</tr>
<tr>
<td>ULARPLog</td>
<td>Log file associated with unit level automatic restart process messages.</td>
</tr>
</tbody>
</table>

For message classes (MSGCLLS) that normally LOG, the ECD destinations are listed only for the sake of completeness. If a message class is to be logged only, it will not be output to any device, but if the message class is
set off-normal so that it is to be both logged and printed, then output messages will be sent to the listed ECD destinations as well as to the requesting device.

UNIX® RTR message classes (Table 4) and common network interface (CNI) message classes (Table 5) do not log in the 5ESS® switch log file DAYLOG and their log and print status can not be changed. If logged, they appear only in the log file listed in the ECD destinations.

APP:NVMEM-REASON
Software Release: 5E18(1) and later
Message Class: N/A
Application: 5
Type: Output

1. PACKET SWITCHING UNIT (PSU) NON-VOLATILE MEMORY (NVMEM) RESPONSES APPENDIX

The following is a list of reason text phrases that are used in the non-volatile memory (NVMEM) output messages for the PSU.

NVMEM modification can be initiated during a conditional restore, unconditional restore or diagnostics of the PSU common controller (PSUCOM). It can also be initiated as part of a program update request.

The response is information about why an action was performed or was denied. This information is especially helpful in understanding why a requested action could not complete as requested.

If the version identifier associated with a specific image is zero, this implies that either the PSUCOM query was unsuccessful or the image is invalid. If the image version associated with the factory image is offnormal, an NVMEM update will not be attempted.

Table 1  NVMEM Report Reasons

<table>
<thead>
<tr>
<th>Reason:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA MAY BE INVALID UNIT NOT IN SERVICE</td>
<td>If NVMEM modification or query request is done while PSUCOM is not in service or in a degraded state, the image version data may be invalid. The version identifier associated with the specific image will be the last booted version since the PSUCOM was not reset.</td>
</tr>
<tr>
<td>NO UNITS EQUIPPED</td>
<td>Denied request to obtain image version data while no PSUCOM units are equipped.</td>
</tr>
<tr>
<td>NVMEM FACTORY OFFNORM</td>
<td>An off normal condition was detected indicating that the version identifier associated with the factory image is greater that version identifier associated with the SM ODR. Office personnel can either replace the circuit pack or upgrade the SMP ODR.</td>
</tr>
<tr>
<td>NVMEM FAILED TO ESTAB COMM AFTER MOD</td>
<td>NVMEM failure occurred while trying to establish communication with PSUCOM after modification has completed.</td>
</tr>
<tr>
<td>NVMEM FAILED TO ESTABLISH COMMUNICATION</td>
<td>SM received an error while attempting to reset the PSUCOM. NVMEM modification will be terminated.</td>
</tr>
<tr>
<td>NVMEM FAILED TO QUERY PSUCOM</td>
<td>SM received an error while trying to query the PSUCOM.</td>
</tr>
<tr>
<td>NVMEM FAILED TO QUERY PSUCOM AFTER MOD</td>
<td>NVMEM failure occurred while trying to query PSUCOM after modification has completed.</td>
</tr>
<tr>
<td>NVMEM MOD COMPLETED</td>
<td>The PSUCOM non-volatile memory has been modified successfully so that the version identifiers for the hardware and firmware images associated with the control fanout (CF) and the packet fanout (PF) circuit boards, match the version identifiers of the optional data region (ODR) which resides on the Switching module (SM). The ODR refers to a dedicated section of memory, resident on the SM, containing some pre-defined subset of the SM's static office dependent data (ODD).</td>
</tr>
<tr>
<td>NVMEM MOD COMPLETED WITH ERRORS</td>
<td>Modification of NVMEM completed but some errors have been encountered. If this request was part of an unconditional restore, diagnose the PSUCOM to obtain more detailed information about the failures. If this request was part of a conditional restore of the PSUCOM, see results of the diagnostics on the ROP.</td>
</tr>
<tr>
<td>NVMEM MOD FAILED</td>
<td>NVMEM modification received a failure. Modification will be denied.</td>
</tr>
<tr>
<td>NVMEM MOD REQ IN PROGRESS</td>
<td>NVMEM modification is in progress.</td>
</tr>
<tr>
<td>NVMEM MOD REQ STOPPED</td>
<td>Received stop request from system process. NVMEM modification will be stopped.</td>
</tr>
<tr>
<td>NVMEM MOD TIMEOUT</td>
<td>NVMEM modification received a timeout while waiting to receive a response from the PSUCOM.</td>
</tr>
<tr>
<td>NVMEM OFFNORM</td>
<td>An off normal condition was detected indicating at least one NVMEM image resident in the PSUCOM hardware is not consistent with the associated image in the SMP. An inconsistency is declared when the version identifier associated with the last booted image</td>
</tr>
</tbody>
</table>
of CF/PF circuit board is not equal to the version identifier associated with the SM ODR. An inconsistency may also occur if the version identifier associated with the factory image is greater than the version identifier associated with the SM ODR. If this is the case, the circuit board will need to be replaced.

<table>
<thead>
<tr>
<th>NVMEM OFFNORM MOD REQ STARTED</th>
<th>Off normal conditions were detected. Modification of NVMEM has started.</th>
</tr>
</thead>
<tbody>
<tr>
<td>NVMEM PREVIOUS REQ IN PROGRESS</td>
<td>Received request to modify NVMEM while previous request is in progress. New request will be blocked.</td>
</tr>
<tr>
<td>NVMEM PSUCOM COMMUNICATION FAILURE</td>
<td>SM received an error while attempting to communicate with the PSUCOM. NVMEM modification terminated without completion.</td>
</tr>
<tr>
<td>NVMEM SUPPLEMENTARY DATA INFO</td>
<td>NVMEM modification supplementary data will follow. This data provides further information regarding failures received by the NVMEM modification sequence.</td>
</tr>
<tr>
<td>PSUCOM IS NOT IN SERVICE</td>
<td>Denied request to obtain image version data while PSUCOM side is not in service.</td>
</tr>
<tr>
<td>REQUEST NOT SUPPORTED FOR THIS UNIT</td>
<td>Denied request to obtain image version data while PSUCOM unit type is unexpected.</td>
</tr>
</tbody>
</table>

The following are the reasons supplementing the NVMEM response:

### Table 2 Supplementary Data Reasons

<table>
<thead>
<tr>
<th>Reason:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>FAILED TO ESTABLISH COMMUN.</td>
<td>SM failed to establish packet bus communication with PSUCOM.</td>
</tr>

<td>SM failed to send query message to PSUCOM.</td>
</tr>
<tr>
<td>TIME OUT</td>
<td>Received a timeout message.</td>
</tr>
</tbody>
</table>

† The first data shown is a 4-digit hexadecimal number representing a bitmap identifying the PF/CF circuit pack(s) and/or the associated images. Valid value(s):

| Bit 13 | CF hardware (HW). |
| Bit 12 | PF4 HW. |
| Bit 11 | PF3 HW. |
| Bit 10 | PF2 HW. |
| Bit 9 | PF1 HW. |
| Bit 8 | PF0 HW. |
| Bit 5 | CF firmware (FW). |
| Bit 4 | PF4 FW. |
| Bit 3 | PF3 FW. |
| Bit 2 | PF2 FW. |
| Bit 1 | PF1 FW. |
| Bit 0 | PF0 FW. |

If more hexadecimal dumps are displayed please see the next level of technical support for clarification.
1. OUTPUT MESSAGE DATABASE (OMDB) CROSS REFERENCE APPENDIX

The output message database (OMDB) cross reference contains information concerning every message contained in the OMDB. The information includes its key, message class, alarm level, message text, variable offsets, sizes and translation types.

The following is an example of a cross reference entry and an explanation of the fields.

KEY = 5  MSGCLS = 1  ALARM = MAN  %1 OMDB COMPLETED

The example contains a database entry for key number 5, which has a message class of 1 (MAINT) and an alarm level of MAN (manual). The message has a variable field indicated by the %. In this particular case the variable field is telling you which enum the OMDB completed.

Exhibit 1

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>The key (index) into the OMDB. The key(s) for each message in the database can be found on the Output Message manual pages.</td>
</tr>
<tr>
<td>MSGCLS</td>
<td>The numeric message class for this message (0-255). For a complete list of message classes, refer to the APP:MSG-CLS output message appendix.</td>
</tr>
<tr>
<td>Alarm</td>
<td>The alarm level defined for this message. It will be one of the following: CRIT, MAJ, MIN, MAN, ACT, INFO, VAR.</td>
</tr>
<tr>
<td>Message</td>
<td>Reason the OMDB was output. The percent sign (%) in this field indicates variable information. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
</tbody>
</table>

APP:POINT-CODE

Software Release: 5E14 and later
Message Class: NA
Application: 5
Type: Output

1. APPENDIX

Adjacent Point Code (displayed as APC in output messages), Destination Point Code (displayed as DPC) and Origination Point Code (displayed as OPC) appear in outputs as 9-digit numbers of the form:

**aaabbcdddd** (or **aaa-bbc-ddd**)

These parameters can be parsed into four possible formats, as follow:

**Format 1: ANSI® format**

<table>
<thead>
<tr>
<th>aaaa</th>
<th>network (001-235, 237-253, 255)</th>
</tr>
</thead>
<tbody>
<tr>
<td>bbcc</td>
<td>cluster (000-255)</td>
</tr>
<tr>
<td>dddd</td>
<td>cluster member (000-255);</td>
</tr>
</tbody>
</table>

**Format 2: AT&T format**

<table>
<thead>
<tr>
<th>aaaa</th>
<th>network (254)</th>
</tr>
</thead>
<tbody>
<tr>
<td>bb</td>
<td>cluster region (00-31)</td>
</tr>
<tr>
<td>c</td>
<td>cluster type (0-7)</td>
</tr>
<tr>
<td>dddd</td>
<td>cluster member (000-255);</td>
</tr>
</tbody>
</table>

**Format 3: UNITEL format**

<table>
<thead>
<tr>
<th>aaaa</th>
<th>network (236)</th>
</tr>
</thead>
<tbody>
<tr>
<td>bb</td>
<td>cluster region (00-31)</td>
</tr>
<tr>
<td>c</td>
<td>cluster type (0-7)</td>
</tr>
<tr>
<td>dddd</td>
<td>cluster member (000-255);</td>
</tr>
</tbody>
</table>

The last format is used for CNI Inter-Module Trunks (IMTs), and only applies to DPCs. Specifically this format is:

**Format 4: IMT format**

<table>
<thead>
<tr>
<th>aaaa</th>
<th>network (000)</th>
</tr>
</thead>
<tbody>
<tr>
<td>bbcc</td>
<td>near SM number (1-192)</td>
</tr>
<tr>
<td>dddd</td>
<td>far SM number (1-192)</td>
</tr>
</tbody>
</table>
Format 5: near single SM IMT format

aaa network (000)
bbc 255
ddd far SM number (1-192)

Format 6: far single SM IMT format

aaa network (000)
bbc near SM number (1-192)
ddd 255

An OPC is displayed based upon the value of its network.

DPCs are displayed based upon their own network and the network of their corresponding OPCs, as delineated in the table below:

<table>
<thead>
<tr>
<th>DPC network</th>
<th>OPC uses ANSI® format</th>
<th>OPC uses ATT format</th>
<th>OPC uses UNITEL format</th>
</tr>
</thead>
<tbody>
<tr>
<td>network = 001-235, 237-253, 255</td>
<td>network = 254</td>
<td>network = 236</td>
<td></td>
</tr>
<tr>
<td>network=001-235, 237-253, 255</td>
<td>use ANSI® format</td>
<td>use ANSI® format</td>
<td>use ANSI® format</td>
</tr>
<tr>
<td>network=254</td>
<td>use ANSI® format</td>
<td>use ATT format</td>
<td>use ANSI® format</td>
</tr>
<tr>
<td>network=236</td>
<td>use ANSI® format</td>
<td>use ANSI® format</td>
<td>use UNITEL format</td>
</tr>
<tr>
<td>network=0</td>
<td>use IMT format or</td>
<td>use IMT format or</td>
<td>use IMT format or</td>
</tr>
<tr>
<td>network=0</td>
<td>near single SM IMT format or</td>
<td>near single SM IMT format or</td>
<td>near single SM IMT format or</td>
</tr>
<tr>
<td>network=0</td>
<td>far single SM IMT format</td>
<td>far single SM IMT format</td>
<td>far single SM IMT format</td>
</tr>
</tbody>
</table>
APP:PORT-STATUS
Software Release: 5E14 and later
Message Class: N/A
Application: 5
Type: Output

1. PORT STATUS APPENDIX

1.1 INTRODUCTION

This appendix provides additional information about the statuses that are assigned to ports throughout the switch. The term "status" refers to the logical state of a trunk or line. This logical status is in addition to any hardware status that may be maintained for a trunk circuit, digital facility interface (DFI), line unit (LU) grid or integrated services line unit (ISLU) line card (LC).

1.2 PORT STATUS DESCRIPTION

The status of any port, trunk, or line is made up of five (5) fields:
Basic state (STATE) = Whether the port is in-service (IS) or out-of-service (OOS).
Qualifier (QALFR) = Major reason for the port status.
Operational (RSTN) restriction = What restrictions have been placed on the port.
Supplementary (INFO) Information = Additional information to help clarify the reason or condition.
Mode (MODE) = How the status was applied.

All five of the listed fields together make up a unique status that describes why the port is in-service (IS) or out-of-service (OOS). Since all five fields are required, a null or blank field is significant.

In the switch, a port has a primary status and up to three pending statuses that are all applicable to the port at the same time. Statuses that can be applied to a port simultaneously are said to be able to co-exist. This co-existence, however, requires rules that govern what statuses can co-exist and what priority each status has. This is referred to as the co-existence hierarchy. In addition to co-existence, there are overwrite rules. The overwrite rules govern the condition by which a new status can replace an existing primary status.

A general case is IS versus OOS. If a port is IS and an OOS status is applied to that port, then the OOS status replaces the IS status. However, if an OOS status is removed, primary or pending, then the port will not be placed IS until all co-existing OOS statuses are removed. Another case concerns the statuses that are applied due to recent change activity. Here, the OOS statuses of circuit administration (CADN) and pre-post service (PPSRV) overwrite all other statuses. When this happens, any pending statuses are also removed. Since the overwrite and co-existence hierarchies are different for different ports (lines, DSLs, incoming trunks, outgoing trunks, and so forth).

1.3 OBTAINING THE PORT STATUS OF A PORT

The port status is controlled automatically by the switch or manually through input messages. A report of the status of a trunk or line can be obtained through input message requests, but there is no automatic mechanism for periodically reporting the status of trunks and/or lines. To obtain the status of a single trunk or line use the input message:

OP:STATUS

To obtain the status of all the out-of-service trunks or lines in the office, use the listed formats of the OP:LIST input message:
The status of an entire trunk group, both in-service and out-of-service, can be obtained by entering:

\[ \text{OP:LIST,TG=x} \]

where 'x' is the trunk group number.

### 1.4 Changing the Port Status of a Port

To change the logical status of a port for a trunk or line use the listed input messages:

- RMV:DATALINK
- RST:DATALINK
- RMV:TRK
- RST:TRK
- RMV:LINE
- RST:LINE
- RMV:OSPSPORT
- RST:OSPSPORT

For more information about the listed input requests, refer to the description of these messages in this manual. For each input request, there is a corresponding output message.

### 1.5 Contents of Appendix

The EXPANDED DESCRIPTIONS section contains additional information about various port status groups listed in this appendix.

The remainder of this appendix contains these set of tables:

<table>

### 1.6 Expanded Descriptions

#### 1.6.1 CADN

The circuit administration (CADN) port statuses have been provided to allow trunks to be placed in a state that will prevent the switch from selecting them for call processing and in a state that will prevent their being placed on the IS list if a full initialization occurs. A trunk can be given a CADN status when it is grown in or updated with recent change (RC/V). This status is applied so that the trunk can be tested before being placed IS. The CADN statuses can also be applied manually to trunks if the need arises. The two available CADN statuses are OOS CADN DSBLD and OOS CADN LKDO. The OOS CADN LKDO status is only valid for two-way trunks. The descriptions for these statuses can be found in Exhibit 3 of this appendix.

The OOS CADN DSBLD status can also be seen on lines, but no recovery action is required. In certain cases, the
switch will apply the CADN status to lines for circuit administration purposes but will automatically remove the status within a short period of time.

To prevent the CADN statuses from accidentally being removed from a port, certain port status transition rules apply to CADN trunks. Below is a diagram which shows the port status transitions that are allowed when adding and deleting the CADN statuses. Valid Port Status Transitions for CADN Trunks

When the RMV:TRK or RST:TRK input messages are used to change a port status to or from a CADN state, the full port status should be included in the message, otherwise the request could fail. For example, to remove a trunk to the OOS CADN DSBLD state, the port status must be specified in the input message:

```
RMV:TRK,TKGMN=g-m,OOS,CADN,DSBLD;
```

- **g** = Trunk group number.
- **m** = Trunk member number.

All CADN transitions on trunks are logged as customer originated recent changes (CORCs). As a result, the ODD does not have to be backed up after manually adding or deleting a CADN status to or from a trunk to ensure that the trunk’s status is preserved through a full initialization. However, because the CADN transitions are logged as CORCs, there are several situations during which any transition to or from an OOS CADN status could fail.
- CORCs manually inhibited.
- ODD backup in progress.
- Trunk’s static data being updated with ODBE or Recent Change.

For CCS7 trunks, no blocking messages are sent when an OOS CADN status is applied. Therefore, any type of manual OOS CADN transition on a CCS7 trunk should be negotiated with the far-end office.

### 1.6.2 ANSI®

The ANSI® standard U-interface can provide additional information about the status of the U-interface, T-interface, and basic rate interface transmission extension (BRITE) links. In addition, the ANSI® network termination (NT1) is capable of reporting its power and maintenance status to the switch. As a result, the switch software is able to provide more information in the port status. The port statuses added for the ANSI® standard U-interface and NT1:

</tbody>
</table>

* Refers to the BRITE link position from 1 to 6 that can’t be accessed. Link 1 is between channel unit 1 and channel unit (CU) 2, link 2 is between CU 2 and CU 3, and so forth.

** Indicates the port status is also applied to the alternate mark inversion (AMI) U-interface.

*** The ANSI® NT1 or ANSI® BRITE channel unit is in test mode.

These IS and OOS BLKD port statuses are not allowed to co-exist, but the OOS BLKD statuses are allowed to overwrite each other.
## 1.7 Exhibit 1 -- List of Possible Port Status Values

<tr>
<td></td>
<td>FRC</td>
<td>-</td>
<td>TEST</td>
</tr>
</tbody>
</table>

**IS FRCD - AML AUTO** Indicates that a trunk has exceeded the automatic maintenance limit of a trunk group.

**IS FRCD - AUDIT AUTO** The port has been placed back in-service by the unloader (UNLD) system process because some recovery action, audit or single process purge, detected a problem, and recovered the port by placing the port on the to-be-idled (TBI) list so that it could be recovered.

**IS FRCD - FORPOT AUTO** Was forced in-service even though there was a foreign potential encountered.

**IS FRCD - L2QLTY AUTO** This status indicates that the packet pipe, X.75 or X.75' packet switching trunk is experiencing layer 2 protocol errors. The switch will not select the trunk for new outgoing calls but will allow the trunk to handle incoming calls. If this status is applied to a packet trunk that has a call up, the call will not be torn down. The switch will automatically restore all ports with this status at midnight. However, if the layer 2 errors continue, the port will return to this in-service state. If this status persists on a X.75 or X.75' port, try isolating the location of the problem by executing sectionalized digital loopback tests on the trunk with the TST:TRK input message or the trunk and line work station (TLWS).

**IS FRCD - MPP AUTO** Indicates that the analog line of the modem pool member identified has failed a user-initiated modem pool test. The FRCD condition can be removed by removing the line from service and then restoring it.

**IS FRCD - TEST AUTO** The port, usually a modem pool analog line, has been forced in-service while it is being tested. When testing is completed the port status will be restored to what it was before testing. If it fails to return to the previous status, the port is already in-service. To change or remove the TEST supplementary field, remove and restore the port indicated.

**IS TEST AUTO/MAN** ANSI® standard digital subscriber line (DSL): For an ANSI® DSL, this port status means the DSL has layer 1 protocol established and either the network termination (NT1) or a basic rate interface transmission extension channel unit (BRITE CU) is being tested by a source other than the switch.

Primary rate interface (PRI) trunk: For a PRI trunk, this status indicates that the trunk has been seized by the trunk and line work station (TLWS) or is in the process of being tested using the TST:TRK input message. While in this state, the trunk is not available for call processing.

Packet switching trunk: For a packet switching trunk, this port status means that a loopback test is in progress.
progress on the port.

External information system (EIS) datalinks: For EIS
datalinks, this port status indicates that the link has
been put into test mode by the EIS, and only test calls
will be routed to the link.

For lines, trunks, and datalinks, the TEST value in the
supplementary information field of the port status will
be removed from the port when the test is done. To
manually clear this port status, try to remove and then
restore the port with the RMV:LINE and RST:LINE input
messages (or RMV:TRK, RST:TRK, RMV:DATALINK,
or RST:DATALINK as appropriate). If the port remains
in this TEST state, it probably means a test is still being
executed on the NT1, BRITE CU, trunk, or datalink.

| IS | NM | - | MAN | The port is in-service due to network management
controls. |
| IS | STBY | - | - | AUTO/MAN | This status indicates that the port is the standby D-channel
of a standard primary rate interface (PRI) with D-channel
backup (DCBU). The standby D-channel acts as a backup
D-channel in case the active D-channel for the PRI goes
out-of-service. If the active D-channel goes out-of-service,
the switch will automatically attempt to switch over to the
IS STBY D-channel. All layer 3 messages received on a
D-channel in this state will be ignored except for Q.931
SERVICE and SETUP messages. If either of these
messages are received, the switch will attempt to send a
SERVICE message on the active D-channel to verify
D-channel synchronization. |
| IS | WAIT | - | - | AUTO/MAN | This status indicates that the D-channel backup (DCBU)
primary rate interface (PRI) D-channel is waiting for a
Q.931 SERVICE or SERVICE_ACK message from the far
end so that the D-channel can be placed IS - -
AUTO/MAN. This status is applied to DCBU PRI
D-channels during PRI initializations and D-channel
switch-overs. This is a transitional status that will only be
applied to the D-channel trunk for a maximum duration of
T321 seconds. If a SERVICE or SERVICE_ACK message
is received within T321 seconds the D-channel will be
transitioned to the IS - - AUTO/MAN state. While in
this in-service state, the D-channel is not considered
active and can not be used to set up calls on the
B-channels of the PRI. |

detected problem or a single process purge. The port is currently on the to-be-idled (TBI) list.

Outgoing or two-way trunk: For an outgoing or two-way trunk, this status indicates that an off-hook is being received from the distant office.
Digital link trunk (DLT): For a DLT, this status indicates that it is unable to carry traffic.
Common channel signaling (CCS) trunk: For a CCS trunk, this status indicates that the trunk has been remotely blocked by the far-end office. As of software release 5e11(1) note, this status may be added to CCS trunks while active on a call.
Digital subscriber line (DSL): For a DSL, it indicates that the customer premises equipment (CPE) is powered off, or the switch is waiting for a message or signal from the CPE to re-establish communication. When such communication is received, an attempt will be made to place the port in-service automatically. This status indicates the DSL is out-of-service because layer 1 is down for some unknown reason. To clear this status from a port, first try restoring the line to service with the RST:LINE input message. If the port status changes to another out-of-service or in-service status, refer to the description of that status in this appendix for additional information. However, if the port status remains OOS BLKD - - AUTO, run a digital sectionalization test on the DSL with the TST:DSL input message. If the loopback tests pass, try diagnosing the line card with the DGN:ISLULC input message. Specify the NT1 demand phase option in the diagnostic test.

The port has been put into the blocked state manually. (Refer to OOS BLKD AUTO.) (This state is not valid for CCS trunks.)

The primary rate interface (PRI) D-channel trunk or packet switching trunk had a link level failure due to the receipt of a layer 2 DISC frame from the far-end, or the switch sent out a SABME and got a DISC in response. This status may indicate that the far-end trunk has been removed from service manually, or the far-end trunk may have been taken out-of-service automatically by the far-end switch. This status generally indicates that the far-end requested that layer 2 be taken down.

This status indicates that layer 1 is down because a "dying gasp" message may have been received by the switch from the network termination (NT1). Typically, the "dying gasp" message is sent to the switch from the NT1 when the NT1 loses power. However, this message can also be generated if there is a problem with the U-interface or NT1. As a result, the digital subscriber line (DSL) will be under study by the switch until the automatic or manual mismatch test runs to verify whether or not it was a true loss of power by the NT1. When the mismatch test runs on the port, the port status will be changed to indicate the problem that caused this "dying gasp" message. To have the port status updated...
immediately, execute a manual mismatch test with the TST:DSL input message. Otherwise, if the automatic mismatch test has been enabled for the switching module (SM) that this port is on (using the ALW:MISMATCH input message), then the port status will be updated automatically within a 1 hour period.

**NOTE:** This port status indicates the state of the DSL at the time this condition was detected. It is possible that the condition of the DSL may change such that no indication is received by the switch to cause the port status to be updated.

**NOTE:** The NT1 automatic mismatch test does not apply for integrated digital carrier unit (IDCU) DSLs. If this port status is experienced on an IDCU DSL, manually remove the port (RMV:LINE).

<table>
<thead>
<tr>
<th>Condition</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OOS BLKD</td>
<td>ENDPOINT AUTO</td>
<td>The endpoint hardware supporting the virtual line or trunk is detected to be down.</td>
</tr>
<tr>
<td>OOS BLKD</td>
<td>IDLE AUTO</td>
<td>Packet switching link access level protocol did not receive any flags (bit pattern consisting of 01111110) in the incoming bit stream. This state corresponds to the expiration of the T3 timer in level 2 protocol. When this occurs on a packet pipe trunk it means that the channel group PPCG on the PH4 has lost communication to the far end (CDMA cell site).</td>
</tr>
<tr>
<td>OOS BLKD</td>
<td>INIT AUTO</td>
<td>This status indicates that the switch is attempting to bring up layer 2 on the port. This is a transitional status that is used when a D-channel of a primary rate interface (PRI) with D-channel backup (DCBU) is restored manually with the RST:TRK input message. No action is needed unless the port remains in this state for more than a minute. If a port appears to be stuck in this state, attempt to restore the port by using the ALL option in the RST:TRK input message.</td>
</tr>
<tr>
<td>OOS BLKD</td>
<td>LINK[1-6] AUTO</td>
<td>The digital subscriber line (DSL) is out-of-service because the indicated basic rate interface transmission extension (BRITE) link has lost layer 1 communication. LINKx defines the link that is out-of-service, which is the link between channel unit (CU) x and CU (x+1). If the link number is an even number, this status could be the result of a power loss at the network termination (NT1), or the NT1 may have been disconnected. The U-interface is up between the line card and the first BRITE CU. To clear this status from a port, try restoring the line to service with the RST:LINE input message. If the line remains in this state, try to isolate the location of the problem by executing a digital sectionalization test on the line with the TST:DSL input message. If the test fails and implicates a problem with the same link shown in the port status, try examining the physical connection indicated by the link number. Also, there may be a problem with the BRITE CU(s) connected to the indicated link.</td>
</tr>
<tr>
<td>OOS BLKD</td>
<td>MSMTCH AUTO</td>
<td>The digital subscriber line (DSL) is out-of-service (OOS) because of a mismatch between the line card type (ANSI®/AMI) and either the first BRITE CU type or the NT1...</td>
</tr>
</tbody>
</table>
type. For all mismatch conditions, layer 1 is down at the U-interface.

All possible mismatch conditions are shown:
*ODD line|line card|First BRITE CU card type|type | or NT1 type
---------------------------------
AMI | AMI | ANSI
AMI | ANSI | AMI
AMI | ANSI | ANSI
ANSI | ANSI | AMI
ANSI | AMI | ANSI
ANSI | AMI | AMI

Note: The mismatch test assumes the line card type stored in the switching module’s (SM’s) office-dependent data (ODD) is correct for the U-card under test.

To clear this OOS status, a metallic loop test can first be performed on the DSL with the trunk and line work station (TLWS) to confirm that the status is due to an NT1 or BRITE CU mismatch and not a metallic loop fault. Next, the manual mismatch test (using the TST:DSL input message) can be used to determine if it is an NT1, BRITE CU, or line card mismatch. The incorrect NT1, BRITE CU, or line card must then be replaced with the correct type in order for this port to be placed in-service.

Note: This port status indicates the state of the DSL at the time this condition was detected. It is possible that the condition of the DSL may change such that no indication is received by the switch to cause the port status to be updated.

Note: This port status does not apply for integrated digital carrier unit (IDCU) DSLs because of the inability to run the NT1 automatic mismatch test.

OOS BLKD - RTIDCU AUTO
This port status only applies to lines and trunks which reside on an IDCU TR303 RT. It indicates that the primary service state maintained in the RT for this line or trunk is out-of-service. This port status will be cleared automatically once the primary service state is restored to in-service.

OOS BLKD - NO_RESP AUTO
The primary rate interface (PRI) D-channel trunk or packet switching trunk had a link level failure. The switch attempted to set up level 2 communication with the far-end, but the far-end did not respond to the link set up requests. This status may indicate that the far-end trunk has been removed from service manually, or the far-end trunk may have been taken out-of-service automatically by the far-end switch.

If this is an IP, X.75, or X.75’ trunk group that connects two switches, check to see LAPB ADDR is set to N on one end of the trunk and Y on the other end for each
member (RC\V 5.5). If both ends are set to the same value, this will be the status of the respective trunk group member.

If this trunk group is connecting a switch and a PPSN (Number 1 Packet Switching System (1PSS), Tymnet, and so forth), each trunk member on the switch side must have the opposite setting as to what the trunk member terminating at the PPSN side has.

<td>BLKD</td>
<td>NTPWR</td>
<td>AUTO</td>
</tr>
</tbody>
</table>

- **OOS BLKD - NR AUTO**: The digital subscriber line (DSL) is out-of-service because layer 1 is down at the T-interface. The reason the port status was marked no response (NR) rather than T-interface (TINTF) was the switch was not able to get a message stimulated response from either the network termination (NT1) or a basic rate interface transmission extension channel unit (BRITE CU) after losing layer 1 communication at the T-interface. To help isolate the location of the problem that is causing this port to be out-of-service, try executing a digital sectionalization test on the line with the TST:DSL input message. Also, try diagnosing the line card with the DGN:ISLULC input message since the embedded operations channel (EOC) may be faulty. Specify the NT1 demand phase option in the diagnostic test.

- **OOS BLKD - NRT AUTO**: The digital subscriber line (DSL) is out-of-service because layer 1 is down at the T-interface. In addition, the NT1 or a BRITE CU is under test by a source other than the switch. The reason the port status was marked no response test (NRT) rather than TEST or TEST[1-6] was the switch was not able to get a message stimulated response from either the network termination (NT1) or a basic rate interface transmission extension channel unit (BRITE CU) after losing layer 1 communication at the T-interface. Before attempting any recovery actions with the switch, investigate to see what tests are being performed on the NT1 or BRITE CUs. When the testing is done and the NT1 or BRITE CUs are taken out of the test mode, the switch should remove this NRT status from the port automatically.

- **OOS BLKD - NTOFN AUTO**: This status indicates that the layer 1 user error threshold has been exceeded. For this condition, the network termination (NT1) is considered “off normal”, and the switch’s monitoring of the layer 1 user errors (that is, NT1 power status and test mode maintenance indication) has been inhibited. The U-interface is up between the line card and the NT1 or the first basic rate interface transmission extension channel unit (BRITE CU). Since the NT1 “off normal” state does not cause a port to go out-of-service (OOS), the indicated port was probably OOS before the NT1 became “off normal” (that is, OOS BLKD - TINTF). Routine port conditioning will clear the NTOFN status and allow the switch to monitor the layer 1 user errors, but the port’s status may change to another OOS state. Also, if the layer 1 user errors continue and exceed the threshold again, the port will return to this “off normal” state.

- **OOS BLKD - NTPWR AUTO**: The digital subscriber line (DSL) is out-of-service because the network termination (NT1) lost power and layer 1 is
This status will be cleared once power is restored to the NT1.

**NOTE:** This port status indicates the state of the DSL at the time this condition was detected. It is possible that the condition of the DSL may change such that no indication is received by the switch to cause the port status to be updated.

<table>
<thead>
<tr>
<th>Port Status</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>OOS BLKD - NTDACT AUTO</td>
<td>The digital subscriber line (DSL) is out-of-service because layer 1 is down at the U-interface. This status applies only to AMI U-DSLs and is applied when the integrated services line unit (ISLU) line card receives an &quot;NT1 deactivation&quot; message over the maintenance channel. An AMI basic rate interface transmission extension channel unit (BRITE CU) is probably being tested by a source other than the switch. For example, if a test set is connected to an AMI BRITE CU, the BRITE CU will send an &quot;NT1 deactivation&quot; message to the switch. The DSL should return to service when the testing is done and the test set is removed from the BRITE CU.</td>
</tr>
<tr>
<td>OOS BLKD - OCU_CSU AUTO</td>
<td>The packet switching port has failed a routine loopback test at the office channel unit (OCU) or the channel service unit (CSU). This condition is usually associated with faulty OCU or CSU. An attempt will be made to restore the port automatically as soon as the situation is corrected.</td>

<td>OOS BLKD - RESTRT AUTO</td>
<td>This status indicates that the trunk is undergoing Q.931 RESTART procedures. Restart procedures are used to clear calls on Custom and Standard PRI B-channels. For Standard PRIs, restart procedures are also used to bring the B-channels into service. This status is transitional and should remain on the port for at most T316 seconds. If the restart procedure fails, the port will be transitioned to the OOS MTCE L3ERR RESTRT state. If the restart procedures succeed, the port will be transitioned to IS.</td>
</tr>
<tr>
<td>OOS BLKD - STARTUP AUTO</td>
<td>The packet switching trunk is being brought into service. The handshake at level 2 (SABM/UA exchange) is not yet complete. The trunk in this state is not available for call processing.</td>
</tr>
<tr>
<td>OOS BLKD - TEST AUTO</td>
<td>The digital subscriber line (DSL) is out-of-service because layer 1 is down at the T-interface between the network termination (NT1) and the customer premises equipment (CPE). The NT1 is probably in the test mode and is being tested by a source other than the switch. When the testing is done and the NT1 is taken out of the test mode, the switch will remove this TEST port status automatically. If there is some concern about this status, an investigation should be done to see what tests are being performed on the DSL.</td>
</tr>
<tr>
<td>OOS BLKD - TEST[1-8] AUTO</td>
<td>The digital subscriber line (DSL) is out-of-service because layer 1 is down at the indicated basic rate interface transmission extension (BRITE) link. The NT1 or a BRITE channel unit (CU) is being tested by a source other than the switch. TESTx defines the BRITE link that is out-of-service.</td>
</tr>
</tbody>
</table>
which is the link between CUx and CU(x+1). When the
testing is done and the NT1 or BRITE CU is taken out of the
test mode, the switch will remove this TESTx port status
automatically. If there is some concern about this status, an
investigation should be done to see what tests are being
performed on the DSL.

<table>
<thead>
<tr>
<th>Port Status</th>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
</table>
| OOS BLKD    | TINTF     | For U line cards: This port status means the digital
subscriber line (DSL) is out-of-service because layer 1 is
down at the T-interface, which is the interface between
the NT1 and the customer premises equipment (CPE). The
U-interface is up between the line card and the NT1 or the first basic rate interface transmission extension
channel unit (BRITE CU). The problem may be with the
NT1, CPE, or CPE to NT1 connection.
For T line cards: This port status means the DSL is
out-of-service because layer 1 is down at the T-interface,
which is the interface between the line card and the CPE.
The problem may be with the CPE, line card, or CPE to
line card connection. |
| OOS BLKD    | UINTF     | The digital subscriber line (DSL) is out-of-service because
layer 1 is down at the U-interface, which is between either
the NT1 and the line card or if the DSL is equipped with
basic BRITE CU, between the first BRITE CU and the line
card. To clear this status from a port, first try restoring
the line to service with the RST:LINE input message. If the port
status doesn't change, try locating the problem by executing
a digital loopback test on the line with the TST:DSL input
message. If the loopback test is done to the NT1 or the first
BRITE CU, a verification can be made as to whether or not a
good connection exists between the line card and the NT1 or
BRITE CU. The U-interface connection can also be checked
by running metallic and digital tests on the line from the trunk
and line work station (TLWS). If the tests used to verify the
U-interface connection pass, but the port remains
out-of-service, try diagnosing the line card with the
DGN:ISLULC input message. If this also passes but the port
remains out-of-service, the problem may be with the first
BRITE CU or the NT1. |

**NOTE:** This port status indicates the state of the DSL at
the time this condition was detected. It is
possible that the condition of the DSL may change such that no indication is received by
the switch to cause the port status to be
updated.

<table>
<thead>
<tr>
<th>Port Status</th>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OOS BLKD</td>
<td>PCTF</td>
<td>The port is blocked because of a per-call test failure (PCTF).</td>
</tr>
</tbody>
</table>
| OOS CADN    | -         | The port will be out-of-service for a short period of time
because circuit administration is being performed. This
generally happens when new circuits (ports) are being
added to the system. This port status will be removed
automatically by the switch and cannot be manually applied
to a port. |
| OOS CADN    | RDTA      | A remote digital test access session has been executed on
this port taking priority over its previous state. |
When the session is terminated the port will be released back to its previous supplementary information state.

**OOS CADN DSBLD - AUTO/MAN**
This port status can apply to trunks that have been added or altered by recent change and can be manually applied to an incoming, outgoing, or two-way trunk. This status can also apply to lines, but no recovery action is required. A trunk is given this status to prevent the switch from selecting it for call processing, and will stay in this state until it is manually placed in-service. Outgoing trunks can be tested in this state, and the only valid port status transitions for a port with this status are to another CADN status or to the in-service state. For common channel signaling (CCS) trunks, the OOS CADN DSBLD AUTO status can also mean that the trunk received an unequipped label (UQL) message from the far end trunk. This can be verified by the existence of a UQL machine detected interoffice irregularity (MDII report provided the MDII reporting has been allowed. An MDII will only be reported if a call is affected.

**OOS CADN DSBLD PROV AUTO**
This port status only applies to lines and trunks which reside on IDCU TR303 RTs. It indicates that successful provisioning has not occurred. Provisioning is the process by which the switch informs the TR303 RT of the existence and characteristics of lines and trunk assigned to the RT. This port status exists between the time a line is assigned using recent change and when the line is successfully provisioned to the RT. If this status last for over 1 minute, check the embedded operations channel (EOC) to the RT to ensure that they are in-service.

**OOS CADN DSBLD RO MAN**
The port will be out-of-service for a short period of time because its static data is being updated using recent change. This port status will be removed automatically by the switch within a short period of time.

**OOS CADN LKDO - AUTO/MAN**
This port status can be manually applied to two-way trunks to allow trunk testing. The trunk will stay in this state until it is manually placed in-service, and the only valid port status transitions for a port with this status are to another CADN status or to the in-service state. While in this state, the switch will not select the two-way trunk for outgoing calls but will allow incoming calls. Therefore, the far end two-way trunk should be in the locked-out state to prevent a non-test call from being made. For packet switching trunks, the switch treats this port status as OOS MTCE LKDO. For common channel signaling (CCS) trunks, such port status is functionally equivalent to OOS CADN DSBLD, prior to 5E11; as of 5E11, the OOS CADN LKDO state is no longer supported for CCS trunks.

**OOS DSLIN IT - AUTO**
This status indicates that the ISDN, BRI, PRI, packet pipe trunk or speech handler trunk port is out-of-service because the SM has been initialized. It may also indicate that the port needed to be taken out-of-service because the resources needed to put it in-service were unavailable. For a packet pipe trunk, this state may also indicate that frame relay protocol Handler on the PH4 is out-of-service or experiencing problems. For a speech handler trunk, this state may also indicate that the speech handler on the PHV

</table>

An ODD problem has been encountered and is associated with this port. Relations to verify include FC_PORTTYP, FC_TRUNK, FC_LINE, KEY_TALK and DSLEQUIP. The port implicated must be restored manually.

The port is OOS due to a per-call test failure. The port must be restored manually.

The trunk identified is OOS AUTO due to a one way audio failure detected by the automatic trunk test scheduler (ATTS). The path is always maintained when trunk is taken from IS state to this status. Run PVELBK test manually to identify the path used. The trunk can manually be removed from service with this status. In either case, the trunk must be restored manually. (5E15.1+)

A remote digital test access session has been executed on this port taking priority over its previous state. When the session is terminated the port will be released back to its previous supplementary information state.

The port is OOS because of some routine or other reason. On an OSPS basic services terminal (BST), it indicates that terminal firmware retrofit is in progress.

The port was disabled because excessive scanner-stuck-off-hook operational test failures were encountered during originations. The port will be placed in-service automatically after a minimum of 5 minutes.

The identified trunk terminates on a remote switching module (RSM) that has gone into the module stand-alone (MSA) mode of operation. The trunk will be restored automatically by the switch once the RSM is restored from the MSA mode.

The port was placed OOS by the SCC.

This is because the SP FIFO to overflow. This babbling port rapidly caused off-hooks faster than the switch could unload them from the SP FIFO. The port was placed OOS in order to avoid degraded service for the other ports using the same SP FIFO. The switch will automatically restore the port in a few minutes. If the port continues to babble it will be put in the OOS TBLA state. Ports in the OOS TBLA state are only restored by the switch once a day during the middle of the night.

The port status is automatically applied by the switch to an in-service OSPS EDSL B-channel when it is seized by the trunk & line work station (TLWS) or when an automatic loopback test is requested for it with the TST:TRK input message. When the automatic testing of the port has completed or when the port is released from the TLWS, the switch will restore the port automatically.

The port is OOS because of some unspecified trouble.

<td></td>
</tr>
<tr>
<td>OOS MTCE LVL1ERR - AUTO</td>
<td>The digital subscriber line (DSL) is out-of-service because of excessive layer 1 state transitions. The switch will attempt to restore the indicated DSL automatically every 3 minutes. However, if the excessive layer 1 state transitions are still occurring, the port will return to this out-of-service state. To clear this status from a port, first try to isolate the location of the problem by executing a digital sectionalization test on the line with the TST:DSL input message. If all of the digital tests pass, try diagnosing the line card with the DGN:ISLULC input message.</td>
<td></td>
</tr>
<tr>
<td>OOS MTCE LVL1ERR MTCECH AUTO</td>
<td>The digital subscriber line (DSL) is out-of-service because of excessive layer 1 state transitions on the maintenance channel. The switch will attempt to restore the indicated DSL automatically every 3 minutes. However, if excessive layer 1 state transitions are still occurring on the maintenance</td>
<td></td>
</tr>
</tbody>
</table>
The digital subscriber line (DSL) is out-of-service because of excessive layer 1 "info" state transitions or framing errors on the T-interface. The switch will attempt to restore the indicated DSL automatically every 3 minutes. However, if excessive layer 1 "info" state transitions are still occurring, the port will return to this out-of-service state. There might be a problem with the customer premises equipment (CPE) or T-interface wiring.

The digital subscriber line (DSL) is out-of-service because of excessive layer 1 state transitions on the U-interface. The U-interface may be going in and out of frame. The switch will attempt to restore the indicated DSL automatically every 3 minutes. However, if the excessive layer 1 state transitions are still occurring, the port will return to this out-of-service state. For possible recovery actions for a port in this state, refer to the recovery actions described for the OOS MTCE LVL1ERR - AUTO port status.

The digital subscriber line (DSL) is out-of-service because a stuck scan lead has been detected on the indicated port's integrated services line unit (ISLU) line group controller (LGC), line card (LC), or possibly another line card connected to the same ISLU LGC. This is a transient state, and the switch will perform its own recovery actions to handle it. The switch will first attempt to restore the indicated DSL port automatically within 3 minutes; but if the scan lead remains stuck, the port will remain in this out-of-service (OOS) state. If the DSL remains in this OOS state, the switch will automatically remove the line card from service and schedule a diagnostic. If the diagnostic then finds a problem with the LGC or LC, the switch will keep the hardware OOS and the port status will change to an OOS MTCE FE state for all ports associated with that hardware. The faulty hardware must then be repaired or replaced in order for the DSL to be put back in-service.

The DSL/DLT, packet pipe trunk or speech handler trunk port is disabled because of excessive level 2 protocol errors. The port indicated will be restored automatically once level 2 is restored.

The DSL/DLT port is disabled because of excessive level 3 protocol errors. The DSL port indicated will be restored automatically once level 3 is restored.

This status applies to an autoquote DSL (AQ-DSL). The local modem attached to the AQ-DSL is faulty. The AQ-DSL modem will be tested automatically every 3 minutes, and when no problems are detected, the AQ-DSL will be restored to service.

A B-channel could not be connected from the TSIU to an OSPS position. The DSL port indicated will be restored automatically once level 3 is restored.

An OSPS position did not send the "Initialization Complete" message after levels 1, 2, and 3 were established (no response). The DSL port indicated will be restored automatically once level 3 is restored.

1.12 Exhibit 6 -- List of statuses applied to CDMA packet pipe and packet pipe member trunks.

Exhibit 6 shows port statuses for the packet pipe and packet pipe member, the state of packet pipe manager for the channel group PPCG, the state reported to the Autoplex® executive cellular processor (ECP), the path state in response to various stimuli.
Stimuli:
1. Out-of-service due to software initialization or resource problems.
2. Packet pipe (PP) members up and PP up.
3. The PPCG channel group on the PH4 loses communication with the far end (cell site). This is detected by the loss of flags.
4. Layer 2 quality problem due to the protocol monitoring threshold exceeded in PPCG channel group. This condition can be restored without going OOS.
5. A PPCG channel group on the PH4 or PSU is removed from service.
6. PP is disabled (manual or auto).
7. PP manually placed in the circuit administration (CADN) state through a RMV request or by RC/V activity.
8. PP manually placed in the pre-port service (PPSRV) state through RC/V activity.
9. PP is automatically placed in maintenance level 2 error state on a PH hard switch that fails. A transient state applied during the PH hard switch to turn channel off. The trunk will exist in this state for only a short period.
10. PP member (one or all) removed due to family of equipment (FE) (manual or auto). Note that this scenario and the following three states are mapped to the same PP state, so as to avoid multiple pending states on the PP.
11. PP member (one or all) is disabled (manual or auto). If testing the PP member, it must be unconditionally taken OOS manually. The PPCG channel group's packet pipe state is off and path is down. Path is down since a path must be setup to a test circuit.
12. PP member (one or all) is manually placed in the circuit administration (CADN) state through a RMV request or by RC/V activity.
13. PP member is manually placed in the pre-port service (PPSRV) through RC/V activity.
14. All PP members OOS due to a carrier group alarm (CGA)/facility failure (FAF) on the DFI facility terminating the packet pipe members (DS0s).

1.13 Exhibit 7 -- List of status applied to CDMA speech handler trunks

Exhibit 7 shows the port statuses for the speech handler trunk, the trunk busy/idle state, the corresponding state reported to the Autoplex® ECP and the state of the speech handler (PHV) channel, path, and loopback.

<table>

</tr>
</tbody>
</table>
Stimuli:
1. Speech handler (SH) trunk is in-service and idle.
2. SH trunk is in-service and busy.
3. SH trunk is out-of-service due to initialization or resource problems.
4. SH trunk is out-of-service because the PHV is removed or degraded.
5. SH trunk is disabled (manual or auto).
6. SH trunk is manually placed in the circuit administration (CADN) state through RMV requests or by RC/V activity.
7. SH trunk is manually placed in the pre-port (pre-post) service (PPSRV) state through RC/V activity.
8. SH trunk is automatically placed in maintenance level 2 error state on a hard switch that fails. The trunk will exist in this state for only a short period.
9. SH trunk is out-of-service because the built in self test failed on the PHV.

1.14 Exhibit 8 -- List of status applied to SDL trunks for 5E11 and later

The signaling data link (SDL) trunk port, which provided access for PSU-terminated CCS signaling links (supported in 5E11 and later), may possess the listed states only, noting that states are noted in the standard form used in output messages (Base state - qualifier - operational restriction):

<table>
<thead>
<tr>
<th>STATE MEANING</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS SDL is in-service (this only refers to the availability of the DFI/DNU-S trunk ports used by the signaling link, not the usefulness of the link itself in CCS operation)</td>
</tr>
<tr>
<td>OOS-MTCE-DSBLD SDL port has been manually removed (it must be restored manually)</td>
</tr>
<tr>
<td>OOS-MTCE-FAF SDL port is OOS due to a carrier group alarm on the associated facility (this port status will be deleted automatically, when the CGA clears).</td>
</tr>
<tr>
<td>OOS-MTCE-FE SDL port is OOS due to &quot;family-of-equipment&quot; reasons (such as, parent DFI or DNU-S SFI/TMUX/CD hardware or an associated facility have been removed).</td>
</tr>
</tbody>
</table>

The OOS-MTCE-DSBLD state may coexist with OOS-MTCE-FE or OOS-MTCE-FAF. The OOS-MTCE-FE state will overwrite an existing OOS-MTCE-FAF condition. IS is actually the absence of all OOS conditions.

These states (both primary, and pending states, if appropriate) may be viewed by using the OP:ST-TRK input message, using the DEN or NEN as an identifier.

1.15 Exhibit 9 -- Bearer Channel

The next item shows port statuses for the bearer channel and bearer channel member, the state reported to the Autoplex® executive cellular processor (ECP), the path state in response to various stimuli.

The list of statuses shown applies to CDMA bearer channel and bearer channel member trunks for 5E12 and later.

B/I = Busy/Idle state (lstat)
OR = Operational restriction (op_restrn)
Q = Qualifier (qualfr)
SI = Supplementary information (suppl_info)
UAV = Unavailable
UAS = Unassigned
MB = Maintenance Busy

Stimuli
1. Out-of-service due to software initialization or resource problems.
2. BC Members up and BC up and SVCs up.
BC Members up and BC up but Layer 2 quality is in question and SVCs up.
BC loses communication with the far end (loss of flags).
Layer 2 communication with the far end has been lost and layer 2 is down.
IFRPH (PH4) removed from service no spares available.
PSU removed from service.
BC disabled (manual or auto).
BC manually placed Circuit Administration (CADN).
BC manually placed Pre-Port Service (BCSRV).
BC automatically placed in maintenance level 2 error on a hard switch that fails, transient state to turn channel off, or has reach the layer 2 error threshold.
BC automatically placed in maintenance level 3 error because it has reach the layer 3 error threshold.
BC member (one or all) removed due to family of equipment (FE) (manual or auto). Note that this scenario and the following two are mapped to the same BC state, so as to avoid multiple pending states on the BC.
BC Member (one or all) disabled (manual or auto). If testing the BC Member, it must be taken OOS manually. Path is down since need to set up a path to test circuit; IFRPH's BC state is off and path is down.
BC Member (one or all) manually placed Circuit Administration (CADN).
SVCs, BC and BC Members (all) OOS due to Carrier Group Alarm (CGA)/Facility Failure (FAF).
SVC manually/automatically placed in a disabled maintenance state.
SVC in the process of being provisioned or deleted. This is know as the Circuit Administration state (CADN).
SVC is in the process of being put in grown in or will be deleted.

1.16 Exhibit 10

Exhibit 10 lists all 5ESS port statuses for ISLP trunk (PSU side) and associated ISLP trunk member (DFI/DNU_S side). This applies to 5E14 and later.

Stimuli: Listed are brief descriptions for each individual port status. Refer to the sections mentioned for detail.

1. Out-of-Service due to software initialization, resource problems, or port is on the port recovery list.

2. ISLP up and ISLPmem up. Idle: no call up. Busy: call up.

3. ISLP loses communication with the far end.

4. Layer 2 quality problem due to PM threshold exceeded in ISLP, can restore without going OOS. This state will remain until midnight or until the trunk is manually cleared.

5. The PSU or the ISLP PH is removed from service or an individual PH channel is removed because of excessive operational errors.

6. ISLP disabled (manual or auto).

7. ISLP manually placed Circuit Administration (CADN).

8. ISLP manually placed Pre-Port Service (PPSRV).

9. ISLP automatically placed in Maintenance Level 2 Error on a hard switch that fails, or by a L2BABBLE job (because of excessive errored frame indications).

10. ECP requests trunk testing on the ISLP.

11. ECP requests to block the ISLP via TIATKMNT_X message.

12. ISLPmem removed due to Family of Equipment (FE) (manual or auto). If the ISLPmem is on a DFI, OOS-MTCE-FE-DFI is posted on the port status. If the ISLPmem is on a DNU_S, OOS-MTCE-FE-DS1OOS is used. Note that this scenario and the following two are mapped to the same ISLP state, so as to avoid multiple pending states on the ISLP.

13. ISLPmem disabled (manual or auto). If testing the ISLPmem, it must be taken OOS manually. Path is down since need to set up a path to test circuit.

14. ISLPmem manually placed Circuit Administration (CADN).

15. ISLPmem OOS due to Carrier Group Alarm (CGA)/Facility Failure (FAF).

1.17 Exhibit 11 -- CIC Status (5E15.1+)

Exhibit 11 lists all 5ESS CIC statuses for Bearer Independent Call Control (BICC) CICs.

<table>
<thead>
<tr>
<th>Stimulus</th>

<td>- -</td>
</tr>
<tr>
<td>6 OOS MTCE BLKD REMOTE</td>
<td>- -</td>
</tr>
</tbody>
</table>

Stimuli:

1. CIC is IS.

2. CIC is OOS and in the circuit administration state (CADN).

3. CIC is in the to-be-idled (TBI) state and is being recovered.

4. CIC is actively being reset.
A reset is pending for a CIC.
CIC is blocked (BLKD) because of reasons on the remote (far) end of an OPC/DPC pair.

Legend:
- BS Basic state (bsc_state)
- B/I Busy/Idle state (lstat)
- OR Operational restriction (op_restrn)
- Q Qualifier (qualfr)
- S Supplementary information (suppl_info)

**Stimuli**

1. ATM PVC trunk in-service and idle.
2. Audit finds errors with dynamic data associated with the ATM PVC trunk when selective initialization and the link is up.
3. Layer 2 quality problem due to protocol monitoring threshold exceeded in ATM PVC.
4. Detect an upstream failure on the VC level.
5. Detect an downstream failure on the VC level.
6. Detect an upstream failure on the VP level.
7. Detect an downstream failure on the VP level.
8. Detect an upstream failure on physical layer level.
9. Detect an downstream failure on physical layer level.
10. The trunk group and member number for the PVC at cell site mismatch the trunk group and member of PVC at the 5ESS® DCS.
11. Disabled (manual or auto).
(12) ATM PVC manually is placed in the CADN state through a remove (RMV) request or by RC/V activity.

(13) Manually placed pre-port (pre-post) service (PPSRV), after RC delete.

(14) ATM PVC is automatically placed in maintenance level 1 error state when PC condition fails.

(15) ATM PVC trunk is out-of-service because the LINK is down.

</tbody>
</table>

# = any except where specified
- = Null

Stimuli

(1) PCF trunk In-Service and idle.

(2) PCF trunk In-Service and busy.

(3) ETHERNET link is down and no call exists on the PCF trunk.

(4) ETHERNET link is down and a call exists on the PCF trunk.

(5) Audit finds an error in the dynamic data associated with the PCF port, puts the port into the idle list.

(6) PCF trunk manually is placed in the CADN state through a RMV request or by RC/V activity.

(7) Disabled (manual or auto).

(8) PCF trunk is OOS because the PHE2 is removed or degraded. Note: Since OOS-MTCE-DS BLD and OOS-MTCE-FE-PSU can coexist, if both states exist on a port, the ECP state reported it maintenance.

(9) Manually placed pre-port (pre-post) service (PPSRV), after RC delete.
APP:PR-DCF

Software Release: 5E14 and later
Message Class: N/A
Application: 5
Type: Output

1. PR DCF CLASS/FUNCTION APPENDIX

The pr subsystem uses two macros to report errors: PRRTGERR and PRERRASSRT. They can result in the
REPT:PR-DCF-RE and REPT:PR-DCF-EE output messages respectively. Each of these macros uses two
constants as parameters that identify the error: 1) a pr subsystem local constant (mnemonic) that corresponds to the
pr function, and 2) the sourcefile line number of the macro appearance.

The pr mnemonic is of the form: PRX...X where PRX...X should be a capitalization of the function name. For
example, an error in the function 'PRaddqueue' should be called with the mnemonic, PRADDQUEUE. The pr
mnemonic is defined in pr local header files of the form PRfn_xx.h. Its definition is a scalar value that is printed as a
decimal number identified by the word "CLASS" on the output message. Following that value on the output message
is the source file line number of the macro appearance. Values are assigned in ranges of 100, with the relative
displacement between specific values within a range generally remaining constant across software releases,
however a range may shift to prevent overlap. Therefore, the same mnemonic can have a different value in each
software release.

The following tables assist advanced analysis of the output messages by providing a cross reference between
mnemonic value and name, enclosing function name, and function definition source line number for all active
software releases.

The format of the tables is as follows:

1

CLASS to Function:

The CLASS numbers are listed in numerical order with the columns containing a colon-separated
triplet of:

function-name:source-line-number:mnemonic-name.

The source-line-number is the number of the source line in the code where the function definition
starts. This information helps 'anchor' the search for the specific pr macro in the appropriate PR
document.

Note that CLASS numbers with more than one function definition are denoted with a suffix of (a..z).
This occurs when:

a a function appears in more than one product (SM versus AM)
b an incorrect mnemonic is being used in the function
c a mnemonic is a misspelled variant (only the first 8 characters are significant)
d an inappropriate symbol is being used as a mnemonic.

Although the latter three cases should not be, code reuse and movement may have occasionally
missed mnemonic changes ('c' yields appropriate output regardless). Multiple mnemonic usage will
require searching all functions found with the same CLASS number. The source-line-number might
be of use in these cases as any line number on an output message having a value less than a
function source-line-number excludes that multiple entry.
2 Function to CLASS

This table is organized by function name for convenience in identifying those CLASS numbers that will appear for the same error in all software releases. The format of the columns is:

mnemonic-value:mnemonic-name

Note that multiple entries here re-illustrate cases b,c, and d.

3 Mnemonic to CLASS

This table collects current mnemonic values for all software releases. Note that the few mnemonic duplications in this table are due to a rare occurrence of a mnemonic having more than one definition, but each is mutually exclusive in use. The proper values (associated with the correct enclosing functions) were used in the creation of the first two tables so accurate usage is represented. These occurrences should also migrate to a singular definition.
1. PSU RESPONSE APPENDIX

The following is a list of response code strings that are used in some of the switch output messages for packet switch unit (PSU) link maintenance activities.

**ABORTED** The request has been aborted.

**AMEX HARDWARE FAILURE** The asynchronous transfer mode media transfer (AMEX) device in the protocol handler (PH) for asynchronous transfer mode (ATM) (PHA) failed.

**AUTOMATIC PROTECTION SWITCH TIMEOUT** The far end automatic protection channel did not respond.

**BAD VERB IN REQUEST** A bad verb was received by maintenance request administration (MRA).

**CANNOT SEND MESSAGE** Message can not be sent by the operating system to the appropriate process.

**CHANNEL RESTARTED DURING TEST** The channel that was running loopback test was restarted.

**CHANNELS UNAV MANUALLY** PSU link channels were manually made unavailable.

**COMPLETED** The request has successfully completed.

**COMPLETED ALREADY REMOTE LP** A local lock out of protection switch was requested while a remote lock out of protection switch was in effect.

**COULD NOT GET TIMER** Could not get timer.

**CRAFT REQUEST LIMIT EXCEEDED** End user request limit has been exceeded.

**DATA BASE ERROR** An internal database error was detected.

**DENIED LOCAL FS 0** The request was denied because a higher or equal priority force switch on the local channel 0 (the protection channel) was in effect.

**DENIED LOCAL FS 1** The request was denied because a higher or equal priority force switch on the local channel 1 (the working channel) was in effect.

**DENIED LOCAL MS 0** The request was denied because an equal priority manual switch on the local channel 0 (the protection channel) was in effect.

**DENIED LOCAL MS 1** The request was denied because an equal priority manual switch on the local channel 1 (the working channel) was in effect.

**DENIED LOCAL LP** The request was denied because a higher priority local lock out of protection switch request was in effect.

**DENIED LOCAL SD 0** The request was denied because a higher priority signal degrade condition on the local channel 0 (the protection channel) was in effect.

**DENIED LOCAL SD 1** The request was denied because a higher priority signal degrade condition on the local...
channel 1 (the working channel) was in effect.

DENIED LOCAL SF 1 The request was denied because a higher priority signal fail condition on the local channel 1 (the working channel) was in effect.

DENIED LOCAL SF0 The request was denied because a higher priority signal fail condition on the local channel 0 (the protection channel) was in effect.

DENIED REMOTE FS 0 The request was denied because a higher priority force switch on the remote channel 0 (the protection channel) was in effect.

DENIED REMOTE FS 1 The request was denied because a higher priority force switch on the remote channel 1 (the working channel) was in effect.

DENIED REMOTE LP The request was denied because a higher priority lock out of protection switch request from remote was in effect.

DENIED REMOTE MS 0 The request was denied because a higher priority manual switch on the remote channel 0 (the protection channel) was in effect.

DENIED REMOTE MS 1 The request was denied because a higher priority manual switch on the remote channel 1 (the working channel) was in effect.

DENIED REMOTE SD 0 The request was denied because a higher priority signal degrade condition on the remote channel 0 (the protection channel) was in effect.

DENIED REMOTE SD 1 The request was denied because a higher priority signal degrade condition on the remote channel 1 (the working channel) was in effect.

DENIED REMOTE SF 1 The request was denied because a higher priority signal fail condition on the remote channel 1 (the working channel) was in effect.

DENIED REMOTE SF0 The request was denied because a higher priority signal fail condition on the remote channel 0 (the protection channel) was in effect.

EQUAL OR HIGHER PRIORITY REQUEST IN PROGRESS The requested unit was in an equal or higher priority state than the requested state.

FAILED Failed.

HARDWARE FAILURE DURING DRAIN The protocol handler (PH) for asynchronous transfer mode (ATM) (PHA) hardware failed while the internal asynchronous transfer mode media transfer (AMEX) device was draining its finished frame first-in-first-out (FIFO) queue.

INCONSISTENT DATA An inconsistency was detected in the data during the requested action on the unit.

LINK IS NOT EQUIPPED Link is not equipped in the office dependent database (ODD).

MATE COULD NOT GO ACTIVE The mate channel could not go active.

MATE FAILED TO GO ACTIVE The mate channel failed to go active.

MATE IS OOS The mate protocol handler (PH) for asynchronous transfer mode (ATM) (PHA) is out-of-service (OOS) or its channel is OOS.

MATE IS UNAVAILABLE The mate channel was not available.
NO ACTIVE CHANNEL FOUND No active channel was found.

NO CHANNEL EQUIPPED ON PHA No channel is equipped for PHA.

NO EQUIPMENT LOCATION INFORMATION The link location information is not equipped in the office-dependent data (ODD).

NO LINK FOUND No link were found for the request.

NO LOOPBACK RESPONSE RECEIVED No loopback response was received.

NO PHA EQUIPPED ON ACCESSIBLE SMS No protocol handler (PH) for asynchronous transfer mode (ATM) (PHA) is equipped on any accessible switch module (SM).

NO RESPONSE No response.

NONE Request successfully completed with nothing found as requested

NOT STARTED The request was not started.

PARENT CIRCUIT OOS The parent circuit is out-of-service (OOS).

PARENT CIRCUIT UNEQUIPPED The parent circuit is not provisioned.

PASSED Passed.

PHA IS UNEQUIPPED No protocol handlers (PHs) for asynchronous transfer mode (ATM) (PHAs) were found.

PREP FOR SWITCH ACK TIMEOUT Timed out while waiting for the acknowledgement of preparation for switch request from the mate channel.

PREVIOUS REQUEST IN PROGRESS The requested unit is busy because a previous request was in progress.

PROCESS LIMIT EXCEEDED Terminal process limit has been exceeded.

PROCESS PURGED DURING TEST The process that was running loopback test was purged by single process purge (SPP) or selective init (SI).

PROT CHAN CIRCUIT UNEQUIP OR OOS The protection channel is either unequipped or its circuit is OOS.

PSU LINK IS SIMPLEX The PSU link has only one channel.

REQUEST ALREADY ACTIVE A request is already active.

STOPPED The request was stopped.

STOPPED ALREADY LOCAL FS 0 The request was not carried out because the local channel 0 (the protection channel) was already in the forced switch state.

STOPPED ALREADY LOCAL FS 1 The request was not carried out because the local channel 1 (the working channel) was already in the forced switch state.

STOPPED ALREADY LOCAL LP The request was not carried out because it was already in the local lock out of protection switch state.

STOPPED ALREADY LOCAL MS 0 The request was not carried out because the local channel 0 (the protection
channel) was already in the manual switch state.

**STOPPED ALREADY LOCAL MS 1** The request was not carried out because the local channel 1 (the working channel) was already in the manual switch state.

**STOPPED NOTHING TO CLEAR** The request was not carried out because nothing could be cleared.

**SYSTEM ERROR** The result of the request could not be obtained due to operating system error.

**TERMINATOR HARDWARE FAILURE** The terminator device in the protocol handler (PH) for asynchronous transfer mode (ATM) (PHA) failed.

**TEST ALREADY IN PROGRESS** A test is already in progress.

**TEST LIMIT EXCEEDED** The internal test limit has been exceeded.

**TEST NOT STARTED** Test not started due to resource problem.

**TEST NOT STARTED BY MATE** Test not started by mate due to mate side's resource problem.

**TIMED OUT WAITING FOR MATE TO GO ACTIVE** Timed out while waiting for the mate going active acknowledgement.

**TIMEOUT WAITING FOR PH RESPONSE** A timeout occurred while waiting for a response message from the protocol handler (PH).

**UNABLE TO AUTOMATIC PROTECTION SWITCH** A conditional request to switch the packet switch unit (PSU) link (PSLNK) or the PSU ATM link (PSALNK) was not able to do automatic protection switch.

**UNIT ALREADY IN REQUESTED STATE** The requested unit was in the requested state.
1. PSU SIGNALING MONITOR EVENT MASK INFORMATION

The link monitor can output a large number of indicators. Output of these indicators, called "Events" in this table, can be selected as "ON" or "OFF" by a mask field on the OP:CCS-MON input message. Bits may be "ORed" together to various combinations of control for selecting monitor output. The monitor has a default mask value of h'c0554. For some events output is enabled by this mask. For others, like CCS7 TFX, output is normally disabled. Caution should be exercised whenever the monitor is turned on. System availability may be affected. Special caution is suggested for those areas not covered by the default mask.

The following table shows what may appear for a link monitor output.

eeffghhiijjklmmnnooppqrrssttuvv0000

1.2 Explanation of Variables

- **e** = RCLK (remote clock) hardware error source register.
  - bit 0 = Digital/analog converter (DAC) error/voltage controlled crystal oscillator (VCXO) phase error.
  - bit 1 = Memory error/firmware fault.
  - bit 2 = SYNC 0 local time base energy detector error.
  - bit 3 = SYNC 0 remote time base energy detector error.
  - bit 4 = SYNC 1 local time base energy detector error.
  - bit 5 = SYNC 1 remote time base energy detector error.
  - bit 6 = Not used.
  - bit 7 = Not used.

- **f** = RCLK oscillator (RCOSC) time base error source register.
  - bit 0 = Local time base energy detector.
  - bit 1 = Local time base frequency.
  - bit 2 = Local time base oven bit (inner)
  - bit 3 = Local time base oven bit (outer)
  - bit 4 = Remote time base energy detector.
  - bit 5 = Remote time base frequency.
  - bit 6 = Not used.
  - bit 7 = Not used.

- **g** = RCLK cross-couple (RCXC) error source register.
  - bit 0 = 8 KHz return signal phase error.
  - bit 1 = Not used.
  - bit 2 = 8 KHz return signal energy detector.
  - bit 3 = Cross-couple energy detector.
  - bit 4 = Cross-couple phase error.
  - bit 5 = Not used.
  - bit 6 = Not used.
  - bit 7 = Not used.

- **h** = RCLK reference (RCREF) summary error source register.
  A set bit means that there is an error on the corresponding reference. For more information refer to
the following fields:

- bit 0 = RCREF 1 refer to variable 'j'.
- bit 1 = RCREF 2 refer to variable 'k'.
- bit 2 = RCREF 3 refer to variable 'l'.
- bit 3 = RCREF 4 refer to variable 'm'.
- bit 4 = RCREF 5 refer to variable 'n'.
- bit 5 = RCREF 6 refer to variable 'o'.
- bit 6 = RCREF 7 refer to variable 'p'.
- bit 7 = RCREF 8 refer to variable 'q'.

i = RCLK invalid message address register.

An internal error has occurred and the firmware has received an invalid request. The location is an internal communication control buffer (CCB) address.

j = Reference 1 error source register.

k = Reference 2 error source register.

l = Reference 3 error source register.

m = Reference 4 error source register.

n = Reference 5 error source register.

o = Reference 6 error source register.

p = Reference 7 error source register.

q = Reference 8 error source register.

Individual reference error source registers (ESRs). A set bit in the field means that an error of this type was reported on this reference.

- bit 0 = Out-of-range of allowed frequency.
- bit 1 = Phase step.
- bit 2 = Excess jitter on the reference.
- bit 3 = Local alarm (loss of reference).
- bit 4 = Low error rate threshold.
- bit 5 = High error rate threshold.
- bit 6 = Low out of frame threshold.
- bit 7 = High out of frame threshold.

r = RCLK hardware error source register pets.

A set bit means an error of the noted type is pested. These errors are detected from the remote clock controller (CNTL) or synchronization (SYNC) circuit pack.

- bit 0 = Digital/analog converter (DAC) or voltage-controlled crystal oscillator (VCXO) register error.
- bit 1 = Memory error/firmware fault (CNTL).
- bit 2 = Local oscillator energy detector error (SYNC 0).
- bit 3 = Remote oscillator energy detector error (SYNC 0).
- bit 4 = Local oscillator energy detector error (SYNC 1).
- bit 5 = Remote oscillator energy detector error (SYNC 1).
bit 6 = Not used.
bit 7 = Not used.

\( s \) = RCLK oscillator (RCOSC) error source register pests.
A set bit means that an error of the noted type is pested. These errors are detected on the remote clock oscillator circuit pack.
bit 0 = Local oscillator energy detector.
bit 1 = Local oscillator frequency.
bit 2 = Local oscillator inner oven bit (loss of temperature stability on high stability oscillator).
bit 3 = Local oscillator outer oven bit (loss of temperature stability on high stability oscillator).
bit 4 = Remote oscillator energy detector.
bit 5 = Remote oscillator frequency.
bit 6 = Not used.
bit 7 = Not used.

\( t \) = RCLK error source register pests.
A set bit means that an error of the noted type is pested. These errors are detected on the remote clock controller circuit pack.
bit 0 = 8 KHz return signal frequency difference.
bit 1 = Not used.
bit 2 = 8 KHz return signal energy detector.
bit 3 = Cross-couple energy detector.
bit 4 = Cross-couple frequency difference.
bit 5 = Not used.
bit 6 = Not used.
bit 7 = Not used.

\( u \) = RCLK reference (RCREF) summary error source register pests.
A set bit means that all errors on the corresponding reference are pested. For more information refer to the following fields:
bit 0 = RCREF 1 refer to variable \( 'j' \).
bit 1 = RCREF 2 refer to variable \( 'k' \).
bit 2 = RCREF 3 refer to variable \( 'l' \).
bit 3 = RCREF 4 refer to variable \( 'm' \).
bit 4 = RCREF 5 refer to variable \( 'n' \).
bit 5 = RCREF 6 refer to variable \( 'o' \).
bit 6 = RCREF 7 refer to variable \( 'p' \).
bit 7 = RCREF 8 refer to variable \( 'q' \).

\( v \) = RCLK invalid message pest. Valid value(s):
00 = Unpested.
FF = Pested.
APP:RCVRY-ACTION

Software Release: 5E14 and later
Message Class: N/A
Application: 5
Type: Output

1. RECOVERY ACTION STIMULUS APPENDIX

This appendix provides additional possible stimulus of recovery action options.

10 MS INHIBIT WATCHDOG TIMEOUT = 10 ms inhibit watchdog timeout.

10MS INTERRUPT - SMIM SOFTSWITCH = 10 ms interrupt - SMIM softswitch.

10MS INTERRUPT - SYSTEM INTEGRITY = 10 ms interrupt - system integrity.

155.52MHZ CLOCK NOT LOCKED TO SYNC = 155.52 Mhz clock not locked to synchronization.

ABORTED FRAME RECEIVED = An aborted frame was received.

ACTIVE SYNC = The ACTIVE protocol handler data bus has a synchronization error.

ADDRESS ERROR = Address error.

ADDRESS OUT-OF-RANGE = Address was out-of-range.

AMEX - ATM TX FIFO OVERFLOW = ATM media exchange device transmit FIFO overflow.

AMEX - DORMANT PACKET DETECTED = ATM media exchange device dormant (old) packet detected.

AMEX - MICRO. RX FIFO IS FULL = ATM media exchange device microprocessor receive FIFO is full.

AMEX - PACKET > 4K = ATM media exchange device packet was received which was greater than 4K bytes.

AMEX - PACKET NOT LONG ENOUGH = ATM media exchange device packet received was not long enough.

AMEX - PACKET WITH LENGTH ERROR SENT = ATM media exchange device packet with length error sent.

AMEX - PBMAC RFIW ERROR = ATM media exchange device PBMAC receive frame information word (RFIW) error.

AMEX - RCIW READ BEFORE PREVIOUS BYTES = ATM media exchange device receive cell information word (RCIW) read before previous bytes.

AMEX - RCIW READ ERROR = ATM media exchange device receive cell information word read error.

AMEX - TCIW OVERFLOW = ATM media exchange device transmit cell information word (TCIW) overflow.

AMEX - TOO MANY WORDS PUSHED = ATM media exchange device more data words were written to the AMEX than indicated by the transmit cell information word.

AMEX AAL5 LENGTH FIELD IS GREATER THAN ACTUAL PACKET = ATM media exchange device ATM adaptation layer 5 (AAL5) length field of received AAL5 protocol data unit is greater than actual length of packet.

AMEX AAL5 LENGTH FIELD IS LESS THAN ACTUAL PACKET = ATM media exchange device AAL5 length field
of received AAL5 protocol data unit is less than actual length of packet.

AMEX CELL SYNC ERROR = ATM media exchange device cell sync (frequency) error.

AMEX CRC-32 ERROR ON AAL5 PACKET = ATM media exchange device cyclic redundancy check (CRC-32) error on AAL5 mode packet.

AMEX CYCLE GRANT-DMA DONE = ATM media exchange device cycle grant/direct memory access done.

AMEX DEVICE BIST ERROR = ATM media exchange device built in self test (BIST) error.

AMEX DIAG REGISTER WRITE VIOLATION = ATM media exchange device write was attempted to the diagnostic (DIAG) register when write protect bit in the device control register (DCR) was equal to 0.

AMEX ENTER HARDWARE ASSIST MODE ERROR = ATM media exchange device enter hardware assist mode error.

AMEX ERROR = ATM media exchange device fault was taken trying to access the AMEX.

AMEX EXIT HARDWARE ASSIST MODE ERROR = ATM media exchange device exit hardware assist mode error.

AMEX EXTERNAL SRAM PARITY ERROR = ATM media exchange device external SRAM parity error detected for location containing an intermediate CRC calculation.

AMEX EXTERNAL SRAM PARITY ERROR FOR CELL PAYLOAD = ATM media exchange device external SRAM parity error detected for location containing cell payload.

AMEX EXTERNAL SRAM PARITY ERROR FOR POINTER = ATM media exchange device external SRAM parity error detected for location containing a pointer.

AMEX INTERNAL FIFO BIST ERROR = ATM media exchange device internal FIFO built in self test error has been detected.

AMEX LINKED LIST ERROR = ATM media exchange device linked list error detected.

AMEX PERIPHERAL BUS PARITY ERROR = ATM media exchange device peripheral bus parity error detected on a write to the AMEX device.

AMEX PERIPHERAL BUS TIMEOUT = ATM media exchange device peripheral bus data acknowledge timeout error.

AMEX READ ERROR = ATM media exchange device read error.

AMEX RX ATM DATA STREAM PARITY ERROR = ATM media exchange device parity error detected on received ATM data stream.

AMEX RX EXT CELL SRAM OVERFLOW--CELLS DROPPED = ATM media exchange device received external cell SRAM overrun due to linked list corruption.

AMEX RX EXT CELL SRAM OVERFLOW--FATAL = ATM media exchange device received external cell SRAM overrun due to exhaustion.

AMEX SRAM BIST ERROR = ATM media exchange device SRAM built in self test error has been detected.

AMEX UU-CPI FIELD DOES NOT MATCH AAL5CTL REGISTER = ATM media exchange device AAL5 packet has been received which has UU/CPI field which does not match the value in the ATM adaptation layer.
5 control (AAL5CTL) register.

AMEX WRITE ERROR = ATM media exchange device write error has occurred.

ARRAY BOUNDS EXCEPTION = During BOUND instruction, the array index is outside the array bounds.

ASSERT = Defensive check failure.

AUDITS = Single process purge requested by system audits.

BABBLING CHANNEL = Babbling digital subscriber line (DSL) messages sent to integrated services port administrator (ISPA).

BAD BYTE COUNT ON REC. FRAME = Bad byte count on received frame.

BAD PARITY ON MICRO. ACCESS OF TRAC = Bad parity on microprocessor access of TERMINATOR register access controller (TRAC).

BAD RECEIVE FRAME - CRC = Cyclic redundancy check detected an error.

BDS BEING RETURNED > MAX FOR A FRAME = Buffer descriptors being returned > maximum allowed for a frame.

BREAKPOINT INTERRUPT = Generated if the overflow flag is set.

BRICPIT BIST = Bit register interrupt controller programmable interval times (BRICPIT) built in self test error.

BUS ERROR = Bus error M68030, access fault M68040.

BUS ERROR DURING TRANSLATION TABLE SEARCH = Bus error during translation table search.

BUS PARITY CHECKER = System bus parity checker error.

BUS PARITY CHECKER BYTE_X ERROR = Bus parity checker byte_X error.

BUS WATCHDOG TIMER EVENT = Bus watchdog timer expiration occurred.

CAS LOOP ITERATIONS EXCEEDED MAXIMUM = Channel associated signaling (CAS) loop iterations exceeded maximum.

CHANNEL OFF = Channel off error occurred.

CHANNEL STATUS CHANGE = Channel status change idle and active.

CHANNEL STATUS CHANGE ACTIVE = Channel status change - active.

CHANNEL STATUS CHANGE IDLE = Channel status change - idle.

CHK, CHK2 INSTRUCTION = CHK, CHK2 instruction.

COLLISIONS EXCEEDS RETRIES = Collisions exceeds retries.

COPROCESSOR PROTOCOL VIOLATION = Co-processor protocol violation (M68030, not used by the M68040).

CORRUPT PH CHANNEL = Corrupted channel on a PH.

CPTRAPCC, TRAPCC, TRAPV INSTRUCTIONS = Used by cpTRAPcc, TRAPcc, TRAPV instructions.
CYCLIC REDUNDANCY ERROR = Cyclic redundancy error occurred.
DATA PRESERVING SWITCH = Protocol handler data preserving switch.
DEFERRED ON TRANSMISSION = Traffic on the link was deferred on transmission.
DEFINED FOR 68851 NOT USED BY 68030 = Defined for 68851, not used by 68030 or M68040.
DIVIDE ERROR EXCEPTION = Calculated quotient is larger than specified destination.
DMA 0 INTERRUPT = Direct memory access (DMA) controller 0 received an interrupt.
DMA 1 INTERRUPT = DMA controller 1 received an interrupt.
DMA OVERRUN = DMA processor overrun.
DMA PROCESSOR SANITY ERROR = DMA processor sanity error.
DMA PROCESSOR UNIDENTIFIED INTERRUPT = DMA processor received an unidentified interrupt.
DMA UNDER RUN = DMA processor under run.
DMAP BUS PARITY = DMA processor bus parity error.
DMAP CRC = DMA processor cyclic redundancy error occurred.
DMDSPP = Excessive single process purges as demanded by software.
DRAM CORR MEMORY ERROR = Dynamic random access memory (DRAM) correctable memory error.
DRAM NON-CORR MEMORY ERROR = DRAM non-correctable memory error.
DRAM NON-CORR MEMORY ACCESS ERROR = DRAM non-correctable memory access error.
DSP FAILED TO PUMP/INITIALIZE = Speech handler digital signal processor failed to either pump or initialize <5E11+>.
ERROR IN ACCESSING ATM HARDWARE DEVICE = Error in accessing ATM hardware device.
ESC OPCODE EXCEPTION = Escape opcode exception.
EVENT 0 CHANNEL ATTENTION = Event 0 channel attention error.
EVENT 1 CHANNEL ATTENTION = Event 1 channel attention error.
EVENT 2 CHANNEL ATTENTION = Event 2 channel attention error.
EVENT 3 CHANNEL ATTENTION = Event 3 channel attention error.
EXDAUD = Excessive directed (also known as demand) audits.
EXPSI = Excessive PS initializations.
EXRPI = Excessive return to point of interrupt.
EXSEL = Excessive selective initializations.
EXSPP = Excessive single process purges.

EXSTIM = Escalation due to excessive error stimuli.

EXTERNAL BOARD BUS ERROR = External board bus error occurred.

FORMAT ERROR = Format error has occurred.

FPCP BRANCH OR SET ON UNORDERED CONDITION = Floating point co-processor (FPCP) branch or set on unordered condition.

FPCP DIVIDE BY ZERO = FPCP divide by zero calculation.

FPCP INEXACT RESULT = FPCP inexact result error.

FPCP OVERFLOW ERROR = FPCP overflow error.

FPCP SIGNALING NAN = FPCP signaling NAN.

FPCP UNDER FLOW = FPCP under flow.

FPCP operand error = FPCP operand error.

GPITS NMI = GPITS non maskable interrupt occurred.

GPITS NON MASKABLE INTERRUPT = GPITS non maskable interrupt occurred.

HARDWARE WRITE PROTECT VIOLATION = Hardware write protect violation occurred.

HASH SUM ERROR = Hash sum error.

ILLEGAL ACCESS TO SUPER. PROTECT REGION = Illegal access to supervisor protected region.

ILLEGAL INSTRUCTION = Illegal instruction was encountered.

ILLEGAL SPYDER COMMAND = Illegal synchronous/asynchronous protocol data formatter (SPYDER) message.

INCORRECT PH IMAGE = Wrong PH image is present in the PH.

INT0 DETECT OVERFLOW = Interrupt 0 detected an overflow exception.

INTERRUPT 0 = External maskable interrupt 0.

INTERRUPT 1 = External maskable interrupt 1.

INTERRUPT 2 = External maskable interrupt 2.

INTERRUPT 3 = External maskable interrupt 3.

INVALID ACCESS OF TERMINATOR REGISTER = Invalid access of terminator register.

INVALID BD OFFSET WAS ENCOUNTERED = Invalid buffer descriptor (BD) offset was encountered.

IOMI ISOLATED = Input/output microprocessor interface (IOMI) isolated.

IOP BUS ERROR = Input/Output processor (IOP) bus error.
IOP BUS PARITY ERROR = IOP bus parity error.
IOP BUS WATCHDOG TIMER ERROR = IOP bus watchdog timer error.
IOP DDRAM CORRECTABLE BIT ERROR = IOP dual dynamic random access memory (DDRAM) correctable memory bit error.
IOP DDRAM NON CORRECTABLE ACCESS ERROR = IOP DDRAM non correctable access error.
IOP DDRAM NON CORRECTABLE BIT ERROR = IOP DDRAM non correctable bit error.
IOP DRAM CORR MEMORY ERROR = IOP DRAM correctable memory error.
IOP DRAM NON-CORR MEMORY ACCESS ERROR = IOP DRAM non correctable memory access error.
IOP DRAM NON-CORR MEMORY ERROR = IOP DRAM non correctable memory error.
IOP HARDWARE WRITE PROTECT ERROR = IOP hardware write protect error.
IOP ILLEGAL INTERRUPT ERROR = IOP illegal interrupt error.
LACK OF REC FRAME OF BUFFER DESCRIPTORS = Lack of received frame.
LEVEL 1 INTERRUPT AUTOVECTOR = Level 1 interrupt autovector.
LEVEL 2 INTERRUPT AUTOVECTOR = Level 2 interrupt autovector.
LEVEL 3 INTERRUPT AUTOVECTOR = Level 3 interrupt autovector.
LEVEL 4 INTERRUPT AUTOVECTOR = Level 4 interrupt autovector.
LEVEL 5 INTERRUPT AUTOVECTOR = Level 5 interrupt autovector.
LEVEL 6 INTERRUPT AUTOVECTOR = Level 6 interrupt autovector.
LEVEL 7 INTERRUPT AUTOVECTOR = Level 7 interrupt autovector.
LINE 1010 EMULATOR = Line 1010 emulator.
LINE 1111 EMULATOR = Line 1111 emulator.
LONG FRAME RECEIVED -OVER N1 BYTE = Long frame received - over N1 bytes
LOSS OF CLEAR TO SEND = Loss of clear to send (between beginning of destination address and end of frame check sequence).
LOST LOCAL INTERRUPT = Lost local interrupt.
MESSAGE TO PERFR = Message to peripheral fault recovery.
MISALIGNED FRAME = Misaligned frame.
MMU CONFIGURATION ERROR = Memory management unit (MMU) configuration error M68030, not used M68040.
NEG-PROG = Negative progress detected during initialization.
NESTEDASRT = Nested asserts.
NO CARRIER SENSE = No carrier sense.

NO EOF FLAG = No end-of-frame flag.

NO FREE RECEIVE BUFFER DESCRIPTORS = No free receive buffer descriptors.

NO FREE RECEIVE BUFFERS = No free receive buffers.

NO FREE RECEIVE FRAME DESCRIPTORS = No free receive frame descriptors.

NON-CORRECTABLE MEMORY ERROR = Non correctable memory error.

NON MASKABLE INTERRUPT = Non maskable interrupt occurred.

OPTICAL RCVR LOSS OF LIGHT = Optical receiver loss of light.

PARITY ERROR WHILE READING DAM = Parity error while reading dual access memory (DAM).

PBMAC 0 - LOSS OF CLOCK = PBMAC 0 loss of clock.

PBMAC 1 - LOSS OF CLOCK = PBMAC 1 loss of clock.

PBMAC0 - ALIGNMENT ERROR = Packet bus media access controller (PBMAC) 0 alignment error.

PBMAC0 - BIBBLE BUS PARITY ERR = PBMAC 0 bibble bus parity error.

PBMAC0 - BUILT IN SELF TEST ERROR IN ESR = PBMAC 0 built in self test error in error source register.

PBMAC0 - CONTROL SEGMENT WAS INCORRECT = PBMAC 0 control segment was incorrect.

PBMAC0 - CRC ERROR = PBMAC 0 cyclic redundancy check error.

PBMAC0 - EOF BIT NOT SET ON LAST XMIT BD = PBMAC 0 end of file bit not set on last transmit buffer descriptor.

PBMAC0 - FRAME ABORTED = PBMAC 0 frame aborted.

PBMAC0 - LOSS CRS BEFORE END OF RX = PBMAC 0 loss circuit reset signaling (CRS) before end of receive.

PBMAC0 - LOSS CTS BEFORE END OF TX = PBMAC 0 loss clear to send (CTS) before end of transmit.

PBMAC0 - RAN OUT OF BDS DURING RECEPTION = PBMAC 0 ran out of buffer descriptors during reception.

PBMAC0 - RECEIVE FRAME IS TOO LONG = PBMAC 0 receive frame is too long.

PBMAC0 - RECEIVE FRAME IS TOO SHORT = PBMAC 0 receive frame is too short.

PBMAC0 - RECEIVE OVERRUN = PBMAC 0 receive overrun.

PBMAC0 - RECEIVE UNDERRUN = PBMAC 0 receive underrun.

PBMAC0 - RECEIVE VALID BIT IN FIW NOT SET = PBMAC 0 receive valid bit in frame information word (FIW) not set.
PBMAC0 - RFD LIST CORRUPTED = PBMAC 0 receive frame descriptor (RFD) list corrupted.
PBMAC0 - RFD LIST EXHAUSTED = PBMAC 0 RFD list exhausted.
PBMAC0 - STATUS PARITY ERROR IN FIFO = PBMAC 0 status parity error in first in first out (FIFO).
PBMAC0 - SYSTEM DATA BUS PARITY ERROR = PBMAC 0 system data bus parity error.
PBMAC0 - TFD LIST CORRUPTED = PBMAC 0 transmit frame descriptor (TFD) list corrupted.
PBMAC0 - TFD LIST EMPTY = PBMAC 0 TFD list empty.
PBMAC0 - TRANSMITTER OVERRUN = PBMAC 0 transmitter overrun.
PBMAC0 - TRANSMITTER UNDERRUN = PBMAC 0 transmitter underrun.
PBMAC0 - UNKNOWN INTERRUPT = PBMAC 0 unknown interrupt.
PBMAC0 - WRITE PROTECT VIOLATION = Software tried to write a PBMAC register without turning off PBMAC write protect.
PBMAC0 - XMITTER NOT UNLOADING XFIFO = PBMAC 0 transmitter not unloading transmit FIFO.
PBMAC1 - ALIGNMENT ERROR = PBMAC 1 alignment error.
PBMAC1 - BIBBLE BUS PARITY ERR = PBMAC 1 bibble bus parity error.
PBMAC1 - BUILT IN SELF TEST ERROR IN ESR = PBMAC 1 built in self test error in error source register.
PBMAC1 - CONTROL SEGMENT WAS INCORRECT = PBMAC 1 control segment was incorrect.
PBMAC1 - CRC ERROR = PBMAC 1 cyclic redundancy check error.
PBMAC1 - EOF BIT NOT SET ON LAST XMIT BD = PBMAC 1 end of file bit not set on last transmit buffer descriptor.
PBMAC1 - FRAME ABORTED = PBMAC 1 frame aborted.
PBMAC1 - LOSS CRS BEFORE END OF RX = PBMAC 1 loss CRS before end of receive.
PBMAC1 - LOSS CTS BEFORE END OF TX = PBMAC 1 loss CTS before end of transmit.
PBMAC1 - RAN OUT OF BDS DURING RECEPTION = PBMAC 1 ran out of buffer descriptors during reception.
PBMAC1 - RECEIVE FRAME IS TOO LONG = PBMAC 1 receive frame is too long.
PBMAC1 - RECEIVE FRAME IS TOO SHORT = PBMAC 1 receive frame is too short.
PBMAC1 - RECEIVE OVERRUN = PBMAC 1 receive overrun.
PBMAC1 - RECEIVE UNDERRUN = PBMAC 1 receive underrun.
PBMAC1 - RECEIVE VALID BIT IN FIW NOT SET = PBMAC 1 receive valid bit in FIW not set.
PBMAC1 - RFD LIST CORRUPTED = PBMAC 1 RFD list corrupted.
PBMAC1 - RFD LIST EXHAUSTED = PBMAC 1 RFD list exhausted.
PBMAC1 - STATUS PARITY ERROR IN FIFO = PBMAC 1 status parity error in first in first out (FIFO).

PBMAC1 - SYSTEM DATA BUS PARITY ERROR = PBMAC 1 system data bus parity error.

PBMAC1 - TFD LIST CORRUPTED = PBMAC 1 TFD list corrupted.

PBMAC1 - TFD LIST EMPTY = PBMAC 1 TFD list empty.

PBMAC1 - TRANSMITTER OVERRUN = PBMAC 1 transmitter overrun.

PBMAC1 - TRANSMITTER UNDERRUN = PBMAC 1 receive underrun.

PBMAC1 - UNKNOWN INTERRUPT = PBMAC 1 unknown interrupt.

PBMAC1 - WRITE PROTECT VIOLATION = Software tried to write a PBMAC register without turning off PBMAC write protect.

PBMAC1 - XMITTER NOT UNLOADING XFIFO = PBMAC 2 transmitter not unloading transmit FIFO.

PBMAC2 - ALIGNMENT ERROR = PBMAC 2 alignment error.

PBMAC2 - BIBBLE BUS PARITY ERR = PBMAC 2 bibble bus parity error.

PBMAC2 - BUILT IN SELF TEST ERROR IN ESR = PBMAC 2 built in self test error in error source register.

PBMAC2 - CONTROL SEGMENT WAS INCORRECT = PBMAC 2 control segment was incorrect.

PBMAC2 - CRC ERROR = PBMAC 2 cyclic redundancy check error.

PBMAC2 - EOF BIT NOT SET ON LAST XMIT BD = PBMAC 2 end of file bit not set on last transmit buffer descriptor.

PBMAC2 - FRAME ABORTED = PBMAC 2 frame aborted.

PBMAC2 - LOSS CRS BEFORE END OF RX = PBMAC 2 loss CRS before end of receive.

PBMAC2 - LOSS CTS BEFORE END OF TX = PBMAC 2 loss CTS before end of transmit.

PBMAC2 - RAN OUT OF BDS DURING RECEPTION = PBMAC 2 ran out of buffer descriptors during reception.

PBMAC2 - RECEIVE FRAME IS TOO LONG = PBMAC 2 receive frame is too long.

PBMAC2 - RECEIVE FRAME IS TOO SHORT = PBMAC 2 receive frame is too short.

PBMAC2 - RECEIVE OVERRUN = PBMAC 2 receive overrun.

PBMAC2 - RECEIVE UNDERRUN = PBMAC 2 receive underrun.

PBMAC2 - RECEIVE VALID BIT IN FIW NOT SET = PBMAC 2 receive valid bit in FIW not set.

PBMAC2 - RFD LIST CORRUPTED = PBMAC 2 RFD list corrupted.

PBMAC2 - RFD LIST EXHAUSTED = PBMAC 2 RFD list exhausted.

PBMAC2 - STATUS PARITY ERROR IN FIFO = PBMAC 2 status parity error in FIFO.
PBMAC2 - SYSTEM DATA BUS PARITY ERROR = PBMAC 2 system data bus parity error.

PBMAC2 - TFD LIST CORRUPTED = PBMAC 2 TFD list corrupted.

PBMAC2 - TFD LIST EMPTY = PBMAC 2 TFD list empty.

PBMAC2 - TRANSMITTER OVERRUN = PBMAC 2 transmitter overrun.

PBMAC2 - TRANSMITTER UNDERRUN = PBMAC 2 receive underrun.

PBMAC2 - UNKNOWN INTERRUPT = PBMAC 2 unknown interrupt.

PBMAC2 - WRITE PROTECT VIOLATION = Software tried to write a PBMAC register without turning off PBMAC write protect.

PBMAC2 - XMITTER NOT UNLOADING XFIFO = PBMAC 2 transmitter not unloading transmit FIFO.

PBMAC3 - ALIGNMENT ERROR = PBMAC 3 alignment error.

PBMAC3 - BIBBLE BUS PARITY ERR = PBMAC 3 bibble bus parity error.

PBMAC3 - BUILT IN SELF TEST ERROR IN ESR = PBMAC 3 built in self test error in error source register.

PBMAC3 - CONTROL SEGMENT WAS INCORRECT = PBMAC 3 control segment was incorrect.

PBMAC3 - CRC ERROR = PBMAC 3 cyclic redundancy check error.

PBMAC3 - EOF BIT NOT SET ON LAST XMIT BD = PBMAC 3 end of file bit not set on last transmit buffer descriptor.

PBMAC3 - FRAME ABORTED = PBMAC 3 frame aborted.

PBMAC3 - LOSS CRS BEFORE END OF RX = PBMAC 3 loss CRS before end of receive.

PBMAC3 - LOSS CTS BEFORE END OF TX = PBMAC 3 loss CTS before end of transmit.

PBMAC3 - RAN OUT OF BDS DURING RECEPTION = PBMAC 3 ran out of buffer descriptors during reception.

PBMAC3 - RECEIVE FRAME IS TOO LONG = PBMAC 3 receive frame is too long.

PBMAC3 - RECEIVE FRAME IS TOO SHORT = PBMAC 3 receive frame is too short.

PBMAC3 - RECEIVE OVERRUN = PBMAC 3 receive overrun.

PBMAC3 - RECEIVE UNDERRUN = PBMAC 3 receive underrun.

PBMAC3 - RECEIVE VALID BIT IN FIW NOT SET = PBMAC 3 receive valid bit in FIW not set.

PBMAC3 - RFD LIST CORRUPTED = PBMAC 3 RFD list corrupted.

PBMAC3 - RFD LIST EXHAUSTED = PBMAC 3 RFD list exhausted.

PBMAC3 - STATUS PARITY ERROR IN FIFO = PBMAC 3 status parity error in FIFO.

PBMAC3 - SYSTEM DATA BUS PARITY ERROR = PBMAC 3 system data bus parity error.

PBMAC3 - TFD LIST CORRUPTED = PBMAC 3 TFD list corrupted.
PBMAC3 - TFD LIST EMPTY = PBMAC 3 TFD list empty.

PBMAC3 - TRANSMITTER OVERRUN = PBMAC 3 transmitter overunrun.

PBMAC3 - TRANSMITTER UNDERRUN = PBMAC 3 receive underrun.

PBMAC3 - UNKNOWN INTERRUPT = PBMAC 3 unknown interrupt.

PBMAC3 - WRITE PROTECT VIOLATION = Software tried to write a PBMAC register without turning off PBMAC write protect.

PBMAC3 - XMITTER NOT UNLOADING XFIFO = PBMAC 3 transmitter not unloading transmit FIFO.

PHV - BRICFIT BIST = Speech handler bit register interrupt controller programmable interval times built in self test error.

PHV - BUS PARITY CHECKER = Speech handler bus parity checker error.

PHV - DSP TRANSMIT/RECEIVE INTERRUPT = Speech handler downloadable DSP transmit or receive interrupt error <5E11>.

PHV - GPITS NMI = Speech handler GPITS non maskable interrupt error.

PHV - PBMAC0 INTERRUPT = Speech handler PBMAC 0 interrupt.

PHV - PBMAC0 LOSS OF CLOCK = Speech handler PBMAC 0 loss of clock.

PHV - PBMAC1 INTERRUPT = Speech handler PBMAC 1 interrupt.

PHV - PBMAC1 LOSS OF CLOCK = Speech handler PBMAC 1 loss of clock.

PHV - TIMER 0 INTERRUPT = Speech handler timer 0 interrupt.

PHV - TIMER 1 INTERRUPT = Speech handler timer 1 interrupt.

PHV - TIMER 2 INTERRUPT = Speech handler timer 2 interrupt.

PHV - TIMER 3 INTERRUPT = Speech handler timer 3 interrupt.

PHV - TIMER 4 INTERRUPT = Speech handler timer 4 interrupt.

PHV - TWO RESET WITHIN A WINDOW = Speech handler took two resets within a time window.

PHV - VISA EARLY REFERENCE INTERRUPT = Speech handler vocoder interrupt and serial access chip (VISA) early reference interrupt.

PHV - VISA ERROR SOURCE = Speech handler VISA error source.

PHV - VISA NORMAL REFERENCE INTERRUPT = Speech handler VISA normal reference interrupt.

PHV - VISA RCV OFFSET SUMMARY INTERRUPT = Speech handler VISA receive offset summary interrupt.

PHV - VISA TX OFFSET SUMMARY INTERRUPT = Speech handler VISA transmit offset summary interrupt.

PHV - VOCODER CRITICAL ERROR = Speech handler vocoder critical operational error.
PHV - VOCODER NON-CRITICAL ERROR = Speech handler vocoder non-critical operational error.

PHV - WATCH-DOG TIMER INTERRUPT = Speech handler watch-dog timer interrupt.

PI2 BRICPIT BIST = Packet interface 2 (PI2) bit register interrupt controller programmable interval times built in self test error.

PI2 CHANNEL ATTENTION 0 = PI2 Channel attention 0 error.

PI2 CHANNEL ATTENTION 1 = PI2 Channel attention 1 error.

PI2 CHANNEL ATTENTION 2 = PI2 Channel attention 2 error.

PI2 CHANNEL ATTENTION 3 = PI2 Channel attention 3 error.

PI2 CORRECTABLE ERROR = PI2 DRAM correctable memory error.

PI2 GPITS NMI = PI2 GPITS non-maskable interrupt error.

PI2 NON-CORRECTABLE MEMORY ERROR = PI2 non-correctable memory error.

PI2 NON-CORRECTABLE MEMORY REFRESH ERR = PI2 non-correctable memory refresh error.

PI2 PBMAC0 HIGH-SPEED PB ENABLE = PI2 PBMAC0 high-speed packet bus enable.

PI2 PBMAC0 INTERRUPT = PI2 PBMAC0 interrupt.

PI2 PBMAC0 LOSS OF CLOCK = PI2 PBMAC0 loss of clock.

PI2 PBMAC1 HIGH-SPEED PB ENABLE = PI2 PBMAC1 high-speed packet bus enable.

PI2 PBMAC1 INTERRUPT = PI2 PBMAC1 interrupt.

PI2 PBMAC1 LOSS OF CLOCK = PI2 PBMAC1 loss of clock.

PI2 PBMAC2 HIGH-SPEED PB ENABLE = PI2 PBMAC2 high-speed packet bus enable.

PI2 PBMAC2 INTERRUPT = PI2 PBMAC2 interrupt.

PI2 PBMAC2 LOSS OF CLOCK = PI2 PBMAC2 loss of clock.

PI2 PBMAC3 HIGH-SPEED PB ENABLE = PI2 PBMAC3 high-speed packet bus enable.

PI2 PBMAC3 INTERRUPT = PI2 PBMAC3 interrupt.

PI2 PBMAC3 LOSS OF CLOCK = PI2 PBMAC3 loss of clock.

PI2 READ PARITY ERROR = PI2 read parity error.

PI2 TIMER 0 INTERRUPT PB ENABLE = PI2 timer 0 interrupt packet bus enable.

PI2 TIMER 1 INTERRUPT = PI2 timer 1 interrupt.

PI2 TIMER 2 INTERRUPT = PI2 timer 2 interrupt.

PI2 TIMER 3 INTERRUPT = PI2 timer 3 interrupt.
PI2 TIMER 4 INTERRUPT = PI2 timer 4 interrupt.
PI2 TWO RESET WITHIN A WINDOW = PI2 took two resets within a time window.
PI2 WATCH-DOG TIMER INTERRUPT = PI2 watch-dog timer interrupt.
POWER-UP = Power up port processor initialization.
PRIVILEGED VIOLATION = Privileged violation.
PROGRAMABLE INTERVAL TIMER 0 = Programmable interval timer 0.
PROGRAMABLE INTERVAL TIMER 1 = Programmable interval timer 1.
PROGRAMABLE INTERVAL TIMER 2 = Programmable interval timer 2.
PROGRAMABLE INTERVAL TIMER 3 = Programmable interval timer 3.
PROGRAMABLE INTERVAL TIMER 4 = Programmable interval timer 4.
PS HDW FAILURE = Packet switch hardware failure.
PSFAIL = Packet switch (PS) initialization failure.
RECEIVE FRAME TOO SHORT = Receive frame too short.
RECEIVER OVERRUN = Receiver overrun.
RESERVED INTERRUPT = Receiver interrupt.
RESET INITIAL INTERRUPT STACK POINTER = Reset initial interrupt stack pointer.
RESET INITIAL PROGRAM COUNTER = Reset initial program counter.
RESOURCE ALLOCATION SHORTAGE = Unable to allocate a resource such as a timer control block because of shortage.
RFD LIST CORRUPTION = Receive frame descriptor list is corrupted.
SABM RECEIVED = Set asynchronous balance mode (SABM) received.
SERIAL DATA READ FROM TERMINATOR HAD BAD PARITY = The serial read data from the TERMINATOR had bad parity.
SHORT FRAME RECEIVED = Short frame received.
SINGLE STEP INTERRUPT = Single step interrupt.
SM-REQ = SMP requested initialization.
SPI - MICROPROCESSOR BUS PARITY ERROR = SONET PHDB interface (SPI) microprocessor bus parity error.
SPI - PHDB TO SONET PHD FIFO ERROR = SPI protocol handler data block (PHDB) to SONET path overhead (POH) FIFO error.
SPI - PHDB TO SONET SOH FIFO ERROR = SPI protocol handler data block to SONET section overhead (SOH) FIFO error.
SPI - POH CHANNEL PARITY ERROR = SPI path overhead channel parity error.
SPI - POH RX CLOCK ERROR = SPI path overhead receive clock error.
SPI - POH RX SYNC. ERROR = SPI path overhead receive sync (frequency) error.
SPI - POH TX CLOCK ERROR = SPI path overhead transmit clock error.
SPI - POH TX SYNC. ERROR = SPI path overhead transmit sync (frequency) error.
SPI - SOH CHANNEL PARITY ERROR = SPI section overhead channel parity error.
SPI - SOH RX CLOCK ERROR = SPI section overhead receive clock error.
SPI - SOH RX SYNC. ERROR = SPI section overhead receive sync (frequency) error.
SPI - SOH TX CLOCK ERROR = SPI section overhead transmit clock error.
SPI - SOH TX SYNC. ERROR = SPI section overhead transmit sync (frequency) error.
SPI - SONET TO PHDB POH FIFO ERROR = SPI SONET to protocol handler data block path overhead FIFO error.
SPI - SONET TO PHDB SOH FIFO ERROR = SPI SONET to protocol handler data block section overhead FIFO error.
SPI - SYNC ERROR ON ACTIVE PHDB = SPI sync error on active protocol handler data block.
SPI - SYNC ERROR ON STANDBY PHDB = SPI sync error on standby protocol handler data block.
SPI ERROR = SPI SONET protocol handler data block interface error.
SPORT FIFO OVER RUN = Synchronous protocol receiver/transmitter (SPORT) FIFO overrun.
SPORT FIFO STATUS PARITY = SPORT FIFO status parity.
SPORT FIFO UNDER RUN = SPORT FIFO underrun.
SPORT TSA RAM PARITY = SPORT time slot assign (TSA) RAM parity.
SPORT XCVR BUS CONTENTION = SPORT transmit/receiver bus contention.
SPORT XCVR PTR RAM PARITY = SPORT transmit/receiver pointer RAM parity.
SPORT XCVR RAM PARITY = SPORT transmit/receiver RAM parity.
SPURIOUS INTERRUPT = Spurious interrupt.
SQE TEST = Signal quality error test.
STACK PROTECT ERROR = Stack protect error.
STACK PROTECTION ERROR = Stack protection error.
STANDY SYNC = The STANDBY protocol handler data bus has a synchronization error.
STATUS CHANGE = Status change.

TERMINATOR ACCESS COMPLETE = TERMINATOR access complete error.

TERMINATOR CORRECTABLE HEADER ERROR = TERMINATOR correctable header error.

TERMINATOR EXTERNAL RAM PARITY ERROR = TERMINATOR external RAM parity error.

TERMINATOR INVALID ADDRESS ERROR = TERMINATOR invalid address error.

TERMINATOR READ ERROR = TERMINATOR read error.

TERMINATOR RECEIVED CELL DROPPED DUE TO BAD HEC = TERMINATOR received cell dropped due to bad header contents.

TERMINATOR RX INPUT SIDE LOSS OF CLOCK = TERMINATOR receive input side loss of clock.

TERMINATOR TX ATM CELL PARITY ERROR = TERMINATOR transmit ATM cell parity error.

TERMINATOR TX INPUT SIDE LOSS OF CLOCK-FRAME SYNC = TERMINATOR transmit input side loss of clock-frame synchronization.

TERMINATOR TX PATH OVERHEAD ACCESS PARITY ERROR = TERMINATOR transmit path overhead access parity error.

TERMINATOR TX SECTION OVERHEAD ACCESS PARITY ERROR = TERMINATOR transmit section overhead access parity error.

TERMINATOR WRITE COMMAND ERROR = TERMINATOR write message error.

TIMEOUT = Recovery action timeout.

TIMER 0 = Timer 0.

TIMER 1 = Timer 1.

TIMER 2 = Timer 2.

TIMER 3 INTERRUPT = Programmable interval timer 3 interrupt (10 ms watchdog).

TRAC ERROR = TRAC error.

TRACE = Trace stimulus.

TRANSMIT FRAME COMPLETE = Transmit frame complete.

TRANSMITTER UNDERRUN = Transmitter underrun.

TRAP 0 INSTRUCTION VECTOR = Trap 0 instruction vector.

TRAP 1 INSTRUCTION VECTOR = Trap 1 instruction vector.

TRAP 2 INSTRUCTION VECTOR = Trap 2 instruction vector.

TRAP 3 INSTRUCTION VECTOR = Trap 3 instruction vector.

TRAP 4 INSTRUCTION VECTOR = Trap 4 instruction vector.
TRAP  5 INSTRUCTION VECTOR = Trap 5 instruction vector.
TRAP  6 INSTRUCTION VECTOR = Trap 6 instruction vector.
TRAP  7 INSTRUCTION VECTOR = Trap 7 instruction vector.
TRAP  8 INSTRUCTION VECTOR = Trap 8 instruction vector.
TRAP  9 INSTRUCTION VECTOR = Trap 9 instruction vector.
TRAP 10 INSTRUCTION VECTOR = Trap 10 instruction vector.
TRAP 11 INSTRUCTION VECTOR = Trap 11 instruction vector.
TRAP 12 INSTRUCTION VECTOR = Trap 12 instruction vector.
TRAP 13 INSTRUCTION VECTOR = Trap 13 instruction vector.
TRAP 14 INSTRUCTION VECTOR = Trap 14 instruction vector.
TRAP 15 INSTRUCTION VECTOR = Trap 15 instruction vector.
TWO RESETS WITHIN A WINDOW EVENT = Two resets within a memory clearing reset event window.
TYPE  0 EXPANSION BOARD INTERRUPT = Type 0 expansion board interrupt.
TYPE  1 EXPANSION BOARD INTERRUPT = Type 1 expansion board interrupt.
TYPE  2 EXPANSION BOARD INTERRUPT = Type 2 expansion board interrupt.
UAB RECEIVE FIFO UNDERRUN = User application bus receive FIFO underrun.
UN–USED OP CODE EXCEPTION = Un-used op code exception.
UNIDENTIFIED ERROR = Unidentified error.
UNIDENTIFIED FRM INTERRUPT = Unidentified frame interrupt.
UNIDENTIFIED INTERRUPT = Unidentified interrupt.
UNIDENTIFIED PB RECEPTION ERROR = Unidentified packet bus (PB) reception error.
UNIDENTIFIED PB TRANSMISSION ERROR = Unidentified PB transmission error.
UNIDENTIFIED REC. STATUS ERROR = Unidentified received status error.
UNIDENTIFIED SANITY ERROR = Unidentified sanity error.
UNIDENTIFIED SCB INTERRUPT = Unidentified SPORT (shared protocol receiver transmitter) control block interrupt.
UNIDENTIFIED SPYDER ERROR = Unidentified SPYDER error.
UNINITIALIZED INTERRUPT = Uninitialized interrupt.
UNKNOWN ERROR TYPE = Unknown error type.
UNUSED USER DEFINED VECTOR = Unused user defined vector.

VISA - ACTIVE PHDB INTERFACE SYNC ERROR = Active protocol handler data block interface sync error.

VISA - DATA BUS PARITY ERROR - HIGH BYTE = Data bus parity error in the high byte.

VISA - DATA BUS PARITY ERROR - LOW BYTE = Data bus parity error in the low byte.

VISA - DSP OUTPUT PARITY ERROR = Digital signal processor output parity error.

VISA - MULTIPLE VOCODER LOAD ERROR = Multiple vocoder load error.

VISA - STANDBY PHDB INTERFACE SYNC ERROR = Standby protocol handler data block interface sync error.

WATCH-DOG TIMER INTERRUPT = Watch-dog timer interrupt fired.

WRITE PROTECT ERROR = Write protect error.

WRITE PROTECTION ERROR = Write protection error.

ZERO DIVIDE EXCEPTION = Zero divide exception error.
## 1. BIT AND BYTE NUMBERING (ALL REGISTERS)

<table>
<thead>
<tr>
<th>Bit</th>

<td></td>
</tr>
</tbody>
</table>

* If bit 21 is a 1 (RAM), then:
  - bits 12-13, 16-19 select a DMA RAM location,
  - bits 12, 13 designate one of 4 words in the block of RAM for the device,
  - bits 16-19 designate one of 16 devices allocated to each channel,
  - bit 20 designates one of 2 DMA channels.

If bit 21 is a 0 (REG), then:

<table>
<thead>
<tr>
<th>Bits 12-20</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>DIO data</td>
</tr>
<tr>
<td>2</td>
<td>Store address</td>
</tr>
<tr>
<td>6</td>
<td>Store data</td>
</tr>
<tr>
<td>7</td>
<td>Incrementer (incremented by 4)</td>
</tr>
<tr>
<td>D</td>
<td>Clear mask for channel 0</td>
</tr>
<tr>
<td>15</td>
<td>Set mask for channel 0</td>
</tr>
<tr>
<td>25</td>
<td>Clear mask for channel 1</td>
</tr>
<tr>
<td>45</td>
<td>Set mask for channel 1</td>
</tr>
</tbody>
</table>

If there are no error bits set in the DMAC status register, refer to the channel data register for the error.

**CHANNEL DATA REGISTER**

<table>
<thead>
<tr>
<th>Bits 0-2</th>
<th>Error Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Invalid WCA message</td>
</tr>
<tr>
<td>2</td>
<td>Illegal device request</td>
</tr>
<tr>
<td>3</td>
<td>End of segment error</td>
</tr>
<tr>
<td>4</td>
<td>Page access failure</td>
</tr>
<tr>
<td>5</td>
<td>DIO channel failure</td>
</tr>
</tbody>
</table>

If the channel data register has a value of five, look in the DMAC status register for the DIO error.

Bits 24 and 25 have no active state but are decoded as shown in the following exhibit.

<table>
<thead>
<tr>
<th>Bits 24,25</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>DMA read from the device</td>
</tr>
<tr>
<td>1</td>
<td>PIO to the channel was issued</td>
</tr>
<tr>
<td>2</td>
<td>DMA write to the device</td>
</tr>
<tr>
<td>3</td>
<td>Setup data was requested from the device</td>
</tr>
</tbody>
</table>

**DUAL SERIAL CHANNEL (DSCH) CHANNEL STATUS REGISTER (NOTE)**

Type: Output

1. STREAM CONTROL PROTOCOL HANDLER (SCTP) ENDPOINT AND ASSOCIATION STATUSES
APPENDIX

1.1 ASSOCIATION STATUSES

CLOSED ENDPT[1] = The SCTP endpoint related to this association is OOS MAN or OOS UNAVL.

CLOSED ERROR[2] = The association is closed because:

- all paths are INACTIVE.
- an ABORT or SHUTDOWN has been received from the far end.
- anything that can happen to make the association CLOSE autonomously.

CLOSED MAN[3] = The association has been manually removed through the RMV:SCTP input message with the ASSOC parameter or the association has just been grown in, using RC/V, and has not been ESTABLISHED through the associate operation using the RST:SCTP input message with the ASSOC parameter.

DEGRADED[4] = One or more, but not all, paths in the association are INACTIVE. Reasons include:

- Path heartbeat failure.
- anything that can happen autonomously to make the path INACTIVE.

ESTABLISHED[5] = All paths in the association are ESTABLISHED.

TRANSIENT[6] = The SCTP association is transitioning from one state to another.

1.2 ENDPOINT STATUSES

GROW[1] = The SCTP endpoint has no associations assigned.

INSERV[2] = The SCTP endpoint is IN SERVICE. All associations related to this SCTP endpoint are ESTABLISHED or DEGRADED.

NOSERV[3] = All associations are CLOSED MAN or CLOSED ERROR.

PARTSERV[4] = The SCTP endpoint is PARTIAL SERVICE. One or more but not all associations related to this endpoint are CLOSED.

OOS MAN[5] = The SCTP endpoint has been removed and placed out-of-service manually.

OOS UNAVL[6] = The SCTP endpoint has been removed and placed out-of-service because both (duplex) of its associated session initiation protocol for telephony protocol handlers (SIP-T PHs) are
UNAVAILABLE.

TRANSIENT[7] = The SCTP endpoint is transitioning from one state to another.
1. STANDARD REPAIR PROCEDURE APPENDIX

1. Verify unit/circuit 'x' is removed from service.
   a. Bring up display page for unit/circuit 'x'.
   b. Circuit 'x' should be out of service (OOS); if not, make sure further action is necessary; if so, use REMOVE poke to remove circuit 'x'.

2. Establish consistent diagnostic failure (some tests failed - STF) pattern.
   a. Use DIAGNOSE poke to diagnose circuit 'x' and get a suspected faulty equipment list.
   b. If diagnostic STF pattern (PH, SEG, TEST, MM) is the same as original failure, continue to Step 3;
   c. If STF pattern is not the same as original failure, diagnose (DGN) circuit several more times, try to get predominant failure pattern, the fault may be intermittent such that diagnosis is all tests passed (ATP) some times. Use UCL and RAW options on DGN input message to see if later tests or phases are failing more consistently; the RPT and PH options are handy for repeating particular phase(s).
   d. If there is no predominant failure, construct a combined suspect pack list with common packs at the top of list.

3. Examine next pack on suspect pack list along with accompanying notes.
   a. If suspect pack list has been exhausted, go to Step 9.
   b. If pack/suspect equipment is in circuit under test continue to Step 4; if not, proceed to next item.
   c. Remove and diagnose other circuit containing suspect pack (attempt to get confirmation of failure from the other circuit diagnostic).
   d. If other circuit's diagnosis is STF, choose which unit diagnostic (and suspect pack list) to continue working (usually best to work circuit that is highest in the control hierarchy; such as, if LUCHAN diagnostic's suspected faulty equipment list points to LUCOMC and LUCOMC diagnosis is STF, then work the LUCOMC failure).

   Note: When a board is replaced in a second unit, that unit should be diagnosed ATP and restored before rerunning the first unit's diagnostic.

4. Replace suspect pack/equipment with spare. Note: observe any caution indicated by note with
pack on suspected faulty equipment output message.

5 Diagnose circuit and examine results.

a If diagnostic result is ATP, go to Step 6.

b If failure pattern (PH, SEG, TEST, MM) is identical to original, return original pack to the unit and proceed to the next entry on the suspect pack list (Step 3).

c If failure pattern is different, diagnose circuit again using DGN input with UCL and RAW options. If predominant failure pattern is now different from original failure, the spare pack is probably faulty (or wrong series, etc) and another spare pack should be tried (Step 4).

6 If original diagnostic failure was intermittent, diagnose circuit several times to confirm that intermittent failure is indeed cleared; if not, return to Step 3.

7 Swap original apparently faulty board with last spare that was inserted, diagnose the circuit again to confirm the failure returns with that board, then replace with the spare board.

8 Run additional diagnostics if suggested by the note field in the suspected faulty equipment message (for final verification of spare board). Then enter request to restore (RST) unit/circuit.

a If RST diagnosis is ATP and no new error reports are observed after unit/circuit is restored to service, then trouble is cleared.

b If trouble is not cleared, return to Step 5.

9 When the suspect pack list has been exhausted, make a judgement on which of the following is the appropriate alternative depending on the situation:

a Replace, one at a time, the remaining packs in the unit not previously tried.

b Replace, one at a time, packs in adjacent unit(s) connected to the failing unit.

Note: Be sure to remove unit before replacing pack.

c Do multiple pack swap with another unit that diagnoses ATP and that can be removed from service. If problem moves with packs, return the packs until the faulty board is isolated. If the problem does not move with the boards, check for possible cable or wiring problems. Multiple pack swaps must be done very carefully to avoid creating additional problems.

d Request additional assistance, particularly if the trouble is in a critical duplex unit such as a CU, MHD, ONTC, MCTSI, etc.
1. SYSTEM UPDATE PROCEDURE MENU PAGE APPENDIX

1.1 Introduction

This appendix contains the system update menu page error codes and describes all the possible system update menu page error conditions that can occur when installing a system update using the system update menu page. These error conditions are not affiliated in any way with the error conditions output by the system update processes. System update error conditions are described in the APP:SUPR appendix in the Appendixes section of the Output Messages manual. The system update menu page error conditions are divided into five categories: system update log file errors (1-199), UNIX® RTR system call errors (200-399), system update menu page internal errors (400-599), user errors (600-799), and general warning messages (800-999).

For all error conditions corresponding to system update processes, the following actions should be taken in the order they are listed here.

1. After correcting the condition that caused the error, try to continue the update using the 704 menu page poke for the continue option.

2. If the continue option does not work, try finishing the update manually using an input message on the manual input message line.

3. If the update cannot be finished manually, remove the system update log file (/etc/log/suprlog), terminate the system update menu page, and start the update over from the very beginning of the system update procedures (the enter option). The update may be installed using either manual procedures or menu driven procedures (system update menu page). Make sure that the system is in a valid state before re-starting the update.

1.2 System Update Log File Errors

These error conditions can occur when system update is accessing the system update log file.

1. The system update getlog() function failed when the continue option was specified. The getlog() function was called to get the last log entry in the system update log file to determine which option is to be continued. If continuing the update does not work, the log file may be damaged.

2. When the continue option was specified, the last log entry in the system update log file was obtained in order to determine which option is to be continued. Either no log entries were found in the log file or only the LOGFIRST entry was found which indicates that no option executed long enough to be able to be continued. Try to execute the desired option from the beginning of that option. If continuing the update does not work, the log file may be damaged.

3. When the continue option was specified, the last log entry in the system update log file was obtained in order to determine which option is to be continued. The process type in the log entry found contains a bad value. Therefore, the process being continued cannot be determined. Valid process types are:

- b = Backout option.
Commit option.

Enter option.

Proceed option.

Restore option.

If continuing the update does not work, the log file may be damaged.

The system update log file was being searched in order to determine which system update process last completed successfully so that a visual indication of the successfully completed input messages can be displayed in reverse video on the system update menu page. A bad process type was found in the log entry corresponding to the last completed process. Valid process types are:

Backout process.

Commit process.

Enter process.

Proceed process.

Restore process.

The log file may be damaged.

The system update menu page was trying to get, from the begin enter entry in the system update log file, the enter option line arguments that were previously specified. An invalid sequence option was found in the begin enter log entry. Valid sequence options are:

Single sequence (first sequence).

Double sequence (second sequence).

Triple sequence (third sequence).

The menu page terminates when this error occurs since this may be an indication that the log file is damaged. Try to bring up the menu page again. If the error persists, read the log file using the OP:G-READLOG input message. Look at the begin enter log entry and make sure that the sequence options are listed correctly. If not, remove the log file and start the update over from the beginning of the enter step. If the sequence options are correct, try to finish the update manually using input messages.

The system update menu page was trying to get, from the begin enter entry in the system update log file, the enter option line arguments that were previously specified. An invalid update method was found in the begin enter log entry. Valid update methods are:

Backup partition update method.

Off-line disk update method.
The menu page terminates when this error occurs since this may be an indication that the log file is damaged. Try to bring up the menu page again. If the error persists, read the log file using the OP:G-READLOG input message. Look at the begin enter log entry and make sure that the sequence options are listed correctly. If not, remove the log file and start the update over from the beginning of the enter step. If the sequence options are correct, try to finish the update manually using input messages.

7

- When it is time for a user to mount a tape and continue the update during the enter option, the enter option sends a signal to the menu page in order to tell the menu page that a "mount tape and continue" message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the system update log file. When the menu page receives the "mount tape and continue" signal from the enter option, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the enter option line in the display area of the menu page. In this case, the fake disk log entry could not be found in the log file. Terminate the menu page and try to bring it back up again. The "mount tape and continue" message should be displayed and the enter input option line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the enter option, or try to continue the update manually using input messages.

8

- When it is time for a user to mount a tape and continue the update during the enter option, the enter option sends a signal to the menu page in order to tell the menu page that a "mount tape and continue" message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the system update log file. When the menu page receives the "mount tape and continue" signal from the enter option, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the enter option line in the display area of the menu page. In this case, an invalid disk pair number was found in the fake disk log entry. The disk pair number found was a number less than one. Valid value(s) 1 and greater. Terminate the menu page and try to bring it back up again. The "mount tape and continue" message should be displayed and the enter input option line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the enter option, or try to continue the update manually using input messages.

9

- When it is time for a user to mount a tape and continue the update during the enter option, the enter option sends a signal to the menu page in order to tell the menu page that a "mount tape and continue" message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the system update log file. When the menu page receives the "mount tape and continue" signal from the enter option, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the enter option line in the display area of the menu page. In this case, an invalid disk pair number was found in the fake disk log entry. The disk pair number found was a number that is greater than the total number of disks being updated. Terminate the menu page and try to bring it back up again. The "mount tape and continue" message should be displayed and the enter input option line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the enter option, or try to continue the update manually using input messages.

1.3 UNIX® RTR System Call Errors
These error conditions occur when a UNIX® RTR system call executed by the system update menu page fails.

200 = The function sendpw() failed when the menu page was sending DAP a message to free and initialize the system update menu page. Try to bring up the system update menu page again by typing the 107 menu poke.

201 = When the term page poke was requested, the function sendpw() failed. The menu page was sending DAP a message to free the system update menu page before it terminated so that the menu page would terminate cleanly. Try to terminate the menu page again using the term page poke.

202 = When the term page poke was requested, the function sendpw() failed. The menu page was sending DAP a message to free enter arguments page 1 before it terminated the menu page so that the menu page would terminate cleanly. Try to terminate the menu page again using the term page poke.

203 = When the term page poke was requested, the function sendpw() failed. The menu page was sending DAP a message to free enter arguments page 2 before it terminated the menu page so that the menu page would terminate cleanly. Try to terminate the menu page again using the term page poke.

204 = The getenv() function failed when the menu page tried to get the terminal type from the environment. Try to bring up the system update menu page again by typing the 107 poke.

205 = The sendpw() function failed when the menu page tried to send DAP a message to display one of the system update pages.

   page number 0 = System update menu page.
   page number 1 = Enter arguments page 1.
   page number 2 = Enter arguments page 2.

Try to display the page again by typing the appropriate poke.

206 = The mesgenab() function failed when the menu page tried to enable message reception. Try to bring up the system update menu page again by typing the 107 poke.

207 = The recvw() function failed when receiving or waiting for a message from DAP indicating that a poke was requested from the system update menu page. Re-request the poke that failed.

208 = The sendpw() function failed when sending a message to DAP to display one of the input option lines in the display area of the system update menu page. Re-request the poke for the option that is desired to be displayed.

209 = The recvw() function failed when receiving or waiting for a poke on one of the enter arguments pages. Try to specify the desired poke again.

210 = The recvw() function failed when receiving or waiting for an argument to the enter option line to be input by the user. Re-request the poke to the desired argument and then try to specify the argument contents again.

211 = The sendpw() function failed when sending a pokeop message to DAP so that a poke on the system update menu page can be processed. Try to request the desired poke again.
The open() function failed when the system update log file was being opened for reading. The menu page was going to read the log file entries to determine which system update process last completed successfully in order to visually indicate the successfully completed options in reverse video on the system update menu page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

The read() function failed when reading the first log entry in the system update log file. It was being read when the menu page was in the process of determining which system update process last completed successfully in order to visually indicate the successfully completed options in reverse video on the system update menu page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

The lseek() function failed when "seeking" to the last log entry in the system update log file. The lseek() function was called when the menu page was in the process of determining which system update process last completed successfully in order to visually indicate the successfully completed options in reverse video on the system update menu page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

The read() function failed when reading the last log entry in the system update log file. It was being read when the menu page was in the process of determining which system update process last completed successfully in order to visually indicate the successfully completed options in reverse video on the system update menu page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

The lseek() function failed when "seeking" backwards to the next log entry in the system update log file. The lseek() function was called when the menu page was in the process of determining which system update process last completed successfully in order to visually indicate the successfully completed options in reverse video on the system update menu page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

The read() function failed when reading the next log entry in the system update log file. It was being read when the menu page was in the process of determining which system update process last completed successfully in order to visually indicate the successfully completed options in reverse video on the system update menu page. Try to bring up the menu page again by typing the 107 poke. If this error still occurs, the log file may be damaged.

The function sendpw() failed when the menu page was sending DAP a message to free and initialize enter arguments page 2. Try to bring up the system update menu page again by typing the 107 menu poke.

The lcall() function failed when the restore process was attempting to be executed. Try to execute the restore process again. If this error still occurs, try to finish the update manually using input messages.

The lcall() function failed when the stop process was attempting to be executed. Try to execute the stop process again. If this error still occurs, try to execute the stop process manually using the input message.

Note: The execution and termination messages for the stop process will not be displayed on the system update menu page if the stop process is executed manually.

The lcall() function failed when the application process was attempting to be executed. Try to execute the application process again. If this error still occurs, try to execute the application process manually using the input message.
Note: The execution and termination messages for the application process will not be displayed on the system update menu page if the application process is executed manually.

222 = The lcall() function failed when the backout process was attempting to be executed. Try to execute the backout process again. If this error still occurs, try to finish the update procedures manually using input messages.

Note: The execution and termination messages for the system update options will not be displayed on the system update menu page if the options are executed manually.

223 = The lcall() function failed when the commit process was attempting to be executed. Try to execute the commit process again. If this error still occurs, try to execute the commit process manually using the input message.

Note: The execution and termination messages for the commit process will not be displayed on the system update menu page if the commit process is executed manually.

224 = The lcall() function failed when the continue process was attempting to be executed. Try to execute the continue process again. If this error still occurs, finish the update manually using input messages.

225 = The vcall() function failed when the enter process was attempting to be executed. Try to execute the enter process again. If this error still occurs, finish the update manually using input messages.

226 = The lcall() function failed when the proceed process was attempting to be executed. Try to execute the proceed process again. If this error still occurs, try to finish the update manually using input messages.

Note: The execution and termination messages for the system update options will not be displayed on the system update menu page if the options are executed manually.

227 = The lcall() function failed when the readlog process was attempting to be executed. Try to execute the readlog process again. If it still does not work, try to execute the readlog process manually using the input message.

Note: The execution and termination messages for the readlog process will not be displayed on the system update menu page if the readlog process is executed manually.

228 = The function sendpw() failed when the menu page was sending DAP a message to free and initialize enter arguments page 1. Try to bring up the system update menu page again by typing the 107 menu poke.

229 = When the system update menu page is first brought up, it figures out which system update options have already been successfully executed so that it can display those menu numbers in reverse video on the menu page. It does this by reading the system update log file. This error occurred when the menu page was trying to "seek" to the very first entry in the log file. The lseek() option failed. Try to bring up the menu page again. If the error persists, either try to continue the
update manually using input messages, or remove the log file and start the update over from the beginning of the enter step.

230 When it is time for a user to mount a tape and continue the update during the enter option, the enter option sends a signal to the menu page in order to tell the menu page that a "mount tape and continue" message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the system update log file. When the menu page receives the "mount tape and continue" signal from the enter option, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the enter option line in the display area of the menu page. In this case, the open() option failed when the menu page was trying to open the log file. Terminate the menu page and try to bring it back up again. The "mount tape and continue" message should be displayed and the enter input option line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the enter option, or try to continue the update manually using input messages.

231 When it is time for a user to mount a tape and continue the update during the enter option, the enter option sends a signal to the menu page in order to tell the menu page that a "mount tape and continue" message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the system update log file. When the menu page receives the "mount tape and continue" signal from the enter option, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the enter option line in the display area of the menu page. In this case, the lseek() option failed when the menu page was trying to "seek" to the first entry in the log file. Terminate the menu page and try to bring it back up again. The "mount tape and continue" message should be displayed and the enter input option line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the enter option, or try to continue the update manually using input messages.

232 When it is time for a user to mount a tape and continue the update during the enter option, the enter option sends a signal to the menu page in order to tell the menu page that a "mount tape and continue" message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the system update log file. When the menu page receives the "mount tape and continue" signal from the enter option, the menu page reads the fake disk entry from the log file and obtains the disk pair number of the disk that is currently being updated. The menu page then displays in reverse video the appropriate disk pathname that is displayed in the enter option line in the display area of the menu page. In this case, the read() option failed when the menu page was trying to read the first entry in the log file. Terminate the menu page and try to bring it back up again. The "mount tape and continue" message should be displayed and the enter input option line should be displayed in the display area with the appropriate disk pathname in reverse video. If this does not happen, either try to start the update over from the beginning of the enter option, or try to continue the update manually using input messages.

233 When it is time for a user to mount a tape and continue the update during the enter option, the enter option sends a signal to the menu page in order to tell the menu page that a "mount tape and continue" message needs to be displayed on the messages line of the menu page. A fake disk log entry, containing the disk pair number of the disk currently being updated, is also written to the system update log file. When the menu page receives the "mount tape and continue" signal from the enter option, the menu page reads the fake disk entry from the log file and obtains the disk pair
number of the disk that is currently being updated. The menu page then displays in reverse video
the appropriate disk pathname that is displayed in the enter option line in the display area of the
menu page. In this case, the lseek() option failed when the menu page was trying to "seek" to the
fake disk entry in the log file. Terminate the menu page and try to bring it back up again. The
"mount tape and continue" message should be displayed and the enter input option line should be
displayed in the display area with the appropriate disk pathname in reverse video. If this does not
happen, either try to start the update over from the beginning of the enter option, or try to continue
the update manually using input messages.

234

= When it is time for a user to mount a tape and continue the update during the enter option, the
enter option sends a signal to the menu page in order to tell the menu page that a "mount tape and
continue" message needs to be displayed on the messages line of the menu page. A fake disk log
entry, containing the disk pair number of the disk currently being updated, is also written to the
system update log file. When the menu page receives the "mount tape and continue" signal from
the enter option, the menu page reads the fake disk entry from the log file and obtains the disk pair
number of the disk that is currently being updated. The menu page then displays in reverse video
the appropriate disk pathname that is displayed in the enter option line in the display area of the
menu page. In this case, the read() option failed when the menu page was trying to read the fake
disk entry in the log file. Terminate the menu page and try to bring it back up again. The "mount
tape and continue" message should be displayed and the enter input option line should be displayed
in the display area with the appropriate disk pathname in reverse video. If this does not happen,
either try to start the update over from the beginning of the enter option, or try to continue the
update manually using input messages.

1.4 System Update Menu Page Internal Errors

These error conditions occur when the system update menu page gets "mixed up" internally.

400

= One of the three system update pages was attempting to be displayed using the internal dispage() function which failed because a bad page number corresponding to the page to be displayed was passed to this function.

page number 0 = System update menu page.
page number 1 = Enter arguments page 1.
page number 2 = Enter arguments page 2.

Try to display the page again by typing the appropriate poke.

401

= While waiting for a poke to be specified on the system update menu page, the recvw() function received a message from DAP that either contained less than the minimum number of bytes allowed or contained greater than the maximum number of bytes allowed in a message. Try to specify the desired poke again.

402

= The stop option was requested, but the execcmd variable, which contains the poke number of the current executing system update option, contains a bad poke number. Therefore, the menu page does not know which option to stop. Try to specify the stop option again.

403

= The application process was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1). Try to request the application process again. If this error still occurs, execute the application manually using the input message.
While waiting for a poke to be specified on one of the enter arguments pages, the recvw() function received a message from DAP that either contained less than the minimum number of bytes allowed or contained greater than the maximum number of bytes allowed in a message. Try to specify the desired poke again.

A poke number could not be found in the text portion of the poke message sent from DAP to the menu page when the user requested a poke from one of the enter arguments pages. Therefore, the specified poke could not be processed. DAP may have sent the menu page a damaged message. Try to specify the desired poke again.

While waiting for an argument to be specified on one of the enter arguments pages, the recvw() function received a message from DAP that either contained less than the minimum number of bytes allowed or contained greater than the maximum number of bytes allowed in a message. Specify the poke corresponding to the desired argument and then try to specify the argument again.

An invalid number of literal strings were found in the text portion of the poke message sent from DAP to the menu page when the user specified arguments contents on one of the enter arguments pages. Therefore, the specified poke or literal string could not be processed. DAP may have sent the menu page a damaged message. Try to specify the desired argument poke and argument contents again.

The internal function checkargs() checks to make sure that all of the mandatory enter option line arguments have been specified. If all of them have not been specified, checkargs() returns the enter arguments page number of the page that contains the poke for the argument that was not specified:

page number 1 = Enter arguments page 1.
page number 2 = Enter arguments page 2.

The appropriate enter arguments page is displayed depending on the return value from checkargs so that the missing argument can be specified. Checkargs returned a bad page number and therefore the appropriate enter arguments page cannot be displayed. Make sure that all of the mandatory enter option line arguments have been specified then type the poke 753 to return to the system update menu page.

When formatting the enter input option line, the bootdisk specified was searched for in the enter arguments structure. It could not be found. Since it is mandatory for a bootdisk to be specified on the enter option line, the enter input option line could not be formatted and therefore could not be displayed in the display area of the system update menu page. Display enter arguments page 2 and make sure that a bootdisk has been specified.

When formatting the enter input option line, a sequence option specified was searched for in the Entry arguments structure. It could not be found. Display enter arguments page 2 again and re-specify sequence options for all the disks specified.

When formatting the enter input option line that is to be displayed in the display area of the system update menu page, too many lines were used for the option. The display area only contains 12 lines and more than 12 lines were used to format the enter input option line.

After formatting the enter input option line, not all of the disks specified were included in the option line (the number of disks formatted into the option line did not match the number of disks that were specified). The counter that contains the number of disks specified may be damaged. Terminate the menu page using poke 750, bring up the menu page again using poke 107, and re-specify all of the enter option line arguments.
= When the enter input option line was being formatted in order to be displayed in the display area of the system update menu page, the variable containing the input mode of the system was found to be damaged (it contained something other than MML). Since the menu page does not know which format to use, it cannot display the enter input option line. Terminate the menu page, bring up the menu page again, and re-specify all of the enter option line arguments.

= When deleting a specified disk, an invalid poke number corresponding to the disk being deleted was found. Try to type in the poke again for the disk being deleted, and then hit (return) to delete the previously specified disk. If that still does not work, terminate the menu page, bring up the menu page again, and re-specify all of the enter option line arguments.

= When specifying a disk, an invalid poke number corresponding to the disk being specified was found. Try to type in the poke again for the disk being specified, and then type in the full pathname of the desired disk. If that still does not work, terminate the menu page, bring up the menu page again, and re-specify all of the enter option line arguments.

= A specified tape sequence option was being added to the enter arguments structure when a bad tape sequence option poke was found in the variable that saves the poke last specified. Try to specify the tape sequence option poke again and then re-specify the tape sequence option argument.

= A previously specified tape sequence option was being deleted from the enter arguments structure when a bad tape sequence option poke was found in the variable that saves the poke past specified. Try to specify the tape sequence option poke again and then try to delete the previously specified tape sequence option.

= A bad poke number was specified on one of the enter arguments pages. Specify only a poke number that is on the page currently being displayed.

= The system update menu page process received a SIGCLD signal. When the function qwait() was executed to find the process ID (PID) of the child that terminated, the qwait() function returned a PID of zero which indicates that no child process terminated. If the rest of the system update cannot be performed using the menu page because of this error, finish the update manually using input messages.

= The system update menu page process received a SIGCLD signal. When the function qwait() was executed to find the PID of the child that terminated, the qwait() function returned a PID of -1 which indicates that no child existed that could terminate. If the rest of the system update cannot be performed using the menu page because of this error, finish the update manually using input messages.

= The enter poke was specified and the menu page process executed the checkargs() function to make sure that all of the mandatory enter option line arguments have been specified. If at least one of these arguments have not been specified, checkargs() returns the page number of the enter arguments page that needs to be displayed so that the missing argument can be specified. In this case, checkargs returned an invalid enter arguments page number. Valid page numbers are:

page number 1 = Enter arguments page 1.
page number 2 = Enter arguments page 2.

Try to specify the enter poke again.

= The application process terminated unsuccessfully with an error code (a value other than one).
Fix the error and then execute the application process again.

427 The backout process terminated unsuccessfully with an error code (a value other than one). To determine the exact system update error that occurred, look at the UPD:GEN-BACKOUT error message that was printed on the ROP by the backout process. This message contains a system update error code. Look up this error code in the APP:SUPR appendix in the Appendixes section of the Output Messages manuals to find the exact cause of the error. Fix the error and then continue the backout process using the continue poke.

428 The commit process terminated unsuccessfully with an error code (a value other than one). To determine the exact system update error that occurred, look at the UPD:GEN-COMMIT error message that was printed on the ROP by the commit process. This message contains a system update error code. Look up this error code in the APP:SUPR appendix in the Appendixes section of the Output Messages manual to find the exact cause of the error. Fix the error and then continue the commit process using the continue poke.

429 The continue process terminated unsuccessfully with an error code (a value other than one). To determine the exact system update error that occurred, look at the UPD:GEN-CONTINUE error message that was printed on the ROP by the continue process. This message contains a system update error code. Look up this error code in the APP:SUPR appendix in the Appendixes section of the Output Messages manual to find the exact cause of the error. Fix the error and then re-execute the continue process.

430 The enter process terminated unsuccessfully with an error code (a value other than one). To determine the exact system update error that occurred, look at the UPD:GEN-ENTER error message that was printed on the ROP by the enter process. This message contains a system update error code. Look up this error code in the APP:SUPR appendix in the Appendixes section of the Output Messages manual to find the exact cause of the error. Fix the error and then continue the enter process using the continue poke.

431 The proceed process terminated unsuccessfully with an error code (a value other than one). To determine the exact system update error that occurred, look at the UPD:GEN-PROCEED error message that was printed on the ROP by the proceed process. This message contains a system update error code. Look up this error code in the APP:SUPR appendix in the Appendixes section of the Output Messages manual to find the exact cause of the error. Fix the error and then continue the proceed process using the continue poke.

432 The readlog process terminated unsuccessfully with an error code (a value other than one). To determine the exact system update error that occurred, look at the OP:GEN-READLOG error message that was printed on the ROP by the readlog process. This message contains a system update error code. Look up this error code in the APP:SUPR appendix in the Appendixes section of the Output Messages manual to find the exact cause of the error. Fix the error and then re-execute the readlog process.

433 The restore process terminated unsuccessfully with an error code (a value other than one). To determine the exact system update error that occurred, look at the UPD:GEN-RESTORE error message that was printed on the ROP by the restore process. This message contains a system update error code. Look up this error code in the APP:SUPR appendix in the Appendixes section of the Output Messages manual to find the exact cause of the error. Fix the error and then continue the restore process using the continue poke.

434 The stop process terminated unsuccessfully with an error code (a value other than one). The process that was attempted to be stopped is still executing. To determine the exact system update error that occurred, look at the STP:GEN error message that was printed on the ROP by the stop process. This message contains a system update error code. Look up this error code in the
APP: SUPR appendix in the Appendixes section of the Output Messages manual to find the exact cause of the error. Fix the error if possible and then try to re-execute the stop process.

435 = A child process terminated, but the PID of the terminated child that was obtained using the qwait() function does not match any of the PIDs that were saved when each child was executed. If the update cannot be finished using the menu page because of this error, finish the update manually using input messages.

436 = The backout option was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1). Try to request the backout option again. If this error still occurs, finish the update procedures manually using input messages.

437 = The backout option was being formatted in order to be displayed when a bad value was found in the unconditional (UCL) flag variable. Try to request the backout option again. If this error still occurs, finish the update procedures manually using input messages.

438 = The commit option was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1). Try to request the commit option again. If this error still occurs, finish the update procedures manually using input messages.

439 = The commit option was being formatted in order to be displayed when a bad value was found in the UCL flag variable. Try to request the commit option again. If this error still occurs, finish the update procedures manually using input messages.

440 = The continue option was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1). Try to request the continue option again. If this error still occurs, finish the update procedures manually using input messages.

441 = An option is being continued. When the option begins execution, a message indicating that this option is executing is printed on the messages line of the menu page and its input option line is displayed in the display area of the system update menu page. The appropriate message and option line are printed depending on the option that was continued. The menu poke number for the continued option is saved in an internal variable which appears to be damaged because an invalid menu poke number was found. Therefore, the execution message and the input option cannot be displayed. This may not disrupt the rest of the update. The system update option is still executing. If problems arise, finish the update manually using input messages.

442 = The proceed option was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1). Try to request the proceed option again. If this error still occurs, finish the update procedures manually using input messages.

443 = The UCL flag (an internal variable) contains an invalid value. This flag indicates whether or not the UCL argument was requested for the last option specified (which in this case is the proceed option). Valid value(s):

  0 = UCL argument was not requested.

  1 = UCL argument was requested.

Try to specify the proceed option first without any arguments. If arguments are desired, specify
them next. If this error still occurs, finish the update manually using input messages.

444  = The retro flag (an internal variable) contains an invalid value. This flag indicates whether or not the retro argument was requested for the proceed option. Valid value(s):
    0   = Retro argument was not requested.
    1   = Retro argument was requested.

Try to specify the proceed option first without any arguments. If arguments are desired, specify them next. If this error still occurs, finish the update manually using input messages.

445  = The readlog option was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1). Try to request the readlog option again. If this error still occurs, execute the readlog option manually using the input message.

446  = The restore option was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1). Try to request the restore option again.

447  = The UCL flag (an internal variable) contains an invalid value. This flag indicates whether or not the UCL argument was requested for the last option specified (which in this case is the restore option). Valid value(s):
    0   = UCL argument was not requested.
    1   = UCL argument was requested.

Try to specify the restore option first without any arguments. If arguments are desired, specify them next. If problems still arise, finish the update manually using input messages.

448  = The proceed option was being formatted with the retro argument in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1). Try to request the proceed option without any arguments. Then, if arguments (such as retro) are desired, specify them next. If this error still occurs, finish the update procedures manually using input messages.

449  = The proceed option was being formatted with the retro argument in order to be displayed when a bad value was found in the UCL flag (internal variable) which indicates whether or not the UCL argument was requested for the last option specified (which in this case is the proceed option). Valid value(s):
    0   = UCL argument was not requested.
    1   = UCL argument was requested.

Try to specify the proceed option first without any arguments. If arguments are desired, specify them next. If this error still occurs, finish the update manually using input messages.

450  = The stop option was being formatted in order to be displayed when a bad value was found in the variable that saves the mode on which the system is running (MML = 1). Try to request the stop option again. If this error still occurs, execute the stop option manually using the input message.
The UCL flag (an internal variable) contains an invalid value. This flag indicates whether or not the UCL argument was requested for the last option specified (which in this case is the stop option). Valid value(s):

0 = UCL argument was not requested.
1 = UCL argument was requested.

Try to specify the stop option first without any arguments. If arguments are desired, specify them next. If this error still occurs, execute the stop option manually using the input message.

After the menu page poke (107) was requested while on one of the enter arguments pages which displayed the system update menu page, a poke was requested from the system update menu page. In order to process this poke, the poke number must be converted to its corresponding literal string name using the internal getname() function which could not find the corresponding literal string name. Try to request the desired poke number again.

When a system update process is continued, the continue option executes the system update process and returns the PID and the process type of the continued process to the menu page. The menu page saves the PID in one of the PID variables depending on the process being continued (indicated by the process type). In this case, a bad process type was received from the continue option. Valid process types are:

b = Backout process.
c = Commit process.
e = Enter process.
p = Proceed process.
r = Restore process.

Therefore, the PID of the continued process could not be saved. Since the menu page determines when a process terminates using the saved PIDs of executed processes, the completion message for the continued process cannot be printed and the menu page will never know when a process terminates. This may or may not be a problem depending on how far the update has gotten. If the enter option was continued, the proceed option will fail since the menu page does not know that the enter option has completed. In all other cases, the update should still work except that the completion message for the continued option will not be displayed on the menu page (but, system update does display the completion message on the ROP).

The menu page determined the system update option that was last successfully completed in order to visually display the appropriate options that have completed in reverse video on the system update menu page and to keep track internally of which system update options have already been executed. But, the variable containing the menu number corresponding to the last successfully completed option contains an invalid menu number. Valid menu numbers of successfully completed system update processes are:

701 = Enter process.
702 = Proceed process.
703 = Commit process.
Since the menu page has no way of knowing which system update processes have been successfully executed and which have not, the menu page cannot continue with the update and therefore terminates with an error. Try to bring up the system update menu page again.

- The system update menu page terminated itself due to an error occurring. The error code that corresponds to the error that occurred can be found printed on the ROP. Fix the error, bring up the system update menu page again, and try to finish the update.

- The lastcmd variable which contains the menu number of the last option that was specified, contains an invalid menu number. When the execute poke is requested, the option to be executed is obtained from the lastcmd variable. Since the lastcmd variable contains an invalid menu number, no process can be executed. Re-specify the desired option that is to be executed, and then type in the execute poke again.

- The unconditional flag for the restore option contains an invalid value. Valid value(s):
  0 = The restore option is to be executed conditionally.
  1 = The restore option is to be executed unconditionally.

  The restore option cannot be executed since it cannot be determined if it is to be executed conditionally or unconditionally. Try to specify and execute the restore option again.

- The unconditional flag for the stop option contains an invalid value. Valid value(s):
  0 = The stop option is to be executed conditionally.
  1 = The stop option is to be executed unconditionally.

  The stop option cannot be executed since it cannot be determined if it is to be executed conditionally or unconditionally. Try to specify and execute the stop option again.

- The unconditional flag for the backout option contains an invalid value. Valid value(s):
  0 = The backout option is to be executed conditionally.
  1 = The backout option is to be executed unconditionally.

  The backout option cannot be executed since it cannot be determined if it is to be executed conditionally or unconditionally. Try to specify and execute the backout option again.

- The unconditional flag for the commit option contains an invalid value. Valid value(s):
  0 = The commit option is to be executed conditionally.
  1 = The commit option is to be executed unconditionally.
The commit option cannot be executed since it cannot be determined if it is to be executed conditionally or unconditionally. Try to specify and execute the commit option again.

= The enter option cannot be executed because the UCL variable in the enter arguments structure contains an invalid value.Valid value(s):

UCL = The enter option is to be executed conditionally.
NOTSET = The enter option is to be executed unconditionally.

Re-specify YES or NO for the UCL argument on enter arguments page 1. Then, try to execute the enter option again.

= The enter option cannot be executed because the DFC preference variable in the enter arguments structure contains an invalid value. Valid value(s):

0 = DFC 0.
1 = DFC 1.
NOTSET = No preference.

Re-specify the DFC preference on enter arguments page 1. Then, try to execute the enter option again.

= The enter option cannot be executed because the variable in the enter arguments structure that indicates whether or not backup partitions are to be updated contains an invalid value. Valid value(s):

NOBKUPD = Do not update the backup partitions.
NOTSET = Update backup partitions.

Re-specify whether or not backup partitions are to be updated on enter arguments page 1. Then, try to execute the enter option again.

= The enter option cannot be executed because the update method variable in the enter arguments structure contains an invalid value. Valid value(s):

BKPRT = Backup partition update method.
OFLDISK = Off-line disk update method.

Re-specify the update method on enter arguments page 1. Then, try to execute the enter option again.

= The enter option cannot be executed because the tape sequence option variable for the bootdisk in the enter arguments structure contains an invalid value. Valid value(s):

SGLSEQ = Single tape sequence.
DBLSEQ = Double tape sequence.
TPLSEQ = Triple tape sequence.

Re-specify the tape sequence option on enter arguments page 2. Then, try to execute the enter option again.

466 = The enter option cannot be executed because the bootdisk could not be found in the enter arguments structure (system update will not work unless a bootdisk is being updated in addition to the other disks). Make sure a bootdisk was specified. If not, specify the bootdisk on enter arguments page 2 and attempt to execute the enter option again.

467 = The unconditional flag for the proceed option contains an invalid value. Valid value(s):

0 = The proceed option is to be executed conditionally.

1 = The proceed option is to be executed unconditionally.

The proceed option cannot be executed since it cannot be determined if it is to be executed conditionally or unconditionally. Try to specify and execute the proceed option again.

468 = The retrofit flag for the proceed option contains an invalid value. Valid value(s):

0 = Execute the proceed option without the retro argument.

1 = Execute the proceed option with the retro argument.

The proceed option cannot be executed since it cannot be determined if it is to be executed with or without the retro argument. Try to specify and execute the proceed option again.

469 = When the system update menu page is first displayed, the system update log file is read in order to determine which system update process last completed successfully. The menu number corresponding to that process is saved in the lastcmd variable. In this case, the lastcmd variable was found to contain an invalid menu number. Since the last system update process that last completed successfully could not be determined, the system update menu page terminated because it needs this information to run properly. Try to bring up the system update menu page again. If errors still persist, finish the update manually using input messages. If this still does not work, the system update log file may be damaged. Return the system to its original sane state, remove the system update log file, and then start the update from the very beginning (the enter option).

470 = If the system update menu page is terminated while a system update process is still executing and the menu page is brought back up before the system update process completes, the menu page reads the last entry written to the log file and sets an internal variable to indicate which process is executing. The currently executing process is determined by the value in the process type field in the last log entry. In this case, an invalid process type was found. Valid process types are:

b = Backout process.

c = Commit process.

e = Enter process.

p = Proceed process.
r = Restore process.

The menu page terminates when this error occurs since this may be an indication that the log file is damaged. Try to bring up the menu page again. If the error persists, read the log file using the OP:G-READLOG input message. Look at the begin log entry and make sure that the process type for the last entry is correct. If not, remove the log file and start the update over from the beginning of the enter step. If the process type is correct, try to finish the update manually using input messages.

471 When the menu page is first brought up, it reads the begin entries in the system update log file to determine the option line arguments that were previously specified for various system update processes that either were executing or are executing. In this case, a begin log entry was read which contains an invalid process type. Valid process types are:

b = Backout process.
c = Commit process.
e = Enter process.
p = Proceed process.
r = Restore process.

The menu page terminates when this error occurs since this may be an indication that the log file is damaged. Try to bring up the menu page again. If the error persists, read the log file using the OP:G-READLOG input message. Look at the begin log entries and make sure that the process types for the entries are correct. If not, remove the log file and start the update over from the beginning of the enter step. If the process types are correct, try to finish the update manually using input messages.

472 If the system update menu page was terminated while the system update enter process was executing and the menu page was brought back up before the enter process terminated, the menu page reads the system update log file to determine the enter option line arguments that were previously specified. In this case, not all of the mandatory enter option line arguments could be determined. Try to bring up the menu page again. If the error persists, read the log file using the OP:G-READLOG input message. Look at the begin enter log entry and make sure that the mandatory enter option line arguments are correct. If not, remove the log file and start the update over from the beginning of the enter step. If the process types are correct, try to finish the update manually using input messages.

473 If the system update menu page was terminated while the system update enter process was executing and the menu page was brought back up before the enter process terminated, the menu page reads the system update log file to determine the enter option line arguments that were previously specified. In this case, the begin enter log entry, which contains the enter option line arguments, could not be found in the log file. Try to bring up the menu page again. If the error persists, read the log file using the OP:G-READLOG input message. Look at the begin enter log entry and make sure that the option line arguments were specified correctly. If not, remove the log file and start the update over from the beginning of the enter step. If the option line arguments were specified correctly, try to finish the update manually using input messages.

474 If the system update menu page was terminated while a system update process was executing and the menu page was brought back up before the process terminated, the menu page determines
which option is currently executing and sets an internal variable to the PID of the currently executing process. In this case, a process is executing, but the menu page cannot figure out which one since all of the internal variables containing the PIDs of the system update process all indicate that there is no process executing. Try to bring up the menu page again. If the error persists, wait until the currently executing system update process terminates. Then, try to bring up the menu page.

### 1.5 User Errors

These error conditions occur when the error may have been caused by the user.

- **600**  
  The poke to terminate the system update menu page was requested when one of the system update processes or the application process was executing. The menu page can only be terminated if there are no processes currently executing. Wait until the executing processes terminates and then try to terminate the menu page again using the term page poke.

- **601**  
  More than three pokes were specified on the CMD< line of the system update menu page. Specify the correct number of pokes (one, two, or three) separated by commas.

- **602**  
  The retro poke was specified on the CMD< line of the system update menu page.

- **603**  
  The first poke that was specified on the CMD< line of the system update menu page is invalid. It must be one of the pokes that are displayed on that page. Pokes from the two enter arguments pages cannot be specified from the system update menu page.

- **604**  
  The enter option was requested when it has already successfully completed. The enter option cannot be executed more than once in one update. Either execute the proceed and/or commit option or execute the backout and/or restore options. If the update needs to be started from the very beginning of the update procedures, remove the system update log file (/etc/log/suprlog) and then execute the enter option.

- **605**  
  The commit option was requested when it has already successfully completed. The commit option cannot be executed more than once in one update. If the update needs to be started from the very beginning of the update procedures, remove the system update log file (/etc/log/suprlog) and then execute the enter option.

- **606**  
  The stop option can be used to stop only the following system update processes: backout, commit, continue, enter, proceed, and restore. The stop option was erroneously executed to stop either the readlog process or the stop process itself which are not allowed to be stopped by the stop option.

- **607**  
  The stop option was requested when no system update processes that can be stopped are executing.

- **608**  
  For the following options, only one or two pokes are allowed to be specified on the CMD< line of the system update menu page at one time (the option poke and the UCL flag if desired): backout, commit, enter, restore, and stop. A third poke was specified which is not allowed. Re-request the desired option specifying only the option poke and the UCL flag if desired.

- **609**  
  Two pokes were specified on the CMD< line of the system update menu page for one of the following options: backout, commit, enter, restore, or stop. The first poke was the poke for the option itself. The only poke value allowed for the second poke for these options is the UCL poke (using either the UCL poke number 710 or the "UCL" or "ucl" literal string) since this is the only argument allowed on these option lines. In this case, something other than the UCL poke or the "UCL" or "ucl" literal string was specified. Re-request the desired option.
= The proceed option was requested when it has already successfully completed. The proceed option cannot be executed more than once in one update. Either execute the commit option or execute the restore option. If the update needs to be started from the very beginning of the update procedures, remove the system update log file (/etc/log/suprlog) and then execute the enter option.

= The retro poke or the "RETRO" or "retro" literal string was specified as the second poke on the CMD< line of the system update menu page when the proceed option was specified as the first poke. The menu page does not allow this flag since system update does not handle it yet.

= The proceed option was specified with an argument on the CMD< line of the system update menu page. The only argument proceed allows is the UCL poke or the "UCL" or "ucl" literal string. The argument specified was something other than UCL.

= Three pokes were specified on the CMD< line of the system update menu page when only two are allowed at one time.

= The third poke specified on the CMD< line of the system update menu page was found to be invalid. Since the first poke specified corresponded to the proceed option, the other two pokes have to correspond with the UCL or retro arguments since these are the only arguments that the proceed option allows. In this case, the third poke was something other than the UCL or the retro argument.

= Three pokes are not allowed to be specified on the CMD< line of the system update menu page at the same time when the first poke corresponds to the application process.

= Only one poke is allowed to be specified on the CMD< line of the system update menu page when that poke corresponds to one of the following: enter args1, enter args2, continue, execute, readlog, and termpage. In this case, more than one poke was specified.

= The retro poke was specified on the CMD< line of the system update menu page, but the last option specified was not the proceed option. The retro poke is only allowed to be specified for the proceed option.

= Two pokes were specified on the CMD< line of the system update menu page. The first corresponded to the retro flag for the proceed option. The only other poke that is allowed to be specified for the proceed option corresponds to the UCL flag. In this case the second poke did not correspond to the UCL poke or literal string.

= Three pokes are not allowed to be specified on the CMD< line of the system update menu page when the first poke corresponds to the UCL poke. Only two pokes are allowed: the UCL poke and the poke or literal string corresponding to the retro flag (only if the last option currently being displayed in the display area is the proceed option).

= Until system update is changed to handle the retro flag on the proceed option line, the system update menu page will not allow the user to specify the retro poke. In this case, the UCL poke was specified on the CMD< line of the system update menu page. A second poke was also specified on the CMD< line. A second poke is not allowed to be specified since the only valid value allowed with the UCL poke is the retro poke and system update does not handle it yet.

= When system update is changed to handle the retro flag on the proceed option line and the UCL poke is specified on the CMD< line of the system update menu page, the second poke must correspond to the retro flag since that is the only argument that can be specified with the UCL argument.

= The UCL and retro flags were specified on the CMD< line of the system update menu page, but the last option specified was not the proceed option. The retro argument is only allowed to be
specified for the proceed option.

623 = The UCL poke was specified on the CMD< line of the system update menu page, but the last option specified does not accept the UCL argument on its option line.

624 = The number 0 was specified for the update method on the enter option line. Zero does not correspond to a valid update method argument. If the off-line disk method is desired, type the letter O. If the backup partition method is desired, type the letter B.

625 = An invalid update method was specified for the enter option line. Specify the letter O for the off-line disk method and the letter B for the backup partition method.

626 = An invalid tape device was specified. Either the full pathname or mt0, MT0, mt1, or MT1 may be used to specify the tape device.

627 = The specified tape device either does not exist or cannot be accessed for reading.

628 = A disk file controller (DFC) preference cannot be specified until an update method has been specified. This is done for error checking since a DFC preference can only be made if using the off-line disk update method.

629 = A DFC preference was specified when the update method specified was not the off-line disk method. A DFC preference can only be specified when using the off-line disk update method.

630 = An invalid DFC preference was specified. Type 0 for DFC 0, 1 for DFC 1, or 2 to specify no preference.

631 = It cannot be specified whether or not the backup partitions will be updated until an update method has been specified. In this case, an update method has not yet been specified. This is done for error checking since it can be specified that the backup partitions will or will not be updated only when using the off-line disk update method.

632 = It was specified that the backup partitions will or will not be specified when the update method specified was not the off-line disk method. It can be specified that the backup partitions will or will not be updated only when using the off-line disk update method.

633 = When requesting that the backup partitions will or will not be updated, an invalid argument value was specified. Type N if the backup partitions are not to be updated, type Y if the backup partitions are to be updated.

634 = When specifying whether or not the enter option is to be executed unconditionally, an invalid argument value was specified. To execute the enter option unconditionally, type Y. To execute the enter option conditionally, type N.

635 = All of the mandatory enter option line arguments were being checked to make sure that they were all specified (update method, tape device, and bootdisk to be updated). It was found that the update method has not yet been specified.

636 = All of the mandatory enter option line arguments were being checked to make sure that they were all specified (update method, tape device, and bootdisk to be updated). It was found that the tape device has not yet been specified.

637 = All of the mandatory enter option line arguments were being checked to make sure that they were all specified (update method, tape device, and bootdisk to be updated). It was found that a tape sequence option was specified for a disk that was not specified. Either remove all tape sequence
option specifications, or specify the corresponding disks to be updated.

- When the tape sequence option becomes a mandatory enter option line argument, this error message will be printed when a disk to be updated has been specified, but its corresponding tape sequence option has not been specified. Either remove the disk to be updated specification or specify its corresponding tape sequence option.

- A disk to be updated was not specified. It is mandatory that at least one disk is specified. This disk must be a bootdisk.

- It is a system update requirement that one of the specified disks to be updated has to be the bootdisk (currently called /dev/vtoc). The bootdisk could not be found and therefore is assumed to have not yet been specified.

- A full pathname was not specified for the specified disk to be updated.

- The specified disk to be updated does not exist, cannot be accessed for reading, or cannot be accessed for writing. Make sure the correct disk has been specified.

- A bad tape sequence option was specified. The only valid tape sequence options are:

  S  = Single tape sequence option.

  D  = Double tape sequence option.

  T  = Triple tape sequence option.

Specify the tape sequence option again using a correct value.

- The commit option was specified before the enter option was executed. First execute the enter and proceed options and then execute the commit option.

- The commit option was specified before the proceed option was executed. Execute the proceed option and then execute the commit option.

- The proceed option was specified before the enter option was executed. Execute the enter option and then execute the proceed option.

- The first poke that was specified on the CMD< line of the system update menu page was invalid. The only pokes allowed are the pokes that are being displayed on the current page. Try to specify the desired poke again.

- A system update process was attempted to be continued when the continue flag in the system update log file for that process indicates that this process is not continuable. Make sure that the last option executed really needs to be continued.

- The UCL argument was specified. But, a option that the UCL argument is for has not yet been specified. Specify the option that is to be executed. If the UCL argument is desired, specify it next.

- The UCL argument was specified. But, the last option specified that the UCL argument is for does not allow the UCL argument on its option line. Specify the desired option and the UCL argument again.

- The commit option cannot be executed because it has already been successfully executed. If the commit option was not really executed previously, try to execute the commit option manually using
the input message. If this error still occurs, terminate the system update menu page, remove the
system update log file, return the system to a sane state, and start the entire update over again
from the very beginning of the enter option.

652 = The enter option cannot be executed because it has already been successfully executed. If the
enter option was not really executed previously, try to execute the enter option manually using the
input message. If this error still occurs, terminate the system update menu page, remove the
system update log file, return the system to a sane state, and start the entire update over again
from the very beginning of the enter option.

653 = The proceed option cannot be executed because it has already been successfully executed. If the
proceed option was not really executed previously, try to execute the proceed option manually using
the input message. If this error still occurs, terminate the system update menu page, remove the
system update log file, return the system to a sane state, and start the entire update over again
from the very beginning of the enter option.

654 = The execute menu poke was requested before the system update or application option that is to
be executed was specified. Type the menu poke that corresponds to the process to be executed,
and then type the execute menu poke.

655 = The application process was requested while a previous call to the application process is still
executing. Only one application process can be executing at a time. Wait for the first application
process to terminate. Then execute the next application process call.

656 = The backout option was attempted to be executed while another system update option (commit,
continue, enter, proceed, or restore) was executing that would conflict with the backout option. Wait
for the executing system update option to terminate or terminate it manually using the stop option,
and then try to execute the backout option again.

657 = The commit option was attempted to be executed while another system update option (backout,
continue, enter, proceed, or restore) was executing that would conflict with the commit option. Wait
for the executing system update option to terminate or terminate it manually using the stop option,
and then try to execute the commit option again.

658 = The continue option was attempted to be executed while another system update option (backout,
commit, enter, proceed, or restore) was executing that would conflict with the continue option. Wait
for the executing system update option to terminate or terminate it manually using the stop option,
and then try to execute the continue option again.

659 = The enter option was attempted to be executed while another system update option (backout,
commit, continue, proceed, or restore) was executing that would conflict with the enter option. Wait
for the executing system update option to terminate or terminate it manually using the stop option,
and then try to execute the enter option again.

660 = The proceed option was attempted to be executed while another system update option (backout,
commit, continue, enter, or restore) was executing that would conflict with the proceed option. Wait
for the executing system update option to terminate or terminate it manually using the stop option,
and then try to execute the proceed option again.

661 = The restore option was attempted to be executed while another system update option (backout,
commit, continue, enter, or proceed) was executing that would conflict with the restore option. Wait
for the executing system update option to terminate or terminate it manually using the stop option,
and then try to execute the restore option again.

662 = Enter arguments page 1 was attempted to be displayed while the enter option was executing.
Since arguments for the enter option cannot be changed, added, or deleted after the enter option has begun its execution, the system update menu page prevents the user from going to enter arguments page 1 in case the user tries to change, add, or delete enter option line arguments.

Enter arguments page 2 was attempted to be displayed while the enter option was executing. Since arguments for the enter option cannot be changed, added, or deleted after the enter option has begun its execution, the system update menu page prevents the user from going to enter arguments page 2 in case the user add, or delete enter option line arguments.

A double tape sequence was specified on enter arguments page 2. But, a corresponding disk to be updated was not previously specified for this sequence option. A disk must first be specified, then its corresponding tape sequence option may be specified.

After formatting the enter input option line, not all the sequence options specified were included in the option line (the number of sequence options formatted into the option line did not match the number of sequence options that were specified). The counter that contains the number of sequence options specified may be damaged. Terminate the menu page using poke 750, bring up the menu page again using poke 107, and re-specify all the enter option line arguments.

A triple tape sequence was specified on enter arguments page 2. But, a corresponding disk to be updated was not previously specified for this sequence option. A disk must first be specified, then its corresponding tape sequence option may be specified.

The backup partition method was attempting to be specified using the poke on enter arguments page 1. But, a DFC preference was previously specified which is valid only for the off-line disk method. If the backup partition method is still desired, delete the DFC preference that was specified and then re-specify the backup partition method.

The backup partition method was attempting to be specified using the poke on enter arguments page 1. But, the update backup partition option was previously specified which is valid only for the off-line disk method. If the backup partition method is still desired, delete the update backup partition option that was specified and then re-specify the backup partition method.

A single tape sequence was specified on enter arguments page 2. But, a corresponding disk to be updated was not previously specified for this sequence option. A disk must first be specified, then its corresponding tape sequence option may be specified.

When executing the system update enter option using pokes on the system update menu page, the log file must be either empty or non-existent. It may not contain log entries from a previous update session. In this case, the log file contains entries. Remove the log file and terminate the menu page. Bring up the menu page again and re-execute the enter option.

### 1.6 Warning Messages

These warning messages are printed when an error occurs that may not affect the outcome of the update.

The function sendpw() failed when the menu page was sending DAP a message to display a message on the messages line of one of the menu page screens:

- SUPRPG = System update menu page.
- ARGSPG1 = Enter arguments page 1.
- ARGSPG2 = Enter arguments page 2.
Look for the message on the ROP. The message was also printed there.

801 = The menu page was trying to change a portion of a page either from normal video to reverse video or from reverse video to normal video. A bad video flag (VFLAG) specifying how to display the page (normal video or reverse video) was passed to the internal function chgvideo().

802 = The menu page was trying to send a message to DAP to change a portion of a page from normal video to reverse video when the sendpw() function failed.

803 = The menu page was trying to send a message to DAP to change a portion of a page from reverse video to normal video when the sendpw() function failed.

804 = The sendpw() function failed when a message was sent to DAP to blank out the messages line on one of the three system update pages.

805 = One of the enter arguments pages was displayed. The menu page found that the UCL argument was previously specified and tried to send a message to DAP to display a "Y" next to the UCL argument poke on enter arguments page 1 to indicate that this argument has previously been specified. The sendpw() function failed when sending DAP this message. Try to specify the UCL argument using the poke on enter arguments page 1.

806 = A attempt was made to blank out the messages line of the enter arguments page that is currently being displayed in order to erase a message that may have previously been displayed. The variable that saves the page that is currently being displayed contains a bad value. The messages line of the current enter arguments page cannot be blanked out since it is unknown which enter arguments page is being displayed.

807 = The application process completed and the variable Execcmd indicated that a system update option is currently executing. The internal function chkexec() was executed to find the name of the system update process that is currently executing. But, chkexec could not find the name of the process currently executing. Therefore, the execution message of the currently executing system update process could not be re-displayed on the messages line of the system update menu page.

808 = The sendpw() function failed when sending a message to DAP to display the "mount tape and continue" message on the messages line of the system update menu page. After mounting the tape, try to continue the update using the continue poke on the menu page.

809 = The sendpw() function failed when sending a message to DAP to blank out a line in the display area of the system update menu page.

810 = The sendpw() function failed when sending a message to DAP to either blank out a previously specified invalid enter option line argument from one of the enter arguments pages or draw an underline on one of the enter arguments pages to indicate where an argument is to be specified. If an argument was being blanked out, try to correct the invalid argument using the pokes on the appropriate enter arguments page. If an argument poke was specified, but the underline was not drawn where the argument is to be specified, type in the argument where the underline should have been drawn (the cursor should appear in the correct input area). The menu page should accept it.
When the poke corresponding to the enter argument that indicates whether or not backup partitions are to be updated is specified, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

When the poke corresponding to the enter argument that indicates whether or not backup partitions are to be updated is specified, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the enter argument is specified, the cursor is moved back up to the CMD< line so that the next enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

The readlog option or the application option was executed while there may have been another system update executing at the same time, or the stop option was executed but completed unsuccessfully. When one of these three conditions occur, the execution message and the option line of the option that is currently executing is re-displayed since it was overwritten by the readlog, stop, or application message and option line. The internal variable execcmd contains the poke menu number that corresponds to the executing option. In this case, execcmd contained an invalid menu number. Therefore, the currently executing option and its execution message could not be displayed. This may not affect the outcome of the update (just the display on the menu page).

The enter input option line was attempting to be re-displayed for one of three reasons:

- The readlog option was executed while the enter option was executing at the same time (when the readlog process completes, the option line for the enter option is re-displayed since the readlog option line overwrote the enter option line),

- The stop option was executed but completed unsuccessfully (since the stop option line overwrote the enter option line, the enter option line is re-displayed since it is still executing), or

- The application process was executed while the enter option was executing at the same time (since the application option line overwrote the enter option line, the enter option line is re-displayed since it is still executing).

But, the enter option line cannot be displayed because not all of the mandatory arguments can be found in the enter arguments structure. This may not affect the outcome of the update (just the display on the menu page).

After opening and reading the contents of the system update log file, the log file is closed. But, the close failed. This should not affect the outcome of the update.

When the poke corresponding to the enter argument that specifies a DFC, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.
When the poke corresponding to the enter argument that specified a DFC, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the enter argument is specified, the cursor is moved back up to the CMD< line so that the next enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

When the poke corresponding to the enter argument that specifies a disk to be updated is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys and then input the desired argument value.

When the poke corresponding to the enter argument that specified a disk to be updated is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the enter argument is specified, the cursor is moved back up to the CMD< line so that the next enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

If a disk to be updated was not specified using a full pathname (starting with a slash '/'), the invalid disk pathname specified is blanked from the page. In order to do this, the indicator name corresponding to the disk menu number specified is needed (the menu page sends a message to DAP with this information and then DAP blanks out the appropriate argument). In this case, the indicator name corresponding to the disk menu number specified cannot be obtained and therefore the invalid disk pathname cannot be blanked out. Specify the valid disk pathname by typing the desired disk poke again and then typing the correct disk pathname in the input field indicated by the blinking cursor. If it is desired to not correct the invalid disk pathname, the invalid pathname displayed should not affect the update (the invalid disk pathname remains on the screen but is ignored by the menu page).

The specified disk to be updated either does not exist or cannot be accessed for reading and/or writing, therefore, it is an invalid argument. The invalid disk specified was attempted to be blanked from the page. In order to do this, the indicator name corresponding to the disk menu number specified is needed (the menu page sends a message to DAP with this information and then DAP blanks out the appropriate argument). In this case, the indicator name corresponding to the disk menu number specified cannot be obtained and therefore the invalid disk pathname cannot be blanked out. Specify the valid disk pathname by typing the desired disk poke again and then typing the correct disk pathname in the input field indicated by the blinking cursor. If it is desired to not correct the invalid disk pathname, the invalid pathname displayed should not affect the update (the invalid disk pathname remains on the screen but is ignored by the menu page).

When the poke corresponding to the enter argument that specifies a disk to be updated is requested, an underline (the maximum length that the disk pathname can be) is drawn immediately after the poke number and its description to indicate where the disk argument is to be typed. The cursor is positioned at the beginning of the underline. Because of an internal error, this underline cannot be drawn. The cursor should still be positioned where the underline should have been drawn. This should not affect the outcome of the update. Go ahead and type in the disk pathname where the cursor is positioned.
When the poke corresponding to the enter argument that specifies a sequence option is requested, an underline (the maximum length that the sequence option input can be) is drawn immediately after the poke number and its description to indicate where the sequence option argument is to be typed. The cursor is positioned at the beginning of the underline. Because of an internal error, this underline cannot be drawn. The cursor should still be positioned where the underline should have been drawn. This should not affect the outcome of the update. Go ahead and type in the sequence option argument where the cursor is positioned.

When the poke corresponding to the immediately following the poke and its description. An internal error prohibited the movement of the cursor. Use the arrow keys to move the cursor to the desired disk input field. An underline may have been drawn to indicate the appropriate input field. Then type the desired disk pathname.

When the poke corresponding to the enter argument that specifies a sequence option is requested, the cursor is moved to the input field for that sequence option immediately following the poke and its description. An internal error prohibited the movement of the cursor. Use the arrow keys to move the cursor to the desired sequence option input field. An underline may have been drawn to indicate the appropriate input field. Then type the desired sequence option argument.

When the poke corresponding to the enter argument that specifies an update method is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

When the poke corresponding to the enter argument that specified an update method is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the enter argument is specified, the cursor is moved back up to the CMD< line so that the next enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending a cursor down message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

When the poke corresponding to the enter argument that specifies a sequence option is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending a cursor right message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

When the poke corresponding to the enter argument that specifies a sequence option is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the enter argument is specified, the cursor is moved back up to the CMD< line so that the next enter argument poke may be specified. This is done by sending a message to DAP to
move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

831

= When the poke corresponding to the enter argument that specifies a tape device is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

832

= When the poke corresponding to the enter argument that specifies a tape device is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the enter argument is specified, the cursor is moved back up to the CMD< line so that the next enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

833

= When the poke corresponding to the enter argument that specifies conditional or unconditional execution is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor to this input field manually using the arrow keys and then input the desired argument value.

834

= When the poke corresponding to the enter argument that specifies conditional or unconditional execution is requested, the cursor is placed at the beginning of the input field immediately after the poke number and its description so that the user can input the desired argument value in the appropriate place on the page. After the enter argument is specified, the cursor is moved back up to the CMD< line so that the next enter argument poke may be specified. This is done by sending a message to DAP to move the cursor. This error occurred when the sendpw() function failed when sending the message to DAP. Move the cursor back up to the CMD< line manually using the arrow keys. Update procedures should continue normally.

835

= When the enter option is executed, the enter option line is formatted to a form that is suitable for printing on the ROP. While formatting the enter option line, the malloc() function is used to allocate space needed for the formatting procedures. The malloc() function failed. This should not affect the outcome of the update (the enter option line that is executing just will not be displayed on the ROP).

836

= When the enter option is executed, the enter option line is formatted to a form that is suitable for printing on the ROP. While formatting the enter option line, the realloc() function is used to allocate space needed for the formatting procedures. The realloc() function failed. This should not affect the outcome of the update (the enter option line that is executing just will not be displayed on the ROP).

837

= The internal buffer array buffer contains the input option line for the option that was last specified on the system update menu page. In this case, the enter option line should reside in the buffer array since it was the last option specified. But, when the enter option line was being formatted to a form that is suitable for displaying on the ROP, the buffer array was found to contain all blanks. Since the enter option cannot be found in the buffer array, it cannot be formatted, and therefore cannot be displayed on the ROP. This should not affect the outcome of the update (the enter option that is executing just will not be displayed on the ROP).
1. System Update Error Codes Appendix

1.1 Introduction

This appendix contains the error codes for system update. The error codes consist of six decimal digits. The first three digits indicate the nature of the error. The next two digits ('xx') indicate the module in which the error occurred (that information is not provided here). The last digit (the error number, 'y') is used to differentiate errors of the same error code that can occur multiple times in the same module. To locate exactly which error in the module failed, each error is given its own unique error number.

1.2 Errors Associated with UNIX® System Calls

More information about these UNIX® system calls can be found in the APP:SYSERR appendix in the Appendixes section of the Output Messages manual. The error code that corresponds with the system call that failed is kept in the system update log file. It can be read by executing the OP:G-READLOG input message. The log entry specifying the UNIX® error number will be the error code for the UNIX® call that failed.

101xxy = mkseg() error.

The UNIX® system call mkseg() failed when the system update enter option tried to create a segment using makeseg() that was to be used as a buffer when reading in a new partition from the LDFT tape and writing it to disk. makeseg() may have failed because there was not enough space in memory for the segment. After resolving the problem, try to continue the update using the UPD:G-CONTINUE input message.

102xxy = open() error.

The UNIX® system call open() failed when system update attempted to open the system update log file. The open may have failed because:

- The system update log file does not exist (/etc/log/suprlog).
- One of the directories in the system update log file pathname (/etc/log) does not exist or does not have read permissions.
- The system update log file is not readable or writable depending on what it is being opened for (reading or writing).
- Too many files are open.

After resolving the problem, try to continue the update using the UPD:G-CONTINUE input message.

103xxy = read() error.

The UNIX® system call read() failed when system update tried to read an entry from the system update log file. The read may have failed because:

- A damaged log file.
- Physical I/O errors.
- A bad read() parameter.
  -- Bad buffer address where the data is to be read.
  -- Number of bytes to be read is bad.
  -- File descriptor indicating the file to be read from is not that of an input file.

Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

104xxxy = "seek()" error.

The UNIX® system call lseek() failed when system update attempted to "seek" to a particular log entry in the system update log file. The lseek may have failed because the file descriptor for the log file is undefined, the "seek" went to a position before the beginning of the log file, or the log file is damaged. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

105xxxy = write() error.

The UNIX® system call write() failed when system update attempted to write a log entry to the system update log file. The write may have failed because:

- Physical I/O errors.
- A bad write() parameter.
  - Bad buffer address from where the data is to be read.
  - Number of bytes to be written is bad.
  - Bad file descriptor for the system update log file to which the data is to be written.

Try to continue the update using the UPD:G-CONTINUE input message.

106xxxy = close() error.

The UNIX® system call close() failed when system update attempted to close the system update log file. An incorrect file descriptor for the log file may have been passed to the close() option. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

107xxxy = unlink() error.

The UNIX® system call unlink() failed when the system update proceed option attempted to unlink (remove) the special device file that was used to copy the system update log file to the offline disk (offline disk method) or to the backup /etc partition (backup partition method). The unlink may have
failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

108xx

= setio() error.

The UNIX® system call setio() failed when system update attempted to set the input/output mode for the disk being updated to physical I/O. The setio may have failed because the disk being updated was never opened. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

109xx

= mknod() error.

The UNIX® system call mknod() failed when the system update restore or commit option attempted to make a node that would be used to copy the new/old partitions over the old/new partitions using the backup partition method. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then manually execute the applhook process.

110xx

= lcall() error.

The UNIX® system call lcall() failed when system update attempted to execute applhook (/proc/supr/applhook). Applhook may not exist or may not have execution permissions. After resolving the problem, try to continue the update using the UPD:G-CONTINUE input message.

111xx

= msgenab() error.

The UNIX® system call msgenab() failed when system update attempted to enable message reception from one of the following processes: applhook, continue, the disk driver, MIRA, or SIM. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

- If this error occurred during any other system update process, start the update over from the beginning of the enter step.
The `send()` error.

The **UNIX®** system call `sendw()` failed when the system update continue option either attempted to send an acknowledgement message to the system update enter process which is currently running or attempted to send a message to SIM in order to request system initialization information. Try to continue the update again using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

The `kill()` error.

The **UNIX®** system call `kill()` failed when the system update stop option attempted to terminate the system update process that is currently running. The kill message may have failed because:

- The process to be killed does not exist.
- The sending process is not a superuser, and the sending and receiving processes do not have the same effective user ID.
- The process ID (PID) of the process being terminated is damaged in the system update log and the stop message passes this PID as a parameter to `kill()`.

If the system update still needs to be stopped, execute the stop process unconditionally (using the UCL argument on its message line).

**CAUTION:** If stop is executed unconditionally, it will attempt to terminated the running system update process by an extreme method using the `pkill()` option. Some system resources in use by the process may not be released automatically.

The `stat()` error.

The **UNIX®** system call `stat()` failed when system update attempted to obtain status information about the disk that is to be updated. This function may have failed because the disk does not exist. If this error occurred during the enter step of system update, make sure that all destination file names specified on the enter option line exist. After resolving the problem, try to continue the update using the UPD:G-CONTINUE input message.

The `msgport()` error.

The **UNIX®** system call `msgport()` failed when system update attempted to send a message to the disk driver so that system update could have access to an out of service disk at the partition level rather than at the disk level. The `msgport()` may have failed because:

- The disk driver is nonexistent.
- The port number specified is invalid.
- No process is connected to the specified port.
- The message buffer is not in the user address space.

Try to continue the update using the UPD:G-CONTINUE input message.
Error 116 = mount() error.

The UNIX® system call mount() failed when system update attempted to mount the /etc file system so that the system update log file can be copied to the new release or the database file system so that the ECD can be updated. The mount may have failed because:

- The effective user ID of the process executing the mount is not a superuser.
- The specified file system does not exist.
- The file system to be mounted is not specified.
- The block special file from which the file system is to be mounted is inaccessible or not an appropriate file.
- The file system is already mounted.
- The directory pathname that the file system is to be mounted on is not a directory.
- Too many file systems are mounted.

Try to continue the update by using the UPD:G-CONTINUE input message.

Error 117 = unmount() error.

The UNIX® system call umount() failed when system update attempted to unmount the /etc file system after the system update log file has been copied to the new release or the database file system after the ECD has been updated. The umount may have failed because:

- The effective user ID of the process executing the umount is not a superuser.
- The file system is not mounted.
- There are active files on the file system being unmounted.

Try to continue the update using the UPD:G-CONTINUE input message.

Error 118 = link() error.

RC/V recognizes the ECD by the name /mount_directory/ecd where mount_directory represents the directory path on which the ECD file system is mounted. However, system update recognizes the ECD by the name /mount_directory/dmert or /mount_directory/appdmert. In order for system update to use RC/V, it must link its database name with the name that RC/V recognizes. This error occurs when the link fails using the UNIX® system call link(). The link may have failed because:

- The original name that is being linked to cannot be found.
- The new name that is being linked already exists.
- The directory that contains the new name does not have write permissions.
- The link is done by a user other than a superuser.
- The link was attempted on a file that is on another file system.
- The file has too many links.

If this update is continued using the UPD:G-CONTINUE input message, it will keep failing until this problem is resolved. Start the update over from the beginning of the enter step.

119xy = create() error.

The UNIX® system call create() failed when a file was being created under the /tmp directory in one of the following situations: the system update enter option attempted to create the system update log file, or the system update readlog option attempted to create a buffer used to store log entries that are about to be printed to the terminal and to the ROP. The create may have failed because:

- A directory in the pathname of the file to be created is not searchable.
- The file to be created does not exist and the directory in which it is to be created does not have write permission.
- The file to be created does exist and does not have write permissions.
- The file to be created is a directory.
- The maximum number of files (20) are already open.
- There is not enough space in the /tmp file system for the created file.

After resolving the problem, try to continue the update using the UPD:G-CONTINUE input message.

120xy = vcall() error.

The UNIX® system call vcall() failed when the system update continue option executed the system update process that is being continued. This function normally fails when the process being executed does not exist or does not have execution permissions. Make sure that all system update processes in /prc/supr have execution permissions. After resolving the problem, re-enter the system update using the UPD:G-CONTINUE input message.

121xy = rmovseg() error.

The UNIX® system call rmovseg() failed when the system update enter option attempted to remove a previously created segment after it was no longer needed. The segment may have been created in the first place to be used as:

- A buffer used to hold the new release which was read in from tape and then written to disk.
- A buffer used to hold the new release which was read from the primary partitions and written to the backup partitions using the offline disk method. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

122xy = mkseg() error.

The UNIX® system call mkseg() failed when the system update enter option tried to create a segment using makeseg() that was to be used as a buffer when reading in an updated segment.
from the offline disk and writing it to its backup partition. makeseg() may have failed because there was not enough space in memory for the segment. After resolving the problem, try to continue the update using the UPD:G-CONTINUE input message.

123xyy  = fopen() error.

The UNIX® system call fopen() failed when the system update restore or commit option attempted to open a partition that is to be used to update the old or new release to the new or old release. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

124xyy  = open() error.

The UNIX® system call open() failed when system update attempted to open the ECD. The open may have failed because:

- The ECD special device file does not exist (/dev/ecd).

- The root directory which contains the ECD does not have read permissions.

- The ECD is not readable or writable depending on what it is being opened for (reading or writing).

- Too many files are open.

Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

- If this error occurred during any other system update process, start the update over from the beginning of the enter step.
The UNIX® system call open() failed when system update attempted to open the disk that is being updated for one of the following reasons:

- The VTOC needs to be read.
- The backup partitions need to be updated during the enter process using the offline disk method.
- The little boot start block address in the VTOC needs to be restored.

The open() may have failed because:

- The disk does not exist.
- One of the directories in the disk pathname does not exist or does not have read permissions.
- The disk is not readable or writable depending on what it is being opened for (reading or writing).
- Too many files are open.

Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

126xy = open() error.

The UNIX® system call open() failed when system update attempted to open one of the partitions that is being updated. The open may have failed because:

- The partition does not exist.
- One of the directories in the partition pathname does not exist or does not have read permissions.
- The partition is not readable or writable depending on what it is being opened for (reading or writing).
- Too many files are open.

Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

127xy = read() error.

The UNIX® system call read() failed when system update tried to read the VTOC from the LDFT tape. The read may have failed because:

- physical I/O errors
- a bad read() parameter
- Bad buffer address where the data is to be read.
- Number of bytes to be read is bad.
- File descriptor indicating the file to be read from is not that of an input file.

Make sure the "head" of the tape drive is clean and continue the update using the UPD:G-CONTINUE input message. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

128\text{xy} = \text{read()} \text{ error.}

The UNIX® system call read() failed when system update tried to read the VTOC from disk. The read may have failed because:

- Physical I/O errors.
- A bad read() parameter.
- Bad buffer address where the data is to be read.
- Number of bytes to be read is bad.
- File descriptor indicating the file to be read from is not that of an input file.

Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

129\text{xy} = \text{read()} \text{ error.}

The UNIX® system call read() failed when system update tried to read a data block from an LDFT tape. The read may have failed because:

- Physical I/O errors.
- A bad read() parameter.
- Bad buffer address where the data is to be read.
- Number of bytes to be read is bad.
- File descriptor indicating the file to be read from is not that of an input file.

Make sure the "head" of the tape drive is clean and continue the update using the UPD:G-CONTINUE input message. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

130\text{xy} = \text{read()} \text{ error.}

The UNIX® system call read() failed when system update tried to read a partition from the offline
disk for one of two reasons: the hash sum needed to be computed to make sure that the partition was written correctly, or the backup partition needed to be updated from its primary partition which contained the new release (for offline disk method only). The read may have failed because:

- Physical I/O errors.
- A bad read() parameter.
- Bad buffer address where the data is to be read.
- Number of bytes to be read is bad.
- File descriptor indicating the file to be read from is not that of an input file.

Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

131xxy = read() error.

The UNIX® system call read() failed when system update tried to read a header from an LDFT tape. The read may have failed because:

- Physical I/O errors.
- A bad read() parameter.
- Bad buffer address where the data is to be read.
- Number of bytes to be read is bad.
- File descriptor indicating the file to be read from is not that of an input file.

Make sure the "head" of the tape drive is clean and continue the update using the UPD:G-CONTINUE input message. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

132xxy = lseek() error.

The UNIX® system call lseek() failed when system update attempted to "seek" to a particular partition on disk. The lseek() may have failed because the file descriptor for the disk is undefined, or the "seek" went to a position before the beginning of the disk. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, the disk may be damaged.

133xxy = lseek() error.

The UNIX® system call lseek() failed when system update attempted to "seek" to a previous block on an LDFT tape. A tape read failure may have occurred. If this happens, system update automatically "seeks" back to the beginning of the set of blocks it tried to read and tries to read those blocks again. Since a read error may have occurred first, check the possible causes for a read error located at error codes 103xxy, and 127xxy - 131xxy and take the action listed there. If a read error is not the problem, make sure the "head" of the tape drive is clean and continue the
update using the UPD:G-CONTINUE input message. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

134xxy = write() error.

The UNIX® system call write() failed when the system update readlog message attempted to write log entries to an output buffer which is later spooled to the terminal and to the ROP. The write may have failed because:

- Physical I/O errors.
- A bad write() parameter.
- Bad buffer address where the data is to be read from.
- Number of bytes to be written is bad.
- Bad file descriptor for the buffer to which the data is to be written.

The log file cannot be read.

135xxy = write() error.

The UNIX® system call write() failed when the system update enter message attempted to write the VTOC to the disk being updated. The write may have failed because:

- Physical I/O errors.
- A bad write() parameter.
- Bad buffer address from where the data is to be read.
- Number of bytes to be written is bad.
- Bad file descriptor for the disk to which the data is to be written.

Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, the disk may be damaged.

136xxy = write() error.

The UNIX® system call write() failed when the system update enter message attempted to write a partition to the disk being updated. The write may have failed because:

- Physical I/O errors.
- A bad write() parameter.
- Bad buffer address where the data is to be read from.
- Number of bytes to be written is bad.
- Bad file descriptor for the disk to which the data is to be written.
Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, the disk may be damaged.

137xxxy = fclose() error.

The UNIX® system call fclose() failed when the system update restore or commit option attempted to close a partition that was used to update the old or new release to the new or old release. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

138xxxy = close() error.

The UNIX® system call close() failed when system update attempted to close the disk being updated. An incorrect file descriptor for the disk may have been passed to the close() message. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the enter step.

139xxxy = close() error.

The UNIX® system call close() failed when system update attempted to close the ECD. An incorrect file descriptor for the ECD may have been passed to the close() message. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the Enter step, or take one of the following actions:

- If this error occurred during the Restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

- If this error occurred during any other system update process, start the update over from the beginning of the enter step.

140xxxy = close() error.

The UNIX® system call close() failed when system update attempted to close a partition on the disk being updated. An incorrect file descriptor for the disk partition may have been passed to the close() message. Try to continue the update using the UPD:G-CONTINUE input message. If the error
persists, start the update over from the beginning of the enter step.

141.xxx = close() error.

The UNIX® system call close() failed when system update attempted to close the tape device from which the new release was read. An incorrect file descriptor for the tape device may have been passed to the close() message. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

142.xxx = unlink() error.

The UNIX® system call unlink() failed when system update attempted to unlink (remove) the special device file that was used to access the offline disk when updating the backup partitions using the offline disk method. The unlink may have failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

143.xxx = unlink() error.

The UNIX® system call unlink() failed when system update attempted to unlink (remove) the special device file that was used to access a partition being updated. The unlink may have failed because the file it is trying to unlink does not exist or the directory this file is in does not have write permissions. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

144.xxx = setio() error.

The UNIX® system call setio() failed when system update attempted to set the input/output (I/O) mode for the tape device from which the new release is to be read to physical I/O. The setio may have failed because the tape device was never opened. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

145.xxx = setio() error.

The UNIX® system call setio() failed when system update attempted to set the I/O mode for a partition to be updated to physical I/O. The setio may have failed because the partition was never opened. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

146.xxx = mknod() error.

The UNIX® system call mknod() failed when the system update proceed option attempted to make a node that would be used to copy the system update log file to the offline disk (offline disk method) or to the backup /etc partition (backup partition method). Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update from the beginning of the
enter step.

148xy  = mknod() error.

The UNIX® system call mknod() failed when system update attempted to make a node that would be used to update the backup partitions using the offline disk method. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update from the beginning of the enter step.

149xy  = mknod() error.

The UNIX® system call mknod() failed when system update attempted to make a node that would be used to copy the new release to the offline disk (offline disk method) or to the backup partitions (backup partition method). Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update from the beginning of the enter step.

150xy  = mknod() error.

The UNIX® system call mknod() failed when system update attempted to make a node that would be used to perform a recent change function on the ECD. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update from the beginning of the enter step.

151xy  = fopen() error.

The UNIX® system call fopen() failed when system update attempted to open a file (located in /tmp) that is to be used to create a recent change script which is used to change the ECD. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

152xy  = fclose() error.

The UNIX® system call fclose() failed when system update attempted to close the file (located in /tmp) that contains a recent change script used to change the ECD. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

153xy  = sendpw() error.

The UNIX® system call sendpw() failed when system update attempted to send a message to MIRA in order to remove or restore a UCB. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

- If this error occurred during any other system update process, start the update over...
from the beginning of the enter step.

### 1.3 Errors Associated with the Input Data

#### 201xxx

- VTOC is not the first piece of data on the mounted LDFT tape.

This error occurred when system update could not find the VTOC because:

- System update incorrectly thinks it should have the first tape of the sequence and therefore searches for the VTOC.
- The wrong tape may have been mounted; check to make sure that the mounted LDFT tape is the first tape in the sequence.

Try to continue the update using the UPD:G-CONTINUE input message. If the problem persists, the LDFT tape may be damaged. Regenerate a new tape.

#### 202xxx

- HEADER and VTOC addresses are different.

While a partition entry was being searched for in the disk VTOC, the search erroneously went beyond the scope of the VTOC. The disk partition address that was specified in the LDFT header for that partition does not match the disk partition address in the corresponding VTOC entry on the disk. The LDFT tape may be damaged. Regenerate a new LDFT tape and start the update over from the beginning of the enter step.

#### 203xxx

- Disk and tape VTOCs are different.

The VTOC entry on tape must be identical to the VTOC entry on disk. The VTOC on the LDFT tape may be damaged. Regenerate a new tape sequence.

#### 204xxx

- A partition being updated does not have a backup partition.

All partitions must have backup partitions if they are being updated using the backup partition method (except for the VTOC and little boot partitions). If some partitions need to be updated but do not have backup partitions, start the update over from the beginning of the enter step using the offline disk method.

#### 205xxx

- Primary and backup versions of same partition found on same tape.

An LDFT tape can only contain the primary or the backup version of the same partition. Both cannot be found on the LDFT tape. The LDFT tape may be damaged. Regenerate a new tape.

#### 206xxx

- Partition data spans across partition boundaries.

Each header on the LDFT tape contains the starting address for that partition on the disk and the partition's size. The address plus the size gives the starting address for the next partition. But, in this case, the address plus the size gives an address that is past the starting address for the next partition. The LDFT tape may be damaged. Regenerate a new tape.

#### 207xxx

- Two VTOCs found in same tape sequence.

Only one VTOC is allowed per tape sequence. This may be a bad tape sequence. The entire tape sequence should be regenerated.
End-of-tape and end-of-sequence flags on LDFT tape are incompatible.

The end-of-sequence flag is set in the last header on the last tape, but the end-of-tape flag is not set. This may be a bad tape. Regenerate a new tape.

Different hash sums.

A hash sum is a computed integer used to make sure that the data on the LDFT tape has not been damaged since the tape was created. The hash sum that is in one of the headers on the LDFT tape for that header or its data block does not match the hash sum that system update computed for that header or data block.

Make sure that the "head" of the tape drive is clean and try to continue the update using the UPD:G-CONTINUE input message. If the error persists, the LDFT tape may be damaged. Regenerate a new tape.

ichk() detected error(s) on file system.

At this time, this error will never occur because system update does not call ichk().

Cannot find VTOC partition entry in the VTOC VTOC on the LDFT tape.

This may be a bad VTOC on the tape. Regenerate a new tape.

Cannot find the RTC partition entry in the VTOC on the disk.

The VTOC on the disk may be bad. This update cannot be continued until this problem is resolved.

Cannot find ETC partition entry in the VTOC on the LDFT tape.

This may be a bad VTOC on the tape. Regenerate a new tape.

Cannot find ECD partition entry in the VTOC on the LDFT tape.

This may be a bad VTOC on the tape. Regenerate a new tape.

SG ID on LDFT tape does not match the SG ID on previous LDFT tape.

An SG ID is an identifier in the first header of an LDFT tape that describes the SG database from which this tape was written. It is used to make sure that multiple tapes and sequences were written using the same SG database. The SG ID on the LDFT tape does not match the SG ID on the previously loaded LDFT tape. This is not really an error, just a warning. This may occur if a field site uses its own SG database when generating tapes. Continue the update using the UPD:G-CONTINUE input message and the error will be ignored.

Release version number on LDFT tape does not match release version number on previous LDFT tape.

A release version number is used to make sure that multiple tapes and sequences were written using the same release version.

Continue the update using the UPD:G-CONTINUE input message and the error will be ignored.

Little boot entry in offline disk VTOC could not be found when system update attempted to restore the little boot start block address to its valid value.
Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, the VTOC on the offline disk may be damaged.

218xxy = Little boot entry in the VTOC on the LDFT tape is different from the little boot entry in the VTOC on the disk when the backup partition method is being used.

During a backup partition method update, the old and new VTOCs must be identical. The LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the enter step.

219xxy = One of the VTOC entries for a partition being updated (excluding VTOC and little boot) in the VTOC on the LDFT tape is different from its corresponding VTOC entry on disk when the backup partition method is being used.

During a backup partition method update, the old and new VTOCs must be identical. The LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

220xxy = One of the VTOC entries for a partition being updated (excluding VTOC and little boot) in the VTOC on the LDFT tape is different from its corresponding VTOC entry on disk when the offline disk method is being used.

This partition was also already updated in a previous tape sequence. During an offline disk method update, a VTOC may be different only as long as the partition corresponding to the VTOC entry that changed has not been updated in a previous tape sequence.

221xxy = VTOC entry for little boot on LDFT tape is different from VTOC entry for little boot on disk when the offline disk method is being used.

The little boot partition was also already updated in a previous tape sequence. During an offline disk method update, a VTOC may be different only as long as the partition corresponding to the VTOC entry that changed has not been updated in a previous tape sequence.

222xxy = Header for VTOC on LDFT tape contains starting address for VTOC on the disk and the VTOC's size.

The address plus the size gives the starting address for the next partition. But, in this case, the address plus the size gives an address that is past the starting address for the next partition. The LDFT tape may be damaged. Regenerate a new tape.

223xxy = VTOC entry for primary source or backup destination partition not found in offline disk VTOC.

When updating the backup partitions using the offline disk method, the VTOC entry for a source (primary) or destination (backup) partition could not be found in the offline disk VTOC. The offline disk VTOC may be damaged. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

224xxy = VTOC entry in VTOC on LDFT tape could not be found.

This may be a bad VTOC on the tape. Regenerate a new tape and start the update over from the beginning of the Enter step.

225xxy = Little boot entry in VTOC read from LDFT tape could not be found when system update attempted to invalidate the little boot start block address to prevent a boot from occurring from the disk that is being updated.
Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, the VTOC on the LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

226xxy

= VTOC entry could not be found in VTOC on the mounted LDFT tape.

The LDFT tape may be damaged. Regenerate a new tape and start the update over from the beginning of the Enter step.

227xxy

= Note: This error message is not available in all releases.

The pack IDs in the tape and destination disk VTOCs do not match. Check that the proper tape is mounted, and that the destination VTOC was entered correctly. This check can be overridden by performing the update unconditionally with the UCL parameter.

1.4 Internal System Update Errors

301xxy

= Too many message line arguments used.

The maximum number of arguments allowed on the message line has been exceeded for one of the following options: continue, readlog, stop, commit, restore, backout, enter, or proceed. The only way this error message could appear is if the system update process has been executed from a UNIX® terminal instead of a user terminal. Re-execute the system update process using the correct arguments, or execute the process from a user terminal using the corresponding input message.

302xxy

= Message returned was not what was expected.

Any time system update sends a message to SIM, the disk driver, applhook, or continue, it checks the return message that is sent back. In this case, a bad message was returned or the time limit set to receive the message from continue expired. Try to continue the update using the UPD:G-CONTINUE input message.

303xxy

= Internal buffers are too small.

The data after a header on the LDFT tape is larger than one segment. Up to only one segment is allowed after each header. The LDFT tape may be damaged. Regenerate a new tape.

304xxy

= Cannot locate system update log.

Any time the system update log is accessed, it is assumed to be in /etc/log/suprlog. In this case, it could not be found. System update may have been attempting to retrieve or write a log entry or attempting to read the entire log file. The log file may have been accidentally removed. If the system update readlog message was executed to read the log file, the log file cannot be read since readlog cannot locate it. If any other system update process was executed, start the update over from the beginning of the enter step.

305xxy

= No "enter" entries in log.

Log entries for the enter step cannot be found in the system update log. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, the log file may be damaged. Start the update over from the beginning of the enter step.

306xxy

= Log entries are inconsistent.
The system update continue option found that one of the entries in the system update log file contains a bad value (the type of log entry, tape sequence number, or disk pair number). The system update log may be damaged. Start the update over from the beginning of the enter step.

307xy  = Bad process type.

A bad process type was found in one of the log entries in the system update log file. This error occurs when system update tries to continue an update and the entry for the system update process that is being continued cannot be found in the log. The log may be damaged. Start the entire update over from the beginning of the enter step.

308xy  = Bad update method.

The system update readlog option found an incorrect update method specified in one of the system update log file entries (begin or disk) or the system update enter option found an incorrect update method specified on its message line. Only two methods are allowed: backup partition method or off-line disk method. If the readlog message was executed, the log may be damaged and therefore cannot be read. If the enter option was executed, start the update over from the beginning of the enter step.

309xy  = Bad execution mode.

The system update readlog option found a bad execution mode in a begin log entry for one of the system update processes. Only two execution modes are allowed: conditional or unconditional. The log file may be damaged and therefore cannot be read.

310xy  = Bad bootfile.

The system update readlog option found an incorrect bootfile specified in the end entry in the system update log file. Only two bootfile types are allowed: DMERT or APPDMERT. The log file may be damaged and therefore cannot be read.

311xy  = Bad file system.

The system update readlog option found an incorrect file system specified in the end entry in the system update log file. Only two file systems are allowed: PRIMARY or SECONDARY. The log file may be damaged and therefore cannot be read.

312xy  = Bad log entry.

A bad disk pair number was found in either the disk or end log entry in the system update log. The log file may be damaged. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

313xy  = Bad completion code.

The system update readlog option found that the end entry in the system update log file contains a bad completion code. Only two completion codes are allowed: SUCCESS or FAILURE. The log may be damaged and therefore cannot be read.

314xy  = Tried to reserve the same disk twice.

System update tried to reserve a disk that has already been reserved. Try to continue the update using the UPD:G-CONTINUE input message.

315xy  = Tried to release an unreserved disk.
System update tried to release a disk that was never previously reserved. Try to continue the update using the UPD:G-CONTINUE input message.

316xy = Bad UCB disk state requested.

A bad state was specified when system update attempted to change the state of a UCB (valid state is either OOS or ACT) or a disk (valid state either OOS or OFL). Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

- If this error occurred during any other system update process, start the update over from the beginning of the enter step.

317xy = Bad sequence indicator.

The system update readlog option found that the tape entry in the system update log file contains a bad sequence number. Only three sequence entries are allowed: FIRST, SECOND, or THIRD. The log may be damaged and therefore cannot be read.

318xy = Bad continuable indicator.

The system update readlog option found that the end entry of the system update log contains a bad continuable flag variable. Only two continuable flag variables are allowed: YES or NO. The log may be damaged and therefore cannot be read.

319xy = BEGIN ENTER log entry could not be found in the system update log file.

The log may be damaged. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

320xy = System update enter option terminated.

The system update enter option terminated while it was updating the backup partitions using the offline disk method and then was continued using the UPD:G-CONTINUE input message. In order for system update to know which partition it was in the middle of updating before it terminated, it looks in the log file and attempts to find the last UPDATE ENTER log entry. In this case, the UPDATE ENTER log entry could not be found. Therefore, system update could not do any further processing. Try to continue the update again using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter message.

321xy = VTOC on FDT tape exceeds maximum allowed.

The size of the VTOC on the LDFT type is greater than the maximum size allowed (512 bytes). The VTOC may be damaged on the LDFT tape. Regenerate a new tape.
322xy = Write log entry found in system update log file without a proceeding disk log entry.

The log file may be damaged. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

323xy = Log file retrieved not requested.

System update requested a log entry (disk, tape, or end) from the log file, but the log entry that was retrieved was not the one requested. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

324xy = Corresponding disk log not found.

While searching the system update log file, system update could not find the disk log entry that corresponds to the bootdisk being updated. Try to continue the update using the UPD:G-CONTINUE input message.

325xy = Incorrect update method specified.

System update found an incorrect update method specified in the internal variable glob_method which was obtained through the enter message line or the system update log file. Only two methods are allowed: backup partition method or off-line disk method. The log may be damaged. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the entire update over from the beginning of the enter step.

326xy = Bad execution mode found on enter message line.

Only two execution modes are allowed: conditional or unconditional. Start the update over from the beginning of the enter step.

327xy = Bad sequence option in log file.

System update found bad sequence option in the log file. Valid sequence options are: SGL, DBL, or TPL. The log may be damaged and therefore cannot be read. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter message.

1.5 Errors Associated with Execution

401xy = Context of request is invalid.

The system update enter option was executed conditionally (without the UCL argument) while the system update log file contained log entries (possibly from a previous update session). Either remove the log file (/etc/log/suprlog) or execute the enter message using the UCL argument on the message line.

402xy = Bad input file (tape unit) specified.

The input file specified (normally a tape unit) on the enter message line is invalid. Make sure that the name is entered correctly (the name of a tape unit is of the form /dev/mtnn where 'nn' is a two digit hexadecimal number). If the input is from a tape, make sure that the unit is on-line. Re-execute the enter message with the UCL argument on its message line.

403xy = Data not in sync.
The tape being read is either not a tape usable with system update (not in LDFT format), the data on it has been mutilated, or the LDFT formatted tape being used was created for a different processor. Make sure that the correct tape has been mounted, and continue the update using the UPD:G-CONTINUE input message.

404xy = Data sequence ID incorrect (wrong tape).

The data input does not belong on the disk being written. Make sure that correct tape has been mounted and continue the update using the UPD:G-CONTINUE input message.

405xy = Data sequence number out of order.

One of the tapes in the sequence has been mounted out of order. Mount the correct tape and continue the update using the UPD:G-CONTINUE input message.

406xy = Bad destination VTOC specified.

The filename specified for the disk being updated is not a block special device file or the disk cannot be opened. Check that the filename was entered correctly. If not, re-execute the Enter message using the UCL argument on the message line.

407xy = This error code is no longer used.

408xy = User did not return from "continue" request.

When a new tape needs to be mounted, a mount tape and continue message appears. After the user mounts the tape, the UPD:G-CONTINUE input message needs to be executed in order for the update to continue its processing.

System update waits 30 minutes for the continue message to be executed. If it is not executed, another mount tape and continue message appears and system update waits another 30 minutes for the continue message to be executed. If it still is not executed, system update terminates with this error code. Execute the UPD:G-CONTINUE input message to continue the update process where system update left off.

409xy = Attempt to run two system update processes.

The user attempted to:

- Run two system update processes at the same time (when one system update process is running another one may not be started unless it is one of the following: stop, continue, or readlog)

- Run a system update process while field update or PDT is currently running (a system update cannot be performed while field update or PDT is running)

If a system update process needs to be stopped, the system update stop message may be used to stop it. If this is not successful, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

410xy = User stopped process (not a fault condition).

This error code is used to acknowledge that the user terminated one of the system update processes (commit, restore, backout, enter, or proceed) using the system update stop option. There
is no fault condition associated with this code.

411xx

= No process exists to talk to (such as, nothing to stop).

The user has attempted to stop a system update process using the system update stop option when there are no system update processes that are running.

412xx

= System update log is empty.

The system update log file does not contain any log entries when it is expected to in one of the following situations:

- An attempt to continue a system update process was made, but the message to be continued could not be figured out since this information is contained in the log file and the log file is either empty or does not contain the BEGIN ENTER log entry,

- The log file was attempted to be read using the system update readlog message, but there was nothing to read since the log file was empty,

- One of the system update processes (excluding the enter process) was executed when the log file was empty. These processes need information in the log in order to complete their processing, or

- The log file was attempted to be searched for information, but the log file is empty.

Start the update over from the beginning of the enter message.

413xx

= Off-line disk method started with one disk active.

The offline disk method is being used and a disk was selected by system update to retain the old release, but this disk is not in the active state. All disk pairs must be duplexed (active) before the enter message is executed. Restore all affected disks to service and execute the enter message again using the UCL argument on its message line. If this error occurred because the system update Enter process aborted leaving one or more disks in the offline state, execute the restore message using the UCL argument on its message line and wait for it to complete. Then, start the update over from the beginning of the enter step.

414xx

= In off-line disk method with both disks active.

An offline disk was somehow restored to service when system update expected it to be in the offline state. If all affected disks are offline, try to continue the update using the UPD:G-CONTINUE input message. If an affected disk(s) is active or if the error persists after the continue, start the update over from the beginning of the enter step.

415xx

= Process did not log failure termination.

The user attempted to restart a system update process with the continue option but the last system update process that was run logged a successful termination and therefore cannot be continued. Dumping the system update log file using the readlog option may be helpful in determining what happened to the last process. Try to execute the next system update process.

416xx

= Process is not continuable.

The user attempted to restart a system update process using the continue option, but the last system update process that was run failed due to a problem which would usually cause it to fail
again. For example, one of the pathnames in an enter input message was bad, or one or more log entries needed for continuing the process are corrupted.

Dumping the log file using the readlog message may be helpful in determining what happened to the original process. Try to re-enter the original input message using the UCL argument on the message line (for the enter option, make sure the disks are duplexed first - refer to error code 413xy).

417xy = Disk is no longer off-line.

A specified disk device is not in any of the following valid states: offline, out of service, or active. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the enter process, restore the disk to an active state and re-execute the enter option using the UCL argument on its message line.

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

418xy = Bad destination DFC specified.

An invalid DFC unit number was specified as an argument to the OFLDISK keyword on the enter message line. Valid DFC unit numbers are zero and one. The DFC number can be omitted, in which case the Enter process will chose DFC 1.

419xy = Command executed out of order.

A system update message was executed out of order.

- The proceed message was executed before the enter message completed successfully.

- The commit message was executed before the proceed message completed successfully.

- The backout message was executed before the proceed message completed successfully.

- If error code ‘y’ is 4, the restore option was executed before the proceed option completed successfully. Execute the restore option unconditionally using the UCL argument on its message line.

- If error code ‘y’ is 5, conditional restore after successful backout or proceed is no longer valid. Execute the restore message unconditionally using the UCL argument on its message line.
420xxxy = Incorrect file system base is running.

The wrong file system base is currently running for the system update message that was just executed.

- For backout and commit options, the file system currently running needs to be the new release.

- For proceed and restore options, the file system currently running needs to be the old release.

If the wrong option was executed, execute the right one. If the right option was executed, boot the system so that it is running on the correct file system, then execute the option again.

421xxxy = Disk not in active state.

The offline disk method is being used and a disk was selected by system update to contain the new release, but this disk is not in the active state. All disk pairs must be duplexed (active) before the enter option is executed. Restore all affected disks to service and execute the enter option again.

If this error occurred because the system update enter process aborted leaving one or more disks in the offline state, execute the restore options using the UCL argument on the message line and wait for it to complete. Then, start the update over from the beginning of the enter step.

422xxxy = Disk being updated not in offline state.

When the backup partitions are being updated using the offline disk method, the disk being updated should be in the offline state, but it is not. Check the common processor display page or another page which shows the MHDs. If all disks affected are active, try to re-execute the enter option using the UCL argument on the message line. If any affected disks are out of service, restore them and then re-execute the enter option using the UCL argument on the message line.

423xxxy = Disk being updated is no longer in offline state.

The disk being updated, which should be in the offline state, is no longer in that state. Check the common processor display page or another page which shows the MHDs. If all disks affected are active, try to re-execute the enter option using the UCL argument on the message line. If any affected disks are out of service, restore them and then re-execute the enter option using the UCL argument on the message line.

1.6 Errors Associated with Application Processing

501xxxy = Time limit message error.

This error may have occurred because:

- The application process did not send a message indicating a time limit that it needs to do its processing.

- The message that the application process sent to set a time limit was damaged.

- The UNIX® RTR send() process failed when the application process tried to use it to send a time limit message to the system update process.
If the error occurred because the application process did not send a time limit message, start the application process over using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

502xy = Application hook process failed or did not return.

Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

1.7 Errors Associated with Interfaces with UNIX® RTR

601xy = User is not privileged for execution.

The system update process must be executed from a login that has superuser permissions. After resolving the problem, try to continue the update using the UPD:G-CONTINUE input message.

602xy = Timeout for SIM message.

When system update sends SIM a message, it sets a time out limit by which it must receive the return message from SIM. This error occurred when system update was waiting for the return message from SIM. This error may have occurred because:

- System update did not receive a return message from SIM within the time out limit.
- The recvw() process that waits for the return message from SIM failed.

Try to continue the update using the UPD:G-CONTINUE input message.

603xy = Time out for MIRA message.

When system update sends MIRA a message, it sets a time out limit by which it must receive the return message from MIRA. This error occurred when system update was waiting for the return message from MIRA. This error may have occurred because:

- System update did not receive a return message from MIRA within the time out limit.
- The recvw() process that waits for the return message from MIRA failed.

Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.
- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.
- If this error occurred during any other system update process, start the update over from the beginning of the enter step.

604xy = Timeout for disk driver message.

When system update sends the disk driver a message, it sets a time out limit by which it must receive the return message from the disk driver. This error occurred when system update was waiting for the return message from the disk driver. This error may have occurred because:

- System update did not receive a return message from the disk driver within the time out limit.
- The recvw() process that waits for the return message from the disk driver failed.

Try to continue the update using the UPD:G-CONTINUE input message.

605xy = Bad MIRA return on message.

When system update receives a return message from MIRA, it checks certain fields in the message for bad values. This error occurs when system update finds a bad value in one of the fields in the return message. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

- If this error occurred during any other system update process, start the update over from the beginning of the enter step.

606xy = Bad disk driver return on message.

When system update receives a return message from the disk driver, it checks the return code that is in the message. The value of the return code must be zero. This error occurred because the return code was a value other than zero. Try to continue the update using the UPD:G-CONTINUE input message.

607xy = Wrong disk state result.

After MIRA changes the state of the disk (to active or out of service), system update checks the UCB of that disk in the ECD to make sure that the change actually took place. This error occurred when system update thought it changed the state of the disk, but the UCB of that disk does not reflect the change. Either MIRA did not change the state correctly or the state field in the UCB is damaged. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:
- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

- If this error occurred during any other system update process, start the update over from the beginning of the enter step.

608xy = No active boot disks.

System update checks the UCB in the ECD to find out which disk is the current system disk that is in the active state. This error occurred because there were not any disks that were in the active state. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, restore both disks to the active state and start the update over from the beginning of the enter step.

609xy = Partition copy error.

The COPY:PTN-ALL input message failed when the system update restore or commit option used it to copy the new or old release over the old or new release during a backup partition method update. The error(s) associated with the COPY:PTN-ALL input message will be saved in /tmp/supr.ptcp. The most common cause for this error is when the disks are not duplexed (such as, both disks are not active) when the restore or commit options are executed. After resolving the problem, (such as, duplex both disks), continue the update using the UPD:G-CONTINUE input message.

610xy = Recent change error.

This error occurred when system update was performing a recent change on the ECD. The journal file and the error messages will be saved in /tmp/supr.rcv and /tmp/supr.rcvout respectively. After resolving the problem, try to continue the update using the UPD:G-CONTINUE input message.

611xy = Copy message failed.

This error may have occurred when system update was copying the log from the old release to the new release. Additional error codes can be found in /tmp/supr.cp. After resolving the problem, try to continue the update using the UPD:G-CONTINUE input message.

612xy = ECDMAN ugucbn() error.

This error occurred when system update used the ECD function ugucbn() to get information about the UCB record associated with a specified disk. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks
containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

- If this error occurred during any other system update process, start the update over from the beginning of the enter step.

613xxxy = ECDMAN ugetucb() error.

This error occurred when system update used the ECD function ugetucb() to get the UCB record for a specified disk. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, either start the update over from the beginning of the enter step, or take one of the following actions:

- If this error occurred during the restore process, manually restore the partitions containing the new release (for the backup partition update method) or the disks containing the new release (for the offline disk update method) to the old release. Then, manually execute the applhook process.

- If this error occurred during the commit process, manually restore the partitions containing the old release (for the backup partition update method) or the disks containing the old release (for the offline disk update method) to the new release. Then, manually execute the applhook process.

- If this error occurred during any other system update process, start the update over from the beginning of the enter step.

614xxxy = ECDMAN ugmamirids() error.

This error occurred when system update used the ECD function ugetrec() to get the pointer to the UCBs for the two disks that are associated with the update. Try to continue the update using the UPD:G-CONTINUE input message.

615xxxy = ECDMAN ursvucd() error.

This error occurred when system update used the ECD function ursvucb() to reserve a UCB. The disk that system update is trying to update must first be reserved so that no other processes can write to it. This is done by reserving the disk’s UCB. The ursvucb() function may have failed because another process has already reserved the disk that is trying to be reserved. Check to see if the disk is already reserved. If it has been reserved, execute the following input message on a UNIX® terminal to unreserve the disk: /etc/udgnnm MHD x where ‘x’ is the disk number that needs to be unreserved. Then, try to continue the update using the UPD:G-CONTINUE input message.

616xxxy = ECDMAN ugsdf() error.

This error occurred when system update used the ECD function ugsdf() to get the special device file name associated with the disk to be updated so that system update can access that disk. Try to continue the update using the UPD:G-CONTINUE input message. If the error persists, start the update over from the beginning of the enter step.

617xxxy = ECDMAN urelucb() error.

This error occurred when system update used the ECD function urelucb() to release (unreserve) a reserved UCB. Try to continue the update using the UPD:G-CONTINUE input message.
618axy = ECDMAN ursdf() error.

This error occurred when system update used the ECD function ursdf() to give back to the system the special device file name of the updated disk that was obtained by the ugsdf() message (refer to error 616axy). Try to continue the update using the UPD:G-CONTINUE input message.

619axy = ECDMAN usettnum() error.

System update no longer uses the ECD usettnum() function, so this error should never appear.

620axy = ECDMAN usetucb() error.

System update no longer uses the ECD usetucb() function, so this error should never appear.

621axy = Unable to stop process with pkill()..

The system update stop option could not stop the currently running system update process using the pkill() function call. If the stop options cannot kill a system update in progress using the kill() function call, it then tries to kill it using the pkill() function call. The pkill function call may have failed because there was a bad process ID number (PID) in the system update log file for the process that needed to be terminated.

The stop option looks in the log file to find the PID of the process that is currently running and calls pkill() with that PID. If the PID is damaged in the log file, the pkill() option may be executed manually using the correct PID of the process that needs to be terminated.

622axy = Unable to stop process with kill.

The system update stop option could not stop the currently running system update process using the kill() function call. The kill() function call is used in the stop option to terminate the system update process that is currently running. The kill() function call may have failed because:

- The process to be killed does not exist.
- The sending process is not a superuser, and the sending and receiving processes do not have the same effective user ID.
- The PID of the process being terminated is damaged in the system update log. The stop option passes this PID as a parameter to kill().

If the system update still needs to be stopped, execute the system update stop process unconditionally using the UCL argument on its message line.

CAUTION: If stop is executed unconditionally, the system update process will be terminated by a more extreme method than a kill (pkill). Some system resources in use by the process may not be automatically released.

623axy = System error killed the process.

A system update process was terminated due to a phase 1 signal. System update may not get a chance to print this error message when the interrupt occurs. If the system update process is continued using the UPD:G-CONTINUE input message, the continue option will put this error code in the end entry of the system update log file.
Cannot execute system update while the alternate boot disk (ABD) feature is active.

System update checks the status of the ABD feature when starting. If the system has a boot disk other than MHD0 or MHD1, the ABD feature is active. Wait until the ABD active state has been cleared and then start the update.

## 1. System Error Code Numbers

Note: Some of the system error codes from 60 to 87 may be generated from either the process manager or fault recovery.

1. TAPE LIBRARY ERROR APPENDIX

This appendix contains the error codes returned by the functions in the tape library.

-1 E_CLOSE = The close() system call failed. Could not close the tape special device file.

-2 E_INVALTP = Invalid tape special device file input argument.

-3 E_INVALSES = Invalid session input argument.

-4 E_INVALVOL = Invalid volume input argument.

-5 E_LSEEK = The lseek() system call failed.

-7 E_NOMULVOL = Data read is not in multi-volume format.

-8 E_NOSESSION = Specified session is not on tape.

-9 E_NOVOLUME = Specified volume is not on tape.

-10 E_OPENNORWD = The open() system call failed. Could not open the no-rewind tape special device file.

-11 E_OPENRWD = The open() system call failed. Could not open the rewind tape special device file.

-12 E_READ = The read() system call failed. Could not read tape header.

-13 E_SESORDER = Multi-volume tape sessions are not sequential.

-14 E_SETIO = The setio() system call failed.

-15 E_STAT = The stat() system call failed for the tape special device file.

-16 E_UNLINK = The unlink() system call failed. Could not remove the temporary tape special device file.

-17 E_VOLORDER = Multi-volume tape volumes are not in ascending order.
1. APPENDIX: TEST ERROR CODES

<table>
<thead>
<tr>
<th>Error code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVATE FAILURE</td>
<td>Could not activate the trunk. This could be due to hardware problems and/or the trunk's being out-of-service due to a diagnostic or facility failure. The trunk could also be being a blocking (off-hook) signal from the far end.</td>
</tr>
<tr>
<td>ADDRESS COMPLETE TIMEOUT</td>
<td>The outgoing CCS terminal process port under test (PUT) timed out waiting for a CCS address complete (ADC) message.</td>
</tr>
<tr>
<td>ADDRESS INCOMPLETE</td>
<td>The outgoing CCS terminal process PUT received a CCS address incomplete unsuccessful backward setup (UBS) message.</td>
</tr>
<tr>
<td>ALL ATMPP VCIDS INVALID</td>
<td>All of the ATM packet pipe VCIDs for the link are invalid.</td>
</tr>
<tr>
<td>ALL MEMBERS ON PH CHANNEL INVALID</td>
<td>All of the PSU channel members in one channel are invalid.</td>
</tr>
<tr>
<td>AUDIO DETECTION FAILURE</td>
<td>This error indicates a failure in the path on the CDMA/TDMA voice encoding algorithm occurred. The trunk should be taken out-of-service with the PVELBK status to isolate path components.</td>
</tr>
<tr>
<td>AM ROUTING TRBL</td>
<td>A problem occurred in routing to the trunk in the administrative module (AM). The probable cause is an office-dependent data (ODD) or dynamic data problem in the AM. An assert, which contains specific information, may have been triggered.</td>
</tr>
<tr>
<td>ANI TLWSR DN</td>
<td>Calls over trunks requiring ANI digits use the DN from the ODD relation TLWSR or device &quot;55a11&quot; for the billing DN. Either no DN was found, it contained other than 7 digits, or the relation could not be read.</td>
</tr>
<tr>
<td>ANSWER MESSAGE TIMEOUT</td>
<td>The outgoing CCS terminal process PUT timed out waiting for a CCS answer (ANS) message.</td>
</tr>
<tr>
<td>ATM PACKET PIPE OUT OF SERVICE</td>
<td>The ATM packet pipe is out-of-service (ATMPP=SM-PSU-LINK-VCID).</td>
</tr>
<tr>
<td>BAD ATMPP CHANNEL STATE</td>
<td>The status of the ATM channel in the PH is invalid.</td>
</tr>
<tr>
<td>BAD ATMPP LINK NUM</td>
<td>ATM packet pipe link is invalid or out of range (ATMPP=SM-PSU-LINK-VCID).</td>
</tr>
<tr>
<td>BAD ATMPP PSU NUM</td>
<td>The PSU number is invalid or out of range (ATMPP=SM-PSU-LINK-VCID).</td>
</tr>
<tr>
<td>BAD ATMPP SM NUM</td>
<td>The SM number is invalid or out of range (ATMPP=SM-PSU-LINK-VCID).</td>
</tr>
<tr>
<td>BAD ATMPP VCID NUM</td>
<td>The VCID number is invalid or out of range (ATMPP=SM-PSU-LINK-VCID).</td>
</tr>
<tr>
<td>BAD BEARER PCT LINK NUM</td>
<td>The bearer path PCT link number entered was invalid or out of range (PCTTS=PCTLINK-TIMESLOT). [5E16(2)+]</td>
</tr>
<tr>
<td>BAD BEARER PCT TIME SLOT NUM</td>
<td>The bearer path PCT timeslot number entered was invalid or out of range (PCTTS=PCTLINK-TIMESLOT). [5E16(2)+]</td>
</tr>
<tr>
<td>BAD BEARER SM NUM</td>
<td>The bearer path hardware switching module number specified was invalid or out of range. [5E16(2)+]</td>
</tr>
<tr>
<td>BAD BEARER SUBUNIT NUM</td>
<td>The bearer path subunit specified was invalid or out of range. The subunit for OIU bearer paths is the OIU protection group (OIUPG=SM-UNIT-PG). [5E16(2)+]</td>
</tr>
<tr>
<td>BAD BEARER UNIT NUM</td>
<td>The bearer path unit number specified was invalid or out of range. The unit for OIU bearer paths is the OIU (OIU=SM-UNIT, OIUPG=SM-UNIT-PG). [5E16(2)+]</td>
</tr>
<tr>
<td>BAD CCB KEY</td>
<td>Internal software error. Could not find the channel control block for the current process.</td>
</tr>
<tr>
<td>BAD CCS STATE ENCOUNTERED</td>
<td>The outgoing CCS terminal process PUT entered an invalid state.</td>
</tr>
<tr>
<td>BAD PACKET GRP MEMBER NUM</td>
<td>The packet group member number specified was invalid. [5E16(2)+]</td>
</tr>
<tr>
<td>BAD PACKET GRP NUM</td>
<td>The packet group number specified was invalid. [5E16(2)+]</td>
</tr>
<tr>
<td>BAD TRUNK CLASS</td>
<td>Office data indicates that the trunk type will not handle an outgoing test call. For example, a recorded announcement trunk, an incoming trunk, or a local test desk trunk.</td>
</tr>
<tr>
<td>BAD REASON</td>
<td>Internal software error. Program executed for unexpected reason.</td>
</tr>
<tr>
<td>BAD TEST CODE</td>
<td>Internal software error. Invalid test codes (such as, not 100 or 102).</td>
</tr>
<tr>
<td>BEARER HW COMMUNICATION PROBLEM</td>
<td>A transmission failure occurred trying to communicate with the bearer path hardware. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER HW DOES NOT SUPPORT PKTG</td>
<td>The specified bearer path hardware is incompatible with the specified packet group. The request to test the specified packet group using the specified bearer path hardware cannot be performed. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER HW DOES NOT SUPPORT REQUEST</td>
<td>The bearer path hardware specified either does not exist, or is not of the correct type for the request made. For OIU bearer paths, the OIUPG specified must be an IP OIU, or the OIU specified must contain at least one IP OIU which can support the request. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER HW ERROR</td>
<td>An unknown/unexpected failure has been detected trying to set up the bearer hardware test path. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER HW FAILURE TO IDLE</td>
<td>Unable to idle one or more resources associated with the test call. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER HW RESOURCE UNAVAILABLE</td>
<td>Unable to complete the request due to a resource blockage involving the necessary bearer path hardware. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER HW SETUP FAILURE</td>
<td>An unspecified resource failure has been encountered during the set up of the bearer hardware test path. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER HW UNAVAILABLE</td>
<td>The bearer path hardware specified is not available for use for this test. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER PCT LINK UNAVAILABLE</td>
<td>The bearer path PCT link specified is not available for the test call. The PCT link is either unequipped, out of service, or not functional. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER PCT TIME SLOT INVALID/UNASSIGNED</td>
<td>The specified bearer path PCT link time slot is either invalid or unassigned and cannot be used for the test. For example, PCT link time slots that are used to pump the bearer hardware are considered invalid for test purposes and should not be specified. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER PCT TIME SLOT IS BUSY</td>
<td>The specified bearer path PCT link time slot is busy and cannot currently be used for the test. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER SUBUNIT UNAVAILABLE OR FULL</td>
<td>The bearer path hardware subunit specified cannot be used for the test. This is caused either by unavailable or OOS hardware, or if all available paths are already busy. [5E16(2)+]</td>
</tr>
<tr>
<td>BEARER UNIT UNAVAILABLE OR FULL</td>
<td>The bearer path hardware unit specified cannot be used for the test. This is caused by either no hardware on the unit that is compatible with the test request, all compatible hardware being unavailable or OOS, or all compatible hardware paths are already busy. [5E16(2)+]</td>
</tr>
<tr>
<td>BLANK NO. INTERCEPT</td>
<td>Internal software error.</td>
</tr>
<tr>
<td>BLOCKED (REORDER)</td>
<td>The call progressed through outpulsing and then received reorder [120 interruptions per minute (IPM)] from the far end indicating that the call could not be completed on that end.</td>
</tr>
<tr>
<td>BLOCKING MESSAGE RECEIVED</td>
<td>The outgoing CCS terminal process PUT received a CCS blocking (BLO) message.</td>
</tr>
<tr>
<td>BROADBAND OR NOISE</td>
<td>The call progressed through outpulsing and then received continuous noise or tone (but not 1004 or 2225 Hz) for 4 seconds or longer.</td>
</tr>
<tr>
<td>BUSY TONE</td>
<td>The call progressed through outpulsing and then received a busy signal from the far end (60 IPM).</td>
</tr>
<tr>
<td>CALL FAILURE</td>
<td>The outgoing CCS terminal process PUT received a CCS call failure UBS message.</td>
</tr>
<tr>
<td>CCS EXTRA ONE</td>
<td>Internal error code reserved for CCS.</td>
</tr>
<tr>
<td>CCSENDMSG() FAILED</td>
<td>The outgoing CCS terminal process PUT was unable to send a CCS message.</td>
</tr>
<tr>
<td>CCCGETMSG() TIMEOUT</td>
<td>The outgoing CCS terminal process PUT timed out waiting for a message.</td>
</tr>
<tr>
<td>CGA ACTIVE</td>
<td>OP Carrier Group Alarms preemption value.</td>
</tr>
<tr>
<td>CIRCUIT GROUP CONGESTION</td>
<td>The outgoing CCS terminal process PUT received a CCS switching equipment congestion UBS message.</td>
</tr>
<tr>
<td>CIRCUIT RESET RECEIVED</td>
<td>The outgoing CCS terminal process PUT received a CCS circuit reset (RST) message.</td>
</tr>
<tr>
<td>CLEAR BACK</td>
<td>The far end went on-hook unexpectedly during the call.</td>
</tr>
<tr>
<td>CLEAR FORWARD GLARE</td>
<td>The outgoing CCS terminal process PUT encountered communications line fault (CLF) glare on the CCS trunk under test.</td>
</tr>
<tr>
<td>CNI/CMT UNAVAILABLE</td>
<td>The input request could not be completed because either a common network interface (CNI) or a CCS message transport (CMT) is inaccessible. Retry the request later.</td>
</tr>
<tr>
<td>CONFUSION</td>
<td>The outgoing CCS terminal process PUT received a CCS confusion UBS message.</td>
</tr>
<tr>
<td>CONT TEST FAIL</td>
<td>Continuity test failed. Voice path assurance (VPA) is the same as continuity test.</td>
</tr>
<tr>
<td>CONT TEST NOT VALID FOR CONN APP</td>
<td>Continuity test is not valid for connection appraisal.</td>
</tr>
<tr>
<td>CONT TEST PASS</td>
<td>Continuity test was successful. VPA is the same as continuity test.</td>
</tr>
<tr>
<td>CONT TEST VALID ON CCS TRKS ONLY</td>
<td>An attempt was made to run a CONT test on a NON-CCS trunk.</td>
</tr>
<tr>
<td>CONTINUITY GLARE</td>
<td>The continuity test (CONT) encountered central office terminal (COT) glare on the CCS trunk under test.</td>
</tr>
<tr>
<td>CONTINUITY TEST FAILED</td>
<td>The continuity test (CONT) failed.</td>
</tr>
<tr>
<td>CONTINUITY TEST PASSED</td>
<td>The continuity test (CONT) passed.</td>
</tr>
<tr>
<td>Condition</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>COULD NOT SEND MSG</strong></td>
<td>Internal software error. The operating system failed to send a message.</td>
</tr>
<tr>
<td><strong>DATA BASE READ FAILED</strong></td>
<td>The outgoing CCS terminal process PUT was unable to read a database relation.</td>
</tr>
<tr>
<td><strong>DB FAIL RLFC_TRUNK</strong></td>
<td>An error was detected in the RLFC_TRUNK relation for the trunk under test. Office data may be populated incorrectly.</td>
</tr>
<tr>
<td><strong>DIGITAL PATH PROBLEM</strong></td>
<td>Internal software error. Peripheral control failed to define the initial path definition in the path setup sequence.</td>
</tr>
<tr>
<td><strong>DIGITAL PATH RELEASE</strong></td>
<td>Internal software error. The operating system sent a message to release the path while in call disposition analysis routine.</td>
</tr>
<tr>
<td><strong>DPC CONGESTION</strong></td>
<td>The input request could not be completed because the destination point code (DPC) is congested. Retry the request later.</td>
</tr>
<tr>
<td><strong>DPC INACCESSIBLE</strong></td>
<td>The input request could not be completed because the DPC is inaccessible. Retry the request later.</td>
</tr>
<tr>
<td><strong>EXCESSIVE BIT ERROR RATE</strong></td>
<td>The digital test found too many errors in returned bit stream to make reliable measurements.</td>
</tr>
<tr>
<td><strong>FAIL 1ST RING FWD</strong></td>
<td>No on-hook was received or only an on-hook pulse (flash) was received.</td>
</tr>
<tr>
<td><strong>FAIL 2ND RING FWD</strong></td>
<td>Fewer than four supervision changes were received.</td>
</tr>
<tr>
<td><strong>FAIL DIG PATH CLOSE</strong></td>
<td>Internal software error. Failed to close the path toward the responder or trunk under test.</td>
</tr>
<tr>
<td><strong>FAIL DIG PATH OPEN</strong></td>
<td>Internal software error. Failed to open the path toward trunk under test.</td>
</tr>
<tr>
<td><strong>FAIL DIG PATH SET</strong></td>
<td>Internal software error. Failed to close path toward the trunk under test or tone detector, failed path setup message.</td>
</tr>
<tr>
<td><strong>FAIL OSTIMER</strong></td>
<td>Internal software error. The operating system failed to set a timer.</td>
</tr>
<tr>
<td><strong>FAIL TO START ATM LOOPBACK TEST</strong></td>
<td>PH could not be activated to send ATM loop back request.</td>
</tr>
<tr>
<td><strong>FAIL OVERALL TIMER</strong></td>
<td>Overall time of test too long; retry.</td>
</tr>
<tr>
<td><strong>FAILED TO DETECT LOOPBACK</strong></td>
<td>No far-end loopback was detected by the test. If an OPDN was specified in the request, make sure it is a valid loopback OPDN. [5E16(2)+]</td>
</tr>
<tr>
<td><strong>FAILED TO GENERATE TEST TONE</strong></td>
<td>TTF/GDSF failed to generate requested tone.</td>
</tr>
<tr>
<td><strong>FAILED TO INITIATE VPA TEST</strong></td>
<td>The outgoing CCS terminal process (PUT) was unable to obtain or activate a VPA circuit.</td>
</tr>
<tr>
<td><strong>FAILED TO RECEIVE LPA FROM FAR END</strong></td>
<td>During the setup of the continuity test, the loop-back acknowledgement (LPA) message was not received from the far end. This could be due to the CCS message link being down or not connected to the far end office, a trunk data mis-match between the near end and far end offices, or the unsuccessful activation of the far end test equipment.</td>
</tr>
<tr>
<td><strong>FAILED TO RING LINE</strong></td>
<td>Failure to ring a line in attempting to contact far office.</td>
</tr>
<tr>
<td><strong>GLARE</strong></td>
<td>The far office tried to originate on a two-way trunk at the same time the test call was trying to originate.</td>
</tr>
<tr>
<td><strong>GROUP RESET</strong></td>
<td>Global reset received.</td>
</tr>
<tr>
<td><strong>HDW FAIL INTERRUPT</strong></td>
<td>A test call process received an interrupt message due to a hardware failure (not necessarily the trunk) and has terminated the call.</td>
</tr>
<tr>
<td><strong>IAM GLARE</strong></td>
<td>The outgoing CCS terminal process (PUT) encountered initial address message (IAM) glare on the CCS trunk under test.</td>
</tr>
<tr>
<td><strong>INCONSISTENT DATA</strong></td>
<td>The inter-module trunk task (IMMTASK) buffer data does not match the inter-module trunk ODD relation (RLIMTRKS or RLRT_TRKG) data.</td>
</tr>
<tr>
<td><strong>INDIVIDUAL RESET CIRCUIT</strong></td>
<td>Individual Reset circuit received.</td>
</tr>
<tr>
<td><strong>INTERCEPT</strong></td>
<td>Internal software error.</td>
</tr>
<tr>
<td><strong>INTERCEPT MESSAGE</strong></td>
<td>The test was interrupted by a stimulus external to TST:TRK. Could be an internal software error.</td>
</tr>
<tr>
<td><strong>INTERCEPT RECEIVED</strong></td>
<td>The outgoing CCS terminal process PUT received an interrupt message.</td>
</tr>
<tr>
<td><strong>INRPT BAD MSG</strong></td>
<td>Internal software error. Unexpected message was sent from the far terminal process.</td>
</tr>
<tr>
<td><strong>INVALID DURATION FOR TRUNK</strong></td>
<td>Maximum test duration on AUTOPLEX® trunks that require executive cellular processor (ECP) notification is 240 seconds.</td>
</tr>
<tr>
<td><strong>INVALID PSU CHANNEL GROUP NUMBER</strong></td>
<td>Invalid PSU channel number was received in the software.</td>
</tr>
<tr>
<td><strong>INVALID PSU CHANNEL MEMBER NUMBER</strong></td>
<td>Invalid PSU channel member number was received in the software.</td>
</tr>
<tr>
<td><strong>INVALID PSU NUMBER</strong></td>
<td>Invalid PSU number was received in the software.</td>
</tr>
<tr>
<td><strong>INVALID SHELF NUMBER</strong></td>
<td>Invalid shelf number was received in the software.</td>
</tr>
<tr>
<td><strong>INVALID ROTL COMMAND (CCS)</strong></td>
<td>Invalid ROTL command received for CCS trunk.</td>
</tr>
<tr>
<td><strong>INVALID SM NUMBER</strong></td>
<td>Invalid SM number was received in the software.</td>
</tr>
<tr>
<td><strong>INVALID TEST CALL TARGET TYPE</strong></td>
<td>Internal software error. Unexpected test target was received in the software.</td>
</tr>
<tr>
<td><strong>INVALID TEST FOR CCS TRUNKS</strong></td>
<td>An attempt was made to run a test that is invalid for CCS trunks (103, SYNC, NSYNC,</td>
</tr>
<tr>
<td>Condition</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>INVALID TEST FOR PACKET TRUNKS</td>
<td>Test type other than LBKOCU or LBKCSU was erroneously requested for a packet switched trunk.</td>
</tr>
<tr>
<td>LINE OUT OF SERVICE</td>
<td>The outgoing CCS terminal process PUT received a CCS line out-of-service UBS message.</td>
</tr>
<tr>
<td>LOOPBACK TEST NOT PROVISIONED</td>
<td>Access to the trunk was denied because loopback testing at either the OCU or CSU is not allowed by ODD.</td>
</tr>
<tr>
<td>LOW ERROR FREE BLOCKS</td>
<td>Too many blocks in digital testing were found to have errors in bits.</td>
</tr>
<tr>
<td>LTP ACTIVATE FAIL</td>
<td>Internal 5ESS® switch software error. Could not get a channel control block for the associated port in response to a service request. Failed to initialize the hardware and software appropriately.</td>
</tr>
<tr>
<td>LVNL NOT ACCEPTABLE</td>
<td>Test tone level not acceptable for code answer test line (CATL) test.</td>
</tr>
<tr>
<td>MESSAGE REFUSED</td>
<td>The outgoing CCS terminal process PUT received a CCS message refusal UBS message.</td>
</tr>
<tr>
<td>NATIONAL NETWORK CONGESTION</td>
<td>The outgoing CCS terminal process PUT received a CCS national network congestion unsuccessful backward setup (UBS) message.</td>
</tr>
<tr>
<td>NETWORK BLOCKED</td>
<td>The test call was blocked in the 5ESS® switch network while trying to connect the trunk to a logical test port.</td>
</tr>
<tr>
<td>NO ANI OFFHOOK</td>
<td>An offhook should be received within two seconds of outpulsing on automatic number identification (ANI) trunks as an indication to send ANI billing digits. This offhook was not received.</td>
</tr>
<tr>
<td>NO ANSWER</td>
<td>No response was received (other than possibly audible rings) after outpulsing was completed.</td>
</tr>
<tr>
<td>NO MGDLGLACK</td>
<td>Internal software error. Did not receive test results from SM.</td>
</tr>
<tr>
<td>NO MGDLGRS_R</td>
<td>An expected measurement result was not received from the TTF responder or GDSF GDG transceiver.</td>
</tr>
<tr>
<td>NO MGPH_SET</td>
<td>Internal software error. Failed to receive a &quot;path set&quot; message within six seconds from the operating system.</td>
</tr>
<tr>
<td>NO MGRLS_GRD</td>
<td>The call tear down sequence at the trunk under test did not complete normally and/or the message indicating this was lost.</td>
</tr>
<tr>
<td>NO MSGYN_RSLT</td>
<td>Internal software error. Failed to receive results of synchronous or non-synchronous test call within 40 seconds.</td>
</tr>
<tr>
<td>NO MGTMREL_P</td>
<td>Internal software error. Failed to receive release message from the operating system after the test call is complete and the final status has been determined.</td>
</tr>
<tr>
<td>NO MGTMSETUP</td>
<td>Internal software error. Failed to receive a path setup complete message.</td>
</tr>
<tr>
<td>NO RESPONDER</td>
<td>A TTF responder was not available, probably due to being busy or out-of-service (OOS).</td>
</tr>
<tr>
<td>NO SYNC PULSE</td>
<td>Internal software error. Received only one signal change report during a test call analysis.</td>
</tr>
<tr>
<td>NO TEST CQ</td>
<td>Either a TTF responder, tone detector, or tone generator or a GDSF tone generator, tone transceiver, or GDG transceiver was not available, probably due to being busy or OOS.</td>
</tr>
<tr>
<td>NO TEST MADE</td>
<td>Failed to make a measurement, no test made.</td>
</tr>
<tr>
<td>NO TONE DET</td>
<td>A TTF tone detector was not available, probably due to being busy or OOS.</td>
</tr>
<tr>
<td>NO TONE</td>
<td>The test call was waiting on a tone (either 1004 or 2225 Hz) and it was not received.</td>
</tr>
<tr>
<td>OFFHOOK 6TH PULSE</td>
<td>A synchronous test call expects the far end to be on-hook at the end of a train of six pulses and it was found to be off-hook.</td>
</tr>
<tr>
<td>OSPS COMM. FAILURE</td>
<td>A failure occurred in communication with the far-end OSPS.</td>
</tr>
<tr>
<td>OSSRESTART() RETURNED</td>
<td>The outgoing CCS terminal process PUT was unable to restart to another terminal process.</td>
</tr>
<tr>
<td>OSSSENDMSG() FAILED</td>
<td>The outgoing CCS terminal process PUT was unable to send an OSDS message.</td>
</tr>
<tr>
<td>OSWGETMSG FAILURE</td>
<td>Internal software error. OS primitive failed to get a message in the allowed time.</td>
</tr>
<tr>
<td>OUT OF SERVICE</td>
<td>Internal software error.</td>
</tr>
<tr>
<td>OUTPUT FAILURE</td>
<td>A failure occurred during outpulsing. This is not likely to be due to the trunk unless it is revertive dial. The problem may be with the equipment used for outpulsing [such as, multi-frequency (MF) sender].</td>
</tr>
<tr>
<td>PACKET GRP MEMBER BUSY</td>
<td>The specified packet group member is busy and cannot be used for the request at this time. [5E16(2)+]</td>
</tr>
<tr>
<td>PACKET SERVICE GROUP NOT TESTABLE</td>
<td>The group specified is a packet service group, and cannot be tested by this request. [5E16(2)+]</td>
</tr>
<tr>
<td>PACKET TTP FAILED TO SEND MGMTSETUP</td>
<td>The request failed since the packet signaling terminal process was not able to send the MGMTSETUP message to another process. [5E16(2)+]</td>
</tr>
<tr>
<td>Packet Signal</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>TTP RECEIVED MGBRR_FAIL MESSAGE</td>
<td>The packet signaling terminal process received a message from the bearer path terminal process indicating an unspecified failure condition. [SE16(2)+]</td>
</tr>
<tr>
<td>TTP RECEIVED MGIGEVENT MESSAGE</td>
<td>The packet signaling terminal process received a message from the bearer path hardware indicating an unexpected failure event occurred. [SE16(2)+]</td>
</tr>
<tr>
<td>TTP TIMEOUT WAITING FOR MSGSET_BRR</td>
<td>The packet signaling terminal process timed out waiting for acknowledgement from the bearer path terminal process indicating the bearer path had been successfully set up. [SE16(2)+]</td>
</tr>
<tr>
<td>PASS ALONG MSG RECEIVED</td>
<td>The outgoing CCS terminal process PUT received a CCS pass along message.</td>
</tr>
<tr>
<td>PATH CLOSURE FAILED</td>
<td>The outgoing CCS terminal process PUT was unable to close the digital path between the test execution control (TEC) and PUT.</td>
</tr>
<tr>
<td>PATH DEFINITION FAILED</td>
<td>The outgoing CCS terminal process PUT was unable to establish the digital path between the TEC and PUT.</td>
</tr>
<tr>
<td>PORT ACTIVATION FAILED</td>
<td>The outgoing CCS terminal process PUT was unable to activate the CCS trunk under test port.</td>
</tr>
<tr>
<td>PREEMPT INTRT</td>
<td>The test call was preempted for either the logical test port or the trunk under test (most likely) by a higher priority request. Possibilities include a RMV:TRK request. It may also be due to fault recovery requesting the hardware.</td>
</tr>
<tr>
<td>PRETRIP FAIL</td>
<td>The trunk received one audible ring followed by 120 IPM (reorder) while making a synchronous test call.</td>
</tr>
<tr>
<td>PULSES TOO LONG</td>
<td>The synchronous test call has detected at least one pulse longer than 2.3 seconds.</td>
</tr>
<tr>
<td>PUT ROUTE FAILURE</td>
<td>The PUT is inaccessible for trunk testing (that is, trunk hardware is OOS or the PUT SM is unavailable).</td>
</tr>
<tr>
<td>PUT TIMEOUT</td>
<td>The outgoing CCS terminal process PUT timed out waiting for an event.</td>
</tr>
<tr>
<td>PERMANENT VIRTUAL CIRCUIT ACTIVE</td>
<td>Access to the trunk was denied because the trunk is provisioned for a permanent virtual circuit (PVC).</td>
</tr>
<tr>
<td>PH SOFT/HARD SWITCH OCCURED</td>
<td>During testing the PH supporting the tested trunk was switched making test results invalid.</td>
</tr>
<tr>
<td>PH TYPE NOT SUPPORTED</td>
<td>PVELBK test type is only valid for PHV4 and PHV5.</td>
</tr>
<tr>
<td>PREEMPTION DUE TO MANUAL REQUEST</td>
<td>Preemption due to manual request.</td>
</tr>
<tr>
<td>QUEUING FAIL INTRT</td>
<td>Queuing for requested resources was interrupted.</td>
</tr>
<tr>
<td>RAI-2-3, CB2-3 RECEIVED</td>
<td>The outgoing CCS terminal process PUT received an unexpected CCS reanswer or clearback message.</td>
</tr>
<tr>
<td>RELEASE GUARD RECEIVED</td>
<td>The outgoing CCS terminal process PUT received a CCS release guard message.</td>
</tr>
<tr>
<td>RELEASE GUARD TIMEOUT</td>
<td>The outgoing CCS terminal process PUT timed out waiting for a CCS release guard (RLG) message.</td>
</tr>
<tr>
<td>RETURNED IAM</td>
<td>The outgoing CCS terminal process PUT received a returned CCS IAM. This indicates that the common network interface (CNI) is in overload.</td>
</tr>
<tr>
<td>REVERSE BUSY</td>
<td>The far end has busied the outgoing trunk by going off-hook. A mixup in signaling could also cause this.</td>
</tr>
<tr>
<td>RING FORWARD RECEIVED</td>
<td>The outgoing CCS terminal process PUT received a ring forward message.</td>
</tr>
<tr>
<td>ROUTE-BUSY</td>
<td>Access was denied to the trunk under test because it was busy.</td>
</tr>
<tr>
<td>ROUTE-FAIL TO TRK</td>
<td>A failure occurred during routing to the trunk.</td>
</tr>
<tr>
<td>ROUTE-OVERLOAD</td>
<td>The test call could not route from the logical test port to the trunk due to an overload condition in 5ESS® switch.</td>
</tr>
<tr>
<td>ROUTE-REORDER</td>
<td>Failed to route to trunk or test equipment.</td>
</tr>
<tr>
<td>SECONDARY START MSG RECEIVED</td>
<td>The outgoing CCS terminal process PUT received a secondary start dial (SSD) message.</td>
</tr>
<tr>
<td>SIG CHG REPT FAIL</td>
<td>Internal software error. Special signal change reporting mechanism not turned off by peripheral control.</td>
</tr>
<tr>
<td>SM DATA PROBLEM\f1</td>
<td>A problem occurred in routing to the trunk in the SM. The probable cause is an ODD or dynamic data problem in the SM. An assert, which contains specific information, may have been triggered.</td>
</tr>
<tr>
<td>SOFTWARE OPTIONED PACKAGE NOT LOADED</td>
<td>The software option package needed to run test was not loaded.</td>
</tr>
<tr>
<td>SPP OF SM PROCESS</td>
<td>One of the terminal processes associated with the call has been purged. More information should be available in the resulting RE PT message.</td>
</tr>
<tr>
<td>STOPPED BY REQUEST</td>
<td>A manual request to stop the currently executing test was received. The current test (or set of repeated tests) have been stopped.</td>
</tr>
<tr>
<td>SUBSCRIBER BUSY</td>
<td>The outgoing CCS terminal process PUT received a CCS subscriber busy UBS message.</td>
</tr>
<tr>
<td>Event Description</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>SYNCHRONIZATION FAILURE</td>
<td>Synchronization was never achieved with data returned from the trunk under test. Failure to synchronize could happen for the following reasons: VL &quot;-&quot; break or open in the trunk, Li &quot;-&quot; data rate mis-match between the trunk and the digital facility interface (DFI), Li &quot;-&quot; improper loopback termination (such as, wrong test-line), Li &quot;-&quot; digital insertion of loss and/or gain. Synchronization failures may occur while running inverted loopback tests, even though non-inverted loopback tests may synchronize. This is usually due to digital insertion of loss and/or gain on the trunk.</td>
</tr>
<tr>
<td>SYNCHRONIZATION LOST</td>
<td>Synchronization with data returned from the trunk under test has been lost.</td>
</tr>
<tr>
<td>TEST CALL SETUP FAILURE</td>
<td>Failed to set up an outgoing test call for an EDSL trunk.</td>
</tr>
<tr>
<td>TEST EQ FAIL</td>
<td>A failure has occurred in either a tone detector, tone generator, responder, or the integrated services test function (ISTF).</td>
</tr>
<tr>
<td>TEST PORT NOT AVAIL</td>
<td>All logical test ports in the port group for outgoing test calls are busy, OOS, or otherwise inaccessible to the test call software. A second reason may be printed on the same line indicating why routing failed to the logical test port. This second reason is not related to the trunk.</td>
</tr>
<tr>
<td>TEST VALID FOR PACKET TRUNKS ONLY</td>
<td>Test type LBKOCU or LBKCSU was erroneously specified for a non-packet switching trunk.</td>
</tr>
<tr>
<td>TIME OUT FOR PH RESPONSE</td>
<td>The outgoing terminal process PUT timed out waiting for the PH to respond.</td>
</tr>
<tr>
<td>TMGLCDA INTERNAL ERROR</td>
<td>Internal error has occurred in the function TMglcda_eo. This does not implicate the ISTF.</td>
</tr>
<tr>
<td>TMEO NO MGTM_TERM</td>
<td>Internal software error in the function TMeo. Failed to get a test call message from &quot;OS&quot; within 15 seconds.</td>
</tr>
<tr>
<td>TMFOSRES</td>
<td>Internal software error. The operating system did not return after setting a timer.</td>
</tr>
<tr>
<td>TMNDCIU</td>
<td>DCTU port not available.</td>
</tr>
<tr>
<td>TMNFL</td>
<td>Failed to receive preemption wink correctly.</td>
</tr>
<tr>
<td>TMNJC</td>
<td>AC jack not available.</td>
</tr>
<tr>
<td>TMNMPTH</td>
<td>No metallic path available.</td>
</tr>
<tr>
<td>TMNTSB</td>
<td>Unable to allocate a metallic test bus.</td>
</tr>
<tr>
<td>TMOSMGE</td>
<td>Internal software error. Timed out waiting for a response from the trunk or had an error in the OSWEG primitive.</td>
</tr>
<tr>
<td>TMRTE10C</td>

</tbody>
</table>
1. SM/CM TLP NOTE

TLPNOTEs for the SM/CM diagnostics are 0.

Note - 1 Check the restore-to-service (RST)/ request out-of-service (ROS) switch on board SN412 (or SN516). It should be in the RST position.

Note - 2 Check the fuses and fuse panel wiring of the SN412, SN516, UN516, TN1424, or UN589 boards, in the MCTU, depending on the MCTU model installed. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Note - 3 This failure may have been triggered by a fuse failure anywhere in the switching module (SM). Check all peripheral unit fuses before proceeding with the diagnosis of the module controller time-slot interchanger (MCTSI).

Note - 4 Diagnose both of the dual link interfaces (DLI0 and DLI1) in the interface or SM, verify ATP.

Note - 5 Procedure:
- After replacing a TN117, TN119 or UN71, verify that the MCTSI diagnoses ATP and restores to active (ACT) without causing interrupts.
- If the board was replaced to fix a peripheral unit failure, verify that the peripheral unit now diagnoses ATP.
- If the board replacement does not clear the problem, check the peripheral interface control bus (PICB) cable between the MCTSI and the affected peripheral unit.

Note - 6 After replacing a data interface (DI) board, verify MCTSI diagnoses ATP and restores to standby (STBY). Also, verify the peripheral interface data buses (PIDBs) associated with the DI board by diagnosing the affected peripheral unit(s).

If the board replacement does not clear the problem, check the PIDB cable between the MCTSI and the affected peripheral unit.

Note - 7 After replacing a TN118 or TN837, repeat the procedure in TLP Note 6 to verify PIDBs5-15.

Note - 8 CAUTION: The first three steps must be done in the exact order shown when a TN340 or TN340B board is to be replaced.
- Pull both TN338 boards in the affected GRID.
- Replace the TN340 or TN340B board.
- Reinsert both TN338 boards.
- Enter input message RST:GRID and verify ATP.
- Enter input message TST:GRID and verify ATP.

If following the previous steps does not clear the problem, then there is a high probability that the problem exists on the outside plant. Changing circuit packs is not likely to clear a FOREIGN POTENTIAL or POWER CROSS failure.
Note - 9  Procedure:
- Replace board TN338.
- Enter input message RST:GRID and verify the grid restores ATP.
- Enter input message TST:GRID and verify the grid test completes ATP.

Note - 10  Ignore this note (no longer used).

Note - 11  Ignore this note (no longer used).

Note - 12  Incorrect setting of the control message timeslot dual in-line package (DIP) switch on the backplane for this DLI could cause failure.

Note - 13  Incorrect setting of the DIP switch on the trunk unit channel board could cause failure.

Note - 14  Incorrect setting of the DIP switch on the TN304B could cause failure.

Note - 15  CAUTION: The next three steps must be performed in the exact order as shown when a TN332/TN332B or TN832/TN832B board is to be replaced.
- Pull out the TN331 or TN831 board in the affected gated diode crosspoint access (GDXACC) service group.
- Replace the TN332/TN332B or TN832/TN832B board.
- Reinsert the TN331 or TN831 board.

Note - 16  The board code is not consistent with the office-dependent database (ODD).

Note - 17  CAUTION: The following three steps must be performed in the exact order as shown when a TN332B board is to be replaced.
- Pull the TN331B in the affected GDXACC.
- Replace the TN332B board.
- Reinsert the TN331B.

Note - 18  CAUTION: The following four steps must be performed in the exact order as shown when a TN340B board is to be replaced.
- Pull both TN338B boards in the affected GRID.
- Replace the TN340B.
- Reinsert both TN338B boards.
- After RST:GRID is ATP, enter input message TST:GRID and verify ATP.

Note - 19  Board series may not be consistent with circuit's change level indicator (CLI) in the CKTDATA relation in the switching module database.

Note - 20  If all trunk equipment numbers (TENs) in the trunk unit (TU) service group are failing, pull trunk unit channel boards (TUCHBDs) 1-7. Diagnose TUCHBD0 and replace it if it fails. If it is ATP, reinsert the other TUCHBDs, one at a time, until the faulty one causes diagnosis of TUCHBD0 to fail again.

Note - 21  As a last resort, replace remaining boards, one at a time, in the transmission test facility (TTF) which are not on the TLP.

Note - 22  If replacement of boards on the TLP does not clear the failure, check the fiber optic link transmitter at the time-multiplexed switch (TMS) end and receiver at the DLI end. The failure indicates either loss of clocks on the TMS-DLI link or out-of-phase (drifting) clocks from the two sides of the on-line network timing and control common (ONTCCOM). Before replacing an optic transceiver, follow the
power down procedure which follows and reverse the order upon powering it back up.
- If at the TMS, remove TMS/ONTCCOM power and unseat the associated link board (TN243 for CM1 or TN888 or TN883 for CM2).
- If at a DLI, remove DLI power and unseat the DLI board (TN877 or TN1077).
- If at an RLI, remove RLI power and unseat the DLI board (TN834 or TN1510).

Note - 23
A TN887 is a compatible replacement for the TN147.

Note - 24
If replacement of boards on the TLP does not clear the failure, check the fiber optic link transmitters and receivers at the link interface circuit (DLI, RLI, NLI, NLI1, or ENLI) under test and at the TMS.

Before replacing an optic transceiver, follow the power down procedure for the appropriate link interface circuit:
- If at an DLI, remove DLI power and unseat the DLI board (TN877 or TN1077 series).
- If at an RLI, remove RLI power and unseat the DLI board (TN877, TN1510, or TN1077 series).
- If at an NLI, NLI1, or ENLI, unseat the BKD series board from the backplane. Use the reverse order upon powering it back up.

If replacing the fiber optic equipment does not clear the failure, it may indicate an out-of-phase (drifting) clock from the ONTCCOM. Diagnose the ONTCCOM side relative to the failing link interface circuit.

Note - 25
If board replacements do not clear the problem, check the bootstrapper (BTSR) cable connections.

Note - 26
Verify circuit's microcode series is consistent with its change level indicator (CLI) value. Microcode series 5D045A1 CLI value should be 0; microcode series 5D045A2 CLI value should be 1.

Note - 27
Metallic test bus (MTB) diagnostics start with phase 2 segment 2 test X. To find the failing MTBs number: segment number - 2 = MTB number.

For an unassigned MTB there are 4 tests performed.

</tbody>
</table>

Note - 28 Try replacing the grid boards for the line unit (LU) (TN338s and TN340s). Grids should be in out-of-service (OOS) status before removing.

CAUTION: Boards in a grid must be removed and inserted as follows:
- Pull the TN338 boards before pulling the TN340 board.
- Insert the TN340 board before reinstating the TN338 boards.

Note - 29 Verify that the memory boards equipped are consistent with the office-dependent database.

If a TN875B is listed in the TLP, the office-dependent database should indicate that TN56 memory boards are equipped.

If a TN875 is listed, then the database should indicate that TN28 memory boards are equipped in which case either a TN875 or TN875B may be used.

Note - 30 Phase 6 segment 4 of the message interface (MI) diagnostic involves time-multiplexed switch (TMS) initialization. This is used by the MI to loop around data in the TMS. The initialization sends a no-operation message (NOP) message to make sure the TMS can be initialized. If the message does not come back, a test will fail and some TMS boards will be listed in the TLP. Before changing those boards, run the TMS diagnostic since it has a thorough test of the unit. If the TMS diagnostics pass, check the fiber optic cables and the optic transceiver. Also run the network clock (NC) diagnostic.

Note - 31 If the office is not equipped with a compact CM2 (CM2C), verify that the single/dual fabric configuration backplane strap is consistent with office dependent data (ODD) in relation RLSCORE. If the office is equipped with CM2C, the ODD relation SCORE must be populated as a single fabric time multiplexed switch (TMS).

Note - 32 If replacement of boards on the TLP does not clear the problem, run the ONTC diagnostics (TMS boards are involved in the message interface bus (MIB) data loopback test). Check the MIB cable connected to the peripheral controller (PC) being tested. Check 4MHz and sync clock on both sides of MIB.

Note - 33 If replacement of boards on the TLP does not clear the problem, check UN33 in the input-output processor (IOP) and wiring of scan and distribute points to the failing unit. Check both IOP0 and IOP1.

Note - 34 The power monitor test failure could be caused by any of the power converters or SN516 boards in the unit. The UN33 (and scan/distribute point wiring) in the input/output processor (IOPs) are also involved (refer to Note 33). If a visual alarm indication is present on the power converter, a circuit pack in the associated unit may be causing the problem.
If the unit being diagnosed is part of the office network and timing complex (ONTCCOM) (which includes the network clock (NC), the time multiplex switch (TMS), and the message interface (MI)), the problem could lie in any one (or more) of the power converters and/or SN516’s of the communication module control unit (CMCU) and/or the TMS switch unit (TMSU) shelves. In the case of the TMSU, a circuit pack in the E bus unit (EBU) may be causing the power converter to alarm.

Note - 35 WARNING: First pull the SM250 (MC2P002-C), then pull the SM257 before pulling the SM264 in the precision measurement unit (PMU). Insert the replacement SM264 before reinserting the SM257 and finally insert the SM250 (MC2P002-C).

Note - 36 The E-bus boards (UN197, UN198, UN310, UN311, UN312, UN313, UN500, UN501, UN503, UN504) participate in the signal exchanges and should not be overlooked as a last resort suspect. To isolate E-bus faults, run the TMS2 demand phase 14 with the RAW and UCL (unconditional) options specified.

Note - 37 If fault persists after replacement of all packs listed on the TLP, executing all office network and timing clock (ONTCCOM) diagnostics is suggested.

Note - 38 If the fault persists after replacement of all packs on the TLP list, check the sync signal from the DFI, D4 channel bank, or sync distributor.

For 30 channel systems, MCC page 1211 will identify the location of the DFI that provides the T1 reference.

Note - 39 Failure may also be caused by the equalizer pack. The following packs may exist in the digital line and trunk unit host (DLTURH) and DLTU remote (DLTURR). The packs should be checked if problems persist.

SN549 E5DT30BC
SN550 E5DT40BC
SN551 E5DT50BC
SN552 E5DT60BC
SN553 E5DT70BC

Note - 40 When a TLP for the line unit high level service circuit (LUHLSC), GDXACC or line unit channel (LUCHAN) implicates a faulty TN838 circuit board, any one of the line unit half-grids can affect this portion of the diagnostic. It may be necessary to diagnose each of the half-boards associated with this line unit. The grid board diagnostic can be invoked with the RST:GRIDBD input message.

It should be possible to locate the failing half-grid within half the possible combinations. If the TLP of the failing LUHLSC diagnostic indicates an equipment location (EQL) position of xx-112 (where xx represents the vertical position) the failing half-grid should be located by running the GRIDBD diagnostic on each of the even (0) half-grid board numbers. If the EQL board position is xx-120, then the failing half-grid should be located by running the GRIDBD diagnostic on each of the odd (1) half-grid board numbers.

Note - 41 Any one of the half-grid boards may affect this portion of the diagnostic. However, this is low priority, so exhaust the TLP list before checking the grid boards. If the faulty pack is not found on the TLP list, run DGN and FABEX on the half-grid boards to determine if one of them is the cause.

Note - 42 The detected fault is associated with link 0.

Note - 43 The detected fault is associated with link 1.

Note - 44 The detected fault is associated with link 2.
Note - 45 The detected fault is associated with link 3.

Note - 46 The tests of phase 12 proper have not started yet. This failure is associated with initialization tests.

Note - 47 Ignore the TLP. Only this board note is meaningful here. To decode the fault indications that are encoded in the 'mask' and 'expected' bytes, read the comment at the beginning of file 'DNC2ftms12.C', or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. This phase gives better insight, when run with the RAW and UCL (unconditional) options.

Note - 48 This phase is only for the factory, and not to be used in the field.

This phase assumes scan point cabling is disconnected and no scan points are in the closed state.

This phase will fail because of any of the following problems on a TN220 or TN220B:
- Cables connected to the scan pack.
- Fault in backplane wiring to the scan points.
- Fault in internal registers in the scan pack.

Note - 49 If the replacement of boards on the TLP does not clear the failure, check the transmission facility. The test involves sending data from a dual link interface (DLI) to a quad link interface (QLI) and back to the same DLI. Before replacing an optic transceiver, follow the power down procedures which follow and reverse the order upon powering it back up.
- If at the TMS, remove TMS/ONTCCOM power and unseat the associated link board (TN243 for CM1 or TN888 or TN883 for CM2).
- If at a DLI, remove DLI power and unseat the DLI board (TN877 or TN1077).
- If at an RLI, remove RLI power and unseat the DLI board (TN834 or TN1510).

Note - 50 The switching module (SM) is equipped with the processor speed-up enhancement, that is, the SMP is running at 10MHz and not at 9MHz. This requires that a TN871B circuit pack be equipped in the SMP and not a TN871.

Note - 51 The switching module (SM) is equipped with the processor speed-up enhancement, that is, the SMP is running at 10MHz and not at 9MHz. This requires that a TN875C circuit pack be equipped in the SMP and not a TN875 or a TN875B.

Note - 52 Present failure cannot be handled by phase 14. Run phase 14 with the "UCL" and "RAW" options, and analyze the "failing key", according to the instructions in the comment appearing right before the beginning of function DNC2ftms14 in file DNC2ftms14.C. The 4 bytes of the "failing key" (byte 0/1/2/3) are given by the ACTL result associated with failing tests 1/2/3/4 of segment 2.

Note - 53 If Phase 1 has failed, the probable cause is that a pack/board other than the type being tested is plugged in. Verify that the actual pack/board type is correct.

If the failure is in any other phase, look for an incorrect change level indicator (CLI) in the ODD for this pack/board. Verify that this pack/board has the correct CLI in the ODD.

If the type and the CLI are both correct, the pack/board under test is probably defective.

Note - 54 Customer may have gone off-hook during the critical part of the diagnostic. Repeat the diagnostic. If the failure persists, then replace the pack/board.

Note - 55 Diagnostic has detected a high current of false cross to ground.
This failure can be caused by any one of the following:
- Metallic access network pack/board operated incorrectly.
- Defective circuit under test.
- Defective high level service circuit.
- High voltage on tip/ring of the line under test.

Note - 56  The secondary KCB8 pack is bolted together with KCB9 pack to form the 6A interface unit for phase 1 U-card development.

Note - 57  The network termination type 1 (NT1) is part of the U-DSL and resides at the customer’s premise. The NT1 needs to be hooked up in order for phase 4 to run and could be a possible cause of diagnostic failure.

Note - 58  The main purpose of phase 5, segment 1, is to detect external loads and/or foreign potentials on the line group bus (lgbus) and/or spare bus (sprbus) of the metallic access network (MAN) pack under diagnosis. A failure in segment 1 will most likely be a result of the following condition:
Testno 11 = Bad MAN pack.
Testno 12 = Bad line card. Refer to the table.
Testno 13 = Bad line card. Refer to the table.
Testno 14 = Bad spare card.

The MM (mismatch) data from the failure message will be needed to determine where the fault is at. This data will be in hex format and will need to be converted to a binary format, so that the failing bits (those set to 1) can be identified. When determining the failing bit number from the binary format, begin counting from right to left starting with bit 0. For example: if MM=31 (h’31) then the binary equivalent is 0000000000110001 and so the failing bits are 0, 4, and 5.

For test 14 bits 0 or 1 failures, an external load was detected on the spare bus; therefore, any spare card could be at fault.

The following table will indicate which line group controller (LGC) and group of line cards (LCs) in the LGC could be causing the trouble for the appropriate MAN test number 12 and/or 13 test failures.

</table>
Note - 59  
Check that both digital facilities interface (DFI) -H1(E) packs [TN1306(07)], both DFI-R1(E) packs [TN1304(05)] and the other remote clock (RCLK) pack (TN1319) are present in order to get valid results. If not present, insert missing board and run diagnostic again.

Note - 60  
There are several versions of the TN495 power converter unit, such as, TN495G1 and TN495FB. These are all backward compatible, however, the TN495FB is the later version. If an older version of the TN495 is suspected of being faulty, it is recommended that it be replaced with the TN495FB.

Note - 61  
High probability of problem exists in the outside plant. Changing circuit packs is not likely to clear a FOREIGN POTENTIAL or POWER CROSS failure.

Note - 62  
The equipment configuration database (ECD) and ODD equipage for the input and output message interface (IOMI) specified on the TLP do not match. If the EXPECTED test value returned from a diagnostic output message equals 0, then the IOMI is equipped in the ECD, but not in the ODD. A value of 1 implies equipage in the ODD, but not in the ECD.

Up to four IOMI's (A-D) may be equipped as shown in the following chart.

<table>
<thead>
<tr>
<th>MSCU2 IOMI</th>
<th>MSCU3 IOMI</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
</tr>
<tr>
<td>UN25</td>
<td>UN25</td>
</tr>
</tbody>
</table>

Note - 63  
If replacing circuit packs as defined by the TLP doesn't solve the problem, try running demand phase 5. If phase 5, segment 1 fails, then refer to board note indicated by phase 5 failure.

Note - 64  
A loss of communication between the foundation peripheral controller (FPC) and the TMS caused the current test failure. The failure is not necessarily related to the diagnostic test being run. Message switch control unit (MSCU), FPC, and TMS diagnostics should be run to fully isolate the problem.

Note - 65  
Ignore this note (no longer used).

Note - 66  
Ignore this note (no longer used).

Note - 67  
If replacing all packs on the TLP does not fix the problem, the cause could be a bad line card/circuit connected to the MAN pack that is being used as a helper circuit. To determine the cause, run the following diagnostic phase on the helper MAN pack depending on the unit type.

<table>
<thead>
<tr>
<th>Unit</th>
<th>RG Pack #</th>
<th>MAN Pack Diagnostic to run</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISLU</td>
<td>TN1347</td>
<td>Phase 5</td>
</tr>
<tr>
<td></td>
<td>TN1384</td>
<td></td>
</tr>
<tr>
<td>ISLU2</td>
<td>TN1374B</td>
<td>Phase 6</td>
</tr>
<tr>
<td></td>
<td>TN1384B</td>
<td></td>
</tr>
</tbody>
</table>

Note - 68  
If, after replacing the LC under test, the failure has not been corrected, there is a possibility that the fault may be caused by a tip/ring short, open, or ground on the line. Go to page 5600 on the TLWS or MCC and run the appropriate metallic tests.

If the previous steps do not resolve the failure, continue to exhaust the TLP list as the failure may be caused by a resource circuit.

Note - 69  
Ignore this note (no longer used).

Note - 70  
This note is valid for 5E2(2) and later software releases. The phase 1 segment 3 test 3 can be caused by any of the SM248/SM248B circuit packs in this directly connected test unit (DCTU). If replacing the circuit packs on the TLP does not resolve the problem, verify that at least two other
DCTUPORTs are failing with the same failure. Then try the following method to find the defective circuit pack.
- In the specific DCTU, take all the DCTUPORTs OOS, and physically unplug all the SM248/SM248Bs.
- Then insert one SM248/SM248B at a time and diagnostics should each ATP.
- Then do the same with each DCTUPORT until the insertion of a specific circuit pack causes the same failure.

Note - 71 If replacing the boards on the TLP does not clear the failure, run the dual link interface (DLI) diagnostics. The diagnostic tests that run in phase 25 of TMS model 1 and phase 15 of TMS model 2 test a loop to the host transmission rate converter unit (TRCU) only, but the remote TRCU can also cause failures.

Note - 72 If there is a power converter shut down or power alarm or fuse alarm indication at the MCC or the failing unit, refer to the Power Alarm procedure in the Maintenance Procedures manual to clear the problem in the unit.

Note - 73 Additional steps may be necessary for this failure of the MCTSI diagnostic depending on the pack at the EQL:
- If the pack at this location is a TN833 with 5D085A1 firmware or a TN1637, the pack may not have been initialized properly prior to running the MCTSI diagnostic. Initialize the pack using a digital service unit (DSU) diagnostic (or if appropriate, by requesting an unconditional restoration) and then re-diagnose the MCTSI.
- If the pack at this EQL is a TN128 or a TN833 with 5D073A1 firmware, or if the procedures in Step 1 have been done and the circuit still fails diagnostics, the fault could be due to the pack or the connecting peripheral interface data bus (PIDB) cables. Inspect the cables and/or replace the pack as appropriate, then repeat the diagnostic tests.

Note: If the pack is a TN833 or TN1637 and it is replaced, press the switch on the faceplate of the replacement pack after it is installed in the slot to apply power to the pack.

Note - 74 This failure is due to a special test which checks the memory of the switch module processor (SMP). It can be reliably reproduced only if phase 1 of the diagnostic is requested again without having either executed any other phase, or power cycled the MCTSI, or restored the MCTSI to service.

It is VERY important that the failing phase, segment, and test number be included on the trouble ticket. Otherwise, repair is difficult and this board will likely be returned no trouble found (NTF). If the diagnostic is requested again and the failing test changes, record all test failures on the trouble ticket.

Other hardware failures can exhibit symptoms similar to this failure. Determine if the failure has been corrected by the replacement of this board before sending the suspect pack in for repair. A three-day waiting period is suggested.

Note - 75 The switch on the optical line interface (OLI) circuit packs (16E or 16F or 16G) or strap on the AKM3 circuit packs must be set properly during installation. The setting is based on the light-wave signal loss between the transmit and receive plugs. When replacing the OLI or AKM3 circuit packs on TLP, refer to the NOTE that is on the plastic cover panel of the TRCU2 housing to determine the proper switch or strap setting.

Note - 76 The diagnostic failure may be caused by a faulty DMA controller (3B20 UN46 or 3B21 KBN15) or
channel board (3B20 UN9 or 3B21 KBN15). The UN46, UN9 and the KBN15 reside in the AM.

Note - 77 Check that the NT1 and the LC are of the same type.

A KCB17 cannot be mixed with an AMI NT1. A KCB10 cannot be mixed with an ANSI NT1. If the LCs and NT1s are mixed, a failure will occur in phase 4 of the diagnostics.

To verify the type of error, run the diagnostics using the RAW option in the DGN:ISLULC input message. Check the "actual" data to find what type of mismatch occurred.

<table>
<thead>
<tr>
<th>ACTUAL</th>
<th>EQUIPMENT MISMATCH</th>
</tr>
</thead>
<tbody>
<tr>
<td>0xffce</td>
<td>A mismatch was detected at the NT1 or the first CU.</td>
</tr>
<tr>

<td>A mismatch was detected between the LC installed and the LC in the ODD.</td>
</tr>
<tr>
<td>0xffcc</td>
<td>Tip and ring polarity reversed.</td>
</tr>
<tr>
<td>0xffcb</td>
<td>Both the LC and the NT1 differ from the ODD.</td>
</tr>
</tbody>
</table>

Note - 78 Remove and restore remote ISLU common control (RISLU CC) parent circuit, DFIH.

The RISLU CC diagnostic failure "PH 1 SEG 10 TEST 3 MM H'ff" implies that the control link between the RISLU H1/R1 DFI pair has silently gone down with the DFI's remaining active. This condition is monitored by the switch on 5-minute intervals and, if detected, automatic recovery action occurs.

Before replacing packs on this TLP, verify the failure by the following sequence:
- Remove and restore the failing RISLU CC's parent DFI.
- Restore the RISLU CC when the DFI restoration completes.

If failure persists, attempt pack replacement.

Note - 79 The number of equipped recorded announcement function (RAF) memory packs in the database should match the number of RAF memory packs physically inserted. Refer to the recent change/verify (RC/V) field for PACK NUM.

Check the microcode number entries in the database; they should match the microcode for each RAF memory pack physically inserted. The RC/V field for reference is MICRO CODE.

Check the RAF service entries in the database; the unit must have valid services defined in order to diagnose/restore it properly. The RC/V views for reference are the RAF SERVICES and RAF PACK.

Note - 80 To be sure of correcting this failure, the UN516 boards equipped in the SM must be a minimum of series 7.

Note - 81 This failure may be due to any problems in the fan alarm circuit, including the fan alarm cabling and the 233A board. For more detailed information refer to:

SD5D012-2 Switching Module Application Schematic

Note - 82 If the SM is equipped with a TN1370 board in the last slot of the memory expansion unit (MEU) and all other boards on the TLP have been replaced without clearing the failure, replace the TN1370.

If the TN1370 board is not equipped, paddle boards (terminating resistors) should have been placed on the backplane instead:

EQL: 101-013 (6122 111 09331)
EQL: 103-013 (6122 111 09331)
EQL: 103-032 (6122 111 09321)
Note - 83  For an SM installed in an SM cabinet:

This failure may be due to the 272A or 298A board (depends on the vintage of the alarm and status unit), which is part of the alarm and status unit located in the cabinet bezel cover, or the cable connecting that board to the SMP. For more detailed information refer to:

- SD5D160  SM Cabinet Schematic Drawing
- SD5D017  ASU (272A) Schematic Drawing
- SD5D148  ASU2 (298A) Schematic Drawing

For an SM or SM-2000 installed in an SM-2000 cabinet:

This failure may be due to the 298A board which is part of the alarm and status unit located on the cable rack, or the cable connecting that board to the SMP. For a classic SM, the cable connects the 298A to the SMP backplane. For an SM-2000, the cable connects the 298A to the 9822DU paddle board. For more detailed information refer to:

- SD5D160  SM Cabinet Schematic Drawing
- SD5D195  SMPU4 Unit Schematic Drawing
- SD5D148  ASU2 (298A) Schematic Drawing

Note - 84  The alarm and status circuit (ASC) is wired to the distribution frame (DF) and then from the DF to scan and distribute points (SP) in the modular metallic service unit (MMSU). In some special cases, the ASC is wired directly to the scan and distribute points in the MMSU. To locate a wiring problem, use the diagnostic failure phase, segment, and test numbers in the table below to identify the alarm point number. Then, using the alarm point number in the ODD RCV 8.0 view (OFFICE MISC & ALARM), subview 8.11 (REMOTE ALARM ASSIGNMENT), find the scan point or distribute point on the DF and trace the wires connected to the point.

Additional steps may be necessary to replace the 215A or 299A boards (depending upon the vintage of the ASC unit):
- Replace 215A if ED5D586-10 is stamped on the upper right corner of the opened bezel cover.
- Replace 299A if ED5D678-10 is stamped on the upper right corner of the opened bezel cover. For the 5ESS® switch, the ASC circuit is mounted in the alarm and status unit (ASU) on the cable rack.

</table>

Note - 85 Verify that the remote/local jumper P1 is installed on the SN560. If present, continue with TLP for probable cause of fault. If jumper P1 is not present, install the jumper and rerun diagnostic.

Note - 86 This problem may be caused by a faulty SN516 or power converter pack. If this is the suspected problem, prior to replacing any packs on the TLP, refer to the Power Alarm procedure in the Maintenance Procedures manual to clear the problem.

Note - 87 This note applies to dual message interface (DMI) phase 7 failures.

- If the MI phase 7 fails on only one ONTCCOM side, check the MIB cable connection on the DMI side of the failing peripheral pump controller (PPC)/module message processor (MMP). If no MIB cable-related problem is found, run the MI phase 7 diagnostic UCL. If more than one PPC and MMP fail, the most likely problem is in the ONTCCOM being diagnosed.

- If the failing ONTCCOM can be restored UCL, run MI phase 7 on the mate ONTCCOM. If MI phase 7 fails on both sides and the TLP points to the same PPC or MMP, then the most likely problem is in the PPC/MMP itself or in the MIB cable connection on the PPC/MMP side.

- If the failure is on an MMP that belongs to a multiple MMP community and if replacing boards in the TLP does not fix the problem, check the sync pulses of the failing MMP community. If they are not in phase, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Note - 88 When there is a power loss to the MCTSI of an remote switching module (RSM) equipped with a DLTU-2, the straps on the TN619 circuit packs of the FIU must be properly set to re-establish communication links after restoring power to the MCTSI. Determine the art master and series of the TN619 circuit packs. Perform the following steps and set the straps on all the TN619 circuit packs. The component side of the TN619 circuit pack is described in the diagram. For more information on setting the straps on TN619 circuit packs refer to the 5ESS® Switch Equipment Facilities Interface Unit Model 3 Circuit-SD5D401-02 drawing in the Common Switch Module Equipment for Remote Switching Module 3 manual (235-990-107).

- If the TN619 is art master 5, and series is 5, 5-6:
  -- Set the strap at J3 to [1] and [2] for DLTU-1.

- If the TN619 is art master 6, and series is 7 use:
  -- Set the strap at X3 to [1] and [2] for DLTU-1.
Note - 89 This failure may be due to an interaction problem between the SM253 and the SM258(B) circuit packs. A procedure for use by repair personnel to correctly identify the specific circuit packs that are out of tolerance (defective) as well as those that are within tolerance (good and marginal) is included in the Corrective Maintenance Procedures Manual (235-105-220), Hardware Maintenance (Trouble Clearing) Procedures Section.

Note - 90 This memory circuit pack is actually a TN1409.

Note - 91 This failure may result from a discrepancy between the office-dependent database (ODD) and the equipage present in the circuit under test. Verify that the ODD agrees with the installed circuit. Items to examine include (but are not limited to) change level indicator (CLI) value(s) for the circuit under test, missing, extra, or incorrect tuples related to the circuit under test, and so forth. Unseat any circuit pack in the unit which is not equipped using the ODD. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Note - 92 This failure may also be caused by an inhibited sanity timer. Before replacing any circuit packs, determine that the sanity timer is not inhibited. Check Master Control Center (MCC) page 1800, where "X" is the affected switching module (SM) number. The sanity timer should normally be allowed. If it is inhibited, determine the reason and correct it. Then rerun the diagnostic with the sanity timer allowed and act on the results.

Note - 93 The demand phase 3 metallic access (MA) diagnostic tests between the MA using metallic access bus (MAB) 0 to remote terminal (RT) 1 using the trunk bus control unit (TBCU) are as follows:

<table>
<thead>
<tr>
<th>TEST</th>
<th>TEST RAN</th>
<th>DESCRIPTION OF TEST</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>TRREV</td>

</table>

Note - 95 Phases 29 and 30 of the IDCU diagnostic are intended for factory and installation applications only. All 20 DS1 signals associated with this LSI must be physically looped back (transmit to receive) on itself for these phases. The loopback can be done either at the backplane (using a special loopback cable) or at the DSX.

Note - 96 This ISLU2 line board diagnostic failure may have just caused some form of failure on other line boards, 0-7, that are on the same LIDB. Correct failures on the line board being diagnosed before investigating any other failure related to these line boards.

Note - 97 If replacing the circuit packs as defined by the TLP does not solve the problem, then run demand phase 6. This diagnoses all line boards. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
Note - 99
If replacement of boards on the TLP does not clear problem, it could be caused by a defective DFI circuit pack (ANN3B, ANNS) located in the DLTU shelf. The defective DFI pack generates noise on the -48V power bus that feeds it, causing problems with other sensitive hardware fed from that same bus.

Excessive AC noise and ripple between -48V RTN and FRAME GRND indicates a defective DFI pack. These voltages can be observed with an oscilloscope and will be in the approximate range of 1-15 volts peak-to-peak.

To locate the defective pack:
- Identify which power bus the troubled DLI is powered from (either A or B).
- Locate and identify all DFI packs powered from that same bus. (SEE SD-5D201-01 NOTE 311C FOR SPECIFIC DETAILS ON POWER BUS DISTRIBUTION for the DLTU or RSM FIU.)
- Remove each DFI pack from service one at a time and physically unseat the pack, observe if the DLI alarm LED is still lit, then run diagnostic on the troubled DLI.
- If the DFI pack removed does not clear alarm condition and the DLI still fails diagnostic, reseat the DFI pack and restore it to service unconditionally. Follow the same procedure for all remaining packs identified until the defective one can be found. If all DFI packs have been removed and the DLI still fails diagnostic, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Note - 100
The circuit under test failed the abbreviated functionality diagnostic. If replacing this pack does not clear the problem, request a manual diagnosis for a complete set of tests.

Note - 101
If replacing the pack(s) on the TLP list doesn't correct the failure, it may be caused by a problem on the customer loop.

Note - 102
This failure may be caused by an inconsistency between the installed hardware and the office-dependent data (ODD).

Use the recent change and verify (RC/V) terminal to verify the time multiplexed switch (TMS) fabric type is consistent with the dual message interface (DMI) equipage. Access the RC/V view that supports the CM MODULE and then go to the CMBCU SHELF sub view.

Note - 103
The office dependent data (ODD) does not agree with the dip switch settings on the two switches of the BKD4 board located on the backplane of the time slot interface unit (TSIU4). The control time slot (CTS) settings on the dip switch must match the data in relation MODATT, attributes cts_even and cts_odd, or the links to the SM-2000 equipment will fail.

Note - 104
Investigate the source of the problem according to the TLP list in the normal manner.

If the diagnostic still fails after exhausting the TLP list, the problem may be caused by a subtending circuit pack of the circuit under test (LC in a line group LG) or a sister member pack in units having multiple members (grid board in a LU). To identify the defective pack apply this procedure.
- Remove all subtending/sister member packs from service, if not already in that state, and electrically disconnect them by unplugging them from their sockets.
- Repeat the diagnosing of the circuit under test and verify that it ATPs.
- Re-insert the subtending/sister member circuits one at a time, repeating the diagnosing of the circuit under test until the diagnostic fails. Replace the subtending/sister member which caused the failure with a new one.
- Re-insert the remaining unplugged circuits.
- Repeat the diagnosing of the circuit under test and verify it ATPs.
Either the board connected to a time slot interchange (TSI) link appears to be faulty or is of an incorrect type or the office-dependent data (ODD) is incorrect.

Each of the four ports on the back of a TSI slice board has two sub-ports (simplex TSI links). For the following analysis, “near” indicates sub-port 0 of each TSI link on side 0 or sub-port 1 link on side 1; “far” indicates the opposite cross-connection.

The "expected" and "actual" values are defined in the values table:

<table>
<thead>
<tr>
<th>Data</th>
<th>Board type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No board</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>APC</td>
<td>Application controller</td>
</tr>
<tr>
<td>2</td>
<td>DI</td>
<td>Data interface (expansion)</td>
</tr>
<tr>
<td>3</td>
<td>NLI</td>
<td>Network link interface - 64 megabit</td>
</tr>
<tr>
<td>4</td>
<td>PLI</td>
<td>Peripheral link interface</td>
</tr>
<tr>
<td>5</td>
<td>ENLI</td>
<td>Electrical Network link interface - 32 megabit</td>
</tr>
<tr>
<td>15</td>
<td>NLI1</td>
<td>Network link interface - 32 megabit</td>
</tr>
<tr>
<td>others</td>
<td>unknown type</td>
<td></td>
</tr>
</tbody>
</table>

Some types of boards should have a simplex connection to a TSI link using only the "near" connection. Other board types should be cross-connected with the "near" connected to one MCTSI side and the "far" connected to the opposite MCTSI side.

The test number may be used to determine the problem. TSI slice boards and port numbers are both numbered starting with 0. First, divide the test number by 40. The whole number indicates the TSI slice number. The TSI slice board appears on the TLP list. The remainder divided by 10 indicates the port number. Look up the right-most digit in the test number in the description table for a description of what is wrong. As an example, assume test number 65 failed with actual data of 5 and expected data of 2. The TSI slice board is 1 (65 / 40 = 1 remainder 25). The port number is 2 (25 / 10 = 2 with a remainder 5). Look up 5 (the right-most digit in the test number) in the description table. The actual data of 2 means that a DI is connected (refer to the preceding table) while the expected data of 5 means that a NLI should be connected.

An unsupported "use" field was found in relation LNK_USE for the applicable switch module. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

The failure may be due to problems in the fan alarm circuit of the switch module processor model 40 (SMP40), including the fan alarm cabling and the 233A board attached to a fan. For more detailed information, refer to the switching module interconnect diagrams. The actual value from the diagnostic failure message may be compared with the following table to determine the failing hardware.

<table>
<thead>
<tr>
<th>Actual</th>
<th>Hardware implicated</th>
</tr>
</thead>
<tbody>
<tr>
<td>80 to 8F</td>
<td>Active fan alarm scan point and/or driver on fan alarm</td>
</tr>
<tr>
<td>40 to 7F</td>
<td>Out of Service fan alarm scan point and/or alarm ckt</td>
</tr>
<tr>
<td>00 to 0F</td>
<td>Either SMP40, any fan alarm circuit in the SM</td>
</tr>
<tr>
<td>20 to 2F</td>
<td>Out of Service SMP40, fan alarm ckt</td>
</tr>
<tr>
<td>10 to 1F</td>
<td>Active SMP40, fan alarm ckt</td>
</tr>
<tr>
<td>3C</td>
<td>Out of Service SMP40, fan alarm ckt</td>
</tr>
<tr>
<td>33</td>
<td>Active SMP40, fan alarm ckt</td>
</tr>
</tbody>
</table>
If the problem persists after replacing all of the packs on the trouble locating procedure (TLP) list,
- Check if the unit is manually powered down. If it is, the failure is not necessarily an indication
  of any hardware fault.
- Check the fuse alarm & test cables between the switch module processor unit 4 (SMPU4)
  and the fuse unit

Side 0 EQLs: 19-023-004 to 68-098-003, and 68-102-103
Side 1 EQLs: 28-023-004 to 68-098-006, and 68-102-106
- Check the control & display cables between the SMPU4 and the time slot interchange Unit 4
  (TSIU4) shelves.

Side 0 EQLs: 19-023-045 to 62-018-032
Side 1 EQLs: 28-023-045 to 62-114-032
- Check whether the second power pack (486AA) in the TSIU4 shelf is missing. It is necessary
  to have the additional power pack on each side of the TSIU4 shelf if:
  -- there are four or more TSI slice (TSIS) (KLU1) packs equipped per side, OR
  -- there are six data expansion (UM73) packs equipped per side.

- If the second TSIU4 power pack is not equipped and not required, then a power interlock
  board (PIB) paddle board (982AAE) must be equipped on the TSIU4 backplane. Without the
  paddle board, the MCTSI will not power up.

Side 0 EQL: 62-084-132
Side 1 EQL: 62-180-132
- Check for a short from power to ground on any board in the unit. To isolate the faulty pack(s)
  causing the short, pull each pack on the unavailable power (UNVP) side, except the power
  pack, one at a time, and see if the power can be restored on that side.

If replacing the packs on the trouble locating procedure (TLP) list does not clear the failure, then the
error may be the result of a packet bus cable problem. The following information may be used to
localize packet bus cable problems:

<table>
<thead>
<tr>
<th>Failing</th>
<th>Explanation of Fault</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit</td>
<td>Phase</td>

</tr>
<tr>
<td>PSUCOM</td>
<td>10</td>
</tr>
<tr>
<td>PSUCOM</td>
<td>10</td>
</tr>
</tbody>
</table>
The packet bus cables between either the active or the standby PI and the OOST PSU control fanout may be faulty or mis-positioned.

Note - 109 Check the switching module 2000 (SM-2000) cross coupled MCTSI backplane cables for disconnected or broken wires or incorrect cable location before replacing any packs listed on the trouble locating procedure (TLP).

Side 0 EQLs: 19-076-032
Side 1 EQLs: 28-076-032

CAUTION: An SM initialization starts if the mate side is powered down and a pack is changed without first fixing a defective cable connection.

Note - 110 This failure may result from a discrepancy between the office-dependent data (ODD) and the control fanout and/or packet fanout circuits installed in the packet switch unit (PSU).

Use the recent change and verify (RC/V) terminal to verify the circuit type is consistent with the PSU equipage. This information is given in field PSU TYPE on RC/V view 22.2.

The following table shows the pack to PSU type equipage.

<table>
<thead>
<tr>
<th>PSU type</th>
<th>control fanout</th>
<th>packet fanout</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSU1</td>
<td>TN1082 series</td>
<td>TN1083 series</td>
</tr>
<tr>
<td>PSU2</td>
<td>TN1843 series</td>
<td>UN396 series</td>
</tr>
</tbody>
</table>

Note - 111 If replacing the pack(s) on the trouble location procedure (TLP) does not correct the problem, the failure could be caused by a defective Ethernet interface (EIB) coaxial paddle board 982YD, EIB address paddle board 9822BY or EIB paddle board 982AAH. If the failure is on side 0, the cause may be the Ethernet connectorized (coaxial) cable between side 1 and side 0.

To replace the paddle boards, refer to the MCTSI section of the Corrective Maintenance (235-105-220) manual.

Note - 112 If replacing all the circuit packs on the TLP list does not correct the failure, the problem may be caused by a missing or a partially extracted or an incorrectly inserted cable going from the application specific controller (APC) board (UN539) to the time slot interchange common (TSICOM) board (UM74/UM74B).

Note - 113 If replacement of boards on the suspect equipment list does not clear the problem, the failure may be caused by a defective or incorrectly installed cross-connect cable between the two clock boards.

Note - 114 The TN2518 clock synchronization circuit (CSC) board provides a remote clock source for the dual link interface (DLI) units in this optical remote (ORM) application. This CSC board resides in the module controller and time slot interchanger unit (MCTU2) shelf, equipment location (EQL) 19-120 for MCTU2 side 0, and EQL 28-120 for MCTU2 side 1. In the event of a DLI diagnostic failure, perform pack replacements as outlined on the TLP list; if the same failure persists, check the following for the CSC equipped ORM:
- Verify the CSC board is supplying power to the DLI by analyzing the respective fuses.
- Verify the fiber optic link transmitter at the transmission rate converter unit (TRCU) end and receiver at the DLI.
- Verify the cable connected between the CSC board and the DLI. For cabling EQL information, refer to ED 5D793-30
- Verify the building integrated timing supply (BITS) clock cable from the BITS box to the MCTU2 backplane behind the CSC board. For cabling EQL information, refer to ED 5D793-30.
- If possible, verify good clock signal from the BITS box.
If these checks pass and the failure persists, remove the MCTSI from service in which the CSC is equipped and replace the TN2518 CSC board and restore the MCTSI to service.

Note - 115 The module controller time-slot interchanger (MCTSI) diagnostics “retro” option is used ONLY during some procedures when the microcode is expected to be different between the two sides of the MCTSI. Check for correct usage of the “retro” option before changing the suggested pack(s).

Note - 116 This note intentionally left blank.

Note - 117 This note intentionally left blank.

Note - 118 If this problem is intermittent on a model 3 LU (LU3) with a series 1 UN322B, it only affects diagnostics and does not interfere with normal operational performance of the channel pack. In this case, replacement of the common data and control (COMDAC) pack with a UN322B (series 2) or higher level pack is recommended.

Note - 119 Review the TLP list for the ENLI failure. An LTP number of 99 indicates that the wrong ENLI port was connected to the EXM TRCU2 unit. Refer to cable drawing ED5D618-40, equipment drawing J5D003NB-1, and TSIU4 wiring side designation label comcode number 847004413 for proper ENLI - TRCU2 equipage.

Prior to the replacement of the BKD3 circuit pack, the mate NLI associated with the optical link interface Unit (OLIU - 16E2 or 16F2) or AKM3 must be removed from service.

Prior to the replacement of the TN1345, OLIU, or AKM3 circuit packs, or the 494AA power pack, all DLIs or ENLIs routed through the corresponding transmission rate converter unit (TRCU) side must be removed from service prior to any TRCU board replacement.

Note - 120 It has been found in actual field experience that this diagnostic failure may be caused by multiple faults. Therefore, it may be necessary to replace a combination of the packs/components indicated on the TLP list.

Note - 121 A peripheral control and timing facility interface (PCTFI) version mismatch between the switch and the synchronous digital hierarchy transport equipment (SDH-TE) has been detected and could be related to the test failure. Execute a manual diagnostic with the UCL option to determine the specific problem.

Note - 122 This note intentionally left blank.

Note - 123 This note intentionally left blank.

Note - 124 This note intentionally left blank.

Note - 125 After replacing all of the packs on the TLP list, if the diagnostic still fails, verify that the host central office is providing battery and that proper tip/ring polarity is observed.

Note - 126 ODD data is inconsistent with the hardware. Either the data in the ODD for the trace ID is incorrect or the cable is connected to the wrong pack at the terminating equipment.

Note - 127 This note intentionally left blank.

Note - 128 This note intentionally left blank.

Note - 129 This note intentionally left blank.
Note - 130  If replacement of boards on the trouble location procedure (TLP) list does not clear the problem,
- Check the cable connecting the 982YPA to the hub or far-end system.
- Inspect hub or far-end system hardware.
- Check RC/V views ETHERNET PIPE ASSIGNMENT and ETHERNET LINK ASSIGNMENT.
  Verify ETHERNET specification, IP addresses and HW addresses.

Note - 131  This note intentionally left blank.

Note - 132  This failure may result from a discrepancy between the office-dependent database (ODD) and the equipage present in the circuit under test. Verify that the ODD agrees with the installed circuit. Items to examine include (but are not limited to) change level indicator (CLI) value(s) for the circuit under test, missing, extra, or incorrect tuples related to the circuit under test, and so forth.

Unseat any circuit pack in the unit which is not equipped by the ODD. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Note - 133  If replacing the packs on Trouble Locating Procedure (TLP) does not clear the problem, the diagnostic failure may be the result of a mis-connected Control Interconnection Bus (CIB) cable between the Control Fanout circuit pack (CF) and Packet Fanout circuit packs (PFs).

In the case of the DF2, verify the Packet Control and Timing Link (PCT) cable and the Peripheral Link Interface (PLI) paddleboard on the Data Fanout (DF2) backplane.

Note - 134  The cause of the diagnostic failure may be due to incorrect initialization of the TMSU2/3 hardware. If replacing the circuit packs listed on the TLP does not clear the problem then:
- Power down the CMCU shelf and all TMSU2/3 shelves of the side that failed TMS diagnostics.
- Power the CMCU shelf back up.
- Power up the TMSU2/3 shelves in the following sequence:

For Single Fabric CM2:

<table>
<thead>
<tr>
<th>TMSU2/3 Shelf EQLs.</th>
<th>POWER UP SEQUENCE BY NO. SHELVES EQUIPPED</th>
</tr>
</thead>
<tbody>
<tr>
<td>side 0</td>

</tr>
</tbody>
</table>

Note - 135  If replacement of boards on the TLP does not clear the failure, check the fiber optic link transmitters and receivers at the remote switch's TRCU3 under test. Execute MCTSI diagnostics to verify the integrity of the switch hardware. Before replacing an optic transceiver, refer to the Routine Operations and Maintenance (235-105-210) and Corrective Maintenance Procedures (235-105-220) Manuals.

Copyright ©2003 Lucent Technologies
Note - 136 If replacement of boards on the TLP does not clear the failure, check the fiber optic link transmitters and receivers at the remote switch's TRCU3 under test. Execute ONTCCOM diagnostics to verify the integrity of the TMS hardware. Before replacing an optic transceiver, refer to the Routine Operations and Maintenance (235-105-210) and Corrective Maintenance Procedures (235-105-220) Manuals.

Note - 137 The circuit under test may be affected by a fault on another line board. If changing the packs on the TLP list does not correct the problem, replace the other line packs in this line group starting with those that are on the same shelf as the circuit under test.

Note - 138 This failure may have been caused by one or more of the other assigned MTB's connected to the same (one-to-four) cable as the MTB under test. To verify the failure is due to the MTB under test, do the following:

Remove OOS each of the other MTB's attached to same cable as the MTB under test, and physically remove the cable connector from the MMSU for those MTB's. Keep the MTB under test connected.

Run diagnostics again on the MTB under test.

If diagnostics still STF, follow normal TLP procedures.

If diagnostics ATP, individually test the other MTB's in the same manner.

The test is not allowed on CAMA keying and talking trunk.

Capability is not available in this generic.

Not allowed because office data indicates that port is not a coin line or because requested operation is not defined for this type (lp_type in RLFC_PORT_TYP) of port.

Attempt digital test on a non DSL or digital trunk; test fails.

Cannot request dial-through announcement tests on port unless it is a dial-through announcement port.

An acceptable test was made to perform a test which is only valid on recorded announcement facility or service announcement system trunks.

Port under test was not a trunk.

A packet pipe (PP) can not be seized from the TLWS.

An in service packet pipe member (PPM) can not be seized from the TLWS.

Attempted test that is invalid for U-DSL.

Attempted a test that is not allowed on a PPM.

Attempted a test that is not allowed on a speech handler trunk (SHT).

Are starting to queue for TTF or GDSF resources.

Received a failure acknowledgement for a request to loopback or un-loopback an SHT.

Stopped queuing for TTF or GDSF resources. Only CPE tests are valid when the CPE tests menu is invoked.

Attempt test that is only valid for U-DSL.

No good. Not allowed because can only do outpulsing on trunks not on lines.

Input value (freq or level) is out of range.

Cannot outpulse over an incoming trunk. Outpulsing can be run on outgoing and two way trunks only.

The NT or channel unit indicates that it is in test mode. Any testing done in NT/CU test mode is unreliable, the results may be invalid. Testing is allowed in case the test mode indicators being returned by the NT or channel units are incorrect. Refer to the TST:DSL output message for a description of the test mode.

Attempt an invalid test on a packet switching trunk.

The TLWS will not allow subsequent messages while another TLWS message is in progress. The exception is the 'test position release' message.

Cannot request a test while queuing.

Cannot request any supervision testing besides playing an announcement OR the phrases on a DSU2-RAF or SAS announcement PORT.

The results of a metallic test performed on a FTTH line have been displayed on the screen. The resistance values displayed for “R1”, “R2” and “R3” are three terminal resistance values instead of the two terminal resistance values that are normally displayed for metallic tests. The results of this test are invalid because the Metallic Test Pair tip-to-ground and/or ring-to-ground

</table>
If the test is still running, stop the test then repeat the request later. The UCL option of RLS:WSPOS can override this restriction.

185  SYSTEM ERROR
    Unable to process request due to system error. Repeat request later.

186  SYSTEM ERROR -- RLS TEST POS
    A system error has occurred which requires that the test position be dropped.

187  SYSTEM OVERLOAD
    The TLWS will not allow a test position to be acquired or a port to be seized while the system is in an overload condition. Limits based on global parameters GLTPMAJOR and GLTPMINOR.

188  T&M IN USE AT ANOTHER TP
    Cannot add T&M phone because it is already in this test position's testing configuration. Remote T&M phones are not subject to this check. It is assumed that a remote T&M will have multiple call appearances at the test position CPE phone set, or else the remote T&M (RT&M) phone number has been overridden.

189  T&M NOT ALLOWED AFTER OPD ON OUTGOING BLV
    Adding T&M phone after outpulsing digits invalid for outgoing BLV trunks.

190  T&M NOT AVAILABLE
    Cannot add T&M phone because it is in use in other test configuration.

191  T-DSL PORT
    Attempt test that is invalid for T-DSL.

192  TALK CONNECTION
    Line/Trunk was idle when MNTR BUSY was requested, so a talk connection was established.

193  TALK/MNTR BLOCKED -- WIDEBAND
    T&M blocked for wideband calls.

194  TALK/MNTR LINE BUSY -- NOT AVAILABLE FOR USE
    T&M line is busy at another test position, therefore it is not in the connection.

195  TALK/MNTR ROUTED TO ANNOUNCEMENT -- CHECK DATA
    The remote T&M phone ended up routing to a recorded announcement. A office data problem exists.

196  TEI INVALID, UPDATING SCREEN
    The CPE test has returned with an error indicating the TEI supplied was invalid. A screen update has been initiated to correct the incorrect information on the TLWS display.

197  TEST CALL SETUP FAILURE
    PRI test call set up (from Q.931 messages) has failed.

198  TEST IN PROGRESS
    Cannot request a test while another test is in progress.

199  TEST NOT ALLOWED ON HAIRPIN
    The test is not allowed on an IDCU hairpin connection.

200  TEST NOT ALLOWED ON PUB43801
    The test is not allowed on an IDCU PUB43801 connection.

201  TEST NOT VALID FOR PORT UNDER TEST
    A test was requested that is not valid for the type of port that is currently seized at this test position.

202  TP IDLE
    The test position has not been selected yet. Must go to page 160 to select it.

203  TP RELEASED DUE TO INACTIVITY
    After the TMau_tlws() function is called to audit the test position table, any TPs that have been inactive for 1 hour or more will be torn down.

204  UNKNOWN TP
    Test position is not marked IN USE at TLWS of requester. Repeat message after reentering test position from page 160.

205  CCS TRUNK RESET IN PROGRESS
    TLWS can not seize a CCS7 trunk that is undergoing a reset procedure.

206  Reserved for future use.

207  Reserved for future use.

208  UNDEFINED LINE/TRUNK
    Line/trunk data could not be translated into a valid gport.

209  TIMEOUT FOR 1-HOUR TEST DURATION LIMIT
    All TLWS continuous tests are limited to one-hour duration.

210  WINK TEST NOT VALID ON INCOMING TRUNKS
    Cannot run a wink or a quick wink test on an incoming trunk. These tests can be run on outgoing and two way trunks only.

211  NO AVAILABLE TP
    All available test positions are currently in use. Was unable to select a test position.

has a T&M resource which is NULL or defines a LOCAL T&M port. Overriding the T&M phone number is allowed only on REMOTE T&M ports.

While testing with a metallic connection to a port under test, a failure occurred while attempting to communicate with the DCTU.

While testing with a metallic connection to a port under test, the DCTU failed to respond.

While attempting to route to a DC jack connection, a failure at the equipment occurred.

While attempting to setup a metallic connection to the port under test, the MSU needed for the metallic path was busy.

Failed while attempting to route for seizure of the requested port under test.

While attempting to add OOS MTCE DSBLD TEST port status to an OSPS PRI B-channel a failure occurred on the port status read.

While executing a request for an automatic test the TLWS was unable to communicate with the responsible system to request the testing.

When executing a request, an internal system resource failure prevented a message from being sent.

A database read failure occurred while attempting to read the database relation RLTLSWR.

Failed while attempting to route for seizure of the test equipment requested for testing.

While setting up a test configuration, no setup complete indication was received from the test logic within the required setup interval.

A database read failure occurred while attempting to read the database relation RLFC_PORTTYP.

An input message reseizure message is entered while the test position was already seized through POKE message.

A POKE reseizure message is entered while the test position was already seized through an input message.

Not allowed because the T&M phone is not in the connection.

Can only add pair gain test controller into metallic connections which could be universal SLC(rg) lines.

A metallic connection to the port under test must already be established before attempting to add in a pair gain test controller.

An attempt to connect to an incoming 101 test call failed.

The test position has no talk and monitor phone associated with it which could terminate 101 test calls.

While adding the T&M phone, failed digit zero security.

An attempt to play an announcement on a RAF or SAS port failed because the header identifier provided was incorrect.

An attempt to play an announcement on a RAF or SAS port failed because the trailer identifier provided was incorrect.

An attempt to play an announcement on a RAF or SAS port failed because the inflection identifier provided was incorrect.

An attempt to play an announcement on a RAF or SAS port failed because of an announcement database problem.

Table Note 1: Refer to trunk records for expected measured loss (EML). The number printed is the actual level so the sign is opposite from EML. If a ":F" follows a measurement result, it means that the test failed compared to the threshold measurements specified in RC/V View 14.12. If a ":M" follows a measurement result, it means that the test results are marginal compared to the threshold measurements specified in RC/V View 14.12.

Table Note 2: Actual level from a -16dBm signal. Add 16dBm to obtain the results in the same perspective as LEVEL. For example, if the measurement = -24dBm, the loss = -1 X (-24 + 16) = 8dB.

Table Note 3: Since BLKSZ can vary greatly, this field can not be typically represented.

2. EXPLANATION OF TERMS

BER
Bit error ratio. Ratio of bits received in error to the total number of bits transmitted during the test. The test is to send data and measure errors in data returned from the trunk under test.

ERBLK
Errored blocks. The total number of errored data blocks sent toward the test line that failed verification upon return.

FTON
Far to near. The measurement was made by the 5ESS\(rg-2000 switch transmission test facility (TTF) responder or global digital services function (GDSF) guard data guard (GDG) transceiver.

NODAT
No test data was returned from the far end.

NOTST
The far end did not send a test tone when expected.
NRESP: The far end responder is not equipped to make the measurement.

NTOF: Near to far. The measurement was made by the far end and the results sent back to the TTF responder or GDSF GDG transceiver.

OORHI: Out of range high.

OORLO: Out of range low.

OORHI:F: Test failed due to OORHI. It only applies to PVELBK test type.

OORLO:F: Test failed due to OORLO. It only applies to PVELBK test type.
1. DESCRIPTION

This section describes the traffic, plant, and service measurements of the switch. The switch generates and reports these measurements. Also included are the methods by which the measurements are interfaced to the various Operational Support Systems.

1.1 MEASUREMENT CATEGORIES

1.1.1 General

The switch measurements are broken down into the following three categories:

- Traffic measurements
- Plant measurements
- Service measurements.

In general, the traffic, plant, and service measurements are used to view a particular aspect of a switching system operation over a specified period of time. Different reports cover the following intervals:

- 5 minutes
- 15 minutes
- 30 minutes
- 1 hour
- 24 hours
- Monthly.

These measurements provide a summary of events that have taken place within the switching system. A particular measurement is included in a report on a per-software release basis.

1.1.2 Traffic Measurements

Traffic measurements, primarily used for engineering purposes, provide the current status of the switch as well as indications to support the switching system with additional resources. Traffic measurements may consist of office total, component, network, customer, and validity measurements.

1.1.3 Plant Measurements

Plant measurements provide data to identify problem areas and to evaluate equipment and office personnel performance, particularly to evaluate the impact of troubles on customer service. Maintenance personnel evaluate equipment performance to identify equipment that requires maintenance attention. However, plant measurements are not intended to provide sufficiently detailed data to isolate troubles to a replaceable subset of equipment, such
as a circuit pack, or to verify the continued existence of a particular trouble.

Plant measurements are divided into categories including base, plant service, and performance measurements. Plant base measurements provide counts of service requests, billing volumes, and equipment quantities. Plant service measurements provide counts of customer perceptible service-affecting events related to the maintenance condition of the switching system. Plant performance measurements provide counts of events that, regardless of the effect on service, can be related to the maintenance condition of the switching system.

1.1.4 Service Measurements

Service measurements are used to evaluate the quality of telephone service to the customer. The main emphasis is on interruptions such as calls that fail to be switched, calls that are switched but fail to reach the talking state due to resource failures, and calls in the talking state which fail because of facility or switch cutoffs.

1.2 MEASUREMENT TYPES

1.2.1 Peg Count

Peg count is a cumulative count of the number of times a specified event occurs during a given time interval. In some cases, the event may be defined as an attempt to take some action, not necessarily a successful attempt. The peg count can also be a count of the number of circuits, for example, tone decoders.

Overflow is a cumulative peg count, during a given time interval, of the number of call attempts which failed to seize a member of a specified group of facilities because no idle member was available. Overflow counts are included in peg counts. An overflow scoring in the switch does not always imply that a call has been lost, rather it sometimes indicates that a call has been delayed; for example, placed in a queue where it is held until the desired circuit becomes available.

1.2.2 Usage

Usage is a measure of the total amount of time the members of a group of facilities are busy during a given interval. Usage may be measured by time stamping events and deriving the difference between the end time and start time. The Operator Services Position System (OSPS) uses time stamps for usage reported to the OSPS administrative processor (OAP). Typically, traffic usage is obtained by examining a specified group at regular intervals and accumulating the number found in a busy state at each scan over a fixed period of time. The accumulation period and scan rate normally used are 1/2 hour and 100 seconds, respectively. This results in the accumulated total being readable directly as hundred call seconds. Increased measurement accuracy, on facilities having a holding time of 10 seconds or less, is achieved by using a 10-second scan rate. The readings from a 10-second scan rate can be converted to hundred call seconds by dividing the readings by ten. The switch reports normal usage in tens of seconds to engineering and administrative data acquisition system (data collection system) for the 10-second scan rate. When printed on the receive-only printer (ROP), it is converted to a 100-second scan rate.

Total usage is the total load measured on a group of facilities, whether the load is customer-generated or due to a maintenance busy condition. Traffic usage is the generated load excluding maintenance busy usage. Usage obtained by fast scan (10-second rate) in the switch contains traffic usage only. Since service circuits are generally on fast scan, the usage collected is normally traffic usage. Usage obtained for trunk groups, which are normally on a 100-second scan basis, is total usage. In all cases, total usage is the sum of traffic usage plus maintenance usage. Maintenance usage is the time the system is not available for call processing. Maintenance usage is obtained separately on a 100-second scan basis.

1.3 COUNTERS

1.3.1 General
Measurements are recorded by counters which are used in all items where peg or usage counts are maintained. Each time a given event or sample (scan) occurs, a value is added to the corresponding counter. Internal to the traffic measurement, methods are used which guarantee the accuracy of the output counts.

1.3.2 Data Validity

The data validity field indicates whether or not the switch detected that the measurements for a given report are suspect or invalid. The switch detects incomplete and invalid measurements resulting from one of the following conditions:

(a) Initializations in the switching module (SM), communication module processor (CMP), and/or administrative module (AM).

(b) Any database manager (DBM) read failure in the SM, CMP, and/or AM.

(c) Failure to send poll messages to an SM or CMP.

(d) Failure to receive data from an SM or CMP.

(e) Invalid previous report (due to DBM read failure in the SM, CMP, and/or AM, failure to send poll messages to an SM or CMP, or failure to receive data from an SM or CMP).

If one of the conditions occurs, the affected report(s) is marked DATA MAY BE INVALID. If the conditions do not occur, the report is marked DATA IS VALID.

1.4 MEASUREMENT COLLECTION AND REPORT GENERATION

Measurement collection and report generation refers to the gathering of measurements from each SM and CMP and making them available in the AM to the report generation functions. Most of the measurements are collected in the SMs and are sent to the AM. Measurements may also be collected in the protocol handler (PH) and packet interface (PI) and sent to the AM.

As a switch office grows and more lines or trunks are added to the switching system, the information regarding new line/trunk additions is inserted. Therefore, the new line/trunk measurements will appear in the reports.

1.5 INPUT/OUTPUT (I/O) INTERFACES FOR DATA COLLECTION

1.5.1 General

The switch communicates measurement data using data links with three operational support systems, the switching control center system (SCCS), and the OAP. The data collection system receives binary data from the switch in the form of 30-minute traffic and 5-minute surveillance measurements. The 5-minute surveillance measurements are only used by network management (NM) and defense switched network (DSN). Plant measurements and traffic measurements are automatically directed to the SCCS, the master control center (MCC), and the ROP in the form of 15-minute traffic, 30-minute traffic, 1-hour plant, 24-hour plant, and monthly plant reports. The SCCS sends data to its network administration center (NAC) channel. The hourly and 24-hour traffic separation reports are not available at the SCCS, NAC, or the MCC, but are available to the data collection systems. The OSPS force management data is sent to the OAPs. The OAP measurements and reports are documented separately.

The on-site NM capability also has an on-demand interface to the MCC and SCCS to print requested data packages.

Internal mechanisms are provided to transfer measurements to data collection systems, SCCS, and the MCC.
1.5.2 Data Collection System Interface

The data collection system is a centrally located traffic collection system connected to the switch. The switch measurement collection interface provides an efficient high-capacity means of transmitting the desired data to data collection system, which receives traffic count information for the 30-minute traffic report, the hourly traffic separation report, the 24-hour traffic separation report, and the 5-minute surveillance data report. Additional information on the data collection system interface is provided in 235-070-100, Administration and Engineering Guidelines.

1.5.3 Data Collection System/Network Management Interface

The switch provides the basic trunk group control capability without common channel signaling (CCS) related options. The data collection system/NM can activate, remove, and audit the switch trunk group controls. The data collection system/NM facilities can activate code controls and select trunk groups for selective incoming load control (SILC). For NM purpose, the data collection system forwards 5-minute data to data collection system/NM. This data is only used by NM to determine proper controls to apply in the call network. Additional information on the data collection system/NM interface is provided in 235-070-100, Administration and Engineering Guidelines.

1.5.4 SCCS/NAC Interface

The SCCS/NAC channel (or interface) is a virtual channel on the BX.25 link between the switch and the SCCS. The channel may be accessed by the SCCS/NAC work station. The SCCS/NAC is automatically sent the 15-minute traffic, 1-hour plant, the 24-hour plant, and the monthly plant reports. The 30-minute traffic report may be requested over this channel to the SCCS/NAC. Additional information on the SCCS/NAC interface is provided in 235-070-100, Administration and Engineering Guidelines.

1.5.5 Maintenance Personnel Interface

The 15-minute traffic, 1-hour plant, the 24-hour plant, and the monthly plant reports are automatically output at the SCCS, the MCC, the ROP, and over the SCCS/NAC channel for inspection. Each report is retained in the switch for the appropriate length of time (14 minutes following the last 15-minute traffic report, 1 hour following the last 1-hour plant report, 24 hours following the last 24-hour plant report, and approximately 1 month following the last monthly report) and may be requested by personnel at any time during that interval by entering the proper input at the MCC, SCCS/NAC, or SCCS. For the monthly plant report (PLNTMO), a month's summary is available for only 23 hours at the end of the month. When the next 24-hour plant report (PLNT24) is generated, the PLNTMO structure is zeroed and the PLNT24 is added to it.

All reports (including the 24-hour plant, 1-hour plant, 5-minute, 30-minute traffic, and monthly plant reports) can be requested from any terminal and output to the associated (requesting) terminal. Scheduled and/or demand report requests are summarized in the following bullet listing.

- ALW:TRFC30, ALW:TRFC15, ALW:DRHR, ALW:PLNTHR, or ALW:PLNT24 - Schedules a report to be collected or to be output after each collection interval. The 30-minute traffic report is not automatically printed to the ROP or traffic channel, but may be allowed. Sections of this report are allowed for collection or output individually. The traffic separation report can only be enabled for output to the local traffic channel. The 15-minute traffic report and the plant reports are output automatically, but may be inhibited.

- SET:M5 (package type) - Allows for the collection of the 5-minute data.

- INH:TRFC30, INH:TRFC15, INH:DRHR, INH:PLNTHR, or INH:PLNT24 - Inhibits the collection or printing of the report. The traffic separation report can only be inhibited for output to the local traffic channel.

- OP:ST-TRFC30 - Requests the output scheduling status of 30-minute traffic reports (TRFC30).

- OP:MEASTAT - Prints the status of 15-minute traffic, 30-minute traffic, hourly plant, and hourly traffic
separations reports (that is, prints whether each of the mentioned reports is allowed or inhibited for ROP and the traffic channel and the size of the ROP and traffic channel). The collection status of each section of the 30-minute traffic report is printed.

- OP:MEASTAT, CLCT - Prints the collection status for each section of the 30-minute traffic report.
- OP:TRFC30 - Demands an immediate output to the ROP of a section of the 30-minute traffic report (data of the previous collection interval).
- OP:PMCR - Requests the various plant measurement common reports, detailing system performance statistics. By default, the data collected for the previous hour is reported every hour and the data collected for the previous day is collected at midnight.

### 1.5.6 Traffic Channel Interface

A traffic channel is an optional RS232, 1200-baud, 1-way outgoing interface used to support administrative functions in offices which do not have data collection system and/or SCCS interfaces. The traffic channel data (30-minute traffic, hourly traffic separation, and the 24-hour traffic separation reports) is directed to a traffic channel. The traffic channel data may be printed locally, printed remotely, or collected for downstream processing.

### 1.5.7 Central Office Equipment Reports (COERs) Interface

The Stored Program Controlled Systems COER is a centrally located traffic data retention and reporting system which may be used to automate traffic measurement data collection and processing. It receives traffic data from data collection system or is available as part of data collection system. The COER calculates and reports high day and once-a-month load for various types of office equipment. In addition, each month's set of values are retained for long-term monitoring of traffic patterns by traffic engineers and network administrators.

The COER can provide call capacity estimates for the switch. For the module message processor (MMP) and message switch control unit (MSCU), COER produces estimates of message capacity. Additional information on the COER interface is provided in 235-070-100, Administration and Engineering Guidelines.

### 1.6 REPORT TYPES, CONTENT, AND FORMAT

#### 1.6.1 General

The intervals that reports are generated by the switch are as follows:

- 5-minute
- 15-minute
- 30-minute
- 1-hour
- 24-hour
- Monthly.

The contents of each measurement report are specified on a per-software release program basis and cannot be altered by maintenance personnel. Not all sections of the 30-minute traffic report can be guaranteed to be collected and printed out due to resource limitations in some heavily equipped offices (quantity of SMs). It may be required that the complement of regularly scheduled reports be assembled by shutting off some sections or reports that are
not as useful. To assist in making up a report complement, sizes of reports are available using the two input

1.7 AVAILABILITY

The 30-minute traffic report is also output at the SCCS and MCC in order to provide a more complete set of
measurement data for on-site evaluation of the switch. The 30-minute traffic report can be requested at the SCCS,
MCC, or SCCS/NAC channel. The 24-hour traffic separation report can be sent to the traffic channel but not SCCS.
All reports are not available while they are being generated. Additional printouts and/or re-requests are allowed.

2. 5-MINUTE NM REPORT

This report contains counts on overload control, call direction, critical service circuit, network management (NM)
trunk group control, carrier interconnect, ineffective machine attempt (IMA), basic trunk group, network management
code control, automatic route cancellation, destination code cancellation, etc. These counts are grouped together
and called packages. The 5-minute report is only printed by package request. These 5-minute counts are pegged
constantly but are collected and stored in the administrative module (AM). These counts are only available when the
package is set. The 5-minute counts go through data collection system to NM.

The 5-minute NM report consists of a number of packages. The layout of the 5-minute NM report is shown in
Example 1. The layout and measurements for each package are shown under second level headings in
alphabetical order.

3. 5-MINUTE DSN REPORT

This report contains counts on call direction, critical service circuit, basic trunk group, defense switched network (DSN) control, automatic route cancellation, destination code cancellation, etc. These counts are grouped together and called packages. The 5-minute report is only printed by package request. These 5-minute counts are pegged constantly but are collected and stored in the administrative module (AM). These counts are only available when the package is set.

The 5-minute DSN report consist of a number of packages. The layout of the 5-minute DSN report is shown in Example 2. The layout and measurements for each package are under second level headings. There are no packages numbered 1, 2, 5, 6, 8 through 16, or 18 through 23.

4. 15-MINUTE REPORTS

These reports contain the machine integrity data that is used for real-time monitoring of the switching system. They are automatically generated by the switch every quarter-hour and are sent to the SCCS, the NAC, and the MCC, but this action may be turned off. The latest report may be requested at any time during the 14-minute interval following initial issue of the message. However, the report cannot be obtained while a new version is being constructed.

The 15-minute report consists of two parts. The layout of the 15-minute report is shown in Example 3. The layout and measurement for each part are shown under second level headings.

To determine the status of the 15-minute report, refer to the OP:MEASTAT input message with the PRINT option.

To inhibit (disable) the automatic printing of this report, refer to the INH:TRFC15 input message.

To allow (enable) the automatic printing of this report, refer to the ALW:TRFC15 input message.

PROCESSOR PERFORMANCE
5. 30-MINUTE TRAFFIC REPORT

This report contains the bulk of the switching system data and, as such, supports a majority of the functions of the network administration and network engineering. The size of this report is closely linked to office size because much of the data is collected and reported on a per-component (for example, SM, high-level service circuit, line unit, trunk group) basis.

The report is generated by the 5ESS® switch every half-hour and is sent to the company data collection system (CDCS) or may be sent to a ROP. If a traffic channel is used, the 30-minute report may automatically be sent to the traffic channel. The 30-minute report is unavailable while it is being generated (approximately 3 minutes before it prints). This report can also be requested by the MCC, the SCCS, and the SCCS/network administration center channel.

The print status of the sections on the 30-minute traffic report can be checked by entering the input message OP:ST-TRFC30. By default (at system initialization), sections are inhibited for ROP output. Sections can be allowed by entering the input message ALW:TRFC30 with the ROP parameter. Each section can be inhibited by entering the input message INH:TRFC30 with the ROP parameter. Some sections require additional identifiers in the input message. Refer to appropriate input message for the identifier.

The input message used to enable sections is ALW:TRFC30. The input message used to disable the sections is INH:TRFC30.

Office personnel have the choice to restrict ROP output for certain per-SM sections or get those sections for all SMs. Previously, all collected data for these sections would print at the ROP as a result of OP or ALW:TRFC30 messages. If the ROP option is used, office personnel can select up to 6 records for output to the ROP. Records can be selected explicitly by SM number (UNIT keyword) or by requesting records based on count values (HIGH, LOW, and HILO keywords). In the latest case, the records with the 6 highest (HIGH), 6 lowest (LOW), or 3 highest and 3 lowest (HILO) can be printed. The count identification for each count is given with the description for each section.

Other sections use the HIGH/LOW/HILO limit mechanism but have limited ROP output of six records.

Each section has the following parameters:

- **Time Stamp:** The time stamp presented on the traffic measurements outputs reflects the real time of accumulation start time. Beginning with Software Release 5E14, it is 30 seconds before the half-hour mark.

- **Data Collection Unit:** This parameter indicates the unit that collects the data.
**Maximum Collection Units:** This parameter indicates the maximum number of records that the section could contain on a heavily loaded switch. It is not a theoretical maximum but a practical maximum.

With the introduction of the TRFC30 Traffic Expansion feature, increased data limits for selected traffic sections were introduced. In order to support increased data traffic over the EADAS interface in 5E14 the data link speed needs to be increased from the 2.4kbps at least 9.6kbps synchronous operation. If the link speed is not increased, either data may be lost or the requirement to transmit data within the required window will not be met.

The traffic measurement collection buffer used to collect data in the TRFC30 report is increased from 75000 bytes to 384Kbytes in size. The maximum number of sections that may be created for TRFC30 report is increased from 255 to 65535 Sections.

**NOTE:** The restriction to allow collection of up to 255 sections at the same time remains unchanged.

The maximum section size for a traffic 30 minute report is increased from 32000 bytes to the space occupied by the whole TRFC30 buffer.

Starting from 5E14 only message type 123 will be used to identify the 30 minute traffic. This type is an extended message type to allow larger section information past the 32000 octet boundary. New ALW command is created to allow ROP selectivity for section 139 (PIDB). It is possible to allow at least 10 IDCUs for ROP at the moment. Appropriate INH command is created in parallel to ALW input message.

Several single section sizes will be increased to allow more collection capabilities beyond 32000 bytes limit. The following sections:

- 12 TG - Trunk Group
- 68 PSPH - ISDN Packet Switch Protocol Handler
- 77 DSL - Digital Subscriber Line
- 90 LINE - Per Line Measurements
- 139 IPIDB - Integrated Digital Carrier Unit PIDB
- 141 ILINE - Integrated Digital Carrier Unit LINES
- 143 IRT - Integrated Digital Carrier Unit RT
- 144 SG - Switch Group
- 145 LGC - Line Group Controller
- 217 AIULN - AIU Line
- 218 AIULC - AIU Line Card
- 230 MTP- Message Transfer Point Signaling Link

are extended in size to break down 32000 bytes limit and allow maximum number of components which fits into TRFC30 total buffer space. The sections is limited only by TRFC30 buffer space available and physical availability of the certain components within the office.

RC/V View 13.4 (ANALOG LU CONCENTRATOR UTILIZATION MEASUREMENTS) should be updated to allow selection 1011 concentrators for Section 90 to support extended collection capability created along TRFC30 buffer.

**Precision:** This parameter indicates the data collection system precision of the section. The data collection system supports two precisions: single and double. Single precision means that each data count or register occupies a short or two bytes. Double precision means that each data count or register occupies a long or four bytes.
**Length:** This parameter indicates the data collection system length of the section. The data collection system supports two lengths: fixed and variable. Fixed length means that the section can only have one record maximum. Variable length means that the section can have more than one record maximum, up to the number specified under maximum collection units.

**Activation:** This indicates the input message that is needed to obtain a copy of the section.

**Report Buffer Fields:** This indicates the number of fields.

**Report Buffer Layout:** This shows the layout of the fields.

**NOTE 1:** Some sections have an extra parameter which is the maximum units for ROP output. This indicates the maximum number of units that can be included in a ROP output at one time.

**NOTE 2:** If a problem is encountered when activating a 30 minute traffic section contact the switching control center (SCC) to verify if the global parameter has been populated (Refer to Table 2, for a listing of traffic sections affected by a global parameter).

The 30-minute report consists of a number of sections. Each section can be requested individually. For unassigned sections there are no associated document sections. An example of the layout of the 30-minute traffic report is shown in Example 4. The layout and measurements for each section are shown under second level headings. For unassigned sections there are no associated document sections.

Limited memory and real-time resources may make it impossible (in heavily equipped offices) for all sections of the 30-minute traffic report to be allowed at the same time. Memory constraints against the 30-minute traffic report may be checked by entering the input message **OP:MEASTAT** with the **CLCT** option. Sections may be allowed for automatic collection by entering the input message **ALW:TRFC30** with the **CLCT** option, and may likewise be inhibited by using input message **INH:TRFC30** with the **CLCT** option. For automatic printout of the report sections, collection of those sections must have been allowed earlier.

The valid data will be collected in the next reporting interval after a report selection for collection. During the first interval after a report is allowed for collection for most reports the report containing counters set to zero values is printed on rop. For some reports there is no layout - message "REPORT NOT SELECTED FOR COLLECTION" is received instead.

At initialization of the traffic 30 report, the 30-minute traffic report sections are allowed for collection. The report is allowed for as many sections as will fit in the buffer provided. However, not all sections are allowed; some sections require office personnel input while others depend on the feature being loaded. When new equipment types are added to the switch (i.e. AIU, DNUS, etc.) office personnel are required to allow the appropriate section(s) for collection.

Several Sections have to be enabled using recent change (RC). Refer to the appropriate RC manual for proper use of the views. This RC provides control over which type of groups [individual dialing plan (IDP), constructed feature, terminal group, multiline hunt groups, attendant groups, or simulated facility groups] can be measured as well as the form for enabling measurements for members of each of the above groups. The business and residence custom services (BRCS) features are described in 235-190-101, *Business and Residence Modular Features*.

Several sections use RC/V Views 13.7 (MEASUREMENT COLLECTION SELECTIVITY) and 13.8 (MEASUREMENT RANGE SELECTIVITY) for specifying the components to be collected and/or printed on the ROP. Others use RC/V View 13.10 (DN COLLECTION SELECTION) for component selection.

For all of the above sections, enabling a component for collection or ROP printing is a two step process. First the component is selected on an RC/V view. The second step involves updating measurements control tables. This step happens at the next report preparation time. Therefore, there is a lag of one reporting interval between when a
component is chosen in RC/V and when it is actually enabled for measurements collection or ROP printing.

If any of these sections has components selected for collection via RC/V but has no components which have been enabled for measurements collection, an OP:TRFC30 input message for the section will respond "NG - NO COMPONENTS ENABLED".

If any of these sections has components selected for ROP printing using RC/V but has no components which have been enabled for measurements ROP printing, an OP:TRFC30 input message for the section will respond "NG - NO COMPONENTS ENABLED FOR ROP PRINTING".

Enabled means that the activities measurable for the group-type will be able to generate counts. If not enabled, no measurements are taken for the group and, hence, it cannot be allowed. Enabling takes place (from the call processing point of view) shortly after the half-hour mark following the RC action to enable the group. That is, there will be a delay of at least one-half hour between the RC action of enabling and the appearance of data for the enabled group on any 30-minute traffic report (either data collection system or ROP). There is no half-hour delay for sections 144 and 145. After the RC has been completed, the particular section should be allowed for collection by the ALW:TRFC30 message with the CLCT option.

The maximum allowed sections in an office is determined by automatically calculated real-time parameters for the office. The real time is converted into message units allocated for printout at either the ROP or redirection to a local traffic channel and is provided as part of the OP:MEASTAT with the PRINT status report of 15-minute traffic, 30-minute traffic, hourly plant, and hourly separation reports. The print status and sizes of the various sections of the 30-minute report for ROP and traffic channel are reported by using the OP:ST-TRFC30 input message.

Any section which requires the office personnel to take an explicit action before data is collected is a special study. The required action can be an input message (ALW:TRFC30 with the CLCT option) or RC work. Special study sections are always inhibited for collection at system initialization time, unlike other 30-minute traffic report sections.

The following steps are to be taken for system initialization:

- The 5ESS® switch will automatically inhibit all ROP output.
- Input message ALW:TRFC30 with the ROP option needs to be executed if output is desired to a ROP.
- The 30-minute traffic sections are allowed for collection automatically, with the exception of those sections that require craft input. Sections that relate to features or equipment are dependent on that feature or equipment being resident in the switch.
- Sections that were previously inhibited for collection that are defaulted to the allow status will need to be inhibited by entering the INH:TRFC30 input message with the CLCT, xxx! [where xxx = section name (not number)].
- Sections that were previously enabled for collection that are defaulted to the inhibit status will need to be enabled by entering the ALW:TRFC30 input message with the CLCT, xxx! option [where xxx = section name (not number)].
- Input message OP:MEASTAT with the CLCT! option can be used to check the collect status of all 30-minute traffic sections.
- Input message OP:ST-TRFC30 can be used to check the print status and the size of the various sections for ROP and traffic channel output.

Table 1 shows the default collection status of each 30-minute traffic section:

Exhibit 4 30-Minute Traffic Report

5.1 Originating Call

The call begins when the calling party goes off-hook. The lines are scanned from an origination scanner to determine which ones have gone off-hook. The results are sent to the switch module processor (SMP) using the control interface (CI). The SMP detects a change from the last scan and orders the origination scanner to identify the line that is off-hook using a directed scan. The results of the directed scan are sent to the SMP using the CI.
(1) Scan eight lines as a group
(2) Queue group summary data block (GSDB)
(3) If GSDB not served in 20 seconds, score DTDSC and DTDPC in Section 4.
(4) Else serve GSDB
(5) Direct scan for off-Hooks
(6) Score LOAD in Section 15

Every originating call in the 5ESS® switch is sampled for dial tone. There are three "events" that trigger dial tone sample count (DTDSC) and dial tone delay peg count (DTDPC) to score in the 5ESS® switch. The events are:

- Dial tone is scored for lines that have been off-hook for greater than 20-seconds.
- When a call is abandoned before dial tone is provided, the switch calculates the time the line is off-hook. If off-hook time is greater than 3 seconds, score DTDSC and DTDPC.
- Dial tone is served in 3 or less seconds - score DTDSC only, if more than 3 seconds score DTDSC and DTDPC.

The next step in the process to reserve a path through the line unit for the call. The SMP opens scan cut-off contacts, sets up a path from the line through stages 0 and 1 of the concentrator in the line unit to the HLSC, directs the HLSC to perform the per-call testing, and releases the HLSC.

(1) Get path through the A links and B links for the LU. Get path through the PIDB time slot (TS) for the AIU and ISLU(2). Get path through the DS1 TS and PIDB TS for the DCLU and IDCU. Get path through the DS1 TS and PCT TS for the TR303 on DNUS and EAIU.
  - If no path is free, then blocked call indicator report (BCIRPT) (for LU only) message will print every 3 seconds (if turned on) until a path becomes available. (This message is similar to the LEN01 message in the 1A™ switch).
  - Call will be retried (approximately 3 second delay).

(2) False cross and ground, power cross and continuity check scores the high level service circuit (HLSC) PEGCT Section 8.

(3) If no HLSC available for the port test, SHTOVF is scored on Section 8 and retry this origination as soon as possible.

(4) If customer abandoned and time since off-hook is > 3 seconds then score DTDSC and DTDPC in Section 4, off hook time subtracted from time on-hook detected.

(5) Else score the origination request, DPORQ or TTORQ in Section 3.

The SMP connects the local digital service unit 2 (LDSU2) tone generator to the line using the alternate data random access memory (RAM) (ADR) in the time slot interchanger (TSI).

Dial tone delivery is accomplished by closing the remaining switches between the originating line and the data interface (DI). This completes the path from the originating line to the channel circuit. From this point, the path routes through the DI to the TSI. The TSI switches the time slot from the LDSU2 containing dial tone to the time slot of the originating line.

(1) Tone decoder attempt is scored PEGCT in Section 7.
(2) If no tone decoder is available, then score OVFLOW Section 7 and retry this origination attempt.
(3) Generate dial tone
(4) If unable to generate dial tone, then REORD Section 4 is scored or Announcement.
(5) Test dial tone delay score DTDSC Section 4, if time since off hook is > 3 seconds then DTDPC is scored in Section 4 once dial tone is provided, off hook time subtracted from time dial tone provided.

After all digits have been received, the SMP determines the identity of the routing SM. The SMP of the originating SM sends a control message containing the dialed digits to the SMP of the routing SM. The routing SM contains the translation information for the called directory number (DN). The routing SM is used to determine the SM that terminates the called party.

1. Determination of destination.
2. Line to Line score INTRAOFF and TERMINAT in Section 5, line to trunk score OUTGOING in Section 5.
3. If AM in overload (rare condition) and this call is throttled score BLKOVD and REORD in Section 4.
4. If detect on-hook after digit then scores ORIGIN PDABAN Section 6.
5. If detect dialed number is vacant code, disconnected or out of service, if invalid digits are dialed score CDIRR in Section 3, REORD in Section 4 or announcement is scored.
6. If terminating party is busy score TCBSY in Section 3 in the originating switch (no terminating SM/LU counts are scored).
7. Once call is established, score originating + terminating (O+T) usage in Section 5.
8. Disconnect detected, score HLSC PEGCT Section 8 and the call is terminated.
9. If HLSCs are unavailable, no scoring, calls are unaffected.

If the called party is idle, the SMP in the terminating module notifies the SMP in the originating module using a control message of the NCT link time slot.

Under control of the SMP, the originating line is connected to a tone decoder in the LDSU2. The originating subscriber dials a digit and when that digit is received, dial tone is released from the line. The SMP then performs digit analysis. This process continues until all digits have been received and then the tone decoder is released.

1. If detect on-hook before digits dialed, then scores ORIGIN FALST in Section 6.
2. If pre-digit time out occurs, then scores ORIGIN PERMSIG in Section 6.
3. If first digit was received then scores ORIGINAT peg count in Section 5, ORGHC in Section 15, and ORIG in Section 22.
4. If detect on-hook after digit then scores ORIGIN PDABAN Section 6.
5. If inter-digit time out occurs then scores ORIGIN PDTIMO Section 6.
6. If on-hook detected after all digits are dialed, but before ring then score ORIGIN ABAND Section 6.
7. If invalid digits are dialed score CDIRR in Section 3, REORD in Section 4 or Announcement is scored.

NOTE: Expect 10%-15% Ineffective attempts in a busy business office and 15%-25% in a residential office.

5.2 Incoming Call

Each trunk on the 5ESS® switch is connected to an origination scanner in its trunk unit. When an off hook signal is sent from a connecting office over an incoming trunk, the OS recognizes the service request. An originating terminal process (OTP) retrieves data about the trunk from the database relations. This information includes the type of supervision, type of signaling, and type of start signal.

(1) Signal sent from connecting office over an incoming and/or 2-Way Trunk, score ISUPRQ, DPINRQ, or MFINRQ Section 3.

(2) If CCS7, obtain tone transceiver for voice path assurance score PC and VBPC Section 60. If no transceiver available, PCOVFL.

(3) Receives information as type of supervision, signaling, and start signal (e.g. wink, none, etc.)

(4) Connects the channel to a time slot for a tone decoder to perform touch-tone multifrequency and dial pulse digit reception from incoming trunk calls score PEGCT Section 7. If no tone decoder available, score OVFLOW Section 7 and incoming NOCKT Section 5.

(5) If disconnect occurs before receipt of first digit score FALST Incoming Section 6.

(6) If time-out occurs before receipt of first digit score PERMSIG Incoming Section 6.

(7) Send start signal over the trunk to far-end office indicating digits can be sent score IPC Incoming Peg Count Section 12.

(8) Receipt of first digit score PEGCT incoming Section 5, INCHC Section 15, if ISUP score INCPEGCT Section 50, if packet trunks, score INCDMPC Section 93 and INCPC Section 69, INCHC Section 132, do not score INCPC for Section 5, 12, or 50.

(9) Digits received sent to tone decoder.

(10) If call is abandoned before completion, score PDABAN partial dial abandon Section 6 or PDTIMO partial dial time out Section 6.

(11) Incoming digits analyzed determines if call is trunk to line or trunk to trunk score terminating or tandem Section 5.

(12) Call continues as terminating call or outgoing call.

Figure 5  Incoming Call - Part 1
5.3 Terminating Half Call

The next step is notification of the terminating SM. The path from the SMP to the second SM using the dual link interface (DLI) and the communication module (CM) indicates the path for the route request. When the terminating SMP receives the route request, it checks the status of the terminating line (port). If it is busy, the terminating SMP
notifies the originating SMP, that in turn gives the originating line busy tone.

The routing SM sends the route request to the terminating SMP, where the status of the port is checked for a busy signal. When the port is idle, a terminal process is created to handle termination. The terminal process activates the port and sends a PATH_EST message to the AM/CMP to allocate the network time slots. Then, the terminating terminal process (TTP) waits for a reply for a maximum of 3 seconds. When the reply arrives, it sends the TMSCONNECT message to the TMS in the SM. The TTP continues the terminating procedures on the terminating port.

(1) Score LOAD in Section 15.

(2) Score SM count - TERMHC in Section 15.

(3) LU score TMCALLS in Section 11, DCLU score TERMATT Section 21, ISLU(2) score TMATT Section 49, IDCU score TMATT Section 139, AIU score TMATT Section 216 or TR303 on DNUS score ATMPT Section 224.

(4) If no path available through the A links and the B links, then score TMBLK in Section 11 for the line unit, TERMBLK in Section 21, or TMBLK in sections 49, 139, 216, or 224 based on type of peripheral and score REORD in Section 4.

Disconnect

- Disconnect Detected
  - Yes: Score HLSC PEGCT Section 8 Call Terminated
5.4 Ring Terminating Port

(1) Connect the ringing circuit and score PEGCT for the HLSC in Section 8.

(2) If no HLSC circuit available score RNGOVF in Section 8, REORD in Section 4, and NOCKT counts score Section 5 for line to line: ORIGINAT, INTRAOFF, and TERMINAT or trunk to line: INCOMING and TERMINAT.

(3) If ring without answer score TCRNG in Section 3.

(4) If terminating party busy score TCBSY in Section 3.

(5) Else, if intercept treatment score TCINT in Section 3.

(6) Else, valid answer score TCANS in Section 3.

(7) The HLSC is normally used for disconnect on both switch modules, whether the disconnect occurred from the originating or terminating end, and scores.

(8) PEGCT for the HLSC in Section 8.

(9) If HLSCs are unavailable, no scoring, calls are unaffected.

6. PLANT REPORTS

6.1 24-HOUR PLANT REPORT

Plant measurements provide data to identify problem areas and to evaluate equipment and craft personnel performance, particularly to evaluate the impact of troubles on customer service. Maintenance personnel evaluate equipment performance to identify equipment that requires maintenance attention. However, plant measurements are not intended to provide sufficiently detailed data to isolate troubles to a replaceable subset of equipment, such as a circuit pack, or to verify the continued existence of a particular trouble.

Plant measurements are divided into categories including base, plant service, and performance measurements. Plant base measurements provide counts of service requests, billing volumes, and equipment quantities. Plant service measurements provide counts of customer-perceptible, service-affecting events related to the maintenance condition of the switching system. Plant performance measurements provide counts of events that, regardless of the effect on service, can be related to the maintenance condition of the switching system.

This report contains data pertaining to originating calls, incoming calls, terminating calls, outgoing calls, and call connect setup troubles. This data reflects the maintenance effect on traffic during the past 24 hours.

The 24-hour plant report is generated and issued by the 5ESS® switch once a day at 02:07:00. The report is sent to the MCC, the SCCS, the ROP, and the SCCS/network administration center channel, and is available for the next 24 hours to fulfill requests.

The layout of the 24-hour plant report is shown in Example 5. Header information was added to the report. The header information includes the report office, report interval, date, and time. The layout and measurements of each part are shown under second level headings.

Parts can be selected to be printed on the ROP with two input messages: ALW:PLNT24 allows the automatic printing of the specified part(s) of the report at regularly scheduled intervals and OP:PLNT24 will print the most recently generated (previous) part(s) of the report. If a specific part(s) is desired, use ALW:PLNT24 and the
OP:PLNT24 with the PART attribute, where "a" is an individual part number. If all the parts are to be selected, use the ALL option. To prevent a part from printing at the ROP, use the INH:PLNT24 input message with the PART option. A print status report of all the parts can be obtained with the input message OP:ST-PLNT24. The print status table is used to keep track of whether each part is allowed or inhibited for the regularly scheduled 24-hour plant report.

For the 24-hour plant report, the ALW/INH print status is only applied to the regularly scheduled 24-hour plant report. Only the parts with print status "ALW" are output automatically to the MCC, ROP, and the switching control center. Therefore, the manual OP:PLNT24 request prints the specified part or all parts of the 24-hour plant report to the ROP regardless of the print status. A complete 24-hour plant report can be provided without changing the print status.

**Exhibit 5 24-Hour Plant Report**
### 6.2 HOUMLY PLNT REPORT

This report contains data pertaining to originating calls, incoming calls, terminating calls, outgoing calls, and call connect setup troubles. This data reflects the maintenance effect on traffic during the past hour.

If enabled for ROP output, the hourly plant report is automatically printed. It can also be requested at any time, and a copy of the last normally scheduled report can be printed. It is also possible to inhibit or allow the hourly plant report and to check its inhibit/allow status using the `OP:MEASTAT` input message with the `PRINT` option.

The hourly plant report consists of parts 1 through 3. The counts for parts 4 through 19, parts 21 through 26, and 29 do not apply to the hourly plant report. The layout of the hourly plant report is shown in Example 6. The layout and measurements of each part are shown under second level headings. The input and output messages use `OP:PLNTHR` instead of `OP:PLNT24`.

Exhibit 6  Hourly Plant Report

6.3  MONTHLY PLANT REPORT

The monthly plant report is an accumulation of the existing 24-hour plant reports. Each day at approximately 02:07, when the 24-hour plant report is generated, the daily totals are accumulated in a monthly plant measurements data area.

Every month on the 23rd of that month, the monthly totals are printed at approximately 03:07 using the exact format of the 24-hour plant report. The counts are actually accumulated following the 24-hour plant report generation at 02:07.

The completed monthly report which is generated on the 23rd of each month, may be printed on demand at any time until the 24th of the month at approximately 02:07. At this time, the 24-hour plant report is generated. The previous month's totals are zeroed, and counts begin accumulating again.

The monthly plant report consists of parts 1 through 19, parts 21 through 26, and 29. The layout of the monthly plant report is identical to the 24-hour plant report shown in Example 5 except the remote switching module (RSM) counts on part 3 are not on the monthly report. Part 5 prints the format "1 of X" only for office totals maintained. The layout and measurements of each part are shown under second level headings. The input and output messages use OP:PLNTMO, instead of OP:PLNT24.

7.  TRAFFIC SEPARATION REPORT

7.1  HOURLY TRAFFIC SEPARATION REPORT

Traffic separation is the process by which revenues are shared among telephone companies based on the resources used. The hourly traffic separation report assists in the development of call holding time factors and toll calling volumes by incoming separations (INSEP) class and destination separation (DESEP) class. For traffic separation purposes, every incoming and originating call may be assigned an INSEP or DESEP.
After the INSEP/DESEP assignment, the INSEP/DESEP pair is translated to cell groupings. The cell grouping is determined by the INSEP and DESEP of each cell.

If enabled, the hourly traffic separation report is sent to the traffic channel and to the data collection system. The hourly traffic separation report consists of a number of sections. The layout of the hourly traffic report is shown in Example 7. The layout and measurements for each section are shown under third level headings.

The traffic separation report can be controlled using recent change (view 8.1) to set data base parameters. Parameters are provided to turn the daily and hourly reports and their counts on or off.

The output of the report to the traffic channel only is controllable by using the input message _ALW:DRHR_ to request that the report be enabled or _INH:DRHR_ to disable it. The status of this report may be obtained by using the input message _OP:MEASTAT_ with the _PRINT_ option.

In the traffic separation measurements, each call is categorized based on information about the originating line and terminating line category pairs or cell groups. A set of measurements consisting of peg and usage counts can be recorded for each set of cell groupings.

The traffic separation report is produced every hour at nine minutes before the hour and daily at midnight. The report is sent to the traffic channel within a half-hour of the time it was produced. If the traffic channel is present, this report is automatically sent if allowed using _ALW:DRHR_.

7.2 24-HOUR TRAFFIC SEPARATION REPORT

The 24-hour traffic separation report is sent to Data Collection System at nine minutes before midnight in response to a request. The report is also available at the traffic channel. The 24-hour traffic separation report consists of a number of sections. The layout of the 24-hour traffic report is shown in Example 7. The layout and measurements for each section are shown under second level headings.

8. COMMON NETWORK INTERFACE (CNI) MEASUREMENTS AND REPORTS

This section describes the CNI measurements and reports available to the user. Additional information is provided in 235-200-115 Common Channel Signaling Service Feature.

The CNI measurements are classified as ring-node-oriented, link-oriented, and total-office-oriented. This distinction is useful from a maintenance standpoint since faults generally occur in these categories.

The measurement data is collected, stored, and output to various destinations within and outside the office. The CNI reports along with plant measurement reports appear on the maintenance terminal and printer. Support organizations can request plant or CNI measurement data.

The following are CNI measurement classifications.

(a) **Ring-Node-Oriented Measurements:** Ring-node-oriented measurements include ring blockages, node isolations, ring read/write errors, etc. Ring node measurements are mostly concerned with counts and transmission errors relating to internal messages (such as messages between the central processor and the ring). Software in the node either pegs the counts or notifies the central processor. The counts are maintained in buffers in the node processors (and possibly in the central processor). Occasionally, an error notification is sent to the central processor to report error conditions in the ring. In addition to responding to the reported error, software in the central processor often updates the corresponding per-office counts and/or per-node counts. This report to the central processor occurs in real time independently from the periodic data collection. The measurements maintained in the central processor are collected for history file generation at the same time the node counts are collected.

The node also collects the link counts maintained by the link interface. The link interface counts are read by the node processor and placed in the buffers for subsequent reporting to the central processor.

The interprocess message switch (IMS) measurement descriptions identify three types of ring-node-oriented measurements:

- **Ring Peripheral Controller (RPC):** Per-node measurement originated in a ring peripheral controller.
- **IMS User Node:** Per-node measurement originated in some ring node other than a ring peripheral controller
- **Node Processor:** Per-node measurement originated in any node processor.

(b) **Link-Oriented Measurements:** Link-oriented measurements contain traffic volume counts and error conditions related to CCS messages. Some examples are:

- Signaling errors
- Link failures
- Link congestions
- Buffer overloads.

The counts reflect the operating load of the system. This data is useful in engineering the office and the entire...
CCS network. This category of measurements also reflect network abnormalities such as processor outages and emergency restarts.

The link-oriented measurements are maintained in buffers in the link interface circuits and the node processors (and possibly in the central processor when notified by the node). The link interface circuit allows messages to enter and exit the CNI system. Since the link interface is a buffer circuit between the node and the data link, the counts pegged by the link interface are related to specific traffic counts. The measurements are usually taken from a circuit standpoint rather than on a message basis.

Other link-related counts, pegged by the node software, are based on the message discrimination performed by the node. Since the node software has a view of the node's function, it can recognize larger events than the link interface. These counts are maintained in the node.

(c) **Total Office Measurements**: The total office measurements reflect the view of various occurrences in an office. Some of these indicate the impact of corresponding per-link and per-node occurrences on the entire office. Others are not specific to any link or node and are, therefore, inherently total office counts. The office measurements include processor outages, initializations, ring failures, link failures, and various counts related to message processing in general (not specific to any link or node). These counts are maintained solely in the central processor. The measurements are pegged in the central processor and are either recognized by it or reported to it by the nodes when they occur.

The IMS measurement descriptions identify two types of total office measurements.

- **Office**: These are total office measurements.
- **CHN**: These are measurements oriented for a particular channel (possibly in a ring node or the central processor). When a message is to be read from or written to the ring, an association is made between the open channel and the buffer containing the message by the use of a queue that is dedicated to the channel. The central processor manages the 256 possible channels (each intended for a specific type of message) that can carry messages.

### 8.1 DESCRIPTION OF REPORTS

The measurement reports may present the data in either a fixed or a flexible format. There are two ways to view the measurement data. The reports present a specific view of the common measurement data and some reports make this view definable using a measurement output control table. Automatic reports are output as **REPT SMR** messages, while demand reports are output as **OP SMR** messages. The reports are available in two formats.

- **Fixed Format Reports**: Certain measurement data is provided in a fixed layout. This data is output automatically and on demand.
- **Flexible Format Reports**: This format allows the user to have any specified set of measurement data output in one of four ways. These reports are NFDISK, NFDISKEX, NFLPM, and NFLPMEX. These can be scheduled or on demand.

Following the general discussion of the various report types are some examples of each of the fixed format reports.

### 8.2 REPORTS AND MEASUREMENT DATA OUTPUT

The users of the measurement data are involved in daily maintenance and operations of the CNI-equipped office from various support system centers. All measurement data gathered is available to any of the users by using the output control features of the measurement output control table. When IMS measurements are inhibited, however, some measurements are not available. To determine if the IMS measurements are inhibited, use the **INH:IMSMEAS**
input message with the STATUS option.

In addition to the scheduled printing of fixed format reports, they can be obtained any time with the OP:SMR input message. This output request message causes the system to search the measurement output control table schedule for the report specified. When the entry is found, the report is generated and printed using the current data found in the appropriate history file. Most scheduled and demand reports appear on the receive-only maintenance printer.

Since the measurement output control table provides for a delay of up to 5 minutes, the scheduled report may not be printed at the precise scheduled time. This delay is to prevent pages of different reports scheduled to print at the same time from being intermingled. Some reports may be specified as polled reports which are not output at all, but rather are generated and stored for later retrieval.

NOTE: The system is usually busiest at 15-minute intervals updating history files and printing scheduled reports. Demand reports should be requested at 5- to 10-minute periods after the 15-minute intervals.

Measurement data can be demanded on an individual measurement basis at any time. Individual measurement messages provide more current real-time data than reports. These are most useful to office personnel when troubleshooting. To request specific measurements, use the DUMP:SMEAS message. This command can provide specific measurements for specified links, nodes, etc., or it can print data on all links, nodes, etc. The measurement data is retrieved from the history files and output according to the measurement type. The data is sent to the requested designation as an output message. This command is available for on-site users to obtain more detailed measurements of conditions identified, but it is not available to support system users.

Support system users receive measurement data from the CNI-equipped offices through the BX.25 data links. Reports and messages are sent to the support system through the different BX.25 data links. Reports designated "Polled" are saved in specific files in a standard system directory. Support system users and on-site users may request data from these files by using the DUMP:SFILE message.

8.3 FIXED FORMAT

A fixed format report contains a fixed set of measurements and the contents cannot be changed. The view in the measurement output control table with a fixed format report should not be changed. The data is presented with labels arranged in a fixed layout. Table 4 is an alphabetical index of the measurement names related to CNI. The report that each measurement appears on is listed in the table.

The format names are forms of the names used to specify a particular report. All reports fall into one of three categories.

(a) Total Office: Total office reports provide a general view of the office. The data in the reports is a summary of office performance. There are two total office fixed format reports:

- **Signaling Network Performance Report, Part 1 (ASNPR1):** This report is a total office report that is output automatically for each hour and once for the entire day. The purpose of the report is to provide an overall view of signaling performance for the office.

  The report does not provide detail measurements for each link. Therefore, the data on this report cannot be directly used to determine the condition of any specific piece of hardware. It shows cumulative counts for the entire office. The area reflected in this report are signaling load handled, signaling link failures experienced, signal unit errors detected, and the number of message transfer failures that occurred.

  This report should be checked daily for counts indicating poor link performance. The hourly reports from any period should be compared for trends and abnormalities. Keep in mind that a high count on one report does not necessarily indicate problems. The same counts occurring at the same time each day may point to externally induced problems. If problems are indicated, refer to the signaling network...
performance report, part 2 (ASNPR2) or the signaling link 30-minute marginal performance report (A30MPR30) for detailed measurements of specific links. The counts of particular concern are:

- Emergency Restarts (EMRs)
- SUER_TE (Signal Unit Errors)
- SUERX_TE (Retransmission Requests)
- AURSTE (Repeated and Skipped Automatic Calling Units).

Refer to REPT:SMR-ASNPR1 for more information.

- Machine Performance Report (AMPR): This report is a total office report that is output automatically for each hour and once for the entire day. The time of the report is important when isolating problems. The purpose of the report is to provide an overall view of the message switching capability for the office.

The report does not provide detailed measurements for each link or node. The machine performance report shows cumulative counts for the entire office. This report can be used to determine the message switching status of the office in general.

The report should be checked daily for counts indicating ring node failures or degraded ring performance. The hourly reports from several measurement periods should be compared for trends and abnormalities. A high count on one report does not necessarily indicate a problem. The same counts occurring at the same time each day may point to externally induced problems. If problems are indicated, refer to the signaling equipment performance report or ring exception report for detail measurements of specific nodes.

Refer to REPT:SMR-AMPR for more information.

The ASNPR1 and the AMPR reports are scheduled to be output daily and hourly. Therefore, they should be output on-site every hour.

(b) Detailed Performance: The detailed performance reports provide a closer look at the individual links and nodes. There are separate measurements for each link in the office. Thus, the reports provide information helpful in isolating problems to a particular link or node. They are necessary for compiling monthly performance reports. There are two detailed performance reports.

- Signaling Network Performance Report, Part 2 (ASNPR2): This report is a detailed report of signaling link performance. It is output automatically once each day. The purpose of the report is to provide enough detail on each signaling link in the office to allow troubleshooting of faulty links and the compilation of statistical data on each link. The report consists of a number of pages because of the amount of data provided. Each page of the report is output as a single message.

The ASNPR2 and the A30MPR30 reports are the main sources for analyzing link failures and marginal performance. The ASNPR2 report provides an overview of signaling capabilities for the office giving a detailed description of CCS link performance. This report should be checked whenever link problems are indicated. The counts in the CCS link performance section are of particular concern since the data is mostly an expansion of similar total office data provided on the ASNPR1 report. The ASNPR2 reports should be compared each day to determine trends in signaling link problems and provide long-term analysis intermittent problems.

The link performance section of the ASNPR2 report provides data for each equipped link (provided all measurements on the particular report line in question are other than zero). If there is no data available
for a link, the type field is shown with an asterisk. The measurements for each link are listed on separate
lines with link identification (common language location identifier code, layer number, link type, group
number, and member number) to the left of each. Refer to the Rept:SMR-ASNPR2 output message for
more information.

- **Signaling Equipment Performance Report (ASEPR):** This report is a detailed report on node
  performance that is output once each day. The purpose of the report is to provide a profile of each node's
  status for the reporting period.

  The report should be examined to note any excessive counts. The OOSAU_ (automatic out-of-service
counts and durations) and OOSCFG_ (reconfigured out-of-service counts and duration) columns of the
report are of particular concern. This is especially true in the ring peripheral controller node section.
Proper operation of the ring peripheral controller is critical to the message switching function.

  Any node out of service may be caused by node processor or ring interface problems. Problems in the
link node may be caused by poor link performance. When a link is declared failed, the node is
automatically removed from service to perform diagnostics. A normal link is not necessarily declared
failed when the node is removed because of other problems. The RPC node problems may be caused
by the dual signal channel problems. The report may indicate problems in a specific node or the ring in
general.

  The ASEPR report does not provide a detailed analysis of why a node failed. The out-of-service counts
and durations are provided for each node according to the major cause of the change to out-of-service or
standby state. There are three conditions that may cause this report to be generated.

  — Automatic action because of a node or link fault
  — Manual action
  — Ring reconfiguration affecting a normally operating node.

  A total count of the number of times a node restarted for any reason is provided. A few points to consider
for interpreting the report are:

  — The duration counts are cumulative for all occurrences.

  — The out-of-service counts indicate the initial reason for a node being removed. The node
  maintenance state may change without affecting the out-of-service measurements as long as the
  major state remains the same. For example, a node removed because of failing diagnostics causes
  the out-of-service automatic count to peg. Later changing the node state to manual out-of-service
does not cause the out-of-service manual count to peg.

  The data is provided, one node per line, with group and member number identification to the left. If a
node is not in the out-of-service state at any time during the reporting period, it is not shown in the report.
Refer to the Rept:SMR-ASEPR output message for more information.

The ASNPR2 and the ASEPR reports are quite lengthy. Therefore they are scheduled to be output only once
each day and only on-site.

(c) **Exception:** Exception reports are used to single out those measurements that are significant when they
exceed some predetermined value. Any measurement in an exception report that does not exceed this
predetermined value is not output in the report. If there are no measurements that exceed their respective
thresholds, the report itself may not be output. The report shows specific pieces of equipment that have
experienced higher than normal errors or excessive loading. There are two fixed format exception reports:

- **Signaling Link 30-Minute Marginal Performance Report (A30MPR30):** This report is a detailed exception report of signaling link performance. It can be automatically output each 30 minutes, but only if one of the measurements contained in the report exceeds some predefined threshold. The purpose of the report is to identify links that are showing marginal performance. The set of measurements provided indicate various problems with the link such as parity errors in the received signal units, alignment problems, excessive changeovers, or excessive downtime.

  This report should be checked when link problems are indicated. The 30-minute reports of various measurement periods can be compared to identify trends and abnormalities. Look for failures associated with an individual link, group links, or a particular far-end office.

  If any measurement in a particular section exceeds its threshold as specified in the measurement output control table, all equipped links in the section are printed. Those measurements that exceed their threshold are identified by an asterisk. If no measurements in a section exceed their threshold, the section is not printed. The number of pages to the report depends on the number of links that are included.

  Refer to the `REPT:SMR-A30MPR30` output message for more information.

- **Ring Peripheral Controller Overflow Report (RINGEX):** This report is output only if thresholds are exceeded. This report contains exception ring peripheral controller congestion status. It can be output automatically every 5 minutes, but will only be output if one of the measurements contained in the report exceeds some predefined threshold. If no measurements exceed their thresholds, the message NO RPC OVERFLOW ENCOUNTERED is printed out.

  The purpose of the report is to identify ring peripheral controller nodes that are experiencing various levels of congestion. This report should be used with the machine performance report to determine possible causes of the congestion and appropriate action necessary to relieve it. Give particular attention to overflow levels 2 and 3 (RRBOVFLW2_ and RRBOBFLW3_).

The A30MPR30 and RINGEX reports, output on-site, identity problems with either signaling links or ring peripheral controllers, respectively.

### 8.4 FLEXIBLE FORMAT

Flexible format reports are user-defined. The CNI allows the user to create customized reports containing data pertaining to their needs by means of the measurement output control table. These reports require a view in the measurement output control table to specify what measurements should be printed. The view is used to extract measurements from the database.

When users in the support centers need reports for a specific purpose and the desired information is not available in a fixed format report, or the fixed report is not available, a new report can be created to fit the need. To generate this report, use the measurement output control table to specify the name, content, frequency, and format of the desired report. You can also specify if the report will be output automatically or only on demand. The format is specified by using the appropriate flexible format report generator.

Flexible format reports can be either regular or exception reports. The regular format shows a value for all measurements specified in the view regardless of value. The exception format shows a value for all measurements specified if any one of those measurements has exceeded its threshold.

1. EXPLANATION OF RESPONSES APPENDIX

The ‘response’ is additional information on the completion status of the requested UT action. This information is helpful in understanding why an action could not complete as requested. Not all responses apply to all messages. The responses starting with STOPPED imply that the input message or entire message clause was not entered or executed, unless otherwise specified.

ACCEPTED - STATUS INH The WHEN clause has been accepted and marked as inhibited. Use the ALW:UT message to activate the clause.

COMPLETED The requested (UT) operation has completed successfully.

COMPLETED - NO WHENS The operation was performed, but no WHEN message clauses were found in memory.

COMPLETED - NO WHENS TO ALLOW The operation was performed, but no WHEN message clauses were found to allow in specified processor.

COMPLETED - NO WHENS TO CLEAR The operation was performed, but no WHEN message clauses were found to clear in specified processor.

COMPLETED - NO WHENS TO INHIBIT The operation was performed, but no WHEN message clauses were found to inhibit in specified processor.

COMPLETED - SOME UNITS IN RANGE ISOLATED The specified operation was performed on all the ACTIVE processors within the given range. The input message was not executed on the isolated units within the given range.

COMPLETED - SOME WHENS NOT MODIFIED The operation was performed, but not all WHEN message clauses were found to be modified (that is, allowed, cleared or inhibited).

IN PROGRESS More data will follow.

Not Translated <ADDRESS NOT ALIGNED> This string appears in a disassembly dump when the starting address is not long word aligned. All valid PowerPC® instructions must be on a long word aligned address.

Not Translated <OUT OF DATA> This string appears in the disassembly dump when the requested dump length ends in the middle of a 4-Byte PowerPC® instruction. Whenever there are less than 4 bytes of data remaining, the data can’t be translated as a valid PowerPC® instruction. All PowerPC® instructions are 4-bytes or 32-bits.

PARTIAL RESULT - MORE THAN 40 MATCHES Too many matches have been found to print a complete list. The 40 matches found have been printed, but this informs the user that more matches exist for the symbol name provided. If the desired information is not present, the user needs to provide more characters of the symbol name to enable UT to resolve the matches.

STARTED Requested operation has started. More data will follow.

STATUS - ALW — The specified breakpoint is allowed and will execute if the address in the WHEN input message
is executed.
— The specified TIMED WHEN breakpoint is allowed and will execute when timer expires.

STATUS - INH  The specified breakpoint is inhibited and will not be executed.

STOPPED - ADDR AND LENGTH MUST BE EVEN FOR OOS MATE PI  The length and address specified in the input message must be even for out-of-service (OOS) mate peripheral interface (PI).

STOPPED - ALL UNITS IN RANGE ISOLATED  All units specified in the input message range are isolated.

STOPPED - ALL UNITS IN RANGE UNEQUIPPED  All units specified in the input message range are unequipped.

STOPPED - BUFFER OVERFLOW  The internal output message buffer overflowed. The output data is incomplete.

STOPPED - BYTES DO NOT MATCH
— The entire WHEN clause was removed because the specified value of the opcode (OPC) parameter in the input message does not match the value of the address specified.

NOTE: The OPC value needs to be a 4 byte value in the following processor types:
(1) A communication module processor when the communication module is a Model 3.
(2) A PSUPH when the hardware type is a PHA2, PHE2, PHV5, PHV6, PH31 or PH33.
(3) A switching module processor when its software configuration is CNFG2KPPC.

All other processors the OPC value needs to be a 2 byte value.
— ALW could not be performed on the WHEN clause because the specified value of the opcode parameter does not match the value of the address specified by the WHEN clause.

STOPPED - CANNOT OPEN FILE NAME  The specified information can not be determined because the required file could not be opened.

STOPPED - CANNOT SEEK TO SYMBOL TABLE  The symbol table could not be found in the symbol file for the given processor.

STOPPED - CANNOT DISASSEMBLE MULTIPLE REGISTER DUMPS  The disassembly option can not be specified with multiple register dump.

STOPPED - CLAUSES NOT ALLOWED FOR THIS PROCESSOR  The WHEN clause is only supported on PSUPH(s) of the PH3 and later hardware type.

STOPPED - COMMAND MUST BE PART OF A CLAUSE  The specified input message must be part of a clause.

STOPPED - COMMAND NOT ALLOWED FOR SPECIFIED PROCESSOR  The input message is not supported for the specified processor.

STOPPED - COMMUNICATION FAILURE  There was a communication failure in sending the input message clause to the target processor. The entire input message clause was removed. The input message clause will need to be re-entered after communication has been established.

STOPPED - COMMUNICATION FAULT BETWEEN SM & PERIPHERAL  There was a communication failure in sending the input message clause to the target peripheral. The entire input message clause was removed. The input message clause will need to be re-entered after communication has been established.
STOPPED - CONDITIONAL COMMANDS DO NOT MATCH
   — The number of IF:UT-ENDIF input messages can not exceed the number of corresponding
     IF:UT in a WHEN clause for a given processor.
   — The number of IF:UT input messages can not exceed the number of ELSE:UT in a single
     WHEN clause for a given processor.

STOPPED - COULD NOT RECEIVE UT MESSAGE A message could not be received by the UT system process
   because of an internal error.

STOPPED - DATA BASE READ FAILURE The input clause was not executed because a failure occurred while
   accessing the database.  The input message will need to be re-entered after the problem is
   resolved.

STOPPED - DUPLEX FAILURE OF THE CCs The input clause was not executed because both of the common
   controllers (CC) in the unit are not active. The input message should be re-entered after the
   problem is resolved.

STOPPED - ERROR SENDING UT COMMAND A message could not be sent to the UT target processor for
   execution because of an internal error.

STOPPED - FAILURE TO TAKE OWNERSHIP OF THE MATE The input clause was not executed because a
   failure occurred in obtaining ownership of the mate processor. The input message will need to be
   re-entered after the problem is resolved.

STOPPED - FILE READ FAILURE The symbol file could not be read to resolve the requested symbol information.

STOPPED - FILE TYPE NOT SUPPORTED BY UT UT can find, open and read the provided or determined file, but
   the MAGIC value is either not supported by UT or is not recognized. The user needs to correct or
   change the file being used in order to use this input message.

STOPPED - GOTO OPTION NOT ALLOWED FOR SPECIFIED UNIT The GOTO option is not supported for the
   specified unit.

STOPPED - GOTO OPTION ONLY VALID IN A BREAKPOINT COMMAND The GOTO option is only valid when
   entered inside of a clause.

STOPPED - ILLEGAL ADDRESS An invalid address was specified in the input message.

STOPPED - INDIREDIRECTION NOT ALLOWED WITH UCI REGISTERS Indirection is not allowed with unified control
   interface (UCI) registers.

STOPPED - INPUT CLAUSE TIME OUT The UT input message clause being installed in the indicated processor
   has timed out. The entire clause was removed. The time-out occurred between two input
   messages of a clause and not on an overall time for the entire clause.

STOPPED - INTERNAL ERROR An error occurred while trying to get the PH image and hardware type.

STOPPED - INVALID IMAGE TYPE RETURNED FOR PH An invalid PH image type was received by UT.

STOPPED - INVALID INDIREDIRECTION SPECIFIED The offsets can not be specified without an indirection or the
   number of offsets has to be less than or equal to the number of indirections in an input message.

STOPPED - INVALID LENGTH The length specified in the input message is invalid.

STOPPED - INVALID SIZE The size specified in the input message is invalid.
STOPPED - INVALID UNIT SPECIFIED The unit specified in the input message is invalid.

STOPPED - INVALID UNITS MIXED IN A CLAUSE An input clause can not mix a PH3 unit with a non-PH3 unit in the same clause.

STOPPED - INVALID USE OF OPTIONS The specified options are syntactically correct for the specified processor but the combination of the options do not make sense together.

STOPPED - MATE CANNOT BE PUT IN HOLD STATE The mate processor could not be put in the hold state. The input message will need to be re-entered after the problem is resolved.

STOPPED - MATE PI IS NOT VALID The specified input message is not valid for the mate PI.

STOPPED - MATE REG IS INVALID
— The REG option with mate is only valid when indirection is specified on the input message.
— The REGS option with mate is invalid.

STOPPED - MATE UVAR IS INVALID
— The UVAR option with mate is only valid when indirection is specified on the input message.
— The UVAR option is not valid with OOS mate PI.

STOPPED - MATE/INDIRECTION INCONSISTENCIES MATE/INDIRECTION are not valid when VAL option is specified with IF:UT and COPY:UT input messages.

STOPPED - MODIFYING STATUS OF NON-EXISTENT WHEN The WHEN message specified by the input message does not exist. Perform OP:UT input message to determine what WHEN messages are in the processor.

STOPPED - NESTED WHEN A WHEN clause can not be nested within a WHEN clause.

STOPPED - NO GOOD MESSAGE RECEIVED An unexpected message type is received by UT system process.

STOPPED - NO PATHNAME EXISTS The path to the symbol file for the specified processor could not be determined.

STOPPED - NO SYMBOL ENTERED The input message did not provide the name of the symbol to be resolved.

STOPPED - NOT SUPPORTED ON THIS CM MODEL The input message is not supported on this CM Model. The input manual page indicates what CM Model the command is valid for and what UT input message should be used for the processor.

STOPPED NON-UT USER HAS DATA ACCESS REGISTERS ACTIVE The data access registers are currently being used by someone other than UT. The registers can only be active for one user at a time. The \texttt{\textbackslash{}f(CW\textbackslash{}WH\textbackslash{}EN\textbackslash{}fR is left in the code in an INHIBITED state.

STOPPED NON-UT USER HAS INSTRUCTION ACCESS REGISTERS ACTIVE The instruction access registers are currently being used by someone other than UT. The registers can only be active for one user at a time. The \texttt{\textbackslash{}f(CW\textbackslash{}WH\textbackslash{}EN\textbackslash{}fR is left in the code in an INHIBITED state.

STOPPED - NOT SUPPORTED ON THIS UNIT The input command is not supported on this unit. The input manual page indicates what units(s) the command is valid for and what UT input message(s) should be used for the processor.

STOPPED - OPTION NOT VALID WITH SPECIFIED PROCESSOR The option specified in the input message is
invalid with the specified processor.

**STOPPED - OUT OF SEQUENCE COMMAND RECEIVED** The specified processor received a clause message out of sequence.

**STOPPED - OVERLAP OF THE UCI REGISTERS** The UCI registers have a specific memory range allocated. Overlap with the UCI register range is not allowed.

**STOPPED - PATHNAME TOO BIG** The path to the symbol file has been determined, but it is too big to store in the cache.

**STOPPED - PROCESSOR IS ISOLATED** The processor specified in the input message is isolated.

**STOPPED - PROCESSOR IS UNEQUIPPED** The processor specified in the input message is unequipped.

**STOPPED - RANGES NOT ALLOWED IN CLAUSES** The range option is invalid in a clause.

**STOPPED - REQUESTED TASK FAILED** The requested task failed.

**STOPPED - SPECIFIED PERIPHERAL DOES NOT EXIST** The peripheral specified in the input message does not exist.

**STOPPED - SPECIFIED RANGE INCLUDES THE PROCESSOR IN A CLAUSE** The range specified in the input message includes the processor currently in a clause.

**STOPPED - STANDBY PH IS NOT VALID** The EXC input message can not be performed on a standby PH.

**STOPPED - SYMBOL INDEX INVALID** The symbol index provided was found, but it provides a reference to either an auxiliary symbol entry or a symbol entry type which is not valid for UT to handle (such as, ".file", ".eb", ".fb", ".bss", ".data", or ".text"). The user needs to correct the symbol index value in order to use this input message.

**STOPPED - SYMBOL INDEX NOT FOUND** The symbol index value provided in the input message is out of range for the COFF file. The user must correct the symbol index value or change the PATH to the symbol file in order to use the input message.

**STOPPED - SYMBOL IS NOT A FUNCTION** The specified symbol must be a function in order to execute it.

**STOPPED - SYMBOL NAME AMBIGUOUS** The given symbol name matched more than one symbol in the symbol file. The user needs to provide more characters of the symbol name or use the DUMP:UT-SYMID input message to determine which symbol index should be used in place of the symbol name.

**STOPPED - SYMBOL NOT FOUND** The specified symbol was not found in the specified processor's symbol file.

**STOPPED - TABLE OVERFLOW** The user exceeded the maximum number of utility messages. The user can store a maximum of 45 input messages as part of WHEN clauses in the UT table buffer. The user can still perform immediate UT input messages.

**STOPPED - TIMED OUT WAITING FOR PARENT SM TO RESPOND** Parent SM did not return the PH image within the required time.

**STOPPED - UNIT DOES NOT EXIST** The specified unit does not exist.

**STOPPED - UNIT IS OUT-OF-SERVICE** The specified unit is out-of-service.

**STOPPED - UNIT NOT ACCESSIBLE** The specified unit is not accessible.
STOPPED - UNIT NOT SUPPORTED ON SM  The peripheral specified in the input message is not supported on this SM.

STOPPED - UNIT WENT ISOLATED DURING CLAUSE INPUT  The specified unit went isolated during clause input.

STOPPED - UNSUCCESSFUL DMA TRANSFER  An error has occurred in the direct memory access (DMA) process between the administrative module (AM) and the specified processor.

STOPPED UT HAS DATA ACCESS REGISTERS ACTIVE ALREADY  There is only one set of data access registers. UT is already using the registers. This 'C WALW'R command can not enable the registers until the existing set is disabled.

STOPPED UT HAS INSTRUCTION ACCESS REGISTERS ACTIVE ALREADY  There is only one set of instruction access registers. UT is already using the registers. This 'C WALW'R command can not enable the registers until the existing set is disabled.

STOPPED - UT TIMED WHEN COMMANDS INHIBITED DUE TO UT PROCESS PURGE  The UT TIMED WHEN messages in the indicated processor have been inhibited due to a single-process purge (SPP). The TIMED WHEN messages must be reallowed manually if needed by the user.

STOPPED - UTPH BREAKPOINTS INHIBITED DUE TO SELECTIVE INIT  The UT WHEN messages in the indicated processor have been inhibited due to a selective initialization. The WHEN messages must be reallowed manually if needed by the user.

STOPPED - UVAR OUT OF RANGE  The utility variable specified was not in the valid range for the specified processor.

STOPPED - VALUE WILL NOT FIT  The value to be loaded would not fit in the space specified in the input message.

STOPPED - WHEN ALREADY ALLOWED  The specified WHEN clause is already allowed.

STOPPED - WHEN ALREADY AT THAT LOCATION  A WHEN message already exists at the specified location. Multiple WHEN clauses can not be installed at one memory location.

STOPPED - WHEN ALREADY INHIBITED  The specified WHEN clause was already inhibited.

STOPPED - WHEN DOES NOT EXIST  The WHEN message specified in the input message does not exist.

STOPPED - WHEN INHIBITED  The specified WHEN clause is already inhibited.

STOPPED - WHEN NOT VALID INSIDE OF CLAUSE  A WHEN message is invalid inside of a WHEN clause.

SYMBOLIC LOOK-UP COMPLETED  The symbolic reference of the input message was resolved. The user can continue input.

SYMBOLIC LOOK-UP IP - WAIT FOR COMPLETION REPORT  The symbolic reference of the input message is being resolved. No new input messages will proceed until the completion report (SYMBOLIC LOOK-UP COMPLETED) is printed.

WHEN DOES NOT EXIST  The WHEN message specified in the input message does not exist. Use the OP:UT input message to determine what WHEN messages are in the processor.
### 1. UTILITY ID

Note These utility IDs (UIDs) are in hexadecimal notation.

<table>
<thead>

</table>
/bin/env  Set environment for message execution.
/bin/falloc  Allocate space for an external file.
/bin/find  Search a file for a pattern.
/find  Find files.
/bin/fmove  Move file into contiguous space.
/bin/fsize  Prints size of files.
/bin/grep  Search a file for a pattern.
/bin/kill  Send a signal to a process or a group of processes.
/bin/killp  Kill user processes using a full pathname.
/bin/ln  Link files.
/bin/logdir  Get login directory.
/bin/ls  List contents of directory.
/bin/makekey  Generates encryption key.
/bin/kill  Send a signal to a process or a group of processes.
/bin/ls  List contents of directory.
/bin/mv  Move a file.
/bin/mail  Send mail to users or read mail.
/usr/lib/makekey  Generates encryption key.
/bin/mesg  Permit or deny messages.
/bin/mkdir  Make a directory.
/usr/bin/mop  Mount off-line partition.
/bin/closewd  Close window.
/bin/newgrp  Log in to a new group.
/bin/news  Print news items.
/stty  Set the options for a terminal.
/bin/passwd  User information file.
/bin/pio  I/O to a traced process image.
/bin/pr  Print files.
/bin/pwd  Print working directory name/path.
/bin/ps  Print a list of processes.
/bin/read  Read from a file.
/bin/rm  Remove files.
/bin/rmdir  Remove directories.
/bin/run  Run kernel processes.
/bin/sleep  Suspend execution for interval.
/bin/sort  Sort and/or merge files.
/bin/split  Split a file into pieces.
/bin/stat  Get file status.
/bin/stdio  Standard I/O to a traced process image.
/bin/sync  Update super-block.
/bin/tail  Deliver the last part of a file.
/bin/tee  Pipe fitting.
/bin/time  Get time.
/bin/touch  Update access and modification times of a file.
/bin/tty  Terminal device interface.
/bin/uname  Print name of current system.
/bin/wc  Word count.
/bin/who  Who is on the system.
/bin/write  Write on a terminal.
/bin/sed  Side-by-side difference program.
/bin/sleep  Suspend execution for interval.
/bin/sort  Sort and/or merge files.
/bin/split  Split a file into pieces.
/bin/stat  Get file status.
/bin/synty  Set the options for a terminal.
/bin/su  Change user ID.
/bin/sum  Print checksum and block count of a file.
/bin/sync  Update super-block.
/bin/tail  Deliver the last part of a file.
/bin/tee  Pipe fitting.
/bin/time  Get time.

**ABT:ALIT**

- **Software Release:** 5E14 and later
- **Message Class:** MTCE
- **Application:** 5
- **Type:** Output

1. **FORMAT**

   \[\text{ABT [a] ALIT=b-c-d-e f [g]}\]

2. **REASON FOR OUTPUT**

   To indicate the results of an attempt to abort (ABT) the current action on the automatic line insulation test (ALIT) circuit at the specified location.

3. **VARIABLE FIELD DEFINITIONS**

   - **a**: Action being aborted (default is the action currently executing on the ALIT). Valid value(s):
     - DGN = Diagnose.
     - EX = Exercise.
     - RMV = Remove.
     - RST = Restore.

   - **b**: Switching module (SM) number.

   - **c**: Metallic service unit number.

   - **d**: Service group number.

   - **e**: Metallic service unit board number.

   - **f**: Termination report. Valid value(s):
     - ABORTED = Requested action was terminated before completion and the termination was immediate.
     - COMPLETED = Request has successfully completed.
     - COMPLETED-CERTIFIED = Request has successfully completed and independent certification of resulting hardware status is made.
     - NOT STARTED = Requested action has not begun.
     - STOPPED = Requested action was terminated before a normal completion.

   - **g**: Additional data qualifying the termination report (variable 'g'). Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. **ACTION TO BE TAKEN**

   None.

5. **ALARMS**

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ABT [a] ASC=b c [d]

2. REASON FOR OUTPUT

Indicates the result of an abort of the current action on the remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC).

3. VARIABLE FIELD DEFINITIONS

a = Action being aborted, default is the action currently executing on the ASC. Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number.

c = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was complete.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before normal completion.

d = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ABT [a] EAN=b-c d [e]

2. REASON FOR OUTPUT

To indicate the results of an attempt to abort (ABT) the current action on the equipment access network (EAN) at the specified location.

3. VARIABLE FIELD DEFINITIONS

a = Action being aborted (default is the action currently executing on the EAN). Valid value(s):
   DGN = Diagnose.
   EX = Exercise.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number.

c = Directly connected test unit number.

d = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = Request has successfully completed.
   COMPLETED−CERTIFIED = Request has successfully completed and independent certification of resulting hardware status is made.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion.

e = Additional data qualifying the termination report (variable ‘d’). Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

ABT [a] EC1STE=b-c-d-e f [g]

2. REASON FOR OUTPUT

Indicates the result of an ABT:EC1STE input request to abort maintenance actions on a digital networking unit - Electrical Carrier Level 1 SONET Termination equipment facility (EC1STE).

3. VARIABLE FIELD DEFINITIONS

a = Action being aborted. Valid value(s):
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number.

c = Digital Networking Unit - SONET (DNU-S) number.

d = Data group (DG) number.

e = SONET Termination Equipment (STE) facility number.

f = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was not graceful.
   COMPLETED = Requested action was successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

1510 (DNUS STATUS)
**ABT:FAC**

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5  
**Type:** Output

1. **FORMAT**

`ABT [a] FAC=b-c-d-e f [g]`

2. **REASON FOR OUTPUT**

To report the result of an ABT:FAC input message to abort the current action on a remote switching module (RSM) facility (FAC) or a trunk FAC.

An RSM FAC can be a host-remote facility between a host switching module (HSM) and an RSM, or a remote facility between two RSMs. A trunk FAC is an inter-office trunk.

3. **VARIABLE FIELD DEFINITIONS**

   a. Action being aborted. Valid value(s):
      - `RMV` = Remove.
      - `RST` = Restore.
      - `TST` = Test.
      
      Default is the action currently executing on the FAC.

   b. = Switching module (SM) number.

   c. = Digital line and trunk unit (DLTU) number.

   d. = RSM digital facilities interface (RDFI), RSM communication link digital facilities interface (CFI), or inter-office trunk digital facilities interface (DFI) number.

   e. = FAC number. The FAC number is the T1 facility number on a RDFI, CDFI, or DFI.

   f. = Termination report. Valid value(s):
      - `ABORTED` = Requested action was terminated before completion, and the termination was not graceful.
      - `COMPLETED` = Request has successfully completed.
      - `NOT_STARTED` = Requested action had not begun.
      - `STOPPED` = Requested action was terminated before a normal completion. Termination was graceful.

   g. = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

APP: MAINT-RESP
**ABT:GKCCR**

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   \[\text{ABT GKCCR} \ (SM=a|\text{CMP}=b-c \ (\text{PRIM}|\text{MATE})|\text{AM}) \ - \ d\]

2. **REASON FOR OUTPUT**

   To report the status of a request to abort a generated key collection and compression routine (GKCCR). The abort request was requested using the ABT:GKCCR input message. The message is repeated for each processor that was requested in the ABT:GKCCR input message.

   ABT:GKCCR aborts an executing GKCCR whether it is an automatic or manual GKCCR. Automatic GKCCR runs periodically unless GKCCR is inhibited using the INH:GKCCR input message. Manual GKCCR runs as a result of the EXC:GKCCR input message.

3. **VARIABLE FIELD DEFINITIONS**

   - **AM** = The GKCCR abort was requested on the administrative module.
   - **MATE** = The GKCCR abort was requested on the mate communication module processor (CMP).
   - **PRIM** = The GKCCR abort was requested on the primary CMP.
   - **a** = Number of the switching module for which the GKCCR abort was requested.
   - **b** = Message switch side for the desired CMP.
   - **c** = CMP number for which the GKCCR abort was requested.
   - **d** = Output message termination report. Valid value(s):
     - **ABORT COMPLETED** = The GKCCR was aborted on the requested processor. Any queued GKCCR requests are de-queued.
     - **NO RUNNING GKCCR PROCESS FOUND** = No GKCCR process was running on the requested processor. Any queued GKCCR requests are de-queued.

4. **ACTION TO BE TAKEN**

   None. If the “ABORT COMPLETED” output termination occurs, all processes are terminated immediately. No data corruption occurs as a result of the abort. Any queued GKCCR requests are de-queued.

5. **ALARMS**

   None.

ABT:LDSU

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

ABT [a] LDSU=b-c-d e [f]

2. REASON FOR OUTPUT

To indicate the results of an attempt to abort (ABT) the current action on the local digital service unit- model 2; (LDSU2) board.

3. VARIABLE FIELD DEFINITIONS

a = Action being aborted (default is the action currently executing on the LDSU2 board). Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number.

c = Local digital service unit number.

d = Service group number.

e = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action has not begun.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

Output Appendix(es):

APP:MAINT-RESP
ABT:LDSUCOM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ABT [a] LDSUCOM=b-c-d e [f]

2. REASON FOR OUTPUT

To indicate the results of an attempt to abort (ABT) the current action on the local digital service unit common (LDSUCOM) board at the specified location.

3. VARIABLE FIELD DEFINITIONS

a = Action being aborted (default is the action currently executing on the LDSUCOM board). Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number.

c = Local digital service unit number.

d = Service group number.

e = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = Request has successfully completed.
   COMPLETED-CERTIFIED = Request has successfully completed and independent certification of resulting hardware status is made.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion.

f = Additional data qualifying the termination report (variable ‘e’). Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

ABT:LIB

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ABT LIB TEAM a b c d

2. REASON FOR OUTPUT

To report the completion status of a manually issued ABT:LIB input message.

3. VARIABLE FIELD DEFINITIONS

a = Team number.

b = Administrative module (AM) flag. Valid value(s):
   N = AM is not reporting.
   Y = AM is reporting.

c = Switching module (SM) number. Default is that SM is not reporting.

d = Results. Valid value(s):
   COMPLETED
   STOPPED - PROGRAM IS NOT STARTED
   STOPPED - PROCESSOR LOADED BY A DIFFERENT TEAM
   STOPPED - NO PROGRAM LOADED

4. ACTION TO BE TAKEN

Since this is a response to a manual request, no action is required. Normally, testing would proceed from this point.

ABT:RRCLK

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

ABT [a] RRCLK=b-c-d e [f]

2. REASON FOR OUTPUT

Indicates the result of an ABT:RRCLK input message to abort the current maintenance action on the remote integrated services line unit remote clock (RRCLK) circuit pack.

3. VARIABLE FIELD DEFINITIONS

a  = Action being aborted. Valid value(s):
    DGN  = Diagnose.
    EX  = Exercise.
    RMV  = Remove.
    RST  = Restore.
    SW  = Switch.

b  = Switching module (SM) number.

c  = Remote integrated services line unit (RISLU) number.

d  = RRCLK side.

e  = Termination report. Valid value(s):
    COMPLETED  = Request has successfully completed.
    NOT STARTED  = Requested action had not begun.

f  = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If unexpected results occur, refer to the Corrective Maintenance Manual.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: SMCONFIG
Application: 5
Type: Output

1. FORMAT

ABT [a] RT EOC=b–c d [e]

2. REASON FOR OUTPUT

To report the result of an ABT:RT-EOC input message that aborts the current action on a TR303 remote terminal (RT) embedded operations channel (EOC) circuit.

Note: A TR303 RT includes the Series 5 feature package 303G RT.

3. VARIABLE FIELD DEFINITIONS

a = Action to be aborted. Valid value(s):
   RMV = Remove.
   RST = Restore.

b = Site identification number.

c = EOC number.

d = Termination report. Valid value(s):
   COMPLETED = Requested action was successfully completed.
   NOT_STARTED = Requested action has not begun.

e = Additional information qualifying the termination report. This information can be found in the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

ABT:SDFI

Software Release: 5E14 and later  
Message Class: MTCE  
Application: 5  
Type: Output

1. FORMAT

ABT [a] SDFI=a-b-c d e [f]

2. REASON FOR OUTPUT

To indicate the results of an attempt to abort (ABT) the current action on the SLC®96 digital facility interface (SDFI).

3. VARIABLE FIELD DEFINITIONS

a = Action being aborted (default is the action currently executing on the SDFI). Valid value(s):
DGN = Diagnose.  
EX = Exercise.  
RMV = Remove.  
RST = Restore.

b = Switching module (SM) number.

c = Digital carrier line unit (DCLU) number.

d = SDFI number.

e = Termination status. Valid value(s):
ABORTED = The action requested was unsuccessful and the termination was not graceful. Hardware states are not reliable.  
COMPLETED = The action completed successfully.  
NOT STARTED = The action to be aborted has not yet started.  
STOPPED = The action terminated before a normal completion but the termination was graceful. Hardware states are reliable.

f = Additional data qualifying the termination report (variable ‘e’). Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If the termination status is ABORTED, purge the MRA process using input message INIT:SM-SPP. Otherwise, no action is necessary.

1. FORMAT

ABT TST LEN=a-b-c-d-e-f g [h]

2. REASON FOR OUTPUT

To indicate the results of an attempt to abort (ABT) the current action on the line equipment number (LEN) unit at the specified location.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Grid number.
d = Grid board number.
e = Grid board switch number.
f = Grid board switch level number.
g = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion.

h = Additional data qualifying the termination report (variable ‘g’).

4. ACTION TO BE TAKEN

If an unexpected result occurs, use the OP:OFFNORM-SM input message.

6. ACTV
**ACTV:OMDB**

- **Software Release:** 5E14 and later
- **Message Class:** MTCE
- **Application:** 5,3B
- **Type:** Output

### 1. FORMAT

1. **ACTV OMDB COMPLETED**
   - OMDB SEGMENTS.
   - TOTAL        ACTIVE
     - a           b

2. **ACTV OMDB FAILED**

3. **ACTV OMDB ABORTED**
   - UNABLE TO SEND REQUEST TO CSOP

### 2. REASON FOR OUTPUT

To report the completion of processing an ACTV:OMDB input message to refresh the active (incore) output message database (OMDB).

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Total number of segments that the OMDB requires.
- **b** = Number of segments that are active (incore).

### 4. ACTION TO BE TAKEN

For Format 2, refer to the REPT:CSOP output message(s) found in the receive-only printer (ROP) output preceding this message. They should give more information about the nature of the error. If they indicate that the file /cft/spl/omdb is not accessible, determine if the disk is available. If the disk is available, verify the status of the OMDB disk file by using the OP:ST-LISTDIR input message for /cft/spl/omdb. If neither of these actions determines a probable cause, there may be insufficient memory available to bring a fresh copy of the OMDB incore.

For Format 3, verify that the coordinator of spooler output processes (CSOP) output spooler is running.

### 5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[4] ALW ALE u: TOTAL OF v SEGMENTS PRINTED

2. REASON FOR OUTPUT

To acknowledge the ALW:ALE input message indicating the status of ALE control parameters. The parameters reported in this message are grouped into two classes.

A Switching module (SM) controls:

The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER. If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for all the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL. If the PER generation parameter is inhibited, then no PERs will be recorded for any ISDN protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual integrated services digital network (ISDN) protocol channel determines if PERs are recorded for that channel.

B Line/trunk controls: Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks. Only the PER generation control parameter may be manipulated by the ALW:ALE input message. The level 1 parameters are manipulated using RC/V
View 22.15 (PERFORMANCE MONITORING THRESHOLD GROUP) for performance monitoring groups. The level 1 parameters are reported for completeness. The level 1 control parameters consist of an overall level 1 inhibit, hourly alert generation, daily alert generation, interval report generation, and daily report generation. If the overall level 1 inhibit is active, then all level 1 performance monitoring activities for the U-interface are disabled. If the hourly alert generation inhibit is active, then the reporting of hourly alerts to the ROP will be suppressed for the interface. If the daily alert generation inhibit is active, then the reporting of daily alerts to the ROP will be suppressed for the interface. If the interval report generation inhibit is active, then the interface will not contribute to the interval report, if applicable. If the daily report generation inhibit is active, then the interface will not contribute to the daily report, if applicable. One or more of the level 1 controls may be active. If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel.

Format 1 provides a status message for the progress of the allow request.

Format 2 acknowledges manipulation of the SM control parameters. Up to 24 SMs may be reported in a single message.

Format 3 acknowledges manipulation of the line/trunk control parameters. Up to 6 ISDN protocol channels may be reported in a single message.

Format 4 provides a completion message indicating the number of segments printed for the session.

3. VARIABLE FIELD DEFINITIONS

INH = Inhibited. Otherwise allowed.

L1-PM = Level 1 protocol monitoring is inhibited for this SM.

NOT AVAILABLE = Inhibit status information cannot be obtained for this SM.

PER-GEN = PER generation is inhibited for this SM.

\[a\]

\[\text{ABORTED-COMMUNICATION FAILURE} = \text{The current allow request was stopped because of failures in inter-process message transmission.}\]
\[\text{ABORTED-DATA BASE ERROR} = \text{The current allow request was stopped due to database access failure in the administrative module (AM).}\]
\[\text{ABORTED-INVALID SM} = \text{The requested SM was invalid.}\]
\[\text{COMPLETED} = \text{The allow request was completed.}\]
\[\text{COMPLETED-NO DSL EQUIPPED/ASSIGNED} = \text{The SM to effect the PER generation allow does not have any ISDN protocol channels assigned.}\]
\[\text{NOT STARTED-INVALID PORT} = \text{A single ISDN protocol channel PER generation allow request was made for a non-existent channel.}\]
\[\text{NOT STARTED-SM UNAVAILABLE} = \text{A single ISDN protocol channel PER generation allow request was made where the channel was on an SM that was not fully operational.}\]
\[\text{NOT STARTED-NON-PRIMARY DN SPECIFIED} = \text{A PER generation allow request was made for a DN that was not a primary DN.}\]
\[\text{NOT STARTED-NON-UNIQUE NXX DN} = \text{A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.}\]

\[\text{STARTED} = \text{The allow ALE request has begun processing.}\]

\[b\]

[3] ALW ALE INHIBIT REPORT - SEGMENT b
  SM=c STATUS: d e

2. REASON FOR OUTPUT

To acknowledge the ALW:ALE input message indicating the status of ALE control parameters. The parameters reported in this message are grouped into two classes.

Switching module (SM) controls:

— The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

— If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for all the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.
— After the introduction of PCF on PHE2 feature, ALE doesn't provide performance monitoring error count information on A10/A11/ETHERNET protocols, but PER is able to provide the protocol error histories on A10/A11/ETHERNET protocols on PCF. There are two kinds of PERs: level 2 and level 7. Level 2 PER retrieves the ethernet protocol error histories stored in the PH. Level 7 retrieves A10/A11 error histories stored in PH.
— If the PER generation parameter is inhibited, then no PERs will be recorded for any ISDN protocol channels or PCF trunks on the SM. If the parameter is allowed, then the PER generation parameter for the individual integrated services digital network (ISDN) protocol channel or the individual PCF determines if PERs are recorded for that channel or PCF PH.

Line/trunk controls: Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks or all PCF PH. Only the PER generation control parameter may be manipulated by the ALW:ALE input message. The level 1 parameters are manipulated using RC/V View 22.15 for performance monitoring groups. The level 1 parameters are reported for completeness.

The level 1 control parameters consist of an overall level 1 inhibit, hourly alert generation, daily alert generation, interval report generation, and daily report generation. If the overall level 1 inhibit is active, then all level 1 performance monitoring activities for the U-interface are disabled. If the hourly alert generation inhibit is active, then the reporting of hourly alerts to the ROP will be suppressed for the interface. If the daily alert generation inhibit is active, then the reporting of daily alerts to the ROP will be suppressed for the interface. If the interval report generation inhibit is active, then the interface will not contribute to the interval report, if applicable. If the daily report generation inhibit is active, then the interface will not contribute to the daily report, if applicable. One or more of the level 1 controls may be active.

If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel or for the PCF PH.

Format 1 provides a status message for the progress of the allow request.

Format 2 acknowledges manipulation of the SM control parameters. Up to 24 SMs may be reported in a single message.

Format 3 acknowledges manipulation of the line/trunk control parameters for ISDN protocol channels. Up to 6 ISDN protocol channels may be reported in a single message.

Format 4 acknowledges manipulation of the PCF control parameters. Up to 6 PCF PER may be reported in a single message.

Format 5 provides a completion message indicating the number of segments printed for the session.

3. VARIABLE FIELD DEFINITIONS

INH = Inhibited. Otherwise allowed.
L1-PM = Level 1 protocol monitoring is inhibited for this SM.
NOT AVAILABLE = Inhibit status information cannot be obtained for this SM.
PER-GEN = PER generation is inhibited for this SM.
a = Status message. Valid value(s):
ABORTED-COMMUNICATION FAILURE = The current allow request was stopped because of failures in inter-process message transmission.

ABORTED-DATABASE ERROR = The current allow request was stopped due to database access failure in the administrative module (AM).

ABORTED-INVALID SM = The requested SM was invalid.

COMPLETED = The allow request was completed.

COMPLETED-NO DSL EQUIPPED/ASSIGNED = The SM to effect the PER generation allow does not have any ISDN protocol channels assigned.

NOT STARTED-INVALID INPUT FOR PCF = A single PCF PER generation allow request was made for a trunk member or a PSUEN.

NOT STARTED-INVALID PORT = A single ISDN protocol channel PER generation allow request was made for a non-existent channel.

NOT STARTED-SM UNAVAILABLE = A single ISDN protocol channel PER generation allow request was made where the channel was on an SM that was not fully operational.

NOT STARTED-NON-PRIMARY DN SPECIFIED = A PER generation allow request was made for a DN that was not a primary DN.

NOT STARTED-NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

STARTED = The allow ALE request has begun processing.

b = Segment number.

c = SM number.

d = Level 1 performance monitoring status. Valid value(s):
L1PM-ALW = Level 1 performance monitoring is allowed.
L1PM-INH = Level 1 performance monitoring is inhibited.

e = PER generation status. Valid value(s):
PER-ALW = PER generation is allowed.
PER-INH = PER generation is inhibited.

f = Equipment number. Valid value(s):

AIUEN=c-i^1-j^1-k^1
DEN=c-g-h-i
DNUSEOC=c-c^1-n-p
DNUSTMC=c-c^1-n-p
IDCUEOC=c-m-n-p
IDCUTMC=c-m-n-p
ILEN=c-m-n-o
INEN=c-c^1-n-o
LCEN=c-j-k-l
LCKEN=c-z-h^1-a^1-b^1
NEN=c-c^1-d^1-l^1-e^1-f^1-m^1-g^1
OIUEN=c-v^1-w^1-x^1-e^1-f^1-m^1-g^1
PLTEN=c-n^1-o^1-p^1-q^1
PSUEN=c-w-x-y-r
VBRI=c-r^1
VTRK=c-s^1-t^1
g = Digital line and trunk unit (DLTU) number.
h = Digital facility interface number.
i = Digital channel number.
j = Integrated services line unit number.
k = Line group controller number.
l = Line card number.
m = Integrated digital carrier unit number.
n = Remote terminal (RT) number.
o = RT line number.
p = Primary/protection identifier.
q = Protocol handler (PH) channel group number.
r = PH channel group member number.
s = Channel type. Valid value(s):
  B1  = Channel B1.
  D   = D-channel.
t = Interface type. Valid value(s):
  AD  = AUTOPLEX® data trunk.
  BC  = Frame relay bearer channel.
  FD  = EOC or TMC facility data link.
  OT  = Optical interface unit (OIU) trunk.
  SH  = Speech handler trunk.
  SU  = American national standards institute (ANSI) U-Interface.
  T   = T-interface.
  TK  = Digital trunk.
  U   = Alternate mark inversion (AMI) U-interface.
  XT  = X.25 link over T1 trunk.

u = Completion status. Valid value(s):
  COMPLETED = Operation successfully completed.
  STOPPED   = Operation stopped.
v = Number of segments printed.
w = Packet switching unit (PSU) number.
x = PSU shelf number.
y = PSU channel group number.
z  = Integrated service line unit 2 (ISLU2) number.
a^1 = Line board number.
b^1 = Line circuit number.
c^1 = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
d^1 = Data group (DG) number.
e^1 = Synchronous transport signal (STS) facility number.
f^1 = Virtual tributary (VTG) group number.
g^1 = Digital signal level 0 (DS0) number.
h^1 = Line group number.
i^1 = Access interface unit (AIU) number.
j^1 = AIU pack number.
k^1 = AIU circuit number.
l^1 = SONET termination equipment (STE) facility number.
m^1 = Virtual tributary member (VTM) number.
n^1 = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.
o^1 = PCT facility interface (PCTFI) number.
p^1 = Tributary number.
q^1 = Channel number.
r^1 = Virtual BRI line number.
s^1 = Virtual trunk facility number.
t^1 = Virtual trunk channel number.
u^1 = IP address field. Valid value is 0-255.
v^1 = OIU number.
w^1 = Protection group (PG) number.
x^1 = OC-3 STE number.

4. ACTIONS TO BE TAKEN

Inspect the output. If the status of the indicated parameters is incorrect, use the INH:ALE and ALW:ALE input messages or RC/V to correct the status of the incorrect parameters.
5. ALARMS

None.

[3] ALW ALM RAS SCPT=f SITE=j h d [k]

[4] ALW ALM EAIU=g-l SCPT=f h d [m]

2. REASON FOR OUTPUT

To give a termination report of a request to allow alarm reporting on scan points. Format 1 is for alarms assigned to input/output processor (IOP) scan points. Format 2 is for alarms assigned to remote switching modules (RSM), optical remote modules (ORM), or two-mile remote modules (TRM) which are equipped with metallic service unit (MSU) scan points and have the alarm input option on. Format 3 is for alarms assigned to remote alarm section (RAS) scan points. Format 4 is for alarms assigned to expansion access interface unit (EAIU) scan points.

3. VARIABLE FIELD DEFINITIONS

- a = Alarm scan point. Valid value(s):
  BPSC = Building/power IOP scan point.
  CNI = Common network interface.
  ESM = External sanity monitor.
  MFFUSE = Miscellaneous frame fuse.
  MFFAN = Miscellaneous frame fan -- CM2 offices only.
  MISC = Miscellaneous IOP scan point.
  MSGS = Message switch -- CM1 offices only.
  ONTC = Office network and timing complex -- CM2 offices only.
  TMS = Time-multiplexed switch -- CM1 offices only.

- b = Scan point number or unit number.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNI, MFFAN, ESM</td>
<td>'b' = null.</td>
</tr>
</tbody>
</table>

- c = Alarm type. Valid value(s):
  FANALM = Fan alarm.
FRMFUSE = Frame fuse alarm.
PWR = Power alarm.

d = Termination report. Valid values include:

ABORTED
COMPLETED
NOT STARTED

e = Explanation of termination report. Valid value(s):

INCONSISTENT DATA
INVALID OPERATION
SCPT OUT OF RANGE
VALID IN CM1 ONLY
VALID IN CM2 ONLY

f = Remote building/power MSU scan point (RBPSC) number, RAS scan point number, or EAIU scan point number.

g = Switching module (SM) number.

h = Name of scan point.

i = Explanation of termination report for type RBPSC for one of the following termination reports. Valid value(s):

If 'd' = 'i' =
ABORTED POINT ALREADY ALLOWED = The point is already allowed.
ABORTED POINT NOT ASSIGNED = The point is shown as not in service in the database.
ABORTED POINT OUT OF PERMITTED RANGE = The specified point is not within the range of the remote building/power group.
ABORTED ALARM PROCESS NOT ACTIVE = The switching module number specified does not have remote alarms associated with it.
ABORTED DATA BASE ERROR = A database error has been found.
ABORTED SOFTWARE FAILURE = A software failure has been found.
COMPLETED BOTH MSU SG OOS = Both MSU service groups (SG) are out-of-service (OOS) however, the software copy of the allow state was changed, so when the service groups are put back into service, the point will be allowed.
COMPLETED ONE MSU SG OOS = One MSU SG is OOS. The point was successfully allowed in the active service group. The software copy of the allow state was changed in the other service group, so when it is put back into service, the point will be allowed there also.

If no explanation prints, then the requested allow was invoked. Both metallic service unit (MSU) service groups are in service.

j = Remote peripheral site number.

k = Explanation of completion status for type remote alarm section (RAS) for one of the following termination reports. Valid value(s):

If 'j' =
ABORTED
AUDIT IN PROGRESS = The RAS data is being verified, so the requested allow cannot be performed. Since the audit takes at most two minutes (and often completes much sooner), the allow request can be resubmitted in a short
<table>

Application: 5
Type: Output

1. FORMAT

ALW:CPUQADM a;

2. REASON FOR OUTPUT

To report the results of the ALW:CPUQADM input message.

3. VARIABLE FIELD DEFINITIONS

a = One of the following. Valid value(s):
    CPU QUEUE ADMINISTRATION SUCCESSFULLY COMPLETED = All processing in determining
    CPU queue redistribution has been completed along with redistributing the queues
    to another SM if needed.
    REDISTRIBUTION OF CPU QUEUES NOT NECESSARY AT THIS TIME = The read of certain
    data has indicated that there is no reason to redistribute the CPU queues.
    UNABLE TO REDISTRIBUTE CPU QUEUES AT THIS TIME = The read or update of certain
    static relations has failed due to data base inconsistency or inability to perform
    cross processor reads or updates. A check to see if any SM is not linked to the
    administration module (AM) will determine if the redistribution of CPU queues
    should be tried again at a time when all SMs are linked.

4. ACTION TO BE TAKEN

When 'a' is "UNABLE TO REDISTRIBUTE CPU QUEUES AT THIS TIME" retry the ALW:CPUQADM input
message when all resources are available.

**Application:** 5  
**Type:** Output

1. **FORMAT**

   [1] ALW DEBUG a SM[=b[&c]] d

   [2] ALW DEBUG a AM d

2. **REASON FOR OUTPUT**

   To report the results of an ALW:DEBUG input message.

   Format 1 is for ALE, DIGITAL, METALLIC, METPTRACE, METALLMSG, METRESBLK, METSWBLK, METHWFAIL, METSUCCESS, and CCS7MTCE SM only cases.

   Format 2 is for CCS7MTCE AM only cases.

3. **VARIABLE FIELD DEFINITIONS**

   a
   
   = Feature with additional debugging messages. Valid value(s):
   
   ALE = Automatic line evaluation.
   CCS7MTCE = Common channel signal maintenance activity.
   DIGITAL = Digital testing of lines (TST:DSL) and trunks (TST:TRK).
   METALLIC = Metallic path setup ASSERT and PTRACE messages with low-level unformatted information, not intended for general customer use.
   METPTRACE = Metallic related PTRACE messages.
   METALLMSG = Metallic path setup blockage and failure (REPT:METALLIC).
   METRESBLK = Metallic path setup resource blockage (REPT:METALLIC).
   METSWBLK = Metallic path setup software blockage (REPT:METALLIC).
   METHWFAIL = Metallic path setup hardware failure (REPT:METALLIC).
   METSUCCESS = Metallic path setup completed successfully (REPT:METALLIC).
   TSTPATH = Test path application (TST:PATH).

   b
   
   = Switching module (SM) number or the lower limit of a range of SM numbers.

   c
   
   = The upper limit or a range of SM numbers.

   d
   
   = The result of the request. Valid value(s):
   
   COMPLETED = The debug messages were allowed on the specified SM(s).
   SM UNAVAILABLE = The request could not be completed because the specified SM(s) was/were not able to communicate with the administrative module (AM).
   SM UNEQUIPPED = The request could not be completed because the specified SM(s) did not exist.

4. **ACTIONS TO BE TAKEN**
When the report indicates SM UNAVAILABLE, retry the input request once the SM(s) becomes available. Otherwise, no action is required.

5. ALARMS

None.

[1] ALW DMQ COMPLETED

______________________________________________________________________________

[2] ALW DMQ SOURCE IS NOT INHIBITED

______________________________________________________________________________

[3] ALW DMQ ENABLED a

______________________________________________________________________________

2. REASON FOR OUTPUT

To indicate the status of the ALW:DMQ input message.

Format 1 an ALW:DMQ input message has completed.

Format 2 an ALW:DMQ input message was entered for a noninhibited source.

Format 3 reports that a specific source of automatic maintenance requests is no longer inhibited. It is now allowed to send requests to the maintenance input request administrator (MIRA).

3. VARIABLE FIELD DEFINITIONS

a = Three-character name of the source now allowed to make automatic maintenance requests. Valid value(s):
    ADP = Automatic diagnostic process.
    ALL = Allows all automatic maintenance requests by clearing the inhibited sources.
    ARR = Automatic ring recovery.
    REX = Routine exercises.

4. ACTION TO BE TAKEN

Use the OP:DMQ input message to determine which diagnostic sources are inhibited.

5. ALARMS

None.

ALW DOC TG=a b

2. REASON FOR OUTPUT

To report the allowing of dynamic overload controls (DOCs) on a per trunk group basis.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number.
b = Termination status. Valid value(s):
   ABORTED = Command failed.
   COMPLETED = Command successfully completed.
   FAILED-PARAMETER = Command failed due to bad input. The trunk group specified does not have a DOC assigned.

4. ACTION TO BE TAKEN

No action is needed for an automatically generated request from the engineering and administrative data acquisition system network management (EADAS/NM). For manually generated requests, the following actions will apply. Valid value(s):

<table>
<thead>
<tr>
<th>&quot;b&quot; =</th>

Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] ALW EAIINT a COMPLETED

[2] ALW EAIINT a COMPLETED WITH c

[3] ALW EAIINT a ABORTED b

2. REASON FOR OUTPUT

To indicate the result of a request to allow emergency action interface (EAI) error interrupts on a specified 3B21D computer control unit (CU), or on both 3B21D computer CUs.

Note: The 3B20D computer CUs do not have EAI error interrupts.

Format 1 indicates successful completion.

Format 2 indicates successful completion with a message port problem.

Format 3 indicates an error.

3. VARIABLE FIELD DEFINITIONS

a = Unit type. Valid value(s):
   CU 0
   CU 1
   CU 0 AND CU 1

b = Error code. Valid value(s):
   50 = Message could not be sent to a driver or real time status (RTS) report.
   51 = Equipment configuration database (ECD) access function completed unsuccessfully.
   52 = Error in message communication.
   53 = Error internal to the inhibit administrator.

c = Port problem. Valid value(s):
   AN INVALID SYSTEM PORT SPECIFIED
AN INVALID SYSTEM PORT SPECIFIED FOR AIM  
NO PROCESS ATTACHED TO THE SPECIFIED PORT  
NO PROCESS ATTACHED TO THE AIM PORT

4. ACTION TO BE TAKEN

For Format 1 no action is necessary.

For Format 2, if the process completes with a port problem, Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 3, if an error was reported, use the OP:ERRCHK input message to find out the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a computer technical representative.

5. ALARMS

For Format 1, none. This report is a manually-requested report.

For Formats 2 and 3, none. This is an automatically-generated report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Software Release: 5E14 and later
Message Class: AUDIT
Application: 5
Type: Output

1. FORMAT

[1] ALW ECDAUD COMPLETED

[2] ALW ECDAUD ABORTED - SYSTEM ERROR a

2. REASON FOR OUTPUT

To report the termination status of the ALW:ECDAUD input message.
Format 1 indicates successful execution. No action is necessary.
Format 2 indicates that an internal error has occurred. Refer to variable 'a' for more information.

3. VARIABLE FIELD DEFINITIONS

   a = System error number. Valid value(s):
      1 = Cannot open audit rule file - /lla/ECDAUD/ecdaud.rules.
      2 = Cannot attach to ECD database.
      3 = Unable to kill running audit, check PID in /lla/ECDAUD/.ecdaud.pid.
      4 = Bad rule in rule file (/lla/ECDAUD/ecdaud.rules).
      5 = Unable to audit data (/lla/ECDAUD/ecdaud.rules).
      6 = Failure in reading ECD database.
      7 = Cannot open audit rule file - /lla/ECDAUD/hwchk.rules.
      8 = Failed to obtain current status.
      9 = Internal system error.
     10 = Database partition greater than 80% full, remove unused files.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request of the ALW:ECDAUD input message. No further action is necessary.

5. ALARMS

Minor if system error encountered.

Type: Output

1. FORMAT

[1] ALW EXTPM PSALNK=a-b-c
d

[2] ALW EXTPM COMPLETED

2. REASON FOR OUTPUT

Format 1 indicates the status of the packet switch unit (PSU) asynchronous transfer mode (ATM) link (PSALNK) in response to an ALW:EXTPM input message.

Format 2 indicates the completion of the ALW:EXTPM input message. This output is always printed after all target PSALNKs have reported (in Format 1).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number of the target PSALNK.
b = PSU number of the target PSALNK.
c = Link number of the target PSALNK.
d = Status. Valid value(s):

EXTERNAL PM SESSIONS PREVIOUSLY ALLOWED = External performance monitoring (PM) sessions are already allowed on the PSALNK.
EXTERNAL PM SESSIONS SUCCESSFULLY ALLOWED = External PM sessions are now allowed on the PSALNK.
UNABLE TO SERVICE REQUEST - SM UNAVAILABLE = The request could not be serviced because the SM was unavailable.

4. ACTIONS TO BE TAKEN

For Format 1 outputs, if there is an indication that the request could not be serviced because the SM was unavailable, verify the current status of the SM.

[10] ALW FAC VT1FAC=a-j-k-l-m-n-o e f

[11] ALW FAC DS1SFAC=a-j-k-l-m-n-o e f

2. REASON FOR OUTPUT

To output the results of executing an ALW:FAC input request to allow alert reports of transmission facility 15-minute and daily performance monitoring count threshold crossings (REPT:FAC output message) to be output.

Format 1 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a digital facility interface model 2 (DFI-2) facility. Format 2 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for all facilities terminated on a DFI-2. Format 3 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for all facilities terminated on a digital line and trunk unit (DLTU) model 2 (DLTU2). Format 4 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for all facilities terminated on an integrated digital carrier unit (IDCU). Format 5 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a IDCU facility (IFAC). Format 6 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for all facilities
terminated on an IDCU-supported or digital networking unit - synchronous optical network (SONET) (DNU-S) supported TR303 remote terminal (RT). Format 7 appears after the ALW:FAC input message was used to allow all threshold crossing alert output message generation for all DFI-2, DNU-S and IDCU facilities on a switching module (SM). The individual facilities’ INH/ALW state is not changed by this command. Format 8 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for all facilities terminated on a DNU-S. Format 9 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a given DNU-S SONET termination equipment (STE) facility, and its subtending virtual tributary 1.5 (VT1.5) and digital signal level-1 (DS1) facilities. Format 10 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a given DNU-S VT1.5 facility and its subtending DS1 facility. Format 11 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a given DNU-S DS1 facility.

3. VARIABLE FIELD DEFINITIONS

a  = SM number.
b  = DLTU number.
c  = DFI-2 number.
d  = Facility number.
e  = Type of alerts allowed. Valid value(s):
ALL     = Both interval and daily alerts.
DAY     = 24 hour alerts.
INT     = 15-minute interval alerts.
f  = Status of command. Valid value(s):
COMPLETED   = Request has been successfully completed.
COMPLETED RC INH ACTIVE = Request has been completed, but some facilities are inhibited through RC/V.
FAILED      = Failed to allow performance monitoring alerts for the specified facility or unit. This may also mean the switch was able to allow the requested facilities' alert reports, but unable to send that information to the transmission facility. Retry the request later.
FAILED RC INH ACTIVE = Performance monitoring alerts were turned off by RC/V for the requested intervals.
FAILED SM INHIBITED = Performance monitoring alerts were turned off by INH:FAC command for this SM.
FAILED SWITCH INHIBITED = Performance monitoring alerts were turned off by RC/V View 8.1 for the entire switch.
NO MATCH     = The specified facility or unit does not exist. If the unit type selected was SM, then NO MATCH means the SM is not equipped with any unit or facility.
NOT ALLOWED  = The requested action is not allowed for the given facility or unit.
SM UNAVAILABLE = The input request could not be processed because communication with the associated SM is not possible.
SYSTEM BUSY  = The system's processing capability has been reached or a system resource is unavailable. Retry the request later.
g  = IDCU number.
h  = IFAC number.
i = RT number.

j = DNU-S number.

k = Data group (DG) number.

l = STE facility number.

m = Synchronous transport signal (STS) facility number.

n = Virtual tributary group (VTG) number.

o = Virtual tributary member (VTM) number.

4. ACTIONS TO BE TAKEN

Retry ALW:FAC input message when variable ‘f’ equals SYSTEM BUSY or FAILED. Use the INH:FAC input message to re-inhibit alerts if needed or change the alerting thresholds using RC/V View 8.1 for the entire office, 20.23 for IDCU, 20.25 for DNU-S or 22.15 for DLTU.

5. ALARMS

None.

2. REASON FOR OUTPUT

To output the results of executing an ALW:FAC input request to allow alert reports of transmission facility 15-minute and daily performance monitoring count threshold crossings (REPT:FAC output message) to be output.

Format 1 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a digital facility interface model 2 (DFI-2) facility.

Format 2 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for all facilities terminated on a DFI-2.

Format 3 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for all facilities terminated on a digital line and trunk unit (DLTU) model 2 (DLTU2).

Format 4 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for all facilities terminated on an integrated digital carrier unit (IDCU).

Format 5 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for an IDCU facility (IFAC).

Format 6 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for all facilities terminated on an IDCU-supported or digital networking unit - synchronous optical network (SONET) (DNU-S) supported TR303 remote terminal (RT).

Format 7 appears after the ALW:FAC input message was used to allow all threshold crossing alert output message generation for all DFI-2, DNU-S and IDCU facilities on a switching module (SM). The individual facilities' INH/ALW state is not changed by this command.

Format 8 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for all facilities terminated on a DNU-S.

Format 9 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a given DNU-S SONET termination equipment (STE) facility, and its subtending virtual tributary 1.5 (VT1.5) and digital signal level-1 (DS1) facilities.

Format 10 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a given DNU-S VT1.5 facility and its subtending DS1 facility.

Format 11 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a given DNU-S DS1 facility.

Format 12 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a given optical interface unit (OIU).

Format 13 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a given optical carrier - level 3 (OC3).

Format 14 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for a given synchronous transport signal-level 1 (STS1).

Format 15 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for an OIU virtual tributary - level 1.5 (VT15).

Format 16 appears after the ALW:FAC input message was used to allow threshold crossing alert output message generation for an OIU digital signal - level 1 (DS1).
3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = DLTU number.
c = DFI-2 number.
d = Facility number.
e = Type of alerts allowed. Valid value(s):
   ALL = Both interval and daily alerts.
   DAY = 24 hour alerts.
   INT = 15-minute interval alerts.
f = Status of command. Valid value(s):
   COMPLETED = Request has been successfully completed.
   COMPLETED RC INH ACTIVE = Request has been completed, but some facilities are inhibited through RC/V.
   FAILED = Failed to allow performance monitoring alerts for the specified facility or unit. This may also mean the switch was able to allow the requested facilities' alert reports, but unable to send that information to the transmission facility. Retry the request later.
   FAILED RC INH ACTIVE = Performance monitoring alerts were turned off by RC/V for the requested intervals.
   FAILED SM INHIBITED = Performance monitoring alerts were turned off by INH:FAC command for this SM.
   FAILED SWITCH INHIBITED = Performance monitoring alerts were turned off by RC/V View 8.1 for the entire switch.
   NO MATCH = The specified facility or unit does not exist. If the unit type selected was SM, then NO MATCH means the SM is not equipped with any unit or facility.
   NOT ALLOWED = The requested action is not allowed for the given facility or unit.
   SM UNAVAILABLE = The input request could not be processed because communication with the associated SM is not possible.
   SYSTEM BUSY = The system's processing capability has been reached or a system resource is unavailable. Retry the request later.

g = IDCU number.
h = IFAC number.
i = RT number.
j = DNU-S number.
k = Data group (DG) number.
l = STE facility number.
m = Synchronous transport signal (STS) facility number.
n = Virtual tributary group (VTG) number.
4. ACTIONS TO BE TAKEN

Retry ALW:FAC input message when variable 'f' equals SYSTEM BUSY or FAILED. Use the INH:FAC input message to re-inhibit alerts if needed or change the alerting thresholds using RC/V View 8.1 for the entire office, 20.23 for IDCU, 20.25 for DNU-S or 22.15 for DLTU.

5. ALARMS

None.

   STS3C=b-q-r-w-x
   VT15=b-q-r-s-t-u-v
   VT1FAC=b-k-l-m-n-o-p

b = SM number.

c = DLTU number.

d = DFI-2 number.

e = Facility number.

f = Type of alerts allowed. Valid value(s):
   ALL = Both interval and daily alerts.
   DAY = 24 hour alerts.
   INT = 15-minute interval alerts.
g  = Status of message. Valid value(s):
   COMPLETED  = Request has been successfully completed.
   COMPLETED RC INHIBIT ACTIVE = Request has been completed, but some facilities are inhibited through RC/V.
   FAILED   = Failed to allow performance monitoring alerts for the specified facility or unit. This may also mean the switch was able to allow the requested facilities' alert reports, but unable to send that information to the transmission facility. Retry the request later.
   FAILED CKT OOS = Failed to allow performance monitoring alerts because the specified circuit was out of service.
   FAILED RC INHIBIT ACTIVE = Performance monitoring alerts were turned off by RC/V for the requested intervals.
   FAILED SM INHIBITED = Performance monitoring alerts were turned off by INH:FAC input message for this SM.
   FAILED SWITCH AND SM INHIBITED = Performance monitoring alerts were turned off by both RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)] for the entire switch and by INH:FAC input message for this SM.
   FAILED SWITCH INHIBITED = Performance monitoring alerts were turned off by RC/V View 8.1 for the entire switch.
   NO MATCH = The specified facility or unit does not exist. If the unit type selected was SM, then NO MATCH means the SM is not equipped with any unit or facility.
   NOT ALLOWED = The requested action is not allowed for the given facility or unit.
   SM UNAVAILABLE = The input request could not be processed because communication with the associated SM is not possible.
   SYSTEM BUSY = The system's processing capability has been reached or a system resource is unavailable. Retry the request later.

h  = IDCU number.
i  = IFAC number.
j  = RT number.
k  = DNU-S number.
l  = Data group (DG) number.
m  = STE facility number.
n  = Synchronous transport signal (STS) facility number.
o  = Virtual tributary group (VTG) number.
p  = Virtual tributary member (VTM) number.
q  = Optical interface unit (OIU) number.
r  = Protection group (PG) number.
s  = Optical carrier - level 3 (OC3) number.
t  = Synchronous transport signal - level 1 (STS1) number.
u = VT15 group number.
v = VT15 member number.
w = Optical carrier - level 3 concatenated (OC3C) number.
x = Synchronous transport signal - level 3 concatenated (STS3C) number.
y = Packet switch unit (PSU) number.
z = Packet switch unit shelf (PSUSHLF) number.
a\textsuperscript{1} = Packet switch unit protocol handler (PSURELPH) number.

4. ACTIONS TO BE TAKEN

Retry ALW:FAC input message when variable ‘h’ equals SYSTEM BUSY or FAILED. Use the INH:FAC input message to re-inhibit alerts if needed or change the alerting thresholds using RC/V View 8.1 for the entire office, 20.23 [IDCU FACILITY EQUIPMENT (IFAC)] for IDCU, 20.25 (DNU-S PERFORMANCE MONITORING THRESHOLD GROUP) for DNU-S, 20.32 (PERFORMANCE MONITORING THRESHOLD GROUP) for OIU or SIP PSUPH, or 22.15 (PERFORMANCE MONITORING) for DLTU.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ALW HDWCHK CLNK{=a-b-c-d| ALL} e [f]

2. REASON FOR OUTPUT

To report on an attempt to allow level 2; and level 3; hardware checks (errors) on one or all communication links (CLNKs). (Refer to the Corrective Maintenance manual.)

3. VARIABLE FIELD DEFINITIONS

ALL = Attempt was to allow errors on all CLNKs.

a = Switching module (SM) number.

b = Office network and timing complex (ONTC) side.

c = Module message processor (MMP) type. Valid value(s):
   0 = Alpha.
   1 = Beta.

d = Message switch (MSGS) side.

e = Termination report. Valid value(s):
   ABORTED = The requested action was terminated abnormally. Hardware and software status is questionable.
   COMPLETED = Completed normally.
   NOT STARTED = Requested action was not attempted.
   STOPPED = The requested action was terminated before a normal completion. Hardware and software status is consistent.

f = Optional additional qualifying information.

ALW:HDW-CM

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

ALW HDWCHK CM a [b]

2. REASON FOR OUTPUT

To acknowledge a manual request from the ALW:HDW-CM input message to allow hardware error checks on all communication module (CM) units. This includes the message switch control unit (MSCU) (for communication module model 2; hardware only), foundation peripheral controller (FPC), pump peripheral controller (PPC), module message processor (MMP), office network and timing complex (ONTC), and communication links (CLNKs).

3. VARIABLE FIELD DEFINITIONS

a = Termination report. Valid value(s):
  COMPLETED = Request completed successfully.
  STOPPED = Request was terminated before a normal completion. Variable ‘b’ will be printed to explain why the request was stopped.

b = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the ‘b’ field should give some indication as to why the request failed.

To report the result of executing an ALW:HDW-LDSUCOM input message to allow hardware error checks on the local digital service unit common (LDSUCOM) board.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital service unit number.
c = Service group number.
d = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

e = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

Application: 5
Type: Output

1. FORMAT

ALW HDWCHK LUCHAN=a-b-c-d-e f [g]

2. REASON FOR OUTPUT

To report the result of executing an ALW:HDW-LUCHAN input message to allow hardware error checks on the line unit channel (LUCHAN).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Service group number.
d = Channel board number.
e = Channel number.
f = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED-CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT_STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

   g = Data qualifying the termination status. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

None.

235-105-220 Corrective Maintenance
ALW:HDW-MSUCOM
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ALW HDWCHK MSUCOM=a-b-c d [e]

2. REASON FOR OUTPUT

To report the result of executing an ALW:HDW-MSUCOM input message to allow hardware error checks on the metallic service unit common (MSUCOM) board.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   COMPLETED-CERTIFIED = Successful completion. Independent certification of resulting hardware status is made.
   NOT STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.
e = Data qualifying the termination status.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

ALW : HDW-MSUCOM
ALW:HDW-NCREF

Software Release: 5E14 and later
Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

ALW HDWCHK NCREF,a=b c [d]

2. REASON FOR OUTPUT

This message is in response to the ALW:HDW-NCREF input message. The request is to allow hardware errors to be reported on network clock references (NCREF).

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>NC1</th>
<th>NC2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIM = Primary reference.</td>
<td>REFn = Reference number n (1-8).</td>
</tr>
<tr>
<td>XC = Cross-couple reference.</td>
<td></td>
</tr>
</tbody>
</table>

a = Network clock reference (NCREF). Valid value(s):

b = Network clock side.

c = Termination report. Valid value(s):

ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).

COMPLETED = Requested action completed successfully.

STOPPED = Request was terminated before it completed normally due to hardware failure, data inconsistency, or another problem.

d = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

No action is necessary if the request completed successfully. If the request failed, the variable ‘a’ should give some indication as to why the request failed. Check network clock Master Control Center (MCC) pages or the OP:CFGSTAT output message to verify that the NC was in a valid state to perform the request. Also, check the receive-only printer (ROP) for error messages using the REPT:NC output messages. These may indicate problems or system reconfigurations.

5. ALARMS

None.

**Message Class:** SM  
**Application:** 5  
**Type:** Output

1. **FORMAT**

ALW HDWCHK OFI=a-b-c-d e [f]

2. **REASON FOR OUTPUT**

Indicates the result of an ALW:HDW-OFI input message to allow hardware checks on an optical facility interface (OFI).

3. **VARIABLE FIELD DEFINITIONS**

   a = Switching module (SM) number.

   b = Optical interface unit (OIU) number.

   c = Protection group (PG) number.

   d = Side number.

   e = Termination report. Valid value(s):

       ABORTED = The requested action was terminated before completion, and the termination was not graceful.

       COMPLETED = The requested action has successfully completed.

       IN PROGRESS = The requested action is in progress.

       NOT STARTED = The requested action has not begun.

       STOPPED = The requested action terminated before a normal completion.

   f = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. **ACTIONS TO BE TAKEN**

If unexpected results occur, refer to the Corrective Maintenance and System Recovery manuals.

   Software Release: 5E14 and later
   Message Class: ONTC
   Application: 5
   Type: Output

1. FORMAT

   ALW HDWCHK ONTC=a b [c]

2. REASON FOR OUTPUT

   To acknowledge a request to allow hardware checks on the specified office network and timing complex (ONTC).

3. VARIABLE FIELD DEFINITIONS

   a = ONTC side.
   b = Termination report. Valid value(s):
      COMPLETED = Request completed successfully.
      NOT STARTED = Requested action could not begin.
      STOPPED = Request was terminated before a normal completion due to a failure.
   c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

   This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, variable 'c' should give some indication as to why the request failed. Check ONTC MCC pages or OP:CFGSTAT output to verify that the ONTC was in a valid state to perform the request.

ALW:HDW-RCLK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ALW HDWCHK RCLK=a-b c [d]

2. REASON FOR OUTPUT

To indicate the result of an ALW:HDW-RCLK input message to allow hardware checks on a remote clock (RCLK) circuit.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RCLK side.
c = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination is immediate. Consistency of hardware and data is questionable.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before a normal completion.
d = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If the termination report (variable ‘c’) is COMPLETED or NOT STARTED, no action is required. If the termination report is STOPPED, check for reference error reports on the receive only printer (ROP).

5. ALARMS

None.

[3] ALW HDWCHK ABORTED  a

__________________________________________________________________

[4] ALW HDWCHK NOT STARTED  
   INVALID ID FIELD

__________________________________________________________________

2. REASON FOR OUTPUT

To indicate the result of a request to allow administrative module (AM) hardware checks.

3. VARIABLE FIELD DEFINITIONS

a  = One of the following error codes. Valid value(s):
   50  = A message could not be sent to a driver or real time status (RTS) report.
   51  = An equipment configuration database (ECD) access function completed
       unsuccessfully.
   52  = An error in message communication.
   53  = An error internal to the inhibit administrator.

b  = One of the following port problems. Valid value(s):
   -  = An invalid system port specified.
   -  = An invalid system port specified for application integrity monitor (AIM).
   -  = No process attached to the specified port.
   -  = No process attached to the AIM port.

4. ACTION TO BE TAKEN

If an error was reported, use the OP:ERRCHK input message to find out the resulting status of AM inhibits. All error codes associated with this activity are significant and should be reported to next highest level of assistance.

If the process completes with a port problem, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   ELEMENTS ALLOWED: b [c] [d] [e]

2. **REASON FOR OUTPUT**

   To respond to an OP:MEASTAT-CLCT input message for 30-minute traffic sections which require group identifiers for collection.

   When allowing a section of the 30-minute traffic report (TRFC30) for collection (ALW:TRFC30, CLCT:a), some sections require identifiers [for example, switching module (SM), line unit and concentrator] which effectively select what is collected. This message reports the collect status for those sections and is output after the OP:MEASTAT-CLCT output message.

3. **VARIABLE FIELD DEFINITIONS**

   a = Section name. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

   b–e = Identifier. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

4. **ACTION TO BE TAKEN**

   None.

**Message Class:** LINE  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   ALW MISMATCH [REPT][SM=a[&b]] c

2. **REASON FOR OUTPUT**

   To report the results of the ALW:MISMATCH input message.

3. **VARIABLE FIELD DEFINITIONS**

   **REPT** = Reporting was allowed.  
   a = Switching module (SM) number or the lower limit of a range of SMs.  
   b = The upper limit of a range of SMs.  
   c = The result of the request. Valid value(s):
      
      COMPLETED = ALW MISMATCH was enabled for the specified SM(s).
      SM UNAVAILABLE = ALW MISMATCH could not be completed because the specified SM(s) were not able to communicate with the administrative module (AM).
      SM UNEQUIPPED = ALW MISMATCH could not be completed because the specified SM(s) did not exist.

4. **ACTION TO BE TAKEN**

   When the report indicates SM UNAVAILABLE, retry the input request once the SM(s) become(s) available. Otherwise, no action is required.

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ALW MON {AM | SM=a | CMP=b-c} {ABORTED | COMPLETED}

2. REASON FOR OUTPUT

To respond to an ALW:MON input message which allowed the Operating System for Distributed Switching (OSDS) monitor.

3. VARIABLE FIELD DEFINITIONS

AM = Administrative module (AM).
a = Switching module (SM) number.
b = Message switch side.
c = Communications module processor (CMP) number.

4. ACTION TO BE TAKEN

If appropriate, correct the ALW:MON input message. If there are subsequent failures, contact appropriate technical support.

Application: 5
Type: Output

1. FORMAT

ALW PCTF VERBOSE [SM=a[&b]] c

2. REASON FOR OUTPUT

To report the results of an ALW:PCTF input message.

3. VARIABLE FIELD DEFINITIONS

  a = Switching module (SM) number or the lower limit of a range of SM numbers.
  b = The upper limit of a range of SM numbers.
  c = The result of the request. Valid value(s):
      COMPLETED = The per-call test failure (PCTF) verbose mode was allowed on the specified SM(s).
      SM UNAVAILABLE = The request could not be completed because the specified SM(s) was/were not able to communicate with the AM.
      SM UNEQUIPPED = The request could not be completed because the specified SM(s) did not exist.

4. ACTION TO BE TAKEN

When the report indicates SM UNAVAILABLE, retry the input request once the SM(s) becomes available. Otherwise, no action is required.

. . . . .
. . . . .
. . . . .
________________________________________________________

2. REASON FOR OUTPUT

To acknowledge the ALW:PM input message indicating the status of parameters.

Format 1 provides a status message for the progress of the allow request.

Format 2 provides an error message for the allow message.

Format 3 provides an error message for the allow message with the number of components exceeding the limit.

Format 4 provides a layout of the ATM links which exceeds the PM session limit of 50. The ATM LINKS that exceeded the limit are listed.

3. VARIABLE FIELD DEFINITIONS

a = Session type. Valid value(s):
ATMPP = Packet Pipe.
ATMPSU = ATM PSU-PSU.

b = Status message. Valid value(s):
ACTIVATION COMPLETE FOR SESSIONS = Activation of requested performance monitoring session(s) has completed successfully.
ACTIVATION DENIED BY FAR END FOR SESSIONS = Far end denied request to activate performance monitoring request.
ACTIVATION FAILURE FOR SESSIONS = Activation of requested performance monitoring session(s) has failed.
ACTIVATION TIMED OUT FOR SESSIONS = Timeout waiting for activation of performance monitoring session(s).
AM TIMED OUT ON PH RESPONSE FOR SESSIONS = PH that has session provisioned did not respond to allow request.
SESSIONS ALREADY ALLOWED = The requested performance monitoring session(s) are already activated.

c = Session IDs. There is a maximum of 105 sessions in the message.
d = Error message. Valid value(s):
COMPLETED = Request has completed.
DATABASE ERROR = A database error has occurred while processing allow command.
EXCEEDED ALLOWED BLOCK LIMIT = At least one session ID requested in the input request was not processed because the maximum number of session IDs allowed in one input request was exceeded.
NO SESSION DEFINED = Requested performance monitoring session has not been defined using RC/V View 22.31 (PSU TO PSU PERFORMANCE MONITORING SESSION). This error message is only shown if the single session ID entered in the input request is not defined on view 22.31 or if none of the session IDs are defined on view 22.31 when a range of session IDs are entered in the input request.
REACHED END OF PM RELATIONS = Reached end of performance monitoring session relation and session not found.

e = Component count.
f = Session type. Valid value(s):
      ATM PACKET PIPE
      PSU TO PSU CONNECTIVITY

g = SM.
h = PSU.
i = ATM link.

4. ACTIONS TO BE TAKEN

Inspect the output. Use RC/V to verify the session IDs.
5. ALARMS

None.

2. **REASON FOR OUTPUT**

   To report the success or failure of the allow request.

3. **VARIABLE FIELD DEFINITIONS**

   a = CCS GSM number.  
   b = Link set number.  
   c = Link set member.  
   d = Termination status. Valid value(s):
      PARTIAL SUCCESS = Some link(s) in the linkset fails the request. (Only apply to linksets)
      STOPPED = Request was terminated before normal completion.
      SUCCESS = Request was processed successfully.
   e = Reason for failure of the allow request. Valid value(s):
      RESOURCE EXHAUSTION = Processing stops due to PI FIFO full.
      SYSTEM ERROR = An internal error occurred which prevented further processing.
      UNEQUIPPED = The linkset or link is unequipped.

ALW:S7RPT

Software Release: 5E15 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

ALW S7RPT

2. REASON FOR OUTPUT

To report the results of the ALW:S7RPT input message.

If successful, the office is allowed to view common channel signaling (CCS) maintenance messages.

3. VARIABLE FIELD DEFINITIONS

   a = The result of the request. Valid value(s):
     COMPLETED = All the SMs in the office received the message.
     NOT ALL SM(S) REACHED = Not all SMs in the office received the message.

4. ACTIONS TO BE TAKEN

   None.

5. ALARMS

   None.

6. REFERENCES

   None.
**ALW:SCSD**

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5.3B  
**Type:** Output

1. **FORMAT**

   [1] ALW SCSD UNIT a PT b[bbbbbbb] f

   [2] ALW SCSD GRPN c DUPID d PT e[eeeee] f

   [3] ALW SCSD NOT STARTED
   CONFLICT WITH CURRENT SYSTEM STATUS

2. **REASON FOR OUTPUT**

   To indicate whether a scan point has been enabled as a result of executing an ALW:SCSD input message. This allows a scan point transition to be reported.

   Format 1 is used when a scan point was identified by physical location.

   Format 2 is used when a scan point was identified by logical address.

   Format 3 is used when the scanner and signal distributor (SCSD) administration process is not active. No communication with SCSD points is possible.

3. **VARIABLE FIELD DEFINITIONS**

   a = Member number of SCSD unit.

   b = Physical scan point number on an SCSD.

   c = Name of the logical group.

   d = Duplex group ID.

   e = Number of a point within a logical group.

   f = Termination status. Valid value(s):

   FAILED = Action could not be completed by SCSD administrator. Possible reasons for failure are:
   - SCSD unit number is invalid.
   - Point number is invalid for the logical group.
   - Logical group name is invalid and either the SCSD unit is out-of-service (OOS) or is in an inactive state to the SCSD administrator.

   COMPLETED = Action completed.
4. ACTION TO BE TAKEN

Issue the OP:OOS input message to determine if the SCSD unit is listed as OOS. Otherwise enter in recent change and verify (RCV) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the results of the above actions are negative, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[3] ALW SFTCHK ABORTED a

__________________________________________________________________

[4] ALW SFTCHK NOT STARTED
    INVALID ID FIELD

__________________________________________________________________

2. REASON FOR OUTPUT

To indicate the result of a request to allow administrative module (AM) software checks.

3. VARIABLE FIELD DEFINITIONS

a = Error codes. Valid value(s):
   50 = A message could not be sent to a driver or real time status (RTS) report.
   51 = An equipment configuration database (ECD) access function completed unsuccessfully.
   52 = An error in message communication.
   53 = An error internal to the inhibit administrator.

b = One of the following port problems. Valid value(s):
   - An invalid system port specified.
   - An invalid system port specified for application integrity monitor (AIM).
   - No process attached to the specified port.
   - No process attached to the AIM port.

4. ACTION TO BE TAKEN

If an error was reported, use the OP:ERRCHK input message to find out the resulting status of AM inhibits. All error codes associated with this activity are significant and should be reported. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

If the process completes with a port problem, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

OP: ERRCHK
ALW:SSTR

Software Release: 5E14 and later
Message Class: ADMN
Application: 5
Type: Output

1. FORMAT

ALW SSTR TG=a b

2. REASON FOR OUTPUT

To report the allowing of the service selective trunk reservation (SSTR) control. This is a response to an ALW:SSTR input message.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group (TG) number.
b = Termination status. Valid value(s):
   ABORTED = Message failed.
   COMPLETED = SSTR control is in effect for TG 'a'.
   FAILED-PARAMETER = Message failed due to bad input. The trunk group specified is invalid.

4. ACTION TO BE TAKEN

No action is needed for an automatically generated request from the Remote Network Management Center (RNMC). For manually generated requests, the following actions will apply:

<table>
<thead>
<tr>
<th>IF 'a'</th>
<th>ACTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED</td>
<td>Reinitiate the request.</td>
</tr>
<tr>
<td>COMPLETED</td>
<td>The message is a confirmation of a request from an input message.</td>
</tr>
<tr>

MCC Display Page(s):

130 (NM EXCEPTION)
ALW:ST-TRFC30
Software Release: 5E14 and later
Message Class: TRFM
Application: 5
Type: Output

1. FORMAT

ALW STATUS TRFC30 a       s areWED [b]

    c ALLOWED:

    d      [e]      [f]      [g]
    .      .        .        .
    .      .        .        .
    .      .        .        .

2. REASON FOR OUTPUT

To respond to an OP:ST-TRFC30 input message for 30-minute traffic sections that require group identifiers. The
APP:TRFC-SECTION input appendix indicates which sections require identifiers.

When allowing a section of the 30-minute traffic report (TRFC30) for reporting at the receive-only printer (ROP)
(ALW:TRFC30,ROP:a), some sections require identifiers (such as groups, units) which effectively select what is
printed at the ROP. Some sections require single identifiers (such as trunk group number) while other sections
require multiple identifiers [such as switching module (SM), protocol handler and shelf numbers]. Some sections can
be allowed for reporting a specified count.

Each line of output represents either one element (such as group or unit; identified by one or multiple identifiers) or
one count (refer to variables ‘d–g’).

3. VARIABLE FIELD DEFINITIONS

a = Section name. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the
   Output Messages manual.

b = If a count was allowed, type of count screening. Valid value(s):

   HIGH
   HILO
   LOW

c = Indicates what was allowed. Valid value(s):
   COUNT = A specific count within the indicated section.
   ELEMENTS = Unit(s).

d–g = Identifier. Valid value(s):
   If ‘c’ = ‘d’–‘g’ =
   COUNT Refer to the OP:TRFC30 message for count identifiers.
   ELEMENTS Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the
   Output Messages manual.
4. ACTION TO BE TAKEN
None.

ALW:TRAP

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,CNI
Type: Output

1. FORMAT

[1] ALW TRAP
   MTRP: ALW TRAP ID ALL COMPL; NO INH OR PND TRAP

[2] ALW TRAP
   MTRP: ALW TRAP ID ALL COMPL; ID(S) = a[a[a]]

[3] ALW TRAP
   MTRP: ALW TRAP ID ALL FAILED; b

[4] ALW TRAP
   MTRP: ALW TRAP ID COMPL; ID = a

[5] ALW TRAP
   MTRP: ALW TRAP ID COMPL; ABT/CMP TRAP; OID = a NID = a

[6] ALW TRAP
   MTRP: ALW TRAP ID FAILED; {b|c}; ID = a

[7] ALW TRAP
   MTRP: ALW TRAP ID FAILED; NO RESRC (MT_TBL ENTRY UNAVAIL)

2. REASON FOR OUTPUT

This output message is in response to an ALW:TRAP input message.

Format 1 prints when ID ALL is specified and there are no inhibited or pending traps in the message trap system.

Format 2 prints when ID ALL is specified and there is one or more inhibited or pending traps to be allowed. A list of the trap IDs that have been allowed will be displayed.

Format 3 prints when ID ALL is specified and there is one or more inhibited or pending traps to be allowed. However, the processing of the ALW:TRAP input message has failed due to the reason being printed.

Format 4 prints when one or a list of trap IDs is given. Each trap specified will be allowed in the given order. This format will be printed for the traps that have been successfully allowed. One message per trap ID allowed will be printed.

Format 5 prints when one or a list of trap IDs is given. Each trap specified will be allowed in the given order. In this case, one of the trap IDs given belongs to a trap that has aborted or has completed. A new trap is started with the same trap information as the one specified and a new trap ID is assigned. OID denotes the old trap ID, whereas NID
denotes the new trap ID. One message per ID allowed will be printed. Note that the “old” trap will remain intact.

Format 6 prints when one or a list of trap IDs is given. Each trap specified will be allowed in the given order. This format results when the processing of a trap has failed due to the reason being printed. One message per ID failed will be printed.

Format 7 prints when trying to overindex the monitor trap table entry. The maximum traps allowed in the monitor trap table is 32.

3. VARIABLE FIELD DEFINITIONS

a = Trap identification number.

b = Reason ALW:TRAP input message failed (internal error condition). Valid value(s):

CAN'T GET INDEX
INVALID TRAP STATE
NO TRAP ALLOWED

= Reason ALW:TRAP input message failed. Valid value(s):

ACT TRAP = Cannot allow active traps.
INVALID ID = ID does not belong to any trap.
MAX_SIMTRP REACHED = Maximum number of simultaneous traps that are allowed on the
message trap system is reached.
TRM TRAP = Cannot allow terminated traps.

4. ACTION TO BE TAKEN

For Formats 1, 2, 4, 5 and 7, none.

For Format 3, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 6, if any of the reasons in variable 'b' are printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Otherwise, the reasons in variable 'c' are self-explanatory. Correct the error and try again.

5. ALARMS

None.

ALW TRFC30 TG CHANGE
   TRUNK GROUPS ALLOWED:   a       b       c       d       e
   INVALID TRUNK GROUPS:   f       g       h       i       j
   ALLOWED TRUNK GROUP COUNT:      k       (LIMIT = 5)

2. REASON FOR OUTPUT

To respond to an ALW:TRFC30 input message request to allow the output of up to five trunk groups when one or more of the trunk group identifiers requested is invalid.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

  a-e       = Trunk group identifiers currently allowed for output.
  f-j       = Invalid trunk group identifiers requested.
  k       = Current number of trunk groups allowed for output.

4. ACTION TO BE TAKEN

A trunk group can be allowed for output again if it was flagged as invalid because of a typing error.

       .       .
   ALLOWED ELEMENT COUNT: g (LIMIT = h)

[3] OK - ALLOWED ELEMENTS COUNT : g (LIMIT=h)

2. REASON FOR OUTPUT

To respond to a request to allow a 30-minute traffic report (TRFC30) section that requires group identifiers to be collected (CLCT) or output to the read-only printer (ROP). The APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual indicates which sections require identifiers.

Some sections require single identifiers [for example, trunk group number] while other sections require multiple identifiers [for example, switching module (SM), protocol handler (PH) and shelf numbers]. Each line of output represents one element (for example, unit or group) identified by one or multiple identifiers. Format 2 is used by section 128, customer directory number (CDN) and section 199, personal communications services directory number (PCSDN) counts. Format 3 is used by command alw:trfc30,clct,irt,all in section 143 (IRT). All other sections that use this message use Format 1. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS
a = Section name. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

b = Status of the section following the ALW request. Valid value(s):
ALLOW LIMIT REACHED = The maximum number of elements allowable for this section have been allowed.
ALLOW LIMIT REACHED - ROP INHIBITED = The maximum number of elements allowable for this section has been allowed. Because the PRINT budget has been exceeded, the section has been inhibited for ROP.
ALLOWED FOR CLCT - ROP INHIBITED = Some elements have been allowed. The section was allowed for collection. Because the PRINT budget has been exceeded, the section has been inhibited for ROP.
ALLOWED FOR CLCT - STUDY UNCHANGED = Some studies have been allowed for collection. The memory budget would be exceeded due to the status change of switch groups (SG)/line group controllers (LGC) to operational, since the last allow request. All previously allowed studies in this request have been allowed, without including the new operational SGs/LGCs (that is, study is unchanged since last ALW).
ALLOWED FOR COLLECTION = Some elements have been allowed. The section was allowed for collection.
ALLOWED FOR ROP = Some elements have been allowed. The section was allowed for printing on the ROP.
DATABASE ERROR = A database error prevented the request from being successfully processed. The requested action failed.
INHIBITED = All elements have been inhibited. The section remains inhibited.
MEMORY ALLOCATION EXCEEDED = None of the requested units were allowed. Buffer allocation would be exceeded if they were allowed.

c-f = Element identifier. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Output Messages manual.

g = Number of elements allowed.

h = Maximum number of elements allowable for this section.

i = Reason that element is invalid (applies only to sections 128 and 199). Valid value(s):
Note: Reason messages with "(#)") will include an SM number.
ALLOW LIMIT REACHED IN SM(#) = The specified directory number (DN) was not allowed because the per-SM maximum of studied DNs has been reached.
DEPENDENT DN OF MDNL(#) = The specified DN was not allowed because it is a dependent DN of a multiple DN line (MDNL).
DN CANNOT BE STUDIED(#) = This reason is provided by the switch when a DN is removed from the CDN study set by some automatic operation in response to some administrator action that resulted in a status change to a DN, currently under study, which makes the DN invalid for study. This automatic operation may be the CDN audit run during the 30-minute report cycle, or an instantaneous request, to remove the DN, by an existing relational trigger.
DN DOES NOT EXIST IN OFFICE = The specified DN was not allowed because relational data for the specified DN could not be located, even though the database reads were successful.
DN IS NOT PCS DN(#) = The specified DN was not allowed because it is not a PCS DN.
FC_PORTTYP DATA READ FAILED(#) = The specified DN was not allowed because the read of...
the FC_PORTTYP database relation failed.

**IS_TERM DATA READ FAILED(#)** = The specified DN was not allowed because the read of the IS_TERM database relation failed to obtain the DN's PCS status.

**ISDN OR SHARED LINE NOT ALLOWED(#)** = The specified DN was not allowed because it is either assigned to a digital subscriber line (DSL), or to an analog line whose DN is shared with integrated services digital network (ISDN) terminals. Section 128 studies only analog lines (except for analog shared DNs).

**NOCCODE DATA READ FAILED** = The specified DN was not allowed because the read of the NOCCODE database relation failed.

**OFFICE ALLOW LIMIT REACHED** = The specified DN was not allowed because the office maximum of studied DNs has been reached. Only those DNs from the Input Message up to the point where the study set is filled will be accepted.

**RT_DNTRAN DATA READ FAILED** = The specified DN was not allowed because the read of the RT_DNTRAN database relation failed to obtain the DN's terminating module.

**RTDNMOD DATA READ FAILED** = The specified DN was not allowed because the read of the RTDNMOD database relation failed to obtain the DN's routing module.

**SERVICE CLASS NOT INDIVIDUAL(#)** = The specified DN was not allowed because the DN's service class was not INDIVIDUAL.

**TERMINATING CLASS NOT INDIVIDUAL(#)** = The specified DN was not allowed because it is either assigned to a multi-line hunt group (MLHG) line, which can be studied in section 34 of the TRFC30 report, or to a private branch exchange (PBX) line. Section 128 studies only individual lines.

**UNAVAILABLE ROUTING SM** = The specified DN was not allowed because its routing SM was unavailable.

**UNAVAILABLE TERMINATING SM(#)** = The specified DN was not allowed because its terminating SM was unavailable.

   ALW UT MCTSI=a-b PI {UTIL|UTILFLAG c} d

2. **REASON FOR OUTPUT**

   To report the status of the ALW:UT-MCTSI-PI input message used to activate the specified WHEN clause(s) in the packet interface (PI).

3. **VARIABLE FIELD DEFINITIONS**

   - **UTIL** = Message was run on all UT WHEN clauses in the processor.
   - **UTILFLAG** = Designates one specific WHEN clause.
   - **a** = Switching module (SM) number
   - **b** = Side of the module controller/time-slot interchange (MCTSI).
   - **c** = WHEN message identification number, in decimal.
   - **d** = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

4. **ACTION TO BE TAKEN**

   If appropriate, correct the specified input message and repeat.

5. **ALARMS**

   None.

Type: Output

1. FORMAT

ALW UTIL a #b

2. REASON FOR OUTPUT

To report the disposition of an ALW:UTIL input message.

3. VARIABLE FIELD DEFINITIONS

a  = Termination status. Valid value(s):
   COMPLETED  = The actions associated with any breakpoint will be executed when the breakpoint conditions occur.
   STOPPED UCERR = The operation was completed successfully for all software breakpoints, but the utility circuit does not respond or does not match the circuit present when the hardware breakpoints were defined.

b  = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If ‘a’ is STOPPED UCERR, check the utility circuit hardware. After it is fixed, use the INIT:UC input message to reinitialize the circuit.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   CODE EQL FS SYM SD UNIT WT NOTE
   [g] [h] [i] [j] [k] [l] m [n]

2. REASON FOR OUTPUT

To print trouble location information for a failing diagnostic.

Format 1 is always printed after diagnostic failures have occurred. This message summarizes the failing trouble locating procedure (TLP) key information for each failing phase.

Formats 2 through 4 are printed only when diagnostic failures have occurred on the common network interface (CNI) ring and the TLP option was specified in the input message. The information in these messages is used to
repair the failing unit.

3. VARIABLE FIELD DEFINITIONS

a = Unit and side that failed diagnostic (for example, CU 0).
b = Failing diagnostic phase number.
c = Failing TLP keys - word 1. One bit set for each failing TLP key, 0-31.
d = Failing TLP keys - word 2. One bit set for each failing TLP key, 32-63.
e = First failing TLP key number.
f = Unique decimal number identifying the TLP process.
g = Equipment code.
h = Equipment location.
i = Functional schematic number for the equipment.
j = Functional schematic symbol number for the equipment.
k = Schematic diagram number for the unit.
l = Unit(s) containing the equipment when not the same as the unit being diagnosed. Do not remove power or equipment from an active or in-service unit.

"ONL" in the unit column means on-line or active unit. "PU" in the unit column means peripheral unit such as disk file controller (DFC) or input/output processor (IOP).
m = Weight on a scale from 1 to 10 with the equipment most probably to be faulty having the highest number.

n = Note number. If note is nonzero, refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual for additional information. (Note zero is not used.)
o = Model version (mv) of the unit being diagnosed.

4. ACTION TO BE TAKEN

Format 1 is failing TLP key summary information. If the failing diagnostic did not have the TLP option specified, request the diagnostic again with the TLP option. The failing TLP key summary information can be used to monitor changes in failing TLP keys. No actions based on the contents of this message are required.

Format 2 provides the ID of the TLP process which is running. No actions based on the contents of this message are required.

Formats 3 and 4 are used to repair the faulty unit using the suspected faulty equipment list. The most likely equipment is at the top of the list.

If the NOTE column ‘n’ has non-zero entries, first read the identified TLP notes for the failing unit from the APP:TLP-NOTE appendix in the appendixes section of the Output Messages manual. TLP notes may contain
information regarding the cause of the trouble. Check for any specific trouble identified by the TLP notes. In some cases, the trouble can be resolved without replacing equipment.

If the UNIT column ‘l’ has non-blank entries, the suspected faulty equipment is not in the unit that failed diagnostics. Defer replacing equipment in other units until all suspected equipment in the failing unit has been tried. It may be necessary to reconfigure the system to allow the other unit(s) to be removed from service. It will be necessary to remove from service and power down the other unit(s) before replacing equipment in the other unit(s).

Replace the equipment at the top of the list with a spare, and retest the unit with the diagnostics. If the unit still fails, restore the original equipment to the unit and replace the next equipment on the list with a spare. Continue until faulty equipment found or list exhausted.

When faulty equipment is found, verify it causes the diagnostic failure by restoring it to the unit and rerunning diagnostics. If the diagnostics do not fail as before, suspect the faulty equipment is intermittent or temperature sensitive. Occasionally, removing and restoring power to the unit or reseating equipment clears the trouble. Note the equipment involved in clearing the trouble. If the diagnostic failure returns and the same equipment is involved in clearing the trouble, replace the equipment.

If asterisks (*) are printed in the equipment location field ‘h’, TLP cannot directly determine the location of the equipment from the failing diagnostic ‘a’. If the UNIT column ‘l’ is blank, all equipment of the code identified in ‘g’ are implicated in the failing unit. If the UNIT column ‘l’ identifies another unit (or units), all equipment of the code identified in ‘g’ are implicated in the unit (or units) identified by ‘l’. In some cases, further resolution is possible; refer to the following:

<table>
<thead>
<tr>
<th>If ‘g’</th>
<th>= Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>UN09</td>
<td>TLP may not be able to directly determine the channel based on the unit under test. Channel diagnostics should be run to more accurately determine the faulty equipment. For example, if the DMA 0 diagnostic failed and TLP implicated the UN09, run DMA 0 Channel diagnostics (CH 11-14).</td>
</tr>
<tr>
<td>UN19</td>
<td>Indicates that TLP cannot directly determine the channel based on the unit under test. Channel diagnostics (CH 0-9) should be run to more accurately determine the faulty equipment.</td>
</tr>
<tr>
<td>TN69, TN70</td>
<td>The TN69 or TN70 equipment in the peripheral device being used as a helper unit is being implicated. Refer to the diagnostic listing for further information on the peripheral device involved with the phase which failed. Exhibit B translates some of the channel diagnostic phases to the subchannel being tested.</td>
</tr>
<tr>
<td>TN14, TN28, TN56, or TN2012</td>
<td>Indicates TLP may not be able to determine the failing mainstore array (MASA) based on the unit under test. Some MASC diagnostic phases have a histogram output message that identifies the failing MASA. If the MASC diagnostic was not run, the MASC diagnostic should be run to more accurately determine the faulty equipment.</td>
</tr>
</tbody>
</table>

9. APPLY
1. FORMAT

[1] APPLY OMDB COMPLETED

[2] APPLY OMDB COMPLETED
   OMDB LOG FILE FOUND

[3] APPLY OMDB NO DATA BASE ENTRY FOUND FOR THE
   FOLLOWING KEYS:
   a

[4] APPLY OMDB FAILED
   UNABLE TO ACCESS /cft/spl/omdb

[5] APPLY OMDB LOGFILE ERROR
   ENTRY SKIPPED
   b

[6] APPLY OMDB CANNOT OPEN OR CREATE LOGFILE
   UPDATE NOT LOGGED

[7] APPLY OMDB ABORTED
   UNABLE TO CREATE TEMP FILE

[8] APPLY OMDB ABORTED
   UNABLE TO SEND REQUEST TO CSOP

[9] APPLY OMDB ABORTED
   CANNOT ALLOCATE DISK SPACE FOR OMDB

[10] APPLY OMDB ABORTED
    CANNOT CREATE TEMPORARY OMDB

    OMDB COPY FAILED

[12] APPLY OMDB ABORTED
    CANNOT SWITCH COPIES OF OMDB
2. REASON FOR OUTPUT

To report the result of executing an APPLY:OMDB input message. Format 1 indicates successful execution of the message. Formats 2, 3, 5, and 6 are warning messages. In some cases, updates may have taken place. All other formats indicate complete failure.

3. VARIABLE FIELD DEFINITIONS

a = List of message keys for which the APPLY:OMDB failed, that is, these keys no longer exist in the OMDB disk file.

b = Logfile entry containing the syntax error.

4. ACTION TO BE TAKEN

Format 1 indicates success. No action is required. However, the list of successful updates can be found in the file /cft/spl/OMDB_LOG.

Format 2 indicates that no record of previous updates could be found. If no updates have been made to the OMDB previously, this message can be ignored. If previous updates have been made to the OMDB, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

Format 3 indicates that some of the updates failed. This generally indicates that keys have been removed from the OMDB. Verify that the keys no longer exist by executing the UPD:OMDB input message, which allows the user to examine the DISK copy of the OMDB. If the keys do not exist, the message can be ignored. If the keys do exist, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

Format 4 indicates that the OMDB disk file could not be accessed. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

Format 5 most likely results from direct manipulation of the logfile. The entry in error should be examined for the cause of the error, and, if appropriate, the UPD:OMDB input message can be used to reapply that update with the corrected data. The format of each logfile entry is: a keyword indicating that type of update (either ALARM or MSGCLS), the new value for either the alarm level or the message class, and a list of keys for which the update had been performed.

Formats 6 and 7 indicate a possible file system problem. Use the OP:ST-FREEDISK input message to check if the root file system is out of space. If the file system is out of space, clean up unused files and retry the message. If the file system is not out of space, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

Format 8 indicates that the message could not send a message to CSOP. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

Formats 9 - 12 indicate that CSOP could not make a new temporary copy of the OMDB for applying updates while the OMDB is in the temporary state. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

NOTE: For example, the office receives a DOC2 level. If the user assigns DOC and the response category chosen is E, DOC will be applied to 100% of the alternate route non-HTR traffic, 75% of the direct route non-HTR traffic, 100% of the direct route HTR traffic, and 100% of the alternate route HTR traffic.

c = Control option. Valid value(s):
CANT = DOC control.
SKIP = DOC control.

D = Termination status. Valid value(s):
ABORTED = Command failed. System error encountered.
4. ACTIONS TO BE TAKEN

No action is needed for an automatically generated request from the engineering and administrative data acquisition system network management (EADAS/NM). For manually generated requests, the following actions will apply.

<table>
<thead>
<tr>
<th>If 'o' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED</td>
<td>Reinitiate request.</td>
</tr>
<tr>
<td>COMPLETED</td>
<td>The message is confirmation of a request from an input message.</td>
</tr>
<tr>
<td>FAILED-OVERFLOW</td>
<td>Refer to the Feature Description manual for maximum allowable controls.</td>
</tr>
<tr>
<td>FAILED-PARAMETER</td>
<td>Check for the validity of input parameters and reinitiate the corrected request.</td>
</tr>
</tbody>
</table>

5. ALARMS

Application: 5
Type: Output

1. FORMAT

ASGN DPSCH a
   ROW=b COLUMN=c
   TG=d .. d
   for up to 8 trunk groups

2. REASON FOR OUTPUT

To report the assignment of trunk groups (TGs) to the network management (NM) schedule and the trunk group display block (the TRUNK block) if requested on the ASGN:DPSCH input message.

3. VARIABLE FIELD DEFINITIONS

   a = Termination status. Valid value(s):
      ABORTED = Command aborted. System error encountered.
      COMPLETED = Command successfully completed.
      FAILED-OVERFLOW = Command failed. Maximum control limit reached.
      FAILED-PARAMETER = Command failed. Input parameter error.
      PARTIAL-COMPLETE = Command partially successful.

   b = Row number or "0" if not applicable.

   c = Column number or "0" if not applicable.

   d = List of trunk group numbers successfully assigned to the NM schedule and the trunk group display block.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'a' =</th>

130 NM EXCEPTION
ASGN:NMNODES

Software Release: 5E14 and later
Message Class: ADMN
Application: 5
Type: Output

1. FORMAT

ASGN NMNODES a
     CLLI   V/D
     [b    c]
     .    .
     .    .
     .    .

2. REASON FOR OUTPUT

To report the assignment of up to 4 node identifiers to the five-minute network management node schedule (NMNODES). A node is identified by a CLLI code and the voice/data indicator. This is a response to an ASGN:NMNODES input message.

3. VARIABLE FIELD DEFINITIONS

   a   = Termination status. Valid value(s):
       ABORTED  = Command aborted. System error encountered.
       COMPLETED = Command successfully completed.
       FAILED-OVERFLOW = Command failed. Maximum node limit reached.
       FAILED-PARAMETER = Command failed. Input parameter error.
       PARTIAL-COMPLETE = Command partially successful.

   b   = Common language location ID (CLLI) code.

   c   = Voice/data indicator. Valid value(s):
       V   = Voice indicator.
       D   = Data indicator.

   Note: The presence of parameters 'b' and 'c' indicates the node has been successfully added to the node schedule. If a requested node failed to be added to the node schedule the node will not be displayed.

Software Release: 5E14 - 5E16(1)
Message Class: ADMN
Application: 5
Type: Output

1. FORMAT

ASGN TR TG=a RL1=b RL2=c RESP=d CNTL=e ARA=f INH=g h

2. REASON FOR OUTPUT

To report the adding or changing of a trunk reservation (TR) control. This is a response to an ASGN:TR input message.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group (TG) number.
b = Reservation level 1 (RL1). The number of idle circuits per trunk group to be reserved.
c = Reservation level 2 (RL2). The number of idle circuits per trunk group to be reserved.
d = Response category (RESP). These categories, designated 'A' through 'E', along with the reservation level triggered determine the percentage of calls on which to apply TR.

<table>
<thead>
<tr>
<th>TR Response Category</th>
<th>TRAFFIC TYPE</th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td>RL1 Alt.</td>

<tr>
<td>RL2 Direct</td>
<td>0%</td>
<td>0%</td>
<td>0%</td>
<td>100%</td>
<td>0%</td>
<td></td>
</tr>
</tbody>
</table>

For example, if the RL2 reservation level is triggered and the response category chosen is 'C', TR will be applied to 100% of the alternate route traffic and 0% of the direct route traffic.

e = Control (CNTL) action. Valid value(s):
- CANT = TR cancel-to control.
- SKIP = TR skip control.

f = Automatic reservation adjustment (ARA) option adjusts the reservation levels on a per-call basis according to the traffic load on the trunk group. Valid value(s):
- N = ARA is in effect.
- Y = ARA is not in effect.

g = TR control status. Valid value(s):
- N = TR control is inhibited.
- Y = TR control is allowed.

h = Termination status. Valid value(s):
COMPLETED = Message successfully completed.
FAILED-OVERFLOW = Message failed. Maximum control limit reached.
FAILED-PARAMETER = Message failed due to bad input.

2. REASON FOR OUTPUT

To report the results of a manual request for a common channel signaling (CCS) translation test for CCS6 and CCS7 trunks.

Format 1 reports all translation tests pass.

Format 2 reports near-end office translation test failure.

Format 3 reports no response from the far-end office translation test failure.

Format 4 reports translation test failure as indicated in variable field definition 'c'.

Format 5 reports trunk data mismatch translation test failure.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number.
b = Trunk member number.
c = The result of the CCS translation test. Valid value(s):
   FE XLATE FAILURE = Far-end translations failure.
   STP C-LINK FAILURE = Signal transfer point (STP) C-link failure.
STP PBC FAILURE = STP peripheral bus computer failure.
STP XSTATE FAILURE = STP translations failure.

d = Name of relation failure or SM TIMOUT for SM timeout failure.

e = Signaling link group number.
f = Signaling link member number.
g = Signaling link virtual link number.
h = Band number.
i = Member number.
j = Destination point code.
k = Circuit identification code.
l = Near-end circuit identification number.
m = Far-end CLLI code.
n = STP CLLI code.
o = Far-end circuit identification number.
p = Types of trunk data mismatch failures. Valid value(s):
   CGA = Carrier group alarm (CGA) software or hardware mismatch.
   CIN = Near-end circuit identification number does not match far-end circuit identification number.
   GLARE CNTL = Control of trunk during glare is inconsistent.
   TRK TYPE = Digital and/or analog trunk type mismatch.

4. ACTION TO BE TAKEN

Proceed according to local practices for trunk turn-up procedures.

5. ALARMS

None.

Input Message(s):

AUD:CCSXLATE
AUD:CMP-ABORTED

Software Release: 5E14 and later
Message Class: AUDTFST,AUDTMON, AUDT
Application: 5
Type: Output

1. FORMAT

AUD  CMP=a-f {PRIM|MATE}  b  ABORTED  ERRORS=c  EVENT=d

2. REASON FOR OUTPUT

To report that an audit in the communication module processor (CMP) was aborted because a higher priority audit ran. All messages related to a problem use the same event number (variable 'd').

3. VARIABLE FIELD DEFINITIONS

a = Message switch side.
b = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.
c = Total number of errors found.
d = Event number.
f = CMP where application audit resides.

4. ACTION TO BE TAKEN

If this message has been automatically generated, retrieve the output messages related to the audit ID 'b'. If this message is in response to a manual request, all output messages related to the audit ID 'b' will have been printed. These messages include: AUD:CMP-DUMP, AUD:CMP-ERROR, and AUD:CMP-FAILURE. Refer to the Audits manual for a description of actions.

This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include audit messages with the AUDTFST message class, defensive check failures, or single process purge messages. AUDT indicates this message occurred as a response to a manual request.

Type: Output

1. FORMAT

AUD CMP=a-b {PRIM|MATE} c COMPLETED ERRORS=d EVENT=e

2. REASON FOR OUTPUT

To report the number of errors found at audit completion in the communication module processor (CMP). All messages related to a problem use the same event number (variable 'e').

3. VARIABLE FIELD DEFINITIONS

a = Message switch side.
b = CMP number.
MATE = Mate CMP.
PRIM = Primary CMP.
c = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.
d = Total number of errors found.
e = Event number.

4. ACTION TO BE TAKEN

If this message has been automatically generated, retrieve the output messages related to the audit ID 'c'. If this message is in response to a manual request, all output messages related to the audit ID 'c' will have been printed. These messages include: AUD:CMP-DUMP, AUD:CMP-ERROR, and AUD:CMP-FAILURE. Refer to the Audits manual for a description of actions.

This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include audit messages with the AUDTFST message class, defensive check failures, or single process purge messages. AUDT indicates this message occurred as a response to a manual request.

5. ALARMS

Output Message(s):

AUD: CMP-DUMP
AUD: CMP-ERROR
AUD: CMP-FAILURE

Other Manual(s):

235-600-400  Audits
AUD:_CMP-DUMP

Software Release: 5E14 and later
Message Class: AUDTFST,AUDTMON, AUDT
Application: 5
Type: Output

1. FORMAT

AUD CMP=a-i {j} b DUMP PART d OF e EVENT=c
   KEY=f
   BLOCK-ADDR=g AU_ETYPE_INFO=k
   h
   .
   .

2. REASON FOR OUTPUT

To dump data from an audit which detected errors in a communication module processor (CMP).

This message will always be preceded by the AUD:CMP-ERROR output message. A given audit ID 'b' could have many different error messages with corresponding dump messages. The field that ties the dump message to the error message is the ERROR-ADDR field 'd'. All dump messages related to a single problem use the same event number (variable 'c').

3. VARIABLE FIELD DEFINITIONS

a = Message switch side.
b = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.
c = Event number.
d = Part indicator to identify related dumps when there is too much data for a single report.
e = Total number of related dump messages when there is too much data for a single report.
f = Dump identifying information. There are three lines. The first has the dump data type identifier or NOT_APPLICABLE. The second line has the names of the data keys or KEYS_ARE_NOT_APPLICABLE or KEYS_ARE_IN_THE_DATA_DUMP. The third line has the key values where H'0 is used as a default for the cases where keys do not apply.
g = Block address in hexadecimal.
h = Hexadecimal dump of a block of up to 199 bytes with up to eight groups of four bytes per line.
i = Communications module processor where application audit resides.
j = CMP number. Valid value(s):
   MATE = Mate CMP.
   PRIM = Primary CMP.
k = Audit environment type information (used by rop analysis tools).
4. ACTIONS TO BE TAKEN

Refer to the Audits manual to interpret information given. Use the audit ID 'b:' and the error code from the corresponding error message (AUD:CMP-ERROR) to find the interpretation in the "Audits Description" section.

This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include audit messages with the AUDTFST message class, defensive check failures, or single process purge messages. AUDT indicates this message occurred as a response to a manual request.

5. ALARMS

None.

6. REFERENCES

   AUD : CMP-ERROR

Other Manual(s):

235-600-400   Audits
AUD:_CMP-ERROR

Software Release: 5E14 and later
Message Class: AUDTFST, AUDTMON, AUDT
Application: 5
Type: Output

1. FORMAT

   AUD  CMP=a-i  {PRIM|MATE}  b  ERROR-CODE=c  EVENT=d
       ERROR-ADDR=e  BAD-DATA=f
       LOG-KEY=g  GOOD-DATA=h

2. REASON FOR OUTPUT

   To report that an audit detected an error in a communication module processor (CMP). There may be one or more
   optional AUD:_CMP-DUMP output messages corresponding to this message.

   The ERROR-ADDR field 'e' can be used to determine corresponding messages. All the errors reported during an
   invocation of an audit will be summarized by the AUD:_CMP-ABORTED or AUD:_CMP-COMPLETED output
   messages. All error messages related to a problem use the same event number (variable 'd'). This message uses
   variable message classes. AUDTFST indicates that this message caused a new event number to be allocated (and
   is the most significant message in the event). AUDTMON indicates that this message does not describe a new
   event; look for previous messages with the same event number. Previous messages could include audit messages
   with the AUDTFST message class, defensive check failures, or single process purge messages. AUDT indicates
   this message occurred as a response to a manual request.

3. VARIABLE FIELD DEFINITIONS

   a = Message switch side.
   b = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.
   c = Error code. Refer to the Audits manual.
   d = Event number.
   e = Error address.
   f = Bad (incorrect) data in hexadecimal.
   g = Logical key in hexadecimal.
   h = Good (correct) data in hexadecimal.
   i = CMP where application audit resides.

4. ACTION TO BE TAKEN

   Refer to the Audits manual to interpret information given. Use the audit ID 'b' and the error code 'c' to find the
   interpretation in the "Audit Descriptions" section.

5. ALARMS

   None.

**Application:** 5
**Type:** Output

1. **FORMAT**

   AUD  CMP=a-b {PRIM|MATE}  c  FAILURE-CODE=d  EVENT=e

2. **REASON FOR OUTPUT**

   To report a failure that has been encountered by an audit in a communication module processor (CMP). A failure indicates that the audit could not proceed due to some problem it has detected, and it has triggered escalation or other audit actions. All failure messages related to a problem use the same event number (variable ‘e’).

   This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include audit messages with the AUDTFST message class, defensive check failures, or single process purge messages. AUDT indicates this message occurred as a response to a manual request.

2. REASON FOR OUTPUT

To report the termination status of the cumem audit and/or any error found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.
b = Total number of errors corrected.
c = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was faulted while correcting errors.
   5 = System integrity monitor (SIM) could not start or dispatch the audit.
   6 = An error was encountered in the audit control/audit library interface.
   7 = Audit exceeded its timeout or segment limit.
   8 = SIM aborted an executing routine audit because of a blocking request.
   9 = Transient process that was running the process terminated.
= A segmented audit exceeded an error threshold.

\( \text{d} \) = Error code, in decimal notation. Valid value(s):
- 2 = Bad data in the equipment configuration database (ECD) for a control unit (CU) unit or subunit.
- 4 = Could not access the ECD. Possibly a bad record identification number (RID).
- 6 = Maintenance channel failed.
- 8 = Could not read the offline mainstore.
- 10 = Call to the kconfig library failed.
- 12 = Erroneous major state for a CU unit or subunit.
- 14 = Bad online system status register (SSR) value.
- 16 = Bad offline SSR value.
- 18 = Bad online hardware status register (HSR) value.
- 20 = Bad offline HSR value.
- 22 = Cache hit/miss ratio is unacceptable.
- 24 = Plant measurements library call failed.
- 26 = Audit control library call failed.
- 28 = Internal custat error.
- 30 = Offline store access failed.
- 32 = Internal error during memory compare.
- 34 = Memory mismatch mainstore error.
- 36 = Memory mismatch cache error.
- 38 = Control unit memory (CUMEM) tried to run, CUs not in active standby.

**f** = Indicates if error was corrected.

1 = Yes.
15 = No.

**g** = Valid value(s):

<table>
<thead>
<tr>
<th>'i' =</th>
<th>'g' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>30, 34, or 36</td>
<td>0</td>
</tr>
<tr>
<td>all other error codes</td>
<td>Complimented offline SSR value.</td>
</tr>
</tbody>
</table>

**h** = Valid value(s):

<table>
<thead>
<tr>
<th>'i' =</th>
<th>'h' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>30, 34, or 36</td>
<td>0</td>
</tr>
<tr>
<td>all other error codes</td>
<td>Complimented online SSR value.</td>
</tr>
</tbody>
</table>

**i** = Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.

**j** = Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.

Note: Refer to the APP:AUD-A and APP:AUD-B appendices in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.
k = Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes section of the Output Messages manual.

1 = Inhibit status. Valid value(s):
   ALLOWED = Audit has been automatically allowed by SIM.
   INHIBITED = Audit has been automatically inhibited by SIM.

4. ACTION TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, there is no readily available means for correcting the problem. If the message persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual. Some possible actions to specific error types are listed in the following exhibit.

<table>
<thead>
<tr>
<th>Fault Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x4</td>
<td>Run ECD 1 audit.</td>
</tr>
<tr>
<td>0x6</td>
<td>Check maintenance channel cable. Run CC diagnostics. The problem could also be in the online maintenance channel. The problem is serious and should be taken care of as soon as possible.</td>
</tr>
<tr>
<td>0x8</td>
<td>Run CU diagnostics, switch CUs, run CU diagnostics.</td>
</tr>
<tr>
<td>0xe</td>
<td>Take action on this error only if it occurs repeatedly. Switch CUs, run CU diagnostics.</td>
</tr>
<tr>
<td>0x10</td>
<td>Take action on this error only if it occurs repeatedly. Run CU diagnostics.</td>
</tr>
<tr>
<td>0x12</td>
<td>Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited on-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.</td>
</tr>
<tr>
<td>0x14</td>
<td>Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited off-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.</td>
</tr>
<tr>
<td>0x18</td>
<td>Run plant measurements system (PMS) 1 audit.</td>
</tr>
<tr>
<td>0xe</td>
<td>Run CU diagnostics, switch CUs, run CU diagnostics.</td>
</tr>
<tr>
<td>0x2a</td>
<td>Clear EAls with a poke 14 on the EAI page of the MTTY. Take further action on this error only if it occurs repeatedly. Run CU diagnostics, switch CUs, run CU diagnostics.</td>
</tr>
<tr>
<td>0x2c</td>
<td>Take action on this error only if it occurs repeatedly. Either CU could cause inconsistent values between the SSRs. Run CU diagnostics, switch CUs, run CU diagnostics.</td>
</tr>
</tbody>
</table>

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the termination status of the equipment configuration database (ECD) audit and/or any errors found.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. Valid value(s):
   1 = Structural incore ECD audit.
   2 = Structural disk ECD audit.
= Raw data incore ECD audit.

b = Instance name (appears when 'a' = 2). Valid value(s):
APPECD = Application ECD.
ECD = UNIX® RTR only ECD.

c = Total number of errors found.
d = Total number of errors corrected.
e = Abort code. Valid value(s):
3 = Audit was aborted without completing its work.
4 = Audit was faulted while correcting errors.
5 = System integrity monitor (SIM) could not start or dispatch the audit.
6 = An error was encountered in the audit control/audit library interface.
7 = Audit exceeded its timeout or segment limit.
8 = SIM aborted an executing routine audit because of a blocking request.
9 = Transient process that was running the process terminated.
10 = A segmented audit exceeded an error threshold.

f = Error code. Valid value(s):
(1-2999) = LLA structural error.
(3000-3999) = Fatal error.
(4000-4999) = Error.
(5000-5999) = Correction.

g = Explanation of error identified by error code. If error code is 1-2999, refer to the APP:LLA appendix in the Appendixes section of the Output Messages manual.

</tbody>
</table>

**h** = Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.

**i** = Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.

**j** = Inhibit status. Valid value(s):
- ALLOWED = Audit has been automatically allowed by SIM.
- INHIBITED = Audit has been automatically inhibited by SIM.

**k** = UCB complex unit.

**l** = UCB unit.

**m** = UCB complex unit.

**n** = UCB name.

**o** = File name. Valid value(s):
- `/etc/log/ecdaud-disk` = For disk audit.
- `/etc/log/ecdaud-struct` = For structural incore audit.
- `/etc/log/ecdaud-raw` = For raw audit.

**p** = Integer.

**q** = Hexadecimal integer.

**r** = Database name.
4. ACTION TO BE TAKEN

If the audit was manually run in the noncorrecting mode and the output indicates that corrections are needed, rerun the audit in correcting mode.

Note: Recent changes should not be applied while an audit that uses the ECD is running.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report.

235-600-400 Audits
AUD:ENV-ABORTED

Software Release: 5E14 and later
Message Class: AUDTFST, AUDTMON, AUDT
Application: 5
Type: Output

1. FORMAT

AUD ENV=a b ABORTED ERRORS=c EVENT=d

2. REASON FOR OUTPUT

To report that a kernel process environment (OKP or SMKP) audit in the administrative module (AM) was aborted because a higher priority audit ran. This message is also used to report that an application interprocessor audit could not communicate with an SM. All messages related to a problem use the same event number (variable 'd').

3. VARIABLE FIELD DEFINITIONS

a = Kernel process where the application audit resides. Valid value(s):
    OKP = Operation kernel process.
    SMKP = Switch maintenance kernel process.

b = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.

c = Total number of errors found.

d = Event number.

4. ACTION TO BE TAKEN

If this message has been automatically generated, retrieve the output messages related to the audit ID 'b'. If this message is in response to a manual request, all output messages related to the audit ID 'b' will have been printed. These messages include: AUD:ENV-DUMP, AUD:ENV-ERROR, and AUD:ENV-FAILURE. Refer to the Audits manual for a description of actions.

This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include other audits messages with the AUDTFST message class, defensive check failure, or single process purge messages. AUDT indicates this message occurred as a response to a manual request.

5. ALARMS

None.

4. AUD ENV=RTR CNC 1 ERROR d REPORT
   DATA1 X'e DATA2 X'f
   DATA3 X'g DATA4 X'h
   NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

To report the termination status of the central node control (CNC) audit and/or any errors found.

This audit may have been executed due to routine schedule, manual request, or interprocess message switch (IMS) initialization (level 0 or 1A).

When the audit finds no errors, termination status is printed only for manual requests.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected. Non-zero values indicate that error correction has been attempted, not that it has been verified.

c = Abort code. Valid value(s):
    3 = Audit was aborted without completing its work.
    4 = Audit was faulted while correcting errors.
    5 = System integrity monitor (SIM) could not start or dispatch the audit.
    6 = An error was encountered in the audit control/audit library interface.
    7 = Audit exceeded its timeout or segment limit.
    8 = SIM aborted an executing routine audit because of a blocking request.
    9 = Transient process that was running the process terminated.
   10 = A segmented audit exceeded an error threshold.
   11 = An audit was blocking a needed demand audit.
   12 = Audit rejected a request to run from SIM.
   13 = SIM aborted audit, audit subsystem was reinitialized.
d = Error code. Valid value(s):
0 = Illegal restoration job state ('e' or 'g').
1 = Restore job states ('e' and 'g') inconsistent about CNC abort.
2 = Restore job states ('e' and 'g') indicate too many active jobs.
3 = Restore job states ('e' and 'g') indicate queued job with none active.
4 = Job or CNC abort time limit exceeded.
5 = CNC and automatic ring recovery (ARR) inconsistent.
6 = CNC has job from dead IMSRMVRST.
7 = CNC inconsistent with RST.IUN.
8 = 3BWRT.NP inconsistent with IUN.PUMP.

e = Valid value(s):

<table>

</tr>
</tbody>
</table>

4. ACTION TO BE TAKEN

Format 1 should appear alone only when the audit is manually requested with the summary option or detected no errors. Error analysis must be based on Format 4 messages.

Format 2 is printed when an execution of the audit is stopped with the STOP:AUD input message or by an initialization of the IMS subsystem.

Format 3 should occur only during outages and initializations of the IMS subsystem. If it occurs when IMS is operational, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Format 4 reports errors detected by the audit. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

All of the errors reported by this audit indicate mutilated internal data or other software problems. Such errors can occur as a side effect of other problems, such as those reported with the REPT:IMSDRV-FLT output message.

If error correction was indicated ('b' > 0), then the audit attempted to clear the trouble by canceling the maintenance jobs associated with the errors.
To verify that error correction was successful, run the audit again with the AUD:CNC 1 input message.

5. ALARMS

Formats 1, 2 and 3 sound no alarms.

Format 4 sounds a minor alarm unless the audit was manually requested.

Message Class: AUDTFST, AUDTMON, AUDT
Application: 5
Type: Output

1. FORMAT

AUD  ENV=a  b  COMPLETED  ERRORS=c  EVENT=d

2. REASON FOR OUTPUT

To report the number of errors found at kernel process environment (OKP or SMKP) audit completion in the administrative module (AM). All messages related to a problem use the same event number (variable ‘d’).

3. VARIABLE FIELD DEFINITIONS

a = Kernel process where the application audit resides.
   OKP = Operational kernel process.
   SMKP = Switch maintenance kernel process.

b = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.

c = Total number of errors found.

d = Event number.

4. ACTION TO BE TAKEN

If this message has been automatically generated, retrieve the output messages related to the audit ID ‘b’. If this message is in response to a manual request, all output messages related to the audit ID ‘b’ will have been printed. These messages include: AUD:ENV-DUMP, AUD:ENV-ERROR, and AUD:ENV-FAILURE. Refer to the Audits manual for a description of actions.

This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include other audits messages with the AUDTFST message class, defensive check failure, or single process purge messages. AUDT indicates this message occurred as a response to a manual request.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

AUD: ENV
Output Message(s):

AUD: ENV-DUMP  
AUD: ENV-ERROR  
AUD: ENV-FAILURE

Other Manual(s):

235-600-400 Audits  
235-600-500 Asserts
AUD:ENV-DUMP

Software Release: 5E14 and later
Message Class: AUDTFST,AUDTMON, AUDT
Application: 5
Type: Output

1. FORMAT

AUD  ENV=a  b  DUMP PART d OF e EVENT=c
     KEY=f
     BLOCK-ADDR=g AU.GetType_INFO=i
     h
     .
     .

2. REASON FOR OUTPUT

To dump data from a kernel process environment (OKP or SMKP) audit which detected errors in the administrative module (AM). This message will always be preceded by the AUD:ENV-ERROR output message. A given audit ID 'b' could have many different error messages with corresponding dump messages. The field which ties the dump message to the error message is the field ERROR-ADDR 'd'. All dump messages related to a single problem use the same event number (variable 'c').

3. VARIABLE FIELD DEFINITIONS

a = Kernel process where the application audit resides.
   OKP = Operational kernel process.
   SMKP = Switch maintenance kernel process.

b = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.

c = Event number.

d = Part indicator to identify related dumps when there is too much data for a single report.

e = Total number of related dump messages when there is too much data for a single report.

f = Dump identifying information. There are three lines. The first has the dump data type identifier or NOT_APPLICABLE. The second line has the names of the data keys or KEYS_ARE_NOT_APPLICABLE or KEYS_ARE_IN_THE_DATA_DUMP. The third line has the key values where H'0' is used as a default for the cases where keys do not apply.

g = Block address in hexadecimal.

h = Hexadecimal dump of a block of up to 199 bytes with up to 8 groups of 4 bytes per line.

i = Audit environment type information (used by rop analysis tools).

4. ACTIONS TO BE TAKEN
Refer to the Audits manual to interpret information given. Use the audit ID ‘b’ and the error code from the corresponding error message (AUD ERROR) to find the interpretation.

This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include other audits messages with the AUDTFST message class, defensive check failure, or single process purge messages. AUDT indicates this message occurred as a response to a manual request.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

AUD: ENV

Output Message(s):

AUD: ENV-ERROR

Other Manual(s):

235-600-400  Audits
235-600-500  Asserts
AUD:ENV-ERROR

Software Release: 5E14 and later
Message Class: AUDTFST, AUDTMON, AUDT
Application: 5
Type: Output

1. FORMAT

AUD ENV=a b ERROR-CODE=c EVENT=d
  ERROR-ADDR=e BAD-DATA=f
  LOG-KEY=g GOOD-DATA=h

2. REASON FOR OUTPUT

To report that a audit detected an error in the kernel process environment (OKP or SMKP) audit or administrative module (AM). There may be an optional dump message AUD:ENV-DUMP corresponding to this message. The ERROR-ADDR field ‘e’ should be used to determine corresponding messages. All the errors reported during an invocation of an audit will be summarized by the AUD:ENV-ABORTED or AUD:ENV-COMPL output messages. All error messages related to a problem use the same event number (variable ‘d’).

3. VARIABLE FIELD DEFINITIONS

a = Kernel process where the application audit resides. Valid value(s):
   OKP = Operational kernel process.
   SMKP = Switch maintenance kernel process.

b = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.

c = Error code. Refer to the Audits manual.

d = Event number of related reports.

e = Error address in hexadecimal.

f = Bad (incorrect) data in hexadecimal.

g = Logical key in hexadecimal.

h = Good (correct) data.

4. ACTION TO BE TAKEN

Refer to the Audits manual to interpret information given. Use the audit ID ‘b’ and the error code ‘c’ to find the interpretation of data.

Variables ‘e’ through ‘h’ contain information relating to the data which is in error. The Audits manual should be referred to interpret the data.

This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated and is always the most significant message in the event. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include other audits messages with the AUDTFST message class, defensive check failure, or single process purge messages. AUDT indicates this message occurred as a response to a manual request.

Message Class: AUDTFST, AUDTMON, AUDT
Application: 5
Type: Output

1. FORMAT

AUD ENV=a b FAILURE-CODE=c EVENT=d;

2. REASON FOR OUTPUT

To report a failure that has been encountered by a kernel process environment (OKP or SMKP) audit in the administrative module (AM). A failure indicates that the audit could not proceed due to some problem it has detected, and it has triggered escalation or other audit actions. All failure messages related to a problem use the same event number (variable ‘d’).

This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include other audits messages with the AUDTFST message class, defensive check failure, or single process purge messages. AUDT indicates this message occurred as a response to a manual request.

Input Message(s):

Other Manual(s):
Audits
AUD:ENV-LKBDST

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] AUD ENV=RTR LKBDST 1 COMPLETED
   a ERRORS FOUND
   b ERRORS CORRECTED

[2] AUD ENV=RTR LKBDST 1 STOPPED

[3] AUD ENV=RTR LKBDST 1 ABORTED CODE c

[4] AUD ENV=RTR LKBDST 1 ERROR d REPORT
   DATA1   H'e     DATA2   H'f
   DATA3   H'g     DATA4   H'h
   NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

To report the results of an audit of the consistency of basic link and band status information in the administrative module (AM) and the interprocess message switch user node (IUN). Unless the abort code indicates otherwise, any errors found have been corrected and no other action is needed.

Format 1 is printed when the audit completed.

Format 2 is printed when the audit was stopped (such as, STOP:AUD).

Format 3 is printed when the audit aborted.

Format 4 provides details of the audit results.

If Formats 1 and 4 both are printed, other messages may be interposed between them.

3. VARIABLE FIELD DEFINITIONS

  a = Total number of errors found (maximum 16).
  b = Total number of errors corrected (maximum 16).
  c = Abort code. Valid value(s):
      3 = Audit was aborted without completing its work.
      4 = Audit was faulted while correcting errors.
      5 = System integrity monitor (SIM) could not start or dispatch the audit.
      6 = An error was encountered in the audit control/audit library interface.
      7 = Audit exceeded its timeout or segment limit.
      8 = SIM aborted an executing routine audit because of a blocking request.
      9 = Transient process that was running the process terminated.
A segmented audit exceeded an error threshold.

d = Error code for each detected error. This is followed by the appropriate block of raw data. This output is printed for up to 16 errors per audit; if more than 16 errors are found, a 17th block (variable ‘d’ = 200) is added to indicate the number of detected errors. Valid value(s):

-5 = Node number from input request no good.
-4 = Member number on input request no good.
-3 = Comma missing, possible other syntax problem on input request.
-2 = Group number specified on input request too big.
-1 = Syntax error in PARAM field of input request.
0  = Mismatch of internal link status in the AM.
1  = Mismatch of internal mate link status in the AM.
2  = Mismatch of internal mate link status in IUN.
3  = Mismatch of the link prove-in state.
4  = Route switch table entry for this link, kept in IUN, reflects received TFP, TFR, TFA signals; used to route banded message traffic.
100–161 = CCS7 and CCS6 error codes. Refer to the following explanation of variable fields 'e','f','g','h'.

200 = Overflow indicator (over the threshold of 16); indicates total number of errors detected by this audit.

201 = Node audit timeout. Indicates that one or more of the audit response messages from the node was not received. This may occur due to previously reported errors on the node, or due to transient node overload conditions. The ring node address (RNA) of the node is contained in field 'e'.

e = Valid value(s):

4. ACTION TO BE TAKEN

Format 1 requires no action.

Format 2 is printed when an execution of the audit is stopped using the AUD:STOP input message or by an initialization of the CNI subsystem.

Format 3 should occur only during outages or initializations of the CNI subsystem. If it occurs when the CNI is operational, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Format 4 reports non-fatal errors detected by the audit. To determine the cause of the trouble, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

All of the errors reported by this audit indicate mutilated internal data or other software problems. Such errors can occur as a side effect of other problems such as hardware faults.

If error correction was indicated (‘b’ > 0), then the audit attempted to clear the trouble, where possible, either by data correction or by other action. To verify that either action was successful, run the audit again using the AUD:LKBDST input message.

5. ALARMS

Formats 1, 2 and 3 sound no alarm.

Format 4 sounds a minor alarm unless the audit was manually requested.

2. REASON FOR OUTPUT

To report errors encountered while auditing the data for the link node so that the appropriate action can be taken to correct the table(s).

3. VARIABLE FIELD DEFINITIONS

  a = Total number of errors found.
  b = Total number of errors corrected.
  c = Abort code. Valid value(s):
     3 = Audit was aborted without completing its work.
     4 = Audit was faulted while correcting errors.
     5 = The system integrity monitor (SIM) could not start or dispatch the audit.
     6 = An error was encountered in the audit control/audit library interface.
     7 = Audit exceeded its timeout or segment limit.
     8 = SIM aborted an executing routine audit because of a blocking request.
     9 = The transient process that was running the process terminated.
    10 = A segmented audit exceeded an error threshold.
    11 = An audit was blocking a needed demand audit.
    12 = Audit rejected a request to run from SIM.
    13 = SIM aborted audit, audit subsystem was reinitialized.

d = Error code. Valid value(s):
   100 = Unable to open the office data disk file.
   101 = Read error encountered with the office data disk file.
= The local CLLI code on disk does not match the administrative module (AM) copy.
= Invalid local CLLI code.
= Links cannot use the local CLLI code.
= The region number on disk does not match the AM copy.
= Invalid region number.
= The function number on disk does not match the AM copy.
= Invalid function number.
= Links cannot use the local function number as their far-end function number.
= The point code on disk does not match the AM copy.
= Invalid point code.
= The region number contained in the point code does not match the local region number.
= Links cannot use the local point code as their far-end point code.
= The LIS destination on disk does not match the AM copy.
= Invalid LIS destination.
= Cannot write or create the office data disk file.
= Invalid version number on disk file.
= Unable to open the link set to multiple point code disk file.
= Read error encountered with the link set to multiple point code data disk.
= The point code on disk does not match AM computer copy.
= Invalid point code in the link set to multiple point code table.
= Up to 8 different point codes are allowed in the link set to multiple point code table.
= At least one of the point codes in the table should be equal to a local point code from the office data disk file.
= Unable to open the link data disk file.
= Read error encountered in the link data disk file.
= Link data exists for a ring peripheral control (RPC).
= Disk file exists but no data in the AM.
= Invalid protocol.
= Invalid encryption field.
= Invalid link type.
= Invalid far-end signal transfer point (STP).
= Inappropriate syu code.
= Inappropriate break-in.
= Invalid combined link set.
= Invalid mate link.
= Mate link is an RPC.
= Invalid mate relationship.
= Mate links are going to same far-end STP.
= Invalid CLLI code (first 6 characters or last 5 characters).
= A/E/B/D-link has local/mate CLLI code.
= A/E/B/D-link has an invalid far-end function.
= A/E/B/D-link has local/mate function.
= Invalid major state.
= Available links cannot be self-looped.
= Available CCS6 links must have signaling links (SLKs) assigned.
= Invalid speed (that is, does not match protocol).
= Invalid voice frequency link (VFL) field.
= Invalid voice access test (VAT) quadrant.
= B/D-link has an invalid far-end region.
= Invalid pool number.
= No pool but there is a combined pool.
= The pool-link table is not consistent with the link data.
= Invalid layer number.
= Invalid signaling link code.
= Invalid link set.
= No link set but there is a combined link set.
= A/E/B/D-link has an invalid far-end point code.
= A/E/B/D-link has local/mate point code.
= The link data in the AM does not match the copy on disk.
= Links going to the same destination needed to have consistent data.
= The derived data items are incorrect.
= The linkset-link table is not consistent with the link data.
= The linkset relation table is not consistent with the link data.
= There are files in the link data directory which do not conform to the naming convention.
= The virtual link (VL) assignments as shown in the link data do not match the logical-physical tables.
= Mate link should be a CCS link.
= For SADC node, facility access type (FACIL) must be MODEM.
= Invalid LI4 equipage.
= Invalid mate link field.
= Invalid link speed.
= Invalid link facility ID.
= Invalid circuit ID number (CIN).
= Invalid user.
= Invalid ring node address (RNA) or RNA out-of-range.
= For SADC node with MODEM facility, T1FA control node (TCN) field must be unassigned.
= Invalid mate link major field.
= Mated mate DCHN link should not be in the same node.
= Inconsistent PRIM/SEC field and mate link field.
= Invalid logical link ID (LACID).
= LACID provisioned for link does not match the LACID provisioned on the mate link.
= Mate link must be SECONDARY, since link is provisioned as PRIMARY.
= Mate link must be PRIMARY, since link is provisioned as SECONDARY.
= Invalid primary/secondary field.
= Invalid mate link RNA.
= Invalid mate link node type.
= Invalid screen field.
= Invalid far-end region.
= The user has not provided these tables to the common network interface (CNI).
= Open/read error encountered with the lxp_tab disk file.
= Open/read error encountered with the px1_tab disk file.
= Open/read error encountered with the vl_tab disk file.
= Open/read error encountered with the ln7slots disk file.
= The logical-physical data on disk does not match the AM copy.
= The physical-logical data on disk does not match the AM copy.
= All CCS6 links in the available (AVL) major state must have an SLK assigned.
A link has an SLK assigned but there is no link data for the link.
Physical-logical table indicates that the link is CCS7 but the link data is CCS6.
The index into the virtual link table is invalid.
A link is using an entry in the virtual link table which is marked as unused.
The virtual link data on disk does not match the AM copy.
A link is using an invalid SLK.
An RNA/VL translates to an SLK but the reverse translation does not hold true.
A CCS7 link has an entry in the VL table but it doesn't have any VLs assigned.
Physical-logical table indicates that the link is CCS6 but the link data is CCS7.
An SLK translates to an invalid RNA/VL.
An SLK translates to a link that is unequipped (that is, no link data).
An SLK translates to an CCS6 link but the virtual link is not 0.
An SLK translates to an RNA/VL but the reverse translation does not hold true.
An SLK translates to a CCS7 link but has no index into virtual link table.
An SLK translates to a CCS7 link but the virtual link is invalid.
The ln7slots data on disk does not match the AM copy.
Invalid value in the ln7slots table.
A virtual link entry is marked used but no link is using this entry.
A virtual link entry is marked unused but there is a virtual link assigned.
The virtual link assignments in the logical-physical tables are inconsistent with the link data.
An SLK translates to a link that is equipped but is not a common channel signaling (CCS) link.
Invalid version numbers on disk files.
Unable to open the cluster disk file.
Read error encountered in the cluster disk file.
Cluster level only populated cluster is not allowed for local network.
The member level preferred field is not assigned properly.
Small network populated cluster is for nonlocal network only.
The number of static members in a small network is incorrect.
The cluster flag in the administrative module (AM) does not match the cluster flag on disk.
Invalid cluster flag.
Invalid linkset in the cluster or member table(s).
Point code cannot be equal to local point code.
The linkset in the AM cluster table does not match the linkset on disk.
Invalid flag for network ID (NID) cluster in the meminfo table.
An unused member index should not have a point code.
Unable to open the nonlocal member disk file.
Read error encountered in the nonlocal member disk file.
Cannot create disk file.
Inconsistency between the cluster level flag and the unpopulated bit for the nonlocal network.
The cluster is marked as unassigned but routing information exists.
The member index in the AM cluster table does not match the member index on disk.
Invalid member index in the cluster table.
The member flag in the AM table does not match the member flag on disk.
Invalid flag in the member table.
The linkset in the AM member table does not match the linkset on disk.
Unused.
= The member is marked as unassigned but routing information exists.
= The cluster is using a member index that is unused.
= The cluster is using a member index that is using a different cluster.
= The meminfo table in the AM does not match the meminfo table on disk.
= The member index is using a cluster that is either not populated or has a different member index.
= Members in an unused member table should be unassigned.
= The cNmem_cls entry does not match the cluster table.
= Unable to open the subsystem distribution disk file.
= Read error encountered in the subsystem distribution disk file.
= Unable to open the local subsystem information disk file.
= Read error encountered in the local subsystem information disk file.
= The data in the AM does not match the copy on disk.
= The subsystem should be equipped.
= Invalid equipped indicator.
= For an equipped subsystem: Invalid channel to receive signaling messages.
= For a subsystem which is equipped by default: Invalid local function index.
= For a subsystem which is not equipped by default: Invalid local function index.
= For an equipped subsystem: Invalid want pause indicator.
= For an equipped subsystem: Invalid channel to receive management indications.
= Invalid simplex/duplex indicator.
= For an unequipped subsystem: Invalid address to receive signaling messages.
= For an unequipped subsystem: Invalid channel to receive signaling messages.
= For an unequipped subsystem: Invalid local function index.
= For an unequipped subsystem: Invalid want pause indicator.
= For an unequipped subsystem: Invalid simplex/duplex indicator.
= For an unequipped subsystem: Invalid channel to receive management indications.
= For an unequipped subsystem: Invalid mate subsystem number.
= For an unequipped subsystem: Invalid mate point code.
= For an unequipped subsystem: Invalid address to receive management indications.
= For an equipped subsystem: Invalid address to receive signaling messages, or invalid address to receive management indications.
= For an equipped subsystem: The address to receive signaling messages or the address to receive management indications is an RPC.
= For an equipped subsystem: The address to receive signaling messages or the address to receive management indications should be an equipped CCS7 link.
= For a simplex subsystem: Should have a null mate subsystem number.
= For a simplex subsystem: Should have a null mate point code.
= For a duplex subsystem: Invalid mate subsystem number.
= For a duplex subsystem: Invalid mate point code.
= For a subsystem which is not equipped by default: Invalid outgoing local function index.
= For an unequipped subsystem: Invalid outgoing local function index.
= Subsystem manager has an invalid field.
= Invalid version numbers on disk files.
= Read error encountered with the permanent relations disk file.
= Unable to open the permanent relations disk file.
= The other clock node does not appear in the permanent relations table.
= The permanent relations table should be empty.
= Even home STP missing from the permanent relations table.
= Odd home STP missing from the permanent relations table.
= Mated point code and subsystem(s) missing from the permanent relations table.
= Multiple appearances of a point code in the permanent relations table.
= Permanent relations table or disk contain embedded zeros within the table.
= Subsystem(s) associated with the point code from disk does not match the subsystem(s) from the AM.
= Point code on disk does not match point code in AM.
= Subsystem(s) associated with the point code from the AM does not match the subsystem(s) on disk.
= Point code in AM does not match point code on disk.
= Network identifier of the point code out of range.
= Invalid version number on disk file.

e = Text string describing the error encountered.

4. ACTION TO BE TAKEN

[4] AUD ENV=RTR NIDATA 1 ERROR d REPORT
    DATA 1 H’00000000     DATA 2 H’00000000
    DATA 3 H’00000000     DATA 4 H’00000000
    SUPPLEMENTARY DATA FILE e

2. REASON FOR OUTPUT

To report any errors encountered while auditing the office identification data so that the appropriate action can be
taken to correct the table(s).

Format 1 is printed when the audit completed, and indicates the number of errors found and corrected.

Format 2 is printed when the audit has stopped before its completion.

Format 3 is printed because audit failed. Refer to variable ‘c’ for explanation.

Format 4 is printed when the audit is having trouble completing. Refer to fields ‘d’ and ‘e’ for explanations.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.
b = Total number of errors corrected.
c = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was faulted while correcting errors.
   5 = System integrity monitor (SIM) could not start or dispatch the audit.
   6 = An error was encountered in the audit control/audit library interface.
   7 = Audit exceeded its timeout or segment limit.
   8 = SIM aborted an executing routine audit because of a blocking request.
   9 = Transient process that was running the process terminated.
  10 = A segmented audit exceeded an error threshold.
= An audit was blocking a needed demand audit.
= Audit rejected a request to run from SIM.
= SIM aborted audit, audit subsystem was reinitialized.

d  = Error code. Valid value(s):
  100  = Unable to open the office data disk file.
  101  = Read error encountered with the office data disk file.
  102  = The local CLLI code on disk does not match the administrative module (AM) copy.
  103  = Invalid local CLLI code.
  104  = Links cannot use the local CLLI code.
  105  = The region number on disk does not match the AM copy.
  106  = Invalid region number.
  107  = The function number on disk does not match the AM copy.
  108  = Invalid function number.
  109  = Links cannot use the local function number as their far-end function number.
  110  = The point code on disk does not match the AM copy.
  111  = Invalid point code.
  112  = The region number contained in the point code does not match the local region number.
  113  = Links cannot use the local point code as their far-end point code.
  119  = Cannot write or create the office data disk file.
  120  = Invalid version number on disk file.
  127  = The signal transfer point (STP) indicator flag is not 0.
  128  = The ANSI standard point code flag on disk does not match the AM copy.
  129  = The ANSI standard point code flag is invalid.
  130  = The critical event throttling parameter "ce_num" on disk does not match the AM copy.
  131  = The critical event throttling parameter "ce_num" is out of range.
  132  = The critical event throttling parameter "ce_time" on disk does not match the AM copy.
  133  = The critical event throttling parameter "ce_time" is out of range.
  134  = The signaling route set test low priority timer "Srs_low_timer" on disk does not match the AM copy.
  135  = The signaling route set test low priority timer "Srs_low_timer" is out of range.
  136  = The signaling route set test low priority timer "Srs_low_timer" is not a multiple of 30.
  137  = The MTP restart ON/OFF value on disk does not match the AM copy.
  138  = The MTP restart ON/OFF value is invalid.
  139  = The feature status value on disk does not match the AM memory copy.
  140  = An unused bit of the secured feature status value should be 0 instead of 1.

e  = Text string describing the error encountered.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If &quot;d&quot; =</th>
<th>Action to be taken is:</th>
</tr>
</thead>
<tbody>
<tr>
<td>100, 101</td>
<td>The audit is having difficulty in opening and/or reading the office or link set to multiple point code data disk file. This will be corrected during the audit by creating a new disk file and populating it with the data in the AM. Re-run the audit to verify that this condition no longer</td>
</tr>
</tbody>
</table>
exists.

The data on disk does not match the data in the AM. If the data in the AM is correct, then doing a recent change that copies AM to disk will remedy the problem. If, however, the disk version is correct, then the data in the AM must be changed using an office data or link set multiple point code data recent change.

One of the data items is invalid. These can be corrected by doing a recent change of the office data or link set to multiple point code data and modifying the data item in question.

These are discrepancies between the office data and the link data. If the link data is in error, then doing link data recent changes on the appropriate links should clear up the problems. If, however, the office data is wrong, then a recent change of the office data can be done to modify the item(s) in error.

The audit is having difficulty in creating or writing the new office data disk file. The audit should be re-run and if the error message appears again, the user should consult with his system administrator to find out the cause of the error.

The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was retrofitted or whether it is in the proper format.

The STP indicator flag is not 0. The value 0 indicates that the office is not an STP. This can be corrected by performing a common network interface (CNI) level 3 initialization.

The ANSI® standard point code flag is invalid. If the flag in the AM is correct, then doing a recent change that copies AM office data to disk will remedy the problem. If the flag in the AM is not correct, then use cnidboc's "U" option for office data to change the flag, cDstdpc, to the correct value. A value of 0 means that the office has the AT&T point code format. A value of 1 means that the office has the ANSI® point code format. After correcting the AM flag, perform a recent change that copies AM office data to disk.

These errors indicate that the data on disk does not match the data in the AM. If the data in the AM is correct, then doing a recent change that copies AM to disk will remedy the problem. If the disk version is correct, then the data in the AM must be changed using an office data recent change.

These errors indicate that one of the data items is out of range. These can be corrected by doing a recent change of the office data and modifying the data item in question.

5. ALARMS

2. **REASON FOR OUTPUT**

   To report errors encountered while auditing the link data tables so that appropriate action can be taken to correct the table(s).

   Format 1 is printed when the audit completed, and indicates the number of errors found and corrected. Format 2 is printed when the audit has stopped before its completion. Format 3 is printed because audit failed (variable ‘c’). Format 4 is printed when the audit is having trouble completing (variables ‘d’ and ‘e’).

3. **VARIABLE FIELD DEFINITIONS**

   a = Total number of errors found.

   b = Total number of errors corrected.

   c = Abort code. Valid value(s):
      3 = Audit was aborted without completing its work.
      4 = Audit was faulted while correcting errors.
      5 = The system integrity monitor (SIM) could not start or dispatch the audit.
      6 = An error was encountered in the audit control/audit library interface.
      7 = Audit exceeded its timeout or segment limit.
      8 = SIM aborted an executing routine audit because of a blocking request.
      9 = Transient process that was running the process terminated.
     10 = A segmented audit exceeded an error threshold.
     11 = An audit was blocking a needed demand audit.
     12 = Audit rejected a request to run from SIM.
     13 = SIM aborted audit, audit subsystem was reinitialized.
= Error code. Valid value(s):
200  = Unable to open the link data disk file.
201  = Read error encountered in the link data disk file.
202  = Link data exists for an ring process controller (RPC).
203  = Disk file exists but no data in the administrative module (AM).
204  = Invalid protocol.
205  = Invalid encryption field.
206  = Invalid link type.
207  = Invalid far-end signal transfer point (STP).
208  = Inappropriate synchronized signal unit (SYU) code.
209  = Inappropriate break-in.
210  = Invalid combined link set.
211  = Invalid mate link.
212  = Mate link is a RPC.
213  = Invalid mate relationship.
214  = Mate links are going to same far-end STP.
215  = Invalid CLLI code (first 6 characters or last 5 characters).
216  = A/E/F-link has local/mate CLLI code.
217  = A/E/F-link has an invalid far-end function.
218  = A/E/F-link has local/mate function.
219  = Invalid major state.
220  = Available links cannot be self-looped.
221  = Available CCS6 links must have signaling links (SLK)s assigned.
222  = Invalid speed (does not match protocol).
223  = Invalid voice frequency link (VFL) field.
224  = Invalid voice access test (VAT) quadrant.
226  = Invalid pool number.
227  = No pool but there is a combined pool.
228  = The pool-link table is not consistent with the link data.
229  = Invalid layer number.
230  = Invalid signaling link code.
231  = Invalid link set.
232  = No link set but there is a combined link set.
233  = A/E/F-link has an invalid far-end point code.
234  = A/E/F-link has local/mate point code.
235  = The link data in the AM does not match the copy on disk.
236  = Links going to the same destination needed to have consistent data.
237  = The derived data items are incorrect.
238  = The linkset-link table is not consistent with the link data.
239  = The linkset relation table is not consistent with the link data.
240  = There are files in the link data directory which do not conform to the naming convention.
241  = The virtual link (VL) assignments as shown in the link data do not match the logical/physical tables.
242  = Mate link should be a CCS link.
243  = For special access data channel (SADC) node, facility access type (FACIL) must be MODEM.
244  = Invalid LI4 equipage.
245  = Invalid mate link field.
246  = Invalid link speed.
247  = Invalid link facility ID.
= Invalid circuit identification number (CIN).
  = Invalid user.
  = Invalid ring node address (RNA) or RNA out of range.
  = For SADC node with MODEM facility, TCN (T1FA control node) field must be
    unassigned.
  = Invalid version number on disk file.
  = Invalid mate link major field.
  = Mated D-channel (DCHN) link should not be in the same node.
  = Inconsistent primary/secondary field and mate link field.
  = Invalid logical link ID (LACID).
  = LACID provisioned for link does not match the LACID provisioned on the mate
    link.
  = Mate link must be SECONDARY, since link is provisioned as PRIMARY.
  = Mate link must be PRIMARY, since link is provisioned as SECONDARY.
  = Invalid primary/secondary field.
  = Invalid mate link RNA.
  = Invalid mate link node type.
  = Invalid facility field.
  = Invalid medium field (must be SATELLITE or TERRESTRIAL).
  = Invalid error correction mode (ec_mode) field.
  = Invalid receive queue (rqlen) and/or transmit queue (xqlen) fields.
  = Invalid congestion onset threshold field.
  = Invalid congestion abatement threshold field.
  = Invalid normal alignment error rate monitor (AERM) signal unit (SU) error rate
    threshold (tin_val) field.
  = Invalid emergency AERM SU error rate threshold (tie_val) field.
  = Invalid ts_val field.
  = Invalid re-transmit queue (rxqlen) field.
  = Invalid screen field.
  = Invalid far-end region.
  = Invalid link interface (LI) type field.

= Text string describing the error encountered.

### 4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'd' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>200, 201</td>
<td>Problems were encountered in opening/reading the link data disk file. These will be corrected in the audit by creating a new file and populating it based on the data in the AM. Re-run the audit to ensure that this condition no longer exists.</td>
</tr>
<tr>
<td>202:</td>
<td>A link data disk file exists for a RPC. This can be verified by going into the /database/cni/lndata (using the UNIX® shell) directory and looking for a ln00-00 file. If this file exists, call your local support organization and inform them you have invalid CNI database file.</td>
</tr>
<tr>
<td>203:</td>
<td>If the disk file is not needed, remove it. If, however, this link is supposed to have data, then do a link data recent change and add appropriate information (the old disk file will be over-written with the new data).</td>
</tr>
<tr>
<td>204-218, 220, 222-227, or 229-234, 242-251, 253-275:</td>
<td>There are some invalid data items in the link data. Correct by doing a link data recent change and modifying the appropriate field.</td>
</tr>
<tr>
<td>221:</td>
<td>Available CCS6 links must have a logical link assigned if the logical/physical tables are to be used. Assign the SLK using a logical/physical add recent change.</td>
</tr>
<tr>
<td>235:</td>
<td>The data in the AM does not match the data on disk. If the data in the AM is deemed correct, then</td>
</tr>
</tbody>
</table>
do a recent change that copies the AM to disk. If, however, the data on disk is correct, then do a link data recent change and modify the appropriate fields.

236: Links going to the same far-end function have inconsistent data. The link(s) that are incorrect can be fixed using a link data recent change.

237: Certain items stored in the link data do not appear on the recent change (RC) form because these items can be derived based on the speed of the link. If these items should become inconsistent with the current speed of the link, then doing a link data recent change without really changing anything should cause the items to be derived correctly.

239: While scanning through the link data, a linkset relation table will be generated. If the current linkset relation table does NOT match the table just generated, then the existing table will be corrected accordingly. Running the audit again will verify that the table was indeed updated correctly.

240: There are files in the link data directory that do not fit the 'lnXX-X' format. Inspect and correct these files accordingly.

241: Correct these errors by doing a recent change that copies the logical/physical tables to disk. When the logical/physical tables are updated on disk, the VL assignments in the link data will be updated at the same time.

249: This error message indicates that there is an invalid data item in the link data. Doing a link data recent change without changing anything should cause the item to be derived correctly.

252: The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was retrofitted or whether it is in the proper format.

| 9        | Transient process that was running the process terminated.  
| 10       | A segmented audit exceeded an error threshold. |
An audit was blocking a needed demand audit.

Audit rejected a request to run from SIM.

SIM aborted audit, audit subsystem was reinitialized.

d = Error code. Valid value(s):

300 = The user has not provided these tables to the common network interface (CNI).
301 = Open/read error encountered with the lxp_tab disk file.
302 = Open/read error encountered with the px1_tab disk file.
303 = Open/read error encountered with the vl_tab disk file.
304 = Open/read error encountered with the ln7slots disk file.
305 = The logical/physical data on disk does not match the administrative module (AM) copy.
306 = The logical/physical data on disk does not match the AM copy.
307 = All Common Channel Signaling System 6 (CCS6) links in the available (AVL) major state must have a signaling link (SLK) assigned.
308 = A link has an SLK assigned but there is no link data for the link.
309 = Logical/physical table indicates that the link is Common Channel Signaling System 7 (CCS7) but the link data is CCS6.
310 = The index into the virtual link (VL) table is invalid.
311 = A link is using an entry in the virtual link table which is marked as unused.
312 = The VL data on disk does not match the AM copy.
313 = A link is using an invalid SLK.
314 = A ring node address (RNA)/VL translates to an SLK but the reverse translation does not hold true.
315 = A CCS7 link has an entry in the VL table but it doesn't have any VLS assigned.
316 = Logical/physical table indicates that the link is CCS6 but the link data is CCS7.
317 = An SLK translates to an invalid RNA/VL.
318 = An SLK translates to a link which is unequipped (that is, no link data).
319 = An SLK translates to an CCS6 link but the virtual link is not 0.
320 = An SLK translates to an RNA/VL but the reverse translation does not hold true.
321 = An SLK translates to a CCS7 link but has no index into virtual link table.
322 = An SLK translates to a CCS7 link but the virtual link is invalid.
323 = The ln7slots data on disk does not match the AM copy.
324 = Invalid value in the ln7slots table.
325 = A virtual link entry is marked used but no link is using this entry.
326 = A virtual link entry is marked unused but there is a virtual link assigned.
327 = The virtual link assignments in the logical/physical tables are inconsistent with the link data.
328 = An SLK translates to a link that is equipped but is not a CCS link.
329 = Invalid version numbers on disk files.

e = Text string describing the error encountered.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'd' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>301, 302, 303, 304</td>
<td>These errors indicate problems in opening/reading the disk files associated with the logical/physical translation tables. These will be corrected in the audit by creating a new disk file and populating it based on the data in the AM. Re-run the audit in order to ensure that this condition no longer exists.</td>
</tr>
</tbody>
</table>
The data in the AM does not match the data on disk. If the AM is correct, then do a recent change that copies the AM to disk. If however, the disk is correct, do a recent change which updates the tables with the correct data.

These errors are not corrected. User should do recent change to remove the incorrect entry, and another recent change to add the logical-to-physical and physical-to-logical data.

The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was retrofitted or whether it is in the proper format.

5. ALARMS

    SUPPLEMENTARY DATA FILE e

2. REASON FOR OUTPUT

To report any errors encountered while auditing the common channel signaling system 7 (CCS7) routing data so that the appropriate action can be taken to correct the table(s).

Format 1 is printed when the audit completed and indicates the number of errors found and corrected.

Format 2 is printed when the audit stopped before its completion.

Format 3 is printed because audit failed. Refer to variable 'c' for explanation.

Format 4 is printed when the audit had trouble completing. Refer to variables 'd' and 'e' for reasons why.

3. VARIABLE FIELD DEFINITIONS

a  = Total number of errors found.

b  = Total number of errors corrected.

c  = Abort code. Valid value(s):
    3  = Audit was aborted without completing its work.
    4  = Audit was faulted while correcting errors.
    5  = System integrity monitor (SIM) could not start or dispatch the audit.
    6  = An error was encountered in the audit control/audit library interface.
    7  = Audit exceeded its timeout or segment limit.
    8  = SIM aborted an executing routine audit because of a blocking request.
    9  = Name of the transient process that was running the process terminated.
   10  = A segmented audit exceeded an error threshold.
An audit was blocking a needed demand audit.
Audit rejected a request to run from SIM.
SIM aborted audit, audit subsystem was reinitialized.

= Error code. Valid value(s):
400 = Unable to open the ccs7_pc routing data disk file.
401 = Unable to open the rtg_patterns data disk file.
402 = Read error was encountered with the ccs7_pc routing data disk file.
403 = Read error was encountered with the rtg_patterns data disk file.
404 = Invalid version number was encountered on disk file.
405 = Data on disk is not in sequential order, NIDATA is attempting to sort the disk file.
406 = Inconsistent prim, alt1, and alt2 routes were encountered between the rtg_patterns table on disk and the routing priority table in the administrative module (AM) memory.
407 = Missing prim, alt1, and alt2 routes were encountered from the rtg_patterns table on disk.
408 = Missing prim, alt1, and alt2 routes were encountered from the routing priority table in the AM.
409 = Invalid items on ccs7_pc disk file. Found duplicate point code and routing flag, but different priority routes and/or director index.
410 = Invalid items on ccs7_pc disk file. Duplicate point code and conflicting routing flag were found.
411 = Fatal errors 409, 410, or 431 were found; NIDATA 4 is terminated.
412 = Invalid prim/alt1/alt2 routes were found on ccs7_pc routing data disk file.
413 = Invalid director index was found on ccs7_pc routing data disk file.
414 = Point code has invalid cluster number on ccs7_pc routing data disk file.
415 = Point code has invalid member number on ccs7_pc routing data disk file.
416 = Prim/alt1/alt2 routes are not active on ccs7_pc routing data disk file.
417 = Local network has invalid director index on ccs7_pc routing data disk file.
418 = Point code with cluster or member flag has no network data on ccs7_pc routing data disk file.
419 = Point code with member flag has no cluster data on ccs7_pc routing data disk file.
420 = Unable to create a new file.
421 = Mismatch between the routing flags on disk and in the AM.
422 = Mismatch between the prim/alt1/alt2 routes on disk and in the AM.
423 = Mismatch between the director index on disk and in the AM.
424 = Missing routing data on ccs7_pc routing data disk file.
425 = Missing routing data in the AM.
426 = Invalid routing flag on ccs7_pc routing data disk file.
428 = Duplicate routing information on ccs7_pc routing data disk file.
429 = Too many error messages, NIDATA 4 terminated.
430 = Unable to write a file.
431 = Not enough room on disk for all the AM routing data while updating the disk from the AM.
432 = Invalid routing flag found in the AM while in the process of updating the disk from the AM.

= Text string describing the error encountered.
4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'd' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>400, 401, 402, 403</td>
<td>These errors are corrected during the audit. A new disk file is created and populated from the table in the AM. Rerunning the audit verifies that the condition no longer exists.</td>
</tr>
<tr>
<td>404</td>
<td>The version number on the disk does not match the version number the audit expects. Check whether or not the file was retrofitted. If the file has been retrofitted, then verify the routing data in the AM is correct and do a disk update.</td>
</tr>
<tr>
<td>405</td>
<td>This error is not corrected during the audit. The memory buffer that contains the disk data is sorted by point code as the first key and the routing flag as the second key, so that the audit can continue testing. After the audit is complete, do the recent change and update the disk.</td>
</tr>
<tr>
<td>406</td>
<td>Audit found a mismatch between the prim/alt1/alt2 routes in the rtg_patterns table on the disk and the routing priority table in the AM. Manually check all the ccs7 point code data in the AM. If any ccs7 point code has an incorrect prim/alt1/alt2, do a recent change to correct the routes for the point codes. Once all the ccs7 point codes in the AM are correct, do a disk update.</td>
</tr>
<tr>
<td>407, 408, 424</td>
<td>Audit found missing information during comparison of the disk and the AM. Do a recent change or disk update accordingly. If error 408 is found, run AUD:NMDATA-1 in order to have a complete correction.</td>
</tr>
<tr>
<td>409, 410, 412, 413, 414, 415, 416, 417, 418, 419, 420</td>
<td>These errors are found when AUD:NIDATA-4 validates the routing information on disk. The data is invalid. Do the correction by doing recent change on the point code and update the disk. Then rerun AUD:NIDATA-4.</td>
</tr>
<tr>
<td>411</td>
<td>Fatal error, the audit terminates. According to the error messages, do the recent change fix and rerun the audit.</td>
</tr>
<tr>
<td>420, 430</td>
<td>The audit is having difficulty in creating or writing a new file. It is suggested that the audit be rerun and if the error message appears again, consult with the system administrator to find out the cause of the error.</td>
</tr>
<tr>
<td>421, 422, 423</td>
<td>During the comparison of the disk and the AM, the audit found the data in the AM memory does not match the data on the disk. Analyze which data is correct, do the recent change, and update the disk.</td>
</tr>
<tr>
<td>425</td>
<td>Verify the routing data on disk is correct, then recent change the missing point code and rerun AUD:NIDATA-4.</td>
</tr>
<tr>
<td>428</td>
<td>This error is automatically corrected by deleting the duplicated point code in the routing data table.</td>
</tr>
<tr>
<td>429</td>
<td>Too many errors occurred during the audit. It is suggested that all reported errors be fixed and then rerun AUD:NIDATA-4.</td>
</tr>
<tr>
<td>431, 432</td>
<td>These errors were found during the disk update from AM memory. Check the data in the AM, make the correction, and rerun AUD:NIDATA-4.</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To report any errors encountered while auditing the subsystem information data so that the appropriate action can be taken to correct the table(s).

Format 1 is printed when the audit completed and indicates the number of errors found and corrected.

Format 2 is printed when the audit has stopped before its completion.

Format 3 is printed because audit failed. Refer to parameter 'c' for explanation.

Format 4 is printed when the audit is having trouble completing (variables 'd' and 'e').

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was faulted while correcting errors.
   5 = System integrity monitor (SIM) could not start or dispatch the audit.
   6 = An error was encountered in the audit control/audit library interface.
   7 = Audit exceeded its timeout or segment limit.
   8 = SIM aborted an executing routine audit because of a blocking request.
   9 = Transient process that was running the process terminated.
  10 = A segmented audit exceeded an error threshold.
An audit was blocking a needed demand audit.
Audit rejected a request to run from SIM.
SIM aborted audit, audit subsystem was reinitialized.

**Error code. Valid value(s):**

- 500 = Unable to open the subsystem distribution disk file.
- 501 = Read error encountered in the subsystem distribution disk file.
- 502 = Unable to open the local subsystem information disk file.
- 503 = Read error encountered in the local subsystem information disk file.
- 504 = The data in the administrative module (AM) does not match the copy on disk.
- 505 = The subsystem should be equipped.
- 506 = Invalid equipped indicator.
- 507 = For an equipped subsystem: Invalid channel to receive signaling messages.
- 508 = For a subsystem that is equipped by default: Invalid local function index.
- 509 = For a subsystem that is not equipped by default: Invalid local function index.
- 510 = For an equipped subsystem: Invalid want pause indicator.
- 511 = For an equipped subsystem: Invalid channel to receive management indications.
- 512 = Invalid simplex/duplex indicator.
- 513 = For an unequipped subsystem: Invalid address to receive signaling messages.
- 514 = For an unequipped subsystem: Invalid channel to receive signaling messages.
- 515 = For an unequipped subsystem: Invalid local function index.
- 516 = For an unequipped subsystem: Invalid want pause indicator.
- 517 = For an unequipped subsystem: Invalid simplex/duplex indicator.
- 518 = For an unequipped subsystem: Invalid channel to receive management indications.
- 519 = For an unequipped subsystem: Invalid mate subsystem number.
- 520 = For an unequipped subsystem: Invalid mate point code.
- 521 = For an unequipped subsystem: Invalid address to receive management indications.
- 522 = For an equipped subsystem: Invalid address to receive signaling messages, or invalid address to receive management indications.
- 523 = For an equipped subsystem: The address to receive signaling messages or the address to receive management indications is an RPC.
- 524 = For an equipped subsystem: The address to receive signaling messages or the address to receive management indications should be an equipped CCS7 link.
- 525 = For a simplex subsystem: Should have a null mate subsystem number.
- 526 = For a simplex subsystem: Should have a null mate point code.
- 527 = For a duplex subsystem: Invalid mate subsystem number.
- 528 = For a duplex subsystem: Invalid mate point code.
- 529 = For a subsystem which is not equipped by default: Invalid outgoing local function index.
- 530 = For an unequipped subsystem: Invalid outgoing local function index.
- 531 = Subsystem manager has an invalid field.
- 532 = Invalid version numbers on disk files.

**Text string describing the error encountered.**

**4. ACTION TO BE TAKEN**

<table>
<thead>
<tr>
<th>Action:</th>

   SUPPLEMENTARY DATA FILE e

2. REASON FOR OUTPUT

To report any errors encountered while auditing the global title translator so that the appropriate action can be taken to correct the table(s).

Format 1 is printed when the audit completed, and indicates the number of errors found and corrected.

Format 2 is printed when the audit stopped before its completion.

Format 3 is printed because audit failed. Refer to variable 'c' for explanation.

Format 4 is printed when the audit had trouble completing. Refer to variables 'd' and 'e' for reasons why.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.
b = Total number of errors corrected.
c = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was fauluted while correcting errors.
   5 = System integrity monitor (SIM) could not start or dispatch the audit.
   6 = An error was encountered in the audit control/audit library interface.
   7 = Audit exceeded its timeout or segment limit.
   8 = SIM aborted an executing routine audit because of a blocking request.
   9 = Transient process that was running the process terminated.
  10 = A segmented audit exceeded an error threshold.
An audit was blocking a needed demand audit.
Audit rejected a request to run from SIM.
SIM aborted audit, audit subsystem was reinitialized.

\[d\] = Error code. Valid value(s):
800 = Unable to open the global title translator disk file.
801 = Read error encountered with the global title translator data disk file.
802 = Unable to create or write the global title translator data disk file.
803 = The administrative module (AM) global translator pair and cSadjstp table do not match.
804 = The AM copy and disk do not match.
805 = The global title translator pair is zero.
806 = Invalid network identifier.
807 = Member should be zero for a signal transfer point (STP) point code.
808 = If an STP, the global translator pair must equal the local point code.
809 = No routing data exists for the point code.
810 = Invalid version number on disk file.

\[e\] = Text string describing the error encountered.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If (d) =</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>800, 801</td>
<td>The audit is having problems in opening or reading the disk file associated with the global title translator. These will be corrected during the audit by creating a new disk file and populating it with the data in the AM. Re-run the audit to verify that this condition no longer exists.</td>
</tr>
<tr>
<td>802</td>
<td>The audit is having difficulty in creating or writing the new global title translator data disk file. The audit should be re-run. If the error message appears again, the user should consult with his system administrator to find out the error.</td>
</tr>
<tr>
<td>803</td>
<td>This error indicates that the data in the AM for the general translator pair does not match the cSadjstp table. The audit will correct the general translator pair according to the cSadjstp table.</td>
</tr>
<tr>
<td>804</td>
<td>The data on disk does not match the data in the AM. If the data in the AM is correct, then doing a recent change that copies AM to disk will remedy the problem. If, however, the disk version is correct, then the data in the AM must be changed using a global title translator data recent change.</td>
</tr>
<tr>
<td>805</td>
<td>This error indicates that the general translator pair is zero and different from the cSadjstp table (the cSadjstp point codes are not zero). The audit will correct the general translator pair according to the cSadjstp table.</td>
</tr>
<tr>
<td>806, 807</td>
<td>These errors indicate that one of the data items in the table is invalid. These can be corrected by doing a recent change of the global title translator data and modifying the data item in question (refer to RC/V View 15.11). One of the data items in the table is invalid. These can be corrected by doing a recent change of the global title translator data and modifying the data item in question.</td>
</tr>
<tr>

2. **REASON FOR OUTPUT**

   To report any errors encountered while auditing the protocol timers/parameters data will be output so that the appropriate action can be taken to correct the data.

   Format 1 is printed when the audit completed, and indicates the number of errors found and corrected.

   Format 2 is printed when the audit stopped before its completion.

   Format 3 is printed because audit failed. Refer to variable 'c' for explanation.

   Format 4 is printed when the audit had trouble completing. Refer to variables 'd' and 'e' for reasons why.

3. **VARIABLE FIELD DEFINITIONS**

   a = Total number of errors found.  
   b = Total number of errors corrected.  
   c = Abort code. Valid value(s):
      3 = Audit was aborted without completing its work.  
      4 = Audit was faulted while correcting errors.  
      5 = System integrity monitor (SIM) could not start or dispatch the audit.  
      6 = An error was encountered in the audit control/audit library interface.  
      7 = Audit exceeded its timeout or segment limit.  
      8 = SIM aborted an executing routine audit because of a blocking request.  
      9 = Transient process that was running the process terminated.  
     10 = A segmented audit exceeded an error threshold.
An audit was blocking a needed demand audit.
Audit rejected a request to run from SIM.
SIM aborted audit, audit subsystem was reinitialized.

d  = Error code. Valid value(s):
  000  = Unable to open the protocol timer/parameter disk file.
  001  = Read error encountered in the protocol timer/parameter disk file.
  002  = Unable to create/write protocol timer/parameter disk file.
  003  = Office timer data in administrative module (AM) memory differs from that in the
        disk file.
  004  = Office timer data in AM memory is invalid.
  005  = Link set timer data in AM memory differs from that in the disk file.
  006  = Link set timer data in AM memory is invalid.
  007  = Link set threshold data in AM memory differs from that in the disk file.
  008  = Link set threshold data in AM memory is invalid.
  009  = Link timer data in AM memory differs from that in the disk file.
  010  = Link timer data in AM memory is invalid.
  011  = Signal unit error rate monitor (SUERM) threshold data in AM memory differs from
        that in the disk file.
  012  = SUERM threshold data in AM memory is invalid.
  013  = Invalid version number in disk file.
  014  = Too many bytes in the protocol timer/parameter disk file.

e  = Text string describing the error encountered.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>Action:</th>
</tr>
</thead>
</table>
| 1000, 1001 | These errors are corrected during the audit. A new disk file will be created and populated from
        the data in the AM. Re-running the audit will verify that the condition no longer exists. |
| 1002 | This error indicates that the operating system prevented the audit from creating/writing a new
       disk file. The reason should be determined and corrected before re-running the audit. |
| 1003 | Error messages of this type reflect the fact that the office timer data in the AM does not match
       the data on the disk. If the data in the AM is deemed correct, then do an office timer recent
       change that copies the AM memory office timers to disk. If the data on disk is correct, then do
       an office timer recent change for AM memory and modify the appropriate timer(s). |
| 1004 | These error messages indicate that there are invalid office timer data items in AM memory.
       These can be corrected by doing an office timer recent change to AM memory. Consider
       following this with an office timer recent change that copies the AM memory office timers to
       disk. |
| 1005 | Error messages of this type reflect the fact that the link set timer data in the AM does not
       match the data on the disk. If the data in the AM is deemed correct, then do a link set timer
       recent change that copies the AM memory link set timers to disk. If the data on disk is correct,
       then do a link set timer recent change for AM memory and modify the appropriate timer(s). |
| 1006 | These error messages indicate that there are invalid link set timer data items in AM memory.
       These can be corrected by doing a link set timer recent change for AM memory. Consider
       following this with a link set timer recent change that copies the AM memory link set timers to
       disk. |
| 1007 | Error messages of this type reflect the fact that the link set threshold data in the AM does not
       match the data on the disk. If the data in the AM is deemed correct, then do a link set
       threshold recent change that copies the AM memory link set thresholds to disk. If the data on
       disk is correct, then do a link set threshold recent change for AM memory and modify the

Software Release: 5E14 and later
Message Class: MTCE
Application: 5, CNI
Type: Output

1. FORMAT

[1] AUD ENV=RTR NMDATA 1   COMPLETED
   a ERRORS FOUND
   b ERRORS CORRECTED

[2] AUD ENV=RTR NMDATA 1 STOPPED

[3] AUD ENV=RTR NMDATA 1 ABORTED CODE c

[4] AUD ENV=RTR NMDATA 1 ERROR de f REPORT COMPLETED
   DATA1 X'00000000
   DATA2 X'00000000
   DATA3 X'00000000
   DATA4 X'00000000
   NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

To respond to the AUD:NMDATA input message.

Format 1 contains the summary report when the audit runs to completion (with or without errors).

Format 2 is in response to the STOP:AUD,NMDATA input message.

Format 3 is in response to a problem that the system integrity monitor (SIM) encountered with the audit.

When errors are detected by the audit, Format 4 is used to report the errors.

3. VARIABLE FIELD DEFINITIONS

DATA1 = The address of the error.
DATA2 = The erroneous data value.
DATA3 = The index into the table (variable 'd' determines which table).
DATA4 = The correct data value.

a = Total number of errors found.
b = Total number of errors corrected.
c = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was faulted while correcting errors.
   5 = SIM could not start or dispatch the audit.
An error was encountered in the audit control/audit library interface.

Audit exceeded its timeout or segment limit.

SIM aborted an executing routine audit because of a blocking request.

Transient process that was running the process terminated.

A segmented audit exceeded an error threshold.

An audit was blocking a needed demand audit.

Audit rejected a request to run from SIM.

SIM aborted audit, audit subsystem was reinitialized.

Table that the error occurred in. Valid value(s):

- Network table.
- Cluster table.
- Page access table.
- Member table.
- Free list header table.
- Link set translation table.
- Routing priority index (RPI) Status table.
- Director index to network table.
- Page access count.

Error code. Valid value(s):

- Invalid free list header.
- Infinite free list (loop in free list).
- Multiple pointers point to the next table entry.
- No pointer exists.
- Index error.
- Invalid flag value.
- Invalid/inconsistent route status.
- Error in count of exceptional page access data.
- An unused data field has an invalid value.
- An entry in the director index to network table is inconsistent with data in the network table.
- The link set translation table is inconsistent with the link set relation or routing priority tables.
- The RPI status table is inconsistent with the link set status table.
- Signaling connection control part (SCCP) index field inconsistency.
- Maximum errors threshold reached.
- Invalid internal audit data.

NOTE: Errors 13 and 14 are not associated with any tables. Therefore, variable field 'd' will not be printed.

Error status. Valid value(s):

CORR = Correct.
NOT CORR = Not correct.

4. ACTION TO BE TAKEN
Common network interface (CNI) customer support should always be notified in the event of an error. CNI does not recommend running this audit in error correction mode. Error correction mode should only be used under the guidance of CNI Customer Support.

**NOTE:** When the audit is run in error correction mode, the applications are not notified of the updates to the AM routing data.

5. ALARMS

None.

[4] AUD ENV=RTR NMDATA 2 ERROR de f REPORT COMPLETED
   DATA1 X'ggggggggg
   DATA2 X'ggggggggg
   DATA3 X'ggggggggg
   DATA4 X'ggggggggg
   NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

To respond to the AUD:NMDATA input message.

Format 1 contains the summary report when the audit runs to completion (with or without errors).

Format 2 is in response to the STOP:AUD input message with the NMDATA=2 option.

Format 3 is in response to a problem that the system integrity monitor (SIM) encountered with the audit.

When errors are detected by the audit, Format 4 is used to report the errors.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.
b = Total number of errors corrected.
c = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was faulted while correcting errors.
   5 = SIM could not start or dispatch the audit.
   6 = An error was encountered in the audit control/audit library interface.
   7 = Audit exceeded its timeout or segment limit.
   8 = SIM aborted an executing routine audit because of a blocking request.
   9 = Transient process that was running the process terminated.
  10 = A segmented audit exceeded an error threshold.

d = Table that the error occurred in. Valid value(s):
17  = Loadshare table.

e  = Error code. Valid value(s):
  13  = Maximum errors threshold reached.
  15  = Invalid internal audit data.

  Note: Errors 13 and 15 are not associated with any tables. Therefore, variable field 'e' will not be printed.

  20  = Bad ring node address (RNA) value in loadshare table.
  21  = RNA in loadshare table is inconsistent with link node data.
  22  = RNA found in loadshare table but should not be in the table.
  23  = RNA was not found in loadshare table, but should be.
  24  = Link state for RNA indicates that the linkset status should be NORMAL.

f  = Correction status. Valid value(s):
  CORR
  NOT CORR

  = Valid value(s):

<table>
<thead>
<tr>
<th>If 'e' =</th>
<th>'g' =</th>
</tr>
</thead>
</table>
| 20, 21, 22 | DATA1 = The address of the error in the loadshare table.
|          | DATA2 = The erroneous data value. For error 21, DATA2 contains the value of the RNA which has the inconsistency with the link node data. For error 22, DATA2 contains the value of the RNA which is in the table, but should not be.
|          | DATA3 = The linkset number which is used to access the specific loadshare table.
|          | DATA4 = The correct data value from a newly-created copy of the loadshare table. The correct data value from the copy of the loadshare table is associated with the same signaling link selection (SLS) code as the incorrect data value.
| 23, 24   | DATA1 = The address of the RNA in the linkset-to-RNA table.
|          | DATA2 = The erroneous data value. For error 23, DATA2 contains the value of the RNA which is not in the table but should be. For error 24, DATA2 contains the value of the RNA for which the link state indicates the linkset status should be NORMAL.
|          | DATA3 = The linkset number used to access the specific loadshare table.
|          | DATA4 = 0 for these errors.

4. ACTION TO BE TAKEN

Common network interface (CNI) customer support should always be notified in the event of an error. This audit is normally run in error correcting mode. Any changes in the AM data are also reflected in direct link nodes (DLNs). The user is notified of loadshare table updates when this audit is run in error correction mode.

5. ALARMS

None.

   DATA 3 H’h           DATA 4 H’i
   NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

To report the termination status of the ring node state (NODEST) audits and/or any errors found.

These audits may be executed due to routine schedule, manual request, or interprocess message switch (IMS) initialization (level 0 or 1A).

When the audit finds no errors termination status is printed only for manual requests.

3. VARIABLE FIELD DEFINITIONS

a  = The node availability map audit. (Refer to the AUD:NODEST input message for a description.)
b  = Total number of errors found.
c  = Total number of errors corrected.
d  = Abort code. Valid value(s):
   3  = Audit was aborted without completing its work.
   4  = Audit was faulted while correcting errors.
   5  = The system integrity monitor (SIM) could not start or dispatch the audit.
   6  = An error was encountered in the audit control/audit library interface.
   7  = Audit exceeded its timeout or segment limit.
   8  = SIM aborted an executing routine audit because of a blocking request.
   9  = Transient process that was running the audit terminated.
  10  = A segmented audit exceeded an error threshold.
  11  = An audit was blocking a needed demand audit.
  12  = Audit rejected a request to run from SIM.
  13  = SIM aborted audit, audit subsystem was reinitialized.
e = Error code. For \( a = 1 \), the error code is always 0.

f = For \( a = 1 \), the bit position in the node availability map (0-X'3FF). When this is expressed as three hexadecimal digits, the left two digits identify the ring node group and the right digit identifies the ring node position in the group. Thus X'3FF corresponds to ring node group 63, position 15.

g = For \( a = 1 \), the expected value of the map bit corresponding to the ring node \( f \). Valid value(s):

0 = Ring node is a ring processor node (RPCN) or is an IMS user node (IUN) which is not in the ACT major state.
1 = Ring node is an IUN in the ACT major state.

h = For \( a = 1 \), the major state of ring node \( f \), as recorded within the IMS driver process. Refer to the OP:RING output message. Valid value(s):

0 = Active.
1 = Standby.
2 = Unavailable.
3 = Off-line.
4 = Out-of-service.
5 = Unequipped.
6 = Initialize.
7 = Grow.

i = For \( a = 1 \), should always be 0.

### 4. ACTION TO BE TAKEN

Format 1 should appear alone only when the audit is manually requested with the summary option or detected no errors. Error analysis must be based on Format 4 messages.

Format 2 is printed when an execution of the audit is stopped using the STOP:AUD input message or by an initialization of the IMS subsystem.

Format 3 should occur only during outages and initializations of the IMS subsystem. If it occurs when IMS is operational, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Format 4 reports errors detected by the audit. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For \( a = 1 \) (the node availability map audit), all of the errors indicate mutilated internal data or other software problems. These errors can occur as a side effect of other problems, such as those reported using the REPT:IMSDRV-FLT output message.

Correction should be made by the audit. If error correction was indicated \( (c > 0) \) then the audit corrected the errors.

To verify that error correction was successful, run the audit again using the AUD:NODEST input message.

### 5. ALARMS

For Formats 1, 2, and 3, none.
Format 4 sounds a minor alarm unless the audit was manually requested.

AUD:ENV-NOT-RUN

Software Release: 5E14 and later
Message Class: AUDTFST,AUDT
Application: 5
Type: Output

1. FORMAT

AUD ENV=a b NOT_RUN ERRORS=c EVENT=d

2. REASON FOR OUTPUT

To report that a kernel process environment (OKP or SMKP) audit in the administrative module (AM) was not run as requested (due to CM isolation being detected, a relation in transaction update mode, and so forth).

3. VARIABLE FIELD DEFINITIONS

a  = Kernel process where the application audit resides. Valid value(s):
   OKP    = Operation kernel process.
   SMKP   = Switch maintenance kernel process.

b  = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.

c  = Total number of errors found (zero).

d  = Event number.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

[6] AUD ENV=RTR FMGR 1 AUTOMATICALLY l

2. REASON FOR OUTPUT

To report the termination status of the task queue audit (FMGR 1) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.
b = Total number of errors corrected.
c = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was faulted while correcting errors.
   5 = System integrity monitor (SIM) could not start or dispatch the audit.
   6 = An error was encountered in the audit control/audit library interface.
   7 = Audit exceeded its timeout or segment limit.
   8 = SIM aborted an executing routine audit because of a blocking request.
   9 = Transient process that was running the process terminated.
  10 = A segmented audit exceeded an error threshold.

Copyright ©2003 Lucent Technologies
12 = Audit rejected the request to run from SIM.
13 = SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Valid value(s):
  2 = Invalid taskid field.
  3 = Invalid sleep address.
  4 = Invalid task stack pointer.
  5 = Invalid message pointer.
  6 = Task too old.
  7 = Invalid task time stamp.

e = Address of the error: pointer to the task header information.

f = Erroneous data value.

g = Error index: used to identify the error.

h = Corrected data value.

i = Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.

j = Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.

k = Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes section of the Output Messages manual.

l = Inhibit status. Valid value(s):
   ALLOWED = Audit has been automatically allowed by SIM.
   INHIBITED = Audit has been automatically inhibited by SIM.

Note: Refer to the APP:AUD-A and APP:AUD-B appendixes in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode. If the messages continue to appear (rolling audit messages) after the audit is run in correcting mode, contact your next level of technical support.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the termination status of the internal inode table audit (FMGR 2) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.
b = Total number of errors corrected.
c = Abort code. Valid value(s):
  3 = Audit was aborted without completing its work.
  4 = Audit was faulted while correcting errors.
  5 = System integrity monitor (SIM) could not start or dispatch the audit.
  6 = An error was encountered in the audit control/audit library interface.
  7 = Audit exceeded its timeout or segment limit.
  8 = SIM aborted an executing routine audit because of a blocking request.
  9 = Transient process that was running the process terminated.
A segmented audit exceeded an error threshold.
Audit rejected the request to run from SIM.
SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Valid value(s):
   12  = Invalid reference count.
   13  = Invalid write count.
   14  = Invalid taskid.
   15  = Invalid time stamp.
   16  = DISK/INCORE inode mismatch.
   17  = Invalid file table pointer.
   19  = Invalid mount table pointer or invalid inode flag.
   25  = Incorrect inode in use count.
   26  = Invalid table size value.
   27  = Bad degrow page start pointer.
   28  = Invalid mount table or mount table pointer.
   92  = Open count for driver is incorrect.

e = Address of the error: pointer to the inode table, block device table or character device table.

f = Valid value(s):

<table>
<thead>
<tr>
<th>d</th>
<th>f</th>
</tr>
</thead>
<tbody>
<tr>
<td>16</td>
<td>Minor device chain table record ID (MDCT-RID).</td>
</tr>
<tr>
<td>other</td>
<td>Erroneous data.</td>
</tr>
</tbody>
</table>

= Error index. Valid value(s):

<table>
<thead>
<tr>
<th>d</th>
<th>g</th>
</tr>
</thead>
</table>
| 12  | 1 = Incorrect inode open count.
|     | 2 = Inode open count nonzero, but no corresponding file table exists. |
| 16  | m = 1, size field mismatch.
|     | n = 1, group ID field mismatch.
|     | o = 1, user ID field mismatch.
|     | p = 1, link field mismatch.
|     | q = 1, mode field mismatch.
|     | r = 0, not used.
|     | s = 1-13, s address mismatch (1 - d in hex). |
| 19  | 0 = Invalid inode flag (i-flag). |
|     | 1 = Invalid mount table pointer. |
| 28  | 1 = Invalid device pointer field inode. |
|     | 2 = Device pointer field in inode does not point to start of mount table. |
|     | 3 = Invalid mount table entry. |
| 92  | 0 = The block device table is incorrect. |
|     | 1 = The character device table is incorrect. |

The variable 'g' is unused for all other values of 'd'.

h = Corrected data value. Valid value(s):
If 'd' = 'h' =

12 Open count for the file table entry corresponding to the inode.
13 Inode reference count.
14 NULL.
15 Current system time.
16 Partition number inode number.
17 Correct file table pointer.
19 If g=0, valid inode flag (i-flag). If g=1, valid mount table pointer (if one exists).
25-28 NULL.
92 Correct open count for driver.

i = Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.

j = Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.

k = Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes section of the Output Messages manual.

l = Inhibit status. Valid value(s):
   ALLOWED = Audit has been automatically allowed by SIM.
   INHIBITED = Audit has been automatically inhibited by SIM.

Note: Refer to the APP:AUD-A and APP:AUD-B appendixes in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

2. REASON FOR OUTPUT

To report the termination status of the internal capability table audit (FMGR 5) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.
b = Total number of errors corrected.
c = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was faulted while correcting errors.
   5 = System integrity monitor (SIM) could not start or dispatch the audit.
   6 = An error was encountered in the audit control/audit library interface.
   7 = Audit exceeded its timeout or segment limit.
   8 = SIM aborted an executing routine audit because of a blocking request.
   9 = Transient process that was running the process terminated.
A segmented audit exceeded an error threshold.
Audit rejected the request to run from SIM.
SIM aborted the executing audit because the audit system is being reinitialized.

**d**
Error code. Valid error codes are:
- 41: Nonexistent process.
- 42: Invalid file table pointer.
- 43: Invalid pointer to the next capability table entry on the chain.
- 44: Invalid capability pointer in file table entry.
- 45: Invalid capability chain.
- 47: Invalid free list.
- 48: Incorrect capability table size.
- 49: Incorrect degrowth page marker.

**e**
Address of the error: pointer to the file table entry.

**f**
Erroneous data value.

**g**
Error index used to identify the error. Index is zero unless listed.

**i**
Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.

**j**
Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.

**k**
Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes section of the Output Messages manual.

**l**
Inhibit status. Valid value(s):
- ALLOWED = Audit has been automatically allowed by SIM.
INHIBITED = Audit has been automatically inhibited by SIM.

Note: Refer to the APP:AUD-A and APP:AUD-B appendixes in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode. If the messages continue to appear (rolling audit messages) after the audit is run in correcting mode, contact your next level of technical support.

In addition, run the file table audit.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT
To report the termination status of the buffer audit (FMGR 6) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Total number of errors found.

b = Total number of errors corrected.

c = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was faulted while correcting errors.
   5 = System integrity monitor (SIM) could not start or dispatch the audit.
   6 = An error was encountered in the audit control/audit library interface.
   7 = Audit exceeded its timeout or segment limit.
   8 = SIM aborted an executing routine audit because of a blocking request.
   9 = Transient process that was running the process terminated.
  10 = A segmented audit exceeded an error threshold.
12 = Audit rejected the request to run from SIM.
13 = SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Valid value(s):
   51 = Free list chain is broken.
   52 = Device chain is broken.
   54 = Invalid free list chain pointer.
   55 = Invalid device chain pointer.
   56 = Invalid buffer pointer.
   57 = Invalid mount table pointer.
   58 = Invalid taskid.
   59 = Buffer is too old.
   60 = Invalid time stamp.
   61 = Invalid taskid/flock combination.
   62 = Invalid taskid/flock combination.
   64 = Invalid total number of free inodes.

e = Address of the error.

f = Erroneous data value.

g = Error index. Used to identify the error.

2. REASON FOR OUTPUT

To report the termination status of the file system block audit and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. UNIX® RTR audits have the value 1, but application audits may be greater than 1.
b = Name of the file system that was audited.
c = Total number of errors found.
d = Total number of errors corrected.
e = Abort code. Valid value(s):
    3 = Audit was aborted without completing its work.
    4 = Audit was faulted while correcting errors.
    5 = System integrity monitor (SIM) could not start or dispatch the audit.
An error was encountered in the audit control/audit library interface.
Audit exceeded its timeout or segment limit.
SIM aborted an executing routine audit because of a blocking request.
Transient process that was running the process terminated.
A segmented audit exceeded an error threshold.
Audit rejected the request to run from SIM.
SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Valid value(s):
1 = Bad superblock label.
2 = Bad file mode. Refer to the APP:FILE-TYPE appendix in the Appendixes section of the Output Messages manual (235-600-750) for more information on file types.
3 = Bad block size.
4 = Bad block (block out of file system block range).
5 = Duplicate block number.
6 = Bad address block (address block contains invalid block addresses).
7 = Temp file found in file system when audit invoked with PARM="BACKUP". This condition does not represent an actual file system error, but if a backup tape is made with this condition present, the backup tape could contain file system errors. There is no corrective action possible or needed for this condition.
8 = Audit library initialization failed.
9 = Unable to open device file.
10 = Unable to start device file.
11 = Device file not a block device.
12 = Unable to open device file.
13 = Unable to queue a message.
14 = Unable to add segments.
15 = Unable to read superblock.
16 = Unable to access block (or get buffer to read block).
17 = Unable to get a free block.
18 = Unable to access inode.
19 = Unable to remove a segment.
20 = Cannot mount the device.
21 = Unable to get bitmap segment ID.
22 = Bitmap I/O failed.
26 = The device file is open for writing.
35 = File manager segment list is full.
36 = File system size in superblock is out of range.
37 = Inode list size in superblock is out of range.

g = Inode reference. Valid value(s):

\[ j \]

Usage. Valid value(s):

\[ k \]

Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.

\[ l \]

Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.
Messages manual.

m = Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes section of the Output Messages manual.

n = Inhibit status. Valid value(s):
ALLOWED = Audit has been automatically allowed by SIM.
INHIBITED = Audit has been automatically inhibited by SIM.

NOTE: Refer to the APP:AUD-A and APP:AUD-B appendixes in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

p = Block content. Valid value(s):
0 = The block is a data block.
1 = The block is an address block.

q = Block type. Valid value(s):
1 = Regular file direct block.
2 = Single indirect block.
3 = Double indirect block.
4 = Triple indirect block.
5 = Extent file.

4. ACTIONS TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, take the following action.

<table>
<thead>
<tr>
<th>Error code</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 2</td>
<td>They are not correctable. Back up the file system from backup source.</td>
</tr>
<tr>
<td>3, 4, 5, 6</td>
<td>Use the input message OP:FNAME to print the full pathname of the file then rerun the audit in the CORR mode to correct those errors.</td>
</tr>
<tr>
<td>7</td>
<td>No action is required.</td>
</tr>
<tr>
<td>8 - 26, 36, 37</td>
<td>Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>35</td>
<td>This will occur when the maximum number of file manager tasks are running and using the available file manager segment table slots. Rerun the audit at different times during the day when there are no other file system audits running. If the problem persists, execute a level 3 initialization. If the problem still persists, then create an off-line memory dump tape and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
</tbody>
</table>

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the termination status of the file system compaction audit and/or errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Audit application. UNIX® RTR audits have the value 1, but application audits may be greater than 1.
b = Name of the file system that was audited.
c = Total number of error or report messages.

d = Total number of reports for corrected errors and for compaction completed.

e = Abort code. Valid value(s):
3 = Audit was aborted without completing its work.
4 = Audit was faulted while correcting errors.
5 = System integrity monitor (SIM) could not start or dispatch the audit.
6 = An error was encountered in the audit control/audit library interface.
7 = Audit exceeded its timeout limit.
8 = SIM aborted an executing routine audit because of a blocking request.
12 = Audit rejected the request to run from SIM.
13 = SIM aborted an executing audit because the audit system is being reinitialized.

f = Error code. Valid value(s):
1 = Bad superblock label. Valid value(s):
   g = Not used.
   h = File system label.
   i = Not used.
   j = Not used.

4 = Bad block (block out of file system block range). Valid value(s):
   g = Inode number.
   h = Bad or duplicate block number.
   i = 0x000000AB indicating block and file type, or 0x000000C0 indicating the block usage change that was occurring when the error was detected.

h  = Inode list size.
  
i  = Not used.
  
j  = File system size.

37  = Inode list size in superblock is out of range.
  
g  = Not used.
  
h  = Inode list size.
  
i  = Not used.
  
j  = File system size.

k  = Data report code. Valid data codes are:
  
  2  = This report is generated for one of three conditions:

  — Compaction was requested in non-correcting mode.

  — Compaction was requested in either correcting or non-correcting mode and could not complete because of non-corrected errors.

  — Compaction was requested in correcting mode and the projected number of
contiguous blocks that could be freed is less than or equal to the current number of contiguous free blocks.

Fields 'g' through 'j' contain the information.

- \( g \) = Total number of free blocks.
- \( h \) = Projected number of contiguous free blocks after compaction.
- \( i \) = Current maximum number of contiguous free blocks.
- \( j \) = Projected cost of compaction in number of relocations required.

If the audit is internally aborted before the cost of compaction could be estimated, this field will be 0xffffffff. If the audit is internally aborted after some compaction effort has been made, this field is the number of input/output (I/O) read/write jobs already executed before the internal abort.

\( 3 \) = Compaction was completed.

- \( g \) = Total number of free blocks.
- \( h \) = Number of contiguous free blocks at end of the file system after compaction.
- \( i \) = Maximum number of contiguous free blocks before compaction.
- \( j \) = Cost of compaction in number of I/O read/write jobs executed. If this field is zero, the file system requires no compaction.

\( l \) = Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.

\( m \) = Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.

\( n \) = Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes section of the Output Messages manual.

\( o \) = Inhibit status. Valid value(s):
- ALLOWED = Audit has been automatically allowed by SIM.
- INHIBITED = Audit has been automatically inhibited by SIM.

**NOTE:** Refer to the APP:AUD-A and APP:AUD-B appendixes in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

**4. ACTIONS TO BE TAKEN**

For Formats 1, 2, 3, 5, 6, and 7, no action is necessary.

For Format 4, take the following action.

<table>
<thead>
<tr>
<th>Error code</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>It is not correctable. Back up the file system from backup source.</td>
</tr>
<tr>
<td>4, 5, 6</td>
<td>Run the block audit in noncorrecting mode. If it finds errors, run the block audit in correcting mode. Then this audit may be tried again.</td>
</tr>
<tr>
<td>8 - 23</td>
<td>Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
</tbody>
</table>
Run this audit with reduced file system activity.

This will occur when the maximum number of file manager tasks are running and using the available file manager segment table slots. Rerun the audit at different times during the day when there are no other file system audits running. If the problem persists, execute a level 3 initialization. If the problem still persists, then create an off-line memory dump tape and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT
To report the termination status of file system link audit and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. UNIX® RTR audits have the value 1, but application audits may be greater than 1.
b = Name of the file system that was audited.
c = Total number of errors.
d = Total number of reports for corrected errors and for compaction completed.
e = Abort code. Valid value(s):
  3 = Audit was aborted without completing its work.
  4 = Audit was faulted while correcting errors.
  5 = System integrity monitor (SIM) could not start or dispatch the audit.
An error was encountered in the audit control/audit library interface.

Audit exceeded its timeout or segment limit.

SIM aborted an executing routine audit because of a blocking request.

Transient process that was running the audit terminated.

A segmented audit exceeded an error threshold.

Audit rejected the request to run from SIM.

SIM aborted an executing audit because the audit system is being reinitialized.

Error code. Valid value(s):

1 = Bad superblock label. Valid value(s):
   g  = Not used.
   h  = File system label.
   i  = Not used.
   j  = Not used.

2 = Trashed inode in the inode table. Valid value(s):
   g  = Inode number (index into inode table).
   h  = Inode number from inode table entry.
   i  = Not used.
   j  = Not used.

3 = Bad directory entry. Valid value(s):
   g  = Inode number (index into inode table).
   h  = Inode number in the directory entry.
   i  = File type of directory. Valid value(s):
      1 = Regular file direct block.
      2 = Single indirect block.
      3 = Double indirect block.
      4 = Triple indirect block.
      5 = Extent file.
   j  = Corrected directory inode number, if corrected; otherwise, inode
        number is the directory entry.

4 = Bad directory block (block out of file system block range). Valid value(s):
   g  = Inode number (index into inode table).
   h  = Bad block number.
   i  = Not used.
   j  = Not used.

5 = Bad link count (link count in inode not same as number of references in
    directories). Valid value(s):
   g  = Inode number.
   h  = Bad link count of the inode.
   i  = Not used.
   j  = CORRECTED (if correcting audit); otherwise, CORRECT link count.

6 = Unreferenced inode. Valid value(s):
   g  = Inode number.
   h  = Bad link count of the inode.
   i  = For non-correcting audits, not used. For correcting audit,
correction type. Valid value(s):
0 = The unreferenced inode was zeroed out.
1 = The unreferenced inode was written into a lost+found directory.

j = If non-correcting mode, the number of links from the file system.

If correcting mode and the file was zero length, the file is removed and this value is zero. Otherwise, the file is linked into the lost+found directory and this value will be the number of corrected links from the file system.

7 = Link count of the director inode is less than 2. Valid value(s):
   g = Inode number.
   h = Link count in inode.
   i = Not used.
   j = Not used.

8 = Audit library initialization failed. Valid value(s):
   g = Not used.
   h = Not used.
   i = Index used to locate error.
   j = Not used.

9 = Unable to open device file. Valid value(s):
   g = Not used.
   h = Error returned from attempt to open.
   i = Index used to locate error.
   j = Not used.

10 = Unable to stat device file. Valid value(s):
   g = Not used.
   h = Error returned from attempt to get status.
   i = Index used to locate error.
   j = Not used.

11 = Device file not block device. Valid value(s):
   g = Not used.
   h = File type.
   i = Index used locate error.
   j = Not used.

12 = Unable to allocate a message. Valid value(s):
   g = Not used.
   h = Not used.
   i = Index used to locate error.
   j = Not used.

13 = Unable to queue a message. Valid value(s):
   g = Not used.
   h = Not used.
   i = Index used to locate error.
   j = Not used.
14 = Unable to add segments. Valid value(s):
g = Segment index into file manager's segment table.
h = Error returned from attempt to add segment.
i = Size in bytes of the segment to be added.
j = Not used.

16 = Unable to access block (or get buffer to read block). Valid value(s):
g = Block number.
h = Error returned.
i = Index used to locate error.
j = Inode number of current inode.

18 = Unable to access inode. Valid value(s):
g = Inode number.
h = Error returned on attempt to access.
i = Index used to locate error.
j = Not used.

19 = Unable to remove a segment. Valid value(s):
g = Index in file manager's segment list.
h = Zero or error returned from attempt to remove the segment.
i = Indicates reason for failure. Valid value(s):
  000c = Failed to allocate a message.
  000d = Failed to queue the message.
  0013 = Request to remove the segment failed, error returned is found in 'h'.
j = Not used.

20 = Cannot mount the device. Valid value(s):
g = Not used.
h = Not used.
i = Index with the following values. Valid value(s):
  000a = No free mount table entry.
  000b = Unable to read superblock.
j = Not used.

26 = The device file is open for writing. Valid value(s):
g = Inode number of device file.
h = Number of opens for writing on the device.
i = Record ID (RID) of the monitor device chain table (MDCT) for the file system on which the device file resides.
j = Partition for the file system on which the device file resides.

27 = Current directory entry could not be referenced from the parent directory. Valid value(s):
g = Inode number.
h = Bad link count of the inode.
i = Correction type. Valid value(s):
  1 = Not corrected - aborted. Parent inode should be two but it is not.
  2 = Corrected. Parent inode should be two but it is
3 = Not corrected - aborted. Parent inode is not a directory.
4 = Corrected. Parent inode is not a directory, but all files under the parent inode have written into the lost+found directory.
5 = Unable to make the correction. Unable to write into the lost+found directory.
6 = Corrected. Corrupted inode has been written into the lost+found directory.

j = Zero if unknown, otherwise the bad inode number.

28 = Current directory entry cannot reference its parent directory. Valid value(s):
    g = Current directory inode number.
    h = Bad link count of the inode.
    i = Not used.
    j = Parent directory inode number.

29 = Current directory entry has a bad inode. Valid value(s):
    g = Inode number.
    h = Bad link count of the inode.
    i = Not used.
    j = Bad inode number.

30 = References to a free inode. Valid value(s):
    g = Inode number with invalid reference.
    h = Not used.
    i = Not used.
    j = Zero if corrected; otherwise, number of invalid references.

31 = Current directory has more than one parent directory. Valid value(s):
    g = Inode number.
    h = Parent inode originally specified by ".." in current directory.
    i = Not used.
    j = Not used.

32 = Current directory is not reachable from file system root. Valid value(s):
    g = Inode number.
    h = Parent inode originally specified by ".." in current directory.
    i = Not used.
    j = Not used.

33 = Active but unreferenced file in file system when audit invoked with PARAM="BACKUP". This condition does not represent an actual file system error, but if a backup tape is made with this condition present, the backup tape could contain file system errors. There is no corrective action for this condition. Valid value(s):
    g = Inode number.
    h = Number of active opens on this inode.
    i = Not used.
    j = Process ID (PID) of a process (there may be others) with the inode open.
= File manager segment list is full. Valid value(s):
g = Not used.
h = Not used.
i = Index used to locate error.
j = Not used.

= File system size in superblock is out of range. Valid value(s):
g = Not used.
h = Inode list size.
i = Not used.
j = File system size.

= Inode list size in superblock is out of range. Valid value(s):
g = Not used.
h = Inode list size.
i = Not used.
j = File system size.

k = Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.
l = Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.
m = Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes section of the Output Messages manual.
n = Inhibit status. Valid value(s):
ALLOWED = Audit has been automatically allowed by SIM.
INHIBITED = Audit has been automatically inhibited by SIM.

NOTE: Refer to the APP:AUD-A and APP:AUD-B appendixes in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

4. ACTIONS TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, the action to be taken depends on the error code.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Other Manual(s):

235-600-400 Audits
AUD:MCTSI-DUMP

Software Release: 5E14 and later
Message Class: LAUDIT
Application: 5
Type: Output

1. FORMAT

[1] AUD MCTSI=i-j PI a DUMP PART b OF c EVENT=d 
   KEY=e 
   e 
   e 
   BLOCK-ADDR=f AU_ETYPE_INFO=g 
   h
   .
   .
   .

[2] AUD MCTSI=i-j MHk a DUMP PART b OF c EVENT=d 
   KEY=e 
   e 
   e 
   BLOCK-ADDR=f AU_ETYPE_INFO=g 
   h
   .
   .
   .

2. REASON FOR OUTPUT

To dump debugging data associated with an audit detected error. This message will always be preceded by an 
AUD:ERROR output message.

3. VARIABLE FIELD DEFINITIONS

a = Application audit identifier.
b = Part indicator identifying which portion of a multi-message dump is included.
c = Total number of messages expected for the current dump.
d = Event number.
e = Dump identifying information. There are three lines. The first has the dump data type identifier or NOT_APPLICABLE. The second line has the names of the data keys or KEYS_ARE_NOT_APPLICABLE or KEYS_ARE_IN_THE_DATA_DUMP. The third line has the key values where H'0 is used as a default for the cases where keys do not apply.
f = Address of the data being dumped.
g = Audit environment type information (used by ROP analysis tools).
h = Hexadecimal data dump with up to 8 groups of 4 bytes per line. The total size varies depending on the data being dumped and the processor which generated the dump message.

i = Switching module number.

j = Switching module side.

k = Message handler processor.

4. ACTIONS TO BE TAKEN

Refer to the Audits manual to interpret the dumped data. Use the audit ID from variable ‘a’ and the error code from the corresponding error message (AUD:ERROR) to find a description of the dump.

5. ALARMS

None.

   DATA3 X'h' DATA4 X'i'
   [NO SUPPLEMENTARY DATA]
2. REASON FOR OUTPUT

To report the termination status of the memory manager audits and/or any errors found.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. Valid value(s):
   1 = Segment descriptor table audit.
   2 = Page table audit.
   3 = Page descriptor table audit.
   4 = Segment release audit.
   5 = Segment unlock audit.
   9 = Swap space compaction audit.

b = Total number of errors found.

c = Total number of errors corrected.

d = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was faulted while correcting errors.
   5 = System integrity monitor (SIM) could not start or dispatch the audit.
   6 = An error was encountered in the audit control/audit library interface.
   7 = Audit exceeded its timeout or segment limit.
   8 = SIM aborted an executing routine audit.
   9 = Transient process that was running the audit terminated.
  10 = A segmented audit exceeded an error threshold.

E-i = Error code and error data. Possible error codes and corresponding error data are. Valid value(s):
   1 = Not a real error. Swap space has been compacted.
   f = Number of holes after compaction.
   g = Size of the largest hole after compaction.
   h = Number of segments "moved" on the swap disk.
   i = Number of segments swapped into memory by the compaction function.

2 = The swap space compaction audit was requested to run in a non-correcting mode, which is meaningless for this audit. If 'a' = 2, fields 'f' through 'i' will be 0, field 'b' will be 1 (1 error found) and 'c' will be 0 (no errors corrected).

3 = The swap space compaction audit was unable to "move" a particular segment.
   f = Disk address (block number) of the segment.
g = Segment size in blocks.

h, i = 0 - Not used.

10 = Incorrect values in one or more of the following: pointer to first segment descriptor, pointer to last segment descriptor, number of segment descriptors.

f = Value in pointer to first segment descriptor.

g = Value in pointer to last segment descriptor.

h = Value in number of segment descriptors.

i = 0 - Not used.

20 = Incorrect values in one or more of the following: pointer to first page table, pointer to last page table, number of page tables.

f = Value in pointer to first page table.

g = Value in pointer to last page table.

h = Value in number of page tables.

i = 0 - Not used.

30 = Incorrect values in one or more of the following: pointer to first page descriptor, pointer to last page descriptor, number of page descriptors.

f = Value in pointer to first page descriptor.

g = Value in pointer to last page descriptor.

h = Value in number of page descriptors.

i = 0 - Not used.

101 = Invalid link in the segment descriptor free list.

f = Invalid segment descriptors.

g, h, i = 0 - Not used.

102 = Segment descriptor on the free list is allocated.

f = Pointer to the allocated segment descriptor.

g, h, i = 0 - Not used.

103 = Incorrect value in the number of free segment descriptors.

f = Correct number of free segment descriptors.

g = Incorrect value in the number of free segment descriptors.

h, i = 0 - Not used.

104 = Segment descriptor free list is circular.

f = Pointer to the segment descriptor at which error was found.

g, h, i = 0 - Not used.

105 = Segment descriptor on free list not marked on-free-list.

CORR mode:

f = Pointer to the segment descriptor.

g, h, i = 0 - Not used.

NOT CORR mode:

f = Pointer to the segment descriptor.

g = Pointer to first free segment descriptor.

h, i = 0 - Not used.

106 = Free segment descriptor not on the free list.
f = Pointer to the segment descriptor.
g = Pointer to first free segment descriptor.
h, i = 0-Not used.

107 = Segment descriptor with a valid page table pointer and/or non-zero status not marked allocated.
f = Pointer to the segment descriptor.
g = Uncorrected value of the status word in the segment descriptor.
h, i = 0-Not used.

108 = Empty page table linked to a segment descriptor that is not page-protected.
f = Pointer to the segment descriptor.
g = Pointer to the page table.
h, i = 0-Not used.

109 = Page table linked to a segment descriptor not marked allocated.
f = Pointer to the segment descriptor.
g = Pointer to the page table.
h, i = 0-Not used.

110 = Invalid page table pointer in a segment descriptor.
f = Pointer to the segment descriptor.
g = Invalid page table pointer.
h, i = 0-Not used.

112 = Incorrect segment index in a page descriptor for a page linked to a segment descriptor.
f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = Incorrect segment index.

113 = Incorrect page index in a page descriptor for a page linked to a segment descriptor.
f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = Incorrect page index.

114 = Incorrect in-memory-page-count in segment descriptor.
f = Pointer to the segment descriptor.
g = Correct in-memory-page-count.
h = Incorrect in-memory-page-count in segment descriptor.
i = 0-Not used.

115 = Page descriptor for a page linked to a segment descriptor not marked allocated.
f = Pointer to the segment descriptor.
g = Index into the segment's page table for the page.
h = Page number.
i = 0-Not used.

(116 - 122) Serious errors involving segment corruptions.
For these errors, the information reported differs depending on the mode of the audit. In NOT CORR mode, no supplementary data is provided. In CORR mode, one or two blocks of supplementary data is provided. The data field descriptions for NOT CORR mode will be listed for each error code individually. The data field descriptions for CORR mode, which are identical for all these errors, will follow. The SUPPLEMENTARY DATA BLOCK descriptions for these errors are given last.

(116 - 122) NOT CORR mode:

116 = Invalid page address in page table entry for a segment.
   f = Pointer to the segment descriptor.
   g = Index into the segment's page table for the page.
   h = The invalid page address.
   i = 0 - not used.

118 = Segment has pages that overlap.
   f = Pointer to the segment descriptor.
   g = Index of one entry in the page table for the page.
   h = Index of the other entry in the page for the page.
   i = Page number.

120 = Two segments overlap in a page.
   f = Pointer to the segment descriptor for the first segment.
   g = Pointer to the segment descriptor for the second segment.
   h = 00PP00QQ, where PP (00 - 3F) is the index in the page table of
      the first segment for the common page, and QQ (00 -3F) is the
      index in the page table of the second segment for the common
      page.
   i = Page number.

122 = Two segments have the same page table.
   f = Pointer to the segment descriptor for the first segment.
   g = Pointer to the segment descriptor for the second segment.
   h = Pointer to the common page table.
   i = 0 - not used.

(116 - 122) CORR mode:

Data field descriptions:
   f = Number of segments with error.
   g = Number of non-killable processes that have any of these
      segments in their address spaces.
   h = Number of killable processes that have any of these segments in
      their address spaces.
   i = Number of killable processes that have been terminated.

In SUPPLEMENTARY DATA BLOCK NUMBER 1, each line of four data words describes a serious error.

j = Error code. Possible error codes and corresponding error data are:

00000074 (decimal 116)-invalid page address in an entry of the
page table for a segment.

k = Pointer to the segment descriptor.
l = 000000NN, where NN (00-3F) is the index of the entry in the page table.
m = The invalid page address.

00000076 (decimal 118)-overlap of pages within a segment.

k = Pointer to the segment descriptor.
l = 000000NN, where NN (00-3F) is the index of one entry in the page table for the page.
m = 000000PP, where PP (00-3F) is the index of the other entry in the page table for the page.

00000078 (decimal 120)-Two segments overlap in a page.

k = Pointer to the segment descriptor for the first segment.
l = Pointer to the segment descriptor for the second segment.
m = 00PP00QQ, where PP (00-3F) is the index in the page table of the first segment for the common page, and QQ (00-3F) is the index in the page table of the second segment for the common page.

0000007a (decimal 122)-two segments have the same page table.

k = Pointer to the segment descriptor for the first segment.
l = Pointer to the segment descriptor for the second segment.
m = Pointer to the common page table.

In SUPPLEMENTARY DATA BLOCK NUMBER 2, each pair of data words describes a process that contains in its address space one or more of the segments with serious errors.

RRRRRRRR = Process number of the process.
S = Flags describing the process. Valid value(s):
8 = The process is a special kernel process.
4 = The process is non-killable.
3 = The process is killable and a termination message has been sent.
2 = The process is killable, but no termination message was sent by this audit of the process.

TTTT = The pcode portion of the utility ID.

201 = Invalid link in the page table free list.
f = Invalid page table pointer.
g = 0-not used.
h = 0-not used.
i = 0-not used.

202 = Page table on the free list has non-free entries.
f = Pointer to the page table.
\( g = 0 \)-not used.
\( h = 0 \)-not used.
\( i = 0 \)-not used.

203 = Incorrect value in the number of free page tables.
\( f \) = Correct number of free page tables.
\( g \) = Incorrect value in the number of free page tables.
\( h \) = 0-Not used.
\( i \) = 0-Not used.

204 = Page table free list is circular.
\( f \) = Pointer to the page table at which error was found.
\( g \) = 0-Not used.
\( h \) = 0-Not used.
\( i \) = 0-Not used.

205 = Page table on free list not marked on-free-list.
\( f \) = Pointer to the page table.
\( g \) = 0-Not used.
\( h \) = 0-Not used.
\( i \) = 0-Not used.

206 = Page table lost; not on the free list and not linked to a segment descriptor.
\( f \) = Pointer to the page table.
\( g \) = Pointer to first free page table.
\( h \) = 0-Not used.
\( i \) = 0-Not used.

301 = Invalid link index in the list of free pages.
\( f \) = Invalid link index.
\( g \) = 0-Not used.
\( h \) = 0-Not used.
\( i \) = 0-Not used.

302 = Page on the free list is allocated.
\( f \) = Page number of the page.
\( g \) = 0-Not used.
\( h \) = 0-Not used.
\( i \) = 0-Not used.

303 = Incorrect value in the number of free pages.
\( f \) = Correct number of free pages.
\( g \) = Incorrect value in the number of free pages.
\( h \) = 0-Not used.
\( i \) = 0-Not used.
304 = Free page list is circular.
   = Page number at which error was found.
   = 0-Not used.
   = 0-Not used.
   = 0-Not used.

305 = Page descriptor for a page on free list not marked on-free-list.
   = Page number of the page.
   = 0-Not used.
   = 0-Not used.
   = 0-Not used.

306 = Lost page; page not on free list and not linked to a segment descriptor.
   = Page number of the page.
   = Page number of first free page.
   = 0-Not used.
   = 0-Not used.

401 = Breakdown of a segment interrupted.
   = Pointer to a segment descriptor.
   = Status word in segment descriptor.
   = Index into segment descriptor table.
   = 0-Not used.

501 = Old iolocked segment.
   = Pointer to segment descriptor.
   = Age of segment in minutes.
   = Index into segment descriptor table.
   = Utility ID of segment's last owner (not necessarily the process
that left the segment locked). Zero indicates the utility ID is not
available.

n = Data report code. Possible date codes and corresponding data values are:
   = Swap space has been compacted.
   = Number of holes after compaction.
   = Size of largest hole after compaction.
   = Number of segments "moved" on the swap disk.
   = Number of segments swapped into memory by
the compaction function.

o= Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes
section of the Output Messages manual.

p= Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes
section of the Output Messages manual.

q= Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes
section of the Output Messages manual.

\[ r \] Inhibit status. Valid value(s):
- \[ \text{ALLOWED} \] = Audit status has been automatically allowed by SIM.
- \[ \text{INHIBITED} \] = Audit status has been automatically inhibited by SIM.

**NOTE:** Refer to the APP:AUD-A and APP:AUD-B appendixes in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

### 4. ACTION TO BE TAKEN
If the audit was run in non-correcting mode and reported errors, rerun it in correcting mode.

### 5. ALARMS
None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the termination status of the message buffer (MSGBUF) resources audit and/or any errors found.

3. VARIABLE FIELD DEFINITIONS

a = Audit member. Valid value(s):
   1 = Message buffer queue audit.
   2 = Message buffer extender block audit.

b = Total number of errors found.

c = Total number of errors corrected.

d = Abort code. Valid value(s):
   3 = Audit was aborted without completing its work.
   4 = Audit was faulted while correcting errors.
   5 = System integrity monitor (SIM) could not start or dispatch the audit.
   6 = An error was encountered in the audit control/audit library interface.
   7 = Audit exceeded its timeout or segment limit.
   8 = SIM aborted an executing routine audit because of a blocking request.
   9 = Transient process that was running the audit terminated.
  10 = A segmented audit exceeded an error threshold.
  12 = Audit rejected the request to run from SIM.
  13 = SIM aborted an executing audit because the audit system is being reinitialized.

e = Error code. Valid value(s):

NOTE: The utility ID contains the following information:
   bits 31-16 Process dct index
   bits 15-0 Process code (utility from process .bfile)

NOTE: A NULL utility ID for a queued/dequeued message indicates that the associated process has died.

110 = Bad message queue head pointer

f = Address of the queue head pointer.

g = Bad queue head pointer.

h = Utility ID of process owning queue.

i = Corrected queue head pointer if the error was corrected, 0 if it was not. (0 is also a valid queue head pointer).
= Bad message queue link pointer.
\(f\) = Address of the message extender.
\(g\) = Bad queue link pointer.
\(h\) = Utility ID of process owning queue.
\(i\) = Corrected queue link pointer if the error was corrected, 0 if it was not. (0 is also a valid queue link pointer).

If the corrected queue link pointer is the same as the bad queue link pointer, then the message extender with the bad link pointer was either marked unallocated or unqueued, and was not put onto the rebuilt message queue.

= Allocation bit not set in message extender of queued message.
\(f\) = Address of the message extender.
\(g\) = Bad extender flags field.
\(h\) = Utility ID of process owning queue.
\(i\) = 0 - not used.

= Bad on-queue indicator in message extender of queued message.
\(f\) = Address of the message extender.
\(g\) = Bad extender flags field.
\(h\) = Utility ID of process owning queue.
\(i\) = Correct extender flags field.

= Allocation bit not set in message header of queued message.
\(f\) = Address of the message.
\(g\) = Bad message flags field.
\(h\) = Utility ID of process owning the queue.
\(i\) = Correct message flags field.

= Bad message-to field in message and bad message owner field in message extender.
\(f\) = Address of the message.
\(g\) = Process ID in message to field.
\(h\) = Process ID in message owner field.
\(i\) = Process ID of process owning queue.

= Bad message owner in message extender.
\(f\) = Address of the message extender.
\(g\) = Process ID in message owner field.
\(h\) = Utility ID of process owning queue.
\(i\) = Process ID of process owning queue.

= Bad message to field in message.
\(f\) = Address of the message.
\(g\) = Process ID in message to field.
\(h\) = Utility ID of process owning queue.
\(i\) = Process ID of process owning queue.

= Message queue out of order.
\(f\) = Address of the message.
\(g\) = Receiver's utility ID.
\(h\) = Message type.
= Sender's utility ID.

119 = Old audit fault message queued to a non-killable process.
    = Address of the message.
    = Receiver's utility ID.
    = Message type.
    = Sender's utility ID.

120 = Old audit fault message queued to a killable process.
    = Address of the message.
    = Receiver's utility ID.
    = Message type.
    = Sender's utility ID.

121 = Old queued message (except an old queued audit fault message).
    = Address of the message.
    = Receiver's utility ID.
    = Message type.
    = Sender's utility ID.

122 = Process has a circular message queue.
    = Address of the message extender.
    = Queue link pointer.
    = Utility ID of process owning queue.
    = Corrected queue link pointer if the error was corrected, 0 if it was not. (0 is also a valid queue link pointer).

123 = Bad message queue tail pointer.
    = Address of the queue tail pointer.
    = Bad queue tail pointer.
    = Utility ID of process owning queue.
    = Corrected queue tail pointer if the error was corrected, 0 if it was not. (0 is also a valid queue tail pointer).

124 = Bad message queue block count.
    = Address of message queue count.
    = Bad message queue block count.
    = Utility ID of process owning queue.
    = Correct message queue block count.

125 = Old acknowledgment message queued to a non-killable supervisor process.
    = Address of the message.
    = Receiver's utility ID.
    = Message type.
    = Sender's utility ID.

126 = Old acknowledgment message queued to a killable supervisor process.
    = Address of the message.
    = Receiver's utility ID.
    = Message type.
    = Sender's utility ID.

200 = Allocated message with an invalid owner field.
f = Address of the message.
g = Process ID in message owner field.
h = Message type.
i = Sender's utility ID.

201 = Old allocated message.
f = Address of the message.
g = Owner's utility ID.
h = Message type.
i = Sender's utility ID.

214 = Allocated bit not set in message header of allocated message.
f = Address of the message.
g = Bad message flags field.
h = Utility ID of process owning queue.
i = Correct message flags field.

216 = Queued message with an invalid owner.
f = Address of the message.
g = Process ID in message owner field.
h = Message type.
i = Sender's utility ID.

219 = Old audit fault message queued to a non-killable process.
f = Address of the message.
g = Receiver's utility ID.
h = Message type.
i = Sender's utility ID.

220 = Old audit fault message queued to a killable process.
f = Address of the message.
g = Receiver's utility ID.
h = Message type.
i = Sender's utility ID.

221 = Old queued message (except an old queued audit fault message).
f = Address of the message.
g = Receiver's utility ID.
h = Message type.
i = Sender's utility ID.

270 = Dequeued message with an invalid owner field.
f = Address of the message.
g = Process ID in message owner field.
h = Message type.
i = Sender's utility ID.

271 = Old dequeued audit fault message owned by a non-killable process.
f = Address of the message.
g = Receiver's utility ID.
h = Message type.
i = Sender's utility ID.
272  = Old dequeued audit fault message owned by a killable process.
f    = Address of the message.
g    = Receiver's utility ID.
h    = Message type.
i    = Sender's utility ID.

273  = Old dequeued message (except an audit fault message).
f    = Address of the message.
g    = Receiver's utility ID.
h    = Message type.
i    = Sender's utility ID.

274  = Over nine old non-queued messages (excluding audit fault messages) owned by a killable process.
f    = Owner's process ID.
g    = Owner's utility ID.
h    = 0 - not used.
i    = 0 - not used.

290  = Audit fault message response has an invalid message status.
f    = Address of the audit fault message.
g    = Invalid message status.
h    = Sender's process ID.
i    = 0 - not used.

291  = Invalid status for a message pointer in an audit fault message response.
f    = Address of the audit fault message.
g    = Invalid message pointer status.
h    = Sender's process ID.
i    = Message pointer.

j    = Message link.
k    = Process ID of message sender.
l    = Process ID of message receiver.
m    = Size of message in blocks.
n    = Message flags.
o    = Message type.
p    = Message status.
q    = Message size in bytes.
r    = Old message type.
s    = Sequence number.
t    = Message identification.
u = Message queue link.
v = Process ID of message owner.
w = Time stamp.
x = Size of message in blocks.
y = Message extender flags.
z = Message type.
a¹ = Unused.
b¹ = Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.
c¹ = Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.

Note: Refer to APP:AUD-A and APP:AUD-B appendixes in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

d¹ = Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes section of the Output Messages manual.
e¹ = Inhibit status. Valid value(s):
ALLOWED = Audit has been automatically allowed by SIM.
INHIBITED = Audit has been automatically inhibited by SIM.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>Error:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>119, 120, 219, 220, 271, 272, 290, and 291</td>
<td>Indicate that a process has probably mishandled an audit fault message, notify your next level of technical assistance. It is likely that errors 201 and 273 will not be corrected if any of these errors occur.</td>
</tr>
<tr>
<td>121, 125, 126, 201, 221, 273, and 274</td>
<td>Indicate that a process may be having problems in processing its messages. Notify your next level of technical assistance.</td>
</tr>
<tr>
<td>219, 220, and 221</td>
<td>Indicate an error in a queued message found by the message extender audit. Run the message queue audit (MSGBUF1) and if the error is not found and corrected, then run the message extender audit (MSGBUF2) again.</td>
</tr>
<tr>
<td>200, 216, and 270</td>
<td>Indicate a problem in the ownership of a message. This may occur if a breakdown happens in a process termination. Run the process administration audit (PROAD1) to complete the process termination.</td>
</tr>
</tbody>
</table>

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

235-600-400  *Audits*
AUD:MSGS-DUMP

Software Release: 5E15 and later
Message Class: AUDTFST, AUDTMON, AUDT, LAUDIT
Application: 5
Type: Output

1. FORMAT

AUD MSGS=a b c DUMP PART d OF e EVENT=f
    KEY=g
g
    g
    BLOCK-ADDR=h AU_ETYPE_INFO=i
j
j

2. REASON FOR OUTPUT

To dump debugging data associated with an audit detected error. This message will always be preceded by an AUD:ERROR output message.

3. VARIABLE FIELD DEFINITIONS

a = Message switch processor side.

b = Processor image. Valid value(s):
   AP = Application processor.
   IP = Input/Output processor.

c = Application audit identifier.

d = Part indicator identifying which portion of a multi-message dump is included.

e = Total number of messages expected for the current dump.

f = Event number.

g = Dump identifying information. There are three lines. The first has the dump data type identifier or NOT_APPLICABLE. The second line has the names of the data keys or KEYS_ARE_NOT_APPLICABLE or KEYS_ARE_IN_THE_DATA_DUMP. The third line has the key values where H'0 is used as a default for the cases where keys do not apply.

h = Address of the data being dumped.

i = Audit environment type information (used by ROP analysis tools).

j = Hexadecimal data dump with up to 8 groups of 4 bytes per line. The total size varies depending on the data being dumped and the processor which generated the dump message.

4. ACTIONS TO BE TAKEN
Refer to the Audits manual to interpret the dumped data. Use the audit ID from variable ‘c’ and the error code from the corresponding error message (AUD:ERROR) to find a description of the dump.

5. ALARMS

None.

2. REASON FOR OUTPUT

Format 1 indicates the input message completed, how many errors were found, and how many were corrected.
Format 2 indicates the audit stopped. Format 3 indicates the audit aborted. Formats 4, 5, and 6 indicate that an error
has been found in the audit of the plant measurement database (PMS). Format 7 indicates that the audit can not be
started at this time. Format 8 indicates the inhibit status of the PMS audit.
3. VARIABLE FIELD DEFINITIONS

a  = Audit member number. Valid value(s):
   1   = Manual, routine, or demand audit.
   2   = Create the database.

b  = Total number of errors found.

c  = Total number of errors corrected.

d  = Abort code. Valid value(s):
   3   = Audit was aborted without completing its work.
   4   = Audit was faulted while correcting errors.
   5   = System integrity monitor (SIM) could not start or dispatch the audit.
   6   = An error was encountered in the audit control/audit library interface.
   7   = Audit exceeded its timeout or segment limit.
   8   = SIM aborted an executing routine audit because of a blocking request.
   9   = Transient process that was running the process terminated.
  10  = A segmented audit exceeded an error threshold.
  12  = Audit rejected the request to run from SIM.
  13  = SIM aborted an executing audit because the audit system is being reinitialized.

e  = Error code (0-5034). If the error code is 0-3, 1000, 1001, or 2000-5034, refer to the Audits manual. If the error code is 100-1301, refer to the APP:LLA appendix in the Appendixes section of the Output Messages manual.

f  = Supplementary data block number.

g  = An explanation of the error identified by the error code. If the error code is 100-1301 refer to the APP:LLA appendix in the Appendixes section of the Output Messages manual. If the error code is 0-3, 1000, 1001, or 2000-5034, valid values are:

h = Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.

i = Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.

j = Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes section of the Output Messages manual.

k = Inhibit status. Valid value(s):
ALLOWED = Audit has been automatically allowed by SIM.
INHIBITED = Audit has been automatically inhibited by SIM.

Note: Refer to the APP:AUD-A and APP:AUD-B appendixes in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

4. ACTION TO BE TAKEN

Format 1 indicates success. Take no action.

Format 2 is an informational message that the audit has stopped. Take no action.
Format 3 indicates that the audit aborted. The action to be taken varies from retrying the audit to seeking technical advice, depending on the abort code. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Formats 4, 5, and 6 indicate that an error has been found in the audit of the PMS. Look up the error code as described in the variable field description section. Action to be taken varies depending on the error code.

Format 7 indicates that the audit cannot be started at this time. Action to be taken varies from retrying the audit to seeking technical advice, depending on the reason for failure. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Refer to the APP:AUD-C and APP:AUD-D appendixes in the Appendixes section of the Output Messages manual.

Format 8 indicates the inhibit status of the PMS audit. Take no action.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

   To report the termination status of the process administration audit and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

   a  = Total number of errors found.  
   b  = Total number of errors corrected.  
   c  = Abort code. Valid value(s):  
       3  = Audit was aborted without completing its work.  
       4  = Audit was faulted while correcting errors.  
       5  = System integrity monitor (SIM) could not start or dispatch the audit.  
       6  = An error was encountered between the audit control and audit library interface.  
       7  = Audit exceeded its timeout or segment limit.  
       8  = SIM aborted an executing routine audit because of a blocking request.  
       12 = Audit rejected the request to run from SIM.
= SIM aborted an executing audit because the audit system is being reinitialized.

d = Error code. Values 100-399 represent errors which occur during process termination. In particular, values 100-199 occur in the scheduler, 200-299 in the capability manager, 300-399 in the process manager. Values 500-799 represent errors which occur during process creation. In particular, values 500-599 represent errors during pcreat of kernel processes, 600-699 represent errors during pcreat of supervisor processes, and 700-799 represent errors during process fork. Value 800 indicates that the process has been suspended from execution for over 30 minutes.

A problem occurred during or after:
100 = The use count was decremented.
110 = term_dct was called.
120 = GRASP/DART was informed.
130 = The DCTE was unlinked from its dispatch chain.
140 = The address translation buffers (ATBs) were flushed.
150 = The acknowledgement message was allocated and copied.
160 = The dispatch control table entry (DCTE) was unlinked from the ready/not ready list.
170 = The incarnation count was bumped.
180 = The message has (or should have) gone to the capability manager.
190 = The message has (or should have) gone to the process manager.
200 = The capabilities were removed.
210 = The segments were removed (supervisor process).
220 = The segments were removed (kernel process).
300 = The core dump has started.
310 = The message was sent to the capability manager.
500 = pcreat has started (kernel process).
510 = DCTE was linked.
520 = Initialization event sent.
600 = pcreat has started (supervisor process).
610 = DCTE was linked.
620 = The pstart has completed.
630 = Execute started.
700 = fork started (pfork1).
710 = DUPCAPS message sent to the file manager.
720 = pfork2 started.
730 = Sending the wake up event to the child.
800 = Process has been suspended from execution.

e = Process's utility ID.

f = The amount of time, in milliseconds, that the process has been stuck.

g = Process number.

h = Correction completion code. Valid value(s):
00000000 = The error was corrected, or the audit was run in non-correcting mode.
00000010 = The dispatcher control table (DCT) pointer failed fault retry validation when trying to send a DUPCAPS message.
00000020 = The DCT extender pointer failed fault retry validation when trying to send DUPCAPS message.
00000030 = The PCB segid in the process' DCT entry was found to be invalid when trying to send a DUPCAPS message.
00000040 = The audit could not attach to the process' PCB when trying to send a DUPCAPS message.
00000050 = The audit could not allocate a DUPCAPS message.
00000060 = The audit could not queue a DUPCAPS message.
00000070 = The DCT pointer failed fault retry validation when trying to send a terminate message.
00000080 = The DCT extender pointer failed fault retry validation when trying to send a terminate message.
00000090 = The audit could not allocate a terminate message to kill a suspended process.
000000a0 = The audit could not queue a terminate message to kill a suspended process.
000000b0 = The PCB segid in the process' DCT entry was found to be invalid when trying to fake a pcreat acknowledgement message.
000000c0 = The audit could not attach to the process' PCB when trying to fake a pcreat acknowledgement message.
000000d0 = The audit could not allocate a pcreat message to fake a pcreat acknowledgement message.
000000e0 = The audit could not queue a pcreat message to fake a pcreat acknowledgement message.
000000f0 = The audit could not allocate a terminate message to kill a process.
00000100 = The audit could not queue a terminate message to kill a process.

i = Explanation of error. Refer to the APP:AUD-C appendix in the Appendixes section of the Output Messages manual.

j = Explanation of error. Refer to the APP:AUD-D appendix in the Appendixes section of the Output Messages manual.

k = Explanation of error. Refer to the APP:AUD-B appendix in the Appendixes section of the Output Messages manual.

l = Inhibit status. Valid value(s):
ALLOWED = Audit has been automatically allowed by SIM.
INHIBITED = Audit has been automatically inhibited by SIM.

Note: Refer to the APP:AUD-A and APP:AUD-B appendixes in the Appendixes section of the Output Messages manual for assorted parsing errors when the input message (IM) catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, default is a report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

235-600-400  Audits
AUD:PSUPH-CD

**Software Release:** 5E14 and later
**Message Class:** CP
**Application:** 5
**Type:** Output

1. **FORMAT**

```
AUD {PSUPH=a-b-c-d CHNG=a-b-c-d|MCTSI=a-b,PI} e DUMP PART g OF I EVENT=f
MESSAGE-NO=h
KEY=j
BLOCK-ADDR=k AU_ETYPE_INFO=m
l

2. **REASON FOR OUTPUT**

To dump data from an audit which detected errors in a packet switching unit protocol handler (PH) or packet interface (PI).

3. **VARIABLE FIELD DEFINITIONS**

a = Switching module (SM) number.
b = Unit number.
c = Shelf number.
d = Slot number.
e = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.
f = Event number.
g = Part indicator to identify related dumps when there is too much data for a single report.
h = Message number.
i = Total number of related dump messages when there is too much data for a single report.
j = Dump identifying information. There are three lines. The first has the dump data type identifier or NOT_APPLICABLE. The second line has the names of the data keys or KEYS_ARE_NOT_APPLICABLE or KEYS_ARE_IN_THE_DATA_DUMP. The third line has the key values where H'0 is used as a default for the cases where keys do not apply.
k = Block address (in hexadecimal).
l = Hexadecimal dump of a block of up to 199 bytes with up to 8 groups of 4 bytes per line.
m = Audit environment type information (used by rop analysis tools).

4. **ACTIONS TO BE TAKEN**
This message will always be preceded by the AUD:PSUPH-CEC output message. Refer to the Audits manual to interpret information given. Use the audit ID ‘k’ and the error code from the corresponding error message (AUD:PSUPH-CEC) to find the interpretation in the “Audits Description” section of the manual.

When inhibiting or allowing PHs or PIs, use the INH or ALW input message with PSIUPH for switching module processor (SMP) PH audit ID or PI for SMP PI audit ID. Individual PH or PI audits cannot be inhibited or allowed. Refer to the INH:UT-SM or ALW:UT-SM input message for more information.

5. ALARMS

None.

Other Manual(s):
235-600-400 Audits
AUD:PSUPH-CE

Software Release: 5E14 and later
Message Class: CP
Application: 5
Type: Output

1. FORMAT

AUD {PSUPH=a-b-c-d  CHNG=e-f-g-h|MCTSI=i-j,PI}  k  l ERRORS=m  EVENT=n
MESSAGE-NO=o

2. REASON FOR OUTPUT

To report the status (aborted or completed) of an audit in the packet switching unit (PSU) protocol handler (PH) or the packet interface (PI). This message is also used to report that an application interprocessor audit could not communicate with a PH or PI.

3. VARIABLE FIELD DEFINITIONS

CHNG  = Channel group.
MCTSI  = Module controller time slot interchange.
a  = Switching module (SM) number where PH audit resides.
b  = Unit number (side 0 or 1).
c  = Shelf number.
d  = Slot number (PH number 0-15).
e  = SM number where PH audit resides.
f  = Unit number (side 0 or 1).
g  = Shelf number.
h  = Slot number (channel group number).
i  = SM number where PI audit resides.
j  = Unit number (side 0 or 1).
k  = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.
l  = Status (ABORTED|COMPLETED).
m  = Total number of errors found.
n  = Event number.
o  = Message number.

4. ACTION TO BE TAKEN
If this message has been automatically generated, retrieve the output messages related to the audit ID 'k'. These messages include: AUD:PSUPH and AUD:PSUPH-ERROR. Refer to the Audits manual for a description of actions.

When inhibiting or allowing PHs or PIs, you must use the INH or ALW input message with AUUPSUPH for switching module processor (SMP) PH audit ID or AUPI for SMP PI audit ID. Individual PH or PI audits cannot be inhibited or allowed. Refer to the INH or ALW Input Message manual page for more information.

5. ALARMS

Type: Output

1. FORMAT

AUD {PSUPH=a-b-c-d CHNG=e-f-g-h|MCTSI=i-j,PI} k ERROR-CODE=l EVENT=m
   ERROR-ADDR=n BAD-DATA=o
   LOG-KEY=p GOOD-DATA=q MESSAGE-NO=r
   IMAGE=s

2. REASON FOR OUTPUT

To report that an audit detected an error in a packet switching unit (PSU) protocol handler (PH) or packet interface (PI).

3. VARIABLE FIELD DEFINITIONS

CHNG = Channel group.
MCTSI = Module controller time slot interchange.
a = Switching module (SM) number where PH audit resides.
b = Unit number.
c = Shelf number.
d = Slot number.
e = SM number where PH audit resides.
f = Unit number.
g = Shelf number.
h = Slot number (channel group number).
i = SM number where PI audit resides.
j = Unit number (side 0 or 1).
k = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.
l = Error code. Refer to the Audits manual.
m = Event number.
n = Error address in hexadecimal.
o = Bad (incorrect) data in hexadecimal.
p = Logical key in hexadecimal.
q = Good (correct) data in hexadecimal.

r = Message number.

s = Image type in the PH/PI. Valid value(s):
- ERROR IMAGE = The image contained an error.
- NULL IMAGE = No image was loaded.
- PH1 GATEWAY IMAGE = Image used for all features on a PH1 was loaded.
- PH2 ACCESS IMAGE = All features (other than X.75 or X.75) on a PH2 were loaded.
- PH2 GATEWAY IMAGE = X.75 or X.75 features on a PH2 were loaded.
- PH3 COMMON IMAGE = All features on a PH3 were loaded. This image contains both access and gateway.
- PI IMAGE = Image used for PI was loaded.

4. ACTION TO BE TAKEN

There may be an optional AUD:PSUPH-CD message corresponding to this message. The error address field 'n' can be used to determine corresponding messages. All the errors reported during an invocation of an audit will be summarized by the AUD:PSUPH-CE output message. Refer to the Audits manual to interpret information given. Use the audit ID 'k' and the error code 'l' to find the interpretation in the "Error Code Comment Blocks" section of the manual.

When inhibiting or allowing PHs or PIs, you must use the INH or ALW input message with AUPSUPH for switching module processor (SMP) PH audit ID or AUPI for SMP PI audit ID. You cannot inhibit or allow individual PH or PI audits. Refer to the INH or ALW input message for more information.

5. ALARMS

Type: Output

1. FORMAT

AUD QGP=a-b c  DUMP PART d OF e EVENT=f
KEY=g
BLOCK-ADDR=h AU_ETYPE_INFO=i
j
.
.
.

2. REASON FOR OUTPUT

To dump debugging data associated with an audit detected error. This message will always be preceded by an AUD:ERROR output message.

3. VARIABLE FIELD DEFINITIONS

a = Quad-linked packet switched network number.
b = QGP number.
c = Application audit identifier.
d = Part indicator identifying which portion of a multi-message dump is included.
e = Total number of messages expected for the current dump.
f = Event number.
g = Dump identifying information. There are three lines. The first has the dump data type identifier or NOT_APPLICABLE. The second line has the names of the data keys or KEYS_ARE_NOT_APPLICABLE or KEYS_ARE_IN_THE_DATA_DUMP. The third line has the key values where H'0 is used as a default for the cases where keys do not apply.
h = Address of the data being dumped.
i = Audit environment type information (used by ROP analysis tools).
j = Hexadecimal data dump with up to 8 groups of 4 bytes per line. The total size varies depending on the data being dumped and the processor which generated the dump message.

4. ACTIONS TO BE TAKEN

Refer to the Audits manual to interpret the dumped data. Use the audit ID 'c' and the error code from the corresponding error message (AUD:ERROR) to find a description of the dump.

5. ALARMS

6. REFERENCES

IM/OM References:
  None.
AUD:SM-ABORTED

Software Release: 5E14 and later
Message Class: AUDTFST, AUDTMON, AUDT
Application: 5
Type: Output

1. FORMAT

AUD  SM=a [SVC-GP=b]  c  ABORTED  ERRORS=d  EVENT=e

2. REASON FOR OUTPUT

To report that an audit in the switching module (SM) was aborted because a higher priority audit ran. This message
is also used to report that an application interprocess audit could not communicate with an SM. All messages
related to a problem use the same event number (variable ’e’).

3. VARIABLE FIELD DEFINITIONS

a  = SM number. This number is either 1) where the application audit resides; or 2) where the
interprocess audit portion aborted.

b  = Service group where the portion aborted.

c  = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.

d  = Total number of errors found.

e  = Event number.

4. ACTION TO BE TAKEN

If this message has been automatically generated, retrieve the output messages related to the audit ID ’c’. If this
message is in response to a manual request, all output messages related to the audit ID ’c’ will have been printed.
These messages include: AUD:SM-DUMP, AUD:SM-ERROR, and AUD:SM-FAILURE. Refer to the Audits manual
for a description of actions.

This message uses variable message classes. AUDTFST indicates that this message caused a new event number
to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages
with the same event number. Previous messages could include other audits messages with the AUDTFST message
class, defensive check failure, or single process purge messages. AUDT indicates this message occurred as a
response to a manual request.

5. ALARMS

None.

Message Class: AUDTFST,AUDTMON, AUDT
Application: 5
Type: Output

1. FORMAT

AUD SM=a [SVC-GP=b] c COMPLETED ERRORS=d EVENT=e

2. REASON FOR OUTPUT

To report the number of errors found at audit completion or at an intermediate break in an interprocessor audit in the switching module (SM). All messages related to a problem use the same event number (variable 'e').

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number. This number is either 1) where the application audit resides; or 2) where the interprocessor audit portion was completed.

b = Service group where the audit was completed.

c = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.

d = Total number of errors found.

e = Event number.

4. ACTION TO BE TAKEN

If this message has been automatically generated, retrieve the output messages related to the audit ID 'c'. If this message is in response to a manual request, all output messages related to the audit ID 'c' will have been printed. These messages include: AUD:SM-DUMP, AUD:SM-ERROR, and AUD:SM-FAILURE. Refer to the Audits manual for a description of actions.

This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include other audits messages with the AUDTFST message class, defensive check failure, or single process purge messages. Type: Output

1. FORMAT

AUD  SM=a  [SVC-GP=b]  c  FAILURE-CODE=d  EVENT=e

2. REASON FOR OUTPUT

To report a failure that has been encountered by an audit in an switching module (SM). A failure indicates that the audit could not proceed due to some problem it has detected, and it has triggered escalation or other audit actions. All failure messages related to a problem use the same event number (variable 'e').

3. VARIABLE FIELD DEFINITIONS

a = SM number. This can be either 1) where the application audit resides; or 2) where the interprocessor audit portion is executing.
b = Service group where the portion executed. The application audit is the CONFC interprocessor audit.
c = Application audit ID. Refer to the APP:AUDITS appendix in the Audits manual.
d = Failure code. Refer to the Audits manual.
e = Event number of related reports.

4. ACTION TO BE TAKEN

This message uses variable message classes. AUDTFST indicates that this message caused a new event number to be allocated. AUDTMON indicates that this message does not describe a new event; look for previous messages with the same event number. Previous messages could include other audits messages with the AUDTFST message class, defensive check failure, or single process purge messages.     Other Manual(s):
        235-600-400 Audits
AUD:SODD

Software Release: 5E14 and later
Message Class: AUDT
Application: 5
Type: Output

1. FORMAT

[1]  AUD SODD a b {STARTED|STOPPED|ABORTED|INVALID RELATION [c]
IN PROGRESS [c]}

__________________________________________________________________

[2]  AUD SODD a b COMPLETED d ERRORS THE OUTPUT WAS SENT TO FILE e

__________________________________________________________________

2. REASON FOR OUTPUT

Format 1 reports that the static ODD audit has either started, stopped, aborted, has found the input relation to be invalid or is in progress.

Format 2 reports that the static ODD audit is completed auditing what was requested. It also gives the number of errors it detected, and where the output of the errors can be found.

3. VARIABLE FIELD DEFINITIONS

a = Form of the audit that is running, either LINE, TRUNK, or redundant (RED).

b = Type of the audit which is running either office equipment (OE), directory number (DN), business and residence customer services (BRCS), multi-line hunt (MLH), or trunk group (TG).

c = The number of the last switching module (SM), DN, multi-line hunt group (MLHG), or trunk group number (TGN) the audit was working on or the name of the last relation (REL) the audit was working on.

d = Number of errors found with the static ODD audit.

e = The path name for the file containing the errors found by static ODD audit.

4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, look at the errors found by the audit, if there are any. Verify and correct any legitimate errors found with the data base.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

EXC:SODD-BRCS
12. BKUP
BKUP: ODD

Software Release: 5E14 and later
Message Class: ODD
Application: 5
Type: Output

1. FORMAT

BKUP  ODD  [FULL]  [ODDEVOL]  [NRODD=a|RODD=a|AM|CMP=b|CI  OF  SM]c[d][KBYTES=e]

2. REASON FOR OUTPUT

To report the status of input requests to back up the office dependent data (ODD) from memory to disk with either a full or differential dump of the entire system. A full dump of the ODD dumps all blocks of the ODD. A differential dump of the ODD dumps only blocks that have changed since the last backup.

3. VARIABLE FIELD DEFINITIONS

AM = The report is for the AM.
CMP = The report is for the CMP.
FULL = A full dump was performed. If the administrative module (AM) ODD is being backed up the default is FULL. Differential dump is the default for switching module (SM), for redundant and non-redundant ODD and communications module processors (CMPs).
NRODD = The report is for non-redundant ODD (NRODD).
ODDEVOL = Marks the beginning of ODD evolution stage during a retrofit.
RODD = The report is for redundant ODD (RODD).
a = Switching module (SM) number.
b = CMP number.
c = Termination report. Valid value(s):
   ABORTED = The requested action was terminated before completion and the termination was immediate, with consistency of hardware states or data questionable.
   COMPLETED = The requested action terminated after completion.
   IN PROGRESS = The requested action is currently in progress.
   NOT STARTED = The requested action could not begin. Probable cause is that a previously requested input message to backup the ODD is still in progress.
   STOPPED = The requested action terminated before a normal completion, and the termination was graceful.
d = Reason for failure. Valid value(s):
   AM BACKOUT RC = Recent changes (RCs) are backed out of the AM.
   AM OVERLOAD = AM is in overload condition.
   BST IN PROGRESS = The bitmap salvage technique (BST) process is in progress.
   CANNOT MOUNT ODD PARTITION = Possible causes: /no5odd/cpdata or /no5odd/cidata is busy, the device associated with the no5aodd or no5codd1 does not exist, or there are no more mount table entries.
**CMP ABNORMAL** = Possible causes: CMP is down, communications link is lost, or the SMP is in overload.

**CMP BACKOUT CORC** = Customer-originated recent changes (CORCs) are backed out of a CMP.

**CMP BACKOUT RC** = RCs are backed out of the CMP.

**CMP OVERLOAD** = CMP is in overload condition.

**DBM CANNOT ACCESS DISK ODD** = Database manager (DBM) has a bad logical device number for the disk ODD partition.

**DBM INTERNAL ERROR** = Database manager cannot begin a transaction for ODD backup.

**GLOBAL PARAMETERS ERROR** = An inconsistency occurred between the global parameters and the calculated ones in the SM.

**HASH SUM ERROR** = Hash sum check on the backed-up NRODD/RODD failed.

**MEMMAN IN PROGRESS** = The memory management bitmap data base audit (MEMMAN) is in progress after the BST.

**NO OPERATIONAL CMPs** = There are no operational CMPs to backup.

**NO OPERATIONAL SMs** = An RODD SM is not specified, and there are no operational SMs to use for an RODD backup.

**NRODD GROWTH ABORTED** = ODD Growth has occurred and aborted. Wait for Growth to recover itself before request another BKUP:ODD on this SM.

**NRODD IS NOT BACKED UP** = A non-redundant growth (NRODD) occurred on this SM and RODD back up cannot be done from this SM until NRODD is backed up. Use a different SM to back up the RODD or back up NRODD and then RODD.

**ODD DISK PARTITION OFFNORMAL** = ODD disk partition not accessible.

**ODD GROWTH IN PROGRESS** = ODD Growth is currently in progress. Wait for it to complete before request another BKUP:ODD on this SM.

**PROCESS TIME OUT** = A process has taken too much time to perform a function. Lost messages may be the cause.

**SM ABNORMAL** = Possible causes: SM is down, communication link is lost, or the SM is in overload.

**SM BACKOUT CORC** = CORCS are backed out of an SM.

**SM BACKOUT RC** = RCs are backed out of an SM.

**SM MOD GROW OCCURRED** = SM core growth occurred on this SM and it is not pumped yet.

**e** = The number of kilobytes backed up. Applies to NRODD, RODD and CMP ODD backup.

### 4. ACTION TO BE TAKEN

If ODD backup does not complete, check the reason of failure described on variable field ‘a’. If the failure is caused by a temporary system resource shortages such as CMP OVERLOAD, DBM INTERNAL ERROR and etc., retry the ODD backup later; otherwise, correct the problem and retry the ODD backup. If the problem is beyond being correctable by the user, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

### 5. ALARMS

Minor.

### 6. REFERENCES

Input Message(s):

- ABT:ODDBKUP

13. CFR
CFR:DUPLEXDISKS

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] CFR DUPLEXDISKS STOPPED WITH ERROR a

2. REASON FOR OUTPUT
To report the result of executing the CFR:DUPLEXDISKS input message.

3. VARIABLE FIELD DEFINITIONS

a = Error type. Valid value(s):
   X'C000' = ABD is not active. The system is not booted with an alternate boot disk selected.
            MHD0 and MHD1 are the current duplexed boot disk pair.
   X'C001' = Failed to get UCB for the current duplexed boot disk pair. An internal error
            occurred trying to read the in-core ECD. Additional information is provided by PRMs
            generated by EIH.
   X'C002' = An invalid state was detected.
            - If MHD0 is one of the current duplexed boot disks, its state must
              be ACT. MHD1 and the alternate boot disk must not be in the ACT,
              STBY, or INIT states.
            - If MHD1 is one of the current duplexed boot disks, its state must
              be ACT. MHD0 and the alternate boot disk must not be in the ACT,
              STBY, or INIT states.
   X'C003' = A failure occurred trying to configure the duplex boot disk pair to the system
            default. An internal error occurred trying to configure the duplex boot disk pair to
            MHD0 and MHD1. Additional information is provided by PRMs generated by EIH.
   X'C004' = Disk driver not notified of change. The 120 status page will not show the correct
            disk status.
   X'C005' = RTS not notified of change. The 102 status page will not show the correct disk
            configuration.
   X'C006' = This is only support on the 3B21D Hardware Platform.
   X'C007' = At least one of MHD 0, MHD 1, or the ABD is reserved by another process.

4. ACTIONS TO BE TAKEN
For Format 1, resolve the error condition described. Refer to the TECHNICAL ASSISTANCE portion of the
INTRODUCTION section of the Output Messages manual.

5. ALARMS
None.

Software Release: 5E14 and later
Message Class: OFR
Application: 5
Type: Output

1. FORMAT

[1] CFR SAMEM a b COMPLETED
   STANDALONE MEMORY SIZE: c, PREVIOUS SIZE:d

2. REASON FOR OUTPUT

To report the results of the CFR:SAMEM input message.

Format 1 reports that the configuration request for a change in size of the stand alone billing memory (SABM) was successful. The new size and the previous size are reported, see the Variable Field Definitions section.

Format 2 reports that the configuration request for a change in size of the SABM was not successful because the requested size was less than the minimum size.

Format 3 reports that the configuration request for a change in size of the SABM was not successful because the requested size was not a multiple of four kilobytes. Requested size is in kilobytes (see the CFR:SAMEM Input Message manual page).

Format 4 reports that the configuration request for a change in size of the SABM was not successful because the requested size exceeds the available space. Requested size is the total new size.

Format 5 reports that the configuration request for a change in size of the SABM was not successful because the SABM is being accessed by another request. This other request may be another manual request or one internal to the system. Retry the CFR:SAMEM input message later.

3. VARIABLE FIELD DEFINITIONS

a = Switching module type. Valid value(s):
   HSM = Host switching module.
   LSM = Local switching module.
   ORM = Optical remote switching module.
   RSM = Remote switching module.
   TRM = Two-mile optical remote switching module.
   DRM = Distinctive remote switching module.

b = Switching module number.

c = Number of kilobytes (in decimal) configured for SABM usage.

d = Previous size (number of kilobytes, in decimal) of memory configured for SABM usage.

e = Reason for stop. Valid value(s):
4. ACTIONS TO BE TAKEN

CFR:SPRMEM
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

CFR SPRMEM IMAGE=a SM=b TYPE=c d e

2. REASON FOR OUTPUT

To confirm the configuration of spare memory for the addition or deletion of peripheral images to a switching module’s memory layout.

3. VARIABLE FIELD DEFINITIONS

a = Peripheral image name when performing growth or degrowth. The phrase, SPAREMEM, when performing memory consolidation.

b = Switching module (SM) number.

c = Request type. Valid value(s):

    DEGROW
    GROW

d = Status. Valid value(s):

    COMPLETED = Request has been successfully executed.
    FAILED = Request did not complete successfully.

e = Reason. Valid value(s):

    IMAGE ALREADY IN REQUESTED STATE = The peripheral image was either already included in the SM’s memory layout when a request to grow it was issued or already deleted from the SM’s memory layout when a request to degrow it was issued.
    IMAGE BEING PUMPED = The image to be degrown is currently being pumped. The pump must complete before the image can be degrown.
    INSUFFICIENT SPARE SM MEMORY = The amount of spare memory available to allocate for the peripheral image requested was not enough. Degrowth of Standalone Billing Memory (SABM), Real Time Billing Memory (RTBM), or memory board growth may be necessary.
    INVALID IMAGE = The unit specified in the input message did not map to a valid peripheral image.
    MEMORY ALREADY CONTIGUOUS - MEMORY POINTERS NOT UPDATED = There were no fragmented holes in memory to consolidate. No updates to the memory pointers were needed. This makes the ODD backup unnecessary.
    MEMORY POINTERS UPDATED - ODD BACKUP REQUIRED = Memory consolidation was successful and updates were made to the memory pointers. ODD backup is required to save the critical information changes to disk.
    RELATED CIRCUIT EXISTS IN ODD = The circuit specified was found in the ODD. RC/V work must first be done to delete the tuples for the unit being degrown.
    RELATED CIRCUIT NOT EQUIPPED IN ODD = The circuit specified was not found in the ODD.
RC/V work must first be done to insert the tuples for the unit being grown.

UNABLE TO LOCK IMAGE TO CONSOLIDATE MEMORY = After deletion of an image, the memory growth process was unable to lock another image that was to be moved to consolidate memory holes.

4. ACTION TO BE TAKEN

Resolve errors as indicated and retry the message. If errors continue, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

   SLK a b CHANGE DENIED, CURRENT MINOR STATE = d
   SLK a b CHANGE DENIED, FAR END MCO ACTIVE
   SLK a b CHANGE DENIED, FAR END REFUSED MCO REQUEST
   SLK a b CHANGE DENIED, INSUFFICIENT BACKUP FOR MCO, AV
   SLK a b CHANGE DENIED, INSUFFICIENT BACKUP FOR MCO, CV
   SLK a b CHANGE DENIED, RETRY LATER
   SLK a b CHANGE DENIED, VALID CHANGES FOR UNA LINK = GROW TEST
   SLK a b CHANGE DENIED, VALID CHANGES FOR AVL LINK = IS MOOS FIS XFR
   SLK a b CHANGE REQUEST FAILED, INTERNAL ERROR
   SLK a b CHANGE REQUEST TIMEOUT, VERIFY SLK STATE
   SLK a b RESPONSE UNKNOWN, VERIFY SLK STATE

d = Minor state. Valid value(s):
   GROW = Unavailable growth.
   IS = Available in-service.
   MOOS = Manually out-of-service.
   OOS = Out-of-service.
   TEST = Test.

On the "CHANGE ACCEPTED, NEW MINOR STATE = d" output message, 'd' is the "externally visible" minor state that existed when the INITIAL state change processing completed. Total processing to change minor states
begins with this INITIAL state change processing, which initiates a concurrent sequence of protocol actions and associated additional processing that usually complete very quickly, and usually are completed by the time INITIAL state change processing ends. In this case the value of ‘d’ is the final minor state requested in the CHG:SLK Input Message. But the initiated sequence of protocol actions may complete with some delay, or be obstructed and not complete at all, in which case ‘d’ is an intermediate minor state or even the minor state that existed when the CHG:SLK message was entered.

For an example that involves protocol action delays, the input message "CHG:SLK=a-b:IS" requests the change from the MOOS state to the IS state. This message actually sequences the link through the MOOS, OOS, and IS states. If link protocol actions are delayed or obstructed, the link may be reported as being OOS instead of IS when the "CHANGE ACCEPTED, NEW MINOR STATE = d" message is printed.

When the "CHANGE ACCEPTED" message is printed, the value of ‘d’ is the externally visible minor state value that actually existed when INITIAL STATE CHANGE PROCESSING ended. If, in the rare occurrence of protocol delay or obstruction, the value of 'd' is not the final minor state being requested, then per-link displays (if available) should be monitored for progress toward the final requested minor state, or the OP:SLK input message should be used to check for progress toward that requested state. The OP:SLK input message with the RAW option can be used to display the numerical values of some internal states.

4. ACTIONS TO BE TAKEN

If a change request is denied, the output message will indicate what kind of a problem was encountered.

Any requested action that would disrupt network signaling capability will result in a change denied response. Input message OP:C7NET,ABNORMAL should be used to identify point codes that may be blocked, resulting in a denied request.

A common reason for denied change requests is incompatibility between the request and the current minor state of the link. The current minor state of the link is printed in the output message in some cases, or it can be determined using the OP:SLK message or other status displays. The CHG:SLK Input Message manual page should be used to determine the valid change requests for a given link minor state.

If a change request is denied with the message CHANNEL IN USE, RETRY LATER, the most likely reason is that a previously issued CHG:SLK message is currently executing. Only one CHG:SLK request can be in-progress at any one time.

If c = SLK a b CHANGE DENIED, FAR END REFUSED MCO REQUEST The far end has refused the manual change over (MCO) request, and there is no data at the near end to indicate why the MOOS was denied. To determine the reason for refusal, a MOOS can be requested from the far end and the reason for refusal will be output there.

COULD NOT WRITE AMA CONFIGURATION FILE FOR STREAM x = Where ‘x’ is the data stream number. The configuration file for this stream could not be written.

COULD NOT WRITE AMA CONTROL FILE FOR STREAM x = Where ‘x’ is the data stream number. The AMA control file for this stream could not be written.

COULD NOT WRITE AMA GLOBAL MAP FILE FOR STREAM x = Where ‘x’ is the data stream number. The AMA global map file for this stream could not be written.

COULD NOT WRITE CLEAREDAMA PARTITION x TO MHD y = Where ‘x’ is the MHD number and ‘y’ is the UNIX® process error number.

MHD x IS NOT OFFLINE CANNOT CLEAR AMA MAPS = Where ‘x’ is the MHD number.

PARTITION x ON OFFLINE MHD y HAS BEEN CLEARED = Where ‘x’ is the partition number and ‘y’ is the MHD number. This simply indicates that the AMA partition on the offline MHD was successfully cleared.

PCLOSE OF DGNNM FILE FAILED FOR MHD x ERROR NUMBER = y = Where ‘x’ is the MHD number and ‘y’ is the UNIX® process error number. /etc/dgnnm failed for this MHD because the pipe to the process could not be closed.

PCLOSE OF UDGGNNM FILE FAILED FOR MHD x ERROR NUMBER = y = Where ‘x’ is the MHD number and ‘y’ is the UNIX® process error number. /etc/udggnm failed for this MHD because the pipe to the process could not be closed.

VTOC ENTRY FOR PARTITION x ON MHD y IS CORRUPT = Where ‘x’ is the AMA disk partition number and ‘y’ is the MHD number.

DEVICE NOT EQUIPPED CANNOT CLEAR AMA MAPS = An MHD is not equipped.

CANNOT FIND RID CANNOT CLEAR AMA MAPS = The disks are improperly split, or there is ECD corruption.

CAN NOT CREATE SDF CANNOT CLEAR AMA MAPS = There are permissions problems or filesystem corruption in the /tmp filesystem, or an ECD corruption.

CAN NOT ACCESS SG DATABASE CANNOT CLEAR AMA MAPS = There may be corruption of the new-release /database filesystem or of the new-release ECD/SG databases.

CAN NOT LOAD RCL MODULE CANNOT CLEAR AMA MAPS = This is an internal error due to missing files. The AUD:FILES input message can be run to determine what the missing files are.

DISK TO PREPARE MUST BE SPECIFIED Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

NUMERIC MHD NUMBER REQUIRED Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

MHDS NOT SPLIT CANNOT CLEAR AMA MAPS = The MHD that needs to be cleared is not in the required state after completion of the ENTER stage.

MHD x IS NOT ACTIVE CANNOT CLEAR AMA MAPS = The MHD that needs to be cleared is not active.

4. ACTION TO BE TAKEN

If the AMA disk partitions have been successfully cleared and the AMA control, global map and configuration files...
have been successfully created, no action is necessary; otherwise, consult the transitions procedures in the Software Release Retrofit Procedures manual or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Note: If the CLR:AMA-MAPS input message is entered at any time other than during a transition, it will fail and several output messages will be printed.

5. ALARMS

None.

1. FORMAT

CLR BKUP a  
   [b[, ERRNO = c]]

2. REASON FOR OUTPUT

To report the result of the CLR:BKUP input message.

3. VARIABLE FIELD DEFINITIONS

   a
   = Status. Valid value(s):
     ABORTED
     COMPLETED
     IN PROGRESS
     NOT STARTED
     STARTED

   b
   = Message. Valid value(s):
     FAILED TO ALLOCATE INTERNAL MEMORY = An internal process error occurred while attempting to allocate memory. Re-execute the CLR:BKUP input message.
     FAILED TO {CLOSE|OPEN|STAT|WRITE} CRON TABLE FILE = An attempt to access the system cron table file has failed. Interpret the system error number and verify that the cron file, /unixa/spool/cron/crontabs/root, exists with read/write permission and that the /dev/unixa file system has free data blocks.
     FAILED TO {CLOSE|OPEN|STAT|WRITE} SCHEDULE FILE = An attempt to access the automated system backup schedule file has failed. Interpret the system error number and verify that the schedule file, /no5text/bkup/autobkup/.bkup_sched, exists with read/write permission.
     FAILED TO RE-INITIALIZE CRON DAEMON PROCESS = The cron daemon process could not be re-initialized after a new backup entry was deleted from the system cron table file. Prompt the cron daemon process to read the modified cron table file by executing the crontab command. For additional information, refer to the crontab manual page in 235-700-200. UNIX® RTR Operating System Reference Manual.
     INVALID TIME OF DAY SPECIFIED = An invalid time of day (TIME) parameter was specified in the input message. Refer to the CLR:BKUP input message manual page for the correct format and values for the time of day parameter and re-execute CLR:BKUP.
     OUT OF RANGE DAY OF {MONTH|WEEK} SPECIFIED = An invalid day of month or week (DAY) parameter was specified in the input message. Refer to the CLR:BKUP input message manual page for the correct format and values for the day of month or week parameter and re-execute CLR:BKUP.
     SPECIFIED BACKUP IS NOT SCHEDULED = The backup specified by the CLR:BKUP input message parameters is not scheduled. Verify that the parameters specified in the input message are correct or execute the OP:BKUP input message to obtain a list of all scheduled backups. Re-execute CLR:BKUP to unschedule the correct backup.
System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

If an error message is output, refer to the message description in the VARIABLE FIELD DEFINITIONS section of this manual page. If the problem cannot be resolved, refer to the TECHNICAL ASSISTANCE portion of the Output Messages Manual INTRODUCTION section. If a CLR:BKUP completed message is output, the OP:BKUP input message may be executed to verify that the backup specified with the CLR:BKUP input message line was unscheduled.

[4] CLR CGAP c

2. REASON FOR OUTPUT

To report the clearing of one or all code control(s).

Format 1 is for removal of one code control on all calls to both a destination code and access prefix.

Format 2 is for removal of one code control on all calls to a destination code regardless of access prefix.

Format 3 is for removal of one code control on calls to an access prefix regardless of destination code.

Format 4 is for removal of all code controls in the office.

3. VARIABLE FIELD DEFINITIONS

ALL = Reports clearing of code control for all domains.

a = Destination code gapped, or "-" if not applicable.

b = Access prefix gapped. The prefix field will contain a blank or "-" if the access prefix is not specified. The access prefix only applies to feature group D carriers.

c = Termination status. Valid value(s):
ABORTED = Message aborted. System error occurred.
COMPLETED = Message successfully completed.
FAILED-PARAMETER = Message failed. Input parameter error.

d = Switching domain list.

2. REASON FOR OUTPUT

To report the clearing of one or all destination code cancellation (DCC) control(s).

Format 1 is for the removal of one DCC control in this office.

Format 2 is for the removal of all DCC controls in this office.

3. VARIABLE FIELD DEFINITIONS

For removal of all DCC controls, the keyword 'CODE' and variable 'a' will be absent. For removal of one destination code cancellation (DCC) control to a destination code.

a = One to ten digit destination code.

b = Termination status. Valid value(s):
ABORTED = Command aborted. System error encountered.
COMPLETED = Command successfully completed.
FAILED-PARAMETER = Command failed. Input parameter error.

4. ACTION TO BE TAKEN

1. FORMAT

CLR DSNM5 PKG=a b

2. REASON FOR OUTPUT

To report the deletion of a package from the package list. This message only appears in defense switched network (DSN) switches.

3. VARIABLE FIELD DEFINITIONS

a = Package name. Valid value(s):
ARC = Alternate route cancellation control.
CLCT = Network management control count.
CLDIR = Call direction.
DCC = Destination code cancellation control.
DLYR = Delayed readiness.
IMA = Additional ineffective machine attempts.
OVRLD = Overload or congestion control.
RRC = Manual reroute trunk group controls.
SVC = Critical service circuit.
TGFLAG = Trunk group flags.
TGMEAS = Basic trunk group measurements.

Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

CLR EMERDMP COMPLETED

2. REASON FOR OUTPUT

To report the termination status of the CLR:EMERDMP input message.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

CLR : EMERDMP
COPY : TAPE - EMERDMP
OP : EMERSTAT

Output Message(s):

REPT : EMER - DUMP
CLR:ESA

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

CLR ESA
a
[PRIMARY ESA: APID=b STATE=c HEALTH=d]
[SECONDARY ESA: APID=b STATE=c HEALTH=d]

2. REASON FOR OUTPUT

Response to the CLR:ESA input message that clears the force active state and reports current status of the primary and secondary enhanced 911 service adjuncts (ESAs). This message could also indicate that the request has timed out.

3. VARIABLE FIELD DEFINITIONS

a = Informational text describing results of clearing the force active state. Valid value(s):
   FORCED ACTIVE CLEARED = The force was cleared and the active ESA was healthier, or as healthy than the inactive, so a switch was not needed. The current status will be printed.
   FORCED ACTIVE CLEARED AND SWITCH COMPLETED = The force was cleared and the inactive ESA was healthier than the active so a switch was done. The current status will be printed.
   NO FORCED ACTIVE TO CLEAR = There is no force to clear since no ESA was forced active. The current status will be printed.
   NO INFORMATION TEXT = The informational text was not set correctly in the message. This should be reported as a problem.
   REQUEST HAS TIMED OUT = The request for information has timed out and no information will be printed.

b = Applications processor identifier (APID) of the ESA. If the APID for the ESA (GLE911APID or GLE911SECID office parameter) is 0, no data for that ESA will be printed.
