.

Indeterminate treatment applies to the call.

p = LIDB CCD abnormal network replies. Number of abnormal LIDB CCD replies received. These are queries that do not make it to the destined database and are returned by the network. (total of LICCD: RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWFA + NWCONG).

q = * LIDB CCD query routing failures. Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated no translation for an address of such nature. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

r = * LIDB CCD address failures. Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated no translation for this specific address. This resulted in calling card denial on the call.
= * LIDB CCD subsystem congestion. Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated subsystem congestion. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the subsystem congestion response.

t = * LIDB CCD subsystem failures. Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated subsystem failure. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the subsystem failure response.

u = * LIDB CCD unequipped user. Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated unequipped user. This resulted in calls receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

v = * LIDB CCD network failures. Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated network failure. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the network failure response.

w = * LIDB CCD network congestion. Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated network congestion. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the network congestion response.

x = LIDB BNS abnormal network replies. Number of abnormal LIDB BNS replies received. These are queries that do not make it to the destined database and are returned by the network (total of LIBNS: RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWFA + NWCONG).

y = * LIDB BNS query routing failures. Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated no translation for an address of such nature. Indeterminate treatment applies to the call.

z = * LIDB BNS address failures. Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated no translation for this specific address. This resulted in billing denial on the call.

a¹ = * LIDB BNS subsystem congestion. Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated subsystem congestion. Indeterminate treatment applies to the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the subsystem congestion response.

b¹ = * LIDB BNS subsystem failures. Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated subsystem failure. Indeterminate treatment applies to the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the
subsystem failure response.

c$^1$ = * LIDB BNS unequipped user. Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated unequipped user. Indeterminate treatment applies to the call.

d$^1$ = * LIDB BNS network failures. Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated network failure. Indeterminate treatment applies to the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the network failure response.

e$^1$ = * LIDB BNS network congestion. Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated network congestion. Indeterminate treatment applies to the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the network congestion response.

f$^1$ = LIDB CCD database replies received. Number of LIDB CCD replies received. Total of LICCD: UNEXP + INVFRMT + VLDFRMT.

g$^1$ = * Unexpected LIDB CCD replies. Number of times an unexpected or duplicate LIDB CCD query reply was received from the database. Replies for which the switch had timed out while waiting for them are included.

h$^1$ = * Invalid format LIDB CCD reply. Number of LIDB CCD replies received in an invalid format where the reply was garbled in some manner or data fields did not conform to correct message syntax. Examples of such cases are:
- The value in the translation ID field was invalid.
- The component sequence ID field was invalid.
- The component type ID field was invalid.
- The length of the entire query response was longer than expected.
- The length of the transaction capability application part (TCAP) message was longer than expected.
- The package type identifier field was invalid.
- The message type field was invalid.
- The response was a service message from the SS7 network and the service message type was not recognized.

i$^1$ = Valid format LIDB CCD reply. Number of LICCD replies received that were in a valid format regardless of content. This number is the sum of LICCD: MSGRP + NPRTGRP + NONWKRS + REJ + VALID + NOT-FND + DENIAL + NO-PIN.

j$^1$ = Timed-out LIDB CCD queries. Number of times that the OSPS timed out waiting for a LIDB CCD reply to a query from the database. Refer to the CC and BNS TIME parameter in RC/V View 8.9. The call will receive indeterminate query treatment as specified by parameter QUERY REPLIES TIMEOUT in RC/V view 8.9. Valid value(s):
A = If TIMEOUT indicates allow, then the reply will be treated as an allow.
D = If TIMEOUT indicates deny, then the reply will be treated as a deny.
E = If TIMEOUT indicates existing treatment, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V view 8.9.

k$^1$ = LIDB CCD test queries sent. Number of LIDB CCD test queries sent to the CCS network.
l^1 = LIDB BNS database replies received. Number of LIDB BNS replies received. Total of LIBNS: UNEXP + INVFRMT + VLDFRMT.

m^1 = * Unexpected LIDB BNS replies. Number of times an unexpected or duplicate LIDB BNS query reply was received from the database. Replies for which the switch had timed out while waiting for them are included.

n^1 = * Invalid format LIDB BNS reply. Number of LIDB BNS replies received in an invalid format where the reply was garbled in some manner or data fields did not conform to correct message syntax. Examples of such cases are:
- The value in the translation ID field was invalid.
- The component sequence ID field was invalid.
- The component type ID field was invalid.
- The length of the entire query response was longer than expected.
- The length of the TCAP message was longer than expected.
- The package type identifier field was invalid.
- The message type field was invalid.
- The response is a service message from the SS7 network and the service message type was not recognized.

o^1 = Valid format LIDB BNS reply. Number of LIDB BNS replies received that were in a valid format regardless of content. This number is the sum of LIBNS: MSGRP + NPRTGRP + NONWKRS + REJ + NORRSP + BRCNFND.

p^1 = Timed-out LIDB BNS queries. Number of times that the OSPS timed out waiting for a BNS reply to a query from the database. Refer to the CC and BNS TIME parameter in RC/V View 8.9. The call will receive indeterminate query treatment as specified by parameter QUERY REPLIES TIMEOUT in RC/V view 8.9. Valid value(s):
A = If TIMEOUT indicates allow, then the reply will be treated as an allow.
D = If TIMEOUT indicates deny, then the reply will be treated an a deny.
E = If TIMEOUT indicates existing treatment, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V view 8.9.

q^1 = LIDB BNS test queries sent. Number of LIDB BNS test queries sent to the CCS network.

r^1 = LIDB CCD missing rout or misrouted error code. Number of error messages, returned from the database in response to a CCD query, indicating missing group or misrouted. The call will receive indeterminate query treatment as specified by parameter QUERY REPLIES OTHER INDET in RC/V view 8.9. Valid value(s):
A = If OTHER INDET indicates allow, then the reply will be treated as an allow.
D = If OTHER INDET indicates deny, then the reply will be treated an a deny.
E = If OTHER INDET indicates existing treatment, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V view 8.9.

s^1 = LIDB CCD nonparticipating group error code. Number of error messages, returned from the database in response to a CCD query, indicating nonparticipating group. The call will receive indeterminate query treatment as specified by parameter QUERY REPLIES UNR AND NPG in RC/V view 8.9. Valid value(s):
A = If UNR AND NPG indicates allow, then the reply will be treated as an allow.
D = If UNR AND NPG indicates deny, then the reply will be treated an a deny.
E = If UNR AND NPG indicates existing treatment, then the type of indeterminate
query treatment is specified by parameter CC BILL BLOCK in RC/V view 8.9.

t\(^1\) = iLIDB CCD unavailable network resource error code. Number of error messages, returned from the database in response to a CCD query, indicating unavailable network resource. The call will receive indeterminate query treatment as specified by parameter QUERY REPLIES UNR AND NPG in RC/V view 8.9. Valid value(s):
A = If UNR AND NPG indicates allow, then the reply will be treated as an allow.
D = If UNR AND NPG indicates deny, then the reply will be treated as a deny.
E = If UNR AND NPG indicates existing treatment, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V view 8.9.

u\(^1\) = * LIDB CCD reject messages. Number of reject messages received from the database in response to a LIDB CCD query. The call will receive indeterminate query treatment as specified by parameter QUERY REPLIES OTHER INDET in RC/V view 8.9. Valid value(s):
A = If OTHER INDET indicates allow, then the reply will be treated as an allow.
D = If OTHER INDET indicates deny, then the reply will be treated as a deny.
E = If OTHER INDET indicates existing treatment, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V view 8.9.

v\(^1\) = OSPS initiated/aborted LIDB calling card queries. Number of CCD queries to the database that were initiated then aborted by OSPS because of customer abandonment or inward operator abandonment or operator change of billing type.

w\(^1\) = LIDB BNS missing group or misrouted error code. Number of error messages, returned from the database in response to a BNS query, indicating missing group or misrouted. Indeterminate treatment applies to the call. Valid value(s):
A = If OTHER INDET indicates allow, then the reply will be treated as an allow.
D = If OTHER INDET indicates deny, then the reply will be treated as a deny.
E = If OTHER INDET indicates existing treatment, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V view 8.9.

x\(^1\) = LIDB BNS nonparticipating group error code. Number of error messages, returned from the database in response to a BNS query, indicating nonparticipating group. Indeterminate treatment applies to the call. Valid value(s):
A = If OTHER INDET indicates allow, then the reply will be treated as an allow.
D = If OTHER INDET indicates deny, then the reply will be treated as a deny.
E = If OTHER INDET indicates existing treatment, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V view 8.9.

y\(^1\) = LIDBBNS unavailable network resource error code. Number of error messages, returned from the database in response to a BNS query, indicating unavailable network resources. Indeterminate treatment applies to the call. Valid value(s):
A = If OTHER INDET indicates allow, then the reply will be treated as an allow.
D = If OTHER INDET indicates deny, then the reply will be treated as a deny.
E = If OTHER INDET indicates existing treatment, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V view 8.9.

z\(^1\) = * LIDB BNS reject messages. Number of reject messages received from the database in response to a BNS query. Indeterminate treatment applies to the call. Valid value(s):
A = If OTHER INDET indicates allow, then the reply will be treated as an allow.

D = If OTHER INDET indicates deny, then the reply will be treated as a deny.

E = If OTHER INDET indicates existing treatment, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V view 8.9.

\[a^2\] = OSPS initiated/aborted LIDB BNS queries. Number of LIDB BNS queries that were initiated then aborted by OSPS because of customer abandonment or inward operator abandonment or operator change of billing type.

\[b^2\] = LIDB CCD valid reply. Number of CCD replies received from the database containing a response that indicates that a match between the account number and personal identification number (PIN) was found, regardless of whether the PIN is restricted or unrestricted.

\[c^2\] = LIDB CCD billing number not found. Number of error messages, returned from the database in response to a CCD query, indicating unexpected data value, vacant group, or missing customer record. In all cases the calling card number was assumed invalid and the call was denied completion.

\[d^2\] = LIDB CCD service denial. Number of CCD replies received from the database indicating service denial for the calling card account number received or service denial because:
- A PIN threshold within the database was exceeded.
- Non-payment associated with the PIN.
- No PIN was assigned to the account.
- A line number service application (LSA) reply containing a value of 240 is received, indicating fraud.

\[e^2\] = LIDB CCD no PIN match. Number of CCD replies received from the database indicating that a matching PIN was not found for a valid calling card account number. The call was denied completion.

\[f^2\] = LIDB BNS replies with billing allowed. Number of BNS query replies, received from the database, that indicated that billing should be allowed. This measurement is pegged for:
- a collect call, the reply indicated that acceptance of a collect call to the associated forward number was to be verified by an operator.
- a collect call, the reply indicated that a collect call to the associated forward number may be placed without verification by an operator.
- an intralATA collect call, the reply indicated that an intralATA collect call to the associated forward number may be placed without verification by an operator.
- an interLATA collect call, the reply indicated that acceptance of an interLATA collect call to the associated forward number was to be verified by an operator.
- a collect call to a public phone, the reply indicated that a collect call to a public phone was allowed.
- a third number call, the reply indicated that a third number call billed to the associated third number may be placed without verification by an operator.
- a third number call, the reply indicated that acceptance of a third number call billed to the associated third number was to be verified by an operator.
- an intralATA third number call, the reply indicated that an intralATA third number call billed to the associated third number may be placed without verification by an operator.
- an intralATA third number call, the reply indicated that acceptance of an intralATA third number call billed to the associated third number was to be verified by an operator.
- a sent-paid call, the reply indicated that a sent-paid call billed to the back number was allowed.

= LIDB BNS replies with billing denied. Number of BNS query replies received from the database where the response indicated that billing should be denied. Reasons for denial:
- An error message was received indicating unexpected data value, vacant group, or missing customer record.
- For a collect call, the collect acceptance indicator in the query response indicated that collect calls to the associated forward number were to be denied.
- For an interLATA collect call, the collect acceptance indicator in the query response indicated that all interLATA collect calls were to be denied.
- For a third number billing call, the third number acceptance indicator in the query response indicated that third number billing was not allowed with the third number used on the call.
- For an interLATA third number billing call, the third number acceptance indicator in the query response indicated that interLATA third number billing was not allowed with the third number used on the call.
- For a third number billing call, the service indicator in the query response indicated that the third number was assigned to a public phone.
- For a sent-paid call, the service indicator in the query response indicated that sent-paid billing was not allowed from the back number.
- For collect, third number billing and sent-paid calls, an LSA reply containing a value of 240 is received, indicating fraud.

This measurement is not pegged if the missing customer record BNS reply code was received and the missing LIDB data call handling modification feature has been activated.

= LIDB BNS replies with billing indeterminate. Number of times the switch was unable to determine by a BNS query whether billing should be allowed or denied. In all cases, indeterminate treatment applies to the call. Reasons why billing could not be determined:
- A BNS query was not sent to the database because the CNI ring was not available.
- A BNS query was not sent to the LIDB database because of abnormal AM conditions or abnormal communication link conditions between the SM and AM.
- The reply code returned from the database in response to a BNS query indicated nonparticipating group, misroute, missing group, unavailable network resource or reject.
- The switch timed out waiting for a BNS query response.
- The switch was unable to obtain a system timer to time for a BNS query response.
- The switch did not send a query because of network management cutback controls or because of database cutback controls.
- The value returned in the collect acceptance indicator field or the third number acceptance indicator field was unrecognizable.
- The CCS network responded to a BNS query with a service message indicating either of the following: no translation for an address of such nature, subsystem congestion, subsystem failure, unequipped user, network failure, or network congestion.
- The missing customer record BNS reply code was received and the missing LIDB data call handling modification feature had been activated.

= Normal LIDB BNS responses received. Number of BNS query responses received from the database indicating that a record for the data contained in the query was found in the database.
= LIDB BNS missing customer record error code. Number of error messages, returned from the
database in response to a BNS query, indicating unexpected data value, vacant group, or missing
customer record.

= * Combined LIDB CCD and BNS ACG indicator replies. Number of BNS or CCD query replies
from the database that contained an ACG component. All queries for calls that matched the first six
digits of the affected billing number were potentially cut back as specified by the ACG control
parameters. This resulted in calls' receiving indeterminate query treatment. The type of
indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

= 89/CCC queries sent. Number of telecommunications card/commercial credit card queries sent
from the OSPS into the network connecting the OSPS to the database. This count excludes test
queries.

= 89/CCC queries not sent. Number of 89/CCC queries attempted but not sent (total of 89CCC:
HDW + OVRLD + NM + NO-ID + AMBLK).

= * 89/CCC hardware problems. Number of 89/CCC queries not sent because the common network
interface (CNI) ring was not available. This resulted in calls receiving indeterminate query treatment.
For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE
in RC/V View 27.56.

= * 89/CCC database cutbacks. Number of 89/CCC queries not sent because the switch had
enforced query cutbacks according to automatic call gapping (ACG) controls received from the
database. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of
indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

= * 89/CCC network management cutbacks. Number of 89/CCC queries not sent to the database
because a cutback was in effect to accommodate a network management control measure.
Network management cutbacks are implemented for a period of five seconds after a calling card
query reply indicates network congestion, network failure, subsystem congestion or subsystem
failure. This resulted in calls receiving indeterminate query treatment. For 89/CCC, the type of
indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

= * 89/CCC query no ID failures. Number of 89/CCC queries not sent to the database because a query
ID was not available. The switch can handle 256 outstanding queries. This resulted in calls'
receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is
specified by parameter INDETERMINATE in RC/V View 27.56.

= * 89/CCC query AM blocking. Number of 89/CCC queries not sent to the database because of:
- Abnormal AM conditions.
- Abnormal communication link conditions between the SM and AM.
- Switch data in the AM could not be read to determine the translation type
  parameter that is to be sent in the query to the Signaling System 7 (SS7) network.

This resulted in calls receiving indeterminate query treatment. For 89/CCC, the type of
indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

= * 89/CCC test queries sent. Number of 89/CCC test queries sent to the CCS network.

= 89/CCC abnormal network replies. Number of abnormal 89/CCC replies received. These are
queries that do not make it to the destined database and are returned by the network (total of
89CCC: RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWFA + NWCONG).
= * 89/CCC query routing failures. Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated no translation for an address of such nature. This resulted in calls receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

= * 89/CCC address failures. Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated no translation for this specific address. This resulted in calling card denial on the call.

= * 89/CCC subsystem congestion. Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated subsystem congestion. This resulted in calls receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the subsystem congestion response.

= * 89/CCC subsystem failures. Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated subsystem failure. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the subsystem failure response.

= * 89/CCC unequipped user. Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated unequipped user. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

= * 89/CCC network failures. Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated network failure. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the network failure response.

= * 89/CCC network congestion. Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated network congestion. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the network congestion response.

= 89/CCC database replies received. Number of 89/CCC replies received of all types. Total of 89CCC: UNEXP + INVFRMT + VLDFRMT.

= * Unexpected 89/CCC replies. Number of times an unexpected or duplicate query reply was received from the database. Replies for which the switch had timed out while waiting for them are included.

= * Invalid format 89/CCC reply. Number of 89/CCC replies received in an invalid format where the reply was garbled in some manner or data fields did not conform to correct message syntax. Examples of such cases are:
- The value in the translation ID field was invalid.
- The component sequence ID field was invalid.
- The component type ID field was invalid.
- The length of the entire query response was longer than expected.
- The length of the TCAP message was longer than expected.
- The package type identifier field was invalid.
- The message type field was invalid.
- The response was a service message from the SS7 network and the service message type was not recognized.

= Valid format 89/CCC reply. Number of 89/CCC replies received with valid data in the common portion of the reply. This number is the sum of 89CCC: MSGRP + NPRTGRP + NONWKRS + REJ + VALID + NOT-FND + DENIAL + NO-PIN.

= timed-out 89/CCC reply. Number of times that the OSPS timed out waiting for an 89/CCC reply to a query from the database (refer to the QUERY TIMEOUT parameter in RC/V View 27.56). This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

= 89/CCC missing group or misrouted. Number of error messages, returned from the database in response to an 89/CCC query, indicating missing group or misrouted. This resulted in calls receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

= 89/CCC nonparticipating group. Number of error messages, returned from the database in response to an 89/CCC query, indicating nonparticipating group. This resulted in calls receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

= 89/CCC unavailable network resource. Number of error messages, returned from the database in response to an 89/CCC query, indicating unavailable network resource. This resulted in calls receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

= * 89/CCC reject messages. Number of reject messages received from the database in response to an 89/CCC query. This resulted in calls’ receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

= OSPS initiated/aborted 89/CCC queries. Number of 89/CCC queries that were initiated then aborted by OSPS because of customer abandonment or operator change of billing type.

= 89/CCC valid reply. Number of CCD replies received from the database containing a response that indicates that a match between the account number and personal identification number (PIN) was found, regardless of whether the PIN is restricted or unrestricted.

= 89/CCC billing number not found. Number of error messages, returned from the database in response to an 89/CCC query, indicating unexpected data value, vacant group, or missing customer record. In all cases the calling card number was assumed invalid and the call was denied completion.

= 89/CCC service denial. Number of 89/CCC replies received from the database indicating service denial for the calling card account number received or service denial because:
  - A PIN threshold within the database was exceeded.
  - Non-payment associated with the PIN.
  - No PIN was assigned to the account.

### 4. ACTIONS TO BE TAKEN

None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

The validity for the administrative module applies to this section.

### 5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 110: Operator Services Position System (OSPS) customer account services (CAS) measures of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

For variables marked with an asterisk (*), these measurements are collected in the direct link node (DLN) if a DLN is present. If the office is equipped with the DLN and the set of variables is zero, the DLN failed to report these variables, and these variables are invalid for the reporting period. These measurements will be scored on the administrative module (AM) if DLN is not present.

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Number of CAS database query attempts in destination-routed common channel interoffice signaling 6 (DCIS6) format. This count is equal to the sum of ‘c’ and ‘d’.

c = CAS queries sent. Number of calling card queries* in DCIS6 format sent to the CAS database. This excludes test queries.

d = CAS queries not sent. Number of calling card queries in DCIS6 format that were attempted but not sent. This count is equal to the sum of ‘e’, ‘f’, ‘g’, ‘h’, and ‘i’.

e = CAS queries not sent - hardware problems. Number of calling card queries* in DCIS6 format not sent to the CAS database because the common network interface (CNI) ring was not available. This resulted in calls receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

f = CAS queries not sent - database cutbacks. Number of calling card queries* in DCIS6 format not
sent to the CAS database because the switch had enforced query cutbacks according to call
gapping controls received from the CAS database. This resulted in calls’ receiving indeterminate
query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

\( g \) = CAS queries not sent - network management cutbacks. Number of calling card queries* in DCIS6
format not sent to the CAS database because of network management cutbacks. Network
management cutbacks are implemented for calling card queries for a period of five seconds after a
calling card query reply indicates network congestion or network blockage. This resulted in calls’
receiving indeterminate query treatment. The type of indeterminate query treatment is specified in
RC/V View 8.9.

\( h \) = CAS queries not sent - no query ID. Number of calling card queries* in DCIS6 format not sent to
the CAS database because a query ID was not available or was out of range due to an internal
software error, where the range is 1-128. This resulted in calls’ receiving indeterminate query
treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

\( i \) = CAS queries not sent - AM blocking. Number of calling card queries in DCIS6 format not sent to
the CAS database because of abnormal administrative module (AM) conditions or abnormal
communication link conditions between the switching module (SM) and AM. This resulted in calls’
receiving indeterminate query treatment. The type of indeterminate query treatment is specified in
RC/V View 8.9.

\( j \) = CAS test queries sent. Number of calling card test queries sent to the CCS network.

\( k \) = CAS queries with abnormal replies. Number of abnormal calling card replies. This count is equal
to the sum of ‘\( l \)’, ‘\( m \)’, ‘\( n \)’, and ‘\( o \)’.

\( l \) = CAS queries with normal routing data failures. Number of times an calling card query* in DCIS6
format failed to reach the CAS database because of no routing data in the network. A query reply
from the common channel signaling (CCS) network indicated that a failure reason of "no routing
data". This resulted in call completion denial.

\( m \) = CAS queries with network congestion failures. Number of times an calling card query* in DCIS6
format failed to reach the CAS database because of network congestion. A query reply from the
CCS network indicated a failure reason of "network congestion." The result was a cutback of
subsequent calling card queries that had the same first three digits in the card account number as
the account number that resulted in the network congestion reply. The cutbacks are in effect for a
period of five seconds. This resulted in calls’ receiving indeterminate query treatment. The type of
indeterminate query treatment is specified in RC/V View 8.9.

\( n \) = CAS queries with network blockage failures. Number of times an calling card query* in DCIS6
format failed to reach the CAS database because of network blockage. A query reply from the CCS
network indicated a failure reason of "network blockage." The result was a cutback of subseuent
calling card queries that had the same first three digits in the card account number as the account
number that resulted in the network blockage reply. The cutbacks are in effect for a period of five
seconds. This resulted in calls’ receiving indeterminate query treatment. The type of indeterminate
query treatment is specified in RC/V View 8.9.

\( o \) = CAS queries with unequipped destination failures. Number of times an calling card query* in
DCIS6 format failed to reach the CAS database because the function was not equipped in the
network. A query reply from the CCS network indicated a failure reason of "unequipped destination."
This occurred when a query was sent to a destination which could not process CAS queries. This
resulted in call completion denial.

\( p \) = CAS database replies received. Number of calling card replies received. This count is equal to the
sum of 'q', 'r', 's', and 't'.

\( q \) = CAS queries with unable to process replies. Number of calling card query replies received in DCIS6 format from the CAS database indicating that the database was unable to process the query. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

\( r \) = Unexpected CAS replies. Number of unexpected or duplicate calling card query replies* received from the CAS database.

\( s \) = Invalid format CAS replies. Number of calling card query replies* received in DCIS6 format from the CAS database containing an invalid response in the message type field or the reply code field. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

\( t \) = Valid format CAS replies. Number of calling card query replies in DCIS6 format with a valid format. This count is equal to the sum of 'u', 'v', 'w', 'x', and 'y'.

\( u \) = CAS queries - allow call replies. Number of CAS replies received from the CAS database in DCIS6 format indicating that the call was allowed.

\( v \) = CAS queries - deny call - invalid card number. Number of CAS replies received from the CAS database in DCIS6 format indicating that the call should be blocked because the calling card number entered was not valid.

\( w \) = CAS queries - deny call - invalid personal identification number (PIN). Number of CAS replies received from the CAS database in DCIS6 format indicating that the call should be blocked because the PIN entered was not valid.

\( x \) = CAS queries - deny call - domestic restrictions. Number of CAS replies received from the CAS database in DCIS6 format indicating that the call should be blocked based on a NAR geographic restriction.

\( y \) = CAS queries - deny call - international restrictions. Number of CAS replies received from the CAS database in DCIS6 format indicating that the call should be blocked because of an international restriction.

\( z \) = Timed-out CAS queries with no response. Number of times the OSPS switch timed out waiting for a reply to a calling card query in DCIS6 format from the CAS database. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

\( a^1 \) = CAS replies - database overload responses. Number of calling card replies* in DCIS6 format (received from the CAS database) containing an overload indicator that required the switch to cutback queries to the database. This resulted in CAS query cutbacks according to the call gapping parameters received in the reply. The call was given indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

\( b^1 \) = CAS queries initiated and then aborted. Number of calling card queries in DCIS6 format canceled by OSPS call processing.

\( c^1 \) = 89C CCRD operator-assisted calls. Number of times an operator entered an 89C (CAS and non-CAS) calling card number on an operator-assisted inward calling card validation call.

\( d^1 \) = 89C CCRD touch-tone operator attempts. Number of times an automated inward calling card
validation request was received from an operator who was using touch-tone equipment to validate an 89C (CAS and non-CAS) calling card.

e\textsuperscript{1} = 89C CCRD multi-frequency attempts. Number of times an automated inward calling card validation request was received from an operator who was using multi-frequency equipment to validate an 89C (CAS and non-CAS) calling card.

f\textsuperscript{1} = 89C CCRD operator attempts with abandon. Number of automated inward calls that were abandoned or timed out during the entry of an 89C (CAS and non-CAS) calling card number.

g\textsuperscript{1} = Automated 89C CCRD validations. Number of automated inward calling card validation requests received from an operator who was validating an 89C calling card. This count is equal to the sum of 'd\textsuperscript{1}' and 'e\textsuperscript{1}'.

h\textsuperscript{1} = CCC card operator-assisted calls. Number of times an operator entered a commercial credit card (CCC) calling card number on an operator-assisted inward calling card validation call.

i\textsuperscript{1} = CCC card touch-tone operator attempts. Number of times an automated inward calling card validation request was received from an operator who was using touch-tone equipment to validate a CCC calling card.

j\textsuperscript{1} = CCC card multi-frequency attempts. Number of times an automated inward calling card validation request was received from an operator who was using multi-frequency equipment to validate a CCC calling card.

k\textsuperscript{1} = CCC card operator attempts with abandon. Number of automated inward calls using a CCC card that were abandoned or timed out.

l\textsuperscript{1} = Automated CCC card validations. Number of automated inward calling card validation requests received from an operator who was validating a CCC calling card. This count is equal to the sum of 'i\textsuperscript{1}' and 'j\textsuperscript{1}'.

m\textsuperscript{1} = CCRD customer-dialed sequence calls initiated. Number of times the back party initiated a sequence call by depressing the # key at the end of an automated calling card service (ACCS) call, that was placed with an (CAS and non-CAS) calling card (that is, the forward party went on-hook); or when the call was placed with an 89C (CAS and non-CAS) calling card and the back party depressed the # key during the ringing of the forward party's phone.

n\textsuperscript{1} = 89C CCRD customer-dialed sequence call abandoned. Number of times the back party went on-hook during the keying of a new forward number, during routing to the forward party, or during ringing of the forward party's phone on an ACS sequence call placed with an 89C (CAS and non-CAS) calling card.

o\textsuperscript{1} = CCC card customer-dialed sequence calls initiated. Number of automated sequence calls initiated using a CCC card either by depressing "#" key after the forward party went on-hook, or during the ringing state of the forward party's phone.

p\textsuperscript{1} = CCC card customer-dialed sequence call abandoned. Number of times the back party went on-hook during the keying of a new forward number, during routing to the forward party, or during ringing of the forward party's phone on an automated sequence call placed with a CCC card.

q\textsuperscript{1} = Potentially valid 89C CCRD. Number of times the switch determined that the back party had entered a potentially valid 89C (CAS and non-CAS) calling card number on an ACCS call before the calling card query was sent.
\( r^1 \) = Potentially valid CCC CCRD. Number of times the switch determined that the back party had entered a potentially valid CCC calling card number on an ACCS call before the calling card query was sent.

\( s^1 \) = Position seizure - 89C card number. Number of times the back party entered an 89C card number and the call was attached to an operator.

\( t^1 \) = Operator - 89C card number. Number of times an operator entered an 89C card number in either the back or forward number card field.

\( u^1 \) = ACCPT BLG key 89C card number. Number of times an operator entered the accepting billing key while manually validating an 89C card number.

\( v^1 \) = Position seizure - CCC number. Number of times the back party entered a CCC number and the call was attached to an operator.

\( w^1 \) = Operator - CCC card number. Number of times an operator entered a CCC card number in either the back or forward number card field.

\( x^1 \) = ACCPT BLG key CCC card number. Number of times an operator entered the accepting billing key while manually validating a CCC card number.

\( y^1 \) = Operator-handled CAS card calls table lookup. Number of times a contract table check was required on a call for which an operator entered an calling card number in either the back or forward card fields. The check is based on the numbering plan area (NPA)-NXX in the billed party's telephone number and verifies whether an (CAS) calling card may be used to place a local exchange carrier (LEC) carried call.

\( z^1 \) = Operator-handled CAS card calls failed table check. Number of times a contract table check was required on a call for which an operator entered an (CAS) calling card number and the table indicated that the billed party may not use an calling card to place a LEC-carried call.

\( a^2 \) = Automated CAS card call table lookup. Number of times a contract table check was required on a call for which the back party entered an (CAS) calling card number. The check is based on the NPA-NXX in the back party's telephone number and verifies whether an calling card may be used to place an LEC-carried call.

\( b^2 \) = Automated CAS card call table lookup failure. Number of times a contract table check was required on a call for which the back party entered an calling card number and the table indicated that the back party may not use an calling card to place a LEC-carried call.

\( c^2 \) = Operator-entered CCC and 89 calls table lookup. Number of times a contract table check was required on a call for which an operator entered a non-CAS 89C or CCC card number in either the back or forward card fields. The check is based on the NPA-NXX in the billed party's telephone number and verifies whether a non-CAS 89C or CCC card may be used to place a LEC-carried call.

\( d^2 \) = Operator-entered CCC and 89 calls table lookup failed. Number of times a contract table check was required on a call for which an operator entered a non-CAS 89C or CCC card number and the table indicated that the billed party may not use a non-CAS 89C or CCC card to place a LEC-carried call.

\( e^2 \) = Customer-entered CCC and 89C calls table lookup. Number of times a contract table check was required on a call for which the back party entered a non-CAS 89C or CCC card number. The check is based on the NPA-NXX in the billed party's telephone number and verifies whether a non-CAS 89C or CCC card may be used to place an LEC-carried call.
\( f^2 \) = Customer-entered CCC and 89C calls table lookup failure. Number of times a contract table check was required on a call for which the back party entered a non-CAS 89C or CCC card number and the table indicated that the billed party may not use a non-CAS 89C or CCC card to place a LEC-carried call.

\( g^2 \) = Operator-handled LEC card calls table lookups. Number of times an inverse contract table check was required on a call for which an operator entered an LEC calling card number in either the back or the forward card fields. The check is based on the NPA-NXX or revenue accounting office (RAO)-0/1XX in the billed party's card number and verifies whether an LEC calling card may be used to place an AT&T-carried call.

\( h^2 \) = Operator-handled carrier LEC card calls table check failed. Number of times an inverse contract table check was required on a call for which an operator entered an LEC calling card number in either the back or the forward card fields and the table indicated that the billed party may not use a LEC calling card to place an AT&T-carried call.

\( i^2 \) = Automated LEC card calls table lookups. Number of times an inverse contract table check was required on a call for which the back party entered an LEC calling card number. The check is based on the NPA-NXX or RAO-0/1XX in the billed party's card number and verifies whether an LEC calling card may be used to place an AT&T-carried call.

\( j^2 \) = Automated LEC card calls - table check failed. Number of times an inverse contract table check was required on a call for which the back party entered an LEC calling card number the table indicated that the back party may not use a LEC calling card place an AT&T-carried call.

\( k^2 \) = Billable card limit (CL) calls exceeded intermediate timer. Number of billable CL calls which have exceeded the initial intermediate timer. This excludes all calls for which an intermediate timer is not used [such as, volume limit (VL) only/ multiple calls in progress (MCIP)].

\( l^2 \) = Billable CAS CL calls terminated initial intermediate timer. Number of billable CAS CL calls which have terminated before the first intermediate timer has expired. This excludes all calls for which an intermediate timer is not used (such as, VL only/MCIP).

\( m^2 \) = ACCS calls with invalid calling card number. Number of ACCS calls for which the caller entered an invalid calling card number, and an operator was then requested, either by the customer (dial 0 or flash) or automatically by the OSPS. This includes non-LEC card numbers not found in the card recognition tables, and card numbers resulting in either a contract or inverse contract table failure.

\( n^2 \) = Card recognition failures. Number of card recognition failures that occur in which the card length is at least 11 digits and not exactly 14 digits. This includes all customer or operator entered calling card numbers.

\( o^2 \) = Request for more balance call disposition messages (RFMB-CDM). Number of request for more balance call disposition messages sent* to the card database for purchase limit (PL) and/or duration limit (DL) calls. This includes RFMB-CDMs sent before setting up the call as well as those sent after the call has been set up.

\( p^2 \) = Grants received from the card database. Number of balance "grants" received from the card database, where a grant is defined to be a successful reply to an RFMB-CDM such that for every balance requested in the RFMB-CDM (PL and/or DL) there is a non-zero balance allocation returned in the reply.

\( q^2 \) = Denies received from card database. Number of "denies" received from the card database, where a deny is defined to be the failure to receive a non-zero balance allocation for any one (or more) of the balances (PL and/or DL) requested in the corresponding RFMB-CDM.
\( r^2 \) = Call attempts billed to an enforced PL multiple calls in progress. Number of call attempts billed to an enforced PL multiple calls in progress (MCIP) card whose initial PL balance, allocated by the card database and successfully translated into a call duration by the Real Time Rating System (RTRS), is insufficient for the initial period of the call.

\( s^2 \) = Call attempts billed to an enforced with receive PL/DL MCIP card. Number of call attempts billed to an enforced PL MCIP card which receive an initial PL balance and are successfully rated by RTRS.

\( t^2 \) = Call attempts billed to an enforced with disconnect PL/DL MCIP card. Number of call attempts billed to an enforced with disconnect PL and/or DL MCIP card whose initial balance(s), allocated by the card data base and, for PL, successfully translated into a call duration by RTRS, is insufficient to cover the first intermediate interval.

\( u^2 \) = Number of call attempts billed to an enforced with disconnect PL and/or DL MCIP card which receive an initial balance(s) and, if PL applies, are successfully translated into a call duration by RTRS.

\( v^2 \) = Disconnect warning announcement. Number of card limit calls that receive the disconnect warning announcement.

\( w^2 \) = Card based speed dial calls outpulsed by the OSPS. Number of card based speed dial calls successfully outpulsed by the OSPS.

\( x^2 \) = Card based speed dial calls answered. Number of card based speed dial calls answered.

\( y^2 \) = Card based speed dial queries sent. Number of card validation queries sent that include a SDC digit parameter in lieu of the called number digit parameter.

\( z^2 \) = Card based speed dial calls denied. Number of speed dialed calls that are denied due to forward number digit analysis failure at the OSPS.

\( a^3 \) = Speed dialing auto-provisioning (SDAP) calls received. Number of calls received that cannot be sent to a speed dialing auto-provisioning (SDAP) automated position (AP) because all positions are busy and the queue is full.

\( b^3 \) = Sent calls. Number of 10 digit true choice calling card (10D-TCCC) queries sent to the CAS database.

\( c^3 \) = Denied calls. Number of denied calls where undetermined card issuer replies were received.

\( d^3 \) = Indeterminate calls. Number of indeterminate replies received in response to 10D-TCCC queries.

4. ACTIONS TO BE TAKEN

None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

The validity for the administrative module applies to this section.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 135: Operator Services Position System (OSPS) customer account services (CAS) Common Channel Signaling System 7 (CCS7)/ international credit card validation (ICCV) signaling measures of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

The variables with ‘*’ represent the measurements collected in the direct link node (DLN). If the office is equipped with the DLN and the set of variables with ‘*’ is zero, this suggests that the DLN failed to report these variables and these variables are invalid for the reporting period.

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = CAS transaction capabilities application part (TCAP) query attempts. Number of CAS TCAP database query attempts. This count is equal to the sum of ‘c’ and ‘d’.

c = CAS TCAP queries sent. Number of queries* sent from the OSPS to a card database where the query conforms to CAS TCAP signaling protocol. This excludes test queries.

d = CAS TCAP queries not sent. Number of CAS TCAP queries not sent. This count is equal to the
The sum of 'e', 'f', 'g', and 'h'.

- e = CAS TCAP queries not sent - internal problems. Number of CAS TCAP queries* not sent because of OSPS internal problems (the administrative module (AM) or direct link node (DLN) is in an abnormal state, the common network interface (CNI) is not operational, or data could not be read successfully). The call received indeterminate treatment.

- f = CAS TCAP queries not sent - query ID not available. Number of CAS TCAP queries* not sent because a query ID was not available, or was out of range due to an internal software error, where the range is 0-255. The call received indeterminate treatment.

- g = CAS TCAP queries not sent - network management blocked. Number of CAS TCAP queries* not sent because a cutback was in effect to accommodate a network management (NM) control measure due to CCS7 network problems. The network management cutbacks are implemented for a period of 5 seconds after CAS CCS7 replies are received indicating network congestion, subsystem congestion, network failure, or subsystem failure. The call received indeterminate treatment.

- h = CAS TCAP queries not sent - database cutbacks. Number of CAS TCAP queries* not sent because the switch has enforced query cutbacks according to call gapping controls received from the CAS database. The call received indeterminate treatment.

- i = ICCV TCAP query attempts. Number of ICCV International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) TCAP database query attempts. This count is equal to the sum of 'j' and 'k'.

- j = ICCV TCAP queries sent. Number of queries* sent from the OSPS to a card database where the query conforms to ICCV ITU-TS TCAP signaling protocol. This excludes test queries.

- k = ICCV TCAP queries not sent. Number of ICCV ITU-TS TCAP queries not sent. This count is equal to the sum of 'l', 'm', and 'n'.

- l = ICCV TCAP queries not sent - internal problems. Number of ICCV ITU-TS TCAP queries* not sent because of OSPS internal problems (the AM or DLN is in an abnormal state, the CNI is not operational, data could not be read successfully). The call received indeterminate treatment.

- m = ICCV TCAP queries not sent - query ID not available. Number of ICCV ITU-TS TCAP queries* not sent because a query ID was not available, or was out of range due to an internal software error, where the range is 0-255. The call received indeterminate treatment.

- n = ICCV TCAP queries not sent - NM blocked. Number of ICCV ITU-TS TCAP queries* not sent because a cutback was in effect to accommodate a NM control measure due to CCS7 network problems. The network management cutbacks are implemented for a period of 5 seconds after CAS CCS7 replies are received indicating network congestion, subsystem congestion, network failure, or subsystem failure. The call received indeterminate treatment.

- o = CAS TCAP test queries sent. Number of CAS TCAP test queries that are sent by maintenance personnel (this does NOT include any replies to the test queries).

- p = ICCV TCAP test queries sent. Number of ICCV ITU-TS TCAP test queries that are sent by maintenance personnel (this does NOT include any replies to the test queries).

- q = CAS TCAP queries - network abnormal replies. Number of abnormal CAS TCAP replies received. This count is equal to the sum of 'r', 's', 't', 'u', 'a1', 'b1', 'c1', and 'd'.

235-600-750 December 2003

Copyright ©2003 Lucent Technologies
= CAS TCAP query reply - no translation data for address of such nature. Number of CAS TCAP unit data service messages* received with a diagnostic reason of "No translation data for an address of such nature". The call received indeterminate treatment.

= CAS TCAP query reply - no translation data for this address. Number of CAS TCAP unit data service messages* received with a diagnostic reason of "No translation data for this specific address". The call received denial treatment.

= CAS TCAP query reply - subsystem congestion. Number of CAS TCAP unit data service messages* received with a diagnostic reason of "Subsystem congestion". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

= CAS TCAP query reply - subsystem failure. Number of CAS TCAP unit data service messages* received with a diagnostic reason of "Subsystem failure". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

= ICCV TCAP queries - network abnormal replies. Number of abnormal ICCV TCAP replies received. This count is equal to the sum of 'w', 'x', 'y', 'z', 'e', 'f', 'g', and 'h'.

= ICCV TCAP query reply - no translation data for address of such nature. Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "No translation data for an address of such nature". The call received indeterminate treatment.

= ICCV TCAP query reply - no translation data for this address. Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "No translation data for this specific address". The call received denial treatment.

= ICCV TCAP query reply - subsystem congestion. Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "Subsystem congestion". All subsequent ICCV queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

= ICCV TCAP query reply - subsystem failure. Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "Subsystem failure". All subsequent ICCV queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

= CAS TCAP query reply - unequipped user. Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Unequipped user". The call received denial treatment.

= CAS TCAP query reply - network congestion. Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Network congestion". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

= CAS TCAP query reply - network failure. Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Network failure". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

= CAS TCAP query reply - unqualified. Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Unqualified". The call received indeterminate treatment.
e^1 = ICCV TCAP query reply - unequipped user. Number of ICCV ITU-TS TCAP unit data service
messages* received with the diagnostic reason of "Unequipped user". The call received denial
treatment.

f^1 = ICCV TCAP query reply - network congestion. Number of ICCV ITU-TS TCAP unit data service
messages* received with the diagnostic reason of "Network congestion". All subsequent ICCV
queries with the same routing destinations were cut back for a period of 5 seconds. This call and
subsequent calls that were cut back received indeterminate treatment.

g^1 = ICCV TCAP query reply - network failure. Number of ICCV ITU-TS TCAP unit data service
messages* received with the diagnostic reason of "Network failure". All subsequent ICCV queries
with the same routing destinations were cut back for a period of 5 seconds. This call and
subsequent calls that were cut back received indeterminate treatment.

h^1 = ICCV TCAP query reply - unqualified. Number of ICCV ITU-TS TCAP unit data service
messages* received with the diagnostic reason of "Unqualified". The call received indeterminate
treatment.

i^1 = CAS TCAP database error replies received. Total number of CAS TCAP return error replies
received. This count is equal to the sum of 'j^1', 'k^1', 'l^1', 'm^1', 's^1', 'r^1', and 'u^1'.

j^1 = CAS TCAP return error - unexpected data value. Number of CAS TCAP return error replies
received with an error code of "Unexpected Input Data Value", signifying that the query contained
unexpected data. The call received indeterminate treatment.

k^1 = CAS TCAP return error - missing parameter. Number of CAS TCAP return error replies received
with an error code of "Missing Parameter", signifying that a mandatory parameter was missing from
the query. The call received indeterminate treatment.

l^1 = CAS TCAP return error - unexpected parameter. Number of CAS TCAP return error replies received
with an error code of "Unexpected Parameter", signifying that an unrecognized parameter was
contained in the query. The call received indeterminate treatment.

m^1 = CAS TCAP return error - misrouted query. Number of CAS TCAP return error replies received
with an error code of "Misrouted Query", signifying that the database has determined that the card
number contained in the query is not within the range expected. The call received indeterminate
treatment.

n^1 = ICCV database error replies received. Total number of ICCV ITU-TS return error replies received.
This count is equal to the sum of 'o^1', 'p^1', 'q^1', 'r^1', 'v^1', and 'w^1'.

o^1 = ICCV return error - unexpected data value. Number of ICCV ITU-TS return error replies received
with an error code of "Unexpected Input Data Value", signifying that the query contained
unexpected data. The call received indeterminate treatment.

p^1 = ICCV return error - missing parameter. Number of ICCV ITU-TS return error replies received with
an error code of "Missing Parameter", signifying that a mandatory parameter was missing from the
query. The call received indeterminate treatment.

q^1 = ICCV return error - unexpected parameter. Number of ICCV ITU-TS return error replies received with
an error code of "Unexpected Parameter", signifying that an unrecognized parameter was contained in the query. The call received indeterminate treatment.

r^1 = ICCV return error - misrouted query. Number of ICCV ITU-TS return error replies received with an
error code of "Misrouted Query", signifying that the database has determined that the card number
contained in the query is not within the range expected. The call received indeterminate treatment.

s1 = CAS TCAP return error - task refused. Number of CAS TCAP return error replies received with an error code of "Task Refused", signifying that the node could not handle the request at this time. The call received indeterminate treatment.

t1 = CAS TCAP return error - vacant code. Number of CAS TCAP return error replies received with an error code of "Vacant Code", signifying that the database has determined that the card number contained in the query has not been assigned. The call is denied.

u1 = CAS TCAP return error - gateway error. Number of CAS TCAP return error replies received with an error code of "Gateway Error", signifying that communication with a commercial credit card vendor was unsuccessful. The call received indeterminate treatment.

v1 = ICCV return error - database unavailable. Number of ICCV ITU-TS return error replies received with an error code of "Database Unavailable", signifying that the database could not handle the request at this time (not because the operation was incorrect). The call received indeterminate treatment.

w1 = ICCV return error - message format. Number of ICCV ITU-TS return error replies received with an error code of "Error in Message Format", signifying that the structure of the query is not what was expected. The call received indeterminate treatment.

x1 = 89C/CAS automatic validation reply - valid card/ personal identification number (PIN). Number of CAS TCAP database replies received with either an "allow call" or an "allow call - terminating code screening (TCS) override" response in reply to an 89C card validation query, signifying that the card number and PIN contained in the query were valid. Call processing continued.

y1 = 89C/CAS automatic validation reply - billing number not found. Number of CAS TCAP database replies received with an error code of "missing customer record" in response to an 89C card validation query, signifying that the card number was not found in the database. The call was denied.

z1 = 89C/CAS automatic validation reply - service denied - fraud. Number of CAS TCAP database replies received with an error code of "deny - fraud restricted" in response to an 89C card validation query, signifying that it is suspected that the card is being used fraudulently. The call is denied.

a2 = 89C/CAS automatic validation reply - invalid PIN. Number of CAS TCAP database replies received with an error code of "invalid PIN" in response to an 89C card validation query, signifying that the entered PIN is not allowed with the entered card number. The call is denied.

b2 = 89C/CAS automatic validation reply - called number restrictions. Number of CAS TCAP database replies received with an error code of "called number restrictions" in response to an 89C card validation query, signifying that the card may not be used when placing a call to the forward number contained in the query. The call was denied.

c2 = CCC automatic validation reply - valid card/PIN. Number of CAS TCAP database replies received with either an "allow call" or an "allow call - TCS override" response in reply to a CCC card validation query, signifying that the card number and PIN contained in the query were valid. Call processing continued.

d2 = CCC automatic validation reply - billing number not found. Number of CAS TCAP database replies received with an error code of "missing customer record" in response to a CCC card validation query, signifying that the card number was not found in the database. The call was denied.
e² = CCC automatic validation reply - fraud restriction. Number of CAS TCAP database replies received with an error code of "deny - fraud restricted" in response to a CCC card validation query, signifying that it is suspected that the card is being used fraudulently. The call is denied.

f² = CCC automatic validation reply - invalid PIN. Number of CAS TCAP database replies received with an error code of "invalid PIN" in response to a CCC card validation query, signifying that the entered PIN is not allowed with the entered card number. The call is denied.

g² = ICCV CCITT automatic validation reply - valid card/PIN. Number of ICCV ITU-TS database replies received with an "allow call" response, signifying that the card number and PIN contained in the query were valid. Call processing continues.

h² = ICCV CCITT automatic validation reply - billing number not found. Number of ICCV ITU-TS database replies received with an error code of "invalid card number", signifying that the card number was not found in the database, or "expired card", signifying that the card number has expired. The call was denied.

i² = ICCV CCITT automatic validation reply - service denied - fraud. Number of ICCV ITU-TS database replies received with an error code of "volume threshold exceeded", signifying that the number of calls has exceeded the limit within a specific time interval, or "fraud restricted", signifying that the card is restricted to prevent fraudulent use. The call was denied.

j² = ICCV CCITT automatic validation reply - invalid PIN. Number of ICCV ITU-TS database replies received with an error code of "invalid PIN", signifying that the entered PIN is not allowed with the entered card number. The call was denied.

k² = 89C/CAS automatic validation reply - calling number restrictions. Number of CAS TCAP database replies received with an error code of "calling number restrictions" in response to an 89C card validation query, signifying that the card may not be used when placing a call to the calling number contained in the query. The call was denied.

l² = 89C/CAS automatic validation reply - credit restriction. Number of CAS TCAP database replies received with an error code of "deny - credit restricted" in response to an 89C card validation query, signifying that the card holder is delinquent in payment. The call is denied.

m² = CCC automatic validation reply - invalid CCC. Number of CAS TCAP database replies received with an error code of "invalid commercial credit card" in response to a CCC card validation query, signifying that the card vendor has indicated that the card is invalid. The call was denied.

n² = CCC automatic validation reply - ineligible CCC. Number of CAS TCAP database replies received with an error code of "ineligible commercial credit card" in response to a CCC card validation query, signifying that even though the card number is valid, it may not be used for this service. The call is denied.

o² = CCC validation query - calling number restrictions. Number of ICCV ITU-TS database replies received with an error code of "calling number restrictions", signifying that the card may not be used outside of the issuing administration's network, or "call not permitted from station", signifying that there is not an agreement between the card issuing administration and the card originating administration. The call was denied.

p² = ICCV CCITT automatic validation reply - credit restriction. Number of ICCV ITU-TS database replies received with an error code of "credit threshold exceeded", signifying that the credit limit of the card has been exceeded, or "due to non-payment", signifying that the card holder is delinquent in payment. The call was denied.
Valid CAS TCAP replies received. Total valid CAS TCAP replies received, regardless of the calling card used. This count is equal to the sum of \(x^1\), \(y^1\), \(z^1\), \(a^2\), \(b^2\), \(s^3\), \(k^2\), \(l^2\), \(r^3\), \(g^3\), \(t^3\), \(c^2\), \(d^2\), \(e^2\), \(f^2\), \(j^3\), \(h^3\), \(i^3\), \(m^2\), \(n^2\), \(k^3\), and \(d^4\).

Valid ICCV TCAP replies received. Total valid ICCV ITU-TS TCAP replies received. This count is equal to the sum of \(q^2\), \(h^2\), \(j^2\), \(i^2\), \(l^3\), \(k^2\), and \(p^2\).

CAS TCAP rejects. Number of CAS TCAP TCAP "Reject" components* received in response to a card validation query. The call received indeterminate treatment.

CAS SS7 aborts. Number of CAS SS7 U-Abort or P-Abort messages* received. The call received indeterminate treatment.

CAS TCAP time-out. Number of times the query timer expired before receipt of a CAS TCAP database reply. The call received indeterminate treatment.

CAS TCAP replies initialized then abandoned. Number of CAS TCAP queries initiated, then abandoned. The condition occurs if the call is canceled or the class of charge is changed after a query has been sent but before a reply was received. When the reply was received, it was ignored.

CAS TCAP unexpected replies. Number of CAS TCAP replies* received which were not expected. The replies were ignored. They could be late or duplicate responses.

CAS TCAP invalid format replies. Number of CAS TCAP database replies* received in invalid format. It includes data field values, as well as invalid TCAP format. The reply was dropped and the call received indeterminate treatment.

CAS automatic call gaping (ACG) indicator replies. Number of CAS SS7 replies* received with an ACG component. All CAS SS7 queries to the same destination were gapped according to the received information. The call received appropriate treatment according to the response. Subsequent calls that were cut back due to these gapping controls received indeterminate treatment.

ICCV TCAP rejects. Number of ICCV ITU-TS TCAP "Reject" components* received in response to a card validation query. The call received indeterminate treatment.

ICCV CCITT aborts. Number of ICCV ITU-TS SS7 U-abort or P-abort messages* received. The call received indeterminate treatment.

ICCV TCAP time-out. Number of times the query timer expired before receipt of an ICCV ITU-TS database reply. The call received indeterminate treatment.

ICCV replies initiated then abandoned. Number of ICCV ITU-TS queries initiated, then abandoned. The condition occurs if the call is canceled or the class of charge is changed after a query has been sent but before a reply was received. When the reply was received, it was ignored.

ICCV unexpected replies. Number of ICCV ITU-TS replies received* which were not expected. The replies were ignored. They could be late or duplicate responses.

ICCV invalid format replies. Number of ICCV ITU-TS database replies received* in invalid format. It includes data field values, as well as invalid TCAP format. The reply was dropped and the call received indeterminate treatment.

CAS7 update only. Number of CAS TCAP update-only call disposition messages (UO-CDMs)* that have been sent to the card database.
| g³ | 89C/CAS TCAP database replies - card limit (CL). Number of CAS TCAP database replies received with an error code of "card limit call in progress", "CL insufficient balance", or "card unavailable" in response to an 89C card validation query. The call is denied. |
| h³ | CCC error code - calling number restrictions. Number of CAS TCAP database replies received with an error code of "calling number restrictions" in response to a CCC card validation query, signifying that the card may not be used when placing a call from the calling number contained in the query. The call was denied. |
| i³ | CCC validation query - deny credit restrictions. Number of CAS TCAP database replies received with an error code of "deny - credit restrictions" in response to a CCC card validation query, signifying that the card holder is delinquent in payment. The call was denied. |
| j³ | CCC validation query - called number restrictions. Number of CAS TCAP database replies received with an error code of "called number restrictions" in response to a CCC card validation query, signifying that the card may not be used when placing a call to the forward number contained in the query. The call was denied. |
| k³ | CAS TCAP database replies - card limit. Number of CAS TCAP database replies received with an error code of "CL call in progress", "CL insufficient balance", or "card unavailable" in response to a CCC card validation query. The call is denied. |
| l³ | ICCV CCITT automatic validation called number restrictions. Number of ICCV ITU-TS database replies received with an error code of "called number restrictions" signifying that the card may not be used when placing a call to the forward number contained in the query. The call is denied. |
| o³ | Request for more balance. Number of CAS TCAP request for more balance call disposition messages (RFMB-CDMs)* that have been sent to the card database for purchase limit (PL) and/or duration limit (DL) calls, including RFMB-CDMs sent before setting up the call as well as those sent after the call has been set up. |
| p³ | Number of replies to CAS TCAP RFMB-CDMs* received from the card database, regardless of whether the reply is a "grant" or a "deny". |
| q³ | ICCV update only. Number of ICCV UO-CDMs* that have been sent to the card database. |
| r³ | 89C/CAS automatic validation reply - ineligible card. Number of CAS TCAP database replies received with an error code of "ineligible card" in response to an 89C card validation query, signifying that even though the card number is valid, it may not be used for this service. The call is denied. |
| s³ | Card based SD with deny - invalid speed code. Number of CAS TCAP database replies received with an error code of "invalid speed code" in response to an 89C card validation query, signifying that the speed code sent in the query could not be mapped to a forward number. |
| t³ | Card based SD with deny - feature not allowed. Number of CAS TCAP database replies received with an error code of "speed calling feature not allowed" in response to an 89C card validation query, signifying that the card number can not be used in speed dialing. The call is denied. |
| u³ | Virtual card queries. Total number of virtual card format (VCF) validation queries made. |
| v³ | Virtual card allowed. Total number of VCF validation replies received with an "allow call" response from a VCF validation query. |
| w³ | Virtual card replies denied. Total number of VCF validation replies received with a response of
“missing customer record”, “invalid PIN”, or “vacant code” from a VCF validation query.

\[ x^3 \]

= Total number of forward number check (FNC) messages sent by the OSPS.

\[ y^3 \]

= Total number of allow replies received to the FNC Query, with a reply code of “allow call - valid speed call number”.

\[ z^3 \]

= Total number of deny replies received to the FNC Query, with a reply code of “deny call - invalid speed call number”.

\[ a^4 \]

= Total number of speed dialing list (SDL) update requests sent by the OSPS.

\[ b^4 \]

= Total number of allow replies received in response to the SDL update.

\[ c^4 \]

= Total number of deny replies received in response to the SDL update.

\[ d^4 \]

= Other valid CAS7 query replies not specifically listed. This count is equal to the sum of “DIOR PERSONAL TOLL-FREE NUMBER-POS” and “DIOR PERSONAL TOLL-FREE NUMBER-NEG” both in OP:TRFC30-OMISC.

### 3.2 Parameters

<table>
<thead>
<tr>
<th>Data collection unit</th>

### 4. ACTIONS TO BE TAKEN

None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

**OP:TRFC30, VLD**

The validity for the administrative module applies to this section.

### 5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for an immediate or scheduled output of section 100: Operator Services Position System (OSPS) coin measurements of the 30-minute traffic report. Refer to the APP: MEASUREMENTS appendix in the
Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when report was prepared, in the form hours:minutes:seconds.

b = Number of successful initial contact rating queries on 0+, 0-, or 1+ postpay coin calls.

c = Customer abandons before operator queue. Number of times the back party went on-hook before being queued for an operator on a 1+ postpay automated coin toll service (ACTS) or non-ACTS coin call.

d = Customer abandons while on operator queue. Number of times the back party went on-hook while queued on a 1+ postpay ACTS or non-ACTS coin call.

e = Initial contact - rating failures. Number of initial contact rating query failures on 0+, 0-, or 1+ postpay coin calls. Associated calls are given treatment according to "INI RAT FL" in RC/V View 8.9.

f = Seizures resulting in operator being attached. Number of times an operator was attached to a 1+ postpay ACTS or non-ACTS coin call.

g = Number of successful initial coin rating queries on 0+, 0-, or 1+ prepay non-ACTS coin calls.

h = Customer abandons before operator queue. Number of times the back party went on-hook before being queued for an operator on a 1+ prepay non-ACTS coin call.

i = Customer abandons while on operator queue. Number of times the back party went on-hook while queued on a 1+ prepay non-ACTS coin call.

j = Initial coin rating failures. Number of initial coin rating query failures on 0+, 0-, or 1+ prepay non-ACTS calls. Associated calls are given treatment according to "INI RAT FL" in RC/V View 8.9.

k = Seizures resulting in operator being attached. Number of times an operator was attached to a 1+ prepay non-ACTS coin call.

l = Total sent-paid coin calls. Number of operator-handled and automated 1+ sent paid coin calls. This count is equal to the sum of PREPAY PERPD, PREPAY STAPD, POSTPAY PERPD, POSTPAY STAPD, PERFORMANCE INIT in OP:TRFC30-OVOEQ.

m = Postpaid calls shared as sent paid. Number of initial 0+, 0-, or 1+ postpay coin calls with a class of charge of sent paid floated by an operator.

n = Non-ACTS compatible calls shared as sent paid. Number of initial 0+, 0-, or 1+ postpay or prepay coin calls received on a non-ACTS trunk that were floated by an operator with a sent paid class of charge.

o = Successful initial coin rating queries. Number of successful initial coin rating queries on 0+, 0-, or 1+ prepay ACTS coin calls.

p = Rating failures on initial coin queries. Number of initial rating query failures on 0+, 0-, or 1+ prepay ACTS coin calls. Associated calls are given treatment according to "INI RAT FL" in RC/V View 8.9.
q = Seizures sent to an operator. Number of times any of the following events occurred on a 1+ prepay ACTS coin call during the initial contact:
- Originating call treatment had timed out (10 seconds) waiting for an announcement process to be created.
- The announcement process failed to activate an announcement circuit.
- Routing to an announcement circuit failed.
- The announcement process informed originating call treatment of an announcement circuit hardware failure.

r = Customer abandons before deposit announcement. Number of calls on which the back party went on-hook before the initial deposit announcement on a 1+ prepay ACTS coin call after the call had entered a state where it was waiting for connection to an announcement circuit. Once a call is attached to the announcement circuit, this measurement will not be scored.

s = Customer abandons during deposit announcement. Number of calls on which the back party went on-hook during the initial deposit announcement or while the coin deposits were being detected on a 1+ prepay ACTS coin call.

t = Customer flashes during deposit. Number of calls on which the back party flashed during the initial deposit announcement or while the coin deposits were being detected on a 1+ prepay ACTS coin call.

u = Customer time-outs during deposit collection. Number of calls on which an interim coin deposit timeout occurred during the initial coin deposits on a 1+ prepay ACTS coin call.

v = Seizures sent to an operator due to a large charge. Number of 1+ prepay ACTS coin calls that were successfully attached to an announcement service circuit during initial contact but were subsequently routed to an operator because of large charge, that is, amount due was greater than 5 times LRG CHG THR in RC/V View 8.9.

w = Operator overrides. Number of 0+, 0-, or 1+ prepay ACTS initial seizures and 0+, 0-, or 1+ postpay initial seizures at an operator position where the operator performed an override and then floated the call.

x = Initial deposits satisfied with manual coin detection. Number of times an operator floated a 0+, 0-, or 1+ postpay or prepay, ACTS or non-ACTS initial coin call with a class of charge of sent paid.

y = Coin sent-paid calls reaching end of initial period. Number of coin sent paid calls that reached the end of the initial period and a notification announcement was required. This measurement is not scored when a notification announcement is not required.

z = No notify announcement due to lack of resources. Number of times any of the following events occurred at the end of the initial period of a coin-sent-paid call and a notification announcement was required:
- A 3-port conference circuit could not be obtained (call proceeded into grace period).
- Call processing could not define a path to the announcement circuit (call was routed to an operator).
- Call processing failed to route to an announcement circuit (call was routed to an operator).
- Call processing was waiting for an announcement circuit to be connected and a software failure or timeout (10 seconds) indication was received (call was idled).

a = Number of successful interim coin rating queries on coin sent paid calls.
b^1 = Interim coin rating failures. Number of long-duration interim coin rating failures at the end of overtime periods on coin sent paid calls (call was consequently routed to an operator) plus the number of times that the real-time rating service (RTRS) does not respond to an interim coin rating query.

c^1 = Fully automated charges due seizures. Number of times an overtime seizure occurred for which automation was attempted. This measurement is scored whether or not an announcement circuit was successfully attached.

d^1 = Number of automated coin calls on which the back party flashed after the call had been successfully attached to an announcement circuit. The call was consequently routed to an operator.

e^1 = Number of coin calls on which an intercoin timeout occurred. The call was consequently routed to an operator.

f^1 = Number of coin calls on which the back party went on-hook without satisfying the deposit during an automated overtime seizure after an announcement circuit had been attached. This measurement is not to be scored when the event occurs with no charge due.

g^1 = Number of times an operator was attached to an automated coin call during an overtime seizure with a large charge (amount due was greater than 5 times LRG CHG THR in RC/V View 8.9) after a conference circuit was successfully obtained.

h^1 = Number of times an operator floated or performed a record ticket on an overtime seizure.

i^1 = Operator overrides on charges due seizure. Number of times an operator overrode the charge due on an overtime seizure. The measurement is scored when the operator floats or performs a record ticket on the overtime seizure.

j^1 = Charges due seizures cannot be performed. Number of times any of the following events occurred after successful rating queries on overtime charge-due seizures:
- A 6-port conference circuit could not be obtained (call was consequently routed to an operator if a 3-port conference circuit could be obtained; if not, call proceeds to next overtime period). For pre-paid overtime for coin calls (PPOCC), the call is idled.
- Call processing could not define a path to the announcement circuit (call was consequently idled).
- Call processing failed to route to an announcement circuit (call was consequently routed to an operator).
- Call processing was waiting for an announcement circuit to be connected and software failure or timeout (10 seconds) indication was received (call was consequently routed to an operator).

k^1 = Successful end-of-call coin rating queries. Number of successful end-of-call rating queries for automated coin calls. The call was ended when either the back party flashed or went on-hook during an overtime period or the forward party went on-hook. This measurement is also scored when an operator enters the PAID key to initiate an end-of-call rating query and the query is successful. The operator typically does this on an automated end-of-call seizure that is routed to an operator when an end-of-call rating query fails.

l^1 = End-of-call rating failures. Number of end-of-call rating query failures, including replies that indicated long duration, on automated coin calls. The call was ended when either the back party flashed or went on-hook during an overtime period or the forward party went on-hook. This measurement is also scored when an operator enters the PAID key to initiate an end-of-call rating query.
query and the query fails. The calls were routed to an operator if "EOC RAT FL" is equal to "OPR" in RC/V View 8.9.

$m^1$ = Fully automated end-of-call seizures. Number of attempted automated end-of-call seizures regardless of whether an announcement circuit could be attached, a walkaway occurred, or the call was routed to an operator for large charge collection. Large charge means that the amount due is greater than 5 times what is indicated in "LRG CHG THR" in RC/V View 8.9.

$n^1$ = End-of-call seizures sent to operator. Number of times an operator was successfully attached to an automated coin call during an end-of-call seizure with a large charge (amount due was greater than 5 times what is indicated in "LRG CHG THR" in RC/V View 8.9) and a conference circuit was successfully requested. The excludes times a conference circuit is not requested, (there is no announcement circuit or forward party on the call).

$o^1$ = Coin-paid walkaways on fully automated seizures. Number of coin calls on which the back party answered an end-of-call ringback and then hung up during the announcement. Also includes the number of coin calls on which the back party did not answer an automated ringback within 30 seconds.

$p^1$ = Coin-paid walkaways on seizures handled by operator. Number of times an operator floated or performed a record ticket on an overtime charge-due seizure or end-of-call seizure on which a walkaway had occurred.

$q^1$ = Operator overrides of coin detection circuitry. Number of times an operator floated or performed a record ticket on an end-of-coin-call seizure after performing an override during the end-of-call seizure.

$r^1$ = Operator attached due to lack of coin detection circuit. Number of times an operator was successfully requested after a successful rating query at the end of an automated coin call and any of the following events occurred:
- An announcement circuit could not be attached to the call because of AM routing throttling.
- Routing to an announcement circuit failed.

Also includes the number of times any of the following events occurred which resulted in the coin call being routed to an operator:
- The call timed out (10 seconds) on an automated overtime charge-due seizure waiting for confirmation that an announcement circuit had been attached or a routing failure occurred when attempting to attach the announcement circuit and the back party had gone on-hook.
- The call timed out (10 seconds) on an automated end-of-call seizure waiting for confirmation that an announcement circuit had been attached or a routing failure occurred when attempting to attach the announcement circuit.
- An end-of-call seizure was routed to an operator.
- An announcement circuit failure or announcement failure occurred after an announcement circuit was successfully attached on an overtime seizure where the back party had subsequently gone on-hook or on an end-of-call seizure.

$s^1$ = Customer flashes during fully automated seizure. Number of automated coin calls on which the back party flashed after the call had been successfully attached to an announcement circuit during an end-of-call seizure. The calls were consequently routed to an operator.

$t^1$ = Customer time-outs during fully automated seizure. Number of automated coin calls on which an
intercoin timeout occurred during an end-of-call seizure. The calls were consequently routed to an operator.

\[ u^1 \] = Deposits satisfied on seizures handled by operator. Number of times an operator floated or performed a record ticket for an end-of-coin-call seizure for which the deposit was satisfied or an override was performed for the end-of-call charges. Also includes no-charge end-of-call seizures released by an operator.

\[ v^1 \] = Number of times any of these events occurred:
- The grace period ended on an automated coin call which coincided with the beginning of the first overtime period.
- When a call failed to be routed to an operator because the deposits were not satisfied on an automated overtime charge-due seizure and switch data indicated that the first overtime period had not been entered.
- After a successful rating query for the first overtime period and after a failure to obtain a 6-port conference circuit and a subsequent failure to obtain a 3-port conference circuit on an automated coin call and switch data indicated that the first overtime period had not been entered.

\[ w^1 \] = Number of non-ACTS coin calls on which any of these events occurred:
- The grace period ended just before entering the first overtime period.
- The call failed to be routed to an operator at the end of an overtime period and switch data indicated that the first overtime period had not been entered.
- After a successful rating query for the first overtime period and after a failure to obtain a 3-port conference circuit and switch data indicated that the first overtime period had not been entered.

\[ x^1 \] = Number of initial coin rating queries successfully sent to RTRS.

\[ y^1 \] = Number of interim coin rating queries successfully sent to RTRS.

\[ z^1 \] = Number of end-of-call coin rating queries successfully sent to RTRS.

\[ a^2 \] = Total number of PPOCC that received answer. For interflowed calls, this is pegged on the sending side.

\[ b^2 \] = Total number of times there were two successive rating failures on a PPOCC call. For interflowed calls, this is pegged on the sending side.

\[ c^2 \] = Total number of walkaways after a switch to post-paid overtime coin service after two successive rating failures. For interflowed calls, this is pegged on the sending side.

2. REASON FOR OUTPUT

To respond to a request for an immediate or scheduled output of section 103: OSPS CAMA TONE DECODER MEASURES. This message is in response to the input message. Data for up to five switching modules (SMs) can be reported in a single message.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a  = Time report was generated, in the form hours:minutes:seconds.
b  = SM number.
c  = Number of times the digital service unit 2/local digital service unit function (DSU2/LDSUF) centralized automatic message accounting (CAMA) tone decoder was accessed.
d  = Number of times a request to a DSU2/LDSUF CAMA tone decoder failed because there were no idle decoders.
e  = Number of DSU2/LDSUF CAMA tone decoder circuits found in an active, non-idle state or a state other than active (including out-of-service and any other maintenance state for a CAMA tone decoder) every 10 seconds.
f  = Number of DSU2/LDSUF CAMA tone decoder circuits found in a state other than active every 100 seconds.

2. REASON FOR OUTPUT

To respond to a request for an immediate or scheduled output of section 134: Operator Services Position System (OSPS) directory assistance (DA) call completion and intercept measures of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = DA calls outpulsed - operator keying. Number of DA calls attempted to a retrieved number as a result of a request by operator keying. The operator indicated to the external information system (EIS) that call completion is desired.
c = DA calls outpulsed - DTMF keying. Number of DA calls attempted to a retrieved number as a result from a request by caller dual tone multi-frequency (DTMF) keying in response to automated announcement prompting.
d = DA calls outpulsed - no operator intervention. Number of DA calls attempted to a retrieved number without operator intervention.
e = Total DA calls outpulsed. Total number of DA calls attempted to a retrieved number regardless of how call completion was requested. This count is equal to the sum of 'b', 'c', and 'd'.

f = DA calls outpulsed - autocollect. Number of directory assistance (DA) calls outpulsed to a retrieved number with an autocollect class of charge. This includes calls where the EIS returned an indication that the call may be completed and charged to the retrieved directory number. This also includes those calls where autocollect has been requested by the operator.

g = Number of DA calls outpulsed to a retrieved number with an automated coin toll service (ACTS) class of charge.

h = Number of DA calls outpulsed to a retrieved number with an automated calling card service (ACCS) class of charge.

i = Number of DA calls outpulsed to a retrieved number with an operator-handled, hotel guest, paid class of charge.

j = Number of DA calls outpulsed to a retrieved number with a non-coin, non-operator, paid class of charge.

k = Number of DA calls outpulsed to a retrieved number with an operator-handled collect class of charge from non-coin or hotel stations.

l = Number of DA calls outpulsed to a retrieved number with an operator-handled third number class of charge from non-coin or hotel stations.

m = Number of DA calls outpulsed to a retrieved number with an operator-handled sent paid or direct distance dialed (DDD) class of charge from non-coin stations.

n = Number of DA calls outpulsed to a retrieved number with an operator-handled "person paid" class of charge from non-coin stations.

o = Number of DA calls outpulsed to a retrieved number with an operator-handled "calling card" class of charge from non-coin or hotel stations.

p = Number of DA calls outpulsed to a retrieved number with an operator-handled "collect" class of charge from coin stations.

q = Number of DA calls outpulsed to a retrieved number with an operator-handled "third number billing" class of charge from coin stations.

r = Number of DA calls outpulsed to a retrieved number with an operator-handled "station paid" class of charge from coin stations.

s = Number of DA calls outpulsed to a retrieved number with an operator-handled "person paid" class of charge from coin stations.

t = Number of DA calls outpulsed to a retrieved number with an operator-handled "calling card" class of charge from coin stations.

u = Total number of automatic number identification (ANI) intercept calls. This count is equal to the total number of calls received with intercept classes 0, 1, 2, or 3.

v = Total number of operator number identification (ONI) intercept calls. This count is equal to the total number of calls received with intercept classes 5, 6, 7, or 8.
\[ w = \text{Total number of "vacant code intercept calls". This count is equal to the total number of calls received with intercept classes 0 or 7.} \]

\[ x = \text{Total number of trouble intercept calls. This count is equal to the total number of calls received with intercept classes 1 or 8.} \]

\[ y = \text{Number of intercept calls that could not find information in the EIS data base.} \]

\[ z = \text{Total number of intercept calls. This is the total number of incoming OSPS calls labeled as intercept by ACD call type determination and includes: ANI intercept calls, ONI intercept calls, and improperly signaled intercept calls given service (based upon non-zero "DEST IDX" in RC/V view 8.9).} \]

\[ a^1 = \text{Number of intercept calls outpulsed to a retrieved number with an autocollect class of charge.} \]

\[ b^1 = \text{Number of intercept calls outpulsed to a retrieved number with a "no charge" class of charge.} \]

\[ c^1 = \text{Number of intercept calls outpulsed to a retrieved number as a result from a request by operator keying. The operator indicated to the EIS that call completion was desired.} \]

\[ d^1 = \text{Number of intercept calls outpulsed to a retrieved number without operator intervention.} \]

\[ e^1 = \text{Intercept call completion requests outpulsed. Total number of intercept call completion requests outpulsed to a retrieved number, regardless of how call completion was requested. This count is equal to the sum of }'c^1', \text{ and }'e^1'. \]

</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 221: on-demand b-channel (ODB) - packet switching unit (PSU) shelf of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Packet switching unit (PSU) number.
d = PSU shelf number.
e = Total number of attempts. Attempts to seize a PSU shelf time slot. This peg count is the number of attempts to seize a PSU shelf time slot to set up an on-demand B-channel (ODB) connection.
f = Overflow. Denied attempts to seize a PSU shelf time slot. This overflow count is the number of attempts to seize a PSU shelf time slot to set up an ODB connection that was denied because an idle time slot was not available.
g = Total usage. Total usage of an ODB PSU shelf time slot. This is the total usage (100-second scan) of ODB PSU shelf time slots. This includes traffic usage for ODB calls plus the maintenance usage of the time slots.
h = Maintenance usage. Maintenance usage of an ODB PSU shelf time slot. This is the maintenance usage (100-second scan) of ODB PSU shelf time slots. This is the cumulative amount of time that each PSU shelf time slot was not available to carry traffic and includes maintenance activity for an ODB that makes PSU shelves unavailable for service.
i = Total time slots. PSU shelf time slots for ODB calls. This peg count is the total number of PSU...
shelf time slots for an ODB calls. This quantity is computed based on the data available from the static database, and the state of a PSU shelf being in service or out-of-service does not affect this number.

\[ j \]

= On-demand B-channel time slots. PSU shelf time slots available for ODB calls. This peg count is the number of PSU shelf time slots available for ODB calls. This excludes PSU shelf time slots used for provisioned B-channels, D-channels, embedded operations channels (EOC), and time-slot management channels (TMC). This quantity is computed based on the data available from the static database, and the state of a PSU shelf being in service or out-of-service does not affect this number.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or a scheduled output of section 124: Operator Services Position System (OSPS) External Information System (OEIS) data links measures of the 30-minute traffic report. This section collects and prints measurements for each link. Each link is associated with a particular switching module (SM). A maximum of 6 links can be printed on the ROP. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = EIS identification number per customer.
c = EIS call processing data link (CPDL) number.
d = EIS link attempts. Total number of attempts to send a message on the CPDL.
e = EIS link attempts dropped. Number of attempts to send a message on the CPDL that were dropped due to hardware failures, system initialization, or other system problems. This number is equal to 'd' minus 'f' and 'g'.
f = EIS link overload. Number of attempts to send a message on the CPDL that could not be sent due to message buffer overflow.
g = Successful access to EIS link. Number of attempts to send a message on the CPDL that were successfully sent or buffered for transmission.
h = EIS responses received. Number of messages received on the CPDL from EIS.
i = EIS link transmission capacity. The average usage of the CPDL bandwidth expressed as a percentage of the maximum link capacity, MAX MSGS indicated in RC/V View 21.51. The percentage is calculated by the following formula:

4. ACTIONS TO BE TAKEN

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report. Refer to the OP:TRFC30 input message for additional information.

Since each link is associated with a particular SM, the validity for the corresponding SM applies to the individual links. Refer to the Administrative Model AM data XNDLDSL (office dependent data) which has attributes xnamid and xnamrl corresponding to EIS_ID and LINKNO and gdport.module for SM number.

An overflow count greater than zero indicates that the CPDL was unable to support the message traffic being assigned to the data link. This may be due to assignment of too many calls to the data link (RC/V View 21.51), more than the expected average number of messages required per call, or data link problems requiring a significant number of message retranmissions.

The USAGE count is based upon the MAX MSGS value specified in Recent Change View 21.51. The actual number of messages sent and received on a CPDL is dependent upon the maximum number of calls assignable to the CPDL (RC/V View 21.51), the average number of messages associated with each call, and the actual bandwidth of the facility and equipment used on the data link during normal operating conditions.

If the OVFL count is greater than zero under normal data link conditions, reduce the number of calls assignable to the CPDL, MAX CALLS. If the USAGE count routinely exceeds 100% and no OVFL counts are indicated, the MAX MSGS parameter is set too low; conversely, if the USAGE count is consistently under 100% and OVFL counts occur regularly, the MAX MSGS parameter is set too high.

2. REASON FOR OUTPUT
To respond to a request for either an immediate or scheduled output of section 61: Operator Services Position System (OSPS) facility administration (OFA) measures of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Number of times a position was released from a call when the call was operator-initiated and there existed a forward number and back number.

c = Operator-initiated external hand offs. Number of times a call is completed to an external operator using a route number or international route number. This count is pegged in these cases:
- A call is handed off to an external operator [such as, mobile, marine, toll station, international operating center (IOC)].
- A call is position released or placed in chargeable hold for OSPS timing and billing.

d = 0+ non-coin calls. Number of times when a position was seized with an initial, intermediate switching point (ISP) originated, 0+, or good automatic number identification (ANI) call from a non-coin or automatic charge quotation service (ACQS) station. This includes seizures associated with automated calling card service (ACCS) sequence calls.

e = 0- non-coin calls. Number of times when a position was seized with an initial, ISP originated, 0-, or good ANI call from a non-coin or ACQS station. This includes seizures associated with ACCS sequence calls.

f = 0+ ACCS calls. Number of 0+ calls that were provided with ACCS treatment. This includes calls that are subsequently routed to a position due to flash, keying in 0, or timing out after the bong tone.

g = Operator number identification calls. Number of transfer centralized automatic message accounting (CAMA), system CAMA, or ISP calls that were sent to an operator because of ANI failure (ANIF) or because operator number identification (ONI) was required. This count is equal to the sum of ANIFAIL and UNEQ in OP:TRFC30-OTA.

h = CCQS quote efforts. Number of times an attempt was made to send a voice quote message to an ACQS establishment.

i = Person-paid calls. Number of times a position was released from a call from a non-coin station and the class-of-charge was person paid.

j = Collect calls. Number of times a position was released from a call from a non-coin station and the class-of-charge was collect.

k = Third party billing. Number of times a position was released from a call from a non-coin station and the class-of-charge was third-number billing.

l = DDD billing. Number of times a position was released from a call from a non-coin station and the class-of-charge was direct distance dialing (DDD).

m = Station-paid calls. Number of non-coin station paid calls that had a class-of-charge of hotel or paid.
n = Calling card class of charge. Number of times a position was released from a call from a non-coin station and the class-of-charge was calling card.

o = Total operator non-coin calls. Number of calls from a non-coin station released from a position and the class-of-charge was person paid, collect, third-number billing, DDD, station paid, or calling card. This count is equal to the sum of 'i', 'j', 'k', 'l', 'm', and 'n'.

p = Incoming inward non-coin calls. Number of incoming inward calls for which digit analysis identified the inward code as 121 or 1158 which was entered by an operator who originated the inward call.

q = Incoming inward operator calling card. Number of incoming inward calls for which digit analysis identified the inward code as 1160 or 1172 which was entered by an operator who originated the inward call.

r = Incoming inward automatic calling card validations. Number of automated inward calling cards, network call denial (NCD), and calling card plus NCD validations received (inward codes 1161, 1162, 1166, 1168, and 1170 which were entered by operators who originated the inward call). The excludes validations for calling cards. This count is equal to the sum of 10DIGIT, DTMF/TT, and MF in OP:TRFC30-OTA.

s = Number of requests for automated inward international billed number screening (IBNS) service received. This number is the sum of "AUTO BNS INWARD REQUESTS:IBNS-DTMF/TT" and "AUTO BNS INWARD REQUESTS:IBNS-MF" in OP:TRFC30-OTA.

t = Number of requests for automated inward billed number screening (AIBNS) service received. This count is equal to the sum of "AUTO BNS INWARD REQUESTS: AIBNS-DTMF/TT" and "AUTO BNS INWARD REQUESTS:AIBNS-MF" in OP:TRFC30-OTA.

u = Incoming transfer CAMA calls. Number of times the OSPS switch received a transfer CAMA call.

v = Incoming system CAMA-ONI. Number of times the OSPS switch received a system "CAMA ANIF/ONI" call.

w = Incoming non-ISP calls. Number of calls arriving on a non-ISP trunk for which an automatic call distributor (ACD) request was made for an operator. This does NOT include ALL calls arriving on non-ISP trunks. Calls such as CAMA, inward, and DIOR do not peg this measurement. This count is pegged for these calls:
- Directory assistance calls arriving on non-ISP trunks which are routed to a terminal for handling.
- Calls arriving on non-ISP trunks which must be set up to go to an operator at a terminal.

These may arrive on non-ISP trunks because ISP trunks cost more to engineer, and the office wishes to use existing trunking instead. The calls are handled with toll and assistance (T&A) type functionality, although it may be somewhat limited.

x = Rating queries attempted. Number of Real-Time Rating System (RTRS) query attempts. This count is equal to the sum of QUERIES SENT TOTAL and NOT SENT TOTAL in OP:TRFC30-ORTR.

y = LICCD queries attempted. Number of line information data base calling card (LICCD) query attempts. This count is equal to the sum of LICCD SENT and NSENT in OP:TRFC30-OATQ.
z = LIBNS queries attempted. Number of line information data base billed number screening (LIBNS) query attempts. This count is equal to the sum of LIBNS SENT and NSENT in OP:TRFC30-OATQ.

a^1 = ANSI TCAP query attempts. Number of American National Standard Institute (ANSI) transaction capabilities application part (TCAP) query attempts. This count is equal to the sum of 89CCC SENT and NSENT in OP:TRFC30-OATQ.

b^1 = 3-port conference circuit requests initiated. Number of times an OSPS call, either operator-assisted or automated, requested a three-port conference circuit. Determination of whether a three-port or six-port conference circuit is needed on the call depends on the number of parties on the call and whether the call needs to be attached to a recorded announcement function circuit.

c^1 = 6-port conference circuit requests initiated. Number of times an OSPS call, either operator-assisted or automated, requested a six-port conference circuit. Determination of whether a three-port or six-port conference circuit is needed on the call depends on the number of parties on the call and whether the call needs to be attached to a recorded announcement function circuit.

d^1 = 3-port conference circuit requests not served. Number of times when a hardware failure (that is, a circuit was not usable) or communication failure prevented OSPS from getting a three-port conference circuit. The events pegged for this count are different from those for 3-PORT CCOFL in OP:TRFC30-UCONF.

e^1 = 6-port conference circuit requests not served. Number of times when a hardware failure (that is, a circuit was not usable) or communication failure prevented OSPS from getting a 6-port conference circuit. The events pegged for this count are different from those for 6-PORT CCOFL in OP:TRFC30-UCONF.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 3: office totals (OFC) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of originating requests for dial pulse.
c = Number of originating requests for touch tone.
d = Number of incoming requests for dial pulse.
e = Number of incoming requests for multi-frequency.
f = Number of customer dialing irregularities.
g = Number of terminating calls to busy.
h = Number of terminating calls to intercept.
i = Number of terminating calls to answer.
j = Number of terminating calls to ring/no answer.
k = Number of total incoming requests for revertive pulsing.
l = Number of common channel interoffice signaling number 6 (CCIS6) incoming requests.
m = Number of integrated services digital network (ISDN) user part incoming requests.
n = Number of telephone user part incoming requests.
= Number of outgoing requests for multi-frequency.

p = Number of CCIS6 outgoing requests.

q = Number of ISDN user part outgoing requests.

4. ACTION TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with the input message OP:TRFC30 using the VLD option:

OP:TRFC30:VLD

The validity of the administrative module (AM) applies to this section.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 3: office totals (OFC) of the
30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Originating requests for dial pulse. Number of times the system initiates action leading to a
readiness to receive customer dial pulse digits. The measurement is taken as soon as the particular
line requesting service is identified. This count may peg multiple times for an originating attempt if
the call is retried because of resource failures.
c = Originating requests for touch tone. Number of times the system initiates procedures to place
itself in a ready state to receive customer touch-tone service digits, or to process a call for which
digits are not required. This measurement is taken at the time the terminal requesting service is
identified. This count may peg multiple times for an originating attempt if the call is retried because
of resource failures.
d = Incoming requests for dial pulse. Number of times the system initiates action leading to a
readiness to receive dial pulse digits. This measurement is taken as soon as the particular dial
pulse trunk requesting service is identified.
e = Incoming requests for multi-frequency. Number of times the system initiates action leading to a
readiness to receive either multifrequency or touch-tone digits from the network or to process a call
for which digits are not required. This measurement is taken as soon as the particular trunk
requesting service is identified.
f = Customer dialing irregularities. Line originations that result in the system’s receipt of at least one
digit and that receive a reorder treatment [that is, 120 interruptions per minute (IPM)] tone, voice
announcement, special tone, or intercept treatment (which may be provided at another location) due
to a customer dialing irregularity. The following customer-initiated actions will increment this count: dialing insufficient digits, dialing too many digits, dialing invalid digits/characters, activating invalid features, and dialing non-existent/disconnected codes/numbers.

- **g** = Terminating calls to busy. Number of calls in which a line busy (60 IPM) occurs.
- **h** = Terminating calls to intercept. Number of terminating calls routed on trunks to automatic intercept system. All types of intercepts (that is, regular intercept, blank number intercept, deny termination, and out of service intercepts) are included in this count. Dialing directory numbers that are no longer in-service or changed numbers are examples of call types that result in intercept treatment.
- **i** = Terminating calls to answer. Number of terminating calls which result in the system recognizing a customer line answer.
- **j** = Terminating calls to ring/no answer. Number of terminating calls for which ringing was applied to the terminating line, audible ringing was returned to the calling customer, and an originating disconnect signal was received prior to a line answer signal.
- **k** = Total incoming requests for revertive pulsing. Number of times the system initiates procedures to place itself in a ready state to receive revertive pulse digits from the network. This measurement is taken as soon as the particular trunk requesting service is identified.
- **l** = Common channel interoffice signaling number 6 (CCIS6) incoming requests. Number of times an incoming CCIS6 common channel signaling attempt has been made. This event provides a total count of CCIS6 CCS attempts on a per-protocol basis.
- **m** = Integrated services digital network (ISDN) user part incoming requests. Number of times an incoming call attempt request [(that is, initial address message (IAM)] was received for a CCS7 ISUP trunk. This event provides a total count of ISUP CCS attempts on a per-protocol basis.
- **n** = Telephone user part incoming requests. Not used by the NAR market switch and will always generate a zero.
- **o** = Number of outgoing requests for multi-frequency.
- **p** = Number of CCIS6 outgoing requests.
- **q** = ISDN user part outgoing requests. Number of times an outgoing call attempt request (that is, IAM) was sent for a CCS7 ISUP trunk.
- **r** = BICC incoming requests. Number of times an incoming call attempt request [(that is, initial address message (IAM)] was received for a BICC group.
- **s** = BICC outgoing requests. Number of times an outgoing call attempt request (that is, IAM) was sent for a BICC group.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 3: office totals (OFC) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Originating requests for dial pulse. Number of times the system initiates action leading to a readiness to receive customer dial pulse digits. The measurement is taken as soon as the particular line requesting service is identified. This count may peg multiple times for an originating attempt if the call is retried because of resource failures.

c = Originating requests for touch tone. Number of times the system initiates procedures to place itself in a ready state to receive customer touch-tone service digits, or to process a call for which digits are not required. This measurement is taken at the time the terminal requesting service is identified. This count may peg multiple times for an originating attempt if the call is retried because of resource failures.

d = Incoming requests for dial pulse. Number of times the system initiates action leading to a readiness to receive dial pulse digits. This measurement is taken as soon as the particular dial pulse trunk requesting service is identified.

e = Incoming requests for multi-frequency. Number of times the system initiates action leading to a readiness to receive either multifrequency or touch-tone digits from the network or to process a call for which digits are not required. This measurement is taken as soon as the particular trunk requesting service is identified.

f = Customer dialing irregularities. Line originations that result in the system's receipt of at least one digit and that receive a reorder treatment [that is, 120 interruptions per minute (IPM)] tone, voice
announcement, special tone, or intercept treatment (which may be provided at another location) due to a customer dialing irregularity. The following customer-initiated actions will increment this count: dialing insufficient digits, dialing too many digits, dialing invalid digits/characters, activating invalid features, and dialing non-existent/disconnected codes/numbers.

\( g \) = Terminating calls to busy. Number of calls in which a line busy (60 IPM) occurs.

\( h \) = Terminating calls to intercept. Number of terminating calls routed on trunks to automatic intercept system. All types of intercepts (that is, regular intercept, blank number intercept, deny termination, and out of service intercepts) are included in this count. Dialing directory numbers that are no longer in-service or changed numbers are examples of call types that result in intercept treatment.

\( i \) = Terminating calls to answer. Number of terminating calls which result in the system recognizing a customer line answer.

\( j \) = Terminating calls to ring/no answer. Number of terminating calls for which ringing was applied to the terminating line, audible ringing was returned to the calling customer, and an originating disconnect signal was received prior to a line answer signal.

\( k \) = Total incoming requests for revertive pulsing. Number of times the system initiates procedures to place itself in a ready state to receive revertive pulse digits from the network. This measurement is taken as soon as the particular trunk requesting service is identified.

\( l \) = Common channel interoffice signaling number 6 (CCIS6) incoming requests. Number of times an incoming CCIS6 common channel signaling attempt has been made. This event provides a total count of CCIS6 CCS attempts on a per-protocol basis.

\( m \) = Integrated services digital network (ISDN) user part incoming requests. Number of times an incoming call attempt request [(that is, initial address message (IAM)] was received for a CCS7 ISUP trunk. This event provides a total count of ISUP CCS attempts on a per-protocol basis.

\( n \) = Telephone user part incoming requests. Not used by the NAR market switch and will always generate a zero.

\( o \) = Number of outgoing requests for multi-frequency.

\( p \) = Number of CCIS6 outgoing requests.

\( q \) = ISDN user part outgoing requests. Number of times an outgoing call attempt request (that is, IAM) was sent for a CCS7 ISUP trunk.

\( r \) = BICC incoming requests. Number of times an incoming call attempt request [(that is, initial address message (IAM)] was received for a BICC group.

\( s \) = BICC outgoing requests. Number of times an outgoing call attempt request (that is, IAM) was sent for a BICC group.

\( t \) = Packet overflow. Number of BICC requests that could not be processed because no more packet facilities were available in the office.

SECTION 97: OSPS INTERFLOW LISTING SERVICES/C-ACD MEASURES

OSPS_ID SENT
b       c
.       .
.       .
.       .

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 97: Operator Services Position System (OSPS) interflow listing services/ commercial-automatic call distributor (C-ACD) measures (OINTA) of the 30-minute traffic report. This section was formerly titled "OSPS Interflow Non-T&A Calls Sent Measures". Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Identification number of the receiving OSPS office.
c = Non-T&A interflow calls sent. Number of times originating call treatment determined that the serving team assigned to handle a call was activated for interflow through reroute and the call was consequently attempted to be rerouted to the network.

3.2 Parameters

<table>
<thead>
<tr>
<th>Data collection unit</th>

SECTION 96: OSPS INTERFLOW T&A CALLS RECEIVED MEASURES

OSPS_ID RECVD BLKD PKLOST
b c d e
.
.
.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 96: Operator Services Position System (OSPS) interflow toll and assistance (T&A) calls received (OIRCV) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Identification number of the sending OSPS office.
c = Interflow toll and assistance calls received. Number of interflow calls received from the sending interflow switch. It is pegged when a voice channel terminal process on the receiving interflow switch end of an interflow extended digital subscriber line (EDSL) link received a call setup request from a voice channel terminal process on the sending interflow switch end of the link. The call setup request indicated the reception of an interflow call.
d = Double interflow T&A attempts. Number of times the automatic call distributor (ACD) on the receiving interflow switch received an interflow call and determined that the serving team assigned to serve the call was activated for interflow. Interflow calls cannot be interflowed a second time.
e = Interflow T&A destination packets lost. Number of times an X.25 level 3 data packet could not be queued on the receiving interflow switch for transmission across the data channel to the sending interflow switch because the transmit queue was full.

3.2 Parameters

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 95: Operator Services Position System (OSPS) interflow toll and assistance (T&A) calls sent (OISNT) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Identification number of the receiving OSPS office.
c = Interflow toll and assistance calls sent. Number of T&A interflow calls sent by the sending interflow switch to each receiving interflow switch. It is pegged when a voice channel terminal process that interfaces with an interflow extended digital subscriber line (EDSL) link on the sending interflow switch received a position termination request from the automatic call distributor (ACD) and sent a call setup request to the receiving interflow switch.
d = Interflow T&A destination overflow. Number of times the ACD on the sending interflow switch attempted to route an incoming call to a voice channel terminal process that interfaces with an interflow EDSL link but none of the processes was available.
e = Interflow T&A destination link occupancy. Percentage of time that the voice channels on an interflow EDSL link were busy with calls. This was derived by scanning every 100 seconds for the status of the voice channel terminal processes that interface with an interflow EDSL link on the sending switch. Accumulated with each scan is the number of terminal processes that were busy handling an interflowed call divided by the total number of terminal processes. The number reported is the average of the accumulations multiplied by 100.
f = Interflow T&A destination packets lost. Number of times an X.25 level 3 data packet could not be queued on the sending interflow switch for transmission across the data channel to the receiving interflow switch because the transmit queue was full.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 195: Operator Services Position System (OSPS) line applications for consumers (LAC) signaling measures and local number portability (LNP) signaling measures of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

A variable with '*' in the definition represents a measurement that is collected in the direct link node (DLN) when a DLN is present. If the office is equipped with the DLN and the set of variables with '*' are zero, this suggests that DLN failed to report these variables and these variables are invalid for the reporting period. These measurements will be scored on the administrative module (AM) if DLN is not present.

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = The total number of LAC query attempts from the OSPS to a database. This variable is equal to the sum of variables 'c' and 'd'.

c = *The number of LAC queries sent from the OSPS to a database.

d = The number of LAC queries not sent from the OSPS to a database. This variable is equal to the sum of variables 'e', 'f', 'g', and 'h'.

e = *The number of LAC queries not sent because of OSPS hardware problems including administrative module (AM) overload or other internal problems.

f = *The number of LAC queries not sent because a cutback was in effect to accommodate a database overload as indicated by the automatic call gapping (ACG) parameter in the reply.

g = *The number of LAC queries not sent because of common channel signaling (CCS) network problems.

h = *The number of LAC queries not sent because a query ID was not available.

i = The total number of LNP query attempts. This variable is equal to the sum of variables 'j' and 'k'.

j = *The number of LNP queries sent.

k = The number of LNP queries not sent. This variable is equal to the sum of variables 'l', 'm', 'n', and 'o'.

l = *The number of LNP queries not sent because of OSPS hardware problems including AM overload, CNI ring (including direct link node) down, or other internal problems.

m = *The number of LNP queries not sent because a cutback was in effect to accommodate a database overload as indicated by the ACG parameter in the reply.

n = *The number of LNP queries not sent because of CCS network problems.
\( o \) = *The number of LNP queries not sent because a query ID was not available.

\( p \) = *The number of LAC intermediate call disposition messages (CDM) and end CDMs generated.

\( q \) = The number of LAC test queries that are initiated by maintenance personnel. This does not include any replies to the test query.

\( r \) = The number of LNP test queries that are initiated by maintenance personnel. This does not include any replies to the test query.

\( s \) = The total number of LAC abnormal network replies received. These were LAC queries that did not reach the destined database and were returned by the network. This variable is equal to the sum of variables \( l \), \( m \), \( n \), \( o \), \( p \), \( q \), \( r \), and \( s \).

\( t \) = *The number of American National Standards Institute (ANSI) and transaction capabilities application part (TCAP) replies of no translation data for an address of such nature.

\( u \) = *The number of ANSI and TCAP replies of subsystem congestion.

\( v \) = *The number of ANSI and TCAP replies of network congestion.

\( w \) = *The number of ANSI and TCAP replies of unequipped user.

\( x \) = *The number of ANSI and TCAP replies of subsystem failure.

\( y \) = *The number of ANSI and TCAP replies of no translation data for this specific address.

\( z \) = The total number of abnormal network LNP replies received. These were LNP queries that did not reach the destined database and were returned by the network. This variable is equal to the sum of variables \( a^{1} \), \( b^{1} \), \( c^{1} \), \( d^{1} \), \( e^{1} \), \( f^{1} \), \( i^{1} \), and \( j^{1} \).

\( a^{1} \) = *The number of LNP replies of no translation data for an address of such nature.

\( b^{1} \) = *The number of LNP replies of subsystem congestion.

\( c^{1} \) = *The number of LNP replies of network congestion.

\( d^{1} \) = *The number of LNP replies of unequipped user.

\( e^{1} \) = *The number of LNP replies of subsystem failure.

\( f^{1} \) = *The number of LNP replies of no translation data for this specific address.

\( g^{1} \) = *The number of ANSI and TCAP replies of network failure.

\( h^{1} \) = *The number of TCAP replies of unqualified.

\( i^{1} \) = *The number of LNP replies of network failure.

\( j^{1} \) = *The number of LNP replies of unqualified.

\( k^{1} \) = *The number of LAC queries that were initiated then aborted as a result of the OSPS receiving either a U-abort or P-abort from the network.

\( l^{1} \) = *The number of times a number 2 line applications for consumers (2LAC) query was initiated and a reply, indeterminate reply, or abnormal reply was not received by the OSPS before the timing
parameter was exceeded.

\( m^1 \) = The number of 2LAC queries that were initiated then abandoned.

\( n^1 \) = *The number of LAC unexpected replies received by the OSPS when the OSPS has timed out while waiting for a reply; or, a query was not sent but a reply was received.

\( o^1 \) = *The number of "error in message format" replies received from the 2LAC in TCAP.

\( p^1 \) = *The number of LAC replies that contained an ACG overload indicator component.

\( q^1 \) = *The number of LNP queries that were initiated then aborted as a result of the OSPS receiving either a U-abort or P-abort from the network.

\( r^1 \) = *The number LNP queries that timed out because no reply (normal or abnormal) was received before the timing parameter was exceeded.

\( s^1 \) = The number of LNP queries that were initiated then abandoned (canceled by call processing because of caller abandon or operator action).

\( t^1 \) = *The number of unexpected LNP replies received because the OSPS has timed out while waiting for a reply; or, a query was not sent but a reply was received.

\( u^1 \) = *The number of LNP replies received in which the OSPS detected an invalid message format.

\( v^1 \) = *The number of LNP replies that contained an ACG overload indicator component.

\( w^1 \) = The number of replies received from a card database indicating a valid card/personal identification number (PIN) combination.

\( x^1 \) = The number of LAC replies received from a card database indicating a billing number was not found resulting in a denial of service for the offered billing. This includes replies with a binary equivalent value of 4 when a deny reply code value of 4 is received.

\( y^1 \) = The number of LAC replies received from a card database indicating a "PIN service denial indicator of 4" (PSDi4) response.

\( z^1 \) = The number of LAC replies received from a card database indicating a denial of service because the PIN did not match the calling card number.

\( a^2 \) = The number of LAC replies received from a card database with a binary equivalent value of 7 indicating a "deny call - card ineligible for service" when a deny reply code value of 7 is received.

\( b^2 \) = The number of LAC calling card reject errors received from a card database.

\( c^2 \) = The number of calling card "missing group" replies received from a card database.

\( d^2 \) = The number of calling card "non-participating group" replies received.

\( e^2 \) = The number of calling card "no network resource available" replies received.

\( f^2 \) = The number of billed number screening (BNS) replies received that indicated that collect or bill to third billing should be allowed.

\( g^2 \) = The number of BNS replies received that indicated that collect or bill to third billing should be denied. This includes replies with a binary equivalent value of 4 when a deny reply code value of 4
is received.

\( h^2 \) = The number of times a BNS query does not return an allowed or denied response for a collect or bill to third query.

\( i^2 \) = The number of times a reject error was received in response to a BNS query.

\( j^2 \) = The number of replies that indicate that the line information database (LIDB) was unable to find a record in response to a BNS request or the database reply indicated "vacant group", "unexpected data value", or "missing customer record."

\( k^2 \) = The number of normal BNS query responses received indicating that a record was found for the billing number.

\( l^2 \) = The number of BNS "missing group" replies received.

\( m^2 \) = The number of BNS "non-participating group" replies received.

\( n^2 \) = The number of BNS "no network resource available" replies received.

\( o^2 \) = *The number of attempts that qualify for network access interrupt (NAI) processing and resulted in a query being sent to the 2LAC.

\( p^2 \) = The number of allow replies received from the 2LAC in the signaling component indicating that the attempt should be allowed due to NAI causes.

\( q^2 \) = The number of deny replies received from the 2LAC in the signaling component indicating that the attempt should be denied due to NAI causes. TCAP reply codes of 1, 4, 5, 22-24 are summed to create this measurement.

\( r^2 \) = The number of NAI replies received from the 2LAC in the reply indicating that the attempt should be thresholded as identified by the receipt of a "continue" message with an operation set to "send notification termination."

\( s^2 \) = *The number of NAI reject error replies received.

\( t^2 \) = The number of NAI vacant code replies received.

\( u^2 \) = The number of NAI replies that resulted in an "unexpected data parameter" from the 2LAC in TCAP.

\( v^2 \) = The number of NAI replies that resulted in a "misrouted query" from the 2LAC in TCAP.

\( w^2 \) = The number of NAI replies that resulted in a "missing parameter" reply code from the 2LAC in TCAP because one or more required parameters were not included in the query.

\( x^2 \) = The number of NAI task refused replies received in TCAP.

\( y^2 \) = The number of NAI replies that resulted in an "unexpected input data value" from the 2LAC in TCAP.

\( z^2 \) = The number of valid LNP replies received (including those with Report Error - Not Portable components).

\( a^3 \) = The number of return error components received with not portable error codes (destination number, billing number, and ANI). Note that there can be more than one of these per LNP reply.
\[ b^3 \] = The number of reject error LNP replies received.

\[ c^3 \] = The number of LNP replies with a return error other than "not portable." This includes "unexpected data value", "task refused", "missing parameter", and "unexpected parameter."

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 220: Operator Services Position System (OSPS) line applications for consumers (OLNS) signaling query measures of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

A variable with “*” in the definition represents a measurement that is collected in the direct link node (DLN) when a DLN is present. If the office is equipped with the DLN and the set of variables with “*” are zero, this suggests that DLN failed to report these variables and these variables are invalid for the reporting period. These measurements will be scored on the administrative module (AM) if DLN is not present.

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = *Number of OLNS queries sent.
c = Number of OLNS queries attempted but not sent.
d = *Number of OLNS queries not sent to the database because the CNI ring was not available.
e = *Number of OLNS queries not sent because of ACG control cutback.
f = *Number of OLNS queries not sent to the database because of network management control cutback.

g = *Number of OLNS queries not sent to the database because query ID not available.

h = *Number of OLNS queries not sent to the database because AM conditions.

i = Number of OLNS test queries.

j = Number of OLNS total abnormal query replies.

k = *Number of OLNS abnormal query replies because of address of such nature.

l = *Number of OLNS abnormal query replies because of no translation for this address.

m = *Number of OLNS abnormal query replies because of subsystem congestion.

n = *Number of OLNS abnormal query replies because of subsystem failure.

o = *Number of OLNS abnormal query replies because of unequipped user.

p = *Number of OLNS abnormal query replies because of network failure.

q = *Number of OLNS abnormal query replies because of network congestion.

r = *Number of total OLNS replies received.

s = *Number of unexpected query replies.

t = *Number of query replies with invalid format.

u = Number of queries that timed out waiting for a query reply.

v = Number of error messages returned from the database because of missing group or misrouted.

w = Number of error messages returned from the database because of nonparticipating group.

x = Number of error messages returned from the database because of unavailable network resources.

y = Number of reject messages received.

z = Number of queries that were aborted due to customer abandonment or operator change of billing type.

a¹ = Number of total valid format query replies.

b¹ = Number of error messages returned from the database because of unexpected data value or vacant group.

c¹ = Number of query responses received from the database indicating that a record for the data contained in the query was found in the database.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or a scheduled output of section 123: Operator Services Position System (OSPS) miscellaneous calls (OMISC) measures of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.
3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = DIOR trunks. Number of direct international originations (DIOR) call attempts. When the call is interflowed, the measurement is pegged in the sending switch. Test calls (10X/958,10X/959,10X), calls with signaling errors and sequence calls are not included.

c = DIOR calls upon initial position seizure. Number of initial DIOR calls that are not eligible for automated treatment that seized an operator position. When the call is interflowed, the measurement is pegged in the sending switch. Sequence calls that result in an operator seizure and subsequent operator handled calls are not included.

d = DIOR calling card calls. Number of operator handled DIOR calls completed having a "calling card" class of charge. This includes initial, subsequent and subsequent directory assistance (DA) completion calls. When the call is interflowed, the measurement is pegged in the sending switch.

e = DIOR collect calls. Number of operator handled DIOR calls completed having a "collect" class of charge. This includes initial, subsequent and subsequent DA completion calls. When the call is interflowed, the measurement is pegged in the sending switch.

f = DIOR third number billing calls. Number of operator handled DIOR calls completed having a third number billing class of charge. This includes initial, subsequent and subsequent DA completion calls. When the call is interflowed, the measurement is pegged in the sending switch.

g = DIOR calls with no charge. Number of operator handled DIOR calls completed having a "no charge" class of charge. This includes initial, subsequent and subsequent DA completion calls. When the call is interflowed, the measurement is pegged in the sending switch.

h = DIOR calls with other class of charge. Number of operator handled DIOR calls completed having an "other" class of charge (that is, not calling card, collect, third number, or no charge). This includes initial, subsequent and subsequent DA completion calls. Unlikely to occur unless originating line screening (OLS) was populated to allow sent paid or autocollect classes of charge and the DIOR operator used such a class of charge on a DIOR call. When the call is interflowed, the measurement is pegged in the sending switch.

i = DIOR ACCS - sequence calls attempted. Number of DIOR automatic calling card service (ACCS) sequence calls attempted. A DIOR caller who is eligible for a DIOR sequence call presses the "#" sign to request a sequence call. To be eligible for a DIOR sequence call, the previous call must have been billed to a calling card and RC/V data for the originating country must allow automated calling. Refer to RC/V View 27.7. This measurement is not pegged for sequence ACCS DA completion calls. When the call is interflowed, the measurement is pegged in the sending switch.

j = DIOR ACCS - sequence calls that seize operator position. Number of valid DIOR ACCS sequence calls that seized an operator position. This can occur if the calling card requires manual validation. This can also occur if a caller attempts to dial a sequence call with a number that is terminating code screening (TCS) restricted and the RC/V data specifies that TCS restricted numbers should seize an operator position as specified in RC/V Views 27.1 and 27.2. This measurement is also pegged for sequence ACCS DA completion calls. When the call is interflowed, the measurement is pegged in the sending switch.

k = DIOR ACCS - billed to calling card. Number of DIOR ACCS sequence calls that completed. This
includes completed sequence calls that were either fully automated or that seized an operator position. This also includes sequence ACCS CICADA accepted DA calls and DA completion calls that originated as ACCS sequence. When the call is interflowed, the measurement is pegged in the sending switch.

l = Calls with MECH treatment allowed. Number of calls for which more efficient call handling (MECH) treatment was allowed. This measurement is pegged on both the sending and receiving switch in an interflow configuration.

m = Calls with MECH calls treatment received. Number of MECH calls released prior to outpulsing in order to float the call until the forward party answers. This means the call received MECH treatment. This measurement is pegged on both the sending and receiving switch in an interflow configuration.

n = MECH calls going to an operator with flash. Number of MECH calls connected to an operator due to calling customer flash. When the call is interflowed, the measurement is pegged in both the sending and receiving switch.

o = MECH calls - routed to MECH holding announcement. Number of MECH calls successfully routed to an announcement facility for the MECH holding announcement. This measurement is pegged on the receiving switch in an interflow configuration.

p = MECH calls unable to be routed to MECH holding announcement. Number of MECH calls that could not be routed to an announcement facility for the MECH holding announcement. This measurement is pegged on the receiving switch in an interflow configuration.

q = MECH calls going to MECH with answer supervision. Number of MECH calls connected to a second operator due to the reception of forward party answer supervision from the called station. When the call is interflowed, the measurement is pegged in both the sending and receiving switch.

r = Off-hook received to third number. Number of times an off-hook was received on a connection to a third number when the class of charge was a back third number and the improved third number acceptance (ITNA) feature is active. If multiple connections are made to a third party and multiple off hooks are received on the connection by the same third party number the count is only increment by one. Examples of when multiple connections might be made using the same third party number are when voice path has distorted transmission or the back party changes from intraLATA to an interLATA call. When the call is interflowed, the count must be pegged only at the sending switch.

s = Third number calls with third number acceptance secured. Number of third number calls for which ITNA was secured when the class of charge was a back third number. This count is only incremented by one when the accept billing key is depressed once or multiple times and the “ACCPT BLG” is displayed when a call is released from the operator position. When the call is interflowed, the count must be pegged only at the sending switch.

t = BNS replies to queries on third number. Number of times the billed number screening (BNS) database returned a reply of “always accept” in response to a ITNA query on a third number when the class of charge was a back third number. When the call is interflowed, the count must be pegged only at the sending switch.

u = Listing service verbal announcement. Number of times the listing access complete key (may also be known as verbal report) was depressed for a verbal announcement. The listing access complete key is a vendor controlled key.

v = AATOS calls. Number of 1+800 calls marked as non-software defined network/network remote access (SDN/NRA) calls when routed from the OSPS. The calls originate as 1+800 alternate
access to operator services (AATOS) or SDN/NRA, but are routed over the public network.

\( w \) = SDN/NRA 0- calls. Number of 0- calls marked as SDN/NRA calls when routed from the OSPS. Pegged only on initial calling card calls that are routed over the private network.

\( x \) = SDN/NRA 0+ calls. Number of 0+ calls marked as SDN/NRA calls when routed from the OSPS. Pegged only on initial calling card calls that are routed over the private network.

\( y \) = SDN/NRA 01+ calls. Number of 01+ calls marked as SDN/NRA calls when routed from the OSPS. Pegged only on initial calling card calls that are routed over the private network.

\( z \) = SDN/NRA 1+800 calls. Number of 1+800 calls marked as SDN/NRA calls when routed from the OSPS. Pegged on all calls that originate as 1+800 AATOS or SDN/NRA, but are routed over the private network.

\( a^1 \) = SDN/NRA sequence calls. Number of sequence calls marked as SDN/NRA calls when routed from the OSPS. Pegged for automated sequence calls that are routed over the private network.

\( b^1 \) = VMS operator-handled call attempts. Number of voice message service (VMS) operator-handled call attempts. It is considered an attempt, and is pegged when a correct service code and a valid access code, that is, 1ZXXX or 19ZXXX, is entered.

The VMS measurements information for variable fields \( 'b^1', 'c^1', 'd^1', \) and \( 'e^1' \) will be reported in OP:TRFC30-OVMS if the OSPS VMS SVC measurements secured feature is active.

\( c^1 \) = VMS operator-handled call completions. Number of VMS operator-handled call completions. This is pegged on completion of the call information transfer process.

\( d^1 \) = VMS automated call attempts. Number of VMS automated call attempts. It is considered an attempt, and is pegged when a correct service code and a valid access code, such as, 1ZXXX or 19ZXXX, is entered.

\( e^1 \) = VMS automated call completions. Number of VMS automated call completions. This is pegged on completion of the call information transfer process.

\( f^1 \) = Initial DIOR calls eligible for automated treatment. Number of initial DIOR calls eligible for automated treatment. Eligible calls are those received from countries that have the "automated handling allowed" bit set to Y.

\( g^1 \) = Initial DIOR calls eligible for automated treatment - connected before successful entry. Number of initial DIOR calls eligible for automated treatment that are connected to the operator before successful forward number entry by the caller. This will happen if the caller dials nothing and times out, dials 0, 0#, dials a forward number that encounters a terminating point restriction, or dials an invalid forward number. This will be pegged on the sending switch in an interflow configuration.

\( h^1 \) = Initial DIOR calls eligible for automated treatment - connected after entry prompt. Number of initial DIOR calls eligible for automated treatment that are connected to the operator after the caller has successfully dialed the forward number and the OSPS has played the card entry prompt. This happens if following the card prompt the customer times out, dials 0, dials 0#, OLS restricts calling card billing, or the customer dials a card number that receives a network call denial. This will be pegged on the sending switch in an interflow configuration.

\( i^1 \) = Fully automated DIOR calls. Number of fully automated initial DIOR calls that are answered by the forward party. This includes CICADA accepted DA calls and DA completion calls that originated as ACCS.
j = Total number of completion of interLATA calls accessing directory assistance (CICADA) - eligible directory assistance (DA) calls handled by the OSPS - whether or not the caller accepted CICADA service.

k = Total number of CICADA-accepted DA calls answered by local exchange carrier (LEC) DAs. A CICADA-eligible DA call becomes a CICADA-accepted DA call once the caller accepts the CICADA service.

l = Total number of subsequent DA completion calls completed (such as, answered) that resulted because the caller accepted the CICADA service offer while receiving automated treatment.

m = Total number of subsequent DA completion calls completed (such as, answered) that resulted because the caller accepted the CICADA service offer while receiving operator treatment.

n = Total number of DIOR country-to-country (CTC) requests attempted. This number is pegged if the DIOR call passes the following country pair screening (CPS) checks: The call is an automated initial, automated sequence, or operator-assisted DIOR call and the forward number is either an international forward number or a North American numbering plan (NANP) forward number where the NPA-NXX is outside the United States as indicated by RC/V View 26.6.

o = Total DIOR CTC call requests attempted. This peg count is the total number of DIOR CPS requests that are allowed. This is pegged when a successful DIOR CPS ATTEMPT passes the these additional data checks:

- The DIOR originating country code and carrier has an entry in RC/V View 27.8.

- For the originating country code and carrier, the called number is allowed based on RC/V View 27.8 data that defines the completion type and related terminating countries (in the terminating country identifier list field). Possible completion types and their meanings are:
  
  MEMBER = Allowed only if call is to a country defined to be a DIOR club member.
  MEMBER+ = Allowed only if call is to a DIOR club member country or to a country defined in the terminating country identifier list.
  MEMBER− = Allowed only if the call is to a DIOR club member country that is not defined in the terminating country identifier list.

- For MEMBER, MEMBER+, and MEMBER−, the terminating country is defined to be a member in either RC/V View 26.6 for NANP international, or RC/V View 27.8 for international forward numbers.

p = DIOR speed calling attempts. Total number of attempts of automated initial DIOR speed dialing calls, operator assisted DIOR speed dialing calls, and sequenced DIOR speed dialing calls. This count is pegged after the DIOR speed dialing access code entered has been verified as matching the DIOR speed dialing service access code (DSD SERVICE CODE) on RC/V View 8.9.

q = Successful DIOR speed calling attempts. Number of successfully translated DIOR speed dialing speed codes. This count is pegged after a DIOR speed dialing call attempt has successfully completed translating the speed code to a forward number using RC/V View 27.9.
**r**

- Total number of times the sum of direct international origination offered transfer to operator (DOTTO) announcements A1, A2, A3, A4, A5, A6, A7, and A8 are offered to the customer.

**s**

- Total number of times that callers accept transfer to an operator after any of the DOTTO announcements A1 through A8 have been played and operator seizure has resulted.

**t**

- Total number of times a DOTTO call that has been routed to an operator results in a call attempt. This single measurement is the sum of call attempts to a new number and calls to the same number.

**u**

- Total number of times a call has resulted in an automated sequence call after announcement A2, A4, A5, A6, and A8 have been played.

**v**

- DIOR CPS special screening checks. Total number of calls that received DIOR CPS special screening table checks.

**w**

- DIOR CPS card screening. Total number of calls (initial and sequence) that received DIOR CPS special screening table checks and are eligible for DIOR CPS-card screening.

**x**

- DIOR CPS card screening completed. Total number of calls (initial and sequence) routed for completion that received DIOR CPS special screening table checks and were eligible for DIOR CPS-card screening.

**y**

- DIOR CPS terminating operator handling. Total number of calls (initial and sequence) that received DIOR CPS special screening table checks and are eligible for DIOR CPS-terminating operator handling.

**z**

- DIOR CPS terminating operator handling completed. Total number of calls (initial and sequence) routed for completion that received DIOR CPS special screening table checks and were eligible for DIOR CPS-terminating operator handling.

**a**

- DIOR I800 call attempts. Total number of DIOR international 800 (I800) call attempts, where the forward number is determined to be an 800 number.

**b**

- DIOR I800 "toll free" calls answered. Total number of DIOR I800 "Toll-free" calls that are successfully answered.

**c**

- DIOR I800 "caller paid" calls answered. Total number of DIOR I800 "Caller-paid" calls that are successfully answered.

**d**

- DIOR I800 blocked calls. Total number of DIOR I800 "Blocked" calls that result in the caller hanging up, without a new call attempt being made.

**e**

- ICS calls routed to the EIS. Number of inmate calling services (ICS) calls routed to the external information system (EIS). This measurement counts the number of request action messages sent to the EIS by OSPS.

**f**

- ICS calls completed by the EIS. Number of ICS calls completed by the EIS. This measurement counts the number of initial begin billing messages received by OSPS from the EIS.

**g**

- ICS timer T1 expired. Number of times that the ICS timer T1 has expired. Timer T1 is used when OSPS informs the vendor of the arrival of a call that's eligible for inmate calling services treatment. It is also used when a call terminating error condition is encountered after communication has been established with the EIS.
h = ICS timer T2 expired. Number of times that the ICS timer T2 has expired without OSPS receiving a call processing data link (CPDL) message from the EIS. Timer T2 is used when OSPS recognizes that the EIS has gone off-hook on the external audio response unit (ARU) trunk selected by OSPS for communication between the back party and the EIS.

i = ICS timer T3 expired. Number of times that the ICS timer T3 has expired without OSPS receiving a CPDL message from the EIS. Timer T3 is used when OSPS has determined that billing is acceptable for the associated call and that, from an OSPS perspective, the call can be allowed to complete.

j = DIOR network remote access allow. Number of DIOR calls where the forward number is determined to be a DIOR network remote access (NRA) 800 number and the DIOR NRA treatment is allowed.

k = DIOR NRA allow calls answered. Number of allowed DIOR NRA calls successfully answered.

l = DIOR NRA calls blocked. Number of DIOR calls where the forward number is determined to be a DIOR NRA 800 number and the DIOR NRA treatment is blocked.

m = Automated calls. Number of automated calling card service (ACCS) calls and automated position system (APS) calls that invoke automation of TCS/CPS override (ATCO) processing.

n = ATCO operator assisted calls. Number of operator-assisted initial seizure calls with TCS/CPS card restrictions that are eligible for ATCO processing. This does not include APS calls.

o = Operator transferred calls. Number of calls that are transferred to ATCO processing by the operator. This does not include APS calls.

p = Calls connected to ICVC. Number of ATCO calls that successfully connect to the international card verification center (ICVC) and receive answer supervision.

q = Information announcement calls. Number of times the call information announcement is played to the ICVC attendant on ATCO calls.

r = Verified calls. Number of ATCO calls that enter into a verification dialogue between the ICVC attendant and the caller.

s = Allowed calls. Number of ATCO calls that are allowed by the ICVC attendant prior to the attendant conversing with the caller.

t = Denied calls. Number of ATCO calls that are denied by the ICVC attendant prior to the ICVC attendant conversing with the caller.

u = Other billing requests. Number of ATCO calls that are sent to an operator queue for "other-billing" by the ICVC attendant prior to the ICVC attendant conversing with the caller.

v = Operator assistance requests. Number of ATCO calls that are sent to an operator queue for "operator assistance" by the ICVC attendant prior to the ICVC attendant conversing with the caller.

w = Bailout warning announcement. Number of ATCO calls that are given the bail out warning announcement prior to the ICVC attendant conversing with the caller.

x = Timed out calls. Number of ATCO calls that are sent to an OSPS operator queue due to the caller being "split" for too long a period of time prior to the ICVC attendant conversing with the caller. This number includes bail outs from the initial call set-up segment of an ATCO call.
\[ y^2 = \text{Allowed calls. Number of ATCO calls that are allowed by the ICVC attendant after the ICVC attendant converses with the caller.} \]

\[ z^2 = \text{Denied calls. Number of ATCO calls that are denied by the ICVC attendant after the ICVC attendant converses with the caller.} \]

\[ a^3 = \text{Other billing calls. Number of ATCO calls that are sent to an operator queue for "other-billing" by the ICVC attendant after the ICVC attendant converses with the caller.} \]

\[ b^3 = \text{Operator assistance calls. Number of ATCO calls that are sent to an operator queue for "operator-assistance" by the ICVC attendant after the ICVC attendant converses with the caller.} \]

\[ c^3 = \text{Warning calls. Number of ATCO calls that are given the bail out warning announcement during the verification dialogue between the ICVC attendant and caller.} \]

\[ d^3 = \text{Time out calls. Number of ATCO calls that are sent to an OSPS operator queue due to the verification dialogue continuing for too long a period of time or due to a delay in the entering of a call disposition after the ICVC attendant has "split" the caller.} \]

\[ e^3 = \text{Help messages. Number of times the help message is given to an ICVC attendant for an ATCO call prior to the ICVC attendant conversing with the caller.} \]

\[ f^3 = \text{Invalid DTMF entries. Number of times that the ICVC attendant keys in an invalid dual tone multifrequency (DTMF) entry for an ATCO call prior to the ICVC attendant conversing with the caller.} \]

\[ g^3 = \text{Abandoned calls. Number of times that the caller abandons an ATCO call prior to the ICVC attendant conversing with the caller.} \]

\[ h^3 = \text{Disconnected calls. Number of times that the ICVC attendant disconnects an ATCO call unexpectedly prior to having a verification dialogue with the caller.} \]

\[ i^3 = \text{Call duration. Total duration of ATCO calls prior to the ICVC attendant conversing with the caller. The duration is represented as "minutes:seconds." This is the "minutes" portion of the duration value.} \]

\[ k^3 = \text{Help messages. Number of times the help message is given to the ICVC attendant during the verification dialogue of an ATCO call.} \]

\[ l^3 = \text{Invalid entries. Number of times that the ICVC attendant keys an invalid DTMF entry during the verification dialogue of an ATCO call.} \]

\[ m^3 = \text{Abandoned calls. Number of times that the caller abandons during the verification dialogue of an ATCO call.} \]

\[ n^3 = \text{ICVC attendant disconnected calls. Number of times that the ICVC attendant disconnects an ATCO call unexpectedly during the verification dialogue with the caller.} \]

\[ o^3 = \text{Call duration. Total duration of ATCO calls after the ICVC attendant and caller enter into a verification dialogue. The duration is represented as "minutes:seconds." This is the "minutes" portion of the duration value.} \]

\[ q^3 = \text{Number of callers who receive a busy VMS prompt announcement.} \]

\[ r^3 = \text{Number of callers who receive a ring/no answer VMS prompt announcement.} \]
\(^{3}\)s = Number of callers who are eligible for the ring/no answer VMS prompt announcement but who hang up before the announcement playback begins.

\(^{3}\)t = Rejected DIOR commercial calling attempts. Number of times a commercial credit card (CCC) number entry on a DIOR call is rejected because the call was ineligible for CCC billing.

\(^{3}\)u = Successful DIOR routed and answered calling attempts. Number of DIOR calls where the forward number is a personal toll-free (PTF) number and the call was successfully routed and answered.

\(^{3}\)v = CAS7 queries checked. Number of CAS7 queries attempted to check if the DIOR toll-free number entered is a PTF number.

\(^{3}\)w = PTF numbers that are toll-free. Number of replies received from PTF checks which indicate that the toll-free number is a PTF number.

\(^{3}\)x = PTF numbers that are not toll-free. Number of replies received from PTF checks which indicate that the toll-free number is not a PTF number.

\(^{3}\)y = Indeterminate replies from PTF check. Number of indeterminate replies received from PTF checks. This includes queries not sent due to hardware or software problems, query timeouts, abnormal replies received, error replies received indicating protocol errors, garbled messages received, abort messages received, etc.

\(^{3}\)z = DIOR calling card restrictions for NAR terminations. Number of DIOR initial and sequence card calls that encounter a DIOR calling card restrictions to domestic terminations (CCRDT) restriction and the restriction is applied to the call.

This count excludes those calls in which the restriction is automatically overridden. Included in this count are those calls in which a non-AT&T card has been blocked or an AT&T card was blocked or restricted by the CCRDT restrictions.

2. **REASON FOR OUTPUT**

   To respond to a request for either an immediate or scheduled output of section 63: Operator Services Position System (OSPS) real-time rating (ORTR) query measures of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. **VARIABLE FIELD DEFINITIONS**

3.1 **Variables**

   a = Time when the report was prepared, in the form hours:minutes:seconds.

   b = Rate queries sent. Number of rating queries sent to the real-time rating service (RTRS) database. This number is equal to the sum of variables 'c', 'd', 'e', 'p', and 'l'.
c = Rate quote queries sent. Number of rate quote queries sent to the RTRS database.

d = CCQS queries sent. Number of centralized charge quotation system (CCQS) queries sent to the RTRS database.

e = T&C queries sent. Number of time and charges (T&C) queries sent to the RTRS database.

f = Rating queries not sent. Number of rating queries not sent to the RTRS database. This variable is equal to the sum of variables 'g', 'h', and 'j'.

 g = Rating query/hardware problems. Number of rating queries not sent to the RTRS because of database link hardware problems. This count is not pegged when a test query cannot be sent to RTRS because of link hardware problems.

h = Rating query/database cutback. Number of rating queries not sent to the RTRS because of database cutbacks.

i = Number of CL initial and subsequent RTRS queries that are not successfully rated.

j = No rating query ID available. Number of rating queries not sent to the RTRS because no query identifiers were available.

k = Number of CL initial and subsequent RTRS queries that are successfully rated.

l = CL queries sent to RTRS. Number of card limit (CL) queries sent to the RTRS database including initial and subsequent queries.

m = Rating query abort. Number of times that a rating query was canceled by call processing.

n = Coin reply rate failures. Number of coin rating query failures.

o = Coin reply success. Number of successful coin rating queries.

p = Coin queries sent. Number of coin rating queries sent to the RTRS database.

q = Rate reply/database not able to process. Number of RTRS query replies received that indicated that the database was unable to process the reply.

r = Unexpected rating replies. Number of unexpected RTRS query replies received.

s = Rating reply invalid format. Number of RTRS query replies received in an invalid format.

t = Rating query/no reply. Number of times that the OSPS switch timed out waiting for a reply from the RTRS database.

u = Rating database overload replies. Number of RTRS query replies received that contained a non-zero overload indicator.

v = Rating test queries. Number of rating test queries sent to the RTRS database.

w = Rate quote query success. Number of rating query replies received from the RTRS that indicated a rate quote query was successfully rated.

x = Rate quote reply failure. Number of rating query replies received from the RTRS that indicated a rate quote query was not successfully rated.
y = CCQS reply success. Number of rating query replies received from the RTRS that indicated a CCQS query was successfully rated.

z = CCQS reply rate failure. Number of rating query replies received that indicated a CCQS query was not successfully rated. This count also includes replies that were successfully rated but the charges were greater than what hotel billing information system (HOBIS) or hotel billing information center (HOBIC) can receive.

a = T&C reply success. Number of rating query replies received that indicated a T&C query was successfully rated.

b = T&C reply rate failure. Number of rating query replies received that indicated a T&C query was not successfully rated.

c = Total rating replies received. Number of rating query replies received that indicated that the query was successfully rated. This number is equal to the sum of variables 'w', 'y', 'a', and 'o'.

d = Total call-processing rating failures. Number of rating query failures. This number is equal to the sum of variables 'x', 'y', 'b', and 'n'.

e = Total rating replies received. Number of rating query replies received. This number is equal to the sum of variables 'c' and 'd'.

u

2. REASON FOR OUTPUT

To respond to a request for either an immediate or a scheduled output of section 44: Operator Services Position System (OSPS) measurements, of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Incoming OSPS call attempts. Number of incoming OSPS call attempts for:
   - A directory-assistance (DA) call was received.
   - Any automated toll and assistance (T&A) OSPS call (such as, coin, calling card,
inward) was received.

- Any operator-assisted T&A OSPS call was received.
- The end of a time-and-charge call which was routed to an operator.
- An intercept call was received.

\[c\] = Incoming OSPS call attempts failed. Number of incoming OSPS call attempt failures for:

DA and intercept calls

- Call type determination failed.
- Failure to read RC/V View 21.22 to obtain call queue information.
- Failure to read RC/V View 21.7 to determine if interflow was active.
- Failure to read RC/V View 21.27 when interflow, using reroute, was active for the DA serving team assigned to receive the incoming call.
- Could not obtain a directory assistance system computer (DASC) channel number to send a position seizure message to the external information system (EIS).
- Failure to interflow a DA call, using reroute, when interflow was active for the serving team assigned to receive the call.

Automatic call distributor (ACD)

- Failure to send route request message to the ACD.
- Failure to receive acknowledgement from the ACD acknowledging that an operator request was received.
- Call processing determined that the call received was a Commercial ACD call type but COMMERCIAL ACD in RC/V View 8.30 was set to N.
- Failure of ACD to route a call to an operator for reasons other than the call queue was full.
- Failure to set a system timer to wait for an ACD response to an operator request.
- After a second timeout while waiting for a response from the ACD to an operator request.
- When a system interrupt signal was received while the call was waiting for a response to an operator request from the ACD.

Coin toll calls

- The back party went on-hook while the call was being routed to an operator on a 1+ coin call that required an operator for initial customer contact.
- The back party went on-hook while a queue overflow announcement was being played on a 1+ coin call that required an operator for initial customer contact.

- After successfully giving a queue overflow announcement on a 1+ coin call that required an operator for initial customer contact.

- A failure to allocate coin dynamic data on a coin call occurred.

- A 0+ coin test call had bad automatic number identification (ANI).

Others

- Failure to define a path to an operator.

- Failure on an automated calling card service (ACCS) call to release the path to the announcement service circuit on a call that was to be routed to an operator.

- Failure to route to an announcement when a call queue was closed.

- A call queue was closed.

- Failure to route to level 3 delay announcement.

- More than 11 digits were received on an inward call.

- Digit analysis failed on a 950, 0+, 0-, or 011+ call.

- Digit analysis failed on an ACCS call being routed to an operator.

d = Number of successful incoming OSPS call attempts. This count is the sum of 'a' - 'b'.

e = Outgoing OSPS call attempts. Number of times an operator attempted to initiate a call to a point external to the switch using the DIAL key on a basic services terminal (BST) or an operator initiated a delayed call using BK# SEND or FWD# SEND from a video display terminal (VDT) or combined services terminal (CST).

f = Outgoing OSPS call attempts failed. Number of times an operator canceled an external call by entering the DIAL or POSREL key on a BST or a routing failure occurred on an outgoing call as defined by OUTGOING ATTEMPT.

g = Number of successful outgoing OSPS call attempts. Equal to the sum of variables 'd' and 'e'.

h = Local OTRs. Number of local operator trouble reports created by operators who entered SPCL-digits-ENTER at a BST or by operators who entered a valid trouble number at a VDT, CST or BST-LS.

i = Recalls. Number of recall seizures to operators for:

- A failure to set up or play an announcement on a DA or intercept call.

- The back party remained off-hook after the announcement had been played on a DA call.
The back party remained off-hook after the announcement had been played on an intercept call where call completion was not offered to the calling party.

A T&A call, the back party flashed with or without a forward party connected and the call was connected to an operator.

A T&C call had ended and was connected to an operator.

A DA call completion call, the back party flashed with or without a forward party connected and the call was connected to an operator.

A DA call completion call, the back party keyed a dual tone multi-frequency (DTMF) star (*) that OSPS accepted as a DA recall.

OSPS calls sent to reorder. Number of OSPS calls routed to reorder tone for:

- A rating query failed on an initial automated coin toll service (ACTS) coin call.
- Failure to get a conference circuit on an initial ACTS coin call.
- Failure to route a call to an operator.
- Failure to route a call to a closed queue announcement.

OSPS call queue overflow. Number of times the ACD tried to queue a call and either the call queue was full or no call queue data blocks (CQDBs) were available to queue the call. CQDBs are system data allocated to each queued call.

Level 1 delay announcement. Number of times the ACD queued a call and determined that a level 1 delay announcement should be played because the expected delay of the call just queued equals or exceeds the delay 1 threshold assigned to the call queue.

Level 2 delay announcement. Number of times the ACD queued a call and determined that a level 2 delay announcement should be played because the expected delay of the call just queued equals or exceeds the delay 2 threshold assigned to the call queue.

Level 3 delay announcement. Number of times the ACD queued a call and determined that a level 3 delay announcement should be played because the expected delay of the call just queued equals or exceeds the delay 3 threshold assigned to the call queue.

Abandonment. Number of times the ACD successfully removed a queued call for which the back party had gone on-hook.

ACD entries. Number of times a request was made for a connection to an operator or an operator conferenced or transferred a call to a specified operator identifier or position number.

DA customer-controlled recalls. Number of times a DTMF star (*) is received to request reconnection to a listing services/directory assistance (LS/DA) operator position as a recall under the customer-controlled reconnect to LS/DA feature. Also included in variable 'h'.

SS7 nonspeech calls received. Number of incoming OSPS SS7 calls received with an information transfer capability other than "speech" or "3.1-kHz audio" in the initial address message (IAM) user service information parameter. Such calls cannot be handled by OSPS.
t = SS7 wireless calls RCD requiring billable answer returned. Number of SS7 signaled wireless calls for which billable answer was returned. OSPS shall peg this count on calls requiring billable answer after returning the answer message.

u = Existing descriptions deleted. Number of calls received with local number portability (LNP) processing already performed for the called number.

<td>k</td>
<td>l</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or a scheduled output of section 45: Operator Services Position System (OSPS) directory assistance system computer (DASC) or management information system data link (MISLNK) of the 30-minute traffic report. The maximum number of switching modules (SMs) for which DASC or MISLNK measurements are reported is 32. SMs must have the ISDN loadable package to be reported.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared in the form hours:minutes:seconds.
b = SM number.
c = DASC attempts. Number of times the switch attempted to notify the DASC about a directory assistance (DA) position seizure (count 1).
d = DASC attempt failure. Number of times the switch failed to notify the DASC about a DA position seizure because the level 3 protocol was unavailable or down (count 2).
e = DASC attempt overflow. Number of times the switch failed to notify the DASC about a DA position seizure because the level 3 protocol buffers were full (count 3).
f = DASC successful access. Number of times the switch successfully notified the DASC about a DA position seizure (count 4). This count is equal to ‘c’ - ‘d’ - ‘e’.
g = DASC maintenance usage. Number of seconds a DASC port was found to be in an out-of-service state. This count is equal to the accumulation of the number of ports found to be in an out-of-service state every 100 seconds multiplied by 100 (count 5).
h = MISC attempts. Number of times the switch unloaded the MISLNK event buffer to the MISLNK or replied to an MISLNK heartbeat message received from the MISLNK (count 6).

i = MISC attempt failure. Number of times the switch failed to unload the MISLNK event buffer to the MISLNK or failed to reply to an MISLNK heartbeat message received from the MISLNK because the level 3 protocol was unavailable/down (count 7).

j = MISC attempt overflow. Number of times the switch failed to unload the MISLNK event buffer to the MISLNK or failed to reply to an MISLNK heartbeat message received from the MISLNK because the level 3 protocol buffers were full (count 8).

k = MISC successful access. Number of times the switch successfully unloaded the MISLNK event buffer to the MISLNK and successfully replied to the MISLNK heartbeat message (count 9). This count is equal to 'h' - 'i' - 'j'.

l = MISC maintenance usage. Number of seconds a MISLNK port was found to be in an out-of-service state. This count is equal to the accumulation of the number of ports found to be in an out-of-service state every 100 seconds multiplied by 100 (count 10).

m = MISC call control messages. Number of third party call control event messages received by the switch from the MISLNK using the application interface unit (AIU) (count 11).

Type: Output

1. FORMAT

   OP TRFC30 OUTPUT TERMINATED - REPT NOT READY

2. REASON FOR OUTPUT

Reports when the sections currently allowed for output are unable to be printed before the next 30-minute traffic report is formed. This may occur when more than 3-5 sections are allowed for output in a medium to large office or when the message traffic on the printer is heavy. This may also output when an immediate print of a section is requested and a new 30-minute traffic report begins to form while the output is being printed. This may result in incomplete data. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

   No variables.

4. ACTIONS TO BE TAKEN

   If this occurs for more than one 30-minute interval, the user should use the INH:TRFC30 input message to inhibit some or all of the currently allowed sections. To find which sections are currently allowed, the OP:ST-TRFC30 input message should be used.

   If this occurs as a result of an immediate print request, the data may be incomplete. The section can be requested at a later time and the data from the new report will be output.

5. ALARMS

   None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 64: Operator Services Position System (OSPS) toll and assistance (OTA) miscellaneous calls measures of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

- **a** = Time the report was prepared, in the form hours:minutes:seconds.
- **b** = Number of times the early position release indicator was displayed when an operator floated or externally transferred a call.
- **c** = Number of times an operator entered a valid credit number from 1 to 10.
- **d** = Number of times an associated process block (APB) was requested for OSPS call processing and they were exhausted. APBs are system-allocated data required to process OSPS calls.
- **e** = Number of operator-entered trouble numbers sent to a centralized automatic message accounting (CAMA) office on a transfer CAMA call.
- **f** = Number of times the OSPS switch received a rating query reply indicating that a Centralized Charge Quotation System (CCQS) query was successfully rated. This number is equal to CCQS SUCCESS in section 63: TRFC30 ORTR.
- **g** = Number of times an operator released a transfer CAMA call from a position. This results in a POSITION DISCONNECT signal sent to the CAMA office.
- **h** = Number of times the back party flashed on an inward call.
- **i** = Number of times an automated inward network call denial (NCD) validation request was received.
- **j** = Number of times any of the following events occurred:
  - The back party entered a ‘0’ after the bong tone on an automated calling card.
service (ACCS) call and CCC ON was N in RC/V View 8.9, that is, the customer account services - release 2 (CASR2) feature was not turned on.

- If CASR2 is turned on (CCC ON is Y) and the CASR2 initial digit timing parameter (ZERO TIMEOUT) is zero in RC/V View 8.9 then this count is pegged immediately after the back party enters '0' after the ACCS bong tone.

- If the CASR2 feature is turned on and the initial digit timing parameter is greater than zero, then this count is pegged after the back party enters '0' after the ACCS bong tone and the switch times out (as specified by ZERO TIMEOUT) while waiting for a second digit to be entered.

- Pegged any time the 0# keys are entered after the ACCS bong tone.

k = Number of ACCS calls where the back party flashed after the bong tone and before entering the first calling card digit.

l = Number of ACCS calls on which the switch timed out after the bong tone waiting for the first calling card digit to be entered.

m = Number of potential ACCS calls that were routed to operators (the total of 0+KEY0 + FLASH + TO-NK).

n = Number of initial ACCS calls where the back party went on-hook before entering the first calling card digit or while the call was being routed to an announcement circuit for the playing of the bong tone and detection of calling card digits.

o = Number of initial ACCS calls where the back party was keying a calling card number (at least one digit must have been entered), or the back party went on-hook while the call was being routed to the forward party or while the forward party's phone was ringing.

p = Number of ACCS calls where the back party had entered a potentially valid local exchange carrier (LEC) calling card number. This count is pegged before the calling card query is sent.

q = Number of ACCS sequence calls initiated, using a LEC calling card, where the back party entered a # sign at the end of an ACCS call or during the ringing of the forward party's phone.

r = Number of LEC customer-dialed sequence call sequences (batches) initiated. These are first ACCS sequence calls initiated by the back party, using a LEC calling card, whether or not the call was completed.

s = Number of ACCS sequence calls placed with an LEC calling card where the back party went on-hook during the keying of a new forward number, during routing to the forward party, or during ringing of the forward party's phone.

t = Number of ACCS sequence calls placed with an LEC calling card where the back party entered a valid forward number.

u = Average number of ACCS sequence calls, placed with an LEC calling card, per call sequence. This equals the value of ACCS OK divided by the value of ACCS BINIT.

v = Number of subaccount billing (SAB) sequence calls initiated where the back party entered a # sign at the end of a SAB call during TRD timing or during the ringing of the forward party's phone.

w = Number of customer-dialed SAB sequence call sequences (batches) initiated. Number of first SAB sequence calls initiated by the back party in a series of SAB sequence calls whether or not a forward party answered the initial SAB call.
\[x\] = Number of times the back party completed an initial SAB call and nine sequence calls. A call is considered complete only after a forward party has answered.

\[y\] = Number of SAB sequence calls where the back party went on-hook during the keying of a new forward number, during routing to the forward party, or during ringing of the forward party's phone.

\[z\] = Number of SAB sequence calls where the back party entered a valid forward number. If an NCD query was sent, that is, this count was not pegged if the query response was DENY. If the query response was ALLOW or could not be determined because of a query failure, then this count was pegged.

\[a^1\] = Average number of SAB sequence calls per call sequence. Equals the value of SAB OK divided by the value of SAB BINIT.

\[b^1\] = Number of calls where the back party entered a SAB number (1ZX[X][X][X]), that is, ACCESS CODE in RC/V View 8.9 followed by 1 to 4 digits, and the back number was determined not to be screened using original line screening (OLS) from making SAB calls or paid direct distance dialing (DDD) calls.

\[c^1\] = Number of calls where the back party entered a SAB number (1ZX[X][X][X]), that is, ACCESS CODE in RC/V View 8.9 followed by 1 to 4 digits and the back number was determined to be screened using OLS from making SAB calls.

\[d^1\] = Number of operator-assisted inward calling card validations for special number (1160) for non-AT&T.

\[e^1\] = Number of automated inward calling card validation requests received and the number of automated inward calling card plus NCD validation requests received from an operator who was using touch-tone equipment to validate a LEC calling card.

\[f^1\] = Number of automated inward calling card validation requests and the number of automated inward calling card plus NCD validation requests received from an operator who was using multifrequency equipment to validate a LEC calling card.

\[g^1\] = Number of automated inward calls abandoned or timed out during the entry of a LEC calling card number.

\[h^1\] = Number of ACCS and operator-assisted calls where a calling card query response indicated acceptable billing.

\[i^1\] = Number of ACCS and operator-assisted calls where a calling card query response indicated that the calling card number had been rejected.

\[j^1\] = Number of screened calls handled by operators. Equal to SCRND FAIL + SCRND SUCC.

\[k^1\] = Number of times an operator canceled a call on which the back party was screened against one or more classes of charge.

\[l^1\] = Number of times an operator floated or externally transferred a call on which the back party was screened against one or more classes of charge.

\[m^1\] = Number of times the back party flashed for an operator. Equal to SUBSCRBR RECALLS: OP-REC + QUE + OVFL.

\[n^1\] = Number of subscriber recalls where the back party flashed for an operator and the call was not
queued before being served by an operator.

\[ o^1 = \text{Number of subscriber recalls where the back party flashed for an operator and the call was queued before being served by an operator.} \]

\[ p^1 = \text{Number of subscriber recalls where the back party went on-hook after flashing for an operator while the call was queued.} \]

\[ q^1 = \text{Number of subscriber recalls where the back party flashed for an operator but an operator could not be reached because the call queue assigned to receive the recall was full.} \]

\[ r^1 = \text{Number of times an operator routed a call to an inward operator for a calling card validation, that is, the inward code used was 1160, 11601, 1172 and 11721.} \]

\[ s^1 = \text{Number of incoming transfer CAMA calls where the back party went on-hook before being connected to an operator.} \]

\[ t^1 = \text{Average answer time for the incoming transfer CAMA calls (in seconds). The transfer CAMA queue, as defined by CALL TYPE in RC/V View 26.10 is scanned every 10 seconds and the number of calls on queue is accumulated. Equal to the total accumulated queued transfer CAMA calls multiplied by 10 seconds and divided by INCOMING CAMA CALLS XFER in Section 61: TRFC30 OFA.} \]

\[ u^1 = \text{Number of incoming system CAMA calls where the back party were abandoned (that is, on-hook) before being connected to an operator.} \]

\[ v^1 = \text{Average answer time for the incoming system CAMA-operator number identification (ONI) calls (in seconds). The system CAMA queue, as defined by CALL TYPE in RC/V View 26.10 is scanned every 10 seconds and the number of calls on queue is accumulated. Equal to the total accumulated queued system CAMA calls multiplied by 10 seconds and divided by INCOMING CAMA CALLS ONI in Section 61: TRFC30 OFA.} \]

\[ w^1 = \text{Number of calls received on CAMA and ISP trunks requiring ONI due to automatic number identification (ANI) failure.} \]

\[ x^1 = \text{Number of calls received on CAMA and ISP trunks sent to an operator because ONI was required, because the originating office was without ANI equipment or served multi-party lines.} \]

\[ y^1 = \text{Number of incoming ISP, feature group D, or CAMA calls that arrived on ANI-search trunks and there were no OLS screening restrictions.} \]

\[ z^1 = \text{Number of times a billing code of "cd" was entered by an operator and accepted by the switch. The 0-/0+ rate differential feature must be activated.} \]

\[ a^2 = \text{Number of automated inward international billed number screening (IBNS) service requests received from positions equipped with dual tone multifrequency (DTMF)/touch-tone (TT) signaling.} \]

\[ b^2 = \text{Number of automated inward IBNS service requests received from positions equipped with multifrequency (MF) signaling.} \]

\[ c^2 = \text{Number of automated inward IBNS service requests that were terminated because of timeout, abandonment or invalid billing number format.} \]

\[ d^2 = \text{Number of automated inward billed number screening (AIBNS) service requests for collect calls or third number billing calls received from positions equipped with DTMF/TT signaling.} \]
e² = Number of AIBNS service requests for collect calls or third number billing calls received from positions equipped with MF signaling.

f² = Number of AIBNS service requests that were terminated because of timeout, abandon by the distant inward operator, or invalid billing number format.

g² = Number of call attempts for international billed number screening - release 2 (IBNS-2) service.

h² = Number of "Allow Collect" or "Indeterminate Allow" calls for IBNS-2 service.

i² = Number of "Deny Collect," "Public," "NAI Deny," or "Indeterminate Deny" calls for IBNS-2 service.

j² = Number of calls completed (answered) after "Deny Collect," "Public," "NAI Deny," or "Indeterminate Deny" for IBNS-2 service.

k² = Number of attempts of pay phone compensable 800/8YY access calls that completed with card billing.

l² = Number of attempts of pay phone compensable 800/8YY access calls that completed with collect billing.

m² = Number of attempts of pay phone compensable 800/8YY access calls that completed with Bill-To-Third (BT3) billing.

n² = Number of attempts of pay phone compensable 102880+/-, 00-/0+ access calls that completed with card billing.

o² = Number of attempts of pay phone compensable 102880+/-, 00-/0+ access calls that completed with collect billing.

p² = Number of attempts of pay phone compensable 102880+/-, 00-/0+ access calls that completed with Bill-To-Third (BT3) billing.

4. ACTION TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

The validity for the administrative module applies to this section.

5. ALARMS

None.

2. REASON FOR OUTPUT
To respond to a request for either an immediate or scheduled output of of section 102: Operator Services Position System (OSPS) toll and assistance performance (OTAP) measurements of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a  = Time when the report was prepared, in the form hours:minutes:seconds.

b  = Number of attempts to send an autoquote message to an autoquote establishment.

c  = Number of printed autoquote calls.

d  = Number of times that an autoquote message was not sent to the autoquote establishment and a credit record was created for the following events:

- Automatic charge quotation service (ACQS) message buffer pointers were corrupted which resulted in credit records created for each queued autoquote.

- An autoquote message was queued for longer than the value in field "HOBIS/C TIME" of RC/V View 8.9.

- The ACQS message buffer was full (max 100) and a new message arrived replacing a queued autoquote message.

- Failures occurred during transmitting the message to the autoquote establishment and when trying to reroute the message to a hotel billing information system (HOBIS) or hotel billing information center (HOBIC).

e  = Number of autoquote messages successfully rerouted to a HOBIS or HOBIC.

f  = Number of autoquote messages that failed because all autoquote digital subscriber lines (DSL) were busy or call processing could not dial up the autoquote establishment because of a lack of software process control blocks (PCB) or process stacks (PS).

g  = Number of credited voice quote messages that were not sent to HOBIS or HOBIC due to such events as:

- The ACQS message buffer pointers were corrupted which resulted in credit records created for each queued voice quote message.

- A voice quote message was queued for longer than the value in field "HOBIS/C TIME" of RC/V View 8.9.

- The ACQS message buffer was full (max 100) and a new message arrived replacing a queued voice quote message;

- A failure occurred during transmitting the message to HOBIS or HOBIC.

h  = Number of successfully outpulsed international calls signaled as direct dialed, excluding calls to Mexico.

i  = Number of successfully outpulsed international calls signaled as operator-assisted, excluding calls
to Mexico.

\( j \) = Number of automated calling card service (ACCS) calls attempted to be routed to reorder because of terminating code screening (TCS) restrictions for either international or USA calls. (Refer to RC/V Views 27.2 and 27.3)

\( k \) = Number of ACCS calls attempted to be routed to an operator or the automated verification process because of TCS restrictions for either international or USA calls. (Refer to RC/V Views 27.2 and 27.3)

\( l \) = Number of times a calling card call encountered a TCS restriction while the call was at a position (this does not include the initial display given when an automated call is routed to an operator).

\( m \) = Number of ACCS 0+ non-coin calls with a valid calling card number and personal identification number (PIN) (whether restricted or unrestricted) plus the number of calling card query failures with indeterminate billing allowed (Refer to the "BILL BLOCK" and "CAS INDT BLK" parameters in RC/V View 8.9). This measurement will be scored whether the initial or sequence call is automatically routed, routed to an operator, sent to reorder, or the announcement circuit is disconnected.

\( n \) = Number of ACCS 0+ coin calls with a valid calling card number and PIN (whether restricted or unrestricted) plus the number of calling card query failures with indeterminate billing allowed (refer to the "BILL BLOCK" and "CAS INDT BLK" parameters in RC/V View 8.9). This measurement will be scored whether the initial or sequence call is automatically routed, routed to an operator, sent to reorder, or the announcement circuit is disconnected.

\( o \) = Number of residual calls [calls to the special operator services traffic (SOST) operator] released from an operator position.

\( p \) = Number of direct international originations (DIOR) calls with a forward number in a North American numbering plan (NANP) format that were subject to terminating point restriction (TPR) checks.

\( q \) = Number of alternate access to operator service (AATOS) calls with a forward number in a NANP format that were subject to TPR checks.

\( r \) = Number of alternate access to language specific operator services (AATLSOS) calls with a forward number in a NANP format that were subject to TPR checks.

\( s \) = Number of wireless calls with a forward number in a NANP format that were subject to TPR checks.

\( t \) = Number of DIOR calls with a forward number in a NANP format that were blocked or restricted by TPR.

\( u \) = Number of AATOS calls with a forward number in a NANP format that were blocked or restricted by TPR.

\( v \) = Number of AATLSOS calls with a forward number in a NANP format that were blocked or restricted by TPR.

\( w \) = Number of wireless calls with a forward number in a NANP format that were blocked or restricted by TPR.

\( x \) = Number of DIOR calls with a forward number in an international format that were subject to TPR checks.
\( y \) = Number of AATOS calls with a forward number in an international format that were subject to TPR checks.

\( z \) = Number of AATLSOS calls with a forward number in an international format that were subject to TPR checks.

\( a^1 \) = Number of wireless calls with a forward number in an international format that were subject to TPR checks.

\( b^1 \) = Number of DIOR calls with a forward number in an international format that were blocked or restricted by TPR.

\( c^1 \) = Number of AATOS calls with a forward number in an international format that were blocked or restricted by TPR.

\( d^1 \) = Number of AATLSOS calls with a forward number in an international format that were blocked or restricted by TPR.

\( e^1 \) = Number of wireless calls with a forward number in an international format that were blocked or restricted by TPR.

\( f^1 \) = Number of automated inward line screening (AILS) queries sent from the call serving OSPS to retrieve originating line screening (OLS) data.

\( g^1 \) = Number of AILS queries sent from the call serving OSPS to retrieve terminating code screening (TCS) data.

\( h^1 \) = Number of AILS replies received in the call serving OSPS returning OLS data. This measure does not include the error replies received in the call serving OSPS.

\( i^1 \) = Number of AILS replies received in the call serving OSPS returning TCS data. This measure does not include the error replies received in the call serving OSPS.

\( j^1 \) = Number of error replies of "task refused" received in the call serving OSPS.

\( k^1 \) = Number of error replies of "misroute" received in the call serving OSPS.

\( l^1 \) = Number of error replies of "unexpected input data value" received in the call serving OSPS.

\( m^1 \) = Number of queries that timed out in the call serving OSPS. This is a measure of the number of queries that actually left the call serving OSPS and became indeterminate (a valid reply was not received) for whatever reason.

\( n^1 \) = Number of AILS queries received in the normal serving OSPS from the call serving OSPS to retrieve OLS data.

\( o^1 \) = Number of AILS queries received in the normal serving OSPS from the call serving OSPS to retrieve TCS data.

\( p^1 \) = Number of AILS replies sent from the normal serving OSPS to the call serving OSPS returning OLS data. This measure does not include the error replies sent to the call serving OSPS.

\( q^1 \) = Number of AILS replies sent from the normal serving OSPS to the call serving OSPS returning TCS data. This measure does not include the error replies sent to the call serving OSPS.

\( r^1 \) = Number of error replies of "task refused" sent from the normal serving OSPS to the call serving OSPS.
OSPS.

\[ s^1 \]
= Number of error replies of "misroute" sent from the normal serving OSPS to the call serving OSPS.

\[ t^1 \]
= Number of error replies of "unexpected input data value" sent from the normal serving OSPS to the call serving OSPS.

\[ u^1 \]
= Number of calls routed over special access trunk groups. OSPS pegs this count whenever a special access trunk group is seized for initial call seizure only.

\[ v^1 \]
= Number of billable calls routed over special access trunk groups. OSPS pegs this count whenever a billable call having a negative prior call completion status was routed over a special access trunk group.

\[ w^1 \]
= Number of attempts of 1-800-225-5288 using call processing data link (CPDL) interface calls. This measurement counts the number of times OSPS identified an incoming call as a 1-800-225-5288 using CPDL interface call.

\[ x^1 \]
= Number of 1-800-225-5288 using CPDL interface calls routed to the customer data service unit (CDSU). This measurement counts the number of "request action" messages sent to the CDSU by OSPS.

\[ y^1 \]
= Number of attempts of 1-800-225-5288 using CPDL interface calls that completed (answered with billable time) with back card billing.

\[ z^1 \]
= Number of attempts of 1-800-225-5288 using CPDL interface calls that completed (answered with billable time) with collect billing.

\[ a^2 \]
= Number of attempts of 1-800-225-5288 using CPDL interface calls that completed (answered with billable time) with back third number billing.

\[ b^2 \]
= Number of times that the AATLSOS automated access prompting using CPDL interface timer T1 expired. Timer T1 is used to guard against the occurrence of a hung call while OSPS is waiting for further instructions from the CDSU during processing of a call. Specifically, timer T1 is used when OSPS informs the CDSU of the arrival of a call that's eligible for AATLSOS automated access prompting using CPDL interface treatment, or when error conditions are encountered after communication has been established with the CDSU and OSPS expects the call to be terminated.

\[ c^2 \]
= Number of times that the AATLSOS automated access prompting using CPDL interface timer T2 expired. Timer T2 is used to guard against the occurrence of a hung call while OSPS is waiting for further instructions from the CDSU during processing of a call. Specifically, timer T2 is used when OSPS recognizes that the CDSU has gone off-hook on the external audio response unit (ARU) trunk selected by OSPS for communication between the back party and the CDSU. Prior to expiration of this timer OSPS expects the CDSU to send the OSPS complete call message or the transfer request message.

\[ d^2 \]
= Number of times that the AATLSOS automated access prompting using CPDL interface timer T3 expired. Timer T3 is used to provide a timeout interval after the 10th or 11th digit of a NANP forward number is entered because the caller may attempt to enter [forward number][#][card number] format at the forward number prompt or reprompt.

\[ e^2 \]
= Number of times that the AATLSOS automated access prompting using CPDL interface timer T4 expired. Timer T4 is used to provide a timeout interval after the "#" sign is entered following a forward number because the caller may attempt to enter [forward number][#][card number] format.
at the forward number prompt or reprompt.

\( f^2 \) = Number of times AT&T card calls encounter an Intercept Screening restriction (such as, an Intercept Screening Indicator returned in the Customer Account Services (CAS) query validation response) and the Intercept Screening restriction is applied to the call (such as, feature is activated and the Intercept Screening restriction has precedence). This count shall include those calls in which the look-up in the Customized Handling By Card Product Type table results in the call receiving "Verify" or "Other Billing" treatment.

\( g^2 \) = Number of DIOR calls that extend their calling time by entering another add-on card. This measurement is pegged for each initial call or sequence call that extends its calling time.

\( h^2 \) = Number of non-DIOR calls that extend their calling time by entering another add-on card. This measurement is pegged for each initial call or sequence call that extends its calling time.

\( i^2 \) = Number of add-on cards for DIOR calls that are successfully entered during add-on processing. This measurement only includes subsequent entries of add-on cards and not the first entered card number. Add-on cards that are rejected by the system are not included in this measurement.

\( j^2 \) = Number of add-on cards for non-DIOR calls that are successfully entered during add-on processing. This measurement only includes subsequent entries of add-on cards and not the first entered card number. Add-on cards that are rejected by the system are not included in this measurement.

\( k^2 \) = Number of attempts of 1-800-CALLATT calls that the caller selects the option for Non-Tariffed Terms and Conditions.

\( l^2 \) = Number of attempts of National DA 00- Access calls are accessing the Directory service option and the DDD class of charge is allowed by the switch.

\( m^2 \) = Number of National DA 00- Access calls are accessing the Directory service option, the DDD class of charge is allowed by the switch, and the “called end answers” after routing the call to the network.

\( n^2 \) = Number of National DA 00- Access calls (after the caller selects the Directory service option) are sent from an AP to an operator due to any one of the following error handling conditions:

- the call is originated from a station type requiring special handling for sent-paid (coin or Automated Charge Quotation System (ACQS)),
- the call is not allowed for paid/DDD billing per the Originating Line Screening (OLS) data, or
- the DDD class of charge is not allowed by the switch (either due to key blocking or due to billing validation failure).

\( o^2 \) = Number of attempts of 1-800-CALLATT calls that the caller selects the option for Directory Assistance Service. This measurement will be pegged under the following conditions:

- when the Non-Tariffed feature is on and LSCCS Measurement feature is off, or
- when the Non-Tariffed feature is off and LSCCS Measurement feature is on, or
- when both of the Non-Tariffed feature and LSCCS Measurement feature are on.
\( p^2 \) = Number of AAP 1-800-CALLATT calls are accessing the Directory service option, the card class of charge is used and allowed by the switch, and the "called end answers" after routing the call to the network.

\( q^2 \) = Number of National DA 00- Access calls and AAP 1-800-CALLATT calls are accessing the Directory service option and receive a Release message containing a request for DA call completion.

\( r^2 \) = Number of National DA 00- Access calls and AAP 1-800-CALLATT calls are accessing the Directory service option, receive a Release message containing a request for DA call completion, and are successfully completed and billable for DA call completion with the OSPS AMA "Listing Services Call Completion" Module 321 appended in OSPS AMA record.

\( s^2 \) = Number of National DA 00- Access calls and AAP 1-800-CALLATT calls that are accessing the Directory service option are received and recognized by the OSPS-LS.

\( t^2 \) = Number of National DA 00- Access calls and AAP 1-800-CALLATT calls that are accessing the Directory service option are received and recognized by the OSPS-LS and are eligible for DA call completion.

\( u^2 \) = Number of National DA 00- Access calls and AAP 1-800-CALLATT calls that are accessing the Directory service option are received and recognized by the OSPS-LS and are eligible for DA call completion and the caller accepts the DA call completion offer.

\( v^2 \) = Number of times a call was attempted to be routed to an External Verification Routing number for card validation and subsequent call processing.

\( w^2 \) = Number of times the answer timer expires on a call routed to an External Verification Routing number.

4. ACTIONS TO BE TAKEN

None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

The validity for the administrative module (AM) and switching modules (SMs) applies to this section.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 102: Operator Services Position System (OSPS) toll and assistance performance (OTAP) measurements of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Completed autoquote calls. Number of attempts to send an autoquote message to an autoquote
establishment.

c = Number of printed autoquote calls.

d = Credited autoquote messages. Number of times that an autoquote message was not sent to the autoquote establishment and a credit record was created for the following events:

- Automatic charge quotation service (ACQS) message buffer pointers were corrupted which resulted in credit records created for each queued autoquote.

- An autoquote message was queued for longer than the value in field "HOBIS/C TIME" of RC/V View 8.9 (OSPS OFFICE PARAMETERS).

- The ACQS message buffer was full (max 100) and a new message arrived replacing a queued autoquote message.

- Failures occurred during transmitting the message to the autoquote establishment and when trying to reroute the message to a hotel billing information system (HOBIS) or hotel billing information center (HOBIC).

e = Rerouted autoquote messages. Number of autoquote messages successfully rerouted to a HOBIS or HOBIC.

f = Autoquote request fail. Number of autoquote messages that failed because all autoquote digital subscriber lines (DSL) were busy or call processing could not dial up the autoquote establishment because of a lack of software process control blocks (PCB) or process stacks (PS).

g = Credited voice quote messages. Number of credited voice quote messages that were not sent to HOBIS or HOBIC due to:

- The ACQS message buffer pointers were corrupted which resulted in credit records created for each queued voice quote message.

- A voice quote message was queued for longer than the value in field "HOBIS/C TIME" of RC/V View 8.9.

- The ACQS message buffer was full (max 100) and a new message arrived replacing a queued voice quote message.

- A failure occurred during transmitting the message to HOBIS or HOBIC.

h = International calls signaled automated. Number of successfully outpulsed international calls signaled as direct dialed, including calls to Mexico.

i = International calls operator-assisted. Number of successfully outpulsed international calls signaled as operator-assisted, including calls to Mexico.

j = ACCS calls reordered due to TCS. Number of automated calling card service (ACCS) calls attempted to be routed to reorder because of terminating code screening (TCS) restrictions for either international or USA calls [refer to RC/V Views 27.2 (OSPS TERMINATING CODE SCREENING FOR NPA-NXX) and 27.3 (OSPS TERMINATING CODE SCREENING & PCC FOR COUNTRY CODE)].

k = ACCS calls routed to operator due to TCS. Number of ACCS calls attempted to be routed to an
operator or the automated verification process because of TCS restrictions for either international or USA calls (refer to RC/V Views 27.2 and 27.3).

\[ \text{l} = \text{TCS calling card error. Number of times a calling card call encountered a TCS restriction while the call was at a position (this does not include the initial display given when an automated call is routed to an operator).} \]

\[ \text{m} = \text{ACCS 0+ non-coin calls valid calling card number and PIN. Number of ACCS 0+ non-coin calls with a valid calling card number and personal identification number (PIN) (whether restricted or unrestricted) plus the number of calling card query failures with indeterminate billing allowed (refer to the "BILL BLOCK" and "CAS INDT BLK" parameters in RC/V View 8.9). This measurement will be scored whether the initial or sequence call is automatically routed, routed to an operator, sent to reorder, or the announcement circuit is disconnected.} \]

\[ \text{n} = \text{ACCS 0+ coin calls valid calling card number and PIN. Number of ACCS 0+ coin calls with a valid calling card number and PIN (whether restricted or unrestricted) plus the number of calling card query failures with indeterminate billing allowed (refer to the "BILL BLOCK" and "CAS INDT BLK" parameters in RC/V View 8.9). This measurement will be scored whether the initial or sequence call is automatically routed, routed to an operator, sent to reorder, or the announcement circuit is disconnected.} \]

\[ \text{o} = \text{Residual calls. Number of residual calls [calls to the special operator services traffic (SOST) operator] released from an operator position.} \]

\[ \text{p} = \text{DIOR calls subjected to TPR checks. Number of direct international originations (DIOR) calls with a forward number in a North American numbering plan (NANP) format that were subject to terminating point restriction (TPR) checks.} \]

\[ \text{q} = \text{AATOS calls subjected to TPR checks. Number of alternate access to operator service (AATOS) calls with a forward number in a NANP format that were subject to TPR checks.} \]

\[ \text{r} = \text{AATLOS calls subjected to TPR checks. Number of alternate access to language specific operator services (AATLSOS) calls with a forward number in a NANP format that were subject to TPR checks.} \]

\[ \text{s} = \text{Wireless calls subjected to TPR checks. Number of wireless calls with a forward number in a NANP format that were subject to TPR checks.} \]

\[ \text{t} = \text{DIOR calls blocked or restricted by TPR. Number of DIOR calls with a forward number in a NANP format that were blocked or restricted by TPR.} \]

\[ \text{u} = \text{AATOS calls blocked or restricted by TPR. Number of AATOS calls with a forward number in a NANP format that were blocked or restricted by TPR.} \]

\[ \text{v} = \text{AATLOS calls blocked or restricted by TPR. Number of AATLSOS calls with a forward number in a NANP format that were blocked or restricted by TPR.} \]

\[ \text{w} = \text{Wireless calls blocked or restricted by TPR. Number of wireless calls with a forward number in a NANP format that were blocked or restricted by TPR.} \]

\[ \text{x} = \text{DIOR calls subjected to international TPR checks. Number of DIOR calls with a forward number in an international format that were subject to TPR checks.} \]

\[ \text{y} = \text{AATOS calls subjected to international TPR checks. Number of AATOS calls with a forward number in an international format that were subject to TPR checks.} \]

<td>AILS query timed out. Number of queries that timed out in the call serving OSPS. This is a measure of the number of queries that actually left the call serving OSPS and became indeterminate (a valid reply was not received) for whatever reason.</td>
</tr>
<tr>
<td>n</td>
<td>AILS query received for OLS. Number of AILS queries received in the normal serving OSPS from the call serving OSPS to retrieve OLS data.</td>
</tr>
<tr>
<td>o</td>
<td>AILS query received for TCS. Number of AILS queries received in the normal serving OSPS from the call serving OSPS to retrieve TCS data.</td>
</tr>
<tr>
<td>p</td>
<td>AILS reply sent for OLS. Number of AILS replies sent from the normal serving OSPS to the call serving OSPS returning OLS data. This measure does not include the error replies sent to the call serving OSPS.</td>
</tr>
<tr>
<td>q</td>
<td>AILS reply sent for TCS. Number of AILS replies sent from the normal serving OSPS to the call serving OSPS returning TCS data. This measure does not include the error replies sent to the call serving OSPS.</td>
</tr>
</tbody>
</table>
\( r^1 \) = AILS task refused error reply. Number of error replies of “task refused” sent from the normal serving OSPS to the call serving OSPS.

\( s^1 \) = AILS misroute error reply. Number of error replies of “misroute” sent from the normal serving OSPS to the call serving OSPS.

\( t^1 \) = AILS unexpected reply. Number of error replies of “unexpected input data value” sent from the normal serving OSPS to the call serving OSPS.

\( u^1 \) = Routed calls. Number of calls routed over special access trunk groups. OSPS pegs this count whenever a special access trunk group is seized for initial call seizure only.

\( v^1 \) = Billable calls. Number of billable calls routed over special access trunk groups. OSPS pegs this count whenever a billable call having a negative prior call completion status was routed over a special access trunk group.

\( w^1 \) = Call attempts. Number of attempts of 1-800-225-5288 (CALLATT) using call processing data link (CPDL) interface calls. This measurement counts the number of times OSPS identified an incoming call as a 1-800-225-5288 using CPDL interface call.

\( x^1 \) = Routed calls. Number of 1-800-225-5288 (CALLATT) using CPDL interface calls routed to the customer data service unit (CDSU). This measurement counts the number of “request action” messages sent to the CDSU by OSPS.

\( y^1 \) = Completed calls with back card billing. Number of attempts of 1-800-225-5288 using CPDL interface calls that completed (answered with billable time) with back card billing.

\( z^1 \) = Completed calls with collect billing. Number of attempts of 1-800-225-5288 using CPDL interface calls that completed (answered with billable time) with collect billing.

\( a^2 \) = Completed calls with third number billing. Number of attempts of 1-800-225-5288 using CPDL interface calls that completed (answered with billable time) with back third number billing.

\( b^2 \) = Expired T1 timer. Number of times that the AATLSOS automated access prompting using CPDL interface timer T1 expired. Timer T1 is used to guard against the occurrence of a hung call while OSPS is waiting for further instructions from the CDSU during processing of a call. Specifically, timer T1 is used when OSPS informs the CDSU of the arrival of a call that's eligible for AATLSOS automated access prompting using CPDL interface treatment, or when error conditions are encountered after communication has been established with the CDSU and OSPS expects the call to be terminated.

\( c^2 \) = Expired T2 timer. Number of times that the AATLSOS automated access prompting using CPDL interface timer T2 expired. Timer T2 is used to guard against the occurrence of a hung call while OSPS is waiting for further instructions from the CDSU during processing of a call. Specifically, timer T2 is used when OSPS recognizes that the CDSU has gone off-hook on the external audio response unit (ARU) trunk selected by OSPS for communication between the back party and the CDSU. Prior to expiration of this timer OSPS expects the CDSU to send the OSPS complete call message or the transfer request message.

\( d^2 \) = Expired T3 timer. Number of times that the AATLSOS automated access prompting using CPDL interface timer T3 expired. Timer T3 is used to provide a timeout interval after the 10th or 11th digit of a NANP forward number is entered because the caller may attempt to enter [forward number][#] [card number] format at the forward number prompt or reprompt.

\( e^2 \) = Expired T4 timer. Number of times that the AATLSOS automated access prompting using CPDL
interface timer T4 expired. Timer T4 is used to provide a timeout interval after the "#" sign is entered following a forward number because the caller may attempt to enter [forward number][#] [card number] format at the forward number prompt or reprompt.

f² = Calls intercepted. Number of times AT&T card calls encounter an intercept screening restriction (such as, an intercept screening indicator returned in the customer account services (CAS) query validation response) and the intercept screening restriction is applied to the call (such as, feature is activated and the intercept screening restriction has precedence). This count shall include those calls in which the look-up in the customized handling by card product type table results in the call receiving "verify" or "other billing" treatment.

g² = Extended DIOR calls. Number of DIOR calls that extend their calling time by entering another add-on card. This measurement is pegged for each initial call or sequence call that extends its calling time.

h² = Extended non-DIOR calls. Number of non-DIOR calls that extend their calling time by entering another add-on card. This measurement is pegged for each initial call or sequence call that extends its calling time.

i² = Successful add-on DIOR calls. Number of add-on cards for DIOR calls that are successfully entered during add-on processing. This measurement only includes subsequent entries of add-on cards and not the first entered card number. Add-on cards that are rejected by the system are not included in this measurement.

j² = Successful add-on non-DIOR calls. Number of add-on cards for non-DIOR calls that are successfully entered during add-on processing. This measurement only includes subsequent entries of add-on cards and not the first entered card number. Add-on cards that are rejected by the system are not included in this measurement.

k² = Number of attempts of 1-800-CALLATT calls that the caller selects the option for non-tariffed terms and conditions.

l² = National DA 00- access attempts. Number of attempts of national DA 00- access calls are accessing the directory service option and the DDD class of charge is allowed by the switch.

m² = National DA 00- access answers. Number of national DA 00- access calls are accessing the directory service option, the DDD class of charge is allowed by the switch, and the "called end answers" after routing the call to the network.

n² = National DA 00- access blocked. Number of national DA 00- access calls (after the caller selects the Directory service option) are sent from an AP to an operator due to any one of these error handling conditions:

- The call is originated from a station type requiring special handling for sent-paid [coin or automated charge quotation system (ACQS)].
- The call is not allowed for paid/DDD billing per the originating line screening (OLS) data.
- The DDD class of charge is not allowed by the switch (either due to key blocking or due to billing validation failure).

o² = DA service. Number of attempts of 1-800-CALLATT calls that the caller selects the option for directory assistance service. This measurement will be pegged when:

- The non-tariffed feature is on and LSCCS measurement feature is off.
- The non-tariffed feature is off and LSCCS measurement feature is on.
- Both of the non-tariffed feature and LSCCS measurement feature are on.

\( p^2 \) = Card class answers. Number of AAP 1-800-CALLATT calls are accessing the directory service option, the card class of charge is used and allowed by the switch, and the "called end answers" after routing the call to the network.

\( q^2 \) = Release message request. Number of national DA 00- access calls and AAP 1-800-CALLATT calls are accessing the directory service option and receive a release message containing a request for DA call completion.

\( r^2 \) = National DA 00- access calls and AAP 1-800-CALLATT calls billable. Number of national DA 00-access calls and AAP 1-800-CALLATT calls are accessing the directory service option, receive a release message containing a request for DA call completion, and are successfully completed and billable for DA call completion with the OSPS AMA “listing services call completion” module 321 appended in OSPS AMA record.

\( s^2 \) = National DA 00- access calls and AAP 1-800-CALLATT calls received. Number of national DA 00-access calls and AAP 1-800-CALLATT calls that are accessing the directory service option are received and recognized by the OSPS-LS.

\( t^2 \) = DA call completion eligibility. Number of national DA 00- access calls and AAP 1-800-CALLATT calls that are accessing the directory service option are received and recognized by the OSPS-LS and are eligible for DA call completion.

\( u^2 \) = DA call completion accepted. Number of national DA 00- access calls and AAP 1-800-CALLATT calls that are accessing the directory service option are received and recognized by the OSPS-LS and are eligible for DA call completion and the caller accepts the DA call completion offer.

\( v^2 \) = External routing verification - attempts. Number of times a call was attempted to be routed to an external verification routing number for card validation and subsequent call processing.

\( w^2 \) = External routing verification - time-outs. Number of times the answer timer expires on a call routed to an external verification routing number.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or a scheduled output of section 168: Operator Services Position System (OSPS) voice messaging service (VMS) measures of the 30-minute traffic report. This section collects and prints measurements for each access code which had one or more of the measurements pegged for this reporting period. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = VMS access code.
c = Number of VMS operator-handled call attempts. It is considered an attempt, and is pegged when a correct service code and a valid access code, that is, 1ZXXX or 19ZXXX, is entered.
d = Number of VMS operator-handled call completions. This is pegged on completion of the call information transfer process.
e = Number of VMS automated call attempts. It is considered an attempt, and is pegged when a correct service code and a valid access code, that is, 1ZXXX or 19ZXXX, is entered.
f = Number of VMS automated call completions. This is pegged on completion of the call information transfer process.
g = Number of callers who are transferred to an enhanced service provider (ESP) when a Common Channel Signaling System 7 (CCS7) busy condition is encountered.
h = Number of callers who are transferred to an ESP when a CCS7 ring/no answer or called number status undefined condition is encountered.

2. REASON FOR OUTPUT

To respond to a request for an immediate or scheduled output of section 101: Operator Services Position System (OSPS) call volume and equipment usage (OVOEQ) measurements of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS
3.1 Variables

\(a\) = Time when the report was prepared, in the form hours:minutes:seconds.

\(b\) = Operator-handled 1+ calls non-sent-paid. Number of operator-handled 1+ calls from prepay automatic coin terminal service (ACTS) compatible coin stations that were released from an operator position with a class of charge set to something other than sent paid.

\(c\) = Operator-handled 1+ calls person-paid. Number of operator-handled 1+ calls from prepay ACTS compatible coin stations that were released from an operator position with a class of charge set to person paid.

\(d\) = Operator-handled 1+ calls station-paid. Number of operator-handled 1+ calls from prepay ACTS compatible coin stations that were released from an operator position with a class of charge set to station paid.

\(e\) = Total operator 1+ calls. Total number of operator-handled 1+ calls from prepay ACTS compatible coin stations. This count is equal to the sum of \(b\), \(c\), and \(d\).

\(f\) = Initial seizure attempts. Number of initial seizure attempts from prepay ACTS compatible stations that were dialed 1+ or 1+800/950.

\(g\) = Operator-handled 1+ calls non-sent-paid. Number of operator-handled 1+ calls from postpay ACTS or non-ACTS compatible or from prepay non-ACTS compatible coin stations that were released from an operator position with a class of charge set to something other than sent paid.

\(h\) = Operator-handled 1+ calls person-paid. Number of operator-handled 1+ calls from postpay ACTS or non-ACTS compatible or from prepay non-ACTS compatible coin stations that were released from an operator position with a class of charge set to person paid.

\(i\) = Operator-handled 1+ calls station-paid. Number of operator-handled 1+ calls from postpay ACTS or non-ACTS compatible or from prepay non-ACTS compatible coin stations that were released from an operator position with a class of charge set to station paid.

\(j\) = Total operator-handled 1+ calls. Total number of operator-handled 1+ calls from postpay ACTS or non-ACTS compatible or prepay non-ACTS compatible coin stations that were released from an operator position with a class of charge set to station paid.

\(k\) = Initial seizure attempts. Number of initial seizure attempts from postpay ACTS or non-ACTS compatible or prepay non-ACTS compatible coin stations that were dialed 1+ or 1+800/950.

\(l\) = 0+ and 0- coin calls charged person-paid. Number of operator-handled 0+ and 0- coin calls, regardless of station type, that were released from an operator position with a class of charge set to person paid.

\(m\) = 0+ and 0- coin calls charged station-paid. Number of operator-handled 0+ and 0- coin calls, regardless of station type, that were released from an operator position with a class of charge set to station paid.

\(n\) = 0+ and 0- coin calls charged collect. Number of operator-handled 0+ and 0- coin calls, regardless of station type, that were released from an operator position with a class of charge set to collect.

\(o\) = 0+ and 0- coin calls charged third number. Number of operator-handled 0+ and 0- coin calls, regardless of station type, that were released from an operator position with a class of charge set to
third number.

\[ p = 0^+ \text{ and } 0^- \text{ coin calls charged calling card. Number of operator-handled } 0^+ \text{ and } 0^- \text{ coin calls, regardless of station type, that were released from an operator position with a class of charge set to calling card.} \]

\[ q = \text{Total operator-handled } 0^+ \text{ and } 0^- \text{ coin calls. Total number of operator-handled } 0^+ \text{ and } 0^- \text{ coin calls. This count is equal to the sum of 'l', 'm', 'n', 'o', and 'p'.} \]

\[ r = \text{Initial seizure attempts } 0^+ \text{ calls. Number of initial seizure attempts that were dialed } 0^+ \text{ regardless of station type and regardless of whether an operator was successfully attached.} \]

\[ s = \text{Initial seizure attempts } 0^- \text{ calls. Number of initial seizure attempts that were dialed } 0^- \text{ regardless of station type and regardless of whether an operator was successfully attached.} \]

\[ t = \text{BLV activation attempts. Number of busy line verification (BLV) activation attempts.} \]

\[ u = \text{BLV activation attempts not in OSPS. Number of BLV activation attempts on lines that were not in this OSPS verify network. Refer to RC/V View 27.10.} \]

\[ v = \text{BLV activation attempts excluded from verification. Number of BLV activation attempts on lines that were in the verify network but were excluded from verification. Refer to RC/V View 27.11.} \]

\[ w = \text{Cancel call key used to end BLV transaction. Number of times the CANCEL CALL key was used to end a BLV transaction.} \]

\[ x = \text{Number of times a BLV was successfully terminated with the RECRD TICKT key.} \]

\[ y = \text{BLV queue for trunk. Number of times a BLV had to queue for a trunk.} \]

\[ z = \text{EI activation attempts. Number of emergency interrupt (EI) activation attempts.} \]

\[ a^1 = \text{Number of times the CANCEL CALL key was used to end an EI transaction.} \]

\[ b^1 = \text{Number of times the EI CANCEL key was used to end an EI transaction.} \]

\[ c^1 = \text{Number of times an EI was successfully terminated with the RECRD TICKT key.} \]

\[ d^1 = \text{Number of times there was a software failure or a local digital service unit (LDSU) hardware failure such that EI tone could not be provided on an EI attempt.} \]

\[ e^1 = \text{Number of times a request to use an announcement circuit failed for:} \]
\[ \begin{align*}
&\text{- Time-out.} \\
&\text{- Q overflow.} \\
&\text{- Announcement circuit unavailable and queuing was not requested.}
\end{align*} \]

The queued timing parameter is specified by “DSU2 Q TIME” in RC/V View 8.9.

\[ f^1 = \text{Number of initial deposits satisfied on fully automated } 1^+ \text{ coin seizures.} \]

\[ g^1 = \text{Number of times that coin calls requiring an operator to provide a notify announcement were successfully attached to an operator and a conference circuit was successfully obtained when either an announcement circuit and/or forward party were attached. If an announcement circuit and forward party were not on the call, then a conference circuit was not required.} \]
h₁ = Number of deposits satisfied on fully automated charges-due seizures.

i₁ = Number of times that ACTS or non-ACTS coin calls requiring an operator on an overtime charges-due seizure were successfully attached to an operator and a conference circuit was successfully obtained when either an announcement circuit and/or forward party were attached. If an announcement circuit and forward party were not on the call, then a conference circuit was not required.

j₁ = Number of times that ACTS or non-ACTS coin calls requiring an operator on an end-of-call seizure were successfully attached to an operator and a conference circuit was successfully obtained when either an announcement circuit and/or forward party were attached. If an announcement circuit and forward party were not on the call, then a conference circuit was not required.

k₁ = Number of deposits satisfied on fully automated end-of-call seizures.

l₁ = Number of 1+ automatic number identification (ANI), automatic number identification failure (ANIF), or operator number identification (ONI) system-centralized automated message accounting (CAMA) calls received on operator trunks.

m₁ = Number of customer flashes during grace period for coin calls.

n₁ = Number of automated end-of-initial-period announcements.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or a scheduled output of section 254: packet access gateway (PAG) measurements of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form of hours:minutes:seconds.
b = Switching module (SM) number.
c = Total usage. Number of 100 second scans taken while the PAG(s) is busy with the calls over ATM links (in-service busy) plus maintenance busy (OOS). number.
d = Maintenance usage. Number of 100 second scans taken while the ATM links connected to PAG are maintenance OOS or in test call state.
e = Number of attempts. Number of times this SM was the preferred SM for a PAG call.
f = Number of overflows. Number of times this SM was the preferred SM but could not be used.
g = Number of links. Number of network links of PAG on a per SM basis.

</tbody>
</table>

- . . . . . . .
- . . . . . . .
- . . . . . . .

2. **REASON FOR OUTPUT**

To respond to a request for either an immediate output or a scheduled output of section 119: packet business groups (PBG) of the 30-minute traffic report. For variables 'd' - 'h', a packet mode call is non-intra-PBG if it is an interswitch call, if the originating and terminating parties are not members of the same PBG, or if one or the other (or even both) are not members of any PBG.

3. **VARIABLE FIELD DEFINITIONS**

3.1 **Variables**

a  = Time when the report was prepared, in the form hours:minutes:seconds

b  = PBG number.

c  = The number of X.25 originations from an ISDN business group element (BGE-I) that are routed towards a terminating BGE-I of the same PBG under study. This includes intra-PBG calls that are blocked/routed calls when the PBG is in overflow, as well as calls which are routed when not in overflow (count 1).

d  = Originating call attempts. Number of originating call attempts. This is the number of X.25 call request packets that have been processed for a delivery to a BGE-I of the PBG that is under study. This includes non-intra-PBG calls that are blocked/routed when the terminating PBG is in overflow as well as calls which are routed when not in overflow (count 2).

e  = Terminating call attempts. Number of terminating call attempts. This is the number of X.25 call request packets that are received from a BGE-I of the PBG that is under study. This includes non-intra-PBG calls that are blocked/routed when the originating PBG is in overflow as well as calls which are routed when not in overflow (count 3).

f  = X.25 originations and terminations blocked aggregate logical channel. Number of X.25 originations and terminations for a BGE-I of the PBG under study that are blocked because the aggregate logical channel count for the associated PBG has exceeded the provisional limit. Intra-PBG calls will be pegged twice (count 4).
\[ g \] = X.25 originations and terminations blocked aggregate throughput class. Number of X.25 originations and terminations for a BGE-I of the PBG under study that are blocked because the aggregate throughput class for the associated PBG has exceeded the provisional limit. Intra-PBG calls will be pegged twice (count 5).

\[ h \] = X.25 originations and terminations routed. Number of X.25 originations and terminations for a BGE-I of the PBG under study that are routed when in overflow. Intra-PBG calls will be pegged twice (count 6).

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 165: PSU2 packet bus occupancy (PBOCC) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

Format 1 reports packet bus occupancy measurements for packet switch units which successfully collected valid occupancy measurements.
Format 2 lists packet switch units which did not successfully collect valid occupancy measurements.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Switching module (SM).

c = Packet switching unit (PSU).

d = Average packet bus occupancy (percentage).

e = Maximum packet bus occupancy (percentage).

f = Packet bus occupancy threshold 1 value (percentage).

g = Packet bus occupancy exceed threshold 1. This field contains the percentage of time that the packet bus exceeded the packet bus occupancy threshold 1 value. If the percentage of time that the packet bus occupancy exceeded the threshold 1 value is a fraction of 1%, it will be reported as 1 percent.

h = Packet bus occupancy threshold 2 value (percentage).

i = Packet Bus occupancy exceed threshold 2. This field contains the percentage of time that the packet bus exceeded the packet bus occupancy threshold 2 value. If the percentage of time that the packet bus occupancy exceeded the threshold 2 value is a fraction of 1%, it will be reported as 1 percent.

4. ACTIONS TO BE TAKEN

No action is required.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.
If the data is checked, check the validity of the corresponding SM.

5. ALARMS

None.

    .   .

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 165: PSU2 packet bus occupancy (PBOCC) of the 30-minute traffic report.

NOTE: These measurements are only applicable to the PSU2. They are not applicable to the PSU2e. When a PSU2 is converted to a PSU2e, the section 165 measurements for the PSU will be stopped automatically. Per ATM link packet bus measurements for PSU2e can be provisioned using TRFC30 section 167: ATM link measurements.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

Format 1 reports packet bus occupancy measurements for packet switch units which successfully collected valid occupancy measurements.
Format 2 lists packet switch units which did not successfully collect valid occupancy measurements.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Packet bus occupancy threshold 1 value (percentage), office provisioned.

c = Packet bus occupancy threshold 2 value (percentage), office provisioned.

d = Switching module (SM).

e = Packet switching unit (PSU).

f = Average packet bus occupancy (percentage).

g = Maximum packet bus occupancy (percentage).

h = Packet bus occupancy exceed threshold 1. This field contains the percentage of time that the packet bus exceeded the packet bus occupancy threshold 1 value. If the percentage of time that the packet bus occupancy exceeded the threshold 1 value is a fraction of 1%, it will be reported as 1 percent.

i = Packet Bus occupancy exceed threshold 2. This field contains the percentage of time that the packet bus exceeded the packet bus occupancy threshold 2 value. If the percentage of time that the packet bus occupancy exceeded the threshold 2 value is a fraction of 1%, it will be reported as 1 percent.

3.2 Parameters

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 234: point code (PC) for packet switch unit (PSU) based common channel signalling (CCS) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information. Selection of components for collection and reporting of this section is administered using RC/V views 13.7 and 13.8.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hh:mm:ss.
b = Global switching module (GSM) number.
c = Network number.
d = Cluster number.
e = Member number.
f = PC unavailable count.
g = Duration of point code unavailability. Number of seconds the PC is unavailable.
h = Link sets available routes. Number of available link sets.
i = Link sets unavailable routes. Number of unavailable routing link sets.

### 2. REASON FOR OUTPUT

Response to a request for either an immediate or scheduled output of section 245: protocol handler packet control function (PCF) for the protocol handler ethernet for the traffic 30 report.

Refer to the APP:MEASUREMENTS appendix in the Appendices section of the Output Messages manual for additional information.
Selection of components for collection and reporting of this section is administered using RC/V Views 13.7 and 13.8.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module.
c = Packet switching unit number in the SM.
d = Packet switching unit shelf number.
e = Channel group within the shelf.
f = Number of 2GPD PCF-initiated (network setup request sent) switch connection attempts for 2GPD mobile re-activations. Resending a network setup request to the ECP after the first expiry of the T310 counter does not peg this count.
g = Number of 3GPD PCF-initiated (network setup request sent) switch connection attempts for 3GPD mobile re-activations. Resending a network setup request to the ECP after the first expiry of the T310 counter does not peg this count.
h = Number of 2GPD unsuccessful PCF-initiated (network setup request sent) switch connection attempts for 2GPD mobile re-activations. Counter shall be pegged after the second T310 expiry or upon receive of a network release response.
i = Number of 3GPD unsuccessful PCF-initiated (network setup request sent) switch connection attempts for 3GPD mobile re-activations. Counter shall be pegged after the second T310 expiry or upon receive of a network release response.
j = Number of 2GPD sessions opened, including both open dormant and open active sessions. Number of sessions are counted at the end of the traffic 30 interval.
k = Number of 3GPD sessions opened, including both open dormant and open active sessions. Number of sessions are counted at the end of the traffic 30 interval.
l = Number of 2GPD R-P connection attempts. New session registration attempts to a PDSN (A11 RRQ sent with connection setup). This counter shall be pegged once per PDSN. For a PDSN redirect, the count is pegged once for the redirect-to PDSN set.
m = Number of 3GPD R-P connection attempts. New session registration attempts to a PDSN (A11 RRQ sent with connection setup). This counter shall be pegged once per PDSN. For a PDSN redirect, the count is pegged once for the redirect-to PDSN set.
n = Number of 2GPD R-P connection attempts data ready to send (DRS)=0. New session registration attempts where DRS=0 with the PDSN.
o = Number of 3GPD R-P connection attempts DRS=0. New session registration attempts where DRS=0 with the PDSN.
p = Number of 2GPD R-P connection attempts to PDSN that fail. This counter is pegged once per PDSN. For a PDSN redirect, the count is pegged once for the redirect-to PDSN set. This counter is pegged after the retry attempts allowed with a PDSN have been exhausted.
q = Number of 3GPD R-P connection attempts to PDSN that fail. This counter is pegged once per PDSN. For a PDSN redirect, the count is pegged once for the redirect-to PDSN set. This counter is pegged after the retry attempts allowed with a PDSN have been exhausted.

r = Number of 2GPD R-P reactivation attempts. The number of 2GPD mobile station and PCF initiated reactivation attempts with the PDSN.

s = Number of 3GPD R-P reactivation attempts. The number of 3GPD mobile station and PCF initiated reactivation attempts with the PDSN.

t = Number of 2GPD R-P reactivation failures. The number of 2GPD mobile station and PCF initiated reactivation attempts with the PDSN that fail.

u = Number of 3GPD R-P reactivation failures. The number of 3GPD mobile station and PCF initiated reactivation attempts with the PDSN that fail.

v = Number of 2GPD session closures. Session closure can be by PDSN, PCF, and ECP.

w = Number of 3GPD session closures. Session closure can be by PDSN, PCF, and ECP.

x = Number of 2GPD connections denied by PCF. The number of 2GPD connections initiated by incoming setup message from ECP that were denied by PCF:
   — Minor overall overload.
   — Major overall overload.
   — All PDSNs out-of-service.

This count is not pegged for:
   — Setup request to close a dormant session.
   — Ethernet link is out-of-service where the PCF PHE is in-service and its associated PCF trunk group in-service trunks have LNKDWN indication.
   — PCF trunk is not available where the ethernet link is in-service but there are no available in-service trunks for the call request.

y = Number of 3GPD connections denied by PCF. The number of 3GPD connections initiated by incoming setup message from ECP that were denied by PCF:
   — Minor overall overload.
   — Major overall overload.
   — All PDSNs out-of-service.

This count is not pegged for:
   — Second 3G PD setup request received.
   — Setup request to close a dormant session.
   — Ethernet link is out-of-service where the PCF PHE is in-service and its associated PCF trunk group in-service trunks have LNKDWN indication.
   — PCF trunk is not available where the ethernet link is in-service but there are no available in-service trunks for the call request.

z = Number of PD switch connections denied by PCF:
   — Service option is not 2GPD or 3GPD.
   — Service option is a 2GPD or 3GPD service option not supported by the PCF.
a\(^1\) = Number of PD peak switch simultaneous connections. Peak number of PD switch connections simultaneously in use within a traffic 30 interval. This is equivalent to the peak number of PCF trunk group members with calls. This is also equivalent to the peak number of PCF active sessions. The number of simultaneous connections are counted every 20 seconds during the traffic 30 interval and the largest count will be reported.

b\(^1\) = PD forward received octet. Number of PD forward octets of A10 payload traffic received from the PDSN. The number is represented in kilobytes (1024).

c\(^1\) = PD forward transmitted octet. Number of PD forward octets of A10 payload traffic sent to mobile. The number is represented in kilobytes (1024).

d\(^1\) = PD reverse received octet. Number of PD reverse octets of A10 payload traffic from mobile. The number is represented in kilobytes (1024).

e\(^1\) = PD reverse transmitted octet. Number of PD reverse octets of A10 payload traffic transmitted to the PDSN(s). The number is represented in kilobytes (1024).

f\(^1\) = PD forward packets received. Number of PD forward packets of A10 payload traffic received from PDSN.

g\(^1\) = PD forward packets transmitted. Number of PD forward packets of A10 payload traffic sent to mobile(s).

h\(^1\) = PD reverse packets received. Number of PD reverse packets of A10 payload traffic received from mobile.

i\(^1\) = PD reverse packets transmitted. Number of PD reverse packets of A10 payload traffic sent to the PDSN.

j\(^1\) = Number of PD packets discarded by PCF due to flow control in forward direction.

k\(^1\) = Number of PD packets discarded by PCF due to insufficient buffer in forward direction. The PCF total dormancy buffer pool is exceeded.

l\(^1\) = Number of PD packets discarded by PCF due to unknown mobile. Number of packets discarded by PCF in forward direction due to no LLCR record for forward packets.

m\(^1\) = Number of PD packets discarded by PCF due to other reasons. Reasons other than flow control, insufficient buffer, or unknown mobile. Examples of other reasons are:

- Invalid PCF session identifier.
- Forward pacing buffer limit reached.
- Invalid link layer connection record (LLCR) state.
- Check generic routing encapsulation (GRE) control block and LLCR linkage fails.
- No GRE control block.
- Duplicate GRE packet received (sequence number).
- Invalid internet protocol (IP) address for a mobile session.

n\(^1\) = Average number of peak packets in GRE resequencing buffer per session. Calculated as (sum of each session’s peak number of packets in GRE resequencing buffer)/(number of sessions in traffic 30 interval).

o\(^1\) = Average messages per second transmitted reverse. Average number of messages per second transmitted in the reverse direction to the PDSN by the PHE with PCF application. Calculated as
(accumulated number of messages)/(number of seconds in the interval). This count is pegged for:
- A11 transmitted signaling messages.
- ICMP transmitted messages.
- ARP transmitted messages.

\[ \frac{\text{Count}}{\text{Interval}} = \text{Average messages per second received forward} \]

\[ p^1 \]

- Average messages per second received forward. Average number of message per second received in the forward direction from the PDSN by the PHE with PCF application. Calculated as (accumulated number of messages)/(number of seconds in the interval). This count is pegged for:
  - A11 received signaling messages.
  - ICMP received messages.
  - ARP received messages.

\[ q^1 \]

- Adaptive packet inactivity timer (APIT) total count expirations. Total number of times the 3G APIT timer expired for an open-active 3G packet data session.

\[ r^1 \]

- APIT throughput driven count expirations. Total number of times the 3G APIT timer expired for an open-active 3G packet data session because of the throughput driven calculation.

\[ s^1 \]

- APIT cumulative total time expirations. The cumulative value of 3G APIT inactivity, in seconds, for open-active 3G packet data sessions regardless of what triggered the inactivity.

\[ t^1 \]

- APIT cumulative throughput driven time expirations. The cumulative value of 3G APIT inactivity, in seconds, for open-active 3G packet data sessions triggered by throughput calculations.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 199, ISDN personal communications services (PCS) directory number (DN) special study counts, of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- \( a \) = Time when the report was prepared, in the form hours:minutes:seconds.
- \( b \) = Directory number (DN).
- \( c \) = Switching module (SM) number.
- \( d \) = Automatic link transfer requests. Number of inter-radio port control unit (RPCU) automatic link transfer (ALT) requests per DN for PCS basic rate interface (BRI) interconnecting the RPCUs and the switch.
- \( e \) = Personal communication services originating attempts. Number of PCS originating attempts per DN for PCS BRI which resulted from the switch receiving at least one dialed digit.

2. REASON FOR OUTPUT

Response to a request for either an immediate or scheduled output of section 2: protocol handler for ethernet (PHE) for the traffic 30 report.

Refer to the APP:MEASUREMENTS appendix in the Appendices section of the Output Messages manual for additional information.

Selection of components for collection and reporting of this section is administered using RC/V Views 13.7 and 13.8.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a  = Time when the report was prepared, in the form hours:minutes:seconds.
b  = Switching module.
c  = Packet switching unit number in the SM.
d  = Packet switching unit shelf number.
e  = Channel group within the shelf.
\(f\) = Total number of three second intervals with real-time overload on PHE.

\(g\) = Total number of three second intervals with resource overload on PHE.

\(h\) = PHE processor percent occupancy.

\(i\) = Frames received from packet bus.

\(j\) = Frames transmitted to packet bus.

\(k\) = Frames received from ethernet link.

\(l\) = Frames transmitted to ethernet link.

\(m\) = Bandwidth received percent occupancy on ethernet link. Calculated as \([(\text{accumulated number of bytes in received frames})/(\text{maximum throughput})]\) expressed as a truncated percentage.

\(n\) = Bandwidth transmit percent occupancy on ethernet link. Calculated as \([(\text{accumulated number of bytes transmitted in frames})/(\text{maximum throughput})]\) expressed as a truncated percentage.

\(o\) = Error frames received from ethernet link. Valid reason(s):
- The frame received CRC did not match the calculated frame CRC.
- The frame exceeded the maximum total frame size for the interface.
- The frame has not enough bytes to determine type or less than the minimum size allowed by the interface.
- The frame type is not supported.
- The frame type is unknown.

### 2. REASON FOR OUTPUT

To respond to a request for either an immediate or schedule output of section 211 packet group (PKTGRP) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

### 3. VARIABLE FIELD DEFINITIONS

#### 3.1 Variables

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Packet Group number.
- **c** = Number of incoming call attempts. This counter provides the number of incoming call attempts. This counter is pegged when the attempt is done to establish the speech path regardless successful or not.
- **d** = Number of incoming calls that were answered. This counter provides the number of incoming call attempts that were answered. This counter is pegged whenever the incoming call reaches talking state.
- **e** = Number of incoming calls in ringing state. This counter provides the number of incoming calls in ringing state. This counter is pegged whenever a SIPT 180 RINGING message with a ACM ISUP MIME that has the called party status indicator field = 'subscriber free' in the Backward call indication parameter is sent for an incoming call.
f = Number of incoming failures. This counter provides the number of incoming call attempts that failed. This counter is pegged when the attempt to establish the speech path fails due to any reason.

g = Number of outgoing call attempts. This counter provides the number of outgoing call attempts. This counter is pegged when the attempt to establish the speech path is done regardless successful or not.

h = Number of outgoing calls that were answered. This counter provides the number of outgoing call attempts that were answered. This counter is pegged whenever the outgoing call reaches talking state.

i = Number of outgoing calls in ringing state. This counter provides the number of outgoing calls in ringing state. This counter is pegged whenever a SIPT 180 RINGING message with an ACM ISUP MIME that has the called party status indicator field = 'subscriber free' in the backward call indication parameter is received for an outgoing call.

j = Number of outgoing failures. This counter provides the number of outgoing call attempts that failed. This counter is pegged when the attempt to establish the speech path fails due to any reason.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 243: primary rate interface group section of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Primary rate interface group number.
c = Valid PRIG transfers. Number of times a FACILITY message is received with a facility IE that contains an invoke component with an Operation value coded for "enhancedExplicitECTExecute", and the feature assignment and validity checks are passed.
d = Successful TBCT transfers. Number of times a transfer request has been validated and the transfer is successfully accomplished (indicated when the switch sends the controller a DISCONNECT message with a facility IE that contains a Return Result component which includes the invoke identifier that corresponds to the TBCT request).
e = PRIG transfer overflows. Number of overflows of maximum number of TBCT transfer requests in current period. This count is pegged each time a valid transfer request is rejected because the number of transfer requests in the current period is greater than the maximum transfer requests per the ten seconds parameter.
f = Active PRIG transfer overflows. Number of overflows of maximum number of active TBCT transfers. This count is be pegged if a valid transfer request is rejected because the number of active transfers is equal to or greater than the maximum active transfers parameter and if the number of transfer requests in the current period does not exceed the maximum transfer requests per 10-seconds parameter limit.

</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 15: processor (PROC) performance of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:seconds:minutes.
b = Valid value(s):

<table>
<thead>
<tr>
<th>Module type</th>
<th>&quot;b&quot; =</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switching module (SM)</td>
<td>Percent of time spent processing jobs other than the two lowest priority jobs in the system.</td>
</tr>
<tr>
<td>Administrative module (AM)</td>
<td>Percent occupancy of call processing only.</td>
</tr>
</tbody>
</table>

c = SM number.
d = Number of terminal processes created.
e = Number of originating half calls.
f = Number of terminating half calls.
g = Number of incoming half calls.
h = Number of outgoing half calls.
i = This overflow count is the number of call pickup calls not queued because there were no available slots in the pickup queue for a particular pickup group.
j = Either NA for not used or total AM percent occupancy. Includes both call processing and non-call processing work done in the AM.

4. ACTION TO BE TAKEN
No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

If the data is checked, check the validity of the corresponding processor.

c k l
.
.
.
.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 15: processor (PROC) performance of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:seconds:minutes.
b = Processor identifier. SM number or AM.
c = Processor occupancy. The percent of processing time (AM) performing call processing activities. For the SM, the percentage of time spent processing jobs other than the two lowest priority jobs in the system. This is sent as a percentage to the ROP.
d = Number of terminal processes created for line and trunk origination or termination, termination to announcement, call forwarding, and series completion requests. Ineffective attempts (that is, false starts, permanent signals) generate a terminal process. This peg count may be sent to the ROP and/or Data Collection System.
e = Originating half calls. Number of originating requests that result in the system's receipt of at least
one digit. Calls that do not normally result in digits being dialed are included when no digits are required.

f = Terminating half calls. Number of terminating calls (that is, the number of half-calls). Calls to a busy line do not peg this count. On-demand B calls do not peg to this count.

g = Incoming half calls. Total number of incoming calls that resulted in the system's receipt of at least one digit. Calls that do not normally result in digits being dialed are included when no digits are required.

h = Outgoing half calls. Number of outgoing calls (that is, the number of half-calls sent to the network plus announcements and calls to intercept).

i = Pickup queue call overflow. This overflow count is the number of call pickup calls not queued because there were no available slots in the pickup queue for a particular pickup group.

j = Total AM percent occupancy and includes both call processing and non-call processing work done in the AM. The ROP prints the AM percent occupancy. The Data Collection System prints the number of seconds the switch is performing call processing and non-call processing activities. Divide the number of seconds by 18 to get actual percentage.

k = The highest number of calls originated from SMP with destination to ATM based on determined time samples (100 second scan).

l = The highest number of calls originated on ATM and terminated on SMP based on determined time samples (100 second scan).

3.2 Parameters

2. **REASON FOR OUTPUT**

To respond to a request for either an immediate or scheduled output of section 71: integrated services digital network (ISDN) packet switching group (PSGRP) counts of the 30-minute traffic report.

3. **VARIABLE FIELD DEFINITIONS**

3.1 **Variables**

- **a** = Time of report, in the form hours:minutes:seconds.
- **b** = Group ID. Valid value(s):
  - **MPG** = Modern pooling group.
  - **MLHG** = Multi-line hunt group.
- **c** = MPG members out-of-service. Maintenance out-of-service (OOS) usage of all members of an MPG reported in 100-second scan. (count 1).
- **d** = ISDN MLHG termination attempts. Number of attempts to terminate to an MLHG (count 2).
- **e** = MLHG termination attempt overflow. Number of termination attempts that are unsuccessful due to the unavailability of an idle group member.
- **f** = Logical channel control block (LCCB) usage reported in 100-second scan. (count 4).

</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 105: integrated services digital network (ISDN) packet switching (PS) on-demand B-channel (ODB) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Integrated services line unit (ISLU) number.
d = ODB connection attempts. Number of attempts to set up the ODB connection to the protocol handler (PH), whether successful or not (count 1).
e = ODB, directly connected peripheral interface data bus (DPIDB) timeslot usage for ISLU. This is the 100-second scan, ODB total (origination and termination) time slot usage measurement of the DPIDB for the ISLU.
f = ODB channel failures. Number of attempts to set up the ODB connections to PH that failed.

3.2 Parameters

</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 69: integrated services digital network (ISDN) packet switching office (PSOFC) totals of 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time of report, in the form hours:minutes:seconds.
b = Originating packet switched calls. Number of packet-switched (call request packets) call origination attempts received from the packet-switching data terminating equipment (DTE) served by the switch.
c = Terminating packet switched calls. Number of packet-switched (call request packets) call terminating attempts transmitted to the packet-switching DTEs served by the switch.
d = Incoming packet switched calls. Number of packet-switched (call request packets) incoming call attempts received on interoffice trunks.
e = Outgoing packet-switched calls. Number of packet-switched (call request packets) incoming call attempts received on interoffice trunks.
f = Packet-switched calls denied due to overload. Number of packet-switched originating calls plus internal protocol incoming calls denied due to protocol handler (originating access, interswitching module, interswitch, or terminating access), packet interface, or switching module processor overload.
g = Trunk group tandem calls. Number of ISDN packet-switched tandem virtual calls which transmit from one X.75’ port to another. These tandem calls include IP-IP (internal protocol), IP-X.75’, IP-X.75, X.75’-X.75’, X.75’-X.75, and X.75-X.75 trunk group tandem calls.

</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 68: integrated services digital network (ISDN) packet switching protocol handler (PSPH)/digital subscriber line group (DSLG) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Channel group or DSLG number. Valid value(s):
   0    NULL
   1    DSLG
   2    ST7
   3    MDST7
   5    MD
   6    ISM
   7    TRK
   8    X75P
   9    X75
  13    DPR1
  14    QPH
d = Shelf number.
e = Protocol handler (PH) unit number within the shelf.
f = Type of PH and PH hardware type. This is a string value that represents a unique application and hardware type.
= packet switched packets transferred. Number of packet-switched packets received at and transmitted from the data fanout (DF) side of the PH. This count included packets in retransmitted frames and internal protocol packets.

h = Packet switched buffer overflow. Number of unsuccessful attempts to seize buffer space in the PH. This count includes all types of PHs. All frames are buffered. Buffer utilization is a function of frame size, window size, and delay. Buffer space is allocated in 32-byte blocks.

i = Packet switched logical channel control block (LCCB) overflow. Number of unsuccessful attempts to seize an LCCB. The LCCB is a software data area that tracks per-call dynamic data. Some of the data items are logical channel number, call states, routing information, and billing data for each virtual call.

j = Hunt idle LCCB attempts. Number of attempts to seize an idle LCCB on the PH, whether successful or not (count 4).

k = LCCB usage. Time an LCCB is in use. Depending on the customer premises equipment (CPE), one port may have between 1 to 128 virtual calls. Each virtual call requires one LCCB. The LCCB is a software data area that tracks per-call dynamic data. Some of the data items are logical channel number, call states, routing information, and billing data for each virtual call. Since there is no internal blockage on the LCCBs, the maximum capacity for each channel is 18 hundred call seconds (CCS).

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 67: integrated services digital network (ISDN) packet switching protocol handler port (PSPORT) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a  = Time when the report was prepared, in the form hours:minutes:seconds.

b  = Switching module (SM) number.

c  = Channel or digital subscriber line group (DSLG) number.

d  = Shelf number.

e  = Protocol handler (PH) unit number within the shelf.
Optional port (channel number). This variable will only appear if the user has turned on arbitrary traffic measurements for DSLG.

Either a port number or an arbitrarily selected ID. This field will only appear if the user has turned on arbitrary traffic measurements for DSLG.

Port number if PSPORT has been allowed for all ports on one PH (a port and ID that print here do not appear in the TRANSLATION TABLE).

Arbitrarily selected ID and port if a random port has been selected (a port and ID that print here do appear in the TRANSLATION TABLE).

Circuit-switched (CKTSW) packets transferred. Number of Q.931 packets received at and transmitted from the data fanout (DF) side of the PH. This count includes packets in retransmitted frames. This count applies to access PHs and primary rate interface (PRI) signaling PHs. This measurement does not include packets received in frames with errors.

For integrated services attendant console (ISAT), port conditioning refreshes the feature buttons every 3-5 minutes in an idle switch, which results in Q.931 messages being sent to the ISAT. Therefore, the counts for ISAT ports may be higher than other integrated services digital network ports.

Packet switch packets transferred. Number of packet-switched packets, and internal protocol (IP) received at and transmitted from the DF side of the PH. This count includes packets in retransmitted frames. This count applies to access PHs, inter-SM PHs, and interswitch PHs but does not include PRI signaling PHs. This measurement does not include packets received in frames with errors (count 2).

Packet switched packets level 3 errors. Number of packet-switched errors in access PH. This count includes invalid call reference, nonexistent channel, invalid digit value, incompatible destination, unexpected messages, and time-outs. (count 3).

PKTSW packets discarded (count 4). Number of packets for which IP layer 3 processing could not be initiated due to insufficient routing or which were nonrecoverable. This count is applicable to access and interswitch PHs only.

PKTSW packets retransmitted (count 5). Number of IP packets retransmitted toward the packet bus due to a lack of acknowledgment from the far network edge.

PKTSW originating or incoming calls (count 6). Number of packet-switched call requests received from the DF side of the PH. For access PHs, this is a count of originating calls. For interswitch PHs, this is a count of incoming calls.

PKTSW terminating or outgoing calls (count 7). Number of incoming packet-switched calls transmitted from the DF side of a PH. For access PHs, this is a count of terminating calls. For interswitch PHs, this is a count of outgoing calls.

Percentage of frames received with errors (count 8). Percentage of frames received with layer 2 errors from the data terminating equipment (DTE) compared to the total frames received.

Percentage of retransmitted frames sent (count 9). Percentage of frames retransmitted compared to the total frames sent.

Logical channel control block (LCCB) usage. This usage measurement (100-second scan) is the time an LCCB is in use. Depending on the customer premises equipment (CPE), one port may have...
between 1 to 128 virtual calls. Each virtual call requires one LCCB. The LCCB is a software data area that tracks per-call dynamic data. Some of the data items are logical channel number, call states, routing information, and billing data for each virtual call. Since there is no internal blockage on the LCCBs, the maximum capacity for each channel is 18 hundred call seconds (CCS).

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 92: packet switching trunk group (PSTG) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Trunk group number.
c = Incoming call attempts (count 1). Number of incoming packet switching trunk call request packets that result in routing requests.
d = Outgoing call attempts (count 2). Number of attempts to hunt an idle member of a packet switching trunk group whether successful or not. It includes only those calls that have been successfully processed and translated to the point of hunting for an idle member.
e = Logical channel control block (LCCB) usage. (count 3). Time an LCCB is in use. Depending on the customer premises equipment (CPE), one port may have between 1 to 128 virtual calls. Each virtual call requires one LCCB. The LCCB is a software data area that tracks per-call dynamic data. Some of the data items are logical channel number, call states, routing information, and billing data for each virtual call. Since there is no internal blockage on the LCCBs, the maximum capacity is 2,304 hundred call seconds (CCS) (128 channels times 18 CCS each).
f = Maintenance usage (count 4). Number of hundreds call seconds (CCS) that any trunk member was unable to provide service. This includes the maintenance disabled, maintenance locked out, circuit administration, out-of-service (OOS) blocked auto, OSS blocked manual, OOS facility, and any other switch defined OOS state. The camped-on and link level quality states are "partially OSS" but should not be counted as maintenance usage. Notification is provided on entry to these states (count 4).
= Outgoing overflow count (count 5). Number of attempts to hunt an idle member of a packet switching trunk group which is denied because an idle trunk member is not available. The "unavailability" of the trunk may be due to overload, out-of-service, or resource shortage.

h = Packet buffer overflow count (count 6). Number of packet buffer overflows. This count is pegged in each protocol handler. Denial of a buffer request due to overload conditions is included in this count. This measurement is representative of the occupancy of the trunk group from the viewpoint of packets transmitted. A trunk group may be providing poor service as indicated by this measurement even though it is not blocking call setups.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 193: packet switch unit channel (PSUCHAN) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hh:mm:ss.
b = Switching module (SM) number.
c = Packet switching unit (PSU) number (0).
d = Shelf (SHLF) number (0-4).
e = QPH Channel group (CHGRP) number (0-15).
f = QLPS Channel (CHAN) number (0-1) represents a QPH QLPS pipe (QPIPE).
g = Bandwidth transmit percent occupancy. This occupancy is taken over an entire 30 minute period. If this QPH QPIPE is out-of-service (OOS) for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the occupancy may appear low. This count will be lost on both a hard and a soft switch of the associated PH.

h = Bandwidth receive percent occupancy. This occupancy is taken over an entire 30 minute period. If this QPH QPIPE is out-of-service (OOS) for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the occupancy may appear low. This count will be lost on both a hard and a soft switch of the associated PH.

i = Channel Transmit 95th Percent Occupancy. This count indicates transmit occupancy on a QPH QPIPE and is computed every 6 seconds. In the 30 minute collection interval, 95% of the 6 second sample have occupancies less than the stated output. If the QPH QPIPE is OOS during the collective interval, this measurement may be distorted; the count will be lost on both a hard and soft PH switch.
Channel Receive 95th Percent Occupancy. This count indicates receive occupancy on a QPH QPIPE and is computed every 6 seconds. In the 30 minute collection interval, 95% of the 6 second sample have occupancies less than the stated output. If the QPH QPIPE is OOS during the collective interval, this measurement may be distorted; the count will be lost on both a hard and soft PH switch.

Average messages per second transmitted by the QPH QPIPE. The number of messages is averaged over an entire 30 minute period. If this QPH QPIPE is OOS for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the average number of messages may appear low. This count will be lost on both a hard and a soft switch of the associated PH.

Average messages per second received by the QPH QPIPE. The number of messages is averaged over an entire 30 minute period. If this QPH QPIPE is OOS for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the average number of messages may appear low. This count will be lost on both a hard and a soft switch of the associated PH.

4. ACTIONS TO BE TAKEN

None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

Check the validity of the corresponding SM.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 193: packet switch unit channel (PSUCHAN) of the 30-minute traffic report. Refer to the APP: MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- `a` = Time when the report was prepared, in the form hh:mm:ss.
- `b` = Switching module (SM) number.
- `c` = Packet switching unit (PSU) number.
- `d` = Shelf number.
- `e` = QPH channel group (CHGRP) number.
- `f` = QLPS channel (CHAN) number. The value of 0 or 1 represents a QPH QLPS pipe (QPIPE).
- `g` = Channel transmit percent occupancy. This occupancy is taken over an entire 30 minute period. If this QPH QPIPE is out-of-service (OOS) for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the occupancy may appear low. This count will be lost on both a hard and a soft switch of the associated PH.
- `h` = Channel receive percent occupancy. This occupancy is taken over an entire 30 minute period. If this QPH QPIPE is OOS for part of that 30 minutes, the calculation still uses 30 minutes as the total...
time. In this case, the occupancy may appear low. This count will be lost on both a hard and a soft switch of the associated PH.

\[ i \] = Channel transmit 95th percent occupancy. This count indicates transmit occupancy on a QPH QPIPE and is computed every 6 seconds. In the 30 minute collection interval, 95% of the 6 second sample have occupancies less than the stated output. If the QPH QPIPE is OOS during the collective interval, this measurement may be distorted; the count will be lost on both a hard and soft PH switch.

\[ j \] = Channel receive 95th percent occupancy. This count indicates receive occupancy on a QPH QPIPE and is computed every 6 seconds. In the 30 minute collection interval, 95% of the 6 second sample have occupancies less than the stated output. If the QPH QPIPE is OOS during the collective interval, this measurement may be distorted; the count will be lost on both a hard and soft PH switch.

\[ k \] = Average messages per second transmitted on the QPH channel. The number of messages is averaged over an entire 30 minute period. If this QPH QPIPE is OOS for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the average number of messages may appear low. This count will be lost on both a hard and a soft switch of the associated PH.

\[ l \] = Average messages per second received on the QPH channel. The number of messages is averaged over an entire 30 minute period. If this QPH QPIPE is OOS for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the average number of messages may appear low. This count will be lost on both a hard and a soft switch of the associated PH.

\[ m \] = Overload. Number of packets that are dropped in the transmit direction in the FRPH due to overload.

   .   .    .     .      .         .          .          .

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 193 or 183: packet switch unit channel (PSUCHAN) of the 30-minute traffic report.

Note: The EADAS contents and output depends on OFID 990. If OFID 990 is switched off then the section 193 will be used. For OFID 990 switched on the section 183 with double precision counters is used.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for
additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hh:mm:ss.
b = Switching module (SM) number.
c = Packet switching unit (PSU) number.
d = Shelf number.
e = QPH channel group (CHGRP) number.
f = QLPS channel (CHAN) number. The value of 0 or 1 represents a QPH QLPS pipe (QPIPE).
g = Channel transmit percent occupancy. This occupancy is taken over an entire 30 minute period. If this QPH QPIPE is out-of-service (OOS) for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the occupancy may appear low. This count will be lost on both a hard and a soft switch of the associated PH.
h = Channel receive percent occupancy. This occupancy is taken over an entire 30 minute period. If this QPH QPIPE is OOS for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the occupancy may appear low. This count will be lost on both a hard and a soft switch of the associated PH.
i = Channel transmit 95th percent occupancy. This count indicates transmit occupancy on a QPH QPIPE and is computed every 6 seconds. In the 30 minute collection interval, 95% of the 6 second sample have occupancies less than the stated output. If the QPH QPIPE is OOS during the collective interval, this measurement may be distorted; the count will be lost on both a hard and soft PH switch.
j = Channel receive 95th percent occupancy. This count indicates receive occupancy on a QPH QPIPE and is computed every 6 seconds. In the 30 minute collection interval, 95% of the 6 second sample have occupancies less than the stated output. If the QPH QPIPE is OOS during the collective interval, this measurement may be distorted; the count will be lost on both a hard and soft PH switch.
k = Average messages per second transmitted on the QPH channel. The number of messages is averaged over an entire 30 minute period. If this QPH QPIPE is OOS for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the average number of messages may appear low. This count will be lost on both a hard and a soft switch of the associated PH.
l = Average messages per second received on the QPH channel. The number of messages is averaged over an entire 30 minute period. If this QPH QPIPE is OOS for part of that 30 minutes, the calculation still uses 30 minutes as the total time. In this case, the average number of messages may appear low. This count will be lost on both a hard and a soft switch of the associated PH.
m = Overload. Number of packets that are dropped in the transmit direction in the FRPH due to overload.

4. ACTIONS TO BE TAKEN

No action is required.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option: Refer to the OP:TRFC30 input message for additional information.

Check the validity of the corresponding SM.
5. ALARMS

None.

### 2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 197: protocol handler for asynchronous transfer mode link (PSULNK) of the 30 minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

**NOTE:** When the near community address (NCA) is that of a gateway (GW) PHA, then the congestion threshold counts are based on the GW PHA capacity. Please refer to 235-200-100 for additional information.

### 3. VARIABLE FIELD DEFINITIONS

#### 3.1 Variables

- **a** = Time when the report was prepared, in the form hh:mm:ss.
- **b** = Near community address (NCA).
- **c** = Far community address (FCA).
- **d** = Active PHA level 1 receive occupancy threshold exceeded seconds (ROT1ES)
- **e** = Active PHA level 2 receive occupancy threshold exceeded seconds (ROT2ES)
- **f** = Standby PHA level 1 receive occupancy threshold exceeded seconds (ROT1ES)
- **g** = Standby PHA level 2 receive occupancy threshold exceeded seconds (ROT2ES)

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 42: queuing announcement (QANN) for multi-line hunt groups of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Multi-line hunt group number.

c = Announcement channel number. Refer to RC/V View 3.40.

d = Announcement channel use peg count. This is the number of times an MLHG delay announcement is connected to a customer's line.

e = Announcement channel overflows. This count is the number of calls blocked from getting MLHG delay announcement treatment.

3.2 Parameters

<table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 175: quad-link gateway processor (QGP) processor performance link occupancy of the 30-minute traffic report. This section is specifically for the switching module (SM)-2000.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Message switching controller unit (MSCU) side. Valid value(s):
   0
   1

c = QGP unit number. Valid value(s):
   0
   1

d = Validity of the data. Valid value(s):
   0 = Valid
   1 = Invalid.

e = Quad-link gateway processor message handler message in. Number of messages received by the QGP message handler (MSGH) from an MSCU.

f = Quad-link gateway processor message handler message out. Number of messages transmitted by the QGP-MSGH to an MSCU.

g = Quad-link gateway processor message handler base level loop cycles. Number of MSGH base level loop cycles divided by 1000.
h = Quad-link gateway processor message handler overflow. Number of times the QGP-MSGH base priority output queue has overflowed.

i = Quad-link gateway processor applications processor message in. Number of messages received by the QGP application processor (AP) from the quad link packet switch (QLPS).

j = Quad-link gateway processor applications processor message out. Number of messages transmitted by the QGP-AP to the QLPS.

k = Quad-link gateway processor applications processor base level loop cycles. Number of QGP AP base level loop cycles divided by 1000.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or a scheduled output of section 40: queueing for multi-line hunt groups (QMLHGs), of the 30-minute traffic report. Up to five multi-line hunt groups (MLHGs) may be reported in a single message.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Multi-line hunt group identifier.
c = Number of multi-line hunt group queuing attempts.
d = MLHG queue abandonment. Number of calls abandoned while they were in the queue.
e = MLHG queue usage. Amount of time the calls are in the queue.
f = MLHG queue overflows. Number of calls that were not queued because the queue was full.
g = Number of calls held in the multi-line hunt group queue for longer than 1 second.

3.2 Parameters

4. ACTIONS TO BE TAKEN

None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

Check administrative module (AM) validity for queuing attempts and queue overflows. Check switching module (SM) validity for all of the counts.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of Section 176: quad-link packet switching (QLPS) QLPS gateway processor (QPIPE) link occupancy of the 30-minute traffic report. This section is specifically for switching module-2000.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Message switch controller unit (MSCU) side. Valid value(s):
  0
  1
c = QGP unit number. Valid value(s):
  0
  1
d = Validity of the data. Valid value(s):
  0 = Valid.
  1 = Invalid.
e = QLPS network 0 received in QGP. Average occupancy of pipe between the QGP and a network 0 QLPS in the receiving direction (QLPS to QGP).
f = QLPS network 1 received in QGP. Average occupancy of pipe between the QGP and a network 1 QLPS in the receiving direction (QLPS to QGP).
g = QLPS network 0 transmitted from QGP Average occupancy of pipe between the QGP and a network 0 QLPS in the sending direction (QGP to QLPS).
h = QLPS network 1 transmitted from QGP. Average occupancy of pipe between the QGP and a network 1 QLPS in the sending direction (QGP to QLPS).

i = QLPS network 0 received in QGP. 95th percentile occupancy of pipe between the QGP and a network 0 QLPS in the receiving direction (QLPS to QGP).

j = QLPS network 1 received in QGP. 95th percentile occupancy of pipe between the QGP and a network 1 QLPS in the receiving direction (QLPS to QGP).

k = QLPS network 0 transmitted from QGP. 95th percentile occupancy of pipe between the QGP and a network 0 QLPS in the sending direction (QGP to QLPS).

l = QLPS network 1 transmitted from QGP. 95th percentile occupancy of pipe between the QGP and a network 1 QLPS in the sending direction (QGP to QLPS).

4. ACTIONS TO BE TAKEN

None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with the input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

The validity of the administrative module applies to this section.

5. ALARMS

None.

### 2. REASON FOR OUTPUT

To respond to a request for either a manual or an automatic output of section 57 for routine and priority queuing simulated facility (QSF) group measures of the 30-minute traffic report. Up to five simulated facility groups may be output in a single message.

### 3. VARIABLE FIELD DEFINITIONS

#### 3.1 Variables

- **a** = Time, in the form hours:minutes:seconds.
- **b** = Simulated facility group identifier.
- **c** = Routine queue attempts. Number of attempts to place a call in a routine queue.
- **d** = Routine queue abandon. Number of abandoned calls while in a routine queue.
- **e** = Routine queue usage.
- **f** = Routine queue overflow. Number of calls not queued because the routine queue was full.
- **g** = Routine queue time-out. Number of calls removed from a routine queue due to time-out treatment.
- **i** = Priority queue attempts. Number of attempts to place call in a priority queue.
- **j** = Priority queue abandon. Number of calls that abandoned while in a priority queue.
k = Priority queue usage.

l = Priority queue overflow. Number of calls not queued because the priority queue was full.

m = Priority queue time-out. Number of calls removed from a priority queue due to time-out treatment.

### 3.2 Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>

2. REASON FOR OUTPUT

To respond to a request for either a manual or an automatic output of section 55, routine and priority queuing for trunk group (QTG) measures of the 30-minute traffic report. Up to five trunk groups may be output in a single message.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time, in the form of hours:minutes:seconds.
b = Trunk group identifier.
c = Routine queue attempts. Number of attempts to place a call in a routine queue.
d = Routine queue abandon. Number of calls that abandoned while in a routine queue.
e = Routine queue usage.
f = Routine queue overflow. Number of calls not queued because the routine queue was full.
g = Routine queue time-out. Number of calls removed from a routine queue due to time-out treatment.
i = Priority queue attempts. Number of attempts to place call in a priority queue.
j = Priority queue abandon. Number of calls that abandoned while in a priority queue.
k = Priority queue usage.
l = Priority queue overflow. Number of calls not queued because the priority queue was full.
m = Priority queue time-out. Number of calls removed from a priority queue due to time-out treatment.

3.2 Parameters
