Inspect the EXC:PM output messages for the results of the monitoring session and analyze for protocol violations or other errors. If translation of the hexadecimal output into ASCII has been requested, examine the ATF. If variable 'd²' is output, save the ROP printout and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the information collected during a protocol monitoring (PM) session.

Format 1 provides an indication that a ISDN or CCS PM session has either successfully started, aborted, stopped, or failed to start.
Format 2 provides an indication that a PCF PM session has either successfully started, aborted, stopped, or failed to start.

For Format 1 and Format 2, in addition, all pertinent information relating to the PM session is displayed. The formats are also used as the prelude to the hexadecimal output or as notification that translation of the hexadecimal output into the American standard code for information interchange (ASCII) has begun.

Format 3 contains the raw data collected during the ISDN or CCS monitoring session.

Format 4 contains the raw data collected during the PCF monitoring session.

For Format 3 and Format 4, additional information regarding the frame is also provided. The raw data is printed in a hexadecimal format. This message type is only used when hexadecimal data is being dumped to the read-only printer (ROP). Translated sessions will not use this output format.

**NOTE:** The maximum amount of recorded data that can be output in one segment is 132 bytes. If the length of the recorded frame or packet or messages is larger than 132 bytes, then the frame or packet or message will require more than one segment to output. Incomplete frames will be noted with the CONT indicator.

Format 5 provides the status for the conclusion of a session (that is, successfully completed, stopped due to a manual request, or terminated abnormally).

### 3. VARIABLE FIELD DEFINITIONS

- **CONT** = The recorded frame is continued in the next output segment.
- **NO XLATE** = The hexadecimal output for this session will not be translated through the protocol monitoring translator.
- **PER** = Trigger value that terminated the recording session was a protocol error record (PER) occurring on the channel being recorded. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.
- **PKTDN** = Directory number with packet-switched service.
- **PORT** = Global port.
- **TEI_CHANGED** = The TEI has changed since the protocol monitoring session began. Note that when the TEI change occurs, the trigger may not yet have been found. The TEI_CHANGED indicator will appear only for multipoint lines and only when user triggering.

**NOTE:** When triggering on a single user of a multipoint line, the TEI for that user is stored at the beginning of the monitoring session and its value is used to determine the triggering frame or message. If the TEI stored and used by the monitoring session changes before the session is triggered, then the TEI_CHANGED indicator will appear for each frame of that session. It is possible, when the offset value is set to be less than 10 and the trigger event occurs around the same time as the change in TEIs, that some EXC:PM DATA messages will display the new TEI number, but the TEI_CHANGED indicator will not appear.

- **TRIG** = The recorded frame is associated with the triggering event.
- **XLATE** = The protocol monitoring translator has been invoked for this session. The output will be translated into an ASCII file.
- **a** = Status. Valid value(s):
  - ABORTED – ATF CLOSE FAILURE = The PM session was aborted because the ASCII translation
file (ATF) could not be closed.

ABORTED - ATF OPEN FAILURE = The PM session was aborted because the ATF could not be opened.

ABORTED - ATF WRITE FAILURE = The PM session was aborted because the ATF could not be written to.

ABORTED - COMMUNICATION FAILURE = An unspecified communication error occurred between the administrative module (AM) and switching module (SM), between the SM and the protocol handler (PH), or between the AM and UNIX® operating system.

ABORTED - DATABASE PROBLEM = The request to start a PM session failed because an error occurred while reading the database.

ABORTED - INVALID PMCFF FILE = The PM session was aborted because the protocol monitoring common format file (PMCFF) contents were corrupted, or were missing.

ABORTED - INVALID SESSION ID = The PM session was aborted because the session identifier did not correspond to a valid session.

ABORTED - PMCFF CLOSE FAILURE = The PM session was aborted because the PMCFF could not be closed.

ABORTED - PMCFF OPEN FAILURE = The PM session was aborted because the PMCFF could not be opened.

ABORTED - PMCFF READ FAILURE = The PM session was aborted because the PMCFF could not be read.

ABORTED - PMCFF WRITE FAILURE = The PM session was aborted because the PMCFF could not be written to.

ABORTED - TEMPORARY FILE CLOSE FAILURE = The PM session was aborted because the temporary file created for this session could not be closed.

ABORTED - TEMPORARY FILE OPEN FAILURE = The PM session was aborted because the temporary file created for this session.

ABORTED - TEMPORARY FILE READ FAILURE = The PM session was aborted because the temporary file created for this session could not be read.

ABORTED - TEMPORARY FILE WRITE FAILURE = The PM session was aborted because the temporary file created for this session could not be written to.

ABORTED - TRANSLATION FAILURE = The PM session was aborted because the protocol translator was not able to translate this session.

ABORTED - INTERNAL FAILURE = The request to start a PM session failed because an internal failure was encountered.

ABORTED - RECORDER FAILURE = The request to start a PM session failed because a recorder failure was encountered.

ABORTED - UNABLE TO CREATE PROCESS = The request to start a PM session failed because of the inability to create the internal processes necessary for controlling the session.

COMPLETED = The protocol monitoring session has completed.

CONTINUING - TRANSLATION NOT AVAILABLE = The protocol monitoring session is continuing, but translation of the output into ASCII is not available.

NOT STARTED - CHANNEL MISMATCH = The channel (CH) specified on the input line is not valid for the protocol (PROT) specified on the input line. The CH specified on the input line is not a valid channel.

NOT STARTED - CHANNEL REQUIRED = CH option must be specified on the input line, since the directory number or multi-line hunt group (MLHG) is assigned to more than one channel.

NOT STARTED - CMP UNAVAILABLE = The request to start a PM session failed because the communication module (CM) is isolated from the AM.

NOT STARTED - INVALID PCF IP ADDRESS = The PCF IP address entered was verified to be invalid.
NOT STARTED – INVALID PDSN IP ADDRESS = The PDSN IP address entered was verified to be invalid.

NOT STARTED – PCF AND PDSN IP ADDRESS MISMATCH = The PCF IP address and the PDSN IP address are not connected.

NOT STARTED – PM FOR ENTIRE PCF IS RUNNING = Since PM is running on the entire PCF, no more PCF PM session can be started.

NOT STARTED – INVALID PCF EQUIPMENT IDENTIFIER INPUT = The request to start a PM session failed because the PCF equipment entered identifier is not IP address.

NOT STARTED – INVALID PORT = The port identifier entered could not be translated and was considered to be invalid.

NOT STARTED – INVALID PROTOCOL = The protocol specified on the input message is not valid.

NOT STARTED – INVALID PROTOCOL ERROR CODE = The protocol error code specified on the input message is not valid. (Refer to the 235-600-755 for details.)

NOT STARTED – MAX JOBS RUNNING = A new PM session could not be started because the maximum number of PM sessions are currently active. The maximum number of sessions is 8 per office.

NOT STARTED – MESSAGE MISMATCH = The trigger value (TRIGVAL) specified on the input line is not valid for the PROT specified on the input line.

NOT STARTED – MLHG DN SPECIFIED = The request to verify a PM session failed because a directory number (DN) for a MLHG or uniform call distribution (UCD) group was specified. Repeat request using MLHG port services identifier option.

NOT STARTED – NON-PRIMARY DN SPECIFIED = The request to verify a PM session failed because the primary DN is required. Repeat request specifying the primary DN.

NOT STARTED – NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

NOT STARTED – NOT PM TESTABLE = The request to verify a PM session failed because the port cannot be tested.

NOT STARTED – PH UNAVAILABLE = The request to start a PM session failed because the PH is isolated from the SM.

NOT STARTED – PORT CONFLICT = A PM session could not be started because a session is currently active on the port specified on the input line.

NOT STARTED – PORT HAS NO PM CAPABILITY = A PM session could not be started because the port specified is either not an integrated services digital network (ISDN) line or does not support ISDN capabilities.

NOT STARTED – PROCESSOR CONFLICT = A PM session could not be started because the maximum number of sessions recording on a processor are currently active. The relationship between protocol and processor type is given in the list of protocols contained in this manual page. The maximum number of sessions recorded on a processor are:

- 8 per office.
- 2 per SM and 4 per SM 2000.
- 2 per PH1 and PH2.
- 3 per PH3 and PH4.
- 2 per PHV1, PHV2, and PHV3.
- 1 per PH4 connected to frame relay bearer channels (FRBCs).

NOT STARTED – PROTOCOL MISMATCH = The PROT specified on the input line does not match
the line identifier specified on the input line.

**NOT STARTED – PROTOCOL ERROR CODE MISMATCH** = The protocol error code (PER) specified on the input line is not a valid protocol error code for the PROT specified on the input line. (Refer to the 235-600-755 for details.)

**NOT STARTED – SM UNAVAILABLE** = The request to start a PM session failed because the SM is isolated from the AM.

**NOT STARTED – TRIGGER MISMATCH** = The TRIGLVL specified on the input line is not valid for the PROT specified on the input line.

**REPORTING – BEGINNING TRANSLATION** = The collection of data in this protocol monitoring session has completed and translation of that data into ASCII (the ATF file) is beginning.

**REPORTING – OUTPUT FOLLOWS** = The collection of data in this protocol monitoring session has completed and the hexadecimal data that was collected will now be output.

**STARTED** = A PM session was successfully started.

**STOPPED** = The PM session was stopped due to a manual request.

**STOPPED – DURATION TIMEOUT** = The PM session was stopped when the duration timer expired.

b = SM number.

c = PH channel group number.

d = PH channel member number.

e = Logical port number.

f = The equipment number identifier.

**NOTE:** If the port is associated with an X.75 trunk or an X.75 trunk or an extended digital subscriber line (EDSL), then the digital equipment number (DEN) is used. If the port is associated with a digital networking unit - synchronous optical network (SONET) (DNU-S) then the DNU-S networking equipment number (NEN) is used or peripheral control and timing line and trunk equipment number (PLTEN). If the port is associated with an embedded operation channel (EOC) or timeslot management channel (TMC), then the EOC or TMC equipment number is used. Otherwise, the line card equipment number (LCEN), line circuit equipment number (LCKEN), access interface unit number (AIUEN), packet switching unit equipment number (PSUEN), integrated digital carrier unit line equipment number (ILEN) or IDLC network equipment number (INEN) is used.

Valid value(s):

- **AIUEN** = \(b-m^n-o\)
- **DEN** = \(b-g-h-i\)
- **DNUSEOC** = \(b-h^n-o\)
- **DNUSTMC** = \(b-h^n-o\)
- **IDCUEOC** = \(b-m^n-o\)
- **IDCUTMC** = \(b-m^n-o\)
- **ILEN** = \(b-m^n-p\)
- **INEN** = \(b-h^n-p\)
- **LCEN** = \(b-j-k-l\)
- **LCKEN** = \(b-e^2-m^n-f^2-g^2\)
- **NEN** = \(b-h^n-v^2-j^2-k^2-w^2-l^2\)
- **OIUEN** = \(b-j^3-k^3-l^3-j^2-k^2-w^2-l^2\)
\[ PLTEN = b - x^2 - y^2 - z^2 - a^3 \]
\[ PSUEN = b - r^2 - t^2 - u^2 - d \]
\[ VBRI = b - b_3 \]
\[ VTRK = b - c^3 - d^3 \]

\[ g = \text{Digital line and trunk unit (DLTU) number.} \]
\[ h = \text{Digital facility interface number.} \]
\[ i = \text{Digital channel number.} \]
\[ j = \text{Integrated services line unit number.} \]
\[ k = \text{Line group controller number.} \]
\[ l = \text{Line card number.} \]
\[ m = \text{Integrated digital carrier unit number.} \]
\[ n = \text{Remote terminal (RT) number.} \]
\[ o = \text{Primary/protection identifier.} \]
\[ p = \text{RT line number.} \]
\[ q = \text{Channel being monitored. Valid value(s):} \]
\[ B1 = \text{Channel B1.} \]
\[ B2 = \text{Channel B2.} \]
\[ D = \text{D-channel.} \]

\[ r = \text{Port services identifier.} \]

**NOTE:** This field will be blank if the port does not have a unique port services identifier.

Valid value(s):

\[ DN = s \]
\[ MLHG = t - u \]
\[ PKTDN = v \]

\[ s = \text{The primary DN associated with the digital subscriber line (DSL) channel. This DN may be either} \]
\[ \text{a circuit-switched or a packet-switched service DN.} \]

\[ t = \text{Multi-line hunt group number.} \]

\[ u = \text{Multi-line hunt group member number.} \]

\[ v = \text{The DN associated with a packet-switched channel of a DSL.} \]

\[ w = \text{Trunk group number.} \]

\[ x = \text{Trunk group member number.} \]
\( y \) = Service characteristic identifier of DSL channel. Valid value(s):

- **ODP** = On-demand packet.
- **PPB** = Permanent packet B.
- **PPD** = Permanent packet D.

\( z \) = The value of the session (SES) identifier for this monitoring session.

\( a^1 \) = The date-stamp of the beginning of the monitoring session, in the form month/day.

\( b^1 \) = The time-stamp of the beginning of the monitoring session, in the form hours:minutes:seconds.

\( c^1 \) = The current date-stamp for the monitoring session, in the form month/day.

\( d^1 \) = The current time-stamp for the monitoring session, in the form hours:minutes:seconds.

\( e^1 \) = The offset (OFFSET) for the number of frames that was recorded after detection of the trigger event.

\( f^1 \) = The duration (DUR) of the recording session in seconds.

\( g^1 \) = Protocol (PROT) being monitored. Valid value(s):

- **LAPB** = The LAPB protocol (recorded on the PH).
- **LAPD** = The LAPD protocol (recorded on the PH).
- **LAPF** = The LAPF protocol (recorded on the PH).
- **Q931** = The Q.931 protocol (recorded on the SM).
- **TMC** = The TMC protocol (recorded on the SM).
- **V120** = The V.120 protocol (recorded on the SM).
- **X25** = The X.25 protocol (B-channel packet recorded on the PH, D-channel packet recorded on the SM).
- **X75** = The X.75 protocol (recorded on the PH).
- **X75P** = The X.75' protocol (recorded on the PH).
- **RLP** = The RLP protocol (recorded on the PHV).
- **CESHL2** = The CESHL2 protocol (recorded on the PHV).
- **CESHL3** = The CESHL3 protocol (recorded on the PHV).
- **ISLP** = The ISLP protocol (recorded on the PHV).

\( h^1 \) = Protocol's trigger level (TRIGLVL).

**NOTE:** Trigger protocol level must be terminated on the same processor as the recording protocol.

Valid value(s):

- **ATS** = The trigger level is the ATS protocol.
- **IDLC** = The trigger level is the IDLC protocol.
- **LAPB** = The trigger level is the LAPB protocol.
- **LAPD** = The trigger level is the LAPD protocol.
- **LAPF** = The trigger level is the LAPF protocol.
- **Q931** = The trigger level is the Q.931 protocol.
- **TMC** = The trigger level is the TMC protocol.
- **V120** = The trigger level is the V.120 protocol.
- **X25** = The trigger level is the X.25 protocol.
- **X75** = The trigger level is the X.75 protocol.
- **X75P** = The trigger level is the X.75' protocol.
RLP = The trigger level is the RLP protocol.
CESHL2 = The trigger level is the CESHL2 protocol.
CESHL3 = The trigger level is the CESHL3 protocol.
ISLP = The trigger level is the ISLP protocol.

\[i\] = TRIGVAL that terminates the recording session. Refer to the EXC:PM input manual page for a complete list of trigger values.

\[j\] = Specific PER that terminated the recording session.

\[k\] = Direction (DIR) of frame or packet or message triggered on. Valid value(s):
- EITHER = Triggered on a frame or packet or message transmitted from the switch to the customer premises equipment (CPE) or the packet data switch network (PDSN) or received by the switch from the CPE or PDSN.
- RCV = Triggered on a frame or packet or message received by the switch from the CPE or PDSN.
- XMT = Triggered on a frame or packet or message transmitted from the switch to the CPE or PDSN.

\[l\] = The protocol level recorded (RECLVL). Valid value(s):
- LEVEL2 = Recorded all layer 2 frames.
- LEVEL3 = Recorded only the layer 3 packets or messages.

\[m\] = The number of events recorded.

\[n\] = State of the protocol monitoring session. Valid value(s):
- ABORTED = The session has aborted.
- DATA RETRIEVAL = The recording of data has completed and is being processed for output.
- DURATION TIMEOUT = The duration timer has fired. Waiting for session output.
- RECORD COMPLETED = The session has completed normally.
- RECORDING = The session is recording data and the trigger has not yet fired.
- STOP NO DUMP = The session has been manually terminated with neither translation nor dump of the output data.
- STOP WITH DUMP = The session has been manually terminated with either translation or dump of the output data.
- TRANSLATING = The hexadecimal data collected during the session is being translated into an ASCII format.
- TRIGGER FIRED = The trigger of the session has fired.
- WAIT DUMP ACK = A manual request has been made to terminate the session with translation or dump. Awaiting response from the switch.
- WAIT STOP ACK = A manual request has been made to terminate the session without translation or dump. Awaiting response from the switch.

\[o\] = The ATF file name. Contains the ASCII translation of the hexadecimal data output from the protocol monitoring session.

\[p\] = The PMCFF file name. The intermediate binary file created during the translation of the hexadecimal output of the session into ASCII output. This file is used internally and is not generally available for inspection.
q
  = The segment (SEG) number of the output data. The segments are in ascending order beginning at 1 for each session output.

NOTE: The segment number is not necessarily the same as the frame number since frames may be continued over more than one segment.

r
  = The date-stamp of the recorded frame, in the form month/day.

s
  = The time-stamp of the recorded frame, in the form hours:minutes:seconds.

t
  = Terminal endpoint identifier (TEI).

u
  = Total bytes.

v
  = The frame number relative to the first frame in the recording window.

w
  = The length of the recorded frame in bytes.

x
  = DIR of recorded frame. Valid value(s):

  RCV = Frame or packet or message received by the switch from the CPE or PDSN.
  XMT = Frame or packet or message transmitted from the switch to the CPE or PDSN.

y
  = The protocol error code (PEC) associated with the recorded frame. Refer to the 235-600-755 for details. In the event that two PER's are reported against the same frame, the PEC of the second PER will overwrite the first. This situation could cause the output message to indicate a triggering event that shows a different PEC than the value that actually triggered the session.

This message may print the following PECs:

UXP-SMVCNTL = For the CESHL3 protocol, an unexpected FS_SMVCNTL message was received from the cell.

INV-APPL-SAPI = For the CESHL4 protocol, an FS_TRANSPORT message was received by the 5ESS® DCS with an unknown service application point identifier (SAPI) value.

INV-PV-L4 = For the CESHL4 protocol, an FS_TRANSPORT message was received by the 5ESS® DCS with an L4_pv_in_use value that is not equal to the value that was sent back to the cell using FS_ACK in response to a FS_CONNECT for the setup of a specific leg of the call.

z
  = The four-byte hexadecimal representation from the recorded frame or packet or message.

a
  = The date-stamp of the end of the monitoring session, in the form month/day.

b
  = The time-stamp of the end of the monitoring session, in the form hours:minutes:seconds.

c
  = The PEC which acted as the trigger. This is displayed only on the EXCPM COMPLETED message and only if PER triggering was chosen for the protocol monitoring session and only if the number of data segments was zero. Refer to the 235-600-755 for details.

d
  = Internal error code to assist in locating reason for abort.

e
  = Integrated service line unit 2 (ISLU2) number.

f
  = Line board number.

g
  = Line circuit number.
h^2 = DNU-S number.

i^2 = Data group (DG) number.

j^2 = Synchronous transport signal (STS) facility number.

k^2 = Virtual tributary group (VTG) number.

l^2 = DS0 number.

m^2 = Access interface unit (AIU) number.

n^2 = AIU pack number.

o^2 = AIU circuit number.

p^2 = Type of messages recorded when monitoring LAP D protocol on a frame relay bearer channel. User can request specifically to monitor either control messages or user data. However, if user data recording is requested, only a summary of the user data frame will be recorded, due to the sheer volume of the user data. The summary of the user data frame will contain the address information and the length of the actual user data frame transmitted or received. Valid value(s):

CTRL = Recorded only control messages. CTRL is the default value.
DATA = Recorded only a summary of the transmitted or received user data frame.
ALL = Recorded both control messages and a summary of the transmitted or received user data frame.

q^2 = Type of messages or frames recorded when protocol monitoring is on a speech handler or an AUTOPLEX® data trunk. This option can be used with CESHL2 or CESHL3 or RLP protocol. Valid value(s):

CTRL = Recorded control frames (S and I) for CESHL2 protocol. Default value for CESHL2 protocol at level 2 recording.
TRAF = Recorded UI traffic messages for CESHL3 protocol.
IP = Recorded inter-processor messages for CESHL3 protocol. Default value for CESHL3 protocol at level 3 recording.
RLP = Recorded non-idle RLP frames for RLP protocol. Default value for RLP protocol at level 7 recording.
ALL = Recorded all messages for CESHL2 or CESHL3 or RLP protocol. This will result in recording S, I, XID, and UI frames for CESHL2 protocol, or UI plus IP frames for CESHL3 protocol, or RLP plus idle frames for RLP protocol.

r^2 = Packet switching unit (PSU) number.

t^2 = PSU shelf number.

u^2 = PSU channel group number.

v^2 = SONET termination equipment (STE) facility number.

w^2 = Virtual tributary member (VTM) number.

x^2 = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.
y^2 = PCT facility interface (PCTFI) number.
z^2 = Tributary number (T1FAC).
a^3 = Channel (CHAN) number.
b^3 = Virtual BRI line number.
c^3 = Virtual trunk facility number.
d^3 = Virtual trunk channel number.
e^3 = IP address field. Valid value is number between 0-255.
f^3 = The GRE frame length.
g^3 = The protocol being monitoring in PCF PM session. Valid value(s):
    A10 = The A10 protocol specified in IS-634.
    A11 = The A11 protocol specified in IS-634.

h^3 = Protocol's trigger level (TRIGLVL) for PCF PM session.

    NOTE: Trigger protocol level must be terminated on the same processor as the recording protocol.
    Valid value(s):
    A10 = The trigger level is the A10 protocol.
    A11 = The trigger level is the A11 protocol.

i^3 = The protocol level recorded (RECLVL) for PCF PM session. Valid value(s):
    LEVEL7 = Recorded only the layer 7 packets or messages.

j^3 = Optical interface unit (OIU) number.
k^3 = Protection group (PG) number.
l^3 = OC3 STE number.

4. ACTIONS TO BE TAKEN

Inspect the EXC:PM output messages for the results of the monitoring session and analyze for protocol violations or other errors. If translation of the hexadecimal output into ASCII has been requested, examine the ATF. If variable 'd^2' is output, save the ROP printout and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the information collected during a CCS protocol monitoring (PM) session.

Format 1 provides an indication that a PM session has either successfully started, aborted, stopped, or failed to start. In addition, all pertinent information relating to the PM session is displayed. This format is also used as a prelude to the hexadecimal output or as notification that translation of the hexadecimal output into the American standard code for information interchange (ASCII) has begun. Format 2 contains the raw data collected during the monitoring session. Additional information regarding the frame is also provided. The raw data is printed in a hexadecimal format. This message type is only used when hexadecimal data is being reported to the receive-only printer (ROP). Translated sessions will not use this output format.

Note: The maximum amount of recorded data that can be output in one segment is 132 bytes. If the length of the recorded frame or packet or messages is larger than 132 bytes, then the frame or packet or message will require more than one segment to output. Incomplete frames will be noted with the CONT indicator.

Format 3 provides the status for the conclusion of a session (that is, successfully completed, stopped due to a manual request, or terminated abnormally). This format also provides information regarding the status of the processors involved in the PM session. (that is, it will report screening, recording, aborted or overloaded processors).
3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

TRIG = The recorded frame triggered the session to end.

CONT = The recorded frame is continued in the next output segment.

NO XDATE = The hexadecimal output for this session will not be translated through the protocol monitoring translator. The output will be reported in hexadecimal format on the ROP.

XDATE = The protocol monitoring translator has been invoked for this session. The output will be translated into an ASCII file.

AM|DLN = Signifies that the AM or DLN processor is associated with this PM session.

SM NUMBERS = Signifies that SM processors are associated with this PM session.

a = Status. Valid value(s):

ABORTED - ATF CLOSE FAILURE = The PM session was aborted because the ASCII translation file (ATF) could not be closed.

ABORTED - ATF OPEN FAILURE = The PM session was aborted because the ATF could not be opened.

ABORTED - ATF WRITE FAILURE = The PM session was aborted because the ATF could not be written to.

ABORTED - COMMUNICATION FAILURE = An unspecified communication error occurred between the administrative module (AM) and the recording processor (SM, DLN or AM) or the AM and UNIX® operating system.

ABORTED - DATABASE PROBLEM = The request to start a PM session failed because an error occurred while reading the database.

ABORTED - INVALID PMCFF FILE = The PM session was aborted because the protocol monitoring common format file (PMCFF) contents were corrupted, or were missing.

ABORTED - PMCFF CLOSE FAILURE = The PM session was aborted because the PMCFF could not be closed.

ABORTED - PMCFF OPEN FAILURE = The PM session was aborted because the PMCFF could not be opened.

ABORTED - PMCFF READ FAILURE = The PM session was aborted because the PMCFF could not be read.

ABORTED - PMCFF WRITE FAILURE = The PM session was aborted because the PMCFF could not be written to.

ABORTED - TEMPORARY FILE CLOSE FAILURE = The PM session was aborted because the temporary file created for this session could not be closed.

ABORTED - TEMPORARY FILE OPEN FAILURE = The PM session was aborted because the temporary file created for this session

ABORTED - TEMPORARY FILE READ FAILURE = The PM session was aborted because the temporary file created for this session could not be read.

ABORTED - TEMPORARY FILE WRITE FAILURE = The PM session was aborted because the temporary file created for this session could not be written to.

ABORTED - TRANSLATION FAILURE = The PM session was aborted because the protocol translator was not able to translate this session.

ABORTED - INTERNAL FAILURE = The PM session was aborted because an internal failure was encountered.
ABORTED - UNABLE TO CREATE PROCESS = The request to start a PM session on a particular processor failed because of the inability to create the internal processes necessary for controlling the session on that processor.

RECORDER ABORTED - DLN OUT-OF-SERVICE = The DLN PM recorder was aborted because the active DLN that was monitoring data became unavailable. This will occur when the DLN switches while the DLN is screening messages or recording data for a PM session.

RECORDERS ABORTED = List of PM processors that have aborted during a PM session.

PROCESSORS SCREENING = List of PM processors that are actively screening messages for this PM session.

PROCESSOR RECORDING = List the PM processor that is recording data for this PM session.

RECORDERS INACTIVE DUE TO OVERLOAD = List of PM processors that have aborted due to a detection of an overload condition.

NOT STARTED - TCAP SESSION REPEAT FAILURE = Repeating TCAP session could not be started due to an internal failure.

NOT STARTED - ISUP SESSION REPEAT FAILURE = Repeating ISUP session could not be started due to an internal failure.

NOT STARTED - INVALID RANGE FOR DN = The range specified for the CALLED or CALLING parameter is out of range.

NOT STARTED - CALLING DN INVALID WHEN LAYER SET TO SCCP = The CALLING parameter is invalid when the LAYER parameter is set to SCCP (default). Invalid combination of input parameters.

NOT STARTED - CDSN INVALID WHEN DIR SET TO XMT = The CDSN parameter is invalid when the DIR parameter is set to XMT. Invalid combination of input parameters.

NOT STARTED - LAYER SET TO TCAP INVALID WHEN DIR SET TO RCV = The LAYER parameter set to TCAP is invalid when DIR is set to RCV. Invalid combination of input parameters.

NOT STARTED - CDSN INVALID WHEN LAYER SET TO TCAP = The CDSN parameter is invalid when the LAYER parameter is set to TCAP. Invalid combination of input parameters.

NOT STARTED - CCS NOT IN OFFICE = The request to start a PM session failed because common channel signaling is not equipped in the office.

NOT STARTED - INVALID CGSN = The calling party subsystem number is invalid.

PROCESSORS NOT STARTED DUE TO OVERLOAD = A list of PM recorders that could not be started because the processor was experiencing an overload condition.

NOT STARTED - CCS PM FEATURE NOT PURCHASED = The CCS PM feature is a secured feature. This error indicates that the CCS PM feature has not been purchased in this office.

RETRY LATER - MAXIMUM NUMBER OF ISUP SESSIONS IN PROGRESS = The maximum number of concurrent ISUP sessions are in progress. Retry this command later.

RETRY LATER - MAXIMUM NUMBER OF TCAP SESSIONS IN PROGRESS = The maximum number of concurrent TCAP sessions are in progress. Retry this command later.

STARTED = The PM session was successfully started.

STOPPED = The PM session was stopped due to a manual request.

STOPPED - DURATION TIMEOUT = The PM session was stopped when the duration timer expired.

STOPPED DUE TO OVERLOAD - SESSION OUTPUT CONV = The PM session has been terminated due to an overload encountered on the recording processor. Data will be reported in subsequent messages provided the overloaded processor can service the request.

COMPLETED = The protocol monitoring session has completed.

REPORTING - BEGINNING TRANSLATION = The collection of data in this protocol monitoring
session has completed and translation of that data into ASCII (the ATF file) is beginning.

REPORTING - OUTPUT FOLLOWS = The collection of data in this protocol monitoring session has completed and the hexadecimal data that was collected will now be output.

b = Called party address directory number.
c = Calling party address directory number.
d = Trunk group number. Trunk group used to route the ISUP call associated with this PM session.
e = Trunk group member number. Trunk group member used to route the ISUP call associated with this PM session.
f = Called party translation type.
g = Calling party subsystem number.
h = Called party subsystem number.
i = Location in the TCAP message to match the CALLED/CALLING parameters (SCCP = SCCP Header; TCAP = TCAP data).
j = Number of times this session will be repeated.
k = The value of the session identifier (SES) for this monitoring session.
l = The date-stamp of the beginning of the monitoring session, in the form month/day.
m = The time-stamp of the beginning of the monitoring session, in the form hours:minutes:seconds.
n = The current date-stamp for the monitoring session, in the form month/day.
o = The current time-stamp for the monitoring session, in the form hours:minutes:seconds.
p = The duration (DUR) of the recording session in seconds.
q = Protocol requested for the session.
r = Direction of the first matching message.
s = Number of events recorded for the session.
t = State of the protocol monitoring session. Valid value(s):
   ABORTED = The session has aborted.
   DATA RETRIEVAL = The recording of data has completed and is being processed for output.
   DURATION TIMEOUT = The duration timer has expired. Waiting for session output.
   RECORD COMPLETED = The session has completed normally.
   RECORDING = The session is screening messages (i.e. has not yet recorded the first matching message) or recording data and the termination message has not yet been recorded.
   STOP NO DUMP = The session has been manually terminated with neither translation nor hexadecimal reporting of the output data.
   STOP WITH DUMP = The session has been manually terminated with either translation or hexadecimal reporting of the output data.
TRANSLATING = The hexadecimal data collected during the session is being translated into an ASCII format.

u = The ATF file name. This file contains the ASCII translation of the hexadecimal data output from the protocol monitoring session. The naming convention for the file is atf.XXX, where XXX corresponds to the session number for the PM session.

v = The segment number (SEG) of the output data. The segments are in ascending order beginning at 1 for each session output. Note: The segment number is not necessarily the same as the frame number since frames may be continued over more than one segment.

w = The date-stamp of the recorded frame, in the form month/day.

x = The time-stamp of the recorded frame, in the form hours:minutes:seconds.

y = Total bytes.

z = The frame number relative to the first frame in the recording window.

a = The length of the recorded frame in bytes.

b = Direction of the recorded frame.

c = The four-byte hexadecimal representation from the recorded frame or packet or message.

d = The date-stamp of the end of the monitoring session, in the form month/day.

e = The time-stamp of the end of the monitoring session, in the form hours:minutes:seconds.

f = The number of PM segments reported.

g = Indicates that the session will not repeat due to an abnormal termination.

h = SM number(s) associated with the PM session.

4. ACTIONS TO BE TAKEN

Inspect the EXC:PMCCS output messages for the results of the monitoring session and analyze for protocol violations or other errors. If translation of the hexadecimal output into ASCII has been requested, examine the ATF file.

5. ALARMS

### 2. REASON FOR OUTPUT

To report the information collected during a CCS protocol monitoring (PM) session.

Format 1 provides an indication that a PM session has either successfully started, aborted, stopped, or failed to start. In addition, all pertinent information relating to the PM session is displayed. This format is also used as a prelude to the hexadecimal output or as notification that translation of the hexadecimal output into the American standard code for information interchange (ASCII) has begun.

Format 2 contains the raw data collected during the monitoring session. Additional information regarding the frame is also provided. The raw data is printed in a hexadecimal format. This message type is only used when hexadecimal data is being reported to the ROP. Translated sessions will not use this output format.

**NOTE:** The maximum amount of recorded data that can be output in one segment is 132 bytes. If the length of the recorded frame or packet or messages is larger than 132 bytes, then the frame or packet or message will require more than one segment to output. Incomplete frames will be noted with the CONT indicator.

Format 3 provides the status for the conclusion of a session (that is, successfully completed, stopped due to a manual request, or terminated abnormally). This format also provides information regarding the status of the processors involved in the PM session (that is, it will report screening, recording, aborted or overloaded processors).
3. VARIABLE FIELD DEFINITIONS

TRIG = The recorded frame triggered the session to end.

CONT = The recorded frame is continued in the next output segment.

NO XLATE = The hexadecimal output for this session will not be translated through the protocol monitoring translator. The output will be reported in hexadecimal format on the ROP.

XLATE = The protocol monitoring translator has been invoked for this session. The output will be translated into an ASCII file.

AM|DLN = Signifies that the AM or DLN processor is associated with this PM session.

SM NUMBERS = Signifies that SM processors are associated with this PM session.

a = Status. Valid value(s):

ABORTED - ATF CLOSE FAILURE = The PM session was aborted because the ASCII translation file (ATF) could not be closed.

ABORTED - ATF OPEN FAILURE = The PM session was aborted because the ATF could not be opened.

ABORTED - ATF WRITE FAILURE = The PM session was aborted because the ATF could not be written to.

ABORTED - COMMUNICATION FAILURE = An unspecified communication error occurred between the administrative module (AM) and the recording processor (SM, DLN or AM) or the AM and UNIX® operating system.

ABORTED - DATABASE PROBLEM = The request to start a PM session failed because an error occurred while reading the database.

ABORTED - INVALID PMCFF FILE = The PM session was aborted because the protocol monitoring common format file (PMCFF) contents were corrupted, or were missing.

ABORTED - PMCFF CLOSE FAILURE = The PM session was aborted because the PMCFF could not be closed.

ABORTED - PMCFF OPEN FAILURE = The PM session was aborted because the PMCFF could not be opened.

ABORTED - PMCFF READ FAILURE = The PM session was aborted because the PMCFF could not be read.

ABORTED - PMCFF WRITE FAILURE = The PM session was aborted because the PMCFF could not be written to.

ABORTED - TEMPORARY FILE CLOSE FAILURE = The PM session was aborted because the temporary file created for this session could not be closed.

ABORTED - TEMPORARY FILE OPEN FAILURE = The PM session was aborted because the temporary file created for this session

ABORTED - TEMPORARY FILE READ FAILURE = The PM session was aborted because the temporary file created for this session could not be read.

ABORTED - TEMPORARY FILE WRITE FAILURE = The PM session was aborted because the temporary file created for this session could not be written to.

ABORTED - TRANSLATION FAILURE = The PM session was aborted because the protocol translator was not able to translate this session.

ABORTED - INTERNAL FAILURE = The PM session was aborted because an internal failure was encountered.

ABORTED - UNABLE TO CREATE PROCESS = The request to start a PM session on a particular processor failed because of the inability to create the internal processes necessary for controlling the session on that processor.
RECOROER ABORTED - DLN OUT-OF-SERVICE = The DLN PM recorder was aborted because the active DLN that was monitoring data became unavailable. This will occur when the DLN switches while the DLN is screening messages or recording data for a PM session.

RECODERS ABORTED = List of PM processors that have aborted during a PM session.

PROCESSORS SCREENING = List of PM processors that are actively screening messages for this PM session.

PROCESSOR RECORDING = List the PM processor that is recording data for this PM session.

RECODERS INACTIVE DUE TO OVERLOAD = List of PM processors that have aborted due to a detection of an overload condition.

NOT STARTED - TCAP SESSION REPEAT FAILURE = Repeating TCAP session could not be started due to an internal failure.

NOT STARTED - ISUP/BICC SESSION REPEAT FAILURE = Repeating ISUP/BICC session could not be started due to an internal failure.

NOT STARTED - INVALID RANGE FOR DN = The range specified for the CALLED or CALLING parameter is out of range.

NOT STARTED - CALLING DN INVALID WHEN LAYER SET TO SCCP = The CALLING parameter is invalid when the LAYER parameter is set to SCCP (default). Invalid combination of input parameters.

NOT STARTED - CDSN INVALID FOR THE DIRECTION SPECIFIED = When CDSN is set to 0, the DIR parameter must be set to XMT. When CDSN is greater than 0, the DIR parameter must be set to RCV. If DIR is not specified, it will default to the correct direction based on the CDSN specified.

NOT STARTED - LAYER SET TO TCAP INVALID WHEN DIR SET TO RCV = The LAYER parameter set to TCAP is invalid when DIR is set to RCV. Invalid combination of input parameters.

NOT STARTED - CCS NOT IN OFFICE = The request to start a PM session failed because common channel signaling is not equipped in the office.

NOT STARTED - CGSN INVALID = The calling party subsystem number is invalid.

PROCESSORS NOT STARTED DUE TO OVERLOAD = A list of PM recorders that could not be started because the processor was experiencing an overload condition.

NOT STARTED - CCS PM FEATURE NOT PURCHASED = The CCS PM feature is a secured feature. This error indicates that the CCS PM feature has not been purchased in this office.

RETRY LATER - MAXIMUM NUMBER OF ISUP/BICC SESSIONS IN PROGRESS = The maximum number of concurrent ISUP/BICC sessions are in progress. Retry the input message later.

RETRY LATER - MAXIMUM NUMBER OF TCAP SESSIONS IN PROGRESS = The maximum number of concurrent TCAP sessions are in progress. Retry the input message later.

STARTED = The PM session was successfully started.

STOPPED = The PM session was stopped due to a manual request.

STOPPED - DURATION TIMEOUT = The PM session was stopped when the duration timer expired.

STOPPED DUE TO OVERLOAD - SESSION OUTPUT FOLLOWS = The PM session has been terminated due to an overload encountered on the recording processor. Data will be reported in subsequent messages provided the overloaded processor can service the request.

SESSION TERMINATED - NO RECORDERS ACTIVE = The protocol monitoring session has been
terminated because there are no active recorders screening messages.

**COMPLETED** = The protocol monitoring session has completed.

**REPORTING** – **BEGINNING TRANSLATION** = The collection of data in this protocol monitoring session has completed and translation of that data into ASCII (the ATF file) is beginning.

**REPORTING** – **OUTPUT FOLLOWS** = The collection of data in this protocol monitoring session has completed and the hexadecimal data that was collected will now be output.

b = Called party address directory number.

c = Calling party address directory number.

d = Trunk group number. Trunk group used to route the ISUP call associated with this PM session. For BICC call, BICC group associated with this PM session will be printed.

e = Trunk group member number. Trunk group member used to route the ISUP call associated with this PM session. For BICC call, normalized CIC used to route the BICC call associated with this PM session will be printed.

f = Called party translation type.

g = Calling party subsystem number.

h = Called party subsystem number.

i = Location in the TCAP message to match the CALLED/CALLING parameters (SCCP = SCCP Header; TCAP = TCAP data).

j = Number of times this session will be repeated.

k = The value of the session identifier (SES) for this monitoring session.

l = The date-stamp of the beginning of the monitoring session, in the form month/day.

m = The time-stamp of the beginning of the monitoring session, in the form hours:minutes:seconds.

n = The current date-stamp for the monitoring session, in the form month/day.

o = The current time-stamp for the monitoring session, in the form hours:minutes:seconds.

p = The duration (DUR) of the recording session in seconds.

q = Protocol requested for the session.

r = Direction of the first matching message.

s = Number of events recorded for the session.

t = State of the protocol monitoring session. Valid value(s):

  ABORTED = The session has aborted.

  DATA RETRIEVAL = The recording of data has completed and is being processed for output.

  DURATION TIMEOUT = The duration timer has expired. Waiting for session output.

  RECORD COMPLETED = The session has completed normally.

  RECORDING = The session is screening messages (that is, has not yet recorded the first matching message) or recording data and the termination message has not yet
been recorded.

**STOP NO DUMP** = The session has been manually terminated with neither translation nor hexadecimal reporting of the output data.

**STOP WITH DUMP** = The session has been manually terminated with either translation or hexadecimal reporting of the output data.

**TRANSLATING** = The hexadecimal data collected during the session is being translated into an ASCII format.

u = The ATF file name. This file contains the ASCII translation of the hexadecimal data output from the protocol monitoring session. The naming convention for the file is atf.XXX, where XXX corresponds to the session number for the PM session.

v = The segment number (SEG) of the output data. The segments are in ascending order beginning at 1 for each session output. The segment number is not necessarily the same as the frame number since frames may be continued over more than one segment.

w = The date-stamp of the recorded frame, in the form month/day.

x = The time-stamp of the recorded frame, in the form hours:minutes:seconds.

y = Total bytes.

z = The frame number relative to the first frame in the recording window.

a¹ = The length of the recorded frame in bytes.

b¹ = Direction of the recorded frame.

c¹ = The four-byte hexadecimal representation from the recorded frame or packet or message.

d¹ = The date-stamp of the end of the monitoring session, in the form month/day.

e¹ = The time-stamp of the end of the monitoring session, in the form hours:minutes:seconds.

f¹ = The number of PM segments reported.

g¹ = Indicates that the session will not repeat due to an abnormal termination.

h¹ = SM number(s) associated with the PM session.

4. **ACTIONS TO BE TAKEN**

Inspect the EXC:PMCCS output messages for the results of the monitoring session and analyze for protocol violations or other errors. If translation of the hexadecimal output into ASCII has been requested, examine the ATF file.

5. **ALARMS**

None.

**EXC:RCRLS**

**Software Release:** 5E14 and later  
**Message Class:** RCVY  
**Application:** 5  
**Type:** Output

1. **FORMAT**

    EXC:RCRLS {CLERK=a|ODDEVOL} b c

2. **REASON FOR OUTPUT**

    To respond to the EXC:RCRLS input message.

3. **VARIABLE FIELD DEFINITIONS**

    **ODDEVOL**  
    = Previously evolved RC logfile was released.

    **a**  
    = Clerk name entered on request.

    **b**  
    = Completion code of EXC:RCRLS input message. Valid value(s):
    
    ABORTED  
    = Input request was aborted after starting. Message-text provides reason.

    COMPLETED  
    = Input message has completed and the recent changes have been applied.

    NOT_STARTED  
    = Input message was not started. Message-text provides reason that message was not started.

    STARTED  
    = Input message was started and the requested application of recent changes is in progress.

    STOPPED  
    = The input request was stopped by a STP:RCRLS input message. All recent changes applied before the STP:RCRLS input message was entered remain.

    **c**  
    = Message text. Expanded reason for completion reason code. Valid value(s):
    
    APPLIED=n  
    = number of recent changes were successfully applied.

    ERRORS=n  
    = number of recent changes were released in error.

4. **ACTION TO BE TAKEN**

    The summary log of each recent change released is written to the receive only printer (ROP). The recent changes released can be validated against those intended to be released.

5. **ALARMS**

    None.

Type: Output

1. FORMAT

EXC:RCRMV CLERK=a b c

2. REASON FOR OUTPUT

To respond to a previously entered EXC:RCRMV command.

3. VARIABLE FIELD DEFINITIONS

a  = Clerkname entered on request.

b  = Completion code of EXC:RCRMV input message. Valid value(s):
ABORTED  = Input request was aborted after starting. Message-text provides reason.
COMPLETED = Input command has completed and record removals have been made.
NOT STARTED = Input message was not started. Message-text provides reason that command
              was not started.
STARTED   = Input command was started and requested record removals should be
            processed.
STOPPED    = Input request was stopped after starting. A STP:RCRMV command initiated stop.
            The contents of the clerkfile specified in the EXC:RCRMV input message are
            restored and no records are removed.

   c  = Message text. Expanded reason for completion code. Valid value(s):
   xxx RECORDS WERE REMOVED = xxx is the count of records removed by the request.

4. ACTION TO BE TAKEN

The summary log of each record removed is written to the receive only printer (ROP). Validate the records removed
against those intended to be removed.

5. ALARMS

None.

   [3] EXC RDTA b FP=l¹
       [c] [l] [w] [y]
       [DAS=z] [INDN=a¹] [OUTDN=d¹]
       MODE=g¹

2. **REASON FOR OUTPUT**

To respond to a manual request to set up or convert (to split) a remote digital test access (RDTA) connection between the port under test (PUT) and the protocol analysis equipment.

Format 1 is a response to a request to start a new session or convert an existing session. The first line shows the session number and the successful start or conversion of the session. The second line describes the PUT in the various port identifications which are applicable to the PUT. The third line shows the output facility information defining routing for the RDTA connection and where the protocol analysis equipment is located. Acronyms are as follows: incoming directory number (INDN), incoming test access port (ITAP), outgoing DN (OUTDN), and outgoing test access port (OTAP). The fourth line shows the type of connection and quarter time-slot, if applicable, along with the remaining session time. The fifth line shows the billing DN, if applicable.

Format 2 is a response to a request to select the quarter section of a 64kb time-slot for placement onto the pseudo BRI D-channel output facility. The first line shows success/failure status information and a failure point number to identify the point in software where failure occurred. The second line shows output facility location identification and quarter time-slot number verification.

Format 3 gives a failure response pertaining to the input message used to start or convert (to split) an RDTA session. Information from the message is shown to relate requested session input to this failure message. Again, as in Format 2, the failure message is supplemented with a failure point number to identify the point in software where failure occurred.

3. **VARIABLE FIELD DEFINITIONS**

   + = Assigned to a multipoint interface.

   a = Session number given to the requested session. Sessions are numbered sequentially from 1
through 99. At 99, the numbers will be recycled starting from 1 again.

b = Response to EXC:RDTA input message. Valid value(s):
ALREADY ACTIVE = An RDTA session of this type on the requested port is already active.
BRI D-CHANNEL QTS CONFLICT = Only one monitor of a basic rate interface (BRI) D-channel may be established per directly-connected peripheral interface data bus (DPIDB) timeslot on a particular shelf. A second BRI D-channel monitor has been requested that uses the same DPIDB timeslot and shelf as the existing BRI D-channel monitor. For this second monitor to exist the previous one must be removed.
BRI LIMIT EXCEEDED FOR THIS SM = Only a certain number recent changeable of BRI RDTA sessions are allowed per SM. This limit has already been reached and therefore, a new BRI session is not allowed for that SM. Refer to RC/V View 8.1.
CAMP-ON TIMEOUT ON PUT = One of two situations occurred. In the case of splitting a primary rate interface (PRI) D-channel, a camp-on failed to get ownership of the D-channel. In the case of splitting a packet trunk member, an attempt was made to camp onto this member for a small segment of time in order to wait for traffic to cease. The timeout occurred before the member was idle. The UCL option on EXC:RDTA input message will set up the connection unconditionally.
CMP UNAVAILABLE = The communication module (CM) required to set up the requested RDTA session is isolated.
COMPLETED = The EXC:RDTA input message was accepted and a successful RDTA session has been established or converted to split.
COMPLETED-QTS CHANGED = The request was accepted and successful for selecting the quarter section of a 64kb time-slot when placing the BRI D-channel PUT data on the pseudo BRI D-channel at the output facility.
CORRUPTED DYNAMIC DATA = Dynamic data has been corrupted. Look at read-only printer (ROP) for a related assert to give assistance toward correcting the office dependent data (ODD) problem. Audits will correct any RDTA session/data inconsistency.
CORRUPTED STATIC DATA = Static data has been corrupted. Look at ROP for a related assert to give assistance toward correcting the ODD problem. Audits will correct any RDTA session/data inconsistency.
COULD NOT ACTIVATE PUT = Could not activate the PUT. This could be due to unavailable resources, hardware problems and/or the port's being out-of-service due to a diagnostic or facility failure.
COULD NOT ACTIVATE TAP = Could not activate the test access port (TAP). This could be due to unavailable resources, hardware problems and/or the port's being out-of-service due to a diagnostic or facility failure.
CUSTID PARAMETER REQUIRED = The CUSTID parameter must be specified on the EXC:RDTA input message in order to successfully route to the output facilities. It was determined that the INDN and/or OUTDN directory numbers route over leased network inter-switch trunks that require automatic route selection (ARS) type of routing.
DATA RATE MISMATCH - TAP = The data rate of the PUT does not match the data rate of the TAP.
DATA RATE MISMATCH - UMBILICAL = The data rate of the umbilical between the host switching module (HSM) and the remote switching module (RSM) does not match either the data rate of the PUT or the TAP.
DIGIT ANALYSIS FAILURE = This error occurred either because an invalid digit analysis selector (DAS) was given on input request, the RTDA default DAS and/or screening index has been populated incorrectly (RC/V View 8.1), or the ODD is not set up correctly.
FAILED CALL SETUP - TAP TO CPE = The RDTA session could not be established because of a failure in setting up a call from an RDTA PRI to a PRI simulator, such as a PRISM.
HARDWARE TROUBLE = One or more peripherals responded in error. These include such peripherals as the integrated services line unit (ISLU), remote integrated services line unit (RISLU), and the packet switching unit (PSU). Investigate the problems seen in the RISLU/ISLU or PSU of the PUT or any problems in the RISLU/ISLU of the TAP(s).

INDN/OUTDN TRANSLATION FAILURE = The digits that were specified for the INDN and/or the OUTDN are not in the ODD. This is equivalent to having a call type of "vacant."

INPUT ERROR = Some data entered in the input message was invalid or incorrect.

INTERRUPT RECEIVED = The RDTA session has been preempted or interrupted due to an abnormal event. This abnormal event could be hardware out-of-service, carrier group alarm, and so forth.

INVALID PUT = The port could not be located in the database. The port identifier used in the input message was found to be invalid or incorrect.

INVALID PUT STATE = The state of the PUT is not acceptable to establish the requested RDTA connection. For a D-channel PRI provisioned with D-channel backup (DCBU), the requested D-channel was either not in-service (IS) or out-of-service blocked for automatic reasons (OOS-BLKD-AUTO), or the mate D-channel was not manually removed from service.

LOCAL ROUTING FAILURE = The switching module (SM) of the PUT could not route from the PUT to the TAP(s). Therefore, routing failed within the switch where the session was to take place.

LOCAL ROUTING FAILURE - REORDER = An attempt to route to the TAPs, the INDN or OUTDN routed to REORDER. There are several possible reasons why this failure could occur. The RPA screening index populated on RC/V View 8.1 may not be correct for routing to the INDN or OUTDN directory number specified. A call will be routed to REORDER when all members of an outgoing trunk group are busy or out-of-service.

MISSING ODD DATA = The necessary office dependent data is not populated to successfully route to the output facilities or set up the session. This failure reason will occur if data is not populated in one of the following relations: RLNET_GPID (RC/V Views 10.5 and 10.27).

MISSING OUTPUT FACILITY DN = One of the necessary output facility DN(s) was not found on the input request as demanded by the mode specified for the session. For example, the INDN was used instead of OUTDN to specify the output facility for a SPLITPH session.

MODE NOT ALLOWED ON PUT = This mode can not be used on this particular port. For example, splits can not be performed on a BRI.

MONITOR NOT ACTIVE = An attempt was made to select the quarter section of a 64kb time-slot to place the BRI D-channel PUT data onto a pseudo BRI D-channel (Format 2 of EXC:RDTA input message). This attempt was made without having an active RDTA monitor connection established on the pseudo BRI D-channel.

NETWORK ROUTING FAILURE = The RDTA session could not be established because of a failure in setting up a call through the network over a CCS7 ISUP trunk or userside PRI.

NO CUSTID ALLOWED - POTS ROUTING = The customer ID must not be specified when routing to output facilities located in the same switch where the PUT resides. POTS routing is always used for intra-switch routing.

NO MONITOR OR DN NOT PRESENT = A request was made to set up an RDTA session where the mode was of a split type. The output facility DN(s) was/were not included. Since a monitor can be converted to split without need of entering the DN(s), the switch did not know whether a conversion was intended (in which case there was no monitor) or the DN(s) was/were forgotten (in which case a split was being started from scratch).

NO NETWORK TIME SLOTS AVAIL = The required network time-slots on the time-slot interchange
NO PERIPHERAL TIME SLOTS AVAIL = The required peripheral time-slots on the TSIU are not available to set up the requested RDTA session. The necessary peripheral time-slots are either nailed-up or the free pool of time-slots have been completely exhausted.

NO PIDB TIME SLOTS EQUIPPED = Peripheral time-slots required to set up the RDTA session are not allocated in the ODD. Refer to RC/V Views 22.2 and 22.3 with respect to this equipage.

NO PIDB TIME SLOTS AVAIL = Peripheral timeslots needed to monitor BRI packet B-channel, on-demand B-channel (ODB), or BRI D-channels have not been sufficiently allocated. Two timeslots are needed for each monitoring session and are allocated on a per-shelf basis. Refer to RC/V Views 22.2 and 22.3 with respect to this equipage.

NON-RDTA BRIDGE ALREADY EXISTS = A bridge already exists on the PUT which was given. Therefore, an RDTA port under test bridge (PUTBRG) process, which is required to set up this RDTA connection, can not be established. The current bridge could involve a trunk and line workstation (TLWS) or busy verify connection.

NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

NOT A PSEUDO BRI D-CHANNEL = An attempt was made to select the quarter section of a 64kb time-slot to place the BRI D-channel PUT data onto an output facility other than a pseudo BRI D-channel (Format 2 of EXC:RDTA input message). A quarter time-slot modification may only be made on a pseudo BRI D-channel.

OFFICE LIMIT EXCEEDED = There can be up to 24 active RDTA sessions running simultaneously in an office. This limit has been reached and therefore, the requested session cannot be established.

OUTPUT FACILITY DN MISMATCH = When the conversion to split was attempted, the output facility DN(s) given on the input request did not match those of the existing monitor.

PATH EXISTS ON PUT = This message applies only when a mode of DTAC is selected. The DTAC mode demands that there be no path set up on the PUT. The PUT currently has a path set up on it.

PATH UNAVAIL FOR ACCESS = All monitors and splits require that there be a path up on the PUT in order for a monitor or split to be established. Currently, there is no path up to monitor or split.

PORT INVOLVED IN RDTA SESSION = An attempt to set up an RDTA session on a port that is already involved in an RDTA session. Blocking of the requested session is done so the software data structures of the active session are on corrupted.

PROCESS TIMEOUT = An RDTA administrative module (AM) or SM process timed out after waiting for an SM process to respond. This condition occurred because of an SM overload condition, an SM isolation, or an internal software error.

PUT OWNERSHIP FAILURE = Could not get ownership of the specified PUT as given on the input request. This may occur when a DTAC or split type mode has been selected.

PUT PATH FAILURE = An attempt to set up a path to the PUT failed.

QTS ALREADY SET = The correct quarter time-slot has automatically been selected by the switch for placement onto the pseudo BRI D-channel output facilities with respect to this particular RDTA session.

RESOURCE FAILURE = Could not obtain the necessary path resources to set up this connection.

SIGNALLING LINK FAILURE = The out-of-band signaling link is out-of-service. This signaling link is required to set up the requested DTAC on the given PUT.

SM UNAVAILABLE = One of the SMs required to set up the requested RDTA session is isolated.

SYSTEM BUSY = System resources are not available to set up the requested connection. The AM or SM may be in an overload condition.

SYSTEM ERROR = Internal system error occurred while establishing the requested RDTA session.
TAP BUSY OR OOS = The TAP which is needed for this RDTA connection is currently busy or it is out-of-service.

TAP INVALID = The TAP is not a valid TAP.

TAP PATH FAILURE = An attempt failed to set up a path either to the ITAP or the OTAP or both.

TEST DENIED - PVC ACTIVE ON PUT = The request has been rejected. A permanent virtual circuit is currently active on the PUT ST an RDTA split connection cannot be established on this PUT.

TEST DENIED DUE TO PSML = The request has been rejected because the packet switch maintenance limit has been exceeded. The requested RDTA split connection could not be honored because there are no other in service (IS) internal protocol (IP) trunks to which the PUT can dynamically route traffic.

UNAUTHORIZED OUTPUT FACILITY DN = The directory number (DN) specified for the output facility (INDN or OUTDN) is not in the database. RC/V Views 22.17 or 22.18 may be checked to get the list of authorized DNs.

UCL OPTION REQUIRED = In order to set up the requested RDTA session, the UCL option on the EXC:RDTA input message must be specified.

UNSupported RDTA PUT TYPE = The specified PUT is currently not supported by the RDTA feature.

c = Service group and member numbers. Valid value(s):

| BST=d-e |
| MLHG=f-g |
| OAPO=d |
| OPT=d-e |
| TKGMN=j-k |

d = Operator service center number.

e = Relative position number.

f = Multi-line hunt group number.

g = Multi-line hunt group member number.

h = Data link relative group number.
i = Data link relative member number.
j = Trunk group number.
k = Trunk group member number.
l = Equipment number. Valid value(s):

| AIUEN=m-t-m^l-n^l |
| DEN=m-n-o-p |
| ILEN=m-q-r-s |
| LCEN=m-t-u-v |
| LCKEN=m-t-v^l-m^l-n^l |
| NEN=m-o^l-p^l-q^l-r^l-s^l-t^l-u^l |
| INEN=m-o^l-r-s |

m = SM number.

n = Digital line and trunk unit (DLTU) number.
o = Digital facility interface number.

p = Digital channel.

q = Integrated digital carrier unit number.

r = Remote terminal number.

s = Channel unit number.

t = Integrated services line unit (ISLU) or access interface unit (AIU) number.

u = Line group controller number.

v = Line card number.

w = Directory number. Valid value(s):

<table>
<thead>
<tr>
<th>DN</th>
<th>PKTDN</th>
</tr>
</thead>
<tbody>
<tr>
<td>w[+]</td>
<td>w[+]</td>
</tr>
</tbody>
</table>

y = Channel type (for BRI). Valid value(s):

B1 = B1-Channel.
D = D-Channel.

z = Digit analysis selector (routing domain) to be used to specify the correct set of digit analysis tables to translate INDN and OUTDN. This parameter will override the office's default DAS for RDTA.

a1 = DN of the output facility where the protocol analyzer is connected to access the test data sent over the PUT to the switch. This direction will be known as incoming. Data sent from the analysis equipment for interaction with the PUT will therefore originate from INDN for all interactive mode connections excepting the SPLITPH connection.

b1 = SM number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

c1 = Logical port number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

d1 = DN of the output facility where the protocol analyzer is connected to access the test data sent from the switch to the PUT. This direction will be known as outgoing. Data sent from the analysis equipment for interaction with the switch will therefore originate from OUTDN for the SPLIT and SPLITPH connections.

e1 = SM number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

f1 = Logical port number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

g1 = Connection mode of the RDTA session. Valid value(s):

<table>
<thead>
<tr>
<th>DTAC</th>
</tr>
</thead>
<tbody>
<tr>
<td>DTAC</td>
</tr>
<tr>
<td>Direct test access connection (DTAC). This is an interactive connection on a port that does not have a path set up on it. The PUT is seized and directly connected to an outgoing port terminating at the protocol analysis equipment.</td>
</tr>
</tbody>
</table>
MON = Monitor. This is a receive-only connection on a busy circuit. A copy of the transmit and receive data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.

SPLIT = Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.

SPLITPH = Simplex split protocol handler (PH) side. This is an interactive connection on an integrated services digital network (ISDN) channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.

SPLITPUT = Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

h = The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the PH.

i = Remaining time for which the session will continue operating before the session will be automatically aborted, in the form days (with a space between) hours:minutes:seconds. If the session has been set for an infinite duration, the time field will be printed as INFINITE. The session may be extended by using the UPD:RDTA input message.

j = The billing directory number that will be passed through the network when routing to the output facilities located in another LATA.

k = The customer identification used to perform ARS type of routing when routing over leased network inter-switch trunks to output facilities located in a different switch from the PUT.

l = Fail point number used to relay the specific point in the software at which a failure occurred. This is used purely for debugging purposes.

m = Line board number.

n = Line circuit number.

o = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

p = Data group (DG) number.

q = SONET termination equipment (STE) facility number.

r = Synchronous transport signal (STS) facility number.

s = Virtual tributary group (VTG) number.

t = Virtual tributary member (VTM) number.

u = Digital signal level 0 (DS0) number.

v = Line group number.
4. ACTIONS TO BE TAKEN

If a successful RDTA session was established, then the output facility ports should give access to the monitor/interactive RDTA connection. If a BRI D-channel is being tested on a different switch than the output facility switch, then the correct quarter time-slot will have to be selected on the switch where the output facility is located using Format 2 of the EXC:RDTA input message.

If the completion code indicates a failure in establishing the requested RDTA connection, investigate the cause of the failure, eliminate the problem and re-attempt to set up or convert the connection.

5. ALARMS

None.

   MODE=g^1

2. REASON FOR OUTPUT

To respond to a manual request to set up or convert (to split) a remote digital test access (RDTA) connection between the port under test (PUT) and the protocol analysis equipment.

Format 1 is a response to a request to start a new session or convert an existing session. The first line shows the session number and the successful start or conversion of the session. The second line describes the PUT in the various port identifications which are applicable to the PUT. The third line shows the output facility information defining routing for the RDTA connection and where the protocol analysis equipment is located. Acronyms are as follows: incoming directory number (INDN), incoming test access port (ITAP), outgoing DN (OUTDN), and outgoing test access port (OTAP). The fourth line shows the type of connection and quarter time-slot, if applicable, along with the remaining session time. The fifth line shows the billing DN, if applicable.

Format 2 is a response to a request to select the quarter section of a 64kb time-slot for placement onto the pseudo BRI D-channel output facility. The first line shows success/failure status information and a failure point number to identify the point in software where failure occurred. The second line shows output facility location identification and quarter time-slot number verification.

Format 3 gives a failure response pertaining to the input message used to start or convert (to split) an RDTA session. Information from the message is shown to relate requested session input to this failure message. Again, as in Format 2, the failure message is supplemented with a failure point number to identify the point in software where failure occurred.

3. VARIABLE FIELD DEFINITIONS

+ = Assigned to a multipointinterface.

a = Session number given to the requested session. Sessions are numbered sequentially from 1
through 99. At 99, the numbers will be recycled starting from 1 again.

b = Response to EXC:RDTA input message. Valid value(s):
ALREADY ACTIVE = An RDTA session of this type on the requested port is already active.
BRI D-CHANNEL QTS CONFLICT = Only one monitor of a basic rate interface (BRI) D-channel may be established per directly-connected peripheral interface data bus (DPIDB) timeslot on a particular shelf. A second BRI D-channel monitor has been requested that uses the same DPIDB timeslot and shelf as the existing BRI D-channel monitor. For this second monitor to exist the previous one must be removed.
BRI LIMIT EXCEEDED FOR THIS SM = Only a certain number recent changeable of BRI RDTA sessions are allowed per SM. This limit has already been reached and therefore, a new BRI session is not allowed for that SM. Refer to RC/V View 8.1.
CAMP-ON TIMEOUT ON PUT = One of two situations occurred. In the case of splitting a primary rate interface (PRI) D-channel, a camp-on failed to get ownership of the D-channel. In the case of splitting a packet trunk member, an attempt was made to camp onto this member for a small segment of time in order to wait for traffic to cease. The timeout occurred before the member was idle. The UCL option on EXC:RDTA input message will set up the connection unconditionally.
CMP UNAVAILABLE = The communication module (CM) required to set up the requested RDTA session is isolated.
COMPLETED = The EXC:RDTA input message was accepted and a successful RDTA session has been established or converted to split.
COMPLETED-QTS CHANGED = The request was accepted and successful for selecting the quarter section of a 64kb time-slot when placing the BRI D-channel PUT data on the pseudo BRI D-channel at the output facility.
CORRUPTED DYNAMIC DATA = Dynamic data has been corrupted. Look at ROP for a related assert to give assistance toward correcting the office dependent data (ODD) problem. Audits will correct any RDTA session/data inconsistency.
CORRUPTED STATIC DATA = Static data has been corrupted. Look at ROP for a related assert to give assistance toward correcting the ODD problem. Audits will correct any RDTA session/data inconsistency.
COULD NOT ACTIVATE PUT = Could not activate the PUT. This could be due to unavailable resources, hardware problems and/or the port's being out-of-service due to a diagnostic or facility failure.
COULD NOT ACTIVATE TAP = Could not activate the test access port (TAP). This could be due to unavailable resources, hardware problems and/or the port's being out-of-service due to a diagnostic or facility failure.
CUSTID PARAMETER REQUIRED = The CUSTID parameter must be specified on the EXC:RDTA input message in order to successfully route to the output facilities. It was determined that the INDN and/or OUTDN directory numbers route over leased network inter-switch trunks that require automatic route selection (ARS) type of routing.
DATA RATE MISMATCH - TAP = The data rate of the PUT does not match the data rate of the TAP.
DATA RATE MISMATCH - UMBILICAL = The data rate of the umbilical between the host switching module (HSM) and the remote switching module (RSM) does not match either the data rate of the PUT or the TAP.
DIGIT ANALYSIS FAILURE = This error occurred either because an invalid digit analysis selector (DAS) was given on input request, the RDTA default DAS and/or screening index has been populated incorrectly (RC/V View 8.1), or the ODD is not set up correctly.
FAILED CALL SETUP - TAP TO CPE = The RDTA session could not be established because of a failure in setting up a call from an RDTA PRI to a PRI simulator, such as a PRISM.
HARDWARE TROUBLE = One or more peripherals responded in error. These include such peripherals as the integrated services line unit (ISLU), remote integrated services line unit (RISLU), and the packet switching unit (PSU). Investigate the problems seen in the RISLU/ISLU or PSU of the PUT or any problems in the RISLU/ISLU of the TAP(s).

INDN/OUTDN TRANSLATION FAILURE = The digits that were specified for the INDN and/or the OUTDN are not in the ODD. This is equivalent to having a call type of "vacant."

INPUT ERROR = Some data entered in the input message was invalid or incorrect.

INTERRUPT RECEIVED = The RDTA session has been preempted or interrupted due to an abnormal event. This abnormal event could be hardware out-of-service, carrier group alarm, and so forth.

INVALID PUT = The port could not be located in the database. The port identifier used in the input message was found to be invalid or incorrect.

INVALID PUT STATE = The state of the PUT is not acceptable to establish the requested RDTA connection. For a D-channel PRI provisioned with D-channel backup (DCBU), the requested D-channel was either not in-service (IS) or out-of-service blocked for automatic reasons (OOS-BLKD-AUTO), or the mate D-channel was not manually removed from service.

LOCAL ROUTING FAILURE = The switching module (SM) of the PUT could not route from the PUT to the TAP(s). Therefore, routing failed within the switch where the session was to take place.

LOCAL ROUTING FAILURE - REORDER = An attempt to route to the TAPs, the INDN or OUTDN routed to REORDER. There are several possible reasons why this failure could occur. The RPA screening index populated on RC/V View 8.1 may not be correct for routing to the INDN or OUTDN directory number specified. A call will be routed to REORDER when all members of an outgoing trunk group are busy or out-of-service.

MISSING ODD DATA = The necessary office dependent data is not populated to successfully route to the output facilities or set up the session. This failure reason will occur if data is not populated in one of the following relations: RLNET_GPID (RC/V Views 10.5 and 10.27).

MISSING OUTPUT FACILITY DN = One of the necessary output facility DN(s) was not found on the input request as demanded by the mode specified for the session. For example, the INDN was used instead of OUTDN to specify the output facility for a SPLITPH session.

MODE NOT ALLOWED ON PUT = This mode can not be used on this particular port. For example, splits can not be performed on a BRI.

MONITOR NOT ACTIVE = An attempt was made to select the quarter section of a 64kb time-slot to place the BRI D-channel PUT data onto a pseudo BRI D-channel (Format 2 of EXC:RDTA input message). This attempt was made without having an active RDTA monitor connection established on the pseudo BRI D-channel.

NETWORK ROUTING FAILURE = The RDTA session could not be established because of a failure in setting up a call through the network over a CCS7 ISUP trunk or userside PRI.

NO CUSTID ALLOWED - POTS ROUTING = The customer ID must not be specified when routing to output facilities located in the same switch where the PUT resides. POTS routing is always used for intra-switch routing.

NO MONITOR OR DN NOT PRESENT = A request was made to set up an RDTA session where the mode was of a split type. The output facility DN(s) was/were not included. Since a monitor can be converted to split without need of entering the DN(s), the switch did not know whether a conversion was intended (in which case there was no monitor) or the DN(s) was/were forgotten (in which case a split was being started from scratch).

NO NETWORK TIME SLOTS AVAIL = The required network time-slots on the time-slot interchange...
unit (TSIU) are not available to set up the requested RDTA session.

NO PERIPHERAL TIME SLOTS AVAIL = The required peripheral time-slots on the TSIU are not available to set up the requested RDTA session. The necessary peripheral time-slots are either nailed-up or the free pool of time-slots have been completely exhausted.

NO PIDB TIME SLOTS EQUIPPED = Peripheral time-slots required to set up the RDTA session are not allocated in the ODD. Refer to RC/V Views 22.2 and 22.3 with respect to this equipage.

NO PIDB TIME SLOTS AVAIL = Peripheral timeslots needed to monitor BRI packet B-channel, on-demand B-channel (ODB), or BRI D-channels have not been sufficiently allocated. Two timeslots are needed for each monitoring session and are allocated on a per-shelf basis. Refer to RC/V Views 22.2 and 22.3 with respect to this equipage.

NON-RDTA BRIDGE ALREADY EXISTS = A bridge already exists on the PUT which was given. Therefore, an RDTA port under test bridge (PUTBRG) process, which is required to set up this RDTA connection, can not be established. The current bridge could involve a trunk and line workstation (TLWS) or busy verify connection.

NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

NOT A PSEUDO BRI D-CHANNEL = An attempt was made to select the quarter section of a 64kb time-slot to place the BRI D-channel PUT data onto an output facility other than a pseudo BRI D-channel (Format 2 of EXC:RDTA input message). A quarter time-slot modification may only be made on a pseudo BRI D-channel.

OFFICE LIMIT EXCEEDED = There can be up to 24 active RDTA sessions running simultaneously in an office. This limit has been reached and therefore, the requested session cannot be established.

OUTPUT FACILITY DN MISMATCH = When the conversion to split was attempted, the output facility DN(s) given on the input request did not match those of the existing monitor.

PATH EXISTS ON PUT = This message applies only when a mode of DTAC is selected. The DTAC mode demands that there be no path set up on the PUT. The PUT currently has a path set up on it.

PATH UNAVAIL FOR ACCESS = All monitors and splits require that there be a path up on the PUT in order for a monitor or split to be established. Currently, there is no path up to monitor or split.

PORT INVOLVED IN RDTA SESSION = An attempt to set up an RDTA session on a port that is already involved in an RDTA session. Blocking of the requested session is done so the software data structures of the active session are on corrupted.

PROCESS TIMEOUT = An RDTA administrative module (AM) or SM process timed out after waiting for an SM process to respond. This condition occurred because of an SM overload condition, an SM isolation, or an internal software error.

PUT OWNERSHIP FAILURE = Could not get ownership of the specified PUT as given on the input request. This may occur when a DTAC or split type mode has been selected.

PUT PATH FAILURE = An attempt to set up a path to the PUT failed.

QTS ALREADY SET = The correct quarter time-slot has automatically been selected by the switch for placement onto the pseudo BRI D-channel output facilities with respect to this particular RDTA session.

RESOURCE FAILURE = Could not obtain the necessary path resources to set up this connection.

SIGNALLING LINK FAILURE = The out-of-band signaling link is out-of-service. This signaling link is required to set up the requested DTAC on the given PUT.

SM UNAVAILABLE = One of the SMs required to set up the requested RDTA session is isolated.

SYSTEM BUSY = System resources are not available to set up the requested connection. The AM or SM may be in an overload condition.

SYSTEM ERROR = Internal system error occurred while establishing the requested RDTA session.
TAP BUSY OR OOS = The TAP which is needed for this RDTA connection is currently busy or it is out-of-service.

TAP INVALID = The TAP is not a valid TAP.

TAP PATH FAILURE = An attempt failed to set up a path either to the ITAP or the OTAP or both.

TEST DENIED - PVC ACTIVE ON PUT = The request has been rejected. A permanent virtual circuit is currently active on the PUT ST an RDTA split connection cannot be established on this PUT.

TEST DENIED DUE TO PSML = The request has been rejected because the packet switch maintenance limit has been exceeded. The requested RDTA split connection could not be honored because there are no other in service (IS) internal protocol (IP) trunks to which the PUT can dynamically route traffic.

UNAUTHORIZED OUTPUT FACILITY DN = The directory number (DN) specified for the output facility (INDN or OUTDN) is not in the database. RC/V Views 22.17 or 22.18 may be checked to get the list of authorized DNs.

UCL OPTION REQUIRED = In order to set up the requested RDTA session, the UCL option on the EXC:RDTA input message must be specified.

UNSUPPORTED RDTA PUT TYPE = The specified PUT is currently not supported by the RDTA feature.

c = Service group and member numbers. Valid value(s):

BST=d-e
MLHG=f-g
OAPO=d
OPT=d-e
RTRS=h-i
TKGMN=j-k

d = Operator service center number.

e = Relative position number.

g = Multi-line hunt group member number.

h = Data link relative group number.

i = Data link relative member number.

j = Trunk group number.

k = Trunk group member number.

l = Equipment number. Valid value(s):

AIUEN=m-t-m^1-n^1
DEN=m-n-o-p
ILEN=m-q-r-s
LCEN=m-t-u-v
LCKEN=m-t-v^1-m^1-n^1
NEN=m-o^1-p^1-q^1-r^1-s^1-t^1-u^1
INEN=m-o^1-r-s
PLTEN=d-w^1-x^1-y^1-z^1
m = SM number.
n = Digital line and trunk unit (DLTU) number.
o = Digital facility interface number.
p = Digital channel.
q = Integrated digital carrier unit number.
r = Remote terminal number.
s = Channel unit number.
t = Integrated services line unit (ISLU) or access interface unit (AIU) number.
u = Line group controller number.
v = Line card number.
w = Directory number. Valid value(s):
  DN=w[+]
  PKTDN=w[+]
y = Channel type (for BRI). Valid value(s):
  B1 = B1-Channel.
  D = D-Channel.
z = Digit analysis selector (routing domain) to be used to specify the correct set of digit analysis tables to translate INDN and OUTDN. This parameter will override the office's default DAS for RDTA.
a = DN of the output facility where the protocol analyzer is connected to access the test data sent over the PUT to the switch. This direction will be known as incoming. Data sent from the analysis equipment for interaction with the PUT will therefore originate from INDN for all interactive mode connections excepting the SPLITPH connection.
b = SM number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.
c = Logical port number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.
d = DN of the output facility where the protocol analyzer is connected to access the test data sent from the switch to the PUT. This direction will be known as outgoing. Data sent from the analysis equipment for interaction with the switch will therefore originate from OUTDN for the SPLIT and SPLITPH connections.
e = SM number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.
f = Logical port number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.
Connection mode of the RDTA session. Valid value(s):

**DTAC** = Direct test access connection (DTAC). This is an interactive connection on a port that does not have a path set up on it. The PUT is seized and directly connected to an outgoing port terminating at the protocol analysis equipment.

**MON** = Monitor. This is a receive-only connection on a busy circuit. A copy of the transmit and receive data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.

**SPLIT** = Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.

**SPLITPH** = Simplex split protocol handler (PH) side. This is an interactive connection on an integrated services digital network (ISDN) channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.

**SPLITPUT** = Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the PH.

Remaining time for which the session will continue operating before the session will be automatically aborted, in the form days (with a space between) hours:minutes:seconds. If the session has been set for an infinite duration, the time field will be printed as INFINITE. The session may be extended by using the UPD:RDTA input message.

The billing directory number that will be passed through the network when routing to the output facilities located in another LATA.

The customer identification used to perform ARS type of routing when routing over leased network inter-switch trunks to output facilities located in a different switch from the PUT.

Fail point number used to relay the specific point in the software at which a failure occurred. This is used purely for debugging purposes.

Line board number.

Line circuit number.

Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

Data group (DG) number.

SONET termination equipment (STE) facility number.

Synchronous transport signal (STS) facility number.

Virtual tributary group (VTG) number.

Virtual tributary member (VTM) number.
u\(^1\) = Digital signal level 0 (DS0) number.

v\(^1\) = Line group number.

w\(^1\) = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

x\(^1\) = PCT facility interface (PCTFI) number.

y\(^1\) = Tributary number.

z\(^1\) = Channel number.

4. ACTIONS TO BE TAKEN

If a successful RDTA session was established, then the output facility ports should give access to the monitor/interactive RDTA connection. If a BRI D-channel is being tested on a different switch than the output facility switch, then the correct quarter time-slot will have to be selected on the switch where the output facility is located using Format 2 of the EXC:RDTA input message.

If the completion code indicates a failure in establishing the requested RDTA connection, investigate the cause of the failure, eliminate the problem and re-attempt to set up or convert the connection.

5. ALARMS

None.

   MODE=g^1

2. **REASON FOR OUTPUT**

   To respond to a manual request to set up or convert (to split) a remote digital test access (RDTA) connection between the port under test (PUT) and the protocol analysis equipment.

   Format 1 is a response to a request to start a new session or convert an existing session. The first line shows the session number and the successful start or conversion of the session. The second line describes the PUT in the various port identifications which are applicable to the PUT. The third line shows the output facility information defining routing for the RDTA connection and where the protocol analysis equipment is located. Acronyms are as follows: incoming directory number (INDN), incoming test access port (ITAP), outgoing DN (OUTDN), and outgoing test access port (OTAP). The fourth line shows the type of connection and quarter time-slot, if applicable, along with the remaining session time. The fifth line shows the billing DN, if applicable.

   Format 2 is a response to a request to select the quarter section of a 64kb time-slot for placement onto the pseudo BRI D-channel output facility. The first line shows success/failure status information and a failure point number to identify the point in software where failure occurred. The second line shows output facility location identification and quarter time-slot number verification.

   Format 3 gives a failure response pertaining to the input message used to start or convert (to split) an RDTA session. Information from the message is shown to relate requested session input to this failure message. Again, as in Format 2, the failure message is supplemented with a failure point number to identify the point in software where failure occurred.

3. **VARIABLE FIELD DEFINITIONS**

   + = Assigned to a multipoint interface.

   a = Session number given to the requested session. Sessions are numbered sequentially from 1
through 99. At 99, the numbers will be recycled starting from 1 again.

= Response to EXC:RDTA input message. Valid value(s):

**ALREADY ACTIVE** = An RDTA session of this type on the requested port is already active.

**BRI D-CHANNEL QTS CONFLICT** = Only one monitor of a basic rate interface (BRI) D-channel may be established per directly-connected peripheral interface data bus (DPIDB) timeslot on a particular shelf. A second BRI D-channel monitor has been requested that uses the same DPIDB timeslot and shelf as the existing BRI D-channel monitor. For this second monitor to exist the previous one must be removed.

**BRI LIMIT EXCEEDED FOR THIS SM** = Only a certain number recent changeable of BRI RDTA sessions are allowed per SM. This limit has already been reached and therefore, a new BRI session is not allowed for that SM. Refer to RC/V View 8.1.

**CAMP-ON TIMEOUT ON PUT** = One of two situations occurred. In the case of splitting a primary rate interface (PRI) D-channel, a camp-on failed to get ownership of the D-channel. In the case of splitting a packet trunk member, an attempt was made to camp onto this member for a small segment of time in order to wait for traffic to cease. The timeout occurred before the member was idle. The UCL option on EXC:RDTA input message will set up the connection unconditionally.

**CMP UNAVAILABLE** = The communication module (CM) required to set up the requested RDTA session is isolated.

**COMPLETED** = The EXC:RDTA input message was accepted and a successful RDTA session has been established or converted to split.

**COMPLETED-QTS CHANGED** = The request was accepted and successful for selecting the quarter section of a 64kb time-slot when placing the BRI D-channel PUT data on the pseudo BRI D-channel at the output facility.

**CORRUPTED DYNAMIC DATA** = Dynamic data has been corrupted. Look at ROP for a related assert to give assistance toward correcting the office dependent data (ODD) problem. Audits will correct any RDTA session/data inconsistency.

**CORRUPTED STATIC DATA** = Static data has been corrupted. Look at ROP for a related assert to give assistance toward correcting the ODD problem. Audits will correct any RDTA session/data inconsistency.

**COULD NOT ACTIVATE PUT** = Could not activate the PUT. This could be due to unavailable resources, hardware problems and/or the port's being out-of-service due to a diagnostic or facility failure.

**COULD NOT ACTIVATE TAP** = Could not activate the test access port (TAP). This could be due to unavailable resources, hardware problems and/or the port's being out-of-service due to a diagnostic or facility failure.

**CUSTID PARAMETER REQUIRED** = The CUSTID parameter must be specified on the EXC:RDTA input message in order to successfully route to the output facilities. It was determined that the INDN and/or OUTDN directory numbers route over leased network inter-switch trunks that require automatic route selection (ARS) type of routing.

**DATA RATE MISMATCH - TAP** = The data rate of the PUT does not match the data rate of the TAP.

**DATA RATE MISMATCH - UMBILICAL** = The data rate of the umbilical between the host switching module (HSM) and the remote switching module (RSM) does not match either the data rate of the PUT or the TAP.

**DIGIT ANALYSIS FAILURE** = This error occurred either because an invalid digit analysis selector (DAS) was given on input request, the RDTA default DAS and/or screening index has been populated incorrectly (RC/V View 8.1), or the ODD is not set up correctly.

**FAILED CALL SETUP - TAP TO CPE** = The RDTA session could not be established because of a failure in setting up a call from an RDTA PRI to a PRI simulator, such as a PRISM.
HARDWARE TROUBLE = One or more peripherals responded in error. These include such peripherals as the integrated services line unit (ISLU), remote integrated services line unit (RISLU), and the packet switching unit (PSU). Investigate the problems seen in the RISLU/ISLU or PSU of the PUT or any problems in the RISLU/ISLU of the TAP(s).

INDN/OUTDN TRANSLATION FAILURE = The digits that were specified for the INDN and/or the OUTDN are not in the ODD. This is equivalent to having a call type of "vacant."

INPUT ERROR = Some data entered in the input message was invalid or incorrect.

INTERRUPT RECEIVED = The RDTA session has been preempted or interrupted due to an abnormal event. This abnormal event could be hardware out-of-service, carrier group alarm, and so forth.

INVALID PUT = The port could not be located in the database. The port identifier used in the input message was found to be invalid or incorrect.

INVALID PUT STATE = The state of the PUT is not acceptable to establish the requested RDTA connection. For a D-channel PRI provisioned with D-channel backup (DCBU), the requested D-channel was either not in-service (IS) or out-of-service blocked for automatic reasons (OOS-BLKD-AUTO), or the mate D-channel was not manually removed from service.

LOCAL ROUTING FAILURE = The switching module (SM) of the PUT could not route from the PUT to the TAP(s). Therefore, routing failed within the switch where the session was to take place.

LOCAL ROUTING FAILURE - REORDER = An attempt to route to the TAPs, the INDN or OUTDN routed to REORDER. There are several possible reasons why this failure could occur. The RPA screening index populated on RC/V View 8.1 may not be correct for routing to the INDN or OUTDN directory number specified. A call will be routed to REORDER when all members of an outgoing trunk group are busy or out-of-service.

MISSING ODD DATA = The necessary office dependent data is not populated to successfully route to the output facilities or set up the session. This failure reason will occur if data is not populated in one of the following relations: RLNET_GPID (RC/V Views 10.5 and 10.27).

MISSING OUTPUT FACILITY DN = One of the necessary output facility DN(s) was not found on the input request as demanded by the mode specified for the session. For example, the INDN was used instead of OUTDN to specify the output facility for a SPLITPH session.

MODE NOT ALLOWED ON PUT = This mode can not be used on this particular port. For example, splits can not be performed on a BRI.

MONITOR NOT ACTIVE = An attempt was made to select the quarter section of a 64kb time-slot to place the BRI D-channel PUT data onto a pseudo BRI D-channel (Format 2 of EXC:RDTA input message). This attempt was made without having an active RDTA monitor connection established on the pseudo BRI D-channel.

NETWORK ROUTING FAILURE = The RDTA session could not be established because of a failure in setting up a call through the network over a CCS7 ISUP trunk or userside PRI.

NO CUSTID ALLOWED - POTS ROUTING = The customer ID must not be specified when routing to output facilities located in the same switch where the PUT resides. POTS routing is always used for intra-switch routing.

NO MONITOR OR DN NOT PRESENT = A request was made to set up an RDTA session where the mode was of a split type. The output facility DN(s) was/were not included. Since a monitor can be converted to split without need of entering the DN(s), the switch did not know whether a conversion was intended (in which case there was no monitor) or the DN(s) was/were forgotten (in which case when a split is being started from scratch).

NO NETWORK TIME SLOTS AVAIL = The required network time-slots on the time-slot interchange
unit (TSIU) are not available to set up the requested RDTA session.

NO PERIPHERAL TIME SLOTS AVAIL = The required peripheral time-slots on the TSIU are not available to set up the requested RDTA session. The necessary peripheral time-slots are either nailed-up or the free pool of time-slots have been completely exhausted.

NO PIDB TIME SLOTS EQUIPPED = Peripheral time-slots required to set up the RDTA session are not allocated in the ODD. Refer to RC/V Views 22.2 and 22.3 with respect to this equipage.

NO PIDB TIME SLOTS AVAIL = Peripheral timeslots needed to monitor BRI packet B-channel, on-demand B-channel (ODB), or BRI D-channels have not been sufficiently allocated. Two timeslots are needed for each monitoring session and are allocated on a per-shelf basis. Refer to RC/V Views 22.2 and 22.3 with respect to this equipage.

NON-RDTA BRIDGE ALREADY EXISTS = A bridge already exists on the PUT which was given. Therefore, an RDTA port under test bridge (PUTBRG) process, which is required to set up this RDTA connection, can not be established. The current bridge could involve a trunk and line workstation (TLWS) or busy verify connection.

NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

NOT A PSEUDO BRI D-CHANNEL = An attempt was made to select the quarter section of a 64kb time-slot to place the BRI D-channel PUT data onto an output facility other than a pseudo BRI D-channel (Format 2 of EXC:RDTA input message). A quarter time-slot modification may only be made on a pseudo BRI D-channel.

OFFICE LIMIT EXCEEDED = There can be up to 24 active RDTA sessions running simultaneously in an office. This limit has been reached and therefore, the requested session cannot be established.

OUTPUT FACILITY DN MISMATCH = When the conversion to split was attempted, the output facility DN(s) given on the input request did not match those of the existing monitor.

PATH EXISTS ON PUT = This message applies only when a mode of DTAC is selected. The DTAC mode demands that there be no path set up on the PUT. The PUT currently has a path set up on it.

PATH UNAVAIL FOR ACCESS = All monitors and splits require that there be a path up on the PUT in order for a monitor or split to be established. Currently, there is no path up to monitor or split.

PORT INVOLVED IN RDTA SESSION = An attempt to set up an RDTA session on a port that is already involved in an RDTA session. Blocking of the requested session is done so the software data structures of the active session are on corrupted.

PROCESS TIMEOUT = An RDTA administrative module (AM) or SM process timed out after waiting for an SM process to respond. This condition occurred because of an SM overload condition, an SM isolation, or an internal software error.

PUT OWNERSHIP FAILURE = Could not get ownership of the specified PUT as given on the input request. This may occur when a DTAC or split type mode has been selected.

PUT PATH FAILURE = An attempt to set up a path to the PUT failed.

QTS ALREADY SET = The correct quarter time-slot has automatically been selected by the switch for placement onto the pseudo BRI D-channel output facilities with respect to this particular RDTA session.

RESOURCE FAILURE = Could not obtain the necessary path resources to set up this connection.

SIGNALLING LINK FAILURE = The out-of-band signaling link is out-of-service. This signaling link is required to set up the requested DTAC on the given PUT.

SM UNAVAILABLE = One of the SMs required to set up the requested RDTA session is isolated.

SYSTEM BUSY = System resources are not available to set up the requested connection. The AM or SM may be in an overload condition.

SYSTEM ERROR = Internal system error occurred while establishing the requested RDTA session.
TAP BUSY OR OOS = The TAP which is needed for this RDTA connection is currently busy or it is out-of-service.
TAP INVALID = The TAP is not a valid TAP.
TAP PATH FAILURE = An attempt failed to set up a path either to the ITAP or the OTAP or both.
TEST DENIED - PVC ACTIVE ON PUT = The request has been rejected. A permanent virtual circuit is currently active on the PUT ST an RDTA split connection cannot be established on this PUT.
TEST DENIED DUE TO PSML = The request has been rejected because the packet switch maintenance limit has been exceeded. The requested RDTA split connection could not be honored because there are no other in service (IS) internal protocol (IP) trunks to which the PUT can dynamically route traffic.
UNAUTHORIZED OUTPUT FACILITY DN = The directory number (DN) specified for the output facility (INDN or OUTDN) is not in the database. RC/V Views 22.17 or 22.18 may be checked to get the list of authorized DNs.
UCL OPTION REQUIRED = In order to set up the requested RDTA session, the UCL option on the EXC:RDTA input message must be specified.
UNSUPPORTED RDTA PUT TYPE = The specified PUT is currently not supported by the RDTA feature.

c = Service group and member numbers. Valid value(s):

BST=d-e
MLHG=f-g
OAPO=d
OPT=d-e
RTRS=h-i
TKGMN=j-k

d = Operator service center number.
e = Relative position number.
f = Multi-line hunt group number.
g = Multi-line hunt group member number.
h = Data link relative group number.
i = Data link relative member number.
j = Trunk group number.
k = Trunk group member number.
l = Equipment number. Valid value(s):

AIUEN=m-t-m^1-n^1
DEN=m-n-o-p
ILEN=m-q-r-s
LCEN=m-t-u-v
LCKEN=m-t-v^1-m^1-n^1
NEN=m-o^1-p^1-q^1-r^1-s^1-t^1-u^1
INEN=m-o^1-r-s
m  = SM number.
n  = Digital line and trunk unit (DLTU) number.
o  = Digital facility interface number.
p  = Digital channel.
q  = Integrated digital carrier unit number.
r  = Remote terminal number.
s  = Channel unit number.
t  = Integrated services line unit (ISLU) or access interface unit (AIU) number.
u  = Line group controller number.
v  = Line card number.
w  = Directory number. Valid value(s):
    DN=w[+]
    PKTDN=w[+]

y  = Channel type (for BRI). Valid value(s):
    B1  = B1-Channel.
    D   = D-Channel.

z  = Digit analysis selector (routing domain) to be used to specify the correct set of digit analysis tables to translate INDN and OUTDN. This parameter will override the office's default DAS for RDTA.

a  = DN of the output facility where the protocol analyzer is connected to access the test data sent over the PUT to the switch. This direction will be known as incoming. Data sent from the analysis equipment for interaction with the PUT will therefore originate from INDN for all interactive mode connections excepting the SPLITPH connection.

b  = SM number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

c  = Logical port number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

d  = DN of the output facility where the protocol analyzer is connected to access the test data sent from the switch to the PUT. This direction will be known as outgoing. Data sent from the analysis equipment for interaction with the switch will therefore originate from OUTDN for the SPLIT and SPLITPH connections.

e  = SM number of the port which corresponds to the OUTDN for local access or of the port which
connects the session switch (where the session is set up) to the network for remote access.

f1 = Logical port number of the port which correlates to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

g1 = Connection mode of the RDTA session. Valid value(s):

DTAC = Direct test access connection (DTAC). This is an interactive connection on a port that does not have a path set up on it. The PUT is seized and directly connected to an outgoing port terminating at the protocol analysis equipment.

MON = Monitor. This is a receive-only connection on a busy circuit. A copy of the transmit and receive data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.

SPLIT = Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.

SPLITPH = Simplex split protocol handler (PH) side. This is an interactive connection on an integrated services digital network (ISDN) channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.

SPLITPUT = Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

h1 = The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the PH.

i1 = Remaining time for which the session will continue operating before the session will be automatically aborted, in the form days (with a space between) hours:minutes:seconds. If the session has been set for an infinite duration, the time field will be printed as INFINITE. The session may be extended by using the UPD:RDTA input message.

j1 = The billing directory number that will be passed through the network when routing to the output facilities located in another LATA.

k1 = The customer identification used to perform ARS type of routing when routing over leased network inter-switch trunks to output facilities located in a different switch from the PUT.

l1 = Fail point number used to relay the specific point in the software at which a failure occurred. This is used purely for debugging purposes.

m1 = Line board number.

n1 = Line circuit number.

p1 = Data group (DG) number.

q1 = SONET termination equipment (STE) facility number. For OIU-NAR, it is OC-3.

r1 = Synchronous transport signal (STS) facility number.
s\textsuperscript{1} = Virtual tributary group (VTG) number.
t\textsuperscript{1} = Virtual tributary member (VTM) number.
u\textsuperscript{1} = Digital signal level 0 (DS0) number.
v\textsuperscript{1} = Line group number.
w\textsuperscript{1} = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.
x\textsuperscript{1} = PCT facility interface (PCTFI) number.
y\textsuperscript{1} = Tributary number.
z\textsuperscript{1} = Channel number.
a\textsuperscript{2} = Optical Interface Unit (OIU) number.
b\textsuperscript{2} = Protection Group number.

4. ACTIONS TO BE TAKEN

If a successful RDTA session was established, then the output facility ports should give access to the monitor/interactive RDTA connection. If a BRI D-channel is being tested on a different switch than the output facility switch, then the correct quarter time-slot will have to be selected on the switch where the output facility is located using Format 2 of the EXC:RDTA input message.

If the completion code indicates a failure in establishing the requested RDTA connection, investigate the cause of the failure, eliminate the problem and re-attempt to set up or convert the connection.

EXC:RT-PROV
Software Release: 5E14 and later
Message Class: RT
Application: 5
Type: Output

1. FORMAT

EXC:RT,PROV,{{{{ALL|GLOBAL|IFAC|DS1SFAC},{SID=b |{IDCURT|DNUSRT}=c-d-e}}}|
{{LINE,{ILEN|INEN}=c-d-e-f}}} h

2. REASON FOR OUTPUT

To report the result of an EXC:RT-PROV input message that requests provisioning of an Integrated Digital Carrier Unit (IDCU) or a Digital Network Unit SONET (DNU-S) terminated TR303 remote terminal (RT), an analog or digital line on an RT, or a digital signal level 1 (DS1) facility on an RT.

3. VARIABLE FIELD DEFINITIONS

Type of provisioning request. Valid value(s):
- ALL = All provisionable data on an RT.
- GLOBAL = Global RT data.
- IFAC = A DS1 facility on an IDCURT.
- DS1SFAC = A DS1 facility on an DNUSRT.
- LINE = Analog or digital line data.

b = Site identification (SID) number of the RT.
c = Switching module (SM) number.
d = Unit number.
e = Local RT number.
f = Line number on an RT.
g = DS1 facility number.
h = Completion status. Valid value(s):
- 15 MIN REFRESH ACTIVE - RL = Retry later. 15 minute automatic refresh of provisioned data is in progress. Data for all TR303 RT's will be updated during this refresh.
- 24 HOUR REFRESH ACTIVE - RL = Retry later. 24 hour automatic refresh of provisioned data is in progress. Data for all TR303 RT's will be updated during this refresh.
- ABORTED - EOC OOS = Retry later. Unavailable system resources to communicate with the RT.
- COMPLETE - NO TASKS PENDING = The requested provisioning operation has completed.
- COMPLETE - TASKS PENDING = The requested provisioning operation has completed with some failures. Further attempts are made at regular intervals for the specific operations that failed.
- DATABASE READ FAILURE = A database read failed when attempting to complete this request.
- INHIBITED - RT MEMORY MISMATCH = Provisioning is inhibited and cannot take place until the RT memory mismatch condition is corrected.
- INVALID PORT = The line number requested is not a valid line number for this RT.
- INVALID REQUEST = The request contained invalid data.
MAN. REQ. REFRESH ACTIVE - RL = Retry later. Another manual refresh of provisioned data for an RT associated with this SM is in progress.

PREEMPTED = The indicated manual request has been preempted by a higher priority provisioning request.

PROV FAILURE = Provisioning has failed. Further attempts will be made at regular intervals.

RT NOT PROVISIONABLE = Request failed because switch does not provision this RT as specified in RC/V View 18.15 PROVISIONRT field.

STARTED = Work on the requested provisioning operation has started.

TR303 RT NOT FOUND = Either the requested RT does not exist in the database or it is not a TR303 RT.

4. ACTION TO BE TAKEN

The purpose of this message is to report the result of the action requested by the corresponding input message. No specific action is indicated.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results from a manual PCI7GR cross check (S7XCHK) request originating in this office.

Format 1 reports that the identified cross check has been STARTED.

Format 2 reports the results of the extra rlAMPCI7GR tuple cross check when extra tuples are found. The format includes a list of each extra tuple, indicating the SM, pci, cic, and cic offset of the extra tuples found. This format is not printed if no extra tuples are detected.
Format 3 reports the extra rLAMPcI7GR COMPLETED report. The format includes the number of extra tuples detected and corrected in rLAMPcI7GR.

Format 4 reports the extra rLAMPcI7GR ABORTED report. The format includes the number of extra tuples detected and corrected in rLAMPcI7GR before the abort occurred.

Format 5 reports that a GSM is inaccessible. The cross check cannot be performed for this GSM.

Format 6 reports the GSM TIME OUT report. The GSM did not respond to a request from the trunk SM for the consistency check within a specified interval.

Format 7 reports the results of the extra rLGMPCI7GR tuple cross check when extra tuples are found. The format includes a list of each extra tuple, indicating the SM, pci, cic, and cic offset of the extra tuple found. This format is not printed if no extra tuples are detected.

Format 8 reports the extra rLGMPCI7GR COMPLETED report. The format includes the number of extra tuples detected and corrected in rLGMPCI7GR.

Format 9 reports the extra rLGMPCI7GR ABORTED report. The format includes the number of extra tuples detected and corrected in rLGMPCI7GR before the abort occurred.

Format 10 reports the rLAMPcI7GR INCONSISTENT tuple report for the trunk SM that is being checked for consistency.

Format 11 reports the trunk SM COMPLETED report. The format includes the number of inconsistent tuples detected and corrected in rLAMPcI7GR/rLGMPCI7GR for the trunk SM being checked.

Format 12 reports the trunk SM ABORTED report. The format includes the number of inconsistent tuples detected and corrected in rLAMPcI7GR/rLGMPCI7GR for the trunk SM being checked before the abort occurred.

Format 13 reports the rLGMPCI7GR INCONSISTENT tuple report for the trunk SM that is being checked for consistency.

Format 14 reports the total number of errors detected and corrected for the input scope.

Format 15 reports the total number of errors detected and corrected for the input scope before the abort occurred.

3. VARIABLE FIELD DEFINITIONS

a = Type of cross check requested. Valid value(s):
   PCI7GR = PCI7GR cross check.

b = Switching module.

c = Optional end of range of switching modules.

d = Correction status indicator. Valid value(s):
   Y = Correct inconsistent tuples.
   N = Only report inconsistent tuples.

e = Point code index (PCI).

f = Circuit identification code (CIC).
= CIC map.

Problem type. Valid value(s):
MISSING = Missing tuple.
INCONSISTENT = Inconsistent tuple.

Errors detected for trunk SM being checked.
Errors corrected for trunk SM being checked.
Total errors detected.
Total errors corrected.

4. ACTIONS TO BE TAKEN

None.

235-200-116  Signaling Gateway Common Channel Signaling
EXC:SODD-RED

Software Release: 5E14 and later
Message Class: ODD
Application: 5
Type: Output

1. FORMAT

[1] EXC SODD RED d REL a

[2] EXC SODD RED d, b ERRORS, OUTPUT FILE c

[3] EXC SODD RED d [REL=a] [ERRORS=b]
[OUTPUT FILE=c]

2. REASON FOR OUTPUT

Format 1 reports that the redundant static office-dependent data (SODD) audit has either started, has found the input relation to be invalid or is in progress.

Format 2 reports that the redundant SODD audit is completed or aborted. It also gives the number of errors it detected, and where the output of the errors can be found.

Format 3 reports that the redundant SODD audit is either in progress, stopped, completed, or aborted. A report of IN PROGRESS indicates a status request has been received.

3. VARIABLE FIELD DEFINITIONS

a = The name of the relation the audit was working on.
b = Number of errors found with the audit.
c = The path name for the file containing the errors found by the audit.
d = Status of the audit. Valid value(s):
   ABORTED = The audit has aborted due to problems.
   ABORTED BAD-OUTPUT-NAME = The audit has aborted due to the input of a bad outfile name.
   ABORTED BAD-RELATION-NAME = The audit has aborted due to the input of a bad relation name.
   COMPLETED = The audit has successfully completed.
   IN PROGRESS = The audit is in progress.
   INVALID RELATION = The audit has found the input relation to be invalid.
   STARTED = The audit has found the input relation to be invalid.
   STOPPED = The audit has received a stop request.

4. ACTION TO BE TAKEN

For Format 1, no action is required.

If the audit has completed (Format 2 and Format 3) look at any errors found by the audit. Verify and correct any legitimate errors found within the database.
If the audit aborted because of a bad relation name or bad outfile name, restart the audit with the correct information.

2. REASON FOR OUTPUT

If no translation point code (TPC) is specified in the initiation command and the initiating signaling point (SP) does not know how to obtain the global title translation (GTT) for the specified global title (GT), the SP responds with 'UNABLE TO DERIVE TPC' and (in case of error in data entered in the initiation command) followed by an appropriate indication identifying parameter(s) in the initiation command found to be in error by the SP. Otherwise one of the formats is possible. These formats are presented for two cases: when one SCCP routing verification test (SRVT) request or verify message was sent, Formats 1-3, and when two messages were sent for a single SRVT initiation request, Formats 4 through 6. Formats 1 and 4 are used when the SRVT was successful and the SRVT user did not request a trace. Formats 2 and 5 are used when the SRVT was successful and the user requested a trace. Formats 3 and 6 are used when either partial success or failure occurred.

3. VARIABLE FIELD DEFINITIONS

a = The translation type.

b = The numbering plan, from SCCP protocol, not included unless specified in the initiation command. Currently not used by the STP, may cause an error.

c = The encoding scheme, from SCCP protocol, not included unless specified in the initiation command. Currently not used by the STP, may cause an error.

d = The digits in global title, 19 digit maximum (such as, an 800 number).

e = The translation point code to which the initiator should address and send and SRVT message. Not included unless specified in the initiation command. Printed in decimal notation (for example, 254062001).

f = The maximum number of translation signaling points (TSPs) allowed to be crossed.

g = Result of SRVT. Valid value(s):
     FAILURE
     PARTIAL_SUCCESS

h = The list of TSP point codes of a received SRVR message indicating success. If multiple success, indicating SRVR messages were received, this line would be printed for each such message. Note that in Format 3, if 'g' is FAILURE, item 'h' will not be present in the output.

i = Text phrases that describes the problem found. Valid value(s):
     EXCESSIVE LENGTH ROUTE 2
     INACCESSIBLE SIGNALING POINT 4
     INACCESSIBLE SIGNALING POINT 4n
     INCORRECT TRANSLATION FOR INTERMEDIATE TSP 11
     INCORRECT TRANSLATION FOR PRIMARY DESTINATION 9
     INCORRECT TRANSLATION FOR SECONDARY DESTINATION 10
     LOOP 1
     MESSAGE ARRIVED AT WRONG SIGNALING POINT 8
     NO TRANSLATION FOR GLOBAL TITLE 3
     NOT PRIMARY DESTINATION 12
     NOT SECONDARY DESTINATION 13
     PRIMARY DESTINATION NOT RECOGNIZED 14
     SECONDARY DESTINATION NOT RECOGNIZED 15
     TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS 5
     TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS 5o

Valid values for 4n are:
- **4A** = Congestion.
- **4B** = Blockage.
- **4C** = Crossing network boundaries.
- **4D** = Not SS7 equipped.
- **4E** = Subsystems prohibited.
- **4F** = Received unidata service message.

Valid values for 5o are:
- **5A** = Processor overload.
- **5B** = Test pertains to GT which is already under test.
- **5C** = Tests limit threshold exceeded.

The value of 'p' can be any code not list above; 'p' is an invalid error code.

- **j** = Point code(s) associated with the failure being reported.

Other Manual(s):
235-190-120  Common Channel Signaling Services
EXC:UT-CMP

Software Release: 5E14 and later
Message Class: UT
Application: 5
Type: Output

1. FORMAT

[1] EXC UT CMP=a-b (MATE|PRIM) g
   SYMIDX c CALL d RETVAL e

[2] EXC UT CMP=a-b (MATE|PRIM) GOTO f g

2. REASON FOR OUTPUT

To report the status of the response to the EXC:UT-CMP input message to execute a function in the communication module processor (CMP) or to transfer control to a specified location.

Format 1 reports the status of a function call defined by a symbolic reference.

Format 2 reports the status of a transfer of control to the specified address.

3. VARIABLE FIELD DEFINITIONS

MATE   = Message was executed in the standby CMP.
PRIM   = Message was executed in the active CMP.
a      = Message switch side.
b      = CMP number.
c      = Symbol index number of the specified function either specified in the input message or determined by the UT code based on the function name ‘d’. If an invalid input message is entered, the symbol index number will be "-1".
d      = Symbolic name specified in the input message or determined by the UT code based on the symbol index number ‘c’. The function name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a ‘*’ to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
e      = Return value (RETVAL) of called function. The return value is stored in utility variable UVAR[10] and can be referenced by using the DUMP:UT-CMP input message. If the return value is a structure, the information is stored in an UT storage array, called UTstrct, which needs to be dumped for the data.

Note: One example of how to accomplish this is when a function returns a structure. The structure can be dumped with a dump message of UVAR=10 with one level of indirection and the length of the structure specified.
f      = The address to which control is transferred.
Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If appropriate, correct the specified input message and repeat.

5. ALARMS

EXC:UT-CMPMSG

Software Release: 5E14 and later
Message Class: UT
Application: 5
Type: Output

1. FORMAT

EXC U T CMPMSG=a-b f
    SYMIDX c CALL d RETVAL e

2. REASON FOR OUTPUT

To report the status of the response to the EXC:UT-CMPMSG input message to execute an unconditional call to a function in the communication module processor (CMP) message handler (CMPSG).

3. VARIABLE FIELD DEFINITIONS

a = Message switch (MSGS) side number.
b = CMPMSG number.
c = Symbol index number of the specified function either specified in the input message or determined by the UT code based on the function name 'd'. If an invalid input message is entered, the symbol index number will be "-1".
d = Symbolic name specified in the input message or determined by the UT code based on the symbol index number 'c'. The function name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
e = Return value of function. If the return value is a structure, the returned data is stored in a UT storage array called UTstrct, which needs to be dumped to retrieve the data.
f = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If appropriate, correct the input message and repeat.

5. ALARMS

None.

Message Class: UT
Application: 5
Type: Output

1. FORMAT

EXC UT DNUS=a-b f
   SYMIDX c CALL d RETVAL e

2. REASON FOR OUTPUT

To report the status of the response to the EXC:UT-DNUS input message to execute a function in the digital networking unit - synchronous optical network (SONET) (DNU-S).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Symbol index number of the specified function either specified in the input message or determined by the UT code based on the function name 'd'. If an invalid input message is entered, the symbol index number will be "-1".
d = Symbolic name specified in the input message or determined by the UT code based on the symbol index number 'c'. The function name is limited to 15 characters in length. If the symbol is longer that 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
e = Return value (RETVAL) of called function. The return value is also stored in utility variable UVAR[10] and can be referenced by using the DUMP:UT-DNUS input message.
f = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If appropriate, correct the EXC:UT-DNUS input message and repeat.

5. ALARMS

None.

EXC:UT-MCTSI-MH

Software Release: 5E14 and later
Message Class: UT
Application: 5
Type: Output

1. FORMAT

EXC UT MCTSI=a MH(b) f
SYMIDX c CALL d RETVAL e

2. REASON FOR OUTPUT

To report the response to the EXC:UT-MCTSI input message to execute a function in a switching module (SM) message handler (MH) unit.

3. VARIABLE FIELD DEFINITIONS

a  = SM number.
b  = The MH unit number.
c  = Symbol index number of the specified function either specified in the input message or determined by the UT code based on the function name 'd'. If an invalid input message is entered, the symbol index number will be "-1".
d  = Symbolic name specified in the input message or determined by the UT code based on the symbol index number 'c'. The function name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input command.
e  = Return value of the called function. The return value is stored in utility variable UVAR 10 and can be referenced by using the DUMP:UT-MH input message. If the return value is a structure, the information is stored in an UT storage array, called UTstrct, which needs to be dumped for the data, and its address is in UVAR=10.

Note: When a function returns a structure the data can be accessed by using the DUMP:UT-MH input message. Dump the contents of UVAR=10 with one level of indirection and the length of the structure specified.

4. ACTIONS TO BE TAKEN

If appropriate, correct the specified input message and repeat.

5. ALARMS

235-105-220  Diagnostic, Trouble Clearing, and System Recovery
EXC:UT-TMUX

Software Release: 5E14 and later
Message Class: UT
Application: 5
Type: Output

1. FORMAT

EXC UT TMUX=a-b-c-d h
    SYMIDX e CALL f RETVAL g

2. REASON FOR OUTPUT

To report the status of the response to the EXC:UT-TMUX input message to execute a function in the digital networking unit - synchronous optical network (SONET) (DNU-S) transmission multiplexer (TMUX).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Data group number.
d = TMUX number.
e = Symbol index number of the specified function either specified in the input message or determined by the UT code based on the function name ‘f’. If an invalid input message is entered, the symbol index number will be “-1”.
f = Symbolic name specified in the input message or determined by the UT code based on the symbol index number ‘e’. The function name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a ‘*’ to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
g = Return value (RETVAL) of called function. The return value is also stored in utility variable UVAR[10] and can be referenced by using the DUMP:UT-TMUX input message.
h = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If appropriate, correct the EXC:UT-TMUX message and repeat.

5. ALARMS

None.

32. FRMV
FRMV:LN

Software Release: 5E14 and later
Message Class: SWM01
Application: 5,CNI
Type: Output

1. FORMAT

[1] FRMV LNa b COMPL
   AT c

[2] FRMV LNa b NOT STARTED
   AT c
d

[3] FRMV LNa b STOPPED
   AT c

2. REASON FOR OUTPUT

To report the results of an FRMV:LN input message, which requests the forced removal of a node from service.

3. VARIABLE FIELD DEFINITIONS

a = A ring node (RN) group number.
b = The node’s position in the RN group.
c = The contents of the administrative module (AM) real-time clock register (in milliseconds) when the request was received by the interprocess message switch (IMS) driver process.
d = Reason the input message was not started. Valid value(s):

RING NODE NOT IN ACT STATE
RING CONFIGURATION NOT STABLE
CONFLICT WITH IMS SYSTEM INITIALIZATION

4. ACTION TO BE TAKEN

For Format 1, no action is required. The RMV:LN output message may also be printed.

For Format 2, if ‘c’ indicates the node was not in the active (ACT) state, then either there is no action to be taken or the RMV:LN input message will remove the node from service. For other values of ‘c’, wait until the condition indicated by ‘c’ changes and try again, if appropriate.

For Format 3, this case is not expected. It indicates a failure return from the_unrmv_iun function in the imsdrv.p process.

5. ALARMS

None.

33. GENBKUP
GENBKUP:POKE
Software Release: 5E14 and later
Message Class: MAINT
Application: 5
Type: Output

1. FORMAT

GENBKUP POKE 195: [(a)] b

2. REASON FOR OUTPUT

To report progress of a request for software release backup. These messages are printed only in response to the input message poke of 195 from the Master Control Center (MCC) or other display type terminal.

3. VARIABLE FIELD DEFINITIONS

a
= The name of the terminal from which the input message was entered (for example, ttya or ttyl).

b
= A phrase reporting the progress or an error condition. It is usually self explanatory. Phrases are listed below in three groups:
- The first group is for those that need some action by the user.
- The second is for those that the user should refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
- The third is for those that need no action by the user.

1
= The following messages require the user to take some corrective action. Suggested action follows the message.

BRAND NEW TAPE?
= Enter Y if this is a tape that has never been used, enter N if this is a tape that has been used.

CRAFT QUIT TAPE WRITE PROCEDURE! POSSIBLE TAPE DRIVE PROBLEMS! CAN'T WRITE AT HIGH DENSITY
= Run a phase 5 diagnostics on magnetic tape drive (DGN:MT=x,PH=5;). Refer to the Corrective Maintenance manual 235-105-220, to run this phase.

GENBKUP TIMED OUT - LAST COMMAND DID NOT COMPLETE
= The genbkup process was waiting for a message to complete but did not receive the completion message within a specified time. This could be caused due to the message taking longer than usual time in completing the task. Retry the RCV:M-GENBKUP input message later. If the same problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

MHD 0 MUST BE ACTIVE TO CONTINUE! PLEASE TYPE A ''RST:MHD=0'' COMMAND
= Enter the suggested input message.

MHD 1 MUST BE ACTIVE TO CONTINUE! PLEASE TYPE A ''RST:MHD=1'' COMMAND
= Enter the suggested input message.

MHD c IS NOT ACCESSIBLE AT THIS TIME
= Restore moving head disk (MHD) 'c'.

ODD BACKUP IN PROGRESS. GENBKUP ABORTING
= Retry when office-dependent data (ODD) backup is complete.
ODD MEMORY GROWTH IN PROGRESS. GENBKUP ABORTING = 
Retry when memory growth process is complete.

RMV/RST OF MTC 0 RESULTED IN AN UNSTABLE MTC 0 STATE. HAVE CRAFT INVESTIGATE
= Diagnose magnetic tape controller (MTC) and take corrective action accordingly.

TAPE VFY FAILED! ENTIRE TAPE SEQ --> MAY <--- NEED TO BE REWRITTEN!
IF THE CRAFT CONTINUES THIS TAPE SEQUENCE
RE-VERIFY THIS FAILED TAPE LATER USING OPTION "p"
FROM GENBKUP'S MAIN MENU" = Follow the suggestion in the message.

THE RMV:MHD=c COMMAND FAILED FROM AN ABORTED/STOPPED ERROR CONDITION
= Take corrective action on MHD 'c'.

THE RST:MHD=c COMMAND FAILED FROM AN ABORTED/STOPPED ERROR CONDITION
= Take corrective action on MHD 'c'.

TAPE SEQ NOT STARTED! FIELD UPDATE ACTIVITY DETECTED! =
Genbkup cannot be run when field update activity is under way, so this tape sequence was not started. Wait until the field update is completed.

TOP TAPE VERIFICATION FAILED = Retry RCV:MENU:GENBKUP. If the same problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

USE POKE 195 = Instead of using the RCV:MENU-GENBKUP input message, use poke message 195.

VFY:MHD=0 CMD FAILED! POSSIBLY SERIOUS DFC-0/MHD-0 HARDWARE PROBLEMS EXIST
= Take corrective action on MHD 0.

VFY:MHD=1 CMD FAILED! POSSIBLY SERIOUS DFC-1/MHD-1 HARDWARE PROBLEMS EXIST
= Take corrective action on MHD 1.

Following messages may indicate serious system problems. If the following messages appear, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

/dev/e IS MOUNTED BUT NOT POPULATED! = The file system /dev/e is mounted but is empty.

/dev/e MOUNTED ON A NON-STANDARD DIRECTORY MOUNT POINT! = The file system /dev/e is mounted on an incorrect directory.

/dev/e SHOULD HAVE BEEN AN ENTRY IN THE MOUNT TABLE BUT WAS NOT!
= The file system /dev/e is not listed in the mount table (probably because it is not mounted).

AM ODD DISK VERIFICATION ABORTED!

AN AM ODD FSBLK/FSLINK AUDIT FAILED! = An audit of AM ODD file system blocks/links failed.

AN SM ODD TAPE SEQ ABORTED! CHECK ROP! = An SM tape sequence was
aborted, read ROP to see if you can find the possible cause.

AN UNRECOGNIZED AUDIT OR CMPR:DISK TO CORE COMMAND WAS
ENCOUNTERED! GENBKUP ABORTING!
= An input message for audit or for compare disk to core was
issued by genbkup but it was not recognized by the system for
some reason.

ATTEMPTED TAPE SEQUENCE ABORTED!

CAN NOT CREATE LINKFILE. GENBKUP ABORTING! = Genbkup cannot
create linkfile (/tmp/.genbkupLINK) which is used as a flag.

CAN NOT CREATE LOCKFILE. GENBKUP ABORTING! = Genbkup cannot
create lockfile (/tmp/.genbkupLOCK) which is used as a flag.
Linkfile and lockfile are linked together (same file with different
names).

CAN NOT FOPEN LOCKFILE FOR APPENDING! GENBKUP ABORTING!! =
Genbkup cannot open lockfile for append mode.

CAN NOT FOPEN LOCKFILE FOR WRITING! GENBKUP ABORTING!! =
Genbkup cannot open lockfile for write mode.

CAN'T BYTE SEEK IN CURRENT MTCLOG! = Access to maintenance log failed.
Maintenance log (named MTCLOG0 or MTCLOG1) are located in
/etc/log or /log/log.

CAN'T BYTE SEEK IN MTCLOG0!

CAN'T BYTE SEEK IN MTCLOG1!

CAN'T CHANGE DIRECTORY TO /cft/shl

CAN'T CLEAR RC INHIBIT BIT! = Inhibit bit for recent change cannot be
cleared for some reason.

CAN'T CREATE TMP FILE FOR SCREEN DUMP! = Genbkup cannot create a
temporary file in /tmp.

CAN'T CREATE TMP FILE FOR THE SOFTWARE BKUP DISK LABEL!

CAN'T CREATE TMP FILE FOR THE TAPE LABEL!

CAN'T DETERMINE IF AN LDFT TAPE IS MOUNTED!

CAN'T GET MOUNT TABLE STATUS FROM mnt.stat()! GENBKUP ABORTING

CAN'T SET RC INHIBIT BIT! = Inhibit bit for recent change cannot be set for
some reason.

CAN'T STAT CURRENT MTCLOG! = Stat() of the current maintenance log failed.

COPY:ACTDISK:MHD=c CMD FAILED FROM AN ABORTED/STOPPED ERROR
CONDITION!
= The above input message issued by genbkup failed.
COPY:SPDISK CMD FOR MHD c FAILED FROM AN ABORTED/STOPPED ERROR CONDITION!

COULD NOT EXEC LAST CMD FROM GBexec_row()! = Genbkup failed to execute the last message (refer to the last message on screen).

COULD NOT KILL CURRENT COPY:BKDISK RELIABLY! = Genbkup attempted to kill currently running COPY:BKDISK, but is unsure of the result due to unclear return code.

CURRENT MTCLOG SIZE LESS THAN ZERO BYTES! = There is something wrong with the maintenance log.

FILE SYSTEM MOUNT TABLE INCONSISTENCY(S)! CRAFT SHOULD INVESTIGATE AND SEEK APPROPRIATE TECHNICAL ASSISTANCE IMMEDIATELY! = There is something wrong with the mount table.

GBgreplog() ABORTED DUE TO ILLEGAL GREP TYPE! = Internal program error--genbkup is looking for a message type that is not in the program.

GBmkdir: cannot access '.' ! = This and the following messages indicate that genbkup tried but could not make the directory "/genbkupDIR" which is used to mount broot file system.

GBmkdir: cannot link /genbkupDIR/. !
GBmkdir: cannot link /genbkupDIR/../!
GBmkdir: cannot make directory /genbkupDIR !
GBrmdir: /genbkupDIR is a mounted file system !
GBrmdir: /genbkupDIR no permission !
GBrmdir: /genbkupDIR non-existent !
GBrmdir: /genbkupDIR not a directory !
GBrmdir: /genbkupDIR not empty !
GBrmdir: /genbkupDIR not removed !
GBrmdir: /genbkupDIR unreadable !
GBrmdir: cannot remove current directory !
GBrmdir: cannot stat . !

GENBKUP INTERNAL ERROR EXPRESSION --><- RETURNED ERROR: n
ODD BACKUP PROCEDURE ABORTED!

PARTITION CHECK FUNCTION FAILED!
POSSIBLY CORRUPT PTN FILES! = Files (with .ptn suffix) under /no5text/bkup used in partition checks may be corrupted or incorrect.

POSSIBLY SERIOUS AUDIT/CMPR:DISK INCONSISTENCIES! = There were inconsistencies in the results of audit and compare disk.

SM ODD DISK VERIFICATION ABORTED!

SM ODD FSBLK/FSLINK AUDIT FAILED! = An audit of SM ODD file system blocks/links failed.

TAPE SEQ ABORTED DUE TO COPY:BKDISK ERROR! = This tape sequence was aborted because COPY:BKDISK message failed.

TEXT DISK VERIFICATION ABORTED!

THE COPY:PTN:ALL COMMAND FAILED FROM AN ABORTED/STOPPED ERROR CONDITION!
= The above input message issued by genbkup failed.

THE INIT:MHD=c, VFY COMMAND FAILED FROM AN ABORTED/STOPPED ERROR CONDITION!
= The above input message issued by genbkup failed.

THE PRIMARY no5sodd[1/2] FILE SYSTEM IS NOT POPULATED! SM INIT RECOVERY IMPOSSIBLE!
= The switching module (SM) ODD file system does not have data in it.

UNABLE TO DETERMINE ACTIVE MTCLOG! = Genbkup cannot tell which MTCLOG (0 or 1) is active.

UNABLE TO KILL THE PREVIOUS GENBKUP PROCESS. ABORTING!! = There can be only one genbkup running at one time. This genbkup tried to kill the already running genbkup but failed.

UNABLE TO OPEN MTCLOG0! = Cannot open the maintenance log (MTCLOG0). MTCLOG0 is in /etc/log or /log/log.

UNABLE TO OPEN MTCLOG1! = Cannot open the maintenance log (MTCLOG1). MTCLOG1 is in /etc/log or /log/log.

UNABLE TO SET THE RC INHIBIT BIT! = Inhibit bit for recent change cannot be set for some reason.

UNINTERPRETABLE ODIN TPREAD RETURN! = Possible internal program error.

UNRECOVERABLE LOGIC ERROR IN GBsetlog()! = Possible internal program error.

WRITE AT END OF LOCKFILE FAILED! GENBKUP ABORTING!! = Genbkup cannot write to lockfile (/tmp/.genbkupLOCK) which is used as a flag.

WRITE AT START OF LOCKFILE FAILED! GENBKUP ABORTING!! = Genbkup cannot write to lockfile (/tmp/.genbkupLOCK) which is
used as a flag.

3

= The following messages describe the action taken.

ABORTED = Before this message appears, a message explaining the cause will appear. Look for that message and check the list above.

= MHD number.
d = Process identification (PID) number.
e = Name of the file system.
f = The software release (for example: 02.00).
g = The date (for example: Wed Mar 6 07:44:34 1996).
h = The tty name.
i = The tape name.
j = The tape drive.
k = The input message string.
l = A dump of the screen at the time.
m = Information on the message that failed (such as /cft/shl/cmds/COPY/BKDISK/START).
n = The error code returned by the message that failed.
o = The disk number used for backup, disk could be 14 or 15.
p = Information on date, generic, BWM level, and so forth.
q = Information on date, generic, density, and so forth.

4. ACTION TO BE TAKEN

When the process terminates normally, there is no action to be taken.

When the process terminates abnormally (for example, "ABORTED"), take the corrective action suggested in the list above for error state phrases or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

34. GRC
GRC:ERROR

Software Release: 5E14 and later
Message Class: GRCV
Application: 5
Type: Output

1. FORMAT

GRC ERROR [MODE = a NAME = b SECTION = c]
    REASON = d
    [e]

2. REASON FOR OUTPUT

To report errors generated by global recent change (GRC) processing. If the error can be directly correlated to a running GRC job or to a GRC input message, the MODE and NAME of the job will be printed. If the job has not been split into sections, SECTION number will be 0. If the error cannot be directly correlated to a GRC job or input message, MODE, NAME, and SECTION will not print.

3. VARIABLE FIELD DEFINITIONS

a = Mode during which error occurred. Valid value(s):
   BACKOUT = Backout operation.
   CLEANUP = Clean-up operation.
   N/A = Not applicable.
   TEST = Test operation.
   UPDATE = Update operation.

b = GRC name.

c = GRC section number, which is 0 unless the job has been split.

d = Reason for error.

e = Continuation of reason for error.

4. ACTION TO BE TAKEN

Correct error and continue accordingly.

5. ALARMS

None.

GRC:FAILURE

Software Release: 5E14 and later
Message Class: GRCV
Application: 5
Type: Output

1. FORMAT

GRC FAILURE NAME = a SECTION = b REASON = c [d]

2. REASON FOR OUTPUT

To report that the processing of a global recent change (GRC) job has terminated due to a resource failure.

3. VARIABLE FIELD DEFINITIONS

a = GRC name.
b = GRC section number.
c = Reason for termination. Valid value(s):
   RCgrcupd STOPPED, /log is out of free space.
   RCgrcupd STOPPED, /log is at n% free space.
   RCgrcupd STOPPED, /smlog is at n% free space.
   RCgrcupd STOPPED, /rclog is at n% free space.
   where n% is a percentage between 0 and 20.
d = Further explanation of reason.

4. ACTION TO BE TAKEN

Check the age of log files and delete unnecessary files, then reschedule the failed GRC.

5. ALARMS

Minor.

Software Release: 5E14 and later
Message Class: GRCV
Application: 5
Type: Output

1. FORMAT

GRC_QUERY LINES.MATCHED = a
SUMMARY_FILE = b

2. REASON FOR OUTPUT

To indicate that the global recent change (GRC) query operation has completed. The number of lines that match the query criteria and the name of the file that contains the query criteria are given.

3. VARIABLE FIELD DEFINITIONS

a = Number of lines that satisfy the query.
b = Full path name to the query.summary file. This file lists the query criteria selected by the user during a GRC query.

4. ACTION TO BE TAKEN

None. The DUMP:F-ALL input message can be used to dump the contents of the query criteria file to an output device.

IF:UT-CMP-ENDIF
Software Release: 5E14 and later
Message Class: UT
Application: 5
Type: Output

1. FORMAT
IF UT CMP=a-b {MATE|PRIM} ENDIF c

2. REASON FOR OUTPUT
To report the status of the IF:UT-CMP-ENDIF input message in the communication module processor (CMP).

3. VARIABLE FIELD DEFINITIONS
ENDIF = Defines the end of the IF block of messages.
MATE = Message was executed in the standby CMP.
PRIM = Message was executed in the active CMP.
a = Message switch side.
b = CMP number.
c = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN
If appropriate, correct the specified input message and repeat.

5. ALARMS
None.

6. REFERENCES

Software Release: 5E14 and later
Message Class: UT
Application: 5
Type: Output

1. FORMAT

[1] IF UT CMP=a-b (MATE|PRIM) (ADDR c|REG d|UVAR e|VAL f) i

[2] IF UT CMP=a-b (MATE|PRIM) i
SYMIDX g GVAR h

2. REASON FOR OUTPUT

To report the status of the IF:UT-CMP input message in the communication module processor (CMP). This output uses the information from the field of the input message found to be in error.

Format 1 reports the status of a IF:UT-CMP input message defined by a physical address, microprocessor register, utility variable, or a constant value.

Format 2 reports the status of a IF:UT-CMP input message defined by a symbolic reference.

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>Variable</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATE</td>
<td>Message was executed in the standby CMP.</td>
</tr>

Input Message(s):

- DUMP:UT-SYMID
- IF:UT-CMP
- WHEN:UT-CMP

Output Appendix(es):

- APP:UT-OM-REASON

Other Manual(s):

235-105-110 System Maintenance Requirements and Tools
1.  FORMAT

[1]  IF UT MCTSI=a-b PI (ADDR c|REG d|UVAR e|VAL f) i

[2]  IF UT MCTSI=a-b PI i
       SYMIDX g GVAR h

2.  REASON FOR OUTPUT

To report the status of the IF:UT-MCTSI-PI input message in the specified packet interface (PI). This output uses the information from the field of the input message found to be in error.

Format 1 reports the status of a IF:UT-CMP input message defined by a physical address, microprocessor register, utility variable, or a constant value.

Format 2 reports the status of a IF:UT-CMP input message defined by a symbolic reference.

3.  VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.

b  = Side of the module controller/time-slot interchange (MCTSI).

c  = Absolute physical address (ADDR) specified in the field of the input message where the error was found.

d  = Register name (REG) specified in the field of the input message where the error was found.

e  = Utility variable (UVAR) number specified in the field of the input message where the error was found.

f  = Value (VAL) specified in the field of the input message where the error was found.

g  = Symbol index number (SYMIDX) of the specified symbol either specified in the input message or determined by the UT code based on the symbol name "h". If an invalid input message is entered, the symbol index number will be "-1".

h  = Symbolic name (GVAR) specified in the input message or determined by the UT code based on the symbol index number "g". The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.

i  = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.
4. ACTION TO BE TAKEN

If appropriate, correct the specified input message and repeat.

5. ALARMS

None.

[1] IF UT PSUPH=a-b-c-d {ADDR e|REG f|UVAR g|VAL h} k

[2] IF UT PSUPH=a-b-c-d k

SYMIDX i GVAR j

2. REASON FOR OUTPUT

To report the status of the IF:UT-PSUPH input message in the packet switch unit protocol handler (PSUPH). This output uses the information from the field of the input message found to be in error.

Format 1 reports the status of a IF:UT-PSUPH input message defined by a physical address, microprocessor register, utility variable, or a constant value.

Format 2 reports the status of a IF:UT-PSUPH input message defined by a symbolic reference.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number
b = Unit number.
c = Shelf number.
d = Slot number.
e = Absolute physical address (ADDR) specified in the field of the input message where the error was found.
f = Register name (REG) specified in the field of the input message where the error was found.
g = Utility variable (UVAR) number specified in the field of the input message where the error was found.
h = Value (VAL) specified in the field of the input message where the error was found.
i = Symbol index number (SYMIDX) of the specified symbol either specified in the input message or determined by the UT code based on the symbol name 'j'. If an invalid input message is entered, the symbol index number will be "-1".
j = Symbolic name (GVAR) specified in the input message or determined by the UT code based on the symbol index number 'i'. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.

1. FORMAT

[1] IF UT SM=a {ADDR b|REG c|UVAR d|VAL e} h

[2] IF UT SM=a h
SYMIDX f GVAR g

2. REASON FOR OUTPUT

To report the status of the response to the IF:UT-SM input message. This output uses the information from the field of the input message found to be in error.

Format 1 reports the status of a IF:UT-SM input message defined by a physical address, microprocessor register, utility variable, or a constant value.

Format 2 reports the status of a IF:UT-SM input message defined by a symbolic reference.

3. VARIABLE FIELD DEFINITIONS

a

= Switching module number.

b

= Absolute physical address (ADDR) specified in the field of the input message where the error was found.

c

= Register (REG) name specified in the field of the input message where the error was found.

d

= Utility variable (UVAR) number specified in the field of the input message where the error was found.

e

= Value (VAL) specified in the field of the input message where the error was found.

f

= Symbol index (SYMIDX) number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name 'g'. If an invalid input message is entered, the symbol index number will be "-1".

g

= Symbolic name (GVAR) specified in the input message or determined by the UT code based on the symbol index number 'f'. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.

h

= Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN
If appropriate, correct the specified input message and repeat.

IN:REMOTE-ERROR

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

IN REMOTE ERROR a[b][, ERRNO = c]
[INVALID TRANSACTION ID: "d"]
[NO TRANSACTION ID]
[READ FAILED]

2. REASON FOR OUTPUT

To report the termination of the file receive process due to an error that is unrelated to the actual transmission of files. This message may occur either before, during or after the transmission of files. "inremote" refers to the process created when IN:REMOTE-START is entered.

3. VARIABLE FIELD DEFINITIONS

a

- Reason for termination. Valid value(s):
  01 = The file receive process could not be executed.
  02 = A bad argument was passed to the file receive process.
  03 = Time limit to establish the dial-up link has expired.
  04 = Non-positive number of blocks was specified on the message line.
  05 = Failed to connect to system port.
  06 = Failed stat call on base directory.
  07 = Failed ustat call on base directory.
  08 = Insufficient disk space in base directory.
  09 = Failed to read connect message or received invalid connect message from the remote sending system. This message may be followed by a message indicating that READ FAILED, NO TRANSACTION ID was sent or an INVALID TRANSACTION ID was sent. The latter will include the invalid ID that was sent, as noted below.
  10 = An error occurred in the printing of file receive output messages.
  11 = An IN:REMOTE-START request was denied because a file receive process already exists. Retry the request later.
  12 = An IN:REMOTE-REPT or IN:REMOTE-STOP request failed because a message could not be sent to inremote or file receive process.
  13 = An IN:REMOTE-REPT or IN:REMOTE-STOP request failed because a message could not be sent to file receive process or inremote.
  14 = Could not enable reception of messages.
  15 = Could not send message from file receive process to inremote.
  16 = Bad message received by inremote.
  17 = Bad message received by file receive.
  18 = Unable to open SCANS data link.
  19 = Unable to open equipment configuration database (ECD).
  20 = Unable to get unit control block (UCB) record for SDL0.

b

= Error code indicating an ECD access problem or database inconsistencies. The following error numbers may be printed if ‘a’ = 18.
= SDL is not active.
= No unit name listed as active in mdct record.
= stat() failed.
= lla_rdget() failed.
= lla_get() failed.
= lla_iatt() failed.
= getdbseg() failed.

c = The system error number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual. The system error number will be printed if 'a' = 1, 5, 6, 7, 10, 14 or 15.

d = The invalid transaction ID received by the file receive process.

4. ACTION TO BE TAKEN

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. If required, cancel software update order and reorder later.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Type: Output

1. FORMAT

IN REMOTE INITIALIZED IP
   TRANSACTION ID: a TIME: bb:bb

2. REASON FOR OUTPUT

To report initialization of the software change administration and notification system (SCANS-2) interface and to provide a transaction ID to be used when ordering software updates from SCANS-2 within the next 24 hours.

3. VARIABLE FIELD DEFINITIONS

a = A transaction ID, from one to ten decimal digits and upper case letters. This ID is supplied to SCANS-2 when software updates are ordered. It is valid only for the next dial-in transmission of files, at which time SCANS-2 must present the transaction ID. If the ID time limit (24 hours) expires, the caller presents an invalid ID, or no ID, an IN:REM-ERROR output message will be displayed.

b = The time at which a 24-hour timer began, in the form hours:minutes.

4. ACTION TO BE TAKEN

Provide the transaction ID to SCANS-2 when ordering the next delivery of software updates. The order must be placed and SCANS-2 must dial in to the administrative module (AM) within 24 hours of the appearance of this message.

Application: 5,3B
Type: Output

1. FORMAT

IN REMOTE STOPPED a
[FILES MAY BE LOST]

2. REASON FOR OUTPUT

To report the reason for termination of the file receiving process.

3. VARIABLE FIELD DEFINITIONS

a = One of the following codes indicating the reason for termination:
   0 = Successful completion of the file transfer session.
   1 = Time limit to receive messages from the remote system has expired.
   2 = Unable to resynchronize messages with the remote sender.
   3 = Unable to resynchronize files with the remote sender.
   4 = Bad file sequence number.
   5 = Insufficient disk space to store incoming files.
   6 = Too many files interrupted.
   7 = An internal error occurred in the process.
   8 = The file receive process was terminated in response to the IN:REMOTE-STOP input message.
   9 = An I/O error occurred in writing a file to disk.
  10 = The remote sender aborted transmission.
  11 = The file receive process terminated for an unknown reason. This message is followed by the FILES MAY BE LOST output message indicating that the file receive session died in an unknown state.
  12 = A bad disconnect message was received from the sender.
  13 = The system message mkdir() failed.

4. ACTION TO BE TAKEN

Verify that all files have been received. If ‘a’ = 11, this message may be ignored if preceded by an IN:REMOTE-STOP or IN:REMOTE-ERROR output message.

5. ALARMS

Manual.

6. REFERENCES

[1] IN REMOTE WAITING

[2] IN REMOTE IN PROGRESS
FILES RECEIVED: a IN PROGRESS
ELAPSED TIME b SPACE REMAINING c [IN PROGRESS]
INODES REMAINING d [IN PROGRESS]
[e ERROR f [IN PROGRESS]]
[CREAT ERRNO = g]

2. REASON FOR OUTPUT

Format 1 reports that the file receive process is waiting for a session connect message from a remote sending site.

Format 2 reports totals for files successfully and unsuccessfully received from the Software Change Administration and Notification System (SCANS-2).

3. VARIABLE FIELD DEFINITIONS

a = Number of successfully received files.

b = Elapsed time in the form hours:minutes.

c = Number of blocks (512 bytes) remaining in the base directory on the receiving machine.

d = Number of inodes remaining in the base directory on the receiving machine.

e = Pathname of a file issued by the sending end which was not received by the file receive process.

f = Error code specifying the reason why the file was not received by the file receive process:
01 = Insufficient space on disk to store the file.
02 = File length exceeds the maximum length permitted (2,500,000 bytes).
03 = The pathname being processed matches that of a file already on disk.
04 = Could not create incoming file on disk.
05 = File transmission was interrupted.
06 = The system message mkdir() failed.

Note: If the system message creat() failed (‘f’ = 4), then ‘g’ is the value of errno set by creat(). For error definitions, refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

1. FORMAT

IN XFER  -  a
   b   [c]

2. REASON FOR OUTPUT

To respond to an IN:XFER input message. It reports the current state of the file transfer system.

3. VARIABLE FIELD DEFINITIONS

a = Status of file transfer system. Valid value(s):
   COMPLETED  = The file transfer session has stopped.
   IN PROGRESS = The file transfer session is running.

b = Additional status information. Valid value(s):
   DATA LINK ERRORS = The file transfer session was stopped due to errors from the data link.
   MANUALLY TERMINATED = The file transfer session was stopped by an IN:XFER input message with the STOP option.
   NO ERRORS = The file transfer session was stopped by the normal end of the session.
   NO PASSWORD = A session was attempted from the remote end but the IN:XFER START message was not entered.
   PASSWORD-NO GOOD = The file transfer session was stopped due to an incorrect password from the remote end.
   RECEIVING = A session is in progress and is currently receiving the file 'c'.
   RUNNING SHELL = A session is in progress and is currently executing shell messages.
   SENDING = A session is in progress and is currently sending the file 'c'.
   WAITING = A session is in progress and is currently waiting for the support computer to respond.

c = File name.

4. ACTION TO BE TAKEN

Inform the support person who requested the IN:XFER input message that this output message occurred.

   . . . . . . . . . . . . . . . . . . . . . . . . . .

[4] INH ALE u: TOTAL OF v SEGMENTS PRINTED

2. REASON FOR OUTPUT

To acknowledge the INH:ALE input message and indicate the status of automatic line evaluation (ALE) control parameters. The parameters reported in this message are grouped into two classes:

A = Switching module (SM) controls:

The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any of the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.

If the PER generation parameter is inhibited, then no PERs will be recorded for any integrated services digital network (ISDN) protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel determines if PERs are recorded for that channel.
= Line/trunk controls:

Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels, whether supported on lines or trunks. Only the PER generation control parameter may be manipulated by the INH:ALE input message. The level 1 parameters are manipulated using RC/V View 22.15 for performance monitoring groups. The level 1 parameters are reported for completeness.

The level 1 control parameters consist of an overall level 1 inhibit, hourly alert generation, daily alert generation, interval report generation, and daily report generation. If the overall level 1 inhibit is active, then all level 1 performance monitoring activities for the U-interface are disabled. If the hourly alert generation inhibit is active, then the reporting of hourly alerts to the receive-only printer (ROP) will be suppressed for the interface. If the daily alert generation inhibit is active, then the reporting of daily alerts to the ROP will be suppressed for the interface. If the interval report generation inhibit is active, then the interface will not contribute to the interval report, if applicable. If the daily report generation inhibit is active, then the interface will not contribute to the daily report, if applicable. One or more of the level 1 controls may be active. This information is only applicable to U-interface DSLs.

If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel.

Format 1 provides a status message for the progress of the inhibit request.

Format 2 acknowledges manipulation of the SM control parameters. Up to 24 SMs may be reported in a single message.

Format 3 acknowledges manipulation of the line/trunk control parameters. Up to 6 ISDN protocol channels may be reported in a single message.

Format 4 provides a completion message indicating the number of segments printed for the session.

2. REASON FOR OUTPUT

To acknowledge the INH:ALE input message and indicate the status of automatic line evaluation (ALE) control parameters. The parameters reported in this message are grouped into two classes:

(A) Switching module (SM) controls:

The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any of the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status
for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.

After the introduction of PCF on PHE2 feature, ALE doesn't provide performance monitoring error count information on A10/A11 protocols, but PER is able to provide the protocol error histories on A10/A11 protocols on PCF. There are two kind of PERs: level 2 and level 7. Level 2 PER retrieves the ethernet protocol frame error histories stored in the PH. Level 7 retrieves A10/A11 frame error histories stored in PH.

If the PER generation parameter is inhibited, then no PERs will be recorded for any ISDN protocol channels or PCF trunks on the SM. If the parameter is allowed, then the PER generation parameter for the individual integrated services digital network (ISDN) protocol channel or the individual PCF determines if PERs are recorded for that channel.

(B) Line/trunk controls:

Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels, whether supported on lines or trunks, as well as the PCF trunks. Only the PER generation control parameter may be manipulated by the INH:ALE input message. The level 1 parameters are manipulated using RC/V View 22.15 for performance monitoring groups. The level 1 parameters are reported for completeness.

The level 1 control parameters consist of an overall level 1 inhibit, hourly alert generation, daily alert generation, interval report generation, and daily report generation. If the overall level 1 inhibit is active, then all level 1 performance monitoring activities for the U-interface are disabled. If the hourly alert generation inhibit is active, then the reporting of hourly alerts to the ROP will be suppressed for the interface. If the daily alert generation inhibit is active, then the reporting of daily alerts to the ROP will be suppressed for the interface. If the interval report generation inhibit is active, then the interface will not contribute to the interval report, if applicable. If the daily report generation inhibit is active, then the interface will not contribute to the daily report, if applicable. One or more of the level 1 controls may be active. This information is only applicable to U-interface DSLs.

If the PER generation inhibit is active, then no PERs will be recorded for either the ISDN protocol channel and the PCF trunks.

Format 1 provides a status message for the progress of the inhibit request.

Format 2 acknowledges manipulation of the SM control parameters. Up to 24 SMs may be reported in a single message.

Format 3 acknowledges manipulation of the line/trunk control parameters. Up to 6 ISDN protocol channels may be reported in a single message.

Format 4 acknowledges manipulation of the PCF control parameters. Only 1 PCF PER may be reported in a single message.

Format 5 provides a completion message indicating the number of segments printed for the session.

3. VARIABLE FIELD DEFINITIONS

L1-PM = Level 1 protocol monitoring is inhibited for this SM.

NOT AVAILABLE = Inhibit status information cannot be obtained for this SM.

a = Status message. Valid value(s):
ABORTED-COMMUNICATION FAILURE = The current inhibit request was stopped because of
failures in inter-process message transmission.

**ABORTED-DATABASE ERROR** = The current inhibit request was stopped due to database access failure in the administrative module (AM).

**ABORTED-INVALID SM** = The requested SM was invalid.

**COMPLETED** = The inhibit request was completed.

**COMPLETED-NO DSLS EQUIPPED/ASSIGNED** = The SM to effect the PER generation inhibit does not have any ISDN protocol channels assigned.

**NOT STARTED-INVALID INPUT FOR PCF** = A single PCF PER generation allow request was made for a trunk member or a PSUEN.

**NOT STARTED-INVALID PORT** = A single ISDN protocol channel PER generation inhibit request was made for a non-existent channel.

**NOT STARTED-INVALID REQUEST** = A single ISDN protocol channel PER generation inhibit request was made where the channel option was specified in conjunction with a line identifier other than line card equipment number (LCEN) or line circuit equipment number (LCKEN).

**NOT STARTED-SM UNAVAILABLE** = A single ISDN protocol channel PER generation inhibit request was made where the channel was on an SM that was not fully operational.

**NOT STARTED-NON-PRIMARY DN SPECIFIED** = A PER generation inhibit request was made for a DN that was not a primary DN.

**NOT STARTED-NON-UNIQUE NXX DN** = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

Application: 5  
Type: Output

1. FORMAT

[1] INH ALM (BPSC a|MISC b|ESM) c [d]

[2] INH ALM RBPSC=e SM=f g c
   [h]

[3] INH ALM RAS SCPT=e SITE=i g c [j]

[4] INH ALM EAIU=f-k SCPT=e g c [l]

2. REASON FOR OUTPUT

To give a termination report of a request to inhibit alarm reporting on scan points. Format 1 is for alarms associated with input/output processor (IOP) scan points. Format 2 is for alarms assigned to remote switching modules (RSM), optical remote modules (ORM), or two-mile remote modules (TRM) which are equipped with metallic service unit (MSU) scan points and have the alarm input option on. Format 3 is for alarms assigned to remote alarm section (RAS) scan points. Format 4 is for alarms assigned to expansion access interface unit (EAIU) scan points.

3. VARIABLE FIELD DEFINITIONS

ESM = External sanity monitor.
SCPT = Scan point.
a = Building/power scan point (BPSC) number.
b = AM miscellaneous (MISC) scan point number.
c = Termination report. Valid value(s):
   ABORTED
   COMPLETED
   NOT STARTED

d = Explanation of termination report, if needed. Valid values include:
   INCONSISTENT DATA
   INVALID OPERATION
   NOT INHIBITABLE
   VALID WITH CM1 ONLY
   VALID WITH CM2 ONLY

e = Remote building/power scan point (RBPSC) number, RAS scan point number, or EAIU scan point number.
f = Switching module (SM) number.

A = Name of scan point.

h = Explanation of termination report for type RBPSC. Valid value(s):
ALARM PROCESS NOT ACTIVE = The switching module (SM) number specified does not have remote alarms associated with it.
BOTH MSU SG OOS = Both metallic service unit (MSU) service groups (SG) are out of service (OOS); however, the software copy of the inhibit state was changed, so when the service groups are put back into service, the point will be inhibited.
DATA BASE ERROR = A database error was found.
ONE MSU SG OOS = One metallic service unit (MSU) service group (SG) is out of service (OOS). The point was successfully inhibited in the active service group. The software copy of the inhibit state was changed in the other service group, so when it is put back into service, the point will be inhibited there also. If no explanation prints, then the requested inhibit was invoked. Both metallic service unit (MSU) service groups are in service.
POINT ALREADY INHIBITED = The point is already inhibited.
POINT NOT ASSIGNED = The point is shown as not in service in the database.
POINT OUT OF PERMITTED RANGE = The specified point is not within the range of the remote building/power group.
SOFTWARE FAILURE = A software failure error was found.

i = Remote peripheral site number.

j = Explanation of termination report for RAS.

<table>
<thead>
<tr>
<th>'c'</th>
<th>'j'</th>
</tr>
</thead>
</table>
| ABORTED | AUDIT IN PROGRESS = The remote alarm section (RAS) data is being verified, so the requested inhibit cannot be performed. Since the audit takes at most 2 minutes (at often completes much sooner), the inhibit request can be resubmitted in a short time.
| | POINT ALREADY INHIBITED = The point is already inhibited.
| | POINT NOT ASSIGNED = The point is shown as not in service in the database.
| COMPLETED | RAS ISOLATED FROM SM = The RAS did not acknowledge the SM's order. However, the SM's software copy of the allow state was changed, so when the RAS's data link digital subscriber line (DSL) returns to service, the point will be inhibited. If no explanation prints, then the requested allow was invoked. The RAS at the RISLU site acknowledged the request.

k = EAIU unit number.

l = Explanation of termination report for type EAIU (if needed). Valid value(s):
FAILED MASK UPDATE = Failed to write hardware inhibit/allow mask.
POINT ALREADY INHIBITED = Point is already inhibited.
POINT NOT ASSIGNED = Point is not assigned in the database.
POINT NOT IN USE = Point is shown as not in use in the database.
POINT OUT OF RANGE = Point is not within the range of valid scan points.

4. ACTION TO BE TAKEN

None.
5. ALARMS

None.

Software Release: 5E15 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

INH AUTOBKUP a
[b[, ERRNO = c]]

2. REASON FOR OUTPUT

To report the result of the INH:AUTOBKUP input message.

3. VARIABLE FIELD DEFINITIONS

a = Status. Valid value(s):
   ABORTED
   COMPLETED
   IN PROGRESS
   STARTED
   WARNING

b = Message. Valid value(s):
   AUTOMATED SYSTEM BACKUP IN PROGRESS, FUTURE BACKUPS WILL BE INHIBITED =
   Automated system backups are being inhibited while an automated system backup
   is currently in progress. The backup currently in progress will be allowed to
   complete. Future backup attempts will be inhibited.
   AUTOMATED SYSTEM BACKUPS ARE INHIBITED = Automated system backups are not allowed
   to execute as long as they are inhibited. If automated system backups need to be
   allowed, execute the ALW:AUTOBKUP input message.
   AUTOMATED SYSTEM BACKUPS ARE NOT INHIBITED = Automated system backups are allowed
   to execute since they are not inhibited. If automated system backups need to be
   inhibited, execute the INH:AUTOBKUP input message.
   FAILED TO CREATE INHIBIT BACKUP FILE = The inhibit backup file,
   /no5text/bkup/autobkup/.inhbkup, could not be created. Interpret the system error
   code.
   FAILED TO CREATE AUTOBKUP DIRECTORY = The system() system call failed to execute the
   UNIX® mkdir input message to create the /no5text/bkup/autobkup directory.

   Verify that the UNIX® mkdir process file exists and has execute permission.
   Execute the UNIX® mkdir input message manually to determine if the process is
   functioning properly.

   Manually create the /no5text/bkup/autobkup directory if it does not exist, and
   re-execute INH:AUTOBKUP.
   FAILED TO OPEN PIPE TO THE PS SHELL COMMAND = The popen() system call failed to
   execute the UNIX® ps input message. Verify that the UNIX® ps process file exists
   and has execute permission. Execute the UNIX® ps input message manually to
   determine if the process is functioning properly.
FAILED TO READ OUTPUT FROM PS SHELL COMMAND = An error occurred while attempting to read the output from the UNIX® ps input message which was executed by inh:autobkup. Execute the UNIX® ps input message manually to determine if the process is functioning properly. Interpret the system error code.

PS COMMAND TIMED OUT = The ps process, executed by inh:autobkup, took longer than the maximum time allowed to execute. Attempt to re-execute the inh:autobkup input message.

c = System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If an error message is output, refer to the message description in the VARIABLE FIELD DEFINITIONS section of this manual page. If the problem cannot be resolved, refer to the TECHNICAL ASSISTANCE portion of the Output Messages Manual INTRODUCTION section.

INH:DEBUG

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] INH DEBUG a SM{=b[&c]} d

[2] INH DEBUG a AM d

2. REASON FOR OUTPUT

To report the results of an INH:DEBUG input message.

Format 1 is for ALE, DIGITAL, METALLIC, METPTRACE, METALLMSG, METRESBLK, METSWBLK, METHWFAIL, METSUCCESS, and CCS7MTCE SM only cases.

Format 2 is for CCS7MTCE AM only cases.

3. VARIABLE FIELD DEFINITIONS

a = Feature with additional debugging messages. Valid value(s):
   ALE = Automatic line evaluation
   CCS7MTCE = Common channel signal maintenance activity.
   DIGITAL = Digital testing of lines (TST:DSL) and trunks (TST:TRK)
   METALLIC = Metallic path setup ASSERT and PTRACE messages with low-level unformatted information, not intended for general customer use.
   METPTRACE = Metallic related PTRACE messages.
   METALLMSG = Metallic path setup blockage and failure (REPT:METALLIC).
   METRESBLK = Metallic path setup resource blockage (REPT:METALLIC).
   METSWBLK = Metallic path setup software blockage (REPT:METALLIC).
   METHWFAIL = Metallic path setup hardware failure (REPT:METALLIC).
   METSUCCESS = Metallic path setup completed successfully (REPT:METALLIC).
   TSTPATH = Test path application (TST:PATH).

b = Switching module (SM) number or the lower limit of a range of SM numbers.

c = The upper limit of a range of SM numbers.

d = The result of the request. Valid value(s):
   COMPLETED = The debug messages were allowed on the specified SM(s).
   SM UNAVAILABLE = The request could not be completed because the specified SM(s) was/were not able to communicate with the administrative module (AM).
   SM UNEQUIPPED = The request could not be completed because the specified SM(s) did not exist.

4. ACTIONS TO BE TAKEN
When the report indicates SM UNAVAILABLE, retry the input request once the SM(s) becomes available. Otherwise no action is required.

5. ALARMS

None.

1. FORMAT

[1] INH DMQ COMPLETED

[2] INH DMQ CANNOT INHIBIT A MANUAL SOURCE a

[3] INH DMQ SOURCE ALL IS ALREADY INHIBITED

[4] INH DMQ TOO MANY ACTIVE INHIBITS

[5] INH DMQ CANNOT LCALL INHTIMER PROCESS a
   FOR INHIBIT ERRNO = b

2. REASON FOR OUTPUT

Format 1 reports MIRA has completed a request to inhibit a source of automatic maintenance requests.

Format 2 indicates MIRA does not inhibit manual source of maintenance requests a.

Format 3 indicates source ALL is already inhibited.

Format 4 reports there are too many active inhibits. Cannot inhibit any more.

Format 5 reports MIRA could not start inhibit timer for automatic maintenance request source a.

3. VARIABLE FIELD DEFINITIONS

a = Three-character name of the source specified in the INH:DMQ input message. ALL indicates all automatic maintenance requests are inhibited.

b = System error number returned for the failing system call. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

Use the OP:DMQ input message to determine which maintenance sources are inhibited.

For Formats 1 and 3, no action is required.

For Format 2, check syntax of source 'a'.

For Format 4, use ALW:DMQ to allow some of the inhibited sources and retry message.

For Format 5, retry the input message, if retry is unsuccessful an operating system function call is failing, obtain
technical assistance to clear the trouble.

__________________________________________________________________

[2] INH EAIINT a COMPLETED WITH c

__________________________________________________________________

[3] INH EAIINT a ABORTED  b

__________________________________________________________________

2. REASON FOR OUTPUT

To indicate the result of a request to inhibit emergency action interface (EAI) error interrupts on a specified 3B21D computer control unit (CU), or on both 3B21D computer CUs.

Note: The 3B20D computer CUs do not have EAI error interrupts.

Format 1 indicates successful completion.

Format 2 indicates successful completion with a message port problem.

Format 3 indicates an error.

3. VARIABLE FIELD DEFINITIONS

a = One of the following: CU 0, CU 1, or CU 0 AND CU 1.

b = Error code. Valid value(s):
   50 = Message could not be sent to a driver or real time status (RTS) report.
   51 = Equipment configuration database (ECD) access function completed unsuccessfully.
   52 = Error in message communication.
   53 = Error internal to the inhibit administrator.

c = Port problem. Valid value(s):
   AN INVALID SYSTEM PORT SPECIFIED
   AN INVALID SYSTEM PORT SPECIFIED FOR AIM (application integrity monitor)
   NO PROCESS ATTACHED TO THE SPECIFIED PORT
   NO PROCESS ATTACHED TO THE AIM PORT

4. ACTION TO BE TAKEN

For Format 1, no action is necessary.

For Format 2, if the process completes with a port problem, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
For Format 3, if an error was reported, use the OP:ERRCHK input message to find out the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a computer technical representative.

5. ALARMS

For Format 1, none. This report is a manually-requested report.

For Formats 2 and 3, none. This is an automatically-generated report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

    AUDIT RUNNING - RETRY LATER

[3] INH ECDAUD ABORTED - SYSTEM ERROR a

2. REASON FOR OUTPUT

To report the termination status of the INH:ECDAUD input message.

Format 1 indicates successful execution. No action is necessary.

Format 2 reports that the ECD Audit was running at the time. The audit will be allowed to complete. The inhibit command should be re-executed after the audit is done or the audit can be stopped with the STOP:ECDAUD input message.

Format 3 indicates that an internal error has occurred. Refer to variable 'a' for more information.

3. VARIABLE FIELD DEFINITIONS

a = System error number. Valid value(s):
1  = Cannot open audit rule file - /lla/ECDAUD/ecdaud.rules.
2  = Cannot attach to ECD database.
3  = Unable to kill running audit, check PID in /lla/ECDAUD/.ecdaud.pid.
4  = Bad rule in rule file (/lla/ECDAUD/ecdaud.rules).
5  = Unable to audit data (/lla/ECDAUD/ecdaud.rules).
6  = Failure in reading ECD database.
7  = Cannot open audit rule file - /lla/ECDAUD/hwchk.rules.
8  = Failed to obtain current status.
9  = Internal system error.
10 = Database partition greater than 80% full, remove unused files.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request of the INH:ECDAUD input message. No further action is necessary.

5. ALARMS

Minor if system error encountered.

   52 = An error in message communication.
   53 = An error internal to the inhibit administrator.

b = Port problems. Valid value(s):
   - An invalid system port specified.
   - An invalid system port specified for application integrity monitor (AIM).
   - No process attached to the specified port.
   - No process attached to the AIM port.

4. ACTION TO BE TAKEN

If an error was reported, use the OP:ERRCHK input message to find out the resulting status of administrative module (AM) inhibits. All error codes associated with this activity are significant and should be reported to an AM technical representative.

If the process completes with a port problem, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Software Release: 5E17(1) and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] INH EXTPM PSALNK=a-b-c
d[e]

[2] INH EXTPM PSALNK=a-b-c
EXTERNAL PM SESSIONS SUCCESSFULLY INHIBITED
SHARED FLOWS NOT DEACTIVATED FOR PM SESSION IDS
f f f f f f f f f f f f f f
f f f f f f f f f f f f f f
.
.
.

[3] INH EXTPM COMPLETED

2. REASON FOR OUTPUT

Format 1 indicates the status of the packet switch unit (PSU) asynchronous transfer mode (ATM) link (PSALNK) in response to an INH:EXTPM input message.

Format 2 indicates the INH:EXTPM request was successful for this PSALNK, but some external PM sessions are shared flows. The output will list all internal PM session IDs that are considered shared flows. These internal PM sessions must be deactivated before their corresponding external PM sessions can be deactivated.

Format 3 indicates the completion of the INH:EXTPM input message. This output is always printed after all target PSALNKs have reported (in either Format 1 or Format 2).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number of the target PSALNK.
b = PSU number of the target PSALNK.
c = Link number of the target PSALNK.
d = Status. Valid value(s):
EXTERNAL PM SESSIONS PREVIOUSLY INHIBITED = External performance monitoring (PM) sessions are already inhibited on this PSALNK.
EXTERNAL PM SESSIONS SUCCESSFULLY INHIBITED = External PM sessions were successfully inhibited on this PSALNK.
UNABLE TO SERVICE REQUEST - CORRUPT DATA ON THE PH = The request could not be serviced because the data on the PH is corrupt. This PSALNK allows external PM...
sessions.  
UNABLE TO SERVICE REQUEST – INVALID PH RESPONSE RECEIVED = The request could not be serviced because the response received was invalid.  
UNABLE TO SERVICE REQUEST – NO SM RESPONSE RECEIVED = The request could not be serviced because there was no response from the SM.  
UNABLE TO SERVICE REQUEST – SM UNAVAILABLE = The request could not be serviced because the SM was unavailable. 

e = Secondary status information. Valid value(s):  
ALL EXTERNAL PM SESSIONS DEACTIVATED = The request was successful and all external PM sessions on the PSALNK were deactivated.  
NO EXTERNAL PM SESSIONS TO DEACTIVATE = The request was successful, but there are no external PM sessions on the PSALNK to deactivate.  
SHARED FLOWS MAY EXIST = The request was successful, but shared flows may exist on the PSALNK. 

f = Internal PM session ID number as seen on RC/V View 22.31 (PSU TO PSU PERFORMANCE MONITORING SESSION).

4. ACTIONS TO BE TAKEN

For Format 1 outputs, if there is an indication that the request could not be serviced due to a problem with the SM, verify the current status of the SM. If there is an indication that the request could not be serviced due to a problem with the PH, verify the current status of the PH.

5. ALARMS

None.

2. REASON FOR OUTPUT

To output the results of executing an INH:FAC input request to inhibit reports of transmission facility 15-minute interval and daily performance monitoring count threshold crossings (REPT:FAC output messages) from being output.

Format 1 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by a digital facility interface (DFI) model 2 (DFI-2) facility. Format 2 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all DFI-2 facilities. Format 3 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all digital line and trunk unit (DLTU) model 2 (DLTU2) facilities. Format 4 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all facilities on an integrated digital carrier unit (IDCU). Format 5 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by a single IDCU.
facility (IFAC). Format 6 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all facilities an IDCU-supported or a digital networking unit - synchronous optical network (SONET) (DNU-S) supported TR303 remote terminal (RT). Format 7 appears after the INH:FAC input message was used to inhibit all threshold crossing alert output messages from being generated by all facilities on an switching module (SM). The individual facilities’ INH/ALW state is not changed by this command. Format 8 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all facilities on a DNU-S. Format 9 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated on a DNU-S SONET termination equipment (STE) facility number, and all the subtending virtual tributary 1.5 (VT1.5) and digital signal level-1 (DS1) facilities. Format 10 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated on a DNU-S VT1.5 facility and the subtending DS1 facility. Format 11 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated on a DNU-S DS1 facility.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = DLTU number.

c = DFI number.

d = Facility number.

e = Type of alerts inhibited. Valid value(s):

ALL = Both interval and daily alerts.

DAY = Daily alerts.

INT = 15-minute interval alerts.

f = Status of command. Valid value(s):

COMPLETED = Request has been successfully completed.

FAILED = Failed to inhibit performance monitoring alerts for the specified facility or unit. This may also mean the switch was able to inhibit the alert reports, but failed to send that information to the specified facility or unit. Retry the request later.

NO MATCH = The specified facility or unit does not exist. If the unit type selected was SM, then the NO MATCH means the SM is not equipped with any unit or facility.

NOT ALLOWED = The specified action is not allowed on the given facility or unit.

SM UNAVAILABLE = The input request could not be processed because communication with the SM is not possible.

SYSTEM BUSY = The system's processing capability has been reached or a system resource is unavailable. Retry the request later.

g = IDCU number.

h = IFAC number.

i = TR303 RT number.

j = DNU-S number.

k = Data group (DG) number.

l = STE facility number.
m = Synchronous transport signal (STS) facility number.
n = Virtual tributary group (VTG) number.
o = Virtual tributary member (VTM) number.

4. ACTIONS TO BE TAKEN

Retry INH:FAC input message when variable 'h' = SYSTEM BUSY or FAILED. Alerts can be re-allowed by using the ALW:FAC input messages. Alert thresholds can be changed by using RC/V View 8.1 for the entire office, 20.23 for IDCU, 20.25 for DNU-S, or 22.15 for DLTU.

5. ALARMS

None.

Format 1 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by a digital facility interface (DFI) model 2 (DFI-2) facility.

Format 2 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all DFI-2 facilities.

Format 3 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all digital line and trunk unit (DLTU) model 2 (DLTU2) facilities.

Format 4 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all facilities on an integrated digital carrier unit (IDCU).

Format 5 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by a single IDCU facility (IFAC).

Format 6 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all facilities an IDCU-supported or a digital networking unit - synchronous optical network (SONET) (DNU-S) supported TR303 remote terminal (RT).

Format 7 appears after the INH:FAC input message was used to inhibit all threshold crossing alert output messages from being generated by all facilities on an switching module (SM). The individual facilities' INH/ALW state is not changed by this command.

Format 8 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all facilities on a DNU-S.

Format 9 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated on a DNU-S SONET termination equipment (STE) facility number, and all the subtending virtual tributary 1.5 (VT1.5) and digital signal level-1 (DS1) facilities.

Format 10 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated on a DNU-S VT1.5 facility and the subtending DS1 facility.

Format 11 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated on a DNU-S DS1 facility.

Format 12 appears after the INH:FAC input message was used to allow threshold crossing alert output message generation for a given optical interface unit (OIU).

Format 13 appears after the INH:FAC input message was used to allow threshold crossing alert output message generation for a given optical carrier - level 3 (OC3).

Format 14 appears after the INH:FAC input message was used to allow threshold crossing alert output message generation for a given synchronous transport signal-level 1 (STS1).

Format 15 appears after the INH:FAC input message was used to allow threshold crossing alert output message generation for an OIU virtual tributary - level 1.5 (VT15).

Format 16 appears after the INH:FAC input message was used to allow threshold crossing alert output message generation for an OIU digital signal - level 1 (DS1).
3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = DLTU number.

c = DFI number.

d = Facility number.

e = Type of alerts inhibited. Valid value(s):
   ALL = Both interval and daily alerts.
   DAY = Daily alerts.
   INT = 15-minute interval alerts.

f = Status of command. Valid value(s):
   COMPLETED = Request has been successfully completed.
   FAILED = Failed to inhibit performance monitoring alerts for the specified facility or unit.
     This may also mean the switch was able to inhibit the alert reports, but failed to send that information to the specified facility or unit. Retry the request later.
   NO MATCH = The specified facility or unit does not exist. If the unit type selected was SM, then the NO MATCH means the SM is not equipped with any unit or facility.
   NOT ALLOWED = The specified action is not allowed on the given facility or unit.
   SM UNAVAILABLE = The input request could not be processed because communication with the SM is not possible.
   SYSTEM BUSY = The system’s processing capability has been reached or a system resource is unavailable. Retry the request later.

g = IDCU number.

h = IFAC number.

i = TR303 RT number.

j = DNU-S number.

k = Data group (DG) number.

l = STE facility number.

m = Synchronous transport signal (STS) facility number.

n = Virtual tributary group (VTG) number.

o = Virtual tributary member (VTM) number.

p = Optical interface unit (OIU) number.

q = Protection group (PG) number.

r = Optical carrier - level 3 (OC3) number.

s = STS - level 1 (STS-1) number.
4. ACTIONS TO BE TAKEN

Retry INH:FAC input message when variable ‘h’ = SYSTEM BUSY or FAILED. Alerts can be re-allowed by using the ALW:FAC input messages. Alert thresholds can be changed by using RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)] for the entire office, 20.23 [IDCU FACILITY EQUIPMENT (IFAC)] for IDCU, 20.25 [DNUS PERFORMANCE MONITORING - THRESHOLD GROUP (SM2000)] for DNU-S, or 22.15 (PERFORMANCE MONITORING - THRESHOLD GROUP) for DLTU.

2. REASON FOR OUTPUT

To output the results of executing an INH:FAC input request to inhibit reports of transmission facility 15-minute interval and daily performance monitoring count threshold crossings (REPT:FAC output messages) from being output.

Format 1 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by a digital facility interface (DFI) model 2 (DFI-2) facility.

Format 2 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all DFI-2 facilities.

Format 3 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all digital line and trunk unit (DLTU) model 2 (DLTU2) facilities.

Format 4 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all facilities on an integrated digital carrier unit (IDCU).

Format 5 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by a single IDCU facility (IFAC).

Format 6 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all facilities an IDCU-supported or a digital networking unit - synchronous optical network (SONET) (DNU-S) supported TR303 remote terminal (RT).

Format 7 appears after the INH:FAC input message was used to inhibit all threshold crossing alert output messages from being generated by all facilities on an switching module (SM). The individual facilities' INH/ALW state is not changed by this command.

Format 8 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated by all facilities on a DNU-S.

Format 9 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated on a DNU-S SONET termination equipment (STE) facility number, and all the subtending virtual tributary 1.5 (VT1.5) and digital signal level-1 (DS1) facilities.

Format 10 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated on a DNU-S VT1.5 facility and the subtending DS1 facility.

Format 11 appears after the INH:FAC input message was used to inhibit threshold crossing alert output messages from being generated on a DNU-S DS1 facility.
Format 12 appears after the INH:FAC input message was used to inhibit threshold crossing alert output message generation for a given optical interface unit (OIU).

Format 13 appears after the INH:FAC input message was used to inhibit threshold crossing alert output message generation for a given optical carrier - level 3 (OC3).

Format 14 appears after the INH:FAC input message was used to inhibit threshold crossing alert output message generation for a given synchronous transport signal-level 1 (STS1).

Format 15 appears after the INH:FAC input message was used to inhibit threshold crossing alert output message generation for an OIU virtual tributary - level 1.5 (VT15).

Format 16 appears after the INH:FAC input message was used to inhibit threshold crossing alert output message generation for an OIU digital signal - level 1 (DS1).

Format 17 appears after the INH:FAC input message was used to inhibit threshold crossing alert output message generation for a given optical carrier - level 3 concatenated (OC3C).

Format 18 appears after the INH:FAC input message was used to inhibit threshold crossing alert output message generation for a given synchronous transport signal-level 3 concatenated (STS3C).

Format 19 appears after the INH:FAC input message was used to inhibit threshold crossing alert output message generation for a given OIU PPP link (PPPLK).

Format 20 appears after the INH:FAC input message was used to inhibit threshold crossing alert output message generation for a all session initiation protocol (SIP) protocol handler (PH) on a specific packet switch unit (PSU).

Format 21 appears after the INH:FAC input message was used to inhibit threshold crossing alert output message generation for a specific SIP PH on a certain PSU.

3. VARIABLE FIELD DEFINITIONS

a  = SM number.
b  = DLTU number.
c  = DFI number.
d  = Facility number.
e  = Type of alerts inhibited. Valid value(s):
    ALL  = Both interval and daily alerts.
    DAY  = Daily alerts.
    INT  = 15-minute interval alerts.

f  = Status of command. Valid value(s):
    COMPLETED  = Request has been successfully completed.
    FAILED     = Failed to inhibit performance monitoring alerts for the specified facility or unit. This may also mean the switch was able to inhibit the alert reports, but failed to send that information to the specified facility or unit. Retry the request later.
    FAILED Ckt OOS = Failed to inhibit performance monitoring alerts because the specified circuit is out of service.
    NO MATCH  = The specified facility or unit does not exist. If the unit type selected was SM, then the NO MATCH means the SM is not equipped with any unit or facility.
NOT ALLOWED = The specified action is not allowed on the given facility or unit.
SM UNAVAILABLE = The input request could not be processed because communication with the SM is not possible.
SYSTEM BUSY = The system's processing capability has been reached or a system resource is unavailable. Retry the request later.

\[ g \] = IDCU number.
\[ h \] = IFAC number.
\[ i \] = TR303 RT number.
\[ j \] = DNU-S number.
\[ k \] = Data group (DG) number.
\[ l \] = STE facility number.
\[ m \] = Synchronous transport signal (STS) facility number.
\[ n \] = Virtual tributary group (VTG) number.
\[ o \] = Virtual tributary member (VTM) number.
\[ p \] = Optical interface unit (OIU) number.
\[ q \] = Protection group (PG) number.
\[ r \] = Optical carrier - level 3 (OC3) number.
\[ s \] = STS - level 1 (STS-1) number.
\[ t \] = Virtual tributary - level 1.5 group (VTGRP) number.
\[ u \] = Virtual tributary - level 1.5 member (VTMEM) number.
\[ v \] = OC3C number.
\[ w \] = STS3C number.
\[ x \] = PSU number.
\[ y \] = PSU shelf (PSUSHLF) number.
\[ z \] = PSU protocol handler (PSURELPH) number.

4. ACTIONS TO BE TAKEN

Retry INH:FAC input message when variable 'h' = SYSTEM BUSY or FAILED. Alerts can be re-allowed by using the ALW:FAC input messages. Alert thresholds can be changed by using RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)] for the entire office, 20.23 [IDCU FACILITY EQUIPMENT (IFAC)] for IDCU, 20.25 [DNUS PERFORMANCE MONITORING - THRESHOLD GROUP (SM2000)] for DNU-S, 20.32 [PERFORMANCE MONITORING THRESHOLD GROUP] for OIU or SIP PSUPH, or 22.15 [PERFORMANCE MONITORING - THRESHOLD GROUP] for DLTU.

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5  
**Type:** Output

1. **FORMAT**

```
INH HDWCHK CDFI=a-b-c d [e]
```

2. **REASON FOR OUTPUT**

To indicate the result of an INH:HDWCHK-CDFI input message to inhibit interrupts on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.

3. **VARIABLE FIELD DEFINITIONS**

   a  = Switching module (SM) number.
   b  = Digital line and trunk unit (DLTU) number.
   c  = CDFI number.
   d  = Termination report. Valid value(s):
       ABORTED  = Requested action was terminated before completion, and the termination was not graceful.
       COMPLETED = Request has successfully completed.
       NOT STARTED = Requested action had not begun.
       STOPPED  = Requested action was terminated before a normal completion. Termination was graceful.

   e  = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. **ACTION TO BE TAKEN**

None.

5. **ALARMS**

None.

6. **REFERENCES**

INH:HDW-CDI

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5  
**Type:** Output

1. **FORMAT**

\[
\text{INH HDWCHK CDI}=a-b-c \ d \ [e]
\]

2. **REASON FOR OUTPUT**

To report the result of executing an INH:HDW-CDI input message to inhibit hardware error checks on the control data interface (CDI).

3. **VARIABLE FIELD DEFINITIONS**

- **a** = Switching module number.
- **b** = Trunk unit number.
- **c** = Service group number.
- **d** = Termination status. Valid value(s):
  - **ABORTED** = Immediate termination.
  - **COMPLETED** = Successful completion.
  - **COMPLETED CERTIFIED** = Successful completion. Independent certification of resulting hardware status is made.
  - **NOT STARTED** = Action has not begun.
  - **STOPPED** = Terminated before normal completion.
- **e** = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

**Output Appendix(es):**

APP:MAINT-RESP
INH:HDW-CLNK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

INH HDWCHK CLNK{=a-b-c-d|ALL} e [f]

2. REASON FOR OUTPUT

To report on an attempt to inhibit level 2; and level 3; hardware checks (errors) on one or all communication links (CLNKs). Refer to the Corrective Maintenance manual for an explanation of level 2; and level 3; errors.

3. VARIABLE FIELD DEFINITIONS

ALL = Attempt was to inhibit errors on all CLNKs.

a = Switching module (SM) number.

b = Office network and timing complex (ONTC) side.

c = Module message processor (MMP) type. Valid value(s):
   0 = Alpha.
   1 = Beta.

d = Message switch (MSGS) side.

e = Termination report. Valid value(s):
   ABORTED = The requested action was terminated abnormally. Hardware and software status is questionable.
   COMPLETED = Completed normally.
   NOT STARTED = Requested action not attempted.
   STOPPED = Requested action was terminated normally before completion. Hardware and software status is consistent.

f = Optional additional qualifying data.

4. ACTION TO BE TAKEN

Refer to the Corrective Maintenance manual.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

INH:HDW–CLNK
Other Manual(s):
235-105-220  Corrective Maintenance
INH:HDW-CM

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

INH HDWCHK CM a [b]

2. REASON FOR OUTPUT

To acknowledge a manual request from the INH:HDW-CM input message to inhibit hardware error checks on all communication module (CM) units. This includes the message switch control unit (MSCU) (for communication module model 2; hardware only), foundation peripheral controller (FPC), pump peripheral controller (PPC), module message processor (MMP), office network and timing complex (ONTC), and communication links (CLNKs).

3. VARIABLE FIELD DEFINITIONS

a = Termination report. Valid value(s):
   COMPLETED = Request completed successfully.
   STOPPED = Request was terminated before a normal completion. Variable 'b' will be printed to explain why the request was stopped.

b = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the variable 'b' should give some indication as to why the request failed.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

ALW:HDW-CM

INH:HDW-CMP

Software Release: 5E14 and later
Message Class: MSGS
Application: 5
Type: Output

1. FORMAT

INH HDWCHK CMP=a-b c [d]

2. REASON FOR OUTPUT

To report the results of a request to inhibit hardware error checks on the specified communication module processor (CMP).

3. VARIABLE FIELD DEFINITIONS

a = Message switch side number.
b = CMP number.
c = Termination status. Valid value(s):
   ABORTED = The requested action was terminated before a normal completion and the termination was not graceful.
   COMPLETED = Request completed successfully.
   NOT STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion. The termination was graceful.
d = Additional data qualifying the report status.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the System Recovery Procedures manual.

5. ALARMS

None.

186x (IDCU CIRCUIT)
INH:HDW-IFAC

Software Release: 5E14 and later
Message Class: SMCONFG
Application: 5
Type: Output

1. FORMAT

INH HDWCHK IFAC=a-b-c d [e]

2. REASON FOR OUTPUT

To report the result of an INH:HDW-IFAC input message that prevents error sources on an integrated digital carrier unit (IDCU) facility (IFAC) circuit.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = IDCU number.
c = IFAC number.
d = Termination report. Valid value(s):
   ABORTED = Immediate termination. A process has been purged and cleanup will be done by audits.
   COMPLETED = Requested action was successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
e = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

d = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

No action is necessary if the request completed successfully. If the request failed, the variable ‘d’ should give some indication as to why the request failed. Check network clock Master Control Center (MCC) pages or the OP:CFGSTAT output message to verify that the NC was in a valid state to perform the request. Also, check the receive-only printer (ROP) for error messages, using the REPT:NC output messages that may indicate problems or system reconfigurations.

5. ALARMS

None.

INH:HDW-SM

Software Release: 5E14 and later
Message Class: INT
Application: 5
Type: Output

1. FORMAT

INH HDWCHK SM=a COMPLETED

2. REASON FOR OUTPUT

To report that all hardware error checks have been inhibited on the specified switching module (SM). This message may be printed automatically, or as a result of the INH:HDW-SM input message.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

4. ACTION TO BE TAKEN

If this message is in response to an input message, proceed in accordance with local practice.

If this message was generated automatically, it will be accompanied by output from a full initialization. Analyze and resolve the problems that led to the full initialization. After the problem is resolved, use input message ALW:HDW-SM to allow all the hardware error checks.

Note: When all hardware checks are inhibited, allowing each error source individually will not clear the MCC indicator. To clear the indicator use input message ALW:HDW-SM.

[4] INH HDWCHK NOT STARTED
   INVALID ID FIELD

2. REASON FOR OUTPUT
To indicate the result of a request to inhibit administrative module (AM) hardware checks.

3. VARIABLE FIELD DEFINITIONS

a = Error codes. Valid value(s):
   50 = A message could not be sent to a driver or real time status report (RTS).
   51 = An equipment configuration database (ECD) access function completed unsuccessfully.
   52 = An error in message communication.
   53 = An error internal to the inhibit administrator.

b = Port problems. Valid value(s):
   - An invalid system port specified.
   - An invalid system port specified for application integrity monitor (AIM).
   - No process attached to the specified port.
   - No process attached to the AIM port.

4. ACTION TO BE TAKEN
If an error was reported, use the OP:ERRCHK input message to find out the resulting status of AM inhibits. All error codes associated with this activity are significant and should be reported to an AM technical representative.

If the process completes with a port problem, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

[2] INH PM SESTYPE = a  
   
   d  

2. REASON FOR OUTPUT

To acknowledge the INH:PM input message indicating the status of parameters.

Format 1 provides a status message for the progress of the inhibit request.

Format 2 provides the error message for the inhibit request.

3. VARIABLE FIELD DEFINITIONS

a = Session type. Valid value(s):
   ATMPP = Packet pipe.
   ATMPSU = ATM PSU-PSU.

b = Status message. Valid value(s):
   AM TIMED OUT ON PH RESPONSE FOR SESSIONS = PH that has session provisioned did not respond to inhibit request.
   DEACTIVATION COMPLETE FOR SESSIONS = Deactivation of requested performance monitoring session(s) has completed successfully.
   DEACTIVATION FAILURE FOR SESSIONS = Deactivation of requested performance monitoring session(s) has failed.
   DEACTIVATION TIMED OUT FOR SESSIONS = Timeout waiting for deactivation of performance monitoring session(s).
   SESSIONS ALREADY INHIBITED = The requested performance monitoring session(s) are already inhibited.

c = Session IDs. There is a maximum of 105 sessions in the message.

d = Error message. Valid value(s):
COMPLETED = Request has completed.
DATABASE ERROR = A database error has occurred while processing allow command.
EXCEEDED ALLOWED BLOCK LIMIT = PM session has exceeded allowed block limit.
NO SESSION DEFINED = Requested performance monitoring session has not been defined using RC/V View 22.31 (PSU TO PSU PERFORMANCE MONITORING SESSION).
REACHED END OF PM RELATIONS = Reached end of performance monitoring session relation and session not found.

2. REASON FOR OUTPUT

To report the results of an INH:RBPSC-SM input message, which inhibits a remote building or miscellaneous alarm scan point.

3. VARIABLE FIELD DEFINITIONS

a = Scan point number in bldg/misc group as shown on the Master Control Center (MCC) remote alarms page.
b = Module number.
c = Name of scan point.
d = Termination report. Valid value(s):
   ABORTED
   REMOTE ALARM PROCESS NOT ACTIVE IN DESIGNATED MODULE The switching module (SM) number specified does not have remote alarms associated with it.
   POINT OUT OF RANGE The specified point is not within the range of the bldg/misc group (2-31).
   POINT NOT ASSIGNED The point is shown as not in service in the data base.
   POINT ALREADY INHIBITED The point is already inhibited.
   COMPLETED
   NO EXPLANATION The requested inhibit was invoked, both metallic service unit (MSU) service groups are in service.
   ONE MSU SG OOS One MSU service group (SG) is out of service (OOS). The point was successfully inhibited in the active service group. The software copy of the inhibit state was changed in the other service group, so when it is put back into service, the point will be inhibited there also.
   BOTH MSU SERVICE GROUPS OOS Both MSU service groups are OOS; however, the software copy of the inhibit state was changed, so when the service groups are put back into service, the point will be inhibited.

  e = Explanation of termination report. Valid value(s):

For ABORTED:
   REMOTE ALARM PROCESS NOT ACTIVE IN DESIGNATED MODULE The switching module (SM) number specified does not have remote alarms associated with it.
   POINT OUT OF RANGE The specified point is not within the range of the bldg/misc group (2-31).
   POINT NOT ASSIGNED The point is shown as not in service in the data base.
   POINT ALREADY INHIBITED The point is already inhibited.
For COMPLETED:

NO EXPLANATION The requested inhibit was invoked, both metallic service unit (MSU) service groups are in service.

ONE MSU SG OOS One MSU service group (SG) is out-of-service (OOS). The point was successfully inhibited in the active service group. The software copy of the inhibit state was changed in the other service group, so when it is put back into service, the point will be inhibited there also.

BOTH MSU SERVICE GROUPS OOS Both MSU service groups are OOS; however, the software copy of the inhibit state was changed, so when the service groups are put back into service, the point will be inhibited.

INH:SCSD

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] INH SCSD UNIT a PT b[bbbbbbb] f

[2] INH SCSD GRPN c DUPID d PT e[eeeee] f
INH SCSD NOT STARTED

[3] INH SCSD NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS

2. REASON FOR OUTPUT

To indicate whether a scan point was disabled as a result of executing an INH:SCSD input message. This prevents the reporting of a scan point’s transitions.

Format 1 is used when a scan point is identified by physical location.

Format 2 is used when a scan point is identified by logical address.

Format 3 indicates the scanner and signal distributor (SCSD) administration process is not active. No communication with SCSD points is possible.

3. VARIABLE FIELD DEFINITIONS

a = Member number of SCSD unit.
b = Physical scan point number on an SCSD.
c = Name of the logical group.
d = Duplex group ID.
e = Number of a point within a logical group.
f = Termination status. Valid value(s):
    COMPLETED  = Action completed.
    FAILED     = Action could not be completed by the SCSD Administrator. Possible reasons for failure are:
                 - SCSD unit number is invalid. - Point number is invalid for the logical group. - Logical group name is invalid and either the SCSD unit is out-of-service (OOS), or is in an inactive state to the SCSD Administrator.

4. ACTION TO BE TAKEN
Issue the OP:OOS input message to determine if the SCSD unit is listed as OOS. Otherwise, enter recent change and verify (RCV) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the above results are negative, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

[1] INH SFTCHK COMPLETED

[2] INH ERRCHK COMPLETED WITH b

[3] INH SFTCHK ABORTED a

[4] INH SFTCHK NOT STARTED
   INVALID ID FIELD

2. REASON FOR OUTPUT

To indicate the result of a request to inhibit administrative module (AM) software checks.

3. VARIABLE FIELD DEFINITIONS

a  = Error code. Valid value(s):
   50 = A message could not be sent to a driver or real time status report (RTS).
   51 = An equipment configuration database (ECD) access function completed
        unsuccessfully.
   52 = An error in message communication.
   53 = An error internal to the inhibit administrator.

b  = Port problem. Valid value(s):
   -  An invalid system port specified.
   -  An invalid system port specified for application integrity monitor (AIM).
   -  No process attached to the specified port.
   -  No process attached to the AIM port.

4. ACTION TO BE TAKEN

If an error was reported, use the OP:ERRCHK input message to find out the resulting status of AM inhibits. All error
codes associated with this activity are significant and should be reported to an AM technical representative.

If the process completes with a port problem, refer to the TECHNICAL ASSISTANCE portion of the
INTRODUCTION section of the Output Messages manual.

5. ALARMS

   - COMPL = The request was successfully completed.
   - ABT = The request was terminated before completion, and the termination was complete.
   - STOPPED = The request was terminated before normal completion.

b = Termination status.

SET: TRACE

Output Message(s):

ALW: TRACE
OP: TRACE
REPT: TRACE
SET: TRACE
INH:TRAP

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] INH TRAP
   MTRP: INH TRAP ID ALL COMPL; NO ACT TRAP

[2] INH TRAP
   MTRP: INH TRAP ID ALL COMPL; ID(S) = a[a[a]]

[3] INH TRAP
   MTRP: INH TRAP ID ALL FAILED; b

[4] INH TRAP
   MTRP: INH TRAP ID COMPL; ID = a

[5] INH TRAP
   MTRP: INH TRAP ID FAILED;{b|c}; ID = a

2. REASON FOR OUTPUT

This output message is in response to an INH:TRAP input message.

Format 1 is printed when ID ALL is specified and there are no active traps in the message trap system.

Format 2 is printed when ID ALL is specified and there is one or more active traps to be inhibited. A list of the trap IDs that have been inhibited will be displayed.

Format 3 is printed when ID ALL is specified and there is one or more active traps to be inhibited. However, the processing of the INH:TRAP input message has failed due to the reason being printed.

Format 4 prints for the traps that have been successfully inhibited. When one or a list of trap IDs is given, each trap specified will be inhibited in the given order. One message per trap ID inhibited will be printed.

Format 5 is printed when the processing of a trap has failed due to the reason being printed. When one or a list of trap IDs is given, each trap specified will be inhibited in the given order. One message per ID failed will be printed.

3. VARIABLE FIELD DEFINITIONS

a = Trap identification number.
b = Reason INH:TRAP input message failed (internal error condition). Valid value(s):
   CAN'T GET INDEX
   NO TRAP INHIBITED
   INVALID TRAP STATE
c = Reason INH:TRAP input message failed. Valid value(s):
    NOT ACT TRAP = Can only inhibit active traps.
    INVALID ID = ID does not belong to any trap.

4. ACTION TO BE TAKEN

For Formats 1, 2, and 4, none.

For Format 3, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 5, if any of the reasons in variable 'b' are printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. The reasons in variable 'c' are self-explanatory. Correct the error and try again.

5. ALARMS

None.

235-190-120 Common Channel Signaling Services
INH:TRFC30-TG

Software Release: 5E14 and later
Message Class: TRFM
Application: 5
Type: Output

1. FORMAT

INH TRFC30 TG CHANGE
   TRUNK GROUPS ALLOWED:   a       b       c       d       e
   INVALID TRUNK GROUPS:   f       g       h       i       j
   ALLOWED TRUNK GROUP COUNT:      k       (LIMIT = 5)

2. REASON FOR OUTPUT

To respond to an INH:TRFC30 input message request to inhibit the output of up to five trunk groups when one or more of the trunk group identifiers requested is invalid.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a-e = Trunk group identifiers currently allowed for output.
f-j = Invalid trunk group identifiers requested.
k = Current number of trunk groups allowed for output.

4. ACTION TO BE TAKEN

A trunk group can be inhibited for output again if it was flagged as invalid because of a typing error.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

1. FORMAT

INH TRFC30 a b
ELEMENTS ALLOWED:
c[d][e][f]
. . .
. . .
. . .

INVALID ELEMENTS:
c[d][e][f]
. . .
. . .
. . .

ALLOWED ELEMENT COUNT: g (LIMIT = h)

2. REASON FOR OUTPUT

To respond to a request to inhibit for collection (CLCT) or for output to the receive-only printer (ROP) a 30-minute traffic report (TRFC30) section that requires group identifiers. Refer to the APP:TRFC-SECTION input appendix in the Appendixes section of the Input Messages manual to indicate which sections require identifiers.

Some sections require single identifiers (for example, trunk group number) while other sections require multiple identifiers (for example, switching module (SM), protocol handler, and shelf numbers).

Each line of output represents one element (for example, unit or group) identified by one or multiple identifiers.

3. VARIABLE FIELD DEFINITIONS

a = Section name. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

b = Status of the section following the INH request. Valid value(s):
ALLOWED = Some elements remain allowed. The section is allowed.
INHIBITED = All elements are inhibited. The section is inhibited.

c-f = Element identifier. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

g = Number of elements allowed.

h = Maximum number of elements allowable for this section.

4. ACTION TO BE TAKEN

None.

Other Manual(s):

235-070-100 Administration and Engineering Guidelines
INH:UEM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

INH UMEM a WAS b NOW c #d

2. REASON FOR OUTPUT

To report that the transfer trace entered the STOPPED state either as the result of an INH:UEM input message or the STOP FULL directive of the INIT:UEM input message. The two cases can be distinguished by the 'priority of action' field which will be either 'M' or 'A', respectively.

3. VARIABLE FIELD DEFINITIONS

a  = Status of the operation. Valid value(s):
   COMPLETED = The trace has stopped monitoring the flow of execution.
   NOT STARTED = The operation was ignored because the trace was not running.
   STOPPED UCERR = The utility circuit either does not respond or does not match the circuit present when the trace was defined.

b  = State of the trace before the operation was attempted. Valid value(s):
   DUMPED = The trace was not running and its data had already been dumped.
   NEW = The trace was not running and did not have data.
   RUNNING = The trace was collecting data.
   STOPPED = The trace was not running and did have data.
   UNDEF = No trace was defined.

c  = State of the trace after the operation was attempted. Valid value(s):
   DUMPED = The trace is not running and its data had already been dumped.
   NEW = The trace is not running and does not contain data.
   STOPPED = The trace is stopped and does contain data.
   UNDEF = No trace is defined.

d  = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If 'a' is STOPPED UCERR check the utility circuit hardware. After it is fixed, use the INIT:UC input message to reinitialize the circuit.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Application: 5,3B
Type: Output

1. FORMAT

INH UTIL a #b

2. REASON FOR OUTPUT

To indicate the disposition of an INH:UTIL input message or report generic access package (GRASP) dynamic time overload.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):

COMPLETED = The action associated with breakpoints will not be executed when the breakpoint conditions occur.
COMPLETED EAI = All defined breakpoints were inhibited by a request from AIM.
COMPLETED OVERLOAD = All defined breakpoints were automatically inhibited because of GRASP overload (due to breakpoints or trace processing). This message will appear when an overload condition occurs, even if no breakpoints are currently defined.
STOPPED UCERR = The operation was completed successfully for software breakpoints but the utility circuit either does not respond or does not match the circuit present when the hardware breakpoints were defined.

b = GRASP execution sequence number.

38. INIT
INIT:AM-LVL-A
Software Release: 5E14 - 5E16(1)
Message Class: ASRT, INT
Application: 5
Type: Output

1. FORMAT

INIT AM LVL=a  b  c EVENT=d  e
SW-ERR FAIL-ADDR=[f] AM-MODE=g CU=h TIME=ii:ii.i
PROCESS: OSDS=j,k CALL-INTJ=l DMERT=m EVENT-FLAGS=[n]
FCODE=o REQ-PROC=p HDW-LVL=q [OOS-HDW-RESTORED]   SPP-COUNTS=s,t
[u] [v]

2. REASON FOR OUTPUT

To indicate that a software stimulus occurred that resulted in a software recovery action in the administrative module (AM).

The ASRT message class is used for defensive check failure errors, otherwise the INT message class is used.

3. VARIABLE FIELD DEFINITIONS

OOS-HDW-RESTORED = Hardware was returned to service as a part of the level of initialization.

a = Level of AM initialization begun. Valid value(s):
FI = Full initialization.
FPI = Full process initialization.
RPI = Return to point of interrupt.
SI = Selective initialization.
SPP = Single process purge.
UNK = Unknown level of initialization.

b = Name of the application kernel, supervisor, or user process in which this recovery was triggered.
Refer to the APP:ENVIR appendix in the Appendixes section of the Output Messages manual for a list of environments and their definitions.

c = Triggering event type. Valid value(s):
ACTIVITY-FAIL = Lack of activity in the operational kernel process (OKP).
APPL-SW-ERROR = Application software error.
BAD-ALIGN-MEM-REF = Bad alignment was found during a memory reference.
BAD-OST-PARAM = Illegal operating system trap (OST) parameter.
CONFIG-MGR-LIMP-MODE(-C|-D) = Configuration manager limp mode.
CONFIG-MGR-RMV-REQ(-A|-B) = Configuration manager removed request.
CONFIG-MGR-INIT-REQ-I = Configuration manager initialization request.
DCF-DEFERRED-SPP = A specified non-running process was purged by an ASSERT-C.
DEF-CHK-FAIL=n = Defensive check failure (assert) error followed by the software error code ('n').
Refer to the Assert manual for specific code information.
DUPLEX-DIO = Direct memory access I/O bus (DIO) state is duplex.
FAULT-CONFIG-MGR-RMV = Configuration manager remove under fault conditions.
FLT-ADDR-ERR-PIO = Addressing error in peripheral I/O (PIO) in progress. No message
associated with fault.
FLT-ADDR-KP-DMA = Direct memory access (DMA) addressing fault for DMA I/O.
FLT-CRAFT-INIT = Craft initialization fault.
FLT-DEV-REPT-DMA = Device reported error for DMA I/O.
FLT-DEV-REPT-KP-PIO = Device reported error for peripheral I/O (PIO).
FLT-DEV-REPT-PIO = Device reported error PIO. No message associated with fault.
FLT-MSG-BUF-AU-NON-QUEUED = Message buffer audit for nonqueued error messages.
FLT-MSG-BUF-AU-QUEUED = Message buffer audit for queued error messages.
FLT-PIC-KP-DMA = Peripheral interface controller (PIC) fault for DMA I/O.
FLT-PIC-KP-PIO = PIC fault for peripheral I/O.
FLT-PIC-PIO = PIC implicated with PIO in progress. No message associated with fault.
FLT-PROC-KP-DMA = Processor fault for DMA I/O.
FLT-PROC-KP-PIO = Processor fault for peripheral I/O.
FROM-AUDIT = The stimulus for this initialization was from errors discovered by the ‘name’ audit.
Refer to the APP:AUDITS appendix in the Audits manual for a list of audit names, or to the Audits manual for more detail.
FULL-DISK-LIMP-DIO = DIO state is full disk limp mode.
FULL-INITIALIZATION = Processor-wide full initialization.
INVALID-OPCODE = Invalid opcode.
INVLD-PAGE-TBL-ENT = Invalid entry in the page table.
INVLD-SEG-TBL-ENTRY = Invalid entry in the page table.
MANUAL-REQ = A user initiated initialization request.
NON-CORR-PARITY-ERR = Noncorrectable memory parity error.
PG-INDX-OUT-OF-RANGE = Out-of-range page index.
PRIV-INSTRUCTION = Illegal attempt to execute privileged instruction.
PROCESSOR-RCVY = Software recovery and initialization.
RCVY-SW-COMPL = Recovery switch of processors is complete.
ROUTINE-RMV = Configuration manager manual automatic diagnostic process or routine remove.
ROUTINE-SOFT-SWITCH = Routine soft switch.
SEGINDX-OUTOF-RANGE = Out-of-range segment index.
SIMPLEX-DIO = DIO state is simplex.
SOFT-SW-COMPL = Soft switch is complete.
SOFT-SWITCH-REQ = Request that a soft switch be done.
STACK-OVERFLOW = Overflow of the process stack.
STACK-SWITCH = Illegal stack manipulation.
SYS-INIT-CRIT = System initialization critical.
SYS-INIT-NON-CRIT = System initialization non-critical.
UNCOND-RMV = Unconditional removal.
UNKNOWN = Unknown event type.
WRITE-PROT-VIOL = Write protect violation.

d = Event number.

e = Termination report. Valid value(s):
ABORTED = The job did not complete before being interrupted.
COMPLETED = The indicated or requested action has completed.

f = Virtual address at the time of the triggered event.

g = Administrative module mode of operation. Valid value(s):
ESSENTIAL = All essential jobs operational.
<table>
<thead>
<tr>
<th>MIN-MODE</th>
<th>= Automatic recovery disabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>= Normal operation.</td>
</tr>
<tr>
<td>POST_RCVY</td>
<td>= Post recovery.</td>
</tr>
<tr>
<td>SW-RCVY</td>
<td>= Start of software initialization.</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>= Mode unknown.</td>
</tr>
</tbody>
</table>

h = The side on which the stimulus occurred.

i = Time the triggering event occurred, in the form minutes:seconds.tenths of second.

j = Process number of the running operating system for distributed switching (OSDS) process.

k = Uniqueness field of the running OSDS process.

l = Operational kernel process (OKP) interject work. Valid value(s):

- AMA = Automatic message accounting.
- AML = Automatic maintenance limit.
- BASE = Communication package.
- BCST = Message broadcast.
- CLFR = Communication link fault recovery.
- CCS = Common channel signaling.
- CTST = Communication test processing.
- DD = Data delivery.
- INTMON = Integrity monitor.
- NONE = Interject was not running.
- PC = Peripheral network control.
- PR = Packet routing.
- PS = Packet switching.
- QLFR = Quad-link fault recovery.
- RTA = Routing and terminal allocation.
- TIME = Operating System time synchronization.

m = Process ID of AM process in which the event occurred.

n = Hex string indicating the events pending for this kernel process at the time of the software fault.

o = The AM fault code that initiated recovery action in SIkfault.

p = The number of the process in switch maintenance kernel process (SMKP) that requested a demand single process purge of the process in SMKP that is indicated in the PID field above.

q = The hardware level of initialization being performed.

s = The number of single process purge jobs that would be equivalent to the amount of call processing real time being taken by audits.

t = The number of single process purges that have occurred.

u = For defensive check failure errors, the audit that was scheduled. Valid value(s):

- `AUD-SCHED=name` = The 'name' audit was scheduled. Refer to the Audit manuals for more detailed information or the APP:AUDITS appendix in the Audits manual for a list of audit names.
NO-AUD-SCHED = No audit was scheduled from this error.

\[ \text{v} \] = Mode in which audit is being run. Valid value(s):
- DEM-MODE = Demand or nonsegmented mode, takes no real time breaks.
- ELEV-MODE = Elevated audit execution mode.
- ROUT-MODE = Routine audit execution mode.

4. ACTION TO BE TAKEN

Monitor the progress of the software recovery. Initiate the appropriate manual actions if the recovery does not proceed as expected.

5. ALARMS

None.

The ASRT message class is used for defensive check failure errors, otherwise the INT message class is used.

3. VARIABLE FIELD DEFINITIONS

OOS-HDW-RESTORED = Hardware was returned to service as a part of the level of initialization.

a
   = Level of AM initialization begun. Valid value(s):
     FI = Full initialization.
     FPI = Full process initialization.
     RPI = Return to point of interrupt.
     SI = Selective initialization.
     SPP = Single process purge.
     UNK = Unknown level of initialization.

b = Name of the application kernel, supervisor, or user process in which this recovery was triggered. Refer to the APP:ENVIR appendix in the Appendixes section of the Output Messages manual for a list of environments and their definitions.

c
   = Triggering event type. Valid value(s):
     ACTIVITY-FAILURE = Lack of activity in the operational kernel process (OKP).
     APPL-SW-ERROR = Application software error.
     BAD-ALIGN-MEM-REF = Bad alignment was found during a memory reference.
     BAD-OST-PARAM = Illegal operating system trap (OST) parameter.
     CONFIG-MGR-LIMP-MODE{-C|-D} = Configuration manager limp mode.
     CONFIG-MGR-RMV-REQ{-A|-B} = Configuration manager removed request.
     CONFIG-MGR-INIT-REQ-I = Configuration manager initialization request.
     DCF-DEFERRED-SPP = A specified non-running process was purged by an ASSERT-C.
     DEF-CHK-FAIL=error-code,error-name = Defensive check failure (Assert) error followed by the software error code and error name. Refer to the Assert manual for specific code information.
     DUPLEX-DIO = Direct memory access I/O bus (DIO) state is duplex.
     FAULT-CONFIG-MGR-RMV = Configuration manager remove under fault conditions.
     FLT-ADDR-ERR-PIO = Addressing error in peripheral I/O (PIO) in progress. No message
associated with fault.

```
FLT-ADDR-KP-DMA = Direct memory access (DMA) addressing fault for DMA I/O.
FLT-CRAFT-INIT = End user initialization fault.
FLT-DEV-REPT-DMA = Device reported error for DMA I/O.
FLT-DEV-REPT-KP-PIO = Device reported error for peripheral I/O (PIO).
FLT-DEV-REPT-PIO = Device reported error PIO. No message associated with fault.
FLT-MSG-BUF-AU-NON-QUEUED = Message buffer audit for nonqueued error messages.
FLT-MSG-BUF-AU-QUEUED = Message buffer audit for queued error messages.
FLT-PIC-KP-DMA = Peripheral interface controller (PIC) fault for DMA I/O.
FLT-PIC-KP-PIO = PIC fault for peripheral I/O.
FLT-PIC-PIO = PIC implicated with PIO in progress. No message associated with fault.
FLT-PROC-KP-DMA = Processor fault for DMA I/O.
FLT-PROC-KP-PIO = Processor fault for peripheral I/O.
FROM-AUDIT = The stimulus for this initialization was from errors discovered by the ‘name’ audit.
             Refer to the APP:AUDITS appendix in the Appendixes section of the Output
             Messages manual for a list of audit names, or to the Audits manual for more detail.
FULL-DISK-LIMP-DIO = DIO state is full disk limp mode.
FULL-INITIALIZATION = Processor-wide full initialization.
INVALID-OPCODE = Invalid opcode.
INVLD-PAGE-TBL-ENT = Invalid entry in the page table.
INVLD-SEG-TBL-ENTRY = Invalid entry in the page table.
MANUAL-REQ = A user initiated initialization request.
NON-CORR-PARITY-ERR = Noncorrectable memory parity error.
PG-INDX-OUT-OF-RANGE = Out-of-range page index.
PRIV-INSTRUCTION = Illegal attempt to execute privileged instruction.
PROCESSOR-RCVY = Software recovery and initialization.
RCVY-SW-COMPL = Recovery switch of processors is complete.
ROUTINE-RMV = Configuration manager manual automatic diagnostic process or routine remove.
ROUTINE-SOFT-SWITCH = Routine soft switch.
SEGINDX-OUTOF-RANGE = Out-of-range segment index.
SIMPLEX-DIO = DIO state is simplex.
SOFT-SW-COMPL = Soft switch is complete.
SOFT-SWITCH-REQ = Request that a soft switch be done.
STACK-OVERFLOW = Overflow of the process stack.
STACK-SWITCH = Illegal stack manipulation.
SYS-INIT-CRIT = System initialization critical.
SYS-INIT-NON-CRIT = System initialization non-critical.
UNCOND-RMV = Unconditional removal.
UNKNOWN = Unknown event type.
WRITE-PROT-VIOL = Write protect violation.
```

d = Event number.

e = Termination report. Valid value(s):
ABORTED = The job did not complete before being interrupted.
COMPLETED = The indicated or requested action has completed.

f = Virtual address at the time of the triggered event.

g = Administrative module mode of operation. Valid value(s):
ESSENTIAL = All essential jobs operational.
MIN-MODE = Automatic recovery disabled.
NORMAL = Normal operation.
POST_RCVY = Post recovery.
SW-RCVY = Start of software initialization.
UNKNOWN = Mode unknown.

h = The side on which the stimulus occurred.
i = Time the triggering event occurred, in the form minutes:seconds.tenths of second.
j = Process number of the running operating system for distributed switching (OSDS) process.
k = Uniqueness field of the running OSDS process.
l = Operational kernel process (OKP) interject work. Valid value(s):
   AMA = Automatic message accounting.
   AML = Automatic maintenance limit.
   BASE = Communication package.
   BCST = Message broadcast.
   CLFR = Communication link fault recovery.
   CCS = Common channel signaling.
   CTST = Communication test processing.
   DD = Data delivery.
   INTMON = Integrity monitor.
   NONE = Interject was not running.
   PC = Peripheral network control.
   PR = Packet routing.
   PS = Packet switching.
   QLFR = Quad-link fault recovery.
   RTA = Routing and terminal allocation.
   TIME = Operating System time synchronization.

m = Process ID of AM process in which the event occurred.
n = Hex string indicating the events pending for this kernel process at the time of the software fault.
o = The AM fault code that initiated recovery action in SIkfault.
p = The number of the process in switch maintenance kernel process (SMKP) that requested a demand single process purge of the process in SMKP that is indicated in the PID field above.
q = The hardware level of initialization being performed.
s = The number of single process purge jobs that would be equivalent to the amount of call processing real time being taken by audits.
t = The number of single process purges that have occurred.
u = For defensive check failure errors, the audit that was scheduled. Valid value(s):
   AUD-SCHED= name = The 'name' audit was scheduled. Refer to the Audit manuals for more detailed information or the APP:AUDITS appendix in the Appendixes section of the Output
Messages manual for a list of audit names.
NO-AUD-SCHED = No audit was scheduled from this error.

v = Mode in which audit is being run. Valid value(s):
DEM-MODE = Demand or nonsegmented mode, takes no real time breaks.
ELEV-MODE = Elevated audit execution mode.
ROUT-MODE = Routine audit execution mode.

4. ACTIONS TO BE TAKEN

Monitor the progress of the software recovery. Initiate the appropriate manual actions if the recovery does not proceed as expected.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report on the final status of the switch after an administrative module (AM) initialization.

3. VARIABLE FIELD DEFINITIONS

a = Level of UNIX® RTR initialization in the AM.
b = Level of software initialization in the AM.
c = Level of hardware initialization in the AM.
d = Level of common network interface (CNI) initialization in the AM.
e = Event number.
f = Initialization scope. Valid value(s):
   AM-FPI = Full process initialization (S5) of a single-kernel process.
   AM-WIDE = Full initialization of the AM only.
   CM-ONLY INIT = Full initialization of the CM Complex only.
   CNI-WIDE = Full initialization of the AM and CNI ring.
   SYS-WIDEFI = Full initialization of the system.
   SYS-WIDEPUMP = Full initialization, full pump of the system.

g = Process scope. Valid value(s):
   AIM ESSENTIAL PROCESSES = Initialization status of all application integrity monitor (AIM) essential processes.
   AIM NON-ESSENTIAL PROCESSES = Initialization status of all non-essential processes.
   AIM CNI PROCESS = Initialization status of all CNI processes.
   AIM PROCESS = Initialization status of all application processes.

h = AM mode. Valid value(s):
   5ESS MIN MODE = AM is in min-mode.
   CNI MIN MODE = CNI is in min-mode.
   OPERATIONAL = AM is in application mode.
Recent changes are backed out. Valid value(s):
NO = AM changes were not backed out.
YES = AM changes were backed out.

Initialization trigger. Valid value(s):
AUTO HARDWARE = Hardware initiated autonomous initialization.
AUTO SOFTWARE = Software initiated autonomous initialization.
GENERIC RETROFIT = Retrofit initialization.
MANUAL = Manually requested initialization.
UNKNOWN = Cause of the initialization can not be determined.

Amount of time required for the initialization in seconds.

Process name.

Process creation status. Valid value(s):
ABORTING = The creation of the process is being aborted.
DEAD = The creation of this process is stopped.
IN-PROGRESS = The creation of this process is in-progress.
SUCCESS = The creation of this process was successful.

Process initialization status. Valid value(s):
FAILED = The initialization of this process failed.
IN-PROGRESS = The initialization of this process is in-progress.
NO ATTEMPT = The initialization of the process has not been attempted.
SUCCESS = The initialization of this process was successful.
TIMED OUT = The initialization of this process timed out.

2. REASON FOR OUTPUT

To indicate that a stimulus was received that resulted in a software recovery action in the specified communication
module processor (CMP). This message describes the state of the CMP at the time of the recovery, the reason for
the recovery, and the level of recovery action that was taken.

The ASRT message class is used for defensive check failure errors; otherwise the INT message class is used.

3. VARIABLE FIELD DEFINITIONS

a = Message switch side (MSGS).
b = Physical CMP number.
c = Processor being reported upon. Valid value(s):
   MATE = Mate CMP.
   PRIM = Primary CMP.
d = Level of CMP initialization. Valid value(s):
   FI = Full initialization.
   FI,PUMP = Full initialization with full pump.
   PGI = Purging initialization.
   REL = Raise the error = lead request.
   RPI = Return to point of interrupt.
   SI = Selective initialization.
   SPP = Single process purge.
   UNK = Unknown level of initialization.
e = Event number.
f = Termination report. Valid value(s):
   ABORTED = The indicated job did not complete before being interrupted by another stimulus.
   COMPLETED = The indicated or requested action has completed.
   IN_PROGRESS = The indicated action has started.
   NOT_STARTED = The indicated or requested action was not started.

g = Triggering event type. Valid value(s):
   DCF-DEFERRED-SPP = A specified non-running process was purged by an ASSERT-C.
DEF-CHK-FAIL=error-code = Defensive check failure (Assert) error followed by the software error code. Refer to the Assert manual for specific code information.

FROM-AUDIT-name = The stimulus for this initialization was from errors discovered by the 'name' audit. Refer to the APP:AUDITS appendix in the Audits manual.

MANUAL-REQ = A user-initiated initialization request has occurred.

h

= Description of the software stimulus reason. Valid value(s):
AM-REQ-POWER-UP = An administrative-module requested power up initialization.
AM-REQUEST = An administrative-module requested initialization.
AP-REL = Request to raise the error-lead as a result of a CMP application processor (AP) error.
ASRT-C-SPP = A count of Assert-C requested deferred single process purge initializations has exceeded the threshold.
ASRT-ERR = An error occurred while handling an Assert.
ASRT-SI = Assert requested selective initialization.
EX-AUD-SPP = A count of audit requested single process purge initializations has exceeded the threshold.
EX-DCF-SPP = A count of defensive check failure (Assert) requested single process purge initializations has exceeded the threshold.
EX-DIR-AUD = Excessive directed audits occurred, forcing a higher level initialization.
EX-DMD-SPP = An excessive amount of demand single process purges (SPP) has been requested.
EX-ERR = A count of returning interrupts has exceeded the threshold.
EX-ERR-50 = 50 stimuli occurred, forcing a higher level initialization.
EX-ERR-100 = 100 stimuli occurred, forcing a higher level initialization.
EX-FR-SPP = A count of switch maintenance requested single process purge initializations has exceeded the threshold.
EX-RPI = A count of return-to-the-point of interrupt initializations has exceeded the threshold.
EX-SELINIT = A count of excessive selective initializations has exceeded the threshold.
EX-SPP = A count of single process purge initializations has exceeded the threshold.
FR-SELINIT = Switch maintenance requested selective initialization.
HPQ-REL = Fault taken during handling of a high priority queue (HPQ) interrupt.
LOCK-OUT = Call processing lock-out.
MANUAL-REQ-POWER-UP = A user-initiated power up initialization.
MANUAL-REQUEST = A user-initiated initialization.
MCB-EXHST = Message control block resource exhaustion.
MSGH-REL = Request to raise the error lead as a result of CMP message handler (MSGH) excessive return to the point of interrupt (RPI) errors.
NEG-PROG = Negative progress was detected during an initialization.
NESTD-ASRT = Nested Asserts occurred.
NO-PROGRESS = No progress was detected during an initialization.
PCB-EXHST = Process control block resource exhaustion.
PRC-TIMOUT = Process initialization time-out.
PROG-LOOP = A program loop was not allowing the integrity monitor to run its background progress.
PURGE-FAIL = Purging initialization failed; the CMP is in an initialization.
REX-REQUEST = Routine exercises (REX) requested initialization.
RSRC-EXHST = Resource shortage error occurred.
SCB-EXHST = Stack control block resource exhaustion.
SCB32EXHST = Big stack control block resource exhaustion.
An attempt to soft switch has failed.

SW-REQUEST = CMP switch requested initialization.

TCB-EXHST = Timer control block resource exhaustion.

For defensive check failure errors, the audit that was scheduled. Valid value(s):

AUD-SCHED=NONE = No audit was scheduled from this error.

AUD-SCHED=name = The 'name' audit was scheduled. Refer to Audits manual for more detailed information or the APP:AUDITS appendix in the Audits manual for a list of audit names.

Mode in which audit is being run. Valid value(s):

DEM-MODE = Demand or nonsegmented mode takes no real-time breaks.

ELEV-MODE = Elevated audit execution mode.

ROUT-MODE = Routine audit execution mode.

AM event number.

Failing address.

Mode of the communication module processor operation (in the order of occurrence). Valid value(s):

CONSISTENT = Hardware consistent with software.

ESSENTIAL = Essential jobs operational.

NORMAL = Normal operation.

OPFULL = All jobs are operational.

RAMDYN = Dynamic memory consistent.

RAMTXT = Text and data consistent.

RAMWP = Write protection has been restored.

SYSPROC = All system processes initialized.

UNKNOWN = Mode unknown.

Time that the event occurred in the form minutes:seconds.tenths of a second.

Process number of the running background (BG) process.

Uniqueness of the running background process.

The running background process address.

The recovery action taken. Valid value(s):

PURGED = The single target job or process was purged.

RPI = Return to the point of interrupt.

blank = No recovery action taken because the target was not active.

The interject state. Valid value(s):

AMA = Automatic message accounting.

AML = Automatic maintenance limit.

BASE = Communication package.

BCST = Message broadcast.

CCS = Common channel signaling.
CTST = Communication test processing.
DD = Data delivery.
INTMON = Integrity monitor.
NONE = Interject was not running.
PC = Peripheral network control.
PR = Packet routing.
PS = Packet switching.
RTA = Routing and terminal allocation.
TIME = Operating System time synchronization.

\( t \) = Source of foreground (FG) activity. Valid value(s):
CM = Communication package.
CM_INTMON = Communication package and integrity monitor.
FAILURE = Unable to determine foreground activity.
INTMON = Integrity monitor.
NONE = Foreground was not being served.
UNK = Unknown foreground activity.

\( u \) = Foreground recovery action. Valid value(s):
PURGED = The indicated process is being purged.
RPI = Return to the point of interrupt.

4. ACTION TO BE TAKEN
Monitor the progress of the software recovery. Initiate manual actions if the recovery does not proceed as expected.

5. ALARMS
None.

2. REASON FOR OUTPUT

To indicate that a stimulus was received that resulted in a software recovery action in the specified communication module processor (CMP), message switch (MSGS), or office network and timing complex (ONTC). This message describes the state of the CMP, MSGS, or ONTC at the time of the recovery, the reason for the recovery, and the level of recovery action that was taken.

The ASRT message class is used for defensive check failure errors; otherwise the INT message class is used.

3. VARIABLE FIELD DEFINITIONS

a = Message switch (MSGS) or office network and timing complex (ONTC) side.
b = Physical CMP number.
c = Processor being reported upon. Valid value(s):
   MATE = Mate CMP.
   PRIM = Primary CMP.
d = Software recovery level. Valid value(s):
   FI = Full initialization.
   FI,PUMP = Full initialization with full pump.
   OSR = Operational software restart.
   PGI = Purging initialization.
REL = Raise the error lead request.
RPI = Return to point of interrupt.
SI = Selective initialization.
SPP = Single process purge.
UNK = Unknown level of initialization.
e = Environment where error occurred.

Termination report. Valid value(s):
AP = Application processor.
IP = Input/output processor.
AP-CMP = Application processor with an in service CMP.
APDGN = Application processor running diagnostics.
APDGN = Input/output processor running diagnostics.
f = Event number.
g = Termination report. Valid value(s):
ABORTED = The indicated job did not complete before being interrupted by another stimulus.
COMPLETED = The indicated or requested action has completed.
IN PROGRESS = The indicated action has started.
NOT STARTED = The indicated or requested action was not started.
h = Triggering event type. Valid value(s):
DCF-DEFERRED-SPP = A specified non-running process was purged by an ASSERT-C.
DEF-CHK-FAIL=error-code = Defensive check failure (Assert) error followed by the software error code. Refer to the Assert manual for specific code information.
FROM-AUDIT-name = The stimulus for this initialization was from errors discovered by the 'name' audit. Refer to the APP:AUDITS appendix in the Appendixes section of the Output Messages manual for a list of audit names, or to the Audits manual for more detail.
MANUAL-REQ = A user-initiated initialization request has occurred.
i = Description of the software stimulus reason. Valid value(s):
AM-REQ-POWER-UP = An administrative-module requested power up initialization.
AM-REQUEST = An administrative-module requested initialization.
AP-REL = Request to raise the error-lead as a result of a CMP application processor (AP) error.
ASRT-C-SPP = A count of Assert-C requested deferred single process purge initializations has exceeded the threshold.
ASRT-ERR = An error occurred while handling an Assert.
ASRT-SI = Assert requested selective initialization.
EX-AUD-SPP = A count of audit requested single process purge initializations has exceeded the threshold.
EX-DCF-SPP = A count of defensive check failure (Assert) requested single process purge initializations has exceeded the threshold.
EX-DIR-AUD = Excessive directed audits occurred, forcing a higher level initialization.
EX-DMD-SPP = An excessive amount of demand single process purges (SPP) has been requested.
EX-ERR = A count of returning interrupts has exceeded the threshold.
EX-ERR-50 = 50 stimuli occurred, forcing a higher level initialization.
EX-ERR-100  = 100 stimuli occurred, forcing a higher level initialization.
EX-FR-SPP   = A count of switch maintenance requested single process purge initializations has exceeded the threshold.
EX-RPI      = A count of return-to-the-point of interrupt initializations has exceeded the threshold.
EX-SELINIT  = A count of excessive selective initializations has exceeded the threshold.
EX-SPP      = A count of single process purge initializations has exceeded the threshold.
FR-SELINIT  = Switch maintenance requested selective initialization.
HPQ-REL     = Fault taken during handling of a high priority queue (HPQ) interrupt.
LOCK-OUT    = Call processing lock-out.
MANUAL-REQ-POWER-UP = A user-initiated power up initialization.
MANUAL-REQUEST = A user-initiated initialization.
MCB-EXHST   = Message control block resource exhaustion.
MSGH-REL    = Request to raise the error lead as a result of CMP message handler (MSGH) excessive return to the point of interrupt (RPI) errors.
NEG-PROG    = Negative progress was detected during an initialization.
NESTD-ASRT  = Nested Asserts occurred.
NO-PROGRESS = No progress was detected during an initialization.
PCB-EXHST   = Process control block resource exhaustion.
PRC-TIMOUT  = Process initialization time-out.
PROG-LOOP   = A program loop was not allowing the integrity monitor to run its background progress.
PURGE-FAIL  = Purging initialization failed; the CMP is in an initialization.
REX-REQUEST = Routine exercises (REX) requested initialization.
RSRC-EXHST  = Resource shortage error occurred.
SCB-EXHST   = Stack control block resource exhaustion.
SCB32EXHST  = Big stack control block resource exhaustion.
SFTSW-FAIL  = An attempt to soft switch has failed.
SW-REQUEST  = CMP switch requested initialization.
TCB-EXHST   = Timer control block resource exhaustion.

j = For defensive check failure errors, the audit that was scheduled. Valid value(s):
AUD-SCHED=NONE = No audit was scheduled from this error.
AUD-SCHED=name = The 'name' audit was scheduled. Refer to Audits manual for more detailed information or the APP:AUDITS appendix in the Appendixes section of the Output Messages manual for a list of audit names.

k = Mode in which audit is being run. Valid value(s):
DEM-MODE     = Demand or nonsegmented mode takes no real-time breaks.
ELEV-MODE    = Elevated audit execution mode.
ROUT-MODE    = Routine audit execution mode.

l = AM event number.

m = Failing address.

n = Mode of the communication module processor operation (in the order of occurrence). Valid value(s):
CONSISTENT   = Hardware consistent with software.
ESSENTIAL    = Essential jobs operational.
NORMAL = Normal operation.
OPFULL = All jobs are operational.
RAMDYN = Dynamic memory consistent.
RAMTXT = Text and data consistent.
RAMWP = Write protection has been restored.
SYSPROC = All system processes initialized.
UNKNOWN = Mode unknown.

O = Operational software job executing when the error occurred. Valid value(s):
AU = Routine audits.
CM = Communications package.
DGN = Diagnostics.
FLASH = Flash update.
INIT = Processor initialization.
OE = Operating environment.
PPC = Pump peripheral controller.
PPC-IIA-AUDIT = Pump peripheral controller inhibit interrupt administrator audits.
PPC-MTCE = Pump peripheral controller maintenance.
QL = Quad-link layer 2 manager.
RHS = Routine hashsums checks.
SI = System integrity.
SMMS = Switch maintenance.
UNK = Unknown or indeterminable running job.

P = If variable "o" is "SMMS", this field indicates the specific ONTC switch maintenance background task that is executing. Valid value(s):
MTCE-AUDITS = ONTC-resident maintenance audits.
NCT-ERR-CNTS = Clearing of network control and timing (NCT) link hardware error counters.
NONE = No ONTC switch maintenance background task.
ONTC-CORE = ONTC core routine maintenance software.
PSM = Power switch monitor (PSM).
SYNC-MON = Network clock synchronization monitor.

Q = Background software client that is currently processing a message. Valid value(s):
AU = Audits.
CALL-PROC = Call processing.
CDAL = Control and diagnostic access link (CDAL) maintenance.
CM = Communication package.
DGN = Diagnostics.
FAB-UPD = TMS fabric update.
FIRMWARE = Firmware.
FLASH-CTL = Flash memory update control.
FPC = Foundation peripheral controller (FPC).
NC = Network clock.
OFLBOOT = Offline boot.
ONTC-CORE = ONTC core software.
OSDS = Operating system for distributed switching.
PSM = Power switch monitor.
QLPS = Quad link packet switch.
TMS = Time multiplexed switch.
UP = Program update.
UT = Generic utilities.

\( r \) = Time that the event occurred in the form minutes:seconds.tenths of a second.

\( s \) = Process number of the running background (BG) process.

\( t \) = Uniqueness of the running background process.

\( u \) = The running background process address.

\( v \) = The recovery action taken. Valid value(s):
PURGED = The single target job or process was purged.
RPI = Return to the point of interrupt.
blank = No recovery action taken because the target was not active.

\( w \) = The interject state. Valid value(s):
AMA = Automatic message accounting.
AML = Automatic maintenance limit.
BASE = Communication package.
BCST = Message broadcast.
CCS = Common channel signaling.
CTST = Communication test processing.
DD = Data delivery.
INTMON = Integrity monitor.
NONE = Interject was not running.
PC = Peripheral network control.
PR = Packet routing.
PS = Packet switching.
RTA = Routing and terminal allocation.
TIME = Operating system time synchronization.

\( x \) = Source of foreground (FG) activity. Valid value(s):
CM = Communication package.
CM_INTMON = Communication package and integrity monitor.
FAILURE = Unable to determine foreground activity.
INTMON = Integrity monitor.
NONE = Foreground was not being served.
UNK = Unknown foreground activity.

\( y \) = Foreground recovery action. Valid value(s):
PURGED = The indicated process is being purged.
RPI = Return to the point of interrupt.

\( z \) = Currently executing foreground (one millisecond interrupt) job. Valid value for MSGS:
CMP = Communication module processor.
FPC = Foundation peripheral controller.
MMP0 = Module message processor 0.
MMP1 = Module message processor 1.
MSCU = Message switch control unit.
NONE = No functionality is active.
PPC = Pump peripheral controller.
QGP = Quad-link gateway processor.

Valid values for ONTC:
BG-SYNC-MON = Background network clock synchronization monitor (invoked from foreground to guarantee execution frequency).
CALL-PROC = Call processing.
CM = Communication package.
FAB-UPD = TMS fabric update.
FG-SYNC-MON = Foreground network clock synchronization monitor.
HP-MSG = High priority maintenance message processing.
NONE = No foreground task was executing.
ONTC-CORE = ONTC core software.
TMS-BG-REQ = Processing a TMS-related request from background.
TMS-FR-POLLING = Polling for TMS-related faults.
UT = Generic utilities.

a^1 = Foreground software client that is currently processing a message. Refer to field "qq" for a description of the possible clients.

b^1 = State of the communication package for the communication links. Valid value(s):
ACTIVE = Communication package was active but the link and action cannot be determined.
A-RECV = Communication link A was receiving.
A-TRANS = Communication link A was transmitting.
BASE = CM was called from the base level environment.
B-RECV = Communication link B was receiving.
B-TRANS = Communication link B was transmitting.
BP AP-TO-IP = Accessing AP to IP base priority message queue.
BP IP-TO-AP = Accessing IP to AP base priority message queue.
BG-TO-FG = Accessing background to foreground message queue.
ENET-RECV = Ethernet link receive.
ENET-TRANS = Ethernet link transmit.
FG-TO-BG = Accessing foreground to background message queue.
HP AP-TO-IP = Accessing AP to IP high priority message queue.
HP IP-TO-AP = Accessing IP to AP high priority message queue.
MMP0-RECV = MMP0 CLNK (CM3) is receiving.
MMP0-TRANS = MMP0 CLNK (CM3) is transmitting.
MMP1-RECV = MMP1 CLNK (CM3) is receiving.
MMP1-TRANS = MMP1 CLNK (CM3) is transmitting.
NONE = Information could not be determined.

^1 c = The QLPS network number.
^1 d = The logical link control block being used at the time of this stimulus.
^1 e = Specifies the direction of the message being processed at the time of the assert or fault. Valid
value(s):
SND = In the state of sending a message to the network.
RCV = In the state of processing a message received from the network.

f¹ = The far end network address or endpoint specified during this stimulus.

g¹ = Message switch (MSGS) side at the far end of the control and diagnostic access link (CDAL) for which CM is currently performing work. This field is only applicable to the ONTC-IP environment.

h¹ = CDAL message transport direction. Valid value(s):
  SND = Messages are being sent.
  RCV = Messages are being received.

4. ACTIONS TO BE TAKEN

Monitor the progress of the software recovery. Initiate manual actions if the recovery does not proceed as expected.

5. ALARMS

None.

2. REASON FOR OUTPUT

To indicate that a stimulus was received that resulted in a software recovery action in the specified communication module processor (CMP), message switch (MSGS), or office network and timing complex (ONTC). This message describes the state of the CMP, MSGS, or ONTC at the time of the recovery, the reason for the recovery, and the level of recovery action that was taken.

The ASRT message class is used for defensive check failure errors; otherwise the INT message class is used.

3. VARIABLE FIELD DEFINITIONS

a = Message switch (MSGS) or office network and timing complex (ONTC) side.

b = Physical CMP number.

c = Processor being reported upon. Valid value(s):
   MATE = Mate CMP.
   PRIM = Primary CMP.

d = Level of CMP initialization. Valid value(s):
   FI = Full initialization.
   FI, PUMP = Full initialization with full pump.
   PGI = Purging initialization.
REL = Raise the error lead request.
RPI = Return to point of interrupt.
SI = Selective initialization.
SPP = Single process purge.
UNK = Unknown level of initialization.

\[ e \] = Event number.

\[ f \] = Termination report. Valid value(s):
ABORTED = The indicated job did not complete before being interrupted by another stimulus.
COMPLETED = The indicated or requested action has completed.
IN PROGRESS = The indicated action has started.
NOT STARTED = The indicated or requested action was not started.

\[ g \] = Triggering event type. Valid value(s):
DCF-DEFERRED-SPP = A specified non-running process was purged by an ASSERT-C.
DEF-CHK-FAIL=error-code,error-name = Defensive check failure (Assert) error followed by
the software error code and error name. Refer to the Assert manual for specific
code information.
FROM-AUDIT-name = The stimulus for this initialization was from errors discovered by the 'name'
audit. Refer to the APP:AUDITS appendix in the Appendixes section of the Output
Messages manual for a list of audit names, or to the Audits manual for more detail.
MANUAL-REQ = A user-initiated initialization request has occurred.

\[ h \] = Description of the software stimulus reason. Valid value(s):
AM-REQ-POWER-UP = An administrative-module requested power up initialization.
AM-REQUEST = An administrative-module requested initialization.
AP-REL = Request to raise the error-lead as a result of a CMP application processor (AP)
error.
ASRT-C-SPP = A count of Assert-C requested deferred single process purge initializations has
exceeded the threshold.
ASRT-ERR = An error occurred while handling an Assert.
ASRT-SI = Assert requested selective initialization.
EX-AUD-SPP = A count of audit requested single process purge initializations has exceeded the
threshold.
EX-DCF-SPP = A count of defensive check failure (Assert) requested single process purge
initializations has exceeded the threshold.
EX-DIR-AUD = Excessive directed audits occurred, forcing a higher level initialization.
EX-DMD-SPP = An excessive amount of demand single process purges (SPP) has been
requested.
EX-ERR = A count of returning interrupts has exceeded the threshold.
EX-ERR-50 = 50 stimuli occurred, forcing a higher level initialization.
EX-ERR-100 = 100 stimuli occurred, forcing a higher level initialization.
EX-FR-SPP = A count of switch maintenance requested single process purge initializations has
exceeded the threshold.
EX-RPI = A count of return-to-the-point of interrupt initializations has exceeded the
threshold.
EX-SELINIT = A count of excessive selective initializations has exceeded the threshold.
EX-SPP = A count of single process purge initializations has exceeded the threshold.
FR-SELINIT = Switch maintenance requested selective initialization.

For defensive check failure errors, the audit that was scheduled. Valid value(s):
- AUD-SCHED=NONE = No audit was scheduled from this error.
- AUD-SCHED=name = The ‘name’ audit was scheduled. Refer to Audits manual for more detailed information or the APP:AUDITS appendix in the Appendixes section of the Output Messages manual for a list of audit names.

Mode in which audit is being run. Valid value(s):
- DEM-MODE = Demand or nonsegmented mode takes no real-time breaks.
- ELEV-MODE = Elevated audit execution mode.
- ROUT-MODE = Routine audit execution mode.

AM event number.

Failing address.

Mode of the communication module processor operation (in the order of occurrence). Valid value(s):
- CONSISTENT = Hardware consistent with software.
- ESSENTIAL = Essential jobs operational.
- NORMAL = Normal operation.
- OPFULL = All jobs are operational.
- RAMDYN = Dynamic memory consistent.
- RAMTXT = Text and data consistent.
- RAMWP = Write protection has been restored.
- SYSPROC = All system processes initialized.
- UNKNOWN = Mode unknown.
n = Operational software job executing when the error occurred. Valid value(s):
   AU = Routine audits.
   CM = Communications package.
   INIT = Processor initialization.
   MTUP = Mate update.
   OE = Operating environment.
   PLNK = Peripheral link for MH1 or MH2.
   QL = Quad-link layer 2 manager.
   RHS = Routine hashsums checks.
   SI = System integrity.
   UNK = Unknown or indeterminable running job.

o = Time that the event occurred in the form minutes:seconds.tenths of a second.

p = Process number of the running background (BG) process.

q = Uniqueness of the running background process.

r = The running background process address.

s = The recovery action taken. Valid value(s):
   PURGED = The single target job or process was purged.
   RPI = Return to the point of interrupt.
   blank = No recovery action taken because the target was not active.

 t = The interject state. Valid value(s):
   AMA = Automatic message accounting.
   AML = Automatic maintenance limit.
   BASE = Communication package.
   BCST = Message broadcast.
   CCS = Common channel signaling.
   CTST = Communication test processing.
   DD = Data delivery.
   INTMON = Integrity monitor.
   NONE = Interject was not running.
   PC = Peripheral network control.
   PR = Packet routing.
   PS = Packet switching.
   RTA = Routing and terminal allocation.
   TIME = Operating System time synchronization.

u = Source of foreground (FG) activity. Valid value(s):
   CM = Communication package.
   CM_INTMON = Communication package and integrity monitor.
   FAILURE = Unable to determine foreground activity.
   INTMON = Integrity monitor.
   NONE = Foreground was not being served.
   UNK = Unknown foreground activity.
v = Foreground recovery action. Valid value(s):
PURGED = The indicated process is being purged.
RPI = Return to the point of interrupt.

w = CM foreground job.

x = State of the communication package for the for the communication links. Valid value(s):
A-RECV = Communication link A was receiving.
A-TRANS = Communication link A was transmitting.
B-RECV = Communication link B was receiving.
B-TRANS = Communication link B was transmitting.
ACTIVE = Communication package was active but the link and action cannot be determined.
BASE = CM was called from the base level environment.
NONE = Information could not be determined.

y = The QLPS network number.

z = The logical link control block being used at the time of this stimulus.

a \superscript{1} = Specifies the direction of the message being processed at the time of the assert or fault. Valid value(s):
SND = In the state of sending a message to the network.
RCV = In the state of processing a message received from the network.

b \superscript{1} = The far end network address or endpoint specified during this stimulus.

c \superscript{1} = CDAL far-end side.

4. ACTIONS TO BE TAKEN
Monitor the progress of the software recovery. Initiate manual actions if the recovery does not proceed as expected.

5. ALARMS
None.

1. **FORMAT**

   INIT CMP=a-b c LVL=d [PUMP] e EVENT=f [g]

2. **REASON FOR OUTPUT**

   To report the completion of an initialization of the communication module processor (CMP).

3. **VARIABLE FIELD DEFINITIONS**

   - **a** = Message switch side.
   - **b** = CMP number.
   - **c** = Processor being reported on. Valid value(s):
     - `MATE` = Standby CMP.
     - `PRIM` = Active CMP.
   - **d** = Initialization level. Valid value(s):
     - `FI` = Full initialization.
     - `PGI` = Purging initialization.
     - `PUMP` = An initialization with pump was requested.
     - `SI` = Selective initialization.
   - **e** = Result. Valid value(s):
     - `ABORTED` = The initialization was aborted.
     - `COMPLETED` = The initialization completed successfully.
     - `FAILED` = The initialization failed.
   - **f** = Event number.
   - **g** = Reason for the failure or abort of the initialization.

4. **ACTION TO BE TAKEN**

   If the CMP initialization request has failed, the reason field will indicate the reason for the failure. Correct the cause of the failure and try the initialization again.

5. **ALARMS**

   None.

Other Manual(s):

235-105-250 System Recovery
INIT:CNI-LVL

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

INIT CNI LEVEL=a STIMULUS=b
   PROCESS=d REPORT=e EVENT=c
   INIT TRIGGER=f MODE=g

2. REASON FOR OUTPUT

To give information about the manual common network interface (CNI) initialization in progress. This message is output by the AIM process during the manual CNI initialization. It indicates the initialization level in progress, the completion report, the initialization source, any child process of CCSINIT which is responsible for or associated with this message in some way, the CNI mode, and the process manager creation failure code in case of child process creation failure.

3. VARIABLE FIELD DEFINITIONS

a
   a = Level of CNI initialization initiated. Valid value(s):
      DLNTBL = Initialize direct link node (DLN) table. Creates dynamic routing tables in the DLN.
               This is only used during DLN growth procedures.
      FPI = Full process abort of the CNI RINGMON when starting an FPI of that process.
      LVL0 = Audit level (CNI level 0). The audits are run on the CNI system during this level.
      LVL1 = Recovery level (CNI level 1). This level indicates the restart of the interprocess message switch (IMS) driver and cleaning of the IMS buffers. The IMS is part of the CNI system.
      LVL2 = Recovery level CCSINIT (CNI level 2). Re-initializes all global CNI data and restarts all noncritical processes.
      LVL3 = (CNI level 3). The CCSINIT and its child processes are recreated during this level and initialized.
      LVL4 = Full initialization (CNI level 4). This level is equivalent to the LVL3 and all the memory being cleared.
      NOINIT = Full process initialization (FPI) of the CNI RING monitor process (RINGMON) with no accompanying CNI initialization (also possible when the CNI RING is not equipped in an office).

b
   b = Stimulus for this message. Valid value(s):
      ABORT
      CNI AUDIT COMPLETION
      CNI INIT COMPLETION
      CNI INIT REQUEST
      CNI INIT SEQUENCE FAILED
      CREATION TIMEOUT
      FULLY OPERATIONAL TIMEOUT
      NO RTR MSG BUF AVAILABLE
      PMGR DEATH OF CHILD RECEIVED
      RTR EVENT SENDING FAILURE
      RTR MESSAGE SENDING FAILED
      RTR PORT CONNECTION FAILED
SOFTINIT TIMEOUT
TOO MUCH PROGRESS
UNKNOWN

= Event number used to correlate messages associated with a single stimulus.

d = Child process which is associated with outputting of this message, if any. Valid value(s):
CNIINIT
NONE
RINGMON

e = Status report. Valid value(s):
ABORTING ALL CNI PROCESSES
CNI AUDITS REQUESTED
CNI INIT BEGUN
CNI INIT SUCCESS
INIT REQUESTED
MANUAL–CNI_ONLY
REQUESTING ESCALATION
SINGLE PROCESS INIT REQUESTED
SUCCESS
UNKNOWN

f = Source of initialization. Valid value(s):
AUTO HARDWARE
AUTO SOFTWARE
GENERIC RETROFIT
MANUAL
UNKNOWN

g = CNI mode. Valid value(s):
5ESS MIN MODE
CNI MIN MODE
OPERATIONAL

4. ACTION TO BE TAKEN

In case of creation failure, use the process manager error code and the process identity to check that the files necessary for creation are in their correct directory location and that they have the correct header information in them. This output message will always be displayed in response to a manually-initiated CNI initialization. If this message is accompanied with a critical alarm, the CNI system can not recover on its own. This could signal creation failures, initialization failure at FPI or FI levels, abort failures, etc. In such cases, user intervention is required to initialize the CNI at a higher level, or possibly take a UNIX® RTR phase. No particular action on the part of user will be required in such cases.

5. ALARMS

All the failure messages which require user intervention will be accompanied with a critical alarm.

6. REFERENCES
Input Message(s):

CLR:MINMODE–CNI
INIT:CNI
SET:MINMODE–CNI

Other Manual(s):
235-600-601 Processor Recovery Messages

MCC Display Page(s):

(CNI STATUS)
INIT:CNI

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

INIT CNI a REPORT=b EVENT=c
STIMULUS=d [e]
INIT SOURCE=MANUAL CNI ONLY CNI MODE=g
[ASSOC CHILD PROCESS i]

2. REASON FOR OUTPUT

To give information about the manual CNI-only initialization requested by input message INIT:CNI. This message is output by the CCSINIT process during a manual common network interface (CNI)-only initialization. The CCSINIT process is responsible for bringing up the CNIINIT process and any other child process, (for example, CCringmon). The CNIINIT process in turn brings up the rest of the CNI system. This message indicates the initialization level in progress, the completion report, the event number, the stimulus for this message, the process manager creation failure code, if any, the source of initialization, the CNI mode, and the child process of the CCSINIT, if any, associated with this message.

3. VARIABLE FIELD DEFINITIONS

a
= Level of CNI initialization. Valid value(s):
AUD = Audit level (CNI level 0). The audits are run on the CNI system during this level.
FI = Full initialization (CNI level 4). This level is equivalent to the FPI and all the memory being cleared.
FPI = Full process initialization (CNI level 3). The CCSINIT and its child processes are recreated during this level and initialized.
RCVRY = Recovery level (CNI level 1). This level indicates the restart of the interprocess message switch (IMS) driver and cleaning of the IMS buffers. The IMS is part of the CNI system.

b
= Completion report. Valid value(s):
CCSINIT ABORT FAILED
CCSINIT ABORTING
CCSINIT CRATION FAILED
CCSINIT FULLY OP STATE FAILED
CCSINIT INIT FAILED
CCSINIT INIT SUCCESSFUL
CNI AUDITS COMPLETED
CNI AUDITS STARTING
CNI RCVRY STARTING
ESCALATING TO RCVRY
NO ESCALATION
SINGLE PROCESS ABORT

Note: The report 'NO ESCALATION'" appears when the CNI is in minmode, and internal escalation requests from AUD level to RCVRY are inhibited.

Note: The report 'CNI AUDITS COMPLETED' does not necessarily mean that all the audits ran or that all audits ran successfully. Look for possible PRMs and/or audit messages to detect problems.
4. ACTION TO BE TAKEN

This output message will always be displayed in response to a manually initiated CNI initialization. If this message is accompanied with a critical alarm, the CCSINIT system can not recover on its own. The critical alarm will accompany creation failure, init failure at FPI or FI levels, abort failures, etc. In these cases, user intervention is
required to initialize CNI at a higher level. Refer to the input messages in the References section for this. The UNIX®
RTR phase 52, 53 or 54 might be necessary if manual CNI-only initialization keeps on failing repeatedly.

5. ALARMS

Critical or none.

INIT:DLN

Software Release: 5E14 and later
Message Class: LSWRPIN, LSPPIN, LHLIN
Application: 5
Type: Output

1. FORMAT

```
INIT DLN=a,b LVL=c EVENT=d e f g [h]
   FAILING ADDR=i DLN-MODE=j TIME=kk:kk:kk
   PROCESS: BG=l,m FG=n
```

2. REASON FOR OUTPUT

To indicate that a stimulus was received that resulted in a software recovery action in the specified direct link node (DLN).

3. VARIABLE FIELD DEFINITIONS

- \(a\) = The ring node (RN) group number of the reporting DLN.
- \(b\) = The ring node member number of the reporting DLN.
- \(c\) = DLN recovery action initiated. Valid value(s):
  - RPI = Return to point of interrupt.
  - SPP = Single process purge.
  - SW = Switch to standby DLN.
- \(d\) = Event number.
- \(e\) = Termination report. Valid value(s):
  - ABORTED = The indicated job did not complete before being interrupted by another stimulus.
  - COMPLETED = The indicated or requested action has completed.
- \(f\) = Type of error stimulus. Valid value(s):
  - HDW-ERR = Suspected cause of error is hardware.
  - SW-ERR = Suspected cause of error is software.
- \(g\) = Triggering event type. Valid value(s):
  - DEF-CHK-FAIL=o = Defensive check failure error followed by (o), the software error code. Refer to the Asserts manual for specific code information.
  - PE=name = Processor exception error followed by (name), the name of the exception that occurred. The processor exception names are:
    - ADDRESSING-ERR = Word access was attempted on an odd-byte boundary.
    - BUS-ERRA = 68000 bus error exception occurred.
    - ILLEGAL-INSTR = The processor detected an illegal opcode.
    - PARITY-ERR = Bad parity was detected by the hardware on a read or write of memory.
    - PRIVILEGE-VIOL = A privileged instruction was attempted while not in the supervisor mode.
SANITY-TIMER = A program sanity timer expired before the program was able to reset the timer. It usually indicates that a program is executing in an infinite loop.

TRAP = A single byte interrupt, a single step, or an unimplemented software interrupt was executed. It usually indicates a software problem.

UNUSED-EXCEPTION = A processor exception that is not used by the software release occurred.

WRITE-PROT-ERR = A write was attempted to a write protected address. It usually indicates a software problem.

ZERO-DIVIDE = An attempt to divide by zero was detected.

h = If escalation occurred, reason for escalating to a higher level of recovery. Valid value(s):
EXCESSIVE-ASSERTS = A count of asserts has exceeded the threshold.
EXCESSIVE-INTERRUPTS = A count of returning interrupts has exceeded the threshold.
EXCESSIVE-RPI = Excessive return to the point of interrupt.
EXCESSIVE-SPP = A count of single process purges has exceeded the threshold.
INIT-ERR = A fatal software error occurred during initialization or recovery.

i = Address, in hexadecimal, immediately following the defensive check failure or exception (otherwise blank).

j = Mode of the direct link node's operation. Valid value(s):
INIT-DLN-SI = The system integrity monitor in the DLN is in Initialization.
INIT-ODD = Initializing (pumping) office dependent data (ODD) in the DLN.
INIT-PROC = Initializing system processes.
INIT-PSDS = The operating system for distributed switching (OSDS) is starting DLN initialization. No processes are running in the DLN yet.
NORM = Normal operation.

k = Time the event occurred, in the form minute:second:tenth of second.

l = Process ID of the running background process in OSDS.

m = Unique field of the running background process in OSDS.

n = State of foreground activity. Valid value(s):
CCSMSG = The foreground common channel signaling (CCS) message processing software was executing.
NONE = Foreground (10 ms. interrupt) was not being served.
SIMON = The foreground system integrity monitor was executing.

4. ACTION TO BE TAKEN

Initiate manual actions if the recovery does not proceed as expected. If hardware is suspected (HDW-ERR) then diagnostics should be performed on the faulty node using either the 118 page pokes or DGN:LN message.

5. ALARMS
None.

2. REASON FOR OUTPUT

To output the results of executing an INIT:FAC input request to initialize performance monitoring (PM) counts for specified digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU) facilities, or digital networking unit - synchronous optical network (SONET) (DNU-S) facilities.

Format 1 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for a specific DFI facility. This format is used to support early model DFIs such as ANN1, ANN3(B), and so forth. (Such a DFI is sometimes known as DFI-1.)

Format 2 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for an individual DFI-2 facility.
Format 3 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on a DFI-2.

Format 4 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on a digital line and trunk unit (DLTU) model 2 (DLTU2).

Format 5 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on an IDCU.

Format 6 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for an IDCU facility (IFAC).

Format 7 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on an IDCU-supported or a DNU-S supported TR303 remote terminal (RT).

Format 8 appears after the INIT:FAC input message was used to initialize performance monitoring counts of all section terminating equipment (STE) facilities terminated on a DNU-S. The PM counts associated with any subtending virtual tributary 1.5 (VT1.5) or digital signal level-1 (DS1) facilities are not initialized.

Format 9 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a single DNU-S STE facility. The PM counts associated with any subtending VT1.5 or DS1 facilities are not initialized.

Format 10 appears after the INIT:FAC input message was used to initialize performance monitoring counts for all VT1.5 facilities or all DS1 facilities on a DNU-S synchronous transport signal-1 (STS-1) facility. The input option used (VT1 or DS1) will be displayed in the output message. If the VT1 option was used, then the PM counts associated with all the VT1.5 facilities on the specified STS-1 facility are initialized. Note that, with the VT1 option, the PM counts associated with each subtending DS1 facility are not initialized. If the DS1 option was used, then the PM counts associated with all the DS1 facilities on the specified STS-1 facility are initialized.

Format 11 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a DNU-S VT1.5 facility. The PM counts associated with the subtending DS1 facility are not initialized.

Format 12 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a DNU-S DS1 facility.

3. VARIABLE FIELD DEFINITIONS

ALL = All (current, previous, and history) 15-minute and day PM data has been initialized for the requested facility or unit.

VT1 = The request was to initialize PM counts on all VT1.5s on an STS-1 facility.

DS1 = The request was to initialize PM counts on all DS1s on an STS-1 facility.

a = Switching module (SM) number.

b = DLTU number.

c = DFI-2 number.

d = Facility number.

e = Status of command. Valid value(s):
    COMPLETED = Request has been successfully completed.
    COMPLETED EOC OOS = The request completed successfully for the IDCU end, but TR303 counts

were not reset because the RT’s embedded operations channel (EOC) was out-of-service (OOS).

**COMPLETED FACS OOS** = The request completed successfully but out-of-service facilities were encountered.

**FAILED** = Failed to initialize performance monitoring counts for the specified facility or unit. Retry the request later.

**FAILED DNUS CC OOS** = The request failed because the DNU-S common control (CC) was out-of-service. DNU-S duplex failure.

**FAILED EOC OOS** = The request to reset counts at the TR303 RT failed because the EOC was out-of-service.

**FAILED IDCU OOS** = The request failed because the IDCU was out-of-service.

**NO MATCH** = The specified facility or unit does not exist. If the unit type requested is SM, then **NO MATCH** means the SM is not equipped with any unit or facility.

**NOT ALLOWED** = The requested initialization is not allowed for the given facility or unit.

**OUT OF SERVICE** = The requested unit is out-of-service.

**SM UNAVAILABLE** = The input request could not be processed because communication with the associated SM is not possible.

**SYSTEM BUSY** = The system’s processing capability has been reached or a system resource is unavailable. Retry the request later.

f = IDCU number.

g = Set of counts zeroed. Valid value(s):

- **ALL** = All (current, previous, and history) PM data, for both 15-minute and day intervals, has been initialized for the requested facility or unit.
- **CURR** = Current PM data, for both 15-minute and day intervals, has been initialized for the requested facility or unit.

h = End of the facility that was initialized. Valid value(s):

- **BOTH** = Both ends. Both ends of the facility were initialized.
- **FE** = Far end. Far end of the facility was initialized.
- **NE** = Near end. Switch end of the facility was initialized.

i = IFAC number.

j = TR303 RT number.

k = DNU-S number.

l = Data group number.

m = STE facility number.

n = STS facility number.

o = VT1.5 facility group number.

p = VT1.5 facility member number.

4. ACTIONS TO BE TAKEN
Retry INIT:FAC input message when variable \( f = \text{SYSTEM BUSY} \) or \( \text{FAILED} \). The initialized counts can be read by executing an OP:FAC input request.

5. ALARMS

None.

2. REASON FOR OUTPUT

To output the results of executing an INIT:FAC input request to initialize performance monitoring (PM) counts for specified digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU) facilities, or digital networking unit - synchronous optical network (SONET) (DNU-S) facilities.

Format 1 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for a specific DFI facility. This format is used to support early model DFIs such as ANN1, ANN3(B), and so forth. (Such a DFI is sometimes known as DFI-1.)

Format 2 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for an individual DFI-2 facility.

Format 3 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on a DFI-2.

Format 4 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on a digital line and trunk unit (DLTU) model 2 (DLTU2).

Format 5 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on an IDCU.

Format 6 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for an IDCU facility (IFAC).

Format 7 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on an IDCU-supported or a DNU-S supported TR303 remote terminal (RT).

Format 8 appears after the INIT:FAC input message was used to initialize performance monitoring counts of all SONET terminating equipment (STE) facilities terminated on a DNU-S. The PM counts associated with any subtending virtual tributary 1.5 (VT1.5) or digital signal level-1 (DS1) facilities are not initialized.

Format 9 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a single DNU-S STE facility. The PM counts associated with any subtending VT1.5 or DS1 facilities are not initialized.

Format 10 appears after the INIT:FAC input message was used to initialize performance monitoring counts for all VT1.5 facilities or all DS1 facilities on a DNU-S synchronous transport signal-level 1 (STS-1) facility. The input option used (VT1 or DS1) will be displayed in the output message. If the VT1 option was used, then the PM counts associated with all the VT1.5 facilities on the specified STS-1 facility are initialized. Note that, with the VT1 option, the PM counts associated with each subtending DS1 facility are not initialized. If the DS1 option was used, then the PM counts associated with all the DS1 facilities on the specified STS-1 facility are initialized.

Format 11 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a DNU-S VT1.5 facility. The PM counts associated with the subtending DS1 facility are not initialized.

Format 12 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a DNU-S DS1 facility.

Format 13 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given optical interface unit (OIU).

Format 14 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given OIU optical carrier - level 3 (OC3 or OC3C for OIUPKT/IP) facility.
Format 15 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given OIU STS1 or STS3C facility.

Format 16 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given OIU virtual tributary - level 1.5 (VT1.5) facility.

Format 17 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given OIU DS1 facility.

3. VARIABLE FIELD DEFINITIONS

ALL = All (current, previous, and history) 15-minute and day PM data has been initialized for the requested facility or unit.

VT1 = The request was to initialize PM counts on all VT1.5s on an STS-1 facility.

DS1 = The request was to initialize PM counts on all DS1s on an STS-1 facility.

a = Switching module (SM) number.

b = DLTU number.

c = DFI-2 number.

d = Facility number.

e = Status of command. Valid value(s):

COMPLETED = Request has been successfully completed.

COMPLETED EOC OOS = The request completed successfully for the IDCU end, but TR303 counts were not reset because the RT’s embedded operations channel (EOC) was out-of-service (OOS).

COMPLETED FACS OOS = The request completed successfully but out-of-service facilities were encountered.

FAC DOES NOT EXIST — NO MATCH = The request completed successfully but the facility does not exist.

FAILED = Failed to initialize performance monitoring counts for the specified facility or unit. Retry the request later.

FAILED DNUS CC OOS = The request failed because the DNU-S common control (CC) was out-of-service. DNU-S duplex failure.

FAILED EOC OOS = The request to reset counts at the TR303 RT failed because the EOC was out-of-service.

FAILED IDCU OOS = The request failed because the IDCU was out-of-service.

FAILED OIU OFI OOS = The request failed because the OIU OFI was out-of-service.

INVALID REQUEST = The request was invalid.

NO MATCH = The specified facility or unit does not exist. If the unit type requested is SM, then NO MATCH means the SM is not equipped with any unit or facility.

NOT ALLOWED = The requested initialization is not allowed for the given facility or unit.

OUT OF SERVICE = The requested unit is out-of-service.

SM UNAVAILABLE = The input request could not be processed because communication with the associated SM is not possible.

SYSTEM BUSY = The system’s processing capability has been reached or a system resource is unavailable. Retry the request later.
f = IDCU number.
g = Set of counts zeroed. Valid value(s):
   ALL = All (current, previous, and history) PM data, for both 15-minute and day intervals, has been initialized for the requested facility or unit.
   CURR = Current PM data, for both 15-minute and day intervals, has been initialized for the requested facility or unit.

h = End of the facility that was initialized. Valid value(s):
   BOTH = Both ends. Both ends of the facility were initialized.
   FE = Far end. Far end of the facility was initialized.
   NE = Near end. Switch end of the facility was initialized.

i = IFAC number.
j = TR303 RT number.
k = DNU-S number.
l = Data group number.
m = STE facility number.
n = STS facility number.
o = VT1.5 facility group number.
p = VT1.5 facility member number.
q = OIU number.
r = Protection group (PG) number.
t = OC3 or OC3C number.
u = STS1 or STS3C number.
v = VT1.5 group number.
w = VT1.5 member number.
x = OFI side that was initialized. Valid value(s):
   0 = Side 0 of the facility was initialized.
   1 = Side 1 of the facility was initialized.

y = Subtending facilities. Valid value(s):
   NOSUB = No subtending facilities. No subtending facilities was initialized.
   ALLSUB = ALL subtending facilities. All subtending facilities were initialized.

4. ACTIONS TO BE TAKEN
Retry INIT:FAC input message when variable \( f = \text{SYSTEM BUSY} \) or \( \text{FAILED} \). The initialized counts can be read by executing an OP:FAC input request.

2. REASON FOR OUTPUT

To output the results of executing an INIT:FAC input request to initialize performance monitoring (PM) counts for specified digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU) facilities, digital networking unit - synchronous optical network (SONET) (DNU-S) facilities, optical interface unit (OIU) facilities, or packet switch unit (PSU) protocol handler (PH).

Format 1 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for a specific DFI facility. This format is used to support early model DFIs such as ANN1, ANN3(B), and so forth. (Such a DFI is sometimes known as DFI-1.)

Format 2 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for an individual DFI-2 facility.

Format 3 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on a DFI-2.

Format 4 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on a digital line and trunk unit (DLTU) model 2 (DLTU2).

Format 5 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on an IDCU.

Format 6 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for an IDCU facility (IFAC).

Format 7 appears after the INIT:FAC input message was used to initialize performance monitoring error counts for all facilities terminated on an IDCU-supported or a DNU-S supported TR303 remote terminal (RT).

Format 8 appears after the INIT:FAC input message was used to initialize performance monitoring counts of all SONET terminating equipment (STE) facilities terminated on a DNU-S. The PM counts associated with any subtending virtual tributary 1.5 (VT1.5) or digital signal level-1 (DS1) facilities are not initialized.

Format 9 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a single DNU-S STE facility. The PM counts associated with any subtending VT1.5 or DS1 facilities are not initialized.

Format 10 appears after the INIT:FAC input message was used to initialize performance monitoring counts for all VT1.5 facilities or all DS1 facilities on a DNU-S synchronous transport signal-level 1 (STS-1) facility. The input option used (VT1 or DS1) will be displayed in the output message. If the VT1 option was used, then the PM counts associated with all the VT1.5 facilities on the specified STS-1 facility are initialized. Note that, with the VT1 option, the PM counts associated with each subtending DS1 facility are not initialized. If the DS1 option was used, then the PM counts associated with all the DS1 facilities on the specified STS-1 facility are initialized.

Format 11 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a
DNU-S VT1.5 facility. The PM counts associated with the subtending DS1 facility are not initialized.

Format 12 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a DNU-S DS1 facility.

Format 13 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given optical interface unit (OIU).

Format 14 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given OIU optical carrier - level 3 (OC3 or OC3C for OIUPKT/IP) facility.

Format 15 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given OIU STS1 or STS3C facility.

Format 16 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given OIU virtual tributary - level 1.5 (VT1.5) facility.

Format 17 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given OIU DS1 facility.

Format 18 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given OIU PPP link.

Format 19 appears after the INIT:FAC input message was used to initialize performance monitoring counts on an extended access interface unit (EAIU) timeslot group (TSGRP).

Format 20 appears after the INIT:FAC input message was used to initialize performance monitoring counts on a given session initiation protocol (SIP) protocol handler (PH) (other PH types are not allowed).

3. VARIABLE FIELD DEFINITIONS

ALL = All (current, previous, and history) 15-minute and day PM data has been initialized for the requested facility or unit.

ALLSUB = All subtending facilities were initialized.

VT1 = The request was to initialize PM counts on all VT1.5s on an STS-1 facility.

DS1 = The request was to initialize PM counts on all DS1s on an STS-1 facility.

a = Switching module (SM) number.

b = DLTU number.

c = DFI-2 number.

d = Facility number.

e = Status of command. Valid value(s):

COMPLETED = Request has been successfully completed.

COMPLETED EOC OOS = The request completed successfully for the IDCU end, but TR303 counts were not reset because the RT's embedded operations channel (EOC) was out-of-service (OOS).

COMPLETED FACS OOS = The request completed successfully but out-of-service facilities were encountered.

CIRCUIT DOES NOT EXIST - NO MATCH = The request completed successfully but the circuit
does not exist.

FAILED = Failed to initialize performance monitoring counts for the specified facility or unit. Retry the request later.

FAILED CKT OOS = The request failed because the specified circuit was out-of-service.

FAILED DNUS CC OOS = The request failed because the DNU-S common control (CC) was out-of-service. DNU-S duplex failure.

FAILED EOC OOS = The request to reset counts at the TR303 RT failed because the EOC was out-of-service.

FAILED IDCU OOS = The request failed because the IDCU was out-of-service.

FAILED OIU OFI OOS = The request failed because the OIU OFI was out-of-service.

INVALID REQUEST = The request was invalid.

NO MATCH = The specified facility or unit does not exist. If the unit type requested is SM, then NO MATCH means the SM is not equipped with any unit or facility.

NOT ALLOWED = The requested initialization is not allowed for the given facility or unit.

OUT OF SERVICE = The requested unit is out-of-service.

SM UNAVAILABLE = The input request could not be processed because communication with the associated SM is not possible.

SYSTEM BUSY = The system's processing capability has been reached or a system resource is unavailable. Retry the request later.

f = IDCU number.

g = Set of counts zeroed. Valid value(s):
ALL = All (current, previous, and history) PM data, for both 15-minute and day intervals, has been initialized for the requested facility or unit.
CURR = Current PM data, for both 15-minute and day intervals, has been initialized for the requested facility or unit.

h = End of the facility that was initialized. Valid value(s):
BOTH = Both ends. Both ends of the facility were initialized.
FE = Far end. Far end of the facility was initialized.
NE = Near end. Switch end of the facility was initialized.

i = IFAC number.

j = TR303 RT number.

k = DNU-S number.

l = Data group number.

m = STE facility number.

n = STS facility number.

o = VT1.5 facility group number.

p = VT1.5 facility member number.

q = OIU number.

r = Protection group (PG) number.
t = OC3 or OC3C number.

u = STS1 or STS3C number.

v = VT1.5 group number.

w = VT1.5 member number.

x = OFI side that was initialized. Valid value(s):
   0 = Side 0 of the facility was initialized.
   1 = Side 1 of the facility was initialized.

y = EAIU number.

z = Common data and control controller (COMDAC) number.

a¹ = TSGRP number.

b¹ = PSU number.

c¹ = Shelf number.

d¹ = Protocol handler number.

4. ACTIONS TO BE TAKEN

Retry INIT:FAC input message when variable $f =$ SYSTEM BUSY or FAILED. The initialized counts can be read by executing an OP:FAC input request.

5. ALARMS

None.

[4] INIT FACR INVALID
   KEY MUST CONTAIN ALL CHARACTERS

[5] INIT FACR COMPLETED
   INHIBIT DETAIL OPTION {DEACTIVATED|ACTIVATED}

2. REASON FOR OUTPUT

To report that the feature activation counting and reconciliation (FACR) password has been initialized or the detail option has been DEACTIVATED or ACTIVATED.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request of the INIT:FACR input message. No further action is necessary if the request completed successfully.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   INIT:FACR

Other Manual(s):
INIT:LN

Software Release: 5E14 and later
Message Class: SWM01
Application: 5,CNI
Type: Output

1. FORMAT

[1] INIT LNa b COMPL
   START c END d

[2] INIT LNa b NOT STARTED
   START c END d e

[3] INIT LNa b STOPPED
   START c END d f

2. REASON FOR OUTPUT

To report the results of an INIT:LN input message, which requests removal from service and restart of a node.

3. VARIABLE FIELD DEFINITIONS

a
   = A ring node (RN) group number.
b
   = The node’s position in the RN group.
c
   = The contents of the administrative module (AM) real-time clock register in milliseconds (ms) when the request was received by the interprocess message switch (IMS) driver process.
d
   = The contents of the AM real-time clock register (ms) when the request was completed or stopped by the IMS driver process.
e
   = Reason the input message was not started. Valid value(s):
   ANOTHER MANUAL RESTART IS IN PROGRESS
   CONFLICT WITH IMS SYSTEM INITIALIZATION
   RING CONFIGURATION NOT STABLE
   RING NODE ALREADY BEING RESTARTED
   RING NODE NOT IN ACT STATE
   SOFTWARE IN THIS RING NODE NOT RESTARTABLE

f
   = Reason the input message was stopped. Valid value(s):
   ABORTED -- DETAILS IN REPT IUN RESTRT
   FAILED -- DETAILS IN REPT IUN RESTRT
   FAILED, NO FAULT -- DETAILS IN REPT IUN RESTRT
   PROGRAM ERROR -- FAILED TO CHANGE RING NODE STATE TO OOS
   PROGRAM ERROR -- _UNRESTRT RETURNED _DENIED
   PROGRAM ERROR -- _UNRESTRT RETURNED _RETRY
   RESOURCE PROBLEM -- FAILED TO SEND NP RESTART MESSAGE TO RING NODE
RESOURCE PROBLEM -- _UNRESTRT RETURNED _FAIL

4. ACTION TO BE TAKEN

For Format 1, no action is required. The RMV:LN and RST:LN output messages may also be printed.

For Format 2, if 'e' indicates the node was not in the ACT state, then it cannot be restarted. If 'e' indicates the software is not restartable, then the software in the node reported that it was not designed to be restartable when it last entered the ACT state. For these cases, if manual recovery is necessary, use the RST:LN input message. For other values of 'e', wait until the condition indicated by 'e' changes and, if appropriate, try again.

For Format 3, the ring node was removed from service but not successfully restarted, so it is no longer eligible to be restarted. The user should use the RST:LN input message to recover it. The RMV:LN and REPT:IUN-RESTR output messages may also be printed. Usually, 'f' will be FAILED -- DETAILS IN REPT IUN RESTRT. The node will have been marked faulty, and the separately printed REPT:IUN-RESTR output message will provide more details. The FAILED, NO FAULT -- DETAILS IN REPT IUN RESTRT case indicates the node was not marked faulty, but this case is not known to occur in the initial release of this input message. A restart can be aborted by some system-wide initializations, by AM direct memory access (DMA) faults, or by automatic recovery. Values of 'e' containing RESOURCE PROBLEM should seldom occur. Values of 'f' containing PROGRAM ERROR should never occur; they indicate software bugs.

5. ALARMS

CALLS LOST: STABLE - o
TRANSIENT - p
BACKOUT:q

2. REASON FOR OUTPUT

To report the results of a manually-initiated recovery in the specified switching module (SM) and the error history at the time of the recovery.

3. VARIABLE FIELD DEFINITIONS

a = Level of software recovery completed. Valid value(s):
  0 = Return to point of interrupt.
  1 = Single process purge.
  2 = Transient clear.
  3 = Transient clear with boot.
  4 = Transient clear with boot ignoring errors.
  5 = Stable clear.
  6 = Stable clear with boot.
  7 = Stable clear with boot ignoring errors.

b = Switching module number.

c = Trouble indicator. Valid value(s):
  TROUBLE = Output results from system action.
  blank = Output results from manual action.

d = Event number, which is used to correlate messages to a single event.

e = Status of the interrupts currently being tested (NONE, PARTIAL, or FULL).

f = Total outage time because of the software recovery (minutes:seconds:tenths of a second).

g = Amount of call processing real time being preempted by audits (in hexadecimal).

h = Number of single process purges that have recently occurred (in hexadecimal).

i = Number of software stimuli that have recently occurred (in hexadecimal).

j = Number of hardware stimuli that have recently occurred (in hexadecimal).

k-n = Hexadecimal dump of additional error counters used for debugging.
\( o \) = Number of stable calls lost because of the recovery.

\( p \) = Number of transient calls lost because of the recovery.

\( q \) = Indicates if ODD was booted. Valid value(s):

CM=n[,CLNK] [NETWORK=o] [LLCB-INDEX=p][,q] [ENDPOINT=r]

2. REASON FOR OUTPUT

To indicate that a stimulus was received that resulted in a software recovery action in the SMP MH (message handler). This message describes the state of the processor at the time of the recovery, the reason for the recovery, and the level of recovery action that was taken.

3. VARIABLE FIELD DEFINITIONS

MCTSI = Module controller/time slot interchange unit.

a = Switch module (SM) number.

b = MCTSI side.

c = Reporting message handler identifier. Valid value(s):
MH0 = Message handler 0.
MH1 = Message handler 1.
MH2 = Message handler 2.

d = Recovery action. Valid value(s):
CEI = Critical error interrupt.
OSR = Operational software restart.
RPI = Return to point of interrupt.
UNK = Unknown recovery action requested.

e = Event number.

f = Termination report. Valid value(s):
ABORTED = The indicated recovery action did not complete before being interrupted by another stimulus.
COMPLETED = The indicated or requested action has completed.

= Critical error trigger reason. Valid value(s):
EX-DCF-ERR = Excessive defensive check failure requested OSRs.
EX-FR-ERR = Fault recovery critical error request.
EX-OSR-ERR = Excessive error stimulus.
= The software error code triggering the event. Refer to the Asserts manual for specific code information.

= For defensive check failure errors, the audit that was scheduled. Valid value(s):
name = The 'name' audit was scheduled. Refer to the APP:AUDITS appendix in the Audits manual.
NONE = No audit was scheduled from this error.

= Mode in which audit is being run. Valid value(s):
DEM-MODE = Demand or nonsegmented mode takes no real-time breaks.

= SM event number.

= Failing address.

= Operational software job executing when the error occurred. Valid value(s):
AU = Routine audits.
CM = Communication package.
INIT = Processor initialization.
MTUP = Mate update.
OE = Operating environment.
PLNK = Peripheral link for MH1 or MH2.
QL = Quad-link layer 2 manager.
RHS = Routine hashsum checks.
SI = System integrity.
UNK = Unknown or indeterminable running job.

= State of the communication package for communication links if CLNK is shown, else state of quad-link packet switch (QLPS) link. Valid value(s):
A-RECV = Communication link A was receiving.
A-TRANS = Communication link A was transmitting.
ACTIVE = Communication package was active but the link and action cannot be determined.
B-RECV = Communication link B was receiving.
B-TRANS = Communication link B was transmitting.
BASE = CM was called from the base level environment.
INACTIVE = Communication package was not active.

= The QLPS network number.

= The logical link control block being used at the time of this stimulus.

= Specifies the direction of the message being processed at the time of the assert or fault.
RCV = In the state of processing a message received from the network.
SND = In the state of sending a message to the network.

= The far end network address or endpoint specified during this stimulus.

4. ACTION TO BE TAKEN
Monitor the progress of the software recovery. Initiate manual actions if the recovery does not proceed as expected.

5. ALARMS

None.

[3] INIT MHD a EARLY TERM VFY FAILED d
BLOCKS BLOCKS BLOCKS BLOCKS
i [i] [i] [i]

[4] INIT MHD a ABORTED b
ERROR DATA j k l m n

2. REASON FOR OUTPUT

To report the status of a request to format a moving head disk (MHD). This report may be invoked by either executing an INIT:MHD input message or by the INIT MHD poke.

If the format process was invoked using the INIT MHD poke on the DFSA display page during disk independent operation (DIOP) mode, a REPT:DKDIP message will precede the output message.

Format 4 provides additional error information when an explicit small computer system interface (SCSI) command fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the moving head disk (MHD) drive.

b = Process step or reason code. Valid value(s):

</table>

c = System error code. Refer to APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
d = Number of failures (bad sectors for SMD MHD or bad disk blocks for SCSI disk) found during the verify step.
e = Relative track number of the indicated bad sector. The track number is relative to the beginning of
the disk. It is calculated using all tracks of the disk excluding those tracks mapped out by defect management. This variable field only applies to an SMD MHD.

\( f \) = Physical cylinder number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.

\( g \) = Physical head number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.

\( h \) = Sector number in use when the failure occurred. It is a relative number (0 to 31). This variable only applies to an SMD MHD.

\( i \) = Logical disk block number of the bad disk block found on the SCSI disk driver during the verify stage.

\( j \) = Command completion word; eight hexadecimal digits in the form: AAAABBCC.

\( AAAA \) = SCSI job block (SJB) completion code. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.

\( BB \) = Status byte. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.

\( CC \) = Not used.

\( k \) = First word of extended sense data (ESD); eight hexadecimal digits in the form: AABBCDDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.

\( AA \) = Byte 0 of ESD.

\( BB \) = Byte 1 of ESD.

\( CC \) = Byte 2 of ESD.

\( DD \) = Byte 3 of ESD.

\( l \) = Second word of ESD; eight hexadecimal digits in the form: AABBCDDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.

\( AA \) = Byte 4 of ESD.

\( BB \) = Byte 5 of ESD.

\( CC \) = Byte 6 of ESD.

\( DD \) = Byte 7 of ESD.

\( m \) = Third word of ESD; eight hexadecimal digits in the form: AABBCDDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.

\( AA \) = Byte 8 of ESD.

\( BB \) = Byte 9 of ESD.

\( CC \) = Byte 10 of ESD.

\( DD \) = Byte 11 of ESD.

\( n \) = Fourth word of ESD; eight hexadecimal digits in the form: AABBCDDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.

\( AA \) = Byte 12 of ESD.

\( BB \) = Byte 13 of ESD.

\( CC \) = Byte 14 of ESD.
4. **ACTION TO BE TAKEN**

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and retry the input request.

A termination report specifying a verification failure indicates that format information on the disk media could not be read, or is incorrect and could not be corrected. This disk media should not be used until the problem is corrected. For an SMD MHD, the HEAD and TRACK information is output to help determine if the problem is with the MHD (head alignment) or in the disk media (bad surface).

If Format 4 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data and contact the next level of technical support to aid in determining the cause of the error condition.

5. **ALARMS**

This alarm may be a manually-requested report or an automatically-generated report.

<table>
<thead>
<tr>

e = Facility number.

f = Status of command. Valid value(s):
   CIRCUIT IS BUSY = The request failed because specified circuit is busy with another request.
   CIRCUIT NOT EQUIPPED = The request failed because specified circuit was not found in data base.
   CIRCUIT STATE INVALID = The request failed because specified circuit was not in service.
   COMPLETED = Request has been successfully completed.
   DATA BASE ERROR = The request failed because of data base errors.
   REQUESTED RESOURCE UNAVAILABLE = The request failed because of unavailable resources.
   SOFTWARE ERROR = The request failed because of software errors.
   SC UNIT NOT EQUIPPED = The request failed because signaling converter is not equipped.

g = DNU-S number.
h = Data group number.
i = STE facility number.
j = STS facility number.
k = VT1.5 facility group number.
l = VT1.5 facility member number.

4. ACTIONS TO BE TAKEN

Retry INIT:SC input message when variable e indicates failure* for reason other then unit not being equipped.

5. ALARMS

None.

RC/V View(s):

8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]
5.5 (TRUNK MEMBER)
INIT:SCCP

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

[1] INIT SCCP SM=a b
   LEVEL = c

[2] INIT SCCP SM=a FAILURE
   d e f g h

2. REASON FOR OUTPUT

To print the status of the common channel signaling (CCS) global switching module (GSM) after a signaling
connection control part (SCCP) audit initialization request or the execution of INIT:SCCP input message.

Format 1 is the output message associated with normal SCCP initialization. Format 2 is printed to report the failure
of INIT:SCCP input message, an SCCP audit initialization request, or an SCCP validation initialization request. The
report explains why the command or request was not processed completely.

3. VARIABLE FIELD DEFINITIONS

a = CCS GSM number.
b = Status of the initialization. Valid value(s):
   COMPLETED
   STARTED
c = Initialization level. Valid value(s):
   FULLINIT = Full initialization.
   GTTFIXED = Global title translation (GTT) fixed digit table.
   GTTINFO = GTT information table.
   GTTINIT = All GTT tables (GTTINFO,GTTFIXED,GTTBL and GTTTRAN).
   GTTBL = GTT table.
   GTTTRAN = GTT area table.
   GTTT = GTT type table.
   NETGSM = Network global switching module.
   SCCPINIT = Signaling connection control part.
   SCMGINIT = All SCCP network management (NM) tables (static and dynamic).
   SCMGSTAT = SCCP NM static table.
   SELINIT = Selective initialization.
d = Reason for failure. Valid value(s):
   2 = Building global title translation (GTT) tables.
   3 = Building SCCP NM tables.
   7 = Generating SCCP hashsums.
   8 = Downloading protocol handlers (PHs).
9 = Hashsums.

e = Source of SCCP. Valid value(s):
0 = From SCCP terminal process.
1 = From PHDA system process.

f = Type of initialization. Valid value(s):
0 = Full SCCP initialization.
1 = Full SM initialization.
2 = Selective SM initialization.
3 = All GTT tables initialization.
4 = GTT information table initialization.
5 = GTT fixed digit table initialization.
6 = GTT type table initialization.
7 = GTT translation table initialization.
8 = GTT table initialization.
10 = All SCCP NM tables initialization.
12 = SCCP NM static table initialization.
17 = Network to GSM table initialization.

g = Data values. Valid value(s):
0 = All SCCP data.
1 = GTT data.
2 = SCCP NM data.

h = Failed relation ID.

4. ACTIONS TO BE TAKEN

If SCCP initialization failure occurred, notify the next level of technical support.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

INIT:SCCP
INIT:SM-LVL-EVENT-A

Software Release: 5E14 - 5E15
Message Class: ASRT,INT
Application: 5
Type: Output

1. FORMAT

INIT SM=a,b LVL=c EVENT=d e
  f [g] [h]
  FAILING-ADDR=[i] SM-MODE=j TIME=kk:kk.k
  PROCESS: BG=l,m,n,[o] CM=p,[q] FG=r,[s],[t]

2. REASON FOR OUTPUT

To indicate that a stimulus was received that resulted in a software recovery action in the specified switching module (SM). This message describes the state of the SM at the time of the recovery, the reason for the recovery, and the level of recovery action that was taken.

The ASRT message class is used for defensive check failure errors, otherwise the INT message class is used.

3. VARIABLE FIELD DEFINITIONS

a
  = SM number.

b
  = The side on which the stimulus occurred (0 or 1).

c
  = Level of SM initialization. Valid value(s):
  RPI = Return to point of interrupt.
  SPP = Single process purge.
  UNK = Unknown level of initialization

d
  = Event number.

e
  = Termination report. Valid value(s):
  ABORTED = The indicated job did not complete before being interrupted by another stimulus.
  COMPLETED = The indicated or requested action has completed.

f
  = Triggering event type. Valid value(s):
  DCF-DEFERRED-SPP = A specified non-running process was purged by an ASSERT-C.
  DEF-CHK-FAIL=error-code = Defensive check failure (Assert) error followed by the software error code. Refer to the Assert manual for specific code information.
  FROM-AUDIT-name = The stimulus for this initialization was from errors discovered by the 'name' audit. Refer to the APP:AUDITS appendix in the Audits manual for more detail.
  MANUAL-REQ = A user-initiated initialization request has occurred.
  UNKNOWN = Unknown event type.

g
  = For defensive check failure errors, the audit that was scheduled. Valid value(s):
  AUD-SCHED=name = The 'name' audit was scheduled. Refer to Audits manual for more detailed information or the APP:AUDITS appendix in the Audits manual for more detail.
  NO-AUD-SCHED = No audit was scheduled from this error.
h = Mode in which audit is being run. Valid value(s):
DEM-MODE = Demand or nonsegmented mode, takes no real time breaks.
ELEV-MODE = Elevated audit execution mode.
ROUT-MODE = Routine audit execution mode.

i = Failing address.

j = Mode of the switching module operation (in order of occurrence). Valid value(s):
CONSISTENT = Hardware consistent with software.
ESSENTIAL = Essential jobs operational.
NORMAL = Normal operation.
OPFULL = All jobs are operational.
RAMDYN = Dynamic memory consistent.
RAMTXT = Text and data consistent.
RAMWP = Write protection has been restored.
SYSPROC = All system processes initialized.
UNKNOWN = Mode unknown.

k = Time when the event occurred, in the form minutes: seconds.tenths of a second.

l = Process number of the running background (BG) process in Operating System for Distributive Switching (EVENT).

m = Uniqueness field of the running background process in OSDS.

n = The running background process address.

o = The recovery action taken. Valid value(s):
PURGED = The single target job or process was purged.
RPI = Return to the point of interrupt.
blank = No recovery action taken because the target was not active.

p = State of communication package (CM) foreground. Valid value(s):
A-CR = Synchronous data link controller (SDLC) combined receive interrupt handler was active on SDLC-A.
ACR-ARECV = SDLC-A receive interrupt handler was interrupted by the SDLC-A combined receive interrupt handler, and the SDLC-A combined receive interrupt handler was active at the time of the error.
ACR-ATRANS = SDLC-A transmit interrupt handler was interrupted by the SDLC-A combined receive interrupt handler, and the SDLC-A combined receive interrupt handler was active at the time of the error.
ACR-BRECV = SDLC-B receive interrupt handler was interrupted by the SDLC-A combined receive interrupt handler, and the SDLC-A combined receive interrupt handler was active at the time of the error.
ACR-BTRANS = SDLC-B transmit interrupt handler was interrupted by the SDLC-A combined receive interrupt handler, and the SDLC-A combined receive interrupt handler was active at the time of the error.
A-RECV = SDLC-A receive interrupt handler was active.
A-TRANS = SDLC-A transmit interrupt handler was active.
ACTIVE = CM is active but which action on which link can not be determined.
B-CR = SDLC combined receive interrupt handler was active on SDLC-B.
BCR-ARECV = SDLC-A receive interrupt handler was interrupted by the SDLC-B combined receive interrupt handler, and the SDLC-B combined receive interrupt handler was active at the time of the error.
BCR-ATRANS = SDLC-A transmit interrupt handler was interrupted by the SDLC-B combined receive interrupt handler, and the SDLC-B combined receive interrupt handler was active at the time of the error.
BCR-BRECV = SDLC-B receive interrupt handler was interrupted by the SDLC-B combined receive interrupt handler, and the SDLC-B combined receive interrupt handler was active at the time of the error.
BCR-BTRANS = SDLC-B transmit interrupt handler was interrupted by the SDLC-B combined receive interrupt handler, and the SDLC-B combined receive interrupt handler was active at the time of the error.
B-RECV = SDLC-B was receiving.
B-TRANS = SDLC-B was transmitting.
BASE = CM was sending ethernet messages.
EL-TRANS = CM was receiving ethernet messages.
EL-RECV = CM was called from the base level environment.
HP-RECV = CM was unloading messages from the high priority peripheral MH FIFO.
HP-TRANS = CM was sending messages to the high priority peripheral MH FIFO.
LP-RECV = CM was unloading messages from the low priority peripheral MH FIFO.
LP-TRANS = CM was sending messages to the low priority peripheral MH FIFO.
MTCE-RECV = CM was unloading messages from the MTCE MH FIFO.
MTCE-TRANS = CM was sending messages to the MTCE MH FIFO.
NONE = CM was not active.
OSDS-RECV = CM was unloading messages from the OSDS MH FIFO.
OSDS-TRANS = CM was sending messages to the OSDS MH FIFO.
q = CM foreground recovery action. Valid value(s):
PURGED = The single target job or process was purged.
RPI = Return to the point of interrupt.
r = State of foreground activity. Valid value(s):
CM = Communication package.
INTMON = The system integrity monitor was executing
NONE = Foreground (10 millisecond interrupt) was not being served.
NONPC = Foreground was being served for an indeterminable job other than PC.
OSDS = OSDS work for 10 millisecond interrupt was executing.
PC = Peripheral control foreground was executing.
s = The type of PC foreground activity that was being performed. Default is that no PC foreground jobs were active. Valid value(s):
CCB10T = Channel control buffer (CCB) 10 millisecond timer (1 second clock).
CCB50T = CCB 50 millisecond timer (6 second clock).
CHDB10T = Channel data block (CHDB) 10 millisecond timer (1 second clock).
CHDB50T = CHDB 50 millisecond timer (6 second clock).
CISCAN = Control interface (CI) scanning.
DPOUT = Dial pulse outpulsing.
EBTSCAN = E-bit scanning.
FGCADTL1 = Tone cadencing, timing list 1.
FGCADTL2 = Tone cadencing, timing list 2.
ISLURING = Integrated services line unit analog (ISLU-Z) ringing cadencing.
IQUNLD = Immediate sequence queue unloader.
LCNSCAN = Line concentrator summary scanning.
LUSEQJB = Line unit sequenced job.
MFTTOUT = Multi-frequency (MF) MDR1 outpulsing.
MFMDR1OUT = MH1 and MH2 scanning.
MHSCAN = Multi-frequency (MF) and TOUCH-TONE (TT) outpulsing.
PISCAN = Packet interface scanning.
RINGC = Ringing cycles.
ROHCAD = Receiver off hook (ROH) cadencing.
SD-PULSING = Metallic service unit signal-distribute pulsing.
SPFUNLD = Signal processor queue unloading.
SQUNLD = Sequence queue unloader.
TONECAD = Tone cadencing.
ETONE-NET = Enhanced tone cadencing in the network direction.
ETONE-PER = Enhanced tone cadencing in the peripheral direction.

\( t \) = Recovery action for PC foreground. Valid value(s):
CLEAR = All scheduled jobs were aborted.
PURGED = The single target job or process was purged.
RPI = Return to the point of interrupt.
blank = No recovery action taken because the target was not active.

4. ACTIONS TO BE TAKEN
Monitor the progress of the software recovery.

5. ALARMS
None.

    \item \texttt{PURGED} = The single target job or process was purged.
    \item \texttt{RPI} = Return to the point of interrupt.
  \end{itemize}

\texttt{r} = State of foreground activity. Valid value(s):
  \begin{itemize}
    \item \texttt{CM} = Communication package.
    \item \texttt{INTMON} = The system integrity monitor was executing
    \item \texttt{NONE} = Foreground (10 millisecond interrupt) was not being served.
    \item \texttt{NONPC} = Foreground was being served for an indeterminable job other than PC.
    \item \texttt{OSDS} = OSDS work for 10 millisecond interrupt was executing.
    \item \texttt{PC} = Peripheral control foreground was executing.
  \end{itemize}

\texttt{s} = The type of PC foreground activity that was being performed. Default is that no PC foreground jobs were active. Valid value(s):
  \begin{itemize}
    \item \texttt{CCB10T} = Channel control buffer (CCB) 10 millisecond timer (1 second clock).
    \item \texttt{CCB50T} = CCB 50 millisecond timer (6 second clock).
    \item \texttt{CHDB10T} = Channel data block (CHDB) 10 millisecond timer (1 second clock).
    \item \texttt{CHDB50T} = CHDB 50 millisecond timer (6 second clock).
  \end{itemize}
CISCAN = Control interface (CI) scanning.
DPOUT = Dial pulse outpulsing.
EBTSCAN = E-bit scanning.
FGCADTL1 = Tone cadencing, timing list 1.
FGCADTL2 = Tone cadencing, timing list 2.
ISLURING = Integrated services line unit analog (ISLU-Z) ringing cadencing.
IQUNLD = Immediate sequence queue unloader.
LCNSCAN = Line concentrator summary scanning.
LUSEQJB = Line unit sequenced job.
MFTTOUT = Multi-frequency (MF) MDR1 outpulsing.
MFMDR1OUT = MH1 and MH2 scanning.
MHSCAN = Multi-frequency (MF) and TOUCH-TONE (TT) outpulsing.
PISCAN = Packet interface scanning.
RINGC = Ringing cycles.
ROHCAD = Receiver off hook (ROH) cadencing.
SD-PULSING = Metallic service unit signal-distribute pulsing.
SPFUNLD = Signal processor queue unloading.
SQUNLD = Sequence queue unloader.
TONECAD = Tone cadencing.
ETONE-NET = Enhanced tone cadencing in the network direction.
ETONE-PER = Enhanced tone cadencing in the peripheral direction.
APSSCN = Automatic Protection Switch Scanning.
ESRSCN = Error Source Register Scanning.

\( t \) = Recovery action for PC foreground. Valid value(s):
CLEAR = All scheduled jobs were aborted.
PURGED = The single target job or process was purged.
RPI = Return to the point of interrupt.
blank = No recovery action taken because the target was not active.

4. ACTIONS TO BE TAKEN

Monitor the progress of the software recovery.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

235-600-500  Asserts
235-600-400  Audits
235-105-250  System Recovery Procedures
INIT:SM-LVL-SUM-A

Software Release: 5E14 only
Message Class: INT
Application: 5
Type: Output

1. FORMAT

INIT SM=a  LVL=b  SUMMARY  EVENT=c
  CALL PROCESSING DOWNTIME=dd:dd:dd
  CALLS LOST:STABLE=e  TRANSIENT=f
  SM IS g [LINES=h  TRUNKS=i]
  GSMTYPE=j  SMTYPE=k  SMCONFIG=m  [TMHCOUNT=n]
  [POWER UP – TIME MAY BE INVALID]

2. REASON FOR OUTPUT

To report the impact of a recovery in the specified switching module (SM).

Note: Outages of less than 30seconds duration are not reported by this mechanism but are included in the 24-hour plant report (OP:PLNT24).

3. VARIABLE FIELD DEFINITIONS

a  = SM number reporting recovery action.

b  = Level of SM initialization. Valid value(s):
FI  = Full initialization.
SI  = Selective initialization.

c  = Event number.

d  = Call processing downtime in this SM, in the form hours:minutes:seconds. If this initialization is part of a power up of the SM, or immediately follows a power up, the time reported may be invalid.

e  = Number of stable calls lost due to this recovery. This count is accurate as a count of stable calls lost on selective initialization. For full initializations, this count is an approximation of the effect the recovery had on stable calls, and includes nailed-up connections, etc., that are used for packet and general communication between processors, and may be used by one or more calls.

f  = Number of transient calls lost due to this recovery. This count is used only for selective initialization level of recovery, and is set to zero on SM full initialization.

g  = Equipment state of the SM. Valid value(s):
   IN GROWTH  - The equipment state of the SM in the ODD is in growth. Since an SM in growth has no potential for live traffic, the line and trunk information will not be printed.
   OPERATIONAL, WITH ASSIGNED LINES=h  TRUNKS=i - The equipment state of the SM in the ODD is operational. Line and trunk information will be printed along with this message.

h  = The total number of assigned analog and ISDN lines on the SM printed in decimal. A value of zero indicates that there is no live line traffic on the SM.
i = The total number of assigned trunks on the SM printed in decimal. A value of zero indicates that there is no live trunk traffic on the SM.

j = The GSM type which can be HOST, ISLAND, or NOT GSM.

k = The SM type such as HSM, RSM, etc.

m = The SM configuration such as LOADED, SM2000, etc.

n = The number of CCS Message Transport (CMT) paths that use MH0 in this SM2000 as a Transfer MH. This is not applicable for Classic SMs since TMHs are non-existent for that configuration.

2. REASON FOR OUTPUT

To print a summary of the status of peripheral controller (PC) foreground at the time of recovery, as well as the recovery action taken for fault location and correction.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Processor side (0 or 1).
c = PC foreground activity group:
   CCB10T = Channel control buffer (CCB) 10 ms. timer (1 sec clock).
   CCB50T = CCB 50 ms. timer (6 sec clock).
   CHDB10T = Channel data block (CHDB) 10 ms. timer (1 sec clock).
   CHDB50T = CHDB 50 ms. timer (6 sec clock).
   CISCAN = Control interface (CI) scanning.
   DPOUT = Dial pulse outpulsing.
   EBTSCAN = E-bit scanning.
   ETONE-NET = Enhanced tone cadencing in the network direction.
   ETONE-PER = Enhanced tone cadencing in the peripheral direction.
   FGCADTL1 = Tone cadencing, timing list 1.
   FGCADTL2 = Tone cadencing, timing list 2.
   ISLURING = Integrated services line unit analog (ISLU-Z) ringing cadencing.
   IQUUNLD = Immediate sequence queue unloader.
   LCNSCAN = Line concentrator summary scanning.
   LUSEQJB = Line unit sequenced job.
   MFTTOUT = Multi-frequency (MF) and touch-tone (TT) outpulsing.
   PISCAN = Packet interface scanning.
   RINGC = Ringing cycles.
   ROHCAD = Receiver off hook (ROH) cadencing.
   SD-PULSING = Metallic service unit signal-distribute pulsing.
   SPFUNLD = Signal processor queue unloading.
   SQUNLD = Sequence queue unloader.
   TONECAD = Tone cadencing.

d = Job number identification. Valid value(s):
   - CCB number (0-511) for CCB activity errors.
   - CHDB number (0-511) for CHDB activity errors.
   - Line unit number (0-7) for line unit activity errors.

2. REASON FOR OUTPUT

Prints in response to a LNUPD:LN input message.
Format 1 prints when ALL is specified in the input message and the message failed. Format 2 prints when a-b is specified in the input message and the message failed.

3. VARIABLE FIELD DEFINITIONS

a  = Ring node group number.
b  = Ring node member number.
c  = Reason the update request stopped. Valid values are:
   - UPDATE REQUEST REJECTED, UPDATE ALREADY IN PROGRESS
   - UPDATE REQUEST REJECTED, THE RING IS UNAVAILABLE
   - UPDATE REQUEST REJECTED, IMS INITIALIZATION IN PROGRESS

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

OP:LNUPD
STOP:LNUPD
Output Message(s):

OP : LNUPD
REPT : LNUPD
STOP : LNUPD
41. LOAD
LOAD:ADDR

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

LOAD ADDR a [,OFF b ] c #d

2. REASON FOR OUTPUT

To report the completion status of a LOAD:ADDR input message.

3. VARIABLE FIELD DEFINITIONS

a = Virtual address, in hexadecimal notation (destination of the load).
b = Offset information from input message.
c = Termination report. Valid value(s):
   COMPLETED = LOAD operation has been successfully completed.
   STOPPED NGADDR = The LOAD message was stopped because the address specified is not valid.
   STOPPED NGLOAD = The LOAD message was stopped because some other error occurred.
   STOPPED NGPROT = The LOAD operation was stopped because the destination address does not
                   have write permission granted.
d = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If c is STOPPED NGADDR, recheck the program listings.

If c is STOPPED NGPROT, recheck the destination to verify that it indicates a writable area.

5. ALARMS

None. This is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of
the Output Messages manual.

c = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

d = There are two formats for this field. Valid value(s):

- INVALID PUMPCODE = Pumpcode failed the hashsum check.
- VALID PUMPCODE = Pumpcode has passed the hashsum check.

### 4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried. The pump failure can also be caused by the incompatibility between the pumpcode and firmware. The pump can also fail due to a corrupted pump file. A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

### 5. ALARMS

Manual alarm. This alarm is a manually-requested report.

LOAD:DFC-PUMP
LOAD:DFC-RAM

Output Message(s):

LOAD:DFC-PUMP

Output Appendix(es):

APP:SYSERR
LOAD:LIB

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

LOAD LIB TEAM  a    b    [c]    d

2. REASON FOR OUTPUT

To report the completion status of a manually issued LOAD:LIB input message.

3. VARIABLE FIELD DEFINITIONS

a = Team number.
b = Administrative module (AM) flag. Valid value(s):
Y = AM is reporting.
N = AM is not reporting.
c = Switching module (SM) number. Default is that SM is not reporting.
d = Results. Valid value(s):
COMPLETED
STOPPED - BAD/MISSING INFO FILE
STOPPED - NO BUFFER SPACE AVAILABLE
STOPPED - PROGRAM NAME NOT ON THE DISK
STOPPED - PROCESSOR LOADED BY A DIFFERENT TEAM
STOPPED - LOAD STILL IN PROGRESS
STOPPED - PROGRAM STARTED
STOPPED - PAGING ABORTED BY PAGING SUPERVISOR
STOPPED - UNABLE TO LOAD PROGRAM

4. ACTION TO BE TAKEN

Since this is a response to a manual request, no action is required. Normally, testing would proceed from this point.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

LOAD:LIB
LOAD:MHD-DEFECT

Software Release: 5E14 and later
Message Class: DSKUTL
Application: 5,3B
Type: Output

1. FORMAT

   | DD | Byte 15 of ESD. |

4. ACTIONS TO BE TAKEN
A termination report that specifies noncompletion provides an error code that usually indicates a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and retry the input request.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk against the following.

The number of GROWN defects should be no more than a recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) should not exceed the specification for the disk drive. If the disk has more than the number of defects allowed, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) on a cylinder should not exceed the recommended limit. If the number of defects on a cylinder is larger than the limit, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the administrative module (AM).

The SCSI disk should be replaced if there is any warning output related to the above recommendations.

Note: For SCSI disk, after new defect blocks are loaded, all the previous information about bad blocks (defects) becomes invalid. For example, bad logical block number 3 is not physically the same block after being loaded; in fact, it is now a good block number 3. Therefore, only a new defect (or defects) detected since the previous LOAD:MHD command should be included in the specfile used for loading new defects into the GROWN defect list.

If Formats 7 or 8 print, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data and contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Input Message(s):

LOAD:MHD-FIRMWARE

Output Appendix(es):

APP:DFC-A
APP:OMDB-X-REF
APP:SYSERR
LOAD:MHD

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1]  LOAD MHD a FROM TD b c [d]

__________________________________________________________________

[2]  LOAD MHD a FROM TD b c [d]
   SESSION e VOLUME f

__________________________________________________________________

2. REASON FOR OUTPUT

To indicate status of restoring a disk from tape during DISK INDEPENDENT OPERATION in response to the LOAD
MHD poke on the data file system access (DFSA) page.

3. VARIABLE FIELD DEFINITIONS

a

= MHD unit number to be restored.

b

= Logical tape unit name from which a disk will be restored, for example /dev/mt18.

c

= Status. Valid value(s):

   ABORTED = The message aborted due to error(s).
   COMPLETED = The message completed successfully.
   ERROR = The message aborted due to tape error.
   IN PROGRESS = Periodic message indicating normal progress.
   STARTED = Poke parameters accepted from the DFSA page.
   STOPPED = The process stopped in response to a poke request.

d

= Error codes. Valid value(s):

</table>

e = Multi-volume DAT session number.

f = Multi-volume DAT volume number.

### 4. ACTION TO BE TAKEN

If the message indicates that there is a problem with the tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing the tape drive, verify that the tape is loaded and the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

### 5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

LOAD PMEM a #b
ADDRESS (HEX) OLD VALUE (HEX) <- NEW VALUE (HEX)
[c d] <- [e]

2. REASON FOR OUTPUT

To report the completion status of a LOAD:PMEM input message.

3. VARIABLE FIELD DEFINITIONS

a = Termination report. Valid value(s):
COMPLETED = LOAD operation has been successfully completed.
STOPPED NGADDR = The LOAD message was stopped because the address specified is not valid.
STOPPED NGLOAD = The LOAD message was stopped because some other error occurred.
STOPPED NGPROT = The LOAD operation was stopped because the destination address does not have write permission granted.

b = Generic access package (GRASP) execution sequence number.

c = Address of word of physical memory that was modified.

d = Original value of specified word of physical memory.

e = New value of specified word of physical memory.

4. ACTION TO BE TAKEN

Application: 5,3B
Type: Output

1. FORMAT

[1] LOAD REG a [,OFF b] c #d

[2] LOAD REG ABT
LOAD INV REG/UVAR VALUE

2. REASON FOR OUTPUT

To report the completion status of a LOAD:REG input message.

Format 2 indicates that this action-list has been aborted. The register or utility variable (UVAR) name is invalid. Refer to the WHEN:RUTIL input message for valid register or UVAR names.

3. VARIABLE FIELD DEFINITIONS

| a  | = Register (destination of the load). |
| b  | = Offset information from input message. |
| c  | = Termination report. Valid value(s):
|    | COMPLETED = LOAD operation has been successfully completed.
|    | STOPPED NGADDR = The LOAD message was stopped because the address specified is not valid.
|    | STOPPED NGLOAD = The LOAD message was stopped because some other error occurred.
|    | STOPPED NGPROT = The LOAD operation was stopped because the destination address does not have write permission granted. |
| d  | = Generic access package (GRASP) execution sequence number. |

4. ACTION TO BE TAKEN

| If 'c' = STOPPED NGADDR | Action: Recheck to program listings. |
| STOPPED NGPROT | Recheck the destination to verify that it indicates a writable area. |

5. ALARMS

None. This is a manually-requested report.

Type: Output

1. FORMAT

[1] LOAD RUTIL ABT

[2] LOAD RUTIL COMPL

2. REASON FOR OUTPUT

To show the status of the requested load. Format 1 indicates an error condition. Format 2 indicates a successful LOAD:RUTIL input message has been performed.

3. VARIABLE FIELD DEFINITIONS

a = Length specified.
b = Number of data items provided.
c = Value of the global variable errno.
d = Return code from the ring generic access package (RGRASP) kernel.
e = Node identifier of the concerned common network interface (CNI) ring node.
f = Abort message. Valid value(s):
   LENGTH a NUM DATA BYTES b MISMATCH
   LOAD LENGTH a INVALID
   MKNOD() FAILURE c
   OPEN() FAILURE c
   READ() FAILURE d (ERRNO = c)

4. ACTIONS TO BE TAKEN

On error conditions, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

LOAD:UT-CMP

Software Release: 5E14 and later
Message Class: UT
Application: 5
Type: Output

1. FORMAT

[1] LOAD UT CMP=a-b {MATE|PRIM} ADDR c f

__________________________________________________________________

[2] LOAD UT CMP=a-b {MATE|PRIM} f
 SYMIDX d GVAR e

__________________________________________________________________

2. REASON FOR OUTPUT

To report the status of the response to the LOAD:UT-CMP input message to load a value into the memory of a specified communication module processor (CMP).

Format 1 reports the status of a LOAD:UT-CMP input message defined by a physical address.

Format 2 reports the status of a LOAD:UT-CMP input message defined by a symbolic reference.

3. VARIABLE FIELD DEFINITIONS

MATE = Message was executed in the standby CMP.
PRIM = Message was executed in the active CMP.
a = Message switch side.
b = CMP number.
c = Absolute address (ADDR) specified in the input message.
d = Symbol index number (SYMIDX) of the specified symbol either specified in the input message or determined by the UT code based on the symbol name ‘e’. If an invalid input message is entered, the symbol index number will be "-1".
e = Symbolic name (GVAR) specified in the input message or determined by the UT code based on the symbol index number ‘d’. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a ‘*’ to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
f = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If appropriate, correct the specified input message and repeat.

5. ALARMS
None.

[2] OP ABD IN PROGRESS

[3] OP ABD COMPLETED
   MHD  STATUS  REASON  DATE
   b  c  [d[e]]  [f]

2. REASON FOR OUTPUT

To display a list of available alternate boot disk units and specify whether or not the unit may be used as a boot disk. If a unit is determined to be a valid boot disk, the date of the last update to the disk will be output if applicable. Otherwise, a special code will be output to explain why the unit cannot be used as a boot disk or why a determination could not be made.

Note: Only data from the primary partitions is used to determine if a unit is a valid boot disk. No checking is done on the backup partitions.

3. VARIABLE FIELD DEFINITIONS

a = Error message. Valid value(s):
   ALTERNATE BOOT DISK FEATURE UNAVAILABLE
   BOOTDISKCHK PROCESS TERMINATED WITH EXIT VALUE g
   CANNOT ATTACH TO ECD DATA SEGMENTS
   CANNOT CREATE BOOTDISKCHK PROCESS
   CANNOT CREATE DATA FILE FOR REPORT
   CANNOT GET ECD DATA SEGMENTS
   CANNOT GET ECDORG RID
   CANNOT SEND MESSAGE TO BOOTDISKCHK PROCESS
   DID NOT RECEIVE MESSAGE FROM BOOTDISKCHK PROCESS
   DID NOT RECEIVE USER EVENT FROM BOOTDISKCHK PROCESS
   HARDWARE PLATFORM NOT VALID FOR ALTERNATE BOOT DISK
   NO UCB RID FOUND FOR DEVICE WITHIN THE ECD

b = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for additional information.

c = Boot status. Valid value(s):
   NO = The unit may not be used as a a boot disk.
   YES = The unit may be used as a a boot disk.
d = A code to indicate why the unit was not marked as a valid boot disk. Refer to the APP:BOOTDISKCHK appendix in the Appendixes section of the Output Messages manual for additional information.

e = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual for additional information.

f = Date when the boot disk was last updated.

g = Exit value of the /unitutil/disk/bootdiskchk process. Refer to the APP:BOOTDISKCHK appendix in the Appendixes section of the Output Messages manual for additional information.

4. ACTIONS TO BE TAKEN

If the description of the error is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   CCH d . . . . . d

2. **REASON FOR OUTPUT**

   To display a two hour history of attempts per circuit per hour (ACH) and connection per circuit per hour (CCH) taken every five minutes for the specified trunk group.

3. **VARIABLE FIELD DEFINITIONS**

   a  
   = Termination report. Valid value(s):  
   COMPLETED = Command successfully completed.  
   ABORTED = System error.

   b  
   = Trunk group number.

   c  
   = A five minute display of ACH for this trunk group. Each ACH value ranges from 0 to 254. ACH values in excess of 254 are indicated by 255.

   d  
   = A five minute display of CCH for this trunk group. Each CCH value ranges from 0 to 254. CCH values in excess of 254 are indicated by 255.

   A maximum of 24 values is reported from both ACH and CCH, starting from the most recent five minute in reverse chronological order up to two hours.

2. REASON FOR OUTPUT

To display the status of automatic call gapping (ACG) controls for the requested application. Up to 64 active controls will be printed starting from the input control ID (variable 'd'). If the end of the list is reached before this output's maximum is reached, the search stops. This is a response to the OP:ACG input message.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
   COMPLETED = This is the only or last of a series of messages.
   CONTINUED = This is the next of a series of messages.
   STARTED = This is the first of a series of messages.

b = Application type. Valid value(s):
   ASP = Advanced services platform release 0.1 application.
   NS800 = Number services 800 application.

c = The current time in milliseconds. The format being displayed is the same as in duration (variable 'l').

d = The input control identifier.

e = The processor from which the list comes (1 to 192 for GSMs; 0 for AM/DLN)

f = The total number of controls in the whole list.

g = The control identifier.

h = The digits of the ACG control.

i = Translation type (for ASP controls only).

j = Cause of the ACG control. Valid value(s):
**MASS** = Mass calling control.
**OUTBND** = Out of band control.
**OVLD** = SCP overload control.
**SOCC** = SMS originated code control.
**VACCD** = Vacant code control.

\[
k\] = Gap interval in milliseconds. For infinite gap, INF is printed.

\[
l\] = Duration of the control in milliseconds. The format being displayed is the same as in current time (variable 'c'). For infinite duration, INF is printed. The expired controls are displayed and can be identified by comparing the duration (variable 'l') with the current time (variable 'c'). If 'c' > 'l' then the control is expired and no longer having any effect.

\[
m\] = Transaction identifier (for NS800 controls only).

### 4. ACTIONS TO BE TAKEN

The message is a response to a request from an input message. No action is required.

### 5. ALARMS

None.

d = Date the request was entered into the ACSR queue.

e = Time the request was entered into the ACSR queue, in the form hours:minutes.

f = Number of records printed, one record for each request.

g = File name.

h = Office equipment (OE) type. Valid value(s):
  G = GEN, GAMA IDCU OE type.
  I = LCEN, ISLU OE type.
  K = LCKEN, ISLU2 OE type.

i = Switching module (SM) number.

j = ISLU number.

k = LGC number.

l = Line card number.

m = IDCU number.

n = RT number.

o = Line number.

p = ISLU2 number.

q = Line group number.

r = Line board number.
s = Line circuit number.

4. ACTION TO BE TAKEN

For Formats 1, or 2, no action is required.

For Format 3, re-enter the OP:ACSR input message using a valid Directory Number/TN.

For Format 4, no action is required. An audit has been scheduled to correct any data inconsistency.
For Format 5, determine why the file could not be created. Check the number of blocks and number of inodes available in the directory.

For Format 6, no action is required.

For Format 7, re-enter the OP:ACSR input message using a 10 digit Directory Number/TN.

For Format 8, re-enter the OP:ACSR input message using a valid Directory Number/TN.

For Format 9, re-enter the OP:ACSR input message using a valid 7 or 10 digit Directory Number/TN.

For Format 10, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to the OP:ACT input message and give device information specific to administrative module (AM) hardware units on requested communities. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. AM unit names are listed in the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Output Messages manual.

b = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes of the Output Messages manual.

c = Subunit name, if $a = \text{CU}$. AM control unit (CU) subunit names are listed in the APP:MEM-NUM-CU
appendix in the Appendixes section of the Output Messages manual.

\[ d \] = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Output Messages manual.

\[ e \] = The current maintenance state of the unit is indicated by the following identifiers. Valid value(s):
- ACT = Active units.
- GROW = Units being grown.
- INIT = Initializing units.
- OFL = Offline units.
- OOS = Out-of-service units.
- STBY = Standby units. Units being grown.
- UNAV = Unavailable units.
- UNEQIP = Unequipped units.

\[ f \] = Current inhibit status of the associated error source. Valid value(s):
- ALW = Allowed.
- INH = Inhibited.

\[ g \] = The results of the last diagnostic on the unit. Valid value(s):
- ABT = Aborted diagnostics.
- ATP = All tests passed.
- CATP = Conditional all tests passed.
- NTR = No tests were run.
- STF = Some tests failed.

\[ h \] = Error number. Valid value(s):
- 9 = Cannot attach to plant measurement library.
- 1 = Cannot open equipment configuration database (ECD) sequence.
- 2 = Cannot sequence unit control blocks (UCBs).

\[ i \] = Retry the message later because:
- CAN'T CREATE FILE IN /tmp
- CAN'T GET DATABASE RECORD ID
- CAN'T SEQUENCE DATABASE

\[ j \] = Temporary output file name.

\[ k \] = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the requested conversion from the AUTOPLEX® mobile phone service (AMPS) facility identifier to its external facility circuit identifier and vice-versa. The AMPS facility identifier is a decimal number. The external facility circuit representation is an equipment number for a digital line and trunk unit (DLTU) facility, a digital networking unit - synchronous optical network (SONET) (DNU-S) facility, or an optical interface unit (OIU) facility.

3. VARIABLE FIELD DEFINITIONS

a = Echo of the input facility type. Valid value(s):
   AFAC=b
   FAC=c-d-e-f
   DS1SFAC=c-g-h-i-j-k-l
   DS1=c-m-n-o-p-k-l

b = Facility type that variable 'a' is mapped to. Valid value(s):
   AFAC=b
   FAC=c-d-e-f
   DS1SFAC=c-g-h-i-j-k-l
   DS1=c-m-n-o-p-k-l

b = AMPS facility identifier.
c = SM number.
d = DLTU number.
e = Digital facilities interface (DFI) number.
f = FAC number.
g = DNU-S number.
h = Data group (DG) number.
i = SONET termination equipment (STE) facility number.
j = Synchronous transport signal (STS) facility number.
k = Virtual tributary group (VTG) number.
l = Virtual tributary member (VTM) number.
\( m \) = OIU number.
\( n \) = Protection group (PG) number.
\( o \) = OC3 number.
\( p \) = STS1 number.

2. REASON FOR OUTPUT

To provide the status of automatic line evaluation (ALE) system control parameters and resource usage.

The control parameters are grouped into three classes:

A  Automatic ALE session output controls:

The parameters LEVEL1, LEVEL2, PRINT, and PER=REPT allow the controls used for generating output information for the automatically requested ALE sessions. These options determine which counts are to be used for the session and where the output is to be directed. These controls have no bearing on the output of information due to a manually requested ALE session.
The default values for these options are restored on an administrative module (AM) full initialization. No other type of initialization will change the requested settings.

B Switching module (SM) controls:

The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any of the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.

Status requests that immediately follow the inhibiting (INH:ALE) of integrated services digital network (ISDN) protocol channels may give an erroneous indication that level 1 performance monitoring has been inhibited. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not be inhibited for a period of up to 5 minutes. Status requests that immediately follow the allowing (ALW:ALE) of ISDN protocol channels may give an erroneous indication that level 1 performance monitoring is operational. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check block errors, may not resume for a period of up to 5 minutes.

If the PER generation parameter is inhibited, then no PERs will be recorded for any ISDN protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel determines if PERs are recorded for that channel.

C Line/trunk controls

Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks.

The level 1 control parameters consist of an overall level 1 inhibit, hourly alert generation, daily alert generation, interval report generation, and daily report generation. If the overall level 1 inhibit is active, then all level 1 performance monitoring activities for the U-interface are disabled. If the hourly alert generation inhibit is active, then the reporting of hourly alerts to the ROP will be suppressed for the interface. If the daily alert generation inhibit is active, then the reporting of daily alerts to the ROP will be suppressed for the interface. If the interval report generation inhibit is active, then the interface will not contribute to the interval report, if applicable. If the daily report generation inhibit is active, then the interface will not contribute to the daily report, if applicable. One or more of the level 1 controls may be active. This information is only applicable to U-interface DSLs.

Status requests that immediately follow the inhibiting (INH:ALE) of ISDN protocol channels may give an erroneous indication that level 1 performance monitoring has been inhibited. The actual counting of level 1 errored seconds, severely errored seconds, and CRC BE, may not be inhibited for a period of up to 5 minutes. Status requests that immediately follow the allowing (ALW:ALE) of ISDN protocol channels may give an erroneous indication that level 1 performance monitoring is operational. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check block errors, may not resume for a period of up to 5 minutes.

If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel.

In addition to the INH:ALE input message, PER generation may be inhibited as a result of digital
loopback testing (TST:DSL), routine exerciser (REX), or mechanized loop testing (MLT). This inhibit condition will exist for the duration of the test being performed for the line/trunk. After completion of the test, the PER inhibit condition will remain for a period of three to six minutes. After this period has expired, the inhibit condition will be cleared if the status prior to the invocation of the test was "allowed". If the previous status was not "allowed", then the line/trunk will remain inhibited.

Use the ALW:ALE input message to clear the inhibit condition prior to the expiration of the three to six minute period.

Six formats are used to provide the status information:

Format 1 provides the status information for the LEVEL1, LEVEL2, ROP, and PER REPT parameters that are used to control the automatic ALE report generation.

Format 2 provides a status message for the progress of the inhibit reports.

Format 3 provides the status of the SM control parameters.

Format 4 provides the status of the line/trunk control parameters.

Format 5 reports the capacity of the PER logging buffer resident in the SM physical memory. In addition, the current indication status of the PER logging buffer will be reported.

Format 6 provides the number of message segments printed for PER generation inhibit reports for multiple ISDN protocol channels.

3. VARIABLE FIELD DEFINITIONS

L1-PM = Level 1 protocol monitoring is inhibited for this SM.

NOT AVAILABLE = Inhibit status information cannot be obtained for this SM.

a = Option status. Valid value(s):
ALW = Option allowed.
INH = Option inhibited.

b = Status message. Valid value(s):
ABORTED–COMMUNICATION FAILURE = The current status request was stopped because of failures in inter-process message transmission.
ABORTED–DATABASE ERROR = The current status request was stopped due to database access failure in the AM.
ABORTED–INVALID SM = The requested SM was invalid.
COMPLETED = The status request was completed.
COMPLETED–NO DLS EQUIPPED/ASSIGNED = The SM to retrieve the status did not have any ISDN protocol channels assigned.
INHIBITS STARTED = A status request was started.
NOT STARTED–INVALID PORT = A status request was made for a non-existent channel.
NOT STARTED–NON–PRIMARY DN SPECIFIED = A status request was made for a DN that was not a primary DN.
NOT STARTED–NON–UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.
NOT STARTED–SM UNAVAILABLE = A status request was made where the channel was on an SM that was not fully operational.
PER LOG CAPACITY REPORT STARTED = A PER logging buffer capacity request was started.
STOPPED = A PER logging buffer capacity request or status request was stopped.

c = Segment number.
d = Switching module number.
e = Level 1 performance monitoring status. Valid value(s):
   L1PM-ALW = Level 1 performance monitoring is allowed.
   L1PM-INH = Level 1 performance monitoring is inhibited.

f = PER generation status. Valid value(s):
   PER-ALW = PER generation is allowed.
   PER-INH = PER generation is inhibited.

g = Equipment number. Valid value(s):

h = Digital line and trunk unit (DLTU) number.
i = Digital facility interface number.
j = Digital channel number.
k = Integrated services line unit number.
l = Line group controller number.
m = Line card number.
n = Integrated digital carrier unit number.
o = Remote terminal (RT) number.
p = RT line number.
q = Primary/protection identifier.
r = Protocol handler (PH) channel group number.
s = PH channel group member number.
t  = Channel type. Valid value(s):  
  B1  = Channel B1.  
  D   = D-channel.  

u  = Interface type. Valid value(s):  
  A   = ANSI® U-Interface.  
  ADT = Autoplex Data Trunk.  
  BC  = Frame Relay Bearer Channel.  
  FD  = EOC or TMC facility data link.  
  SH  = Speech handler trunk.  
  T   = T-interface.  
  TK  = Digital trunk.  
  U   = Alternate mark inversion (AMI) U-interface.  
  XT  = X.25 link over T1 trunk.  

v  = Percentage of PER logging buffer currently in use.  

w  = Buffer usage indication level. Valid value(s):  
  CAUTION = First level of indication preset at 80% capacity.  
  FULL    = Third and final level of indication preset at 100% capacity.  
  WARNING = Second level of indication preset at 90% capacity.  

x  = Date the report was prepared, in the form month/day.  

y  = Time the report was prepared, in the form hours:minutes:seconds.  

z  = One of the following:  
  INHIBITS = ALE inhibits report.  
  PER LOG CAPACITY = PER logging buffer capacity report.  

a^1  = Completion status:  
  COMPLETED = Operation successfully completed.  
  STOPPED   = Operation stopped.  

b^1  = Number of segments printed.  

c^1  = Integrated service line unit 2 (ISLU2) number.  

d^1  = Line group number.  

e^1  = Line board number.  

f^1  = Line circuit number.  

g^1  = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.  

h^1  = Data group (DG) number.  

i^1  = Synchronous transport signal (STS) facility number.
4. ACTIONS TO BE TAKEN

Inspect the data in this output message. If the status of the indicated parameters is incorrect, use the INH:ALE and ALW:ALE input messages or RC/V Views 8.1 and 22.15 to correct the status of the incorrect parameters.

5. ALARMS

None.

2. REASON FOR OUTPUT

To provide the status of automatic line evaluation (ALE) system control parameters and resource usage.
The control parameters are grouped into three classes:

(A) Automatic ALE session output controls:

The parameters LEVEL1, LEVEL2, PRINT, and PER=REPT allow the controls used for generating output information for the automatically requested ALE sessions. These options determine which counts are to be used for the session and where the output is to be directed. These controls have no bearing on the output of information due to a manually requested ALE session.

The default values for these options are restored on an administrative module (AM) full initialization. No other type of initialization will change the requested settings.

(B) Switching module (SM) controls:

The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any of the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.

Status requests that immediately follow the inhibiting (INH:ALE) of integrated services digital network (ISDN) protocol channels may give an erroneous indication that level 1 performance monitoring has been inhibited. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not be inhibited for a period of up to 5 minutes. Status requests that immediately follow the allowing (ALW:ALE) of ISDN protocol channels may give an erroneous indication that level 1 performance monitoring is operational. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check block errors, may not resume for a period of up to 5 minutes.

After the introduction of PCF on PHE2 feature, ALE doesn't provide performance monitoring error count information on A10/A11/ETHERNET protocols, but PER is able to provide the protocol error histories on A10/A11/ETHERNET protocols on PCF. There are two kind of PERs: level 2 and level 7. Level 2 PER retrieves the ethernet protocol error histories stored in the PH. Level 7 retrieves A10/A11 error histories stored in PH.

If the PER generation parameter is inhibited, then no PERs will be recorded for any ISDN protocol channels or PCF trunks on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel or the individual PCF determines if PERs are recorded for that channel or PCF PH.

(C) Line/trunk controls:

Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks, as well as the PCF trunks.

The level 1 control parameters consist of an overall level 1 inhibit, hourly alert generation, daily alert generation, interval report generation, and daily report generation. If the overall level 1 inhibit is active, then all level 1 performance monitoring activities for the U-interface are disabled. If the hourly alert generation inhibit is active, then the reporting of hourly alerts to the ROP will be suppressed for the interface. If the daily alert generation inhibit is active, then the reporting of daily alerts to the ROP will be suppressed for the interface. If the interval report generation inhibit is active, then the interface will not contribute to the interval report, if applicable. If the daily report generation inhibit is active, then the interface will not contribute to the daily report, if applicable. One or more of the level 1 controls may be active. This information is only applicable to U-interface DSLs.
Status requests that immediately follow the inhibiting (INH:ALE) of ISDN protocol channels may give an erroneous indication that level 1 performance monitoring has been inhibited. The actual counting of level 1 errored seconds, severely errored seconds, and CRC BE, may not be inhibited for a period of up to 5 minutes. Status requests that immediately follow the allowing (ALW:ALE) of ISDN protocol channels may give an erroneous indication that level 1 performance monitoring is operational. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check block errors, may not resume for a period of up to 5 minutes.

If the PER generation inhibit is active, then no PERs will be recorded for either the ISDN protocol channel or the PCF trunks.

In addition to the INH:ALE input message, PER generation for ISDN channels may be inhibited as a result of digital loopback testing (TST:DSL), routine exerciser (REX), or mechanized loop testing (MLT). This inhibit condition will exist for the duration of the test being performed for the line/trunk. After completion of the test, the PER inhibit condition will remain for a period of three to six minutes. After this period has expired, the inhibit condition will be cleared if the status prior to the invocation of the test was "allowed". If the previous status was not "allowed", then the line/trunk will remain inhibited.

Use the ALW:ALE input message to clear the inhibit condition prior to the expiration of the three to six minute period.

Six formats are used to provide the status information:

Format 1 provides the status information for the LEVEL1, LEVEL2, ROP, and PER REPT parameters that are used to control the automatic ALE report generation.

Format 2 provides a status message for the progress of the inhibit reports.

Format 3 provides the status of the SM control parameters.

Format 4 provides the status of the line/trunk control parameters.

Format 5 provides the status of the PCF control parameters.

Format 6 reports the capacity of the PER logging buffer resident in the SM physical memory. In addition, the current indication status of the PER logging buffer will be reported.

Format 7 provides the number of message segments printed for PER generation inhibit reports for multiple ISDN protocol channels.

3. VARIABLE FIELD DEFINITIONS

L1-PM = Level 1 protocol monitoring is inhibited for this SM.

NOT AVAILABLE = Inhibit status information cannot be obtained for this SM.

a = Option status. Valid value(s):
ALW = Option allowed.
INH = Option inhibited.

b = Status message. Valid value(s):
ABORTED-COMMUNICATION FAILURE = The current status request was stopped because of failures in inter-process message transmission.
ABORTED-DATABASE ERROR = The current status request was stopped due to database access
failure in the AM.

ABORTED-INVALID SM = The requested SM was invalid.
COMPLETED = The status request was completed.
COMPLETED-NO DSLs EQUIPPED/ASSIGNED = The SM to retrieve the status did not have any ISDN protocol channels assigned.
INHIBITS STARTED = A status request was started.
NOT STARTED-INVALID INPUT FOR PCF = A single PCF PER generation allow request was made for a trunk member or a PSUEN.
NOT STARTED-INVALID PORT = A status request was made for a non-existent channel.
NOT STARTED-NON-PRIMARY DN SPECIFIED = A status request was made for a DN that was not a primary DN.
NOT STARTED-NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.
NOT STARTED-SM UNAVAILABLE = A status request was made where the channel was on an SM that was not fully operational.
PER LOG CAPACITY REPORT STARTED = A PER logging buffer capacity request was started.
STOPPED = A PER logging buffer capacity request or status request was stopped.

h &= \text{Digital line and trunk unit (DLTU) number.}
\end{align*}\]
i = Digital facility interface number.

j = Digital channel number.

k = Integrated services line unit number.

l = Line group controller number.

m = Line card number.

n = Integrated digital carrier unit number.

o = Remote terminal (RT) number.

p = RT line number.

q = Primary/protection identifier.

r = Protocol handler (PH) channel group number.

s = PH channel group member number.

t = Channel type. Valid value(s):
B1 = Channel B1.
D = D-channel.

u = Interface type. Valid value(s):
3G1XPD = 3G-1X high speed packet data trunk.
A = ANSI® U-interface.
ADT = AUTOLEX® data trunk.
BC = Frame relay bearer channel.
FD = EOC or TMC facility data link.
OT = OIU trunk.
SH = Speech handler trunk.
T = T-interface.
TK = Digital trunk.
U = Alternate mark inversion (AMI) U-interface.
XP = Emulated DTE on a PSU (without T1).
XT = X.25 link over T1 trunk.

v = Percentage of PER logging buffer currently in use.

w = Buffer usage indication level. Valid value(s):
CAUTION = First level of indication preset at 80% capacity.
FULL = Third and final level of indication preset at 100% capacity.
WARNING = Second level of indication preset at 90% capacity.

x = Date the report was prepared, in the form month/day.

y = Time the report was prepared, in the form hours:minutes:seconds.
z
  = Valid value(s):
  INHIBITS   = ALE inhibits report.
  PER LOG  CAPACITY = PER logging buffer capacity report.

a
  = Completion status. Valid value(s):
  COMPLETED   = Operation successfully completed.
  STOPPED     = Operation stopped.

b
  = Number of segments printed.

c
  = Integrated service line unit 2 (ISLU2) number.

d
  = Line group number.

e
  = Line board number.

f
  = Line circuit number.

g
  = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

h
  = Data group (DG) number.

i
  = Synchronous transport signal (STS) facility number.

j
  = Virtual tributary group (VTG) number.

k
  = Digital signal level 0 (DS0) number.

l
  = Packet switching unit (PSU) number.

m
  = PSU shelf number.

n
  = PSU channel group number.

o
  = Access interface unit (AIU) number.

p
  = AIU pack number.

q
  = AIU circuit number.

r
  = SONET termination equipment (STE) facility number.

s
  = Virtual tributary member (VTM) number.

t
  = Peripheral control and timing (PCT) line and trunk unit number (PLTU)

u
  = PCT facility interface (PCTFI) number.

v
  = Tributary number (T1FAC).

w
  = Channel number (CHAN).

x
  = Virtual BRI line number.
y^1 = Virtual trunk facility (FAC) number.

z^1 = Virtual trunk channel (CHAN) number.

a^2 = IP address field. Valid value is 0-255.

b^2 = Optical interface unit (OIU) number.

c^2 = Protection group (PG) number.

d^2 = OC3 STE number.

4. ACTIONS TO BE TAKEN

Inspect the data in this output message. If the status of the indicated parameters is incorrect, use the INH:ALE and ALW:ALE input messages or RC/V Views 8.1 and 22.15 to correct the status of the incorrect parameters.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report all active alarms in an office in response to the OP:ALM-ALL input message. Only active alarms are listed except for Format 10 which prints the scan point status for all metallic service unit (MSU) scan and distribute boards. Formats 2 and 6 are for alarms which previously were not included in any user-requested output messages.

Format 1 reports miscellaneous OP:ALM-ALL message status. Format 2 reports active administrative module (AM) fan alarms, local building/power and miscellaneous alarms, common network interface (CNI) alarms, external sanity monitor alarms, miscellaneous frame fan and fuse alarms, and communications module (CM) fan and fan fuse alarms. Format 3 reports the status of all CM units that are in the power alarm maintenance state. Format 4 reports active carrier group alarms (CGAs). Format 5 reports active integrated TR008/TR303 remote terminal (RT) alarms. TR008 RTs can be the SLC® 96, Series 5 feature package B, and Enhanced B. TR303 RTs can be the Series 5 feature package 303G. Format 6 reports active switching module (SM) fan and fan/peripheral fuse alarms. Format 7 reports active alarms for remote SMs (RSMs), optical remote modules (ORMs), or two-mile remote modules (TRMs). This output is only available in a multimodule RSM, ORM, or TRM that has the alarm input option. Only scan points that are actually in service are reported. Format 8 reports active remote alarm section (RAS) scan points. Only scan points that are actually in service are reported. Format 9 reports active remote peripheral scan points. Only scan points that are actually in service are reported. Format 10 reports the status of scan points on an MSU scan board. The status of all points is reported, regardless of whether they are active or inactive.

Note: SP 31 is a current sensing scan point which "turns on" (logical 1) when the current falls below a threshold.

Format 11 reports all SMs that did not respond with alarm information for:
- MSU scan points.
- RSM building/power alarms.
- Integrated TR008/TR303 RT alarms.
- Remote peripheral alarms. Format 12 reports active XAIU scan points.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

DATA MAY BE INCOMPLETE = Data in the message may be incomplete because of communication trouble with an SM.

QUAL = Red CGA Qualifier. Currently only used for synchronous optical network (SONET) termination equipment (STE) facilities. Valid value(s):
LOF = Loss of frame.
LOS = Loss of signal.

a = Report status. Valid value(s):
COMPLETED = The OP:ALM-ALL output has terminated successfully.
MANUAL TERMINATION = The OP:ALM-ALL output has terminated due to a request by the STP:OP-ALM-ALL input message.
TERMINATED—CANNOT CREATE TERMINAL PROCESS FOR SM ALARMS = The OP:ALM-ALL output has terminated because the terminal process could not be created or it could not receive messages.

TERMINATED DUE TO CM ISOLATION—RETRY LATER = The OP:ALM-ALL output has terminated because the CM is isolated and no more alarm information for the CM or the SMs can be obtained. The request should be tried later when the CM is no longer isolated.

TLWS BUFFERS FULL—NO CGA REPORTED = The OP:ALM-ALL - CGA SUMMARY portion will not be printed due to too many currently active trunk and line work station activities. No more resources available. The rest of the alarm types are unaffected.

TLWS BUSY—NO CGA REPORTED = The OP ALM ALL - CGA SUMMARY portion will not be printed due to an in-progress OP:CGA input message. No more resources are available. The rest of the alarm types are unaffected.

\(b\) = Type of alarms being reported. Valid value(s):
- AM FAN = Administrative module fan alarms.
- BPSC = Building and power alarm scan points.
- CNI = Common network interface alarms.
- ESM = External sanity monitor.
- MISC = Miscellaneous input/output processor (IOP) scan points.
- MISC FRAME FAN = Miscellaneous frame fan.
- MISC FRAME FUSE = Miscellaneous frame fuse.
- MSGS = Message switch.
- ONTC = Office network and timing complex.
- TMS = Time-multiplexed switch.

\(c\) = Sequence of message block. Valid value(s):
- FIRST RECORD
- LAST RECORD
- NEXT RECORD

\(d\) = Scan point number. Valid value(s):

| If \(b\) = AM_FAN,CNI,ESM,MISC_FRAME_FAN,MISC_FRAME_FUSE,MSGS,ONTC,or TMS | \(d\) = Null. |

\(e\) = Alarm name (or tag) - character string that identifies the particular scan point.

\(f\) = Unit identification.

\(g\) = Maintenance state.

\(h\) = Inhibit status. Valid value(s):
- ALW,AUTO = Hardware checks are allowed.
- INH,AUTO = Hardware checks are inhibited by automatic request.
- INH,MAN = Hardware checks are inhibited manually.
Note: ALW, MAN is not valid.

\(i\) = Result of last diagnostic run on unit. Valid value(s):
- ABT = Aborted.
- ATP = All tests passed.
CATP  = Conditional all tests passed.  
N/A   = Not applicable.  
NTR   = No tests run.  
STF   = Some tests failed.  
STP   = Stopped.

\[ j \]  = Report status. Valid value(s):
COMPLETED = The OP:CGA output has terminated successfully.  
CONTINUED  = The OP:CGA output consists of several reports. This is one of the intermediate reports.  
STARTED   = This is the initial OP:CGA output.  
SYSTEM ERROR = The OP:CGA output has terminated. The output is incomplete; retry later.  
SYSTEM BUSY REPEAT LATER = System is unable to execute OP:CGA at this time; retry later.

k  = SM number.  
l  = Digital line and trunk unit (DLTU) number.  
m  = Digital facility interface (DFI) number.  
n  = Facility (FAC) number.  
o  = MSU number.  
p  = Service group (SG) number.  
q  = Board (BRD) number.  
r  = Digital carrier line unit (DCLU) number for the SLC® digital facility interface (SDFI) case. Integrated digital carrier unit (IDCU) number for the IDCU facility (IFAC) case.  
s  = Integrated SDFI number or IFAC number.  
t  = Unit IDs. Valid value(s):

| DFIH=k-l-m | SDFI=k-r-s | SPN=k-o-p-q-d | STSFAC=k-j-l-m-n-p-l |
| DS1SFAC=k-j-l-m-n-p-l | EC1STE=k-j-l-m-n | FAC=k-l-m-n | VTIFAC=k-j-l-m-n-p-l |

v  = Local RT number.  
w  = Site identification (SID) number.  
x  = Source of the alarm. Valid value(s):
CARRIER LINE = The T1 facility is suspected of being faulty.
FAR END = The RT is suspected of being faulty or manual action at the RT caused the alarm.
NEAR END = The equipment at the office is suspected of being faulty or manual action at the office caused the alarm. Given the situation where near end and far end caused alarms, only near end will be reported.
y = System alarms that are active for this RT (any combination of the following). Valid value(s):
  CRITICAL = At least one critical alarm is active.
  MAJOR = At least one major alarm is active.
  MINOR = At least one minor alarm is active.
  PWR/MISC = Power/miscellaneous alarm is active. Either AC power has been lost at the RT, or
             a miscellaneous alarm (a door is open, for example) is active at the RT site.

z = Type of alarm. Valid value(s):
  FAN = SM fan alarm.
  FAN/PERPH FUSE = SM fan/peripheral fuse alarm.

a = Alarm level. Valid value(s):
  CR = Critical.
  MJ = Major.
  MN = Minor.
  NA = Not applicable.

b = State of scan point. Valid value(s):
  ALARM = Scan point is in its off-normal state.
  ERROR = Duplex points have different states.
  INH = Scan point is manually inhibited.
  Note: If the scan point is part of a duplex configuration, normal reporting will continue on
        the uninhibited side.

c = Physical location of scan point given as MSU, slot, and point numbers for remote building/power
    MSU scan point number (RBPSC).

e = Remote peripheral site number.

h = Remote peripheral unit number.

i = Type of alarm message not reported on by the associated SM. Valid value(s):
  ALL ALARMS UNAVAILABLE = The specified SM was unavailable for any alarm statuses.
  MSU SCAN POINTS = Some or all MSU scan point reports may be missing for the specified SM.
  REMOTE PERIPHERAL ALARMS = Remote peripheral building/miscellaneous, fan, fuse, power, or
                               battery alarms.
  RSM BUILDING & POWER ALARMS = RSM building/power alarms (includes RSMs, ORMs, TRMs,
                                and Multi-Mod RSMs).
  RTALARMS = Remote terminal alarms. Will be accompanied by the 'DATA MAY BE
             INCOMPLETE' qualifier.

j = Digital networking unit - SONET (DNU-S) number.

k = Data group (DG) number.

l = STE number.

m = Synchronous transport signal (STS) number.

n = Virtual tributary group (VTG) number.
Remote peripheral unit type. Valid values:
- **EAIU** = Expansion access interface unit.
- **RISLU** = Remote integrated services line unit.
- **XAIU** = Multiplex access interface unit.

Virtual tributary member (VTM) number.

XAIU number.

4. ACTIONS TO BE TAKEN

Investigate the cause of the alarm and take corrective action.

5. ALARMS

None

2. REASON FOR OUTPUT

To report all active alarms in an office in response to the OP:ALM-ALL input message. Only active alarms are listed except for Format 10 which prints the scan point status for all metallic service unit (MSU) scan and distribute boards. Formats 2 and 6 are for alarms which previously were not included in any user-requested output messages.

Format 1 reports miscellaneous OP:ALM-ALL message status. Format 2 reports active administrative module (AM) fan alarms, local building/power and miscellaneous alarms, common network interface (CNI) alarms, external sanity monitor alarms, miscellaneous frame fan and fuse alarms, and communications module (CM) fan and fan fuse alarms. Format 3 reports the status of all CM units that are in the power alarm maintenance state. Format 4 reports active carrier group alarms (CGAs). Format 5 reports active integrated TR008/TR303 remote terminal (RT) alarms. TR008 RTs can be the SLC® 96, Series 5 feature package B, and Enhanced B. TR303 RTs can be the Series 5 feature package 303G. Format 6 reports active switching module (SM) fan and fan/peripheral fuse alarms. Format 7 reports active alarms for remote SMs (RSMs), optical remote modules (ORMs), or two-mile remote modules (TRMs). This output is only available in a multimodule RSM, ORM, or TRM that has the alarm input option. Only scan points that are actually in service are reported. Format 8 reports active remote alarm section (RAS) scan points. Only scan points that are actually in service are reported. Format 9 reports active remote peripheral scan points. Only scan points that are actually in service are reported. Format 10 reports the status of scan points on an MSU scan board. The status of all points is reported, regardless of whether they are active or inactive.

Note: SP 31 is a current sensing scan point which "turns on" (logical 1) when the current falls below a threshold. Format 11 reports all SMs that did not respond with alarm information for:

- MSU scan points.
- RSM building/power alarms.
- Integrated TR008/TR303 RT alarms.
- Remote peripheral alarms.

Format 12 reports active XAIU scan points.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

DATA MAY BE INCOMPLETE = Data in the message may be incomplete because of communication trouble with an SM.

QUAL = CGA Qualifier. Currently only used for synchronous optical network (SONET) termination equipment (STE) facilities. Valid value(s):
LOF = Loss of frame.
LOS = Loss of signal.

a = Report status. Valid value(s):
COMPLETED = The OP:ALM-ALL output has terminated successfully.
MANUAL TERMINATION = The OP:ALM-ALL output has terminated due to a request by the
STP:OP-ALM-ALL input message.

TERMINATED—CANNOT CREATE TERMINAL PROCESS FOR SM ALARMS = The OP:ALM-ALL output has terminated because the terminal process could not be created or it could not receive messages.

TERMINATED DUE TO CM ISOLATION—RETRY LATER = The OP:ALM-ALL output has terminated because the CM is isolated and no more alarm information for the CM or the SMs can be obtained. The request should be tried later when the CM is no longer isolated.

TLWS BUFFERS FULL—NO CGA REPORTED = The OP ALM ALL - CGA SUMMARY portion will not be printed due to too many currently active trunk and line work station activities. No more resources available. The rest of the alarm types are unaffected.

TLWS BUSY—NO CGA REPORTED = The OP ALM ALL - CGA SUMMARY portion will not be printed due to an in-progress OP:CGA input message. No more resources are available. The rest of the alarm types are unaffected.

b = Type of alarms being reported. Valid value(s):
AM FAN = Administrative module fan alarms.
BPSC = Building and power alarm scan points.
CM = Communications module.
CNI = Common network interface alarms.
ESM = External sanity monitor.
MISC = Miscellaneous input/output processor (IOP) scan points.
MISC FRAME FAN = Miscellaneous frame fan.
MISC FRAME FUSE = Miscellaneous frame fuse.
MSGS = Message switch.
ONTC = Office network and timing complex.
TMS = Time-multiplexed switch.

c = Sequence of message block. Valid value(s):
FIRST RECORD
LAST RECORD
NEXT RECORD

d = Scan point number. Valid value(s):

| if 'b' = AM FAN, CM, CNI, ESM, MISC FRAME FAN, MISC FRAME FUSE, MSGS, ONTC, or TMS |
| 'd' = Null. |

e = Alarm name (or tag) - character string that identifies the particular scan point.

f = Unit identification.

g = Maintenance state.

h = Inhibit status. Valid value(s):
ALW, AUTO = Hardware checks are allowed.
INH, AUTO = Hardware checks are inhibited by automatic request.
INH, MAN = Hardware checks are inhibited manually.
Note: ALW, MAN is not valid.
i  = Result of last diagnostic run on unit. Valid value(s):
ABT  = Aborted.
ATP  = All tests passed.
CATP = Conditional all tests passed.
N/A  = Not applicable.
NTR  = No tests run.
STF  = Some tests failed.
STP  = Stopped.

j  = Report status. Valid value(s):
COMPLETED = The OP:CGA output has terminated successfully.
CONTINUED = The OP:CGA output consists of several reports. This is one of the intermediate
             reports.
STARTED  = This is the initial OP:CGA output.
SYSTEM ERROR = The OP:CGA output has terminated. The output is incomplete; retry later.
SYSTEM BUSY REPEAT LATER = System is unable to execute OP:CGA at this time; retry later.

k  = SM number.
l  = Digital line and trunk unit (DLTU) number.
m  = Digital facility interface (DFI) number.
n  = Facility (FAC) number.
o  = MSU number.
p  = Service group (SG) number.
q  = Board (BRD) number.
r  = Digital carrier line unit (DCLU) number for the SLC® digital facility interface (SDFI) case.
    Integrated digital carrier unit (IDCU) number for the IDCU facility (IFAC) case.
s  = Integrated SDFI number or IFAC number.
t  = Unit IDs. Valid value(s):

    DFIH=k-l-m
    DS1SFAC=k-j^1-k^1-l^1-m^1-n^1-p^1
    EC1STE=k-j^1-k^1-l^1
    FAC=k-l-m-n
    IFAC=k-r-s
    SDFI=k-r-s
    SPN=k-o-p-q-d
    STSFAC=k-j^1-k^1-l^1-m^1
    TRIB=k-s^1-t^1-u^1
    VT1FAC=k-j^1-k^1-l^1-m^1-n^1-p^1

v  = Local RT number.
w  = Site identification (SID) number.
x = Source of the alarm. Valid value(s):
  CARRIER LINE = The T1 facility is suspected of being faulty.
  FAR END = The RT is suspected of being faulty or manual action at the RT caused the alarm.
  NEAR END = The equipment at the office is suspected of being faulty or manual action at the office caused the alarm. Given the situation where near end and far end caused alarms, only near end will be reported.

y = System alarms that are active for this RT (any combination of the following). Valid value(s):
  CRITICAL = At least one critical alarm is active.
  MAJOR = At least one major alarm is active.
  MINOR = At least one minor alarm is active.
  PWR/MISC = Power/miscellaneous alarm is active. Either AC power has been lost at the RT, or a miscellaneous alarm (a door is open, for example) is active at the RT site.

z = Type of alarm. Valid value(s):
  FAN = SM fan alarm.
  FAN/PERPH FUSE = SM fan/peripheral fuse alarm.

a = Alarm level. Valid value(s):
  CR = Critical.
  MJ = Major.
  MN = Minor.
  NA = Not applicable.

b = State of scan point. Valid value(s):
  ALARM = Scan point is in its off-normal state.
  ERROR = Duplex points have different states.
  INH = Scan point is manually inhibited.
  Note: If the scan point is part of a duplex configuration, normal reporting will continue on the uninhibited side.

c = Physical location of scan point given as MSU, slot, and point numbers for remote building/power MSU scan point number (RBPSC).

e = Remote peripheral site number.

h = Remote peripheral unit number.

i = Type of alarm message not reported on by the associated SM. Valid value(s):
  ALL ALARMS UNAVAILABLE = The specified SM was unavailable for any alarm statuses.
  MSU SCAN POINTS = Some or all MSU scan point reports may be missing for the specified SM.
  REMOTE PERIPHERAL ALARMS = Remote peripheral building/miscellaneous, fan, fuse, power, or battery alarms.
  RSM BUILDING & POWER ALARMS = RSM building/power alarms (includes RSMs, ORM, TRMs, and Multi-Mod RSMs).
  RTALARMS = Remote terminal alarms. Will be accompanied by the 'DATA MAY BE INCOMPLETE' qualifier.
4. ACTIONS TO BE TAKEN

Investigate the cause of the alarm and take corrective action.

2. REASON FOR OUTPUT

To report all active alarms in an office in response to the OP:ALM-ALL input message. Only active alarms are listed except for Format 10 which prints the scan point status for all metallic service unit (MSU) scan and distribute boards. Formats 2 and 6 are for alarms which previously were not included in any user-requested output messages.

Format 1 reports miscellaneous OP:ALM-ALL message status.

Format 2 reports active administrative module (AM) fan alarms, local building/power and miscellaneous alarms, common network interface (CNI) alarms, external sanity monitor alarms, miscellaneous frame fan and fuse alarms, and communications module (CM) fan and fan fuse alarms.

Format 3 reports the status of all CM units that are in the power alarm maintenance state.

Format 4 reports active carrier group alarms (CGAs). See the OP:CGA output message for a more detailed explanation of this output message segment.

Format 5 reports active integrated TR008/TR303 remote terminal (RT) alarms. TR008 RTs can be the SLC® 96, Series 5 feature package B, and Enhanced B. TR303 RTs can be the Series 5 feature package 303G.

Format 6 reports active switching module (SM) fan and fan/peripheral fuse alarms.

Format 7 reports active alarms for remote SMs (RSMs), optical remote modules (ORMs), or two-mile remote modules (TRMs). This output is only available in a multimodule RSM, ORM, or TRM that has the alarm input option. Only scan points that are actually in service are reported.

Format 8 reports active remote alarm section (RAS) scan points. Only scan points that are actually in service are reported.

Format 9 reports active remote peripheral scan points. Only scan points that are actually in service are reported.

Format 10 reports the status of scan points on an MSU scan board. The status of all points is reported, regardless of whether they are active or inactive.

**NOTE:** SP 31 is a current sensing scan point which "turns on" (logical 1) when the current falls below a threshold.

Format 11 reports all SMs that did not respond with alarm information for:

- MSU scan points.
- RSM building/power alarms.
- Integrated TR008/TR303 RT alarms.
- Remote peripheral alarms.

Format 12 reports active XAIU scan points.

3. VARIABLE FIELD DEFINITIONS

**NOTE:** Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.
DATA MAY BE INCOMPLETE = Data in the message may be incomplete because of communication trouble with an SM.

a = Report status. Valid value(s):
COMPLETED = The OP:ALM-ALL output has terminated successfully.
MANUAL TERMINATION = The OP:ALM-ALL output has terminated due to a request by the STP:OP-ALM-ALL input message.
TERMINATED--CANNOT CREATE TERMINAL PROCESS FOR SM ALARMS = The OP:ALM-ALL output has terminated because the terminal process could not be created or it could not receive messages.
TERMINATED DUE TO CM ISOLATION--RETRY LATER = The OP:ALM-ALL output has terminated because the CM is isolated and no more alarm information for the CM or the SMs can be obtained. The request should be tried later when the CM is no longer isolated.
TLWS BUFFERS FULL--NO CGA REPORTED = The OP ALM ALL - CGA SUMMARY portion will not be printed due to too many currently active trunk and line work station activities. No more resources available. The rest of the alarm types are unaffected.
TLWS BUSY--NO CGA REPORTED = The OP ALM ALL - CGA SUMMARY portion will not be printed due to an in-progress OP:CGA input message. No more resources are available. The rest of the alarm types are unaffected.

b = Type of alarms being reported. Valid value(s):
AM FAN = Administrative module fan alarms.
BPSC = Building and power alarm scan points.
CM = Communications module.
CNI = Common network interface alarms.
ESM = External sanity monitor.
MISC = Miscellaneous input/output processor (IOP) scan points.
MISC FRAME FAN = Miscellaneous frame fan.
MISC FRAME FUSE = Miscellaneous frame fuse.
MSGS = Message switch.
ONTC = Office network and timing complex.
TMS = Time-multiplexed switch.

c = Sequence of message block. Valid value(s):
FIRST RECORD
LAST RECORD
NEXT RECORD

d = Scan point number. Valid value(s):

<table>
<thead>
<tr>
<th>'d' =</th>
<th>'d' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>AM FAN, CM, CNI, ESM, MISC FRAME FAN, MISC FRAME FUSE, MSGS, ONTC, or TMS</td>
<td>Null.</td>
</tr>
</tbody>
</table>

e = Alarm name (or tag) - character string that identifies the particular scan point.
f = Unit identification.
g = Maintenance state.
Inhibit status. Valid value(s):

ALW, AUTO = Hardware checks are allowed.
INH, AUTO = Hardware checks are inhibited by automatic request.
INH, MAN = Hardware checks are inhibited manually.

Note: ALW, MAN is not valid.

Result of last diagnostic run on unit. Valid value(s):

ABT = Aborted.
ATP = All tests passed.
CATP = Conditional all tests passed.
N/A = Not applicable.
NTR = No tests run.
STF = Some tests failed.
STP = Stopped.

Report status. Valid value(s):

COMPLETED = The OP:CGA output has terminated successfully.
CONTINUED = The OP:CGA output consists of several reports. This is one of the intermediate reports.
STARTED = This is the initial OP:CGA output.
SYSTEM ERROR = The OP:CGA output has terminated. The output is incomplete; retry later.
SYSTEM BUSY REPEAT LATER = System is unable to execute OP:CGA at this time; retry later.

= SM number.

= Digital line and trunk unit (DLTU) number.

= Digital facility interface (DFI) number.

= Facility (FAC) number.

= MSU number.

= Service group (SG) number.

= Board (BRD) number.

= Digital carrier line unit (DCLU) number for the SLC® digital facility interface (SDFI) case.
Integrated digital carrier unit (IDCU) number for the IDCU facility (IFAC) case.

= Integrated SDFI number or IFAC number.

= Unit IDs. Valid value(s):

DFIH=k-l-m
DS1=k-v^1-w^1-x^1-m^1-n^1-p^1
DS1FAC=k-j^1-k^1-l^1-m^1-n^1-p^1
EC1STE=k-j^1-k^1-l^1
FAC=k-l-m-n
IFAC=k-r-s
OC3=k-v^1-w^1-x^1-y^1
SDFI=k-r-s

STS1=k-v₁⁻w₁⁻x₁⁻m₁
STSFAC=k-j₁⁻k₁⁻l₁⁻m₁
TRIB=k-s₁⁻t₁⁻u₁
VT1FAC=k-j₁⁻k₁⁻l₁⁻m₁⁻n₁⁻p₁
VT15=k-v₁⁻w₁⁻x₁⁻m₁⁻n₁⁻p₁

\( v \) = Local RT number.

\( w \) = Site identification (SID) number.

\( x \) = Source of the alarm. Valid value(s):
- CARRIER LINE = The T1 facility is suspected of being faulty.
- FAR END = The RT is suspected of being faulty or manual action at the RT caused the alarm.
- NEAR END = The equipment at the office is suspected of being faulty or manual action at the office caused the alarm. Given the situation where near end and far end caused alarms, only near end will be reported.

\( y \) = System alarms that are active for this RT (any combination of the following). Valid value(s):
- CRITICAL = At least one critical alarm is active.
- MAJOR = At least one major alarm is active.
- MINOR = At least one minor alarm is active.
- PWR/MISC = Power/miscellaneous alarm is active. Either AC power has been lost at the RT, or a miscellaneous alarm (a door is open, for example) is active at the RT site.

\( z \) = Type of alarm. Valid value(s):
- FAN = SM fan alarm.
- FAN/PERPH FUSE = SM fan/peripheral fuse alarm.

\( a \) = Alarm level. Valid value(s):
- CR = Critical.
- MJ = Major.
- MN = Minor.
- NA = Not applicable.

\( b \) = State of scan point. Valid value(s):
- ALARM = Scan point is in its off-normal state.
- ERROR = Duplex points have different states.
- INH = Scan point is manually inhibited.

Note: If the scan point is part of a duplex configuration, normal reporting will continue on the uninhibited side.

\( c \) = Physical location of scan point given as MSU, slot, and point numbers for remote building/power MSU scan point number (RBPSC).

\( e \) = Remote peripheral site number.
Remote peripheral unit number.

Type of alarm message not reported on by the associated SM. Valid value(s):

- **ALL ALARMS UNAVAILABLE** = The specified SM was unavailable for any alarm statuses.
- **MSU SCAN POINTS** = Some or all MSU scan point reports may be missing for the specified SM.
- **REMOTE PERIPHERAL ALARMS** = Remote peripheral building/miscellaneous, fan, fuse, power, or battery alarms.
- **RSM BUILDING & POWER ALARMS** = RSM building/power alarms (includes RSMs, ORMs, TRMs, and multi-mod RSMs).
- **RT ALARMS** = Remote terminal alarms. Will be accompanied by the 'DATA MAY BE INCOMPLETE' qualifier.

Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

Data group (DG) number.

STE number.

Synchronous transport signal (STS) number.

Virtual tributary group (VTG) number.

Remote peripheral unit type. Valid value(s):

- **EAIU** = Expansion access interface unit.
- **RISLU** = Remote integrated services line unit.
- **XAIU** = Multiplex access interface unit.

Virtual tributary member (VTM) number.

XAIU number.

CGA type(s). Valid value(s):

- **AIS** = Alarm indication signal.
- **BER** = BER alarm.
- **LCA** = Local alarm.
- **RMA** = Remote alarm.
- **SET** = Set alarm.

Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

PCT facility interface number.

PCT tributary number.

Optical interface unit (OIU) number.

Protection group (PG) number.

OIU SONET termination equipment (STE) number.

OIU STE side number.
z\(^1\) = CGA qualifier. Currently only used for DNU-S SONET termination equipment (STE) facilities and OIU facilities.

For DNU-S STE and OIU OC3 facilities, valid value(s):
- \(\text{LOF}\) = Loss of frame.
- \(\text{LOS}\) = Loss of signal.

For OIU STS and VT15 facilities valid value(s):
- \(\text{LOP}\) = Loss of pointer.
- \(\text{PLMU}\) = Payload mismatched - unequipped.
- \(\text{PLM}\) = Payload mismatch.
- \(\text{TIM}\) = Trace identifier mismatch (STS only).

a\(^2\) = Alarm level. Valid value(s):
- \(\text{CRIT}\) = Critical.
- \(\text{MAJ}\) = Major.
- \(\text{MIN}\) = Minor.
- \(\text{NA}\) = Not applicable.

4. ACTIONS TO BE TAKEN
Investigate the cause of the alarm and take corrective action.

5. ALARMS
None

2. REASON FOR OUTPUT

To report all active alarms in an office in response to the OP:ALM-ALL input message. Only active alarms are listed except for Format 10 which prints the scan point status for all metallic service unit (MSU) scan and distribute boards. Formats 2 and 6 are for alarms which previously were not included in any user-requested output messages.

Format 1 reports miscellaneous OP:ALM-ALL message status.

Format 2 reports active administrative module (AM) fan alarms, local building/power and miscellaneous alarms, common network interface (CNI) alarms, external sanity monitor alarms, miscellaneous frame fan and fuse alarms, and communications module (CM) fan and fan fuse alarms.

Format 3 reports the status of all CM units that are in the power alarm maintenance state.

Format 4 reports active carrier group alarms (CGAs). See the OP:CGA output message for a more detailed explanation of this output message segment.

Format 5 reports active integrated TR008/TR303 remote terminal (RT) alarms. TR008 RTs can be the SLC® 96, Series 5 feature package B, and Enhanced B. TR303 RTs can be the Series 5 feature package 303G.

Format 6 reports active switching module (SM) fan and fan/peripheral fuse alarms.

Format 7 reports active alarms for remote SMs (RSMs), optical remote modules (ORMs), or two-mile remote modules (TRMs). This output is only available in a multimodule RSM, ORM, or TRM that has the alarm input option. Only scan points that are actually in service are reported.

Format 8 reports active remote alarm section (RAS) scan points. Only scan points that are actually in service are reported.

Format 9 reports active remote peripheral scan points. Only scan points that are actually in service are reported.

Format 10 reports the status of scan points on an MSU scan board. The status of all points is reported, regardless of whether they are active or inactive.

NOTE: SP 31 is a current sensing scan point which "turns on" (logical 1) when the current falls below a threshold.

Format 11 reports all SMs that did not respond with alarm information for:

- MSU scan points.
- RSM building/power alarms.
- Integrated TR008/TR303 RT alarms.
- Remote peripheral alarms.

Format 12 reports active XAIU scan points.

3. VARIABLE FIELD DEFINITIONS

NOTE: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.
DATA MAY BE INCOMPLETE = Data in the message may be incomplete because of communication trouble with an SM.

a = Report status. Valid value(s):
  COMPLETED = The OP:ALM-ALL output has terminated successfully.
  MANUAL TERMINATION = The OP:ALM-ALL output has terminated due to a request by the STP:OP-ALM-ALL input message.
  TERMINATED–CANNOT CREATE TERMINAL PROCESS FOR SM ALARMS = The OP:ALM-ALL output has terminated because the terminal process could not be created or it could not receive messages.
  TERMINATED DUE TO CM ISOLATION–RETRY LATER = The OP:ALM-ALL output has terminated because the CM is isolated and no more alarm information for the CM or the SMs can be obtained. The request should be tried later when the CM is no longer isolated.
  TLWS BUFFERS FULL–NO CGA REPORTED = The OP:ALM-ALL - CGA SUMMARY portion will not be printed due to too many currently active trunk and line work station activities. No more resources available. The rest of the alarm types are unaffected.
  TLWS BUSY–NO CGA REPORTED = The OP:ALM-ALL - CGA SUMMARY portion will not be printed due to an in-progress OP:CGA input message. No more resources are available. The rest of the alarm types are unaffected.

b = Type of alarms being reported. Valid value(s):
  AM FAN = Administrative module fan alarms.
  ASMC CABINET FUSE = ASMC cabinet fuse.
  BPSC = Building and power alarm scan points.
  CM = Communications module.
  CNI = Common network interface alarms.
  ESM = External sanity monitor.
  MISC = Miscellaneous input/output processor (IOP) scan points.
  MISC FRAME FAN = Miscellaneous frame fan.
  MISC FRAME FUSE = Miscellaneous frame fuse.
  MSGS = Message switch.
  ONTC = Office network and timing complex.
  TMS = Time-multiplexed switch.

c = Sequence of message block. Valid value(s):
  FIRST RECORD
  LAST RECORD
  NEXT RECORD

d = Scan point number. Valid value(s):

<table>
<thead>
<tr>
<th>'b' =</th>
<th>'d' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>AM FAN, CM, CNI, ESM, MISC FRAME FAN, MISC FRAME FUSE, MSGS, ONTC, or TMS</td>
<td>Null.</td>
</tr>
</tbody>
</table>

e = Alarm name (or tag) - character string that identifies the particular scan point.

f = Unit identification.

g = Maintenance state.
h  = Inhibit status. Valid value(s):
   ALW,AUTO = Hardware checks are allowed.
   INH,AUTO = Hardware checks are inhibited by automatic request.
   INH,MAN  = Hardware checks are inhibited manually.

NOTE: ALW, MAN is not valid.

i  = Result of last diagnostic run on unit. Valid value(s):
   ABT   = Aborted.
   ATP   = All tests passed.
   CATP  = Conditional all tests passed.
   N/A   = Not applicable.
   NTR   = No tests run.
   STF   = Some tests failed.
   STP   = Stopped.

j  = Report status. Valid value(s):
   COMPLETED = The OP:CGA output has terminated successfully.
   CONTINUED = The OP:CGA output consists of several reports. This is one of the intermediate
               reports.
   STARTED   = This is the initial OP:CGA output.
   SYSTEM ERROR = The OP:CGA output has terminated. The output is incomplete; retry later.
   SYSTEM BUSY REPEAT LATER = System is unable to execute OP:CGA at this time; retry later.

k  = SM number.

l  = Digital line and trunk unit (DLTU) number.

m  = Digital facility interface (DFI) number.

n  = Facility (FAC) number.

o  = MSU number.

p  = Service group (SG) number.

q  = Board (BRD) number.

r  = Digital carrier line unit (DCLU) number for the SLC® digital facility interface (SDFI) case.
Integrated digital carrier unit (IDCU) number for the IDCU facility (IFAC) case.

s  = Integrated SDFI number or IFAC number.

t  = Unit IDs. Valid value(s):
   DFIH=k-l-m
   DS1=k-v^1-w^1-x^1-m^1-n^1-p^1
   DS1SFAC=k-j^1-k^1-l^1-m^1-n^1-p^1
   EC1STE=k-j^1-k^1-l^1
   FAC=k-l-m-n

Copyright ©2003 Lucent Technologies
IFAC=k-r-s
OC3=k-v^1-w^1-x^1-y^1
OC3C=k-v^1-w^1-x^1-y^1
SDFI=k-r-s
SPN=k-o-p-q-d
STS1=k-v^1-w^1-x^1-m^1
STS3C=k-v^1-w^1-x^1-m^1
STSFAC=k-j^1-k^1-l^1-m^1
TRIB=k-s^1-t^1-u^1
VT1FAC=k-j^1-k^1-l^1-m^1-n^1-p^1
VT15=k-v^1-w^1-x^1-m^1-n^1-p^1

\(v\) = Local RT number.

\(w\) = Site identification (SID) number.

\(x\) = Source of the alarm. Valid value(s):
  CARRIER LINE = The T1 facility is suspected of being faulty.
  FAR END = The RT is suspected of being faulty or manual action at the RT caused the alarm.
  NEAR END = The equipment at the office is suspected of being faulty or manual action at the office caused the alarm. Given the situation where near end and far end caused alarms, only near end will be reported.

\(y\) = System alarms that are active for this RT (any combination of the following). Valid value(s):
  CRITICAL = At least one critical alarm is active.
  MAJOR = At least one major alarm is active.
  MINOR = At least one minor alarm is active.
  PWR/MISC = Power/miscellaneous alarm is active. Either AC power has been lost at the RT, or a miscellaneous alarm (a door is open, for example) is active at the RT site.

\(z\) = Type of alarm. Valid value(s):
  FAN = SM fan alarm.
  FAN/PERPH FUSE = SM fan/peripheral fuse alarm.

\(a^1\) = Alarm level. Valid value(s):
  CR = Critical.
  MJ = Major.
  MN = Minor.
  NA = Not applicable.

\(b^1\) = State of scan point. Valid value(s):
  ALARM = Scan point is in its off-normal state.
  ERROR = Duplex points have different states.
  INH = Scan point is manually inhibited.

**NOTE:** If the scan point is part of a duplex configuration, normal reporting will continue on the uninhibited side.
c = Physical location of scan point given as MSU, slot, and point numbers for remote building/power
MSU scan point number (RBPSC).

e = Remote peripheral site number.

h = Remote peripheral unit number.

i = Type of alarm message not reported on by the associated SM. Valid value(s):
ALL ALARMS UNAVAILABLE = The specified SM was unavailable for any alarm statuses.
MSU SCAN POINTS = Some or all MSU scan point reports may be missing for the specified SM.
REMOTE PERIPHERAL ALARMS = Remote peripheral building/miscellaneous, fan, fuse, power, or
battery alarms.
RSM BUILDING & POWER ALARMS = RSM building/power alarms (includes RSMs, ORMs, TRMs,
and multi-mod RSMs).
RT ALARMS = Remote terminal alarms. Will be accompanied by the 'DATA MAY BE
INCOMPLETE' qualifier.

j = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

k = Data group (DG) number.

l = STE number.

m = Synchronous transport signal (STS) number.

n = Virtual tributary group (VTG) number.

o = Remote peripheral unit type. Valid value(s):
EAIU = Expansion access interface unit.
RISLU = Remote integrated services line unit.
XAIU = Multiplex access interface unit.

p = Virtual tributary member (VTM) number.

q = XAIU number.

r = CGA type(s). Valid value(s):
AIS = Alarm indication signal.
BER = BER alarm.
LCA = Local alarm.
RMA = Remote alarm.
SET = Set alarm.

s = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

t = PCT facility interface number.

u = PCT tributary number.

v = Optical interface unit (OIU) number.

w = Protection group (PG) number.
x = OIU SONET termination equipment (STE) number.

y = OIU STE side number.

z = CGA qualifier. Currently only used for DNU-S SONET termination equipment (STE) facilities and OIU facilities.

For DNU-S STE and OIU OC3 facilities, valid value(s):
LOF = Loss of frame.
LOS = Loss of signal.

For OIU STS and VT15 facilities valid value(s):
LCD = Loss of cell delineation (STS3C only).
LOP = Loss of pointer.
PLMU = Payload mismatched - unequipped.
PLM = Payload mismatch.
TIM = Trace identifier mismatch (STS only).

a = Alarm level. Valid value(s):
CRIT = Critical.
MAJ = Major.
MIN = Minor.
NA = Not applicable.

b = Customer-supplied Common Language® facility identifier (CLFI) string of up to 25 characters.

__________________________________________________________________

[2] OP ALM RAS SITE a LAST RECORD
ALM-LEVEL    STATE    SCAN-PT    DESCRIPTION
--------------------------------------------
NO OFFNORMAL POINTS
__________________________________________________________________

2. REASON FOR OUTPUT

To print a summary of the current status of remote alarm section (RAS) scan points at a remote peripheral site.

NOTE: Normally, only those points that are either off-normal or inhibited are reported. If the ALL option is specified in the input request, all points are reported. In either case, only those points that are actually in service are reported.

3. VARIABLE FIELD DEFINITIONS

ALL POINTS = The 'ALL' option was specified in the input. If 'ALL' was not specified in the input message, and if there are no off-normal points at the specified site, 'c' - 'f' will not apply and the report will print NO OFFNORMAL POINTS.

a = Remote peripheral site number.
b = Sequence identifier. Valid value(s):
   FIRST
   LAST
   NEXT

c = Alarm level. Valid value(s):
   CR = Critical.
   MJ = Major.
   MN = Minor.
   NA = Not applicable.

  d = State of scan point. Valid value(s):
   ALARM = Scan point is off-normal.
AUTOINH = Scan point is automatically inhibited due to chattering.
CLEAR  = Scan point is in its normal state.
INH     = Scan point is manually inhibited.
e      = Logical scan point number.
f      = Name of scan point.

4. ACTION TO BE TAKEN
None.

5. ALARMS
None.

```

2. REASON FOR OUTPUT

To report a summary of current status of either off-normal or all alarm scan points. This output occurs as a result of an input request or automatically when a remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) returns from stand-alone. This message is available only in a multimodule RSM, ORM or TRM that has the alarm input option.

Note: Normally, only those points that are either off-normal or inhibited are reported. If the ALL option is specified in the input request, all points are reported. In either case, only those points that are actually in service are reported.

3. VARIABLE FIELD DEFINITIONS

- **ALL POINTS** = The 'ALL' option was specified in the input.
- **a** = Switching module (SM) number.
- **c** = Sequence identifier. Valid value(s):
  - FIRST
  - LAST
  - NEXT
- **d** = Alarm level. Valid value(s):
  - CRIT = Critical.
  - MAJ = Major.
  - MIN = Minor.
  - NA = Not applicable.
- **e** = State of scan point. Valid value(s):
  - ALARM = Scan point is in its off-normal state.
  - AUTOINH = Scan point is chattering so it is automatically inhibited.
  - CLEAR = Scan point is in its normal state (unalarmed).
  - ERROR = Duplex points have different states.
  - INH = Scan point reporting is inhibited (manual).

Note: If the scan point is part of a duplex configuration, normal reporting will continue on.
the uninhibited side.

\( f \) = Logical scan point number.

\( g \) = Physical location of scan point.
- Metallic service unit (MSU).
- Slot.
- Point numbers for remote building/power MSU scan point number (RBPSC).

\( h \) = Name of scan point.

   ALM-LVL  STATE  SCAN-PT  UNIT   SM   UNITNUM  DESCRIPTION
   ____________________________________________
   NO OFFNORMAL POINTS
   ____________________________

2. REASON FOR OUTPUT

To print a summary of current status of alarm scan points at a remote peripheral site.

NOTE: Normally, only those points that are either off-normal or inhibited are reported. If the ALL option is specified in the input request, all points are reported. In either case, only those points that are equipped on each remote peripheral are reported.

3. VARIABLE FIELD DEFINITIONS

ALL POINTS = The 'ALL' option was specified in the input.

STOPPED = Will occur when an SM hosting scan points at the remote peripheral site fails to report scan point status, or an existing request for remote peripheral data is already in progress.

a = Remote peripheral site number.

b = Sequence identifier. Valid value(s):
   FIRST RECORD
   LAST RECORD
   NEXT RECORD

   c = Alarm level. Valid value(s):
   CR = Critical.
   MJ = Major.
   MN = Minor.
d = Scan point number for miscellaneous scan points.

e = Name of scan point. For miscellaneous scan points, the name is an office-assignable character string. Other valid value(s):
   BATTERY = Battery alarm.
   FAN = Fan alarm.
   FUSE = Fuse alarm.
   POWER = Power alarm.

f = State of scan point. Valid value(s):
   ALARM = Scan point is off-normal.
   AUTOINH = Scan point is automatically inhibited due to chattering.
   CLEAR = Scan point is in its normal state.
   INH = Scan point is manually inhibited.

g = Remote peripheral unit type. Valid value(s):
   EAIU = Expansion access interface unit.
   RISLU = Remote integrated services line unit.

h = Switching module number.

i = Remote peripheral unit number.

Software Release: 5E14 and later
Message Class: AMA
Application: 5
Type: Output

1. FORMAT

[1] OP AMALOST ON TRC=(ON|OFF)
[2] OP AMALOST OFF

2. REASON FOR OUTPUT

To report the activation status of the AMALOST feature which will report in real time on lost AMA records. In addition, when the status is ON, this message reports the activation status of the AMALOST record tracing option. Format 1 indicates that the AMALOST feature is turned ON and whether the tracing option is turned ON or OFF.

Format 2 indicates that the AMALOST feature is turned OFF. An AMA trace of an AMALOST record is invoked if the AMALOST record tracing option has been activated and a partial or complete AMA record exists. The ALW:AMALOST input message with the TRC option activates the AMALOST feature with the record tracing option. The ALW:AMALOST input message activates the AMALOST feature without the record tracing option.

   .    .    .    .    .

__________________________________________________________________

[3] OP AML REACHED LIST CONTAINED h SEGMENTS f

__________________________________________________________________

2. REASON FOR OUTPUT

To print (output) the automatic maintenance limit (AML) data for either a single specified trunk group (Format 1), or
to list the AML data for all trunk groups which have currently reached or exceeded their AML (Format 2). The list will
be followed by a trailer (Format 3) message indicating the end of list.

If many trunk groups have reached their AML, the list may be split into two or more messages. The AML
out-of-service (OOS) counts displayed in this message only include those trunks whose OOS reason was applied
against the group AML. The current total number of OOS trunks in that trunk group are reflected in the OOS counts
in the output message.

This message prints in response to the OP:AML input message.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number.
b = Number of trunks in the group.
c = The total number of OOS trunks in a trunk group. If a ‘*’ appears before the 'OOS', the number
   may be artificially high or low due to loss of communication to an SM. When the communication is
   restored, the switch will automatically update this count to reflect the current trunk status and
   remove the ‘*’.
d = Current AML for the trunk group.
e = Number of trunks that are OOS for reasons which count against the groups AML. If a ‘*’ appears
   before the 'AMLOOS', the number may be artificially high or low due to loss of communication to a
   switching module. When the communication is restored, the switch will automatically update this
   count to reflect the current trunk status and remove the ‘*’.
f = Termination report. Valid value(s):
   COMPLETED = The requested action has been completed. If an AML list was being printed, all
segments have been printed.

CONTINUED = Second and subsequent segments of a list which comprises two or more segments.

NO AML = No AML data exists for the specified trunk group. Most likely, the specified group was not a group of outgoing or two-way trunks.

NO ENTRIES IN LIST = The AML list was requested, but no trunk groups are currently at or exceeding their AML.

STARTED = First segment of an AML list.

SYSTEM ERROR = An internal error occurred which prevents further processing of the request.

TG INVALID = The trunk group specified in the input message does not exist in the office database.

g = Segment number of the current segment.

h = The total number of segments in the list.

4. ACTION TO BE TAKEN
None.

5. ALARMS
None.

Input Message(s):

OP : AML
OP:ANITBL

Software Release: 5E14 and later
Message Class: PRFM
Application: 5
Type: Output

1. FORMAT

OP ANITBL SM=a[&&b] c

2. REASON FOR OUTPUT

To print a summary of ANI (Automatic Number Identification) entries for LDP offices to administer ANI Index Table
(RC View 8.58) and LDP Index Table (RC View 8.59). The summary will be printed in the /updtmp/ANIxxx file, where
xxx is a random number. The ANIxxx file will automatically be removed in 5 days after the file is generated.

The ANI Index Table (RC View 8.58) and LDP Index Table (RC View 8.59) summary includes the following:
- On a per SM bases:
  - Number of ANI Index Table entries
  - Number of ANI Index Table entries within each NPANXX per SM in ascending
    order. The format is: SM Number, NPANXX, Number of ANI Index Table
    entries
- On a per office bases:
  - Total number of ANI Index Table entries for the SMs specified in a[&&b]
  - Total number of ANI Index Table entries per office
  - Total number of LDP Index Table entries In case of an internal error event, a trace
    is stored in the ANIxxx file. Contact your next level of support for explanation.

3. VARIABLE FIELD DEFINITIONS

a = an individual Switching Module (SM) number or lower limit for a range of SM number.
b = upper limit for a range of SM number.
c = Status. Valid status are:

ANI COUNT COMPLETED, SUMMARY IN /updtmp/ANIxxx = This message is printed when all
results have been calculated. Either results or a trace of error events are in the file.
This file may be printed on the ROP using the following command.
dump:file:all,fn="/updtmp/ANIxxx",opl=99
However, if there are lots of lines in the file, then it should not go to the ROP.

INVALID SM OR SM IS NOT IN SERVICE = This is printed when the SM(s) requested on the
command line is/are either invalid or not operational. In this case, the ANIxxx file
may not exist.

ANOTHER OP:ANITBL IS STILL RUNNING = Only one job is allowed at a time.
ANI COUNT IN PROGRESS, SUMMARY IN /updtmp/ANIxxx = This message is printed when the calculations begin. Another file /updtmp/ANIprog may be of interest: it shows the processing status which includes current SM number, entries read so far, and total entries processed. This file is updated periodically during the processing.

. . . . . . . . . . . . . . . .
. . . . . . . . . . . . . . . .
. . . . . . . . . . . . . . . .

2. REASON FOR OUTPUT

This report prints in response to the OP:APSSTAT input message. It lists the automatic protection switching status (APSSTAT) of optical carrier - level 3 (OC3) or optical carrier - level 3 concatenated (OC3C) circuits for optical interface units (OIUs) on a specified switching module (SM). If the ALL option is not specified, only those circuits with an off-normal APS state will be listed. Off-normal APS states include wait to restore (WTR), signal degrade (SD), signal fail (SF), forced switch (FS), and lock out of protection (LP).

Remote automatic protection switch (APS) state and Alarm display apply to bi-directional APS only.

Up to 14 protection groups may be displayed in a single output message block. Multiple output message blocks are possible.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Report status or message block sequence status. Valid value(s):
   FIRST RECORD
   HAS NO CIRCUITS IN THE REQUESTED STATE
   LAST RECORD
   NEXT RECORD
c = Optical interface unit (OIU) number.
d = Protection group (PG) number.
e = Side number.
f = APS state. This field will be blank if the OC3(C) circuit has been manually removed out of service (OOS) or if the parent optical facility interface (OFI) circuit is OOS. Valid value(s):
   DNR = Do not revert.
   FS = Forced switch.
   LP = Lock out of protection.
   MS = Manual switch.
   NR = No request.
   SD = Signal degrade.
SF = Signal fail.

g = APS qualifier. This field will be blank if the APS state is NR or DNR. Valid value(s):
AIS-L = Alarm indication signal - line for SF state.
BABBLING = SF defect.
BER 10-3 = Bit error rate for SF state.
BER 10-4 = Bit error rate for SF state.
BER 10-5 = Bit error rate for SD or SF state.
BER 10-6 = Bit error rate for SD state.
BER 10-7 = Bit error rate for SD state.
BER 10-8 = Bit error rate for SD state.
BER 10-9 = Bit error rate for SD state.
LOF = Loss of frame for SF state.
LOS = Loss of signal for SF state.
MDMIS = APS architecture mode mismatch for SF state (bidirectional only).
PSBF = Protection switch byte failure for SF state (bidirectional only).
RDI-L = Remote defect indication - line (unidirectional only).

h = Status of OC3(C) section. Valid value(s):
PROT = Protection.
WORK = Working.

i = APS remote state (bidirectional only). This field will be blank if the OC3(C) circuit is OOS. Valid value(s):
DNR = Do not revert.
EX = Exercise.
FS = Forced switch.
LP = Lock out of protection.
MS = Manual switch.
NR = No request.
RR = Reverse request.
SD = Signal degrade.
SF = Signal fail.
WTR = Wait to restore.
- = Unknown state.

j = APS alarm. Valid value(s):
CHNMIS = Detected a far end channel mismatch.
FEPLF = Detected a signal failure of the far end protection line.

OP: APT-A

Software Release: 5E14 - 5E16(1)
Message Class: ATL
Application: 5
Type: Output

1. FORMAT

[1] OP APT RUNNING LAST TKGMN TESTED a b AND a b
   ELAPSED

[2] OP APT NOT RUNNING NEXT TKGMN TO BE TESTED a b
   NEXT

2. REASON FOR OUTPUT

To show the status of an automatic (trunk) progression test (APT) session. APT performs operational tests on
trunks from two different trunk groups concurrently. When it is running (Format 1), the last two trunk group and
member numbers (TKGMNs) tested are displayed along with how long the session has been running and the total
length of the time the session will run. If APT is not running (Format 2), the time of the next scheduled session will
be displayed along with the lower TKGMN the session will start with.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number.
b = Member number.
c = The length of time that the APT session has been running, in the form hours:minutes.
d = Current day of the week.
e = Duration of the total session in hours.
f = The time next session is scheduled to start, in the form hours:minutes.
g = The day of the week when APT will be run.

[1]  OP APT     RUNNING        LAST TKGMN TESTED a b AND a b
     ELAPSED TIME    cc:cc    DAY d           DURATION e

________________________________________________________

[2]  OP APT     NOT RUNNING    NEXT TKGMN TO BE TESTED a b
     NEXT SCHEDULED SESSION   ff:ff  DAY g   DURATION e

________________________________________________________

2. REASON FOR OUTPUT

To show the status of an automatic (trunk) progression test (APT) session. APT performs operational tests on trunks from up to 8 different trunk groups concurrently. For Format 1, when APT is running, the numerically lowest and highest trunk group and member numbers (TKGMNs) are displayed which indicate the range in which trunks are being tested. How long the session has been running and the total length of the time the session will run are also displayed.

For Format 2, if APT is not running, the time of the next scheduled session will be displayed along with the numerically highest TKGMN the session will start with.

The trunk group and member number will each display a 0 the first time APT is run in an office or if APT is initialized (AM init or single process purge of APT system process). It is also possible to see zeroes when the number of processes running is one or when APT is searching for a trunk group to test.

3. VARIABLE FIELD DEFINITIONS

a  = Trunk group number.
b  = Member number.
c  = The length of time that the APT session has been running, in the form hours:minutes.
d  = Current day of the week.
e  = Duration of the total session in hours.
f  = The time next session is scheduled to start, in the form hours:minutes.
g  = The day of the week when APT will be run.

2. REASON FOR OUTPUT

To display the advanced services platform (ASP) 0.1 test query parameters as a response to the OP:ASPTQ input message. Displayed parameters have been previously stored using the SET:ASPTQ input message.

The possible parameters that can be displayed are:
- Advanced intelligence network maintenance parameter (AMP).
- Access code.
- AMA measurement.
- Bearer capability.
- Busy cause.
- Busy type.
- Called party ID.
- Called party station type.
- Calling party ID.
- Calling party business group ID.
- Charge number.
- Charge party station type.
- Clear cause.
- Close cause.
- Collected address information.
- Collected digits.
- Disconnect cause.
- DTMF digits detected.
- Failure cause.
- Generic address list.
- Generic name.
- Global title address.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirection information.
- Redirecting party ID.
- Timer.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.
- Vertical service code.

3. VARIABLE FIELD DEFINITIONS

\[ a \] = The message type. For convenience, the test query parameters associated with each message type are also listed below. If a particular parameter is not associated with a message type, an \textit{NA} will be displayed in the first field for the parameter.
Some of the following message types have a limited set of parameters sent for event detection point request (EDP-R) messages as opposed to the full set for trigger detection point request (TDP-R) messages. For these message types, variable \( f^2 \) will be populated with an '*' for the parameters associated with that EDP-R message. In the following message definitions, these parameters that apply to the EDP-R version of the message will be marked with an '*' to the right of the parameter. The rest of the parameters associated with the message type will not be included in the EDP-R messages whether populated or not. Also, note that for those message types that distinguish between EDP-R and TDP-R, the notification indicator parameter will only be part of the EDP-R and not the TDP-R.

**CLOSE**
- Information analyzed. Possible parameters:
  - Advanced intelligence network maintenance parameter.
  - Bearer capability.
  - Close cause.
  - User ID.

**INFOANAL**
- Information analyzed. Possible parameters:
  - Advanced intelligence network maintenance parameter.
  - Access code.
  - Bearer capability.
  - Called party ID.
  - Calling party ID.
  - Calling party business group ID.
  - Charge number.
  - Charge party station type.
  - Collected address information.
  - Collected digits.
  - Global title address.
  - Local access and transport area.
  - Original called party ID.
  - Origination point code.
  - Primary carrier.
  - Redirection information.
  - Redirecting party ID.
  - Timer.
  - Translation type.
  - Traveling class mark.
  - Trigger criteria type.
  - User ID.
  - Vertical service code.

**INFOCOLL**
- Information collected. Possible parameters:
  - Advanced intelligence network maintenance parameter.
  - Access code.
  - Bearer capability.
  - Calling party ID.
  - Charge number.
  - Charge party station type.
  - Collected address information.
  - Collected digits.
  - Generic address list.
  - Global title address.
  - Local access and transport area.
  - Original called party ID.
  - Origination point code.
- Primary carrier.
- Redirection information.
- Redirecting party ID.
- Timer.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.
- Vertical service code.

**NTWKBSY**

= Network Busy. Possible parameters:
- Advanced intelligence network maintenance parameter. *
- Bearer capability. *
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator. *
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Timer.
- Traveling class mark.
- Trigger criteria type.
- User ID. *

**OANSWER**

= Originating answer. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

**OCLDPTYBSY**

= Originating called party busy. Possible parameters:
- Advanced intelligence network maintenance parameter. *
- Bearer capability. *
- Busy cause. *
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator. *
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID. *
ODISCONNECT = Originating disconnect. Possible parameters.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Disconnect cause.
- Notification indicator.
- User ID.

ODTMFENTRD = Originating dial tone multi-frequency (DTMF) entered. Possible parameters.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- DTMF digits detected.
- Notification indicator.
- User ID.

ONOANSWER = Originating no answer. Possible parameters:
- Advanced intelligence network maintenance parameter. *
- Bearer capability. *
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator. *
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID. *

ORIGAT = Origination attempt. Possible parameters.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Calling party ID.
- Charge number.
- Charge party station type.
- Global title address.
- Local access and transport area.
- Origination point code.
- Primary carrier.
- Timer.
- Translation type.
- Trigger criteria type.
- User ID.

OTERMSZD = Originating termination seized. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

RESCLR = Resource clear. Possible parameters.
- Advanced intelligence network maintenance parameter.
- AMA measurement.
- Clear cause.
- Collected address information.
- Collected digits.
- Failure cause.
- Primary carrier.
- Timer.

TANSWER = Terminating answer. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

TBUSY = Terminating busy. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Busy cause.
- Busy type.
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID.

TERMAT = Termination attempt. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Global title address.
- Local access and transport area.
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Timer.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.

**TNOANSWER** = Terminating no answer. Possible parameters:
- Advanced intelligence network maintenance parameter. *
- Bearer capability. *
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Local access and transport area.
- Notification indicator. *
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID. *

**TRMRSCAVL** = Terminating resource available. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

**ALL** = All of the ASP 0.1B test query parameters.

**b** = User ID type. Valid value(s):
- BRI = Basic rate interface.
- DN = Directory number.
- PFID = Private facility ID.
- TGID = Trunk group ID.

**c** = Trunk group ID or private facility ID for the user ID parameter depending upon the user ID type.

**d** = Directory number for the user ID parameter.

**e** = Service profile ID for the user ID parameter.

**f** = Bearer capability. Valid value(s):
- SPEECH
- 3.1KHZ AUDIO
- 56 KBPS
- 64 KBPS

**g** = Called party station type.

**h** = Trigger criteria type. Valid value(s):
- AUTOMATIC FLEXIBLE ROUTING
CHANNEL SETUP PRI

SHARED INTER OFFICE TRUNK
TERMINATING BUSY
TERMINATING NO ANSWER
TERMINATION ATTEMPT
VERTICAL SERVICE CODE

\[i\] = Calling party business group ID.

\[j\] = Attendant status for the calling party BGID parameter. Valid value(s):
ATTENDANT = Attendant line.
NO ATTENDANT = Not an attendant line (or no indication).

\[k\] = Party selector for the calling party BGID parameter. Valid value(s):
CALLING PTY = Calling party.
REDIRECTING PTY = Redirecting party.

\[l\] = Charge party station type.

\[m\] = Carrier ID for the primary carrier parameter.

\[n\] = Carrier selection for the primary carrier parameter. Valid value(s):
NO INDICATION = no indication of whether the selected carrier is presubscribed.
NOT PRESUBSCRIBED AND INPUT = selected carrier is not presubscribed and not input by the calling party.
PRESUBSCRIBED AND INPUT = selected carrier is presubscribed and input by the calling party.
PRESUBSCRIBED AND NO INDICATION = selected carrier is presubscribed and no indication of whether input by the calling party.
PRESUBSCRIBED AND NOT INPUT = selected carrier is presubscribed and not input by the calling party.
o = Original redirecting reason. Valid value(s):
   NO REPLY
   UNCONDITIONAL
   UNKNOWN
   USER BUSY

p = Redirecting reason. Valid value(s):
   NO REPLY
   UNCONDITIONAL
   UNKNOWN
   USER BUSY

q = Redirecting count.

r = AMP key. Valid value(s):
   NO TIME = No AMP time is specified (the following AMP fields are ignored).
   TIME = An AMP time is specified.

s = AMP year. Valid value(s):
   CURRENT YEAR
   LAST YEAR
   NEXT YEAR

t = AMP month. Valid value(s):
   JAN = January.
   FEB = February.
   MAR = March.
   APR = April.
   MAY = May.
   JUN = June.
   JUL = July.
   AUG = August.
   SEP = September.
   OCT = October.
   NOV = November.
   DEC = December.

u = Advanced intelligence network maintenance parameter (AMP) date.

v = Advanced intelligence network maintenance parameter (AMP) hour.

w = Advanced intelligence network maintenance parameter (AMP) minute.

x = Failure cause. Valid value(s):
   RATE TOO HIGH
   UNAVAILABLE RESOURCE

y = Clear cause. Valid value(s):
ABANDON
ABORT
CALLED PARTY ANSWERED
CAPABILITY FAILURE
CHANNELS BUSY
FAILURE
IP TIMEOUT
ISDN TIMEOUT
INVALID CALLER RESPONSE
INVALID CODE
NORMAL
PROTOCOL ERROR
RESOURCE CANCELED
RESOURCE NOT AVAILABLE
RESOURCE TYPE NOT SUPPORTED
SEND TO RESOURCE CANCELED
SUPERVISION SERVICE INVOKED
TASK REFUSED
TEMPORARY FAILURE
TIME OUT

z
= Generic name presentation. Valid value(s):
  BLOCKING TOGGLE
  PRESENTATION ALLOWED
  PRESENTATION RESTRICTED

a¹
= Timer (in seconds)

b¹
= Global title address.

c¹
= Called party ID digits.

d¹
= Called type nature of number. Valid value(s):
  950+   = 950+ call.
  CUT THRU = No address present, cut through to carrier.
  INTL   = International number.
  INTL OPR = International number, operator requested.
  NA     = Not applicable.
  NADR OPR = No address present, operator requested.
  NAT    = National (significant) number.
  NAT OPR = National number, operator requested.
  SS     = Subscriber number.
  SS OPR = Subscriber number, operator requested.
  TST LINE = Test line test code.

e¹
= Numbering plan. Valid value(s):
  ISDN   = ISDN.
  NA     = Unknown.
  PRIV   = Private.
f\textsuperscript{1} = Charge number digits.

g\textsuperscript{1} = Charge type nature of number. Valid value(s):
  APN = Action pointer number.
  NAT CLD = Called party ANI; national number.
  NAT CLG = Calling party ANI, national number.
  NOT AVL = ANI not available or not provided.
  NOT INCL = Called party ANI not included.
  SS CLD = Called party ANI; subscriber number.
  SS CLG = Calling party ANI; subscriber number.

h\textsuperscript{1} = Calling party ID digits.

i\textsuperscript{1} = Calling type nature of number. Valid value(s):
  INTL = Unique international number.
  NA = Not applicable, or unknown.
  NAT = Unique national (significant) number.
  NUNQ INT = Non-unique international number.
  NUNQ NAT = Non-unique national number.
  NUNQ SS = Non-unique subscriber number.
  SS = Unique subscriber number.
  TST LINE = Test line test code.

j\textsuperscript{1} = Presentation restriction indicator. Valid value(s):
  ALW = Presentation allowed.
  REST = Presentation restricted.
  UNAV = Number unavailable.

k\textsuperscript{1} = Screening indicator. Valid value(s):
  NETP = Network provided.
  UPNS = User provided, not screened.
  UPPS = User provided, passed screening.

l\textsuperscript{1} = Original called party ID digits.

m\textsuperscript{1} = Redirecting party ID digits.

n\textsuperscript{1} = Collected address information digits.

o\textsuperscript{1} = Collected digits digits.

p\textsuperscript{1} = Access code digits.

q\textsuperscript{1} = Vertical service code digits.

r\textsuperscript{1} = Local access and transport area digits.

s\textsuperscript{1} = Traveling class mark digits.

t\textsuperscript{1} = Generic address signal digits.
= Generic address type of address. Values are:
COMPLETNBR = Completion number.
DESTNBR = Destination number.
DIALEDNBR = Dialed number.
SUPFAILSCR = Supplemental user provided calling address. Failed screening.
SUPNOTSCR = Supplemental user provided calling address. Not screened.

= Close cause. Valid value(s):
ANSW = Called party answered.
CALLFWD = Call forwarded.
CMPL = Events and reports completed.
TERM = Call terminated.
UCOMM = Unexpected communication.

= Notification indicator. Valid value(s):
NOTIFY = Switch notification message.
REQ = Switch request message.

= Busy cause coding standard. Valid value(s):
CCITT = International telecommunication union - telecommunication, standardization sector (ITU-TS) (formerly CCITT) standard.
NETWK = Network specific.

= Busy cause general location. Valid value(s):
LOCUNKN = Location unknown.
LOCTRL = Local interface controlled by signaling link.
INTNTWK = International network.
PUBLU = Public network serving local user.
PUBRU = Public network serving remote user.
PVIULU = Private network serving local user.
PVTRU = Private network serving remote user.
TRNTWK = Transit network.
USER = User.

= Busy cause value. Valid value(s):
ADRINC = Address incomplete.
AUNKPARM = Parameter non-existent or not implemented - accepted.
BCNOAUTH = Bearer capability not authorized.
BCNOIMPL = Bearer capability not implemented.
BCUNAV = Bearer capability not presently available.
CALLABN = Caller abandon.
CALLREJ = Call rejected.
DESTNORTE = No route to destination.
DESTOUT = Destination out of order.
DUNKPARM = Parameter non-existent or not implemented - discarded.
INFODISCD = Access information discarded.
INTWK = Interworking.
INVRSP = Improper caller response.
NBRCHG = Number changed.
NOCKT = No circuit available.
NOUSRSP = No user responding.
NRMCLR = Normal clearing.
NRM = Normal.
NSRVOPT = Service/option not implemented.
NTWKNORTE = No route to specified transit network.
NTWKOUT = Reserved for network out of order.
PARMINV = Parameter with invalid coding.
PRCLERR = Protocol error.
RDIRCTRX = Redirection counter exceeded.
RQCHANUNV = Requested channel not available.
RSRC = Resource unavailable.
SRVOPT = Service/option not available.
SWCHCONG = Switching equipment congestion.
TMPFAIL = Temporary failure.
UNALCNBR = Unallocated number.
UNKMSG = Msg type non-existent or not implemented.
USRALRT = User alerting, no answer.
USRBSY = User busy.

a² = Translation type (range of 0-255).
b² = AMA measurement start time (mm/dd/y hh:mm:ss.s).
c² = AMA measurement duration (mmmmm:ss.s).
d² = AMA measurement time guard. Valid value(s):
   TIMING GUARD EXISTS = Timing guard exists.
   NO TIMING GUARD = Timing guard does not exist.

e² = Origination point code. Refer to the APP:POINT-C ODE appendix in the Appendixes section of the Input Messages manual.
f² = EDP-R flag. Valid value(s):
   * = This parameter will be sent for EDP-R messages for the message type in variable 'a'.

g² = Busy type. Valid value(s):
   CALL OFFERED = Call can be offered.
   CALL NOT OFFERED = Call can not be offered.

h² = Disconnect cause. Valid value(s):
   FAREND = Far end.

i² = Dial tone multi-frequency (DTMF) digits detected.

4. ACTIONS TO BE TAKEN
None. This message is in response to a manual input request.

5. ALARMS

None.

2. REASON FOR OUTPUT

To display the advanced services platform (ASP) 0.1 test query parameters as a response to the OP:ASPTQ input message. Displayed parameters have been previously stored using the SET:ASPTQ input message.

The possible parameters that can be displayed are:
- Advanced intelligence network maintenance parameter (AMP).
- Access code.
- AMA measurement.
- Bearer capability.
- Busy cause.
- Busy type.
- Called party ID.
- Called party station type.
- Calling party ID.
- Calling party business group ID.
- Charge number.
- Charge party station type.
- Clear cause.
- Close cause.
- Collected address information.
- Collected digits.
- Disconnect cause.
- DTMF digits detected.
- Extension parameters.
- Failure cause.
- Generic address list.
- Generic name.
- Global title address.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
3. VARIABLE FIELD DEFINITIONS

a  = The message type. For convenience, the test query parameters associated with each message
   type are also listed below. If a particular parameter is not associated with a message type, an NA
   will be displayed in the first field for the parameter.

Some of the following message types have a limited set of parameters sent for event detection
point request (EDP-R) messages as opposed to the full set for trigger detection point request
(TDP-R) messages. For these message types, variable f^2 will be populated with an '*' for the
parameters associated with that EDP-R message. In the following message definitions, these
parameters that apply to the EDP-R version of the message will be marked with an '*' to the right of
the parameter. The rest of the parameters associated with the message type will not be included in
the EDP-R messages whether populated or not. Also, note that for those message types that
distinguish between EDP-R and TDP-R, the notification indicator parameter will only be part of the
EDP-R and not the TDP-R.

CLOSE = Information analyzed. Possible parameters:
-  Advanced intelligence network maintenance parameter.
-  Bearer capability.
-  Close cause.
-  User ID.

INFOANAL = Information analyzed. Possible parameters:
-  Advanced intelligence network maintenance parameter.
-  Access code.
-  Bearer capability.
-  Called party ID.
-  Calling party ID.
-  Calling party business group ID.
-  Charge number.
-  Charge party station type.
-  Collected address information.
-  Collected digits.
-  Global title address.
-  Local access and transport area.
-  Original called party ID.
-  Origination point code.
-  Primary carrier.
-  Redirection information.
-  Redirecting party ID.
-  Signaling platform.
-  Timer.
-  Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.
- Vertical service code.

INFOCOLL = Information collected. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Access code.
- Bearer capability.
- Calling party ID.
- Charge number.
- Charge party station type.
- Collected address information.
- Collected digits.
- Extension parameters.
- Generic address list.
- Global title address.
- Local access and transport area.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirection information.
- Redirecting party ID.
- Signaling platform.
- Timer.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.
- Vertical service code.

NTWKBSY = Network Busy. Possible parameters:
- Advanced intelligence network maintenance parameter. *
- Bearer capability. *
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator. *
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Signaling platform.
- Timer.
- Traveling class mark.
- Trigger criteria type.
- User ID. *

OANSWER = Originating answer. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

**OCLDPTYBSY** = Originating called party busy. Possible parameters:
- Advanced intelligence network maintenance parameter. *
- Bearer capability. *
- Busy cause. *
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator. *
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Signaling platform.
- Timer.
- Trigger criteria type.
- User ID. *

**ODISCONNECT** = Originating disconnect. Possible parameters.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Disconnect cause.
- Notification indicator.
- User ID.

**ODTMFENTRD** = Originating dial tone multi-frequency (DTMF) entered. Possible parameters.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- DTMF digits detected.
- Notification indicator.
- User ID.

**ONOANSWER** = Originating no answer. Possible parameters:
- Advanced intelligence network maintenance parameter. *
- Bearer capability. *
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator. *
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID. *
ORIGAT = Origination attempt. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Calling party ID.
- Charge number.
- Charge party station type.
- Global title address.
- Local access and transport area.
- Origination point code.
- Primary carrier.
- Signaling platform.
- Timer.
- Translation type.
- Trigger criteria type.
- User ID.

OTERMSZD = Originating termination seized. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

RESCLR = Resource clear. Possible parameters:
- Advanced intelligence network maintenance parameter.
- AMA measurement.
- Clear cause.
- Collected address information.
- Collected digits.
- Failure cause.
- Primary carrier.
- Timer.

TANSWER = Terminating answer. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

TBUSY = Terminating busy. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Busy cause.
- Busy type.
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID. *

**TERMAT** = Termination attempt. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Global title address.
- Local access and transport area.
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Timer.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.

**TNOANSWER** = Terminating no answer. Possible parameters:
- Advanced intelligence network maintenance parameter. *
- Bearer capability. *
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Local access and transport area.
- Notification indicator. *
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID. *

**TRMRSRCAVL** = Terminating resource available. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

**ALL** = All of the ASP 0.1B test query parameters.
b  = User ID type. Valid value(s):
   BRI  = Basic rate interface.
   DN   = Directory number.
   PFID = Private facility ID.
   TGID = Trunk group ID.

c  = Trunk group ID or private facility ID for the user ID parameter depending upon the user ID type.

d  = Directory number for the user ID parameter.

e  = Service profile ID for the user ID parameter.

f  = Bearer capability. Valid value(s):
   SPEECH
   3.1KHZ AUDIO
   56 KBPS
   64 KBPS

g  = Called party station type.

h  = Trigger criteria type. Valid value(s):
   AUTOMATIC FLEXIBLE ROUTING
   CHANNEL SETUP PRI
   COUNTRY CODE NPA-NXX-XXXX
   CUSTOMIZED ACCESS
   FEATURE ACTIVATOR
   N11
   NPA
   NPA-N
   NPA-NX

   TERMINATION ATTEMPT
   TRUNK GROUP
   VERTICAL SERVICE CODE

i  = Calling party business group ID.
j = Attendant status for the calling party BGID parameter. Valid value(s):
ATTENDANT = Attendant line.
NO ATTENDANT = Not an attendant line (or no indication).

k = Party selector for the calling party BGID parameter. Valid value(s):
CALLING PTY = Calling party.
REDIRECTING PTY = Redirecting party.

l = Charge party station type.

m = Carrier ID for the primary carrier parameter.

n = Carrier selection for the primary carrier parameter. Valid value(s):
NO INDICATION = no indication of whether the selected carrier is presubscribed.
NOT PRESUBSCRIBED AND INPUT = selected carrier is not presubscribed and not input by the calling party.
PRESUBSCRIBED AND INPUT = selected carrier is presubscribed and input by the calling party.
PRESUBSCRIBED AND NO INDICATION = selected carrier is presubscribed and no indication of whether input by the calling party.
PRESUBSCRIBED AND NOT INPUT = selected carrier is presubscribed and not input by the calling party.

o = Original redirecting reason. Valid value(s):
NO REPLY
UNCONDITIONAL
UNKNOWN
USER BUSY

p = Redirecting reason. Valid value(s):
NO REPLY
UNCONDITIONAL
UNKNOWN
USER BUSY

q = Redirecting count.

r = AMP key. Valid value(s):
NO TIME = No AMP time is specified (the following AMP fields are ignored).
TIME = An AMP time is specified.

s = AMP year. Valid value(s):
CURRENT YEAR
LAST YEAR
NEXT YEAR

T = AMP month. Valid value(s):
JAN = January.
FEB = February.
MAR = March.
APR = April.
MAY = May.
JUN = June.
JUL = July.
AUG = August.
SEP = September.
OCT = October.
NOV = November.
DEC = December.

u = Advanced intelligence network maintenance parameter (AMP) date.

v = Advanced intelligence network maintenance parameter (AMP) hour.

w = Advanced intelligence network maintenance parameter (AMP) minute.

x = Failure cause. Valid value(s):
- RATE TOO HIGH
- UNAVAILABLE RESOURCE

y = Clear cause. Valid value(s):
- ABANDON
- ABORT
- CALLED PARTY ANSWERED
- CAPABILITY FAILURE
- CHANNELS BUSY
- FAILURE
- IP TIMEOUT
- ISDN TIMEOUT
- INVALID CALLER RESPONSE
- INVALID CODE
- NORMAL
- PROTOCOL ERROR
- RESOURCE CANCELED
- RESOURCE NOT AVAILABLE
- RESOURCE TYPE NOT SUPPORTED
- SEND TO RESOURCE CANCELED
- SUPERVISION SERVICE INVOKED
- TASK REFUSED
- TEMPORARY FAILURE
- TIME OUT

z = Generic name presentation. Valid value(s):
- BLOCKING TOGGLE
- PRESENTATION ALLOWED
- PRESENTATION RESTRICTED

a = Timer (in seconds)
b\(^1\) = Global title address.

c\(^1\) = Called party ID digits.

d\(^1\) = Called type nature of number. Valid value(s):
    950+ = 950+ call.
    CUT THRU = No address present, cut through to carrier.
    INTL = International number.
    INTL OPR = International number, operator requested.
    NA = Not applicable.
    NADR OPR = No address present, operator requested.
    NAT = National (significant) number.
    NAT OPR = National number, operator requested.
    SS = Subscriber number.
    SS OPR = Subscriber number, operator requested.
    TST LINE = Test line test code.

e\(^1\) = Numbering plan. Valid value(s):
    ISDN = ISDN.
    NA = Unknown.
    PRIV = Private.

f\(^1\) = Charge number digits.

g\(^1\) = Charge type nature of number. Valid value(s):
    APN = Action pointer number.
    NAT CLD = Called party ANI; national number.
    NAT CLG = Calling party ANI, national number.
    NOT AVL = ANI not available or not provided.
    NOT INCL = Called party ANI not included.
    SS CLD = Called party ANI; subscriber number.
    SS CLG = Calling party ANI; subscriber number.

h\(^1\) = Calling party ID digits.

i\(^1\) = Calling type nature of number. Valid value(s):
    INTL = Unique international number.
    NA = Not applicable, or unknown.
    NAT = Unique national (significant) number.
    NUNQ INT = Non-unique international number.
    NUNQ NAT = Non-unique national number.
    NUNQ SS = Non-unique subscriber number.
    SS = Unique subscriber number.
    TST LINE = Test line test code.

j\(^1\) = Presentation restriction indicator. Valid value(s):
    ALW = Presentation allowed.
    REST = Presentation restricted.
    UNAV = Number unavailable.
k = Screening indicator. Valid value(s):
   NETP  = Network provided.
   UPNS  = User provided, not screened.
   UPPS  = User provided, passed screening.

l = Original called party ID digits.

m = Redirecting party ID digits.

n = Collected address information digits.

o = Collected digits digits.

p = Access code digits.

q = Vertical service code digits.

r = Local access and transport area digits.

s = Traveling class mark digits.

t = Generic address signal digits.

u = Generic address type of address. Values are:
   COMPLETNBR  = Completion number.
   DESTNBR     = Destination number.
   DIALEDNBR   = Dialed number.
   SUPFAILSCR  = Supplemental user provided calling address. Failed screening.
   SUPNOTSCR   = Supplemental user provided calling address. Not screened.

v = Close cause. Valid value(s):
   ANSW        = Called party answered.
   CALLFWD     = Call forwarded.
   CMPL        = Events and reports completed.
   TERM        = Call terminated.
   UCOMM       = Unexpected communication.

w = Notification indicator. Valid value(s):
   NOTIFY      = Switch notification message.
   REQ         = Switch request message.

x = Busy cause coding standard. Valid value(s):
   CCITT       = International telecommunication union - telecommunication, standardization
                 sector (ITU-TS) (formerly CCITT) standard.
   NETWK       = Network specific.

y = Busy cause general location. Valid value(s):
   LOCUNKN     = Location unknown.
   LOCTRL      = Local interface controlled by signaling link.
INTNTWK = International network.
PUBLU = Public network serving local user.
PUBRU = Public network serving remote user.
PVTLU = Private network serving local user.
PVTTRU = Private network serving remote user.
TRNTWK = Transit network.
USER = User.

z1 = Busy cause value. Valid value(s):
ADRINC = Address incomplete.
AUNKPARM = Parameter non-existent or not implemented - accepted.
BCNOAUTH = Bearer capability not authorized.
BCNOIMPL = Bearer capability not implemented.
BCUNAV = Bearer capability not presently available.
CALLABN = Caller abandon.
CALLREJ = Call rejected.
DESTNORTE = No route to destination.
DESTOUT = Destination out of order.
DUNKPARM = Parameter non-existent or not implemented - discarded.
INFODISCD = Access information discarded.
INTWK = Interworking.
INVRSP = Improper caller response.
NBRCHG = Number changed.
NOCKT = No circuit available.
NOUSRSP = No user responding.
NRMCLR = Normal clearing.
NRM = Normal.
NSRVOPT = Service/option not implemented.
NTWK = Interworking.
NTKNORTE = No route to specified transit network.
NTWKOUT = Reserved for network out of order.
PARMINV = Parameter with invalid coding.
PRCLERR = Protocol error.
RDRCRTX = Redirection counter exceeded.
REQCHANUNV = Requested channel not available.
RSRC = Resource unavailable.
SRVOPT = Service/option not available.
SWCHCONG = Switching equipment congestion.
TMPFAIL = Temporary failure.
UNALCNBR = Unallocated number.
UNKMSG = Msg type non-existent or not implemented.
USRALRT = User alerting, no answer.
USRBSY = User busy.

a2 = Translation type (range of 0-255).
b2 = AMA measurement start time (mm/dd/y hh:mm:ss.s).
c2 = AMA measurement duration (mmmm:ss.s).
d2 = AMA measurement time guard. Valid value(s):
TIMING GUARD EXISTS = Timing guard exists.
NO TIMING GUARD = Timing guard does not exist.

e\textsuperscript{2} = Origination point code. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

f\textsuperscript{2} = EDP-R flag. Valid value(s):
* = This parameter will be sent for EDP-R messages for the message type in variable 'a'.

g\textsuperscript{2} = Busy type. Valid value(s):
CALL OFFERED = Call can be offered.
CALL NOT OFFERED = Call can not be offered.

h\textsuperscript{2} = Disconnect cause. Valid value(s):
FAREND = Far end.

i\textsuperscript{2} = Dial tone multi-frequency (DTMF) digits detected.

j\textsuperscript{2} = These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

k\textsuperscript{2} = These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

l\textsuperscript{2} = These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

m\textsuperscript{2} = These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

n\textsuperscript{2} = These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

o\textsuperscript{2} = These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

p\textsuperscript{2} = These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

q\textsuperscript{2} = These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

r\textsuperscript{2} = Signaling Platform. Valid value(s):
0 = Common Network Interface (CNI) Platform
1 – 192 = Global Switching Module (GSM) Number

4. ACTIONS TO BE TAKEN

None. This message is in response to a manual input request.
5. ALARMS

None.

2. REASON FOR OUTPUT

To display the advanced services platform (ASP) 0.1 test query parameters as a response to the OP:ASPTQ input message. Displayed parameters have been previously stored using the SET:ASPTQ input message.

The possible parameters that can be displayed are:
- Advanced intelligence network maintenance parameter (AMP).
- Access code.
- AMA measurement.
- Bearer capability.
- Busy cause.
- Busy type.
- Called party ID.
- Called party station type.
- Calling party ID.
- Calling party business group ID.
- Charge number.
- Charge party station type.
- Clear cause.
- Close cause.
- Collected address information.
- Collected digits.
- Disconnect cause.
- DTMF digits detected.
- Extension parameters.
- Failure cause.
- Generic address list.
- Generic name.
- Global title address.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirection information.
- Redirecting party ID.
- Timer.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.
- Vertical service code.
3. VARIABLE FIELD DEFINITIONS

a

= The message type. For convenience, the test query parameters associated with each message type are also listed below. If a particular parameter is not associated with a message type, an \textit{NA} will be displayed in the first field for the parameter.

Some of the following message types have a limited set of parameters sent for event detection point request (EDP-R) messages as opposed to the full set for trigger detection point request (TDP-R) messages. For these message types, variable $f^2$ will be populated with an "*" for the parameters associated with that EDP-R message. In the following message definitions, these parameters that apply to the EDP-R version of the message will be marked with an "*" to the right of the parameter. The rest of the parameters associated with the message type will not be included in the EDP-R messages whether populated or not. Also, note that for those message types that distinguish between EDP-R and TDP-R, the notification indicator parameter will only be part of the EDP-R and not the TDP-R.

\textbf{CLOSE} = Information analyzed. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Close cause.
- User ID.

\textbf{INFOANAL} = Information analyzed. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Access code.
- Bearer capability.
- Called party ID.
- Calling party ID.
- Calling party business group ID.
- Charge number.
- Charge party station type.
- Collected address information.
- Collected digits.
- Global title address.
- Local access and transport area.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirection information.
- Redirecting party ID.
- Timer.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.
- Vertical service code.

\textbf{INFOCOLL} = Information collected. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Access code.
- Bearer capability.
- Calling party ID.
- Charge number.
- Charge party station type.
- Collected address information.
- Collected digits.
- Extension parameters.
- Generic address list.
- Global title address.
- Local access and transport area.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirection information.
- Redirecting party ID.
- Timer.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.
- Vertical service code.

**NTWKBSY** = Network Busy. Possible parameters:
- Advanced intelligence network maintenance parameter. *
- Bearer capability. *
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator. *
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Timer.
- Traveling class mark.
- Trigger criteria type.
- User ID. *

**OANSWER** = Originating answer. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

**OCLDPTYBSY** = Originating called party busy. Possible parameters:
- Advanced intelligence network maintenance parameter. *
- Bearer capability. *
- Busy cause. *
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator. *
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID.

**ODISCONNECT** = Originating disconnect. Possible parameters.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Disconnect cause.
- Notification indicator.
- User ID.

**ODTMFENTRD** = Originating dial tone multi-frequency (DTMF) entered. Possible parameters.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- DTMF digits detected.
- Notification indicator.
- User ID.

**ONOANSWER** = Originating no answer. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID.

**ORIGAT** = Origination attempt. Possible parameters.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Calling party ID.
- Charge number.
- Charge party station type.
- Global title address.
- Local access and transport area.
- Origination point code.
- Primary carrier.
- Timer.
- Translation type.
- Trigger criteria type.
- User ID.
OTERMSZD = Originating termination seized. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

RESCLR = Resource clear. Possible parameters.
- Advanced intelligence network maintenance parameter.
- AMA measurement.
- Clear cause.
- Collected address information.
- Collected digits.
- Failure cause.
- Primary carrier.
- Timer.

TANSWER = Terminating answer. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

TBUSY = Terminating busy. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Busy cause.
- Busy type.
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID.

TERMAT = Termination attempt. Possible parameters.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Global title address.
- Local access and transport area.
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Timer.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.

TNOANSWER = Terminating no answer. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID.

TRMRSRCAVL = Terminating resource available. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

ALL = All of the ASP 0.1B test query parameters.

b = User ID type. Valid value(s):
  BRI = Basic rate interface.
  DN = Directory number.
  PFID = Private facility ID.
  TGID = Trunk group ID.

c = Trunk group ID or private facility ID for the user ID parameter depending upon the user ID type.

d = Directory number for the user ID parameter.

e = Service profile ID for the user ID parameter.

f = Bearer capability. Valid value(s):

i = Calling party business group ID.

j = Attendant status for the calling party BGID parameter. Valid value(s):
ATTENDANT = Attendant line.
NO ATTENDANT = Not an attendant line (or no indication).

k = Party selector for the calling party BGID parameter. Valid value(s):
CALLING PTY = Calling party.
REDIRECTING PTY = Redirecting party.

l = Charge party station type.

m = Carrier ID for the primary carrier parameter.

n = Carrier selection for the primary carrier parameter. Valid value(s):
NO INDICATION = no indication of whether the selected carrier is presubscribed.
NOT PRESUBSCRIBED AND INPUT = selected carrier is not presubscribed and not input by the
calling party.
PRESUBSCRIBED AND INPUT = selected carrier is presubscribed and input by the calling party.
PRESUBSCRIBED AND NO INDICATION = selected carrier is presubscribed and no indication of
whether input by the calling party.
PRESUBSCRIBED AND NOT INPUT = selected carrier is presubscribed and not input by the calling
party.

\( q \) = Redirecting count.

\( r \) = AMP key. Valid value(s):
NO TIME = No AMP time is specified (the following AMP fields are ignored).
TIME = An AMP time is specified.

\( s \) = AMP year. Valid value(s):
CURRENT YEAR
LAST YEAR
NEXT YEAR

\( t \) = AMP month. Valid value(s):
JAN = January.
FEB = February.
MAR = March.
APR = April.
MAY = May.
JUN = June.
JUL = July.
AUG = August.
SEP = September.
OCT = October.
NOV = November.
DEC = December.

\( u \) = Advanced intelligence network maintenance parameter (AMP) date.
v = Advanced intelligence network maintenance parameter (AMP) hour.

w = Advanced intelligence network maintenance parameter (AMP) minute.

x = Failure cause. Valid value(s):
RATE TOO HIGH
UNAVAILABLE RESOURCE

y = Clear cause. Valid value(s):
ABANDON
ABORT
CALLED PARTY ANSWERED
CAPABILITY FAILURE
CHANNELS BUSY
FAILURE
IP TIMEOUT
ISDN TIMEOUT
INVALID CALLER RESPONSE
INVALID CODE
NORMAL
PROTOCOL ERROR
RESOURCE CANCELED
RESOURCE NOT AVAILABLE
RESOURCE TYPE NOT SUPPORTED
SEND TO RESOURCE CANCELED
SUPERVISION SERVICE INVOKED
TASK REFUSED
TEMPORARY FAILURE
TIME OUT

z = Generic name presentation. Valid value(s):
BLOCKING TOGGLE
PRESENTATION ALLOWED
PRESENTATION RESTRICTED

a¹ = Timer (in seconds)

b¹ = Global title address.

c¹ = Called party ID digits.

d¹ = Called type nature of number. Valid value(s):
950+ = 950+ call.
CUT THRU = No address present, cut through to carrier.
INTL = International number.
INTL OPR = International number, operator requested.
NA = Not applicable.
NADR OPR = No address present, operator requested.
NAT = National (significant) number.
NAT OPR = National number, operator requested.
SS = Subscriber number.
SS OPR = Subscriber number, operator requested.
TST LINE = Test line test code.

e = Numbering plan. Valid value(s):
   ISDN = ISDN.
   NA = Unknown.
   PRIV = Private.

f = Charge number digits.

g = Charge type nature of number. Valid value(s):
   APN = Action pointer number.
   NAT CLD = Called party ANI; national number.
   NAT CLG = Calling party ANI, national number.
   NOT AVL = ANI not available or not provided.
   NOT INCL = Called party ANI not included.
   SS CLD = Called party ANI; subscriber number.
   SS CLG = Calling party ANI; subscriber number.

h = Calling party ID digits.

i = Calling type nature of number. Valid value(s):
   INTL = Unique international number.
   NA = Not applicable, or unknown.
   NAT = Unique national (significant) number.
   NUNQ INT = Non-unique international number.
   NUNQ NAT = Non-unique national number.
   NUNQ SS = Non-unique subscriber number.
   SS = Unique subscriber number.
   TST LINE = Test line test code.

j = Presentation restriction indicator. Valid value(s):
   ALW = Presentation allowed.
   REST = Presentation restricted.
   UNAV = Number unavailable.

k = Screening indicator. Valid value(s):
   NETP = Network provided.
   UPNS = User provided, not screened.
   UPPS = User provided, passed screening.

l = Original called party ID digits.

m = Redirecting party ID digits.

n = Collected address information digits.

o = Collected digits digits.
p<sup>1</sup>  = Access code digits.
q<sup>1</sup>  = Vertical service code digits.
r<sup>1</sup>  = Local access and transport area digits.
s<sup>1</sup>  = Traveling class mark digits.
t<sup>1</sup>  = Generic address signal digits.

u<sup>1</sup>  = Generic address type of address. Values are:
COMPLETNBR  = Completion number.
DESTNBR  = Destination number.
DIALEDNBR  = Dialed number.
SUPFAILSCR  = Supplemental user provided calling address. Failed screening.
SUPNOTSCR  = Supplemental user provided calling address. Not screened.

v<sup>1</sup>  = Close cause. Valid value(s):
ANSW  = Called party answered.
CALLFWD  = Call forwarded.
CMPL  = Events and reports completed.
TERM  = Call terminated.
UCOMM  = Unexpected communication.

w<sup>1</sup>  = Notification indicator. Valid value(s):
NOTIFY  = Switch notification message.
REQ  = Switch request message.

x<sup>1</sup>  = Busy cause coding standard. Valid value(s):
CCITT  = International telecommunication union - telecommunication, standardization sector (ITU-TS) (formerly CCITT) standard.
NETWK  = Network specific.

y<sup>1</sup>  = Busy cause general location. Valid value(s):
LOCUNKN  = Location unknown.
LOCTRL  = Local interface controlled by signaling link.
INTNTWK  = International network.
PUBLU  = Public network serving local user.
PUBRU  = Public network serving remote user.
PVTLU  = Private network serving local user.
PVTTRU  = Private network serving remote user.
TRNTWK  = Transit network.
USER  = User.

z<sup>1</sup>  = Busy cause value. Valid value(s):
ADRINC  = Address incomplete.
AUNKPARM  = Parameter non-existent or not implemented - accepted.
BCNOAUTH  = Bearer capability not authorized.
BCNOIMPL = Bearer capability not implemented.
BCUNAV = Bearer capability not presently available.
CALLABN = Caller abandon.
CALLREJ = Call rejected.
DESTNORTE = No route to destination.
DESTOUT = Destination out of order.
DUNKPARM = Parameter non-existent or not implemented - discarded.
INFODISCD = Access information discarded.
INTWK = Interworking.
INVRSP = Improper caller response.
NBRCHG = Number changed.
NCKT = No circuit available.
NOUSRSP = No user responding.
NRMCLR = Normal clearing.
NRM = Normal.
NSRVOPT = Service/option not implemented.
NTWKNORTE = No route to specified transit network.
NTWKOUT = Reserved for network out of order.
PARMINV = Parameter with invalid coding.
PRCLERR = Protocol error.
RDIRCTRX = Redirection counter exceeded.
RQCHANUNV = Requested channel not available.
RSRC = Resource unavailable.
SRVOPT = Service/option not available.
SWCHCONG = Switching equipment congestion.
TMPFAIL = Temporary failure.
UNALCNBR = Unallocated number.
UNKMSG = Msg type non-existent or not implemented.
USRALRT = User alerting, no answer.
USRBSY = User busy.

\[ a^2 \] = Translation type (range of 0-255).

\[ b^2 \] = AMA measurement start time (mm/dd/y hh:mm:ss.s).

\[ c^2 \] = AMA measurement duration (mmmmm:ss.s).

\[ d^2 \] = AMA measurement time guard. Valid value(s):
\[ \text{TIMING GUARD EXISTS} \] = Timing guard exists.
\[ \text{NO TIMING GUARD} \] = Timing guard does not exist.

\[ e^2 \] = Origination point code. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

\[ f^2 \] = EDP-R flag. Valid value(s):
\[ * \] = This parameter will be sent for EDP-R messages for the message type in variable 'a'.

\[ g^2 \] = Busy type. Valid value(s):
\[ \text{CALL OFFERED} \] = Call can be offered.
**CALL NOT OFFERED** = Call can not be offered.

\[ h^2 \]

= Disconnect cause. Valid value(s):

FAREND = Far end.

\[ i^2 \]

= Dial tone multi-frequency (DTMF) digits detected.

\[ j^2 \]

= These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

\[ k^2 \]

= These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

\[ l^2 \]

= These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

\[ m^2 \]

= These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

\[ n^2 \]

= These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

\[ o^2 \]

= These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

\[ p^2 \]

= These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

\[ q^2 \]

= These parameters are associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

### 4. ACTIONS TO BE TAKEN

None. This message is in response to a manual input request.

### 5. ALARMS

None.

### 6. REFERENCES

Input Message(s):

### 2. REASON FOR OUTPUT

To display the advanced services platform (ASP) 0.1 test query parameters as a response to the OP:ASPTQ input message. Displayed parameters have been previously stored using the SET:ASPTQ input message.

Format 3 is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

The possible parameters that can be displayed are:
- Advanced intelligence network maintenance parameter (AMP).
- Access code.
- AMA measurement.
- Bearer capability.
- Busy cause.
- Busy type.
- Called party ID.
- Called party station type.
- Calling party ID.
- Calling party business group ID.
- Charge number.
- Charge party station type.
- Clear cause.
- Close cause.
- Collected address information.
- Collected digits.
- Disconnect cause.
- DTMF digits detected.
- Extension parameters.
- Failure cause.
- Generic address list.
- Generic name.
- Global title address.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
• Origination point code.
• Primary carrier.
• Redirection information.
• Redirecting party ID.
• Timer.
• Translation type.
• Traveling class mark.
• Trigger criteria type.
• User ID.
• Vertical service code.

3. VARIABLE FIELD DEFINITIONS

a = The message type. For convenience, the test query parameters associated with each message type are also listed below. If a particular parameter is not associated with a message type, an NA will be displayed in the first field for the parameter.

Some of the following message types have a limited set of parameters sent for event detection point request (EDP-R) messages as opposed to the full set for trigger detection point request (TDP-R) messages. For these message types, variable \( f^2 \) will be populated with an '*' for the parameters associated with that EDP-R message. In the following message definitions, these parameters that apply to the EDP-R version of the message will be marked with an '*' to the right of the parameter. The rest of the parameters associated with the message type will not be included in the EDP-R messages whether populated or not. Also, note that for those message types that distinguish between EDP-R and TDP-R, the notification indicator parameter will only be part of the EDP-R and not the TDP-R.

CLOSE = Information analyzed. Possible parameters:
• Advanced intelligence network maintenance parameter.
• Bearer capability.
• Close cause.
• User ID.

INFOANAL = Information analyzed. Possible parameters:
• Advanced intelligence network maintenance parameter.
• Access code.
• Bearer capability.
• Called party ID.
• Calling party ID.
• Calling party business group ID.
• Charge number.
• Charge party station type.
• Collected address information.
• Collected digits.
• Global title address.
• Local access and transport area.
• Original called party ID.
• Origination point code.
• Primary carrier.
• Redirection information.
• Redirecting party ID.
• Timer.
• Translation type.
• Traveling class mark.
• Trigger criteria type.
• User ID.
• Vertical service code.

INFOCOLL = Information collected. Possible parameters:
• Advanced intelligence network maintenance parameter.
• Access code.
• Bearer capability.
• Calling party ID.
• Charge number.
• Charge party station type.
• Collected address information.
• Collected digits.
• Extension parameters.
• Generic address list.
• Global title address.
• Local access and transport area.
• Original called party ID.
• Origination point code.
• Primary carrier.
• Redirection information.
• Redirecting party ID.
• Timer.
• Translation type.
• Traveling class mark.
• Trigger criteria type.
• User ID.
• Vertical service code.

NTWKBSY = Network Busy. Possible parameters:
• Advanced intelligence network maintenance parameter. *
• Bearer capability. *
• Called party ID.
• Calling party ID.
• Charge number.
• Charge party station type.
• Local access and transport area.
• Notification indicator. *
• Original called party ID.
• Origination point code.
• Primary carrier.
• Redirecting party ID.
• Redirection information.
• Timer.
• Traveling class mark.
• Trigger criteria type.
• User ID. *

OANSWER = Originating answer. Possible parameters:
• Advanced intelligence network maintenance parameter.
• Bearer capability.
• Notification indicator.
• User ID.

**OCLDPTYBSY** = Originating called party busy. Possible parameters:
• Advanced intelligence network maintenance parameter. *
• Bearer capability. *
• Busy cause. *
• Called party ID.
• Calling party ID.
• Charge number.
• Charge party station type.
• Local access and transport area.
• Notification indicator. *
• Original called party ID.
• Origination point code.
• Primary carrier.
• Redirecting party ID.
• Redirection information.
• Timer.
• Trigger criteria type.
• User ID. *

**ODISCONNECT** = Originating disconnect. Possible parameters.
• Advanced intelligence network maintenance parameter.
• Bearer capability.
• Disconnect cause.
• Notification indicator.
• User ID.

**ODTMFENTRD** = Originating dial tone multi-frequency (DTMF) entered. Possible parameters.
• Advanced intelligence network maintenance parameter.
• Bearer capability.
• DTMF digits detected.
• Notification indicator.
• User ID.

**ONOANSWER** = Originating no answer. Possible parameters:
• Advanced intelligence network maintenance parameter. *
• Bearer capability. *
• Called party ID.
• Calling party ID.
• Charge number.
• Charge party station type.
• Local access and transport area.
• Notification indicator. *
• Original called party ID.
• Origination point code.
• Primary carrier.
- Redirecting party ID.
- Redirection information.
- Timer.
- Trigger criteria type.
- User ID.

**ORIGAT**

- *Origination attempt. Possible parameters.*
  - Advanced intelligence network maintenance parameter.
  - Bearer capability.
  - Calling party ID.
  - Charge number.
  - Charge party station type.
  - Global title address.
  - Local access and transport area.
  - Origination point code.
  - Primary carrier.
  - Timer.
  - Translation type.
  - Trigger criteria type.
  - User ID.

**OTERMSZD**

- *Originating termination seized. Possible parameters:* 
  - Advanced intelligence network maintenance parameter.
  - Bearer capability.
  - Notification indicator.
  - User ID.

**RESCLR**

- *Resource clear. Possible parameters.* 
  - Advanced intelligence network maintenance parameter.
  - AMA measurement.
  - Clear cause.
  - Collected address information.
  - Collected digits.
  - Failure cause.
  - Primary carrier.
  - Timer.

**TANSWER**

- *Terminating answer. Possible parameters:* 
  - Advanced intelligence network maintenance parameter.
  - Bearer capability.
  - Notification indicator.
  - User ID.

**TBUSY**

- *Terminating busy. Possible parameters:* 
  - Advanced intelligence network maintenance parameter. *
  - Bearer capability. *
  - Busy cause. *
  - Busy type. *
  - Called party ID.
  - Called party station type.
• Calling party ID.
• Charge number.
• Charge party station type.
• Generic name.
• Local access and transport area.
• Notification indicator. *
• Original called party ID.
• Origination point code.
• Redirecting party ID.
• Redirection information.
• Timer.
• Trigger criteria type.
• User ID. *

TERMAT = Termination attempt. Possible parameters.
• Advanced intelligence network maintenance parameter.
• Bearer capability.
• Called party ID.
• Called party station type.
• Calling party ID.
• Charge number.
• Charge party station type.
• Generic name.
• Global title address.
• Local access and transport area.
• Original called party ID.
• Origination point code.
• Redirecting party ID.
• Redirection information.
• Timer.
• Translation type.
• Traveling class mark.
• Trigger criteria type.
• User ID.

TNOANSWER = Terminating no answer. Possible parameters:
• Advanced intelligence network maintenance parameter. *
• Bearer capability. *
• Called party ID.
• Called party station type.
• Calling party ID.
• Charge number.
• Charge party station type.
• Generic name.
• Local access and transport area.
• Notification indicator. *
• Original called party ID.
• Origination point code.
• Redirecting party ID.
• Redirection information.
• Timer.
• Trigger criteria type.
- User ID. *

TRMRSRCAVL = Terminating resource available. Possible parameters:
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

ALL = All of the ASP 0.1B test query parameters.

b = User ID type. Valid value(s):
BRI = Basic rate interface.
DN = Directory number.
PFID = Private facility ID.
TGID = Trunk group ID.

c = Trunk group ID or private facility ID for the user ID parameter depending upon the user ID type.

d = Directory number for the user ID parameter.

e = Service profile ID for the user ID parameter.

f = Bearer capability. Valid value(s):

SPEECH
3.1KHZ AUDIO
56 KBPS
64 KBPS

g = Called party station type.

h = Trigger criteria type. Valid value(s):

AUTOMATIC FLEXIBLE ROUTING
CHANNEL SETUP PRI
COUNTRY CODE NPA–NXX–XXXX
CUSTOMIZED ACCESS
FEATURE ACTIVATOR
N11
NPA
NPA–N
NPA–NX
NPA–NXX
NPA–NXX–X
NPA–NXX–XX
NPA–NXX–XXX
NPA–NXX–XXXX
NXX
NXX–XXXX
OFF HOOK DELAY
OFF HOOK IMMEDIATE
ORIG NO ANSWER
ORIG PARTY BUSY
SHARED INTER OFFICE TRUNK
TERMINATING BUSY
TERMINATING NO ANSWER
TERMINATION ATTEMPT
TRUNK GROUP
VERTICAL SERVICE CODE
ZERO MINUS
ZERO PLUS

i = Calling party business group ID.
j = Attendant status for the calling party BGID parameter. Valid value(s):
   ATTENDANT = Attendant line.
   NO ATTENDANT = Not an attendant line (or no indication).

k = Party selector for the calling party BGID parameter. Valid value(s):
   CALLING PTY = Calling party.
   REDIRECTING PTY = Redirecting party.

l = Charge party station type.
m = Carrier ID for the primary carrier parameter.
n = Carrier selection for the primary carrier parameter. Valid value(s):
   NO INDICATION = no indication of whether the selected carrier is presubscribed.
   NOT PRESUBSCRIBED AND INPUT = selected carrier is not presubscribed and not input by the calling party.
   PRESUBSCRIBED AND INPUT = selected carrier is presubscribed and input by the calling party.
   PRESUBSCRIBED AND NO INDICATION = selected carrier is presubscribed and no indication of whether input by the calling party.
   PRESUBSCRIBED AND NOT INPUT = selected carrier is presubscribed and not input by the calling party.

o = Original redirecting reason. Valid value(s):
   NO REPLY
   UNCONDITIONAL
   UNKNOWN
   USER BUSY

p = Redirecting reason. Valid value(s):
   NO REPLY
   UNCONDITIONAL
   UNKNOWN
   USER BUSY

q = Redirecting count.
r = AMP key. Valid value(s):
   NO TIME = No AMP time is specified (the following AMP fields are ignored).
   TIME   = An AMP time is specified.

s = AMP year. Valid value(s):
    CURRENT YEAR
    LAST YEAR
    NEXT YEAR

t = AMP month. Valid value(s):
   JAN   = January.
   FEB   = February.
   MAR   = March.
   APR   = April.
   MAY   = May.
   JUN   = June.
   JUL   = July.
   AUG   = August.
   SEP   = September.
   OCT   = October.
   NOV   = November.
   DEC   = December.

u = AMP date.

v = AMP hour.

w = AMP minute.

x = Failure cause. Valid value(s):
   RATE TOO HIGH
   UNAVAILABLE RESOURCE

y = Clear cause. Valid value(s):
   ABANDON
   ABORT
   CALLED PARTY ANSWERED
   CAPABILITY FAILURE
   CHANNELS BUSY
   FAILURE
   IP TIMEOUT
   ISDN TIMEOUT
   INVALID CALLER RESPONSE
   INVALID CODE
   NORMAL
   PROTOCOL ERROR
   RESOURCE CANCELED
   RESOURCE NOT AVAILABLE
RESOURCE TYPE NOT SUPPORTED
SEND TO RESOURCE CANCELED
SUPERVISION SERVICE INVOKED
TASK REFUSED
TEMPORARY FAILURE
TIME OUT

z
  = Generic name presentation. Valid value(s):
    BLOCKING TOGGLE
    PRESENTATION ALLOWED
    PRESENTATION RESTRICTED

a
  = Timer (in seconds)

b
  = Global title address.

c
  = Called party ID digits.

d
  = Called type nature of number. Valid value(s):
    950+  = 950+ call.
    CUT THRU  = No address present, cut through to carrier.
    INTL  = International number.
    INTL OPR = International number, operator requested.
    NA  = Not applicable.
    NADR OPR = No address present, operator requested.
    NAT  = National (significant) number.
    NAT OPR = National number, operator requested.
    SS  = Subscriber number.
    SS OPR = Subscriber number, operator requested.
    TST LINE = Test line test code.

e
  = Numbering plan. Valid value(s):
    ISDN  = ISDN.
    NA  = Unknown.
    PRIV  = Private.

f
  = Charge number digits.

g
  = Charge type nature of number. Valid value(s):
    APN  = Action pointer number.
    NAT CLD  = Called party ANI; national number.
    NAT CLG  = Calling party ANI, national number.
    NOT AVL  = ANI not available or not provided.
    NOT INCL = Called party ANI not included.
    SS CLD  = Called party ANI; subscriber number.
    SS CLG  = Calling party ANI; subscriber number.

h
  = Calling party ID digits.
i

= Calling type nature of number. Valid value(s):
INTL = Unique international number.
NA = Not applicable, or unknown.
NAT = Unique national (significant) number.
NUNQ INT = Non-unique international number.
NUNQ NAT = Non-unique national number.
NUNQ SS = Non-unique subscriber number.
SS = Unique subscriber number.
TST LINE = Test line test code.

j

= Presentation restriction indicator. Valid value(s):
ALW = Presentation allowed.
REST = Presentation restricted.
UNAV = Number unavailable.

k

= Screening indicator. Valid value(s):
NETP = Network provided.
UPNS = User provided, not screened.
UPPS = User provided, passed screening.

l

= Original called party ID digits.

m

= Redirecting party ID digits.

n

= Collected address information digits.

o

= Collected digits digits.

p

= Access code digits.

q

= Vertical service code digits.

r

= Local access and transport area digits.

s

= Traveling class mark digits.

t

= Generic address signal digits.

u

= Generic address type of address. Values are:
COMPLETNBR = Completion number.
DESTNBR = Destination number.
DIALEDNBR = Dialed number.
SUPFAILSCR = Supplemental user provided calling address. Failed screening.
SUPNOTSCR = Supplemental user provided calling address. Not screened.

v

= Close cause. Valid value(s):
ANSW = Called party answered.
CALLFWD = Call forwarded.
CMPL = Events and reports completed.
TERM = Call terminated.
UCOMM = Unexpected communication.
= Notification indicator. Valid value(s):
  NOTIFY = Switch notification message.
  REQ = Switch request message.

= Busy cause coding standard. Valid value(s):
  CCITT = International telecommunication union - telecommunication, standardization sector (ITU-TS) (formerly CCITT) standard.
  NETWK = Network specific.

= Busy cause general location. Valid value(s):
  LOCUNKN = Location unknown.
  LOCTRL = Local interface controlled by signaling link.
  INTNTWK = International network.
  PUBLU = Public network serving local user.
  PUBRU = Public network serving remote user.
  PVTLU = Private network serving local user.
  PVTRU = Private network serving remote user.
  TRNTWK = Transit network.
  USER = User.

= Busy cause value. Valid value(s):
  ADRINC = Address incomplete.
  AUNKPARM = Parameter non-existent or not implemented - accepted.
  BCNOAUTH = Bearer capability not authorized.
  BCNOIMPL = Bearer capability not implemented.
  BCUNAV = Bearer capability not presently available.
  CALLABN = Caller abandon.
  CALLREJ = Call rejected.
  DESTNORTE = No route to destination.
  DESTOUT = Destination out of order.
  DUNKPARM = Parameter non-existent or not implemented - discarded.
  INFODISCD = Access information discarded.
  INTWK = Interworking.
  INVRSP = Improper caller response.
  NBRCHG = Number changed.
  NOCKT = No circuit available.
  NOUSRSP = No user responding.
  NRMCLR = Normal clearing.
  NRM = Normal.
  NSRVOPT = Service/option not implemented.
  NTWKNORTE = No route to specified transit network.
  NTWKOUT = Reserved for network out of order.
  PARMINV = Parameter with invalid coding.
  PRCLERR = Protocol error.
  RDIRCTRX = Redirection counter exceeded.
  RQCHANUNV = Requested channel not available.
  RSRC = Resource unavailable.
  SRVOPT = Service/option not available.
SWCHCONG = Switching equipment congestion.
TMPFAIL = Temporary failure.
UNALCNBR = Unallocated number.
UNKMSG = Msg type non-existent or not implemented.
USRALRT = User alerting, no answer.
USRBSY = User busy.

a² = Translation type (range of 0-255).
b² = AMA measurement start time (mm/dd/y hh:mm:ss.s).
c² = AMA measurement duration (mmmmm:ss.s).
d² = AMA measurement time guard. Valid value(s):
   TIMING GUARD EXISTS = Timing guard exists.
   NO TIMING GUARD = Timing guard does not exist.

e² = Origination point code. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.
f² = EDP-R flag. Valid value(s):
   * = This parameter will be sent for EDP-R messages for the message type in variable 'a'.

ɡ² = Busy type. Valid value(s):
   CALL OFFERED = Call can be offered.
   CALL NOT OFFERED = Call can not be offered.

h² = Disconnect cause. Valid value(s):
   FAREND = Far end.

i² = Dial tone multi-frequency (DTMF) digits detected.

j² = Assignment authority.

k² = Extension type.

l² = Access type.

m² = LANI 10 digit charge number.

n² = LANI nature of number. Valid value(s):
   APN = Action pointer number.
   INTL = Unique international number.
   NA = Not applicable, or unknown.
   NAT = Unique national (significant) number.
   NUNQ INT = Non-unique international number.
   NUNQ NAT = Non-unique national number.
   NUNQ SS = Non-unique subscriber number.
   SS = Unique subscriber number.
TST LINE = Test line test code.

$\circ^2$ = OLI screen value.

4. ACTIONS TO BE TAKEN

None. This message is in response to a manual input request.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the virtual path(s) (VPATHs) that is (are) in the asynchronous transfer mode (ATM) alarm state, in the
form of far end community address(es) or virtual path identifier (VPI) numbers, with respect to the given near end community address.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Near end community address of the packet switch unit (PSU) link or the virtual path(s).
c  = Far end community address of the packet switch unit (PSU) link or the virtual path(s).
d  = Current page number.
e  = Total number of pages in this output.
f  = Far end community address or VPI number that is in ATM alarm indication signal (AIS) alarm.
g  = Far end community address or VPI number that is in ATM remote defect indication (RDI) alarm.
h  = Termination status. Valid value(s):
   ABORTED = Requested action has aborted.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action has not been started.
   STOPPED = Requested action has stopped.
i  = Additional information qualifying the termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.

4. ACTION TO BE TAKEN

If a virtual path is in ATM alarm, contact far end(s) for resolution.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the virtual path(s) (VPATHs) that is, or are, in the asynchronous transfer mode (ATM) alarm state, in the form of far end community address(es), virtual path identifier (VPI) or virtual channel identifier (VCI) numbers, with respect to the given near end community address.

3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = PSU number.
- **c** = Near end community address of the packet switch unit (PSU) link or the virtual path(s).
- **d** = Far end community address of the packet switch unit (PSU) link or the virtual path(s).
- **e** = Termination status. Valid value(s):
  - **ABORTED** = Requested action has aborted.
  - **COMPLETED** = Request has successfully completed.
NOT STARTED = Requested action has not been started.
STOPPED = Requested action has stopped.

f = Additional information qualifying the termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.
g = Current page number.
h = Total number of pages in this output.
i = Far end community address, VPI number or VCI number that is in ATM alarm indication signal (AIS) alarm.
j = Far end community address, VPI number or VCI number that is in ATM remote defect indication (RDI) alarm.
k = Far subnetwork number.
l = Far end VPI number.
m = PSU link number.
n = Far end community address, VPI number or VCI number that is in layer 2 (L2) quality.

4. ACTIONS TO BE TAKEN
If a virtual path is in ATM alarm, contact far end(s) for resolution.

5. ALARMS
None.

Input Message(s):

OP:ATMALM

Output Appendix(es):

APP:PSU-RESP

MCC Display Page(s):
1187,y,z PSU LINKS STATUS (where y=PSU number and z=SM number)
OP:ATTS

Software Release: 5E14 and later
Message Class: APT,ATL
Application: 5
Type: Output

1. FORMAT

[1] OP ATTS SCHED=a b

[2] OP ATTS SCHED=a b [,DAY=i] j
   [NEXT] SCHEDULE WEEK=c

[3] OP ATTS SCHED=a b j
   SCHEDULE WEEK=c, DAY=d
   CURRENT SESSION STOPS AT e

[4] OP ATTS SCHED=a b j
   SCHEDULE WEEK=c, DAY=d
   NEXT SESSION STARTS ON WEEK=f, DAY=g, h

2. REASON FOR OUTPUT

Reports the manually requested output of the status of an automatic trunk test scheduler (ATTS) test schedule.

3. VARIABLE FIELD DEFINITIONS

a = The number of the ATTS test schedule for which the status was requested.
b = The ATTS test schedule operational state. Valid value(s):
   EMPTY = No test sessions are defined in the schedule.
   IDLE = The schedule is operating, but ATTS is in the process of cycling through a
          seven-day idle period begun by a fifth Monday in the current calendar month.
   PAUSING = The schedule is operating and waiting for the stopping time of the current
              scheduled test session to arrive as a result of the previous test session's early
              completion.
   RUNNING = The schedule is operating and a test session is in execution at the present time.
   SKIPPING = The schedule is operating and a test session is in the process of being skipped
               over at the present time.
   STOPPED = The schedule is not currently operating.
   SUSPENDED = The schedule is suspended when the message STP:ATTS is issued without the
                unconditional parameter.
Note: If atts is stopped conditionally, the resulting status will be
      SUSPENDED. ATTS can be restarted or issue another STP:ATTS
      message at which point the state will then go to STOPPED.
   WAITING = The schedule is operating and waiting for the starting time of the next scheduled
             test session to arrive.
c = The number of either the next ATTS schedule week to be in effect (if the schedule is in the IDLE state) or the current schedule week in effect (if the schedule is operating and not in the IDLE state).

d = The number of the current schedule day in effect.

e = The scheduled stopping hour, in hour:minute:second format, of the test session under current consideration by ATTS.

f = The number of the schedule week associated with the next test session to be considered for execution by ATTS.

g = The number of the schedule day associated with the next test session to be considered for execution by ATTS.

h = The scheduled starting time, in hour:minute:second format, of the next test session to be considered for execution by ATTS.

i = The number of the current schedule day in the idle week.

j = The current schedule time, in hour:minute:second format.

14.9 (ATTS TEST SESSION SCHEDULE DATA)
14.10 (ATTS TEST SCHEDULE PARAMETER)
OP:AUD-ERRLOG

Software Release: 5E14 and later
Message Class: SODD
Application: 5
Type: Output

1. FORMAT

[1] OP AUD = SODD ERRLOG
   a
   b [c]

[2] OP AUD = SODD ERRLOG
   a
   NUMBER OF: ERRORS = d  WARNINGS = e  UNAUDITED RELATIONS = f
   [DETAILED SUMMARY REPORT = g]

[3] OP AUD = SODD ERRLOG
   a
   NUMBER OF: ERRORS = d  WARNINGS = e  UNAUDITED RELATIONS = f
   DETAILED ERROR REPORT = h

2. REASON FOR OUTPUT

To print either a summary of the number of data errors detected by a static office-dependent data (SODD) audit or to indicate that the generation of either a detailed error or summary report for a SODD audit has completed. Format 1 prints when the summary of errors cannot be determined or when either a detailed error or summary report cannot be generated. Format 2 prints when a SODD audit completes or is stopped. It also prints when either a detailed summary report or a summary of errors has been requested using an OP:AUD-ERRLOG input message. If a detailed summary has been generated, the location of where it resides is also printed. Format 3 prints when a detailed error report for a SODD audit has been successfully generated. The location of where the error report resides is also printed.

3. VARIABLE FIELD DEFINITIONS

a  = Audit for which the error summary or report has been produced. Valid value(s):
   TN = i, ALL = j
   OE = k, ALL = j
   RELATION = l, (THE AM|SM = m|THE CMP), ALL = j
   MLHG = n[, MEMB = o], ALL = j
   TGN = p[, MEMB = q], ALL = j
   Audit = FULL, DAY = r, [WEEK = s,] CYCLE = t, ALL = j
   AUDIT = INCR, (THE AM|SM = u|THE CMP|RED ODD|ALL PROCESSORS|DAY = v),
   CYCLE = t, ALL = j
   BRCS, MFT = w, (THE AM|SM = x|THE CMP), ALL = j

b  = Error message.

c  = Continuation of the error message.
= Total number of errors encountered for audit 'a'.

e = Total number of warnings encountered for audit 'a'.

f = Total number of relations that were unaudited by audit 'a'.

g = The location of where the detailed summary report resides.

h = The location of where the detailed error report resides.

i = Telephone number that was audited.

j = Indicates whether all errors and warnings have been printed/counted. Valid value(s):
   N = No, only the errors have been printed/counted.
   Y = Yes, both the errors and warnings have been printed/counted.

k = Office equipment type and number that was audited.

l = Relation that was audited, or "ALL" if all relations on a specific processor were audited.

m = Switching module on which the relation, as specified in 'l', was audited.

n = Multi-line hunt group that was audited.

o = Member of multi-line hunt group that was audited.

p = Trunk group number that was audited.

q = Member of trunk group number that was audited.

r = Day or days that the full audit ran. Valid value(s):
   MON = Monday.
   TUE = Tuesday.
   WED = Wednesday.
   THU = Thursday.
   FRI = Friday.
   SAT = Saturday.
   SUN = Sunday.
   ALL = All days.

s = A single digit number indicating the number of weeks the full audit ran. Valid value(s):
   ALL = All weeks.

t = Audit cycle. Valid value(s):
   CUR = Current.
   PREV = Previous.

u = Switching module on which the incremental audit took place.

v = Day that the incremental audit ran. Valid value(s):
   MON = Monday.
   TUE = Tuesday.
WED = Wednesday.
THU = Thursday.
FRI = Friday.
SAT = Saturday.
SUN = Sunday.

w = MFT that was audited, or "ALL" if all MFT on a specific processor were audited.

x = Switching module on which the relations associated with the MFT, as specified in 'w', were audited.

4. ACTION TO BE TAKEN

For Format 1, analyze and evaluate the reason for the error and take corrective action.

For Formats 2 and 3, if there are data errors detected by the audit, analyze the errors and take corrective action to resolve them in the ODD. If there are no data errors, then no action needs to be taken.

5. ALARMS

None

1. FORMAT

OP AUD = SODD ERROR     AUDIT: AUDIT: a[ = b][, c[ = d]]
   REASON = e
   [f]

2. REASON FOR OUTPUT

To report an error that has occurred during the execution of the full, incremental, or an entity static office-dependent data (SODD) audit.

3. VARIABLE FIELD DEFINITIONS

a = Type of audit. Valid value(s):
   FULL
   INCR
   TN
   OE
   MLHG
   TGN
   RELATION

b = Either the actual TN, OE, MLHG, TGN or RELATION being audited, or ALL if all relations on a specific processor are being audited (that is, a processor entity audit).

c = Valid value(s):

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>'c' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>RELATION</td>
<td>THE AM or THE CMP or SM =</td>
</tr>
<tr>
<td>BRCS MFT</td>
<td>THE AM or THE CMP or SM =</td>
</tr>
<tr>
<td>MLHG or TGN</td>
<td>MEMB</td>
</tr>
</tbody>
</table>

d = Member number or SM number.

e = Reason for error.

f = Continuation of reason for error.

4. ACTION TO BE TAKEN

Analyze and evaluate the reason for the error and take corrective action.

5. ALARMS

None.

6. REFERENCES

Copyright ©2003 Lucent Technologies
Input Message(s):
   EXC : AUD–SODD
   SCHED : AUD–SODD

Other Manual(s):
235-105-210   Routine Operations and Maintenance
OP:AUD-SODD-EXC
Software Release: 5E14 and later
Message Class: SODD
Application: 5
Type: Output

1. FORMAT

[1] OP AUD = SODD EXC
    AUDIT AUDITING % COMPLETE
    a [b] c [d]
__________________________________________________________________

[2] OP AUD = SODD EXC
    NO SODD AUDITS ARE CURRENTLY RUNNING
__________________________________________________________________

[3] OP AUD = SODD EXC ERROR
e[f]
__________________________________________________________________

2. REASON FOR OUTPUT

Reports the execution status of the static office-dependent data (SODD) audits. Format 1 prints the status of any SODD audit that may be executing. Format 2 indicates that there are no SODD audits currently running. Format 3 prints when errors were encountered while attempting to report the status of the SODD audits.

3. VARIABLE FIELD DEFINITIONS

a = Type of audit. Valid value(s):
   AM
   CMP
   FULL
   INCR
   MLHG
   MLHG MEMB
   OE
   RELATION
   SM
   TGN MEMB
   TN
   BRCS
   MFT AM
   MFT CMP
   MFT SM

b = Switching module number that is being audited, in the case where 'a' is SM (for a processor entity audit) or MFT SM (for brcs,mft=all audit).

c = Subject being audited. If 'a' is MLHG, MLHG MEMB, OE, RELATION, TGN, TGN MEMB, TN, or BRCS, then this field contains the actual entity that is being audited (as was specified in the EXC:AUD-SODD input message.) For example, if 'a' is TN, the output in 'c' is formatted such as 5559823. Likewise, if 'a' is RELATION, 'c' is formatted such as FC_LINE, SM = 1. If 'a' is AM,
CMP, FULL, INCR, SM, MFT AM, MFT CMP, or MFT SM then 'c' can contain various information. If any of these audits are currently executing, 'c' contains the relation, processor, and line number that is currently being audited. If any of these audits have been stopped either by executing the STP:AUD-SODD input message or due to an internal error with the audit, 'c' contains the word "STOPPED". (These audits can be restarted using the EXC:AUD-SODD input message.) If 'a' is AM, CMP, SM, MFT AM, MFT CMP, or MFT SM and the audit should be running but cannot due to an ODD growth or backup taking place, 'c' contains the word "PENDING". If 'a' is FULL or INCR, and either of these two audit types has been inhibited using the INH:AUD-SODD input message, 'c' contains the word "INHIBITED". Lastly, if 'a' is FULL and the audit is not currently executing but is scheduled to run at a later time, 'c' contains the word "SCHEDULED".

d  = Percentage of relations that have been audited. If 'a' is AM, CMP, FULL, INCR, SM, MFT AM, MFT CMP, or MFT SM then 'd' contains the percentage of relations that have been audited from the start of the audit up to the point that the OP:AUD-EXC input message was entered. If 'c' contains the word "STOPPED", "INHIBITED", "PENDING", or "SCHEDULED", then 'd' contains the percentage of relations that have been audited from the start of the audit up to the point where it was stopped. This field is not populated for the other entity audit types.

e  = Reason for status error.

f  = Continuation of status errors.

4. ACTIONS TO BE TAKEN

For Formats 1 and 2, verify that the information contained in the messages is what was expected. If it is not, use one of the following input messages to change the state of an audit: STP:AUD-SODD to stop an audit, INH:AUD-SODD to inhibit a full or incremental audit, or EXC:AUD-SODD to execute an audit.

For Format 3, analyze and evaluate the reason for the error and take corrective action.

5. ALARMS

None.

1. FORMAT

[1] OP AUD = SODD SCHED
      DAY   STARTTIME      DURATION
       a       b              c

[2] OP AUD = SODD SCHED
      NO JOBS ARE CURRENTLY SCHEDULED FOR THE FULL AUDIT

[3] OP AUD = SODD SCHED ERROR
       d
       [e]

2. REASON FOR OUTPUT
Reports the current schedule for the full static office-dependent data (SODD) audit.

Format 1 prints the full SODD audit's schedule.

Format 2 indicates that there are no jobs currently scheduled for the full SODD audit.

Format 3 prints when errors were encountered while attempting to print the full SODD audit's schedule.

3. VARIABLE FIELD DEFINITIONS

a = Day for which the audit is scheduled to run. Valid value(s):
   MON = Monday.
   TUE = Tuesday.
   WED = Wednesday.
   THU = Thursday.
   FRI = Friday.
   SAT = Saturday.
   SUN = Sunday.

b = Time the audit is to begin in the format hh:mm, [hour (00-23), minute (00-59)].

c = Duration of the audit in the format hh:mm, [hour  (01-24), minute (00-59)].

d = Reason for schedule error.

e = Continuation of schedule error.

4. ACTION TO BE TAKEN
For Formats 1 and 2, verify that the information contained in the messages is what was expected. If it is not, use the SCHED:AUD-SODD and/or CLR:AUD input message(s) to alter the schedule.

For Format 3, analyze and evaluate the reason for the error and take corrective action.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

    CLR:AUD
    OP:AUD-SODD
    SCHED:AUD-SODD

Other Manual(s):
235-105-210  Routine Operations and Maintenance
OP: AUD-STATUS

Software Release: 5E14 and later
Message Class: SODD
Application: 5
Type: Output

1. FORMAT

```
OP AUD = SODD STATUS
AUDIT: a[ = b][, c[ = d]]
REMARKS = e
[f]
```

2. REASON FOR OUTPUT

To report the status associated with a specific full, incremental or entity static office-dependent data (SODD) audit that is currently running.

3. VARIABLE FIELD DEFINITIONS

\[a\] = Type of audit. Valid value(s):
- FULL
- INCR
- TN
- OE
- MLHG
- TGN
- RELATION
- BRCS

\[b\] = Either the actual TN, OE, MLHG, TGN or RELATION being audited, or "ALL" if all relations on a specific processor are being audited (that is, a processor entity audit). For BRCS entity audit, either one specific MFT is audited or "ALL" if all MFTs are being audited.

\[c\] = Valid value(s):

<table>
<thead>
<tr>
<th>If ( a = ) RELATION</th>
<th>&quot;c&quot; =</th>
</tr>
</thead>
<tbody>
<tr>
<td>THE AM or THE CMP or SM</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>If ( a = ) MLHG or TGN</th>
<th>&quot;c&quot; =</th>
</tr>

<tr>
<th>If ( a = ) BRCS, MFT</th>
<th>&quot;c&quot; =</th>
</tr>
</thead>
<tbody>
<tr>
<td>THE AM or THE CMP or SM</td>
<td></td>
</tr>
</tbody>
</table>

\[d\] = Member number or SM number.

\[e\] = Remarks.

\[f\] = Continuation of remarks.

4. ACTION TO BE TAKEN

This message is used to give the status of a specific SODD audit that is executing or has been requested for execution. If the information contained in the message is not satisfactory, stop the audit using the STP:AUD-SODD input message.

__________________________________________________________________

[6] OP AUD NOT STARTED
    CONFLICT WITH CURRENT SYSTEM STATUS t
    RETRY LATER u
__________________________________________________________________

2. REASON FOR OUTPUT

Format 1 prints the status of the audits controlled by the system integrity monitor (SIM).
Format 2 reports an equipment configuration database (ECD) interface error.
Format 3 reports an error when trying to create a temporary output file.
Format 4 reports an error when writing to a temporary output file.
Format 5 reports when unable to create a uniquely-named temporary file.
Format 6 reports the termination status of the OP:AUD input message.

3. VARIABLE FIELD DEFINITIONS

a = Output message status. Valid value(s):
   COMPLETED = Final or only message segment.
   COMPLETED–NO AUDIT RECORDS IN ECD
   COMPLETED–NO AUDITS RUNNING
IN PROGRESS = Second or subsequent message segment.
STARTED = First of several message segments.

b = Master audit inhibit status for all audits controlled by SIM. Valid value(s):
ALLOWED
AUTOMATICALLY INHIBITED
IN UNKNOWN STATE
MANUALLY INHIBITED

c = Audit name. This field is blank for all instances after the first.
d = Member number. This field is blank for all instances after the first.
e = Record identification (RID) of the audit record from the equipment configuration database (ECD).
This field is blank for all instances after the first.
f = Source of the inhibit: blank if the audit is not inhibited. This field is blank for all instances after the first. Valid value(s):
AUTO = Automatic action.
MAN = Manual request.
??? = Unrecognized reason.

If the inhibit source is enclosed by parentheses, it indicates that the inhibit state for the audit is set. However, the inhibit has no meaning because the audit is not permitted to run in either routine or software request mode (see description for mode permission fields). This inhibit will not cause the audit to appear in the REPT:AUDSTAT report.

g = R if routine mode is allowed for audit, otherwise this field is blank. This field is blank for all instances after the first.
h = M if manual mode is allowed for audit, otherwise this field is blank. This field is blank for all instances after the first.
i = S if software mode is allowed for audit, otherwise this field is blank. This field is blank for all instances after the first.
j = D if demand mode is allowed for audit, otherwise this field is blank. This field is blank for all instances after the first.
k = Record identifier (RID) of the instance record from ECD.
l = Instance name. This field may be blank.
m = Inhibit state of a given instance of the audit: blank if the audit is not inhibited. Valid value(s):
AUTO = Automatic action.
MAN = Manual request.
??? = Unrecognized reason.

If the inhibit state is enclosed by parentheses, it indicates that the inhibit state for the instance is set. However, the inhibit has no meaning because the audit is not permitted to run in either routine or software request mode (see description for mode permissions fields). This inhibit will not cause the audit to appear in the REPT:AUDSTAT report.
n = Mode in which the given instance of the audit is running or blank if the instance is not running.
Valid value(s):
DEM = Part of a recovery sequence.
MAN = Manually requested.
RTN = Routine scheduling.
SFT = Software request.
?? = Unrecognized mode.

o = Scheduling frequency of the audit. Valid value(s):
A through H = Frequency group of audit.
T = Timed audit.
(blank) = Audit is neither timed nor routine.

p = Audit block status. Valid value(s):
Y = Indicates that the audit is blocked, but the block has no meaning because the audit is not permitted to run in any mode (see description for mode permission fields). This block will not cause the audit to appear in the REPT:AUDSTAT report.
(blank) = This instance of the audit is not blocked.

q = ECD interface error number. Valid value(s):
10 = Cannot open audit record sequence.
11 = Cannot sequence through audit records.
12 = Cannot get audit record.
20 = Cannot open audit instance record sequence.
21 = Cannot sequence through instance records.

r = Audit record RID.
s = Name of temporary file.
t = Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.
u = Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.
Note: Refer to the APP:AUD-A and APP:AUD-B appendix in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, and 6, use the ALW:AUD input message to allow audits that should be allowed. Use the INH:AUD input message to inhibit audits that should be inhibited. Use the STP:AUD or STOP:AUD input message to stop audits that should be stopped.

For Format 3, all the inodes of the tmp file system are being used. Clean up unused files in the tmp file system using the CLR:FSYS-FILE input message before retrying the input message.

For Format 4, all tmp file system space has been used. Clean up unused files in the tmp file system using the
CLR:FSYS-FILE input message before retrying the input message.

For Format 5, system resources do not permit of the input message at this time. Retry later. If the message continues to fail, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   ...[e] [e] [e]]
   .
   .
   .
__________________________________________________________________

2. REASON FOR OUTPUT

To report the activation status of blocked call indication (BCI) reporting for both originating (ORIG) and terminating (TERM) calls. In addition, when status is "ON", to report the original input message parameters chosen, as well as to list of the switching modules (SMs) in which reporting is still allowed.

3. VARIABLE FIELD DEFINITIONS

   a = Indicates whether blocked call reporting is turned on or off.
   b = The SM number or the lower limit in the range of SMs chosen with the ALW:BCI input message.
   c = The upper limit SM number.
   d = The maximum number of blocked call messages entered in the ALW:BCI message. The MAX value printed in the OP:BCI message is the MAX value entered in the last ALW:BCI message.
   e = SM number(s) in which blocked call reporting is still turned on.

[3] OP BICC                  [NSEGS=n] c
   a

2. REASON FOR OUTPUT

To print the bearer independant call control data collected for an OP:BICC request. Format 1 provides the output of BICC group data when the input specifies the office. Format 2 provides the output of BICC group data when the input specifies:
- An OPC, DPC and a single BICC call instance code (CIC), or a CIC range.
- A single BICC group (BG) number.
- A single trunk group member number (BGMN), or a BICC group member number range.
- A single trunk group (TG) number.
- A single trunk group member number (TKGMN), or a trunk group member number range.

Format 3 provides the output of the completion report of an BICC data request.

3. VARIABLE FIELD DEFINITIONS

a = An echo of the original input parameters.
b = Number of this segment in the listing produced. Segments are numbered sequentially starting from one.
c = Completion report. Valid value(s):
   BICC NOT AVAILABLE IN OFFICE = The request cannot be processed because the office is not
e = Origination point code (OPC) found for output. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

f = Destination point code (DPC) found for output. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

g = Platform for BICC signalling. This will be CNI or the GSM number for PSU signalling.

h = Base Call Instance Code for the group found for output.

i = Total number of CIC blocks assigned to the group for output. Each block represents 128 CICs.

j = Low member number of range found for output.

k = High member number of range found for output.

l = SM where the CIC block resides.

m = First CIC of the block found.

n = The total number of segments output for an BICC data request. No segment count is produced if no segments were printed for the request prior to the output of the completion report.

o = Indicates CNI to PSU conversion is in progress. Message CNI TO PSU CONVERSION IN
PROGRESS will be reported.

Format 1 reports that the input message has begun to execute.

Format 2 reports the reason that the input message has not started.

Format 3 reports the reason that the input message has been aborted.

Format 4 reports an informational message while the input message is in progress.

Format 5 displays the day (week or month), time of day, and name of the backup option file for each scheduled automated system backup.

Format 6 displays the contents of a specified backup option file residing in /no5text/bkup/autobkup.

Format 7 displays the day (week or month), time of day, name of the backup option file, and content of the backup option file for each scheduled automated system backup.

Format 8 displays the day (of week or month), time of day, name of the backup option file, and a backup option file error.

Format 9 reports successful execution of the input message.

3. VARIABLE FIELD DEFINITIONS

a = Message reporting the reason that the input message has not started. Valid value(s):
BACKUP OPTION FILE CANNOT BE SPECIFIED AS A PATHNAME = The OP:BKUP filename (FN) input message line parameter was input as a full or relative pathname. Re-execute OP:BKUP with the backup option file specified by the file name only.

b = Message reporting the reason that the input message has been aborted. Valid value(s):
BACKUP OPTION FILE DOES NOT EXIST = The backup option file specified in the input message does not exist in the /no5text/bkup/autobkup directory. Verify that the backup option file name specified in the input message is correct. Re-execute OP:BKUP with the correct backup option file name or execute SET:BKUP to create the backup option file.

FAILED TO OPEN BACKUP OPTION FILE = The backup option file specified in the input message cannot be accessed. Verify that the backup option file name specified in the input message is correct and that the backup option file exists in the /no5text/bkup/autobkup directory with read permission. If the file does not exist, execute SET:BKUP to create the backup option file. Re-execute OP:BKUP with the correct backup option file name.
FAILED TO \{OPEN | STAT\} CRON TABLE FILE = An attempt to access the system cron table
file has failed. Interpret the system error number and verify that the cron file,
/unixa/spool/cron/crontabs/root, exists with read/write permission.

INVALID BACKUP OPTION FILE - DUPLICATE
'\{TYPE|DEST|PSESS|PVOL|SESS|VOL|TPSIZE\}' KEYWORD
= A duplicate keyword was detected in the specified backup option file. Remove the
corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file
by executing SET:BKUP and re-execute OP:BKUP.

INVALID BACKUP OPTION FILE - ILLEGAL KEYWORD = An invalid keyword was detected in
the specified backup option file. Remove the corrupt backup option file with
CLR:FILESYS,FILE, create a new backup option file by executing SET:BKUP and
re-execute OP:BKUP.

INVALID BACKUP OPTION FILE - MISSING
'\{TYPE|DEST|PSESS|PVOL|SESS|VOL|TPSIZE\}' KEYWORD
= A missing keyword was detected in the specified backup option file. Remove the
corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file
by executing SET:BKUP and re-execute OP:BKUP.

= Message reported while the input message is in progress. Valid value(s):

NO AUTOMATED SYSTEM BACKUPS SCHEDULED = No automated system backups are scheduled
to be run by the system cron daemon process.

d = Day of the week or month on which the backup will be performed.

e = Time of day the backup is to begin in 24-hour format (For example, 8:00, 22:00).

f = Full pathname of the backup option file.

= Backup option file TYPE field. Valid value(s):
APPEND = Tape backup written after an existing backup.
BOT = Tape backup written to the beginning of tape.
DISK = Software disk or update and verify disk backup.
EOD = Tape backup written to the end of tape data.

h = Backup option file DEST field. Valid value(s):
BKPTN = Base disk pair (MHD 0/MHD 1) backup partitions.
MHD14 = System backup disk MHD 14.
MHD15 = System backup disk MHD 15.
pathname = Tape drive special device file (For example, /dev/mt08).

= Backup option file PSESS field. This field contains the tape positioning session number for an
append to tape backup. The session number 1-9 or "NA" is specified.

j = Backup option file PVOL field. This field contains the tape positioning volume number for an
append to tape backup. The volume number 0-9 or "NA" is specified.

k = Backup option file SESS field. This field contains the tape session number for an append to tape
backup. The session number 1-9 or "NA" is specified.

l = Backup option file VOL field (volume identifiers). Valid value(s):
= Message reporting a problem with the backup option file. Valid value(s):

**FAILED TO OPEN FILE** = The specified backup option file cannot be accessed. Verify that the backup option file exists in the /no5text/bkup/autobkup directory with read permission. If the file does not exist, execute SET:BKUP to create the backup option file or execute CLR:BKUP to unschedule the backup.

**FILE CONTAINS AN ILLEGAL KEYWORD** = An invalid keyword was detected in the specified backup option file. Remove the corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file by executing SET:BKUP and re-execute OP:BKUP.

**FILE CONTAINS DUPLICATE 'TYPE|DEST|PSESS|PVOL|SESS|VOL|TPSIZE' KEYWORD** = A duplicate keyword was detected in the specified backup option file. Remove the corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file by executing SET:BKUP and re-execute OP:BKUP.

**FILE DOES NOT EXIST** = The specified backup option file does not exist in the /no5text/bkup/autobkup directory. Execute SET:BKUP to create the backup option file or execute CLR:BKUP to unschedule the backup.

**FILE IS MISSING 'TYPE|DEST|PSESS|PVOL|SESS|VOL|TPSIZE' KEYWORD** = A missing keyword was detected in the specified backup option file. Remove the corrupt backup option file with CLR:FILESYS,FILE, create a new backup option file by executing SET:BKUP and re-execute OP:BKUP.

n = System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

o = Backup option file TPSIZE field. This field contains the length of the tape mounted on the destination tape drive. Tape lengths of 90, 120, 125, 150 or "NA" is specified.

### 4. ACTIONS TO BE TAKEN

If message Formats 2, 3, 4, and 8 are output, refer to the message description in the VARIABLE FIELD DEFINITIONS section of this manual page. If a problem cannot be resolved, refer to the TECHNICAL ASSISTANCE portion of the Output Messages Manual INTRODUCTION section.

### 5. ALARMS

None.

### 1. FORMAT

```
OP BKUPSTAT
[FULL] [AM] [CMP=a[ TO b]] [NRODD=c[ TO d]] [RODD=c] EVERY=e AT=ff:ff!
```

### 2. REASON FOR OUTPUT

To report all the office dependent data (ODD) backup scheduled requests set by previous BKUP:ODD messages.

### 3. VARIABLE FIELD DEFINITIONS

- **AM** = The report is for AM.
- **CMP** = The report is for the CMP.
- **FULL** = Perform a full dump. The administrative module (AM) ODD is always backed up with the full dump. A differential dump is the default for the communications module processor (CMP) ODD and/or the switching module (SM) redundant (RODD) and non-redundant (NRODD) ODDs.
- **NRODD** = The report is for non-redundant ODD.
- **RODD** = The report is for redundant ODD.
- **a** = CMP number or the lower limit of a range of CMP numbers.
- **b** = Upper limit of range of CMP numbers.
- **c** = Switching module (SM) number or the lower limit of a range of SM numbers.
- **d** = Upper limit of range of SM numbers.
- **e** = Interval in days between scheduled ODD backups.
- **f** = Time of day (expressed as hours and minutes) that the ODD backup is scheduled to occur.

### 4. ACTION TO BE TAKEN

2. REASON FOR OUTPUT

To print a formatted display of the routing data in the cluster, member and load share tables of the common network and for the signaling connection control part (SCCP) subsystem bitmap. This is used in monitoring the common channel signaling (CCS) traffic management code that updates these tables. This output can also be a formatted display of the timer status in the message transfer part (MTP) restart table.

Format 17 shows the link set status, the link set description, the link set to ring node address (RNA) conversion table, and the load share table for the requested link set number. When the SLSEXP feature is enabled, the load share table contains 256 entries. When the SLSEXP feature is disabled, the load share table contains 32 entries.

3. VARIABLE FIELD DEFINITIONS
a = The network identifier (NID) expressed as a hexadecimal number.

b = The NID expressed as a decimal number.

c = The network, cluster, or member level routing flag. Valid value(s):

- **CLU_O** = The cluster only (CLU_O) flag is used to identify a cluster that has cluster-only-routing cluster. When routing to a cluster with this flag, a route will be selected for the SCCP and MTP routing to a signaling point based on only the network and cluster fields of the destination point code.

- **DMEMBER** = The dynamic member (DMEMBER) flag is used to identify dynamic members of a POPCLU. When routing to a member with this flag, a route will be selected for SCCP and MTP routing based on the network, cluster and member fields of the destination point code. **Note:** A DMEMBER is only created as a result of network events (for example, transfer prohibits, subsystem prohibits, remote congestion, and so forth) and contain the abnormal network status of the member. These members will be deleted when the abnormal status is cleared.

- **NTWK** = The network (NTWK) flag is used to identify a network with clusters of signaling points. When routing to a network with this flag, a route will be selected for SCCP and message transfer part (MTP) routing to a signaling point based on the network, cluster, and, possibly, member fields of the destination point code.

- **NTWK_O** = The network only (NTWK_O) flag is used to identify a network that has network-only-routing. When routing to a network with this flag, a route will be selected for SCCP and MTP routing to a signaling point based only on the network field of the destination point code.

- **POPCLU** = A populated cluster (POPCLU) is a group of signaling points, all of which have the same network and cluster in their point codes. The populated cluster flag is used to identify populated clusters. When routing to a cluster with this flag, a route will be selected for SCCP and MTP routing based on the network, cluster and if the member is exceptional [for example, a full point code routing (FPCR) member or a member that has an abnormal route status], member fields of the destination point code.

- **SMEMBER** = The static member (SMEMBER) flag is used to identify static members (FPCR members) of a POPCLU. When routing to a member with this flag, a route will be selected for SCCP and MTP routing based on the network, cluster, and member fields of the destination point code.

- **UPOPCLU** = An unpopulated cluster (UPOPCLU) is a signaling point in a network that has a unique cluster number. The unpopulated cluster flag is used to identify unpopulated clusters (in the NSD network, STPs are unpopulated clusters). When routing to a cluster with this flag, a route will be selected for SCCP and MTP routing based on the network, and cluster fields of the destination point code.

d = The current/active link set (route) number or BLK (blocked) if point code is inaccessible.

e = The primary route's link set number. The value is left blank when there is no link set associated with the primary route.

f = The route status of the first direct link set associated with the route. If there is no first direct link set, this field is blank. Valid value(s):
A = Transfer (cluster) allowed.
P = Transfer (cluster) prohibited.
R = Transfer (cluster) restricted.

g = The route status of the second direct link set associated with the route. If there is no second direct link set, this field is blank. Valid value(s):
A = Transfer (cluster) allowed.
P = Transfer (cluster) prohibited.
R = Transfer (cluster) restricted.

Note: Variable fields 'f' and 'g' denote whether or not the route is a combined link set. If fields 'f' and 'g' are both non-blank then the route's link set is a combined link set. If field 'f' is non-blank and field 'g' is blank, then the link set is a direct link set. If both fields 'f' and 'g' are blank, then there is no link set associated with that route.

h = The first alternate route's link set number. The value is left blank when there is no link set associated with the first alternate route.

i = The second alternate route's link set number. The value is left blank when there is no link set associated with the second alternate route.

j = The remote congestion level. The value is blank when there is no remote congestion for the point code.

k = The routing priority index (RPI) for the point code. However, if the RPI is 0, a blank is printed for the field.

l = The signaling route set congestion test (RCT). It is used to denote what remote congestion timer is running at the present moment. Valid value(s):
0 = Timer protocol T15 is running.
1 = Timer protocol T16 is running.
null = No timers are running.

m = The director index value.

n = The local network's NID in decimal format.

o = The local point code in hexadecimal format.

p = The local point code format. The word "ANSI STANDARD" or "AT&T" is indicated in this field.

q = The full point code in hexadecimal format.

r = Region from which the data is being retrieved in decimal format.

s = Cluster number from which the data is being retrieved in decimal format.

t = Member number from which the data is being retrieved in decimal format.

u = If the routing flag field 'c' indicates that the entry is a populated cluster, this field is used to index into the page access table, cNpage_access[]. If the data retrieved indicates that the entry is an unpopulated cluster or for a member (SMEMBER or DMEMBER), this field is used to index into the SCCP bitmap. For all other cases this field is left blank.
v = The point code translator. Valid value(s):

<table>
<thead>
<tr>
<th>Construct</th>
<th>Format Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>k1^k1^k1\n1^l1^m1^m1</td>
<td>ANSI</td>
</tr>
<tr>
<td>k1^k1^k1\n1^n1^m1^m1</td>
<td>AT&amp;T</td>
</tr>
</tbody>
</table>

w = Which translator value is used for the next translation. The values are 0 and 1.

x = Indicates if the subsystem is equipped or unequipped.

y = Indicates if the subsystem is allowed or prohibited.

z = The program address physical ring node or LADD_3B in hexadecimal format.

a1 = The channel number.

b1 = The preferred user selected function index for incoming messages.

c1 = The active function index for incoming messages.

d1 = The current local point code.

e1 = The subsystem number (SSN).

f1 = The index into the member table, cNmember[].

g1 = The SCCP bitmap index.

h1 = The list of prohibited subsystems.

i1 = This field is used to indicate abnormal route status [transfer (cluster) restricted or transfer (cluster) prohibited] and/or alternate routing. A symbol of "\(\triangleright\)" indicates that there is an abnormal route status on any of the valid routes for that point code. A "\(\triangleright\triangleright\)" indicates that alternate routing is being used for that point code. The alternate routing symbol takes precedence over the abnormal route status symbol.

j1 = Point code expressed in a hexadecimal format.

k1 = Network ID in decimal format.

l1 = Cluster number in decimal format.

m1 = Member number in decimal format.

n1 = Region number in decimal format.

o1 = MTP restart signaling point procedure timer status. Valid value(s):

<table>
<thead>
<tr>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT RUNNING</td>
</tr>
<tr>
<td>RUNNING</td>
</tr>
</tbody>
</table>

p1 = Signaling link selection (SLS) index in decimal.

q1

r1 = Ring node address (RNA) in decimal.
s^1 = The status of the LS. Valid value(s):
   FAILED
   NORMAL
   UNEQUIPPED

   blank = Invalid LS number

Note: The rest of the output message will be printed only when the LS status is NORMAL or FAILED.

t^1 = Number of links in the LS.

u^1 = The index of the links in the LS, in sequence. It ranges from 0 to (t^1 - 1).

v^1 = Group number.

w^1 = Member number.

4. ACTION TO BE TAKEN

For formats 1, 2, 3, 13, 14, and 15, if the output message is alarmed, determine whether the abnormal routing is due to conditions within the switch or in other entities in the network. If this is due to conditions within the switch, take corrective actions.

5. ALARMS

An alarm is associated with the OP C7NET output when both of the following have occurred:
- Output is the result of an OP:C7NET input message with the ABNORMAL or PRTE options.
- Abnormal routing was encountered on one or more point codes.

The alarm may be major or minor, depending upon the severity of the abnormal routing encountered. For example, if a point code was blocked, a major alarm would be associated with the output. If only one link to the point code was blocked, a minor alarm would be associated with the output.

### 2. REASON FOR OUTPUT

To report the call monitor history data upon request by the OP:CALLMON input message.

### 3. VARIABLE FIELD DEFINITIONS

- **a**  
  - The print mode of the monitor. Valid value(s):  
  - NORMAL  
  - VERBOSE  
  - Default state prints failures only.  
  - Verbose mode prints all reports and per test call results.

- **b**  
  - The monitor state. Valid value(s):  
  - ALLOWED  
  - INHIBITED  
  - Default state.  
  - The monitor is inhibited from running.

- **c**  
  - The number of non-CCS test calls that have passed in the indicated time interval.

- **d**  
  - The number of non-CCS test calls that have failed in the indicated time interval.

- **e**  
  - The number of indeterminate non-CCS test call results in the indicated time interval.

- **f**  
  - The number of not-attempted-non-CCS-test-call results in the indicated time interval.

- **g**  
  - The last non-CCS trunk group number (decimal) that passed a test call. If the number is 4002, then no test calls have passed since the monitor was last initialized.

- **h**  
  - The number of CCS test calls that have passed in the indicated time interval.

- **i**  
  - The number of CCS test calls that have failed in the indicated time interval.
j = The number of indeterminate CCS test call results in the indicated time interval.

k = The number of not-attempted-CCS-test-call results in the indicated time interval.

l = The last CCS trunk group number (decimal) that passed a test call. If the number is 4002, then no test calls have passed since the monitor was last initialized.

m = Failure code. If zero, then no failure code stored. Refer to the APP:CALLMON appendix in the Appendixes section of the Output Messages manual.

n = Number of occurrences for failure code.

4. ACTION TO BE TAKEN

Analyze the output and take action according to the procedures in the System Maintenance Requirements and Tools and the Routine Operations and Maintenance manuals.

5. ALARMS

None.

116 (MISCELLANEOUS)
1. FORMAT

[1]  OP CAMPON     STARTED

[3]  OP CAMPON     COMPLETED

2. REASON FOR OUTPUT

To output (in response to an OP:CAMPON input message) a list of trunks, lines, data links, and Operator Services Position System ports (OSPSPORTs) that are currently being camped on. The camp-on activity has resulted from a manual attempt to remove or restore the trunk, line, data link, or OSPSPORT. The camp-ons identified in this list can be stopped by using the STP:CAMPON input message.

Format 1 indicates the start of the OP:CAMPON output message. Format 2 is the actual report that lists the ports that are camped on currently. If there are no ports that are camped on, this format will not print. Format 3 indicates the end of the OP:CAMPON output message.

3. VARIABLE FIELD DEFINITIONS

? = When present, indicates that the RMV/RST request that initiated the camp-on no longer exists. When this is the case, it is possible that the camp-on list is out of date and can be deleted by using the STP:CAMPON input message for that particular trunk, line, data link, or OSPSPORT.

+ = Indicates the line is a party line, a custom multipoint interface DSL, or a standard interface multi-user DSL.

a = Equipment number or identifier. Valid value(s):

AQEST=m^1
AQM=h-i
DN=j^1[-i[^1][+]
PKTDN=j^1
PSUEN=c-s^1-t^1-u^1-v^1
TKGMN=j-k
XDB=l-m

b = Channel identifier. Used only for digital subscriber lines (DSLs), data links, and OSPSPORTs. Valid value(s): B1 B2 D
Switching module (SM) number.

Equipment number or identifier. Valid value(s):

Equipment number or identifier. Valid value(s):

| x^1 |
| ICB=k^1 |
| ICD=l^1 |

Primary rate interface (PRI) group number.

Date and time of the start of the camp-on, in the form, month/day/year hour:min:sec.

Data link (group) number of the associated autoquote data link.

Relative link (member) number of the associated autoquote data link.

Trunk group number.

Trunk member number.

Data link (group) number of the XDB.

Relative link (member) number of the XDB.

Digital line and trunk unit (DLTU) number.

Digital facility interface (DFI) number.

Channel number.

IDCU number.

Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.

RT line number or PUB43801 channel.

Line unit number.

Line group controller number.

Line card number.

Grid number.

Board number.
y = Switch number.
z = Level number.
a\textsuperscript{1} = Logical test port number.
b\textsuperscript{1} = RAF or SAS unit number.
c\textsuperscript{1} = RAF or SAS announcement channel number.
d\textsuperscript{1} = Digital carrier line unit (DCLU) number.
e\textsuperscript{1} = Trunk unit number.
f\textsuperscript{1} = Service group number.
g\textsuperscript{1} = Channel board number.
h\textsuperscript{1} = Circuit number.
i\textsuperscript{1} = Member number of the line time-slot bridging (LTSB) line. For LTSB a member number of '1' represents the lead line and a member number of '2' represents the associate line.
j\textsuperscript{1} = Telephone number of the line or database.
k\textsuperscript{1} = Identifying number of the FGB carrier which can be up to four digits. If present, this variable indicates a direct trunk to a carrier.
l\textsuperscript{1} = Identifying number of the FGD carrier which can be up to four digits. If present, this variable indicates a direct trunk to a carrier.
m\textsuperscript{1} = Telephone number of the AQEST.
n\textsuperscript{1} = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
o\textsuperscript{1} = Data group number.
p\textsuperscript{1} = Synchronous transport signal (STS) number.
q\textsuperscript{1} = Virtual tributary group number.
r\textsuperscript{1} = Digital signal level 0 (DS0).
s\textsuperscript{1} = PSU unit number.
t\textsuperscript{1} = PSU shelf number.
u\textsuperscript{1} = PSU channel group number.
v\textsuperscript{1} = PSU channel group member number.
x\textsuperscript{1} = Identifying number of the IC. If present, this variable indicates a direct trunk to a carrier.
y\textsuperscript{1} = Line group number.
z\textsuperscript{1} = Line board number.
a^2 = Line circuit number.
b^2 = Access interface unit (AIU) number.
c^2 = AIU pack number.
d^2 = AIU circuit number.
e^2 = SONET termination equipment (STE) number.
f^2 = Virtual tributary member number.

4. ACTIONS TO BE TAKEN

None. Refer to the message output for pertinent status and information, and take appropriate action based on the information received, if necessary.

5. ALARMS

None.

RMV: LINE
RMV: OSPSPORT
RMV: TRK
RST: DATALINK
RST: LINE
RST: OSPSPORT
RST: TRK
STP: CAMPON
1. FORMAT

[1] OP CAMPON STARTED

[3] OP CAMPON COMPLETED

2. REASON FOR OUTPUT

To output (in response to an OP:CAMPON input message) a list of trunks, lines, data links, and operator services position system ports (OSPSPORTs) that are currently being camped on. The camp-on activity has resulted from a manual attempt to remove or restore the trunk, line, data link, or OSPSPORT. The camp-ons identified in this list can be stopped by using the STP:CAMPON input message.

Format 1 indicates the start of the OP:CAMPON output message. Format 2 is the actual report that lists the ports that are camped on currently. If there are no ports that are camped on, this format will not print. Format 3 indicates the end of the OP:CAMPON output message.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

? = When present, indicates that the RMV/RST request that initiated the camp-on no longer exists. When this is the case, it is possible that the camp-on list is out of date and can be deleted by using the STP:CAMPON input message for that particular trunk, line, data link, or OSPSPORT.

+ = Indicates the line is a party line, a custom multipoint interface DSL, or a standard interface multi-user DSL.

a = Equipment number or identifier. Valid value(s):

b

__________________________________________________________________

2. REASON FOR OUTPUT

To furnish the linkset serving each accessible destination point code (DPC) for a given global SM in response to the
OP:CCS-ACDPC input message.

Format 1 is the output message where all accessible DPCs associated with their linkset number or combined linkset
number are listed.

Format 2 is the output message where no DPCs are listed.

3. VARIABLE FIELD DEFINITIONS

a = Common channel signaling (CCS) global switching module (GSM) number.

b = Originating point code (OPC) number. Refer to the APP:POINT-CODE appendix in the
Appendixes section of the Output Messages manual for interpretation.

c = Current page. Valid value(s):
FIRST = First page of report.
LAST = Last page of report associated with this report.
NEXT = Next report page.

d = Accessible destination point code (DPC). Refer to the APP:POINT-CODE appendix in the
Appendixes section of the Output Messages manual for interpretation.

e = Linkset number or combined linkset number.

f = Reason the command was not processed. Valid value(s):
DATA BEING UPDATED
THERE IS NO ACCESSIBLE DPC

   IN PROGRESS
d = Destination point code (DPC) number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.
e = DPC status. Valid value(s):
   ACCESS = The DPC is accessible.
   INACCESS = The DPC is inaccessible.
f = Congestion level. Valid value(s):
   CONG1 = The DPC is congested at level 1.
   CONG2 = The DPC is congested at level 2.
   CONG3 = The DPC is congested at level 3.
g = Link set or combined link set number. This is the current access route, which is printed only for accessible DPCs.

h = Reason the message was not processed. Valid value(s):

- THERE ARE NO ACCESSIBLE DPCs.
- THERE ARE NO INACCESSIBLE DPCs.

4. ACTION TO BE TAKEN

2. REASON FOR OUTPUT

To display the destination point codes (DPCs) currently served by a linkset or a combined linkset.

3. VARIABLE FIELD DEFINITIONS

a
= Linkset or combined linkset (CLS) number specified.

b
= Common channel signaling (CCS) global switching module (GSM) number.

c
= Indicates the status of message being processed. Valid value(s):
CT7MPSIU PACKAGE NOT LOADED = The loadable package that contains the software that receives the message has not been loaded.
OUTPUT INCOMPLETE - DATA BEING UPDATED = The message cannot be processed because the relations that contain the status of DPCs are being updated either by traffic diversion terminal process or by audits. The data reported may be incomplete. Retry the input message later.
INVALID LINKSET NUMBER SPECIFIED = Linkset number specified in the input message is invalid for the GSM indicated.
LINKSET NOT AVAILABLE = No number in the linkset specified is capable of supporting traffic. Retry the input message later.
MSG NOT SENT TO CLIENT PROC. = The message cannot be processed because the signaling traffic route and management (STRM) system process failed to create the end user terminal process. Retry the input message later.
OFFICE NOT EQUIPPED WITH CCS = This office does not have common channel signaling (CCS) features on the PSU platform.
SM DATA CURRENTLY NOT AVAILABLE = Command cannot be processed because the requested data is currently not available for processing. Retry the input message later.
SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not accessible. Retry the input message later.
NO DPC SERVED BY LINKSET = Currently no DPCs are served by the linkset.
STARTED = Started generating the report.
COMPLETED = Report completed.

d
= Originating point code (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.
\( f \) = DPC number currently being served by the specified linkset/CLS. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.

2. REASON FOR OUTPUT

To provide output in response to an OP:CCS,GSM request, which provides information associated with one/more common channel signaling (CCS) global switching modules (GSMs), including summary signaling link status and CCS Message Transport (CMT) connectivity status.

3. VARIABLE FIELD DEFINITIONS

- **a** = GSM number.
- **b** = Summary link status. Valid value(s):
  - FULLY AVAILABLE = All provisioned CCS signaling links are available.
  - PARTIAL LOSS = Some, but not all, CCS signaling links are available.
  - TOTAL LOSS = All provisioned CCS signaling links are unavailable.
  - UNKNOWN = The GSM is initializing or is isolated, or a system error occurred while accessing data.
  - GROWTH = No CCS signaling links are provisioned on the GSM (possible only during a growth/degrowth interval).
- **c** = Originating point code (9-digit OPC associated with the GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for a description ANSI and AT&T/UNITEL formats.
- **d** = Type of GSM, currently restricted to: ISLAND = Global SM can provide ISUP and SCCP services only for lines and trunks resident on the GSM.
- **e** = CMT Connectivity (state of internal CCS message transport availability within the GSM).
- **f** = Output message sequence number (FIRST, LAST).

4. ACTIONS TO BE TAKEN

If a status other than FULLY AVAILABLE is produced, see corrective maintenance procedures in 235-190-120 (Common Channel Signaling Service Features).

2. REASON FOR OUTPUT

To provide output in response to an OP:CCS,GSM request, which provides information associated with one/more common channel signaling (CCS) global switching modules (GSMs), including summary signaling link status and CCS message transport (CMT) connectivity status.

3. VARIABLE FIELD DEFINITIONS

a  = GSM number.

b  = Summary link status. Valid value(s):
FULLY AVAILABLE = All provisioned CCS signaling links are available.
GROWTH = No CCS signaling links are provisioned on the GSM (possible only during a growth/degrowth interval).
PARTIAL LOSS = Some, but not all, CCS signaling links are available.
TOTAL LOSS = All provisioned CCS signaling links are unavailable.
UNKNOWN = The GSM is initializing or is isolated, or a system error occurred while accessing data.

c  = Originating point code (9-digit primary OPC associated with the GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for a description ANSI and AT&T/UNTEL formats.

d  = Type of GSM Valid value(s):
HOST = GSM can provide ISUP and SCCP services for lines and trunks resident multiple SMs in the office.
ISLAND = GSM can provide ISUP and SCCP services only for lines and trunks resident on the GSM.

e  = CMT connectivity (state of internal CCS message transport availability within the GSM). Valid value(s):
FULLY AVAILABLE = All CMT paths provisioned for the GSM are available.
GROWTH = No CMT path is provisioned on the GSM (possible only during growth/degrowth interval).
PARTIAL LOSS = Some, but not all, CMT paths provisioned for the GSM are available.
TOTAL LOSS = All CMT paths provisioned for the GSM are unavailable.
= The GSM is initializing or is isolated, or a system error occurred while accessing data.

f = Output message sequence number. Valid value(s):
   FIRST
   LAST

4. ACTIONS TO BE TAKEN

2. REASON FOR OUTPUT

To report the data for originating point codes (OPC) provisioned in the office.

3. VARIABLE FIELD DEFINITIONS

a = Optional parameter. Valid value(s):
   PC = Point code that the output report is referring to.
   CNI = Common network interface platform.
   GSM = Global switching module platform that the output report is referring to.

b = Possible error conditions. Valid value(s):
   OPC IS NOT PROVISIONED IN THE OFFICE = The request for a specific originating point code cannot be processed because the point code specified is not provisioned as a primary or alias point code in the office.

p = Current page. Valid value(s):
   FIRST = First page of report.
   LAST = Last page of report associated with this report.
   NEXT = Next report page.

c = OPC found for output. Refer to the APP:POINT-CODE appendix.

d = Platform. Valid value(s):
   CNI = OPC running on common network interface (CNI) platform.
   GSM # = OPC running on reported common channel signaling (CCS) global switching module (GSM) number platform.

f = Type. Valid value(s):
   PRIMARY = Primary OPC.
   ALIAS = Alias OPC.

Common Channel Signaling Service Features
### OP:CCS-ROUTE

**Software Release:** 5E15 and later  
**Message Class:** CCS  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   ![Table Format 1](image1)

   ![Table Format 2](image2)

   ![Table Format 3](image3)

   ![Table Format 4](image4)

   ![Table Format 5](image5)

2. **REASON FOR OUTPUT**

   235-600-750 December 2003
To report the MTP routing status. This report can include:
- One or more equipped networks.
- One or more equipped clusters.
- One or more destination point codes (DPC) provisioned with member route sets.
- One DPC regardless of what route set it is using.
- Networks, clusters and DPCs that have at least one route that is abnormal.

### 3. VARIABLE FIELD DEFINITIONS

- **e**
  - Specific common channel signalling (CCS) global switching module (GSM) number from which the data is desired.

- **f**
  - Destination is the network, cluster, and/or member number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.

- **g**
  - The overall network, cluster, or member routing status. Valid value(s):
    - **ACCESS** = The network, cluster, or member is accessible.
    - **INACCESS** = The network, cluster, or member is inaccessible.

- **h**
  - The current/active route (linkset or combined linkset) for the network, cluster, or member.

- **i**
  - Local congestion level. Valid value(s):
    - 1 = The local route is congested at level 1.
    - 2 = The local route is congested at level 2.
    - 3 = The local route is congested at level 3.
    - blank = Local congestion is not found.

- **j**
  - Primary route number (linkset or combined linkset) provisioned for the route set. Valid value(s):
    - A = Primary routes that are allowed.
    - P = Primary routes that are prohibited.
    - R = Primary routes that are restricted.
    - X = Primary routes that are out of service.

  If the normal route is a combined linkset, the routing status for each provisioned link set within the combined link set shall be reported.

- **k**
  - Alternate route number (linkset or combined link set) provisioned and its associated routing status. Valid value(s):
    - A = Alternate routes that are allowed.
    - X = Alternate routes that are out-of-service.
    - R = Alternate routes that are restricted.
    - P = Alternate routes that are prohibited.
    - blank = Alternate route set is not provisioned.

- **m**
  - Remote congestion level. Valid value(s):
    - 1 = The current route is congested at level 1.
    - 2 = The current route is congested at level 2.
    - 3 = The current route is congested at level 3.
    - blank = Remote congestion is not found on a DPC, cluster, or network that is reported.
Route set being used to transport the DPC. Valid value(s):
- NETWORK = Routing according to network.
- CLUSTER = Routing according to cluster.
- MEMBER = Routing according to member.

Possible error conditions. Valid value(s):
- RL MSG NOT SENT TO CLIENT PROC = Retry later. Message could not be sent to client process.
- RL DATA BEING UPDATED = Retry later. Data being updated, cannot access the data.
- SYSTEM ERROR = System error occurred.
- INVALID RANGE SPECIFIED = Range entered by the craft for either network, cluster or DPC is not correct.
- INVALID CLUSTER = Cluster entered by craft is invalid.
- INVALID DPC = DPC entered by craft is invalid.
- NO ROUTE SET PROVISIONED = MTP routing status for one DPC regardless of what route set it is using has been requested.
- NO NETWORK ROUTE SET PROVISIONED = MTP routing status for one NETWORK and the network route set is not provisioned has been requested.
- NO CLUSTER ROUTE SET PROVISIONED = MTP routing status for one CLUSTER and the cluster route set is not provisioned has been requested.
- NO DPC ROUTE SET PROVISIONED = MTP routing status for one DPC and the member route set is not provisioned has been requested.
- ALL ROUTES NORMAL = No abnormal routes were found.

Report pages. Valid value(s):
- COMPLETED = The OP:CCS,ROUTE output report terminated.
- CONTINUE = The OP:CCS,ROUTE output consists of several reports. This is one of the intermediate reports.
- STARTED = This is the initial OP:CCS,ROUTE output report.

4. ACTIONS TO BE TAKEN
None.

5. ALARMS
A major alarm is triggered with the OP CCS ROUTE ABNORMAL output message, if any route in any reported destination (network/cluster/DPC) are prohibited or inaccessible.

A minor alarm is triggered with the OP CCS ROUTE ABNORMAL output message, if any route in any reported destination (network/cluster/DPC) are restricted or locally congested.

    OP CCS SCMG GSM=a b
    DPC=c CONGESTION LEVEL=[d]
    SSN  STATUS
    [e]    [f]

2. **REASON FOR OUTPUT**

    To display status information for one or more signaling connection control part (SCCP) subsystems on one or more destination point codes (DPCs).

    Note: Congestion level, subsystem number (SSN), and status will be printed only if a SSN exists for the specified DPC. In addition, if the DPC or all SSNs are prohibited, the congestion level will not be printed.

3. **VARIABLE FIELD DEFINITIONS**

    a = Common channel signaling (CCS) global switching module (GSM) number.

    b = Report status. Valid value(s):

    END OF DATA
    IN PROGRESS
    NO DATA AVAILABLE

    c = Destination point code (DPC) number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.

    d = Congestion level of the DPC. Valid value(s):

    0 = No congestion.
    1 = Level 1 congestion.
    2 = Level 2 congestion.
    3 = Level 3 congestion.

    e = Subsystem number.

    f = Status. Valid value(s):

    ALLOWED = The subsystem is allowed.
    NONE = No data was found for this DPC or subsystem.
    PROHIBITED = The subsystem is prohibited.

2. REASON FOR OUTPUT

To display the normal and current signaling link selection (SLS) distribution on a specific link in a linkset or
combined linkset (CLS).

3. VARIABLE FIELD DEFINITIONS

a = Common channel signaling (CCS) global switching module (GSM) number.
b = Specific destination point code (DPC). DPC is printed if specified in the input message. Refer to
the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for
interpretation.
c = Linkset number or CLS number. LS/CLS is printed if specified in the input message.
d = Originating point code (OPC) number associated with the GSM. Refer to the APP:POINT-CODE
appendix in the Appendixes section of the Output Messages manual for interpretation.
e = Page index. Valid value(s):
FIRST = First page of report.
LAST = Last page of report associated with this report.
NEXT = Next report page.
f = User message or response. Valid value(s):
CTMPSIU PACKAGE NOT LOADED = The loadable package that contains the software that
receives the message has not been loaded.
DATA BEING UPDATED = The message cannot be processed because the relations that contain
the status of DPCs are being updated either by traffic diversion terminal process or
by audits. Retry the input message later.
DPC INACCESSIBLE = The DPC is inaccessible.
GSM NOT EQUIPPED = The specified SM is not a CCS GSM.
INTERNAL ERROR = An internal error occurred.
INVALID DPC NUMBER SPECIFIED = An invalid DPC number was specified.
INVALID LINKSET NUMBER SPECIFIED = Linkset number specified in the message is invalid for
protocol or switching module (SM) indicated.
OFFICE NOT EQUIPPED WITH CCS = This office does not have CCS features on the packet
switching unit (PSU) platform.
SM DATA CURRENTLY NOT AVAILABLE = Command cannot be processed because the requested data is currently not available for processing. Retry the input message later.

SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not accessible. Retry the input message later.

g = Linkset number.
h = Member number of the link in the linkset.
i = SLC number of the link in the linkset.
j = Normal SLS values of the link in the linkset or CLS.
k = Current SLS values of the link in the linkset or CLS.

   ![Example Format 1 and 2]

### 2. REASON FOR OUTPUT

Generates a response to the OP:CCS-TPC input message.

Format 1 displays one or more translation type & the corresponding translation point code (TPC). Format 2 displays in the cause field the reason the message was not processed.

### 3. VARIABLE FIELD DEFINITIONS

- **a**  
  = Single or range of translation types requested. The translation type has a range of 1-256.

- **b**  
  = The page sequence. Valid values:
  - **FIRST**
  - **NEXT**
  - **LAST**

- **c**  
  = Common channel signaling (CCS) global switching module (GSM) number.

- **d**  
  = Reason why the message was not processed. Valid value(s):
    - **TPC IS NOT PROVISIONED IN THE OFFICE** = The single translation type requested does not exist for this GSM.
    - **NO TUPLE FOUND** = For the range of translation types requested, no TPC exist for this GSM.
    - **BLANK** = The translation type(s) and TPC(s) requested were returned.

- **e**  
  = Translation type(s). Maximum of 10 per output page.

- **f**  
  = Translation point code(s) (TPC) serving the translation type(s). Maximum of 10 per output page.

Type: Output

1. FORMAT

OP CCSCQ a     CQ START TIME IS b

2. REASON FOR OUTPUT

To report (in response to an OP:CCSCQ input message) whether the automatic common channel signaling (CCS) circuit query is inhibited or allowed for the entire office, and the circuit query start time.

3. VARIABLE FIELD DEFINITIONS

a = Current automatic circuit query activation state. Valid value(s) are:
   ALLOWED
   MANUALLY INHIBITED

b = Current automatic circuit query start time. Valid value(s) are:
   0-23 = range of start times, in hours.
   NOT SET = no CQ START TIME has been selected.

4. ACTION TO BE TAKEN

If the resulted response is CQ START TIME IS NOT SET, set the circuit query start time within the 0-23 range using the RC/V 8.15 view.

5. ALARMS

None.

__________________________________________________________________

[2] OP CFGSTAT CM HAS NO UNITS IN THE REQUESTED STATE

2. REASON FOR OUTPUT

To print the status of the specified unit or set of units in the specified maintenance state.

Format 1 is the standard output message format when there are communication module (CM) units in the specified state.

Format 2 is the output message format when there are no CM units in the specified state.

If the CM is manually isolated from the administrative module (AM), its current state is not known. In that case, any information reported reflects the last known state of the CM.

3. VARIABLE FIELD DEFINITIONS

a = Text string identifier showing order of CFGSTAT record. Valid value(s):
   FIRST = First record of continuing list.
   LAST  = Last record of list.
   NEXT  = Next record of continuing list.

b = Unit identification.

c = Maintenance state.

d = Inhibit status. Valid value(s):
   ALW,AUTO = Hardware checks are allowed.
   INH,AUTO = Hardware checks are inhibited by automatic request.
   INH,MAN = Hardware checks are inhibited manually.
   N/A     = Not applicable.

e = Result of last diagnostic run on unit. Valid value(s):
   ATP     = All tests passed.
   CATP    = Conditional all tests passed.
   N/A     = Not applicable.
NTR = No tests run.
STF = Some tests failed.
STP = Stopped or Aborted.

4. ACTION TO BE TAKEN

[3] OP CFGSTAT SM a HAS NO CIRCUITS IN THE REQUESTED STATE

2. REASON FOR OUTPUT

To list the configuration status (CFGSTAT) of units in the specified switching module (SM).

Format 1 is the standard output message format.

Format 2 displays any active integrated services line unit (ISLU) spare line cards along with the corresponding faulty line cards that are being replaced.

Format 3 prints when an SM has no circuits in the requested state. If the NOPRINT option is not specified with the OP:CFGSTAT-SM input message, then for all SMs that have no circuits in the requested state, a message 'SM x HAS NO CIRCUITS IN THE REQUESTED STATE' (x = SM number) will be displayed on the receive-only printer (ROP). If the NOPRINT option is specified, then for all SMs that do not have circuits in the requested state, both the header and the empty message (blank space) are suppressed on the ROP.

Note: If the hardware status is required for the module controller/timeslot interchange (MCTSI), use the OP:OFFNORM-SM input message.

3. VARIABLE FIELD DEFINITIONS

ISLULC = ISLU line card.
ISLULCKT = ISLU line circuit.

i = Circuit state. Valid value(s):
    BUSY
    IDLE

j = Hardware check. Valid value(s):
    ALW = Allow.
    INH = Inhibit.
    N/A = Not applicable.

k = Diagnostic result. Valid value(s):
    ATP = All tests passed.
    CATP = Conditional all tests passed.
    N/A = Not applicable.
    NTR = No tests run.
    STF = Some tests failed.
    STP = Stopped or aborted.

l = ISLU number.

m = Line group controller number.
n = Line card number.
o = Line group number.
p = Line board number.
q = Line circuit number.

4. ACTION TO BE TAKEN

If the status (variable 'f') of a grid is ACT, the activity (variable 'i') is BUSY, and the hardware check status (variable 'j') is INH, the line unit fabric exerciser program is being executed on the grid. No action should be taken to allow hardware checks on the grid. On completion, the exerciser program will allow hardware checks on the grid.

If hardware checks are inhibited for a duration of more than one day on a grid whose status is ACT, action should be taken to allow hardware checks on the grid.

5. ALARMS

None.

__________________________________________________________________

2. REASON FOR OUTPUT

To give device information specific to administrative module (AM) hardware units on communities requested using the OP:CFGSTAT input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Output Messages manual for AM unit names.

b = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Output Messages manual.

c = Subunit name, if a = CU. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section
of the Output Messages manual for AM control unit (CU) subunit names.

d = Subunit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Output Messages manual.

e = The current maintenance state of the unit. Valid value(s):
   ACT = Active units.
   GROW = Units being grown.
   INIT = Initializing units.
   OFL = Off-line units.
   OOS = Out-of-service units.
   STBY = Standby units.
   UNAV = Unavailable units.
   UNEQIP = Unequipped units.

f = Current inhibit status of the associated error source. Valid value(s):
   ALW = Allowed.
   INH = Inhibited.

g = The results of the last diagnostic on the unit. Valid value(s):
   ABT = Aborted diagnostics.
   ATP = All tests passed.
   CATP = Conditional all tests passed.
   NTR = No tests were run.
   STF = Some tests failed.

h = Error number. Valid value(s):
   9 = Cannot attach to plant measurement library.
   10 = Cannot open equipment configuration database (ECD) sequence.
   11 = Cannot sequence unit control blocks (UCBs).

i = Retry the message later because:
   CAN’T SEQUENCE DATABASE.
   CAN’T CREATE FILE IN /tmp.
   CAN’T GET DATABASE RECORD ID.

j = Temporary output file name.

k = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

```

2. REASON FOR OUTPUT

To respond to a request for a listing of active carrier group alarms (CGAs).

For digital facility interface (DFI) facilities, multiple CGA alarms can be reported. For the digital networking unit - SONET (DNU-S), this message will report the highest level facility [STE (high), STS-1, VT1.5, or DS1 (low)] in a CGA condition. For DNU-S facilities only the highest level color [AIS (high), LCA, or RMA (low)] is reported. For SONET termination equipment (STE) facilities only local alarm (LCA) and alarm indication signal (AIS) are possible. For the peripheral control and timing (PCT) line and trunk unit (PLTU), only SET is reported.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Data group (DG) number.
d = STE number.
e = Report status. Valid value(s):
   COMPLETED = The OP:CGA output has terminated successfully.
   CONTINUED = The OP:CGA output consists of several reports. This is one of the intermediate reports.
   NO MATCH = The requested facility does not exist or is in growth.
   STARTED = This is the initial OP:CGA output.
   SYSTEM BUSY REPEAT LATER = An OP:CGA request is currently being served; retry later.
   SYSTEM ERROR = The OP:CGA output has terminated. The output is incomplete; retry later.
   UNAVAILABLE = The requested SM is not available or all of the SMs requested in a range are not available.

f = Valid value(s):

```

2. REASON FOR OUTPUT

To respond to a request for a listing of active carrier group alarms (CGAs).

For digital facility interface (DFI) facilities, multiple CGA alarms can be reported.

For the digital networking unit - synchronous optical network (SONET) (DNU-S), this message will report the highest level facility [STE (high), STS-1, VT1.5, or DS1 (low)] which is currently in a CGA condition. For DNU-S facilities only the highest priority CGA [AIS (high), LCA, or RMA (low)] is reported. For SONET termination equipment (STE) facilities only local alarm (LCA) and alarm indication signal (AIS) are possible, with LCA higher than AIS.

For the time division multiplexed optical interface unit (OIU TDM), this message will report the highest level facility in the OIU hierarchy [OC3 (high), STS1, VT15, or DS1 (low)] which is currently in a CGA condition. For OIU facilities only the highest priority CGA [AIS (high), LCA, BER, or RMA (low)] is reported. For the OC3 facility level only, LCA is higher than AIS. BER is used only at the OC3 facility level.

For the peripheral control and timing (PCT) line and trunk unit (PLTU), only SET is reported.

3. VARIABLE FIELD DEFINITIONS

```

### 2. REASON FOR OUTPUT

To respond to a request for a listing of active carrier group alarms (CGAs).

For digital facility interface (DFI) facilities, multiple CGA alarms can be reported.

For the digital networking unit - synchronous optical network (SONET) (DNU-S), this message will report the highest level facility [STE (high), STS-1, VT1.5, or DS1 (low)] which is currently in a CGA condition. For DNU-S facilities only the highest priority CGA [AIS (high), LCA, or RMA (low)] is reported. For SONET termination equipment (STE) facilities only local alarm (LCA) and alarm indication signal (AIS) are possible, with LCA higher than AIS.

For the time division multiplexed optical interface unit (OIU TDM), this message will report the highest level facility in the OIU hierarchy [OC3 (high), STS1, VT15, or DS1 (low)] which is currently in a CGA condition. For OIU facilities only the highest priority CGA [AIS (high), LCA, BER, or RMA (low)] is reported. For the OC3 facility level only, LCA is higher than AIS. BER is used only at the OC3 facility level.

For the packet optical interface unit (OIU IP/ATM), this message will report the highest level facility in the OIU hierarchy [OC3C (high) or STS3C (low)] which is currently in a CGA condition. For STS3C facilities only the highest priority CGA [AIS (high), LCA, BER, or RMA (low)] is reported. For the OC3C facility level only, LCA is higher than AIS. BER is used only at the OC3C facility level.

For the peripheral control and timing (PCT) line and trunk unit (PLTU), only SET is reported.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = DNU-S number.
- **c** = Data group (DG) number.
- **d** = STE number.
- **e** = Report status. Valid value(s):
  - **COMPLETED** = The OP:CGA output has terminated successfully.
  - **CONTINUED** = The OP:CGA output consists of several reports. This is one of the intermediate reports.
  - **NO MATCH** = The requested facility does not exist or is in growth.
STARTED = This is the initial OP:CGA output.
SYSTEM BUSY REPEAT LATER = An OP:CGA request is currently being served; retry later.
SYSTEM ERROR = The OP:CGA output has terminated. The output is incomplete; retry later.
UNAVAILABLE = The requested SM is not available or all of the SMs requested in a range are not available.

f = Unit. Valid value(s):

DFIH=a-g-h
DS1=a-c1-d1-e1-r-s-v
DS1SFAC=a-b-c-d-r-s-v
EC1STE=a-b-c-d
FAC=a-g-h-i
IFAC=a-j-k
OC3=a-c1-d1-e1-f1
OC3C=a-c1-d1-e1-f1
SDFI=a-l-m
SPN=a-n-o-p-q
STS1=a-c1-d1-e1-r
STS3C=a-c1-d1-e1-r
STSFAC=a-b-c-d-r
TRIB=a-z-a1-b1
VT15=a-c1-d1-e1-r-s-v
VT1FAC=a-b-c-d-r-s-v

g = Digital line and trunk unit (DLTU) number.

h = Digital facility interface (DFI) number.

i = FAC number.

j = IDCU number.

k = IFAC number.

l = Digital carrier line unit (DCLU) number.

m = SDFI number.

n = Metallic service unit (MSU) number.

o = Service group (SG) number.

p = Board (BRD) number.

q = Scan point (SP) number.

r = STS number.

s = Virtual tributary group (VTG) number.

t = Switching module (SM) number or lower limit of a range of SM numbers.

u = Upper limit of a range of SM numbers.
v = Virtual tributary member (VTM) number.

w = CGA type. Each type listed below may not be valid for each type of facility. See the REPT CGA output message to determine which types are valid for each facility. Valid value(s):
AIS = Alarm indication signal.
BER = Bit error rate alarm.
LCA = Local alarm.
RNA = Remote alarm.
SET = Set alarm.

x = CGA qualifier. Currently only used for DNU-S STE facilities and OIU facilities.

Valid values for DNU-S STE and OIU OC3 facilities are:
LOF = Loss of frame.
LOS = Loss of signal.

Valid values for OIU STS and VT15 facilities are:
LCD = Loss of cell delineation (STS3C only).
LOP = Loss of pointer.
PLMU = Payload mismatch - unequipped.
PLM = Payload mismatch.
TIM = Trace identifier mismatch (STS only).

y = Customer-supplied Common Language® facility identifier (CLFI) string of up to 25 characters.

z = PLTU number.

a1 = PCT facility interface.

b1 = PCT tributary number.

c1 = OIU number.

d1 = Protection group (PG) number.

e1 = OIU STE number.

f1 = OIU STE side number.

g1 = Unit input scope. Valid value(s):
EC1STE=a-b-c-d
OC3=a-c1-d1-e1
OC3C=a-c1-d1-e1

The OC3 and OC3C unit input scopes do not take the STE side number. The current "selected" side is always used.

4. ACTIONS TO BE TAKEN
If the report status was SYSTEM ERROR or SYSTEM BUSY RETRY LATER, retry later.

5. ALARMS

None.

[2] OP CGAP a

2. REASON FOR OUTPUT

To display the status of all active code controls with the corresponding gap values. One message can contain up to six controls. A maximum of 11 messages can result since 64 controls are allowed. This message is in response to the OP:CGAP input message.

Format 1 displays the termination status of started, continued, or completed control codes.

Format 2 displays the termination status of aborted or failed control codes.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
   ABORTED = Retry message.
   COMPLETED = Last in a series of these messages.
   CONTINUED = Middle of a series of these messages.
   FAILED = Invalid parameter.
   STARTED = First in a series of these messages.

b = Destination code gapped, or "-" if not applicable.

c = Access prefix gapped (0-9999). If the prefix is not specified, the field will contain a blank. The access prefix only applies to feature group D carriers.

d = Gap interval. Valid value(s):
   0 = No control was applied but measurements were collected.
   PT1 = 0.10 sec.
   PT12 = 0.12 sec.
   PT14 = 0.14 sec.
   PT16 = 0.16 sec.
   PT18 = 0.18 sec.
   PT2 = 0.20 sec.
   PT25 = 0.25 sec.
   PT36 = 0.36 sec.
PT5 = 0.50 sec.
PT6 = 0.60 sec.
PT75 = 0.75 sec.
1 = 1.0 sec.
1PT6 = 1.6 sec.
2 = 2.0 sec.
3 = 3.0 sec.
5 = 5.0 sec.
6 = 6.0 sec.
9 = 9.0 sec.
0 = 10.0 sec.
2 = 12.0 sec.
5 = 15.0 sec.
20 = 20.0 sec.
30 = 30.0 sec.
45 = 45.0 sec.
60 = 60.0 sec.
75 = 75.0 sec.
100 = 100.0 sec.
120 = 120.0 sec.
150 = 150.0 sec.
300 = 300.0 sec.
450 = 450.0 sec.
600 = 600.0 sec.
INF = Infinity, block all but one call.

\( e \)  = Announcement (ANN) treatment if blocking occurred. Valid value(s):
EANN1 = Emergency announcement 1.
EANN2 = Emergency announcement 2.
NCA = No circuit announcement.

\( f \)  = Switching domain list or ALL.

4. ACTIONS TO BE TAKEN

If the termination status is ABORTED, retry the input message.

If the termination status is FAILED, this message is a failure because of an input parameter error.

No action is required if the termination status is STARTED, CONTINUED, or COMPLETED.

5. ALARMS

None.

2. REASON FOR OUTPUT

Format 1 is printed when data has been requested for a valid digital facility (DFAC). Data for the 24 channels in the facility is displayed in 6 separate messages. Each of the 6 messages has the same event number. The output contains information on how the channels in the specified facility are being utilized.

Format 2 is printed when data has been requested for a valid digital signal level-1 (DS1) facility (DS1SFAC). Data for the 24 channels in the facility is displayed in 6 separate messages. Each of the 6 messages has the same event number. The output contains information on how the channels in the specified facility are being utilized. Format 3 is printed when an error occurs while trying to lookup data associated with the specified DFAC. Format 4 is printed when an error occurs while trying to lookup data associated with the specified DS1SFAC. There is no explicit indication of wideband calls. Instead, the pattern of process identifier values will be an indication that a wideband call is present. All circuits with the same process identifier are part of a single wideband call. If output is requested for a non-existent or invalid facility, a message with Format 3 (for DFAC facilities) or Format 4 (for DS1SFAC facilities) is printed with the words "NO MATCH" in variable field ‘r’. Some possible non-existent or invalid facilities are:

- Host switching module (HSM)/remote switching module (RSM) umbilical.
- Inter-RSM communication link (ICL) between RSMs.
- SLC® termination.
- Facility 1 (FAC 1) on a DFI-1.

If channels on the facility are provisioned for packet service, including X.75, X.75’, internal protocol (IP), or X.25
service on T1 Facilities (XAT), regardless of whether the channels are active with packet calls, the EN will be printed and "PACKET" in the PID field of the output message. For XAT, the TKGMN field f will be blank. For channels equipped for IP, X.75 and X.75', the TKGMN value is also printed, regardless of whether there are any active packet calls on the channel.

3. VARIABLE FIELD DEFINITIONS

DNU = Digital networking unit (DNU) number.
DNU-S = Digital networking unit (DNU) - synchronous optical network (SONET) (DNU-S).
DS1 = Digital signal level-1 (DS1).
DS1SFAC = DNU-S DS1 facility.
STS = Synchronous transport signal (STS) number.
a = Switching module (SM) number.
b = DLTU number.
c = DFI number.
d = Facility (FAC) number.
e = Event number.
f = Trunk group and member number separated by dashes.
g = Equipment number. When displayed as part of Format 1 the EN is comprised of a "D" followed by 8 digits. The first 3 digits represent the SM number. The fourth digit represents the DLTU number. The fifth and sixth digits represent the DFI number and the last 2 digits represent the channel number.

When displayed as part of format 2 the EN is comprised of a "N" followed by 10 digits. The first 3 digits represent the SM. The fourth digit represents the DNU-S. The fifth digit represents the data group. The sixth digit represents the STS. The seventh and eighth digits represent the DS1 facility number and the last 2 digits represent the channel number.

h = Process identifier (PID). If no port to process association is found, valid values are:
ERROR = Internal failure for a particular port.
IDLE = The port is idle.
PACKET = The port supports packet switched data calls.
UNEQUIPPED = The port is unequipped.

If there is a port to process association, the PID will be in the form: i-j-k.
i = Process number of the owning process identifier.
j = Switching module number of the owning process identifier.
k = Uniqueness number of the owning process identifier.
l = Peripheral time-slot (PTS) number.
m = Network control and timing (NCT) time-slot connection number:
- Intermodule call, NCT time-slots are connected in the time-multiplexed switch (TMS).
- Intramodule call, NCT time-slots are connected in the time-slot interchanger (TSI).
- For RSM-HSM connections, the true time slot used is not printed. Instead, the time slot used for the umbilical is printed.
- For intra SM-2000 connections, the true NCT time slot used is not printed. Instead, a pseudo time slot is printed.

n = DNU-S number.

o = Data group number.

p = STS number.

q = SONET termination equipment (STE) number.

s = Virtual tributary group (VTG) number.

t = Virtual tributary member (VTM) number.

r = Failure reason. Valid reasons are:
CANNOT CREATE TERMINAL PROCESS
CANNOT SEND MESSAGE
INVALID SM OR SM IS NOT UP = Cannot communicate with the requested SM.
NO INTERNAL CIRCUIT NAME FOUND = Name of facility cannot be determined.
NO MATCH = Non-existent or invalid facility.
RECEIVED MESSAGE WAS TOO LONG
RETRY LATER = A timer fired before a response was received.

2. REASON FOR OUTPUT

Format 1 is printed when data has been requested for a valid digital facility (DFAC). Data for the 24 channels in the facility is displayed in 6 separate messages. Each of the 6 messages has the same event number. The output contains information on how the channels in the specified facility are being utilized.

Format 2 is printed when data has been requested for a valid digital signal level-1 (DS1) facility (DS1SFAC). Data for the 24 channels in the facility is displayed in 6 separate messages. Each of the 6 messages has the same event number. The output contains information on how the channels in the specified facility are being utilized.

Format 3 is printed when data has been requested for a valid optical interface unit (OIU) DS1 facility. Data for the 24
channels in the facility is displayed in 6 separate messages. Each of the 6 messages has the same event number. The output contains information on how the channels in the specified facility are being utilized.

Format 4 is printed when an error occurs while trying to lookup data associated with the specified DFAC.

Format 5 is printed when an error occurs while trying to lookup data associated with the specified DS1SFAC.

Format 5 is printed when an error occurs while trying to lookup data associated with the specified DS1.

There is no explicit indication of wideband calls. Instead, the pattern of process identifier values will be an indication that a wideband call is present. All circuits with the same process identifier are part of a single wideband call.

If output is requested for a non-existent or invalid facility, a message with Format 3 (for DFAC facilities), Format 4 (for DS1SFAC facilities) or Format 5 (for DS1 facilities) is printed with the words "NO MATCH" in variable field 'r'. Some possible non-existent or invalid facilities are:

- Host switching module (HSM)/remote switching module (RSM) umbilical.
- Inter-RSM communication link (ICL) between RSMs.
- SLC® termination.
- Facility 1 (FAC 1) on a DFI-1.

If channels on the facility are provisioned for packet service, including X.75, X.75', internal protocol (IP), or X.25 service on T1 Facilities (XAT), regardless of whether the channels are active with packet calls, the EN will be printed and "PACKET" in the PID field of the output message.    f g r f b^1 c^1 d^1 e^1
2. REASON FOR OUTPUT

To respond to an OP:CONV input message and to report the requested conversion of a line, trunk, data link, or operator services position system port (OSPSPORT). Specifically, the unit name (Format 1 or 3) (DN, MLHG, TKGMN, or data link or OSPSPORT type), equipment number (DEN, ILEN, LCEN, LCKEN, LEN, LTP, NEN, PSUEN, SLEN, INEN, AUYEN, and TEN), internal port (PORT), embedded operations channel (EOC), time-slot management channel (TMC), scan point number (SPN), and the physical location in the office is given.

For digital subscriber lines (DSL) (Format 2), all ports defined for the basic rate interface (BRI) are given if no channel was specified on the input request. The OP:CONV message cannot display all possible 25 unique directory numbers (DN) associated with the DSL.

For SLC® lines (SLEN), integrated digital carrier unit (IDCU) line equipment number (ILEN), and IDLC network equipment number (INEN), the SLC® identification (SID) is given, but its physical location is not given because it may not exist in the office.

Format 4 is the result of an input request specifying a PRIGRP identifier and the PRIGRP has D-channel backup (DCBU). The output displays information about both D-channels, D1, the primary D-channel and D2 the secondary or backup D-channel. Format 1 is used if there is only one D-channel for the PRI group.

3. VARIABLE FIELD DEFINITIONS

Variables 'h' through 'o' and 'a1' give the physical location in the office for the port identified.

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.
= Indicates the line was a party line, a custom multipoint interface DSL, or a standard interface multi-user DSL.

= The identifier that was entered on the input request, or related to input request. Valid value(s):

b = Equipment number or identifier. Valid value(s):

<table>
<thead>
<tr>
<th>MLHG=w-x</th>
</tr>
</thead>
<tbody>
<tr>
<td>TKGMN=s-1-z-1</td>
</tr>
</tbody>
</table>

c = SID number.

d = Completion report. Valid value(s):

CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) was unable to respond. Retry the request later.

COMPLETED = The requested conversion has been completed. If unable to obtain physical location, it will not be printed.

INPUT ERROR = One (or more) of the input message fields was incorrect.

INVALID PORT = The port identifier entered could not be translated and was considered invalid.

INVALID PRIGROUP = The PRI group identifier entered could not be translated and was considered invalid.

LOCATION UNKNOWN = Was unable to determine the physical location of the trunk or line in the office.

MLHG ACCESS DN = The DN entered was a uniform call distribution (UCD), multi-position hunt (MUPH) multi-line hunt group, or linear hunt line and as such could not be converted. To obtain the line’s equipment number and/or multi-line hunt group and member number, use RC/V for the DN or refer to office records.

MP ACCESS DN = The DN entered was either a modem pool access DN a (DN that an analog user would dial to reach a packet service through a modern pool) or the DN is a LISTED TN of a packet-switched uniform call distribution multi-line hunt group (a DN that a packet user would dial to gain access into a modem pool as part of one of the two stage dialing effort to reach an analog user) and as such could not be converted. To assess whether this is actually a modem pool access DN, enter this DN on RC/V 23.12 or look up the corresponding office record. If data is populated for this
DN, the associated modem pool MLHG will be given. If data is not there, this must
be a modem pool MLHG LISTED TN. Check office records for RC/V 3.5 to find the
MLHG number using this number. Additionally, if the user knows the equipment
number of one of the analog or digital members of the modem pool group, or if the
analog TN of any of the analog members of the modem pool is known, obtain the
MLHG number through the OP:CONV input message or through RC/V 1.6 for
analog or 23.2 for DSL.

NO DATABASE MATCH = Internal data base error. The desired tuple could not be found.
NO CHANNELS ASSIGNED = The PRI group specified has no channels assigned.
NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs.
Reenter DN with NPA.
NOT PRIMARY DN OR MLHG = The DN or MLHG specified was not identified as the primary DN or
MLHG and member on any line. This could be due to an office-dependent data
(ODD) problem or the DN/MLHG could be a SECONDARY ONLY DN/MLHG. It,
therefore, could not be used to identify for which equipment the status was to be
obtained. Refer to RC/V or office records to determine the primary DNs or MLHG
and member numbers.
SM UNAVAILABLE = The input request could not be completed because a needed switching
module (SM) was unable to respond. Retry the request later.
SYSTEM BUSY = The system's processing capability limit was reached or a system resource was
unavailable. Retry the request later.
SYSTEM ERROR = An unspecified error occurred that prevented further processing of the request.

f = SM number.
g = Logical port number in hexadecimal.
h = Unit number.
i = Service group number.
j = Bay number in aisle.
k = Unit type. Valid value(s):

- DLTU = Digital line and trunk unit.
- DNUS = Digital networking unit - synchronous optical network (SONET) (DNU-S).
- IDCU = Integrated digital carrier unit.
- ISLU = Integrated services line unit.
- LU = Line unit.
- MMSU = Metallic service unit.
- PSA = Packet switching unit.
- RAF = Recorded announcement function.
- RISLU = Remote integrated services line unit.
- SAS = Service announcement system.
TU = Trunk unit.

l = Unit number.
m = Service group number, or DFI number if the unit type is a digital line trunk unit (DLTU).
n = Equipment location: vertical distance of circuit above floor in inches.
o = Equipment location: horizontal distance of circuit from left edge of bay in 1/8-inch increments.
p = Line card types. Valid value(s):
   AMIU = AT&T version BRI 2/wire DSL.
   ANSIU = ANSI Standard BRI 2/wire DSL.
   T = Basic rate interface (BRI) 4/wire DSL.
   Z = Analog subscriber line (2/wire).
   W = Analog subscriber line.

q = Equipment number or identifier. Valid value(s):

```
r = Telephone number of the line or AQEST. If the line was a DSL and has circuit switching and packet switching services on the D-channel, this is the circuit switching DN for the D-channel. If the DSL has packet service on a B-channel, this is the packet DN.

s = Line unit number.
t = Line group controller number.
u = Line card number.
v = Digital subscriber line channel. Valid value(s):
   B1
   B2
   D

w = Multi-line hunt group number.
x = Hunt group member number.
y = Packet switching unit (PSU) channel group number.
z = PSU channel group member number.
a^{1} = Equipment location: depth in the unit in 1/10-inch increments.
b^{1} = Trunk unit number.
c^1 = Service group number.
d^1 = Channel board number.
e^1 = Circuit number.
f^1 = Data link (group) number.
g^1 = Relative link (member) number.
j^1 = Operator service center number.
k^1 = Relative position number.
l^1 = Digital line and trunk unit (DLTU) number.
m^1 = Digital facility interface (DFI) number.
n^1 = Channel number.
o^1 = Grid number.
p^1 = Switch board number.
q^1 = Switch number.
r^1 = Level number.
s^1 = Trunk group number.
t^1 = EIS identifier (ID) on which the CPDL terminates.
u^1 = Force management center number of the OAPF.
v^1 = Digital carrier line unit number.
w^1 = External data link (member) number relative to the EIS.
x^1 = RT line number.
y^1 = RAF or SAS announcement channel number.
z^1 = Trunk member number.
c^2 = CLEI code of the associated circuit pack. Valid only for trunks.
d^2 = Telephone number entered. If a packet switching DN was entered and the digital subscriber line (DSL) has packet service on the D-channel, this will be the packet DN. If a circuit switching DN was entered and packet service is on the D-channel and the circuit and packet DN are different, then the packet DN will not appear in the output.
e^2 = PRI group number.
f^2 = Member number of the line time-slot bridging (LTSB) line. For LTSB a member number of '1' represents the lead line and a member number of '2' represents the associate line.
g² = Logical test port number.
h² = IDCU number.
i² = Remote terminal (RT) number.
j² = ID number.
k² = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.
l² = RT line number or PUB43801 channel.
m² = RAF or SAS unit number.
n² = Board number.
o² = Scan point number.
p² = DNU-S number.
q² = Data group number.
r² = Synchronous transport signal (STS) number.
s² = Virtual tributary group number.
t² = Digital signal level 0 (DS0).
u² = Line board number.
v² = Line circuit number.
w² = PSU unit number.
x² = PSU shelf number.
y² = PSU channel group number.
z² = Line group number.
a³ = ISLU/ISLU2 number.
b³ = Port identification phrase. Valid value(s):
   A5    = A5 trunk.
   ADT   = Autoplex data trunk.
   BCM   = Code division multiple access (CDMA) bearer channel member trunk.
   FRBC  = CDMA frame relay bearer channel trunk.
   IS41  = IS41 trunk.
   ISLPMEM = ISLP member trunk.
   PKTPipe = CDMA packet pipe trunk.
   PPMEM = CDMA packet pipe member trunk.
   SPCHNDLR = CDMA speech handler trunk.
   SVC = CDMA switched virtual circuit trunk.

c³ = Cabinet reference. Possibilities include:
FRONT = The unit is in the front side of the cabinet.
BACK = The unit is in the back side of the cabinet.

d$^3$ = Access interface unit (AIU) number.
e$^3$ = AIU pack number.
f$^3$ = AIU circuit number.
g$^3$ = Equipment number or identifier. Valid value(s):
  LCEN
  LCKEN
  ILEN
  DNUSEOC
  DNUSTMC
  IDCUEOC
  IDCUTMC
  INEN
  AIUEN

h$^3$ = EOC ID number.
i$^3$ = TMC ID number.
j$^3$ = SONET termination equipment (STE) number.
k$^3$ = Virtual tributary member number.

4. ACTIONS TO BE TAKEN

None. Refer to the message output for pertinent status and information, and take appropriate action based on the information received, if necessary.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to an OP:CONV input message and to report the requested conversion of a line, trunk, data link, or operator services position system port (OSPSPORT). Specifically, the unit name (Format 1 or 3) (DN, MLHG, TKGMN, or data link or OSPSPORT type), equipment number, internal port (PORT), embedded operations channel (EOC), time-slot management channel (TMC), scan point number (SPN), and the physical location in the office is given.

For digital subscriber lines (DSL) (Format 2), all ports defined for the basic rate interface (BRI) are given if no channel was specified on the input request. The OP:CONV message cannot display all possible 25 unique directory numbers (DN) associated with the DSL. For SLC® lines (SLEN), integrated digital carrier unit (IDCU) line equipment number (ILEN), and IDLC network equipment number (INEN), the SLC® identification (SID) is given, but its physical location is not given because it may not exist in the office. Format 4 is the result of an input request specifying a PRIGRP identifier and the PRIGRP has D-channel backup (DCBU). The output displays information about both D-channels, D1, the primary D-channel and D2 the secondary or backup D-channel. Format 1 is used if there is only one D-channel for the PRI group.

3. VARIABLE FIELD DEFINITIONS

Variables 'h' through 'o' and 'a1' give the physical location in the office for the port identified.

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

+ = Indicates the line was a party line, a custom multipoint interface DSL, or a standard interface multi-user DSL.

a = The identifier that was entered on the input request, or related to input request. Valid value(s):

b = Equipment number or identifier. Valid value(s):
MLHG=w-x
TKGMN=s^1-z^1

c = SID number.

d = Completion report. Valid value(s):
CMP UNAVAILABLE = The input request could not be completed because a needed communication
module (CM) was unable to respond. Retry the request later.
COMPLETED = The requested conversion has been completed. If unable to obtain physical
location, it will not be printed.
INPUT ERROR = One (or more) of the input message fields was incorrect.
INVALID PORT = The port identifier entered could not be translated and was considered invalid.
INVALID PRIGROUP = The PRI group identifier entered could not be translated and was
considered invalid.
LOCATION UNKNOWN = Was unable to determine the physical location of the trunk or line in the
office.
MLHG ACCESS DN = The DN entered was a uniform call distribution (UCD), multi-position hunt
(MUPH) multi-line hunt group, or linear hunt line and as such could not be
converted. To obtain the line’s equipment number and/or multi-line hunt group and
member number, use RC/V for the DN or refer to office records.
MP ACCESS DN = The DN entered was either a modem pool access DN a (DN that an analog user
would dial to reach a packet service through a modem pool) or the DN is a LISTED
TN of a packet-switched uniform call distribution multi-line hunt group (a DN that a
packet user would dial to gain access into a modem pool as part of one of the two
stage dialing effort to reach an analog user) and as such could not be converted.
To assess whether this is actually a modem pool access DN, enter this DN on
RC/V 23.12 or look up the corresponding office record. If data is populated for this
DN, the associated modem pool MLHG will be given. If data is not there, this must
be a modem pool MLHG LISTED TN. Check office records for RC/V 3.5 to find the
MLHG number using this number. Additionally, if the user knows the equipment
number of one of the analog or digital members of the modem pool group, or if the
analog TN of any of the analog members of the modem pool is known, obtain the
MLHG number through the OP:CONV input message or through RC/V 1.6 for
analog or 23.2 for DSL.

NO DATABASE MATCH = Internal data base error. The desired tuple could not be found.
NO CHANNELS ASSIGNED = The PRI group specified has no channels assigned.
NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs.
Reenter DN with NPA.
NOT PRIMARY DN OR MLHG = The DN or MLHG specified was not identified as the primary DN or
MLHG and member on any line. This could be due to an office-dependent data
(ODD) problem or the DN/MLHG could be a SECONDARY ONLY DN/MLHG. It,
therefore, could not be used to identify for which equipment the status was to be
obtained. Refer to RC/V or office records to determine the primary DNs or MLHG
and member numbers.
SM UNAVAILABLE = The input request could not be completed because a needed switching
module (SM) was unable to respond. Retry the request later.
SYSTEM BUSY = The system's processing capability limit was reached or a system resource was
unavailable. Retry the request later.
SYSTEM ERROR = An unspecified error occurred that prevented further processing of the request.

</table>

| r | = Telephone number of the line or AQEST. If the line was a DSL and has circuit switching and |
packet switching services on the D-channel, this is the circuit switching DN for the D-channel. If the
DSL has packet service on a B-channel, this is the packet DN.

\( s = \) Line unit number.

\( t = \) Line group controller number.

\( u = \) Line card number.

\( v = \) Digital subscriber line channel. Valid value(s):

B1
B2
D

\( w = \) Multi-line hunt group number.

\( x = \) Hunt group member number.

\( y = \) Packet switching unit (PSU) channel group number.

\( z = \) PSU channel group member number.

\( a_1 = \) Equipment location: depth in the unit in 1/10-inch increments.

\( b_1 = \) Trunk unit number.

\( c_1 = \) Service group number.

\( d_1 = \) Channel board number.

\( e_1 = \) Circuit number.

\( f_1 = \) Data link (group) number.

\( g_1 = \) Relative link (member) number.

\( j_1 = \) Operator service center number.

\( k_1 = \) Relative position number.

\( l_1 = \) Digital line and trunk unit (DLTU) number.

\( m_1 = \) Digital facility interface (DFI) number.

\( n_1 = \) Channel number.

\( o_1 = \) Grid number.

\( p_1 = \) Switch board number.

\( q_1 = \) Switch number.

\( r_1 = \) Level number.

\( s_1 = \) Trunk group number.
t¹ = EIS identifier (ID) on which the CPDL terminates.

u¹ = Force management center number of the OAPF.

v¹ = Digital carrier line unit number.

w¹ = External data link (member) number relative to the EIS.

x¹ = RT line number.

y¹ = RAF or SAS announcement channel number.

z¹ = Trunk member number.

c² = CLEI code of the associated circuit pack. Valid only for trunks.

d² = Telephone number entered. If a packet switching DN was entered and the digital subscriber line (DSL) has packet service on the D-channel, this will be the packet DN. If a circuit switching DN was entered and packet service is on the D-channel and the circuit and packet DN are different, then the packet DN will not appear in the output.

e² = PRI group number.

f² = Member number of the line time-slot bridging (LTSB) line. For LTSB a member number of '1' represents the lead line and a member number of '2' represents the associate line.

g² = Logical test port number.

h² = IDCU number.

i² = Remote terminal (RT) number.

j² = ID number.

k² = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.

l² = RT line number or PUB43801 channel.

m² = RAF or SAS unit number.

n² = Board number.

o² = Scan point number.

p² = DNU-S number.

q² = Data group number.

r² = Synchronous transport signal (STS) number.

s² = Virtual tributary group number.

t² = Digital signal level 0 (DS0).

u² = Line board number.

v² = Line circuit number.
= PSU unit number.

= PSU shelf number.

= PSU channel group number.

= Line group number.

= ISLU/ISLU2 number.

= Port identification phrase. Valid value(s):
  3G1XPD = 3G-1X High speed packet data trunk.
  A5 = A5 trunk.
  ADT = Autoplex data trunk.
  BCM = Code division multiple access (CDMA) bearer channel member trunk.
  FRBC = CDMA frame relay bearer channel trunk.
  IS41 = IS41 trunk.
  ISLPMEM = ISLP member trunk.
  PKTPIPE = CDMA packet pipe trunk.
  PPME = CDMA packet pipe member trunk.
  SPCHNDLR = CDMA speech handler trunk.
  SVC = CDMA switched virtual circuit trunk.

= Cabinet reference. Possibilities include:
  FRONT = The unit is in the front side of the cabinet.
  BACK = The unit is in the back side of the cabinet.

= Access interface unit (AIU) number.

= AIU pack number.

= AIU circuit number.

= Equipment number or identifier. Valid value(s):
  LCEN
  LCKEN
  ILEN
  DNUSEOC
  DNUSTMC
  IDCUEOC
  IDCUTMC
  INEN
  AIUEN

= EOC ID number.

= TMC ID number.

= SONET termination equipment (STE) number.

= Virtual tributary member number.
4. ACTIONS TO BE TAKEN

None. Refer to the message output for pertinent status and information, and take appropriate action based on the information received, if necessary.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to an OP:CONV input message and to report the requested conversion of a line, trunk, data link, or operator services position system port (OSPSPORT). Specifically, the unit name (Format 1 or 3) (DN, MLHG, TKGMN, or data link or OSPSPORT type), equipment number, internal port (PORT), embedded operations channel (EOC), time-slot management channel (TMC), scan point number (SPN), and the physical location in the office is given.

For digital subscriber lines (DSL) (Format 2), all ports defined for the basic rate interface (BRI) are given if no channel was specified on the input request. The OP:CONV message cannot display all possible 25 unique directory numbers (DN) associated with the DSL.

For SLC® lines (SLEN), integrated digital carrier unit (IDCU) line equipment number (ILEN), and IDLC network equipment number (INEN), the SLC® identification (SID) is given, but its physical location is not given because it may not exist in the office.

Format 4 is the result of an input request specifying a PRIGRP identifier and the PRIGRP has D-channel backup (DCBU). The output displays information about both D-channels, D1, the primary D-channel and D2 the secondary or backup D-channel. Format 1 is used if there is only one D-channel for the PRI group.

3. VARIABLE FIELD DEFINITIONS

NOTE: Variables 'h' through 'o' and 'a1' give the physical location in the office for the port identified.

Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

+ = Indicates the line was a party line, a custom multipoint interface DSL, or a standard interface multi-user DSL.

a = The identifier that was entered on the input request, or related to input request. Valid value(s):

- AIUEN=f-d³-e³-f³
- AP=f¹-g¹
- AQ=f¹-g¹
- AQM=f¹-g¹
- ATMPP=f-w²-z³-a⁴
- BST=j¹-k¹
- DASC=f¹-g¹
- DEN=f-l¹-m¹-n¹
- DN=d²[-f²][+]
- DSLGM=f-w²-y-z
- EIS=t¹-w¹
- DNUSEOC=f-p²-i²-h³
- DNUSTMC=f-p²-i²-i³
- IDCUEOC=f-h²-i²-h³
- IDCUTMC=f-h²-i²-i³
- HOBICR=f¹-g¹
- HOBICV=f¹-g¹
b = Equipment number or identifier. Valid value(s):

MLHG=w-x
TKGMN=s^1-z^1

c = SID number.

d = Completion report. Valid value(s):
CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) was unable to respond. Retry the request later.
COMPLETED = The requested conversion has been completed. If unable to obtain physical location, it will not be printed.
INPUT ERROR = One (or more) of the input message fields was incorrect.
INVALID PORT = The port identifier entered could not be translated and was considered invalid.
INVALID PRIGROUP = The PRI group identifier entered could not be translated and was considered invalid.
LOCATION UNKNOWN = Was unable to determine the physical location of the trunk or line in the office.

MLHG ACCESS DN = The DN entered was a uniform call distribution (UCD), multi-position hunt (MUPH) multi-line hunt group, or linear hunt line and as such could not be converted. To obtain the line's equipment number and/or multi-line hunt group and member number, use RC/V for the DN or refer to office records.

MP ACCESS DN = The DN entered was either a modem pool access DN a (DN that an analog user would dial to reach a packet service through a modem pool) or the DN is a LISTED TN of a packet-switched uniform call distribution multi-line hunt group (a DN that a packet user would dial to gain access into a modem pool as part of one of the two stage dialing effort to reach an analog user) and as such could not be converted. To assess whether this is actually a modem pool access DN, enter this DN on RC/V 23.12 or look up the corresponding office record. If data is populated for this DN, the associated modem pool MLHG will be given. If data is not there, this must be a modem pool MLHG LISTED TN. Check office records for RC/V 3.5 to find the MLHG number using this number. Additionally, if the user knows the equipment number of one of the analog or digital members of the modem pool group, or if the analog TN of any of the analog members of the modem pool is known, obtain the MLHG number through the OP:CONV input message or through RC/V 1.6 for analog or 23.2 for DSL.

NO DATABASE MATCH = Internal data base error. The desired tuple could not be found.

NO CHANNELS ASSIGNED = The PRI group specified has no channels assigned.

NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

NOT PRIMARY DN OR MLHG = The DN or MLHG specified was not identified as the primary DN or MLHG and member on any line. This could be due to an office-dependent data (ODD) problem or the DN/MLHG could be a SECONDARY ONLY DN/MLHG. It, therefore, could not be used to identify for which equipment the status was to be obtained. Refer to RC/V or office records to determine the primary DNs or MLHG and member numbers.

SM UNAVAILABLE = The input request could not be completed because a needed switching module (SM) was unable to respond. Retry the request later.

SYSTEM BUSY = The system's processing capability limit was reached or a system resource was unavailable. Retry the request later.

SYSTEM ERROR = An unspecified error occurred that prevented further processing of the request.

= Equipment number or identifier. Valid value(s):

ATMP=f-w^2-z^3-a^4
DEN=f-l^1-m^1-n^1
LEN=f-s-o^1-p^1-q^1-r^1
LTP=f-g^2
NEN=f-p^2-q^2-j^3-r^2-s^2-k^3-t^2

PSUEN=f-w^1-x^1-y^1-z^1
RAF=f-m^2-y^1
SAS=f-m^2-y^1
SLEN=f-v^1-w^1-x^1
SPN=f-h-i-n^2-o^2
TEN=f-b^1-c^1-d^1-e^1
f = SM number.
g = Logical port number in hexadecimal.
h = Aisle number.
i = Service group number.
j = Bay number in aisle.
k = Unit type. Valid value(s):
   DLTU = Digital line and trunk unit.
   DNUS = Digital networking unit - synchronous optical network (SONET) (DNU-S).
   IDCU = Integrated digital carrier unit.
   ISLU = Integrated services line unit.
   LU = Line unit.
   MMSU = Metallic service unit.
   OIU = Optical interface unit.
   PLTU = Peripheral control and timing line and trunk unit.
   PSU = Packet switching unit.
   RAF = Recorded announcement function.
   RISLU = Remote integrated services line unit.
   SAS = Service announcement system.
   TU = Trunk unit.

l = Unit number.
m = Service group number, or DFI number if the unit type is a DLTU, or data group number if the unit type is a DNU-S, or protection group number if the unit type is an OIU, or PCT number if the unit type is a PLTU.

n = Equipment location: vertical distance of circuit above floor in inches.

o = Equipment location: horizontal distance of circuit from left edge of bay in 1/8-inch increments.

p = Line card types. Valid value(s):
   AMIU = AT&T version BRI 2/wire DSL.
   ANSIU = ANSI Standard BRI 2/wire DSL.
   T = Basic rate interface (BRI) 4/wire DSL.
   Z = Analog subscriber line (2/wire).
   W = Analog subscriber line.

q = Equipment number or identifier. Valid value(s):
   AP=f^1-g^1
   AQ=f^1-g^1
   AQM=f^1-g^1
   BST=j^1-k^1
   DASC=f^1-g^1
   EIS=t^1-w^1
   HOBICR=f^1-g^1
r = Telephone number of the line or AQEST. If the line was a DSL and has circuit switching and packet switching services on the D-channel, this is the circuit switching DN for the D-channel. If the DSL has packet service on a B-channel, this is the packet DN.

s = Line unit number.

t = Line group controller number.

u = Line card number.

v = Digital subscriber line channel. Valid value(s):
   B1
   B2
   D

w = Multi-line hunt group number.

x = Hunt group member number.

y = Packet switching unit (PSU) channel group number.

z = PSU channel group member number.

a = Equipment location: depth in the unit in 1/10-inch increments.

b = Trunk unit number.

c = Service group number.

d = Channel board number.

e = Circuit number.

f = Data link (group) number.

g = Relative link (member) number.

j = Operator service center number.

k = Relative position number.
1\(^1\) = DLTU number.

m\(^1\) = Digital facility interface (DFI) number.

n\(^1\) = Channel number.

c\(^1\) = Grid number.

p\(^1\) = Switch board number.

q\(^1\) = Switch number.

r\(^1\) = Level number.

s\(^1\) = Trunk group number.

t\(^1\) = EIS identifier (ID) on which the CPDL terminates.

u\(^1\) = Force management center number of the OAPF.

v\(^1\) = Digital carrier line unit number.

w\(^1\) = External data link (member) number relative to the EIS.

x\(^1\) = RT line number.

y\(^1\) = RAF or SAS announcement channel number.

z\(^1\) = Trunk member number.

c\(^2\) = CLEI code of the associated circuit pack. Valid only for trunks.

d\(^2\) = Telephone number entered. If a packet switching DN was entered and the digital subscriber line (DSL) has packet service on the D-channel, this will be the packet DN. If a circuit switching DN was entered and packet service is on the D-channel and the circuit and packet DN are different, then the packet DN will not appear in the output.

e\(^2\) = PRI group number.

f\(^2\) = Member number of the line time-slot bridging (LTSB) line. For LTSB a member number of '1' represents the lead line and a member number of '2' represents the associate line.

g\(^2\) = Logical test port number.

h\(^2\) = IDCU number.

i\(^2\) = Remote terminal (RT) number.

j\(^2\) = ID number.

k\(^2\) = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.

l\(^2\) = RT line number or PUB43801 channel.

m\(^2\) = RAF or SAS unit number.

n\(^2\) = Board number.
Scan point number. = \( a^2 \)

[g PSALNK=a-b-h i j k a l b c m-n]

PSUCA=o
IMAGE=p
```

2. REASON FOR OUTPUT

To print the conversion of a protocol handler (PH) for asynchronous transfer mode (ATM) (PHA) to the associated packet switching unit (PSU) link and channel being serviced.

3. VARIABLE FIELD DEFINITIONS

- **a**: Switching module (SM) number.
- **b**: PSU number.
- **c**: Shelf number.
- **d**: PH number.
- **e**: Termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.
- **f**: Additional information qualifying the termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.
- **g**: Channel number.
- **h**: Link number.
- **i**: Connection type of the PSU link. Valid value(s):
  - **PT**: Point-to-point.
  - **MP**: Point-to-multipoint.
  - **APP**: ATM packet-pipe.
  - **GW**: ATM gateway.
- **j**: PSU community address (CA) of the PSU link. Valid value(s):
  - **PT**: The far end PSU community address.
  - **MP**: The far end PSU community address.
  - **APP**: The community address is not valid. Therefore CA is blank.
  - **GW**: The gateway community address.
k  = Aisle number of SM.
l  = Bay of SM containing PSU.
m  = Equipment location: vertical distance of circuit above floor in inches.
n  = Equipment location: horizontal distance of circuit from left edge of bay in 1/8-inch increments.
o  = Near PSU community address of the link.
p  = Hardware image type

OP:COT-STATUS

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. FORMAT

OP COT STATUS
MODE: \[a\]
PRIORITY: \[b\]
MSGS BUFFERED: \[c\]
[SET COT TIMED OUT - RETRY LATER]

2. REASON FOR OUTPUT

To report the current customer-originated trace (COT) mode (dedicated or nondedicated), current COT message priority, and number of messages currently in the COT buffer. This message is in response to the OP:COT-STATUS or SET:COT input message.

3. VARIABLE FIELD DEFINITIONS

\[a\] = Where to sent COT messages. Valid value(s):
DEDICATED = There is a dedicated tty45 to send COT messages to.
NON DEDICATED = There are writable devices on classdef 160 to send COT messages to. No checking is done to ensure that there actually is a dedicated TTY45 or devices on the classdef. It is up to the user to make certain of this.

WARNING: No checking is done to ensure that there actually is a dedicated TTY45 or devices on the classdef. It is up to the user to make certain of this.

\[b\] = Message priority, a number between 0 and 5, with 0 being lowest and 5 being highest. The priority determines whether the COT messages will be printed when many messages are spooled. Priority is used only for messages spooled to the classdef.

\[c\] = The number of messages currently in the COT buffer (for DEDICATED mode), a number between 0 and 300. If the number of buffered messages reaches 300, the COT feature will be internally disabled until the buffer is emptied to having at most 285 messages. Refer to the SET:COT input message for how to empty the buffer.

4. ACTION TO BE TAKEN

If SET COT TIMED OUT message is printed, the database updating procedure timed out and no changes were made. Retry later.

5. ALARMS

None.

d 1 e1 [d 1 e1]
d 1 e1 [d 1 e1]
2. REASON FOR OUTPUT

To report information describing the current configuration of the specified digital subscriber line (DSL), and to provide the terminal endpoint identifier (TEI) of current customer premises equipment (CPE). This message is in response to an OP:CPE input message.

Format 1 occurs when the input request is not successfully processed and identifies the specific failure reason. Format 2 occurs when TEI is established on either a single point or a restricted multipoint DSL. Note that only one section is printed for these types of DSL. Format 3 occurs when no TEIs are established on either a custom multipoint or a standard DSL. Format 4 occurs when one or more TEIs have been established on a custom multipoint DSL. Format 5 occurs similarly as format 4 but on standard interface only. The output message is displayed in two sections for multipoint interfaces and standard interfaces. Section 1 shows the active user's data and section 2 shows the provisioned data [directory numbers (DNS)/multiline hunt groups (MLHGS) and users service profile identification (USPIDS) valid on this DSL]. Single point interface's and restricted multipoint interface's output message will not display SECTION 2, since they show only the active user's data. If the only service available on the DSL is default service [that is, there are no users assigned to this DSL in the office-dependent data (ODD)] and/or permanent packet B-channel (PPB) service, then SECTION 2 will not be displayed. If a '$' character is printed anywhere in the DN/MLHG or USPID field, it means an untranslatable field was received and a teletypewriter (TTY) error message will follow. The TEI information can be used during manually requested removals (RMV:CPE) or restorations (RST:CPE) of terminals connected to the DSL, as well as when performing digital loop back tests that terminate at the CPE (TST:DSL). The USPID information is provided for custom multipoint interface DSLs and standard interface DSLs to identify what USPIDs must be programmed into the CPE for it to receive subscriber service. The remaining information is provided to assist in determining causes of reported DSL problems. The information provided by this message is similar in content to the information displayed on the trunk and line work station (TLWS) CPE TESTS and CPE USPIDS display page.

3. VARIABLE FIELD DEFINITIONS

= Equipment number or identifier. Valid value(s):

- \( AIUEN=d-j^1-k^1-l^1 \)
- \( DN=m^l \)
- \( ILEN=d-a^1-b^1-c^1 \)
- \( INEN=d-n^1-b^1-c^1 \)
- \( LCEN=d-e-f-g \)
LCKEN=d-e-g^1-h^1-i^1
MLHG=b-c PKTDN=m^1

b = Multi-line hunt group number.
c = Multi-line hunt group member number.
d = Switching module (SM) number.
e = Integrated services line unit (ISLU/ISLU2) number.
f = Line group controller (LGC) number.
g = Line card (LC) number.
h = Maximum number of terminals that will be supported/administered on the DSL. If more than this number of terminals are connected to a custom multipoint interface or standard interface DSL, OP:CPE will not display them. For single-point DSLs, OP:CPE will display at most two TEIs (refer to the SINGLE POINT definition for variable 'i').
i = Type of digital subscriber line. Valid value(s):
  MULTIPOINT = The line is a custom interface pure multipoint DSL. Any number of CPE can connect to the DSL (up to the 'maxterm' limit). Each CPE will receive the service identified by the USPID for fully initializing protocol (FIP) CPE, or the DN for non-initializing protocol (NIP) CPE. No more than one CPE (at any given time) can receive service associated with a valid USPID on a DSL.
The USPID that is displayed for a given TEI is the USPID sent in from a FIP CPE (or the USPID associated with the DN sent from a NIP CPE).
The DN/MLHG that is displayed for a given TEI is the DN sent in from a NIP CPE (or the DN/MLHG associated with the USPID sent from a FIP CPE).
If a FIP CPE sent in an invalid format USPID (such as, length of zero or greater than 10 digits, or non-digits), then a USPID of ?????????? is displayed.
If a NIP CPE sent in an invalid format calling DN then a DN/MLHG of ?????????? is displayed.
If a NIP CPE sent in an invalid format calling DN then a DN/MLHG of ?????????? is displayed.
For a CPE where USPID is unknown, ?????????? is displayed. For a CPE where DN/MLHG is unknown, ?????????? is displayed.

RESTRICTED MPOINT = Restricted multipoint DSL (on custom interface only). Any number of CPE can connect to the DSL (up to the 'maxterm' limit). The first CPE connecting to the DSL will receive the service of the "active" user (if there is one) on the DSL (even if the USPID/DN provided by the CPE does not correspond to that active user). Subsequent CPE will receive default service if available, and will receive no service if default service is not available on the DSL. For an explanation of default service, refer to variable 'm'. Note that a restricted multipoint DSL with more than one CPE present should be a transient condition (such as when converting to a pure multipoint). The USPID and/or DN/MLHG are displayed for a given TEI. A basic initializing protocol (BIP) CPE receiving the service of the "active" user will display the USPID and DN/MLHG associated with that "active" user. For a FIP CPE, the USPID displayed is the USPID sent in from the CPE and the DN/MLHG displayed is ??????????. For a NIP CPE, the DN/MLHG displayed is the DN sent in from the CPE and the USPID displayed is ??????????. A basic protocol CPE receiving
default service or a FIP CPE with an invalid format USPID will display a USPID of ??????????? and a DN/MLHG of ??????????.

**SINGLE POINT** = The line is a custom interface single-point DSL. Only one CPE can connect to the DSL, and that CPE will receive the service associated with the "active" user for the DSL. Devices (CPE) which establish two TEIs (one for circuit switched services and a different TEI for packet switched services) are supported on single point DSLs. Any type of CPE (FIP, NIP, or basic protocol) is supported on a single point DSL. The USPID and DN/MLHG displayed for a TEI is the USPID and DN/MLHG associated with the "active" user.

**STANDARD** = The line is a standard interface DSL. Any number of CPE can connect to the DSL (up to the ‘maxterm’ limit). Each CPE will receive the service identified by the USPID for FIP CPE, or the DN for NIP CPE. No more than one CPE (at any given time) can receive service associated with a valid USPID on a DSL. Note that for FIP CPE, the SPID programmed into the CPE equals the USPID+TID. Refer to the USPID and TID.

The USPID that is displayed for a given TEI is the USPID sent in from a FIP CPE (or the USPID associated with the DN sent from a NIP CPE).

The DN/MLHG that is displayed for a given TEI is the DN sent in from a NIP CPE (or the DN/MLHG associated with the USPID sent from a FIP CPE).

If a FIP CPE sent in an invalid format USPID (such as, less than 3 digits or greater than 20 digits including the 2 digit TID, or non-digit digits), then a USPID of ???????????????????? and a TID of ?? is displayed.

If a NIP CPE sent in an invalid format calling DN then a DN/MLHG of ????????? is displayed.

For a CPE where USPID is unknown, ???????????????????? is displayed. For a CPE where DN/MLHG is unknown, ????????????? is displayed.

= Result (completion code) of the input request. Valid value(s):

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMP UNAVAILABLE</td>
<td>The input request could not be completed because a needed communication module (CM) was unable to respond. Retry the request later.</td>
</tr>
<tr>
<td>STARTED</td>
<td>The OP:CPE printing has started; SECTION 1 is being displayed. SECTION 2 follows.</td>
</tr>
<tr>
<td>COMPLETED</td>
<td>The OP:CPE request has completed; DSL related data is displayed.</td>
</tr>
<tr>
<td>DATA BASE ERROR</td>
<td>An internal error occurred while attempting to access the DSL data; repeat the request if desired.</td>
</tr>
<tr>
<td>DSL BUSY</td>
<td>The DSL remained busy.</td>
</tr>
<tr>
<td>DSL OOS</td>
<td>The DSL is out-of-service.</td>
</tr>
<tr>
<td>INPUT ERROR</td>
<td>Some data entered in the input request was invalid or incorrect. Verify the input and make the request again.</td>
</tr>
<tr>
<td>INVALID DN</td>
<td>The circuit or packet directory number entered was most likely invalid or incorrect.</td>
</tr>
<tr>
<td>INVALID PORT</td>
<td>The line could not be located in the data base. The line identifier used in the input request (DN, MLHG, LCEN, LCKEN and so forth) was most likely invalid or incorrect.</td>
</tr>
<tr>
<td>MLHG ACCESS DN</td>
<td>The DN entered is an access DN for the uniform call distribution (UCD), multi-position hunt (MUPH) multi-line hunt group, or linear hunt. This DN does not uniquely identify a line.</td>
</tr>
<tr>
<td>MP ACCESS DN</td>
<td>The directory number entered is a uniform call distribution multi-line hunt group</td>
</tr>
</tbody>
</table>
line for modem pooling and as such cannot be used by specifying its DN. A line
card equipment number or MLHG and member number must be specified. To
obtain the line card equipment number and/or multi-line hunt group and member
number, use recent change/verify (RC/V) for the DN or refer to office records.

NO DATA BASE MATCH = Internal data base error: the desired tuple could not be found.
NO PROCESS = An attempt to create a process failed. Possible cause is a busy system. Retry the
request later.
NON-DSL/INVALID DSL TYPE = The line is not a DSL or the type of DSL is incorrect. Only
regular subscriber DSLs and attendant DSLs are valid; OSPS DSLs, data links, and
so forth, are not.
NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs.
Reenter DN with NPA.
NOT PARTY EXIST = The specified party does not exist on a DSL.
NOT PRIMARY DN OR MLHG = The DN or MLHG specified is for a key-system CPE and is not the
primary DN for any key-system CPE. A primary DN is required to identify the
specific CPE to be processed. Refer to RC/V or office records to determine the
primary DNs or MLHG and member numbers.
PROCESS TIMEOUT = Internal time-out during processing; request aborted.
SM UNAVAILABLE = The input request could not be completed because a needed SM was unable
to respond. Retry the request later.
SYSTEM BUSY = The system's processing capability limit was reached or a system resource was
unavailable. Retry the request later.
SYSTEM ERROR = System error occurred making it impossible to continue processing request.
UNASSIGNED PORT = The request is invalid since the LCEN or LCKEN entered is for an equipped
but unassigned line card.

k

= Status of the D-channel on DSL. Valid value(s):
IS = In-service.
OOS = Out-of-service. The specific OOS condition can be obtained using the
OP:STATUS input message and that OOS condition is explained in the
APP:PORT-STATUS appendix in the Appendixes section of the Output Messages
manual. Possible reasons that the DSL is OOS are:
- No CPE plugged into the DSL.
- Excessive protocol errors on the DSL.
- Manual maintenance action to explicitly remove the DSL.
UNEQ = Unequipped.

l

= Status of the B-channel on DSL. Indicates that the associated B-channel is provisioned as a PPB.
Packet B-channels are not used for circuit switched voice/data or on demand B-channel packet
switching. For example, PPB1 implies that the B1 channel is provisioned for packet switching, while
B1 indicates that it is not. Valid value(s):
IS = In service.
OOS = Out-of-service.
UNEQ = Unequipped.

m

= Default service availability on this DSL. Valid value(s):
DEFAULT AVAILABLE = Default service is available on this DSL. CPE that do not identify
themselves as a valid subscriber can still access ACSR, 911, 611, 811, 108 test
line, BRIV (BRI verification) and BRITL (BRI test line) services. However, on a
standard interface, if a default DN for circuit switched calls is also available on the
interface (variable 'd' with the -D option), the default DN will take precedence, and
the CPE will be denied access to default service. The services provided by default
service will be provided by the default DN.

NO DEFAULT SERVICE = Default service is not available on this DSL. CPE that do not identify
themselves as a valid subscriber or do not access default DN service will not be
able to receive dial tone or to make any type of call.

n = This field displays the user's primary DN (circuit DN if the user has circuit service. Otherwise,
packet DN) or multi-line hunt group number and member number if the user is a MLHG member
and does not have an individual DN. The DN will be printed in a seven digit or 10 digit format, and
the MLHG will be printed in a group format (such as, 1234-5678). The DN/MLHG that is displayed
for a given TEI is the DN/MLHG associated with that user. Refer to variable 'i' for more details
about the validity of DN/MLHG.

o = Custom USPID. The Custom USPID can be 1 to 10 digits long. This field is right justified when
printing.

p = Terminal identifier (TID) field that is required to construct the SPID for standard FIP CPEs. The
range of values which are valid for the TID is 00 to 62. Values 63 to 99 will prevent the SPID from
being treated as valid. If no SPID is received or an invalid format of SPID is received from a
Standard FIP CPE, this field will display ???. For the custom interface and NIP CPE’s on Standard
interface, this field will be left as blank.

q = The TEI uniquely identifying each CPE on a DSL.

TEIs in the range 0-63 are "fixed TEI". CPE with fixed TEIs always establish the same TEI (unless
the CPE is manually reprogrammed to change the TEI). If two or more CPE on the same DSL have
the same fixed TEI value, the network will be unable to recognize the presence of both, the CPE will
not function properly, and OP:CPE will only identify one CPE present (when more actually exist).
Care should be taken to insure that two fixed TEI CPE on the same DSL do not use the same TEI
value.

TEIs in the range 64-126 are automatic TEI. The TEI assigned to the CPE is negotiated between
the CPE and the network when layer 2 is initialized for the CPE. Uniqueness of the TEI value
assigned to each CPE is controlled by the network.

r = Protocol type that the CPE supports. Valid value(s):

BIP = Non-identifying base-initializing protocol. All CPE on single-point DSLs will display
as BIP protocol type (since the identifying aspects of the FIP and NIP protocols are
ignored on single-point DSLs). BIP protocol CPE should not be used on a pure
multipoint DSL, and protocol errors and/or anomalous behavior could result. On
standard DSLs, BIP CPE can be used.

FFP = Failed FIP (standard interface only). A FIP CPE that is not successfully initialized
appears as FFP. The CPE may get service through the BIP, NIP, or TBD protocols.

FIP = Fully-initializing protocol. This CPE type requires that a SPID be programmed into
the CPE to allow the CPE to identify itself to the network. For Custom interface, the
SPID can be 1 to 10 digits long. For Standard interface, the SPID can be 3 to 20
digits long including the 2 digit TID.

NIP = Non-initializing protocol. This CPE type requires that a seven or ten digit digit DN
be programmed into the CPE to allow the CPE to identify itself to the network for
call originations and to be able to respond to terminating calls to that DN.

TBD = The protocol needs to-be-determined (TBD). It is either NIP or BIP, but the CPE
has not yet provided enough information for the type to be fully determined.
s = Type of CPE as recorded in ODD. Valid value(s):
? = Terminal type not specified. This may imply the CPE has subscribed to plain old
digital service (PODS), which does not record the terminal type.
A = Neither terminal management (TM) nor key system.
B = TM system.
C = Key system.
D = TM and key system.
E = Data only device.
P = Non-business/residential customer services.
T = Attendant.

= Type of CPE as indicated by the CPE itself (custom interface only). Valid value(s):
? = The CPE did not provide this information when requested (or the DSL is
single-point).
A = Neither terminal management (TM) nor key system.
B = TM system.
C = Key system.
D = TM and key system.

u = Service status of the CPE (STAT). Valid value(s):
IS = In service.
OOS = Out-of-service. Refer to RST:CPE if it is desired to restore the CPE to service.

v = Signaling link [service access profile identification (SAPI 0] status for the CPE on D-channel
(SGND). Valid value(s):
IS = In service.
UNV = Unavailable. CPE which do not establish SAPI 0 will cause this condition.

w = The packet link (SAPI 16) status for the CPE on D-channel (PKTD). Valid value(s):
IS = In service.
UNV = Unavailable. CPE which do not establish SAPI 16 (D-channel packet switching)
will cause this condition.

x = Service type of the CPE (SERVICE-TYPE). Valid value(s):
DEFAULT = Default service. The CPE identifier (SPID/DN) was not recognized on this DSL,
and have been given default service. From default service, access to automatic
customer station rearrangement (ACSR), 911, 611, 811, BRIV (BRI verification),
108 test line and BRITL (BRI test line) services are provided. Default service is
identified on originations by "stutter" dial tone. TEIs established by PPB devices for
a PPB-only user may be identified as having default service without affecting the
quality of the PPB service they receive.
SUBSCR-DFDN = Subscriber service on a default DN (standard interface only). The CPE did not
identify itself with a valid DN or USPID and is receiving the service associated with
the default DN (variable ’d’ with the –d option) on this interface.
SUBSCR-FXTEI = Subscriber service on a fixed TEI DN (standard interface only). The CPE is
receiving the service associated with the fixed TEI DN (variable ’d’ with the –F
option) on this interface.
SUBSCRIBER = Subscriber service. The CPE identifier (SPID/DN) has been received and the
CPE is receiving the service associated with the USPID listed (for custom multipoint interface and standard interface DSL) or with the "active" user (for custom restricted multipoint interface and single-point DSL). Subscriber service is identified on originations by "normal" dial tone.

**UNBND/DENIED** = The CPE identifier (SPID/DN) has not yet been received or was received and was not valid on a DSL without default service. TEIs established by PPB devices for a PPB-only user may be identified as having unbound/denied service without affecting the quality of the PPB service they receive.

**z**
- Standard USPID. The Standard USPID can be 1 to 18 digits long. This field is right justified when printing.

**a**
- Integrated digital carrier unit (IDCU) number.

**b**
- Remote terminal (RT) number.

**c**
- RT line number.

**d**
- Displays the valid user's primary DN (circuit DN if the user has circuit service, otherwise, packet DN) or multi-line hunt group number and member number if the user is a MLHG member and does not have an individual DN. The DN will be printed in a seven digit or ten digit format, and the MLHG will be printed in a group format (such as, 1234-5678). Valid value(s):
  - D = Indicates this is a default DN.
  - F = Indicates this is a fixed TEI DN.

**e**
- Displays the USPID that is valid on the custom multipoint interface. Up to 8 USPIDs can be administered onto a custom multipoint interface and each valid USPID is listed. Since USPIDs are not required to be programmed to receive service on single-point and restricted multipoint DSLs, the list of valid USPIDs are identified only for pure multipoint DSL. The Custom Interface USPID can be any combination of digits and between 1 and 10 digits long. This field is right justified when printing.

Users service profile identification. The USPID is used to uniquely identify a user. Fully initializing protocol CPE require that the SPID be programmed into the CPE to receive proper service on pure multipoint custom interface and standard interface DSLs. For a Custom user, the SPID consists of just the USPID. For a Standard DSL (FIP only) user, the SPID consists of USPID and the terminal identification (TID). However, the USPID and TID are displayed separately here. SPIDs are also used during automatic customer station rearrangement (ACSR) procedures to identify users moving their service. Refer to variable 'i' for more details about the validity of USPID.

**f**
- Displays the USPID that is valid on the Standard Interface. Up to 8 USPIDs can be administered onto a Standard Interface and each valid USPID is listed. The Standard Interface USPID can be any combination of digits and between 1 and 18 digits long. This field is right justified when printing.

Users service profile identification. The USPID is used to uniquely identify a user. Fully initializing protocol CPE require that the SPID be programmed into the CPE to receive proper service on pure multipoint custom interface and standard interface DSLs. For a Custom user, the SPID consists of just the USPID. For a Standard DSL (FIP only) user, the SPID consists of USPID and the terminal identification (TID). However, the USPID and TID are displayed separately here. SPIDs are also used during automatic customer station rearrangement (ACSR) procedures to identify users moving their service. Refer to variable 'i' for more details about the validity of USPID.

**g**
- Line group number.
4. ACTIONS TO BE TAKEN

The OP:CPE message is intended to provide manually requested information about the current state of the specified DSL. If the OP:CPE was requested as part of a corrective maintenance procedure, the following information should be useful to identify and correct the problem. Locate the off-normal condition in the list below, and follow the steps given with that condition to identify/resolve the problem.

<table>
<thead>
<tr>
<th>Problem</th>
<th>Causes/Action</th>
</tr>
</thead>
</table>
| No TEIs exist on the DSL. Layer 2 has not been established by any CPE. | a Cause: The D- and B-channels are in some state other than IS or OOS BLOCKED AUTO.  
Action: Refer to the OP:STATUS recovery procedures.  
b Cause: No CPE are connected to the DSL, the wiring is faulty to the CPE, loop integrity may be bad, or the CPE are not functioning properly. |
| If 'x' is DEFAULT (for a given USPID/TEI). | a Cause: The CPE has a misprogrammed USPID.  
Action: Verify that the USPID that is programmed into the CPE ('\(x\)') appears in the list of valid USPIDs for the DSL in the ODD ('\(e_1\)'). If it does not, the USPID in the CPE is incorrect and the user should reprogram the correct USPID into the CPE.  
b Cause: The CPE is a PPB terminal that establishes a TEI on the D-channel. Since the TEI is not required to provide PPB service, it is dependent on the PPB terminal type whether a TEI is established. A PPB channel exists if the channel status line of the OP:CPE message contains the optional PP for either the B1 or the B2 channels.  
Action: Verify that the PPB device's TEI being established does not prevent another CPE from receiving service. Some of the reasons that it may prevent service to another user are:  
A Exceeding maxterm (multipoint and standard interface),  
B Having the PPB device being the first TEI established (single-point and restricted multipoint),  
C On a pure multipoint DSL having the USPID of another user erroneously programmed into the PPB device.  
c Cause: The CPE plugged into the DSL may be ready to perform or may be performing an ACSR transaction. |
If 'x' is UNBND/DENIED (for a given USPID/TEI).

a Cause: The CPE has a misprogrammed USPID (Custom multipoint interface and standard interface DSL only).

Action: Verify that the USPID that is programmed into the CPE ('c' for custom interface and 'z' for standard interface) appears in the list of valid USPIDs for the DSL in the ODD ('e1' or 'f1'). If it does not, the USPID in the CPE is incorrect and the user should reprogram the correct USPID into the CPE.

Also note that, if the BRI type is standard and the CPE protocol is FIP, then a two digit TID (valid range, 00-62) should be programmed with the USPID. The switch will always assume the last two digits of the SPID received from a standard FIP CPE is TID.

b Cause: The CPE is a PPB terminal that generates a TEI on the D-channel. A PPB channel exists if the channel status line of the OP:CPE message contains the optional PP for either the B1 or the B2 channels.

Action: Verify that the PPB device's TEI being established does not prevent another CPE from receiving service. Reasons that it may prevent service to another user are: exceeding maxterm (custom multipoint interface or standard interface) or having the PPB device being the first TEI established (single-point and restricted multipoint).

c Cause: The CPE plugged into the DSL may be a BIP terminal. Verify that field 'r' shows a protocol type of BIP or TBD.

Action: Customer must plug proper CPE into the DSL.

d Cause: The CPE plugged into the DSL is a NIP terminal that has not identified itself to the switch. Verify that the 'z' field shows a protocol type of TBD.

Action: No recovery action is needed.

e Cause: Two different CPE with the identical USPIDs programmed into each.

Action: The CPE with the incorrect USPID should be reprogrammed.

CPE status is OOS.

a Cause: The CPE has been removed from service by the RMV:CPE command or has been removed because of excessive protocol violations.

Action: Refer to the RST:CPE command.

SGND status is UNV.

a Cause: Voice services may not be provisioned for the user.

Action: Check translations.

b Cause: A data-only terminal (which does not establish a SAPI 0 logical link) may be plugged into the DSL. Verify that field 't:' shows a value of '?' (for custom interface DSL only).

Action: Verify that proper CPE is plugged into the DSL.

c Cause: The CPE may have recently been unplugged from the DSL. If the TEI
<table>

__________________________________________________________________

[2] OP DATALINK CPDL{EIS=j-k|LCEN=l-m-n-o}[i]

2. REASON FOR OUTPUT

To report the current usage of an Operator Services Position System (OSPS) External Information System (EIS) data link or data link group in response to a usage (OP:DATALINK). If the group number (EIS identifier) and the switching module (SM) number are given in the OP:DATALINK input message, then the data link usage of all links in the specified group will be displayed.

Note: If a data link is in service, and the approximate usage is displayed as zero, the link capacity as calculated is less than one percent then.

3. VARIABLE FIELD DEFINITIONS

DLGRPSTAT = State of SM with respect to a datalink group. One of the values will be printed if the SM state (with respect to the data link group) is either major, minor, or normal.

EIS = External information system call processing data link (CPDL).

LCEN = Integrated services line card equipment number.

LNKSTATE = Primary status of the data link. This status is the most restrictive to call processing.

b = SM number.

c = The EIS number.

d = External data link member number.

e = Number of times within the last two-minute interval that the data link went into overload.

f = Percent of time during the last two-minute interval that the data link was in use.

g = In-service. The primary status of the data link is in-service (IS).

h = Out-of-service. The primary status of the data link is out-of-service (OOS).
i = The result of the data link usage query. Valid value(s):
   CMPUNAVAILABLE = The input request could not be completed because a needed communication
                  module (CM) was unable to respond. Retry the request later.
   COMPLETED      = The query has completed successfully. All data link usage is displayed.
   INV PORT       = The data link specified in the input query was invalid.
   INPUT ERROR    = The input message contained an undetermined error.
   INV EIS ID     = A request was made to an EIS that is not currently assigned to the switch.
   SM UNAVAILABLE = The input request could not be completed because a needed switching
                   module (SM) was unable to respond. Retry the request later.
   SYSTEM BUSY    = The system was too busy or a system resource failure occurred. Repeat the
                   request later.
   SYSTEM ERROR   = An internal error occurred which prevented further processing. The request has
                   been aborted.

j = EIS number.
k = External data link member number.
l = SM number.
m = Line unit number.
n = Line group number.
o = Line card number.

2. **REASON FOR OUTPUT**

   To display status of all active destination code cancellation (DCC) controls for up to eight code controls per message. A maximum of eight messages can result since a maximum of 64 controls are allowed.

3. **VARIABLE FIELD DEFINITIONS**

   a
   
   - **=** Termination report. Valid value(s):
     - ABORTED = System error.
     - COMPLETED = Last in a series of messages.
     - CONTINUED = Middle of a series of messages.
     - STARTED = First in a series of messages.
   
   b
   
   - **=** Destination code.
   
   c
   
   - **=** Type of traffic subjected to the control. Valid value(s):
     - ALL = All levels of precedence.
     - RTN = Only routine traffic is controlled.
   
   d
   
   - **=** Gap interval. Valid value(s):
     - 0 = No control but collect measurements.
     - 1 = 1.0 sec.
     - 2 = 2.0 sec.
     - 5 = 5.0 sec.
     - 10 = 10.0 sec.
     - 15 = 15.0 sec.
     - 30 = 30.0 sec.
     - 60 = 1.0 min.
     - 120 = 2.0 min.
     - 300 = 5.0 min.
     - 600 = 10 min.
     - INF = Infinity, block all but one call.
     - PT1 = 0.10 sec.
     - PT25 = 0.25 sec.
     - PT5 = 0.50 sec.
= Announcement (ANN) treatment if blocking occurs. Valid value(s):
EANN1 = Emergency announcement 1.
EANN2 = Emergency announcement 2.
ICA = Isolated code announcement.
NCA = No circuit announcement.

2. REASON FOR OUTPUT

To report the result of executing an OP:DFC-INFO input message.

Format 5 is output when all of the subunits of the disk file controller (DFC) are unequipped.

Format 6 outputs data for a storage module drive (SMD) DFC.

Format 7 outputs data for a small computer system interface (SCSI) DFC equipped with only one SCSI bus (SBUS).

Format 8 outputs data for an SCSI DFC equipped with more than one SBUS.

3. VARIABLE FIELD DEFINITIONS

a = DFC member number.

b = Process step or reason code. Valid value(s):

<table>
<thead>
<tr>

</tbody>
</table>
c = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

d = DFC firmware/pumpcode version in the form:

e.f.g - h
NAP = The pumpcode version is not applicable for SMD DFCs.
NAV = The firmware or pumpcode versions are not available or cannot be determined.

e = Version of DFC FIRMWARE/PUMPCODE.

f = Issue of DFC FIRMWARE/PUMPCODE.

g = Point issue of DFC FIRMWARE/PUMPCODE.

h = Laboratory design issue (LDI) of DFC FIRMWARE/PUMPCODE.

i = Unit name and member number.

j = Device ID (drive ID number).

k = Physical port where the SMD is connected to the DFC. Valid value(s):
NAV = The DFC is not available, the DFC is reserved, or the SMD DFC firmware/pumpcode version is earlier than 3.2.0.

l = Major status of unit.

m = Number of tracks (in decimal) on the SMD disk drive. Valid value(s):
NAV = DFC is unavailable, or the unit is reserved.

n = Validity of the volume table of contents (VTOC). Valid value(s):
INVALID = Could not find a valid VTOC entry.
NAP = Not valid for this device.
NAV = Could not reserve unit - VTOC not read.
UNRDBLE = Read error while trying to read VTOC.
VALID = VTOC has a valid VTOC entry.

o = Usability. Valid value(s):
NAP = Not applicable for this device.
NO = Disk data integrity is unknown.
YES = Disk is usable.

p = Unit reserved. Valid value(s):
NO = Unit is not reserved.
YES = Unit is reserved for maintenance activity.

q = Hexadecimal value of the essential field of the unit's unit control block (UCB).
NAP = Not applicable for this device.
r  = Name and number of duplex mate. Valid value(s):
    NAP    = Not applicable for this device.
    SMPLX = Unit has no mate.

s  = Equipage size based on the physical disk drive. For SCSI disks, the physical drive size is
determined by reading the capacity of the disk from the disk drive itself. For SMD disks, the physical
drive size is determined by reading the equipage value in the UCB record. Valid value(s):
    160MB   = SMD disk drive.
    300MB   = SMD disk drive.
    322MB   = SCSI disk drive.
    340MB   = SMD disk drive.
    600MB   = SCSI disk drive.
    1000MB  = SCSI disk drive.
    2000MB  = SCSI disk drive.
    NAP    = Not applicable for this device.
    NAV    = The DFC is not active, the unit is reserved, or the SCSI device is inaccessible.

t  = Equipage size based on the UCB equipage value. The drive size is determined by reading the
equipage value in the UCB record for the unit. Valid value(s):
    160MB   = SMD disk drive.
    300MB   = SMD disk drive.
    322MB   = SCSI disk drive.
    340MB   = SMD disk drive.
    600MB   = SCSI disk drive.
    1000MB  = SCSI disk drive.
    2000MB  = SCSI disk drive.
    NAP    = Not applicable for this device.
    NAV    = The DFC is not active or the unit is reserved.

u  = Equipage size based on the VTOC. The drive size is determined from the maximum capacity of
the unit's VTOC. Valid value(s):
    160MB   = SMD disk drive.
    300MB   = SMD disk drive.
    322MB   = SCSI disk drive.
    340MB   = SMD disk drive.
    600MB   = SCSI disk drive.
    1000MB  = SCSI disk drive.
    2000MB  = SCSI disk drive.
    NAP    = Not applicable for this device.
    NAV    = The DFC is not active, the unit is reserved, or the unit is inaccessible.

v  = Sizes compatible. Valid value(s):
    NAP    = Not applicable for this device.
    NAV    = At least one of the equipage sizes is not available.
    NO     = DRIVE, UCB, and VTOC equipage sizes are not compatible.
    YES    = DRIVE, UCB, and VTOC equipage sizes are compatible.

Equipage sizes are not compatible if the drive size is not equal to the UCB equipage size or if the
drive size is smaller than the VTOC size.

Size comparisons are based on the formatted capacity of a disk drive. The formatted capacity of the
UNIX® RTR-supported disk drives are as follows:

<table>
<thead>
<tr>
<th>Drive</th>
<th>Formatted Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>160MB</td>
<td>133MB</td>
</tr>
<tr>
<td>300MB</td>
<td>253MB</td>
</tr>
<tr>
<td>322MB</td>
<td>322MB</td>
</tr>
<tr>
<td>340MB</td>
<td>277MB</td>
</tr>
<tr>
<td>600MB</td>
<td>604MB</td>
</tr>
<tr>
<td>1000MB</td>
<td>1000MB</td>
</tr>
<tr>
<td>2000MB</td>
<td>2000MB</td>
</tr>
</tbody>
</table>

\( w \) = Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

\( x \) = Alphanumeric serial data representing the serial number of a SCSI device. Valid value(s):
- \( \text{NAP} \) = Not applicable for this device.
- \( \text{NAV} \) = The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

\( y \) = Alphanumeric data representing the product identification of a SCSI device. Valid value(s):
- \( \text{NAP} \) = Not applicable for this device.
- \( \text{NAV} \) = The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

\( z \) = SCSI host adapter (HA) bus identification number (0 or 1).

\( a^1 \) = Alphanumeric data representing the revision level of the firmware in a SCSI device. Valid value(s):
- \( \text{NAV} \) = The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

\( b^1 \) = Device type.

4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was
not available, or became unavailable to perform the requested task. Clear the problem causing the resource
limitation and try the request again.

A termination report specifying completion indicates all directives of the input request were done and no failures
were encountered. If any unit of the associated DFC is reserved. However, certain fields will contain information that
is not available. For more complete information, try the message again after the unit is released.

Format 5 results when all the subunits of the DFC are unequipped.

For Formats 6, 7, and 8, the drive equipage sizes are not compatible, verify the correctness of the UCB equipage
value. If there is still an inconsistency, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION
section of the Output Messages manual.

5. ALARMS

None. This alarm is a manually-requested report.

2. REASON FOR OUTPUT

Formats 2 - 6 report that an equipment configuration database (ECD) database call failed.

Format 7 reports that the SMD moving head disk (MHD) ID plug number does not match with the ID plug number in the ECD records.

Format 8 reports that the SCSI MHD ID switch number does not match with the ID switch number in the ECD records.

Formats 9 - 15 report that the user control string (UCS) portion of the DFCELOG entry is corrupted.

Formats 16 - 19 report that the text portion of the DFCELOG entry is corrupted.

Formats 20 - 23 report and format the enhanced information report (EIR) entries in the disk driver logfile. Refer to the REPT:DFCE and REPT:DFCI output messages for the displayed codes.

Format 21 is for storage module drive (SMD) disk file controller (DFC) reports.

Format 22 is for small computer system interface (SCSI) DFC reports.

3. VARIABLE FIELD DEFINITIONS

A = Command completion word in the form: eeffghii.

C = Firmware version in the form: j.kk.ll - mmmm.

D = Pumpcode version in the form: n.oo.pp - q.

If the SCSI DFC is running without pumpcode, the pumpcode version has the following format:

FFFFFFFF

a = Name of the disk driver logfile.

b = MHD number.

c = Number of the segment being generated.

d = Time stamp.

e = Completion code. Refer to the APP:DFC-B appendix, tables 1 and 2, in the Appendixes section of the Output Messages manual.

f = Number of blocks read on short failure of read message.

h = Autonomous completion code. Refer to the APP:DFC-B appendix, in the Appendixes section of the Output Messages manual.

i = Job ID number.

j = Version of DFC firmware.

k = Issue of DFC firmware.
4. ACTION TO BE TAKEN

If Format 1 is printed, check to see if the logfile exists under /etc/log.

The contents of the corrupted logfile must be SAVED on paper and/or tape for later reference. The corrupted logfile should be removed by using the CLR:FSYS-FILE input message, and terminate the spooler output process (SOP) for the logfile.

Note: Depending on the severity of the corruption, the message may or may not continue processing.

5. ALARMS

__________________________________________________________________

[2] OP DMQ SM a HAS NO REQUESTS ON THE DMQ

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to the OP:DMQ-CM-SM input message to list all requests in a switching module (SM) on the deferred maintenance queue (DMQ).

Format 1 is the standard output message format when SM requests are on the deferred maintenance queue.

Format 2 is the output message format when there are no SM requests on the deferred maintenance queue.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Text identifier showing order of DMQ record. Valid value(s):
   FIRST = First record of continuing list.
   LAST  = Last record of list.
   NEXT  = Next record of continuing list.

c = Action. Valid value(s):
   ALW   = Allow.
   DGN   = Diagnose.
   EX    = Exercise.
   INH   = Inhibit.
   RMV   = Remove.
   RST   = Restore.
   SET   = Set.
   SW    = Switch.
   TST   = Test.

d = Circuit name.
e = Source of request. Valid value(s):
   AUTO = Automatic.
MAN  = Manual.
REX  = Routine exercise.

f  = State of the request. Valid value(s):
PENDING  = in the queue and waiting for a process.
RUNNING  = associated with a process.
TESTING  = executing a diagnostic.
WAITING  = waiting for a blocking condition to clear.

g  = Queue the request is on. Valid value(s):
AUTOQ    = MRA diagnostics queue
FURQ     = Fast Unit Reconfiguration queue
FURSP    = FUR system process
FURTP    = FUR terminal process
ICEWAIT  = ICE process waiting list
HIGHPQ   = MRA High Priority recovery queue
LOWPQ    = MRA Low Priority recovery queue
MRASP    = MRA system process
MRATP    = MRA master terminal process

h  = process identification number

i  = uniqueness field

4. ACTION TO BE TAKEN

The purpose of this message is to report the result of the action requested by the corresponding manually requested input message. No specific action is indicated.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

OP : DMQ-CM-SM

Other Manual(s):
235-105-220  Corrective Maintenance
OP:DMQ

Software Release: 5E14 and later  
Message Class: MTCE  
Application: 5,3B  
Type: Output

1. FORMAT

OP DMQ
REQUEST ACTIVE
    [DIAGNOSTIC EXECUTION SUSPENDED DURING RECOVERY]
    a       b c   d
SOURCE = e         PRIORITY = f
STATUS = g
REQUEST WAITING
    a       b c   d
SOURCE = e         PRIORITY = f
STATUS = g
    INHIBIT SOURCES
    h
OP DMQ COMPLETED

2. REASON FOR OUTPUT

To report the status of the maintenance input request administrator (MIRA) request queue in response to the OP:DMQ input message.

If the statement DIAGNOSTIC EXECUTION SUSPENDED DURING RECOVERY appears under REQUEST ACTING, a previous initialization has suspended all diagnostic requests. (Refer to the ALW:DMQ input message.)

3. VARIABLE FIELD DEFINITIONS

a       = Task number assigned to the request by MIRA. This is the TASK number used in the STP:DMQ input message.
b       = Request type. Valid value(s):
       DGN
       DMQ
       RST
       RMV
c       = Requested unit (for example, CU 0 CC 0).
d       = Request parameters. The request parameters indicate the beginning and ending phase numbers requested. If no phase numbers were specified in the input message, beginning phase (BPH) is shown as 1 and ending phase (EPH) is shown as 100.
e       = Request source. Valid value(s):
       ADP = Automatic diagnostic process.
       ARR = Automatic ring recovery.
       MAN = Manual.
       PSM = Power switch monitor.
       REX = Routine exerciser.
4. **ACTION TO BE TAKEN**

Issue STP:DMQ input message to remove any unwanted requests from the queue. Issue the appropriate maintenance request message (DGN, DMQ, RMV, RST) to add a desired request to the queue.

5. **ALARMS**

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[2] OP DOC a

2. REASON FOR OUTPUT

To display the status of the dynamic overload controls (DOCs).

This message is in response to the OP:DOC message. Format 1 displays the termination status of STARTED, CONTINUED, or COMPLETED. Format 2 displays the termination status of ABORTED or FAILED.

3. VARIABLE FIELD DEFINITIONS

a
   = Termination status. Valid value(s):
   ABORTED = Retry input message.
   COMPLETED = Last in a series of messages.
   CONTINUED = Next in a series of messages.
   FAILED = Invalid parameter.
   STARTED = First in a series of messages.

b
   = DOC transmit state. Valid value(s):
   ALLOWED = DOC allowed for the office.
   INHIBITED = DOC inhibited for the office.

c
   = Highest machine congestion level (overload severity) being transmitted. Valid value(s):
   0 = No DOC.
   1 = Machine congestion level 1.
   2 = Machine congestion level 2.
   3 = Machine congestion level 3.

d
   = Trunk group number.

e
   = Highest machine congestion level received. Valid value(s):
   1 = Machine congestion level 1.
2 = Machine congestion level 2.
3 = Machine congestion level 3.

f = Receive response inhibited. Valid value(s):
N = No.
Y = Yes.

g = DOC control response category. This depends on the machine congestion level and the traffic type to give the proper percentage in the response category.

CELLGRP         PEG           USAGE
  k               l            m

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to an automatically generated hourly or daily plant report.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared by the measurement subsystem (hours: minutes: seconds).

b = Report type. Valid value(s):
   DAILY
   HOURLY

c = Division of revenue (DR) status. Valid value(s):
   OFF
   ON

d = Hourly report status. This field is valid only when DR status is ON.
   OFF
   ON

e = Peg count status. For the daily report, this field is in effect only when DR status is ON. For the
   hourly report, this field is in effect only when DR status is ON and the hourly report status is ON.
   Valid value(s):
   OFF
ON

f = Usage count status. For the daily report, this field is in effect only when DR status is ON. For the hourly report, this field is in effect only when DR status is ON and the hourly report status is ON. Valid value(s):
OFF
ON

g = Processor number.

h = Validity of data. Valid value(s):
INVALID = Data is invalid for this reporting interval.
VALID = Data is valid for this reporting interval.

i = Number of 10-second scans in the reporting interval. This count is not used and will report a zero to the traffic channel and a -6 to the Engineering and Administrative Data Acquisition System (EADAS).

j = Number of 100-second scans in the reporting interval. This count is not used in the AM and will report a zero to the traffic channel for that processor and a -6 to EADAS.

k = Incoming separation class (INSEP)/destination separation class (DESEP) cell grouping number. Cell group zero is the default cell group (DCG). Any call receiving an invalid INSEP/DESEP pairing will peg this cell group.

l = Number of calls for the cell grouping category during the previous reporting interval.

m = Total usage over all reporting switch maintenance (SMs) for the cell grouping category during the previous reporting interval.

4. ACTION TO BE TAKEN

  .            .       .      .        .         .        .
```

2. REASON FOR OUTPUT

To display alternate route cancellation (ARC) control five-minute (M5) surveillance measurements package (PKG); for up to eight ARC controls per message. A maximum of eight messages can result since a maximum of 64 controls are allowed.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
  ABORTED = System error.
  COMPLETED = Last in a series of messages.
  CONTINUED = Middle of a series of messages.
  STARTED = First in a series of messages.

b = Office name.

c = Type of traffic subjected to the cancel to (CANT) control. Valid value(s):
  ALL = All levels of precedence, for example, flash override, override, immediate, priority, and routine.
  RTN = Routine traffic.
  - = Control inactive.

d = Type of traffic subjected to the cancel from (CANF) control. Valid value(s):
  ALL = All levels of precedence, for example, flash override, override, immediate, priority, and routine.
  RTN = Routine traffic.
  - = Control inactive.

e = Announcement (ANN) treatment if blocking occurs for routine calls. Valid value(s):
  EANN1 = Emergency announcement 1.
  EANN2 = Emergency announcement 2.
  NCA = No circuit announcement.
  - = If CANF control is inactive.

Note: The CANT control does not require an announcement, only CANF uses an announcement.
Note: Variables 'f', 'g', and 'h' contain two pieces of data, the items in parentheses represent counts pegged for traffic above routine level. The items not in parentheses represent counts pegged for traffic of all levels of precedence.

\[ \begin{align*}
  f & = \text{Number of attempts to this office.} \\
  g & = \text{Number of calls blocked after attempts to route using this office failed.} \\
  h & = \text{Number of calls skipped due to ARC through the specified office.}
\end{align*} \]

   [2] OP ECDAUD ABORTED - SYSTEM ERROR d

2. **REASON FOR OUTPUT**

   To report the termination status of the OP:ECDAUD input message.

   Format 1 indicates successful execution. No action is necessary.

   Format 2 indicates that an internal error has occurred. Refer to variable 'd' for more information.

3. **VARIABLE FIELD DEFINITIONS**

   a = INH/ALLOW status. Valid value(s):
      ALLOWED
      INHIBITED

   b = Text line consisting of specific audit status. Valid value(s):
      AUDIT IS RUNNING, CHECKS COMPLETE = e
      AUDIT IS NOT RUNNING, LAST RUN ON f

   c = Text line consisting of scheduling information. Valid value(s):
      AUDIT SCHEDULED MONTHLY ON g
      AUDIT SCHEDULED WEEKLY ON h

   d = System error number. Valid value(s):
      1 = Cannot open audit rule file - /lla/ECDAUD/ecdaud.rules.
      2 = Cannot attach to ECD database.
      3 = Unable to kill running audit, check PID in /lla/ECDAUD/.ecdaud.pid.
      4 = Bad rule in rule file (/lla/ECDAUD/ecdaud.rules).
      5 = Unable to audit data (/lla/ECDAUD/ecdaud.rules).
      6 = Failure in reading ECD database.
      7 = Cannot open audit rule file - /lla/ECDAUD/hwchk.rules.
      8 = Failed to obtain current status.
      9 = Internal system error.
     10 = Database partition greater than 80% full, remove unused files.
4. ACTION TO BE TAKEN

This message is printed out in response to a manual request of the OP:ECDAUD input message. No further action is necessary.

5. ALARMS

Minor if system error encountered.

OP:EMERSTAT

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] OP EMERSTAT COMPLETED
   EMERGENCY DUMP PARTITION IS EMPTY

[2] OP EMERSTAT COMPLETED
   EMERGENCY DUMP PARTITION IS FULL
   TIME OF EMERGENCY DUMP: a b c d e
   BOOT DEVICE LOADED = f
   g BYTES OF MAIN MEMORY WERE DUMPED
   FROM THE FOLLOWING SEGMENTS:
   ADDRESS     LENGTH
   X'hhhhhhhhX'iiiiiiii

[3] OP EMERSTAT COMPLETED
   {FOPEN|FREAD|FSEEK|REWIND} OF PANIC DUMP PARTITION FAILED: ERRNO = j

[4] OP EMERSTAT COMPLETED
   PDMPFULL FLAG IN LOW CORE IS NOT SET
   TIME OF LAST DUMP: k

2. REASON FOR OUTPUT

To report the status of the emergency dump partition in response to an OP:EMERSTAT input message.

3. VARIABLE FIELD DEFINITIONS

a  = Day of the week.
b  = Month of the year.
c  = Day of the month.
d  = Time of day.
e  = Year.
f  = Unit number of the disk the dump was written on. Valid value(s):
   0 = MHD 0.
   1 = MHD 1.
   Note: If a disk restoration has been performed, the data reside on both disks.
g  = Total number of bytes written into the emergency dump partition on MHD 'f'.
h = For each segment, bits 31 and 30 represent status information and the remaining bits represent the physical address.

If set, Bit 31 indicates the segment was accessed, and Bit 30 indicates that all the data was dumped.

i = Number of bytes written from address 'h'.

j = Error number.

k = ASCII string indicating time and date when last panic dump occurred.

4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, use the COPY:TAPE-EMERDMP input message to copy the data to magnetic tape, and the CLR:EMERDMP input message to clear the emergency dump partition status flag. Send the tape and this printout to a technical assistance center for analysis.

For Format 3, take no action.

For Format 4, use the COPY:TAPE-EMERDMP input message to copy the data to magnetic tape. Send the tape and this output message to a technical assistance center for analysis.

    .                       .
    .                       .
__________________________________________________________________
[2] OP EQSTAT CM HAS NO UNITS IN THE REQUESTED STATE

2. REASON FOR OUTPUT

To provide a printout of all communication module (CM) units or switching modules (SMs) that are in the growth (GROW) or special growth (SGRO) equipage states, or the equipage state of an individual unit. Refer to variable 'b' for a list of the possible units. This message is output only in response to a manual input request.

Format 1 is the standard output message format when there are CM units in the requested state, or when an individual unit is specified.

Format 2 is the output message format when there are no CM units in the requested state.

3. VARIABLE FIELD DEFINITIONS

a
    = Text identifier showing order of EQSTAT record. Valid value(s):
    FIRST     = First record of continuing list.
    LAST      = Last record of list.
    NEXT      = Next record of continuing list.

b
    = Unit identification. Valid value(s):
    CMP       = Communication module processor.
    MMP       = Module message processor.
    MMPGBRD   = MMP growth board (CM model 1 hardware only).
    MMPSDLC   = MMP synchronous data link controller.
    NLI       = Network link interface.
    QGP       = Quad-link gateway processor.
    QLPS      = Quad-link packet switch.
    SM        = Switching module.
    TMSLNK    = Time-multiplexed switch link.

c
    = Equipage state. Valid value(s):
    GROW     = Growth.
    NON-EXISTENT = Not found.
    OPER     = Operational.
SGRO   = Special growth.
UNEQ   = Unequipped.

UNIT  CTS   STATUS
  c    d   e
  .    .   .
  .    .   .
  .    .   .
```

2. REASON FOR OUTPUT

To provide a printout of the control time slot (CTS) status for all synchronous data link controllers (SDLC) in the module message processors (MMP) that are in the growth (GROW) equipage state. This message is output only in response to a manual input request.

3. VARIABLE FIELD DEFINITIONS

- **a** = Host switch number (HSM).
- **b** = Text identifier showing order of EQSTAT record. Valid value(s):
  - FIRST = First record of continuing list.
  - LAST = Last record of continuing list.
  - NEXT = Next record of continuing list.
- **c** = Module message processor synchronous link controller (MMPSDLC) unit number.
- **d** = Corresponding CTS number.
- **e** = State of CTS. Valid value(s):
  - BUSY = Specified unit CTS status is busy.
  - IDLE = Specified unit CTS status is idle.
  - UNKNOWN = Specified unit CTS status is unknown. This is due to a failure in obtaining data base information for the indicated CTS.

4. ACTION TO BE TAKEN

5. ALARMS

None.

6. REFERENCES

Input Message(s):
OP:ERRCHK
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] OP ERRCHK MESSAGE STARTED
   a
   b
   c
   d
   e

[2] OP ERRCHK IN PROGRESS
   SUMMARY OF INHIBITED UNITS
   f   g   h   i
   OP ERRCHK COMPLETED

[3] OP ERRCHK ABORTED  f

[4] OP ERRCHK NOT STARTED
   INVALID ID FIELD

2. REASON FOR OUTPUT

To indicate the inhibit status of all administrative module (AM) error conditions that may be optionally inhibited or
allowed. There are currently four error conditions of this type:

- Hardware checks identified by HDWCHK.
- Software checks identified by SFTCHK.
- Error interrupts identified by ERRINT.
- CU pseudo-nodes identified by ERRSRC.

The report lists each error condition and its associated inhibit state. In the case of inhibited error interrupts, a
supplemental report is output which then lists all units that are inhibited. Information specific to each device is output
in a format consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful
ABORTED message.

3. VARIABLE FIELD DEFINITIONS

a = This field indicates the existence or non-existence of AM error sources. Valid value(s):
   ACTIVE INHIBITS = Error source inhibits are active.
   NO INHIBITS = Error source inhibits are not active.
b = HDWCHK if the AM hardware checks are inhibited.
c = SFTCHK if the AM software checks are inhibited.
d = ERRSRC if the AM CU pseudo nodes are inhibited.
e = ERRINT if the AM error interrupts are inhibited.
f = Unit name. This name may indicate the complex name in a two-level identification, such as control unit (CU), or can simply indicate a specific hardware unit, such as teletypewriter (TTY).
g = Unit number that specifically identifies a complex type or hardware unit.
h = Indicates a subunit name that must always be identified with a two-level name, such as CU O MASC O.
i = Subunit number that specifically identifies a unit described by a two-level name.
j = Error codes. Valid value(s):
50 = A message could not be sent to a driver or real time status report (RTS).
51 = An equipment configuration database (ECD) access function completed unsuccessfully.
52 = An error in message communication.
53 = An error internal to the inhibit administrator.
54 = Temporary output file could not be opened.

4. ACTION TO BE TAKEN

All error codes associated with this activity are significant. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Message Class: CCS
Application: 5
Type: Output

1. FORMAT

**OP ESA**

a

[PRIMARY ESA: APID=b STATE=c HEALTH=d]

[SECONDARY ESA: APID=b STATE=c HEALTH=d]

2. REASON FOR OUTPUT

Response to the OP:ESA,STATUS input message that reports the current status of the primary and secondary enhanced 911 service adjuncts (ESAs). This message could also indicate that the request has timed out.

3. VARIABLE FIELD DEFINITIONS

a

= Informational text describing results of status query. Valid value(s):

NO INFORMATION TEXT = The informational text was not set correctly in the message. This should be reported as a problem.

REQUEST HAS TIMED OUT = The request for information has timed out and no information will be printed.

STATUS QUERY COMPLETE = The query was successful and the information for the primary ESA and secondary ESA, if defined, will be printed.

b

= Applications processor identifier (APID) of the ESA. If the APID for the ESA (GLE911APID or GLE911SEC office parameters) is 0, no data for that ESA will be printed.

c

= Current state of the ESA. Valid value(s):

ACTIVE = The ESA is active and receiving queries.

FORCED = The ESA is in the forced active state and is receiving queries and cannot be switched to inactive until the force has been removed.

INACTIVE = The ESA is not active and is not currently receiving queries.

d

= Current health value of the ESA. Valid value(s):

COMM LOST = The switch is not currently able to send queries to the ESA.

CRITICAL = The ESA has a critical alarm.

MAJOR = The ESA has a major alarm.

MINOR = The ESA has a minor alarm.

NORMAL = The ESA is functioning normally with no alarms.

UNKNOWN = The health status of the ESA is unknown.

4. ACTION TO BE TAKEN

This message is printed in response to a OP:ESA input message. If the message indicates that REQUEST HAS TIMED OUT, retry the OP:ESA input message. If the message has NO INFORMATION TEXT, this should be reported as a problem.
5. ALARMS

None.

2. REASON FOR OUTPUT

Output (OP) facility (FAC) performance monitoring (PM) counts and alarm status in response to the OP:FAC input message.

Format 1 displays the performance measurements of the specified digital facility interface (DFI) facility. This format is used to support early model DFIs such as the ANN1, ANN3(B), and so forth. (Such a DFI is sometimes known as DFI-1.)

Format 2 displays the performance monitoring counts for a DFI model 2 (DFI-2) facility.

Format 3 displays the performance monitoring counts for one or more integrated digital carrier unit (IDCU) facilities (IFAC) or one or more digital networking unit - synchronous optical network (SONET) (DNU-S) digital signal level 1 SONET (DS1SFAC) far end (FE) facilities.
Format 4 displays the history performance monitoring counts for one of the IFACs or one of the DNU-S DS1 FE facility.

Format 5 displays the reason that the input request for a digital line and trunk unit (DLTU) related request could not complete; that is, its error termination status.

Format 6 displays the initial and final input request status for a requested unit or facility.

Format 7 displays the result of an input message requested alert control status (ACS) for the requested unit or facility.

Format 8 displays the performance monitoring counts for a digital networking unit - synchronous optical network (SONET) (DNU-S) SONET termination equipment (STE) facility number.

Format 9 displays the performance monitoring counts for a DNU-S virtual tributary 1.5 (VT1.5) facility.

Format 10 displays the performance monitoring counts for a DNU-S digital signal level-1 (DS1) facility.

Format 11 displays the history performance monitoring counts for the DNU-S STE facility.

Format 12 displays the history performance monitoring counts for the DNU-S VT1.5 facility.

Format 13 displays the history performance monitoring counts for the DNU-S DS1 facility.

3. VARIABLE FIELD DEFINITIONS

ACS = Alert control status. The unit's input message requested ACS. The status of inhibits for "MML:" and "RC/V:" follows.

ACT = Recent changeable alert inhibits are in effect for the requested unit. Refer to RC/V View 8.1 OFFICE PARAMETERS (MISCELLANEOUS), View 20.23 IDCU FACILITY EQUIPMENT (IFAC), View 22.15 (PERFORMANCE MONITORING - THRESHOLD GROUP), or View 20.25 [DNUS PERFORMANCE MONITORING - THRESHOLD GROUP (SM2000)].

AIS = Alarm indication signal (AIS) is in effect for this facility.

CI = Corrupt indicator (CI) shows if the counts are invalid or incomplete for this interval. When a "*" is present on the column below CI, it means the PM counts are corrupt during that interval.

COND = Conditional request output. The output is generated for facilities that have reported a 15 minute threshold crossing during the current interval or daily threshold crossing during the current day.

CSS = Controlled slip seconds count.

CV = Coding violations count.

CURR = Current 15-minute and day counts were reported or requested.

DAY = Daily interval alerts were inhibited by the INH:FAC input message.

DFI = Digital facility interface.

DLTU = Digital line and trunk unit.

DNUS = DNU-S unit.

DS1SFAC = DNU-S Digital signal level 1 facility.
ES = Errored seconds count.
FAC = Facility terminated on a DFI.
FI = Failure indication flag. When a '*' is present on the column below FI, it means there was a failure during that collection interval. For example, a CGA occurred in the interval treated as a failure.
FLS = Frame loss seconds count.
HIST = History of interval counts were reported or requested. History interval 1 is the most recent and history interval 32 is the oldest.
IDCU = Integrated digital carrier unit.
IFAC = IDCU facility.
INH = Inhibit indicator. This indicates whether the production of the automatic message REPT:FAC is inhibited for this facility for the associated reporting interval (15MN or 24HR). This field is only supported for the "CURR" report since the former inhibit statuses are not stored. The REPT:FAC output message reports the crossing of PM thresholds and other PM events.
INT = 15-minute interval alerts were inhibited by the INH:FAC input message.
L = Line counts. The type of counts being reported are line counts.
LCA = Local alarm (red) is in effect for this facility.
NONE = No input message requested MML inhibits have been requested for this unit. In the case of RCV, no recent changeable alert inhibits are in affect.
P = Path counts. The type of counts being reported are path counts.
PREV = Previous 15-minute and day counts were reported or requested. Note that the previous 15-minute interval is the same as history interval 1 and is not reported if both previous (PREV) and history (HIST) are requested.
RMA = Remote alarm (yellow) is in effect for this facility.
RT = Remote terminal.
S = Section counts. The type of counts being reported are section counts.
SEFS = Severely errored framing seconds count.
SES = Severely errored seconds count.
SS = Slip seconds count.
EC1STE = Electrical carrier level 1 SONET termination equipment.
STSFAC = DNU-S Synchronous transport signal (STS) facility.
THR = Threshold of the PM count named to the immediate left.
UAS = Unavailable seconds count.
VT1FAC = Virtual tributary level 1 facility.

* = For CI, this indicates that the CI is set and at least one PM count is invalid for this interval. For FI, this indicates that the FI is set and at least one failure occurred for this interval. For INH, this indicates that the alerts are inhibited for the reported PM interval.

a = Switching module (SM) number.

b = DLTU number.

c = DFI number.

d = FAC number.

e = Circuit pack type.

f = T1 transmission mode and signaling format. Valid value(s):

64K = T1 DFI D4 format with 8-bit zero code suppression (B8ZS) and rob-bit signaling.

B8ZS = T1 DFI remote SM (RSM) format with B8ZS and word-24 signaling.

D4 = T1 DFI D4 format with zero code suppression (ZCS) and rob-bit signaling.

D464 = T1 DFI D4 format with ZCS and rob-bit signaling.

D4D64 = T1 DFI D4 format with B8ZS and digital multiplex interface bit-oriented signaling (DMI-BOS).

D4DNO = T1 DFI D4 format with DMI-BOS.

D4DZ = T1 DFI D4 format with ZCS and DMI-BOS.

D4NO = T1 DFI D4 format with rob-bit signaling.

D2BTS = T1 DFI extended framing (FE) format with zero byte time slot interchange (ZBTSI) and DMI-BOS.

FE = T1 DFI FE format with rob-bit signaling.

FE64 = T1 DFI FE format with ZCS and rob-bit signaling.

FE8Z = T1 DFI FE format with B8ZS and rob-bit signaling.

FEB7 = T1 DFI FE format with ZCS and rob-bit signaling.

FED64 = T1 DFI FE format with B8ZS and DMI-BOS.

FEDNO = T1 DFI FE format with DMI-BOS.

FEDZ = T1 DFI FE format with ZCS and DMI-BOS.

R2BTS = T1 DFI RSM format with ZBTSI and word-24 signaling.

ZBTSI = T1 DFI FE format with ZBTSI and rob-bit signaling.

ZCS = T1 DFI RSM format with ZCS and word-24 signaling.

g = Facility name (a customer-defined string through RC/V).

h = The result of the request. Valid value(s):

COMPLETED = The request was successfully completed.

COMPLETED_FACS_OOS = The request for performance monitoring (PM) counts from an entire IDCU, or TR303 RT, or DNU-S, or STS-1 completed but counts for out-of-service facilities were not included in the output report.

COMPLETED_EOC_OOS = The request for PM counts completed but counts could not be read from a TR303 RT because its embedded operations channel (EOC) was out-of-service.

CONT = Continuing. Intermediate output report.

CONTINUING = Intermediate output report.

FAILED = The data could not be collected for this report.

FAILED_DNUS_CC_OOS = The request for PM counts failed because DNU-S common control (CC)
was out-of-service. DNU-S duplex failure condition.

FAILED EOC OOS = The request for PM counts from a TR303 RT failed because the RT's EOC was out-of-service.

FAILED IDCU OOS = The IFAC or TR303 request for PM counts failed because the IDCU was out-of-service.

FAILED SM INHIBITED = The input request could not be processed because PM is inhibited at the SM level.

FAILED SWITCH AND SM INHIBITED = The input request could not be processed because PM is inhibited at the both the switch and SM level.

FAILED SWITCH INHIBITED = The input request could not be processed because PM is inhibited at the switch level.

NO MATCH = The specified facility does not exist or is not a DFI-2 or IDCU facility.

NOT ALLOWED = The requested report is not allowed for the given facility or unit.

OUT OF SERVICE = The requested IDCU is out-of-service and no counts were output.

SM UNAVAILABLE = The input request could not be processed because communication with the associated SM is not possible.

STARTED = Initial output report.

SYSTEM BUSY = The system's processing capability has been reached, or a system resource is unavailable. Retry the request later.

i = Facility status (STAT). Valid value(s):
   ACT = Active.
   MICE = Maintenance.

j = Number of path change-of-frame alignments (COFAs) in this interval.

k = Number of controlled slip seconds (CSS) or slip seconds (SS) in this interval.

l = Number of errored seconds (ES) in this interval.

m = Number of severely errored seconds (SES) in this interval.

n = Number of line bi-polar violations (BPVs) in this interval.

o = Number of path failed seconds (FSs) in this interval.

p = Number of path bursty errored seconds (BESs) in this interval.

q = Indicates the PM interval (INT) being reported. Valid value(s):
   15MIN = 15-minute counts.

Note: After a DFI-2 facility initialization (using INIT:FAC or RST:DFI), the BPV, COFA, and cyclical redundancy checks (CRC) counts are zeroed until the next real time 15 minute interval. Also, due to facility initialization time discrepancies, these counts will be staggered as follows: The BPV, COFA, and CRC counts will move to the previous and history registers on the real time 15 minute boundaries and may lag the remaining counts by several minutes. The remaining counts will be moved to the previous and history registers based on the DFI facility internal 15 minute timer. This timer was started when the DFI facility was initialized (using RST:DFI or when the facility became equipped) and may not
coincide with the real time 15 minute clock.

24HR = Daily counts.
HIST = History data interval as described by variable ‘r’ (Format 2 only).

r = Start time of the history interval. PM history interval which ranges from 1-32. The PM history intervals are the 32 previous 15-minute intervals. The intervals are numbered from newest to oldest. The interval marked HIST1 is the previous 15-minute interval and the interval marked HIST32 is the 15-minute interval from 8 hours ago. If both PREV and HIST counts were requested, the previous 15-minute count is not included in the output report to avoid redundancy with history interval 1 (Format 2 only).

s = Current path BES threshold for this interval.
t = Current line BPV threshold for this interval.
u = Current path COFA threshold for this interval.
v = Number of CRC6s or CVs in this interval.
w = Current path CRC6 threshold for this interval.
x = This indicates the current highest carrier group alarm (CGA) alarm status. Valid value(s):
   AIS = Used for AIS CGA, the highest CGA status.
   LCA = Used for a local (or red) CGA, the next highest CGA status.
   RMA = Used for a remote (or yellow) CGA, the lowest CGA status.
   NONE = No CGA condition exits.
y = Current ES threshold for this interval.
z = Current path FS threshold for this interval.
a = Current SES threshold for this interval.
b = Current SS or CSS threshold for this interval.
c = IDCU number.
d = RT number.
e = IFAC number.
f = Framing mode (FM) of facility. Valid value(s):
   D4 = Super frame.
   ESF = Extended super frame.
   SF = Super frame (same as D4 mode).

g = Network element being reported: Valid value(s):
   FE = Far end. Far end of a facility.
   NE = Near end. Near end of a facility.

h = Number of line ES for this interval.
\(i\) = Current LES threshold for this interval.

\(j\) = Number of line SES for this interval.

\(k\) = Current LSES threshold for this interval.

\(l\) = Number of FLS or SEFS for this interval.

\(m\) = Current FLS or SEFS threshold for this interval.

\(n\) = Number of UAS for this interval.

\(o\) = Current UAS threshold for this interval.

\(p\) = Valid value(s):

\[
\text{DFI}=a-b-c \\
\text{DLTU}=a-b
\]

\(q\) = Valid value(s):

\[
\text{IDCU}=a-c^l \\
\text{IDCURT}=a-c^l-d^l \\
\text{DNUSRT}=a-a^2-d^l
\]

\(r\) = Valid value(s):

\[
\text{FAC}=a-b-c-d \\
\text{DLTU}=a-b \\
\text{DFI}=a-b-c
\]

\(s\) = Valid value(s):

\[
\text{IDCU}=a-b^l \\
\text{IDCURT}=a-c^l-d^l \\
\text{IFAC}=a-c^l-e^l
\]

\(t\) = Network element being reported. Valid value(s):

\(\text{BOTH}\) = Both ends of a TR303 facility.

\(\text{COND}\) = Conditional request. Only facilities that have crossed a 15-minute alerting threshold during the current 15-minute interval or daily threshold during the current PM day are reported.

\(\text{FE}\) = Far end. Far end of a facility.

\(\text{NE}\) = Near end. Near end of a facility.

\(u\) = Section of the history report for the given network element.

\(v\) = Total sections of the history report for the given network element.

\(w\) = Valid value(s):
x¹ = Interval start time. The PM history intervals are the 32 previous 15-minute intervals. The timestamps represent the start time of each 15 minute interval. If both PREV and HIST counts were requested, the previous 15-minute count report is not printed to avoid redundancy with the first history interval.

y¹ = Valid value(s):

DNUS=a-a²
DNUSRT=a-a²-d¹
EC1STE=a-a²-b²-c²
STSFAÇ=a-a²-b²-c²-d²
VT1FAC=a-a²-b²-c²-d²-e²-f²
DS1SFAC=a-a²-b²-c²-d²-e²-f²

a² = DNU-S number.
b² = Data group number.
c² = STE facility number.
d² = STS facility number.
e² = Virtual tributary group (VTG) number.
f² = Virtual tributary member (VTM) number.

4. ACTIONS TO BE TAKEN
None. This message is generated in response to the OP:FAC input message.

5. ALARMS
None.

### 2. REASON FOR OUTPUT

Output (OP) facility (FAC) performance monitoring (PM) counts and alarm status in response to the OP:FAC input message.

Format 1 displays the performance measurements of the specified digital facility interface (DFI) facility. This format is used to support early model DFIs such as the ANN1, ANN3(B), and so forth. (Such a DFI is sometimes known as DFI-1.)

Format 2 displays the performance monitoring counts for a DFI model 2 (DFI-2) facility.

Format 3 displays the performance monitoring counts for one or more integrated digital carrier unit (IDCU) facilities (IFAC) or one or more digital networking unit - synchronous optical network (SONET) (DNU-S) digital signal level 1 SONET (DS1SFAC) far end (FE) facilities.

Format 4 displays the history performance monitoring counts for one of the IFACs or one of the DNU-S DS1 FE facility.

Format 5 displays the reason that the input request for a digital line and trunk unit (DLTU) related request could not complete; that is, its error termination status.

Format 6 displays the initial and final input request status for a requested unit or facility.

Format 7 displays the result of an input message requested alert control status (ACS) for the requested unit or facility.
Format 8 displays the performance monitoring counts for a digital networking unit - synchronous optical network (SONET) (DNU-S) SONET termination equipment (STE) facility number.

Format 9 displays the performance monitoring counts for a DNU-S virtual tributary 1.5 (VT1.5) facility.

Format 10 displays the performance monitoring counts for a DNU-S digital signal level-1 (DS1) facility.

Format 11 displays the history performance monitoring counts for the DNU-S STE facility.

Format 12 displays the history performance monitoring counts for the DNU-S VT1.5 facility.

Format 13 displays the history performance monitoring counts for the DNU-S DS1 facility.

Format 14 displays the performance monitoring counts for the OIU OC3 facility.

Format 15 displays the performance monitoring counts for the OIU STS1 facility.

Format 16 displays the performance monitoring counts for the OIU VT15 facility.

Format 17 displays the performance monitoring counts for the OIU DS1 facility.

Format 18 displays the history performance monitoring counts for the OIU OC3 facility.

Format 19 displays the history performance monitoring counts for the OIU STS1 facility.

Format 20 displays the history performance monitoring counts for the OIU VT15 facility.

Format 21 displays the history performance monitoring counts for the OIU DS1 facility.

3. VARIABLE FIELD DEFINITIONS

ACS = Alert control status. The unit's input message requested ACS. The status of inhibits for "MML:" and "RC/V:" follows.

ACT = Recent changeable alert inhibits are in effect for the requested unit. Refer to RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS), View 20.23 [IDCU FACILITY EQUIPMENT (IFAC)], View 22.15 (PERFORMANCE MONITORING - THRESHOLD GROUP), or View 20.25 [DNUS PERFORMANCE MONITORING - THRESHOLD GROUP (SM2000)].

AIS = Alarm indication signal (AIS) is in effect for this facility.

BER = Bit error rate (BER) alarm is in effect for this facility.

CI = Corrupt indicator (CI) shows if the counts are invalid or incomplete for this interval. When a '*' is present on the column below CI, it means the PM counts are corrupt during that interval.

COND = Conditional request output. The output is generated for facilities that have reported a 15 minute threshold crossing during the current interval or daily threshold crossing during the current day.

CSS = Controlled slip seconds count.

CV = Coding violations count.

CURR = Current 15-minute and day counts were reported or requested.

DAY = Daily interval alerts were inhibited by the INH:FAC input message.
DFI = Digital facility interface.
DLTU = Digital line and trunk unit.
DNUS = DNU-S unit.
DS1 = OIU Digital signal level 1 facility.
DS1SFAC = DNU-S Digital signal level 1 facility.
ES = Errored seconds count.
FAC = Facility terminated on a DFI.
FC = Failure count.
FI = Failure indication flag. When a "**" is present on the column below FI, it means there was a failure during that collection interval. For example, a CGA occurred in the interval treated as a failure.
FLS = Frame loss seconds count.
HIST = History of interval counts were reported or requested. History interval 1 is the most recent and history interval 32 is the oldest. For OIU facilities, there are only 31 history intervals as the previous 15-minute interval is not included in the history intervals.
IDCU = Integrated digital carrier unit.
IFAC = IDCU facility.
INH = Inhibit indicator. This indicates whether the production of the automatic message REPT:FAC is inhibited for this facility for the associated reporting interval (15MN or 24HR). This field is only supported for the "CURR" report since the former inhibit statuses are not stored. The REPT:FAC output message reports the crossing of PM thresholds and other PM events.
INT = 15-minute interval alerts were inhibited by the INH:FAC input message.
L = Line counts. The type of counts being reported are line counts.
LCA = Local alarm is in effect for this facility.
NA = CGA not applicable for this facility.
NONE = No input message requested MML inhibits have been requested for this unit. In the case of RCV, no recent changeable alert inhibits are in effect. Also used to indicate no alarm on this facility.
OC3 = OIU optical carrier level 3 facility.
OIU = Optical interface unit.
P = Path counts. The type of counts being reported are path counts.
PREV = Previous 15-minute and day counts were reported or requested. Note that the previous 15-minute interval is the same as history interval 1 and is not reported if both previous (PREV) and history (HIST) are requested for non-OIU facilities. For OIU facilities, the previous 15-minute counts are not included in the history interval counts.
RMA = Remote alarm is in effect for this facility.
RT = Remote terminal.
S = Section counts. The type of counts being reported are section counts.
SEFS = Severely errored framing seconds count.
SES = Severely errored seconds count.
SS = Slip seconds count.
EC1STE = Electrical carrier level 1 SONET termination equipment.
STS1 = OIU Synchronous transport signal level 1 facility.
STSFAC = DNU-S Synchronous transport signal (STS) facility.
THR = Threshold of the PM count named to the immediate left.
UAS = Unavailable seconds count.
VT15 = OIU Virtual tributary level 1.5 facility.
VT1FAC = Virtual tributary level 1 facility.
* = For CI, this indicates that the CI is set and at least one PM count is invalid for this interval. For FI, this indicates that the FI is set and at least one failure occurred for this interval. For INH, this indicates that the alerts are inhibited for the reported PM interval.

a = Switching module (SM) number.
b = DLTU number.
c = DFI number.
d = FAC number.
e = Circuit pack type.
f = T1 transmission mode and signaling format. Valid value(s):
   64K = T1 DFI D4 format with 8-bit zero code suppression (B8ZS) and rob-bit signaling.
   B8ZS = T1 DFI remote SM (RSM) format with B8ZS and word-24 signaling.
   D4 = T1 DFI D4 format with zero code suppression (ZCS) and rob-bit signaling.
   D464 = T1 DFI D4 format with ZCS and rob-bit signaling.
   D4D64 = T1 DFI D4 format with B8ZS and digital multiplex interface bit-oriented signaling (DMI-BOS).
   D4DNO = T1 DFI D4 format with DMI-BOS.
   D4DZ = T1 DFI D4 format with ZCS and DMI-BOS.
   D4NO = T1 DFI D4 format with rob-bit signaling.
   D2BTS = T1 DFI extended framing (FE) format with zero byte time slot interchange (ZBTSI) and DMI-BOS.
   FE = T1 DFI FE format with rob-bit signaling.
   FE64 = T1 DFI FE format with ZCS and rob-bit signaling.
   FE8Z = T1 DFI FE format with B8ZS and rob-bit signaling.
FEB7    = T1 DFI FE format with ZCS and rob-bit signaling.
FED64   = T1 DFI FE format with B8ZS and DMI-BOS.
FEDNO   = T1 DFI FE format with DMI-BOS.
FEDZ    = T1 DFI FE format with ZCS and DMI-BOS.
RZBTS   = T1 DFI RSM format with ZBTSI and word-24 signaling.
ZBTSI   = T1 DFI FE format with ZBTSI and rob-bit signaling.
ZCS     = T1 DFI RSM format with ZCS and word-24 signaling.

\[g\] = Facility name (a customer-defined string through RC/V).

\[h\] = The result of the request. Valid value(s):
\[\text{COMPLETED} = \text{The request was successfully completed.}\]
\[\text{CONT} = \text{Continuing. Intermediate output report.}\]
\[\text{CONTINUING} = \text{Intermediate output report.}\]
\[\text{FAILED} = \text{The data could not be collected for this report.}\]
\[\text{FAILED DNUS CC OOS} = \text{The request for PM counts failed because DNU-S common control (CC) was out-of-service.}\]
\[\text{FAILED EOC OOS} = \text{The request for PM counts completed but counts could not be read from a TR303 RT because its embedded operations channel (EOC) was out-of-service.}\]
\[\text{FAILED IDCU OOS} = \text{The IFAC or TR303 request for PM counts failed because the IDCU was out-of-service.}\]
\[\text{FAILED OIU OFI OOS} = \text{The request for PM counts failed because the OFI or OFIs for the requested OIU protection group were out-of-service.}\]
\[\text{FAILED SM INHIBITED} = \text{The input request could not be processed because PM is inhibited at the SM level.}\]
\[\text{FAILED SWITCH AND SM INHIBITED} = \text{The input request could not be processed because PM is inhibited at the both the switch and SM level.}\]
\[\text{FAILED SWITCH INHIBITED} = \text{The input request could not be processed because PM is inhibited at the switch level.}\]
\[\text{NO MATCH} = \text{The specified facility does not exist or is not a DFI-2 or IDCU facility.}\]
\[\text{NOT ALLOWED} = \text{The requested report is not allowed for the given facility or unit.}\]
\[\text{OUT OF SERVICE} = \text{The requested IDCU is out-of-service and no counts were output.}\]
\[\text{SM UNAVAILABLE} = \text{The input request could not be processed because communication with the associated SM is not possible.}\]
\[\text{STARTED} = \text{Initial output report.}\]
\[\text{SYSTEM BUSY} = \text{The system's processing capability has been reached, or a system resource is unavailable. Retry the request later.}\]

\[i\] = Facility status (STAT). Valid value(s):
\[\text{ACT} = \text{Active.}\]
\[\text{MTCE} = \text{Maintenance.}\]
j = Number of path change-of-frame alignments (COFAs) in this interval.
k = Number of controlled slip seconds (CSS) or slip seconds (SS) in this interval.
l = Number of errored seconds (ES) in this interval.
m = Number of severely errored seconds (SES) in this interval.
n = Number of line bi-polar violations (BPVs) in this interval.
o = Number of path failed seconds (FSs) in this interval.
p = Number of path bursty errored seconds (BESs) in this interval.
q = Indicates the PM interval (INT) being reported. Valid value(s):
   15MIN = 15-minute counts.
   24HR = Daily counts.
   HIST = History data interval as described by variable ‘r’ (Format 2 only).
   235-600-750 December 2003

Note: After a DFI-2 facility initialization (using INIT:FAC or RST:DFI), the BPV, COFA, and cyclical redundancy checks (CRC) counts are zeroed until the next real time 15 minute interval. Also, due to facility initialization time discrepancies, these counts will be staggered as follows: The BPV, COFA, and CRC counts will move to the previous and history registers on the real time 15 minute boundaries and may lag the remaining counts by several minutes. The remaining counts will be moved to the previous and history registers based on the DFI facility internal 15 minute timer. This timer was started when the DFI facility was initialized (using RST:DFI or when the facility became equipped) and may not coincide with the real time 15 minute clock.

r = Start time of the history interval. PM history interval which ranges from 1-32. The PM history intervals are the 32 previous 15-minute intervals. The intervals are numbered from newest to oldest. The interval marked HIST1 is the previous 15-minute interval and the interval marked HIST32 is the 15-minute interval from 8 hours ago. If both PREV and HIST counts were requested, the previous 15-minute count is not included in the output report to avoid redundancy with history interval 1 (Format 2 only).

s = Current path BES threshold for this interval.
t = Current line BPV threshold for this interval.
u = Current path COFA threshold for this interval.
v = Number of CRC6s or CVs in this interval.
w = Current path CRC6 threshold for this interval.
x = This indicates the current highest carrier group alarm (CGA) alarm status for this facility. Valid value(s):
   AIS = Alarm indication signal.
   LCA = Local alarm.
RMA  = Remote alarm.
BER  = Bit error rate alarm.
NONE = No CGA condition exists.
NA   = CGA not applicable.

y   = Current ES threshold for this interval.
z   = Current path FS threshold for this interval.
a   = Current SES threshold for this interval.
b   = Current SS or CSS threshold for this interval.
c   = IDCU number.
d   = RT number.
e   = IFAC number.
f   = Framing mode (FM) of facility. Valid value(s):
D4   = Super frame.
ESF  = Extended super frame.
SF   = Super frame (same as D4 mode).

g   = Network element being reported. Valid value(s):
FE   = Far end. Far end of a facility.
NE   = Near end. Near end of a facility.

h   = Number of line ES for this interval.
i   = Current LES threshold for this interval.
j   = Number of line SES for this interval.
k   = Current LSES threshold for this interval.
l   = Number of FLS or SEFS for this interval.
m   = Current FLS or SEFS threshold for this interval.
n   = Number of UAS for this interval.
o   = Current UAS threshold for this interval.
p   = Valid value(s):
    DFI=a-b-c
    DLTU=a-b

q   = Valid value(s):
    IDCU=a-c
IDCURT=a-c^{1\text{-}d^{1}}
DNUSRT=a-a^{2\text{-}d^{1}}

t^{1} = Network element being reported. Valid value(s):
BOTH = Both near and far ends of the facility.
FE = Far end. Far end of a facility.
NE = Near end. Near end of a facility.

u^{1} = Section of the history report for the given network element.
v^{1} = Total sections of the history report for the given network element.

x^{1} = Interval start time. The PM history intervals are the 32 or 31 (for OIU facilities) previous 15-minute intervals. OIU history counts do not include the previous 15-minute interval. The timestamps represent the start time of each 15 minute interval. If both PREV and HIST counts were requested for non-OIU facilities, the previous 15-minute count report is not printed to avoid redundancy with the first history interval.

y^{1} = Valid value(s):

a^{2} = DNU-S number.
b²  = Data group number.
c²  = STE facility number.
d²  = STS facility number.
e²  = Virtual tributary group (VTG) number.
f²  = Virtual tributary member (VTM) number.
g²  = Optical interface unit (OIU) number.
h²  = Protection group (PG) number.
i²  = Optical carrier level 3 (OC3) number.
j²  = Side number.
k²  = Number of failure counts (FC) in this interval.
l²  = Number of coding violations (CV) in this interval.
m²  = Current CV threshold for this interval.
n²  = Synchronous transport signal level 1 (STS1) number.
o²  = Valid value(s):
    OIU=a-g²
    OC3=a-g²-h²-i²-j²
    STS1=a-g²-h²-i²-n²
    VT15=a-g²-h²-i²-n²-e²-f²
    DS1=a-g²-h²-i²-n²-e²-f²

4. ACTIONS TO BE TAKEN

None. This message is generated in response to the OP:FAC input message.

5. ALARMS

None.

[40] OP FAC [COND] [CURR] [PREV] PSUPH=a-e^4-f^4-g^4 SCTP h
2. REASON FOR OUTPUT

Output (OP) facility (FAC) performance monitoring (PM) counts and alarm status in response to the OP:FAC input message.

Used to output the vacant DS1 trunking facilities terminated on a digital line and trunk unit (DLTU), peripheral control and timing (PCT) line and trunk unit (PLTU), digital networking unit (DNU) - synchronous optical network (SONET) (DNU-S), or optical interface unit (OIU), in response to OP:FAC,VAC input message.

Format 1 displays the performance measurements of the specified digital facility interface (DFI) facility. This format is used to support early model DFIs such as the ANN1, ANN3(B), and so forth. (Such a DFI is sometimes known as DFI-1.)

Format 2 displays the performance monitoring counts for a DFI model 2 (DFI-2) facility.

Format 3 displays the performance monitoring counts for one or more integrated digital carrier unit (IDCU) facilities.
(IFAC) or one or more digital networking unit - synchronous optical network (SONET) (DNU-S) digital signal level 1 SONET (DS1SFAC) far end (FE) facilities.

Format 4 displays the history performance monitoring counts for one of the IFACs or one of the DNU-S DS1 FE facility.

Format 5 displays the reason that the input request for a digital line and trunk unit (DLTU) related request could not complete; that is, its error termination status.

Format 6 displays the initial and final input request status for a requested unit or facility.

Format 7 displays the result of an input message requested alert control status (ACS) for the requested unit or facility.

Format 8 displays the performance monitoring counts for a digital networking unit - synchronous optical network (SONET) (DNU-S) SONET termination equipment (STE) facility number.

Format 9 displays the performance monitoring counts for a DNU-S virtual tributary 1.5 (VT1.5) facility.

Format 10 displays the performance monitoring counts for a DNU-S digital signal level-1 (DS1) facility.

Format 11 displays the history performance monitoring counts for the DNU-S STE facility.

Format 12 displays the history performance monitoring counts for the DNU-S VT1.5 facility.

Format 13 displays the history performance monitoring counts for the DNU-S DS1 facility.

Format 14 displays the performance monitoring counts for the OIU OC3 or OC3C facility.

Format 15 displays the performance monitoring counts for the OIU STS1 or STS3C facility.

Format 16 displays the performance monitoring counts for the OIU VT15 facility.

Format 17 displays the performance monitoring counts for the OIU DS1 facility.

Format 18 displays the history performance monitoring counts for the OIU OC3 or OC3C facility.

Format 19 displays the history performance monitoring counts for the OIU STS1 or STS3C facility.

Format 20 displays the history performance monitoring counts for the OIU VT15 facility.

Format 21 displays the history performance monitoring counts for the OIU DS1 facility.

Format 22 outputs the vacant DS1 trunking facilities for DLTU, PLTU, DNU and OIU.

Format 23 displays the performance monitoring counts for the PPP protocol layer associated with the OIU PPP link.

Format 24 displays the history performance monitoring counts for the PPP protocol layer associated with the OIU PPP link.

Format 25 displays the performance monitoring counts for the IP protocol layer associated with the OIU PPP link.

Format 26 displays the history performance monitoring counts for the IP protocol layer associated with the OIU PPP link.

Format 27 displays the performance monitoring counts for the ICMP protocol layer associated with the OIU PPP link.
Format 28 displays the history performance monitoring counts for the ICMP protocol layer associated with the OIU PPP link.

Format 29 displays the performance monitoring counts for the UDP protocol layer associated with the OIU PPP link.

Format 30 displays the history performance monitoring counts for the UDP protocol layer associated with the OIU PPP link.

Format 31 displays the performance monitoring counts for the RTP protocol layer associated with the OIU PPP link.

Format 32 displays the history performance monitoring counts for the RTP protocol layer associated with the OIU PPP link.

Format 33 displays the performance monitoring counts for the extended access interface unit (EAIU) timeslot group (TSGRP).

Format 34 displays the performance monitoring counts for the ethernet (ETH) protocol layer associated with the session initiation protocol (SIP) protocol handler (PH).

Format 35 displays the history performance monitoring counts for the ETH protocol layer associated with the SIP PH.

Format 36 displays the performance monitoring counts for the IP protocol layer associated with the SIP PH.

Format 37 displays the history performance monitoring counts for the IP protocol layer associated with the SIP PH.

Format 38 displays the performance monitoring counts for the ICMP protocol layer associated with the SIP PH.

Format 39 displays the history performance monitoring counts for the ICMP protocol layer associated with the SIP PH.

Format 40 displays the performance monitoring counts for the SCTP protocol layer associated with the SIP PH.

Format 41 displays the history performance monitoring counts for the SCTP protocol layer associated with the SIP PH.

Format 42 displays the performance monitoring counts for the SIP protocol layer associated with the SIP PH.

Format 43 displays the history performance monitoring counts for the SIP protocol layer associated with the SIP PH.

3. VARIABLE FIELD DEFINITIONS

**ACS**
- Alert control status. The unit’s input message requested ACS. The status of inhibits for “MML:” and “RC/V:” follows.

**ACT**
- Recent changeable alert inhibits are in effect for the requested unit. Refer to RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)], View 20.23 [IDCU FACILITY EQUIPMENT (IFAC)], View 20.25 [DNUS PERFORMANCE MONITORING - THRESHOLD GROUP (SM2000)], View 20.32 [PERFORMANCE MONITORING THRESHOLD GROUP (OIU, SIP PSUPH)], or View 22.15 [PERFORMANCE MONITORING - THRESHOLD GROUP].

**AIS**
- Alarm indication signal (AIS) is in effect for this facility.

**BER**
- Bit error rate (BER) alarm is in effect for this facility. This value is only used on OIU STE facilities.

**CER**
- SCTP Chunk error received count.
<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI</td>
<td>Corrupt indicator (CI) shows if the counts are invalid or incomplete for this interval. When a &quot;*&quot; is present on the column below CI, it means the PM counts are corrupt during that interval.</td>
</tr>
<tr>
<td>COND</td>
<td>Conditional request output. The output is generated for facilities that have reported a 15 minute threshold crossing during the current interval or daily threshold crossing during the current day.</td>
</tr>
<tr>
<td>CSS</td>
<td>Controlled slip seconds count.</td>
</tr>
<tr>
<td>CV</td>
<td>Coding violations count.</td>
</tr>
<tr>
<td>CURR</td>
<td>Current 15-minute and day counts were reported or requested.</td>
</tr>
<tr>
<td>DAY</td>
<td>Daily interval alerts were inhibited by the INH:FAC input message.</td>
</tr>
<tr>
<td>DFI</td>
<td>Digital facility interface.</td>
</tr>
<tr>
<td>DLTU</td>
<td>Digital line and trunk unit.</td>
</tr>
<tr>
<td>DNUS</td>
<td>DNU-S unit.</td>
</tr>
<tr>
<td>DSI</td>
<td>OIU Digital signal level 1 facility.</td>
</tr>
<tr>
<td>DS1SFAC</td>
<td>DNU-S Digital signal level 1 facility.</td>
</tr>
<tr>
<td>EC1STE</td>
<td>Electrical carrier level 1 SONET termination equipment.</td>
</tr>
<tr>
<td>ERR</td>
<td>Invalid RTP datagram received count.</td>
</tr>
<tr>
<td>ES</td>
<td>Errored seconds count.</td>
</tr>
<tr>
<td>ETH</td>
<td>Ethernet link layer.</td>
</tr>
<tr>
<td>EUR</td>
<td>Errored UDP datagram received count.</td>

<tr>
<td>FAC</td>
<td>Facility terminated on a DFI.</td>
</tr>
<tr>
<td>FC</td>
<td>Failure count.</td>
</tr>
<tr>
<td>FI</td>
<td>Failure indication flag. When a &quot;*&quot; is present on the column below FI, it means there was a failure during that collection interval. For example, a CGA occurred in the interval treated as a failure.</td>
</tr>
<tr>
<td>FLS</td>
<td>Frame loss seconds count.</td>
</tr>
<tr>
<td>HIST</td>
<td>History of interval counts were reported or requested. History interval 1 is the most recent and history interval 32 is the oldest. For OIU facilities, there are only 31 history intervals as the previous 15-minute interval is not included in the history intervals.</td>
</tr>
<tr>
<td>ICD</td>
<td>ICMP destination unreachable message received count.</td>
</tr>
<tr>
<td>ICE</td>
<td>ICMP echo request message received count.</td>
</tr>
<tr>
<td>ICMP</td>
<td>Internet control message protocol layer.</td>
</tr>
<tr>
<td>ICP</td>
<td>ICMP parameter problem message received count.</td>
</tr>
<tr>
<td>ICR</td>
<td>Invalid ICMP datagram received count.</td>
</tr>
</tbody>
</table>
ICT = ICMP TTL exceeded message received count.
IDCU = Integrated digital carrier unit.
IEH = ETH Invalid Ethernet header received count.
IFAC = IDCU facility.
IFD = ETH Incoming ethernet frames discarded count.
IIF = Incoming fragmented IP datagram received count.
IIH = Invalid IP header received count.
IIQ = Incoming IP queue congestion count.
INH = Inhibit indicator. This indicates whether the production of the automatic message REPT:FAC is inhibited for this facility for the associated reporting interval (15MN or 24HR). This field is only supported for the "CURR" report since the former inhibit statuses are not stored. The REPT:FAC output message reports the crossing of PM thresholds and other PM events.
INT = 15-minute interval alerts were inhibited by the INH:FAC input message.
IP = Internet protocol layer.
IPC = Invalid PPP checksum received count.
IPH = Invalid PPP header received count.
ISH = Invalid SCTP header received count.
L = Line counts. The type of counts being reported are line counts.
LCA = Local alarm is in effect for this facility.
MSE = ETH MAC sublayer error counts.
NONE = No input message requested MML inhibits have been requested for this unit. In the case of RCV, no recent changeable alert inhibits are in affect. Also used to indicate no alarm on this facility.
OC3 = OIU optical carrier level 3 facility.
OC3C = OIU optical carrier level 3 concatenated facility.
OFD = ETH Outgoing ethernet frames discarded count.
OIU = Optical interface unit.
P = Path counts. The type of counts being reported are path counts.
PPP = Point-to-point protocol layer.
PPPLK = OIU PPP link.
PREV = Previous 15-minute and day counts were reported or requested. Note that the previous 15-minute interval is the same as history interval 1 and is not reported if both previous (PREV) and history
(HIST) are requested for non-OIU facilities. For OIU facilities, the previous 15-minute counts are not included in the history interval counts.

PLTU = PCT line and trunk unit
PSU = Packet switch unit
RDL = RTP datagrams lost count.
RMA = Remote alarm is in effect for this facility. This value is not used on DNU-S STE facilities.
RT = Remote terminal.
RTP = Real-time transport protocol layer.
S = Section counts. The type of counts being reported are section counts.
SCTP = Stream control transmission protocol layer.
SEFS = Severely errored framing seconds count.
SES = Severely errored seconds count.
SIP = Session initiation protocol layer.
SS = Slip seconds count.
STS1 = OIU Synchronous transport signal level 1 facility.
STS3C = OIU Synchronous transport signal level 3 concatenated facility.
STSFAC = DNU-S Synchronous transport signal (STS) facility.
THR = Threshold of the PM count named to the immediate left.
TRIB = PLTU tributary.
UAS = Unavailable seconds count.
UDP = User Datagram Protocol layer.
UPV = SIP Unknown/unsupported protocol version count.
URU = SIP Unknown/unsupported request URI count.
USM = SIP Unknown/unsupported SIP method count.
UUR = Unexpected UDP datagrams received count.
VAC = Report of vacant DS1 trunking facilities.
VT15 = OIU Virtual tributary level 1.5 facility.
VT1FAC = Virtual tributary level 1 facility.
* = For CI, this indicates that the CI is set and at least one PM count is invalid for this interval. For FI, this indicates that the FI is set and at least one failure occurred for this interval. For INH, this
indicates that the alerts are inhibited for the reported PM interval.

\textbf{a} = Switching module (SM) number.

\textbf{b} = DLTU number.

\textbf{c} = DFI number.

\textbf{d} = FAC number.

\textbf{e} = Circuit pack type.

\textbf{f} = T1 transmission mode and signaling format. Valid value(s):

- \textbf{64K} = T1 DFI D4 format with 8-bit zero code suppression (B8ZS) and rob-bit signaling.
- \textbf{B8ZS} = T1 DFI remote SM (RSM) format with B8ZS and word-24 signaling.
- \textbf{D4} = T1 DFI D4 format with zero code suppression (ZCS) and rob-bit signaling.
- \textbf{D464} = T1 DFI D4 format with ZCS and rob-bit signaling.
- \textbf{D4D64} = T1 DFI D4 format with B8ZS and digital multiplex interface bit-oriented signaling (DMI-BOS).
- \textbf{D4DNO} = T1 DFI D4 format with DMI-BOS.
- \textbf{D4DZ} = T1 DFI D4 format with ZCS and DMI-BOS.
- \textbf{D4NO} = T1 DFI D4 format with rob-bit signaling.
- \textbf{D2BTS} = T1 DFI extended framing (FE) format with zero byte time slot interchange (ZBTSI) and DMI-BOS.
- \textbf{FE} = T1 DFI FE format with rob-bit signaling.
- \textbf{FE64} = T1 DFI FE format with ZCS and rob-bit signaling.
- \textbf{FE8Z} = T1 DFI FE format with B8ZS and rob-bit signaling.
- \textbf{FEB7} = T1 DFI FE format with ZCS and rob-bit signaling.
- \textbf{FED64} = T1 DFI FE format with B8ZS and DMI-BOS.
- \textbf{FEDNO} = T1 DFI FE format with DMI-BOS.
- \textbf{FEDZ} = T1 DFI FE format with ZCS and DMI-BOS.
- \textbf{R2BTS} = T1 DFI RSM format with ZBTSI and word-24 signaling.
- \textbf{ZBTSI} = T1 DFI FE format with ZBTSI and rob-bit signaling.
- \textbf{ZCS} = T1 DFI RSM format with ZCS and word-24 signaling.

\textbf{g} = Facility name (a customer-defined string through RC/V).

\textbf{h} = The result of the request. Valid value(s):

- \textbf{COMPLETED} = The request was successfully completed.
- \textbf{COMPLETED EOC OOS} = The request for PM counts completed but counts could not be read from a TR303 RT because its embedded operations channel (EOC) was out-of-service.
- \textbf{COMPLETED FACS OOS} = The request for performance monitoring (PM) counts from an entire IDCU, or TR303 RT, or DNU-S, or OIU, or STS-1 completed but counts for out-of-service facilities were not included in the output report.
- \textbf{COMPLETED PROT SWITCH} = The request for performance monitoring (PM) counts from an entire OIU completed, but counts for a protection group or groups on the OIU were not reported due to a protection switch.
- \textbf{CONT} = Continued. Intermediate output report.
- \textbf{CONTINUED} = Intermediate output report.
- \textbf{FAILED} = The data could not be collected for this report.
- \textbf{FAILED DNUS CC OOS} = The request for PM counts failed because DNU-S common control (CC) was out-of-service. DNU-S duplex failure condition.
FAILED EOC OOS = The request for PM counts from a TR303 RT failed because the RT's EOC was out-of-service.
FAILED IDCU OOS = The IFAC or TR303 request for PM counts failed because the IDCU was out-of-service.
FAILED OIU OFI OOS = The request for PM counts failed because the OFI or OFIs for the requested OIU protection group were out-of-service.
FAILED SM INHIBITED = The input request could not be processed because PM is inhibited at the SM level.
FAILED SWITCH AND SM INHIBITED = The input request could not be processed because PM is inhibited at the both the switch and SM level.
FAILED SWITCH INHIBITED = The input request could not be processed because PM is inhibited at the switch level.
FEATURE NOT LOADED = The INH CGA feature is not activated, the request is not allowed.
NO MATCH = The specified facility does not exist or is not a DFI-2 or IDCU facility.
NOT ALLOWED = The requested report is not allowed for the given facility or unit.
OUT OF SERVICE = The requested IDCU is out-of-service and no counts were output. SM UNAVAILABLE = The input request could not be processed because communication with the associated SM is not possible.
STARTED = Initial output report.
SYSTEM BUSY = The system's processing capability has been reached, or a system resource is unavailable, or, one OP:FAC,VAC request already in progress. Retry the request later.
SYSTEM ERROR = The OP:FAC,VAC output has terminated. The output maybe incomplete. Retry later.
UNAVAILABLE = One or more of the requested SMs are not available and therefore the output maybe incomplete.

\[i\] = Facility status (STAT). Valid value(s):
ACT = Active.
MTCE = Maintenance.

\[j\] = Number of path change-of-frame alignments (COFAs) in this interval.

\[k\] = Number of controlled slip seconds (CSS) or slip seconds (SS) in this interval.

\[l\] = Number of errored seconds (ES) in this interval.

\[m\] = Number of severely errored seconds (SES) in this interval.

\[n\] = Number of line bi-polar violations (BPVs) in this interval.

\[o\] = Number of path failed seconds (FSs) in this interval.

\[p\] = Number of path bursty errored seconds (BESs) in this interval.

\[q\] = Indicates the PM interval (INT) being reported. Valid value(s):
15MN = 15-minute counts.

NOTE: After a DFI-2 facility initialization (using INIT:FAC or RST:DFI), the BPV, COFA, and cyclical redundancy checks (CRC) counts are zeroed until the next real time 15 minute interval. Also, due to facility initialization time discrepancies, these counts will be staggered as follows: The BPV,
COFA, and CRC counts will move to the previous and history registers on the real time 15 minute boundaries and may lag the remaining counts by several minutes. The remaining counts will be moved to the previous and history registers based on the DFI facility internal 15 minute timer. This timer was started when the DFI facility was initialized (using RST:DFI or when the facility became equipped) and may not coincide with the real time 15 minute clock.

24HR  = Daily counts.
HIST  = History data interval as described by variable 'r' (Format 2 only).

r = Start time of the history interval. PM history interval which ranges from 1-32. The PM history intervals are the 32 previous 15-minute intervals. The intervals are numbered from newest to oldest. The interval marked HIST1 is the previous 15-minute interval and the interval marked HIST32 is the 15-minute interval from 8 hours ago. If both PREV and HIST counts were requested, the previous 15-minute count is not included in the output report to avoid redundancy with history interval 1 (Format 2 only).

s = Current path BES threshold for this interval.
t = Current line BPV threshold for this interval.
u = Current path COFA threshold for this interval.
v = Number of CRC6s or CVs in this interval.
w = Current path CRC6 threshold for this interval.
x = This indicates the current highest carrier group alarm (CGA) alarm status for this facility. Valid value(s):
   AIS  = Alarm indication signal.
   BER  = Bit error rate alarm. This value is only used on OIU STE facilities.
   LCA  = Local alarm.
   NONE = No CGA condition exits.
   RMA  = Remote alarm. This value is not used on DNU-S STE facilities.

y = Current ES threshold for this interval.
z = Current path FS threshold for this interval.
a = Current SES threshold for this interval.
b = Current SS or CSS threshold for this interval.
c = IDCU number.
d = RT number.
e = IFAC number.
f = Framing mode (FM) of facility. Valid value(s):
   D4  = Super frame.
   ESF = Extended super frame.
   SF  = Super frame (same as D4 mode).
Network element being reported: Valid value(s):
FE = Far end. Far end of a facility.
NE = Near end. Near end of a facility.

Number of line ES for this interval.

Current LES threshold for this interval.

Number of line SES for this interval.

Current LSES threshold for this interval.

Number of FLS or SEFS for this interval.

Current FLS or SEFS threshold for this interval.

Number of UAS for this interval.

Current UAS threshold for this interval.

Unit. Valid value(s):
DFI = a-b-c
DLTU = a-b

Unit. Valid value(s):
DNUSRT = a-a^2-d
IDCU = a-c^1
IDCURT = a-c^1-d^1

Unit. Valid value(s):
DFI = a-b-c
DLTU = a-b
FAC = a-b-c-d

Unit. Valid value(s):
IDCU = a-b^1
IDCURT = a-c^1-d^1
IFAC = a-c^1-e^1

Network element being reported. Valid value(s):
BOTH = Both near and far ends of the facility.
FE = Far end. Far end of a facility.
NE = Near end. Near end of a facility.

Section of the history report for the given network element.
\( v^1 \) = Total sections of the history report for the given network element.

\( w^1 \) = Unit. Valid value(s):

- DNUS=a-a^2
- DNUSRT=a-a^2-d^1
- DS1SFAC=a-a^2-b^2-c^2-d^2-e^2-f^2
- EC1STE=a-a^2-b^2-c^2
- STSFAC=a-a^2-b^2-c^2-d^2
- VT1FAC=a-a^2-b^2-c^2-d^2-e^2-f^2

\( x^1 \) = Interval start time. The PM history intervals are the 32 or 31 (for OIU facilities) previous 15-minute intervals. OIU history counts do not include the previous 15-minute interval. The timestamps represent the start time of each 15 minute interval. If both PREV and HIST counts were requested for non-OIU facilities, the previous 15-minute count report is not printed to avoid redundancy with the first history interval.

\( y^1 \) = Unit. Valid value(s):

- DNUS=a-a^2
- DNUSRT=a-a^2-d^1
- DS1SFAC=a-a^2-b^2-c^2-d^2-e^2-f^2
- EC1STE=a-a^2-b^2-c^2
- STSFAC=a-a^2-b^2-c^2-d^2
- VT1FAC=a-a^2-b^2-c^2-d^2-e^2-f^2

\( a^2 \) = DNU-S number.

\( b^2 \) = Data group number.

\( c^2 \) = STE facility number.

\( d^2 \) = STS facility number.

\( e^2 \) = Virtual tributary group (VTG) number.

\( f^2 \) = Virtual tributary member (VTM) number.

\( g^2 \) = Optical interface unit (OIU) number.

\( h^2 \) = Protection group (PG) number.

\( i^2 \) = Optical carrier level 3 (OC3) number.

\( j^2 \) = Side number.

\( k^2 \) = Number of failure counts (FC) in this interval.

\( l^2 \) = Number of coding violations (CV) in this interval.

\( m^2 \) = Current CV threshold for this interval.

\( n^2 \) = Synchronous transport signal level 1 (STS1) number.
\( \alpha^2 \) = Unit. Valid value(s):

- DS1 = a-g^2-h^2-i^2-n^2-e^2-f^2
- OC3 = a-g^2-h^2-i^2-j^2
- OC3C = a-g^2-h^2-p^2-j^2
- OIU = a-g^2
- PPFLK = a-g^2-h^2-p^2-j^2
- PSU = a-e^4
- PSUPH = a-e^4-f^4-g^4
- STS1 = a-g^2-h^2-i^2-n^2
- STS3C = a-g^2-h^2-p^2-j^2
- VT15 = a-g^2-h^2-i^2-n^2-e^2-f^2

\( \beta^2 \) = Optical carrier level 3 concatenated (OC3C) number.

\( \gamma^2 \) = Synchronous transport signal level 3 concatenated (STS3C) number.

\( \delta^2 \) = Unit. Valid value(s):

- DS1SFAC = a-a^2-b^2-c^2-d^2-e^2-f^2
- DS1SFAC = a-a^2-b^2-c^2-d^2-e^2-f^2
- FAC = a-b-c-d
- TRIB = a-s^2-t^2-u^2

\( \epsilon^2 \) = PLTU number.

\( \theta^2 \) = PCT facility interface.

\( \iota^2 \) = PCT tributary number.

\( \kappa^2 \) = Number of IPH for this interval.

\( \lambda^2 \) = Current IPH threshold for this interval.

\( \mu^2 \) = Number of IPC for this interval.

\( \nu^2 \) = Current IPC threshold for this interval.

\( \xi^2 \) = Number of IIH for this interval.

\( \omicron^2 \) = Current IIH threshold for this interval.

\( \pi^3 \) = Number of IIQ for this interval.

\( \rho^3 \) = Current IIQ threshold for this interval.

\( \sigma^3 \) = Number of IIF for this interval.

\( \tau^3 \) = Current IIF threshold for this interval.

\( \upsilon^3 \) = Number of ICR for this interval.

\( \phi^3 \) = Current ICR threshold for this interval.
h = Number of ICD for this interval.
i = Current ICD threshold for this interval.
j = Number of ICP for this interval.
k = Current ICP threshold for this interval.
l = Number of ICE for this interval.
m = Current ICE threshold for this interval.
n = Number of ICT for this interval.
o = Current ICT threshold for this interval.
p = Number of UUR for this interval.
q = Current UUR threshold for this interval.
r = Number of EUR for this interval.
s = Current EUR threshold for this interval.
t = Number of RDL for this interval.
u = Current RDL threshold for this interval.
v = Number of ERR for this interval.
w = Current ERR threshold for this interval.
x = Payload layer report type. If the field is not displayed, then all counts associated with the identified facility or OIU PPP link will be output. Valid value(s):
   ETH = Report will only contain ETH counts.
   ICMP = Report will only contain ICMP counts.
   IP = Report will only contain IP counts.
   PPP = Report will only contain PPP counts.
   RTP = Report will only contain RTP counts.
   SCTP = Report will only contain SCTP counts.
   SIP = Report will only contain SIP counts.
   UDP = Report will only contain UDP counts.

y = Switching module (SM) number or lower limit of a range of SM numbers.
z = Upper limit of a range of SM numbers.
a = Requested scope. If not blank, valid value(s):
   ALLDS1 = Report for all DS1s on this STS-1.
   ALLVT1 = Report for all VT1.5s on this STS-1.

b = EAIU number.
c = Common data and control controller (COMDAC) number.
4. ACTIONS TO BE TAKEN

None. This message is generated in response to the OP:FAC input message.

5. ALARMS

None.

2. REASON FOR OUTPUT

Format 1 is printed when data is available for a valid umbilical facility - either a T1 host to remote facility (HFAC) or a T1 remote to host facility (T1FAC). Status for the first 23 channels on the T1 facility is displayed in 5 columns. Channel 24 is not displayed since it is always reserved for CCS signaling.

Format 2 is printed when an error occurs while trying to obtain channel data associated with the requested FAC.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DLTU number.
c = DFI number.
d = Facility (FAC) number.
e = Status. Valid value(s):
B = The channel is busy.
C = The channel is being used for a control time slot (applies only to channel 1).
I = The channel is idle.

f = Error type. Valid value(s):
DATA BASE ERROR = Error occurred while trying to obtain channel information.

4. ACTION TO BE TAKEN

None.

5. ALARMS
None.

| 2 | OP FACR STATUS COMPLETED |
|   | NO FACR AUDIT RUNNING |

| 3 | OP FACR STATUS COMPLETED |
|   | FACR AUDIT SUSPENDED |
|   | LAST PROCESSED SM f |

| 4 | OP FACR STATUS COMPLETED |
|   | FACR AUDIT IN PROGRESS |
|   | PROCESSING SM f |

2. REASON FOR OUTPUT

To report on the status of a feature activation counting and reconciliation (FACR) audit or display the scheduled entries.

Format 1 reports a list of entries the FACR has been scheduled for. This output can be used in conjunction with the DEL:FACR input message for removing a scheduled entry.

Formats 2, 3, and 4 will indicate if the FACR audit is running or suspended, along with the SM that is being processed.

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th></th>
<th>Identification number of each FACR scheduled entry.</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Month FACR has been scheduled for (1-12).</td>
</tr>
<tr>
<td>b</td>
<td>Day of the month FACR has been scheduled for (1-31).</td>
</tr>
<tr>
<td>c</td>
<td>Hour of the day FACR has been scheduled for (0-5, 18-23).</td>

<tr>
<td>d</td>
<td>Type of FACR audit requested to be executed. Valid value(s):</td>
</tr>
<tr>
<td>e</td>
<td>OFFICIAL Request for an official run of the FACR audit.</td>
</tr>
</tbody>
</table>
UNOFFICIAL = Request for an unofficial run of the FACR audit. The output from the audit is restricted for use by the service provider.

SUSPENDED = A previous FACR audit has been suspended and is scheduled to restart at the specified date and time.

UNOFC DETAIL = Request for a detail run of the FACR audit for a single NSEP. All detail runs are executed in the unofficial mode.

5ECAP = Request for a FACR special application audit of the 5E hardware in the switch.

5ETOOL = Request for a FACR custom application audit.

f = Switching module currently being processed.

4. ACTIONS TO BE TAKEN

This message is printed out in response to a manual request of the OP:FACR input message. No further action is necessary if the request completed successfully.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

DEL:FACR
OP:FACR

OP:FNAME

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] OP FNAME a
   b NAME
   c d

[2] OP FNAME NOT STARTED
   RETRY LATER e

[3] OP FNAME ABORTED CANNOT OPEN OUTPUT FILE e

[4] OP FNAME ABORTED CANNOT WRITE OUTPUT FILE e

[5] OP FNAME ABORTED CANNOT CREATE TEMPORARY FILE

2. REASON FOR OUTPUT

Format 1 prints the full path names of files.

Format 2 reports why an OP:FNAME input message aborted.

Format 3 reports that an error occurred when trying to create a temporary file.

Format 4 reports that an error occurred when trying to write to a temporary file.

Format 5 reports an error when unable to create a uniquely-named temporary file.

3. VARIABLE FIELD DEFINITIONS

a = Output message status. Valid value(s):
   COMPLETED = Last or only segment of message.
   IN PROGRESS = Intermediate segment(s) of message.
   STARTED = First segment of message.

b = Search type. Valid value(s):
   BLOCK = The check for matches was made on block numbers.
   INODE = The check for matches was made on inodes.

c = Inode or first block number on which the match occurred.

d = Full path name on which the match occurred.
4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, all the inodes of the tmp file system are being used. Clean up unused files in the tmp file system, using the CLR:FSYS-FILE input message, before retrying the OP:FNAME input message.

For Format 3, all tmp file system space has been used up. Clean up unused files in the tmp file system, using the CLR:FSYS-FILE input message, before retrying the OP:FNAME input message.

For Format 4, system resources do not permit the running of this input message at this time. Retry later. If the OP:FNAME input message continues to fail, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

Whenever the retrofit message UPD:GEN-[BEGIN|ENTER|PROCEED|
COMMIT|SWITCHFWD|SWITCHBCK|BACKOUT|SMSWITCH|SMBKOUT|RESTORE|END] are executed, the
retrofit process applhook populates the log file /etc/log/appllog with information indicating what transpired. As
successive retrofit messages are run, additional entries are appended to the appllog file. The execution of the
UPD:GEN-END message indicates the end of the retrofit message sequence and automatically moves the appllog
file to /etc/log/sv.appllog.

Format 1 indicates the appllog file does not exist. The appllog is required to exist to conditionally execute the
ENTER, PROCEED, COMMIT, SWITCHFWD, SWITCHBCK, BACKOUT, SBSWITCH, SMBKOUT, RESTORE, and END retrofit stages.

Format 2 indicates that appllog exists and a printout of the appllog file contents will follow. Format 2 lists a retrofit log
containing a single retrofit log entry. Several retrofit log entries may be present in the appllog report at any one time.
and would print consecutively one after the other until the entire log contents were output. The optional information fields listed in Format 2 depend on which retrofit stage the log entry is for.

All retrofit log entries contain the following information: the mode of execution, date, starting and ending time that the entry was made, and the major and minor reason for error, if any. The major errors are listed in the section 3.

If variable ‘b’ is a BEGIN or END appllog entry, there are no optional fields. The BEGIN stage indicates the start of the retrofit process; the END stage indicates the completion of the retrofit process.

If variable ‘b’ is an ENTER, COMMIT, or RESTORE appllog entry, it includes all the basic information as well as the optional disk process status and disk error messages. The disk process status and disk error messages are listed in section 3.

If variable ‘b’ is a PROCEED appllog entry, it includes all the basic information as well as the path of the source files copied to the offline disk and the results of the file copies. It also includes the optional disk process status and disk error message. In the retrofit stage sequence, the PROCEED stage follows the ENTER stage.

If variable ‘b’ is a SMSWITCH or SMBKOUT, it includes all the basic information as well as the date and time at which the first central processor intervention (CPI) request was sent to the remote switching module (RSM) and the date and time at which the SM responded to the CPI request. The retrofit SMSWITCH stage is normally executed after the PROCEED stage to switch SMs from MCTSI side 0 to MCTSI side 1. The retrofit SMBKOUT stage is normally executed after the PROCEED stage to switch SMs from MCTSI side 1 to MCTSI side 0.

If variable ‘b’ is a SWITCHFWD, SWITCHBCK or BACKOUT appllog entry, it includes all the basic information as well as the path of the source files copied to the off-line disk, the results of the file copies, the date and time at which the first CPI request was sent to the RSMs and the date and time at which the SM responded to the CPI request. The retrofit SWITCHFWD stage is used to switch SMs from MCTSI side containing the "old" software release to the MCTSI side containing the "new" software release. The retrofit SWITCHBCK and BACKOUT stages are used to switch SMs from the MCTSI side containing the "new" to the MCTSI side containing the "old" software release.

If variable ‘n’ is FAILED, it will be followed by the field ‘o’ which will provide information on why the failure occurred.

If variable ‘n’ is "Switched", it will be followed by a date stamp that marks when the SM successfully responded to the CPI request.

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>b</th>
<th>Appllog entry. Valid value(s):</th>
</tr>
</thead>
<tbody>
<tr>
<td>BACKOUT</td>
<td>Switch SMs MCTSI sides that have been offline pumped from the new back to the old software release. This message also copies log files from the active to the offline MHDs.</td>
</tr>
<tr>
<td>BEGIN</td>
<td>Start of the retrofit process, function performed by applhook include creation of the /etc/log/appllog log file, recent change and routine exerciser inhibits, etc.</td>
</tr>
<tr>
<td>COMMIT</td>
<td>MHDs are restored to duplex operation on the new software release. Functions performed by applhook include restoring even numbered MHDs to service.</td>
</tr>
<tr>
<td>END</td>
<td>Completes the retrofit cycle, functions performed by applhook include moving the /etc/log/appllog log file to /etc/log/sv.appllog, recent change and routine exerciser allow, etc.</td>
</tr>
</tbody>
</table>
ENTER = Generic text loading process, function performed by applhook include removing odd numbered moving head disks (MHD) from service and marking the offline.

PROCEED = Final preparation of the offline MHDs for initialization, functions performed by applhook include copying files from the active to the offline MHDs.

RESTORE = MHDs are restored to duplex operation on the old software release when backing out of the retrofit, function performed by applhook include restoring even numbered MHDs to service.

SM BKOUT = Switch SMs from MCTSI side 1 to MCTSI side 0.
SM SWITCH = Switch SMs from MCTSI side 0 to MCTSI side 1.
SWITCH BCK = Switch SMs MCTSI sides that have been offline pumped from the new back to the old software release. This message also copies log files from the active to the offline MHDs.
SWITCH FWD = Switch SMs MCTSI sides that have been offline pumped from the old to the new software release. This message also copies log files from the active to the offline MHDs.

c = Abbreviated weekday - Sun to Sat.
d = Abbreviated month - Jan to Dec.
e = Day of month - 01 to 31.
f = Time of day, in the form hours:minutes:seconds.
g = Four digits of year.
h = The error that occurred during the applhook process. Valid value(s):
ABNORMAL MNTFS ERROR = An error occurred while copying files to the offline disk using the mount offline file system (MNTFS) process.
BAD ARGUMENT = The input arguments are inconsistent.
CONTEXT ERROR = The current state is inconsistent with the usage of this message.
CPI ERROR = A problem was detected while sending central processor intervention (CPI) message.
DD ERROR = A problem with data delivery (DD) was detected.
DISK LOG ERROR = A problem was detected while reading or writing the file /etc/log/appldsklog.
DISK PROCESS FAULT = An error occurred while either making an MHD offline or restoring an MHD from offline to the active state.
MESSAGE ERROR = An error occurred while sending or receiving messages.
OFFLINE COPY ERROR = An error was detected while copying files from the ACTIVE to the OFFLINE MHDs.
RECEIVED SIGNAL = A signal was received which terminated the message.
SM NOT DUPLEX = The SMs are not duplex.
SUCCESS = No error.
UNIX = A UNIX® error occurred.

i = The error that occurred during the applhook process. The complete list of minor errors can be found in the Generic Retrofit Procedures manual.

j = The path of the source file name being copied to the offline MHD followed by the results of the copy. Valid value(s):
CANNOT ALLOCATE ENOUGH SPACE = Could not allocate contiguous space for the destination file.
CPFILE INCORRECT ARGUMENT COUNT = A line in the file cpfile.prc or cpfile.swfwrd is not in the
correct format.

**DEST WRITE ERROR** = An error occurred while writing the destination file.

**DPATH IS NOT A DIRECTORY** = The destination file name already exists and is a directory.

**INCORRECT SOURCE PATHNAME** = The source file directory or the source file does not exist.

**INVALID DEST PATH OR PTN IN CP FILE** = An invalid entry exists in the cpfile.prc or cpfile.swfwd file for the destination path [field 3] or the destination partition [field 4].

**MNTFS ERROR** = The mount offline file system (MNTFS) process returned an error.

**NOT COPIED-POSSIBLE COPY ERROR** = The entry in the cpfile was skipped.

**OFF LINE MOUNT ERROR** = An error occurred while mounting a file system from the offline MHD.

**OFF LINE MOUNT PROCESS DEAD** = The mount offline partition process (MOPP) is not running and should be running.

**SOURCE READ ERROR** = An error occurred while reading the source file.

**SOURCE NOT FOUND-NO FAILURE** = The source file does not exist but the file is marked as unessential in the cpfile.

**SUCCESSFUL** = no error.

**UNIX** = A UNIX® error occurred.

k = The SM number.

l = The SM type. Valid value(s):

- **HSM** = Host switching module.
- **LSM** = Local switching module
- **ORM** = Optically remote module.
- **RSM** = Remote switching module.
- **TRM** = Two-mile remote module.

m = The action performed on the SM. Valid value(s):

- **END STATE** = SM is already on proper side.
- **GROWTH** = SM is in growth state, no action performed.
- **MANUALLY ISOLATED** = SM is manually isolated, no action performed.
- **NOT REQUESTED** = No action has been requested on this SM.
- **SWITCH TO 0** = SM is being switched to side 0.
- **SWITCH TO 1** = SM is being switched to side 1.

n = The result of action 'm' on the SM. Valid value(s):

- **End State** = SM is already in the end state.
- **Expected State** = SM is in the expected state for this action.
- **Failed** = The SM failed to switch, or is initializing and the status could not be determined.
- **Force Cleared** = The force on the SM has been cleared.
- **No Action** = No action has been requested on this SM.
- **Switched** = The SM has switched successfully.
- **Unknown State** = SM is not in the expected state for this action.

o = The last status taken on the SM. This field will be printed whenever the SM switch result 'n' is "FAILED". Each field r,s,t,u,v,w,x,y,z,a1,b1, represents a different SM attribute. Valid value(s): o = (rstuvwxyzga1b1)

p = Disk process status field describes an action taken on the MHDs during the retrofit process. The possible disk process statuses are listed below. Refer to Exhibit B.
Disk error message field describes a fault that occurred during the retrofit process while changing the status of MHDs. Refer to Exhibit C for disk error messages and definitions.

Note: The first disk error message in the log is the cause of the failure. As this failure is returned back to the calling function, these functions will in most cases also print error messages.

r = Status of the DDRISOL (isolation) data delivery key. Refer to Exhibit A for values.

s = Status of the DDCPLVL3 (level 3 communication) data delivery key. Refer to Exhibit A for values.

t = Status of the DDSMGEND (software release difference) data delivery key. Refer to Exhibit A for values.

u = Status of the DDSFRC (SM force) data delivery key. Refer to Exhibit A for values.

v = Status of the DDSMP (SM side) data delivery key. Refer to Exhibit A for values.

w = Status of the DDIMLVL3 (level 3 communication) data delivery key. Refer to Exhibit A for values.

x = Status of the DDSMTMEM (SM mate memory) data delivery key. Refer to Exhibit A for values.

y = Status of the DDOGEND (software release difference) data delivery key. Refer to Exhibit A for values.

z = Status of the DDSOPSTAT (operational status) data delivery key.

a¹ = Spare field (not currently implemented).

b¹ = Spare field (not currently implemented).

{TAPE CONTAINS A VTOC | TAPE CONTAINS AN INVALID VTOC}
PTN START SIZE DESCRIPTION
i j k [l]

[6] OP GEN READHDR ERROR

FAILED UPDATE OF /etc/log/tapelog

2. REASON FOR OUTPUT
To provide information obtained from a load-disk-from-tape (LDFT) format tape header. A volume table of contents (VTOC) is printed if present.

In Format 1, the READHDR message has completed successfully.

In Format 2, the READHDR message could not access the tape drive.

In Format 3, the READHDR message could not interpret the tape header data. The tape may not be in LDFT format, or the tape may have been damaged.

In Format 4, the information from the LDFT tape header is printed. The tape has no VTOC and is therefore not the first tape in the sequence, or is not a text tape or a data base tape.

In Format 5, the information from the LDFT tape header is printed. The tape contains a VTOC which is printed following the tape header information. If the tape contains an invalid VTOC do NOT attempt to use it.

In Format 6, the READHDR message failed to update the /etc/log/tapelog tape data file. This file is used during a software release transition for tape loading. Consult the appropriate software release (retrofit, update, large terminal growth) transition procedures for more information.

3. VARIABLE FIELD DEFINITIONS

a = The tape sequence type. Valid value(s):
DATA_BASE
OTHER_LDFT_TYPE
TEXT
TOP

b = A tape sequence may consist of one tape or multiple tapes if the sequence would not fit on one tape. The tape number in sequence (1, 2, 3...) refers to the order that the tapes were written. The tapes should be loaded in ascending numerical order.

c = Tape density in bytes per inch (BPI) (1600 or 6250).

d = The tape device used to read the header information from the tape. If the tape was mounted on tape drive zero the possible values for this field are "/dev/mt00" and "/dev/mt08." For tape drive one the values are "/dev/mt10" and "/dev/mt18."

e = The destination device file that this tape was written for (such as, /dev/vtoc). This information is useful for determining or verifying the tape loading parameters during a software release transition. Consult the appropriate software release transition procedures for more information.

f = The moving head disk (MHD) pair that the destination corresponds to.

g = The tape sequence identifier is a time stamp used when reading a sequence consisting of more than one tape. Tapes of the same sequence should have the same sequence identifier.

h = The point release level of a text tape.

i = The disk partition number.

j = Start block address on disk of the partition.

k = The size in blocks of the disk partition.
1 = The partition name, if present, or "UNASGNED" (unassigned partition).

4. ACTION TO BE TAKEN

Errors are generally caused by a damaged tape or problems with the tape drive. Follow the software transition procedures used for execution of the message.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print the contents of the system update event log.

Note: Two of these formats may appear in succession with OP:G-READLOG printed only once.

Format 1 indicates that output of the system update event log has been completed.

Format 2 indicates that output of the system update event log has been stopped due to error. The error is identified.

Format 3 displays the FIRST log entry, including the number of entries in the log.

Format 4 displays a BEGIN log entry, indicating that an identified system update process began the update method in use, the mode of execution and the process ID (PID) of the update process, and the date and time that the entry was made.

Format 5 displays a BEGIN log entry for an ENTER process, which includes all the information in Format 4 as well as the pathname of the input file (normally a magnetic-tape device), the pathname of each volume table of contents (VTOC) on each disk-pair being updated, the unit number of the disk file controller (DFC) for each new-release disk (if one was specified), and the tape sequence options used to update the specified disks. Also included is the pathname of the equipment configuration data base (ECD) which will be accessed in the new software release, the partition in which this ECD will reside, the pathname of the system update log in the new software release, and the partition in which this log will reside. Also included is the PID of the update process, and the date and time of the log entry.

Format 6 displays a DISK entry for the backup partition (BKPRT) update method, indicating the type of update process that began updating a disk-pair, the name of the VTOC on this disk-pair, the process identification (PID) of the update process, and the date and time that the entry was made.

Format 7 displays a disconnect (DISK) entry for the off-line disk (OFLDISK) update method, indicating the type of process that began updating a disk, the disk that was to contain (or contained) the new software release, and its mate, the disk that contained the old software release. Also included is the PID of the update process, and the date and time of the log entry.

Format 8 displays a WRITE entry, indicating that an ENTER process began to update a partition, which partition was being updated, and its backup partition (if one exists). Also, the PID of the update process and the date and time of the log entry are included.

Format 9 displays a TAPE entry, indicating that an ENTER process was ready to read a tape, the sequence number of the tape expected, the system generation (SG)-data base ID (time stamp) expected from the tape, the software release-version number expected from the tape, and an indication of whether the tape is in the first or second sequence for the disk-pair. Also included is the process ID of the update process, and the date and time of the log entry.
Format 10 displays an APPLHOOK entry, indicating the type of update process that initiated application-dependent processing, the PID of the update process, and the date and time of the log entry.

Format 11 displays an UPDATE entry indicating that the ENTER process is updating the backup partitions, the PID of the update process, the backup partition number being updated, and the date and time of the log entry.

Format 12 displays a CONTINUE entry, indicating the type of update process that restarted execution, the PID of the update process, and the date and time of the log entry.

Format 13 displays an END entry, indicating that the execution of an update process ended (and the process type), whether the system was booted on primary or backup root, appdmert or dmert (the latter is MIN_CONFIG on the EAI), and for the off-line disk method the boot disk (moving head disk (MHD) 0 or 1). Also included are: whether the process completed successfully or failed, the error code, an error number set by a UNIX system call or DMERT interface function, the PID of the update process, and the date and time of the log entry.

Formats 14 and 15 indicate that an error was made when entering the input message.

Note: The log is normally emptied when a COMMIT or RESTORE process succeeds.

3. VARIABLE FIELD DEFINITIONS

a = Error code for the reason the process stopped/0 implies success. Refer to the APP:SUPR appendix in the Appendixes section of the Output Messages manual.

b = Number of event entries in the system update log.

c = Process ID associated with the log entry.

d = Date stamp - indicates when the log entry was made.

e = Pathname of the input file; as specified in the UPD:G-ENTER input message.

f = Destination VTOC pathname(s) for subsequent write entries.

g = Sequence options used for the specified destinations.

h = Pathname of the ECD to be accessed in the new software release.

i = Partition number of the partition in which the ECD will reside.

j = Pathname of the system update log in the old software release.

k = Partition number of the partition in which the system update log of the old software release resided.

l = Pathname of the system update log in the new software release.

m = Partition number of the partition in which the system update log will reside.

n = Number, in order of updating, of the disk-pair being updated.

o = Date stamp - indicates when the log entry was made.

p = Member number of the disk containing the new software release; associated with subsequent write entries (off-line disk method only).
q = Member number of the duplexed disk containing the old software release; mate for MHD ‘a’ (off-line disk method only).

r = Partition number of the partition written.

s = Partition number of the partition paired with ‘a’, if one exists; 0 implies that no backup to ‘a’ exists.

t = Sequence number of the tape.

u = System generation data base (SG) unique ID (time stamp).

v = Generic and version number of the new software release.

w = Backup partition number being updated.

x = Error number set by a failed UNIX® system call or DMERT interface function (which usually results in process failure); 0 implies success of all system calls (some DMERT functions set this number to nonzero values even on success).

4. ACTION TO BE TAKEN

   a b [ c d ] e       f     g

[7] OP GROW RETRY LATER i

[8] OP GROW WRITE TO j
   FAILED ON KEY #k

2. REASON FOR OUTPUT

To give device information specific to administrative module (AM) hardware units on communities requested by the OP:GROW input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. AM unit names are listed in the APP:MEM-NUM-UNIT Appendix in the Appendixes section of the Input Messages Manual.

b = Unit number. Refer to the APP:MEM-NUM-UNIT Appendix in the Appendixes section of the Input Messages Manual.

c = Subunit name, if a = CU. AM CU subunit names are listed in the APP:MEM-NUM-CU appendix in
the Appendixes section of the Input Messages manual.

d = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

e = The current maintenance state of the unit is indicated by the following identifiers. Valid value(s):

  ACT     = Active units.
  GROW    = Units being grown.
  INIT    = Initializing units.
  OFL     = Offline units.
  OOS     = Out-of-service units.
  STBY    = Standby units.
  UNAV    = Unavailable units.
  UNEQIP  = Unequipped units.

f = Current inhibit status of the associated error source. Valid value(s):

  ALW     = Allowed.
  INH     = Inhibited.

g = Results of the last diagnostic on the unit. Valid value(s):

  ABT     = Aborted diagnostics.
  ATP     = All tests passed.
  CATP    = Conditional all tests passed.
  NTR     = No tests were run.
  STF     = Some tests failed.

h = Error number. Valid value(s):

  9   = Cannot attach to plant measurement library.
  11  = Cannot open equipment configuration data base (ECD sequence).
  12  = Cannot sequence unit control blocks (UCBs).

i = Retry the input message later because:

  CAN'T CREATE FILE IN /tmp
  CAN'T GET DATABASE RECORD ID
  CAN'T SEQUENCE DATABASE

j = Temporary output file name.

k = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To print the hardware check status of specified communication module (CM) units.

If the CM is manually isolated from the administrative module (AM), its current state is not known. In that case, any information reported reflects the last known state of the CM.

3. VARIABLE FIELD DEFINITIONS

a = Text identifier indicating order of HDWCHK record. Valid value(s):
  FIRST = First record of continuing list.
  LAST  = Last record of continuing list.
  NEXT  = Next record of continuing list.

b = Unit identification. Valid value(s):
  CLNK  = Communication link.
  CMP   = Communication module processor.
  FPC   = Foundation peripheral controller.
  MMP   = Module message processor.
  MSCU  = Message switch control unit.
  PPC   = Pump peripheral controller.
  QGP   = Quad-link gateway processor.

c = Maintenance state.

d = Hardware check status. Valid value(s):
  ALW,AUTO = Hardware checks are allowed.
  INH,AUTO = Hardware checks are inhibited by automatic request.
  INH,MAN  = Hardware checks are inhibited manually.

  ATP    = All tests passed.
  CATP   = Conditional all tests passed.
  N/A    = Not applicable.
  NTR    = No tests run.
  STF    = Some tests failed.
4. ACTION TO BE TAKEN

          f    g
...  
d    g
OP HIST  PART d OF e
          f    g
...  
d    g

2. REASON FOR OUTPUT

To respond to an OP:HIST input message.

The header format indicates the command name, history recording status, range of command numbers available, the current part number and the total number of parts. The rest of the message contains the available command numbers and commands of the requested range.

If more than 15 commands are to be output, the request is broken into parts, each containing 15 commands, except, possibly the last part. Only the first part will contain the full header. Subsequent message headers will have the message name and part information.

3. VARIABLE FIELD DEFINITIONS

a = Status of history recording. Valid value(s):
   ALLOWED
   INHIBITED

b = Lowest command number of available range.

c = Highest command number of available range.

d = Part number of the following output message information.

e = Total number of parts of the request.

f = Command number in requested range.

g = Command text identified by adjacent command number.

   b           c
   .           .
   .           .
   .           .

2. REASON FOR OUTPUT

To report all the destinations on the hard-to-reach (HTR) list in response to the OP:HTR input message.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
   ABORTED   = Command failed. System error encountered.
   COMPLETED = Command successfully completed.
   FAILED-OVERFLOW = Command failed. Maximum control limit reached.

b = Destination code (1 to 10 digits). If it is not specified, this will be blank.

c = The feature group D carrier (0 - 9999). If it is not specified, this will be blank.

4. ACTIONS TO BE TAKEN

No action is needed for an automatically generated request from the Remote Network Management Center (RNMC). For manually generated requests, the following actions will apply.

<table>
<thead>
<tr>
<th>'c'</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED</td>
<td>Reinitiate request.</td>
</tr>
<tr>
<td>COMPLETED</td>
<td>The message is confirmation of a request from an input message.</td>
</tr>
<tr>
<td>FAILED-OVERFLOW</td>
<td>Refer to the Feature Description manual for maximum allowable controls.</td>
</tr>
</tbody>
</table>

5. ALARMS

None.

__________________________________________________________________

2. REASON FOR OUTPUT

To report the incoming line history block (ILHB) or an error message in response to an OP:ILHB input message.

Format 1 displays the ILHB status of a directory number (DN).

Format 2 displays the ILHB status of an office equipment (OE) number, which includes the following: an integrated digital carrier unit (IDCU) line equipment number (ILEN), an integrated services line card equipment number (LCEN), a line equipment number (LEN) of a line, an SLC® line equipment number (SLEN), or an Integrated services line circuit (LCKEN).

Format 3 reports an error response for a DN.

Format 4 reports an error response for an OE number, which includes the following: an ILEN, a LCEN, a LEN, a SLEN, a LCKEN.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Ten-digit directory number (DN) of the line.
b = Date of the last incoming call. Listed in the form of month/day.

c = Time of day of the last incoming call. Listed in the form of hour and minute.

d = Last incoming calling DN.

e = Multiple call indicator. Valid value(s):
   NO = No call was active when this call updated the last incoming call.
   YES = A call was already active when this call updated the last incoming call.

f = Incoming privacy indicator (used for per call privacy and all call privacy features). Valid value(s):
   NO = The LICDN was marked public for display.
   YES = The LICDN was marked private for display.

g = Local area switching services (LASS) customer originated trace (COT) indicator. Valid value(s):
   NO = The LICDN has not been traced using COT.
   YES = The LICDN has already been traced using COT.

h = Individual dialing plan (IDP) indicator. Valid value(s):
   NO = The calling party did not use IDP intercom dialing.
   YES = The calling party (identified by the LICDN) used IDP intercom dialing.

i = LICDN screening indicator. Valid value(s):
   NP = Network-provided.
   UPNS = User-provided - not screened.
   UPSP = User-provided - screened and passed.
   UPSF = User-provided - screened and failed.

j = LICDN type of address. Valid value(s):
   INTL = International.
   LOC = Local.
   NATL = National.
   UNK = Unknown.

k = LICDN numbering plan. Valid value(s):
   ISDN = Integrated services digital network.
   PRIV = Private.
   PUB = Public.
   UNK = Unknown.

l = Uniqueness of the LICDN. Valid value(s):
   NO = Calling DN is not unique.
   UNK = Unknown.
   YES = Calling DN is unique.

m = Calling name and calling number presentation indicator for the calling DN (the LICDN). Valid value(s):
NAP = Name presentation indicator was invoked by the calling DN.
NNDA = Name and number display code was invoked by the calling DN.
NNP = Name and number presentation access code was invoked by the calling DN.
NOP = No name and number presentation access code was invoked by the calling DN.

n = Valid value(s):
ILEN=q-r-s-t
LCEN=q-h^1-i^1-w
LCKEN=q-h^1-v-f^1-g^1
LEN=q-u-e^1-y-z-a^1
SLEN=q-b^1-c^1-d^1

o = Party. For an analog ILEN, LEN, LCEN, or SLEN, valid values are:
I = Individual line.
T = 2 party tip.
R = 2 party ring.
0-9 = Multi-party.

For an ISDN LCEN, ILEN, and LCKEN valid values are:
I,0 = Point-point.
0-7 = Multi-point.

p = Error message in response to an OP:ILHB input message. Valid value(s):
DATA BASE READ FAILURE - rlAR_CF = Data from the relation rlAR_CF could not be successfully retrieved, because a database read failure occurred.
DATA BASE READ FAILURE - rlFC_LINE = Data from the relation rlFC_LINE could not be successfully retrieved, because a database read failure occurred.
DATA BASE READ FAILURE - rlLPT_PT = Data from the relation rlLPT_PT could not be successfully retrieved, because a database read failure occurred.
DN CONTAINS AN INVALID NPA = The DN contains a numbering plan area (NPA) that is invalid or does not exist.
DN CONTAINS AN INVALID NXX = The DN contains an office code that is invalid or does not exist.
DN IS INVALID = The hundreds group is not populated for the specified DN, or the specified DN is invalid or does not exist.
INCOMING LINE HISTORY BLOCK NOT AVAILABLE = The specified DN or OE is not allowed for LASS feature requests, or the ILHB is not available for this request.
NOT PROCESSED: LASS SUPPORT PACKAGE NOT LOADED = The switch does not have the appropriate local area signaling services (LASS) software loaded to handle the request.
OE OR PTY IS INVALID = The OE number or the party is invalid or does not exist.
PTY IS INVALID = The party is invalid or does not exist.
RETRY LATER: REQUEST COULD NOT BE PROCESSED = Switch resources were not available to allow processing of the request.
SM REDUNDANT DATA MISMATCH = This request was not processed, because data was inconsistent across SMs.
UNEXPECTED DATA VALUE = A software fault has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
q = Switching module (SM) number.
r = IDCU number.
s = Remote terminal (RT) number or IDCU facility (IFAC) number.
t = RT line number or IFAC channel number.
u = Line unit number.
v = Line group number.
w = Line card number.
y = Switch board number.
z = Switch number.
a¹ = Level number.
b¹ = Digital carrier line unit (DCLU) number.
c¹ = RT number.
d¹ = RT line number.
e¹ = Grid number.
f¹ = Line board number.
g¹ = Line circuit number.
h¹ = ISDN line unit (ISLU/ISLU2).
i¹ = Line group controller number.

4. ACTION TO BE TAKEN

None.

5. ALARMS

6. OP INIT IN PROGRESS
   a b [ c d ] e f g

7. OP INIT RETRY LATER i

8. OP INIT WRITE TO j
   FAILED ON KEY #k

2. REASON FOR OUTPUT

To give device information specific to administrative module (AM) hardware units on communities requested by the OP:INIT input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. AM unit names are listed in the APP:MEM-NUM-UNIT appendix in the Appendixes section of the input manual.

b = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the input manual.

c = Subunit name, if a = CU. AM CU subunit names are listed in the APP:MEM-NUM-CU appendix in
d = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Output Messages manual.

e = The current maintenance state of the unit. Valid value(s):
   ACT = Active units.
   GROW = Units being grown.
   INIT = Initializing units.
   OFL = Offline units.
   OOS = Out-of-service units.
   STBY = Standby units.
   UNAV = Unavailable units.
   UNEQIP = Unequipped units.

f = Current inhibit status of the associated error source. Valid value(s):
   ALW = Allowed.
   INH = Inhibited.

g = Results of the last diagnostic on the unit. Valid value(s):
   ABT = Aborted diagnostics.
   ATP = All tests passed.
   CATP = Conditional all tests passed.
   NTR = No tests were run.
   STF = Some tests failed.

h = Error number. Valid value(s):
   9 = Cannot attach to plant measurement library.
   11 = Cannot open equipment configuration database (ECD) sequence.
   12 = Cannot sequence unit control blocks (UCBs).

i = Retry the input message later because:

   CAN'T CREATE FILE IN /tmp
   CAN'T GET DATABASE RECORD ID
   CAN'T SEQUENCE DATABASE

j = Temporary output file name.

k = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

    . . . . . . .
    . . . . . . .

[2]  OP INVEN SM a OIU=c l

__________________________________________________________________________

2. REASON FOR OUTPUT

Format 1 is used to display error returns or inventory information for all circuit packs on an optical interface unit (OIU) or on an access interface unit (AIU), or to display inventory information for all OIU circuit packs on a given switching module (SM).

The types of error returns include:
- AIU error returns when a hardware error is encountered
- AIU error returns when a circuit is out of service.
- AIU error returns for a resource related error.
- OIU error returns when an OFI is out of service.
- OIU error returns when the OFI is in service but an error is encountered when attempting to retrieve the data.

Format 2 is used when there are no OFI circuits or there is an invalid OIU number.

3. VARIABLE FIELD DEFINITIONS

a  = SM number.
b  = Unit type. Valid value(s):
   AIU  = Unit is an AIU.
   OIU  = Unit is an OIU.
c  = Unit number.
d  = Text identifier showing order of OP INVEN record. Valid value(s):
   FIRST  = First record of continuing list.
   NEXT   = Next record of continuing list.
   LAST   = Last record of list.
e  = Circuit pack external name.
f  = Circuit packcode identifier or an error indicator. For an error, valid value(s):
g = Circuit pack interchangeability marker or an error indicator. For an error, valid value(s):

H'ff
OFI
DATA

h = Circuit pack serial number or an error indicator. For an error, Valid value(s):

HARDWARE
CKT NOT ACT
RESOURCE
UNAVAILABLE

i = Circuit pack common language equipment identifier or an error indicator. For an error, valid value(s):

ERROR
-------

j = Circuit pack equipment code identifier or an error indicator. For an error, valid value(s):

ERROR
------

k = Circuit pack common code or an error indicator. For an error, valid value(s):

ERROR
-------

l = Error return string. Valid value(s):

SM HAS NO OFI CIRCUITS = Requested SM or OIU has no OFI circuits.
INVALID OIU NUMBER = OIU unit does not exist.
OIU HAS NO OFI CIRCUITS = Requested OIU is in growth with no assigned OFIs.

.
.
.

2. REASON FOR OUTPUT

To report the result of the OP:IOP input message.

3. VARIABLE FIELD DEFINITIONS

a = IOP member number.

b = Message status. Valid value(s):
   ABORT
   ERROR
   NOT_STARTED
   STOPPED

c = Process stop or error code. Valid value(s):
   f01 = Failed to enable message reception.
   f03 = Failed to open ECD.
   f06 = Failed to get UCB by name.
   f08 = Failed to get down UCB.
   f09 = Failed to get the side UCB.
   f0a = Top UCB is not an IOP.
   f10 = Failed to send message to I/O driver.
   f11 = Failed to unreserve UCB.
   f12 = Failed to receive acknowledgement from I/O driver.
   f13 = Failed to close ECD.
   f14 = Failed to reserve UCB.
   f15 = A message to driver has been lost, time out.
   f16 = Terminated externally with signal.
   f20 = Failed to get UCBL.
   f21 = Failed to get page table address.
f23 = Failed to assign a DMA slot.
f24 = Failed to queue a job.
f25 = Failed to define a task with an UCBIP as the idcode, function timreq1 failed.
f27 = I/O is BUSY.
f28 = Time out when access RAM.

d = System error code.
e = IOP unit name.
f = Unit number.
g = MV number.
h = Major states.
i = Pack code.
j = RAM code version.
k = Area where the RAM code version is read from. Valid value(s):
   ECD = Version is read from the ECD.
   RAM = Version is read from the RAM.
c = Refer to variable ‘c’.

4. ACTIONS TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If any unit of the associated IOP is reserved, however, certain fields will contain information that is not available. For more complete information, try the message again after the unit is released.

A termination report specifying non-completion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

5. ALARMS

None. This alarm is a manually-requested report.

[2] OP IPCFG a [NSEGS=m] [SM=n] c

2. REASON FOR OUTPUT

To print the IP configuration (IPCFG) information collected for an OP:IPCFG request.

Format 1 provides the output of IPCFG when the input specifies:
- All possible IP configuration information in the office.
- All possible IP configuration information from a specific SM.
- IP configuration information for a specific IP address.
- All possible IP configuration information from a specific network ID.

Format 2 provides the output of the completion report of an IPCFG data request. Abnormal conditions encountered are also reported using this format.

3. VARIABLE FIELD DEFINITIONS

a = Input parameters. Refer to the OP:IPCFG input message for valid values.

b = Number of this segment in the listing produced. Segments are numbered sequentially starting from one.

c = Completion report. Valid value(s):
COMPLETED = All of the data has been found and printed.
CONTINUED = Second and subsequent segments of a list too long to be printed in a single segment.
DATABASE ERROR = An internal database failure prevented the IPCFG trunk data request from further processing. The request has been aborted.
INVALID SM = The request cannot be processed because the specific SM is not a provisioned SM number.
NO DATA FOUND = The search was performed as requested, but no data was found for the given input.
SM UNAVAILABLE = A specific SM was unavailable.
STARTED = Indicates the first segment in the list. This does not necessarily imply that additional segments will be produced.
SYSTEM UNAVAILABLE = Indicates the system was too busy to process the request or a system resource failure occurred. Retry later.

TIMEOUT = A timeout occurred waiting for a SM response.

SYSTEM ERROR = Indicates a system error was encountered during processing of the request or a system resource failure occurred. Retry later.

d = SM number found for output. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

e = IP Address found for output.

f = Subnet mask found for output.

g = Network ID found for output.

h = Unit type (OIU, PH or SM) found for output. For SM unit types, no other equipment data is output.

i = Unit number found for output. For OIUs this is the OIU number. For PHs, the output includes the PSU number and PSU shelf.

j = Protection/channel group number found for output. For OIUs, the protection group (PG) is output. For PHs, the channel group (CG) is output.

k = Processor group (PG) number found for output (only for SIP PHs).

l = Interface type. Valid value(s):
   Internal = SM/PH processor IP assignment used internally on the 5ESS® switch.
   OC-3c = IP address associated with an OIU-IP OC-3c facility.
   ETH = IP address associated with a PH ethernet facility.
   X.25 = IP address associated with a X.25/X.75 facility.

m = The total number of segments output for an IPCFG trunk data request. No segment count is produced if no segments were printed for the request prior to the output of the completion report.

n = Switching module number. This information is output only when a SM specific error status is being reported.

4. ACTIONS TO BE TAKEN
None.

5. ALARMS
None.

6. REFERENCES
Input Message(s):
   OP:IPCFG
   STP:IPCFG
Output Message(s):

STP: IPCFG
52. OP:J
OP:JOBSTATUS-A

Software Release: 5E14 only
Message Class: TLWS
Application: 5
Type: Output

1. FORMAT

[1] OP JOBSTATUS a b TASKS CURRENTLY ACTIVE STARTED

[2] OP JOBSTATUS b PID=c UNIQ=d

[3] OP JOBSTATUS j

2. REASON FOR OUTPUT

To identify all active jobs controlled by the automatic task administrator (ATA) or by the Autoplex(r) automatic task administrator (AATA) system process in the administration module (AM). ATA jobs are identified as "TLWS" jobs. Refer to variable 'b'. This message is in direct response to an OP:JOBSTATUS input message.

The jobs listed by OP:JOBSTATUS were initiated by one or more input messages described by variable 'f', to accomplish a specific maintenance action. The information contained in this message indicates which ATA jobs or AATA jobs are still executing, and can be used to determine whether a previously requested maintenance action has completed or not. If desired, the job (identified by the task identifier contained in this message) may be aborted using the ABT:TASK input message. Since the ABT:TASK purges the running AM process, its use is strongly discouraged, and should only be used when unable to stop the process by other means.

The list of jobs is composed of a "start-of-list" message (Format 1), followed by zero or more messages that identify active tasks (Format 2), and terminated by an "end-of-list" message (Format 3).

3. VARIABLE FIELD DEFINITIONS

a = The number of tasks currently active in the AM.

b = Job type. Valid value(s):
   AATA = AATA maintenance task.
   TLWS = TLWS maintenance task.

c = Task process number associated with the task. It is required if the task is to be aborted via the ABT:TASK command.

d = A uniqueness qualifier to further identify the task. It is also required if the task is to be aborted via the ABT:TASK command.

e = Priority given an AATA maintenance task (1 is the lowest priority).

* = Indicator (for AATA job type) is printed if the job has been running more than one hour.

f = The type of task.

Input Message(s):

ABT:OTO
System Maintenance Requirements and Tools
53. OP:L
OP:LASRQST-A

Software Release: 5E14 only
Message Class: CP
Application: 5
Type: Output

1. FORMAT

OP LASRQST SM = a
DN = b [LATA = c] OPC = f
d

2. REASON FOR OUTPUT

To report the result of a directory number (DN) validation request in response to an OP:LASSRQST input message. If the request could not be processed, the message should be tried again later. If the DN is invalid, a reason will be provided.

Terminating restrictions and terminal group station restrictions (TGSRs) on a user's DN may impact whether or not DNs can be added to the user's screen list. When the input message is used to validate a DN, no user's DN is specified. Therefore, the terminating restrictions and TGSRs for a specific user's DN and the DN to be validated must be compared as described below.

3. VARIABLE FIELD DEFINITIONS

a = Number of the switching module (SM) that processed the OP:LASSRQST message.
b = Ten-digit directory number.
c = Local access transport area (LATA) number.
d = Result of the DN validation request. Valid value(s):
   NOT PROCESSED: LASS SUPPORT PACKAGE NOT LOADED = The switch does not have the appropriate local area signaling services (LASS) software loaded to handle the request.
   RETRY LATER: RESPONSE MESSAGE WAS NOT RECEIVED = The DN resides off-switch and a common channel signaling (CCS) message requesting validation was sent. A response message was expected but was not received.
   RETRY LATER: REQUEST COULD NOT BE PROCESSED = Switch resources were not available to allow processing of the request.
   RETRY LATER: TEMPORARY INTERSWITCH CCS NETWORK FAILURE = Interswitch messages could not be sent or received.
   IS INVALID: LINE DATA UNAVAILABLE = The specified DN exists in another switch, but data needed for validation does not exist.
   IS INVALID: CCS7 TCAP QUERY MESSAGE WAS REJECTED = The DN resides off-switch and the CCS request message was rejected.
   IS INVALID: CCS RESOURCES UNAVAILABLE = The DN resides off-switch and CCS resources do not exist to transmit a request message.
   IS INVALID: IS INCOMPATIBLE WITH LASS FEATURES = The DN cannot be uniquely identified by LASS selective features (LSFs) or LSFs cannot operate on this DN because of other line characteristics.
   IS INVALID: HAS ORIGINATING RESTRICTIONS = The specified DN cannot originate phone calls and, therefore, would not be added to a user's screen list.
IS INVALID: LONG-TERM INTERSWITCH CCS NETWORK FAILURE = CCS connectivity required to validate the specified DN does not physically exist.

IS INVALID: IS UNASSIGNED = The specified DN is not currently in service.

IS VALID: WOULD BE ADDED TO A SCREEN LIST = The specified DN is completely valid. The user’s DN, however, should still be checked. Terminating restrictions would preclude validity of the specified DN, causing validation failure. Semi- or full-terminating TGSRs would require that the user’s DN and the specified DN be in the same terminal group for complete validation success.

WOULD BE VALID: CHECK TERMINAL GROUP RESTRICTIONS, TGID=e = It is printed only with this response when the DN resides in the host switch and is valid in all other respects. The specified DN would be completely valid only if both the specified DN and the user’s DN have the same TGID and the user’s DN is not terminating restricted.

\[ e \] = The terminal group identifier (TGID) of the DN being validated.

\[ f \] = Origination point code. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

4. ACTION TO BE TAKEN

5. ALARMS

None.

6. REFERENCES

Input Message(s):

OP:LASSRQST

Other Manual(s):
235-190-120 Common Channel Signaling Services Features
OP:LASSRQST-B

Software Release: 5E15 and later
Message Class: CP
Application: 5
Type: Output

1. FORMAT

OP LASSRQST SM = a
    DN = b   [LATA = c]   OPC = f   PLATFORM = g
    d

2. REASON FOR OUTPUT

To report the result of a directory number (DN) validation request in response to an OP:LASSRQST input message. If the request could not be processed, the message should be tried again later. If the DN is invalid, a reason will be provided.

Terminating restrictions and terminal group station restrictions (TGSRs) on a user’s DN may impact whether or not DNs can be added to the user’s screen list. When the input message is used to validate a DN, no user’s DN is specified. Therefore, the terminating restrictions and TGSRs for a specific user’s DN and the DN to be validated must be compared as described below.

3. VARIABLE FIELD DEFINITIONS

a = Number of the switching module (SM) that processed the OP:LASSRQST message.
b = Ten-digit directory number.
c = Local access transport area (LATA) number.
d = Result of the DN validation request. Valid value(s):

- NOT PROCESSED: LASS SUPPORT PACKAGE NOT LOADED = The switch does not have the appropriate local area signaling services (LASS) software loaded to handle the request.
- RETRY LATER: RESPONSE MESSAGE WAS NOT RECEIVED = The DN resides off-switch and a common channel signaling (CCS) message requesting validation was sent. A response message was expected but was not received.
- RETRY LATER: REQUEST COULD NOT BE PROCESSED = Switch resources were not available to allow processing of the request.
- RETRY LATER: TEMPORARY INTERSWITCH CCS NETWORK FAILURE = Interswitch messages could not be sent or received.
- IS INVALID: LINE DATA UNAVAILABLE = The specified DN exists in another switch, but data needed for validation does not exist.
- IS INVALID: CCS7 TCAP QUERY MESSAGE WAS REJECTED = The DN resides off-switch and the CCS request message was rejected.
- IS INVALID: CCS RESOURCES UNAVAILABLE = The DN resides off-switch and CCS resources do not exist to transmit a request message.
- IS INVALID: IS INCOMPATIBLE WITH LASS FEATURES = The DN cannot be uniquely identified by LASS selective features (LSFs) or LSFs cannot operate on this DN because of other line characteristics.
- IS INVALID: HAS ORIGINATING RESTRICTIONS = The specified DN cannot originate phone calls and, therefore, would not be added to a user’s screen list.
IS INVALID: LONG-TERM INTERSWITCH CCS NETWORK FAILURE = CCS connectivity required to validate the specified DN does not physically exist.

IS INVALID: IS UNASSIGNED = The specified DN is not currently in service.

IS VALID: WOULD BE ADDED TO A SCREEN LIST = The specified DN is completely valid. The user's DN, however, should still be checked. Terminating restrictions would preclude validity of the specified DN, causing validation failure. Semi- or full-terminating TGSRs would require that the user's DN and the specified DN be in the same terminal group for complete validation success.

WOULD BE VALID: CHECK TERMINAL GROUP RESTRICTIONS, TGID=e = It is printed only with this response when the DN resides in the host switch and is valid in all other respects. The specified DN would be completely valid only if both the specified DN and the user's DN have the same TGID and the user's DN is not terminating restricted.

e = The terminal group identifier (TGID) of the DN being validated.

f = Origination point code. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

g = Signaling Platform. Valid value(s):

0 = Common Network Interface (CNI) Platform
1 - 192 = Global Switching Module (GSM) Number

[1] OP LIST a [FULL] [SM b] [c] [c] [c] [c] [c] SEGMENT d e [f] [LCEN g h i j] [k] l [l] [l] [l] [l] [m] [m] [m] [m] [m]

[2] OP LIST a [FULL] [SM b] [c] [c] [c] [c] [c] NSEGS o e

2. REASON FOR OUTPUT

To respond to an OP:LIST input message manual request to output a list of data links that match a specified status. The list, if long, will be broken into segments.

Format 1 is used to list the data links that match the specified status. The end of the list and termination report is indicated by a trailer message described in Format 2.

3. VARIABLE FIELD DEFINITIONS

FULL = The primary and all pending statuses for each data link was requested.
a = Indicates what the request was for. Valid value(s):
   AP [n]
   AQ [o]
   DASC [n]
   DATALINKS
   DSLG g p
   EIS [t]
   HOBICR [n]
   HOBICV [n]

   MISLNK [n]
   OAPF
   OAPO
   RAS [n]
   RTRS [n]
   XDB [n]

b = The switching module number that was requested.
c = The status mask entered in the input message which indicates which lines should be included in the list. Fields not specified are ignored. The first subfield indicates the basic state. The second subfield indicates the qualifier. The third subfield indicates the operational restrictions. The fourth
The fifth subfield indicates the mode of the line status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Message manual for a complete list of possible status subfields.

d = Segment number of this segment of the list. Segments are numbered sequentially starting from 1.

e = Completion report. Valid value(s):
  - COMPLETED = All items in the requested list have been output. Will occur only in a trailing (Format 2) message.
  - CONTINUED = Indicates second and subsequent segments of a list that was too long to be printed in a single segment.
  - INPUT ERROR = The input request was in some way incorrect.
  - INV STATUS = The status entered was invalid. Since no lines could possibly have matched, the search was not performed.
  - NO MATCH = The search was performed as requested, but no lines were found that satisfied the status requested.
  - STARTED = Indicates the first segment in the list. This does not necessarily imply that additional segments will be required. The list will be terminated by a 'end-of-list' message (Format 2).
  - STOPPED = The list was stopped by manual action.
  - SYSTEM BUSY = The system was too busy to perform the request or a system resource failure occurred which prevented the request from being processed. This could indicate that another OP:LIST request is in progress.
  - SYSTEM ERROR = An unspecified internal system error occurred which prevents further processing. The request has been aborted.

f = Indicates what the request was for. Valid value(s):

  - XDB n q

g = Switching module (SM) number.

h = Line unit number.

i = Line group number.

j = Line card number.

k = Channel identifier. Valid value(s):
l = Primary status for the line. This is the most restrictive status currently on the line. The first subfield indicates the basic state; the second subfield indicates the qualifier; the third subfield indicates the operational restrictions; the fourth subfield indicates the supplementary information; the fifth subfield indicates the mode of the line status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Message manual for a detailed explanation of the status.

m = Pending statuses for the line. The first subfield indicates the basic state; the second subfield indicates the qualifier; the third subfield indicates the operational restrictions; the fourth subfield indicates the supplementary information; the fifth subfield indicates the mode of the line status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Message manual for a detailed explanation of the status and the status hierarchy.

n = Data link group number.

0 = Total number of segments in the list.

q = Relative link number.

p = The protocol handler (PH) channel group number.

r = EIS identifier on which a CPDL terminates.

s = The force management center number of the OAPF.

t = The operator service center number of the OAPO.

[3] OP LIST FLOWACT
COMPLETED

2. REASON FOR OUTPUT

Format 1 indicates the status of the packet switch unit (PSU) asynchronous transfer mode (ATM) link (PSALNK) in response to an OP:LIST-FLOWACT input message. This format is used when the request for the specific PSALNK cannot be completed or there is no active performance monitoring (PM) flows for the PSALNK.

Format 2 provides active PM session data associated with a specific PSALNK in response to an OP:LIST-FLOWACT input message.

Format 3 indicates the completion of the OP:LIST-FLOWACT input message. This output is always printed after all target PSALNKs have reported (in either Format 1 or Format 2).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number of the target PSALNK.
b = PSU number of the target PSALNK.
c = Link number of the target PSALNK.
d = Status. Valid value(s):
   NO ACTIVE FLOWS FOUND = There are no active PM flows on this PSALNK.
   NO ACTIVE FLOWS FOUND - PARENT HARDWARE OOS = No active flows were found because the PH was OOS.
   UNABLE TO SERVICE REQUEST - CORRUPT DATA ON THE PH = The request could not be serviced because the data on the PH is corrupt.
   UNABLE TO SERVICE REQUEST - NO SM RESPONSE RECEIVED = The request could not be serviced because there was no response from the SM.
   UNABLE TO SERVICE REQUEST - PH UNAVAILABLE = The request could not be serviced because the PH was unavailable.
UNABLE TO SERVICE REQUEST – SM DATABASE ERROR = The request could not be serviced because of an internal database error.
UNABLE TO SERVICE REQUEST – SM UNAVAILABLE = The request could not be serviced because the SM was unavailable.

e = Far subnetwork ID.
f = Far community address.
g = Application type. Valid value(s):
   H = High.
   L = Low.

h = Internal PM session ID number as seen on RC/V View 22.31 (PSU TO PSU PERFORMANCE MONITORING SESSION). For external PM sessions, this field is blank.
i = Direction of the PM session. Valid value(s):
   BW = Both way.
   I = Incoming.
   O = Outgoing.

j = Block size of the PM session.
k = Activation type of the PM session. Valid value(s):
   EXTERNAL = PM session was activated either by another switch, by the local switch using an intra-SM and inter-PSU connection (when dual PSUs exist), or by the local switch via an inter-SM connection.
   INTERNAL = PM session was activated by the local switch.
   SHARED = PM session was activated both internally and externally. The ATM virtual circuit is being tracked for performance by both the local switch and a remote endpoint simultaneously.

4. ACTIONS TO BE TAKEN

For Format 1 outputs, if there is an indication that the request could not be serviced due to a problem with the SM, verify the current status of the SM. If there is an indication that the request could not be serviced due to a problem with the PH, verify the current status of the PH.

5. ALARMS

[g]
[ PRIMARY  HISTORY1  HISTORY2  HISTORY3]
[k   m   n   o   p ]
[MATEDLT=i  q   r   s   t ]
__________________________________________________________________

2. REASON FOR OUTPUT

To respond to an OP:LIST-ISMNAIL input message and indicates in a list form the status of inter-SM (switching module) nailups (ISMNAILs). Format 1 is produced by requesting the status for all ISMNAILs emanating from a specific SM. Only primary maintenance status and the "master/slave" characteristic of the ISMNAIL data link terminal (DLT) on the source SM will be provided. Format 2 is produced by requesting the status for all ISMNAILs emanating from a specific ISM channel group (CHNG). Only primary maintenance status of the ISMNAIL DLT on the source SM/CHNG will be provided. Format 3 is produced by requesting the status for all ISMNAILs between a specified pair of SMs. Primary and history maintenance status of the ISMNAIL DLT on both the source and the destination SMs will be provided.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Channel group number.
c = Mate SM number.
d = Output message segment, designated FIRST, NEXT or LAST. (If there is only one segment, LAST will be output).
e = Event number.
f = Termination report. Valid value(s):
COMPLETED = Request completed successfully.
FAILURE = Request was terminated before a normal completion.
= Additional data qualifying the termination of the request. Includes the following. Valid value(s):
DATABASE PROBLEM = Problem occurred while attempting to access critical data (accompanying
ASSERT should provide more details).
LACK OF MESSAGE RESOURCE = Message resources were not available in the administration
module (AM) and the craft request could not be forwarded to the SM for execution.
MESSAGE NOT RECEIVED = Expected message not received by ATA terminal process within
designated timeout interval.
NO OPTION MATCH = None of the ISMNAILs had states corresponding to option specified in the
input request.
STOPPED = Request stopped due to manual intervention.
SM IN MINMODE = SM is in MINMODE, and, therefore, cannot support ISMNAILs.
SM ISOLATED = SM is isolated, and requested action cannot be honored.
TERMINAL PROCESS NOT CREATED = An automatic task administrator (ATA) terminal process to
execute the craft request could not be created due to system problems.
TIMEOUT = Timeout occurred.
Note: For many failed restorations, the ISMNAIL may be left in a state, which will allow a
successful automatic restoration at some later time; use OP:ST-ISMNAIL to
determine current status associated with the affected ISMNAIL.

h = Mate SM number which represents the SM at the other end of the ISMNAIL.
i = DLT number (1-160).
j = SM number that represents the SM of the ISMNAIL.
k = Mate DLT number (1-160).
l = Master status of the source DLT. Valid value(s):
N = The DLT is slave.
Y = The DLT is master.
m = The primary status for the source port associated with the ISMNAIL; this is the most restrictive
status currently on the port. Valid value(s):
IS = In-service (normal operation).
ISOLATED = No status data could be derived from the SM due to isolation.
OOS DLI = OOS dual link interface (DLI) ISMNAIL is OOS due to a removed DLI on the
major office network and timing complex (ONTC).
OOS DSBLD = OOS disabled (DSBLD) indicates the ISMNAIL is manually removed.
OOS DSLINIT = OOS Initialization (DSLINIT) ISMNAIL will be automatically scheduled for an
initialization.
OOS MASTRSM = Slave ISM port is OOS awaiting a restoration, which must be triggered by the
mate master SM.
OOS NLI = OOS network link interface (NLI) ISMNAIL is OOS due to a removal of all NLIs on
the major office network and timing complex (ONTC).
OOS PSU = OOS packet switch unit (PSU) the ISMNAIL is OOS because of an
OOS/degraded protocol handler (PH).
OOS SLAVESM = Master ISM port is OOS due to problem in mate slave SM.
OOS TBI = OOS to-be-ided (TBI) indicates the ISMNAIL is on the TBI list due to data
corruption discovered by audits; this is a transient state and recovery is automatic.
OOS TBLA = OOS trouble analysis (TBLA) indicates the ISMNAIL is OOS for no known
hardware reasons, but cannot be restored to service for any reasonable length of
time; repeated automatic restorations have been attempted, and maintenance personnel intervention is now required.

**OOS TMSCONN** = OOS time multiplexed switch link connectivity; ISMNAIL is OOS due to a TMS interconnectivity problem between the SMs (out-of-service DLI/NLIs or TMSLNKS) at one or more ends of the nailup.

**TRANSIENT** = The ISMNAIL is in a transient state, due to maintenance activity.

**UNKNOWN** = No status data received from the SM within the allotted timeout interval; valid reasons include unavailability of message resources, high levels of call processing/maintenance activity, or overload.

\[ n \] = The first pending (history) status for the source port associated with the ISMNAIL; a port can have zero to three pending statuses, in addition to the primary status. They are produced only in Format 3 output. Valid value(s):

- **NO STATUS** = No pending (history) status.
- **OOS DLI** = The ISMNAIL is OOS due to a removed DLI on the major ONTC.
- **OOS DSBLD** = The ISMNAIL is manually removed.
- **OOS NLI** = This ISMNAIL is OOS due to a removal of all NLIs on the major ONTC.
- **OOS PSU** = The ISMNAIL is OOS because of an OOS/degraded PH.
- **OOS SLAVESM** = Master ISM port is OOS due to problem in mate slave SM.
- **OOS TMSCONN** = The ISMNAIL is OOS due to a TMS interconnectivity problem between the SMs (out-of-service DLI/NLIs or TMSLNKS) at one or more ends of the nailup.

\[ o \] = The second pending (history) status for the source port associated with the ISMNAIL (Format 3 outputs only).

\[ p \] = The third pending (history) status for the source port associated with the ISMNAIL (Format 3 outputs only).

\[ q \] = The primary status for the destination port associated with the ISMNAIL (Format 3 outputs only). Possible values are the same as listed for variable \( k \).

\[ r \] = The first pending status for the destination port associated with the ISMNAIL (Format 3 outputs only). Possible values are the same as listed for variable \( m \).

\[ s \] = The second pending (history) status for the destination port associated with the ISMNAIL (Format 3 outputs only).

\[ t \] = The third pending (history) status for the destination port associated with the ISMNAIL (Format 3 outputs only).

\[ u \] = State filtering option (selected by the input request). Valid value(s):

- **ALL** = Output produced regardless of status.
- **IS** = Only in-service (IS) ISMNAILs will be output.
- **OOS** = Only out-of-service (OOS) ISMNAILs will be output.

\[ v \] = Source DLT channel group number (0-80).

\[ w \] = Source DLT channel group member (Spyder) number (0-128).

**4. ACTION TO BE TAKEN**
No further action is necessary if the request completed successfully.

If the termination report is FAILURE, the 'g' field will give some indication as to why the request failed.

[g]
[SM DLT= PRIMARY HISTORY1 HISTORY2 HISTORY3]
[j DLT=k m n o p]
[MATEDLT=i q r s t]
__________________________________________________________________

2. REASON FOR OUTPUT

To respond to an OP:LIST-ISMNAIL input message and indicates in a list form the status of inter-SM (switching module) nailups (ISMNAILs).

Format 1 is produced by requesting the status for all ISMNAILs emanating from a specific SM. Only primary maintenance status and the "master/slave" characteristic of the ISMNAIL data link terminal (DLT) on the source SM will be provided. Format 2 is produced by requesting the status for all ISMNAILs emanating from a specific ISM channel group (CHNG). Only primary maintenance status of the ISMNAIL DLT on the source SM/CHNG will be provided. Format 3 is produced by requesting the status for all ISMNAILs between a specified pair of SMs. Primary and history maintenance status of the ISMNAIL DLT on both the source and the destination SMs will be provided.

3. VARIABLE FIELD DEFINITIONS

a  = SM number.
b  = Channel group number.
c  = Mate SM number.
d  = Output message segment, designated FIRST, NEXT or LAST. (If there is only one segment, LAST will be output).
e  = Event number.
f  = Termination report. Valid value(s):
   COMPLETED = Request completed successfully.
FAILURE = Request was terminated before a normal completion.

g = Additional data qualifying the termination of the request. Includes the following. Valid value(s):
DATABASE PROBLEM = Problem occurred while attempting to access critical data (accompanying
ASSERT should provide more details).
LACK OF MESSAGE RESOURCE = Message resources were not available in the administration
module (AM) and the end user request could not be forwarded to the SM for execution.
MESSAGE NOT RECEIVED = Expected message not received by ATA terminal process within
designated timeout interval.
NO OPTION MATCH = None of the ISMNAILs had states corresponding to option specified in the
input request.
STOPPED = Request stopped due to manual intervention.
SM IN MINMODE = SM is in MINMODE, and, therefore, cannot support ISMNAILs.
SM ISOLATED = SM is isolated, and requested action cannot be honored.
TERMINAL PROCESS NOT CREATED = An automatic task administrator (ATA) terminal process to
execute the end user request could not be created due to system problems.
TIMEOUT = Timeout occurred.

Note: For many failed restorations, the ISMNAIL may be left in a state, which will allow a
successful automatic restoration at some later time; use OP:ST-ISMNAIL to
determine current status associated with the affected ISMNAIL.

h = Mate SM number which represents the SM at the other end of the ISMNAIL.
i = DLT number (1-160).
j = SM number that represents the SM of the ISMNAIL.
k = Mate DLT number (1-160).
l = Master status of the source DLT. Valid value(s):
  N = The DLT is slave.
  Y = The DLT is master.

m = The primary status for the source port associated with the ISMNAIL; this is the most restrictive
status currently on the port. Valid value(s):
  IS = In-service (normal operation).
  ISOLATED = No status data could be derived from the SM due to isolation.
  OOS DLI = OOS dual link interface (DLI) ISMNAIL is OOS due to a removed DLI on the
major office network and timing complex (ONTC).
  OOS DSBLD = OOS disabled (DSBLD) indicates the ISMNAIL is manually removed.
  OOS DSLINIT = OOS Initialization (DSLINIT) ISMNAIL will be automatically scheduled for an
initialization.
  OOS MASTRSM = Slave ISM port is OOS awaiting a restoration, which must be triggered by the
mate master SM.
  OOS NLI = OOS network link interface (NLI) ISMNAIL is OOS due to a removal of all NLIs on
the major office network and timing complex (ONTC).
  OOS PSU = OOS packet switch unit (PSU) the ISMNAIL is OOS because of an
OOS/degraded protocol handler (PH).
  OOS SLAVESM = Master ISM port is OOS due to problem in mate slave SM.
  OOS TBI = OOS to-be-idled (TBI) indicates the ISMNAIL is on the TBI list due to data
corruption discovered by audits; this is a transient state and recovery is automatic.

**OOS TBLA** = OOS trouble analysis (TBLA) indicates the ISMNAI L is OOS for no known hardware reasons, but cannot be restored to service for any reasonable length of time; repeated automatic restorations have been attempted, and maintenance personnel intervention is now required.

**OOS TMSCONN** = OOS time multiplexed switch link connectivity; ISMNAI L is OOS due to a TMS interconnectivity problem between the SMs (out-of-service DLI/NLIs or TMSLNKS) at one or more ends of the nailup.

**TRANSIENT** = The ISMNAI L is in a transient state, due to maintenance activity.

**UNKNOWN** = No status data received from the SM within the allotted timeout interval; valid reasons include unavailability of message resources, high levels of call processing/maintenance activity, or overload.

- The first pending (history) status for the source port associated with the ISMNAI L; a port can have zero to three pending statuses, in addition to the primary status. They are produced only in Format 3 output. Valid value(s):
  - **NO STATUS** = No pending (history) status.
  - **OOS DLI** = The ISMNAI L is OOS due to a removed DLI on the major ONTC.
  - **OOS DSBLD** = The ISMNAI L is manually removed.
  - **OOS NLI** = This ISMNAI L is OOS due to a removal of all NLIs on the major ONTC.
  - **OOS PSU** = The ISMNAI L is OOS because of an OOS/degraded PH.
  - **OOS SLAVESM** = Master ISM port is OOS due to problem in mate slave SM.
  - **OOS TMSCONN** = The ISMNAI L is OOS due to a TMS interconnectivity problem between the SMs (out-of-service DLI/NLIs or TMSLNKS) at one or more ends of the nailup.

- The second pending (history) status for the source port associated with the ISMNAI L (Format 3 outputs only).

- The third pending (history) status for the source port associated with the ISMNAI L (Format 3 outputs only).

- The primary status for the destination port associated with the ISMNAI L (Format 3 outputs only). Possible values are the same as listed for variable 'k'.

- The first pending status for the destination port associated with the ISMNAI L (Format 3 outputs only). Possible values are the same as listed for variable 'm'.

- The second pending (history) status for the destination port associated with the ISMNAI L (Format 3 outputs only).

- The third pending (history) status for the destination port associated with the ISMNAI L (Format 3 outputs only).

- State filtering option (selected by the input request). Valid value(s):
  - **ALL** = Output produced regardless of status.
  - **IS** = Only in-service (IS) ISMNAI Ls will be output.
  - **OOS** = Only out-of-service (OOS) ISMNAI Ls will be output.

- Source DLT channel group number (0-80).

- Source DLT channel group member (Spyder) number (0-128).
x              = PSU Number.

4. ACTIONS TO BE TAKEN

No further action is necessary if the request completed successfully.

If the termination report is FAILURE, the ‘g’ field will give some indication as to why the request failed.

5. ALARMS

2. REASON FOR OUTPUT

To respond to a manual request for a list of lines with a specified status. The list, if long, will be broken into segments.

Format 1 lists the lines that match the specified status. Note that there are two cases for the order in which the channel identifier ('g') and the integrated services line card equipment number (LCEN) and integrated services line card, Version 2, line circuit equipment number (LCKEN) are output: [g] [LCEN h f₁ b₁ c₁ e₁] or [g] [LCKEN h f₁ b₁ c₁ e₁]. Is used for the request LINES; [LCEN h f₁ j k] or [LCKEN h f₁ j b₁ c₁] is used for requests DSLG and MLHG. Format 2 describes a trailer message that indicates the end of the list and termination report.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

**FULL** = The primary and all pending statuses for each line was requested.

**+** = Indicates the line is a party line, a custom multipoint interface DSL, or a standard interface multi-user DSL.

**a** = Indicates what the request was. Valid value(s):

<table>
<thead>
<tr>
<th>LINE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINES</td>
<td>The SM number that was requested.</td>
</tr>
<tr>
<td>DSLG h x</td>
<td>Primary status for the line. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for possible line status values for the subfields.</td>
</tr>
<tr>
<td>MLHG y [z[&amp;z]]</td>
<td>Segment number of this segment of the list. Segments are numbered sequentially starting from 1.</td>
</tr>
</tbody>
</table>
e = Completion report. Valid value(s):
COMPLETED = All items in the requested list have been output. Will occur only in a trailing message (Format 2).
CONTINUED = Second and subsequent segments of a list that was too long to be printed in a single segment.

INPUT ERROR = The input request was in some way incorrect.
INV STATUS = The status entered was invalid. Since no lines could possibly have matched, the search was not performed.
MLHG INVALID = The multi-line hunt group specified in the input request was invalid. Verify that the correct group number was specified.

NO MATCH = The search was performed as requested, but no lines were found that satisfied the status requested.
STARTED = The first segment in the list. This does not necessarily imply that additional segments will be required. The list will be terminated by an 'end-of-list' message (Format 2).
STOPPED = The list was stopped by manual action.
SYSTEM BUSY = The system was too busy to perform the request or a system resource failure occurred which prevented the request from being processed. This could indicate that another OP:LIST request is in progress.
SYSTEM ERROR = An unspecified internal system error occurred which prevents further processing. The request has been aborted.

f = Equipment number or identifier (if available). Valid value(s):

| DN v[-1][+] |
| DSLG h x |
| MLHG y z |

= Channel identifier: D, B1, or B2. Used only for DSL lines.

h = SM number.
i = Line unit number.
j = Line group controller number.
k = Line card number.
l = Member number of the line time slot bridging (LTSB) line. For LTSB, a member number of 1 represents the lead line and a member number of 2 represents the associate line.
m = Line grid number.
n = Switch board number.
o = Switch number.
p = Level number.
q = Digital carrier line unit number.
r = Remote terminal (RT) number.
s = RT line number.
t = Primary status for the line. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual.
u = Pending status for the line. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual.
v = Telephone number of the line, XAT, 4-wire analog line, or 4-wire digital line.
w = Total number of segments in the list.
x = Protocol handler (PH) channel group number.
y = Group number.
z = Group member number or range of members.
a = IDCU number.
b = Line group number.
c = Line board number.
d = Radio port controller unit.
e = Line circuit number.
f = Integrated services line unit (ISLU)/ISLU2 number.
g = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
h = Digital line and trunk unit (DLTU) number.
i = Digital facility interface (DFI) number.
j = Channel number.
k = Data group number.
l = SONET termination equipment (STE) number.
m = Synchronous transport signal (STS) number.
n = Virtual tributary group number.
o = Virtual tributary member number.
p = Digital signal Level 0 (DS0) number. (DNU-S) number.
4. ACTIONS TO BE TAKEN

None. Refer to the message output for pertinent status and information, and take appropriate action based on the information received, if necessary.

2. REASON FOR OUTPUT

To respond to an OP:LIST manual request to output a list of Operator Services Position System ports
(OSPSPORTs) that match a specified status. The list, if long, will be broken into segments.

Format 1 is used to list the OSPSPORTs that match the specified status. The end of the list and termination report
is indicated by a trailer message described in Format 2.

3. VARIABLE FIELD DEFINITIONS

AQEST = The autoquote establishment OSPSPORT.
AQM = The autoquote mate analog OSPSPORT.
BST = The basic services terminal OSPSPORT.
FULL = The primary and all pending statuses for each data link was requested.
LCEN = Integrated services line card equipment number if available.
OPT = The operator position terminal OSPSPORT.
OSPSPORTS = All OSPSPORTs in the office that match the specified status.
TEN = Trunk equipment number, if available.
XDPF = The external data port (force management center) OSPSPORT.
XDPO = The external data port (operator service center) OSPSPORT.
a = Indicates what the request was for. Valid value(s):

AQEST
AQM [k]
BST [l]
OPT [m]
OSPSPORT
XDPF
XDPO

b = The switching module (SM) number that was requested.

c = The status mask entered in the input message that indicates which OSPSPORTs should be included in the list. Fields not specified are ignored. Refer to the APP:PORT-STATUS Appendix in the appendixes section of the Output Messages manual for a complete list of possible status subfields.

d = Segment number of this segment of the list. Segments are numbered sequentially starting from 1.

e = Completion report. Valid value(s):

- COMPLETED = All items in the requested list have been output. Will occur only in a trailing message (Format 2).
- CONTINUED = Indicates second and subsequent segments of a list that was too long to be printed in a single segment.
- INPUT ERROR = The input request was in some way incorrect.
- INV STATUS = The status entered was invalid. Because no OSPSPORTs could possibly have matched, the search was not performed.
- NO MATCH = The search was performed as requested, but no OSPSPORTs were found that satisfied the status requested.
- STARTED = Indicates the first segment in the list. This does not necessarily imply that additional segments will be required. The list will be terminated by a 'end-of-list' message (Format 2).
- STOPPED = The list was stopped by manual action.
- SYSTEM BUSY = The system was too busy to perform the request or a system resource failure occurred that prevented the request from being processed. This could indicate that another OP:LIST request is in progress.
- SYSTEM ERROR = An unspecified internal system error occurred which prevents further processing. The request has been aborted.

f = Indicates what the request was for. Valid value(s):

- AQEST m
- AQM k n
- BST l o
- OPT l o
- XDPF p
- XDPO l

g = Valid value(s):

- LCEN q r s t [u]
- TEN q v w x y

h = Primary status for the OSPSPORT. This is the most restrictive status currently on the OSPSPORT. Refer to the APP:PORT-STATUS Appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

i = Pending statuses for the OSPSPORT. Refer to the APP:PORT-STATUS Appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.
j = Total number of segments in the list.
k = The data link group number.
l = Operator service center number.
m = The AQEST telephone number.
n = Relative link (member) number.
o = Relative position number.
p = Force management center number.
q = SM number.
r = Line unit number.
s = Line group number.
t = Line card number.
u = Channel identifier. Valid value(s):
   D
   B1
   B2
v = Trunk unit number.
w = Service group number.
x = Channel board number.
y = Circuit number.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. FORMAT

[1] OP LIST a [FULL] [SM b] [c] [c] [c] [c] SEGMENT d e
   [f] [y1] [ICB=v|ICD=w] l [l] [l] [l] [l]
   [m] [m] [m] [m] [m]

__________________________________________________________________

[2] OP LIST a [FULL] [SM b] [c] [c] [c] [c] [c] NSEGS u e

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to a manual request (using the OP:LIST input message) to list trunks having a specified condition. The output has two different forms depending on the scope of the request:

1. Requests involving all the trunks of one or more switching modules (SMs) (even a whole switch). Only the trunks matching the specified out-of-service (OOS) condition are listed.

2. Remaining requests. Only the trunks matching the specified in-service (IS) or OOS condition are listed. If no IS nor OOS qualifier are specified in the input request, all the trunks are listed.

The list, if long, will be broken into segments as described by Format 1. The end of the list and termination report is indicated by a trailer message described in Format 2.

WARNING: The removal or restoration of a large facility may create a situation in which the OP LIST-TRUNKS output may report individual port status indications that are temporarily inconsistent with the current status of the facility.

3. VARIABLE FIELD DEFINITIONS

a = Indicates what the request was for. Valid value(s):

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFI g n o</td>
<td></td>
</tr>
<tr>
<td>DSLG g z</td>
<td></td>
</tr>
<tr>
<td>FRBC a v1</td>
<td></td>
</tr>
<tr>
<td>MLHG d [e1&amp;&amp;f1]</td>
<td></td>
</tr>
<tr>
<td>PRIGRP [h]</td>
<td></td>
</tr>
<tr>
<td>TG a [b1&amp;&amp;c1]</td>
<td></td>
</tr>
<tr>
<td>TRUNKS</td>
<td></td>
</tr>
<tr>
<td>VTIFAC g l1 m1 w1 n1 o1 x1</td>
<td></td>
</tr>
</tbody>
</table>
= The SM number that was requested.

= Status mask entered in the input message that indicates which trunks should be included in the list. Fields not specified on the input message are omitted in the output. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual.

d = Segment number of this segment of the list. Segments are numbered sequentially starting from 1.

e = Completion report. Valid value(s):

- COMPLETED = Will occur only in a trailing message (Format 2). All items in the requested list have been output.
- CONTINUED = Second and subsequent segments of a list too long to be printed in a single segment.
- INPUT ERROR = The input request was incorrect. It most likely implies that the trunk group entered was invalid.
- INV EQUIPMENT = The request was for equipment that does not exist or was not assigned.
- INVALID PRI GROUP = The PRI Group number entered is invalid.
- INV STATUS = The status entered was invalid. Since no trunks could possibly have matched, the search was not performed.
- NO CHANNELS ASSIGNED = No channels assigned to this PRI group.
- NO MATCH = The search was performed as requested, but no trunks were found that satisfied it. If an incorrect SM number is entered for a specific PRIGRP, NO MATCH will result on the ROP. If the user eliminates the SM= option, they can obtain the correct SM number.
- SM UNAVAILABLE = The request was for ports on a particular SM that was unable to handle the request. Check the status of the SM and try again.
- STARTED = Indicates the first segment in the list. This does not necessarily imply that additional segments will be required. The list will be terminated by a 'end-of-list' message (Format 2).
- STOPPED = The list was stopped by manual action.
- SYSTEM BUSY = The system was too busy to perform the request or a system resource failure occurred which prevented the request from being processed. This could indicate that another OP:LIST input message request is in progress.
- SYSTEM ERROR = An unspecified internal system error occurred which prevented further processing. The request has been aborted.
- TG INVALID = The trunk group specified in the input request was invalid. Verify that the correct group number was specified.

INV STATUS = The status entered was invalid. Since no trunks could possibly have matched, the search was not performed.
NO CHANNELS ASSIGNED = No channels assigned to this PRI group.
NO MATCH = The search was performed as requested, but no trunks were found that satisfied it. If an incorrect SM number is entered for a specific PRIGRP, NO MATCH will result on the ROP. If the user eliminates the SM= option, they can obtain the correct SM number.
SM UNAVAILABLE = The request was for ports on a particular SM that was unable to handle the request. Check the status of the SM and try again.
STARTED = Indicates the first segment in the list. This does not necessarily imply that additional segments will be required. The list will be terminated by a 'end-of-list' message (Format 2).
STOPPED = The list was stopped by manual action.
SYSTEM BUSY = The system was too busy to perform the request or a system resource failure occurred which prevented the request from being processed. This could indicate that another OP:LIST input message request is in progress.
SYSTEM ERROR = An unspecified internal system error occurred which prevented further processing. The request has been aborted.
TG INVALID = The trunk group specified in the input request was invalid. Verify that the correct group number was specified.

f = Valid value(s):
DN q1
DSLG g r1 z
GRP [h1] [i1 j1]
MLHG d1 [e1 & f1]
TKGMN a1 k1

g = SM number.
h = Trunk unit number.
i = Service group number.
j = Channel board number.
k = Channel circuit number.
l = The primary status for the trunk. This is the most restrictive status currently on the port. Refer to the appendix APP:PORT-STATUS in the Appendixes section of the Output Messages manual for a detailed explanation of the status.
m = The pending status(s) for the trunk. A trunk can have zero to three pending statuses in addition to the primary status. Refer to the appendix APP:PORT-STATUS in the Appendixes section of the Output Messages manual for a detailed explanation of the status and the status hierarchy.
n = Digital line and trunk unit (DLTU) number.
o = DFI number.
p = DFI channel number.
q = Digital carrier line unit (DCLU) number.
r = Remote terminal (RT) number.
s = RT line number.
t = IDCU number.
u = Total number of segments in the list.
v = Identifying number of the FGB carrier, which can be up to 4 digits.
w = Identifying number of the FGD carrier, which can be up to 4 digits.
x = RAF or SAS unit number.
y = RAF or SAS announcement channel number.
z = PSU channel group number.
a\textsuperscript{1} = Trunk group or bearer independent call control (BICC) group number.
b\textsuperscript{1} = The lower limit of a range of trunk group member numbers or normalized call instance codes (CICs).
c\textsuperscript{1} = The upper limit of a range of trunk group member numbers or normalized CICs.
d\textsuperscript{1} = Multi-line hunt group number.
e\textsuperscript{1} = The lower limit of a range of multi-line hunt group (MLHG) member numbers.
f\textsuperscript{1} = The upper limit of a range of MLHG member numbers.
g\textsuperscript{1} = Logical test port number.
h\(^1\) = PRI group number specified.

i\(^1\) = Indicates a B for B-channel or D for D-channel.

j\(^1\) = Identifies whether the signaling D channel of the PRI group is marked as primary (D1) or secondary (D2). This field is only filled in if the D channel back up feature is active.

k\(^1\) = Trunk member number.

l\(^1\) = DNU-S number.

m\(^1\) = Data group number.

n\(^1\) = Synchronous transport signal (STS) number.

o\(^1\) = VT1.5 group number.

p\(^1\) = Digital signal level 0 (DS0).

q\(^1\) = Directory number of the XAT, 4-wire analog line, or 4-wire digital line. The DN will be output when no MLHG is associated with the port.

r\(^1\) = PSU unit number. [0-1]

s\(^1\) = PSU shelf number.

t\(^1\) = PSU channel group number.

u\(^1\) = PSU channel group member number.

v\(^1\) = trunk group member number.

w\(^1\) = SONET termination equipment (STE) number.

x\(^1\) = Virtual tributary member number.

y\(^1\) = Peripheral control and timing line and trunk unit (PLTU) number.

z\(^1\) = PCT facility interface (PCTFI) number.

a\(^2\) = Tributary number.

b\(^2\) = Channel number.

c\(^2\) = Equipment number. Valid value(s):

- ATMPP g r\(^1\) l\(^2\) m\(^2\)
- DEN g n o p
- ILEN g t r s
- INEN g l\(^1\) r s
- LTP g g\(^1\)
- NEN g l\(^1\) m\(^1\) w\(^1\) n\(^1\) o\(^1\) x\(^1\) p\(^1\)
- OIUEB g f\(^2\) g\(^2\) h\(^2\) i\(^2\) o\(^1\) x\(^1\) b\(^2\)
- PLTEN g y\(^1\) z\(^1\) a\(^2\) b\(^2\)
- PSUEN g r\(^1\) s\(^1\) t\(^1\) u\(^1\)
RAF g x y
SAS g x y
SLEN g q r s
TEN g h i j k

d^2 = Virtual trunk facility number.
e^2 = Virtual trunk channel number.
f^2 = Optical interface unit (OIU) number.
g^2 = Protection group number.
h^2 = OC-3 STE number.
i^2 = STS level 1 (STS-1) number.
l^2 = Link number.
m^2 = Virtual connection identifier (VCID) number.

     .       .        .       .        .        .      .
__________________________________________________________________

[2] OP LISTOTO o NPA=a1 [z] [MLHG=u-v]
   COUNTS:
   SEGMENTS PRINTED = p
   UNASSIGNED LINES = q
   IDCU ANLG LINES = r
   IDCU ISDN LINES = s
   ISLC LINES = t
__________________________________________________________________

2. REASON FOR OUTPUT

The output is printed in response to an OP:LISTOTO input message. The data printed is used to determine which
lines in the office are assigned, unassigned, and/or integrated digital carrier unit (IDCU) lines, integrated SLC®
(ISLC) lines, integrated services line unit (ISLU) line, or integrated services line unit 2 (ISLU2) lines. The contents
of the reports are controlled by the OP:LISTOTO input message parameters. A request can be made for a single line
or a range of lines by directory number (DN), IDCU line equipment number (ILEN), or SLC® line equipment number
(SLEN). Also, the user can ask to see just the unassigned lines (UNA option), just the IDCU lines (IDCU option), just
the ISLC lines (ISLC option), or by omitting all options, all the lines.

Format 1 is printed in response to a single line request, when a segment is full (12 lines of data), or when the job is
completed.

Format 2 is a summary report and it will be printed only if a range of 2 or more lines is specified in the OP:LISTOTO
input message.

Note: Loss of output is indicative of message throttling. To reduce the possibility of a loss use the
INH:BREVC input message.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms
shown in the format.

a = NXX and local digits of first DN of range request.
b = Local digits of last DN of range request.
c = SM number, IDCU number, remote terminal (RT) or IDCU facility (IFAC) number, RT line or IFAC
channel number or the lower limit of a range of RT line or IFAC channel numbers.

d  = Upper limit of a range of RT line or IFAC channel numbers.

e  = SM number, DCLU number, RT number, RT line number or the lower limit of a range of RT line numbers.

f  = Upper limit of a range of RT line numbers.

g  = Segment number of the LINE-REPORT. The total number of segments printed will be stated in the completion or stop report (Format 2).

h  = NXX and local digits of line being reported.

i  = SM number, IDCU number, RT or IFAC number, RT line or IFAC channel number of the line being reported.

j  = SM number, ISLU number, line group controller number, line card number of the line being reported.

k  = SM number, ISLU2 number, line group number, line board number, line circuit number of the line being reported.

l  = SM number, line unit number, grid number, half-grid number, switch number, level number of line being reported.

m  = SM number, DCLU number, RT number, RT line number of line being reported.

n  = Type of line. Valid value(s):
  (blank) = An assigned line which is neither a SLC® 96 nor IDCU line.
  IDCU = Non-ISDN integrated digital carrier unit line.
  IDCU-ISDN = ISDN integrated digital carrier unit line.
  ISLC = Integrated SLC® 96 line.
  UNASSIGNED = Unassigned line.

o  = Status of request. Valid value(s):
  COMPLETED = Normal completion of request.
  STOPPED = Request was halted by a STP:LISTOTO input message.

p  = Number of segments printed.

q  = Number of unassigned lines in range.

r  = Number of non-ISDN IDCU lines in range.

s  = Number of ISDN IDCU lines in range.

t  = Number of ISLC lines in range.

u  = MLHG group number.

v  = MLHG member number.

w  = Access interface unit equipment number (SM number, AIU number, application pack number,
circuit number).

\( x \)  = SM number, DNU number, RT number, RT line number or the lower limit of a range of RT line numbers.

\( y \)  = Upper limit of a range of RT line numbers.

\( z \)  = Valid value(s):

- \( DN=a[&&b] \)
- \( ILEN=c[&&d] \)
- \( INEN=x[&&y] \)
- \( SLEN=e[&&f] \)

\( a1 \)  = Numbering Plan Area or Area Code of the DN.

\( b1 \)  = SM number, DNU number, RT number, RT line number of the line being reported.

### 4. ACTION TO BE TAKEN

Compare with office-to-office (OTO) test results, verify with office records, and correct data base as necessary.

### 5. ALARMS

2. REASON FOR OUTPUT

To respond to the OP:LIT input message to report the status of automatic line insulation testing (ALIT) for each modular metallic service unit (MMSU) in the office. For each MMSU, the status of the line units (LUs) and integrated service line units (ISLUs) is reported first followed by the status of access interface unit (AIUs) followed by the status of digital carrier line units (DCLUs) and integrated digital carrier units (IDCUs). The status of LUs/ISLUs, AIUs and DCLUs/IDCUs/DNU-Ss is each reported in a different format. The LUs/ISLUs and AIUs status will not print if units of this type do not exist on the MMSU. The same applies to DCLUs/IDCUs/DNU-Ss status.

Format 1 lists the status of LUs/ISLUs per switching module (SM). The current line counts are only printed with the
last section in the report.

Format 2 lists the status of AIUs per SM. The current line counts are only printed with the last section in the report.

Format 3 lists the status of DCLUs/IDCUs/DNU-Ss per groups of remote terminals (RTs) per metallic test bus (MTB). The current line counts is only printed with the last section in the report.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Entity number. All LUs, ISLUs, DCLUs and IDCUs that have their MTBs assigned to a single MMSU are considered 1 test entity. Only the ALIT packs co-located in this same MMSU can test lines assigned to these units. Each entity will test independently of all other entities.

b = SM number of where the entity's MMSU is located.

c = MMSU number.

d = Part number of the report.

e = Total number of parts to the report.

f = SM number being reported on. A maximum of 10 SMs are reported in one part of the summary.

g = LU/ISLU unit number. A maximum of 12 units can be reported on one line of the summary. If the SM has more than 12 units to report on, additional lines will be used with the same SM number.

h = Status of ALIT in given unit. Valid value(s):
   A = Active. ALIT is in progress.
   D = Done. Tested by a previous ALIT session.
   P = Partial. Partially tested when most recent ALIT stopped.
   R = Recent. Testing completed in most recent ALIT session.
   S = Suspended. Testing in this unit has been suspended in the current ALIT session.
   U = Untested. Testing has not started yet.

i = MMSU service group (SG) number of MTB.

j = MMSU shelf number of MTB.

k = MA pack number.

l = MTB number. A maximum of 5 MTBS can be reported on a single line.

m = Number of RTs which have completed testing. A maximum of 20 RTs can be ALIT tested.

n = Total quantity of RTs on the MTB. A maximum of 20 RTs can be located on 1 MTB.

o = Inclusive status of RTs on MTB. Valid value(s):
   A = Active. 1 RT on the MTB is actively being ALIT tested. Overides the status of other RTs on that MTB. This status is printed only when ALIT session is active.
   D = Done. All RTs on the MTB were tested in previous session. This status is printed only when ALIT session is active.
   P = Partial. Some RTs on the MTB but not all were tested in the most recent ALIT
session.

R = Recent. Testing of the RTs on the MTB was completed in the most recent session.

S = Suspended. At least 1 RT on the MTB had its ALIT testing suspended in the most recent ALIT session. Look for an "EXC LIT SINGLE CIRCUIT ABORT" message on the ROP for the line on the RT that failed.

U = Untested. No RTs on the MTB were tested in the most recent ALIT session.

p = Number of lines ALIT attempted to test in the latest session.

q = Number of lines actually tested by ALIT in the latest session.

r = Number of tested lines which failed the ALIT test in the latest session.

s = AIU number. A maximum of 12 units can be reported on one line of the summary. If the SM has more than 12 units to report on, additional lines will be used with the same SM number.

4. ACTION TO BE TAKEN

The purpose of this message is to report the result of the action requested by the corresponding manually requested input message. No specific action is indicated.

5. ALARMS

__________________________________________________________________

2. REASON FOR OUTPUT

Prints in response to the OP:LNSTAT input message. Format 1 prints requested OP:LNSTAT data. Format 2 reports that the OP:LNSTAT command aborted prior to outputting the data.

3. VARIABLE FIELD DEFINITIONS

a = Group number.
b = Member number.
c = Network time (hour:minutes:seconds).
d = Minor state. Valid value(s):
IS = In service.
MOOS = Manual out-of-service.
OOS = Out-of-service.
e = Link type. Valid value(s):
A
E
F
f = Link speed (kilobits per second). Valid value(s):
56 = 56kps.
g = Error correction mode. Valid value(s):
BEC = Basic error correction.
PCR = Preventive cyclic retransmission.

h = Facility type. Valid value(s):
  DSU
  T1FA

i = Link interface board type and circuit pack number. Valid value(s):
  LINE = TN916.
  LIE = TN917B.
  LIE = TN917B-2 (microcode MC3F029A1).

j = Level 2 state. Valid value(s):
  ALG_NRDY = Alignment not ready due to processor outage interruption. Local and/or remote processor outage must cease before level 2 can go in service.
  ALG_RDY = Local initial alignment complete (ready) and waiting on fill-in signal unit (FISU) and/or message signaling unit (MSU) to go in service (level 2 state = IS and timer T1 is active).
  INTALGN_E = This is the initial alignment state 2 of being aligned, level 2 will be sending SIN or SIE and waiting for SIN or SIE (timer T3 is active). Emergency proving time is used.
  INTALGN_N = This is the initial alignment state 2 of being aligned, level 2 will be sending status indicator normal (SIN) or status indicator emergency (SIE) and waiting for SIN or SIE (timer T3 is active). Normal proving time is used.
  INTNALGN_E = This is the first step, or non-aligned stage, of initial alignment (timer T2 is active). Emergency proving time is used.
  INTNALGN_N = This is the first step, or non-aligned stage, of initial alignment (timer T2 is active). Normal proving time is used.
  INTPROVIN_E = This is the initial alignment state 3 with Emergency proving being done, and level 2 is sending and/or receiving SIE (timer T4e is active).
  INTPROVIN_N = This is the initial alignment state 3 with Normal proving being done, and level 2 is sending SIN (timer T4n is active).
  IS = In service; capable of handling level 3 traffic.
  L_POUT = Local processor outage.
  LR_POUT = Both local and remote processor outage.
  OOS = Out-of-service (sending status indicator out-of-service (SIOS) link status signaling unit (LSSU) on link).
  OOS_LLT = Out-of-service (performing local loop-back test).
  OOS_LLT_FAIL = Out-of-service (local loop-back test failed).
  PWROFF = Level 2 is in a power off state due to initialization, hardware failure, or transition to another state.
  R_POUT = Remote processor outage.
  WAIT_POUT = Recovering from processor outage, waiting for events.

k = Transmit link buffer congestion level. Valid value(s):
  XDIS1 = Transmit buffer level 1 discard state, level 0 priority MSUs are discarded.
  XDIS2 = Transmit buffer level 2 discard state, level 0 and 1 priority MSUs are discarded.
  XDIS3 = Transmit buffer level 3 discard state, level 0, 1, and 2 priority MSUs are discarded.

4. ACTIONS TO BE TAKEN

For Format 1, none. This message is a response to the input message OP:LNSTAT. Use information provided for monitoring link node performance and trouble analysis.

For Format 2, the message is self-explanatory. If unable to resolve, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Prints in response to an OP:LNUPD input message when there are 30 or fewer SS7 nodes being reported on.

3. VARIABLE FIELD DEFINITIONS

a = Ring node group number.
b = Ring node member number.
c = A response explaining the update status. Valid values are:
   UPDATE PENDING
   UPDATE IN PROGRESS
   UPDATE SUCCESSFULLY COMPLETED
   UPDATE ABORTED - NODE NOT IN ACT MAJOR STATE
   UPDATE ABORTED - STOP UPDATE REQUESTED
   UPDATE ABORTED - NODE MOVED OUT OF ACT STATE DURING UPDATE
   UPDATE ABORTED - PUMPER RE-CREATION COUNT EXCEEDED
   UPDATE ABORTED - PUMPER REPORTED FAILURE
   UPDATE ABORTED - PUMPER TIMED OUT
   UPDATE ABORTED - CHECKSUM NOT ACKNOWLEDGED
UPDATE ABORTED - CHECKSUM FAILURE
UPDATE ABORTED - SLMK COMMUNICATION FAILURE
UPDATE ABORTED - FAILED TO GET NODE'S GSF ID
UPDATE ABORTED - UPDATE ERRLOG SITUATION
UPDATE FAILED - XFER REQUEST ACKNOWLEDGED, QUERY REPORTED FAILURE
UPDATE FAILED - XFER REQUEST ACKNOWLEDGED, QUERY NOT ACKNOWLEDGED
UPDATE FAILED - XFER REQUEST NOT ACKNOWLEDGED, QUERY REPORTED FAILURE
UPDATE FAILED - XFER REQUEST NOT ACKNOWLEDGED, QUERY NOT ACKNOWLEDGED
UPDATE FAILED - NODE MOVED OUT OF ACT STATE IMMEDIATELY AFTER SUCCESSFUL UPDATE
UPDATE FAILED - UPDATE ERRLOG SITUATION
UPDATE FAILED - FAILED TO CHANGEOVER THE LINK, MOOS FAILED
UPDATE NOT ATTEMPTED

\[d\] = An explicit status of the last LNUPD:LN request. Valid values are:
UPDATE JOB NEVER EXECUTED
UPDATE JOB IS CURRENTLY EXECUTING
UPDATE JOB COMPLETED
UPDATE JOB STOPPED, STOP UPDATE REQUESTED
UPDATE JOB ABORTED, SLMK COMMUNICATION FAILED
UPDATE JOB ABORTED, PUMPER CREATION FAILURE
UPDATE JOB ABORTED, PUMPER RE-CREATION COUNT EXCEEDED
UPDATE JOB ABORTED, PUMPER GUARD TIMER TIMED OUT
UPDATE JOB ABORTED, EXCESSIVE NODE UPDATE FAILURES
UPDATE JOB ABORTED, EXCESSIVE RING COMMUNICATION FAILURES
UPDATE JOB ABORTED, RING DOWN
UPDATE JOB ABORTED, UPDATE ERRLOG SITUATION
UPDATE JOB COMPLETED - NO NODES IDENTIFIED FOR UPDATE

\[e\] = A string showing the time of the last LNUPD:LN completion. For example, MON JUN 23 04:31:19 1997.

STOP:LNUPD
OP:LOG

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] OP LOG a b CORRUPT SEGMENT AT c
   [g]

[2] OP LOG a FILE d CANNOT OPEN TEMPORARY FILE

[3] OP LOG a CANNOT OPEN LOGFILE

[4] OP LOG a {STARTED|IN PROGRESS|COMPLETED} SEGMENT e f
   [g]

[5] OP LOG a OUTPUT FILE EXISTS h

[6] OP LOG a CANNOT CREATE OUTPUT FILE h

[7] OP LOG a OUTPUT DIRECTORY DOES NOT EXIST i

[8] OP LOG a OUTPUT DIRECTORY IS NOT WRITABLE i

[9] OP LOG a PASSED BAD PARM TYPE TO FILE FUNCTION

[10] OP LOG a STOPPED j

2. REASON FOR OUTPUT

Formats 1, 2, 3, and 5 report that an error occurred when executing the OP:LOG input message.

Formats 6 - 8 indicate a system error preventing creation of the file.

Format 9 indicates that the process is using invalid data in the message structure.

Formats 4 and 10 indicate the process status.

3. VARIABLE FIELD DEFINITIONS

a = Name of the logfile.
b = Pathname of the file in which corruption was discovered.
c = Position in file, expressed in characters, where corruption was discovered.

d = Name of temporary file.

e = Number of output segment.

f = Time stamp.

g = Message text from the logfile entry. If the output file parameter has been requested, this will not appear.

h = Name of the output file to be created in /fmt.

i = Name of the directory where the output file will be created.

j = The STOPPED reason code. Valid value(s):
   40 = Cannot open temporary file.
   201 = Given output file name is too long.
   202 = Implied output file name is too long.
   203 = Given output file is formatted incorrectly.
   208 = Given input file name is too long.
   211 = Cannot create temporary file.
   212 = Cannot write temporary file.

4. ACTION TO BE TAKEN

For Format 1, the contents of the corrupt log file must be SAVED on paper and/or tape for later reference. The corrupt logfile entries should be cleaned up by using the DEL:LOG input message on the logfile without any selection criteria.

For Format 2, check the /tmp file system to see if all the space is used up.

For Format 3, check to see if the log file exists under the pathname specified in the device record.

For Format 5, retry the command with a file name that is 14 characters or less and contains no slashes (/) to denote a sub-directory.

For Format 6, check to see if there are i-nodes available on the file system partition in which that directory resides. If i-nodes are available, contact technical support for further assistance.

For Formats 7 or 8, check to see if the identified directory exists and has write permissions.

For Format 9, contact technical support for further assistance.

For Format 10, check SPLLOG for CSOP error messages.

5. ALARMS

None. This alarm is either a manually-requested report, or an automatically-generated report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Input Message(s):

DEL: LOG
OP: LOG

Output Appendix(es):

APP: OMDB-X-REF
OP:LOGSTAT

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

OP LOGSTAT: RCLOG a PERCENT FULL
   CORCLOG b
   RCLOG c
   [RECOVERY NEEDED. ENTER EXC:ODDRCVY;ALL]

2. REASON FOR OUTPUT

To report how full the recent change log files (RCLOG) and the customer-originated recent change log files (CORCLOG) are, to report the number of records logged in both files, and to report if the logs must be manually reapplied to the disk log.

3. VARIABLE FIELD DEFINITIONS

   a = Percentage of log space that has not been used. (The percentage is derived by comparing the percentage of log space used to the space used that can be reapplied to the disk log in one hour).
   b = Number of CORCs found in CORC log file.
   c = Number of recent changes found in recent change log file.

   RECOVERY NEEDED = RCLOG data and CORCLOG data have not been reapplied to the log file after system initialization occurred and must be started manually (refer to the EXC:ODDRCVY input message).

4. ACTION TO BE TAKEN

If the RCLOG is more than 80% full, then the time required to restore the ODD will approach one hour if a system initialization occurs. If an office database backup operation is performed it will not be necessary to recover the recent changes currently in the log file after a system initialization.

5. ALARMS

None.

</tr>
</tbody>
</table>

[2] OP LPS - DISK LPS TABLE MISSING
NEW /log/HMlpstable HAS BEEN CREATED

2. REASON FOR OUTPUT

To respond to an OP:LPS input message (Format 1) or to report automatically that the disk file which contained current status table and backup status table was missing (Format 2). In the latter case a new disk file has been created automatically. If the loss was detected during an initialization, both current and backup statuses are now set to default value. If the loss was detected at other times, current status table is unchanged (same as before the loss of the file) and backup status is set to default value. The new statuses can be obtained by entering OP:LPS input message.

3. VARIABLE FIELD DEFINITIONS

a = Current page number.
b = Total number of pages in this output.
c = Message class name.
d = Numeric representation of the message class classdef number.
e = Daylog routing status indicator (ON or OFF). The backup status will be printed only when it is different from the current status.
f = Equipment configuration data base (ECD) routing status indicator (ON or OFF). The backup status will be printed only when it is different from the current status.

Note: A discard status is represented if 'e' is OFF and 'f' is OFF.

4. ACTION TO BE TAKEN

</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To output the common channel signaling (CCS) general service measurements (CCS) package (PKG) from the five-minute (M5) surveillance data. This message is the result of an OP:M5 input message.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
COMPLETED = Command successfully completed.

b = Total number of 800 service [inward wide area telecommunications service (INWATS)] calls.

c = Total number of network call denial (NCD) queries.

d = Total number of CCS initial address messages (IAMs) received.

e = Total number of CCS initial address messages (IAMs) transmitted.

f = Total number of CCS answer (ANS) messages received.

g = Total number of CCS answer (ANS) messages transmitted.

h = Total number of out-of-chain CCS calls received.

i = Total number of out-of-chain CCS calls received, but failed.

j = Total CCS continuity failure received.

k = Total number of calls skipped due to a group signaling congestion (GSC) control.

2. REASON FOR OUTPUT

To display a call gapping (CGAP) code control five-minute (M5) surveillance measurements package (PKG). One message can contain up to six controls. A maximum of 11 messages can result since a maximum of 64 controls is allowed.

3. VARIABLE FIELD DEFINITIONS

a  = Termination report. Valid value(s):
   COMPLETED = Last in a series of these messages.
   CONTINUED = Middle of a series of these messages.
   STARTED = First in a series of these messages.

b  = Destination code gapped, or "-" if not applicable.

c  = Access prefix gapped (0 - 9999). The prefix field will be blank if the access code is not specified. The access prefix only applies to feature group D carriers.

d  = Gap interval. Valid value(s):
   0 = No control was applied, but measurements were collected.
   PT1 = 0.10 sec.
   PT12 = 0.12 sec.

h i j k l
OUTECHORQ OUTECHORP
m n

2. REASON FOR OUTPUT

To display the internet protocol/internet control message protocol (IP/ICMP) measurement package from the five-minute (M5) surveillance data.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
  COMPLETED = Last in a series of messages.

b = The total number of input datagrams received from interfaces, including those received in error.

c = The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, and so forth.

d = The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported classes (for example, class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.

e = The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (for example, for lack of buffer space, when IP OIU silently discards all received IP datagrams with a multicast destination address). Note that this counter does not include any datagrams discarded while awaiting reassembly.

f = The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission.

g = The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (for example, for lack of buffer space).

h = The total number of ICMP messages received. Note that this counter includes all those counted
by ICMPINER.

i = The number of ICMP messages received but determined as having ICMP-specific errors (bad
  ICMP checksums, bad length, and so forth).

j = The total number of ICMP messages attempted to send.

k = The number of ICMP echo (request) messages received.

l = The number of ICMP echo reply messages received.

m = The number of ICMP echo (request) messages sent.

n = The number of ICMP echo reply messages sent.

    ADDITIONAL INEFFECTIVE MACHINE ATTEMPT MEASUREMENTS
    IN-PSTO MISC-EQPT VCT FHO TTO
       b   c   d   e   f
```

2. REASON FOR OUTPUT

To display, in response to the OP:M5 input message, an ineffective machine attempt (IMA) package (PKG) from the five minute (M5) surveillance data.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a
   = Termination status. Valid value(s): COMPLETED = Command successfully completed.

b
   = Number of IMAs because of the incoming permanent signal timeouts (IN-PSTO).

c
   = Number of IMAs because of miscellaneous (MISC) equipment (EQUIP) problems.

d
   = Number of IMAs because the called digits are not interpretable (that is, vacant code [VCT]).

e
   = Number of calls subjected to final handling overflow (FHO).

f
   = Number of transmitter timeouts (TTO).

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for the output of office-wide counts of the five-minute surveillance package. This is a response to an OP:M5PKG input message for the LNCU package.

3. VARIABLE FIELD DEFINITIONS

   a = Termination status. Valid value(s):
      COMPLETED = Command successfully completed.

   b = Number of critical user originating calls.

   c = Total critical user call load. This is the total number of originating calls and incoming calls.

   d = Number of critical user calls blocked. This indicates the number of critical user calls that did not complete due to resource failure.

   e = Number of calls affected by service selection trunk reservation (SSTR) control. This is the number of non-critical user calls being denied access to a trunk group because of SSTR controls.

4. ACTION TO BE TAKEN

If the termination status is ABORTED, reinitiate the request after the system error has been recovered.

2. REASON FOR OUTPUT

To display the stream control transmission protocol (SCTP) measurement package from the five-minute (M5) surveillance data.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
   COMPLETED = Last in a series of messages.

b = Number of SCTP INIT request sent. This counter provides the number of SCTP INIT requests sent on this SCTP association.

c = Number of SCTP INIT request received. This counter provides the number of SCTP INIT requests received on this SCTP association.

d = Number of operation ERROR chunk received. This counter provides the number of operation ERROR chunk received on this SCTP association.

e = Number of operation ERROR chunk sent. This counter provides the number of operation ERROR chunk sent on this SCTP association.

f = Number of ABORT requests received. This counter provides the number of ABORT requests received on this SCTP association.

g = Number of ABORT requests sent. This counter provides the number of ABORT requests sent on this SCTP association.

h = Number of SHUTDOWN requests received. This counter provides the number of SHUTDOWN requests received on this SCTP association.

i = Number of SHUTDOWN requests sent. This counter provides the number of SHUTDOWN requests sent on this SCTP association.

j = Number of SHUTDOWN acknowledgement requests received. This counter provides the number
of SHUTDOWN acknowledgement requests received on this SCTP association.

\( k \) = Number of SHUTDOWN acknowledgement requests sent. This counter provides the number of SHUTDOWN acknowledgement requests sent on this SCTP association.

\( l \) = Number of SHUTDOWN COMPLETE requests received. This counter provides the number of SHUTDOWN COMPLETE requests received on this SCTP association.

\( m \) = Number of SHUTDOWN COMPLETE requests sent. This counter provides the number of SHUTDOWN COMPLETE requests sent on this SCTP association.

\( n \) = Number of datagrams requiring reassembly. This counter provides the number of SCTP datagrams successfully reassembled at this entity.

\( o \) = Number of times the re-assembly procedure failed. This counter provides the number of failures detected by the SCTP re-assembly algorithm (for whatever reason: timed out, errors, and so forth). Note that this is not necessarily a count of discarded SCTP fragments since some algorithms can lose track of the number of fragments by combining them as they are received.

\( p \) = Number of SCTP datagrams that were fragmented. This counter provides the number of SCTP datagrams that were successfully fragmented at this entity.

2. REASON FOR OUTPUT

To display the basic trunk group flag (TGFLAG) package from the five minute surveillance data. This is a response to an OP:M5 input message.

3. VARIABLE FIELD DEFINITIONS

a = Termination report. Valid value(s):
   COMPLETED = Last in a series of messages.
   CONTINUED = Next in a series of messages.
   STARTED = First in a series of messages.

b = Trunk group (TG) number.

c = Dynamic overload control (DOC). Valid value(s):
   N = No calls have been affected by DOC.
   Y = At least one call has been affected by DOC.

d = Group signaling congestion (GSC). Valid value(s):
   N = No calls have been affected by GSC.
   Y = At least one call has been affected by the receipt of a GSC signal.

e = Trunk reservation controls group (TR). Valid value(s):
   N = No calls have been affected by TR.
   Y = At least one call has been affected by TR.

f = Count of all the calls affected by automatic (AUTO) controls.

4. ACTION TO BE TAKEN

None.

5. ALARMS
None.

2. **REASON FOR OUTPUT**

To display a basic trunk group package (PKG) from the five-minute (M5) surveillance data.

3. **VARIABLE FIELD DEFINITIONS**

- **a** = Termination status. Valid value(s):
  - COMPLETED = Last in a series of messages.
  - CONTINUED = Middle in a series of messages.
  - STARTED = First in a series of messages.

- **b** = Trunk group number.

- **c** = Number of outgoing attempts.

- **d** = Number of overflow count.

- **e** = Total usage of trunk at 100 second intervals.
\[ f \text{ = Number of incoming attempts.} \]
\[ g \text{ = Total maintenance usage of trunk at 100 second intervals.} \]
\[ h \text{ = Number of transmitter timeouts.} \]
\[ i \text{ = Number of trunks requested for outgoing attempts.} \]

Note: For non-wideband calls, variable \( 'c' \) and variable \( 'i' \) are the same.

For wideband calls, variable \( 'c' \) is pegged once per call. Variable \( 'i' \) is pegged \( N \) times per call; where \( N \) is the number of trunks requested for that wideband call.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

   .   .   .   .   .

[3] OP MEASTAT CLCT STATUS

   FIXED LENGTH SECTION a (b) IS COLLECTED

2. REASON FOR OUTPUT

To respond to an OP:MEASTAT input message to report the collection status of each section of the 30-minute traffic report.

To respond to an OP:MEASTAT,CLCT:SECT=b[,START=l] input message to report the maximum 500 collected components of the specified section (refer to the variables 'a', 'b' and 'l') of the 30-minute traffic report. The printing of collected components may be stopped before 500 components are reported. It may occur only when the end of TRFC30 buffer is reached. The APP:TRFC-SECTION appendix of the input message manual provides with description of section's components. This message reports the collection status of each section of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

a = Section number. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

b = Section name. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

c = The number of bytes needed to hold the indicated buffer of the report section.

d = The status (ALW or INH) of the report section collection.
e = The total number of bytes used by the 30-minute traffic report. This is the sum of the sizes of all the allowed sections.

f = The total number of bytes available for the 30-minute traffic report.

g–k = Component identifier. Refer to APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual

l = Starting component number to print from (default is 1).

4. ACTIONS TO BE TAKEN

Use the OP:MEASTAT input message to request the status of the COLLECT allocation usage. If the status report indicates that a desired section is inhibited, choose a section which is not desired and inhibit it (INH:TRFC30). Follow up with the appropriate ALW:TRFC30 request to permit collection of the desired section.

5. ALARMS

None.

   TRFC30          a        d         c        d
   TOTAL MESSAGE UNITS USED = e OUT OF f

2. REASON FOR OUTPUT

   To respond to an OP:MEASTAT input message request to report the print status of the 15-minute traffic (TRFC15),
   the 30-minute traffic (TRFC30), the division of revenue hourly report (DRHR), and the hourly plant (PLNTHR)
   reports.

   To find the status of the individual sections of TRFC30, use the OP:ST-TRFC30 input message.

3. VARIABLE FIELD DEFINITIONS

   a = The size (in message units) needed to print the report when the output is directed to the
      receive-only printer (ROP). In the case of the TRFC30, this is the total of all sections allowed.

   b = The status (ALW or INH) of the report for ROP output.

   c = The size (in message units) needed to print the report when the output is directed to the traffic
      channel (TRFCH). In the case of the TRFC30, this is total of all sections allowed.

   d = The status (ALW or INH) of the report for traffic channel output.

   e = The sum of message units for all reports and sections of TRFC30 currently allowed.

   f = The total allocation of message units.

4. ACTION TO BE TAKEN

   Use the OP:MEASTAT input message to request the status of the PRINT allocation usage. If the status report
   indicates that a desired report or section is inhibited, choose a report (or section) which is not desired and inhibit it
   (INH:TRFC30). Follow up with the appropriate ALW:TRFC30 request to permit printing of the desired report

________________________________________________________

[2] OP MEASTAT STATUS
FIXED LENGTH SECTION a (b) IS COLLECTED

2. REASON FOR OUTPUT

To respond to an OP:MEASTAT input message.

Format 1 reports the maximum 500 collected components of the specified section of the 30-minute traffic report. The printing of collected components may be stopped before 500 components are reported. It may occur only when the end of TRFC30 buffer is reached. The APP:TRFC-SECTION appendix of the input message manual provides with description of section's components. It is followed by the component identifiers that were found for the specified section.

Format 2 reports appropriate information when a section doesn't have components (fixed length section).

3. VARIABLE FIELD DEFINITIONS

a = Section number. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

b = Section name. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

c = Component identifier. Some sections require single identifiers [such as trunk group number] while other sections require multiple identifiers (such as switching module (SM) and line unit (LU)].

Each line of output represents one component (such as unit or group) identified by one or multiple identifiers.

Refer to APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual.

4. ACTIONS TO BE TAKEN

Use the OP:MEASTAT input message to request the status of the COLLECT allocation usage. If the status report indicates that a desired section is inhibited, choose a section which is not desired and inhibit it (INH:TRFC30). Follow up with the appropriate ALW:TRFC30 request to permit collection of the desired section.

[6] OP MEMERRS CANNOT RETRIEVE MEMLOG RECORD FROM ECD

[7] OP MEMERRS COMPLETED
NO MEMLOG ENTRIES MATCH THE SPECIFIED DATE

[8] OP MEMERRS CANNOT WRITE TEMPORARY FILE

[9] OP MEMERRS CANNOT CLOSE TEMPORARY FILE

2. REASON FOR OUTPUT

To report a table of interpreted 3B20D CU memory errors from the memory log file (MEMLOG). 3B21D control unit (CU) memory errors are not interpreted because there is only one memory board in each CU.

Format 3 indicates there are no memory errors stored in the log files.

Format 4 indicates that memory error interpretation was requested on 3B21D CU memory errors.

3. VARIABLE FIELD DEFINITIONS

a = CU number of the faulty unit.
b = Main store controller of the faulty unit.

c = Indicates where the error occurred. Valid value(s):
   MY = My store.
   OTH = Other store.

d = Type of memory error that occurred. Valid value(s):
   Error A = An "or" over several circuit checks resulted in error detection.
   Error B = An attempt was made to access an unequipped memory array or module.
   Error C = The Hamming check circuitry detected a multi-bit uncorrectable error during a
             system access of memory.
   Error D = A system or refresh access of memory detected an error.

e = Slot number of the faulty data. This number is relative to the CU.

f = Hexadecimal code identifier for memory devices.
   This value is only reported on an error D and is used to locate the faulty chip on the array board.
   The form of this identifier is nnss where ss is the side (A, B, 1A, 1B, 2A, 2B) of the memory device.

g = Indicates whether the detected error was correctable or uncorrectable.

h = Indicates whether the error was detected during system or refresh access.

i = The error A interrupt source formed from an "or" of several check circuits internal to the memory
    controller. The error A source is only output if an error A has occurred.

j = An optional warning or abort message of the form:
    SLOT NUMBERS ARE INVALID

k = Date that the memory error occurred. Listed in the form of month/day/year.

l = Time of day of the memory error. Listed in the form of hour and minute.

4. ACTION TO BE TAKEN

If the abort message appears, remove any files in directory "tmp" of the form "MEMERRS-XXXXXX" and retry the
message.

If the warning message that the slot numbers are invalid appears, the slot numbers in the table cannot be trusted.
This message indicates that the equipment configuration data base (ECD) cannot be properly accessed, refer to the
TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Also, all
equipage is assumed to be the same as in CU 0 and only main store controller (MASC) 0 and MASC 1 are allowed
for any CU.

If ?s appear at any place, the data being read is invalid. Output will resume at the next valid entry.

Format 3 is not an error condition. It requires no action.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[2] OP MEMSIZE w [x]
```

2. REASON FOR OUTPUT

To report a forecast summary of the memory needed by the office's administration module (AM), communications module processor (CMP), and switching modules (SMs) to retrofit to the specified release. Any errors encountered are reported with Format 2. The report is also output to /rclog/memsize.rep file.

3. VARIABLE FIELD DEFINITIONS

- **a** = Base and control for the office.
- **b** = Current software release.
- **c** = Retrofit software release.
- **d** = Processor number.
- **e** = Type of processor being associated with variable ‘d’. For SMs, the types are, local switching module (LSM), remote switching module (RSM), host switching module (HSM). Other types to be sized are the AM, CMP and disk facilities.
- **f** = Retrofit configuration. For SMs, the configuration represents the configuration after retrofit. The configuration for SMs can be BSM (BASIC), SSM (STANDARD), LSM (LOADED), or 2KSM (SM-2000). For the AM, CMP and disk facilities, the retrofit configuration is always the same as the
type.

\( g \) = SABM equipped. This indicates whether or not the processor is equipped with the standalone billing memory feature (Yes or No).

\( h \) = RTBM equipped. This indicates whether or not the processor is equipped with the realtime billing memory feature (Yes or No).

\( i \) = Meg memory equipped. This indicates the amount of memory (in megabytes) that the processor is equipped with.

\( j \) = Kilo ODD needed. This indicates the amount of memory (in kilobytes) that the processor needs for the office-dependent data (ODD) after retrofit. This number is the sum of RODD and UODD for SM. It is the sum of SODD and UODD for AM and CMP. For disks, this quantity is the total amount of space needed by the partition that backs up all the NRODDs from SMs.

\( k \) = Meg total (minimum). This indicates the minimum amount of memory (in megabytes) that the processor needs for the retrofit.

\( l \) = This indicates the percent of free space used in computing the meg ODD needed (variable ‘j’).

\( m \) = Memory needed. This indicates if the processor needs additional memory to successfully retrofit (Yes, No, or PCR). PCR means the SM needs new processor. Otherwise, additional memory needed is the difference of variables ‘k’ and ‘i’.

\( n \) = Amount of memory in megabytes on the processor core board of processor ‘d’.

\( o \) = Number of TN56 memory boards on processor ‘d’.

\( p \) = Number of TN2012 memory boards on processor ‘d’.

\( q \) = Number of TN1374 memory boards on processor ‘d’.

\( r \) = Number of TN1376 memory boards on processor ‘d’.

\( s \) = Number of TN1661 memory boards on processor ‘d’.

\( t \) = Number of TN1685 memory boards on processor ‘d’.

\( u \) = Number of TN1806 memory boards on processor ‘d’.

\( v \) = Total memory in megabytes on processor ‘d’. An asterisk (*) in this field indicates that the equipage on the two sides is different and the smaller number is reported.

\( w \) = Job status. Valid value(s):

\textit{ABORTED} = Requested action was terminated before completion and the termination was immediate. Reasons are given in variable ‘w’.

\textit{STOPPED} = Requested action was stopped as requested using the STP:MEMSIZE input message.

\( x \) = Error/warning message. Valid value(s):

\textit{ERROR DURING SIZING} = Rerun command and observe output. If problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

\textit{ERROR IN ACCESSING I/O FILES} = Rerun command and observe output. If problem persists,
refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

ERROR IN ACCESSING THE MODATT RELATION = Rerun command and observe output. If problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

ERROR IN ACCESSING THE SMCONF RELATION = Rerun command and observe output. If problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

ERROR IN COMMUNICATION BETWEEN PROCESSORS = Rerun command and observe output. If problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

ERROR IN COMMUNICATION BETWEEN UNIX AND OKP = Rerun command and observe output. If problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

ERROR IN TRANSFERRING DELTA INFORMATION = Rerun command and observe output. If problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INVALID TORELEASE PARAMETER OR MISSING INPUT FILES = Either the TORELEASE parameter was incorrectly input or the data files needed to run the tool are missing.

NO ACTIVE SMS WERE FOUND = Cannot run the tool as no active SM was found.

ONE OR MORE PROCESSORS ARE IN ISOLATION = Cannot run the tool until all SMs are out of isolation.

WARNING - PROCS NEAR 52 MB MAX SEE /rclog/memsize.rep = Processor number x is at or near 52 megabytes maximum. Please examine the output /rclog/memsize.rep and examine the "%FREE" column of the report output to determine if the values are acceptable to the office.

WARNING - PCR - MEANS NEED NEW PROCESSOR = Processor number x has exceeded its maximum 52 megabytes capacity. The only option is to replace with a new SM processor.

\[ y \] = Current page number.

\[ z \] = Total number of output pages.

\[ a \] = This indicates a projection of the amount of unallocated memory space that will be available when the higher of the MB MEM EQUIPPED or the MB MEM NEEDED is on the SM.

4. ACTIONS TO BE TAKEN

For Format 1, none. This information is output in response to a user-specified request.

For Format 2, rerun the command and observe the output. If the problem persist, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

__________________________________________________________________

[2] OP MGDSC {AM|CMP=a|SM=b} PAGE 1 of 1
   NO OUTPUT MESSAGES HAVE BEEN DISCARDED

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to an OP:MGDSC input message.

If the request is for a specific message class, Format 1 is printed.

If the request is for all message classes, Format 1 is printed with a list of message classes that has non-zero value in the brevity control message discard (MGDSC) count or the throttle message discard count. However, if no messages have been discarded, Format 2 is printed.

The brevity control message discard count contains total number of messages being discarded due to brevity control for the specified processor, administrative module (AM) operational kernel process, communication module processor (CMP), or a switching module (SM). The message throttling discard count contains total number of messages being discarded due to queue overflow for the specified processor, AM, CMP, or an SM. These counts were accumulated since 23:58:00, two minutes before midnight, or the time the last CLR:MGDSC input message was entered.

3. VARIABLE FIELD DEFINITIONS

a = CMP number.
b = SM number.
c = Current page number in this report.
d = Total number of pages in this report.
e = Message class name.
f = Total number of output messages being discarded due to brevity control.
g = Total number of output messages discarded due to message queue overflow.

4. ACTION TO BE TAKEN

2. REASON FOR OUTPUT

To report the result of executing an OP:MHD-INFO input message.

Format 5 outputs data for a storage module drive (SMD) moving head disk (MHD).

Format 6 outputs data for a small computer system interface (SCSI) MHD.

3. VARIABLE FIELD DEFINITIONS

a  = MHD member number.

b  = Process step or reason code. Valid value(s):
   f01  = Failed to enable message reception.
   f03  = Failed to open equipment configuration database (ECD).
   f06  = Failed to get unit control block (UCB) by name.
   f08  = Failed to get top UCB.
   f0a  = Top UCB is not a disk file controller (DFC).
   f0c  = Unknown DFC type.
   f0e  = Failed to get UCB of SCSI bus (SBUS).
   f11  = Failed to assign special device file (SDF) name for DFC.
   f14  = Failed to open SDF for DFC.
   f17  = Refer to the disk driver (DKDRV) report on the receive-only printer (ROP).
   f1a  = Failed to close special device file.
   f1c  = Failed to release special device file.
   f1f  = Failed to unreserve DFC UCB.
   f23  = Failed to get next UCB.
   f26  = Failed to assign SDF name for MHD.
   f29  = Failed to open SDF for MHD.
   f2c  = Failed to set input/output (I/O) mode of device file.
   f2f  = Device size not recognized.
   f33  = Refer to the DKDRV report on the ROP.
   f36  = Failed to close SDF.
f37 = Failed to release SDF.
f38 = Failed to unreserve UCB.
f3e = Message to port failure.
f43 = Message reception failure.
f46 = Process timed out.
f49 = Failed to close special device file.
f4c = Failed to release special device file.
f4f = Failed to unreserve UCB.
f53 = Failed to close ECD.
f56 = Terminated externally with signal.

c = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

d = Member number of controller.

e = DFC firmware/pumpcode version in the form:
f.g.h-i

Valid value(s):
NAP = The pumpcode version is not applicable for SMD DFCs.
NAV = The firmware or pumpcode versions are not available or cannot be determined.

f = Version of DFC FIRMWARE/PUMPCODE.

g = Issue of DFC FIRMWARE/PUMPCODE.

h = Point issue of DFC FIRMWARE/PUMPCODE.

i = Laboratory design issue (LDI) of DFC FIRMWARE/PUMPCODE.

j = Unit number.

k = Device ID (drive ID plug number).

l = Physical port number (where the SMD disk is connected to the DFC). Valid value(s):
NAV = The DFC is not available, is reserved, or the SMD DFC FIRMWARE/PUMPCODE version is earlier than 3.2.0.

m = Major status of unit.

n = Number of tracks (in decimal) on the disk drive. Valid value(s):
NAV = DFC was unavailable or reserved.

o = Validity of the volume table of contents (VTOC). Valid value(s):
INVALID = Could not find a valid VTOC entry.
NAV = Could not reserve unit; VTOC not read.
UNRDBLE = Read error while trying to read the VTOC.
VALID = VTOC has a valid entry for the VTOC.
p = Usability. Valid value(s):
NO   = Disk data integrity is unknown.
YES  = The disk is usable.

q = Unit reserved. Valid value(s):
NO   = The unit is not reserved.
YES  = The unit is reserved for maintenance activity.

r = Hexadecimal value of the essential field of the unit's unit control block (UCB).

s = Unit name and member number of duplex mate or SMPLX (unit has no mate).

t = Equipage size based on the physical drive. For SCSI disks, the physical drive size is determined by reading the capacity of the disk from the disk drive itself. For SMD disks, the physical drive size is determined by reading the equipage value in the UCB record. Valid value(s):
160MB = SMD disk drive.
300MB = SMD disk drive.
322MB = SCSI disk drive.
340MB = SMD disk drive.
600MB = SCSI disk drive.
1000MB = SCSI disk drive.
2000MB = SCSI disk drive.
NAV   = DFC is not active, the unit is reserved, or the SCSI device is inaccessible.

u = Equipage size based on the UCB equipage value. The drive size is determined by reading the equipage value in the UCB record for the unit. Valid value(s):
160MB = SMD disk drive.
300MB = SMD disk drive.
322MB = SCSI disk drive.
340MB = SMD disk drive.
600MB = SCSI disk drive.
1000MB = SCSI disk drive.
2000MB = SCSI disk drive.
NAV   = DFC is not active, or the unit is reserved.

v = Equipage size based on the VTOC. The drive size is derived from the maximum capacity of the unit's VTOC. Valid value(s):
160MB = SMD disk drive.
300MB = SMD disk drive.
322MB = SCSI disk drive.
340MB = SMD disk drive.
600MB = SCSI disk drive.
1000MB = SCSI disk drive.
2000MB = SCSI disk drive.
NAV   = DFC is not active, the unit is reserved, or the unit is inaccessible.

w = Sizes compatible. Valid value(s):
NAV   = At least one of the equipage sizes is not available.
NO    = DRIVE, UCB, and VTOC equipage sizes are not compatible.
YES = DRIVE, UCB, and VTOC equipage sizes are compatible.

Equipage sizes are not compatible if the drive size is not equal to the UCB equipage size or if the drive size is smaller than the VTOC size.

Size comparisons are based on the formatted capacity of a disk drive. The formatted capacity of the UNIX® RTR-supported disk drives are as follows:

<table>
<thead>
<tr>
<th>Drive</th>
<th>Formatted Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>160MB</td>
<td>133MB</td>
</tr>
<tr>
<td>300MB</td>
<td>253MB</td>
</tr>
<tr>
<td>322MB</td>
<td>322MB</td>
</tr>
<tr>
<td>340MB</td>
<td>277MB</td>
</tr>
<tr>
<td>600MB</td>
<td>604MB</td>
</tr>
<tr>
<td>1000MB</td>
<td>1000MB</td>
</tr>
<tr>
<td>2000MB</td>
<td>2000MB</td>
</tr>
</tbody>
</table>

x = Alphanumeric data representing the product identification of a SCSI device. Valid value(s):
  NAV = The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

y = Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

z = SCSI host adapter (HA) bus identification number (0 or 1).

a¹ = Alphanumeric data representing the serial number of a SCSI device. Valid value(s):
  NAP = Not applicable for this device.
  NAV = The DFE or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

b¹ = Alphanumeric data representing the revision level of the firmware in a SCSI device. Valid value(s):
  NAV = The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

c¹ = Device type.

4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered.

For Formats 5 and 6, if the drive equipage sizes are not compatible, verify the correctness of the UCB equipage value. If there is still an inconsistency, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report on the system's disk configuration. This message is a response to the OP:MHD-CFG input message.

3. VARIABLE FIELD DEFINITIONS

a = A normal minor device configuration table (MDCT) form name.
b = A moving head disk (MHD) that is related to the specified MDCT.
c = A MHD that is also related to the specified MDCT.
d = One or more lines of text. Valid value(s):
  AUTO MHD CONFIGURATION IS INHIBITED ON MHD(s) e ... = The specified moving head disks (MHDs) have been blocked from automatic MHD configuration by manual input message. The MHD(s) are specified by the e variable(s).
  AUTO MHD CONFIGURATION IS INHIBITED = Automatic MHD configuration for this office is inhibited office wide.
  AUTO MHD CONFIGURATION IS NOT PERMITTED = The default state of automatic MHD configuration for this office is off.
  * INDICATES RECONFIGURED MHD = MHDs with an asterisk ('*') are not associated with their normal MDCT form.
  WARNING SYSTEM NOT BOOTABLE = If the system takes a level 52 or higher recovery, it will likely not recover.

2. REASON FOR OUTPUT

To respond to an OP:MON-CTL input message. Format 1 is for a response for an administrative module (AM) request. Format 2 is for a response for a switching module (SM) or a communications module processor (CMP) request.

3. VARIABLE FIELD DEFINITIONS

a. Switching module (SM) number.

b. Message switch side (0 or 1).

c. Communications module processor (CMP) number (0-11).

d. Address of the monitor buffer in the AM, SM or CMP. Valid value(s):
   OShisarray = AM monitor buffer variable.
   SIhistory = SM and CMP monitor buffer variable.

e. Status of monitor. Valid value(s):
   0 = OFF.
   Non-zero number = ON.

f. = 0 through H'FFFFFFFF. For:
   DDT = Bit flags that specify data to be stored in the monitor buffer.
   FLG = Bit flags that specify monitor actions to perform.
   IDX = Byte index into the dispatch array of the monitor buffer.

g. = Hexadecimal address (0-FFFFFFFF). 0 specifies end of address dumps. For:
   AD1 = First address of memory to store in monitor buffer.
   AD2 = Second address of memory to store in monitor buffer.
   AD3 = Third address of memory to store in monitor buffer.
   AD4 = Fourth address of memory to store in monitor buffer.
   AD5 = Fifth address of memory to store in monitor buffer.
   AD6 = Sixth address of memory to store in monitor buffer.

h. = Any hexadecimal value (0 through H'FFFFFFFF). For:
   BCL = Start clock in milliseconds for peg and time accumulation.
   ECL = Stop clock in milliseconds for peg and time accumulation.
   FFG = Monitor special function execution control bits (0-15) and special monitor action bits (16-31).
FGC = Clock at beginning of foreground in 125 microsecond units.

FRA = Previous function return address.

LA1 = Process control block link area (PCBLA) first offset of data to be dumped on per event snap shot (SM only).

LA2 = PCBLA second offset of data to be dumped on per event snap shot (SM only).

LA3 = PCBLA third offset of data to be dumped on per event snap shot (SM only).

OET = Real time clock at entry to OKP.

PDA = Data value for match/mismatch function or start time for automatic start/stop feature.

PDM = Mask value for match/mismatch function.

PIC = Foreground PIC interrupt data value.

PST = Time in milliseconds filter for per event shot or consecutive segment check filter, or time interval for timed data dump (SMKP).

PTM = Time in milliseconds for filter for per event data snap shot or consecutive segment check filter, or time interval for timed data dump (OKP).

Time in number of 125 microsecond intervals for filter for per event data snaps or consecutive segment check filter, or time interval for timed data dump (SM CMP).

SA1 = Save dumped data from address AD1.

SA2 = Save dumped data from address AD2.

SA3 = Save dumped data from address AD3.

SA4 = Save dumped data from address AD4.

SA5 = Save dumped data from address AD5.

SA6 = Save dumped data from address AD6.

SET = Real time clock at entry to SMKP.

SL1 = Save dumped data from LA1 (SM only).

SL2 = Save dumped data from LA2 (SM only).

SL3 = Save dumped data from LA3 (SM only).

SMA = Save next segment address for MSKP (similar to SVA).

SMB = Save real time clock at beginning of job for MSKP.

SMP = Save program ID and PCB index for MSKP.

SMY = Save process priority, event type and segment time for MSKP.

SS1 = Save dumped data from address AD1 for SMKP.

SS2 = Save dumped data from address AD2 for SMKP.

SS3 = Save dumped data from address AD3 for SMKP.

SS4 = Save dumped data from address AD4 for SMKP.

SS5 = Save dumped data from address AD5 for SMKP.

SS6 = Save dumped data from address AD6 for SMKP.

SSA = Save next segment address for SMKP (similar to SVA).

SSB = Save real time clock at beginning of job for SMKP.

SSP = Save program ID and PCB index for SMKP.

SSY = Save process priority, event type and segment time for SMKP.

SVA = Save next segment address.

SVB = Save real time clock at beginning of job.

SVF = Location to save FFG word while waiting for the monitor to start.

SVP = Save program ID and PCB index.

SVW = Location to save CTL word while waiting for the monitor to start.

SVY = Save process priority, event type and segment time.

UET = Real time clock at entry to UNIX®-RTR.

= Value of PRG. For:
PRG = Program ID of process or special code for monitor actions involving process dispatch.

For the AM this field applies to the operational kernel process OKP only.

\( j \) = 0 through 7. For:
PRI = Operating system for distributed switching (OSDS) priority level for per event data snapshot.

\( k \) = Value of PGS. For:
PGS = Switch maintenance kernel process (SMKP) program ID or special code for monitor actions involving process dispatch.

\( l \) = Zero means no functions to execute. A non-zero value means execute functions specified by FFG data.

For:
CTL = Monitor special execution control word.

\( m \) = Unused. For:
FGS = Unused.
SGS = Unused.
SP1 = Spare control word 1.
SP2 = Spare control word 2.
SP3 = Spare control word 3.
SP4 = Spare control word 4.
SP5 = Spare control word 5.
SP6 = Spare control word 6.
SP7 = Spare control word 7.
SP8 = Spare control word 8.
SP9 = Spare control word 9.
SPa = Spare control word a.
SPb = Spare control word b.
SPc = Spare control word c.
SPd = Spare control word d.

\( n \) = Loading status of the array. Valid value(s):
0 = Not loading the array.
H'FFFFFFFF = Loading the array.

For:
BGF = Flag indicating background loading of the dispatch array.

\( o \) = Number of days since Jan 1, 1970. For:
SVD = Day that the monitor started.

\( p \) = Number of milliseconds since midnight. For:
SVT = Time of data that the monitor started.

q = Time in milliseconds. For:

SVS = Process segment length.

r = Any hexadecimal value of port from relation FC_PORTYP. For:
PRT = Port number for snapshot filtering.

s = Any hexadecimal value (0 through H'FF). For:
EVN = Foreground exception vector number.

t = Time in 125 microsecond units. For:
SGL = Save process segment length.

4. ACTIONS TO BE TAKEN

Collect the data and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual for additional information about assistance.

5. ALARMS

None.

[4] OP MON PID AM COMPLETED

2. REASON FOR OUTPUT

To respond to a OP:MON-PID input message for the administrative module (AM). Format 1 is the first record for a read-only printer (ROP) request. Format 2 is the second record for a ROP request. Format 3 is the last record for a ROP request. Format 4 is the completion response for all requests.

3. VARIABLE FIELD DEFINITIONS
Note: For definitions with a ‘*’, when the monitor is active this data represents the initial values of the SPY data when the monitor was activated. If the monitor has been inhibited using the INH:MON or the automatic start/stop feature, this data is the “Spy” data time differences during the monitor run period.

Note: For definitions with ‘**’, these values are accumulators for the numbers of various interject message types. They are zeroed at monitor activation but will continue to be incremented when the monitor is inhibited. The counts for the interject message types at the monitor inhibit point are stored elsewhere in the monitor buffer.

ACAPD = Not used.
ACCNI = Amount of time in milliseconds in CCrcvnci() function.
ACC0 = Amount of time in milliseconds in OSDS priority 0.
ACC1 = Amount of time in milliseconds in OSDS priority 1.
ACC2 = Amount of time in milliseconds in OSDS priority 2.
ACC3 = Amount of time in milliseconds in OSDS priority 3.
ACC4 = Amount of time in milliseconds in OSDS priority 4.
ACC5 = Amount of time in milliseconds in OSDS priority 5.
ACC6 = Amount of time in milliseconds in OSDS priority 6.
ACC7 = Amount of time in milliseconds in OSDS priority 7.
ACHIJ = Amount of time in milliseconds in OKP interject.
ACHMX = Amount of time in milliseconds in MSKP.
ACHOX = Amount of time in milliseconds in OKP work entries.
ACHUF = Amount of time in milliseconds in UNIX® RTR operating system work entries.
ACHSX = Amount of time in milliseconds in SMKP.
ACOKP = Amount of time in milliseconds in OKP where segment time is greater than 3 milliseconds.
AMCP = Accumulator for AMCP interject messages.**
AMCT = Accumulator for AMCT interject messages.**
BCST = Accumulator for BCST interject messages.**
CCPT = Accumulator for CCPT interject messages.**
CINJ = Not used.
CMBP = Number of messages sent by the CMbput().
CNIR = Accumulator for CNI receive messages.**
CNIS = Accumulator for CNI send messages.**
DDCP = Accumulator for DDCP interject messages.**
DLTA = Elapsed time of UNIX® RTR operating system “Spy” snap shot for monitor.*
FALT = Accumulator for interject messages that are destined for an OKP process.**
FUNX = Accumulator for message sent from another UNIX® RTR process to OKP.
HAIR = Accumulator for hairpin messages.**
HORQ = Not used.
ICHUF = Number of UNIX® RTR operating system idle entries to operational kernel process (OKP).
ICHOX = Total number of OKP entries.
IDLE = Amount of time in idle event loop.*
IMCP = Accumulator for IMCP interject messages.**
KERN = Amount of time in kernel.*
KNPR = Amount of time in kernel processes.*
LVL0 = Amount of time in UNIX® RTR operating system level 0.*
LVL1 = Amount of time in UNIX® RTR operating system level 1.*
LVL2 = Amount of time in UNIX® RTR operating system level 2.*
LVL3 = Amount of time in UNIX® RTR operating system level 3.*
LVL4 = Amount of time in UNIX® RTR operating system level 4.*
LVL5 = Amount of time in *UNIX®* RTR operating system level 5.*
LVL6 = Amount of time in *UNIX®* RTR operating system level 6.*
LVL7 = Amount of time in *UNIX®* RTR operating system level 7.*
LVL8 = Amount of time in *UNIX®* RTR operating system level 8.*
LVL9 = Amount of time in *UNIX®* RTR operating system level 9.*
LVLa = Amount of time in *UNIX®* RTR operating system level 10.*
LVLb = Amount of time in *UNIX®* RTR operating system level 11.*
LVLc = Amount of time in *UNIX®* RTR operating system level 12.*
LVLd = Amount of time in *UNIX®* RTR operating system level 13.*
VLLe = Amount of time in *UNIX®* RTR operating system level 14.*
LVLf = Amount of time in *UNIX®* RTR operating system level 15.*
MSGI = Accumulator for inter-processor message received.
MSGL = Accumulator for intra-processor message sent.
OKAUD = Last audit segment interval time in milliseconds.
PATH = Not used.
PCAPD = Not used.
PCCNI = Number of calls to function CCrvcvnc().
PCHIJ = Number of entries to OKP interject.
PCHMX = Number of message switch kernel process (MSKP) entries.
PCHOX = Number of OKP work entries.
PCHUF = Number of *UNIX®* RTR operating system work entries.
PCHSX = Number of switch maintenance kernel process (SMKP) entries.
PPG0 = Number of entries to OSDS priority 0.
PPG1 = Number of entries to OSDS priority 1.
PPG2 = Number of entries to OSDS priority 2.
PPG3 = Number of entries to OSDS priority 3.
PPG4 = Number of entries to OSDS priority 4.
PPG5 = Number of entries to OSDS priority 5.
PPG6 = Number of entries to OSDS priority 6.
PPG7 = Number of entries to OSDS priority 7.
PSCP = Accumulator for PSCP interject messages.**
RTFD = Not used.
RTGN = Not used.
SCTU = Accumulator for messages from an SM or CMP to *UNIX®* RTR processes other than OKP.
SKAUD = Real time clock (RTC) at time of last audit segment dispatch.
SPR1 = Not used.
SPR2 = Not used.
SPR5 = Not used.
SPR6 = Not used.
SPR7 = Not used.
SPR8 = Not used.
SPR9 = Not used.
SPRa = Not used.
SPRb = Not used.
SPRc = Not used.
SPRd = Not used.
SPRe = Not used.
SPRf = Not used.
SPRg = Not used.
SPRh = Not used.
SPRi = Not used.
SPRj = Not used.
SPRk = Not used.
SUPR = Amount of time in supervisor processes.*
TOHOX = Number of OKP entries greater than 100 milliseconds.
TSRE = Not used.
TUNX = Accumulator for message sent from OKP to another UNIX® RTR process.
USER = Amount of time in user processes.*
a = Value in hexadecimal.
b = Not used.
c = Value in hexadecimal. When the monitor is active, this data represents the initial values of the SPY data when the monitor was activated. If the monitor has been inhibited using the INH:MON or the automatic start/stop feature, this data is the “Spy” data time differences during the monitor run period.
d = Value in hexadecimal. These values are accumulators for the numbers of various interject message types. They are zeroed at monitor activation but will continue to be incremented when the monitor is inhibited. The counts for the interject message types at the monitor inhibit point are stored elsewhere in the monitor buffer.

4. ACTIONS TO BE TAKEN

Application: 5
Type: Output

1. FORMAT

[1] OP MON PID {AM|SM=a|CMP=b-c}
   PID:  d
   PEG:  e  f
   TIME:  g  h

[2] OP MON PID {AM|SM=a|CMP=b-c}{FIRST|NEXT|LAST} RECORD
   i:       j         k         j         k
   .        .         .         .         .
   .        .         .         .         .
   .        .         .         .         .

[3] OP MON PID {AM|SM=a|CMP=b-c}{IN PROGRESS|COMPLETED}

2. REASON FOR OUTPUT

To respond to a OP:MON-PID input message. Formats 1 and 3 are responses to single program ID requests. Formats 2 and 3 are responses to all program ID requests.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM).
b = Message switch side (0-1).
c = Communications module processor (CMP) number (0 to 11).
d = Program ID (PID).
e = Number of dispatches (PEG) of processes associated with the specified program ID.
f = Hexadecimal value of 'e'.
g = Total time in milliseconds for the 'e' dispatches of the program ID specified by 'd'.
h = Hexadecimal value of 'g'.
i = Relative address in the monitor buffer where the data for program IDs were stored. The number of output blocks depends on the maximum number of program IDs defined for the processor.
j = Number of process dispatches for the program ID.
k = Accumulated real time in milliseconds by the program ID.
4. ACTIONS TO BE TAKEN

Collect and send appropriate data as specified by technical support personnel.

5. ALARMS

None.

__________________________________________________________________

[2] OP MSUSP=a-b-c-d NOT STARTED e

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to an OP:MSUSP input message to output the status of scan points (SP) on a metallic service unit (MSU) scan board.

Format 1 is printed when the status report is completed.

Format 2 is printed when the status report has not started.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = MSU number.
c = Service group number.
d = Scan board number.
e = Termination report. Valid value(s):
   UNIT IS OUT OF SERVICE
   UNIT NOT EQUIPPED WITH SCAN PTS

f = Current status of scan point. Valid value(s):
   0 = Off.
   1 = On.

Note: SP 31 is a current sensing scan point which "turns on" (or logical 1) when the current falls below a threshold.
4. ACTION TO BE TAKEN

If the output message indicates that the unit is out-of-service (OOS), restore the scan board and re-enter the OP:MSUSP input message.

If the output message indicates that the unit is not equipped with scan points, verify that the input message that was entered was really for a SCAN board. If the input message was for a SCAN board re-enter the message. If same results occur, verify MSU hardware and ports in office-dependent data (ODD) relations CKTDATA, PC_MSUSG, and SMEST using recent change.

5. ALARMS

None.

   .
   .
   .

2. **REASON FOR OUTPUT**

   To report the result of executing an OP:MT-INFO input message.

   Format 5 is used to output data for a small computer system interface (SCSI) magnetic tape (MT) device.

3. **VARIABLE FIELD DEFINITIONS**

   a = MT member number.

   b = Process step or reason code. Valid value(s):
   
   f01 = Failed to enable message reception.
   f03 = Failed to open equipment configuration database (ECD).
   f06 = Failed to get unit control block (UCB) by name.
f08 = Failed to get top UCB.
f0a = Top UCB is not a disk file controller (DFC).
f0c = Unknown DFC type.
f0e = Failed to get UCB of SCSI bus (SBUS).
f11 = Failed to assign special device file name for DFC.
f14 = Failed to open special device file for DFC.
f17 = Refer to the disk driver (DKDRV) report on the receive-only printer (ROP).
f1a = Failed to close special device file.
f1c = Failed to release special device file.
f1f = Failed to unreserve DFC UCB.
f23 = Failed to get next UCB.
f26 = Failed to assign special device file name.
f29 = Failed to open special device file.
f2c = Failed to set input/output (I/O) mode of device file.
f2f = Device size not recognized.
f33 = Refer to the DKDRV report on the ROP.
f36 = Failed to close special device file.
f37 = Failed to release special device file.
f38 = Failed to unreserve device UCB.
f3e = Message to port failure.
f43 = Message reception failure.
f46 = Process timed out.
f49 = Failed to close special device file.
f4c = Failed to release special device file.
f5f = Failed to unreserve UCB.
f53 = Failed to close ECD.
f56 = Terminated externally with signal.

c = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
d = Member number of controller.
e = Major status of unit.
f = DFC firmware/pumpcode version in the form:
p.q.s – t
Valid value(s):
NAV = The firmware or pumpcode versions are not available, or cannot be determined.
g = Logical unit number of the SCSI bus that is stored in the SBUS's UCB.
h = SCSI host adapter (HA) bus identification number (0 or 1).
i = Unit number.
j = Device type.
k = Device ID (drive ID number).
1 = Unit reserved. Valid value(s):
   NO      = Unit is not reserved.
   YES     = Unit is reserved for maintenance activity.

m = Product identification. Valid value(s):
   NAP     = Not applicable for this device.

n = Alphanumeric data representing the revision level of the firmware in an SCSI device. Valid value(s):
   NAV     = The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

o = Serial number. Valid value(s):
   NAP     = Not applicable for this device.

p = Version of DFC FIRMWARE/PUMPCODE.
q = Issue of DFC FIRMWARE/PUMPCODE.
s = Point issue of DFC FIRMWARE/PUMPCODE.
t = Laboratory design issue (LDI) of DFC FIRMWARE/PUMPCODE.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

5. ALARMS

None. This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To print the status of one or a group of nail-up connections nailed up using RC/V View 7.11 (NAIL-UP AND HAIRPIN SPECIFICATION). For Formats 1 through 11, the originating ("from") port is shown as the first port in each pair.

Format 1 prints the status information for a specific digital facility interface (DFI) and has up to 30 entries (CON1-CON30).

Format 2 prints the status information for a specific subscriber DFI (SDFI) and has up to 24 entries (CON1-CON24).

Format 3 prints status on a trunk unit channel board level (TUCHBD) and has up to four entries (CON1-CON4).

Format 4 prints status on a DS1 facility (DS1SFAC) of a digital networking unit - synchronous optical network (SONET)(DNU-S) and has up to 24 entries (CON1-CON24).

Format 5 prints status of one connection (CON1) using the digital equipment number (DEN).

Format 6 prints the status of CON1 using the trunk equipment number (TEN).

Format 7 prints the status of one connection using the subscriber loop equipment number (SLEN) number.

Format 8 prints the status of one connection using the DNU-S network equipment number (NEN).

Format 9 prints the status of one connection using the IDCU line equipment number (ILEN) number.

Format 10 prints the status for a specific integrated digital carrier unit (IDCU) facility (IFAC) and has up to 24 entries (CON1-CON24).

Format 11 prints the status of one connection using the integrated digital loop carrier (IDLC) network equipment number (INEN).

Format 12 shows a nail-up request failure.

Format 13 prints the status of an entire switching module (SM) using the quantity (QUAN) parameter.

NOTE: If the DFI parameter is specified, there will be no TEN to TEN combinations printed; when a TUCHBD is specified, there will be no DEN to DEN combinations printed.

3. VARIABLE FIELD DEFINITIONS
HP = Indicates that the connection is a hairpin. Otherwise, the connection is a nail-up.

a = SM number.

b = Digital line and trunk unit (DLTU) number.

c = DFI number.

d = Channel number.

e = Trunk unit (TU) number.

f = Service group number.

g = Channel board number.

h = Circuit number.

j = Loss in decibels (0.0 - 7.0) rounded to nearest 0.5.

k = Basic state of port [such as, in-service (IS)].

l = Qualifier of port.

m = Operational restriction on port.

n = Unit for which OP:NAILUP was requested, as specified in the input message (such as, DEN a-b-c-d).

o = Number of nail-up ports in SM.

p = Percentage of nail-up ports in SM requiring time-slot interchange unit (TSIU) network timeslots divided by the total number of TSIU network timeslots in the SM, rounded to the nearest whole percentage.

q = Number of intra-SM nail-up ports.

r = Number of inter-SM nail-up ports.

s = Status of the request. Valid value(s):
  COMPLETED = OP:NAILUP input message request completed.
  CONTINUED = OP:NAILUP input message request continued.
  PORT NOT NAILED UP = Port not in a nail-up connection.
  STARTED = OP:NAILUP input message request started.

t = Text detail. Valid value(s):
  DATA MAY BE INVALID = Part of message data is invalid indicated by zeros.

u = DCLU number.

v = RT number.

w = RT line number.
x = IDCU number.
y = RT number or IDCU PUB43801 facility number.
z = RT line number or IDCU PUB43801 channel number.
a¹ = IDCU facility (IFAC) number.
c¹ = Supplementary information on port.
d¹ = Mode of port.
e¹ = Number of hairpin ports in SM.
f¹ = Number of intra-SM hairpin ports.
g¹ = DNU-S number.
h¹ = Data group (DG) number.
j¹ = SONET termination equipment (STE) number.
k¹ = Synchronous transport signal (STS) number.
l¹ = Virtual tributary group (VTG) number.
m¹ = Virtual tributary member (VTM) number.
n¹ = Digital signal level 0 (DS0) number.

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

</table>
2. REASON FOR OUTPUT

To print the status of one or a group of nail-up connections nailed up using RC/V View 7.11 (NAIL-UP AND HAIRPIN SPECIFICATION). For Formats 1 through 13, the originating ("from") port is shown as the first port in each pair.

Format 1 prints the status information for a specific digital facility interface (DFI) and has up to 30 entries (CON1-CON30).

Format 2 prints the status information for a specific subscriber DFI (SDFI) and has up to 24 entries (CON1-CON24).

Format 3 prints status on a trunk unit channel board level (TUCHBD) and has up to four entries (CON1-CON4).

Format 4 prints status on a DS1 facility (DS1SFAC) of a digital networking unit - synchronous optical network (SONET)(DNU-S) and has up to 24 entries (CON1-CON24).

Format 5 prints status of one connection (CON1) using the digital equipment number (DEN).

Format 6 prints the status of CON1 using the trunk equipment number (TEN).

Format 7 prints the status of one connection using the SLC® line equipment number (SLEN) number.

Format 8 prints the status of one connection using the DNU-S network equipment number (NEN).

Format 9 prints the status of one connection using the IDCU line equipment number (ILEN) number.

Format 10 prints the status for a specific integrated digital carrier unit (IDCU) facility (IFAC) and has up to 24 entries (CON1-CON24).

Format 11 prints the status of one connection using the integrated digital loop carrier (IDLC) network equipment.
number (INEN).

Format 12 prints status on a DS1 facility (DS1) of an optical interface unit (OIU) and has up to 24 entries (CON1-CON24).

Format 13 prints the status of one connection using the OIU equipment number (OIUEN).

Format 14 shows a nail-up request failure.

Format 15 prints the status of an entire switching module (SM) using the quantity (QUAN) parameter.

**NOTE:** If the DFI parameter is specified, there will be no TEN to TEN combinations printed; when a TUCHBD is specified, there will be no DEN to DEN combinations printed.

### 3. VARIABLE FIELD DEFINITIONS

- **HP** = Indicates that the connection is a hairpin. Otherwise, the connection is a nail-up.
- **a** = SM number.
- **b** = Digital line and trunk unit (DLTU) number.
- **c** = DFI number.
- **d** = Channel number.
- **e** = Trunk unit (TU) number.
- **f** = Service group number.
- **g** = Channel board number.
- **h** = Circuit number.
- **j** = Loss in decibels (0.0-7.0) rounded to nearest 0.5.
- **k** = Basic state of port [such as, in-service (IS)].
- **l** = Qualifier of port.
- **m** = Operational restriction on port.
- **n** = Unit for which OP:NAILUP was requested, as specified in the input message (such as, DEN a-b-c-d).
- **o** = Number of nail-up ports in SM.
- **p** = Percentage of nail-up ports in SM requiring time-slot interchange unit (TSIU) network timeslots divided by the total number of TSIU network timeslots in the SM, rounded to the nearest whole percentage.
- **q** = Number of intra-SM nail-up ports.
- **r** = Number of inter-SM nail-up ports.
- **s** = Status of the request. Valid value(s):
  - **COMPLETED** = OP:NAILUP input message request completed.
CONTINUED = OP:NAILUP input message request continued.
PORT NOT NAILED UP = Port not in a nail-up connection.
STARTED = OP:NAILUP input message request started.

= Text detail. Valid value(s):
DATA MAY BE INVALID = Part of message data is invalid indicated by zeros.

u = DCLU number.
v = RT number.
w = RT line number.
x = IDCU number.
y = RT number or IDCU PUB43801 facility number.
z = RT line number or IDCU PUB43801 channel number.

a = IDCU facility (IFAC) number.
c = Supplementary information on port.
d = Mode of port.
e = Number of hairpin ports in SM.
f = Number of intra-SM hairpin ports.
g = DNU-S number.
h = Data group (DG) number.
j = SONET termination equipment (STE) number.
k = Synchronous transport signal (STS) number.
l = Virtual tributary group (VTG) number.
m = Virtual tributary member (VTM) number.
n = Digital signal level 0 (DS0) number.
o = OIU number.
p = Protection group (PG) number.
q = Optical carrier level 3 (OC3) number.
r = STS level 1 (STS-1) number.

6. REFERENCES

Input Message(s):

OP:NAILUP

RC/V View(s):

7.11 NAIL-UP AND HAIRPIN SPECIFICATION
OP:NETSTAT

Software Release: 5E16(2) and later
Message Class: TRKLN
Application: 5
Type: Output

1. FORMAT

[1] OP NETSTAT OFI a b c d SRCIP e SEGMENT f g
    SOURCE UDP PORT DEST IP DEST UDP PORT
    h i j
    . . .
    . . .
    . . .

[2] OP NETSTAT OFI a b c d [NSEGS k] g

2. REASON FOR OUTPUT

To respond to a manual request (using the OP:NETSTAT input message) to list the IP address of the optical interface unit (OIU) optical facility interface (OFI) protection group (PG) source IP address and the source user datagram protocol (UDP) port number, destination IP address, and destination UDP port number for each UDP port that is currently in use.

The list, if long, will be broken into segments as described by Format 1.

Format 2 describes a message that indicates either the end of the list trailer message or a termination report.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = OIU number.
c = PG number.
d = Side number.
e = Source IP address.
f = Segment number of this segment of the list. Segments are numbered sequentially starting from 1.
g = Completion report. Valid value(s):
   CANNOT CREATE TP = The terminal process cannot be created.
   CANNOT SEND MESSAGE = The OP:NETSTAT message could not be sent to the SM.
   COMPLETED = Will occur only in a trailing message (Format 2). All items in the requested list have been output.
   CONTINUED = Second and subsequent segments of a list too long to be printed in a single segment.
   DATABASE ERROR = A problem occurred while attempting to access data.
   ERROR = An unspecified internal system error occurred which prevented further processing.
INPUT ERROR = The input request was incorrect. It most likely implies that the OFI entered was invalid.

NO CALLS PRESENT = No call processing activity on the specified OFI.

NON-SELECTED OFI SIDE CHOSEN = The non-selected OFI side was chosen in the command line. The selected side needs to be specified.

SM UNAVAILABLE = The SM is currently not available. Handle the request. Check the status of the SM and try again.

STARTED = Indicates the first segment in the list. This does not necessarily imply that additional segments will be required. The list will be terminated by a 'end-of-list' message (Format 2).

TP ALREADY RUNNING = Only one instance of OP:NETSTAT is allowed per SM. The attempt to start another command is denied.

h = Source UDP port number.

i = Destination IP address.

j = Destination UDP port number.

k = Total number of segments in the list.

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

    b c
    . .
    . .
    . .

2. REASON FOR OUTPUT

To print the list of nodes on the five-minute network management node schedule (NMNODES). This is a response to an OP:NMNODES input message.

3. VARIABLE FIELD DEFINITIONS

a = Termination status. Valid value(s):
   ABORTED = Message failed. A system error encountered.
   COMPLETED = This is the last of a series of messages.
   CONTINUED = This is the next of a series of messages.
   STARTED = This is the first of a series of messages.

b = CLLI code.

c = Voice/data indicator. Valid value(s):
   D = Data indicator.
   V = Voice indicator.

4. ACTION TO BE TAKEN

If the termination status is COMPLETED, CONTINUED, or STARTED, the message is a confirmation of a request from an input message. No action required.

2. REASON FOR OUTPUT

To print a copy of the current Master Control Center (MCC) NM exception page (EXCPAGE). This is a response to the OP:NMPGE input message.

3. VARIABLE FIELD DEFINITIONS

a = Call gap control status. Valid value(s):
   NO = Controls do not exist.
   YES = Controls exist.

b = Trunk group control status. Valid value(s):
   NO = Controls do not exist.
   YES = Controls exist.

c = Status of automatic congestion control (ACC) machine congestion level. Valid value(s):
   MC1 = Machine congestion level 1 exists.
   MC2 = Machine congestion level 2 exists.
   NO = Neither MC1 nor MC2 exists.

d = Status of incoming machine congestion levels 1 and 2. Valid value(s):
   MC1 = Machine congestion level 1 exists in the adjacent switches.
   MC2 = Machine congestion level 2 exists in the adjacent switches.
   NO = Neither MC1 nor MC2 exist in the adjacent switches.

e = Status of selective incoming load control (SILC) machine congestion level. Valid value(s):
MC1 = Machine congestion level 1 exists.
MC2 = Machine congestion level 2 exists.
NO = Neither MC1 nor MC2 exists.

g = Status of machine congestion level for SILC. Valid value(s):
   NO = MC3 does not exist.
   YES = Machine congestion level 3 (MC3) exists.

h = Status of incoming machine congestion level 3. Valid value(s):
   NO = MC3 does not exist in the adjacent switches.
   YES = Machine congestion level 3 (MC3) exists in the adjacent switches.

i = Status of machine congestion level for ACC. Valid value(s):
   NO = MC3 does not exist.
   YES = MC3 exists.

k = Status of SILC. Valid value(s):
   ALW = SILC is allowed.
   INH = SILC is inhibited.

l = ACC transmitting status. Valid value(s):
   ALW = The switch informs other switches of the machine congestion levels for ACC.
   INH = The switch does not inform other switches of the machine congestion levels for ACC.

m = Status of trunk reservation (TR) controls inhibit override. Valid value(s):
   NO = All TR per-trunk group inhibits have been overridden.
   YES = TR inhibit override is not in effect.

n = Status of TR controls triggered. Valid value(s):
   NO = TR control(s) have not affected any calls.
   YES = A call has been controlled by TR.

o = Status of service selective trunk reservation (SSTR) controls inhibit override. Valid value(s):
   NO = SSTR inhibit override is not in effect.
   YES = All SSTR per-trunk group inhibits have been overridden.

p = Status of SSTR controls triggered. Valid value(s):
   NO = SSTR control(s) have not affected any calls.
   YES = A call has been controlled by SSTR.

q = Status of assigning SSTR control. Valid value(s):
   NO = An SSTR control is not assigned.
   YES = An SSTR control is assigned.
\[ r = \text{Status of CCS processor overload levels. Valid value(s):}\]
\[ \text{MC1} = \text{Overload level 1 exists.}\]
\[ \text{MC2} = \text{Overload level 2 exists.}\]
\[ \text{NO} = \text{Neither overload level 1 nor level 2 exists, or this is not applicable.}\]

\[ s = \text{CCS processor overload control transmitting status. Valid value(s):}\]
\[ \text{ALW} = \text{The switch informs other switches of the overload level.}\]
\[ \text{INH} = \text{The switch does not inform other switches of the overload level.}\]

2. REASON FOR OUTPUT

To print a copy of the current Master Control Center (MCC) Network Management (NM) exception page (EXCPAGE). This is a response to the OP:NMPGE input message.

NOTE: The executive control processor (ECP) column will only be displayed if an AUTOLEX® office has the AMPS NM trunk group control feature turned on.

3. VARIABLE FIELD DEFINITIONS

a  = Call gap control status. Valid value(s):
   NO  = Controls do not exist.
   YES = Controls exist.

b  = Trunk group control status. Valid value(s):
   NO  = Controls do not exist.
   YES = Controls exist.

c  = At least one destination is assigned to the hard-to-reach (HTR) list. Valid value(s):
   NO  = HTR list contains no destinations.
   YES = HTR list contains at least one destination.

d  = Status of service selective trunk reservation (SSTR) controls inhibit override. Valid value(s):
   NO  = SSTR inhibit override is not in effect.
   YES = All SSTR per-trunk group inhibits have been overridden.
e = Status of trunk reservation (TR) controls inhibit override. Valid value(s):
   NO = TR inhibit override is not in effect.
   YES = All TR per-trunk group inhibits have been overridden.

f = Status of SSTR controls triggered. Valid value(s):
   NO = SSTR control(s) have not affected any calls.
   YES = A call has been controlled by SSTR.

g = Status of TR controls triggered. Valid value(s):
   NO = TR control(s) have not affected any calls.
   YES = A call has been controlled by TR.

h = Status of assigning SSTR control. Valid value(s):
   NO = An SSTR control is not assigned.
   YES = An SSTR control is assigned.

i = Machine congestion level 1 or level 2. Valid value(s):
   X = exists.
   blank = Not applicable.

j = CCS processor congestion level 1 or level 2. Valid value(s):
   X = exists.
   blank = Not applicable.

k = ECP processor congestion level 1 or level 2. Valid value(s):
   X = exists.
   blank = Not applicable.

l = Automatic congestion control (ACC) level being transmitted. Valid value(s):
   MC1 = ACC level 1 is being transmitted.
   MC2 = ACC level 2 is being transmitted.
   blank = No ACC level is being transmitted.

m = Status of selective incoming load control (SILC) machine congestion level. Valid value(s):
   MC1 = Machine congestion level 1 exists.
   MC2 = Machine congestion level 2 exists.

n = Status of ACC transmission/SILC. Valid value(s):
   ALW = ACC transmission and SILC are allowed.
   INH = ACC transmission and SILC are inhibited.

o = ACC received. Valid value(s):
   MC1 = Machine congestion level 1 received.
   MC2 = Machine congestion level 2 received.
   MC3 = Machine congestion level 3 received.

2. REASON FOR OUTPUT
To print the office dependent data (ODD) availability of the administrative module (AM) or one or more switching modules (SMs), or one or more communications module processor (CMPs).

Formats 1-4 are in response to an OP:ODD input message. The ODD usage reflects the real memory usage determined by counting the number of used and free blocks of ODD memory. If the PCT_USED (calculated by dividing the number of blocks currently in use by the total number of blocks) is greater than or equal to 95%, the ODDWARN processor status lamp on the 116 MCC page for AM, the 1800,x MCC page for SM, and the 1850, 1851 MCC pages for CMP will be lit. If the processor status currently has the ODDWARN lamp lit, and if the PCT_USED is determined to be less than 95%, the OP:ODD input message will also clear the ODDWARN status lamp(s).

Formats 5 and 6 are reported automatically when the ODD has 20% or less available ODD space. The ODD usage in this case is based on the ODD high address mark (the largest amount of memory that has ever been used at one time in that processor). If the PCT_USED is greater than or equal to 95%, the ODDWARN processor status lamp on the 116 MCC page for AM, the 1800,x MCC page for SM, and the 1850, 1851 MCC pages for CMP will be lit.

Note: That the PCT_USED value of formats 1-4 may be different from that of formats 5-6 due to different methods of calculation as described above.

3. VARIABLE FIELD DEFINITIONS

Note: The DISK as shown in the FORMAT section refers to the disk resident ODD. This is specifically the DODD disk partition (for 50+- disk resident relations that are not real time independent). Use OP:ST-FREEDISK and OP:AMA-DISK/OP:AMA-CONFIG input messages to ascertain SM ODD and AMA information.

MEMORY = Memory-resident ODD (SODD, UODD, RODD, NRODD).
NRODD = SM memory-resident, non-redundant ODD.
RODD = SM memory-resident, redundant ODD.
SODD = Static ODD.
UODD = Unprotected ODD.
a = Page number.
b = Number of pages.
c = Amount of ODD space used, in kilobytes.
d = Amount of available ODD space, in kilobytes.
e = Percentage of used ODD space.
f = CMP or SM number.
g = Amount of unallocated memory (UNALLOC), in kilobytes for the SMs.
h = Amount of stand-alone billing memory (SABM), in kilobytes for the SMs.
i = Amount of real-time billing memory (RTBM), in kilobytes for the SMs.

4. ACTIONS TO BE TAKEN
Grow the appropriate memory ODD space. Refer to the ODD growth messages listed in the References.

5. ALARMS

Major or minor.

### 2. REASON FOR OUTPUT
To print the office dependent data (ODD) availability of the administrative module (AM) or one or more switching modules (SMs), or one or more communications module processor (CMPs).

Formats 1-4 are in response to an OP:ODD input message. The ODD usage reflects the real memory usage determined by counting the number of used and free blocks of ODD memory. If the PCT_USED (calculated by dividing the number of blocks currently in use by total number of blocks) is greater than or equal to 95%, the ODDWARN processor status lamp on the 116 MCC page for AM, the 1800,x MCC page for SM, and the 1850, 1851 MCC pages for CMP will be lit. If the processor status currently has the ODDWARN lamp lit, and if the PCT_USED is determined to be less than 95%, the OP:ODD input message will also clear the ODDWARN status lamp(s).

Formats 5 and 6 are reported automatically when the ODD has 20% or less available ODD space. The ODD usage in this case is based on the ODD high address mark (the largest amount of memory that has ever been used at one time in that processor). If the PCT_USED is greater than or equal to 95%, the ODDWARN processor status lamp on the 116 MCC page for AM, the 1800,x MCC page for SM, and the 1850, 1851 MCC pages for CMP will be lit.

**NOTE:** That the PCT_USED value of formats 1-4 may be different from that of formats 5-6 due to different methods of calculation as described above.

### 3. VARIABLE FIELD DEFINITIONS

Note The **DISK** as shown in the FORMAT section refers to the disk resident ODD. This is specifically the DODD disk partition (for 50+/- disk resident relations that are not real time independent). Use OP:ST-FREEDISK and OP:AMA-DISK/OP:AMA-CONFIG input messages to ascertain SM ODD and AMA information.

- **a** = Page number.
- **b** = Number of pages.
- **c** = Amount of ODD space used, in kilobytes.
- **d** = Amount of available ODD space, in kilobytes.
- **e** = Percentage of used ODD space.
- **f** = CMP or SM number.
- **g** = Amount of unallocated memory (UNALLOC), in kilobytes for the SMs or CMP.
- **h** = Amount of stand-alone billing memory (SABM), in kilobytes for the SMs.
- **i** = Amount of real-time billing memory (RTBM), in kilobytes for the SMs.

### 4. ACTIONS TO BE TAKEN

Grow the appropriate memory ODD space. Refer to the ODD growth messages listed in the References.

### 5. ALARMS

Major or minor.

Input Message(s):
Output Message(s):

OP : ODDWARN

MCC Display Page(s):
116 AM
1800x SM
1850, 1851 CMP
OP:ODDWARN

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

OP ODDWARN (SM=a | CMP=b-c | AM)
    PERCENTAGE OF USED ODD = d
    AUTO REORG OF RELATIONS IN OVERFLOW = e

2. REASON FOR OUTPUT

To report office-dependent data (ODD) warning information for the specified processor in response to the OP:ODDWARN input message. Two ODD warning conditions are reported as either normal or abnormal: the status of used ODD and the status of generated key (GK) or hashed relations in overflow after automatic reorganization. A generated key relation is one whose access method is DBACC_GK. A hashed relation is one whose access method is DBACC_HASH. The message is repeated for each processor that was requested in the OP:ODDWARN input message.

Note: If automatic reorganization is inhibited (INH:REORG), running automatic reorganization (EXC:REORG) reports relations in overflow without performing any database reorganizations. If overflow is detected, the processor status lamp will indicate ODD WARN on page(s) 1800, 1850, 1851, or 116, depending on which processor(s) have relation(s) in overflow.

3. VARIABLE FIELD DEFINITIONS

AM = ODD warning information was requested for the administrative module (AM).

a = Number of the switching module (SM) for which ODD warning information was requested.

b = Message switch side for the desired communication module processor (CMP).

c = CMP for which ODD warning information was requested.

d = Status of ODD usage. Valid value(s):
   ABNORMAL = The amount of ODD free space on the specified processor is running low. The percentage of used space as determined by OP:ODD output message has exceeded the office engineering recommended maximum.
   NORMAL = The ODD on the specified processor is normal. The percentage of used space as determined by OP:ODD output message is within the office engineering recommended maximum.

Note: If automatic reorganization is inhibited (INH:REORG), running automatic reorganization (EXC:REORG) reports relations in overflow without performing any database reorganizations. If overflow is detected, the processor status lamp will indicate ODD WARN on page(s) 1800, 1850, 1851, or 116, depending on which processor(s) have relation(s) in overflow.

3. VARIABLE FIELD DEFINITIONS

e = Overflow status after last automatic reorganization. Valid value(s):
   ABNORMAL = The latest automatic reorganization on the specified processor detected and could not correct (either because it was inhibited or it failed to reorganize) at least one GK or hashed relation with overflow tuple(s).
   NORMAL = The latest automatic reorganization on the specified processor detected zero GK or hashed relations with overflow tuples.
4. ACTION TO BE TAKEN

If 'd' = ABNORMAL, execute OP:ODD-AM-SM input message for ODD usage statistics. If ODD growth is necessary, refer to the Routine Operations and Maintenance manual for SM and AM ODD memory growth procedures. Refer to the OP:ODD output message for detailed descriptions about ABNORMAL conditions.

If 'e' = ABNORMAL, refer to the Corrective Maintenance manual for manual overflow recovery procedures. After resolving all overflow conditions manually, an automatic database reorganization (EXC:REORG) is required to return the overflow status to NORMAL.

5. ALARMS

None.

OP:OFFNORM-AM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

```
OP OFFNORM AM a
UNIT    MTCE STATE     INH STATE     DGN RESULT
b       c              d             e
```

2. REASON FOR OUTPUT

To print a list of all administrative module units whose current inhibit states are off-normal or whose current maintenance states are off-normal (for example, forced active or forced unavailable).

3. VARIABLE FIELD DEFINITIONS

a = Sequence number of message block. Valid value(s):
   FIRST = First record.
   LAST  = Last record.
   NEXT  = Next record.

b = Unit identification.

c = Maintenance state.

d = Inhibit status. Valid value(s):
   INH,AUTO = Hardware checks are inhibited by automatic request.
   INH,MAN = Hardware checks are inhibited manually.

e = Result of last diagnostic run on unit. Valid value(s):
   ABT   = Aborted.
   ATP   = All tests passed.
   CATP  = Conditional all tests passed.
   NTR   = No tests run.
   STF   = Some tests failed.

4. ACTION TO BE TAKEN

None.

5. ALARMS

**OP:OFFNORM-IS**

Software Release: 5E14 and later  
Message Class: CP  
Application: 5  
Type: Output

1. **FORMAT**

```plaintext
OP OFFNORM ISMNAIL SM=a&&b SEGMENT=c EVENT=d e [f]  
[ SM OOS-FE OOS-TBLA OOS-DSBLD ]  
[NUMBER COUNT COUNT COUNT STATUS]  
[ g h i j k l ]
```

2. **REASON FOR OUTPUT**

To respond to an OP:OFFNORM-IS input request message and indicate the number of off-normal inter-SM (switching module) nailups (ISMNAILs) for the range of SMs specified in the input message. "Off-normal" implies any ISMNAIL that is not in-service (IS) or is not currently undergoing automatic recovery.

3. **VARIABLE FIELD DEFINITIONS**

a = SM number or the lower limit of a range of SM numbers.

b = Upper limit of a range of SM numbers.

c = Output message segment. Valid value(s):
   FIRST
   LAST  If there is only one segment, LAST will be output.
   NEXT

d = Unique event number of output to logically tie multiple segment output messages together.

e = Termination report. Valid value(s):
   COMPLETED = Request completed successfully.
   FAILURE = Request was terminated before a normal completion.

f = Additional data qualifying the termination of the request. Valid value(s):
   DATABASE PROBLEM = Problem occurred, while attempting to access critical data (accompanying ASSERT should provide more details).
   LACK OF MESSAGE RESOURCE = Message resources were not available in the administration module (AM), and craft request could not be forwarded to the SM for execution.
   MESSAGE NOT RECEIVED = Expected message not received by ATA terminal process within designed timeout interval.
   NO OFFNORM ISMNAIL = No off-normal ISMNAILs exist on the SM(s) specified.
   SM IN MINMODE = SM is in MINMODE, and, therefore, cannot support ISMNAILs.
   SM ISOLATED = SM is isolated, and requested action cannot be honored.
   STOPPED = Request stopped due to manual intervention.
   SUCCESS = Success with no error.
   TERMINAL PROCESS NOT CREATED = An automatic task administrator (ATA) terminal process to execute the craft request could not be created due to system problems.
   TIMEOUT = Timeout occurred.

Note: For many failed restorations, the ISMNAIL may be left in a state, which will allow a
successful automatic restoration at some later time; use OP:ST-ISMNAIL to
determine current status associated with the affected ISMNAIL.

g = SM number, for which the off-normal output is being produced.

h = Count of the inter-SM (ISM) ports, which for the specified SM, are out-of-service (OOS) due to
family-of-equipment (FE) reasons, associated repairable hardware problems:
- OOS PSU (packet switch unit).
- OOS DLI (dual link interface).
- OOS TMSCONN (time multiplexed switch or NLI link problem).
- OOS NLI (network link interface).

i = Count of the ISM port, which for the specified SM, are OOS for unknown reasons, such as, OOS
TBLA (trouble analysis) ports.

j = Count of the ISM port, which for the specified SM, are manually removed OOS DSBLD (disabled)
ports.

l = Status of the SM. Valid value(s):
DATABASE PROBLEM = Problem occurred while attempting to access critical data
LACK OF MESSAGE RESOURCE = Message resources were not available in the administration
module (AM) and craft request could not be forwarded to the SM for execution.
MESSAGE NOT RECEIVED = Expected message not received by ATA terminal process within
designated timeout interval.
NO OFFNORM ISMNAIL = No off-normal ISMNAILs exist on the SM(s) specified.
SM IN MINMODE = SM is in MINMODE and, therefore, cannot support ISMNAILs.
SM ISOLATED = SM is isolated and requested action cannot be honored.
STOPPED = Request stopped for unknown reasons. The accompanying ASSERT should
provide more details.
SUCCESS = Success with no errors.
TERMINAL PROCESS NOT CREATED = An automatic task administrator (ATA) terminal process to
execute the craft request could not be created due to system problems.
TIMEOUT = Timeout occurred.

4. ACTION TO BE TAKEN

No further action is necessary if the request completed successfully.

If the termination report indicates a failure, the field will give some indication as to why the request failed.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

    OP:OFFNORM-IS
    OP:ST-ISMNAIL
STP: ISMMAIL

Output Message(s):

STP: ISMMAIL
OP:OFFNORM-PRI

Software Release: 5E14 and later
Message Class: DCHTRK
Application: 5
Type: Output

1. FORMAT

```
OP OFFNORM PRIGRP a
  [                         D1                        D2
    PRIGRP PRI-STAT B-CH DCBU STATE SM  STATE SM
    b   c       [d]   e    f      g    f      g  [h]
    .   .        .    .      .    .      .    .
    .   .        .    .      .    .      .    .
    .   .        .    .      .    .      .    . ]
```

2. REASON FOR OUTPUT

To list all primary rate interface (PRI) off-normal conditions. An off-normal condition is defined as a D-channel in an out-of-service (OOS) state. Output data is sorted on the switching module (SM) number first, and then by PRIGRP.

3. VARIABLE FIELD DEFINITIONS

a  = Completion report. Valid value(s):
   CONTINUED = Second and subsequent segments of a list of off-normal conditions is too long to be printed in a single segment.
   LAST = Will occur only in a trailing message that contains a list of off-normal conditions. All items in the requested list have been output.
   NO MATCH = Indicates that there are no off-normal PRI D-channel conditions to report. This includes conditions where there are no PRI groups in the office, a PRI group is built but no D-channel(s) have yet been assigned, and there are PRI group D-channels assigned but none are in an off-normal condition.
   RL - OP:OFFNORM, PRIGRP CURRENTLY IN PROGRESS = Retry later. The request cannot be executed now because another OP:OFFNORM-PRI request is in progress. No more than one task of this type may be executed at any given time.

b  = PRI group with the off-normal condition. Only groups with off-normal conditions are listed in this report.

c  = Indication of the PRI group status based on the state of the D-channel(s). If all D-channels are out of service, then this is reflected with an OOS status in this field. If at least one D-channel is in service, then this is reflected with an IS status in this field.

d  = Total number of B-channels provisioned within the PRI group. If this field is blank, the data could not be retrieved, due to a cross copy read failure to an SM. If blank, field 'h' indicates there is incomplete data in this output line.

e  = Indication if D-channel backup (DCBU) is provisioned for this group. Valid value(s):
   NO = This PRI group is served by a single D-channel.
   YES = This PRI group has DCBU.

f  = State of the D-channel for this off-normal PRI group. The state is shown for both D-channels if the
PRI group is provisioned with D-channel backup. If the PRI group is provisioned with DCBU, then
D1 is the primary and D2 is the secondary D-channel. If the PRI group is not provisioned with
DCBU, then the D1/D2 labeling has no significance. If the D-channel is in an OOS CADN AUTO or
OOD CADN MAN state, the output will show it as OOS-MAN. Valid value(s):

\[
\begin{align*}
\text{IS} & \quad = \text{In service.} \\
\text{OOS-AUTO} & \quad = \text{Out-of-service automatic.} \\
\text{OOS-MAN} & \quad = \text{Out-of-service manual.}
\end{align*}
\]

\[g\] = SM number where this D-channel is physically provisioned.

\[h\] = Indicates that the number of B-channels could not be determined, due to a cross copy read failure
to an SM. When this is indicated, the field showing the total number of B-channels provisioned is
blank. Valid value(s):

\[
\text{INCOMPLETE DATA} = \text{Indicates incomplete data on this output line.}
\]

[9] OP OFFNORM QPHNET ALL GSM=a UNAVAILABLE

[10] OP OFFNORM QPHNET ALL DATA MAY BE INCOMPLETE
2. REASON FOR OUTPUT

These messages list offnormal quad-link packet switch protocol handler links (QPHLNKs) on a specific global switching module (GSM). This could be in response to an OP:OFFNORM,QPHNET input message, or autonomously on a daily basis.

Format 1 indicates no quad-link packet switch protocol handlers (QPHs) are provisioned on the input GSM.

Format 2 indicates all QPHLNKs are IS on the specified GSM.

Format 3 reports the status of non-active QPH QPIPEs on the GSM, which would cause all child QPHLNKs to be OOS.

Format 4 reports the offnormal status of the MH QPIPEs on NGSM-2000s, which will cause child QPHLNKs to be OOS.

Format 5 reports the offnormal status of the QPHLNK, which are not caused by parent QPH QPIPE or MH QPIPE outages.

Format 6 indicates processing errors have occurred and the output may be incomplete.

Format 7 will be displayed immediately after a PF acknowledgment, when the ALL input parameter is specified.

Format 8 will be displayed after all GSMs in the office have been reported, when the ALL input parameter is specified.

Format 9 will be displayed if a GSM is not available, when the ALL input parameter is specified.

Format 10 reports if any available GSM doesn't send an acknowledgement to the AM, when the ALL input parameter is specified.

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>ALL</th>
<th>= Report status of all OFFNORMAL QPHLNKs on all GSMs in the office.</th>
</tr>
</thead>
<tbody>
<tr>

    __________________________________________________

[2] OP OFFNORM SM a HAS MASTER INHIBITS IN EFFECT FOR HW ERROR CHECKS
    __________________________________________________

[3] OP OFFNORM SM a HAS NO CIRCUITS IN THE REQUESTED STATE
    __________________________________________________

2. REASON FOR OUTPUT

To list all circuits in the specified switching module (SM) that are in service and have hardware checks abnormally inhibited (some subunits run with hardware checks inhibited). This message is output in response to an OP:OFFNORM-SM input message.

Format 1 is the standard output message format when the SM has circuits in the requested state.

Format 2 is the output message format when the NOPRINT option is specified with the OP:OFFNORM-SM input message and the SM has master inhibits applied for the hardware error checks. If the NOPRINT option is not specified and the SM has master inhibits applied for the hardware error checks, the output messages will be in Format 1. The state of the master inhibits for the hardware checks can be determined by examining the MCC (master control center) page INH & RCVRY CNTL.

Format 3 is the output message format when the SM has no circuits in the requested state. If the NOPRINT option is not specified with the OP:OFFNORM-SM input message, then for all SMs that have no circuits in the OFFNORM state, a message 'SM x HAS NO CIRCUITS IN THE REQUESTED STATE' ('x' = SM number) will be displayed on the receive-only printer (ROP). If the NOPRINT option is specified, then for all SMs that do not have circuits in the OFFNORM state, the OP:OFFNORM-SM output response will be suppressed on the ROP.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = Text identifier showing order of OFFNORM record. Valid value(s):
  FIRST = First record of continuing list.
  LAST  = Last record of list.
  NEXT  = Next record of continuing list.

c = Circuit name.

d = Maintenance status. Valid value(s):
ACT = Active. Unit is in service.
LMTD = Limited. Unit is in service but not all subunits are available due to a camp-on timeout.
N/A = Not applicable.
OOS = Out of service.
STBY = Standby. Unit is ready to be placed into service.
UNAV = Unavailable.

e = Maintenance activity. Valid value(s):
   BUSY
   IDLE

f = Hardware check status. Valid value(s):
   ALW = Allow.
   INH = Inhibit.

g = Hardware check qualifier. Valid value(s):
   AUTO = Automatic (fault recovery action).
   MAN = Manual.
   TEMP = Temporary (diagnostics).

h = Module processor inhibit. Valid value(s):
   AFFCI = Active flip-flop cleared interrupt mask.
   ALL = All of the following bits.
   ARPV = Arbitration protocol violation error mask.
   ASDPE = Synchronous data set controller (SDLC) A parity error mask.
   BSDPE = SDLC B parity error mask.
   CACHE = Cache error interrupt mask for all SMs and cache disable for non-SM-2000s.
   CADPE = Memory address mismatch error mask.
   CBERR = Correctable bit interrupt mask.
   CI0IN = Control interface (CI) 0 interrupt mask.
   CI1IN = CI 1 interrupt mask.
   CI2IN = CI 2 interrupt mask.
   CI3IN = CI 3 interrupt mask.
   CPIE = Administrative module (AM) intervention interrupt mask.
   CPINT = Enhanced AM intervention interrupt mask.
   DCODE = Decode error mask.
   DL0PE = Dual link interface (DLI) 0 read parity error mask.
   DL1PE = DLI 1 read parity error mask.
   DL0I = DLI 0 interrupt mask.
   DL1I = DLI 1 interrupt mask.
   DLILINKA = Network control and timing (NCT) A link error mask.
   DLILINKB = NCT B link error mask.
   DLISW = DLI switch error mask.
   IAC0 = DLI 0 invalid access error mask.
   IAC1 = DLI 1 invalid access error mask.
   LPVER = Bus lock violation mask.
   MADPE = Address parity error mask.
MAPCMSC = Application controller miscellaneous errors (loss of clock, receive cyclic-redundancy-check error, loss of synchronization and subunit mismatch error).

MATE = Mate controller and mate peripheral interrupt mask.

MCINT = Mate controller interrupt mask.

MDLIE = DLI interface error mask.

MH0IN = Message handler (MH) 0 interrupt mask.

MH1IN = MH 1 interrupt mask.

MH2IN = MH 2 interrupt mask.

MIOIO = I/O invalid operation error mask.

MIOLE = I/O lock error mask.

MIOPE = I/O bus parity error mask.

MIOUE = I/O unlock error mask.

MMEME = Memory system error mask.

MPRIN = Mate peripheral interrupt mask.

MRDYT = Ready timeout mask.

MRSPERR = Multiple response error mask.

MRWPE = Write/read parity error mask.

MSKMR = Mate reset mask.

MSUSM = Subunit select mismatch mask.

MTINT = Miscellaneous timer interrupt mask.

MTRT = Mate ready timeout mask.

MWPER = Write protect error mask.

N/A = Not applicable.

NCBERR = Non-correctable bit error interrupt mask.

PIINT = Packet interface interrupt mask.

PUMPHW = Pump hardware inhibited.

REFE = Dynamic random access memory (DRAM) refresh fail error mask.

SANTIM = Sanity timer inhibited.

SPINT = Signal processor (SP) interrupt mask.

SSYNC = Scanned I/O synchronization error mask.

STKE = Stack protect error mask.

SU5IN = Subunit 5 mask.

SU6IN = Subunit 6 mask.

SU7IN = Subunit 7 mask.

TSIIN = Time-slot interchange (TSI) interrupt mask. This bit, when inhibited, will block SM detection of network link interface (NLI) interrupts in SM-2000.

TSI4IN = TSI unit 4 interrupt mask. This bit will not affect the inhibits for NLIs.

4. ACTION TO BE TAKEN

If the status (variable 'd') of a grid is ACT, the activity (variable 'e') is BUSY, and the hardware check status (variable 'f') is INH, the line unit fabric exerciser program is being executed on the grid. No action should be taken to allow the hardware checks on the grid. On completion, the exerciser program will allow hardware checks on the grid. If hardware checks are inhibited for more than one day on a grid whose status is ACT, allow hardware checks on the grid with the input message ALW:HDW-GRID or ALW:HDW-GRIDBD, as appropriate.

5. ALARMS

2. **REASON FOR OUTPUT**

   To list all circuits in the specified switching module (SM) that are in service and have hardware checks abnormally inhibited (some subunits run with hardware checks inhibited). This message is output in response to an OP:OFFNORM-SM input message.

   Format 1 is the standard output message format when the SM has circuits in the requested state.

   Format 2 is the output message format when the NOPRINT option is specified with the OP:OFFNORM-SM input message and the SM has master inhibits applied for the hardware error checks. If the NOPRINT option is not specified and the SM has master inhibits applied for the hardware error checks, the output messages will be in Format 1. The state of the master inhibits for the hardware checks can be determined by examining the Master Control Center (MCC) page INH & RCVY CNTL.

   Format 3 is the output message format when the SM has no circuits in the requested state. If the NOPRINT option is not specified with the OP:OFFNORM-SM input message, then for all SMs that have no circuits in the OFFNORM state, a message 'SM x HAS NO CIRCUITS IN THE REQUESTED STATE' ('x' = SM number) will be displayed on the read-only printer (ROP). If the NOPRINT option is specified, then for all SMs that do not have circuits in the OFFNORM state, the OP:OFFNORM-SM output response will be suppressed on the ROP.

3. **VARIABLE FIELD DEFINITIONS**

   a  = SM number.

   b  = Text identifier showing order of OFFNORM record. Valid value(s):
       FIRST = First record of continuing list.
       LAST  = Last record of list.
       NEXT  = Next record of continuing list.

   c  = Circuit name.

   d  = Maintenance status. Valid value(s):
ACT = Active. Unit is in service.
LMTD = Limited. Unit is in service but not all subunits are available due to a camp-on timeout.
N/A = Not applicable.

### 4. ACTIONS TO BE TAKEN
If the status (variable ‘d’) of a grid is ACT, the activity (variable ‘e’) is BUSY, and the hardware check status (variable ‘f’) is INH, the line unit fabric exerciser program is being executed on the grid. No action should be taken to allow the hardware checks on the grid. On completion, the exerciser program will allow hardware checks on the grid. If hardware checks are inhibited for more than one day on a grid whose status is ACT, allow hardware checks on the grid with the input message ALW:HDW-GRID or ALW:HDW-GRIDBD, as appropriate.

5. ALARMS

None.

Application: 5
Type: Output

1. FORMAT

[1] OP OFFNORM CM a RECORD

UNIT MTCE STATE HDWCHK DGN RESULT
b c d e
. . . .
. . . .
. . . .
__________________________________________________________________

[2] OP OFFNORM CM HAS NO UNITS IN THE REQUESTED STATE

2. REASON FOR OUTPUT

To print a list of all communication module (CM) units whose current hardware check states are off-normal or whose current maintenance states are forced active.

Format 1 is the standard output message format when there are CM units in the requested state.

Format 2 is the output message format when there are no CM units in the requested state.

If the CM is manually isolated from the administrative module (AM), its current state is not known. In that case, any information reported reflects the last known state of the CM.

3. VARIABLE FIELD DEFINITIONS

a = Text identifier showing order of OFFNORM record. Valid value(s):
   FIRST = First record of continuing list.
   LAST  = Last record of list.
   NEXT  = Next record of continuing list.

b = Unit identification.

c = Maintenance state.

d = Hardware check status. Valid value(s):
   ALW,AUTO = Hardware checks are allowed.
   INH,AUTO = Hardware checks are inhibited by automatic request.
   INH,MAN  = Hardware checks are inhibited manually.
   N/A      = Not applicable.

e = Result of last diagnostic run on unit. Valid value(s):
   ATP      = All tests passed.
   CATP     = Conditional all tests passed.
   N/A      = Not applicable.
NTR = No tests run.
STF = Some tests failed.
STP = Stopped.

4. ACTION TO BE TAKEN

The purpose of this message is to report the result of the action requested by the corresponding manually requested input message. No specific action is indicated.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   OP : OFFNORM-CM
OP:OFL

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] OP OFL MESSAGE STARTED
UNIT        MTCE   INH   DGN
a b [ c d ] e       f     g

[2] OP OFL COMPLETED

[3] OP OFL INTERFACE ERROR, ERRNO=h

[4] OP OFL NOT STARTED
INVALID DATA FIELD

[5] OP OFL NOT STARTED
RETRY LATER

[6] OP OFL IN PROGRESS
a b [ c d ] e       f     g

[7] OP OFL RETRY LATER i

[8] OP OFL WRITE TO j
FAILED ON KEY #k

2. REASON FOR OUTPUT

To give device information specific to administrative module (AM) hardware units on communities requested using the OP:OFL input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for AM unit names.

b = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

c = Subunit name. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.
Messages manual for AM CU subunit names.

d  = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

e  = The current maintenance state of the unit. Valid value(s):
   ACT  = Active units.
   GROW = Units being grown.
   INIT = Initializing units.
   OFL  = Offline units.
   OOS  = Out-of-service units.
   STBY = Standby units.
   UNAV = Unavailable units.
   UNEQIP = Unequipped units.

f  = Current inhibit status of the associated error source. Valid value(s):
   ALW  = Allowed.
   INH  = Inhibited.

g  = Results of the last diagnostic on the unit. Valid value(s):
   ABT  = Aborted diagnostics.
   ATP  = All tests passed.
   CATP = Conditional all tests passed.
   NTR  = No tests were run.
   STF  = Some test failed.

h  = Error number. Valid value(s):
   9     = Cannot attach to plant measurement library.
   11    = Cannot open equipment configuration data base (ECD) sequence.
   12    = Cannot sequence unit control blocks (UCBs).

i  = Retry the input message later. Valid value(s):

   CAN'T SEQUENCE DATABASE
   CAN'T CREATE FILE IN /tmp
   CAN'T GET DATABASE RECORD ID

j  = Temporary output file name.

k  = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual. The OMDB keys will vary depending on the alarm level of the message.

OP:OFR-CAT

Software Release: 5E14 and later
Message Class: OFR
Application: 5
Type: Output

1. FORMAT

OP OFR CAT=a OPT=b FORMAT=f DEVICE=e
REQUEST ID=c STATUS=d

2. REASON FOR OUTPUT

To acknowledge the OP:OFR-CAT input message, which prints one or all categories of office records forms. This output message also prints the request identification number, which may be used in the STP:OFR input message.

3. VARIABLE FIELD DEFINITIONS

a = Category of forms to be printed. Valid value(s):
  ADMIN = Administrative forms.
  ALL = All categories.
  APPROC = Applications processor forms.
  BRCSD = Business and residential customer services (BRCS) feature definition forms.
  CONFIG = Configuration forms.
  DARC = Digit analysis, screening, routing and charging forms.
  EQUIP = Equipment forms.
  LASS = Local area signaling service forms.
  LINE = Line forms.
  OSPS = Operator Services Position System forms.
  MEAS = Measurements forms.
  PKT = Packet switching forms.
  TRUNK = Trunk forms.

b = Printing option. Valid value(s):
  DELAY = Printing is delayed until the fixed time set by the IN:OFR-PARM input message.
  NONE = None specified.

c = Identification number assigned to this output message.

d = Status of request. Valid value(s):
  CANNOT CREATE REPORT PROCESS = The office records report process could not be started.
  CANNOT EXECUTE REPGEN = The office records report generator process could not be started.
  CANNOT READ SCHEDULING TABLE = An internal error in the office records scheduling process occurred.
  COMPLETED WITH ERRORS = A form completed but errors (typically due to inconsistencies in the ODD) occurred. Other messages detail the errors.
  DATA BASE ERROR = An access to the ODD failed. Other messages should appear detailing the errors.
  DISK ACCESS ERROR = A system call failed while attempting to access a file on the AM file system. If the file cannot be identified, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
FATAL DB SYSTEM ERROR = An internal error in an office record process or in an ODD access routine.
FATAL PROCESSING ERROR = An internal error in the office records report process.
INTERNAL PROGRAMMING ERROR = An internal error in the office records report process.
INVALID MESSAGE RECEIVED = An internal error in the message passing system.
INVALID OUTPUT DEVICE = The device specification was incorrect on a form or category request; correct the device specification and retry.
INVALID REQUEST = A form or category scheduling request has an invalid combination of parameters (typically, incorrect key for a form); correct the request and retry.
NO JOBS PENDING = No jobs in the queue need to run.
NO MORE VALUES TO PROCESS = All elements from a range of values have been processed. This is likely not an error, although it may indicate that an incorrect range was specified.
OUTPUT DEVICE UNAVAILABLE = The requested output device or file could not be opened. Assure that the device is ready and retry.
PROCESS CURRENTLY BUSY = Likely an internal error in the office records scheduling process. If forms do not continue to process, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
PROCESSING HAS STARTED = Active job.
PROCESSING COMPLETED = Job completed without errors.
PROCESSING SCHEDULED = Job was scheduled.
STOPPED PROCESSING = A form was being processed when a stop message was issued. The form was stopped.
UNABLE TO READ OUTPUT DEVICE = Process not able to read the output device.
UNABLE TO SCHEDULE JOB = An internal failure in the scheduling code occurred. If forms do not continue to process or no further forms can be scheduled, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
UNKNOWN ERROR RETURNED = An internal error in an office records process or in the message passing system occurred. If forms do not continue to process, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
OUTPUT DEVICE INCOMPATIBLE WITH FORMAT = RAW = Certain output devices such as printers may hang when attempting to print raw formatted office records. To avoid this situation, certain output devices are not allowed when the raw format option is specified.
RAW FORMAT OFC REC FEATURE MUST BE PURCHASED = The raw formatted office record feature is a secure feature that must be purchased and activated via Recent Change form 8.22.

= Output device/file of the category.

= Output Format.

FORMATTED The office record output is in the traditional human readable format. This is the default output format used when the FORMAT = RAW option is not specified on the input command.

RAW The office record output is in RAW format. Each row of output in a "RAW" formatted office record is an instance of the Recent Change view associated with the form type being processed. Each row contains tab separated values associated with the fields defined for the particular Recent Change view. When using this format the output is machine readable and can be post processed more easily than the default formatting of office records.
4. ACTIONS TO BE TAKEN

Message Class: OFR
Application: 5
Type: Output

1. FORMAT

OP OFR ERROR
REQUEST ID  a    CAT  [b]    FORM  [c]    VIEW  [d]    DEVICE  [e]
(KEY VALUE  f]
  [g]
  .
  .
  .

2. REASON FOR OUTPUT

To report that a database error occurred during processing of the on-line office records (initiated by the
OP:OFR-CAT or OP:OFR-FORM input messages). This error does not terminate the processing and printing of the
records or invalidate the original request.

3. VARIABLE FIELD DEFINITIONS

a  = Requested identification number. This number is used in the STP:OFR input message.

b  = Category of forms to be printed (if 'b' is blank, then refer to variable 'c'). Valid value(s):
   ADMIN  = Administrative forms.
   ALL    = All categories, all forms.
   APPROC = Applications processor forms.
   BRCSFD = All business and residential customer services (BRCS) feature definition forms.
   CONFIG = Configuration forms.
   DARC   = Digit analysis, screening, routing, and charging forms.
   EQUIP  = Equipment forms.
   LASS   = Local area signaling service forms.
   LINE   = Line forms.
   OSPS   = Operator Services Position System forms.
   PKT    = Packet switching forms.
   TRUNK  = Trunk forms.
   (BLANK) = None specified.

c  = Specific form type to be printed. (Refer to the Recent Change Procedures manual for all valid
    form types.)

d  = The recent change view that the office record is associated with.

e  = Device/file in which the error occurred.

f  = The key_attribute(s) of the row of information that was being accessed when the error occurred.
   (If the key value has not yet been generated at the time an error is encountered, this field will be
    blank.)

g  = One to four lines containing the error message.
4. ACTION TO BE TAKEN

If the error message indicates a failure when reading a view, read the indicated view with recent change for the key value(s) given and debug the translations problem following local practice. If the record indicates a fatal database system error and aborts, re-execute the OP:OFR-FORM input message at a later time. If the problem persists, check the information provided and verify the ODD for correctness.

5. ALARMS

None.

Application: 5
Type: Output

1. FORMAT

OP OFR FORM=a      OPT=b   FORMAT=f   DEVICE=c
REQUEST ID=d      STATUS=e

2. REASON FOR OUTPUT

To report the status of the OP:OFR-FORM input message, which prints office record forms.

3. VARIABLE FIELD DEFINITIONS

a = Specific form type. Refer to the table in the OP:OFR-FORM input message.
b = Printing option. Valid value(s):
  DELAY = Job scheduled to process at START TIME set by the IN:OFR-PARM input message.
  NONE = None specified.
c = Output device/file of the form.
d = Request identification number. This number is used with the STP:OFR input message.
e = Status of request. Valid value(s):
  ABNORMAL TERMINATION = Form processing failed, other error messages should appear detailing the failure.
  ABORTED PROCESSING = A form was being processed when an abort message was issued. The form was aborted.
  CANCELED = A form was pending (queued for processing) when an abort or stop message was issued. The form will not be run.
  CANNOT CREATE REPORT PROCESS = The office records report process could not be started.
  CANNOT EXECUTE REPGEN = The office records report generator process (REPGEN) could not be started.
  CANNOT EXECUTE RECPRT = The office records report generator process (RECPRT) could not be started.
  CANNOT PROCESS REQUEST = The message system call that passes initialization information for a form or query request to the report or query process failed.
  CANNOT READ SCHEDULING TABLE = An internal error in the office records scheduling process occurred.
  CANNOT TRANSLATE OFFICE RECORD = An unknown office record was requested. Correct the request and retry.
  COMPLETED WITH ERRORS = A form completed but errors (typically due to inconsistencies in the ODD) occurred. Other messages should appear detailing the errors.
  DATA BASE ERROR = An access to the ODD failed. Other messages should appear detailing the errors.
  DISK ACCESS ERROR = A system call failed while attempting to access a file on the AM file system.
FATAL DB SYSTEM ERROR = An internal error in an office record process or in an ODD access routine.
FATAL PROCESSING ERROR = An internal error in the office records report process.
INTERNAL PROGRAMMING ERROR = An internal error in the office records report process.
INVALID KEY ID SPECIFIED = Verify the valid ranges allowed.
INVALID MESSAGE RECEIVED = An internal error in the message passing system.
INVALID OUTPUT DEVICE = The device specification was incorrect on a form or category request; correct the device specification and retry.
INVALID RANGE SPECIFIED = The range entered is invalid.
INVALID REQUEST = A form or category scheduling request has an invalid combination of parameters (typically, incorrect key for a form); correct the request and retry.
NO JOBS COMPLETED = No queued jobs have completed.
NO JOBS COMPLETED, PROCESSING OR PENDING = No jobs in the queue.
NO JOBS PENDING = No jobs in the queue need to run.
NO MORE VALUES TO PROCESS = All elements from a range of values have been processed. This is likely not an error, although it may indicate that an incorrect range was specified.
NONE PROCESSING = No jobs are running.
OUTPUT DEVICE UNAVAILABLE = The requested output device or file could not be opened. Assure that the device is ready and retry.
PROCESS CURRENTLY BUSY = Likely an internal error in the office records scheduling process. If forms do not continue to process, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
PROCESSING HAS STARTED = Active job.
PROCESSING COMPLETED = Job completed without errors.
PROCESSING SCHEDULED = Job was scheduled.
REQUEST ID UNKNOWN = A specified request ID was not found in the schedule table. Use a status request to check the schedule table and retry.
RESTRICTED CATEGORY OR FORM = The request is restricted.
STOPPED PROCESSING = A form was being processed when a stop message was issued. The form was stopped.
TTY INTERRUPT = An interrupt was received from the TTY.
UNABLE TO READ OUTPUT DEVICE = Process not able to read the output device.
UNABLE TO SCHEDULE JOB = An internal failure in the scheduling code occurred. If forms do not continue to process or no further forms can be scheduled, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
UNKNOWN ERROR RETURNED = An internal error in an office records process or in the message passing system occurred. If forms do not continue to process, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
OUTPUT DEVICE INCOMPATIBLE WITH FORMAT = RAW = Certain output devices such as printers may hang when attempting to print raw formatted office records. To avoid this situation, certain output devices are not allowed when the raw format option is specified.
RAW FORMAT OFC REC FEATURE MUST BE PURCHASED = The raw formatted office record feature is a secure feature that must be purchased and activated via Recent Change form 8.22.

f = Output Format.
FORMATTED The office record output is in a "standard" human readable format. This is the default output format when format is not specified on the input command.
RAW The office record output is in RAW format. Each row of output in a "RAW"
A formatted office record is an instance of the Recent Change view associated with the form type being processed. Each row contains tab separated values associated with the fields defined for the particular Recent Change view. When using this format the output is machine readable and can be post processed more easily than the default formatting of office records.

</tr>
</tbody>
</table>

[3] OP OFR STATUS KEYS

CURRENT KEYS: [j]

2. REASON FOR OUTPUT

To report the results of the OP:OFR-STATUS input message.

Format 1 reports the office records (OFR) capability operating and scheduling parameters. This format prints if the PARM option was specified in the OP:OFR-STATUS input message.

Format 2 reports the status of the jobs scheduled internally by the on-line OFR capability. This format prints if the SCHED, COMPLETED, PROCESSING, PENDING, or REQID option was specified in the OP:OFR-STATUS input message.

Format 3 reports the value of keys being processed by the currently processing office record. This format prints for all OP:OFR-STATUS input messages. Note that if keys are not currently being processed (as is the case when the office record output is being sorted), the message "NO OFFICE RECORDS IN PROGRESS" will be output by this format.

3. VARIABLE FIELD DEFINITIONS

a = Indicates whether scheduled printing and file clean up occurs. Valid value(s):
   OFF = Scheduled printing and file clean up does not occur.
   ON = Scheduled printing and file clean up occurs.
   (blank) = If an error occurred while reading the database, nothing is printed in the space.

Office record files that are older than 24 hours are removed from the RCLOG partition if the DAY field is ON. If the DAY field is OFF, file clean up will not occur.
b = Hour at which automatic printing of changed pages is scheduled to begin. A value of 99 indicates that an error occurred while reading the database.

c = Maximum allowed print time (in hours) for automatic printing of changed pages. A value of zero indicates that an error occurred while reading the database.

d = Status of changed page recording. Valid value(s):
DISABLED = Changed page printing is disabled.
ENABLED = Changed page printing is enabled.
(Blank) = If an error occurred while reading the database, nothing is printed in this space.

e = Identification number. This number is used in the STP:OFR input message.

f = Category of forms to be printed. Valid value(s):
ADMIN = Administrative forms.
ALL = All categories, all forms.
APPROC = Applications processor forms.
BRCSD = All business and residential customer service (BRC) feature definition forms.
CONFIG = Configuration forms.
DARC = Digit analysis, routing and charging forms.
EQUIP = Equipment forms.
LASS = Local area signaling service forms.
LINE = Line forms.
MEAS = Measurements forms.
NONE = This occurs if a category type was not specified.
OSPS = Operator Services Position System forms.
PKT = Packet switching forms.
TRUNK = Trunk forms.

= Specific form type. Refer to the exhibit in the OP:OFR-FORM input message.
Note: NONE occurs if a form type was not specified.

h = Output device/file that is scheduled.

i = Status of scheduled request. Valid value(s):
ABNORMAL TERMINATION = Job did not complete processing.
ABORTED PROCESSING = Processing job was aborted.
CANCELED = Pending job was aborted/stopped.
COMPLETED = Job was completed successfully.
COMPLETED WITH ERRORS = Job completed with errors.
CURRENTLY PROCESSING = Job is currently active.
NONE COMPLETED = No completed jobs are in the table.
NONE COMPLETED, PROCESSING OR PENDING = No jobs are in the table.
NONE PENDING = No pending jobs are in the table.
NONE PROCESSING = No job is active.
PENDING = Job is waiting for processing.
REQUEST ID UNKNOWN = Job number is unknown.
STOPPED PROCESSING = Processing job was stopped.

j = Last valid key generated or 'NO OFFICE RECORDS IN PROGRESS'.

   l

[4] OP OLHB j   PTY=k
   l

2. REASON FOR OUTPUT

To report the outgoing line history block (OLHB) or an error message in response to an OP:OLHB input message.

Format 1 displays the OLHB status of a directory number (DN).

Format 2 displays the OLHB status of an office equipment (OE) number, which includes the following: an integrated digital carrier unit (IDCU) line equipment number (ILEN), an integrated services line card equipment number (LCEN), a line equipment number (LEN) of a line, an integrated SLC® line equipment number (SLEN), or an integrated services line circuit (LCKEN).

Format 3 reports an error response for a DN.

Format 4 reports an error response for an OE number, which includes the following: an ILEN, a LCEN, a LEN, a SLEN, a LCKEN.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Ten-digit directory number (DN) of the line.

b = Up to 20 digits of the last outgoing valid call. A blank value indicates that the digits are invalid or more than 20 digits were dialed.
c = Incoming privacy indicator (used for per call privacy and all call privacy features) for the last outgoing called number.

This indicator is specific to the following local area switching services (LASS) auto callback (AC) interaction. Valid value(s):

Terminal A (the DN or OE specified in the OP:OLHB input request) received a call from Terminal B. Terminal B’s privacy information was stored in Terminal A’s incoming line history block (ILHB). Terminal A then used AC to call Terminal B back. This caused Terminal A’s OLHB to be updated with Terminal A’s ILHB information. The call to Terminal B is now Terminal A’s last outgoing call (specified in field ‘b’). Valid value(s):

NO = The last outgoing call’s DN is marked public, and can be displayed on ringback.
YES = The last outgoing call’s DN is marked private, and cannot be displayed on ringback.

d = Outgoing privacy indicator (used for per call privacy and all call privacy features) for the calling number. Valid value(s):

NO = The DN the last outgoing call dialed was marked public, and could be displayed.
YES = The calling DN (the DN or OE specified in the OP:OLHB input request) was marked private and could not be displayed.

e = Escape to office dialing plan (ODP) indicator. This indicator is specific to the following LASS AC interaction. Valid value(s):

Terminal A (the DN or OE specified in the OP:OLHB input request) received a call from Terminal B. Terminal B’s public DN was stored in Terminal A’s ILHB. Terminal A is in an IDP, and used AC to call Terminal B back. This AC call updated Terminal A’s OLHB. Valid value(s):

NO = For an AC call, an IDP intercom number was derived for Terminal B’s public DN and used for the AC. This intercom number was stored into Terminal A’s OLHB.
YES = For an AC call, Terminal B’s public number was used so Terminal A’s (the DN or OE specified in the OP:OLHB input message) individual dialing plan (IDP) has to be bypassed with an implied escape to ODP.

f = Validity of the OLHB. Valid value(s):

NO = The OLHB output is not valid.
YES = The OLHB output is valid.

g = Bearer capability value of last outgoing call. The bearer capability value for all analog lines will be SPEECH. Valid value(s):

CLR56K = 56 KPS clear data bearer capability.
CLR64K = 64 kilobits per second (KPS) clear data bearer capability.
DCHAN = D-channel packet switching data bearer capability.
RES56K = 56 KPS restricted data bearer capability.
RES64K = 64 KPS restricted data bearer capability.
SPEECH = Speech bearer capability.
VG3.1K = 3.1 kilohertz voice-grade data bearer capability.

h = Calling name and calling number presentation indicator for the last outgoing called number
(specified in field 'b').

This indicator is specific to the following LASS AC interaction. Valid value(s):

Terminal A (the DN or OE specified in the OP:OLHB input request) received a call from Terminal B. Terminal B’s privacy information was stored in Terminal A’s incoming line history block (ILHB). Terminal A then used AC to call Terminal B back. This caused Terminal A’s OLHB to be updated with Terminal A’s ILHB information. The call to Terminal B is now Terminal A’s last outgoing call (specified in field 'b'). Valid value(s):

NAP = Toggle name presentation indicator was invoked by Terminal B.
NNDA = Name and number display code was invoked by Terminal B.
NNP = Name and number presentation access code was invoked by Terminal B.
NOP = No name and number presentation access code was invoked by Terminal B.

i = Calling name and calling number presentation indicator for the calling number (the DN or OE specified in the OP:OLHB input message). Valid value(s):

NAP = Name presentation access code was dialed by the calling DN on the last outgoing call.
NNDA = Name and number display code was dialed by the calling DN on the last outgoing call.
NNP = Name and number presentation access code was dialed by the calling DN on the last outgoing call.
NOP = No name and number presentation access code was dialed by the calling DN on the last outgoing call.

j = Valid value(s):

ILEN=m-n-o-p
LCEN=m-c-l-d-s
LCKEN=m-c-l-r-a-b
LEN=m-q-t-u-v-w
SLEN=m-x-y-z

k = Party. Valid value(s):

<table>
<thead>
<tr>
<th>For:</th>
<th>‘k’ =</th>
</tr>
</thead>
</table>
| analog ILEN, LEN, or SLEN | I = Individual Line.  
T 2 party tip.  
R 2 party ring.  
0-9 = Multi-party.  |

ISDN LCEN | I,0 Point-point.  
0-7 = Multi-point.  |

Data Base Read Failure - r1AR_CF = Data from the relation rlAR_CF could not be successfully retrieved, because a database read failure occurred.

Data Base Read Failure - r1FC_LINE = Data from the relation rlFC_LINE could not be successfully retrieved, because a database read failure occurred.

Data Base Read Failure - r1LPT_PT = Data from the relation rlLPT_PT could not be successfully retrieved, because a database read failure occurred.

DN Contains an Invalid NPA = The DN contains a numbering plan area (NPA) that is invalid.
or does not exist.
DN CONTAINS AN INVALID NXX = The DN contains an office code that is invalid or does not exist.
DN IS INVALID = The hundreds group is not populated for the specified DN, or the specified DN is invalid or does not exist.
NOT PROCESSED: LASS SUPPORT PACKAGE NOT LOADED = The switch does not have the appropriate local area signaling services (LASS) software loaded to handle the request.
OE OR PTY IS INVALID = The OE number or the party is invalid or does not exist.
OUTGOING LINE HISTORY BLOCK NOT AVAILABLE = The specified DN or OE is not allowed for LASS feature requests, or the OLHB is not available for this request.
PTY IS INVALID = The party is invalid or does not exist.
RETRY LATER: REQUEST COULD NOT BE PROCESSED = Switch resources were not available to allow processing of the request.
SM REDUNDANT DATA MISMATCH = This request was not processed, because data was inconsistent across SMs.
UNEXPECTED DATA VALUE = A software fault has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

m = Switching module (SM) number.
n = IDCU number.
o = Remote terminal (RT) number or IDCU facility (IFAC) number.
p = RT line number or IFAC channel number.
q = Line unit number.
r = Line group number.
s = Line card number.
t = Grid number.
u = Switch board number.
v = Switch number.
w = Level number.
x = Digital carrier line unit (DCLU) number.
y = RT number.
z = RT line number.
a¹ = Line board number.
b¹ = Line circuit number.
c¹ = ISDN line unit (ISLU/ISLU2).
\( d^1 \) = Line group controller number.

4. ACTION TO BE TAKEN

**Application:** 5,3B  
**Type:** Output

1. **FORMAT**

[1] OP OMDB COMPLETED

[2] OP OMDB NO DATABASE ENTRY FOUND
   FOR THE FOLLOWING KEYS:
   a

[3] OP OMDB FAILED
   UNABLE TO ACCESS /cft/spl/omdb

[4] OP OMDB FAILED

[5] OP OMDB ABORTED
   UNABLE TO CREATE TEMP FILE

[6] OP OMDB b
   KEY    MSG_CLASS   ALARM   TEXT
c d e f

[7] OP OMDB ABORTED
   UNABLE TO SEND REQUEST TO CSOP

[8] OP OMDB NOT STARTED
   CONFLICT WITH CURRENT SYSTEM STATUS g

2. **REASON FOR OUTPUT**

To report the result of executing an OP:OMDB input message.

3. **VARIABLE FIELD DEFINITIONS**

   a = List of message keys for which the OP:OMDB input message failed.
   b = DISK for OMDB disk file or ACT for active OMDB.
   c = Message key that was requested. There will be one line in the report for each key requested.
   d = Numeric value of the message class associated with the message for the message key in 'c'.
   e = Alarm level associated with the message for the message key in 'c'. Valid value(s):
ACT
CRIT
INFO
MAJ
MAN
MIN
VAR

\( f \)  = Up to 40 characters of the text associated with the message for the message key in \('c'\). The text shown in this report may include "%" characters. These characters indicate that variable data will be passed by the requesting process when this message is to be formatted and spooled.

\( g \)  = Further explanation of error. Valid value(s):

- INVALID KEY
- INVALID OMDB COPY
- SYNTAX ERROR
- TOO MANY KEYS

### 4. ACTION TO BE TAKEN

Format 1 indicates success.

For Format 2, verify that the key(s) was entered correctly.

For Format 3, determine if the disk is available. If the disk is available, verify the status of the OMDB disk file by using the OP:ST-LISTDIR input message for /cft/spl/omdb.

For Format 4, verify that the OMDB disk file (/cft/spl/omdb) is there. If the file is there, run the ACTV:OMDB input message. If that does not solve the problem, attempt a Craft Init. If the file is not on the disk, restore the file and then run ACTV:OMDB.

Format 5 indicates a possible file system problem, such as lack of available disk space.

Format 6 indicates successful execution of the input message.

For Format 7, verify that the craft output spooler (CSOP) is running.

For Format 8, verify that the input message was entered correctly.

### 5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To give device information specific to administrative module (AM) hardware units on communities requested by the OP:OOS input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for AM unit names.

b = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

c = Subunit name, Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the
Input Messages manual for AM control unit (CU) subunit names.

\(d\) = Subunit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

\(e\) = The current maintenance state of the unit. Valid value(s):
- ACT = Active units.
- GROW = Units being grown.
- INIT = Initializing units.
- OFL = Offline units.
- OOS = Out-of-service units.
- STBY = Standby units.
- UNAV = Unavailable units.
- UNEQIP = Unequipped units.

\(f\) = Current inhibit status of the associated error source. Valid value(s):
- ALW = Allowed.
- INH = Inhibited.

\(g\) = Result of the last diagnostic on the unit. Valid value(s):
- ABT = Aborted diagnostics.
- ATP = All tests passed.
- CATP = Conditional all tests passed.
- NTR = No tests were run.
- STF = Some test failed.

\(h\) = Error number. Valid value(s):
- 9 = Cannot attach to plant measurement library.
- 11 = Cannot open equipment configuration database (ECDB) sequence.
- 12 = Cannot sequence unit control blocks (UCBs).

\(i\) = Retry the input message later. Valid value(s):
- CAN'T CREATE FILE IN /tmp
- CAN'T GET DATABASE RECORD ID
- CAN'T SEQUENCE DATABASE

\(j\) = Temporary output file name.

\(k\) = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.
OMDB keys will vary depending on the alarm level of the message.

APP:OMDB–X–REF
OP:OPUMP

Software Release: 5E14 and later
Message Class: GENR
Application: 5
Type: Output

1. FORMAT

[1]  OP OPUMP STATUS SM = a
     [{ISLUCC=a-b-c|IDCU=a-b-c|DNUSCC=a-b-c}] [d]
     .
     .
     .
__________________________________________________________________

[2]  OP OPUMP STATUS SM = a
     NO PERIPHERAL STATUS TO REPORT AT THIS TIME

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to the OP:OPUMP input message. This message lists the switching module (SM) peripherals that failed offline pump.

Format 1 is printed from each SM requested in the input message listing any failures that occurred. No failures are listed if all peripherals were successfully removed, pumped, or restored.

Format 2 is printed from each SM requested in the input message if no peripherals are equipped on that SM or if no peripheral offline pump actions have occurred.

3. VARIABLE FIELD DEFINITIONS

DNUSCC  = Digital networking unit - synchronous optical network (SONET) (DNU-S) common controller (CC).
IDCU    = Integrated digital carrier unit.
ISLUCC  = Integrated services line unit common controller for integrated services line unit (ISLU), remote ISLU (RISLU), or ISLU model 2 (ISLU2) units.
a = SM number.
b = Line unit (ISLU, RISLU, ISLU2, IDCU, DNU-S) number.
c = CC side.
d = Line unit status. Valid value(s):

   PERIPHERAL SIDE FAILED TO OFF-LINE PUMP
   PERIPHERAL SIDE FAILED TO REMOVE FROM SERVICE
   PERIPHERAL SIDE FAILED TO RESTORE TO DUPLEX
   PERIPHERAL SIDE FAILED TO UPDATE FLASH

4. ACTION TO BE TAKEN
In order for a duplex peripheral unit to be offline pumped, the unit must be in an active/standby state prior to the start of the offline pump. If a failure occurs, make sure the failing peripheral is duplex and retry the peripheral offline pump.

5. ALARMS

None.

[1]   OP OSPS OSC=a ST=b DB=c [XDB=d] e

__________________________________________________________________

[2]   OP OSPS NOT LOADED
__________________________________________________________________

2. REASON FOR OUTPUT

To report the external database (XDB) multiline hunt group, given the operator service center (OSC), serving team (ST), and database (DB) numbers. This message is in response to the OP:OSPS input message.

Format 1 is used when OSPS software is loaded.

Format 2 is used when OSPS software is not loaded.

3. VARIABLE FIELD DEFINITIONS

a = OSC number.
b = ST number.
c = DB number.
d = XDB multiline hunt group number corresponding to the above inputs. Nothing is printed if there was an error.
e = Output message completion code. Valid value(s):
   BAD PACKET TELEPHONE NUMBER = The packet telephone number for the external database corresponding to the above inputs is not correct. This can be caused by: an illegal packet telephone number (such as, a packet telephone number with the wrong number of digits), a wrong packet telephone number, an undefined normalized office code (NOC), or no multiline hunt group defined for the packet telephone number.
   COMPLETED = XDB multiline hunt group number was successfully provided.
   INVALID INPUT = No XDB multiline hunt groups could be found for the values provided.
   NO OSPS SMS IN SWITCH = The switch is not configured with any OSPS switching modules (SMs), so there are no XDB multiline hunt groups.
   RETRY LATER - OSPS OR ROUTING SM ISOLATED = Cannot communicate with the OSPS SM or the routing SM.
   SYSTEM ERROR = Database reads could not be performed to determine the XDB multiline hunt group.

OP:OVRLD-A
Software Release: 5E14 - 5E16(1)
Message Class: OVLD
Application: 5
Type: Output

1. FORMAT

OP OVRLD {AM|SM=a|CMP=f-g,h|DLN=i-j|QGP=k-l}
REAL TIME b
RESOURCE c
CONTROLS d e

2. REASON FOR OUTPUT

To report that an overload occurred in the administrative module (AM), one of the switching modules (SM), one of the communication module processors (CMP), in the direct link node processor (DLN), and/or in one of the quad-link gateway processors (QGP). This message is also in response to the OP:OVRLD-AM-SM input message.

This message also reports the current overload status whenever the overload status has changed, and periodically (every 15 minutes) during an overload if the status remains the same.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Real-time overload status. Valid value(s):
  CRITICAL = Critical real-time overload.
  MAJOR = Major real-time overload.
  MINOR = Minor real-time overload.
  NONE = No real-time overload.
c = Resources that are overloaded. Refer to the APP:RESOURCES appendix in the Appendixes section of the Output Messages manual.
d = Controls that are currently in effect. Valid value(s):
  AVRT = Avoidance routing. Route around an overloaded SM.
  CART = CCS avoidance routing. Route around the overloaded switch.
  DNET = Defer non-essential tasks such as terminal maintenance routine tests.
  DPVC = Deny/delay packet virtual calls.
  ESP = Essential service protection is allowed.
  NONE = No controls are in effect.
  RCQM = Reduce CCS QPH messages.
  RIIAR = Input acceptance rates are reduced to the control level specified in variable 'e'.
  RIOR = Inter-SM origination rates are reduced to the control level specified in variable 'e'.
  RRR = Route requests are reduced to the control level specified in variable 'e'.
  RTR = Termination requests are reduced to the control level specified in variable 'e'.
  SBR = Selective bearer routing. Path hunting for traffic on the link served by the affected packet optical facility interface is inhibited.
  SRT = Receiver timing values (permanent signal and partial dial timing) are shortened to overload timing values (SM only).
e = Level of control (number of calls allowed per hour).

f = The message switch control unit (MSCU) side in which the CMP resides.

g = CMP number.

h = CMP identifier. Valid value(s):
   , MATE = Mate processor.
   , PRIM = Primary processor.

i = DLN group number.

j = DLN member number.

k = Message switch side number.

l = QGP number.

4. ACTIONS TO BE TAKEN

Determine the cause of the overload, escalating through normal channels as necessary. To find the status of the overloaded packet interface (PI) and/or packet handlers (PHs), use the OP:TRFC30 and OP:ST input messages.

5. ALARMS

Critical, major, or minor.

   2. [2] OP PCF CHNG=a-b-c-d j i  
       ______________________________________________________
   3. [3] OP PCF CHNG=a-b-c-d j SEGMENT m CONTINUED  
      PDSNIP=e.f.g.h j l  
      ______________________________________________________

2. **REASON FOR OUTPUT**

   To respond to an OP:PCF input message request to output the status of a single packet data serving node (PDSN) or all PDSNs on a packet control function (PCF).

   Format 1 reports the output for a single PDSN status request.

   Format 2 reports the output for the all PDSN status request.

   Format 3 reports the output for the all PDSN status request, listing the information of the matched PDSNs.

3. **VARIABLE FIELD DEFINITIONS**

   a = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   b = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   c = PSU Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   d = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   e = Internet protocol address segment (0-255).

   f = Internet protocol address segment (0-255).

   g = Internet protocol address segment (0-255).

   h = Internet protocol address segment (0-255).

   i = Completion or starting report. Valid value(s):
      COMPLETED = The request was successfully completed.
      INVALID PCF CHANNEL GROUP = The channel group provided in the input message was not valid.
for the OP:PCF input message. No search was performed.

INVALID STATUS = The PDSN status entered was not valid. The search was not performed.

LOST COMMUNICATION WITH SM = Lost communication between SM and AM, the request has been terminated. This report is for all PDSNs status request only.

NO MATCH = No PDSN was found that matched the request.

NOT FOR ALL REQUEST = The request was not for all PDSNs request, so the search was not performed. This report is for all PDSNs status request only.

REQUEST STOPPED = The list was stopped by manual action. This report is for all PDSNs status request only.

SM UNAVAILABLE = SM is not available. The request has been aborted.

STARTED = Indicates the search has been performed and the results will be printed following up. This report is for all PDSNs status request only.

SYSTEM BUSY = The system was too busy to perform the request or a system resource failure occurred which prevented the request from being processed.

SYSTEM ERROR = An internal system error that was not specified occurred which prevents further processing. The request has been aborted.

TIME OUT = An internal query failed which prevents further processing. The request has been aborted.

UNKNOWN IP ADDR = The PDSN IP address provided in the input message is not a valid IP address. This report is for single PDSN status request only.

\[ j \] = PDSN status. Valid value(s):

DEGRADED = The PDSN is in service, but marked degraded.

INVALID = The PDSN IP address was not valid for this PCF.

IS = The PDSN is in service.

OOS = The PDSN is out of service.

REMOVED = The PDSN has been degrown in RC/V but still has active sessions.

UNKNOWN = The status of the PDSN is unknown.

\[ l \] = Count of active sessions on the PDSN.

\[ m \] = Segment number. Segments are numbered sequentially starting from 1.

4. ACTIONS TO BE TAKEN
None.

5. ALARMS

  w [w] [w] [w] [w] [w] [w]
  w [w] [w] [w] [w] [w] [w]

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to a manual request to output a summary list of per-call test failures (PCTFs). Each port or high-level service circuit (HLSC) identified in the summary (Format 1) has experienced at least one PCTF occurrence since the last automatic PCTF summary was generated. The list, if long, will be broken into segments.

The summary report uses the message class PCTFSUM (classdef 84). Format 2 identifies switching modules (SMs) that were not reported in Format 1 because they could not be queried for PCTF data.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

+ = Indicates the line is a party line.

a = SM number, or lower limit of a range of SM numbers.

b = Upper limit of a range of SM numbers.

c = Segment number of this segment of the list. Segments are numbered sequentially starting from 1.

d = Completion report. Valid value(s):
  COMPLETED = All the requested PCTF information has been output.
  CONTINUED = Identifies second and subsequent segments of a list that was too long to be printed in a single segment.
  INPUT ERROR = The input request was in some way incorrect. Processing of the request has been aborted and no PCTF summary output will follow.
  NO PCTFS = No per-call test failures have occurred since the previous periodic report was generated.
  STARTED = Indicates the first segment in the list. This does not necessarily imply that additional segments will be required.
  STOPPED = The list was stopped by manual action.
**SYSTEM BUSY** = The system was too busy to perform the requested action or a system resource failure occurred which prevented the request from being processed. This could indicate that another OP:PCTF request is in progress.

**SYSTEM ERROR** = An unspecified internal system error occurred which prevented further processing. The request has been aborted.

e = Telephone number of the line.

f = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

g = Valid value(s):

<table>

### 2. REASON FOR OUTPUT

To print data from the Operating System for Distributed Switching (OSDS) resource monitoring utility as to the usage of OSDS message, process, stack, and timer control blocks (MCBs, PCBs, SCBs, and TCBs) for the most recent reporting period. These messages are in response to the OP:PERF input message.

### 3. VARIABLE FIELD DEFINITIONS

- **AM** = Operational kernel process in the administrative module (AM).
- **a** = Message switch side.
- **b** = Communications module processor (CMP) number.
- **c** = Switching module (SM) number.
- **d** = Reporting period, in minutes.
- **e** = Maximum number of MCBs available.
- **f** = Minimum number of MCBs used during any six-second interval during the reporting period.
- **g** = Maximum number of MCBs used during any six-second interval during the reporting period.
- **h** = Average (mean) number of MCBs used during the reporting period.
- **i** = Maximum number of PCBs available.
- **j** = Minimum number of PCBs used during any six-second interval during the reporting period.
- **k** = Maximum number of PCBs used during any six-second interval during the reporting period.
- **l** = Average (mean) number of PCBs used during the reporting period.
- **m** = Maximum number of SCBs available.
- **n** = Minimum number of SCBs used during any six-second interval during the reporting period.
- **o** = Maximum number of SCBs used during any six-second interval during the reporting period.
\( p \) = Average (mean) number of SCBs used during the reporting period.

\( q \) = Maximum number of TCBs available.

\( r \) = Minimum number of TCBs used during any six-second interval during the reporting period.

\( s \) = Maximum number of TCBs used during any six-second interval during the reporting period.

\( t \) = Average (mean) number of TCBs used during the reporting period.

  . . . . . . . . . . . . . . . .

[MORE PERIPHERALS IN OVERLOAD THAN CAN BE PRINTED, NUMBER DISCARDED = f]

2. REASON FOR OUTPUT

To report that an overload occurred in one or more peripheral units on the switching module (SM). This message is reported in response to the OP:OVRLD input message if any peripheral unit listed below is in overload on the specified SM. If an optical facility interface (OFI) is in overload, controls are applied to inhibit path hunting for all traffic on the link served by the OFI protection group.

This message also reports the current overload status whenever the overload status has changed, and periodically (every 15 minutes) during an overload if the status remains the same.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Peripheral unit. Valid value(s):
   OFI = a-g-h
   PSUPH = a-i-j-k
c = Channel group. Valid value(s):
   [0-15] = Channel group number for PSUPH.
   NA = Not applicable for OFI.
   OOS = PSUPH is out-of-service.
   STBY = PSUPH is standby.
   UNEQ = PSUPH is unequipped.
d = Level of overload. Valid value(s):
   CRIT = Critical overload.
   MAJOR = Major overload.
   MINOR = Minor overload.
e = Resource in overload. Valid value(s):
   DRPCL = PH dropped cell.
   GPBD = PH general purpose buffer descriptor.
   LKOCC = OFI incoming link occupancy.
LRFD = PH LAN-side received frame descriptor.
MORE = More resources in overload on this peripheral unit than can be printed.
RT = PH real-time.
SRFD = PH SPYDER-side received frame descriptor.
STFD = PH SPYDER-side transmit frame descriptor.

\( f \) = Number of peripheral units in overload that were discarded from the report. There were more than 19 peripheral units in overload on this SM.
\( g \) = Optical interface unit unit number.
\( h \) = OFI protection group number.
\( i \) = Packet switching unit unit number.
\( j \) = PSU shelf number.
\( k \) = PSU slot number.

4. ACTIONS TO BE TAKEN

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Message Class: PFR_RSP
Application: 5
Type: Output

1. FORMAT

OP PERPH SM=a UNIT ERROR SUMMARY

UNIT COF SERV OPER PAR
b c d e f
. . . . .
. . . . .
. . . . .
. . . . .

2. REASON FOR OUTPUT

To provide a summary of transient peripheral errors that have occurred on switching module (SM) peripheral (PERPH) units.

Transient peripheral errors are counted by peripheral fault recovery (PFR), but are not normally reported. This output message contains a list of unit types in the SM and transient errors that have occurred on those units since the last time the error counts were cleared.

The unit error counts can be cleared by request through the OP:PERPH-SM-SUM input message with the CLR option and are automatically cleared at 7:00 p.m. each day.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = Name of unit on which errors occurred. Valid value(s):
   AIU = Access interface unit.
   EAIU = Extended access interface unit.
   DCLU = Digital carrier line unit.
   DCTU = Directly connected test unit.
   DLTU = Digital line trunk unit.
   DSU = Digital service unit.
   IDCU = Integrated digital carrier unit.
   ISLU = Integrated services line unit.
   LU = Line unit.
   MSU = Metallic service unit.
   PDXU = Peripheral control and timing data exchanger unit.
   PSU = Packet switch unit.
   TU = Trunk unit.
   XAIU = Multiplex access interface unit.

   = Total number of control order failures received from a hardware unit. Control order failures indicate that a peripheral interface control bus (PICB) interrupt has occurred.

d = Total number of service request interrupts received from a hardware unit. Service requests are any errors belonging to one category:
   • DCLU service request failures.

Copyright ©2003 Lucent Technologies
• DCTU service requests.
• DCTU spurious messages.
• DFI communications control buffer (CCB) errors.
• DFI unified control interface (UCI) errors.
• DFI status errors.
• DSU digital service circuit (DSC) service request failures.
• DSU common service request failures.
• E-bit errors.
• Gated diode crosspoint (GDX) access power alarms.
• GDX controller power alarms.
• GDX grid power alarms.
• Internal data path faults.
• LU clock failures.
• Model 2 LU address fault alarms.
• S-DFI internal peripheral interface data bus (PIDB) parity errors.
• S-DFI service request failures.
• TU service request failures.
• Unexpected service requests.

The categories above correspond to error types that are contained in the REPT:CDFI-TRBL, REPT:DFIH-TRBL, REPT:HDFI-TRBL, REPT:RDFI-TRBL, and REPT:SDFI output messages.

\[ e = \text{Total number of test failures received from a hardware unit. Test failures are any errors belonging to one category:} \]
- LU operational test failures.
- MSU path setup failures.
- Terminal maintenance transmission test facility (TTF) or global digital services function (GDSF) failures.
- DCTU error messages.

Test failures occur as a result of an error during an operational (for example, call setup) or terminal maintenance (for example, DCTU measurement) test on a line or trunk. These categories correspond to error types which are contained in REPT:CDFI-TRBL, REPT:DFIH-TRBL, REPT:HDFI-TRBL, REPT:RDFI-TRBL, and REPT:SDFI output messages.

\[ f = \text{Total number of parity errors received from a hardware unit. Parity errors are any errors belonging to one category:} \]
- PIDB parity failures.
- Local DSU data parity failures.
- Facilities interface data bus (FIDB) parity failures.
- TSI PIDB parity failures.

These errors correspond to error types contained in the REPT:CDFI-TRBL, REPT:DFIH-TRBL, REPT:HDFI-TRBL, REPT:RDFI-TRBL or REPT:SDFI-TRBL output messages.

4. ACTIONS TO BE TAKEN

A more detailed summary of transient peripheral errors on SM units can be obtained using the OP:PERPH-SM-SUM input message.

By default, output messages for peripheral errors that result in recovery actions in a circuit will be logged and not
printed. The CHG:LPS-MSGCLS input message can be used to change this default print status of the message
class for each peripheral unit type.

The SET:PERPH-SM input message can also be used to output transient peripheral error messages which indicate
that no recovery action has been taken (for example, "ANALYSIS ONLY").

5. ALARMS

2. REASON FOR OUTPUT

To provide a system wide switching module (SM) peripheral (PERPH) transient error summary. Peripheral transient errors are counted by peripheral fault recovery (PFR) but are not normally reported.

This output message is either printed on demand (as a result of the OP:PERPH-SM-SUM input message) or automatically at 7:00 AM. If this message is printed automatically, error data for at most 24 SMs will appear in the message. These will be the SMs with the highest counts of transient peripheral errors since the last automatic printing of this message.

The system wide SM peripheral transient error summary counts can be cleared (CLR) by request, and are automatically cleared at 7:00 PM each day. This summary message is printed in blocks containing data for up to 24 SMs.

3. VARIABLE FIELD DEFINITIONS

a = Sequence of message block. Valid value(s):
   FIRST RECORD
   LAST RECORD
   NEXT RECORD

b = SM number.

c = Total number of transient peripheral errors for that SM. If blank, that SM's information was not available.

4. ACTION TO BE TAKEN

A more detailed summary of transient peripheral errors on SM units can be obtained using the OP:PERPH-SM-SUM input message.

By default, output messages for peripheral errors that result in recovery actions in a circuit will be logged and not printed. The CHG:LPS-MSGCLS input message can be used to change this default print status of the message class for each peripheral unit type.

The SET:PERPH-SM input message can also be used to output transient peripheral error messages which indicate that no recovery action has been taken (for example "ANALYSIS ONLY").

3. VARIABLE FIELD DEFINITIONS
Variables ‘a’ through ‘j’ are service measurements (base counts).

- **a** = Reporting office identifier.
- **b** = Date of the beginning of the report period, in the form month/day/year.
- **c** = Time of the beginning of the report period, in the form hour:minutes:seconds.
- **d** = Date of the end of the report period, in the form month/day/year.
- **e** = Time of the end of the report period, in the form hour:minutes:seconds.
- **f** = Date when the report was prepared, in the form month/day/year.
- **g** = Time when the report was prepared, in the form hour:minutes:seconds.
- **h** = Date the data was last initialized, in the form month/day/year.
- **i** = Time the data was last initialized, in the form hour:minutes:seconds.
- **j** = Status of data. Valid value(s):
  - DATA IS VALID
  - DATA MAY BE INVALID

Variables ‘k’ through ‘x’ are service measurements (base counts).

- **k** = Number of originating calls.
- **l** = Number of incoming calls.
- **m** = Number of terminating calls.
- **n** = Number of outgoing calls.
- **o** = Number of intraoffice calls.
- **p** = Number of originating requests.
- **q** = Number of incoming requests.
- **r** = Number of tandem calls.
- **s** = Number of originating-outgoing calls.
- **t** = Number of incoming-terminating calls.
- **u** = Number of centralized automatic message accounting (CAMA) seizures.
- **v** = Number of CAMA operator number identification (ONI) calls.
- **w** = Number of CAMA automatic number identification (ANI) calls.
- **x** = Number of traditional two-stage international outbound calls where the second stage was processed. This is used by toll offices that have fully coded addressing.

Variables ‘y’ through ‘c1’ are service measurements (cutoff calls).
y = Number of switch cutoff calls.

z = Number of facility cutoff calls.

a^1 = Number of gated diode crosspoint (GDX) cutoff calls.

b^1 = Number of ISDN circuit switched calls (voice and data) which are abnormally terminated due to problems in the ISDN loop.

c^1 = Number of lost nailed up connections. This number represents the accumulated number of connections found out-of-service (OOS) every 15 minutes. Refer to the REPT:NAILUP output message also.

Variables 'd^1' through 'l^1' are service measurements (billing troubles).

d^1 = Number of coin control attempts.

e^1 = Number of stuck coin conditions.

f^1 = Number of automatic message accounting (AMA) entries.

g^1 = Number of AMA entries lost.

h^1 = Number of irregular AMA entries.

i^1 = Number of calls requiring AMA treatment.

j^1 = Number of CAMA free calls.

k^1 = Number of CAMA ANI troubles.

l^1 = Number of CAMA ONI ineffective attempts.

Variables 'm^1' through 'r^1' are Real Time Call Detail (RTCD)

m^1 = Total number of RTCD records generated by all Originating SM's.

n^1 = Total number of RTCD records acknowledged/received at the GBSM from all Originating SM's.

o^1 = Total number of RTCD records transmitted out the MHEIB.

p^1 = Total number of RTCD records lost due to RTBM overflow.

q^1 = Total time (in units of seconds) that the Ethernet link was out-of-service.

r^1 = Total number of Long Duration Call (LDC) RTCD records generated by all Originating SM's.

Variables 's^1' through 'w^1' are blue box fraud counts.

s^1 = Number of short supervisory transitions (SST) detected.

t^1 = Number of ineffective fraud investigations.

u^1 = Number of calls subjected to fraud investigation.
\( v^1 \) = Number of calls determined to be fraudulent and terminated.

\( w^1 \) = Number of calls for which the end customer received no bulk customer line identification (BCLID) message because of switch data equipment. This indicates that BCLID messages are being lost due to unavailability of data equipment due to being in maintenance state.

2. REASON FOR OUTPUT

To print the most recent 24-hour plant report.

3. VARIABLE FIELD DEFINITIONS

a  = Time when the report was prepared, in the form hour:minutes:seconds.
b  = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID

Note: Variables 'c' through 'y' are service measurements-ineffective attempts.
c  = Number of call setup troubles - connecting.
d  = Number of call setup troubles - originating.
e  = Number of call setup troubles - incoming.
f  = Number of call setup troubles - terminating.
g  = Number of call setup troubles - originating-outgoing.
h  = Number of call setup troubles - incoming-outgoing.
i  = Number of transient calls lost - connecting.
j  = Number of false starts - originating.
k  = Number of false starts - incoming.
l  = Number of permanent signals - originating TOUCH-TONE (TT).
m  = Number of permanent signals - incoming TT multi-frequency (MF).
n  = Number of permanent signals - originating dial pulsing (DP).
o  = Number of permanent signals - incoming DP.
p  = Number of partial dial timeouts - originating MF.
q  = Number of partial dial timeouts - incoming MF.
r  = Number of partial dial timeouts - originating DP.
s  = Number of partial dial timeouts - incoming DP.
t  = Number of timeouts and abandons - incoming.
u  = Number of vacant codes - incoming.
v  = Number of no circuits (trunk) - outgoing.
w  = Number of network management (NM) blocked - outgoing.
x = Number of no path or service circuits - connecting.

y = Number of abandons from queues - connecting.

z = Number of permanent signals - incoming revertive pulsing (RP).

a¹ = Number of permanent signal timeouts in the second stage of a traditional 2-stage international outbound call - incoming. This is used by toll offices that have fully coded addressing.

b¹ = Number of partial dial timeouts in the second stage of a traditional 2-stage international outbound call - incoming. This is used by toll offices that have fully coded addressing.

c¹ = Number of vacant codes in the second stage of a traditional 2-stage international outbound call - incoming. This is used by toll offices that have fully coded addressing.

d¹ = Number of partial dial timeouts - incoming RP.

e¹ = Number of ineffective machine attempt address complete timeouts - outgoing.

f¹ = Number of backward failure messages originated - incoming.

g¹ = Number of signaling network failures - outgoing.

h¹ = Number of unreasonable messages - incoming.

i¹ = Number of release guard messages received - outgoing.

4. ACTION TO BE TAKEN

### 2. REASON FOR OUTPUT

To print the most recent 24-hour plant report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

### 3. VARIABLE FIELD DEFINITIONS

- **a**  
  = Time when the report was prepared, in the form hours:minutes:seconds.

- **b**  
  = Status of data. Valid value(s):

  - **DATA IS VALID**
  - **DATA MAY BE INVALID**

- **c**  
  = Number of switching modules (SMs).

- **d**  
  = Number of errors (resets and interrupts) in the SMs.
\( e \) = Number of communication module processors (CMPs).

\( f \) = Number of faults [some tests fail (STF) diagnostics] in the CMPs.

\( g \) = Number of errors (hardware interrupts) in the CMPs.

\( h \) = Number of requested auto diagnostics in the CMPs.

\( i \) = CMP maintenance usage excluding diagnostics and MSCU out of service (OOS) (total time either active or standby OOS) in seconds.

\( j \) = CMP duplex maintenance usage in seconds; there is not an active CMP.

\( k \) = Number of message switch control units (MSCUs).

\( l \) = Number of MSCU faults.

\( m \) = MSCU maintenance usage in seconds.

\( n \) = Number of foundation peripheral controllers (FPCs).

\( o \) = Number of foundation peripheral controller/control and diagnostic access link (FPC/CDAL) faults.

\( p \) = FPC maintenance usage in seconds.

\( q \) = Number of pump peripheral controllers (PPCs).

\( r \) = Number of PPC faults.

\( s \) = PPC maintenance usage in seconds.

\( t \) = Number of module message processors (MMPs).

\( u \) = Number of MMP faults.

\( v \) = MMP maintenance usage in seconds.

\( w \) = Number of office network and timing complex commons (ONTCCOMs).

\( x \) = Number of ONTCCOM critical faults.

\( y \) = ONTCCOM maintenance usage in seconds.

\( z \) = Number of network clock (NC) references.

\( a^1 \) = Number of NC reference noncritical faults.

\( b^1 \) = Number of NC oscillators.

\( c^1 \) = Number of NC oscillator noncritical faults.

\( d^1 \) = Number of link interfaces (LIs).

\( e^1 \) = Number of LI faults.

\( f^1 \) = LI maintenance usage in seconds.
\( g^1 \) = Number of time multiplexed switch links (TMSLNKs).

\( h^1 \) = Number of times the switch maintenance kernel process recognizes any fault on a time multiplexed switch link (TMSLNK).

\( i^1 \) = Number of communication links (CLNKs).

\( j^1 \) = Number of CLNK errors.

\( k^1 \) = Number of QLPS gateway processors (QGPs).

\( l^1 \) = Number of times the switch maintenance kernel process recognizes any critical fault on a QLPS gateway processor (QGP).

\( m^1 \) = QGP maintenance usage in seconds.

\( n^1 \) = Number of QLPS gateway link (QGL).

\( o^1 \) = Number of times the switch maintenance kernel process recognizes any fault on a QLPS gateway link (QGL).

\( p^1 \) = Number of quad-link packet switches (QLPSs).

\( q^1 \) = Number of times the switch maintenance kernel process recognizes any fault on a quad link packet switch (QLPS).

\( r^1 \) = QLPS maintenance usage in seconds.

\( s^1 \) = Number of QLPS time multiplexed switch link (QTMSLNK).

\( t^1 \) = Number of times the switch maintenance kernel process recognizes any fault on a QTMSLNK.

\( u^1 \) = Number of QLPS PIPEs (QPIPEs).

\( v^1 \) = Number of QPIPE software errors.

\( w^1 \) = Number of QLPS links (QLNK).

\( x^1 \) = Number of QLNK software errors.

2. REASON FOR OUTPUT

To print the most recent 24-hour plant report.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID

c = Remote module (RM) number.

Unless otherwise noted all values are peg counts. Variables 'd' through 'e' are base measurements.

d = Number of originating calls.

e = Number of incoming calls.

g = Number of outgoing calls.
Variables ‘h’ through ‘o’ are service measurements.

\[
\begin{align*}
    h &= \text{Number of transient calls lost.} \\
    i &= \text{Number of connecting call setup troubles.} \\
    j &= \text{Number of originating call setup troubles.} \\
    k &= \text{Number of incoming call setup troubles.} \\
    l &= \text{Number of terminating call setup troubles.} \\
    m &= \text{Number of outgoing call setup troubles.} \\
    n &= \text{Number of calls blocked.} \\
    o &= \text{Number of calls blocked- administrative module to RM.}
\end{align*}
\]

Variables ‘p’ through ‘y’ are performance measurements.

\[
\begin{align*}
    p &= \text{Number of automatic full initializations.} \\
    q &= \text{Number of automatic selective initializations.} \\
    s &= \text{Number of automatic directed audit initializations.} \\
    t &= \text{Number of automatic single process purges.} \\
    u &= \text{Number of manual full initializations.} \\
    v &= \text{Number of manual selective initializations.} \\
    w &= \text{Number of manual single process purges.} \\
    x &= \text{Number of seconds in stand-alone.} \\
    y &= \text{Number of times the RM entered stand-alone.}
\end{align*}
\]

Note: An output value of 111 indicates a count that will be implemented in future issues and is not currently being taken.

2. REASON FOR OUTPUT

To print the most recent 24-hour plant report. Part 5 of the 24-hour plant report contains the trunk error analysis (TERA) measurements. Some TERA measurements are kept on a trunk group (that is, peer group) basis (for a maximum of 20 trunk groups - 10 groups each on Formats 1 and 2), some are kept on a machine detected inter-office irregularity (MDII) basis (DEACT in Format 3), some are kept on both peer group and MDII basis (Format 3: first 6 trunk groups for all MDIIs; Format 4: last 14 (maximum possible) trunk groups for all MDIIs), and some are simple totals (Format 1 TOTALs). These outgoing MDIIs are used exclusively for reporting common channel signaling (CCS) failure:

- **MGBAF** = Maintenance group blocking acknowledgment failure.
- **MGUAF** = Maintenance group unblocking acknowledgment failure.
- **HGBAF** = Hardware group blocking acknowledgment failure.
- **HGUAF** = Hardware group unblocking acknowledgment failure.

These MDIIs are generated during a remove or restore of a CCS trunk group. Any of these MDIIs (MGBAF or HGBAF for a remove) (MGUAF or HGUAF for a restore) can be reported more than once on the ROP. TERA is deactivated for these MDIIs by default, since these MDIIs are associated with a whole trunk group and not with a trunk member. Only the measurement counts for TOTAL OUTGOING MDIIs, TOTAL DEACTIVATIONS OF PART5 (1 of x), and OUTGOING OF PART24 of the PLNT 24 report are pegged. Format 5: The count of automatic protection switches is reported on the Part 5 of the PLNT24 report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

- **a** = Section number.
- **b** = Number of sections that will be printed.
- **c** = Time when the report was prepared, in the form hours:minutes:seconds.
- **d** = Status of data. Valid value(s):
  - DATA IS VALID
  - DATA MAY BE INVALID
- **e** = Number of incoming MDIIs detected.
- **f** = Number of outgoing MDIIs detected.
- **g** = Number of times TERA was deactivated,
- **h** = Trunk group number.
- **i** = Number of recovery actions initiated by TERA, per peer group.
\( j \) = Number of times equipment was taken out-of-service (OOS) due to TERA, per peer group.

\( k \) = Number of MDIIs preempted from TERA's peer group analysis, per peer group.

\( l \) = Number of MDIIs preempted from TERA's quick-check analysis, per peer group.

\( o \) = MDII type.

\( p \) = Number of manual requests to deactivate TERA on an MDII basis.

\( q \) = Number of MDIIs input to TERA, per peer group.

\( r \) = Switching Module number.

\( s \) = Optical Interface Unit number.

\( t \) = Protection Group number.

\( u \) = Number of Automatic Protection Switches.

   .  .  .  .  .

2. REASON FOR OUTPUT

To print the most recent 24-hour report.

3. VARIABLE FIELD DEFINITIONS

IC = InterLATA carrier identifier consisting of identifiers 'c' and 'd'.
a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID

c = Feature group identifier (letter B or D).

d = Carrier identifier.

e = Number of incoming call attempts on trunks directly connected to a carrier (trunk class = IC).

f = Number of routed outgoing call attempts on trunks directly connected to a carrier (trunk class = IC).

g = Number of routed outgoing call attempts on trunks connected to a tandem for access-via-tandem calls (trunk class = LTOLL).

h = Number of lines screened by selective carrier denial (SCD).

i = Number of calls blocked by SCD.

j = Number of incoming machine detected interoffice irregularities (MDII) on trunks directly connected to a carrier (trunk class = IC).

k = Number of outgoing MDII on trunks directly connected to a carrier (trunk class = IC).

l = Number of outgoing second start dial (SSD) wink MDII on trunks connected to a tandem for access-via-tandem calls (trunk class = LTOLL).

m = Number of outgoing acknowledgement (ACK) wink MDII on trunks connected to a tandem for access-via-tandem calls (trunk class = LTOLL).

n = Number of incoming integrated services digital network user part (ISUP) MDII on trunks directly connected to a carrier (trunk class = IC).

o = Number of outgoing ISUP MDII on trunks directly connected to a carrier (trunk class = IC).

p = Number of ISUP continuity failures after two attempts at the end office or access tandem (trunk class = IC or LTOLL). A call fails after two successive continuity failures.

q = Number of ISUP initial address messages (IAM) received having a priority other than one.

### 2. REASON FOR OUTPUT

To print the most recent 24-hour plant report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

### 3. VARIABLE FIELD DEFINITIONS

- **a**
  - Time when the report was prepared, in the form hours:minutes:seconds.

- **b**
  - Status of data. Valid value(s):
    - DATA IS VALID
    - DATA MAY BE INVALID

- **c**
  - Number of incoming OSPS call attempts because:
    - A directory-assistance (DA) call was received.
    - Any automated toll and assistance (T&A) OSPS call (that is, coin, calling card, inward) was received.
    - Any operator assisted T&A OSPS call was received.
    - The end of a time-and-charge call that was routed to an operator.

- **d**
  - Number of incoming OSPS call attempt failures because:
### Source: Reason(s):

<table>
<thead>
<tr>
<th>Source:</th>
<th>Reason(s):</th>
</tr>
</thead>
</table>
| For DA calls | - Call type determination failed on a DA call.  
- Failure to read RC/V View 21.22 to obtain call queue information on a DA call.  
- Failure to RC/V View view 21.7 to determine if interflow was active on a DA call.  
- Failure to RC/V View view 21.27 when interflow was active for the DA serving team assigned to receive the incoming call.  
- Could not obtain a (DASC) channel number to send a position seizure message to the DASC on a DA call.  
- Failure to interflow a DA call, through reroute, when interflow was active for the serving team assigned to receive the call. |
| For automatic call distributor (ACD) | - Failure to send route request message to the ACD.  
- Failure to receive acknowledgement from the ACD that an operator request was received.  
- Call processing determined that the call received was a commercial ACD call type but commercial ACD in RC/V View 8.30 was set to N.  
- Failure of ACD to route a call to an operator for reasons other than the call queue was full.  
- Failure to set a system timer to wait for an ACD response to an operator request.  
- After a second timeout while waiting for a response from the ACD to an operator request.  
- When a system interrupt signal was received while the call was waiting for a response to an operator request from the ACD. |
| For coin | - when the back party went on-hook while the call was being routed to an operator on a 1+ coin call that required an operator for initial customer contact.  
- when the back party went on-hook while a queue overflow announcement was being played on a 1+ coin call that required an operator for initial customer contact.  
- after successfully giving a queue overflow announcement on a 1+coin call that required an operator for initial customer contact.  
- when a failure to allocate coin dynamic data on a coin call occurred.  
- when a 0+ coin test call had bad automatic number identification (ANI). |
| Others | - Failure to define a path to an operator.  
- Failure on an automated calling card service (ACCS) call to release the path to the digital service unit model 2/recorded announcement function (DSU2/RAF) on a call that was to be routed to an operator.  
- Failure to route to an announcement when a call queue was closed.  
- When a call queue was closed.  
- Failure to route to level 3 delay announcement.  
- When more than 11 digits were received on an inward call.  
- When digit analysis failed on a 950, 0+, 0-, or 011+ call.  
- When digit analysis failed on an ACCS call being routed to an operator. |

\[ e = \text{Number of times a DA operator attempted to initiate a call to a point external to the switch or a T&A operator initiated a delayed call from BK# SEND or FWD# SEND.} \]

\[ f = \text{Number of times a DA operator canceled an external call by entering the DIAL or POSREL key or a routing failure occurred on an outgoing call as defined by OUTGOING ATTEMPT.} \]

\[ g = \text{Number of OSPS calls routed to reorder tone because:} \]

- A rating query failed on an initial automated coin toll service (ACTS) coin call.
- Failure to get a conference circuit on an initial ACTS coin call.
- Failure to route a call to an operator.

\[ h = \text{Number of times the ACD successfully removed a queued call for which the back party had gone} \]
on-hook.

\( i \) = Operator position maintenance usage in seconds.

Variables ‘\( j \)’ through ‘\( o \)’ are Operator Services Position System (OSPS) performance measurements.

\( j \) = Switching module number. The maximum number of OSPS switching modules (SMs) for which directory assistance services/computer (DAS/C) measurements are reported. Range is 1 to 32.

\( k \) = Number of times the switch attempted to notify the DAS/C about a directory assistance (DA) position seizure.

\( l \) = Number of times the switch failed to notify the DAS/C about a DA position seizure because the level 3 protocol was unavailable or down.

\( m \) = Number of times the switch failed to notify the DAS/C about a DA position seizure because the level 3 protocol buffers were full.

\( n \) = Number of times the switch successfully notified the DAS/C about a DA position seizure. Equal to ATTEMPT - FAILURE - OVFL.

\( o \) = Number of seconds a DAS/C port was found to be in an out-of-service state. Equal to the accumulation of the number of ports found to be in an out-of-service state every 100 seconds multiplied by 100.

Variables ‘\( p \)’ through ‘\( r \)’ are OSPS SM layer 3 protocol measurements. The maximum number of OSPS SMs for which DAS/C measurements are reported is 32.

\( p \) = Number of layer 3 protocol resets.

\( q \) = Number of layer 3 protocol restarts.

\( r \) = Number of layer 3 protocol retransmissions.

2. REASON FOR OUTPUT

To print the most recent 24-hour plant report.

Refer to the APP: MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

Note: For the variables with "*" refer to the 4ACTION TO BE TAKEN section in this manual page.

a = Time when the report was prepared, in the form of hours:minutes:seconds.
b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID
c = Number of rating queries attempted. Equal to SENT + NSENT.
d = Number of rating queries sent to the real-time rating service (RTRS) database. Equal to RATEQT SENT + CCQS SENT + T&C SENT + COIN SENT + CL SENT.
e = Number of rating queries not sent to the RTRS database. Equal to HDW + OVRLD + NM + NO-ID + AMBLK.

f = Number of rating queries not sent to the RTRS because of database link hardware problems. This count is not pegged when a test query cannot be sent to RTRS because of link hardware problems.

g = Number of rating queries not sent to the RTRS because of database cutbacks.

h = Number of rating queries not sent to the RTRS because no query identifiers were available.

i = Number of rating test queries sent to the RTRS database.

j = Number of RTRS query replies received that indicated that the database was unable to process the reply.

k = Number of unexpected RTRS query replies received.

l = Number of RTRS query replies received in an invalid format.

m = Number of times that the OSPS switch timed out waiting for a reply from the RTRS database.

n = Number of RTRS query replies received that contained a non-zero overload indicator.

o = Number of times that a rating query was cancelled before a reply was received due to an operator or caller action.

p = Number of rating query replies received. Equal to TOTAL SUCCESS + TOTAL FAILURE in section 63: TRFC30 ORTR.

q = Number of rate quote queries sent to the RTRS database.

r = Number of rating query replies received from the RTRS that indicated a rate quote query was not successfully rated.

s = Number of centralized charge quotation system (CCQS) queries sent to the RTRS database.

t = Number of rating query replies received that indicated a CCQS query was not successfully rated. This count also includes replies that were successfully rated but the charges were greater than what hotel billing information system (HOBIS) or hotel billing information center (HOBIC) can receive, that is, $999.99.

u = Number of time and charges (T&C) queries sent to the RTRS database.

v = Number of rating query replies received that indicated a T&C query was not successfully rated.

w = Number of coin rating queries sent to the RTRS database. Equal to OVERALL INIT + OVERALL INTRM + OVERALL EOC in Section 100: TRFC30 OCOIN.

x = Number of coin rating query failures. Equal to POSTPAY IRQF + NON-ACTS IRQF + PREPAY INITIAL SEIZURE FAIL + OVERTIME ICRF + END OF CALL ECRF in Section 100: TRFC30 OCOIN.

y = Number of card limit (CL) queries sent to the RTRS database including initial and subsequent queries.

z = Number of CL initial and subsequent RTRS queries that are not successfully rated.
\[ a^1 \] = Number of rating query failures. Equal to RATEQT FAILURE + CCQS FAILURE + T&C FAILURE + COIN FAILURE + CL FAILURE.

4. ACTION TO BE TAKEN

None.

The counts with \( ^\ast \) are specific to a CFR database and will always be zero when the rating database is an RTRS.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

\[ \text{OP:TRFC30, VLD} \]

The validity for the administrative module applies to this section.

5. ALARMS

2. REASON FOR OUTPUT

To print the most recent 24-hour plant report.

Refer to the APP: MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value(s):

DATA IS VALID
c = Number of times an OSPS call, either operator-assisted or automated, requested a 3-port conference circuit. Determination of whether a 3-port or 6-port conference circuit is needed on the call depends on the number of parties on the call and whether the call needs to be attached to an announcement service circuit.

d = Number of times an OSPS call, either operator-assisted or automated, requested a 6-port conference circuit. Determination of whether a 3-port or 6-port conference circuit is needed on the call depends on the number of parties on the call and whether the call needs to be attached to an announcement service circuit.

e = Number of times when a hardware failure (that is, a circuit was not usable) or communication failure prevented OSPS from getting a 3-port conference circuit. The events pegged for this count are different from those for 3-PORT CCOFL in Section 10: TRFC30 UCONF.

f = Number of times when a hardware failure (that is, a circuit was not usable) or communication failure prevented OSPS from getting a 6-port conference circuit. The events pegged for this count are different from those for 6-PORT CCOFL in Section 10: TRFC30 UCONF.

g = Number of REORDER signals sent by the centralized automatic message accounting (CAMA) offices in the last 24 hours.

h = Number of times when either of the following events occurred: (1) The OSPS switch is unable to interpret the automatic number identification failure / operator number identification (ANIF/ONI) tone received from the CAMA office on a transfer CAMA call. (2) The OSPS switch has timed out waiting for the ANIF/ONI tone from the CAMA office on a transfer CAMA call.

i = Number of times an operator released a transfer CAMA call from a position. This results in a POSITION DISCONNECT signals sent to the CAMA offices.

j = Number of times the OSPS switch received a transfer CAMA call.

k = Total number of transfer CAMA calls served without queuing for position in the last 24 hours.

l = Number of incoming transfer CAMA calls where the back party went on-hook before being connected to an operator.

m = Number of times the OSPS switch received a system CAMA ANIF/ONI call.

n = Total number of system CAMA-ONI calls served without queuing for position in the last 24 hours.

o = Number of incoming system CAMA calls where the back party went on-hook before being connected to an operator.

p = Number of automatic calling card service (ACCS) calls where the switch timed out after the bong tone waiting for the first calling card digit to be entered.

q = Number of initial ACCS calls where the back party went on-hook before entering the first calling card digit or while the call was being routed to an announcement service circuit for the playing of the bong tone and detection of calling card digits.

r = Number of potential ACCS calls that were routed to operators.

s = Number of ACCS sequence calls initiated, using a local exchange carrier (LEC) calling card, where the back party entered a # sign at the end of an ACCS call or during the ringing of the
forward party's phone.

t  = Number of ACCS sequence calls placed with a LEC calling card where the back party went on-hook during the keying of a new forward number, during routing to the forward party, or during ringing of the forward party's phone.

u  = Number of screened calls handled by operators. Equal to FAILURE + SUCCESS.

v  = Number of times an operator cancelled a call on which the back party was screened against one or more classes of charge.

w  = Number of times an operator floated or externally transferred a call on which the back party was screened against one or more classes of charge.

x  = Number of transfer CAMA, system CAMA, or ISP calls requiring ONI due to ANI failure.

y  = Number of transfer CAMA, system CAMA, or ISP calls sent to an operator because ONI was required and because the originating office was without ANI equipment or served multi-party lines.

z  = Number of transfer CAMA, system CAMA, or ISP calls that were sent to an operator because of ANI failure or because ONI was required. Equal to ANIFAIL + UNEQ.

a  = Number of times an attempt was made to send a voice quote message to an automatic charge quotation service (ACQS) establishment.

b  = Number of times the OSPS switch received a rating query reply indicating that a centralized charge quotation system (CCQS) query was successfully rated.

c  = Number of incoming ISP calls that arrived on ANI-searched screened trunks and there was no originating line screening restriction.

4. ACTION TO BE TAKEN

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value(s):
DATA IS VALID
DATA MAY BE INVALID

c = Number of attempts to send an autoquote message to an autoquote establishment.
d = Number of printed autoquote calls.

e = Number of times that an autoquote message was not sent to the autoquote establishment and a credit record was created for the following events:
- Automatic charge quotation service (ACQS) message buffer pointers were corrupted which resulted in credit records created for each queued autoquote.
- An autoquote message was queued for longer than the value in field "HOBIS/C TIME" of RC/V View 8.9.
- The ACQS message buffer was full (max 100) and a new message arrived replacing a queued autoquote message.
- Failures occurred during transmitting the message to the autoquote establishment and when trying to reroute the message to a Hotel Billing Information System (HOBIS) or hotel billing information center (HOBIC).

f = Number of autoquote messages successfully rerouted to a HOBIS or HOBIC.

g = Number of autoquote messages that failed because all autoquote digital subscriber lines (DSL) were busy or call processing could not dial up the autoquote establishment because of a lack of software process control blocks (PCB) or process stacks (PS).

h = Number of credited voice quote messages that were not sent to HOBIS or HOBIC because:
- The ACQS message buffer pointers were corrupted which resulted in credit records created for each queued voice quote message.
- A voice quote message was queued for longer than the value in field "HOBIS/C TIME" of RC/V View 8.9.
- The ACQS message buffer was full (max 100) and a new message arrived replacing a queued voice quote message.
- A failure occurred during transmitting the message to HOBIS or HOBIC.

i = Number of times an operator was successfully requested after a successful rating query at the end of an automated coin call and any of the following events occurred:
- An announcement circuit could not be attached to the call because of AM routing throttling.
- Routing to an announcement circuit failed.

Also includes the number of times any of the following events occurred which resulted in the coin call being routed to an operator:
- The call timed out (10 seconds) on an automated overtime charge-due seizure waiting for confirmation that an announcement circuit had been attached or a routing failure occurred when attempting to attach the announcement circuit and the back party had gone on-hook.
- The call timed out (10 seconds) on an automated end-of-call seizure waiting for confirmation that an announcement circuit had been attached or a routing failure occurred when attempting to attach the announcement circuit.
- An end-of-call seizure was routed to an operator.
- An announcement circuit failure or announcement failure occurred after the circuit was successfully attached on an overtime seizure where the back party had subsequently gone on-hook or on an end-of-call seizure.

j = Number of times any of the following events occurred on a 1+ prepay ACTS coin call during the
initial contact:
- Originating call treatment had timed out (10 seconds) waiting for an announcement process to be created.
- The announcement process failed to activate an announcement service circuit.
- Routing to an announcement circuit failed.
- The announcement process informed originating call treatment of a announcement circuit hardware failure.

\[ k = \text{Number of times any of the following events occurred at the end of the initial period of a coin-sent-paid call and a notification announcement was required:} \]
- A 3-port conference circuit could not be obtained (call proceeded into grace period).
- Call processing could not define a path to the announcement circuit (call was routed to an operator).
- Call processing failed to route to an announcement circuit (call was routed to an operator).
- Call processing was waiting for an announcement circuit to be connected and a software failure or timeout (10 seconds) indication was received (call was idled).

\[ l = \text{Number of times any of the following events occurred after successful rating queries on overtime seizures:} \]
- A 6-port conference circuit could not be obtained (call was consequently routed to an operator if a 3-port conference circuit could be obtained; if not, call proceeded to next overtime period); for pre-paid overtime for coin calls, the call is idled.
- Call processing could not define a path to the announcement circuit (call was consequently idled).
- Call processing failed to route to an announcement circuit (call was consequently routed to an operator).
- Call processing was waiting for an announcement circuit to be connected and software failure or timeout (10 seconds) indication was received (call was consequently routed to an operator).

\[ m = \text{Number of attempted automated end-of-call seizures regardless of whether an announcement circuit could be attached, a walkaway occurred, or the call was routed to an operator for large charge collection. Large charge means amount due is greater than 5 times LRG CHG THR in RC/V View 8.9.} \]

\[ n = \text{Number of times an overtime seizure occurred for which automation was attempted. This measurement is scored whether or not an announcement circuit was successfully attached.} \]

\[ o = \text{Number of deposits satisfied on fully automated charges-due seizures.} \]

\[ p = \text{Number of initial coin rating queries successfully sent to RTRS.} \]

\[ q = \text{Number of interim coin rating queries successfully sent to RTRS} \]

\[ r = \text{Number of end-of-call coin rating queries successfully sent to RTRS.} \]

\[ s = \text{Number of automated inward line screening (AILS) queries sent from the call serving OSPS to retrieve originating line screening (OLS) data.} \]

\[ t = \text{Number of AILS queries sent from the call serving OSPS to retrieve terminating code screening (TCS) data.} \]
4. **ACTION TO BE TAKEN**

None.

5. **ALARMS**

None.

### 2. REASON FOR OUTPUT

To print the most recent 24-hour plant report.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Status of data. Valid value(s):
  - DATA IS VALID
  - DATA MAY BE INVALID
- **c** = Identification number of the receiving Operator Services Position System (OSPS) office.
- **d** = Number of times a B-channel has been removed from service in the past 24 hours.
- **e** = Accumulated amount of time the B-channel links were down, in the form hours:minutes:seconds.
- **f** = Number of times a D-channel has been removed from service in the past 24 hours.
- **g** = Accumulated amount of time the D-channel links were down, in the form hours:minutes:seconds.

### 4. ACTION TO BE TAKEN

None.

If an OSPS ID is removed, then a manual request (demand report) will have invalid data.

### 5. ALARMS

None.

2. REASON FOR OUTPUT

To print the most recent 24-hour plant report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

Note: For the variables with '*' refer to the 4ACTION TO BE TAKEN section of this manual page.

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Status of data. Valid value($):
DATA IS VALID
DATA MAY BE INVALID
c = Number of LIDB calling card (CCD) queries attempted. Equal to LICCD SENT + NSENT.
d = *Number of LIDB calling card (CCD) queries sent from the OSPS into the common channel signaling (CCS) network. This count excludes test queries.
e = Number of LIDB CCD queries attempted but not sent (total of LICCD: HDW + OVRLD + NM + NO-ID + AMBLK).
f = *Number of LIDB CCD queries not sent because the common network interface (CNI) ring was not available. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.
g = *Number of CCD queries not sent because the switch had enforced query cutbacks according to automatic call gapping (ACG) controls received from the database. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.
h = *Number of CCD queries not sent because a cutback was in effect to accommodate a network management control measure. Network management cutbacks are implemented for a period of five seconds after a billed number screening (BNS) or calling card query reply indicates network congestion, network failure, subsystem congestion or subsystem failure. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.
i = *Number of CCD queries not sent to the database because a LIDB query ID was not available. The switch can handle 256 outstanding LIDB queries. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.
j = *Number of CCD queries not sent because of:
- Abnormal administrative module (AM) conditions.
- Abnormal communication link conditions between the switching module (SM) and AM.
- Switch data in the AM could not be read to determine the translation type parameter that is to be sent in the query to the signaling system 7 (SS7) network. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.
k = Number of LIDB billing number screening (BNS) queries attempted. Equal to LIBNS SENT + NSENT.
l = *Number of billed number screening (BNS) queries sent from the OSPS into the CCS network. This count excludes test queries.
m = Number of BNS queries attempted but not sent (total of LIBNS: HDW + OVRLD + NM + NO-ID + AMBLK).
n = *Number of BNS queries not sent because the CNI ring was not available. The operator on the call may allow or disallow the call.
o = *Number of BNS queries not sent because the switch had enforced query cutbacks according to ACG controls received from the database. The operator on the call may allow or disallow the call.
p = Number of BNS queries not sent because a cutback was in effect to accommodate a network management control measure. Network management cutbacks are implemented for a period of five seconds after a BNS or calling card query reply indicates network congestion, network failure, subsystem congestion, or subsystem failure. The operator on the call may allow or disallow the call.

q = Number of BNS queries not sent because a query ID was not available. The switch can handle 256 outstanding LIDB queries. The operator on the call may allow or disallow the call.

r = Number of BNS queries not sent because of:
- Abnormal administrative module (AM) conditions.
- Abnormal communication link conditions between the SM and AM.
- Switch data in the AM could not be read to determine the translation type parameter that was to be sent in the query to the signaling system 7 (SS7) network. The operator on the call may allow or disallow the call.

s = Number of abnormal LIDB CCD replies received. These are queries that do not make it to the destined database and are returned by the network. (total of LICCD: RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWFA + NWCONG).

t = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated "no translation for an address of such nature". This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

u = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated "no translation for this specific address". This resulted in calling card denial on the call.

v = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated "subsystem congestion". This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the subsystem congestion response.

w = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated "subsystem failure". This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the subsystem failure response.

x = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated "unequipped user". This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.

y = Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated "network failure". This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the network failure response.
$z$ = *Number of times the CCS network returned a service message in response to a LIDB CCD query and the response indicated network congestion. This resulted in calls’ receiving indeterminate CCD query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9. This also resulted in a five-second cutback of LIDB calling card queries that have a calling card number with the same NPA or RAO as the calling card number that resulted in the network congestion response.

$a_1$ = Number of abnormal LIDB BNS replies received. These are queries that do not make it to the destined database and are returned by the network. (total of LIBNS: RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWFA + NWCONG).

$b_1$ = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated no translation for an address of such nature. The operator on the call may allow or disallow the call.

$c_1$ = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated no translation for this specific address. This resulted in billing denial on the call.

$d_1$ = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated subsystem congestion. The operator on the call may allow or disallow the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the subsystem congestion response.

$e_1$ = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated subsystem failure. The operator on the call may allow or disallow the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the subsystem failure response.

$f_1$ = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated unequipped user. The operator on the call may allow or disallow the call.

$g_1$ = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated network failure. The operator on the call may allow or disallow the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the network failure response.

$h_1$ = *Number of times the CCS network returned a service message in response to a LIDB BNS query and the response indicated network congestion. The operator on the call may allow or disallow the call. This also resulted in a five-second cutback of LIDB BNS queries that have a billing number with the same NPA or RAO as the billing number that resulted in the network congestion response.

$i_1$ = Number of LIDB CCD replies received. Total of LICCD: UNEXP + INVFRMT + VLDFRMT. VLDFRMT is printed in section 109: TRFC30 OATQ.

$j_1$ = *Number of times an unexpected or duplicate LIDB CCD query reply was received from the database. Replies for which the switch had timed out while waiting for them are also included.

$k_1$ = *Number of LIDB CCD replies received in an invalid format where the reply was garbled in some manner or data fields did not conform to correct message syntax. Valid value(s):

- The value in the translation ID field was invalid.
- The component sequence ID field was invalid.
- The component type ID field was invalid.
- The length of the entire query response was longer than expected.
- The length of the transaction capability application part (TCAP) message was longer than expected.
- The package type identifier field was invalid.
- The message type field was invalid.
- The response was a service message from the SS7 network and the service message type was not recognized.

\[ l^1 \] = Number of times that the OSPS timed out waiting for a LIDB CCD reply to a query from the database (refer to the CC and BNS TIME parameter in RC/V View 8.9). The call receives indeterminate query treatment as specified by parameter QUERY REPLIES TIMEOUT in RC/V View 8.9. Valid value(s):
A) = If TIMEOUT indicates "allow" then the reply is treated as an allow.
D) = If TIMEOUT indicates "deny" then the reply is treated as a deny.
E) = If TIMEOUT indicates "existing treatment" then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V View 8.9.

\[ m^1 \] = Number of LIDB CCD test queries sent to the CCS network.

\[ n^1 \] = Number of LIDB BNS replies received. Total of LIBNS: UNEXP + INVFRMT + VLDFRMT. VLDFRMT is printed in section 109: TRFC30 OATQ.

\[ o^1 \] = *Number of times an unexpected or duplicate LIDB BNS query reply was received from the database. Replies for which the switch had timed out while waiting for them are also included.

\[ p^1 \] = *Number of LIDB BNS replies received in an invalid format where the reply was garbled in some manner or data fields did not conform to correct message syntax. Valid value(s):
- The value in the translation ID field was invalid.
- The component sequence ID field was invalid.
- The component type ID field was invalid.
- The length of the entire query response was longer than expected.
- The length of the TCAP message was longer than expected.
- The package type identifier field was invalid.
- The message type field was invalid.
- The response is a service message from the SS7 network and the service message type was not recognized.

\[ q^1 \] = Number of times that the OSPS timed out waiting for a BNS reply to a query from the database (refer to the CC and BNS TIME parameter in RC/V View 8.9). The call receives indeterminate query treatment as specified by parameter QUERY REPLIES TIMEOUT in RC/V View 8.9:
A) = If TIMEOUT indicates allow, then the reply is treated as an allow.
D) = If TIMEOUT indicates deny, then the reply is treated as a deny.
E) = If TIMEOUT indicates existing treatment, then the type of indeterminate query treatment is specified by parameter CC BILL BLOCK in RC/V View 8.9.

\[ r^1 \] = Number of LIDB BNS test queries sent to the CCS network.

\[ s^1 \] = *Number of BNS or CCD query replies from the database that contained an ACG component. All queries for calls that matched the first six digits of the affected billing number were potentially cutback as specified by the ACG control parameters. This resulted in calls' receiving indeterminate query treatment. The type of indeterminate query treatment is specified by parameter BILL BLOCK in RC/V View 8.9.
\[ t^1 \] = Total number of telecommunications card/commercial credit card (89/CCC) queries attempted.
(Total of 89CCC: SENT + NSENT.)

\[ u^1 \] = Number of 89/CCC queries sent from the OSPS into the network connecting the OSPS to the database. This count excludes test queries.

\[ v^1 \] = Number of 89/CCC queries attempted but not sent. (Total of 89CCC: HDW + OVRLD + NM + NO-ID + AMBLK.)

\[ w^1 \] = Number of 89/CCC queries not sent because of the common network interface (CNI) ring was not available. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

\[ x^1 \] = Number of 89/CCC queries not sent because the switch had enforced query cutbacks according to automatic call gapping (ACG) controls received from the database. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

\[ y^1 \] = Number of 89/CCC queries not sent to the database because a cutback was in effect to accommodate a network management control measure. Network management cutbacks are implemented for a period of five seconds after a calling card query reply indicates network congestion, network failure, subsystem congestion or subsystem failure. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

\[ z^1 \] = Number of 89/CCC queries not sent to the database because a query ID was not available. The switch can handle 256 outstanding queries. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

\[ a^2 \] = Number of 89/CCC queries not sent to the database because:
- Abnormal administrative module (AM) conditions.
- Abnormal communication link conditions between the switching module (SM) and AM.
- Switch data in the AM could not be read to determine the translation type parameter that is to be sent in the query to the signaling system 7 (SS7) network. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

\[ b^2 \] = Number of 89/CCC test queries sent to the CCS network.

\[ c^2 \] = Number of abnormal 89/CCC replies received. These are queries that do not make it to the destined database and are returned by the network. (Total of 89CCC: RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWFA + NWCONG).

\[ d^2 \] = Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated no translation for an address of such nature. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

\[ e^2 \] = Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated no translation for this specific address. This resulted in calling card denial on the call.
\( f^2 \) = Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated subsystem congestion. This resulted in calls’ receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the subsystem congestion response.

\( g^2 \) = Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated subsystem failure. This resulted in calls’ receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the subsystem failure response.

\( h^2 \) = Number of times the CCS network returned a service message in response to a 89/CCC query and the response indicated unequipped user. This resulted in calls’ receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

\( i^2 \) = Number of times the CCS network returned a service message in response to an 89/CCC query and the response indicated network failure. This resulted in calls’ receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the network failure response.

\( j^2 \) = Number of times the CCS network returned a service message in response to a 89/CCC query and the response indicated network congestion. This resulted in calls’ receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56. This also resulted in a five-second cutback of calling card queries that have a calling card number with the same issuer as the calling card number that resulted in the network congestion response.

\( k^2 \) = Number of 89/CCC replies received of all types. Total of 89/CCC: UNEXP + INVFRMT + VLDFRMT.

\( l^2 \) = Number of times an unexpected or duplicate 89/CCC query reply was received from the database. Replies for which the switch had timed out while waiting for them are also included.

\( m^2 \) = Number of 89/CCC replies received in an invalid format where the reply was garbled in some manner or data fields did not conform to correct message syntax. Valid value(s):

- The value in the translation ID field was invalid.
- The component sequence ID field was invalid.
- The component type ID field was invalid.
- The length of the entire query response was longer than expected.
- The length of the transaction capability application part (TCAP) message was longer than expected.
- The package type identifier field was invalid.
- The message type field was invalid.
- The response was a service message from the SS7 network and the service message type was not recognized.

\( n^2 \) = Number of times that the OSPS timed out waiting for an 89/CCC reply to a query from the

Copyright ©2003 Lucent Technologies
database [refer to the QUERY TIMEOUT parameter in RC/V View 27.56. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.

$s^2 = \text{Number of 89/CCC query replies from the database that contained an ACG component. All queries for calls that matched the first six digits of the affected billing number were potentially cutback as specified by the ACG control parameters. This resulted in calls' receiving indeterminate query treatment. For 89/CCC, the type of indeterminate query treatment is specified by parameter INDETERMINATE in RC/V View 27.56.}$

$p^2 = \text{Number of 10+4 calling card validation replies with a 'PSDI=4' response from the validation database.}$

$q^2 = \text{Number of 89C/CCC card validation replies with a 'PSDI=4' response from the validation database.}$

4. ACTION TO BE TAKEN

The set of variables with "*" above represents the measurements collected in the direct link node (DLN). If the office is equipped with the DLN and the set of variables with "*" are zero, suggests that the DLN failed to report these variables and these variables are invalid for the reporting period.

None.

2. REASON FOR OUTPUT

To print the most recent 24-hour plant report.

3. VARIABLE FIELD DEFINITIONS

Note: For the variables with ** refer to the 4ACTION TO BE TAKEN section of this manual page.

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Status of data. Valid value(s):
   DATA IS VALID
   DATA MAY BE INVALID

c = Number of customer account service (CAS) queries in destination-routed common channel
   interoffice signaling 6 (DCIS6) format attempted. Equal to SENT + NSENT.
d = Number of calling card queries* in DCIS6 format sent to the CAS database. This excludes test
   queries.
e = Number of calling card queries in DCIS6 format that were attempted but not sent. Equal to HDW
   + OVRLD + NM + NO-ID + AMBLK.
f = Number of calling card queries* in DCIS6 format not sent to the CAS database because the
   common network interface (CNI) ring was not available. This resulted in the call's receiving
   indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View
   8.9.
g = Number of calling card queries* in DCIS6 format not sent to the CAS database because the switch had enforced query cutbacks according to call gapping controls received from the CAS database. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

h = Number of calling card queries* in DCIS6 format not sent to the CAS database because of network management cutbacks. Network management cutbacks are implemented for calling card queries for a period of 5 seconds after a calling card query reply indicates network congestion or network blockage. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

i = Number of calling card queries* in DCIS6 format not sent to the CAS database because a query ID was not available or was out of range due to an internal software error, where the range is 1-128. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

j = Number of calling card queries in DCIS6 format not sent to the CAS database because of abnormal administrative module (AM) conditions or abnormal communication link conditions between the switching module (SM) and AM. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

k = Number of abnormal calling card replies in DCIS6 format. Equal to NRTDG + CONGEST + BLKD + UNEQ.

l = Number of times an calling card query* failed to reach the CAS database because of no routing data in the network. A query reply from the common channel signaling (CCS) network indicated a failure reason of "no routing data". This resulted in call completion denial.

m = Number of times an calling card query* in DCIS6 format failed to reach the CAS database because of network congestion. A query reply from the CCS network indicated a failure reason of "network congestion." The result was cutback of subsequent calling card queries that had the same first three digits in the card account number as the account number that resulted in the network congestion reply. The cutbacks are in effect for a period of 5 seconds. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

n = Number of times an calling card query* in DCIS6 format failed to reach the CAS database because of network blockage. A query reply from the CCS network indicated a failure reason of "network blockage." The result was cutback of subsequent calling card queries that had the same first three digits in the card account number as the account number that resulted in the network blockage reply. The cutbacks are in effect for a period of 5 seconds. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.

o = Number of times an calling card query* in DCIS6 format failed to reach the CAS database because the function was not equipped in the network. A query reply from the CCS network indicated a failure reason of "unequipped destination." This occurred when a query was sent to a destination that could not process CAS queries. This resulted in call completion denial.

p = Number of calling card replies received in DCIS6 format. Equal to NPROC + UNEXP + INVFRMT + VFRMT.

q = Number of calling card query replies in DCIS6 format received from the CAS database indicating that the database was unable to process the query. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View
8.9.

\[ r = \text{Number of unexpected or duplicate calling card query replies* received from the CAS database.} \]

\[ s = \text{Number of calling card query replies* in DCIS6 format received from the CAS database containing an invalid response in the message type field or the reply code field. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.} \]

\[ t = \text{Number of calling card query replies with a valid DCIS6 format. Equal to ALCALL + INVDC + VPN + DOMRS + INTRS in section 110: TRFC30 OCAS.} \]

\[ u = \text{Number of times the OSPS switch timed out waiting for a reply to a calling card query in DCIS6 format from the CAS database. This resulted in the call's receiving indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.} \]

\[ v = \text{Number of calling card replies* in DCIS6 format (received from the CAS database) containing an overload indicator that required the switch to cutback queries to the database. This resulted in CAS query cutbacks according to the call gapping parameters received in the reply. The call was given indeterminate query treatment. The type of indeterminate query treatment is specified in RC/V View 8.9.} \]

\[ w = \text{Number of calling card test queries sent to the CCS network.} \]

4. **ACTION TO BE TAKEN**

None.

The set of variables with '*' represents the measurements collected in the direct link node (DLN). If the office is equipped with the DLN and the set of variables with '*' are zero, suggests that the DLN failed to report these variables and these variables are invalid for the reporting period.

2. REASON FOR OUTPUT

To print the most recent 24-hour plant report in response to either a manual or automatic request.

3. VARIABLE FIELD DEFINITIONS

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Status of data. Valid value(s):
  - DATA IS VALID
  - DATA MAY BE INVALID
- **c** = Number of intercept calls with a class of 0 or a class determination of “automatic number identification (ANI) blank or unassigned number”.
- **d** = Number of intercept calls with a class of 1 or a class determination of “ANI Trouble” denoting customer's line is having problems.
- **e** = Number of intercept calls with a class of 2 or a class determination of “ANI equipment failure to identify line number”.
- **f** = Number of intercept calls with a class of 3 or a class determination of “ANI regular”, a regular intercept call.
- **g** = Number of intercept calls with a class of 5 or a class determination of “concentrator spinoff”.
- **h** = Number of intercept calls with a class of 6 or a class determination of “operator number identification (ONI) regular”.
- **i** = Number of intercept calls with a class of 7 or a class determination of “ONI blank or unassigned number”.
- **j** = Number of intercept calls with a class of 8 or a class determination of “ONI trouble”.
- **k** = Number of intercept calls that could not find information in the external information system (EIS) data base. The EIS vendor supplies this information to the Operator Services Position System
(OSPS) switch. This count may not be supported by all vendors.

\( l \) = Number of intercept calls outpulsed for call completion. This count includes the total number of both automated and non-automated intercept call completions after the call has been successfully routed to the forward number and digits outpulsed.

\( m \) = Number of intercept calls receiving split referral treatment. It is pegged when an EIS message is received to:
- Route an intercept call to an automated split referral announcement,
- Bill for an operator-provided split referral announcement. The EIS vendor supplies this information to the OSPS switch. This count may not be supported by all vendors.

\( n \) = Number of operator-assisted intercept calls receiving a verbal quote. The "listing access key" must be depressed to indicate to the EIS that billing applies to the service before sending a valid billing message to OSPS. The EIS vendor supplies this information to the OSPS switch and may not be supported by all vendors.

\( o \) = Number of intercept calls successfully routed to an external intercept announcement.

\( p \) = Not used.

\( q \) = Number of intercept calls receiving toll fraud announcements. The EIS vendor supplies this information to the OSPS switch and may not be supported by all vendors.

VIRTUAL CARD
2. REASON FOR OUTPUT

To print the most recent 24-hour plant report section 23: Operator Services Position System (OSPS) customer account services (CAS) Common Channel Signaling System 7 (CCS7)/international credit card validation (ICCV) signaling measures, in response to either a manual or automatic request. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

Note: For the variables with '*' refer to the 4ACTION TO BE TAKEN section in this manual page.

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Status of data. Valid value(s):
  - DATA IS VALID
  - DATA MAY BE INVALID
- **c** = Number of CAS transaction capabilities application part (TCAP) database query attempts. Equal to (CAS7): SENT + NSENT.
- **d** = Number of queries* sent from the OSPS to a card database where the query conforms to CAS TCAP signaling protocol. This excludes test queries.
- **e** = Number of CAS TCAP queries not sent. Equal to (CAS7): IPRB + NO-ID + NMBLK + DBCBK.
- **f** = Number of CAS TCAP queries* not sent because of OSPS internal problems (the administrative module (AM) or direct link node (DLN) is in an abnormal state, the common network interface (CNI) is not operational, or data could not be read successfully). The call received indeterminate treatment.
- **g** = Number of CAS TCAP queries* not sent because a query ID was not available, or was out of range due to an internal software error, where the range is 0-255. The call received indeterminate treatment.
- **h** = Number of CAS TCAP queries* not sent because a cutback was in effect to accommodate a network management control measure - due to CCS7 network problems. The network management cutbacks are implemented for a period of 5 seconds after CAS CCS7 replies are received indicating network congestion, subsystem congestion, network failure, or subsystem failure. The call received indeterminate treatment.
- **i** = Number of CAS TCAP queries* not sent because the switch has enforced query cutbacks according to call gapping controls received from the CAS database. The call received indeterminate treatment.
- **j** = Number of ICCV International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) TCAP database query attempts. Equal to (ICCV): SENT + NSENT.
k = Number of queries* sent from the OSPS to a card database where the query conforms to ICCV ITU-TS TCAP signaling protocol. This excludes test queries.

l = Number of ICCV ITU-TS TCAP queries not sent. Equal to (ICCV): IPRB + NO-ID + NMBLK.

m = Number of ICCV ITU-TS TCAP queries* not sent because of OSPS internal problems (the AM or DLN is in an abnormal state, the CNI is not operational, data could not be read successfully). The call received indeterminate treatment.

n = Number of ICCV ITU-TS TCAP queries* not sent because a query ID was not available, or was out of range due to an internal software error, where the range is 0-255. The call received indeterminate treatment.

o = Number of ICCV ITU-TS TCAP queries* not sent because a cut back was in effect to accommodate a network management control measure - due to CCS7 network problems. The network management cut backs are implemented for a period of 5 seconds after CAS CCS7 replies are received indicating network congestion, subsystem congestion, network failure, or subsystem failure. The call received indeterminate treatment.

p = Number of CAS TCAP test queries that are sent by maintenance personnel (this does NOT include any replies to the test queries).

q = Number of ICCV ITU-TS TCAP test queries that are sent by maintenance personnel (this does NOT include any replies to the test queries).

r = Number of abnormal CAS TCAP replies received. Equal to (CAS7): RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWCONG + NWFA + UNQUAL.

s = Number of CAS TCAP unit data service messages* received with a diagnostic reason of "No translation data for an address of such nature". The call received indeterminate treatment.

t = Number of CAS TCAP unit data service messages* received with a diagnostic reason of "No translation data for this specific address". The call received denial treatment.

u = Number of CAS TCAP unit data service messages* received with a diagnostic reason of "Subsystem congestion". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

v = Number of CAS TCAP unit data service messages* received with a diagnostic reason of "Subsystem failure". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

w = Number of abnormal ICCV ITU-TS TCAP replies received. Equal to (ICCV): RTEFA + ADDFA + SYSCONG + SYSFA + UNEQ + NWCONG + NWFA + UNQUAL.

x = Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "No translation data for an address of such nature". The call received indeterminate treatment.

y = Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "No translation data for this specific address". The call received denial treatment.

z = Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "Subsystem congestion". All subsequent ICCV queries with the same routing destinations were cut
back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.

\[a^1 = \text{Number of ICCV ITU-TS TCAP unit data service messages* received with a diagnostic reason of "Subsystem failure". All subsequent ICCV queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.}\]

\[b^1 = \text{Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Unequipped user". The call received denial treatment.}\]

\[c^1 = \text{Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Network congestion". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.}\]

\[d^1 = \text{Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Network failure". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.}\]

\[e^1 = \text{Number of CAS TCAP unit data service messages* received with the diagnostic reason of "Unqualified". The call received indeterminate treatment.}\]

\[f^1 = \text{Number of ICCV ITU-TS TCAP unit data service messages* received with the diagnostic reason of "Unequipped user". The call received denial treatment.}\]

\[g^1 = \text{Number of ICCV ITU-TS TCAP unit data service messages* received with the diagnostic reason of "Network congestion". All subsequent ICCV queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.}\]

\[h^1 = \text{Number of ICCV ITU-TS TCAP unit data service messages* received with the diagnostic reason of "Network failure". All subsequent CAS CCS7 queries with the same routing destinations were cut back for a period of 5 seconds. This call and subsequent calls that were cut back received indeterminate treatment.}\]

\[i^1 = \text{Number of ICCV ITU-TS TCAP unit data service messages* received with the diagnostic reason of "Unqualified". The call received indeterminate treatment.}\]

\[j^1 = \text{Total number of CAS TCAP return error replies received. Equal to (CAS7): UXDT + NOPARM + UXPARM + MSQRY + TSKREF + VCODE + GATEWAY.}\]

\[k^1 = \text{Number of CAS TCAP return error replies received with an error code of "Unexpected Input Data Value", signifying that the query contained unexpected data. The call received indeterminate treatment.}\]

\[l^1 = \text{Number of CAS TCAP return error replies received with an error code of "Missing Parameter", signifying that a mandatory parameter was missing from the query. The call received indeterminate treatment.}\]

\[m^1 = \text{Number of CAS TCAP return error replies received with an error code of "Unexpected Parameter", signifying that an unrecognized parameter was contained in the query. The call received indeterminate treatment.}\]
\[ n^1 \] = Number of CAS TCAP return error replies received with an error code of "Misrouted Query", signifying that the database has determined that the card number contained in the query is not within the range expected. The call received indeterminate treatment.

\[ o^1 \] = Total number of ICCV ITU-TS TCAP return error replies received. Equal to (ICCV): UXDT + NOPARM + UXPARM + MSQRY + DBUNAV + MSGFMT.

\[ p^1 \] = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Unexpected Input Data Value", signifying that the query contained unexpected data. The call received indeterminate treatment.

\[ q^1 \] = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Missing Parameter", signifying that a mandatory parameter was missing from the query. The call received indeterminate treatment.

\[ r^1 \] = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Unexpected Parameter", signifying that an unrecognized parameter was contained in the query. The call received indeterminate treatment.

\[ s^1 \] = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Misrouted Query", signifying that the database has determined that the card number contained in the query is not within the range expected. The call received indeterminate treatment.

\[ t^1 \] = Number of CAS TCAP return error replies received with an error code of "Task Refused", signifying that the node could not handle the request at this time. The call received indeterminate treatment.

\[ u^1 \] = Number of CAS TCAP return error replies received with an error code of "Vacant Code", signifying that the database has determined that the card number contained in the query has not been assigned. The call is denied.

\[ v^1 \] = Number of CAS TCAP return error replies received with an error code of "Gateway Error", signifying that communication with a commercial credit card vendor was unsuccessful. The call received indeterminate treatment.

\[ w^1 \] = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Database Unavailable", signifying that the database could not handle the request at this time (not because the operation was incorrect). The call received indeterminate treatment.

\[ x^1 \] = Number of ICCV ITU-TS TCAP return error replies received with an error code of "Error in Message Format", signifying that the structure of the query is not what was expected. The call received indeterminate treatment.

\[ y^1 \] = Total valid CAS TCAP replies received, regardless of the calling card used. Refer to the OP:TRFC30-OCAS7 field "VALID REPLIES CAS TOTAL", for further description of this field.

\[ z^1 \] = Total valid ICCV ITU-TS TCAP replies received. Refer to the OP:TRFC30-OCAS7 field "VALID REPLIES ICCV TOTAL", for further description of this field.

\[ a^2 \] = Number of CAS TCAP "Reject" components* received in response to a card validation query. The call received indeterminate treatment.

\[ b^2 \] = Number of CAS TCAP U-abort or P-abort messages* received. The call received indeterminate treatment.
c² = Number of times the query timer expired before receipt of a CAS TCAP database reply. The call received indeterminate treatment.

d² = Number of CAS TCAP queries initiated, then abandoned. The condition occurs if the call is canceled or the class of charge is changed after a query has been sent but before a reply was received. When the reply was received, it was ignored.
