4. ACTIONS TO BE TAKEN

None.

The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.

The validity for the administrative module (AM) applies to this section.

5. ALARMS

None.

SECTION 93 : REMOTE ACCESS SERVICES OFFICE TOTALS

REMOTETATMPT TRNDSCNCT OVFL
ACCESSb c d e
CF ACT/DEACTf

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 93: remote access services (RAS) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a  = Time when the report was prepared, in the form hours:minutes:seconds.
b  = Number of calls that terminated to the remote access directory number (RADN).
c  = Number of completed remote access transactions. This is a count of the number of times remote access successfully passed control to a feature based upon the feature access code dialed.
d  = Number of times a RAS call was forcibly disconnected due to user errors.
e  = Number of times RAS was denied due to system errors and/or software resources unavailable.
   System errors are customer originated recent change (CORC) failures and/or database read failures. Software errors occur when remote access cannot obtain dynamic data structures.
f  = Number of attempts to activate/deactivate call forwarding (CF) using remote access.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 224: digital network unit - synchronous optical network (SONET) (DNU-S) - remote digital terminal (RDT) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = DNU-S number.
d = RDT number.
e = Number of times the switch recognizes a request for service (such as, a setup message) from the RDT locally-switched lines (those lines not nailed up using RC/V view 7.11) or attempts to terminate calls to the RDT locally-switched lines or private branch exchange (PBX) direct inward dialing (DID) trunks. The count is incremented when the switch identifies the originating or terminating party and is incremented only once for each originating or terminating call regardless of retry attempts due to resource failures.
f = Number of times the switch recognizes a request for service (such as, a setup message) from the RDT locally-switched lines (those lines not nailed up using RC/V view 7.11) or attempts to terminate
calls to the RDT locally-switched lines or private branch exchange (PBX) direct inward dialing (DID) trunks. The count is incremented when the switch identifies the terminating party.

\[ g \] = Number of times locally-switched originating calls are blocked due to non-availability of an idle digital signal level 1 (DS1) time slot.

\[ h \] = Number of times locally-switched terminating calls are blocked due to non-availability of an idle DS1 time slot.

\[ i \] = Total usage reported in hundred-call-seconds (CCS) of the RDT DS1 time slots this includes traffic for locally-switched originating and terminating calls plus the maintenance usage of the DS1 time slots.

\[ j \] = Maintenance usage of the DS1 time slots. This is the cumulative length of time that each of an RDT active DS1 time slots was not available for traffic due to maintenance activity and includes time slots for non-locally switched circuits (any circuit nailed up using RC/V view 7.11), D-channels, provisioned B-channels, embedded operations channels (EOC), and time-slot management channel (TMC). Maintenance usage for an out-of-service DS1 is calculated by multiplying the time the facility is not available for service by 24, the number of channels per DS1. The time a DS1 is on protection is not considered in this measurement of maintenance usage.

\[ k \] = Number of time slots on the RDT active DS1s [excludes time slots on the protection DS1, but includes time slots for semi-permanent cross connections (provisioned B-channels, provisioned D-channels), EOCs, and TMCs].

\[ l \] = Number of the RDT active DS1 time slots available for locally-switched traffic; this excludes all time slots that are used for semi-permanently cross-connected services, EOCs, and TMCs.

\[ m \] = Number of packets transmitted and received in Information frames (I frames) over the RDT active and standby EOCs.

\[ n \] = Number of packets transmitted and received in I frames over the RDT active and standby TMCs.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 224: digital network unit - synchronous optical network (SONET) (DNU-S) - remote digital terminal (RDT) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Switching module (SM) number.
- **c** = DNU-S number.
- **d** = RDT number.
- **e** = Number of times the switch recognizes a request for service (such as, a setup message) from the RDT locally-switched lines (those lines not nailed up using RC/V view 7.11) or attempts to terminate calls to the RDT locally-switched lines or private branch exchange (PBX) direct inward dialing (DID) trunks. The count is incremented when the switch identifies the originating or terminating party and is incremented only once for each originating or terminating call regardless of retry attempts due to resource failures.
- **f** = Number of times the switch recognizes a request for service (such as, a setup message) from the RDT locally-switched lines (those lines not nailed up using RC/V view 7.11) or attempts to terminate
calls to the RDT locally-switched lines or private branch exchange (PBX) direct inward dialing (DID) trunks. The count is incremented when the switch identifies the terminating party.

\[ g \] = Number of times locally-switched originating calls are blocked due to non-availability of an idle digital signal level 1 (DS1) time slot.

\[ h \] = Number of times locally-switched terminating calls are blocked due to non-availability of an idle DS1 time slot.

\[ i \] = Total usage reported in hundred-call-seconds (CCS) of the RDT DS1 time slots this includes traffic for locally-switched originating and terminating calls plus the maintenance usage of the DS1 time slots.

\[ j \] = Maintenance usage of the DS1 time slots. This is the cumulative length of time that each of an RDT active DS1 time slots was not available for traffic due to maintenance activity and includes time slots for non-locally switched circuits (any circuit nailed up using RC/V view 7.11), D-channels, provisioned B-channels, embedded operations channels (EOC), and time-slot management channel (TMC). Maintenance usage for an out-of-service DS1 is calculated by multiplying the time the facility is not available for service by 24, the number of channels per DS1. The time a DS1 is on protection is not considered in this measurement of maintenance usage.

\[ k \] = Number of time slots on the RDT active DS1s [excludes time slots on the protection DS1, but includes time slots for semi-permanent cross connections (provisioned B-channels, provisioned D-channels), EOCs, and TMCs].

\[ l \] = Number of the RDT active DS1 time slots available for locally-switched traffic; this excludes all time slots that are used for semi-permanently cross-connected services, EOCs, and TMCs.

\[ m \] = Number of packets transmitted and received in Information frames (I frames) over the RDT active and standby EOCs.

\[ n \] = Number of packets transmitted and received in I frames over the RDT active and standby TMCs.

d = RDT number.
e = Number of times the switch recognizes a request for service (such as a setup message) from the RDT locally-switched lines (those lines not nailed up using RC/V view 7.11) or attempts to terminate calls to the RDT locally-switched lines or private branch exchange (PBX) direct inward dialing (DID) trunks. The count is incremented when the switch identifies the originating or terminating party and is incremented only once for each originating or terminating call regardless of retry attempts due to resource failures.
f = Number of times the switch recognizes a request for service (such as a setup message) from the
RDT locally-switched lines (those lines not nailed up using RC/V view 7.11) or attempts to terminate calls to the RDT locally-switched lines or private branch exchange (PBX) direct inward dialing (DID) trunks. The count is incremented when the switch identifies the terminating party.

\( g \) = Number of times locally-switched originating calls are blocked due to non-availability of an idle digital signal level 1 (DS1) time slot.

\( h \) = Number of times locally-switched terminating calls are blocked due to non-availability of an idle DS1 time slot.

\( i \) = Total usage reported in hundred-call-seconds (CCS) of the RDT DS1 time slots this includes traffic for locally-switched originating and terminating calls plus the maintenance usage of the DS1 time slots.

\( j \) = Maintenance usage of the DS1 time slots. This is the cumulative length of time that each of an RDT active DS1 time slots was not available for traffic due to maintenance activity and includes time slots for non-locally switched circuits (any circuit nailed up using RC/V view 7.11), D-channels, provisioned B-channels, embedded operations channels (EOC), and time-slot management channel (TMC). Maintenance usage for an out-of-service DS1 is calculated by multiplying the time the facility is not available for service by 24, the number of channels per DS1. The time a DS1 is on protection is not considered in this measurement of maintenance usage.

\( k \) = Number of time slots on the RDT active DS1s [excludes time slots on the protection DS1, but includes time slots for semi-permanent cross connections (provisioned B-channels, provisioned D-channels), EOCs, and TMCs].

\( l \) = Number of the RDT active DS1 time slots available for locally-switched traffic; this excludes all time slots that are used for semi-permanently cross-connected services, EOCs, and TMCs.

\( m \) = Number of packets transmitted and received in Information frames (I frames) over the RDT active and standby EOCs.

\( n \) = Number of packets transmitted and received in I frames over the RDT active and standby TMCs.

| . | . | . | . |
+---+---+---+---+---+

2. REASON FOR OUTPUT

To measure the amount of stand-alone and partial stand-alone time in the remote site. This message responds to a request for an immediate or scheduled teletypewriter (TTY) output of section 39 of the 30-minute traffic report. One line prints for each multimodule remote switching module (RSM) (remote site). Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time in the form hours:minutes:seconds.
b = Text identifier of the remote site.
c = Numerical identifier of the remote site.
d = Amount of time (in seconds) the remote site was in full stand alone.
e = Amount of time (in seconds) the remote site was in partial stand alone.

2. REASON FOR OUTPUT

To respond to a request for either an immediate output or scheduled output of section 20: remote terminal (RT) - digital carrier line unit (DCLU) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Switching module (SM) number.

c = DCLU number.

d = Remote terminal number.

e = Remote terminal traffic usage, reported in hundred-call-seconds.

f = Number of times an originating call request from the RT cannot get a time slot over the T1 links to the RT to set up the call.

g = Number of times a call attempts to terminate to a directory number (DN) on the RT cannot get a time slot over the T1 links to the RT to set up the call.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 233: Signalling Connection Control Part (SCCP) for Packet Switch Unit (PSU) based Common Channel Signalling (CCS) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information. Note that selection of components for collection and reporting of this section is administered using RC/V views 13.7 and 13.8.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

- a = Time when the report was prepared, in the form hh:mm:ss.
- b = Global Switching module (GSM) number.
- c = The number of SCCP routing failure of no translation of address for such nature.
- d = The number of SCCP routing failure due to no translation of this specific address.
- e = Number of SCCP routing failure due to network point code not available.
- f = Number of SCCP routing failure due to network congestion.
- g = Number of SCCP routing failure due to subsystem unavailable.
- h = Number of SCCP routing failure due to unequipped user.
- i = Number of global title translations (GTTs) failed for any reason.
\( j \) = Number of successful global title translations (GTTs).

\( k \) = Number of connectionless SCCP messages discarded for any reason.

### 3.2 Parameters

2. REASON FOR OUTPUT

To respond to a request for either an immediate or schedule output of section 210 stream control transmission protocol (SCTP) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a  = Time when the report was prepared, in the form hours:minutes:seconds.

b  = SM number.

c  = Association number.

d  = Validity of the measurements. This counter provides the information concerning the validity of the collected traffic measurements. If the collection process was finished successfully and the data collected for the most recent interval has been successfully transmitted from all entities to AM, then the value of this counter is zero. the following cases are used:

<table>
<thead>
<tr>
<th>If:</th>
<th>Then:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 0=1</td>
<td>Changeover from serving to non-serving unit was done within the traffic measurements collection period. This field must be set to 1 then on both units, that is, serving and non-serving.</td>
</tr>
<tr>
<td>Bit 1=1</td>
<td>No possibility to reach session initiation protocol protocol handler (SIPPH) to transfer the traffic data from that SIPPH or the transfer was torn down during traffic data transfer. This bit is handled and set by the switching module processor (SMP). The rest of bits are for future use and currently by default they must be zero.</td>
</tr>
</tbody>
</table>

e  = Number of SCTP DATA chunks received. This counter provides the number of SCTP DATA chunks received on this SCTP association.

f  = Number of SCTP DATA chunks sent. This counter provides the number of SCTP DATA chunks sent on this SCTP association.

g  = Number of SCTP INIT requests sent. This counter provides the number of SCTP INIT requests sent on this SCTP association.

h  = Number of SCTP INIT requests received. This counter provides the number of SCTP INIT requests received on this SCTP association.

i  = Number of SCTP INIT ACK requests sent. This counter provides the number of SCTP INIT ACK requests sent on this SCTP association.

j  = Number of number of SCTP INIT ACK requests received. This counter provides the number of SCTP INIT ACK requests received on this SCTP association.
k = Number of ERROR requests received. This counter provides the number of operation ERROR chunk received on this SCTP association.

l = Number of ERROR requests sent. This counter provides the number of operation ERROR chunk sent on this SCTP association.

m = Number of state COOKIE requests received. This counter provides the number of COOKIE requests received on this SCTP association.

n = Number of state COOKIE requests sent. This counter provides the number of COOKIE requests sent on this SCTP association.

o = Number of COOKIE ACK requests received. This counter provides the number of COOKIE ACK requests received on this SCTP association.

p = Number of COOKIE ACK requests sent. This counter provides the number of COOKIE ACK requests sent on this SCTP association.

q = Number of state ABORT requests received. This counter provides the number of ABORT requests received on this SCTP association.

r = Number of state ABORT requests sent. This counter provides the number of ABORT requests sent on this SCTP association.

s = Number of state SHUT requests received. This counter provides the number of SHUTDOWN requests received on this SCTP association.

r = Number of state SHUT requests sent. This counter provides the number of SHUTDOWN requests sent on this SCTP association.

u = Number of state SHUT ACK requests received. This counter provides the number of SHUTDOWN acknowledgement requests received on this SCTP association.

v = Number of state SHUT ACK requests sent. This counter provides the number of SHUTDOWN acknowledgement requests sent on this SCTP association.

w = Number of state SHUT CPL requests received. This counter provides the number of SHUTDOWN COMPLETE requests received on this SCTP association.

x = Number of state SHUT CPL requests sent. This counter provides the number of SHUTDOWN COMPLETE requests sent on this SCTP association.

y = Number of unexpected or duplicated requests received. This counter provides the number of unexpected or duplicated INIT, INIT ACK, COOKIE ECHO and COOKIE ACK requests received on this SCTP association.

z = Number of datagrams requiring reassembly. This counter provides the number of SCTP datagrams successfully reassembled at this entity.

a¹ = Number of fragments requiring reassembly. This counter provides the number of SCTP fragments requiring reassembly on this SCTP association.

b¹ = Number of times the re-assembly procedure failed. This counter provides the number of failures detected by the SCTP re-assembly algorithm (for whatever reason: timed out, errors, and so forth). Note that this is not necessarily a count of discarded SCTP fragments since some algorithms can
lose track of the number of fragments by combining them as they are received.

\[ c^1 \] = Number of SCTP datagrams that were fragmented. This counter provides the number of SCTP datagrams that were successfully fragmented at this entity.

\[ d^1 \] = Number of SCTP datagram fragments created. This counter provides the number of SCTP datagram fragments that were generated as result of fragmentation on this SCTP association.

### 4. ACTIONS TO BE TAKEN

No action is required.

If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRFC30 input message for additional information.
The validity for the administrative module applies to this section.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 94: action control point (ACP) for software defined network (SDN) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

For the variables with "*" refer to the ACTION TO BE TAKEN section.

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of originating SDN/automatic number identification (ANI) services attempts.
c = Number of SDN/ANI queries to database.
d = Number of completed SDN/ANI services calls successfully outpulsed (OPLS).
e = Number of failures to obtain ANI on a centralized automatic message accounting (CAMA) trunk.
f = Number of failures to obtain ANI through operator number identification (ONI) on CAMA trunk.
g = Number of call processing failures - transaction inactive (INATRN).
\[ h = \text{Number of call processing failures - transaction active (ACTTRN)}. \]
\[ i = \text{Number of transaction capability (TC) signaling failures blocked (BLKD) at switch}. \]
\[ j = \text{Number of TC signaling failures timeout (TO) at switch}. \]
\[ k = \text{Number of TC signaling failures blocked in common channel signaling (CCS) network}. \]
\[ l = ^* \text{Number of invalid TC message/components (INVMSG)}. \]
\[ m = \text{Number of invalid TC message sequences received (INVSEQ)}. \]
\[ n = \text{Number of TC return errors received}. \]
\[ o = \text{Number of TC rejects received}. \]
\[ p = \text{Number of TC aborts received}. \]
\[ q = \text{Number of TC terminates (TERM) due to failure}. \]
\[ s = \text{Number of abandons after initial query, before reply}. \]
\[ t = \text{Number of abandons after outpulsing before answer}. \]

4. ACTIONS TO BE TAKEN

None.

The set of variables with "*" above represents the measurements collected in the direct link node (DLN). If the office...
is equipped with the DLN and the set of variables with "*" are zero, this suggests that the DLN failed to report these variables and these variables are invalid for the reporting period. The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

The validity for the administrative module applies to this section.

2. **REASON FOR OUTPUT**

To respond to a request for either an immediate or scheduled output of section 32: simulated facility group (SFG) measures of the 30-minute traffic report. Up to five SFGs may be reported in a single message.

3. **VARIABLE FIELD DEFINITIONS**

3.1 **Variables**

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = SFG identifier.
- **c** = SFG usage in hundred call seconds.
- **d** = Number of SFG access attempts.
- **e** = Number of SFG attempts that met with simulated blocked access.
- **f** = Number of SFG attempts that met with physical blocked access.
- **g** = Number of SFG hung members.
- **h** = Number of intercom calling restriction (ICR) overflow calls that were allowed to complete after notification that extra billing would be applied to complete the call.

### 4. ACTIONS TO BE TAKEN

None.

To check the validity of the data, first determine which switching modules (SMs) the reported groups belong to using the RC/V View 7.3. The validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

```
OP:TRFC30,VLD
```

The validity for the SMs applies to this section.

### 5. ALARMS

<td>.</td>
<td>.</td>
<td>.</td>
<td>[.]</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of Section 144: switching group (SG) measurements of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number.
c = Line unit (LU) number.
d = Concentrator number.
e = Switch group number.
f = Traffic usage reported in hundred-call-second (CCS). This count is only generated after the SG has been allowed for collection and is in use (count 1).

For each SG, the traffic usage measurement will be generated for:

- Circuit-switched calls (voice and/or data).
- Terminal maintenance.
- Network fabric exercise.

The traffic usage measurement will not reflect the following:

- Diagnostic maintenance. Generation of the usage count does not begin until the section is allowed for collection using the ALW:TRFC30 input message. Therefore, when comparing usage of one SG to another SG, the following must be
considered.

Note: The differential may be especially significant if comparing weekly data.

- Length of time a study has been allowed for collection. If one study is allowed for collection before another study is allowed, the SGs on the LUs on the first study will appear to have higher usage.

- Length of time an LU has been a member of a study. If an LU is added to a study (RC/V View 13.6 update) and the study is already allowed for collection, the SGs on the LU added by the update will appear to have lower usage than the SGs on the LUs on the study before the update.

- Length of time SGs have been operational. If a study is allowed for collection and SGs on an LU on the study are updated to operational and then the study is reallocated for collection, the recently operational SGs will appear to have lower usage than the SGs which were on the study before the second allow input message was entered.

\[ g = \text{Total originating and terminating blockage}. \]

### 3.2 Parameters

### 2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 194: speech handler (SH) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

### 3. VARIABLE FIELD DEFINITIONS
a = Time when the report was prepared, in the form hh:mm:ss.
b = Switching module (SM) number.
c = Packet Switching Unit (PSU) number (0).
d = Number of 20 millisecond (ms) reverse voice intervals that occur in which all reverse voice packets are early, late, or missing.
e = Number of 20 ms reverse voice intervals that occur for calls that are in 2-way soft handoff in which a low quality voice packet is fed to the vocoder.
f = Number of occurrences of a single 20 ms reverse voice interval for calls that are in 2-way soft handoff in which all reverse voice packets are either early, late, missing or erase.
g = Number of occurrences of two consecutive 20 ms reverse voice intervals for calls that are in 2-way soft handoff in which all reverse voice packets are either early, late, missing or erase.
h = Number of occurrences of more than two consecutive 20 ms reverse voice intervals for calls that are in 2-way soft handoff in which all reverse voice packets are either early, late, missing or erase.
i = Number of 20 ms reverse voice intervals that occur for calls that are in 2-way soft handoff.
j = Number of 20 ms reverse voice intervals that occur for calls that are in 3-way soft handoff in which a low quality voice packet is fed to the vocoder.
k = Number of occurrences of a single 20 ms reverse voice interval for calls that are in 3-way soft handoff in which all reverse voice packets are either early, late, missing or erase.
l = Number of occurrences of two consecutive 20 ms reverse voice intervals for calls that are in 3-way soft handoff in which all reverse voice packets are either early, late, missing or erase.
m = Number of occurrences of more than two consecutive 20 ms reverse voice intervals for calls that are in 2-way soft handoff in which all reverse voice packets are either early, late, missing or erase.
n = Number of 20 ms reverse voice intervals that occur for calls that are in 3-way soft handoff.
o = Number of 20 ms reverse voice intervals that occur for calls that are not in soft handoff in which a low quality voice packet is fed to the vocoder.
p = Number of occurrences of a single 20 ms reverse voice interval for calls that are not in soft handoff in which all reverse voice packets are either early, late, missing or erase.
q = Number of occurrences of two consecutive 20 ms reverse voice intervals for calls that are not in soft handoff in which all reverse voice packets are either early, late, missing or erase.
r = Number of occurrences of more than two consecutive 20 ms reverse voice intervals for calls that are not in soft handoff in which all reverse voice packets are either early, late, missing or erase.
s = Number of 20 ms reverse voice intervals that occur for calls that are not in soft handoff.

4. ACTION TO BE TAKEN

No action is required.
If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option:

OP:TRFC30,VLD

If the data is checked, check the validity of the corresponding SM.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or schedule output of section 209 session initiation protocol for telephony (SIP-T) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Number of INVITE requests received. This counter provides the number of INVITE requests received by the SIP-T entity including retransmissions (if retransmissions are supported).

c = Number of INVITE requests sent. This counter provides the number of INVITE requests sent by the SIP-T entity including retransmissions (if retransmissions are supported).

d = Number of 183 SESSION PROGRESS requests received. This counter provides the number of 183 SESSION PROGRESS requests received by the SIP-T entity.
e = Number of 183 SESSION PROGRESS requests sent. This counter provides the number of 183 SESSION PROGRESS requests sent by the SIP-T entity.

f = Number of 180 RINGING requests received. This counter provides the number of 180 RINGING requests received.

g = Number of 180 RINGING requests sent. This counter provides the number of 180 RINGING requests sent.

h = Number of 200 OK (INVITE) message is received. This counter provides the number of 200 OK (INVITE) message is received.

i = Number of 200 OK (INVITE) message is sent. This counter provides the number of 200 OK (INVITE) message is sent.

j = Number of BYE requests received. This counter provides the number of BYE requests received by SIP entity.

k = Number of BYE requests sent. This counter provides the number of BYE requests sent by SIP entity.

l = Number of 200 OK (BYE) requests received. This counter provides the number of 200 OK (BYE) requests received by SIP-T entity.

m = Number of 200 OK (BYE) requests sent. This counter provides the number of 200 OK (BYE) requests sent by SIP-T entity.

n = Number of CANCEL requests received. This counter provides the number of CANCEL requests received by the SIP entity.

o = Number of CANCEL requests sent. This counter provides the number of CANCEL requests sent by the SIP entity.

p = Number of INFO requests received. This counter provides the number of INFO requests received by the SIP entity.

q = Number of INFO requests sent. This counter provides the number of INFO requests sent by the SIP entity.

r = Number of SIP-T time-outs. This counter provides the number of SIP-T time-outs. This counter must be pegged when timeouts (INVITE transaction timeout, non-INVITE transaction timeout, ACK wait timeout, UPDATE wait timeout) are exceeded.

s = Message dropped before or after setup. When receiving an 4xx-6xx to an INFO message before or after call-setup, the message shall be dropped and the count shall be pegged.

t = Message format not acceptable. The maximum size that a 5ESS switch is required to support for a received mandatory header field shall be 256 bytes. When such a header field is received exceeding 256 bytes, the message shall be dropped and the count BADFMT shall be pegged. For the special case in which "To" header field is received with a length less than 256 but which would exceed 256 upon addition of the tag field, the 5ESS switch shall also reject this case in the same manner and the count BADFMT must be pegged.

u = Number of status code response classes 1xx received. This counter provides the number of SIP responses received for status code response classes 1xx.
\( v \) = Number of status code response classes 2xx received. This counter provides the number of SIP responses received for status code response classes 2xx.

\( w \) = Number of status code response classes 3xx received. This counter provides the number of SIP responses received for status code response classes 3xx.

\( x \) = Number of status code response classes 4xx received. This counter provides the number of SIP responses received for status code response classes 4xx.

\( y \) = Number of status code response classes 5xx received. This counter provides the number of SIP responses received for status code response classes 5xx.

\( z \) = Number of status code response classes 6xx received. This counter provides the number of SIP responses received for status code response classes 6xx.

\( a^1 \) = Number of status code response classes 4xx sent. This counter provides the number of SIP responses sent for status code response classes 4xx.

\( b^1 \) = Number of status code response classes 5xx sent. This counter provides the number of SIP responses sent for status code response classes 5xx.

\( c^1 \) = Number of status code response classes 6xx sent. This counter provides the number of SIP responses sent for status code response classes 6xx.

### 2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 230: MTP Signaling Link (SL) for Packet Switch Unit (PSU) based Common Channel Signalling (CCS) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information. Note that selection of components for collection and reporting of this section is administered using RC/V views 13.7 and 13.8.

### 3. VARIABLE FIELD DEFINITIONS

#### 3.1 Variables

- **a** = Time when the report was prepared, in the form hh:mm:ss.
- **b** = Global Switching Module (GSM) number.
- **c** = Link Set Number
- **d** = Link Set Member Number
- **e** = Link Set Member Type
- **f** = SS7 Link Parameter Set Class.
g = Number of signaling units in error.
h = Number of SIF (Service Information Field) and SIO (Signaling information Octets) received.
i = Number of receive buffer overflows per signaling link.
j = Number of times a signaling link failure occurred regardless of the reason.
k = Number of times there is an excessive delay of ACK causing signaling link failure.
l = Number of times an excessive error rate causes a signaling link failure.
m = Number of times an excessive period of congestion occurs causing a signaling link failure.
n = Number of times a signaling link alignment failure occurs for any reason.
o = Number of seconds that a signaling link is unavailable for any reason.
p = Duration the signaling link is in the IN-SERVICE state.
q = Duration the signaling link is inhibited due to local management action.
r = Duration the signaling link is inhibited due to remote management action.
s = Duration the signaling link is congested.
t = Number of SIF and SIOs transmitted.
u = Number of MSUs transmitted for the first time (such as, excluding retransmitted MSUs).
v = Number of MSUs received by each signaling link.
w = Number of MSUs discarded due to signaling link congestion.
x = Number of congestion events resulting in loss of MSUs.
y = Number of messages retransmitted by each signaling link.
z = The number of times the messages in the level 2 retransmission buffer waiting for acknowledgement has exceeded a defined threshold.
a¹ = Number of times the remote office is in reception congestion and sends a SIB (status indication busy).
b¹ = The number of times the messages in the DMA processor has exceeded a defined threshold due to SS7 reception congestion.
c¹ = Number of transmission buffer congestions on a per signaling link basis.
d¹ = Number of times level 1 congestion has been exceeded on the signalling link.
e¹ = Number of times level 2 congestion has been exceeded on the signalling link.
f¹ = Number of times level 3 congestion has been exceeded on the signalling link.
g¹ = Number of negative acknowledgement received.
\( h^1 \) = Number of octets retransmitted.

\( i^1 \) = Number of local automatic changeover performed.

\( j^1 \) = Number of local automatic changeback performed.

\( k^1 \) = Number of local manual changeover performed.

\( l^1 \) = Duration of signaling link unavailability due to a link failure.

\( m^1 \) = MTP3 Message Octets Received.

\( n^1 \) = Link Maintenance.

\( o^1 \) = Priority 0 MTP3 Messages Discarded due to Congestion.

\( p^1 \) = Priority 1 MTP3 Messages Discarded due to Congestion.

\( q^1 \) = Priority 2 MTP3 Messages Discarded due to Congestion.

\( r^1 \) = Priority 3 MTP3 Messages Discarded due to Congestion.

To respond to a request for either an immediate or scheduled output of section 206: SM IWG PCT measurements (SMIWGPCT) of the 30-minute traffic report.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
c = Total usage for measured SM of all the PCT links used for IWG connections. This is the number of slots across all the PCT links that are traffic busy (in-service and busy) plus maintenance busy (out-of-service) during the scan.
d = Maintenance usage for measured SM of all the PCT links used for IWG connections. This is the number of slots across all the PCT links that are Out-of-Service during the scan.
e = Number of attempts to hunt for an idle slot among PCT links used for IWG connections for measured SM. This is the number of calls that attempted to use this SM to find an ATM bearer path.
f = Number of times overflow occurs when hunting for an idle slot among the PCT links used for IWG connections for measured SM. This is the number of calls that failed to find an idle ATM bearer path on this SM.
g = Total number of PCT links on the SM.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number. Refer to the APP: RANGES appendix in the Appendixes section of the Output Messages manual.
c = Total usage for measured SM of all the links used for IWG connections. This is the number of slots across all the links between SM and IWG unit that are traffic busy (in-service and busy) plus maintenance busy (out-of-service) during the scan.
d = Maintenance usage for measured SM of all the links used for IWG connections. This is the number of slots across all the links between SM and IWG that are Out-of-Service during the scan.
e = Number of attempts to hunt for an idle slot among links used for IWG connections for measured SM. This is the number of calls that attempted to use this SM to find an ATM bearer path.
f = Number of times overflow occurs when hunting for an idle slot among the links used for IWG connections for measured SM. This is the number of calls that failed to find an idle ATM bearer path on this SM.
g = Total number of links between SM and IWG unit.

3.2 Parameters

<table>

</tr>
</tbody>
</table>
4. ACTIONS TO BE TAKEN

No action is required. If desired, the validity of this data may be checked by requesting the validity section of the 30-minute traffic report with input message OP:TRFC30 using the VLD option. Refer to the OP:TRRC30 input message for additional information.

The validity for the administrative module (AM) applies to this section.

5. ALARMS

None.

SECTION 22: SWITCHING MODULE SYSTEM

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 22: switching module system (SMS) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = Switching module (SM) number.

c = Number of originating calls (count 1). This peg count provides the number of originating requests that result in the SM's receipt of at least one digit. Calls that do not normally result in digits being dialed are included upon the determination that no digits are required. The total count for all SMs appears as ORIGPC on the 15-minute traffic report (part 1), PEGCT (ORIGINAT) (section 5) and ORGHC (section 15) on the 30-minute traffic report, and ORIGIN (BASE) on the plant report (part 1A).

d = Number of incoming (line and trunk) calls (count 2). This peg count provides the number of inter-SM call termination requests (to a line or a trunk) received by this SM from other SMs. This is not equivalent to the INCHC count in section 15. The INCHC count represents interoffice traffic.

e = Number of outgoing (line and trunk) calls (count 3). This peg count provides the number of inter-SM calls originating in this SM and terminating to a line or trunk in other SMs. This count includes calls from incoming trunk groups (trunk to line or trunk to trunk call) terminating from one SM to another SM in the switch. In this case, the OTG is pegged and no ORIG peg count is pegged. Line to line or line to trunk inter-SM calls will score both the ORIG and OTG counters. This count also includes inter-SM CDMA calls connected over dedicated PSU to PSU facilities. These calls do not use TMS time slots.
\[ f \] = Number of outgoing (line and trunk) calls blocked (count 4). This peg count provides the number of calls blocked in the SM while the SM was isolated from the communication module processor (CMP) for both stand-alone and non-stand-alone SMs.

\[ g \] = Number of incoming (line and trunk) calls blocked (count 5). This peg count provides the number of calls blocked in the AM or CMP because the terminating SM was in standalone.

\[ h \] = Stand alone time in seconds (count 6). This usage measurement (seconds) provides the number of seconds the SM was in standalone. The SM must have the stand-alone feature option. For non-RSMs, this is equivalent to full stand-alone duration. For MMRSMs, this is equivalent to the combined full plus partial stand-alone duration time. This count can also provide the number of seconds RSMs were unable to communicate because of isolation of the host SM. This measurement also appears on the plant report (part 4) and is reported on a per-SM basis.

\[ i \] = Number of wideband interSM call attempts where 2, 3, 4, 5, or 6 channels were requested coming into this SM from another SM or going out of this SM to another SM. The call attempt can be either primary rate interface (PRI) or integrated digital services network (ISDN) user part (ISUP) signaling. Calls that peg this count do not peg counts incoming (INC) or outgoing (OTG) which pertain to single channel calls (count 7).

\[ j \] = Number of wideband interSM call attempts where 7 or more (max of 24) channels were requested coming into this SM from another SM or going out of this SM to another SM. The call attempt can be either PRI or ISUP signaling. Calls that peg this count do not peg counts INC or OTG which pertain to single channel calls (count 8).

\[ k \] = Number of blocked due to time slot hunt failure wideband interSM call attempts where 2, 3, 4, 5, or 6 channels were requested coming into this SM from another SM or going out of this SM to another SM. The call attempt can be either PRI or ISUP signaling. Calls that peg this count do not peg counts INC block (INCBLK) or OTG block (OTGBLK) which pertain to single channel calls (count 9).

\[ l \] = Number of blocked due to time slot hunt failure wideband interSM call attempts where 7 or more (max of 24) channels were requested coming into this SM from another SM or going out of this SM to another SM. The call attempt can be either PRI or ISUP signaling. Calls that peg this count do not peg counts INCBLK or OTGBLK which pertain to single channel calls (count 10).

### 2. REASON FOR OUTPUT

To respond to a request for an immediate or scheduled output of section 203: signaling link set of the 30-minute traffic report.

### 3. VARIABLE FIELD DEFINITIONS

#### 3.1 Variables

- **a** = Time when the report was prepared, in the form hours:minutes:seconds.
- **b** = Global switching module.
- **c** = Signaling point isolation (peg count). Each time a member-routed adjacent point code (APC) becomes inaccessible, this count will be pegged.
- **d** = Signaling point isolation (time). The duration begins when an APC becomes unaccessible and ends when an APC becomes accessible.
- **e** = Link set failure (peg count).
- **f** = Link set failure (time).
- **g** = Signaling link set congestion (peg count). The number of times a link set transfers from no congestion to some level level of congestion. Individual levels of congestion (that is, level 1 to level 2, level 2 to level 3) are not pegged.
- **h** = Signaling link set congestion (time).
- **i** = Automatic change overs. This is the sum of near-end and far-end automatic change overs. The near-end change overs occur usually due to excessive errors on the link. The far-end change overs involve transferring signaling messages from the unavailable link.
j = Alternate link set routing transitions (peg count). This is a cumulative count of the number of times an alternate route was used.

k = Alternate link set routing transitions (time). This is a cumulative duration of all alternate link set routing transitions.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 243: Two B-Channel Transfer section of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Primary Rate Interface Group Number. number.
c = Number of valid TBCT transfer requests. This count is pegged each time a FACILITY message is received with a facility IE that contains an Invoke component with an Operation value coded for "enhancedExplicitECTExecute", and the feature assignment and validity checks are passed.
d = Number of successful TBCT transfers. This count is pegged each time a transfer request has been validated and the transfer is successfully accomplished (indicated when the switch sends the controller a DISCONNECT message with a facility IE that contains a Return Result component which includes the Invoke Identifier that corresponds to the TBCT request).
e = Number of overflows of maximum number of TBCT Transfer Requests in Current Period. This count is pegged each time a valid transfer request is rejected because the number of transfer requests in the current period is greater than the Maximum Transfer Requests per Ten Seconds parameter.
f = Number of overflows of maximum number of active TBCT Transfers. This count is be pegged if a valid transfer request is rejected because the number of active transfers is equal to or greater than the Maximum Active Transfers parameter and if the number of transfer requests in the current period does not exceed the Maximum Transfer Requests per 10-Seconds parameter limit.

3.2 Parameters
### Data collection unit

2. REASON FOR OUTPUT

To respond to a request for either an immediate or schedule output of section 180: transaction capability application part (TCAP) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Total number of TCAP messages that are sent to all TC-users.
c = Total number of TCAP messages that are received from all TC-users.
d = Count of TC-user generated problems when a TC user reject is received with one of the following causes:
- Duplicate invoke ID (invoke problem).
- Unrecognized operation (invoke problem).
- Mistyped parameter (invoke problem).
- Resource limitation (invoke problem).
- Initiating release (invoke problem).
- Linked response unexpected (invoke problem).
- Unexpected linked operation (invoke problem).
- Unrecognized error (return error problem).
- Unexpected error (return error problem).
- Mistyped parameter (return result problem).
- Mistyped parameter (return error problem).
e = Count of protocol errors detected in the transaction portion of a message by another network element that result in a P-abort message being received with one of the following causes:

- Unrecognized message type.
- Incorrect TP.
- Badly formatted TP.
- Unrecognized TID.
- Resource limitation.

\( f \) = Count of protocol errors detected in the component portion of a message by another network element that result in a reject being received with one of the following general problem causes:
  - Unrecognized component (general problem).
  - Mistyped component (general problem).
  - Badly structured component (general problem).

\( g \) = Count of protocol errors detected in the component portion of a message by another network element that result in a reject being received with one of the following other problem causes:
  - Unrecognized linked ID (invoke problem).
  - Unrecognized invoke ID (invoke) (return result problem).
  - Return result (RR) unexpected (return result problem).
  - Unrecognized invoke ID (RE) (return error problem).
  - Return error (RE) unexpected (return error problem).

\( h \) = Count of protocol errors detected in the transaction portion of a message that cause a P-abort message to be sent with one of the following causes:
  - Unrecognized message type.
  - Incorrect TP.
  - Badly formatted TP.
  - Unrecognized TID.
  - Resource limitation.

\( i \) = Count of protocol errors detected in the component portion of a message which cause a reject to be generated with one of the following general problem causes:
  - Unrecognized component (general problem).
  - Mistyped component (general problem).
  - Badly structured component (general problem).

Whether or not the reject gets sent depends on the TC-user.

\( j \) = Count of protocol errors detected in the component portion of a message which cause a reject to be generated with one of the following other problem causes:
  - Unrecognized linked ID (invoke problem).
  - Unrecognized invoke ID (invoke) (return result problem).
  - RR unexpected (return result problem).
  - Unrecognized invoke ID (RE) (return error problem).
  - RE unexpected (return error problem).

Whether or not the reject gets sent depends on the TC-user.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 12: trunk group (TG) of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Trunk group number.
c = Trunk group name.
d = Number of incoming calls.
e = Number of outgoing calls.
f = Number of attempts to access a trunk when none was available for that trunk group.

g = Maintenance usage, reported in CCS.

h = Total usage, the sum of both traffic and maintenance usage reported in hundred-call-seconds (CCS).

i = Trunk group incoming traffic usage.

j = Trunk group outgoing traffic usage.

k = Number of incoming peg count (IPC) total trunk (IPCTT) seizures for all incoming calls. For non-wideband trunk groups, IPCTT and IPC are the same.

l = Number of outgoing peg count (OPC) total trunk (OPCTT) seizures for all outgoing calls. For non-wideband trunk groups, OPCTT and OPC are the same.

m = Number of overflow (OFL) total trunks (OFLTT). It provides the total number of attempted trunk seizures that resulted in an unsuccessful call. For all calls, this count pegs the total number of trunks requested for the call. For non-wideband trunk groups, OFLTT and OFL are the same.

An unsuccessful call may succeed on another trunk group if an alternate route is specified.

For wideband calls, this count provides the total number of trunks needed for the call to succeed, although a subset of trunks may have been available.

n = Number of calls blocked by selective incoming load control (SILC).

o = Number of equal access signaling (EAS) incoming calls.

p = Total EAS usage, the number of times the EAS was used, reported in CCS.

q = Flexible alerting outgoing call attempt. This count provides the number of times a trunk was seized for an outgoing flexible alerting call for AMPS only.

r = Number of calls resulting in an initial address message with redirect capability parameter being sent as a result of release link initiation.

s = Number of calls setup as a result of having received a release message with redirection information message.

t = Number of trunks in service.

u = Number of trunks out of service.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 212: trunk group (TGN) of the
30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for
additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Trunk group number.
c = Trunk group name.
= Number of incoming calls.

= Number of outgoing calls.

= Number of attempts to access a trunk when none was available for that trunk group.

= Maintenance usage, reported in CCS.

= Total usage, the sum of both traffic and maintenance usage reported in hundred-call-seconds (CCS).

= Trunk group incoming traffic usage.

= Trunk group outgoing traffic usage.

= Number of incoming peg count (IPC) total trunk (IPCTT) seizures for all incoming calls. For non-wideband trunk groups, IPCTT and IPC are the same.

= Number of outgoing peg count (OPC) total trunk (OPCTT) seizures for all outgoing calls. For non-wideband trunk groups, OPCTT and OPC are the same.

= Number of overflow (OFL) total trunks (OFLTT). It provides the total number of attempted trunk seizures that resulted in an unsuccessful call. For all calls, this count pegs the total number of trunks requested for the call. For non-wideband trunk groups, OFLTT and OFL are the same.

An unsuccessful call may succeed on another trunk group if an alternate route is specified.

For wideband calls, this count provides the total number of trunks needed for the call to succeed, although a subset of trunks may have been available.

= Number of calls blocked by selective incoming load control (SILC).

= Number of equal access signaling (EAS) incoming calls.

= Total EAS usage, the number of times the EAS was used, reported in CCS.

= Flexible alerting outgoing call attempt. This count provides the number of times a trunk was seized for an outgoing flexible alerting call for AMPS only.

= Number of calls resulting in an initial address message with redirect capability parameter being sent as a result of release link initiation.

= Number of calls setup as a result of having received a release message with redirection information message.

= Number of trunks in service.

= Number of trunks out of service.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 30: terminal group (TRMG) measurements of the 30-minute traffic report. Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Terminal group number.
c = Number of originating calls.
d = Number of incoming calls.
e = Number of intragroup calls.
f = Number of multi-way feature with direct connect control attempts.
g = Number of call forwarding features with 'don't answer' option attempts.
h = Number of call forwarding features with 'regular' option attempts.
i = Number of call forwarding features with 'busy line' option attempts.
\[ j \] = Number of multi-way feature with a 'hold' control option attempts.

\[ k \] = Number of call pick-up feature attempts.

\[ l \] = Number of multi-way feature with 'automatic 3-way' control option attempts.

\[ m \] = Number of multi-way feature with '3-way' control option attempts.

\[ n \] = Number of multi-way feature with 'n-way' control option attempts.

\[ o \] = Number of call waiting feature attempts.

### 3.2 Parameters

<table>
<thead>
<tr>
<th>Data collection unit</th>
<th>Terminal group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum collection units</td>
<td>200</td>
</tr>
<tr>
<td>Maximum lines for ROP output</td>
<td>5</td>
</tr>
<tr>

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 150: time slot measurements (TSM) of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
c = Number of network time slot attempts.
This is a number of times there is the attempt to use network time slot by given SM originating the call, regardless if this attempt was successful or not. The wide-band calls attempt is counted as one attempt, regardless of number of the network time slots requested.
d = Number of network time slot overflows.
This is a number of times there is the attempt to use network time slot by given SM originating the call, but this attempt is not successful due to lack of free network time slots in NCT link leading from SM originating the call to CM.
e = Number of network time slot mismatches.
This is the number of times there is an attempt to use network time slot by given SM originating the call, but it is not successful due to fact that it is not possible to find the same time slot in NCT links leading from SM originating the call to CM and from CM to terminating SM. This counter is pegged for both originating and terminating SMs. This counter is the existing TRFC30 report counter.
(section 4 (SAD), counter TSMM) and it is added to this new TRFC30 report section 150 (TSM) to keep all the network time slot related measurements in one place. This counter is not removed from TRFC30 report, section 4 for compatibility reasons.

\[ f \] = Network time slots usage.

This measurement provides the usage generated when network time slots are busy for any reason. The count includes control time slot (CTS) usage, both traffic and maintenance usage of NCT time slots, and usage from all nailed-up time slots associated with given SM. This counter is the existing TRFC30 report counter (section 7 (TD), counter NTSUSG) and it is added to this new TRFC30 report section 150 (TSM) to keep all the network time slot related measurements in one place. This counter is not removed from TRFC30 report, section 7 for compatibility reasons.

\[ g \] = Network time slots maintenance usage.

This measurement provides the usage generated when network time slots are busy for any other reason than the call traffic.

\[ h \] = Network time slots occupancy.

This is the number, in percent, of peak network time slots occupancy of all 100 second periods during the TRFC30 interval. This counter is the existing TRFC30 report counter (section 83 (MOD1), counter NTSOCC) and it is added to this new TRFC30 report section 150 (TSM) to keep all the network time slot related measurements in one place. This counter is not removed from TRFC30 report, section 83 for compatibility reasons.

3-PORT: CCPC = b  CCUSG = c  CCOFL = d  CCMTU = e
6-PORT: CCPC = f  CCUSG = g  CCOFL = h  CCMTU = i

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 10: universal conference circuits (UCONF) of the 30-minute traffic report. These counts will be affected for a switch configured for code division multiple access (CDMA) traffic. Refer to the 235-200-100 for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.
b = Number of attempts to use a 3-port conference circuit.
c = 3-port conference circuit total usage reported in hundred-call-seconds (CCS). This measurement includes maintenance usage counts.
d = 3-port conference circuit overflow count. This overflow count is the number of times that a 3-port circuit was requested but was unavailable. The originator will be given a reorder tone.
e = 3-port conference circuit maintenance usage reported in CCS.
f = Number of attempts to use a 6-port conference circuit.
g = 6-port conference circuit total usage reported in CCS. This measurement includes maintenance usage counts.
h = 6-port conference circuit overflow count. This overflow count is the number of times that a 6-port circuit was requested but was unavailable. The originator will be given a reorder tone.
i = 6-port conference circuit maintenance usage reported in CCS.

</tbody>
</table>

2. **REASON FOR OUTPUT**

   To respond to a request for either an immediate or scheduled output of section 1: validity of the 30-minute traffic report. Reasons why the data in the report may be invalid for a processor are:

   - Initialization in the switching module (SM), communications module processor (CMP), and/or administrative module (AM).
   - Any database manager (DBM) read failure in the SM, AM and/or CMP.
   - Failure to send poll messages to an SM or CMP.
   - Failure to receive data from an SM or CMP.
   - Invalid previous report (due to DBM read failure in the SM, AM and/or CMP, failure to send poll messages to an SM or CMP, or failure to receive data from an SM or CMP).

3. **VARIABLE FIELD DEFINITIONS**

3.1 **Variables**

   a = Time when the report was prepared, in the form hours:minutes:seconds.

   b = Validity of the data in this report interval for the AM. Valid value(s):
   
   INVAL = Some inconsistency in the collection of the count has been detected. Scan counts do not enter into this count.
   
   VALID

   c = Number of 100-second scans during this report interval for the AM. During a 30-minute collection interval, this measurement should equal 18 plus or minus 1.

   d = SM number.
Validity of the data in this report interval for the SM. Valid value(s):

- **INVAL**: Some inconsistency in the collection of the count has been detected. Scan counts do not enter into this count.
- **VALID**

Number of 10-second scans during this report interval for the SM. During a 30-minute collection interval, this measurement should equal 180 plus or minus 1.

For the AM, this value will always be zero (0).

Number of 100-second scans during this report interval for the SM. During a 30-minute collection interval, this measurement should equal 18 plus or minus 1.

2. REASON FOR OUTPUT

To respond to a request for either an immediate or scheduled output of section 246: vocoder of the 30-minute traffic report.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

3.1 Variables

a = Time when the report was prepared, in the form hours:minutes:seconds.

b = VOCODER type. Valid value(s):
   8K
   13K
   ACELP
   EVRC
   VSELP

= Number of overflows.

d = VOCODER usage generated by regular calls, in CCS.

3.2 Parameters

OP:TRUNK
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT
OP TRUNK TGRP a TKMN b c d

2. REASON FOR OUTPUT
To respond to an OP:TRUNK input request to output trunk groups that are being monitored for being held off-hook and out-of-service.

3. VARIABLE FIELD DEFINITIONS
a = Trunk group being output.
b = Trunk member being output.
c = Indicator of whether the trunk is being held. Valid value(s):
Held = Trunk is being held off-hook and out-of-service.
Not Held = Trunk is not being held off-hook and out-of-service.
d = Output message termination report. Valid value(s):
Completed = Trunk group and member are output.
Input Error = Invalid trunk group or member.
No Match = Trunk group and member not being held.
Some Members Not Monitored = While printing the list of monitored members in this group, at least one member was found not being monitored.
System Error = System processing error.

4. ACTION TO BE TAKEN
If input message OP:TRUNK has failed, try the message once again. Also try alternative formats of the input message.

5. ALARMS
None.

1. FORMAT

OP TSESS
SLIM TESTSESSION START DATE START TIME STATUS
a b c d e

2. REASON FOR OUTPUT

Prints the status of up to 40 subscriber line and instrument measurement (SLIM) routine mode test sessions.

3. VARIABLE FIELD DEFINITIONS

a = Test session identity.
b = Date of currently executing test session or the starting date of the test session, in yy-mm-dd format.
c = Time of currently executing test session or the starting time of the test session in hour:minute format.
d = Status of test session. Valid value(s):
   ABORTED = Test session aborted.
   DEF = Test session defined.
   DONE = Test session completed.
   ERROR = Test session error.
   INH = Test session suspended.
   IP = Test session scheduled for execution.
   SCHED = Test session scheduled for execution.
e = Status frequency. Valid value(s):
   - DAILY
   - MONTHLY
   - ONCE
   - WEEKLY

162 (TESTSESSION STATUS)
62. OP:U
OP:ULARP-COM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] OP ULARP COMMAND {STARTED|IN PROGRESS|COMPLETED}
   NAME  STATUS LAST CHANGED
   a     b     c

[2] OP ULARP COMMAND ABORTED - DATABASE ACCESS ERROR

[3] OP ULARP STOPPED - CANNOT CREATE TEMPORARY FILE d

2. REASON FOR OUTPUT

To report the result of executing an OP:ULARP-COMMAND input message.

3. VARIABLE FIELD DEFINITIONS

a  = Name of the equipment configuration data base (ECD) record for the run command.
b  = Status of the run command. Valid value(s):
   COMPLETED  = Run command has successfully executed. Numeric value indicates the exit status
                 of a run command that failed.
   EXECFAIL   = ULARP could not execute the command.
   FORK_FAIL  = User level automatic restart process's (ULARP's) attempt to fork a process to
                 execute the run command failed.
   NON_EXEC   = Run command was not executed.

c  = Date and time status field last changed.
d  = Name of the file which could not be create.

4. ACTION TO BE TAKEN

Format 1 indicates successful execution of the command. If run commands have failed, use the status to determine
any appropriate corrective action. If the failing commands should be run again, use the INIT:ULARP input message
to have ULARP re-run the commands that failed.

Formats 2 and 3 indicate that the command has failed. Retry the command later. If problems still exist, refer to the
TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

__________________________________________________________________

2. REASON FOR OUTPUT

To report the result of executing an OP:ULARP-EXECSEQ input message.

3. VARIABLE FIELD DEFINITIONS

a = Sequence number.
b = Name of equipment configuration data base (ECD) record for child process or run command.
c = Child process or run command. Valid value(s):
   C = Run command.
   P = Child process.
d = BOOTPRM. Two digit hex number which is output as part of a processor recovery message (PRM) resulting from the creation of each child process.
e = Record identification (ID) in the case of a run command, or utility ID in the case of a child process.
f = Delay timing field (in seconds).
g = Wait-for-completion flag for run commands. Valid value(s):
   NO
   YES
h = Name of the file which could not be created.
4. **ACTION TO BE TAKEN**

Formats 1 and 2 indicate success. Take no action.

Formats 3 and 4 indicate that the command failed. Retry the command later. If the problems still exist, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. **ALARMS**

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

OP:ULARP-PROC

Software Release: 5E14 and later  
Message Class: MTCE  
Application: 5,3B  
Type: Output

1. FORMAT

[1] OP ULARP PROCESS {STARTED|IN PROGRESS|COMPLETED}  
NAME  PID  STATUS  LAST CHANGED  RST CNT  RST TIME  
a  b  c  d  e  f

[2] OP ULARP ABORTED - DATABASE ACCESS ERROR

[3] OP ULARP STOPPED - CANNOT CREATE TEMPORARY FILE g

2. REASON FOR OUTPUT

To report the result of executing the OP:ULARP-PROC input message.

3. VARIABLE FIELD DEFINITIONS

a = Name of equipment configuration database (ECD) record for a ULARP child process.
b = Process ID.
c = Status of the process. Valid value(s):
   CFTTERM = User initialization is in progress.
   EXECFAIL = ULARP failed to execute the process.
   FORKFAIL = ULARP's attempt to fork the process failed.
   NONEXEC = Process was not executed.
   RUNNING = Process is running.
   UFATAL = Process terminated because of a fatal error.

Numeric value indicates that the process terminated and was not restarted by ULARP. The value is the exit status that was returned to ULARP the last time the process terminated.
d = Date and time status field last changed.
e = Restart count, if non-zero.
f = Date and time ULARP started counting restarts if 'e' is non-zero.
g = Name of the file which could not be created.

4. ACTION TO BE TAKEN

Format 1 indicates successful execution of the command. If processes have died and not been restarted, use the status to determine any appropriate corrective action. Once the problems are corrected, use the INIT:ULARP input message to have ULARP restart the processes that are not running.
Formats 1 and 2 indicate that the command has failed. Retry the command later. If the problems still exist, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

2. REASON FOR OUTPUT

Format 1 is printed when data is available for a valid host umbilical. Status for the first 23 channels on the host umbilical is displayed in 5 columns. Channel 24 is not displayed since it is always reserved for CCS signaling. Format 2 is printed when an error occurs while trying to obtain channel data associated with the requested umbilical.

3. VARIABLE FIELD DEFINITIONS

- **a** = Host switching module (HSM) number.
- **b** = Remote switching module (RSM) number.
- **c** = Host umbilical (UMBIL) number.
- **d** = Status. Valid value(s):
  - **B** = The channel is busy.
  - **C** = The channel is being used for a control time slot (applies only to channel 1).
  - **I** = The channel is idle.
- **e** = Error type. Valid value(s):
  - **DATA BASE ERROR** = Error occurred while trying to obtain channel information.

4. ACTIONS TO BE TAKEN

None.

2. REASON FOR OUTPUT

To give device information specific to administrative module (AM) hardware units on communities requested by the OP:UNAV input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

3. VARIABLE FIELD DEFINITIONS

a = Unit name. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for AM unit names.

b = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Output Messages manual.

c = Subunit name. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the
Input Messages manual for AM control unit (CU) subunit names.

d = Subunit number.

e = The current maintenance state of the unit. Valid value(s):
   ACT = Active units.
   GROW = Units being grown.
   INIT = Initializing units.
   OFL = Offline units.
   OOS = Out-of-service units.
   STBY = Standby units.
   UNAV = Unavailable units.
   UNEQIP = Unequipped units.

f = Current inhibit status of the associated error source. Valid value(s):
   ALW = Allowed.
   INH = Inhibited.

g = Results of the last diagnostic on the unit. Valid value(s):
   ABT = Aborted diagnostics.
   ATP = All tests passed.
   CATP = Conditional all tests passed.
   NTR = No tests were run.
   STF = Some tests failed.

h = Error number. Valid value(s):
   9 = Cannot attach to plant measurement library.
   11 = Cannot open equipment configuration data base (ECD) sequence.
   12 = Cannot sequence (UCBs).

i = Retry the command later. Valid value(s):
   CAN’T CREATE FILE IN /tmp
   CAN’T GET DATABASE RECORD ID
   CAN’T SEQUENCE DATABASE

j = Temporary output file name.

k = Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

d = Completion report Valid value(s):
  CCS NOT AVAILABLE IN OFFICE = The request cannot be processed because the office is not
  equipped with CCS capability.
  DPC INVALID = The entered DPC is not valid. The DPC may be out of the valid range, or it may
  not be provisioned in the office.
  GSM UNAVAILABLE = The GSM is busy at this moment. Retry this command later.
  OPC INVALID = The entered OPC is not valid. The OPC may be out of the valid range, or it may
  not be provisioned in the office.
  OPC DPC NOT PROVISIONED = The OPC DPC specified in the input message are not
  provisioned in the office.
  REMOTE USER PART AVAILABLE = The remote user part is available.
  REMOTE USER PART INACCESSIBLE = The remote user part is unavailable with inaccessible
  cause.
  REMOTE USER PART UNEQUIPPED = The remote user part is unavailable with unequipped
  cause.
  REMOTE USER PART UNKNOWN = The remote user part is unavailable with unknown cause.
  SIGTYPE NOT PROVISIONED = The entered signalling type is not provisioned in this office.
  SYSTEM ERROR = A system error has occured making it impossible to continue processing the
  request.

e = Supplementary Information Valid value(s):
  CNI TO PSU CONVERSION IN PROGRESS = The output value may be inaccurate due to the
  processing of CNI to PSU conversion.
  OPC DPC NOT BICC PROVISIONED = The OPC DPC specified in the input message are not
  provisioned for BICC protocol in the office.
4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

Input Appendix(es):

   APP:POINT-CODE

Output Appendix(es):

   APP:POINT-CODE
OP:UT-CMP-A

Software Release: 5E14 only
Message Class: UT
Application: 5
Type: Output

1. FORMAT

[1] OP UT CMP=a-b (MATE|PRIM) UTILFLAG c ADDR d i HIT j

[2] OP UT CMP=a-b (MATE|PRIM) UTILFLAG c i
   SYMIDX e FUNC f OFF g HIT j

[3] OP UT CMP=a-b (MATE|PRIM) UTILFLAG c TIME h i HIT j

[4] OP UT CMP=a-b (MATE|PRIM) UTIL i

2. REASON FOR OUTPUT

To report the status of the response to the OP:UT-CMP input message, which reports the status of one or more communication module processor (CMP) WHEN clauses.

Format 1 reports the operational status of a specific WHEN breakpoint input message which has been defined with a physical address.

Format 2 reports the operational status of a specific WHEN breakpoint input message which has been defined with a symbolic reference and an optional offset.

Format 3 reports the operational status of a timed specific WHEN input message.

Format 4 provides the status of the OP:UT-CMP input message when the UTIL option is used.

3. VARIABLE FIELD DEFINITIONS

MATE = Message was executed in the standby CMP.
PRIM = Message was executed in the active CMP.
UTIL = The message was run on all UT WHEN clauses in the processor.
UTILFLAG = Designates one specific WHEN clause in this processor.
a = Message switch side.
b = CMP number.
c = WHEN message clause identification number, in decimal.
d = Physical address specified in the WHEN message. If an error is encountered, the value of the address may be invalid.
e = Symbol index number of the specified symbol either specified in the WHEN input message or
determined by the UT code based on the symbol name ‘f’.

\[ f = \text{Symbolic name specified in the WHEN input message or determined by the UT code based on the symbol index number ‘e’. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a ‘*’ to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.} \]

\[ g = \text{Offset specified in the WHEN message.} \]

\[ h = \text{Time interval specified in the WHEN message (in milliseconds).} \]

\[ i = \text{Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages Manual.} \]

\[ j = \text{Current hit-count of the WHEN message clause. If an error occurs the hit-count is 0.} \]

4. **ACTION TO BE TAKEN**

If appropriate, correct the specified input message and repeat.

5. **ALARMS**

None.

[2] OP UTIL NOT STARTED
   INVALID ACTION FIELD INVALID KEYWORD

[3] OP UTIL NOT STARTED
   RETRY LATER THE SYSTEM IS IN AN OVERLOAD CONDITION

2. REASON FOR OUTPUT

To print a summary status report of the generic access package (GRASP). This is in response to an OP:UTIL input message. The effective values of the dynamic and static thresholds, defined breakpoints and their attributes, and the transfer trace attributes are printed.

3. VARIABLE FIELD DEFINITIONS

- **a**: Threshold value of dynamic real time usage at which GRASP will take overload recovery. Expressed as a percentage.
- **c**: Interval of time over which GRASP real time usage is accumulated. Expressed in milliseconds.
- **d**: Length of time of debugging inactivity through which GRASP will wait before terminating itself. Expressed in minutes.
- **e**: Breakpoint number.
- **f**: Utility ID (UID) of the process in which the breakpoint is planted. The value is enclosed in parentheses if the breakpoint definition specified a process ID instead of a utility ID.
- **g**: Process ID (PID) of the process in which the breakpoint is planted. The value is enclosed in parentheses if the breakpoint definition specified a utility ID instead of a process ID. The field will be blank if no suitable process has been found.
- **h**: Address of the breakpoint.
i = Length of the match interval. Execution breakpoints indicate one byte.

j = Breakpoint condition as specified in the WHEN: input message.

k = Implementation of the breakpoint. Software implemented breakpoints are not marked. Hardware implemented breakpoints are marked with an 'H'. In addition, the range matcher is marked with an asterisk (*) and the hardware execution matcher is marked with a pound sign (#).

l = Breakpoint state. Valid value(s):
   DISABLED
   ENABLED

m = Stop condition of the trace. Valid value(s):
   CIRC = The trace will run indefinitely, replacing the oldest data with the newest.
   STOP FULL = The trace will stop when the memory fills up.

n = Utility ID to which the trace is restricted. The value will be enclosed in parentheses if the INIT:UMEM message specified a process ID. If no restriction was given, will be blank.

o = Process ID to which the trace is restricted. If no PID restriction was given, will be blank.

p = Beginning address to which the trace is restricted.

q = Length of the address interval to which the trace is restricted.

r = Storage mode. Valid value(s):
   DATA
   DFFPAR
   DTRANS
   FPARAM
   TRANS
   UID

s = Implementation of the trace. Indicates which matcher is used with 'H*' for the range matcher and 'H' for the execution matcher.

t = Trace state. Valid value(s):
   DUMPED = The trace is not running and its data has already been dumped.
   NEW = The trace is not running and does not contain data.
   RUNNING = The trace is collecting data.
   STOPPED = The trace is not running but does contain data.

u = GRASP execution sequence number range. Other GRASP operations have higher priority then OP:UTIL, some may occur during OP:UTIL formatting.

4. ACTION TO BE TAKEN

None.

OP VERS a=b  LAST BOOTED FIRMWARE   c
           FACTORY FIRMWARE   d
           WRITABLE FIRMWARE   e

2. REASON FOR OUTPUT

To respond to the OP:VERS input message. This message displays the version of CM3 firmware for the MSGS or ONTC.

3. VARIABLE FIELD DEFINITIONS

a = Unit. Valid value(s):
   MSGS
   ONTC

b = Side number. Valid value(s):
   0
   1

c = Booted firmware version. The version of firmware that initializes and provides the present functionality for the circuit pack. This version number will match either the FACTORY or WRITABLE version in most cases.

d = Factory non-writable firmware version. The firmware version installed when the circuit board is manufactured. If no firmware updates have occurred, the factory firmware is used to initialize the circuit board and transition it to RAM. Factory firmware initializes the circuit board to the level of functionality available when the circuit pack is manufactured.

e = Writable firmware. Software updated version of firmware updated from ROM disk files.

4. ACTIONS TO BE TAKEN

No specific action is required. Retain this information and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual for additional information. This message is the direct response to a manually executed input message.

5. ALARMS

None.

6. REFERENCES

Input Message(s):
OP:VERSION
Software Release: 5E14 and later
Message Class: UPDT
Application: 5
Type: Output

1. FORMAT

```
OP VERSION [MISMATCH]  a  [PART b [COMPLETED]]
PARTITION   VERSION         BWM
c               d               e
               ...
               ...
[DISK CONFIGURATION  f
BASE AND CONTROL  g
OFFICE CLLI CODE  h
OFFICE CONFIG    i  j [k] [WIRELESS]]
```

2. REASON FOR OUTPUT

To respond to the input message OP:VERSION.

3. VARIABLE FIELD DEFINITIONS

**WIRELESS**  = Office is configured as a digital cellular switch (DCS).

**a**  = Indicated version and level to which date partitions were set.

**b**  = Message part number.

**c**  = Partition name. The pseudo-partition ‘ECD’ refers to the 'systype' and 'genid' items from the 'eaiopt' form in the equipment configuration database (ECD).

**d**  = Generic text version of this partition.

**e**  = Software update level of this partition. The ECD partition does not have a software update level.

**f**  = Office disk configuration.

**g**  = Office base and control number.

**h**  = Office Common Language® location code.

**i**  = Office software update environment. Valid value(s):

- **5ESS**  = Standard 5ESS® switch software updates required.
- **ASM**  = Administrative services module (ASM) software updates are required.
- **VCDX**  = Very compact digital exchange (VCDX) software updates are required.
- **DRM**  = Distinctive remote module - VCDX software updates are required.

**j**  = Signaling system 7 (SS7) configuration. Valid value(s):

- **CNI**  = Common network interface SS7.
- **CNI+PSUSS7**  = Both CNI and packet switching unit (PSU) SS7.
PSUSS7 = Packet switching unit SS7.
NOSS7 = Office is not equipped for SS7.

k = Communications module vintage. Valid value(s):
CM1 = Communications module model 1.
CM2 = Communications module model 2.
CM3 = Communications module model 3.

4. ACTIONS TO BE TAKEN

None. This message is the direct response to a manually executed input message. No specific action is required.

5. ALARMS

None.

    WIRED PHONE=q             ALERT ID=[r s]
    LINE PORT STATUS=t [u] [v] [w] x
    SERVICE RESTRICTION=y

2. REASON FOR OUTPUT

To report the results of the OP:WCPE input message.

3. VARIABLE FIELD DEFINITIONS

a = Wireless directory number (DN).
b = Switching module (SM) number.
c = Integrated services line unit version 2 (ISLU2) unit number.
d = Line group number.
e = Line board number.
f = Line circuit number.
g = Status. Valid value(s):
  COMPLETED = The OP:WCPE request completed successfully.
  DATA BASE ERROR = An error occurred in accessing the system's database. Retry the request. If the problem persists, check for any associated asserts and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
  DUPLICATE REQUEST = An OP:WCPE request is already in progress for the wireless phone specified in the OP:WCPE input message. If the correct wireless phone was specified, wait and retry the request after the active OP:WCPE request completes. Otherwise, verify that the correct wireless phone was specified in the input message and retry the request.
  INPUT ERROR = Some data entered in the OP:WCPE input message was incorrect. If a wireless phone's DN is entered, all 10 digits of the wireless DN must be specified. Verify that the data specified in the OP:WCPE input message is correct and retry the request.
INVALID PORT = The port specified in the OP:WCPE input message is unknown to the system. Verify that a valid wireless phone is specified in the OP:WCPE input message and retry the request.

INVALID PORT TYPE = The port specified in the OP:WCPE input message is valid for the system but is not associated with a wireless phone. Verify that a valid wireless phone is specified in the OP:WCPE input message and retry the request.

PROCESS TIMEOUT = The request failed because an internal process timed-out waiting for a response. The system may be too busy to process the request. Retry the request at a later time. If the problem persists, check for any associated asserts and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

SM UNAVAILABLE = An SM required to process the OP:WCPE input message is unavailable. Retry the request at a later time.

SYSTEM BUSY = The request failed because the system is too busy. Retry the request at a later time. If the problem persists, check for any associated asserts and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

SYSTEM ERROR = The request failed because of a system error. The system may be too busy to process the request. Retry the request at a later time. If the problem persists, check for any associated asserts refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

h = Electronic serial number (ESN) stored in the wireless network controller (WNC) for the wireless phone.

i = Terminal ID stored in the WNC for the wireless phone.

j = Indication of whether the wireless phone is a wireless test set or a wireless subscriber's phone. Valid value(s):
    NO = The wireless phone is a wireless subscriber's phone and not a test set.
    YES = The wireless phone is a test set.

k = Tenant group wireless phone is assigned to.

l = Registration state of the wireless phone. Valid value(s):
    DENIED-AUTH FAILURE = The wireless phone is not registered because it failed authentication. Attempt to update the wireless phone's shared secret data (SSD) using the UPD:SSD input message. Refer to the UPD:SSD manual pages for additional information.
    INTERNAL ERROR = The wireless phone's registrations state is indeterminate. This may be due to a system error. Retry the OP:WCPE input message at a later time. If the problem persists, check for any associated asserts or audits and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
    NOT REGISTERED = The wireless phone is not registered. The phone is probably turned off.
    REGISTERED = The wireless phone is registered. There is one exception to this. Following a SM full initialization, the WNC will consider a wireless phone as registered if it was registered at the time the initialization occurred. For this situation, the registration area reported by OP:WCPE will be null. Both the registration state and registration area will not be updated for the wireless phone unless the phone attempts a wireless origination or registration, or an attempt is made to terminate a call to the phone.
Note: Variables ‘m’ and ‘n’ form the registration area the wireless phone is registered in. These fields are blank if the wireless phone is not registered or the registration area is unknown to the WNC.

\[ m \] = The wireless service provider ID (WSPID).

\[ n \] = The registration code.

\[ o \] = Call state of the wireless phone. Valid value(s):

- **ACTIVE** = The wireless phone is active on a call. If OP:WCPE indicates that the wireless phone is active on a call but the wireless phone is not registered, the wireless phone is active on an emergency call.
- **DENIED-TESTSET** = The wireless phone is denied service because a wireless test set is assigned to the wireless subscriber.
- **IDLE** = The wireless phone is idle.
- **NA** = The wireless call state is not applicable (NA) because the wireless phone is not registered.
- **TRANSIENT** = The wireless phone is in a transient call state. Examples of transient call states include origination call setups, registrations, and SSD updates.

\[ p \] = Status of the wireless phone's visual message waiting indicator (MWI) as maintained in the WNC. Valid value(s):

- **OFF** = The MWI is off.
- **ON** = The MWI is on.

\[ q \] = Hook status of the wireless phone's associated wired phone. Valid value(s):

- **OFF-HOOK** = The wired phone is off-hook.
- **ON-HOOK** = The wired phone is on-hook.
- **UNKNOWN** = The wired-phone's hook status can not be determined because hardware is out-of-service (OOS).

Note: Variables ‘r’ and ‘s’ form the alert ID assigned by the WNC to the wireless phone. The alert ID is used by the wireless phone to know when it is being paged by the WNC. These fields are blank if the wireless phone is not registered.

\[ r \] = The alert phase.

\[ s \] = The alert value.

Note: Variables ‘t’ through ‘x’ make up the port status of the wireless phone's associated ISLU2 W-card port. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for the definition of the port status.

\[ t \] = The port status's basic state.

\[ u \] = The port status's qualifier.

\[ v \] = The port status's operational restriction.

\[ w \] = The port status's supplementary information.

\[ x \] = The port status's mode.
y

= Service restriction assigned to the wireless phone. Valid value(s).

AUTH NOT SUPPORTED = Service is denied because the wireless phone attempted to access the system without authentication.

AUTHR MISMATCH = Service is denied because the wireless phone's authentication values do not match the phone's authentication values stored in the WNC.

CALL COUNT MISMATCH = Service is denied because the wireless phone's call count does not match the phone's call count stored in the WNC.

CAVE NOT SUPPORTED = Service is denied because the wireless phone's authentication algorithm is not supported by the WNC.

COUNT NOT SUPPORTED = Service is denied because the wireless phone does not support a call count.

COUNT UPDATE FAILURE = Service is denied because the call count in the wireless phone could not be updated.

DELINQUENT ACCOUNT = Service is denied because the wireless phone's bill has not been paid.

DUPLICATE UNIT = Service is denied because this wireless phone is suspected of having been duplicated.

INVALID SERIAL NUMBER = Service is denied because the wireless phone's ESN does not match the ESN stored in the WNC.

MISSING AUTH PARAMETER = Service is denied because the wireless phone failed to provide all of the necessary information for authentication.

NONE = No service restriction exists for the wireless phone.

SHARING SSD NOT SUPPORTED = Service is denied because the home location register (HLR) will not provide the SSD required to process the wireless phone's authentication request.

SKEY NOT SUPPORTED = Service is denied because the WNC does not support the wireless phone's signaling message encryption (SME) algorithm.

SSD UPDATE FAILURE = Service is denied because the WNC's and/or wireless phone's SSD could not be updated.

STOLEN UNIT = Service is denied because the wireless phone was reported as stolen.

UNASSIGNED DN = Service is denied because the wireless phone is unknown to the system.

UNIQUE CHALLENGE FAILURE = Service is denied because the wireless phone's authentication values do not match the authentication values stored in the wireless network controller.

UNSPECIFIED = Service is denied due to an undetermined system error.

4. ACTION TO BE TAKEN

The OP:WCPE message is intended to provide manually requested information about the current state of the specified wireless phone. If OP:WCPE was used as part of a corrective maintenance procedure, refer to the wireless subscriber maintenance section of the AIR EXTENSION® User Guide for information on clearing any abnormal conditions reported by the OP:WCPE output message.

5. ALARMS

None.

2. REASON FOR OUTPUT

List the most-recent metallic test results for directly connected test unit (DCTU) or subscriber line and integrated measurement (SLIM) at the specified trunk and line work station (TLWS) test position (TP). Enter the input message OP:WSDATA to get a hard copy of the results shown in the result area of the test position page after test results have been displayed.

Format 1 is for the output of line testing. Format 2 is for the output of trunk testing.

3. VARIABLE FIELD DEFINITIONS

a = TP number.
b = Telephone number entered.
c = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.
d = Line equipment number. Valid value(s):
   AP=e-f
   ILEN=g-h-i-j
   INEN=g-f^3-l-j
   LCEN=g-k-l-m
   LCEN=g-k-l-w^3-x^3
   LEN=g-k-n-o-p-q
   SLEN=g-r-s-t
   AIUEN=g-g^4-h^4-i^4
e = Data link (group) number.
f = Relative link (member) number.
g = Switching module (SM) number.
h = IDCU number.
i = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.
j = RT line number or PUB43801 channel.
k = Line unit number.
l = Line group number.
m = Line card number.
n = Grid number.
o = Switch board number (LU1, LU2, or LU3).
p = Switch number.
q = Level number.
r = Digital carrier line unit number.
s = RT number.
t = RT line number.
u = Multi-line hunt group number.
vF = Microfarads.
w = Access type. Valid value(s):
   AC1 JACK = Connection to the AC jack number 1.
   AC2 JACK = Connection to the AC jack number 2.
   CAMPED ON = Line or trunk is camped on.
   CPE TESTS = Test customer premises equipment.
   DC1 JACK = Connection to the DC jack number 1.
   DC2 JACK = Connection to the DC jack number 2.
   DIG TRANS = Connection to digital transmission equipment.
   IN PROGRESS = Test or test setup is in progress.
   METALLIC = Connection to metallic measurement equipment.
   MONITOR B&I = Monitor a busy or idle line/trunk.
   MONITOR BUSY = Monitor a busy line/trunk.
   SEIZED = Line or trunk is seized.
   SUPERVISION = Supervisory test running.
   TRANSMISSION = Connection to transmission equipment.
x = Trunk group number.
y = Trunk member number.

z = Trunk equipment number. Valid value(s):

DENG = a\textsuperscript{1}-b\textsuperscript{1}-c\textsuperscript{1}
INEN = f\textsuperscript{3}-i\textsuperscript{j}
NEN = f\textsuperscript{3}-g\textsuperscript{3}-h\textsuperscript{3}-j\textsuperscript{k}\textsuperscript{4}
PSUEN = k\textsuperscript{3}-m\textsuperscript{3}-n\textsuperscript{3}
RAF PORT = d\textsuperscript{1}-e\textsuperscript{1}
TEN = f\textsuperscript{1}-h\textsuperscript{1}-i\textsuperscript{1}
SAS PORT = d\textsuperscript{1}-e\textsuperscript{1}

a\textsuperscript{1} = Digital line and trunk unit (DLTU) number.

b\textsuperscript{1} = Digital facility interface (DFI) number.

c\textsuperscript{1} = Channel number.

d\textsuperscript{1} = RAF or SAS unit number.

e\textsuperscript{1} = RAF or SAS channel number.

f\textsuperscript{1} = Trunk unit number.

g\textsuperscript{1} = Service group number.

h\textsuperscript{1} = Channel board number.

i\textsuperscript{1} = Circuit number.

j\textsuperscript{1} = Test results. Valid value(s):

k = Port number.
l1 = AC foreign potential measured tip-to-ground (TG).
m1 = DC foreign potential measured tip-to-ground.
n1 = AC foreign potential measured ring-to-ground (RG).
o1 = DC foreign potential measured ring-to-ground.
p1 = AC foreign potential measured tip-to-ring (TR).
q1 = DC foreign potential measured tip-to-ring.
r1 = Resistance measured tip-to-ground.
s1 = Resistance measured ring-to-ground.
t1 = Resistance measured tip-to-ring.
u1 = Capacitance measured tip-to-ground.
v1 = Capacitance measured ring-to-ground.
w1 = Capacitance measured tip-to-ring.
x1 = Distance in feet, or times 1000 feet (x 1000), to an open on the subscriber's tip-ring loop pair. This measurement is a translated capacitance value based on the fact that, given a particular gauge of wire, the distance two wires run side by side is directly proportional to the capacitance between...
them (assuming that they are not connected).

Prior to running the distance-to-open test, a check is made to determine whether a tip-to-ring open can be detected. If no open is detected, the warning 'DATA MAY BE INVALID; NO TR OPEN DETECTED' will be displayed in addition to the translated capacitance of the loop pair.

To determine the capacitance value of the loop pair, or to determine whether there is a tip-to-ring open, perform a metallic capacitance or resistance test on the pair (TST:WSMET).

\[ y^1 = \text{Initial current.} \]

\[ z^1 = \text{Final current.} \]

\[ a^2 = \text{Number of attempts.} \]

\[ \text{OORLO} = \text{Out-of-range low.} \]

\[ l^2 = \text{Frequency of tone being sent. Range is 0 to +4095 Hz.} \]

\[ m^2 = \text{Level of tone being sent in db. Range is +3.2 to -49.0.} \]

\[ n^2 = \text{Time stamp in milliseconds to the beginning of the wink from the near end signaling off-hook.} \]

\[ o^2 = \text{State of beginning of wink (on or off).} \]
p^2 = Time stamp in milliseconds to the end of the wink from the near end signaling off-hook.
q^2 = State of end of wink (on or off).
r^2 = Duration time of the wink in milliseconds.
s^2 = Elapsed time in seconds since the test started.
t^2 = Current block size being used.
u^2 = Bit error rate (BER).
v^2 = Negative exponential value for BER.
w^2 = Number of errored blocks (ERBLK).
x^2 = Positive exponential value for ERBLK.
y^2 = The test equipment number of the PH/ISTF which the channel is used.
z^2 = Number of channel units equipped on an ANSI U-DSL as determined by direct polling.
a^3 = The directory number (DN), trunk group and member number (TKGMN), or digital subscriber line (DSL).
b^3 = DN of the line or the TKGMN of the trunk.
c^3 = Either ANSI or AMI.
d^3 = Line card type (T, AMI, ANSI, or Z).

The mismatch test detects a mismatch of an ISLU linecard (LC) and the first metallic termination beyond the LC on U-DSLs. This test will not detect NT1 mismatches when CUs are present.

The mismatch test also tests for loop resistance that is too high or too low between the tip and ring of the LC connected to the first metallic termination (NT1 or CU) or loop resistance that is too low between tip and ground or ring and ground.

For AMI U-DSLs, the mismatch test will also detect a tip and ring reversal at the AMI NT1.

DSRs = DSN reuse wink sent.
DSTs = DSN test signal sent.
DT = Dial tone.
ERW = Expensive rate warning.
FBAT = Forward battery.
FLSH = Flash.
HTOT = Home totalizer.
OFHs = Off-hook sent.
OIT = Operator intrusion tone.
ONHs = On-hook sent.
OPA = Operator attached.
OPNI = Open interval.
OPR = Operator release.
ORCC = Operator release coin collect.
PDT = Party departure tone.
PT = Preemption tone.
RBAK = Ring back.
RBAT = Reverse battery.
RING = Ring tone.
ROH = Receiver-off-hook.
RT = Reorder tone.
STKO = Stuck off-hook.
WINK = Wink.
ZIP = Zip tone.

Received by the switch:

??r = Unknown signal received.
DSCr = DSN clear wink received.
DSFr = DSN wink failure received.
DSRr = DSN reuse wink received.
DSTr = DSN test signal received.
KP = Multi-frequency (MF) start pulse.
OFHr = Off-hook received.
OFPL = Off-hook pulse of short duration other than normal off-hook.
ONHr = On-hook received.
ONPL = On-hook pulse of short duration other than disconnect (that is, wink, flash).
ST = MF stop pulse.
ST1 = MF stop pulse.
ST2 = MF stop pulse.
ST3 = MF stop pulse.

f³ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
g³ = Data group (DG) number.
h³ = Synchronous transport signal (STS) facility number.
i³ = SONET termination equipment (STE) facility number.
j³ = Digital signal level 0 (DS0) number.
k³ = PSU unit number.
l³ = PSU shelf number.
m³ = PSU channel group number.
n³ = PSU channel group member number.
o³ = Dial speed of subscribers handset (Hz).
p³ = Dial speed of subscribers handset (%).
q³ = Duration time of flash hook in milliseconds (ms).
r³ = Keytone levels of subscribers handset (db).
s³ = Keytone difference of subscribers handset (db).
t³ = Keytone frequency of subscribers handset (Hz).

2. REASON FOR OUTPUT

List the most-recent metallic test results for directly connected test unit (DCTU) or subscriber line and integrated measurement (SLIM) at the specified trunk and line work station (TLWS) test position (TP). Enter the input message OP:WSDATA to get a hard copy of the results shown in the result area of the test position page after test results have been displayed.

Format 1 is for the output of line testing.
Format 2 is for the output of trunk testing.

3. VARIABLE FIELD DEFINITIONS

a = TP number.
b = Telephone number entered.
c = Member number of the line time slot bridging (LT SB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.
d = Line equipment number. Valid value(s):
   AP=e-f
   ILEN=g-h-i-j
   INEN=g-f^3-i-j
   LCEN=g-k-l-m
   LCKEN=g-k-l-w^3-x^3
   LEN=g-k-n-o-p-q

   AIUEN=g-g^4-h^4-i^4

e = Data link (group) number.
f = Relative link (member) number.
g = Switching module (SM) number.
h = IDCU number.
i = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.
j = RT line number or PUB43801 channel.
k = Line unit number.
l = Line group number.
m = Line card number.
n = Grid number.
o = Switch board number (LU1, LU2, or LU3).
p = Switch number.
q = Level number.
r = Digital carrier line unit number.
s = RT number.
t = RT line number.
u = Multi-line hunt group number.
uF = Microfarads.
v = Hunt group member number.
w = Access type. Valid value(s):
   AC1 JACK = Connection to the AC jack number 1.
   AC2 JACK = Connection to the AC jack number 2.
   CAMPED ON = Line or trunk is camped on.
   CPE TESTS = Test customer premises equipment.
   DC1 JACK = Connection to the DC jack number 1.
   DC2 JACK = Connection to the DC jack number 2.
   DIG TRANS = Connection to digital transmission equipment.
   IN PROGRESS = Test or test setup is in progress.
   METALLIC = Connection to metallic measurement equipment.
   MONITOR B&I = Monitor a busy or idle line/trunk.
   MONITOR BUSY = Monitor a busy line/trunk.
   SEIZED = Line or trunk is seized.
   SUPERVISION = Supervisory test running.
   TRANSMISSION = Connection to transmission equipment.
x = Trunk group number.
y = Trunk member number.

z = Trunk equipment number. Valid value(s):

DEN = g-a^1-b^1-c^1

k^1 = Port number.
l^1 = AC foreign potential measured tip-to-ground (TG).
m^1 = DC foreign potential measured tip-to-ground.
n^1 = AC foreign potential measured ring-to-ground (RG).
o^1 = DC foreign potential measured ring-to-ground.
p^1 = AC foreign potential measured tip-to-ring (TR).
q^1 = DC foreign potential measured tip-to-ring.
r^1 = Resistance measured tip-to-ground.
s^1 = Resistance measured ring-to-ground.
t^1 = Resistance measured tip-to-ring.
u^1 = Capacitance measured tip-to-ground.
v^1 = Capacitance measured ring-to-ground.
w^1 = Capacitance measured tip-to-ring.
x^1 = Distance in feet, or times 1000 feet (x 1000), to an open on the subscriber's tip-ring loop pair. This
measurement is a translated capacitance value based on the fact that, given a particular gauge of wire, the distance two wires run side by side is directly proportional to the capacitance between them (assuming that they are not connected).

Prior to running the distance-to-open test, a check is made to determine whether a tip-to-ring open can be detected. If no open is detected, the warning 'DATA MAY BE INVALID; NO TR OPEN DETECTED' will be displayed in addition to the translated capacitance of the loop pair.

To determine the capacitance value of the loop pair, or to determine whether there is a tip-to-ring open, perform a metallic capacitance or resistance test on the pair (TST:WSMET).

n\textsuperscript{2} = Time stamp in milliseconds to the beginning of the wink from the near end signaling off-hook.

o\textsuperscript{2} = State of beginning of wink (on or off).

p\textsuperscript{2} = Time stamp in milliseconds to the end of the wink from the near end signaling off-hook.

q\textsuperscript{2} = State of end of wink (on or off).

r\textsuperscript{2} = Duration time of the wink in milliseconds.

s\textsuperscript{2} = Elapsed time in seconds since the test started.

t\textsuperscript{2} = Current block size being used.

u\textsuperscript{2} = Bit error rate (BER).

v\textsuperscript{2} = Negative exponential value for BER.

w\textsuperscript{2} = Number of errored blocks (ERBLK).

x\textsuperscript{2} = Positive exponential value for ERBLK.

y\textsuperscript{2} = The test equipment number of the PH/ISTF which the channel is used.

z\textsuperscript{2} = Number of channel units equipped on an ANSI® U-DSL as determined by direct polling.

a\textsuperscript{3} = The directory number (DN), trunk group and member number (TKGMN), or digital subscriber line (DSL).

b\textsuperscript{3} = DN of the line or the TKGMN of the trunk.

c\textsuperscript{3} = Either ANSI® or AMI.

d\textsuperscript{3} = Line card type (T, AMI, ANSI®, or Z).

The mismatch test detects a mismatch of an ISLU linecard (LC) and the first metallic termination beyond the LC on U-DSLs. This test will not detect NT1 mismatches when CUs are present.

The mismatch test also tests for loop resistance that is too high or too low between the tip and ring of the LC connected to the first metallic termination (NT1 or CU) or loop resistance that is too low between tip and ground or ring and ground.

For AMI U-DSLs, the mismatch test will also detect a tip and ring reversal at the AMI NT1.

OP:WSSTAT-A

Software Release: 5E14 only
Message Class: TLWSRSP
Application: 5
Type: Output

1. FORMAT

[1] OP WSSTAT TEST POSITION = a                 AVAILABLE

[2] OP WSSTAT TEST POSITION = a, ID = b         IN USE ACCESS=f T&M=g c[-d] e

[3] OP WSSTAT SUMMARY TOTAL TP AVAILABLE = g1
    MAX TP = h1, MAJOR TP = i1, MINOR TP = j1, DIGIT ZERO = k1

2. REASON FOR OUTPUT

To list the current testing status of a trunk and line work station (TLWS) test position (TP). This status can be seen on the TP summary page at the Master Control Center (MCC).

The user would enter the input message OP:WSSTAT to get a hard-copy of the TP summary page. By default, the output is sent only to the input device where the request originated (TLWSRSP). The input message OP:WSDATA,LOG can be used to change the output so that it appears on all devices associated with the class definition TLWS.

3. VARIABLE FIELD DEFINITIONS

a

b = TLWSR tuple identification.

c = Directory number (DN) or trunk group member number (TKGMN).

d = Member number of the line time slot bridging (LTSB) line. Valid value(s):
   1 = The lead line.
   2 = The associate line.

e = Equipment number. Valid value(s):

f = Test access type. Valid value(s):
AC1 JACK = Connection to the AC jack number 1.
AC2 JACK = Connection to the AC jack number 2.
CAMPED ON = Line or trunk is camped on.
DC1 JACK = Connection to the DC jack number 1.
DC2 JACK = Connection to the DC jack number 2.
DIG TRANS = Connection to digital transmission equipment.
IDLE = No port seized at TP.
IN PROGRESS = Test or test setup is in progress.
METALLIC = Connection to metallic measurement equipment.
SEIZED = Line or trunk is seized.
SUPERVISION = Supervisory test running.
TRANSMISSION = Connection to transmission equipment.

g = The mode of the talk and monitor (T&M) phone in the test connection. Valid value(s):
H = The T&M phone is ON-HOLD (metallic connections).
M = The T&M phone is in the MONITOR mode (listen-only).
N = No T&M phone in the connection.
T = The T&M phone is in the TALK mode (listen and talk).

h = Data link (group) number of the AP.
i = Relative link (member) number of the AP.
j = Switching module (SM) number.
k = Digital line and trunk unit (DLTU) number.
l = Digital facility interface (DFI) number.
m = Channel number.
n = Line unit number.
o = Line group number.
p = Line card number.
q = Grid number.
r = Switch board number (LU1, LU2, or LU3).
s = Switch number.
t = Level number.
u = RAF or SAS unit number.
v = RAF or SAS channel number.
w = Digital carrier line unit number.
x = Remote terminal (RT) number.
$y$ = RT line number.

$z$ = Trunk unit number.

$a^1$ = Service group number.

$b^1$ = Channel board number.

$c^1$ = Circuit number.

$d^1$ = IDCU number.

$e^1$ = RT number or IDCU digital signal level 1 (DS1) serving PUB43801 number.

$f^1$ = RT line number or PUB43801 channel.

$g^1$ = Number of TPs currently unused. This value represents the number of test positions available out of 32 test positions without considering the value of MAX TP.

$h^1$ = The value of the global parameter GLTPMAX. Represents the maximum number of test positions that may be active concurrently. A test position is considered active if it has been seized using a SET:WSPOS request.

$i^1$ = The value of the global parameter GLTPMAJOR. Represents the maximum number of test positions that may be active concurrently while the AM is in major overload.

$j^1$ = The value of the global parameter GLTPMINOR. Represents the maximum number of test positions that may be active concurrently while the AM is in minor overload.

$k^1$ = The value of the global parameter GLDIGZERO. Indicates whether remote talk and monitor access requires digit zero security precautions.

$l^1$ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

$m^1$ = Data group (DG) number.

$n^1$ = Synchronous transport signal (STS) facility number.

$o^1$ = SONET termination equipment (STE) facility number.

$p^1$ = Digital signal level 0 (DS0) number.

$q^1$ = PSU unit number.

$r^1$ = PSU shelf number.

$s^1$ = PSU channel group number.

$t^1$ = PSU channel group member number.

$u^1$ = Line board number.

$v^1$ = Line circuit number.

$w^1$ = Access interface unit (AIU) number.
x¹ = AIU line pack number.
y¹ = AIU line circuit number.
z¹ = Intergrated Digital Carrier Unit.
a² = Virtual tributary group (VTG) number.
b² = Virtual tributary member (VTM) number.

66. ORD
ORD:CPI

Software Release: 5E14 and later  
Message Class: MTCE  
Application: 5  
Type: Output

1. FORMAT

ORD:CPI a [b [c]] CMD d [e] f  
[UNIT RESULT]  
[g h]  
. .  
. .  
. .

2. REASON FOR OUTPUT

To provide the results of CPI requests. These requests can be in the form of ORD:CPI input messages, MCC menu options or the craft intervention key (CIK).

3. VARIABLE FIELD DEFINITIONS

  a = Switching module (SM) number.
  b = Office network and timing complex (ONTC) side (0 or 1).
  c = Even (0) or odd (1) network control and timing (NCT) link to the SM.
  d = Central processor intervention (CPI) message sent to the SM. Valid value(s):  
     ALW = A request to allow the sanity timer was sent.
     CIK = The specified module controller/time slot interchange (MCTSI) was forced active and initialized by a manual request through the craft intervention key at the RSM.
     CLR = A request to clear the force on the specified SM was sent.
     FRC = A request to force the specified module controller/time slot interchange (MCTSI) active was sent. This causes a single process purge if a processor switch is involved.
     GRSW = A request to force the specified MCTSI active and cause a full initialization was sent.
     INH = A request to inhibit the sanity timer was sent.
     RESET = A request to reset the specified SM was sent. This results in a full initialization.
     SW = A request to switch the MCTSI to the specified side, then force that side active.
  e = Side (0 or 1) of the MCTSI (only for FRC and SW messages).
  f = Result of the input message. Valid value(s):  
     COMPLETE = The request was successfully executed in all requested SMs.
     NOT COMPLETED = The expected results were not received from the SMs listed below.
  g = SM number that failed to complete the CPI request.
  h = Reason for failure. Valid value(s):  
     FAULT-STATUS UNKNOWN = Error detected during CPI transmission by message interface (MI).
MATE IS POWERED OFF = The force was cleared because the mate is powered off.
STATUS UNKNOWN = The message was sent to the SM and no response was received.
TIMEOUT–STATUS UNKNOWN = Message acknowledgement timeout with MI.
UNABLE TO SWITCH = State of SM prevented a soft switch from occurring (valid only for the SW message).

__________________________________________________________________

2. REASON FOR OUTPUT

To report the sequence of actions requested by an ORD:DLOOP input message.

3. VARIABLE FIELD DEFINITIONS

DEN = The digital equipment number (DEN) of the digital trunk.

NEN = The networking equipment number (NEN) of the digital trunk.

a = Action requested. Valid value(s):
OPR = Operate or connect.
RLS = Release or undo function.

b = Number of seconds the connection was maintained.

c = Switching module (SM) number.

d = Digital line and trunk unit (DLTU) number.

e = Digital facility interface (DFI) number.

f = Channel number.

g = Disposition of the input request. Valid value(s):
ABORTED = SM detected a software defensive check failure and aborted.
ALREADY IDLE = Trunk is already in an idle state.
CIRCUIT BUSY = Trunk is in a busy state.
COMPLETED = Action performed successfully.
FAILED = Failed to loop or unloop trunk.
INV PORT = The equipment number (DEN or NEN) for the trunk was invalid.
INVALID TRUNK TYPE = The trunk signaling type is not valid for this request.
PROCESS TIMEOUT = A process in the administrative module (AM) or SM timed out waiting for a response from another processor.
SM/DLTU/DFI BUSY = SM cannot obtain hardware resources [digital network unit - synchronous optical network (SONET) (DNU-S), digital line and trunk unit (DLTU), or their respective subtending circuits may be out of service], or the SM cannot obtain network timeslots.
SM UNAVAILABLE = The SM identified by the DEN or NEN is not available.
h = Digital Networking Unit - SONET (DNU-S) number.
i = Data group (DG) number.
j = SONET Terminal Equipment (STE) facility number.
k = Synchronous transport signal (STS) facility number.
l = Virtual Tributary Group (VTG) number.
m = Virtual Tributary Member (VTM) number.
n = Digital signal level 0 (DS0) number.

ORD:DLOOP-B

Software Release: 5E16(1) and later
Message Class: TRK
Application: 5
Type: Output

1. FORMAT

[1] ORD DLOOP a [b] DEN=c-d-e-f g;
[2] ORD DLOOP a [b] NEN=c-h-i-j-k-l-m-n g;
[3] ORD DLOOP a [b] OIUEN=c-o-p-j-k-l-m-n g;

2. REASON FOR OUTPUT

To report the sequence of actions requested by an ORD:DLOOP input message.

3. VARIABLE FIELD DEFINITIONS

a = Action requested. Valid value(s):
   OPR = Operate or connect.
   RLS = Release or undo function.

b = Number of seconds the connection was maintained.

c = Switching module (SM) number.

d = Digital line and trunk unit (DLTU) number.

e = Digital facility interface (DFI) number.

f = Channel number.

g = Disposition of the input request. Valid value(s):
   ABORTED = SM detected a software defensive check failure and aborted.
   ALREADY IDLE = Trunk is already in an idle state.
   CIRCUIT BUSY = Trunk is in a busy state.
   COMPLETED = Action performed successfully.
   FAILED = Failed to loop or unloop trunk.
   INV PORT = The equipment number (DEN, NEN or OIUEN) for the trunk was invalid.
   INVALID TRUNK TYPE = The trunk signaling type is not valid for this request.
   PROCESS TIMEOUT = A process in the administrative module (AM) or SM timed out waiting for a response from another processor.
SM/DLTU/DFI BUSY = SM cannot obtain hardware resources [digital network unit - synchronous optical network (SONET) (DNU-S), digital line and trunk unit (DLTU), or their respective subtending circuits may be out-of-service], or the SM cannot obtain network timeslots.

SM UNAVAILABLE = The SM identified by the DEN, NEN or OIUE is not available.

h = Digital networking unit - SONET (DNU-S) number.
i = Data group (DG) number.
j = SONET terminal equipment (STE) facility number. For OIU-NAR, it is OC-3.
k = Synchronous transport signal (STS) facility number.
l = Virtual tributary group (VTG) number.
m = Virtual tributary member (VTM) number.
n = Digital signal level 0 (DS0) number.
o = Optical Interface Unit (OIU) number.
p = Protection Group number.

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

Input Message(s):

    ORD:SCAN
ORD:SCSD

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] ORD SCSD UNIT a PT b[bbbb] f g

[2] ORD SCSD GRPN c DUPID d PT e[ee] f g

[3] ORD SCSD NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS

2. REASON FOR OUTPUT

To indicate the result of a distribute operation requested by an ORD:SCSD input message. The operations are: set, clear, flash for eight seconds, and flash continuously.

Format 1 is used when a distribute point is identified by physical location.

Format 2 is used when a distribute point is identified by logical address.

Format 3 indicates the scanner and signal distributor (SCSD) administration process is not active. No communication with SCSD points is possible.

3. VARIABLE FIELD DEFINITIONS

a = Member number SCSD unit.
b = Physical scan point number on an SCSD.
c = Name of the logical group.
d = Duplex group ID (0 or 1).
e = Number of a point within a logical group.
f = Distribute operation. Valid value(s):
    OPERATE = Set.
    RELEASE = Clear.
    REPEAT = Flash continuously.
    STEP = Flash for eight seconds, which it terminates in the cleared state.
g = Termination status. Valid value(s):
    COMPLETED = Action completed.
    FAILED = Action could not be completed by SCSD Administrator. Possible reasons for failure are:
- SCSD unit number is invalid.
- Point number is invalid for the logical group. If more than one point number is specified, at least one of them is invalid. Operation will complete for all valid point numbers if there are no other errors.
- Logical group name is invalid and either the SCSD unit is out-of-service (OOS), or is in an inactive state to the SCSD Administrator.

4. ACTION TO BE TAKEN

Issue the OP:OOS input message to determine if the SCSD unit is listed as OOS. Otherwise, enter recent change and verify (RC/V) to verify message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the above results are negative, seek technical assistance.

5. ALARMS

None. This alarm is a manually-requested report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

    Cannot OPEN a transaction, View aborted.
2. REASON FOR OUTPUT

To report the result of the business and residence customer service (BRCS) feature group (BFG) update, such as the total number of successes and failures of the update operations on each switching module (SM) and all SMs in the office, or failure-related information during a BFG update.

The message will start with a message header, either for the summary or failure message, followed by statistical information for the summary message or the failure-related information for a failure message. For failure-related messages, the user should consult the Business and Residence Modular Features manual. In this manual, refer to the "Feature Assignment" section on "BFG (BRCS Feature Grouping)" subsection "BFG ROP Errors". This is especially true for failure-related message(s) of Format 16, in order to interpret variable fields: 'r', 's' and 't'.

BFG summary messages use the RCVYMON message class.

3. VARIABLE FIELD DEFINITIONS

a = Event number.
b = Message section number.
c = SM number.
d = The total number of successful BFG updates on 'c'.
e = The total number of failing BFG lines/operations updates on 'c'.
f = The total number of successful BFG updates on all SMs.
g = The total number of failing BFG lines/operations updates on all SMs.
h = The type of the logical termination index (LTM IDX).
i = The LTM IDX.
j = Range key value for DN_FEATS the relation.
k = The port number in hexadecimal for the line that has the BFG.
l = The party type of the port number for the line that has the BFG. Refer to the Recent Change
Attribute Definitions manual for valid party types.

m = The name of the BFG.
n = The identification number of the BFG.
o = The telephone number.
p = The member number of the multi-line hunt group (MLHG).
r = The number of the error class for the given error - ’s’.
s = The unique error message number, for the given error class - ’x’.
t = Substitution value(s) used for interpreting an error message.

4. ACTION TO BE TAKEN

Take corrective actions based on the failure information. Refer to the Business and Residential Modular Features manual for further information.

ODD RCV
**RCV:MENU-BKUPCHK**

**Software Release:** 5E14 and later  
**Message Class:** MAINT  
**Application:** 5  
**Type:** Output

### 1. FORMAT

1.  
   | [1] | RCV MENU BKUPCHK: PTN FILES CHECK COMPLETE |
   |
   | [2] | RCV MENU BKUPCHK: a APPEARS TO BE CORRUPT |

### 2. REASON FOR OUTPUT

To report the result of request for validity check on /no5text/bkup/*.ptn files. These messages are printed only in response to RCV:M-BKUPCHK input message.

Format 1 will print when all .ptn files pass the validity check.

Format 2 will print when a .ptn file fails the validity check.

### 3. VARIABLE FIELD DEFINITIONS

\( a \)  
- The name of the .ptn file that failed the validity check. The file is located in /no5text/bkup.

### 4. ACTION TO BE TAKEN

No action is needed when Format 1 prints.

If Format 2 prints, it is possible that the bkupsum file was not properly updated. Compare the sum (use sum -r) value of the named .ptn file with the sum value listed in /no5text/bkup/bkupsum file for that file. If they are different, try changing the value in bkupsum file.

Otherwise, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

*Routine Operations and Maintenance*
RCV:MENU-GENBKUP
Software Release: 5E14 and later
Message Class: MAINT
Application: 5
Type: Output

1. FORMAT

RCV MENU GENBKUP: [(a)] b

2. REASON FOR OUTPUT

To report progress of a request for software release backup. These messages are printed only in response to RCV:MENU-GENBKUP input message.

3. VARIABLE FIELD DEFINITIONS

a = The name of the terminal from which the input message was entered (for example, ttya or ttyl).

b = A phrase reporting the progress or an error condition. It is usually self explanatory. Phrases are listed in the ACTION TO BE TAKEN section in three groups: one for those that need some action by the user, another for those that the user should refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual, and another for those that need no action by the user.

4. ACTION TO BE TAKEN

When the process terminates normally, no action is required.

When the process terminates abnormally (for example, 'ABORTED') take the corrective action suggested in the list above for error state phrases or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. In the phrases below: ‘x’ is a numeric expression and ‘<>' denotes a variable string with a brief explanation inside the brackets.

The following messages require the user to take some corrective action.

<table>
<thead>
<tr>
<th>Error message</th>
<th>Action</th>

</tr>
</tbody>
</table>
The above input message issued by genbkup failed.

Genbkup failed to execute the last message (refer to the last message on the screen).

Genbkup attempted to kill currently running COPY:BKDISK, but is unsure of the result due to unclear return code.

There is something wrong with the maintenance log.

There is something wrong with the mount table.

Internal program error--genbkup is looking for a message type that is not in the program.

This and the following messages indicate that genbkup tried but could not make the directory "/genbkupDIR" which is used to mount broot file system.

There is something wrong with the mount table.

There were inconsistencies in the results of audit and compare disk.

An audit of SM ODD file system blocks/links failed.

This tape sequence was aborted because COPY:BKDISK message failed.

The switching module (SM) ODD file system does not have data in it.

Genbkup cannot tell which MTCLOG (0 or 1) is active.

There can be only one genbkup running at one time. This genbkup tried to kill the already running genbkup but failed.

Genbkup cannot write to lockfile (/tmp/.genbkupLOCK) which is used as a flag.

Genbkup cannot write to lockfile (/tmp/.genbkupLOCK) which is used
The following messages require no action.

Application: 5,3B
Type: Output

1. FORMAT

RCV MENU a b [c] [ERRNO d]

2. REASON FOR OUTPUT

To specify the termination status of a RCV:MENU input message.

3. VARIABLE FIELD DEFINITIONS

a = Name of first ID field of corresponding input message.

b = Termination status. Valid value(s):
   ABORTED = Error.
   COMPLETED = Successful completion.

c = Reason for abort. Valid value(s):
   CANNOT CREATE ERROR FILE = Recent Change activity unable to create a log file for errors; permissions may be inappropriate or file space may be insufficient.
   CANNOT DETERMINE DEFAULT VALUES = Special error return from RCV indicating failure to determine default mask directory.
   CANNOT EXEC = Unknown recent change activity in second data field or permissions inappropriate.
   CANNOT GETTRAP = System call failed.
   CANNOT GETTRAP STDIN = System call failed.
   CANNOT REOPEN STREAM = Library call failed.
   CANNOT REOPEN TERMINAL = Library call failed.
   CANNOT SETTRAP = System call failed.
   CANNOT WAIT = MENU finds system call failure.
   CLOSE FAILED = System call failed.
   DATA SUBFIELD num INCORRECT = Parameters to recent change activity incorrect; num is an integer starting from one indicating which parameter is not understood.
   DUP FAILED = System call failed.
   FCLOSE FAILED = Library call failed.
   FORK FAILED = MENU finds system call failure.
   INTERNAL ERROR = Recent change activity encountered an internal error; error message logged to error file named for the activity.
   ODIN FORM CHECK FAILED FOR BATCH = Special error return from RCV3B to indicate a failure in batch mode.
   OUT OF MEMORY = MENU cannot find main memory for setup.
   PIPE FAILED = System call failed.
   READ FAILED = System call failed.
   SETTRAP STDIN FAILED = System call failed.
   WRITE FAILED = System call failed.
\[ d \] = Error number after system call failure. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual. Conflict with current system status interactive process on MTTY requires redirection of STDIN and STDOUT.

4. ACTION TO BE TAKEN

Check the Input Messages manual and the Output Messages manual version of the message to see if an error log file exists.

If \texttt{INTERNAL ERROR} is printed, examine the error log file. If an error log file does not exist, check the ROP.

Obtain assistance to restore the system to sanity if any other system-related or library-related message is printed.

Refer to Input Messages manual and reenter the correct input format for any other error messages.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

235-190-120   Common Channel Signaling Service Feature
72. REMACS
REMACS: AUD-ERR

Software Release: 5E12 and later
Message Class: MTCE
Application: 5,CNI
Type: Output

1. FORMAT

1. REMACS AUD ERR STARTED

2. REMACS AUD ERR SUM STARTED

2. REASON FOR OUTPUT

To report that the remote access subsystem (REMACS) software detected an audit error between replicated data in the administrative module (AM) data memory and the data memory in the nodes on the IMS ring. Normally, the REMACS audits will run continually because of the criticality of the data involved.

Format 1 is used to identify that an audit error has been detected between AM data and the same replicated data in one or more nodes on the IMS ring. Normally, only the first node that responds with the audit error will have its faulty data displayed on the printout. After detecting the audit error, the REMACS software will broadcast correction data to the node(s) to get the AM and node data back into conformity. It is always assumed that the AM data is the correct data while the audit is running.

Format 2 is used to summarize the results of the previous audit cycle in which an audit error was detected. Only as much information as needed is printed out on this summary to give the results of the audit. If no audit errors are detected, messages of this type will not occur.
3. VARIABLE FIELD DEFINITIONS

a = The hexadecimal ring node address of a node on the IMS ring which reported an audit error.

b = The hexadecimal window number in which an audit error was detected. REMACS uses window numbers to identify unique sets of data (tables) that are to be audited. To identify the affected data, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

c = A hexadecimal address that is relative to the start of the data window.

d = Hexadecimal data contents of the AM data or node data at the time the audit error was detected. Compare the differences between the AM data image and the node data image in order to find the byte(s) in error. It is always expected that the AM data is the correct data to be used.

e = A hexadecimal address relative to the start of the data window which is start point for a chunk of data to be audited. The relative window address given previously (field 'a') will be within the range of the chunk of data being audited.

f = Specific node ring node addresses for nodes that reported an audit error to the REMACS software.

g = If more than 10 nodes are identified for 'f', this field gives the total number of those nodes exceeding 10.

h = Number of audit errors that were detected by the REMACS software, but could not be stored in the audit error buffers because of a lack of resources. The OTHER ERRORS line will not print out if there are sufficient audit error buffers to contain the detected audit errors.

i = In conjunction with the error count (field 'h'), the number of nodes that reported audit errors while the audit error buffers were congested.

4. ACTION TO BE TAKEN

The REMACS audit software is designed to automatically correct data inconsistencies between the AM memory and the memory of the affected nodes on the IMS ring, therefore no further action is required. Since the cause of these printouts is most likely a software problem in the AM or the nodes, collect printouts and notify the next level of technical support.

The EXC:REMACS input message can be used to control the execution environment for the audit. It may also be used to initiate a single audit cycle while the audit is in a disabled state.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

235-190-120  Common Channel Signaling Services Features
73. REPT:0
REPT:10MIN-CIC

Software Release: 5E15 and later
Message Class: TRK
Application: 5
Type: Output

1. FORMAT

[1] REPT 10MIN CIC BLKD UNBLKD SEGMENT=a  b
   POINT CODES BICC ISUP
   OPC  DPC BLKD UNBLKD BLKD UNBLKD
   [c] [d] [e] [e] [e] [e]
   . . . . . .
   . . . . . .
   . . . . . .

[2] REPT 10MIN CIC BLKD UNBLKD COMPLETED [h]
   TOTAL SEGMENTS=f  [g]

2. REASON FOR OUTPUT

This is the 10 minute blocking report. It prints an indication of the BICC/ISUP blocking or unblocking reception activity over the last 10 minute period. Format 1 is produced to report the OPC-DPC pairs that have had blocking or unblocking reception activity in the last 10 minutes. Format 2 is produced as a summary after all Format 1 reports have been produced. However, only format 2 (without format 1) will be produced if there was no blocking or unblocking reception activity on any SM's in the last 10 minutes.

3. VARIABLE FIELD DEFINITIONS

a = The segment number of the output produced. Segments are numbered sequentially starting from one.
b = Report status. Valid values(s):
   STARTED = This is the first segment of the report, segment is equal to one (1).
   CONTINUED = Subsequent segments of the report, segment number is 2 or greater.
c = Origination point code (OPC).
d = Destination point code (DPC).
e = BICC/ISUP blocking, unblocking activity indicator. Valid value(s):
   x = There was blocking activity on OPC, DPC pair.
   - = No blocking unblocking activity on OPC, DPC pair.
f = Total number of segments in the report. If this value is 0 (zero), then variable 'h' will print.
g = Data message. Valid value(s):
DATA MAY BE INCOMPLETE = Some of the SMs were not responsive or inaccessible.

= Blocking information. Valid value(s):

- NO BLOCKING/UNBLOCKING ACTIVITY = No blocking or unblocking reception activity on any responsive or accessible SM(s).

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

74. REPT:3
REPT:3BN-DMA
Software Release: 5E14 and later
Message Class: SWM01
Application: 5,CNI
Type: Output

1. FORMAT

[1] REPT 3BN DMA RSTRT
    UNEXPECTED ERR DURING DLN DMA RESTART ON a b, STATE = c

[2] REPT 3BN DMA RSTRT
    a b RESTART DMA TIMEOUT

2. REASON FOR OUTPUT

Format 1 is printed when a hardware message fails in the sequence of direct memory access (DMA) restart on the specified node. Format 2 is printed when the sequence of restart DMA on the specified node times out.

3. VARIABLE FIELD DEFINITIONS

Note: An administrative module (AM) node is defined to be a node that is not a ring peripheral controller (RPC) and yet is connected directly to the AM.

a = The AM node name [such as, direct link node (DLN)] and group number.
b = The AM node member number.
c = The reason for the complaint. Valid value(s):
   1 = Attach interrupt failure.
   2 = Clear duplex dual serial bus selector (DDSBS) failure.
   3 = Cannot send reset 3BI pio.
   4 = Fail to program the direct memory access controller (DMAC) to the user's area.
   5 = Cannot enable interrupt.
   6 = Cannot send node processor (NP) level 1 restart pio.

4. ACTION TO BE TAKEN

For Formats 1 and 2, use normal maintenance procedures, diagnose the AM node. If all tests passed (ATP), contact interprocess message switch (IMS) technical personnel and restore the node to service. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Note: Unless inhibited, the automatic ring recovery (ARR) routine, will attempt (up to 3 times) automatic recovery of out-of-service (OOS) AM nodes if the node maintenance state is not marked MANUAL.

75. REPT:A
REPT: ABNORMAL-AT

Software Release: 5E15 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT ABNORMAL ACK TYPE a SIGTYPE b TKGMN c-d
   OPC e DPC f CIC g

   SENT STATUS           H'h

   RECEIVED STATUS  H'i

2. REASON FOR OUTPUT

To print the status bit abnormal acknowledgment report. This is triggered when one of the following acknowledgment messages is received from the far-end office with unacknowledged circuit identification codes (CICs) or extra acknowledged CICs relative to the request sent:

MGBA = Maintenance group blocking acknowledgment.
HGBA = Hardware group blocking acknowledgment.
MGUA = Maintenance group unblocking acknowledgment.
HGUA = Hardware group unblocking acknowledgment.

This report is allowed by default after system initialization, however, it can be inhibited by using the INH:S7ACK input message.

3. VARIABLE FIELD DEFINITIONS

a = Common channel signaling (CCS) message type that initiated an acknowledgment from the far-end office. Valid Value(s):
   HGB = Hardware group blocking.
   HGU = Hardware group unblocking.
   MGB = Maintenance group blocking.
   MGU = Maintenance group unblocking.

b = Protocol. Valid value(s):
   ISUP = Integrated services digital network (ISDN) user part.
   BICC = Bearer independent call control.

c = ISUP trunk group/ BICC group.

d = ISUP member number/ BICC normalized call instance code.

e = Origination point code (OPC).

f = Destination point code (DPC).

g = Circuit identification code (CIC). For BICC message this value will represent a 32 bit call instance code.

h = Sent status map in hexadecimal.
Received status map in hexadecimal.

2. REASON FOR OUTPUT

To report access dictionary information for a relation. Each relation has a common access dictionary (ACCDICT) and an access-type specific dictionary. The request was issued from within the ACCED tool, which is invoked by the RCV:M-ACCED input message.

Format 1 reports the access dictionaries for a relation of access type DBACC_CIND.
Format 2 reports the access dictionaries for a relation of access type DBACC_HASH.
Format 3 reports the access dictionaries for a relation of access type DBACC_IND.
Format 4 reports the access dictionaries for a relation of access type DBACC_LIN.
Format 5 reports the access dictionaries for a relation of access type DBACC_GK.

3. VARIABLE FIELD DEFINITIONS

AM = Administrative module.
MATE = CMP is mate (standby).
PRIM = CMP is primary (active).
a = Switching module (SM) number.
b = Message switch side.
c = Communication module processor (CMP) number.
d = Relation name.
e = Dictionary version. Valid value(s):
   ANY = Arbitrary version identified by the access dictionary index (ACCID).
   CURRENT = Current version.
   ODD = Office-dependent data (ODD) version.
f = Access dictionary index, non-negative integer.
g = Relation ID (acc_rid), non-negative integer.
h = Number of processes currently reading dictionary. Reader count (acc_rcnt).
i = Write flag (acc_wflg). Valid value(s):
   DBNO = The access dictionary is not currently waiting on the Memory Manager (MEMMAN) DBdo_acc list.
   DBYES = The access dictionary is waiting on MEMMAN DBdo_acc list.
j = “Relation is being reorganized” flag (acc_reorg). Valid value(s):
DBNO = This access dictionary is not currently being reorganized.
DBYES = Hashed reorganization is currently taking place on this dictionary.

k = Forward version list index into access dictionary (acc_nidx), non-negative integer.
l = Backward version list index into access dictionary (acc_bidx), non-negative integer.
m = Head table size in bytes (rel_hsze), non-negative integer.
n = Head table block ID (acc_head), non-negative integer.
o = Current state of this copy of the access dictionary (acc_state). Valid value(s):
   CURRENT = Entry is the current version.
   FUTURE = Entry is an updater's future version.
   GARBAGE = Entry is on the garbage collect list.
   IDLE = Entry is not currently used.
   READER = Entry is not current but still has readers.

p = Data page size in bytes (rel_dsze).
q = Maximum number of tuples (rel_tmax).
r = Intermediate data page size in bytes (rel_size).
s = Elements per page per level (inc_maxelt).
t = Element size in bytes per page per level (inc_eltsize).
u = Original length in bytes of key elements (inc_keylen).
v = Subkey length in bytes (sk_len).
w = Bits of key per level (inc_ckspli).
x = Subkey byte offset (sk_byteoff).
y = Subkey bit offset (sk_bitoff).
z = Number of bytes for ASCII-to-binary conversion (sk_cvnlen).

a\textsuperscript{1} = "Are keys stored" flag (inc_kstore). Valid value(s):
   DBNO = Tuple key is not stored with tuple.
   DBYES = Tuple key is stored with tuple.

b\textsuperscript{1} = Indexing type (inc_itype). Valid value(s):
   IND1 = Relation is one-level indexed.
   IND2 = Relation is two-level indexed.
   IND3 = Relation is three-level indexed.

c\textsuperscript{1} = "Hashing gone into overflow" flag (acc_oflg). Valid value(s):
   DBNO = There are no tuples in overflow for this relation.
   DBYES = There is at least one tuple in overflow for this relation.
d = Folding algorithm (acc_foldtyp), G16 or G31.

e = Maximum search depth per stage (acc_probedepth).

f = Number of tuples per page (acc_tpag).

g = Number of data pages (per stage for DBACC_HASH) (acc_npag).

h = Total number of pages in all 5 stages (acc_totp).

i = Indexing method (ind_acctyp). Valid value(s):
  IND1 = Relation is one-level indexed.
  IND2 = Relation is two-level indexed.

j = Length in bytes of first index (ind_len).

k = Key shift for dynamic relations (rel_kshft). Key shift is a value to add to a logical key to arrive at a physical key.

l = Length in bytes of attributes forming key (ind_keylen).

m = Byte offsets of attributes forming key (key_byteoff).

n = Bit offsets of attributes forming key (key_bitoff).

o = Number of pages per hash stage (gk_stgsz).

p = Reverse index relation ID (gk_revid).

q = Index into GK parent dictionary (acc_parid).

r = Number of entries in parent dictionary (acc_parcnt).

s = This field is not used.

t = ODD copy of DB_GKCTRL.gk_lastagk (acc_lastagk).

u = ODD copy of DB_GKCTRL.gk_freegk (acc_freegk).

v = ODD copy of DB_GKCTRL.gk_delcnt (acc_delcnt).

w = Number of processes accessing relations (gk_prmcnt).

x = Process ID of active garbage collection process on relation (gk_gpid.procono).

y = Processor ID of active garbage collection process on relation (gk_gpid.pcrid).

z = Uniqueness field of active garbage collection process on relation (gk_gpid.uniq).

a = Time (in milliseconds) to wait before reducing gk_prmcnt by force (gk_wait.tod).

b = Number of days to wait before reducing gk_prmcnt by force (gk_wait.day).

c = Progress marker for the generated key collection and compaction routine (GKCCR). Garbage
collection has been done for this relation (gk_gcdone). Valid value(s):
DBNO = Progress marker is not set.
DBYES = Progress marker is set.

d\textsuperscript{2} = Percentage of potential GK reference deletions collected in last garbage collection pass (gk_percent).
e\textsuperscript{2} = This field is not used.
f\textsuperscript{2} = This field is not used.
g\textsuperscript{2} = This field is not used.
h\textsuperscript{2} = This field is not used.
i\textsuperscript{2} = Relation dictionary index of parent relation (gk_prntid).
j\textsuperscript{2} = Link field byte offset in parent tuple (gk_tpos).
k\textsuperscript{2} = Link field bit offset in byte; right shift (gk_shft).
l\textsuperscript{2} = Memory type of relation. Valid value(s):
DISK = Relation resides on disk.
NRAM = Relation resided in non-redundant random access memory (RAM).
PRAM = Relation resides in protected RAM.
RRAM = Relation resides in redundant RAM.
URAM = Relation resides in unprotected RAM.

2. REASON FOR OUTPUT

To display a section of memory office-dependent data (ODD) or a section of disk ODD. Data may be displayed:

- Format 1 dumps memory given the starting absolute address. The data is printed as hexadecimal words.

- Format 2 dumps memory given the starting block ID. The data is printed as hexadecimal words.

- Format 3 dumps the data page containing a tuple given the relation name and tuple key. The data is printed as hexadecimal words.

- Format 4 dumps the head table for a relation given the relation name. The data is printed as short integers.

- Format 5 dumps the intermediate data page containing a tuple given the relation name and tuple key. The data is printed as short integers.

The review request was issued from within the ACCED tool, which is invoked by the RCV:M-ACCED input message.

MATE = CMP is mate (standby).

PRIM = CMP is primary (active).
| a | Switching module (SM) number. |
| b | Message switch side. |
| c | Communication module processor (CMP) number. |
| d | Type of memory reviewed. Valid value(s):
  - **DISK**: Office-dependent data resident on the disk.
  - **NRAM/URAM**: Unprotected random access memory (RAM), or SM and CMP non-redundant ODD.
  - **PRAM**: AM ODD.
  - **RRAM**: SM ODD. |
| e | Current output page number. |
| f | Total number of output pages. |
| g | Starting relative address of data. Relative address is a decimal number and is always 0 (zero) for first page of output. |
| h | Starting absolute address of data. Absolute address is a hexadecimal number. |
| i | Data as dumped from memory in hexadecimal format. |
| j | Block ID where review started. |
| k | Relation name. |
| l | Intermediate data page number, which is relevant for 3-level indexed relations. |
| m | Data page number. |
| n | Data as dumped from memory in decimal format. |

\end{align*}
\]

2. REASON FOR OUTPUT

To report the status of a destroy operation on a relation or part of a relation. The destroy request was issued from within the ACCED tool, which is invoked by the RCV:M-ACCED input message.

Format 1 reports that the whole relation was destroyed on a single processor.

Format 2 reports that an intermediate data page (IDP) of the relation was destroyed on a single processor.

Format 3 reports that a data page (DP) of the relation was destroyed on a single processor.

Format 4 reports that the whole relation was destroyed on all available SMs. The SM numbers on which the relation was destroyed are listed.

3. VARIABLE FIELD DEFINITIONS

- **AM** = Administrative module.
- **a** = Switching module (SM) number.
- **b** = Communication module processor (CMP) number. CMP is always primary (active) for DESTROY operation.
- **c** = Relation name.
- **d** = Number of the IDP destroyed.
- **e** = Block ID of the destroyed page.
- **f** = Intermediate data page number that points to the DP destroyed. This appears in the output only
for 3-level indexed relations, that is, only for relations whose access dictionary contains an inc_ctype value of IND3 (refer to the REPT:ACCED-ACCDIC output message).

\[ g \] = Number of the DP destroyed.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

Type: Output

1. FORMAT

REPT ACCED HASHSIM (AM|SM=a|CMP=b) REL=c ACC_TYPE=d

{HASH|GK} STAGED SIMULATION PROBE DEPTH=e [PSZE=f] FOLDTYPE=g

PAGE h of i

STAGE NUMBER: 1 2 3 4 5
j RESERVED: k l m n o TOTAL = p
j ALLOCATED: q r s t u TOTAL = v
PERCENT OCCUPIED: w x y z a

TUPLES = b1 PAGES = c1 SEARCH = d1
TMAX = e1 TPAG = f1 LOAD = g1
OVFLW = h1 MSEARCH = i1 K-BYTES = j1
HSZE = k1 IHSZE = l1 DSZE = m1
SCORE = n1

[WARNING: VALUES THAT GENERATE OVERFLOW SHOULD NOT BE USED]

2. REASON FOR OUTPUT

To report the hashing statistical information for selected values of rel_tmax (maximum number of tuples) and rel_dsze (data page size). For range values of rel_tmax and/or rel_dsze, the three best combinations of rel_tmax and rel_dsze for a relation are reported. The hashing simulation request is issued from within the ACCED tool, which is invoked by the RCV:M-ACCED input message.

3. VARIABLE FIELD DEFINITIONS

AM = Administrative module.
GK = Simulation was performed on a generated key relation.
HASH = Simulation was performed on a hashed relation.
a = Switching module (SM) number.
b = Communication module processor (CMP) number. CMP is always primary (active) for HASHSIM operation.
c = Relation name.
d = Access type of relation (DBACC_HASH or DBACC_GK).
e = Probe depth (maximum search depth per stage). Valid value(s):

<table>
<thead>
<tr>
<th>AM</th>
<th>Probe depth</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBACC_HASH</td>
<td>The maximum number of element searches on a data page.</td>
</tr>
<tr>
<td>DBACC_GK</td>
<td>The target size for each generated key bucket. This target value may be exceeded slightly for short</td>
</tr>
</tbody>
</table>
periods without harm.

\[ f \] = Physical tuple size (in bytes).
\[ g \] = Foldtype used in hashing (DBDEFAULT or G31).
\[ h \] = Current output page number.
\[ i \] = Total number of output pages to display.
\[ j \] = Type of space allocated. Valid value(s):
    
    - **BUCKETS** = Generated key buckets.
    - **PAGES** = Data pages.

\[ k \] = Total number of pages reserved for use in the first hashing stage.
\[ l \] = Total number of pages reserved for use in the second hashing stage.
\[ m \] = Total number of pages reserved for use in the third hashing stage.
\[ n \] = Total number of pages reserved for use in the fourth hashing stage.
\[ o \] = Total number of pages reserved for use in the fifth hashing stage.
\[ p \] = Total number of pages reserved for stages 1-5.
\[ q \] = Number of pages used in the first hashing stage.
\[ r \] = Number of pages used in the second hashing stage.
\[ s \] = Number of pages used in the third hashing stage.
\[ t \] = Number of pages used in the fourth hashing stage.
\[ u \] = Number of pages used in the fifth hashing stage.
\[ v \] = Total number of pages used in stages 1-5.
\[ w \] = Percentage of space occupied in the first stage.
\[ x \] = Percentage of space occupied in the second stage.
\[ y \] = Percentage of space occupied in the third stage.
\[ z \] = Percentage of space occupied in the fourth stage.
\[ a^1 \] = Percentage of space occupied in the fifth stage.
\[ b^1 \] = Number of tuples in relation.
\[ c^1 \] = Number of data pages generated, including overflow pages.
\[ d^1 \] = Average number of accesses required to locate or place a tuple.
\[ e^1 \] = Maximum number of tuples for the relation.
f^1 = Tuples per data page. If 'd' = DBACC_GK, then 'f^1' = 0 because TPAG (acctpag) is not defined for relations of access type DBACC_GK.

g^1 = Percent of space allocated that was actually occupied. This value includes the overflow pages.

h^1 = Number of tuples in overflow.

i^1 = Maximum number of accesses required to locate or place a tuple.

j^1 = Total amount of memory used, including overflow, expressed in Kilo-bytes. (Bytes = K-bytes * 1024)

k^1 = Head table size expressed in bytes.

m^1 = Intermediate data page size expressed in bytes. If 'd' = DBACC_HASH, then 'm^1' = 0 because IHSZE (rel_isze) is not defined for relations of access type DBACC_HASH.

m^1 = Data page size expressed in bytes.

n^1 = A weighted value based on ovflw, load, search, msearch, and K-bytes. Used to determine "best" simulation values. Lower scores indicate better values.

4. ACTION TO BE TAKEN

TUPLE NUMBER o
PHYS TUPLE SIZE p
LOGICAL TUPLE SIZE q

2. REASON FOR OUTPUT

To report information about a tuple within a relation. The request for tuple information was issued from within the ACCED tool, which is invoked using the RCV:M-ACCED input message.

3. VARIABLE FIELD DEFINITIONS

AM = Administrative module.
MATE = CMP is mate (standby).
PRIM = CMP is primary (active).
a = Switching module (SM) number.
b = Message switch side.
c = Communication module processor (CMP) number.
d = Relation name.
e = Memory type of relation. Valid value(s):
  DISK = Relation resides on disk.
  NRAM = Relation resided in non-redundant RAM.
  PRAM = Relation resides in protected random access memory (RAM).
  RRAM = Relation resides in redundant RAM.
  URAM = Relation resides in unprotected RAM.

f = Address, in hexadecimal, of head table under which the tuple is located.
g = Block ID of head table under which the tuple is located.

REPT ACCED OVERWRITE {AM|SM=a|CMP=b} {DISK|MEMORY}
   ADDRESS            c
   OLD DATA           d
   NEW DATA           e

2. REASON FOR OUTPUT

To report the status of a memory or disk overwrite operation. The overwrite request was issued from within the ACCED tool, which is invoked using the RCV:M-ACCED input message.

The report occurs when the memory or disk overwrite operation is successful. The following information is provided in the output message: the physical address where the overwrite occurred, the old data at that location, and new data at that location. The physical address and data values are printed in hexadecimal notation.

3. VARIABLE FIELD DEFINITIONS

AM = Administrative module.
DISK = Disk office dependent data (disk ODD) is overwritten.
MEMORY = Memory ODD is overwritten.
a = Switching module (SM) number.
b = Communication module processor (CMP) number. CMP is always primary (active) for OVERWRITE operation.
c = Starting physical address (hexadecimal) of overwritten storage.
d = Old data (hexadecimal) at that storage location.
e = New data (hexadecimal) at that storage location.

2. REASON FOR OUTPUT

To report the status of a reorganization operation on a relation. The reorganization request was issued from within
the ACCED tool, which is invoked by the RCV:M-ACCED input message.

3. VARIABLE FIELD DEFINITIONS

AM = Administrative module.

a = Switching module (SM) number.

b = Communication module processor (CMP) number. CMP is always primary (active) for REORG operation.

c = Relation name.

d = Termination report. Valid value(s):
   ABORTED = Relation cannot be reorganized due to corrupted data in current copy of relation.
   CANCELED = Relation cannot be reorganized due to overflow tuple in new copy of relation.
   COMPLETE = Relation has been reorganized.
   COMPLETED CONDITIONALLY = Relation has been reorganized but failed to log for CMP generated key (GK) relation.
   FAILED = Relation cannot be reorganized due to system failure.
   NEEDED = Reorganization was run under inhibit mode, and reorganization is needed.
   STOPPED = Relation could not be reorganized due to low ODD space.

For the COMPLETED and COMPLETED CONDITIONALLY termination reports, the access dictionaries that follow in the output message reflect new changes to the access dictionaries for the relation.

For the remaining termination reports, the access dictionaries that follow in the output message represent the access dictionaries that would have resulted had the reorganization not failed for the relation.

e = Relation ID (acc_rid), non-negative integer.

f = Reader count (acc_rcnt), non-negative integer.

g = Writer flag (acc_wflg). Valid value(s):
   DBNO = The access dictionary is not currently waiting on the memory manager (MEMMAN) DBdo_acc list.
   DBYES = The access dictionary is waiting on MEMMAN DBdo_acc list.

h = Relation is being reorganized flag (acc_reorg). Valid value(s):
   DBNO = This access dictionary is not currently being reorganized.
   DBYES = Hashed reorganization is currently taking place on this dictionary.

i = Forward version list index into access dictionary (acc_nidx), non-negative integer.

j = Backward version list index into access dictionary (acc_bidx), non-negative integer.

k = Head table size in bytes (rel_hsze), non-negative integer.

l = Head table block ID (acc_head), non-negative integer.
m = Current state this copy of the access dictionary (acc_state). Valid value(s):
   CURRENT = Entry is the current version.
   FUTURE  = Entry is an updater's future version.
   GARBAGE = Entry is on the garbage collect list.
   IDLE    = Entry is not currently used.
   READER  = Entry is not current but still has readers.

n = Hashing gone into overflow flag (acc_oflg). Valid value(s):
   DBNO    = There are no tuples in overflow for this relation.
   DBYES   = There is at least one tuple in overflow for this relation.

o = Folding algorithm (acc_foldtyp), one of G16 or G31.

p = Maximum search depth per stage (acc_probedepth), non-negative integer.

q = Number of tuples per page (acc_tpag), non-negative integer.

r = Data page size in bytes (rel_dsze), non-negative integer.

s = Number of pages per stage (acc_npag), non-negative integer.

t = Maximum number of tuples (rel_tmax), non-negative integer.

u = Total number of pages in all stages (acc_totp), non-negative integer.

v = Number of pages per hash stage (gk_stgsz), non-negative integer.

w = Intermediate data page size in bytes (rel_size), non-negative integer.

x = Reverse index relation ID (gk_revid), non-negative integer.

y = Elements per page per index level (inc_maxelt), non-negative integer.

z = Element size in bytes per page per index level (inc_eltsize), non-negative integer.

a = Original length in bytes of key elements (inc_keylen), non-negative integer.

b = Bits of key per index level (inc_cksplit), non-negative integer.

c = Index into GK parent dictionary (acc_parid), non-negative integer.

d = Number of entries in parent dictionary (acc_parcnt), non-negative integer.

e = Indexing type (inc_itype). Valid value(s):
   IND1    = Relation is one-level indexed.
   IND2    = Relation is two-level indexed.
   IND3    = Relation is three-level indexed.

f = This field is currently not used.

g = ODD copy of DB_GKCTRL.gk_lastagk - last allocated GK (acc_lastagk), non-negative integer.

h = ODD copy of DB_GKCTRL.gk_freeagk - first element on free list (acc_freeagk), non-negative integer.
integer.

\[ i^1 = \text{ODD copy of DB_GKCTRL.gk_delcnt (acc_delcnt), non-negative integer.} \]

\[ j^1 = \text{Additional information qualifying termination report. Valid value(s):} \]

TUPLE NUMBER k
PHYS TUPLE SIZE l

2. REASON FOR OUTPUT

To report the status of scan operation on a relation. The scan request was issued from within the ACCED tool, which is invoked by the RCV:M-ACCED input message.

The report indicates that, starting from the designated data page, the relation was scanned until an error was detected. Information on the corrupted tuple, corrupted data page, and corrupted intermediate data page (if relation is 3-level indexed) is provided.

3. VARIABLE FIELD DEFINITIONS

AM = Administrative module.
a = Switching module (SM) number.
b = Communication module processor (CMP) number. CMP is always primary (active) for SCAN operation.
c = Relation name.
d = Intermediate data page (IDP) number where the scan started.
e = Data page (DP) number where the scan started.
f = Intermediate data page number where corrupted data was found.
g = Block ID of intermediate data page where corrupted data was found.
h = Data page number where corrupted data was found.
i = Block ID of data page where corrupted data was found.
k = Tuple number of corrupted tuple.
k = Address, in hexadecimal, of corrupted tuple.
l = Physical size, in bytes, of corrupted tuple.
4. ACTION TO BE TAKEN

Investigate office-dependent data (ODD) corruption and correct corruption using the ACCED tool (RCV:M-ACCED).

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the occurrence of a software defined network (SDN) and leased network (LN) trapped event at an action
control point (ACP). This message is in response to the SET:DSE input message.

Format 1 is used for the NCANI, and NOCANI events, Format 2 is used for the GTCAP event, and Format 3 is used
for the remaining events.

3. VARIABLE FIELD DEFINITIONS

a = The feature application type. Valid value(s):
   LN = Leased network.
   SDN = Software defined network.

b = The event trapped. Valid value(s):
   BAS--QUERY BLOCK BY ACG = (automatic call gap) Call failed due to the query’s being blocked at
      the switch.
   BN--QUERY BLOCK IN CCS NETWORK = Call failed due to the query's being blocked in the
      common channel signaling (CCS) network.
   GTCAP--GARBLED TCAP MESSAGE = A garbled transaction capability application part (TCAP)
      message was received. The message cannot be parsed.
   NCANI--CAMA TRUNK DIDN’T RECEIVE ANI = Centralized automatic message accounting
      (CAMA) call failed due to CAMA trunk’s not providing automatic number
      identification (ANI) for query.
   NCFA--CALL FAILED TRANS ACTIVE = Call failed for some reason, while the transaction with
      the network control point (NCP) was active.
   NCFI--CALL FAILED TRANS INACTIVE = Call failed for some reason, while the transaction with
      the NCP was inactive.
   NOCANI--CAMA TRUNK DIDN’T RECEIVE ONI = CAMA call failed due to CAMA trunk’s not
providing ANI, and failed to obtain the number through the operator number identification (ONI), for query.

RER--NCP RETURN ERROR RECEIVED = Call failed because the conversation with the NCP resulted in a return error response.

RR--NCP REJECT RECEIVED = Call failed because the conversation with the NCP resulted in a reject response.

TIM--NCP DIDN'T REPLY IN TIME = Call failed because the query was not answered in time by the NCP.

TRF--NCP TERMINATED CALL = Call failed because the NCP answered with a terminate request.

\[c\] = Number of the switching module (SM) on which the trapped event occurred.

\[d\] = Seven or ten-digit dialed number which caused the event to occur.

Note: If the query returns from the NCP with a new destination dialed number, that new number is used instead of the dialed number.

\[e\] = Four-digit trunk group number which caused the event.

\[f\] = Four-digit trunk member number which caused the event.

\[g\] = Parsing error code. Valid value(s):

REPT:ADP-AUTORST

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

REPT ADP AUTORST THRESHOLD EXCEEDED FOR a b [c] [d]

2. REASON FOR OUTPUT

To report that the specified faulty hardware unit or community of units has exceeded its error threshold. The automatic diagnostic process (ADP) will no longer attempt to diagnose or restore the unit or community of units. The maximum number of restorations allowed is found in the max_restorable field in the ucbdyn form in the equipment configuration database (ECD).

Note: The ucbdyn form is a review-only form.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.
b = Unit number.
c = Subunit name.
d = Subunit number.

4. ACTION TO BE TAKEN

Manual diagnosis and restoration of the unit is required. This can be accomplished by using the RST input message for a restoration on a specified unit with or without diagnostics being run. The DGN input message will run diagnostics on the specified unit with no restoration.

5. ALARMS

None. This automatically-generated report requires no action.

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5,3B  
**Type:** Output

1. **FORMAT**

REPT ADP INHIBIT ACTIVE a b [c] [d]

2. **REASON FOR OUTPUT**

To report that the automatic diagnostic process (ADP) attempted to diagnose and restore the specified hardware unit or community but was inhibited from doing so by the diagnostics subsystem maintenance input request administrator (MIRA).

3. **VARIABLE FIELD DEFINITIONS**

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Unit name.</td>
</tr>
<tr>
<td>b</td>
<td>Unit number.</td>
</tr>
<tr>
<td>c</td>
<td>Subunit name.</td>
</tr>
</tbody>
</table>

4. **ACTION TO BE TAKEN**

Manual action is required to diagnose, repair, and restore the unit to service. Diagnostic inhibit status can be determined by the OP:DMQ input message. The diagnostic inhibit on ADP can be allowed by the ALW:DMQ input message.

5. **ALARMS**

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:ADP-INTER

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT ADP INTERFACE ERROR a [b][c][d][e][f]

2. REASON FOR OUTPUT

To report that the automatic diagnostic process (ADP) has encountered a problem interfacing with another part of the DMERT system while attempting to restore a hardware unit or community of units.

3. VARIABLE FIELD DEFINITIONS

a = Message. Valid value(s):
   INHIBIT ACTIVE = ADP has been inhibited from running diagnostics.
   INTERFACE ERROR = ADP has encountered a problem interfacing with another part of the DMERT system.

b = Error codes. Valid value(s):
   1 = ADP could not open the equipment configuration database (ECD).
   2 = ADP could not obtain a unit control block (UCB).
   3 = ADP could not set a value in a UCB.
   4 = ADP could not enable messages.
   5 = ADP could not send a message to the port that is assigned to the maintenance input request administrator (MIRA).
   6 = MIRA could not execute a request that was sent to it by ADP.
   7 = ADP could not retrieve an input/output processor (IOP) peripheral controller (IOPPC) UCB.

c = Unit name.

d = Unit number.
e = Subunit name.
f = Subunit number.

4. ACTION TO BE TAKEN

For error code 6, use the OP:DMQ input message to determine the status of the MIRA process. If automatic diagnostics are inhibited in MIRA, the ALW:DMQ input message may be used to remove the inhibit. If the problem persists, obtain technical assistance.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1]  REPT ADP AUTORST FAILURE FOR a b [c] [d]

[2]  REPT ADP MAJOR ALARM AUTORST FAILURE FOR a b [c] [d]

[3]  REPT ADP MINOR ALARM AUTORST FAILURE FOR a b [c] [d]

[4]  REPT ADP NO AUTORST, UNIT IS MAN RMV FOR a b [c] [d]

[5]  REPT ADP NO AUTORST, UNIT IS FLT RMV FOR a b [c] [d]

[6]  REPT ADP NO AUTORST, UNIT IS NOT OOS FOR a b [c] [d]

2. REASON FOR OUTPUT

To report that the automatic diagnostic process (ADP) after-fault branch was unable to restore a faulty hardware unit and that it will no longer attempt to diagnose or restore the specified hardware unit or community.

Format 1 is output to report that the suspected faulty hardware unit or community of units has exceeded its error threshold.

Format 2 is output when the specified hardware unit or community is essential.

Format 3 is output when the hardware unit or community is a unit or community whose top unit is an input/output processor (IOP) (that is, the unit is an IOP peripheral controller - IOPPC).

Format 4 is output to report that the unit will not be autorestored because it was manually removed.

Format 5 is output to report that the unit will not be autorestored because it was fault removed.

Format 6 is output to report that the unit will not be autorestored because it was not out of service.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.
b = Unit number.
c = Subunit name.
d = Subunit number.
4. ACTION TO BE TAKEN

For Format 1, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

For Formats 2 and 3, if the hardware unit or community actually failed the restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

The maintenance input request administration (MIRA) process might not start or complete ADP's restore requests for one of the following reasons [use the OP:DMQ input message to check the deferred maintenance queue (DMQ)]:

- The DMQ already has a restore request for the hardware unit, community, or top unit. MIRA canceled ADP's restore request as a duplicate.
- Request source ADP is inhibited in the DMQ. Determine why ADP was inhibited and, if practical, use the ALW:DMQ input message to remove the inhibit.
- An initialization interval is in progress. MIRA aborted tasks in the active queue. Tasks in the waiting queue are started at the end of the initialization interval. ADP may generate another restore request.
- ADP's internal request timer may have expired if there is a large number of manual requests and/or there is a high system load. ADP's request might still be in the DMQ. MIRA defers ADP requests in favor of manual requests, and part of the active queue is for manual requests only.

Request a restore on the hardware unit or community if the hardware unit, community, or top unit does not have a restore request in the queue. No further action is required if the restore is successful.

For format 4, if the hardware unit should be restored, then restore the unit manually.

For format 5, if the hardware unit should be restored, determine what is wrong with the unit using diagnostics, correct the problem, and manually restore the unit.

For format 6, if the hardware unit is not active and not out-of-service (OOS), and if the hardware unit should be restored, then move the unit to OOS using RC/V and manually restore the unit.

5. ALARMS

There is no alarm for an automatically-generated report.

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   **SOURCE ANALYSIS DATA:**

   m

2. **REASON FOR OUTPUT**

   To respond to either a time-slot interchange (TSI) interrupt caused by peripheral interface data bus (PIDB) parity errors or a packet-switch unit (PSU) interrupt caused by directly connected peripheral interface data bus (DPIPDB) parity errors in the access interface unit (AIU).

3. **VARIABLE FIELD DEFINITIONS**

   a

   = AIU circuit type. Valid value(s):

<table>
<thead>
<tr>
<th>COM=n-o-p</th>
<th>PIDB=n-o-p-q</th>
</tr>
</thead>
</table>

   b

   = Line unit status. Valid value(s):

   ACT = Active.
   MAJOR = Active major.
   MINOR = Active minor.
   OOS = Out of service.

   c

   = Circuit equipment status qualifier. Valid value(s):

   AUOOS = On recovery queue.
   BLKD = Communication blocked.
   CAMPON = Camped-on.
   CDNY = Customer denied.
   DGN = Diagnose.
   DGR = Degraded.
   FE = Family of equipment.
   FLT = Fault.
   NULL = Null value.
   PROOS = Pre-out of service.
   REX = Routine exercise.
RMV = Removed.
TBLA = Trouble analysis.

d = Type of trouble report. Valid value(s):
   DPIDB PARITY FAILURE
   PIDB PARITY FAILURE

e = Event number.

f = Error type. Valid value(s):
   PIDB PARITY TROUBLE

g = Recovery action. Valid value(s):
   ANALYSIS ONLY = This report is provided for reference only.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
   NO RECOVERY ACTION TAKEN = This report is provided for reference only.
   RE-INHIBIT ERROR = The failing circuit has been inhibited and error are still detected.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
   UNCONDITIONAL RST PREEMPT = The failing circuit was preempted and restored without scheduling any diagnostic.

h = System time when the fault happened, formatted in hh:mm:ss.msec

i = External logical circuit name in the fault. More than one circuit may be listed when multiple circuits can be blamed for the trouble.

j = Number of recent failures of this error type (variable 'e') on this AIU failing circuit (in decimal).

k = Error count threshold.

l = Next recovery action, the same actions are possible as in variable 'f'.

m = Source analysis data.

n = SM number.

o = AIU number.

p = COMDAC number.

q = PIDB number.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the failing circuit from service during a period of low usage and perform trouble locating procedures.
5. ALARMS

None.

2. REASON FOR OUTPUT

To report failure during a client process or peripheral fault recovery (PFR) test process on an access interface unit (AIU), line circuit (LC), application pack (AP), common data and control (COMDAC), or time slot group (TSGRP). This report indicates what recovery action was taken and gives the current fault counts against the circuit specified in the report. Refer to variable 'f' to determine the effect the fault recovery activity had on the system.

   SP FIFO OVERFLOW FAILURE RECOVERY ACTION c  
   d e f  
   gggghhhh iiijjjjj kkkkllll

2. **REASON FOR OUTPUT**

   To respond to a signal processor (SP) error caused by the SP first-in first-out (FIFO) buffer’s overflowing.

3. **VARIABLE FIELD DEFINITIONS**

   a = AIU circuit type. Valid value(s):
   - LF=m-n-o
   - LC=m-n-o-p

   b = Event number.

   c = Recovery action. Valid value(s):
   - ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
   - RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

   d = External logical circuit name in the fault. More than one circuit (refer to variable ‘a’) may be listed when multiple circuits can be blamed for the trouble.

   e = Number of recent failures of this error on this AIU failing circuit (variable ‘d’), in decimal.

   f = Error count threshold, above which the recovery action will become stronger, in decimal.

   g = Time slot number that had the most entries in the FIFO, in hexadecimal.

   h = Total number of entries in the FIFO for time slot ‘g’, in hexadecimal.

   i = Total number of time slots on the high-runner time slot interchange (TSI) link with entries in the FIFO, in hexadecimal.

   j = Contents of the current internal fault recovery error counter, in hexadecimal.

   k = Total number of failures reported on unlinked timeslots, in hexadecimal.

   l = SP number, in hexadecimal.

   m = Switching module (SM) number.

   n = Access interface unit (AIU) number.
4. ACTION TO BE TAKEN

Monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected.

2. REASON FOR OUTPUT

To indicate that an automatic level 1 automatic line evaluation (ALE) event has occurred. Three automatic level 1 tasks can be performed: hourly alert, daily alert, and interval transfer.

An hourly alert task event is generated when a digital subscriber line (DSL) exceeds its defined hourly alert errored second (ES) or severely errored seconds (SES) thresholds. This task is invoked immediately upon detection of the threshold exception.

A daily alert task event is executed each hour. The daily alert task will generate a report for each DSL that exceeds its defined daily alert ES or SES thresholds. If no DSL is found to exceed the daily alert thresholds, then no reports are generated.

An interval transfer task event is executed each interval. This task transfers the ALE level 1 interval information from the switching modules (SM) to the administrative module (AM) disk file storage system.

Format 1 indicates the ALE level 1 task completion status.

Format 2 reports the level 1 errored seconds and severely errored seconds for the indicated DSLs generating an alert event. Up to 11 DSLs may be reported in a single message.

Format 3 outputs the completion status of the ALE level 1 session indicating the number of ALE level 1 message segments printed.
Format 4 indicates that some switching modules (SMs) did not execute the ALE task successfully or the data is incomplete.

3. VARIABLE FIELD DEFINITIONS

ILEN = Integrated digital carrier unit line equipment number.
INEN = IDLC network equipment number
LCEN = Integrated services line card equipment number.

* = Corruption indication flag (CIF). When set, the counts may not be complete since this indicates that the counters have stopped because the line card was removed from service, a cyclic redundancy check (CRC) test has been run, or layer 1 was not operational. This flag is not valid for basic rate interface transmission extension (BRITE) channel units (CU).

a = Report type. Valid value(s):
DAILY ALERT = Indicates a daily level 1 alert job.
HOURLY ALERT = Indicates an hourly level 1 alert job.
INTERVAL TRANSFER = Indicates an interval transfer job.

b = Job completion status. Valid value(s):
COMPLETED = Job completed normally.
STOPPED = Session stopped due to manual request.

c = Segment number of the message. Segments are numbered sequentially starting from 1.

d = Equipment number. Valid value(s):
ILEN e-i-j-k INEN e-u-j-k LCEN e-f-g-h

e = Switching module number.

f = Integrated services line unit number.

h = Line card number.

i = Switching module number.

j = Integrated digital carrier unit number.

k = Remote terminal (RT) number.

l = RT line number.

A = ANSP\textsuperscript{\textregistered} standard U-interface.
U = Alternate mark inversion (AMI) U-interface.
m = The count set being reported. Valid value(s):
n = Number of upstream error seconds. An errored second occurs when at least one CRC block error occurs in a second.

o = Number of downstream error seconds.

p = Number of errored seconds alerting threshold.

q = Number of upstream severely error seconds. A severely errored second occurs when a fixed number of CRC block errors occurs in a second. The parameter defining a severely errored second is specified on RC/V View 8.1.

r = Number of downstream severely error seconds.

s = The severely errored seconds alerting threshold.

t = Total number of segments printed.

u = Digital network unit - synchronous optical network (SONET) (DNU-S) number.

4. ACTION TO BE TAKEN

Inspect the REPT:ALE-LVL1 output message for ALE information indicating DSL line problems.

5. ALARMS

None.

8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]
REPT: ALE-PER-LOG

Software Release: 5E14 and later
Message Class: PRFM
Application: 5
Type: Output

1. FORMAT

REPT ALE PER LOG CAPACITY - SEGMENT a

<table>
<thead>
<tr>
<th>SM</th>
<th>USAGE(%)</th>
<th>INDICATOR</th>
<th>TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>b</td>
<td>[c]</td>
<td>[dd/dd ee:ee:ee]</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To report that a switching module (SM) protocol error record (PER) logging buffer has achieved a prespecified capacity usage threshold. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

Three thresholds have been defined:

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Usage(%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAUTION</td>
<td>80</td>
</tr>
<tr>
<td>WARNING</td>
<td>90</td>
</tr>
<tr>
<td>FULL</td>
<td>100</td>
</tr>
</tbody>
</table>

In addition to reporting the indication level, the time of day when that level was reached is also reported.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Percentage of PER logging buffer currently in use (0-100).
c = Indication level. Valid value(s):
    - CAUTION = First level of indication preset at 80% capacity.
    - FULL   = Third and final level of indication preset at 100% capacity.
    - WARNING= Second level of indication preset at 90% capacity.
d = Date the report was prepared, in the form month/day.
e = Time the report was prepared, in the form hours:minutes:seconds.

4. ACTION TO BE TAKEN

None. The PER logging buffer may be reset at any time by using the EXC:ALE input message, however this will purge all data from memory or send to the receive-only printer (ROP) before the purge pending the type of reset requested.

5. ALARMS

None.

   OIUEN=b-t¹-u¹-v¹-e¹-f¹-l¹-g¹
   PLTEN=b-m¹-n¹-o¹-p¹
= Digital line and trunk unit (DLTU) number.
g = Digital facility interface number.
h = Digital channel number.
i = Integrated services line unit number.
j = Line group controller number.
k = Line card number.
l = Integrated digital carrier unit number.
m = Remote terminal (RT) number.
n = RT line number.
o = Primary/protection identifier.
p = Directory number. Valid value(s):

```
DN=q[+]
PKTDN=q[+]
```

q = Directory number.
r = Service group and member numbers. Valid value(s):

```
MLHG=s-t
TKGMN=u-v
```

s = Multi-line hunt group number.
t = Multi-line hunt group member number.
u = Trunk group number.
v = Trunk group member number.
w = Channel type (CH). Valid value(s):

```
B1 = Channel B1.
D = D-channel.
```

x = Packet service capability. Valid value(s):

```
ODP = On-demand packet service.
PPB = Permanent packet B-channel service.
PPD = Permanent packet D-channel service.
```

y = Integrated service line unit 2 (ISLU2) number.
z = Line group number.

a¹ = Line board number.

b¹ = Line circuit number.

c¹ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

d¹ = Data group (DG) number.

e¹ = Synchronous transport signal (STS) facility number.

f¹ = Virtual tributary group (VTG) number.

g¹ = Digital signal level 0 (DS0) number.

h¹ = Access interface unit (AIU) number.

i¹ = AIU pack number.

j¹ = AIU circuit number.

k¹ = SONET termination equipment (STE) facility number.

l¹ = Virtual tributary member (VTM) number.

m¹ = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

n¹ = PCT facility interface (PCTFI) number.

o¹ = Tributary (T1FAC) number.

p¹ = Channel (CHAN) number.

q¹ = Packet switching unit (PSU) number.

r¹ = IP address field. Valid value is 0-255.

s¹ = Physical PH

t¹ = Optical interface unit (OIU) number.

u¹ = Protection group (PG) number.

v¹ = OC-3 SONET termination equipment (STE) number.

4. ACTIONS TO BE TAKEN

Execute the demand ALE input message EXC:ALE on the indicated channel to get a listing of the PERs that have been generated on that channel. Review the PERs and take the necessary corrective action, if possible.

5. ALARMS

None.

235-105-110 System Maintenance Requirements and Tools
235-600-755 Protocol Error Record Descriptions
REPT:ALINK-TLOT
Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT ALINK=a-b-c-d-e TRBL LU OPERATIONAL TEST FAILURE f
   g  RECOVERY ACTION h
   i  i  i  i
   j  k  l
   m  n  o

2. REASON FOR OUTPUT

To respond to an operational test failure (during call setup or disconnect) on a line unit where the grid board A-link (ALINK) is suspect.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Line unit number.

c = Grid number.

d = Grid board number.

e = ALINK number.

f = Event number, which is the time sequence indicator.

g = Secondary error type. Valid value(s):
   3 OPEN GDX NTWK PATHS - SUSPECT GRID FAILURE = 3 open GDX network paths have been found; suspect parent grid failure. Refer to 4ACTION TO BE TAKEN. (Not available for model 1 line unit.)
   CUTOFF GDX NTWK LATCH = During line disconnect, a gated diode crosspoint (GDX) network latch was found to be open indicating a suspected cut off call. Plant measurement report "CUT OFF CALLS, GDX" is pegged in function PCflt_rpt. Refer to variable field 'o'. (Not available for model 1 line unit.)
   FCG TEST FAILURE = During a call setup or line disconnect, a false cross and ground test failure had occurred. Refer to 4ACTION TO BE TAKEN.
   OPEN GDX NTWK PATH = During line disconnect, a GDX network path was found to be open but the associated GDX latches were closed. Refer to variable field 'o'. (Not available for model 1 line unit.)

h = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is provided but the error count has not reached a threshold that requires an automatic recovery action.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
   REPORT TO TERMINAL MAINT = Terminal maintenance has been notified of the failure.
RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.

RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.

RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

i = Logical circuit name, in order of output. Valid value(s):
  ALINK = Line unit A-link.
  LEN = Line equipment number.
  LUCHAN = Line unit channel.
  LUHLSC = Line unit high level service circuit.

j = External logical circuit name.

k = Current decimal number of errors recorded.

l = Error count threshold, above which further automatic recovery action will be taken.

m = Hexadecimal data in the form xxxxyyyy.
  xxxx = LUCHAN attribute ‘name’ as identified in relation CKTDATA.
  yyy y = LUHLSC attribute ‘name’ as identified in relation CKTDATA.

n = Hexadecimal data in the form xxxxyyyy.
  xxxx = Ignore.
  yyy y = LEN hexadecimal port name.

o = When variable ‘g’ = OPEN GDX NTWK PATH or CUTOFF GDX NTWK LATCH, a network path test executed in function JB2disc has failed. The first and second characters of the format xxxxyyyy identify the type of call being disconnected, the third and forth characters must be converted to binary to identify the fault. Following is an explanation of the format:

Type of call being disconnected:

<table>
<thead>
<tr>
<th>Call type</th>
</tr>
</thead>
<tbody>
<tr>
<td>02   Normal originating or unanswered terminating call</td>
</tr>
<tr>
<td>04   Supervision transfer detected in function JB2orig</td>
</tr>
<tr>
<td>08   Terminating answered call</td>
</tr>
<tr>
<td>10   Abandon during dialing</td>
</tr>
<tr>
<td>40   Ringing current failure detected in LPstop_r</td>
</tr>
</tbody>
</table>

(The following is true if the binary bit value = 1.) Type of fault detected:

<table>
<thead>
<tr>
<th>Call type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bit 0  Channel break ckt opened during disconnect but closed OK - only tested if customers line is off hook, a pattern pointing to one channel could indicate a defective TN335.</td>
</tr>
<tr>
<td>bit 1  Customers line tested off hook at scanner.</td>
</tr>
<tr>
<td>bit 2  Restore verify test (RVF) failed - loop start lines tested using high level service circuit (HLSClcw ip-to-ring 619 ohm short, ground start lines tested using HLSC 2.2k ring ground: scanner expected to be off hook.</td>
</tr>
<tr>
<td>bit 3  Open GDX grid path - if customers line was off hook, tested using scanner to reversed channel: channel expected to be off hook - else tested using RVF.</td>
</tr>
<tr>
<td>bit 4  Open GDX access (fwd/rev) path tested using HLSC tip-to-ring 619 ohm short: channel expected to be off hook.</td>
</tr>
</tbody>
</table>
4. ACTION TO BE TAKEN

Use pattern analysis to determine possible faulty hardware or software related problems. Use input message TST:LEN and TST:GRIDBD to verify failures. Refer to the Corrective Maintenance manual, sections: "Maintenance Procedures", "Clear Diagnostic Failure in Hardware".

If the secondary error type is 3 OPEN GDX NTWK PATHS - SUSPECT GRID FAILURE, diagnose and replace the parent grid of the ALINKs.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report changes in alarm scan point states, according to type. Format 1 is for the administrative module (AM). Format 2 reports changes in fan, fuse, and power status of switching module (SM) units. Format 3 is for remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) alarms and is available only in an RSM, ORM or TRM that has the alarm input option. Format 4 is for remote peripheral alarm scan points. Format 5 is for remote alarm section (RAS) scan points. Format 6 is for multiplexed access interface unit (XAIU) fan and fuse alarm scan points.

3. VARIABLE FIELD DEFINITIONS

a = Alarm status. Valid value(s):
AUTOINH = Reporting is automatically inhibited because a possible chattering scan point input has been detected.
AUTOINH CLEAR = Reporting on a scan point that was previously automatically inhibited is now allowed.
CLEAR = Normal state (unalarmed).
ERROR = A discrepancy exists between duplex scan point states.
SCAN PTS UNREADABLE = Scan points are unreadable.

b = Alarm type. Valid value(s):
BPSC = Building/power IOP scan point.
CNI = Common network interface.
ESM = External sanity monitor.
MISC = Miscellaneous IOP scan point.
MSGS = Message switch.
ONTC = Office network and timing complex.
SCSDC = Scanner and signal distributor controller.
TMS = Time-multiplexed switch.

C = Unit or scan point number. If 'b' is CNI or ESM, 'c' is null.
= Alarm name (or tag)- fixed or office assignable character string that identifies the particular scan point. Valid value(s):

Note: The word in square brackets is not part of the variable 'd'. It may be a keyword in one of the five formats as shown or it may be a part of one or more other variables.

ALM BAT = Alarm battery.
BAT LOW VLTG = Low voltage on battery.
[CNI] FAN ALM = Common network interface fan alarm.
[CNI]/DFA FUSE = Common network interface/digital facility access fuse alarm.
CO BAT DSCHG = Central office (CO) battery discharged.
COM PWR FAIL = Commercial power failure.
DISCH FUSE = Discharge fuse alarm.
[ESM] POWER = External sanity monitor power alarm.
FIRE = Fire alarm.
FIR ALM TBL = Fire alarm trouble.
FS PDF0 = Power distribution frame 0 fuse alarm.

STBYPLT FUEL = Standby plant out of fuel.
STBYPLT OPER = Standby plant operation alarm.
STBYPLT RECT = Standby plant rectifier alarm.
[TMS0] FAN FS = Time multiplexed switch 0 fan fuse alarm.
[TMS0] FANALM = Time multiplexed switch 0 fan alarm.
[TMS1] FAN FS = Time multiplexed switch 1 fan fuse alarm.
[TMS1] FANALM = Time multiplexed switch 1 fan alarm.

= Alarm scan point name. Valid value(s):
FAN
PERIPHERY FS
PWR
PWR SW FAIL

f = Switching module (SM) number.
g = Side number (0 or 1).
h = Module control unit identifier. Valid value(s):
ALARM STATUS CIRCUIT
PWR BUS0
PWR BUS1
REMOTE ALARM UNIT

i = Remote building/power MSU scan point (RBPSC) number or RAS scan point number.
j = Remote peripheral unit number.
k = Remote peripheral site number.
l = Alarm scan point name. Valid value(s):
BATTERY = Battery alarm.
FAN = Fan alarm.
FUSE = Fuse alarm.
POWER = Power alarm.
SCPT0 = Miscellaneous scan point 0.
SCPT1 = Miscellaneous scan point 1.
SCPT2 = Miscellaneous scan point 2.
SCPT3 = Miscellaneous scan point 3.
SCPT4 = Miscellaneous scan point 4.
SCPT5 = Miscellaneous scan point 5.

m = Aisle number for SM fan or fuse report. If the fan unit or fuse bus is physically wired to scan points
at the switching module controller (SMC) cabinet, the aisle number is that of the SMC. If the cabinet
housing the fan or fuse is remotely located (not in the same cabinet lineup as the SMC cabinet for
that SM) and is wired to a PCT-based peripheral unit which reports fan and fuse status (such as a
DNU-S), the aisle number represents the aisle of this PCT-based unit.

n = XAIU number.
p = Aisle number of XAIU reporting on a fan or fuse alarm condition.

4. ACTIONS TO BE TAKEN

For an ALM AUTOINH CLEAR or ALM CLEAR, no action need be taken.

For an ALM, investigate the cause of the alarm and take corrective action.

For an ALM AUTOINH, investigate the cause of the chattering input.
For an ALM ERROR, check for:
- Open or shorted input to the scan point on one input.
- Malfunctioning metallic service unit (MSU) scan board.
- Alarm input is wired incorrectly. For an ALM SCAN PTS UNREADABLE, both the MSU service groups are being reported out-of-service. Investigate the cause of the alarm and take corrective action.

5. ALARMS

Critical, major, or minor as assigned. An ALM ERROR or ALM AUTOINH will be reported at the same alarm level as an ALM.

2. REASON FOR OUTPUT
To report changes in alarm scan point states, according to type.

Format 1 is for the communications module (CM) and the administrative module (AM).

Format 2 reports changes in fan, fuse, and power status of switching module (SM) units.

Format 3 is for remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) alarms and is available only in an RSM, ORM or TRM that has the alarm input option.

Format 4 is for remote peripheral alarm scan points.

Format 5 is for remote alarm section (RAS) scan points.

Format 6 is for multiplexed access interface unit (XAIU) fan and fuse alarm scan points.

3. VARIABLE FIELD DEFINITIONS

a  = Alarm status. Valid value(s):
AUTOINH  = Reporting is automatically inhibited because a possible chattering scan point input has been detected.
AUTOINH CLEAR = Reporting on a scan point that was previously automatically inhibited is now allowed.
CLEAR  = Normal state (unalarmed).
ERROR  = A discrepancy exists between duplex scan point states.
SCAN PTS UNREADABLE = Scan points are unreadable.
b  = Alarm type. Valid value(s):
   ASMC  CAB  FS  = ASMC cabinet fuse.
   BPSC          = Building/power IOP scan point.
   CM          = Communications module.
   CNI          = Common network interface.
   ESM          = External sanity monitor.
   MISC          = Miscellaneous IOP scan point.
   MSGS          = Message switch.
   ONTC          = Office network and timing complex.
   SCSDC          = Scanner and signal distributor controller.
   TMS          = Time-multiplexed switch.

c  = Unit or scan point number. If 'b' is CM, CNI or ESM, 'c' is null.

d  = Alarm name (or tag)- fixed or office assignable character string that identifies the particular scan
   point. Valid value(s):

   NOTE: The word in square brackets is not part of the variable 'd'. It may be a keyword in one of the
   five formats as shown or it may be a part of one or more other variables.

   ALM BAT          = Alarm battery.
   BAT LOW VLTG = Low voltage on battery.
   [CM]  FAN          = Communications module fan alarm.
   [CM 0] FUSE          = Communications module 0 fuse alarm.
   [CM 1] FUSE          = Communications module 1 fuse alarm.
   [CNI]  FAN ALM = Common network interface fan alarm.
   [CNI]/DFA FUSE = Common network interface/digital facility access fuse alarm.
   CO BAT DSCHG = Central office (CO) battery discharged.
   COM PWR FAIL = Commercial power failure.
   DISCH FUSE = Discharge fuse alarm.
   [ESM]  POWER = External sanity monitor power alarm.
   FIRE          = Fire alarm.
   FIR ALM TBL = Fire alarm trouble.
   FS PDF0          = Power distribution frame 0 fuse alarm.
   FS PDF1          = Power distribution frame 1 fuse alarm.
   FS PDF2          = Power distribution frame 2 fuse alarm.
   FS PDF3          = Power distribution frame 3 fuse alarm.
   FS PDF4          = Power distribution frame 4 fuse alarm.
   FS PDF5          = Power distribution frame 5 fuse alarm.
   FS PDF6          = Power distribution frame 6 fuse alarm.
   FS PDF7          = Power distribution frame 7 fuse alarm.
   HIGH VOLTAGE = High voltage alarm.
   INV FAIL = Inverter failure.
   INV XFER = Inverter transfer.
   [MISC]  FR FAN = Miscellaneous frame fan alarm.
   [MISC]  FR FS0 = Miscellaneous frame fuse 0 alarm.
   [MISC]  FR FS1 = Miscellaneous frame fuse 1 alarm.
   [MISC]  PWR = Miscellaneous power source alarm.
   [MSGS0]  FAN FS = Message switch 0 fan fuse alarm.
   [MSGS0]  FANALM = Message switch 0 fan alarm.
   [MSGS1]  FAN FS = Message switch 1 fan fuse alarm.
[MSGS1] FANALM = Message switch 1 fan alarm.
[ONTC0] FAN FS = Office and network timing complex 0 fan fuse alarm.
[ONTC0] FANALM = Office and network timing complex 0 fan alarm.
[ONTC1] FAN FS = Office and network timing complex 1 fan fuse alarm.
[ONTC1] FANALM = Office and network timing complex 1 fan alarm.

RECT FAIL = Rectifier failure.
STBYPLT FAIL = Standby plant failure.
STBYPLT FUEL = Standby plant out of fuel.
STBYPLT OPER = Standby plant operation alarm.
STBYPLT RECT = Standby plant rectifier alarm.

[TMS0] FAN FS = Time multiplexed switch 0 fan fuse alarm.
[TMS0] FANALM = Time multiplexed switch 0 fan alarm.
[TMS1] FAN FS = Time multiplexed switch 1 fan fuse alarm.
[TMS1] FANALM = Time multiplexed switch 1 fan alarm.

= Alarm scan point name. Valid value(s):

FAN
PERIPHERY FS
PWR
PWR SW FAIL

= Switching module (SM) number.

= Side number (0 or 1).

= Module control unit identifier. Valid value(s):

ALARM STATUS CIRCUIT
PWR BUS0
PWR BUS1
REMOTE ALARM UNIT

= Remote building/power MSU scan point (RBPSC) number or RAS scan point number.

= Remote peripheral unit number.

= Remote peripheral site number.

= Alarm scan point name. Valid value(s):

BATTERY = Battery alarm.
CABINET FAN = Cabinet fan alarm.
CABINET FUSE = Cabinet fuse alarm.
POWER = Power alarm.
SCPT0 = Miscellaneous scan point 0.
SCPT1 = Miscellaneous scan point 1.
SCPT2 = Miscellaneous scan point 2.
SCPT3 = Miscellaneous scan point 3.
SCPT4 = Miscellaneous scan point 4.
SCPT5 = Miscellaneous scan point 5.
m = Aisle number for SM fan or fuse report. If the fan unit or fuse bus is physically wired to scan points at the switching module controller (SMC) cabinet, the aisle number is that of the SMC. If the cabinet housing the fan or fuse is remotely located (not in the same cabinet lineup as the SMC cabinet for that SM) and is wired to a PCT-based peripheral unit which reports fan and fuse status (such as a DNU-S), the aisle number represents the aisle of this PCT-based unit.

n = XAIU number.

p = Aisle number of XAIU reporting on a fan or fuse alarm condition.

q = Subunit XCDU or OXU. Valid value(s):

- XCDU1
- XCDU2
- XCDU3
- XCDU4
- XCDU5
- XCDU6
- XCDU7
- XCDU8
- OXU1
- OXU2
- OXU3
- OXU4
- OXU5
- OXU6
- OXU7
- OXU8

4. ACTIONS TO BE TAKEN

For an ALM AUTOINH CLEAR or ALM CLEAR, no action need be taken.

For an ALM, investigate the cause of the alarm and take corrective action.

For an ALM AUTOINH, investigate the cause of the chattering input.

For an ALM ERROR, check for:

- Open or shorted input to the scan point on one input.
- Malfunctioning metallic service unit (MSU) scan board.
- Alarm input is wired incorrectly.

For an ALM SCAN PTS UNREADABLE, both the MSU service groups are being reported out-of-service. Investigate the cause of the alarm and take corrective action.

5. ALARMS

Critical, major, or minor as assigned. An ALM ERROR or ALM AUTOINH will be reported at the same alarm level as an ALM.

Software Release: 5E14 and later
Message Class: BPSC
Application: 5
Type: Output

1. FORMAT

REPT ALM [CLR] MISC g SPN=a-b-c-d-e [f]

2. REASON FOR OUTPUT

To report a state change of a metallic service unit (MSU) scan point (SPN).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = MSU or modular MSU (MMSU) number.
c = Service group.
d = Slot number.
e = Scan point number.
f = Optional facility name or alarm text string.
g = Unit type - MSU or MMSU.

4. ACTIONS TO BE TAKEN

Report alarm conditions to appropriate local maintenance personnel.

5. ALARMS

Major or minor.

6. REFERENCES

Other Manual(s):

REPT:ALM-ST-RBPSC
Software Release: 5E14 and later
Message Class: BPSC
Application: 5
Type: Output

1. FORMAT
REPT ALM STATUS RBPSC a SM b

2. REASON FOR OUTPUT
To report an undesirable state of the remote alarm process. Normally this is due to the alarm scan boards in both metallic service unit (MSU) service groups' being unavailable, so that no building, power, or miscellaneous alarms can be monitored. This message is available only in a multimodule remote switching module (RSM) that has the alarm input option.

3. VARIABLE FIELD DEFINITIONS
a = Explanation of the perceived problem.
b = Switching module (SM) number.

4. ACTION TO BE TAKEN
Investigate and correct the problem (normally returning at least one metallic service unit (MSU) service group (SG) to service).

5. ALARMS
Major.

Type: Output

1. FORMAT

[1] REPT ALMMDE=a RBPSC SM=b
__________________________________________________________________
[2] REPT ALMMDE=a RAS SITE=c
__________________________________________________________________

2. REASON FOR OUTPUT

To report a change in the alarm retire mode (ALMMDE) at a remote site. Format 1 is for remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) sites that have the alarm output option. Format 2 is for remote peripheral sites equipped with a remote alarm section (RAS). This message is generated when the alarm retire mode switch on the remote alarm and status panel has been manually depressed.

3. VARIABLE FIELD DEFINITIONS

a = Alarm retire mode selected. Valid values are:
AUTO = Automatic retire mode. Audible alarms will retire automatically in five seconds to five minutes or when manually retired—whichever occurs first.
MAN = Manual retire mode. Audible alarms will sound until manually retired by pressing the alarm retire button on the remote alarm and status panel.

b = Switching module (SM) number.

c = Remote peripheral site number.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

REPT:AMA-CONFIG

Software Release: 5E14 and later
Message Class: AMA
Application: 5
Type: Output

1. FORMAT

[1] REPT AMA CONFIG FILE
STREAM INDICATOR INVALID OR MISSING

[2] REPT AMA CONFIG FILE FOR STREAM a
   b

[3] REPT AMA CONFIG FILE FOR STREAM a
   RETRY EQUIP/UNEQUIP REQUEST LATER
   c

[4] REPT AMA CONFIG FILE FOR STREAM a
   NUMBER OF EQUIPPED PARTITIONS d
   TOTAL NUMBER OF AMA BLOCKS e
   [ f g h ]

2. REASON FOR OUTPUT

To provide responses to either the OP:AMA-CONFIG or the SET:AMA-CONFIG input message, and to report problems, if any, with the configuration file.

If Format 1 is printed, either ST1 or ST2 should be included in the input message.

If Format 2 is printed, the status message indicated by 'b' occurred while the input message was being executed.

If Format 3 is printed, the error indicated by 'c' occurred while the input message was being executed.

If Format 4 is printed, the partition has been successfully equipped or unequipped.

Note: After this message is displayed, make backup tapes to prevent loss of the updated automatic message accounting (AMA) configuration files in the event of a reload from tape.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = ST1 data stream.
   ST2 = ST2 data stream.

b = Text phrase indicating the outcome of the operation requested by either the OP:AMA-CONFIG or SET:AMA-CONFIG input message. Refer to the ACTION TO BE TAKEN section.

c = Text phrase indicating why the EQUIP or UNEQUIP request must be tried again at a later time.
Refer to the ACTION TO BE TAKEN section.

d = Number of AMA partitions equipped for this stream.

e = Total number of AMA blocks for this stream.

f = AMA partition number.

g = AMA partition file name.

h = Number of AMA blocks in this partition.

4. ACTION TO BE TAKEN

If Format 1 is printed, the SET:AMA-CONFIG message should be tried again, and either ST1 or ST2 should be specified, depending on which AMA data stream the user wishes to set.

For Format 2,

<table>
<thead>
<tr>
<th>If ’b’ =</th>

<td>ST1 CONFIG FILE COULD NOT BE WRITTEN</td>
<td>Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
</tbody>
</table>
For Format 4, no action is required.

5. ALARMS

This message itself does not cause any alarms, but is accompanied by critical and minor alarmed messages from the AMA diskwriter. The purpose of these alarms is to alert the user that the AMA diskwriter has been killed as a result of the SET:AMA:CONFIG input message. Since killing the AMA diskwriter may result in a delay in writing AMA data to the disk, the user must be notified. The diskwriter is killed because it must immediately reinitialize on the new disk maps created by the change in the configuration files. If it were not killed, the resulting delay in initialization could cause primary data to be lost. As a result of killing and restarting the diskwriter, PRMs are also generated.

[2] REPT AMA CONTROL FILE AUDIT FOR STREAM a
   AMA CONTROL FILE COULD NOT BE (OPENED|READ)

[3] REPT AMA CONTROL FILE AUDIT FOR STREAM a
   TEMPORARY FILE COULD NOT BE CREATED

2. REASON FOR OUTPUT

To indicate the state of the automatic message accounting (AMA) control file after its audit has been run (Format 1), that the control file could not be opened or read (Format 2), or that the system could not allocate a temporary file to print the audit results (Format 3).

3. VARIABLE FIELD DEFINITIONS

OPENED = Control file could not be opened.
READ = Control file could not be read.
a
   = Data stream. Valid value(s):
   ST1 = Indicates the control file data is for the ST1 data stream.
   ST2 = Indicates the control file data is for the ST2 data stream.
b = Office ID.
c = Number of days until the tape expires.
d = Start time in hours and minutes for automatic tape writing or teleprocessing.
e = Stop time in hours and minutes for automatic tape writing or teleprocessing.
f = Default tape drive for the AMA function.
g = The AMA option that is in effect.
h = Indication of whether AMA data transfer sessions have been manually inhibited.
i = Automatic message accounting teleprocessing (AMAT) password.
j = Host collector (HOC) password.
k = Backup HOC password.
l = Password of the last HOC that polled this AMAT.
m = Indicates whether or not a tape writing or verification session is currently in progress.
n = Indicates whether or not a teleprocessing session is currently in progress.
o = Indicates whether or not automatic tape writing has been inhibited by the INH:AMA-AUTOST input message.
p = Percent of current AMA disk space occupancy.
q = Next AMA tape sequence number.
r = Data set ID used by the revenue accounting office (RAO).

4. ACTIONS TO BE TAKEN

For Format 1, examine the values that the audit assigned to the fields in the control file. If any values need to be corrected, use the input messages listed under References.

If Format 2 prints, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

If Format 3 prints, use the OP:AMA-CONTROLF input message to check the contents of the control file. If any of the values are invalid, correct them using the input messages listed under References.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the current state of the automatic message accounting (AMA) control file (Format 1). Format 2 indicates that the system could not allocate a temporary file to print the control file information.

Formats 3, 4, 5, 6, and 7 print in response to input message SET:AMA-CONTROL and indicate that the user made an error while entering that input message.

3. VARIABLE FIELD DEFINITIONS

a  = Data stream. Valid value(s):
    ST1 = Indicates the control file data is for the ST1 data stream.
    ST2 = Indicates the control file data is for the ST2 data stream.

b  = Office identification.

c  = Number of days until tape expires.

d  = Start time in hours and minutes for automatic tape writing or teleprocessing.

e  = Stop time in hours and minutes for automatic tape writing or teleprocessing.

f  = Default tape drive for AMA function.

g  = Indicates the option in effect.

h  = Indicates whether or not the AMA data transfer sessions have been manually inhibited by the INH:AMA-SESSION input message.

i  = AMA teleprocessing (AMAT) password.

j  = Host collector (HOC) password.

k  = Backup HOC password.

l  = Password of last HOC that polled this AMAT.

m  = Indicates whether or not a tape writing or verification session is currently in progress.

n  = Indicates whether or not a teleprocessing session is currently in progress.

o  = Indicates whether or not automatic tape writing has been inhibited by the INH:AMA-AUTOST input message.

p  = Next AMA tape sequence number.

q  = Data set ID used by the revenue accounting office (RAO).

4. ACTIONS TO BE TAKEN

If Format 1 is output, take no action.

If Format 2 is output, re-enter the OP:AMA-CONTROLF input message.
If Formats 3, 4, 5, or 6 are output, re-enter input message SET:AMA-CONTROL.

If Format 7 is output, set field 45, "AMADNS ACTIVE" on RC/V view 8.1 to "Y" and re-enter input message SET:AMA-CONTROL.

5. ALARMS

None.

__________________________________________________________________

[2] REPT AMA CRITICAL ALARM DOWNGRADED TO A MINOR ALARM FOR STREAM a
   DISK IS b% FULL

__________________________________________________________________

2. REASON FOR OUTPUT

If Format 1 is printed, this reports that automatic message accounting (AMA) disk space occupancy has dropped to between the percentages indicated by the MAJ AMA ALRM value minus 1 inclusive and CRIT AMA ALRM value minus 1 on RC/V view 8.1. A major alarm is sounded.

If Format 2 is printed, this reports that AMA disk space occupancy has dropped to between the percentages indicated by the MIN AMA ALRM value minus 1 inclusive and MAJ AMA ALRM value minus 1 on RC/V view 8.1. A minor alarm is sounded.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = The information is for the ST1 data stream.
   ST2 = The information is for the ST2 data stream.

b = Percent of disk space occupancy.

   FBO: m  LBO: n  FBS: o  LBS: p

[2] REPT AMA DISK MAPS FOR STREAM a
   q

[3] REPT AMA DISK MAPS FOR STREAM a
   GLOBAL MAP NOT AVAILABLE

[4] REPT AMA DISK MAPS FOR STREAM a
   WRITE PARTITION b READ PARTITION c
   PARTITION d DISK MAP r

2. REASON FOR OUTPUT

To respond to input message OP:AMA-MAPS, which prints the contents of the disk maps for all partitions and prints the contents of the global maps for each stream.

Format 1; indicates the status of the global and disk maps.

Format 2; is used to indicate that the system could not create a temporary file to print the outcome of the verification process, or the configuration file used to obtain a list of partitions to search for disk maps could not be opened or read.

Format 3; is used to indicate that the global map file used to identify the read and write partitions could not be opened or read.

Format 4; is used when the partition from which the disk map is being read cannot be opened or read.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = Indicates that the information is for the ST1 data stream.
   ST2 = Indicates that the information is for the ST2 data stream.

b = Partition number in which the disk writer will write AMA data.

c = Partition number from which AMA data will be taken during a teleprocessing or tape session.
\(d\) = Partition number from which the disk map is read.

Note: Offsets are measured in disk blocks from the beginning of the partition. Each disk block is 512 bytes in size.

Note: Sequence numbers are at the corresponding AMA block taken from the disk map. Each AMA block is 1536 bytes in size.

e = First primary offset (FPO).

f = Last primary offset (LPO).

g = First primary sequence (FPS) number.

h = Last primary sequence (LPS) number.

i = First secondary offset (FSO).

j = Last secondary offset (LSO).

k = First secondary sequence (FSS) number.

l = Last secondary sequence (LSS) number.

m = First block offset (FBO).

n = Last block offset (LBO).

o = First block sequence (FBS) number.

p = Last block sequence (LBS) number.

q = Reason the contents of the disk maps could not be output. Valid value(s):

```
COULD NOT OPEN CONFIGURATION FILE
COULD NOT READ CONFIGURATION FILE
TEMPORARY FILE COULD NOT BE CREATED
```

r = Reason why the disk map cannot be opened or read. Valid value(s):

```
UNAVAILABLE
NOT READABLE
```

4. ACTION TO BE TAKEN

Format 1 requires no action. If Formats 2, 3, and 4 occur repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

[7] REPT AMA DISK READER FOR STREAM a
   k

2. REASON FOR OUTPUT

To report that an automatic message accounting (AMA) block is out of sequence and to report the disposition of the block. This message also reports problems with assigning or rvtoc and special AMA files for moving head disks (MHDs) during AMA offline sessions for software transitions.

3. VARIABLE FIELD DEFINITIONS
a = Data stream. Valid value(s):
   ST1 = Indicates that the information is for the ST1 data stream.
   ST2 = Indicates that the information is for the ST2 data stream.

b = The partition number in which the error occurred.

c = Sequence number which is being ignored.

d = Type of data area being processed by the disk reader when an error occurred. Valid value(s):
   PRIMARY
   SECONDARY

e = Sequence number where disk reader started to read primary data.

f = Sequence number where disk reader finished reading primary data.

g = For software transitions, the even MHD that could not be assigned or released when the offline disks are being read on the new generic release.

h = For software transitions, the AMA partition on the even MHD that could not be assigned or released, when the offline disks are being read on the new generic release.

i = For software transitions, the pointer file to the AMA partition on the even MHD, that could not be assigned or released when the offline disks are being read on the new generic release.

j = For software transitions, the RTR error reported for the pointer file to the AMA partition on the even MHD that could not be assigned or released when the offline disks are being read on the new generic release.

k = Error message that occurs when an incorrect sequence number block is read in from either the even or odd MHD that the current AMA read partition is located on. This message only occurs following a message of format type 1 when a read has failed a sequence number check. This message is only printed once on the first failed attempt for given set of blocks read in. Valid value(s):
   DETECTING SEQUENCE NUMBER MISMATCH - RETRYING

4. ACTIONS TO BE TAKEN

The quantity of out-of-sequence messages is defined in Administration and Engineering Guidelines manual.

When the message(s) for releasing or assigning the offline rvtoc file is seen during software transitions, look in the /dev directory for files of the form rvtocx. These files should have been created during the software transitions, and backout in software transitions is necessary if they don’t exist when the offline AMA process accesses them. This should be a very rare occurrence, and if it did happen, there is a problem with the overall process for software transitions that creates these files.

If the device does not exist message is reported for software transitions, this is not a problem. This means the pointer files /tmp/amax which allow access to the offline AMA partitions and are created by the AMA offline process already exist, and are being removed and recreated. This should not interfere with the oncoming offline AMA process, and the offline AMA data should be readable off disk.
If the AMA files (/tmp/amax) could not be created message is reported for software transitions, then backout in software transitions is necessary. This should be a very rare occurrence, and if it did happen, there is a problem with the overall process for software transitions that creates these files.

5. ALARMS

None.

1. FORMAT

REPT AMA DISK STORAGE IS a% FULL FOR STREAM b

2. REASON FOR OUTPUT

To report the potential loss of billing data. A major, minor, or critical alarm may accompany this message.

3. VARIABLE FIELD DEFINITIONS

a = Percentage of automatic message accounting (AMA) disk space occupied by primary data.
Note: If 'a' is between the minor AMA alarm value (inclusive) and the major AMA alarm value, a minor alarm occurs. If 'a' is between the major AMA alarm value inclusive and the critical AMA alarm value, a major alarm occurs. If 'a' is greater than or equal to the critical AMA alarm value, a critical alarm occurs.

The minor AMA alarm, major AMA alarm, and the critical AMA alarm appear as parameters on recent change (RC) View 8.1 (MINAMAALRM, MAJAMAALRM and CRITAMAALRM).

b = Data stream. Valid value(s):
   ST1 = Indicates that the information is for the ST1 data stream.
   ST2 = Indicates that the information is for the ST2 data stream.

4. ACTION TO BE TAKEN

Notify personnel at the host collector (HOC) immediately. Poll the switch AMAT as soon as possible to avoid the loss of AMA data.

5. ALARMS

Major.
Minor.
Critical.

[8] REPT AMA DISK SUMMARY FOR STREAM a
2. REASON FOR OUTPUT

To report the amount of automatic message accounting (AMA) disk space currently occupied by the primary AMA records. In addition, the message also reports the number of primary AMA blocks in use on the disk. This message prints in response to the OP:AMA-DISK input message. An additional message possibly accompanied by an alarm will be printed in the event a change to the alarm levels in recent change (RC) caused a change in alarm status.

If Format 1 is printed, then only the amount of AMA disk space currently occupied by the primary AMA records is printed. No change in alarm status occurred.

If Format 2 is printed, then the amount of AMA space currently occupied by the primary AMA records is printed. A similar message is printed again to report the percentage occupancy of billing data on disk, if alarm status has changed. A major, minor, or critical alarm will accompany this message. This message is printed because a change to the alarm levels caused a change in alarm status.

If Format 3 is printed, then the amount of AMA disk space currently occupied by the primary AMA records is printed. The second message reports that the AMA disk space occupancy has dropped to between the percentages indicated by the MAJ AMA ALRM minus 1 inclusive and CRIT AMA ALRM value minus 1 on RC view 8.1. A major alarm is sounded. This message is printed because a change to the alarm levels in RC caused a change in alarm status.
If Format 4 is printed, then the amount of AMA disk space currently occupied by the primary AMA records is printed. The second message reports that the AMA disk space occupancy has dropped to between the percentages indicated by the MIN AMA ALRM value minus 1 inclusive and MAJ AMA ALRM value minus 1 on RC view 8.1. A minor alarm is sounded. This message is printed because a change to the alarm levels in RC caused a change in alarm status. In this case, the previous alarm status was critical.

If Format 5 is printed, then the amount of AMA disk space currently occupied by the primary AMA records is printed. The second message reports that the AMA disk space occupancy has dropped to between the percentages indicated by the MIN AMA ALRM value minus 1 inclusive and MAJ AMA ALRM value minus 1 on RC view 8.1. A minor alarm is sounded. This message is printed because a change to the alarm levels in RC caused a change in alarm status. In this case, the previous alarm status was critical.

If Format 6 is printed, then the amount of AMA disk space currently occupied by the primary AMA records is printed. The second message reports that the AMA disk space occupancy has dropped below the percentage indicated by the MIN AMA ALRM value minus 1 on RC view 8.1. A minor alarm is sounded. This message is printed because a change to the alarm levels in RC caused a change in alarm status. In this case, the previous alarm status was minor.

If Format 7 is printed, then the amount of AMA disk space currently occupied by the primary AMA records is printed. The second message reports that the AMA disk space occupancy has dropped to below the percentage indicated by the MIN AMA ALRM value minus 1 on RC view 8.1. This message is printed because a change to the alarm levels in RC caused a change in alarm status.

If Format 8 is printed, then contact with the AMonitor process failed and primary disk storage capacity was not determined. The user should retry the command later to obtain this information.

If Format 9 is printed, then during transitions when the offline disks are being accessed, the global map file for the old software release could not be opened.

If Format 10 is printed, then during transitions when the offline disks are being accessed, the global map file for the old software release could not be read.

If Format 11 is printed, then during transitions when the offline disks are being accessed, the configuration file for the old software release could not be opened.

If Format 12 is printed, then during transitions when the offline disks are being accessed, the configuration file for the old software release could not be read.

If Format 13 is printed, then during software transitions on the new software release prior to the point where the disks are being accessed in an offline AMA session, the percent and number of blocks on disk could not be determined.

If Format 14 is printed, then after software transitions on the new software release there is no more AMA data on the offline side and the AMA process has been transitioned to the active online side. In this case, both the 'b' and 'c' values should be zero.

If Format 15 is printed, then the system could not allocate a temporary file to print the disk summary information.

3. VARIABLE FIELD DEFINITIONS

\[ a \]

= Data stream. Valid value(s):
\[ \text{ST1} \quad \text{Indicates that the information is for the ST1 data stream.} \]
\[ \text{ST2} \quad \text{Indicates that the information is for the ST2 data stream.} \]

\[ b \]

= Percentage of disk space occupied by primary AMA records. The true occupancy of the disk is
between 'b' and ('b'+1)%). Therefore, if 0% is displayed, there may be primary data on the disk. To permit the positioning of pointer values, the last block of primary data cannot be read at this time.

\[ \text{c} \]

\[ \text{Number of primary AMA blocks in use for the stream. Since data is being written continuously to the disk, and since the AMA pointer values change frequently, this number may overstate the actual number of primary AMA blocks in use on the disk at the time this message is printed.} \]

4. ACTIONS TO BE TAKEN

If Format 9 or 10 is generated, then the backup copy of the global maps in /database/amabfiles needs to be copied into the primary global map location in /database/amafiles. The global map files are ogmfile for stream ST1 and igmfile for stream ST2. If Format 11 or 12 is generated, then the backup copy of the old generic config files in /database/amabfiles needs to be copied into the primary old generic config file locations in /database/amafiles. The old generic config files are config1.oc for stream ST1 and config1.ic for stream ST2. If the configuration file cannot be opened or read, or the global map cannot be open or read, then backout in software transitions will be necessary if both the primary and backup copies of these files are corrupted. This should be a very rare occurrence and if it did happen, there is a problem with the overall process for software transitions that copies files with information about the old release over to the new release. If Format 8 or 13 is generated several times in succession, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

1. FORMAT

[1] REPT AMA DISK WRITER FOR STREAM a INITIALIZATION COMPLETE
__________________________________________________________________

[2] REPT AMA DISK WRITER FOR STREAM a ERROR CODE b [c|d]  
__________________________________________________________________

[3] REPT AMA DISK WRITER FOR STREAM a TERMINATION CODE e
   DISK WRITER IS WAITING f {MINUTES|SECONDS} TO TERMINATE THEN RETRY
__________________________________________________________________

[4] REPT AMA DISK WRITER FOR STREAM a FAULT CODE g [VIRT ADDR h]
__________________________________________________________________

[5] REPT AMA DISK WRITER FOR STREAM a
   RECORDING TO DISK {SUSPENDED|RESUMED}
__________________________________________________________________

2. REASON FOR OUTPUT

To report an automatic message accounting (AMA) disk writer related software error or status condition.
Format 1 indicates that the disk writer has completed its initialization sequence and is resuming normal operations.
Format 2 indicates that an error or status condition occurred while the disk writer was either initializing or executing.
Format 3 indicates the event that caused the disk writer to terminate itself.
Format 4 indicates that the disk writer has been notified that a fault has occurred in the system. This happens when
either the disk writer or another UNIX® RTR kernel process performs an invalid operation, which results in a fault.
Format 5 indicates the disk writer’s progress in writing AMA data to the disk. The ‘SUSPENDED’ message indicates
that the disk writer is no longer writing AMA data to the disk. A Format 3 message is printed immediately following
this message identifying the termination code. The ‘RESUMED’ message indicates that the disk writer has initialized
and has resumed recording AMA data to disk.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = The information printed is for the ST1 data stream.
   ST2 = The information printed is for the ST2 data stream.

b = Disk writer error code. Valid value(s):
   1 = Unexpected event.
   2 = Unexpected message.
   3 = Unused.
   4 = Primary copy of disk map corrupted.
= Unused.
6 = Both copies of disk map corrupted - map initialized.
7 = Message buffer allocation failure.
8 = ioqueuem failure.
9 = Failed to attach the equipment configuration database (ECD).
10 = Failed to release the ECD.
11 = Failed to read a ucb form from the ECD.
12 = Failed to read eaiopt form from the ECD.
13 = Failed to read an mdct form from the ECD.
14 = FM_STAT message failed for a partition.
15 = Couldn't read disk map for a partition, or a read failed during the binary search.
16 = Couldn't write disk map for a partition.
17 = Couldn't write data from shared data segment buffer.
18 = Couldn't open configuration file.
19 = Couldn't read configuration file.
20 = Configuration file audit failed.
25 = Global map audit failed.
27 = No partitions equipped in configuration file.
28 = Configuration file has been changed - make a backup.
29 = Size of partition was changed.
30 = No partitions are available due to out of service disks.
31 = Partition is unavailable - cannot change size.
33 = Couldn't create configuration file.
34 = Couldn't write configuration file.
35 = Couldn't close configuration file.
36 = Couldn't read volume table of contents (VTOC) file.
37 = Couldn't close VTOC file.

c = Partition number in which the error occurred.

d = Type of map or file. Valid value(s):
BKUP = An error occurred during processing of the backup copy of the map or file.
PRIM = An error occurred during processing of the primary copy of the map or file.

e = Disk writer termination code. Valid value(s):
1 = Port connection failure.
2 = Termination request from other process.
3 = Disk writer was faulted when it was initializing.
4 = Disk writer was faulted during its internal audit.
5 = Disk writer was faulted when it was running.
6 = Disk writer memory corruption.
8 = Too many unexpected faults.
9 = IOBADMSG returned from the disk drive.
10 = FLT_BADOST returned from the disk drive.
11 = BADPORT returned from a kportid() function call.
21 = Sanity check failure.
22 = No usable configuration file.
23 = Audit of the global AMA option (GLAMAOPT) indicates that the disk writer should not be running.
101 = Too many type 1 errors, refer to variable 'b'.
102 = Too many type 2 errors, refer to variable 'b'.
103 = Too many type 3 errors, refer to variable 'b'.
104 = Too many type 4 errors, refer to variable 'b'.
105 = Too many type 5 errors, refer to variable 'b'.
106 = Too many type 6 errors, refer to variable 'b'.
107 = Too many type 7 errors, refer to variable 'b'.
108 = Too many type 8 errors, refer to variable 'b'.

f = Amount of time the disk writer is disabled before termination after which the application integrity monitor (AIM) will recreate the process immediately.

g = Hexadecimal number representing the fault code of the disk writer. Refer to the APP:DFC-I appendix in the Appendixes section of the Output Messages manual.

h = Hexadecimal number representing the virtual address of the instruction the disk writer was executing at the time the fault occurred.

### 4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'b' =</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 2, 4, 7, or 8-14</td>
<td>If problem occurs more than once, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>6</td>
<td>If the system is not restarted from backup disk, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>15, 16, or 17</td>
<td>VTOC or moving head disk (MHD) duplex failure has occurred in the system. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>18, 19, or 20</td>
<td>The configuration file was corrupted or destroyed. It should be repaired using the SET:AMA-CONFIG input message.</td>
</tr>
<tr>
<td>25</td>
<td>No action is necessary. The disk writer initializes itself.</td>
</tr>
<tr>
<td>27</td>
<td>The disk writer is inoperative for this stream until the SET:AMA-CONFIG message is used to equip a partition for this stream.</td>
</tr>
<tr>
<td>28 or 29</td>
<td>Backup tapes should be made.</td>
</tr>
<tr>
<td>30</td>
<td>Repair the MHDs indicated to be out of service.</td>
</tr>
<tr>
<td>31</td>
<td>Determine whether the indicated partition is valid, and unequip it if it is unusable.</td>
</tr>
<tr>
<td>33, 34, 35, 36, or 37</td>
<td>This indicates an internal error, which should be reported to your support organization.</td>
</tr>
</tbody>
</table>

If a Format 5 message is printed which indicates that the disk writer has suspended writing to disk, wait for the Format 3 message and take appropriate action for that termination code. If the 'SUSPENDED' message is not followed by the 'RESUMED' message within five minutes, re-initialize the disk writer, using the INIT:AM-FPI input message.

### 5. ALARMS

Error code 6 causes a minor alarm.

Termination codes as well as the Format 5 message, which indicates that the disk writer has suspended writing to disk, will cause critical alarms.

REPT:AMA-DISKSD

Software Release: 5E14 and later
Message Class: AMA
Application: 5
Type: Output

1. FORMAT

REPT AMA DISKSDS FOR STREAM a
   ALL THREE SDS SUBSEMENTS ARE FULL
   F5    UNABLE TO WRITE TO DISK

2. REASON FOR OUTPUT

To report that automatic message accounting (AMA) data cannot be written to disk. A critical alarm will first sound when all three shared data segment (SDS) subsegments become full, provided the AMA disk writer and monitor process are operational. When the AMA disk writer is non-operational, the alarm will sound within 10 minutes of when the SDS subsegments first become full. In both cases (disk writer and monitor process operational or disk writer process non-operational) the alarm will sound at or within every 10 minutes thereafter, while the condition is in effect. When the monitor process is down, it will only print out (and the alarm sound) when the /database partitions are mounted read-only. In this last case, the alarm will sound within 30 seconds of when the SDS subsegments first become full, and every 10 minutes thereafter. The above message will not print out, nor the alarm sound during disk independent operation (DIOP).

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = ST1 data stream.
   ST2 = ST2 data stream.

4. ACTION TO BE TAKEN

If the disk writer is non-operational, try initializing the disk writer using the INIT:AM-FPI input message. If the AMA partitions are full, set up a teleprocessing/tape session to read the data off the disk, and/or equip more AMA partitions. The OP:AMA-DISK command can be used to determine if the disks are full or not. If the /database partitions are mounted read only, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

In all cases, preventive action is necessary, because the risk of losing AMA data is highly likely in this situation. The SM buffers will store some of the data while the SDS subsegments are full, but eventually, they themselves become full. The status of the SDS subsegments is output by the OP:AMA-STATUS input message.

This condition may occur when the disk writer becomes non-operational, when the AMA partitions become full, or when the /database partitions are mounted in the read only state. There are also other situations where the SDS subsegments can become full.

If none of these cases apply, then refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

Critical.

2. REASON FOR OUTPUT

To print the last 7 days of automatic message accounting (AMA) maintenance data in response to the
OP:AMA-MAINT input message, and to report problems, if any, with the AMA maintenance file.

If Format 1 is printed, the error message indicated by 'b' occurred while the input message was being executed.

If Formats 2 or 3 are printed, the AMA maintenance data has been successfully printed. Format 3 will only be
printed if AMA data networking services processing is active.

Note: For Format 2, the counts in the Data Link Control section (variables 'g' through 'q') will always be
zero. The OP:LOG,IODRVLOG command can be used to diagnose problems that have occurred
with the AMA data link over the past 24 hours.

3. VARIABLE FIELD DEFINITIONS

a = Data stream ID.
b = Text phrase indicating why the AMA maintenance data failed to be printed.
c = Text phrase indicating that less than 7 days of AMA maintenance data will be printed.
d = Office name.
e = Office ID.
f = Date.
g = Number of CRC errors that occurred.
h = Number of data link adapter errors that occurred.
i = Number of level 2 errors that occurred.
j = Number of level 3 errors that occurred.
k = Number of times the T1 timer expired.
l = Number of frames that were transmitted.
m = Number of frames that were received.
n = Number of packets that were transmitted.
o = Number of packets that were received.
= Number of packet time outs that occurred.
q = Audit flag.
r = Number of answered calls.
s = Number of calls where dialing was complete but no answer was received.
t = Number of records written to disk.
u = Number of records sent to the data link.
v = Number of long duration calls in progress.
w = Number of records lost.
x = Number of calls where dialing was complete and AMA treatment was required.
y = Number of records containing mutilated data.
z = Number of minutes that the percentage of primary data on disk equals or exceeds the critical AMA alarm value.
\( a^1 \) = Number of minutes that the percentage of primary data on disk equals or exceeds the major AMA alarm value.
\( b^1 \) = Number of minutes that the percentage of primary data on disk equals or exceeds the minor AMA alarm value.

4. ACTIONS TO BE TAKEN

For Format 1:

<table>
<thead>
<tr>
<th>If ( b = )</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CANNOT OPEN AMA MAINTENANCE FILE FOR READING</td>
<td>If an office has been on the tape option since cutover, then the AMA maintenance file will not exist. Also, while the site file exists during software transitions, the maintenance file cannot be created. Thus, the maintenance file may not exist for up to 24 hours after the site file is removed. Thus, it cannot be opened for reading. Otherwise, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>AMA MAINTENANCE FILE CONTAINS NO RECORDS</td>
<td>Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>TEMPORARY FILE COULD NOT BE CREATED</td>
<td>Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
</tbody>
</table>

For Formats 2 and 3, none.

1. FORMAT

REPT AMA MONITOR FOR STREAM a b
c
d
2. REASON FOR OUTPUT

To report an automatic message accounting (AMA) input message or an event detected by the AMA monitor process.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = The information is for the ST1 data stream.
   ST2 = The information is for the ST2 data stream.

b = Error message. Valid value(s):
   AMA AUTO TAPE SESSION ABORTED = The automatic tape session was not successfully started or was terminated abnormally.
   AMA MAINTENANCE FILE INITIALIZED = The AMA maintenance file could not be opened. A new maintenance file was created and initialized.
   AMA SESSION ABORTED = A tape or teleprocessing session was not successfully started or was terminated abnormally.
   CANNOT CREATE AMA MAINTENANCE FILE = The AMA maintenance file could not be opened and a new file could not be created.
   CONTROL FILE BACKUP FAILED = The memory copy of the AMA control file could not be backed up to disk; if this prints in response to an input message, the most recent change to the control file will probably not be permanent.
   CONTROL FILE CHANGE ABORTED = The control file was not updated because an AMA session was in progress or because the control file was audited.
   CONTROL FILE COULD NOT BE COPIED INTO PAS = During transitions, the disk copy of the control file could not be copied into PAS memory. The control file in PAS is therefore created and initialized with default values.
   CONTROL FILE INITIALIZED = During initialization, the disk copy of the control file did not exist or was unreadable; a new control file was created and initialized with default values.
   COULD NOT ATTACH TO THE ODD = The AMA monitor process was unable to attach to the ODD [the AMA monitor process accesses global recent change (RC) variables and therefore needs to attach to the ODD].
   INIT COMPLETE = The AMA monitor process was successfully started or restarted.
   INIT FAILED = The AMA monitor process was not successfully started or restarted.
   INVALID MESSAGE RECEIVED FROM DISK WRITER = A disk occupancy message from the AMA disk writer process contained garbled information. The disk occupancy information reported by the REPT AMA DISK SUMMARY output message may no longer be accurate.
   SANITY CHECK FAILURE = An internal sanity check failed.
SOME AMA MTC RECORDS UNREADABLE

Some or all of the AMA maintenance file could not be read. Attempt to read maintenance file returned less than 7 full maintenance records. Using the SET:AMA:STREAM input message.

c = Reason for abort or failure. Valid value(s):

2. REASON FOR OUTPUT

To report the current status or result of executing an OP:AMA-SEQ input message.

Format 1 occurs when there are disk blocks on the automatic message accounting (AMA) partitions corresponding to the block sequence number on a given stream. This results in the output of the three disk blocks defined by the corresponding block sequence number. These are the disk block numbers for the block sequence number on the AMA partition.

Format 2 indicates that the system could not create a temporary file to print the outcome of the verification process, or the configuration file used to obtain a list of AMA partitions to search for disk maps that could not be opened or read.

Formats 3 through 10 occur when the block sequence number listed is not found on any AMA partition on a given stream.

Formats 4 through 10 will result if there are any AMA partitions that are unavailable, unreadable, and/or fail audit on the stream, and no disk blocks were found.

Format 3 will result if all AMA partitions are available, readable, and pass audit, and if no disk blocks are found.
Formats 11 and 12 occur when the block is on the AMA partition, but it cannot be read because the AMA partition cannot be opened or read.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Data stream. Valid value(s):
  - **ST1** = Indicates that the information is for the ST1 data stream.
  - **ST2** = Indicates that the information is for the ST2 data stream.

- **b** = The partition number on which the AMA data is found.

- **c** = The block sequence number for which disk blocks are to be found.

- **d** = The first disk block corresponding to the given block sequence number.

- **e** = The second disk block corresponding to the given block sequence number.

- **f** = The third disk block corresponding to the given block sequence number.

- **g** = The first disk block corresponding to the given block sequence number listed in binary coded decimal.

- **h** = The second disk block corresponding to the given block sequence number listed in binary coded decimal.

- **i** = The third disk block corresponding to the given block sequence number listed in binary coded decimal.

- **j** = Reason the contents of the disk maps could not be output. Valid value(s):
  
  - **COULD NOT OPEN CONFIGURATION FILE**
  - **COULD NOT READ CONFIGURATION FILE**
  - **TEMPORARY FILE COULD NOT BE CREATED**

- **k** = List of AMA partition disk maps that are unavailable.

- **l** = List of AMA partition disk maps that are not readable.

- **m** = List of AMA partition disk maps that failed audit.

### 4. ACTION TO BE TAKEN

If there is a sequence number gap on the partition for consecutive blocks on a disk, then execute the OP:AMA-SEQ input message. This type of output should occur very rarely, since the AMA disk writer is designed so that data can be read in sequence block number order either using tape or teleprocessing.

### 5. ALARMS

None.

1. FORMAT

REPT AMA SESSION CONNECT FAILED FOR STREAM a
   REASON b

2. REASON FOR OUTPUT

To report that an automatic message accounting (AMA) teleprocessing session could not be started. A minor alarm is sounded.

3. VARIABLE FIELD DEFINITIONS

   a = Data stream. Valid value(s):
      ST1 = Indicates that the information is for the ST1 data stream.
      ST2 = Indicates that the information is for the ST2 data stream.

   b = Reason for failure. Valid value(s):
      AMAT PORT UNAVAILABLE
      HIGHER LEVEL FAILURE
      INCORRECT PASSWORD
      INVALID SESSION CONNECT MESSAGE
      UNRECOGNIZABLE MESSAGE RECEIVED

4. ACTION TO BE TAKEN

Notify host collector (HOC) personnel if 'a' is INVALID SESSION CONNECT MESSAGE, INCORRECT PASSWORD, or UNRECOGNIZABLE MESSAGE RECEIVED. If the INCORRECT PASSWORD message is received then the HOC password on the 5ESS® switch end does not match the HOC password on the HOC end. The HOC password on the 5ESS® switch end can be set using the HOCPSWD field with the input message SET:AMA-CONTROLF. AMAT PORT UNAVAILABLE is reported either because polling is not allowed between the process start and stop time as listed in REPT:AMA-CONT, or because AMA sessions are inhibited during software transitions when the retrofit site file exists.

5. ALARMS

Minor.

[4] REPT AMA SESSION TERMINATED FOR STREAM a
   TEMPORARY FILE COULD NOT BE CREATED

2. REASON FOR OUTPUT

To report the termination of a teleprocessing session (Format 1 and Format 2 or Format 1 and Format 3). The Format 1 only occurs when the termination is abnormal and is accompanied by a minor alarm. Formats 2 and 3 occur for both normal and abnormal terminations. Format 3 will occur when reading the offline side during software transitions when the percentage of automatic message accounting (AMA) data left on disk is not known. Format 4 indicates that the system could not create a temporary file to print the termination message.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
ST1 = Indicates that the information is for the ST1 data stream.
ST2 = Indicates that the information is for the ST2 data stream.

b = Type of termination. Valid value(s):
ABNORMAL
NORMAL

c = Text phrase that prints if 'b' is ABNORMAL. Valid value(s):
REASON HIGHER LEVEL ERROR = This message is encountered if the disk writer is unable to mark the data just read during a teleprocessing session as secondary data.
REASON HIGHER LEVEL FAILURE = This message is encountered if an AMA teleprocessing session fails for some other reason than a failure to transmit to or from the host collector (HOC) [such as, AMA data link put out-of-service (OOS) from the active state, or the HOC-switch connection is severed]. Also, this failure will occur when a file level message other than file confirm, file reject, file interrupt, poll or repoll is received from the HOC, because of an inability to read or open the testfile transmitted to the HOC by the switch, or an inability to physically read data off disk, or a bad sequence number (AMA block number out of sequence) was encountered more than once, or there is a cabling problem. During software transitions when the retrofit site file exists, this failure reason can also occur if one of the even MHDs being accessed is not offline, an even MHD cannot be accessed even though it is offline, or the prior release config files or the global map files are missing. A higher level failure encompasses the TR385 categories of "Higher Level Failure" and "No Information Available" for abnormal AMA teleprocessing terminations.
REASON MESSAGE NOT ALLOWED = This message is encountered if a file layer or session level message not allowed or not in sequence is encountered. A "Message Not Allowed" encompasses the TR385 categories of "Message Not Allowed", "Data Not Allowed" and "Message Out of Sequence" for abnormal terminations of AMA teleprocessing sessions.
REASON UNRECOGNIZABLE MESSAGE = This message is encountered if a session level or file layer message is in improper format or has an illegal length. It can also be obtained if the test file to be transmitted by the switch cannot be open or read.
REASON TIMEOUT OR ATTEMPT COUNTER REACHED = This message is encountered when, during an AMA teleprocessing session, the switch takes longer than 60 seconds to read or 20 seconds to write a message from the HOC. In addition, it can be obtained if the HOC rejects the session, because the AMA teleprocessing (AMAT) password is invalid (the OP:AMA-CONTROLF input message lists the AMAT password for the stream). The HOC AMAT password needs to be compared with the AMAT password. If they are different corrections need to be made. The first four digits of the password are the stream identifier (0080 for stream 1 or 0081 for stream 2), and the last six digits are the office ID of the particular office being polled. This is set using the OFFICEID field of the SET:AMA-CONTROLF input message. This message can also occur if the HOC does not send the session message confirm message after every fifth block of AMA data is transmitted.

d = Sequence number of the first block transmitted. For secondary data, it is not possible to transmit the oldest 51 blocks of secondary data. Therefore, this number may not reflect the actual first block of secondary data transmitted in the case where the first block falls in this range. To determine the oldest secondary block of data, use OP:AMA-MAPS and determine the FSS from the right side of the maps for the WRITE PARTITION listed at the top of the OP:AMA-MAPS output. This block plus the 50 blocks following cannot be accessed. This is necessary since the oldest secondary AMA
data could be overwritten by primary AMA data while a secondary session is in progress.

- e = Sequence number of the last block transmitted.
- f = Total number of blocks transmitted.
- g = Total number of AMA records transmitted.
- h = Total number of primary polls rejected.
- i = Total number of secondary polls rejected.
- j = Percentage of primary data remaining on disk.
- k = Start month.
- l = Start day.
- m = Start hour.
- n = Start minute.
- o = Start second.
- p = Stop month.
- q = Stop day.
- r = Stop hour.
- s = Stop minute.
- t = Stop second.
- u = Hours of session length.
- v = Minutes of session length.
- w = Seconds of session length.

4. ACTIONS TO BE TAKEN

Notify the HOC personnel if the session terminated abnormally and instruct them to repoll the switch using the last block number received and note where polling data begins so that they do not process duplicate primary data. If Format 3 is output, then another AMA session is indicated during retrofit, since the percentage on disk could not be determined (there could be AMA data on disk). If Format 4 was output, use the OP:AMA-SESSION input message to get information on the status of the session. Primary/Secondary Polls can be rejected if the HOC detects a AMAT password mismatch on their end. If this happens then either the HOC or AMAT will have to reset the AMAT password so that both ends are using the same AMAT password.

5. ALARMS

Minor.

    i

[3] REPT AMA STATUS - j

2. REASON FOR OUTPUT

To report the status of automatic message accounting (AMA) records in the administrative module (AM) buffer. This message is in response to an OP:AMA-STATUS input message.

Format 1; indicates the status of the AM buffer and the last time data was written to disk. Format 2; indicates that the configuration file or partition disk map used to obtain the last time the disk writer wrote to disk could not be opened, read or was unavailable. Format 3; indicates either that the system could not open a temporary file to store the outcome of the status report or that the address of the AM buffer was not obtained.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = The information is for the ST1 data stream.
   ST2 = The information is for the ST2 data stream.

b = The subsegment number in the AM buffer.

c = The percentage full of the AM buffer.

d = The number of records in the AM buffer.

e = The last time the disk writer wrote to disk (HOUR).
f = The last time the disk writer wrote to disk (MINUTES).
g = The last date the disk writer wrote to disk (MONTH).
h = The last date the disk writer wrote to disk (DAY).
i = Reasons why the record of the last time the disk writer wrote to disk could not be output. Valid value(s):
   
   COULD NOT OPEN CONFIGURATION FILE
   COULD NOT READ CONFIGURATION FILE
   PARTITION 'x' DISK MAP NOT READABLE
   PARTITION 'x' FAILED TO READ AMA BLOCK

j = Reasons why the status report could not be printed. Valid value(s):
   
   COULD NOT OPEN FOR WRITING
   GETSEGS DID NOT GET CORRECT ADDRESS

4. ACTION TO BE TAKEN

For Format 1, none.

If Format 2 or 3 occurs more than once, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

1. FORMAT

REPT AMA STREAM INDICATOR IS a

2. REASON FOR OUTPUT

To indicate whether the office is a dual or a single data stream automatic message accounting (AMA) office.

3. VARIABLE FIELD DEFINITIONS

a = Data stream indicator. Valid value(s):
   DUAL = Indicates both an ST1 and an ST2 AMA data stream.
   INVALID = Indicates an invalid value was found.
   ST1 = Indicates that the information is for the ST1 data stream.
   ST2 = Indicates that the information is for the ST2 data stream.

4. ACTION TO BE TAKEN

If the data stream indicator is INVALID, use input message SET:AMA-STREAM to set the indicator to the proper value.

5. ALARMS

None.

1. FORMAT

[1] REPT AMA TAPE a RECORDS LOST AT BLOCK b FOR STREAM c

[2] REPT AMA TAPE - BLOCK SIZE CHECK FAILS FOR BLOCK b FOR STREAM c

2. REASON FOR OUTPUT

For Format 1, to report that either the length of the automatic message accounting (AMA) block, the length of the individual AMA records, or the number of AMA records for the AMA block currently being written to tape is corrupt.

For Format 2, to report that the size of a particular block in the AMA block header is not equal to the total sum of the number of bytes of AMA records in the block plus 14 (the size of the AMA block header).

3. VARIABLE FIELD DEFINITIONS

a = Number of records in the AMA block which could not be written to tape.
b = Sequence number of the AMA block.
c = Data stream. Valid value(s):
   ST1 = Indicates that the information is for the ST1 data stream.
   ST2 = Indicates that the information is for the ST2 data stream.

4. ACTIONS TO BE TAKEN

If this problem persists, locate the corrupt AMA record or block and follow the normal channels of escalation so that the problem can be corrected.

   [l]

__________________________________________________________________

[2] REPT AMA TAPE SESSION FOR STREAM a
   TEMPORARY FILE COULD NOT BE CREATED

__________________________________________________________________

2. REASON FOR OUTPUT

To output the status of the current or most recent automatic message accounting (AMA) tape session if the tape option is in effect. This message prints in response to the OP:AMA-SESSION input message.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1   = Indicates that the information is for the ST1 data stream.
   ST2   = Indicates that the information is for the ST2 data stream.

b = Status of tape session. Valid value(s):
   CURRENT   = Tape writing is currently in progress.
   PREVIOUS   = Tape writing is not currently in progress.

c = Serial number of the tape.

d = Start time in month, day, hours, minutes, and seconds.

e = Indicates whether primary or secondary data was written to tape.

f = Sequence number of the first block of data written to tape. For secondary data, it is not possible to transmit the oldest 51 blocks of secondary data. Therefore, this number may not reflect the actual first block of secondary data transmitted in the case where the first block falls in that range. To determine the oldest secondary block of data, use OP:AMA-MAPS and determine the FSS from the right side of the maps for the WRITE PARTITION listed at the top of the OP:AMA-MAPS output. This block plus the 50 blocks following cannot be accessed. This is necessary since the oldest secondary AMA data could be overwritten by primary AMA data while a secondary session is in
progress.

g = Time of first block in month, day, hour, and minute.

h = Sequence number of the last block of data written to tape.

i = Time of last block in month, day, hour, and minute.

j = Current percentage of tape occupancy.

k = Total number of AMA records written to tape.

l = Text phrase indicating the outcome of the previous AMA tape writing session. This variable prints if this is the status of the previous session. Valid value(s):

- NORMAL TERMINATION—MORE DATA REQUESTED THAN AVAILABLE
- NORMAL TERMINATION—AMA TAPE FULL — MORE DATA TO BE WRITTEN
- NORMAL TERMINATION—NO MORE DATA
- TERMINATION REQUESTED VIA STP:AMATAPE MESSAGE
- TRAILER LABELS COULD NOT BE WRITTEN
- AUTOMATIC TAPE WRITING STOP TIME WAS REACHED
- TAPE WRITING STOPPED FOR REX DGNS
- NEXT AMA PARTITION UNAVAILABLE
- INVALID TERMINATION REASON SPECIFIED

4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, re-enter the OP:AMA-SESSION input message.

5. ALARMS

None.

[2] REPT AMA TAPE SUMMARY FOR STREAM a
   TEMPORARY FILE COULD NOT BE CREATED

2. REASON FOR OUTPUT

To output a summary of automatic message accounting (AMA) tape activity for one day (Format 1). This message
prints automatically, once every 24 hours. Format 2 indicates that the system could not create a temporary file to
print the summary information.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = Indicates that the information is for the ST1 data stream.
   ST2 = Indicates that the information is for the ST2 data stream.

b = Total number of AMA tape sessions conducted today.

c = Total number of AMA tape sessions that terminated normally.

d = Total number of AMA tape sessions that terminated abnormally.

e = Number of primary records written to tape.

f = Number of secondary records written to tape.
\[ g \] = Number of calls where dialing is complete and AMA treatment is required.

\[ h \] = Number of answered calls.

\[ i \] = Number of calls where dialing is complete but no answer was received.

\[ j \] = Number of records containing mutilated data.

\[ k \] = Number of long duration calls in progress.

\[ l \] = Number of records lost.

\[ m \] = AMA blocks written to disk.

\[ n \] = Kbytes of AMA data written to disk.

\[ o \] = Total Number of Allocated AMA Blocks on disk.

\[ p \] = Percentage of Total AMA Space used on disk.

\[ q \] = Total number of blocks written to tape over the past 24 hours.

\[ r \] = Number of records written to disk.

4. ACTIONS TO BE TAKEN

For Format 2, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

__________________________________________________________________

[2] REPT AMA TELEPROCESSING SESSION FOR STREAM a
TEMPORARY FILE COULD NOT BE CREATED

2. REASON FOR OUTPUT

To report the status of the current or previous automatic message accounting (AMA) teleprocessing session (Format 1). This message prints in response to the OP:AMA-SESSION input message if the teleprocessing option is in effect. Format 2 indicates that the system could not create a temporary file to print the status information. In the case of abnormal termination (refer to variable ‘j’) this message is accompanied by a minor alarm.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = Indicates that the information is for the ST1 data stream.
   ST2 = Indicates that the information is for the ST2 data stream.

b = Session status. Valid value(s):
   CURRENT = Session is in progress at this time.
   PREVIOUS = No session is in progress now.

c = Start time in month, day, hour, minute, and second.

d = Session status. Valid value(s):
   CURRENT = Session is in progress at this time.
   STOP = This report is for the previous session.

e = Current time or stop time in month, day, hour, minute, and second.

f = Total number of blocks transmitted.

g = Total number of primary data blocks remaining on disk.
h = Number of primary file polls that were rejected.

i = Number of secondary file polls that were rejected.

j = Text phrase indicating the outcome of the previous AMA teleprocessing session. This message only prints if this is the status of the previous session. Valid value(s):

ABNORMAL TERMINATION–HIGHER LEVEL ERROR = This message is encountered if the disk writer is unable to mark the data just read during a teleprocessing session as secondary.

ABNORMAL TERMINATION–HIGHER LEVEL FAILURE = This message is encountered if an AMA teleprocessing session with the link fails for some other reason than a failure to transmit to or from the host collector (HOC) (such as, AMA data link put out-of-service (OOS) from the active state, or the HOC-switch connection is severed). Also, this failure will occur when a file level message other than file confirm, file reject, file interrupt, poll or repoll is received from the HOC, because of an inability of the switch to read or open the testfile in order to transmit it to the HOC by the switch, or an inability to physically read data off disk, or a bad sequence number (AMA block number out of sequence) was encountered more than once, or there is a cabling problem. During software transitions when the retrofit site file exists, this failure reason can also occur if one of the even moving head disks (MHDs) being accessed is not offline, an even MHD cannot be accessed even though it is offline, or the prior release config files or global map files are missing. A “Higher Level Failure” encompasses the TR385 categories of “Higher Level Failure” and “No Information Available” for abnormal teleprocessing terminations.

ABNORMAL TERMINATION–MESSAGE NOT ALLOWED = This message is encountered if a file layer or session level message not allowed or not in sequence is encountered. A “Message Not Allowed” encompasses the TR385 categories of “Message Not Allowed”, “Data Not Allowed” and “Message Out of Sequence” for abnormal terminations of AMA teleprocessing (AMAT) sessions.

ABNORMAL TERMINATION–UNRECOGNIZABLE MESSAGE = This message is encountered if an session level or file layer message is in improper format or has an illegal length. It can also be obtained if the switch is unable to read or open a testfile in order to transmit it to the HOC.

ABNORMAL TERMINATION–TIMEOUT OR ATTEMPT COUNTER REACHED = This message is encountered when, during an AMA teleprocessing session, the data link remains idle for a 60 second interval with no message received during this interval or for 20 seconds with no message sent during this interval. In addition, it can be obtained if the AMAT password transmitted by the HOC was incorrect (use the OP:AMA-CONTROLF input message to determine the correct AMAT password for the stream). The HOC AMAT password needs to be compared with the AMAT password. If they are different corrections need to be made. The first four digits of the password are the stream identifier (0080 for stream 1 or 0081 for stream 2), and the last six digits are the office ID of the particular office being polled. This is set using the OFFICEID field of the SET:AMA-CONTROLF input message. This message can also occur if the HOC does not send the session message confirm message after every fifth block of AMA data is transmitted.

NORMAL TERMINATION

4. ACTIONS TO BE TAKEN
For Format 1, no action is required.

For Format 2, re-enter the OP:AMA-SESSION input message. If polling fails after several attempts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Primary/Secondary Polls can be rejected if the HOC detects a AMAT password mismatch on their end. If this happens then either the HOC or AMAT will have to reset the AMAT password so that both ends are using the same AMAT password.

5. ALARMS

None.

2. REASON FOR OUTPUT

To summarize automatic message accounting (AMA) teleprocessing activity for the past 24 hours (Formats 1 and 3). If Format 2 is output, the system could not create a temporary file to print the summary information. Format 4 is output to report teleprocessing activity for the AMA data networking services (AMADNS) data server application.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = Indicates that the information is for the ST1 data stream.
   ST2 = Indicates that the information is for the ST2 data stream.

b = Total number of AMA teleprocessing sessions conducted today.

c = Number of sessions that terminated normally.

d = Number of sessions that terminated abnormally.

e = Number of sessions that were rejected.

f = Number of primary data blocks transmitted.

g = Number of secondary data blocks transmitted.

h = Number of primary file polls that were rejected.

i = Number of secondary file polls that were rejected.

j = Number of calls where dialing is complete and AMA treatment is required.

k = Number of answered calls.

l = Number of calls where dialing is completed but answer was not received.
m = Number of records containing mutilated data.

n = Number of records written to disk.

o = Number of records sent to the data link.

p = Number of long duration calls in progress.

q = Number of records lost.

r = Number of minutes that the percentage of primary data on disk equals or exceeds the minor AMA alarm value. (MIN AMA ALRM on RC/V View 8.1)

s = Number of minutes that the percentage of primary data on disk equals or exceeds the major AMA alarm value. (MAJ AMA ALRM on RC/V View 8.1)

t = Number of minutes that the percentage of primary data on disk equals or exceeds the critical AMA alarm value. (CRIT AMA ALRM on RC/V View 8.1)

u = Sequence number of first primary block transmitted over the past 24 hours.

v = Sequence number of last primary block transmitted over the past 24 hours.

w = AMA blocks written to disk.

x = Kbytes of AMA data written to disk.

y = Total number of allocated AMA blocks on disk.

z = Percentage of total AMA space used on disk.

a¹ = Number of primary files transmitted.

b¹ = Number of secondary files transmitted.

c¹ = Number of primary file requests rejected.

d¹ = Number of secondary file requests rejected.

e¹ = Number of minutes that the percentage of primary data used or sequence numbers used is greater than or equal to the amamin administrative parameter on the AMADNS data server application.

f¹ = Number of minutes that the percentage of primary data used or sequence numbers used is greater than or equal to the amamaj administrative parameter on the AMADNS data server application.

g¹ = Number of minutes that the percentage of primary data used or sequence numbers used is greater than or equal to the amacrit administrative parameter on the AMADNS data server application.

h¹ = Name of the first file transmitted during the current day.

i¹ = Name of the last file transmitted during the current day.
4. ACTIONS TO BE TAKEN

For Formats 1, 3, and 4, none.

For Format 2, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Primary/Secondary Polls can be rejected if the HOC detects a AMAT password mismatch on their end. If this happens then either the HOC or AMAT will have to reset the AMAT password so that both ends are using the same AMAT password.

2. REASON FOR OUTPUT

To report a summary of automatic message accounting (AMA) tape and teleprocessing activity. The message prints automatically once every hour and any time on demand. Formats 3 and 4 will only be printed if AMA data networking services (AMADNS) processing is active. Format 4 is printed in response to execution of the display-tpsum command on the AMADNS data server application.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
   ST1 = The information is for the ST1 data stream.
   ST2 = The information is for the ST2 data stream.

b = Total number of AMA teleprocessing/tape sessions.
c = Number of AMA sessions that terminated normally.
d = Number of AMA sessions that terminated abnormally.
e = Number of AMA sessions that were rejected.
f = Number of primary data blocks that were transmitted.
g = Number of secondary data blocks that were transmitted.
h = Number of primary file polls that were rejected.
i = Number of secondary file polls that were rejected.
j = Number of calls where dialing was complete and AMA treatment was required.
k = Number of answered calls.
l = Number of calls where dialing was complete but no answer was received.
m = Number of records containing mutilated data.
n = Number of records written to disk.
o = Number of records sent to the data link.
p = Number of long duration calls in progress.
q = Number of records lost.
r = Number of minutes that the percentage of primary data on disk equals or exceeds the minor AMA alarm value (MIN AMA ALRM on RC/V View 8.1)
s = Number of minutes that the percentage of primary data on disk equals or exceeds the major AMA alarm value (MAJ AMA ALRM on RC/V View 8.1)
t = Number of minutes that the percentage of primary data on disk equals or exceeds the critical AMA alarm value (CRIT AMA ALRM on RC/V View 8.1)
u = Sequence number of first primary block transmitted over the past hour.
v = Sequence number of last primary block transmitted over the past hour.
w = AMA blocks written to disk.
x = Kbytes of AMA data written to disk.
y = Total Number of allocated AMA blocks on disk.
z = Percentage of total AMA space used on disk.
a¹ = Number of primary records written to tape.
b¹ = Number of secondary records written to tape.
c¹ = Total number of blocks of written to tape over the past hour.

\[d^1 = \text{Number of primary files transmitted.}\]

\[e^1 = \text{Number of secondary files transmitted.}\]

\[f^1 = \text{Number of primary file requests rejected.}\]

\[g^1 = \text{Number of secondary file requests rejected.}\]

\[h^1 = \text{Number of minutes that the percentage of primary data used or sequence numbers used is greater than or equal to the amamin administrative parameter on the AMADNS data server application.}\]

\[i^1 = \text{Number of minutes that the percentage of primary data used or sequence numbers used is greater than or equal to the amamaj administrative parameter on the AMADNS data server application.}\]

\[j^1 = \text{Number of minutes that the percentage of primary data used or sequence numbers used is greater than or equal to the amacrit administrative parameter on the AMADNS data server application.}\]

\[k^1 = \text{Name of the first file transmitted during the current day.}\]

\[l^1 = \text{Name of the last file transmitted during the current day.}\]

### 4. ACTIONS TO BE TAKEN

For Format 1, Primary/Secondary Polls can be rejected if the HOC detects a AMAT password mismatch on their end. If this happens then either the HOC or AMAT will have to reset the AMAT password so that both ends are using the same AMAT password.

For Formats 2, 3, and 4, none.

### 5. ALARMS

None.

### 6. REFERENCES

8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]
REPT:AMA-TELEP
Software Release: 5E14 and later
Message Class: AMA
Application: 5
Type: Output

1. FORMAT
REPT AMA TELEPROCESSING FOR STREAM a

2. REASON FOR OUTPUT
To report the detection of an abnormal condition for the automatic message accounting (AMA) teleprocessing operation.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
  ST1 = The information is for the ST1 data stream.
  ST2 = The information is for the ST2 data stream.

b = Cause of condition. Valid value(s):
  AMA MAINTENANCE FILE UNREADABLE
  CANNOT CREATE MAINTENANCE FILE
  CANNOT READ AMA DATA - DISK OUT OF SERVICE
  ERROR DURING OPEN OF AMA TEST FILE
  ERROR DURING WRITE OF AMA MAINTENANCE FILE
  ERROR IN READING AMA TEST FILE
  FAILED TO ATTACH TO SHARED SEGMENT - UNABLE TO READ MESSAGE
  FAILED TO ATTACH TO PAS = Cannot attach to protected application segment (PAS).
  FAILED TO CONNECT TO AMHISP PORT - AMHISP EXITING
  FAILED TO CREATE TEST FILE
  FAILED TO WRITE ENTIRE TEST FILE
  FILE REJECTED BY AMADNS DATA SERVER
  FILE REJECTED BY HOC = Host collector (HOC) rejected file.
  HOC REJECTED SESSION - CHECK AMAT PASSWORD = Host collector (HOC) rejected session; check AMA teleprocessing password.
  INCORRECT SUN REQUESTED = Sending unit (SUN) of host collector does not match the designated sending unit on the switch.
  INITIALIZATION COMPLETED
  MAINTENANCE FILE INITIALIZED
  NO AMA TELEPROCESSING DEVICE EXISTS FOR THIS STREAM
  SOME MTC RECORDS UNREADABLE
  UNEXPECTED DISK READER FAILURE
  ALL THE DATA ON THE OFFLINE SIDE HAS BEEN READ
  THE AMA PROCESS HAS BEEN TRANSITIONED TO THE ACTIVE SIDE = This message is printed when AMADNS teleprocessing is in progress during software transitions on the new software release to inform the craft that there is no more AMA data on the offline side and the AMA process has been transitioned to the active online side.
4. ACTIONS TO BE TAKEN

If 'b' = INCORRECT SUN REQUESTED, notify the HOC to send another session connect using SUN0 if configured for ST1, or SUN1 if configured for ST2. An INVALID PASSWORD message will follow immediately after the INCORRECT SUN REQUESTED message. Take no action for the INCORRECT PASSWORD message until the session connect is sent with the correct SUN specified.

For other failure conditions, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

REPT:AMADNS-TELEP-A
Software Release: 5E14 only
Message Class: AMA
Application: 5
Type: Output

1. FORMAT

[1] REPT AMADNS TELEPROCESSING
   ERROR STORING BILLING DATA

[2] REPT AMADNS TELEPROCESSING
   CORRUPTED BILLING DATA RECEIVED

[3] REPT AMADNS TELEPROCESSING
   PRIMARY BILLING IS USING a % OF AVAILABLE SPACE
   PRIMARY BILLING IS USING b % OF AVAILABLE FILE SEQUENCE NUMBERS

[4] REPT AMADNS TELEPROCESSING
   FAILED TO ESTABLISH c DDI SESSION

[5] REPT AMADNS TELEPROCESSING
   ERROR WHILE TRANSMITTING DATA TO THE DPMS

[6] REPT AMADNS TELEPROCESSING
   AMADNS DATA SERVER APPLICATION SHUTTING DOWN DUE TO ERRORS

[7] REPT AMADNS TELEPROCESSING
   UNABLE TO ESTABLISH BILLING DATA CONNECTION

2. REASON FOR OUTPUT

To report errors occurring on the Automatic Message Accounting Data Networking System(AMADNS) Data Server Application that require corrective action.

3. VARIABLE FIELD DEFINITIONS

a  = Percentage of storage space occupied by primary data.
b  = Percentage of file sequence numbers used by primary data files.
c  = Type of data server/data processing management system interface(DDI) session. Valid values:
   Sender Initiated
   Receiver Initiated

4. ACTIONS TO BE TAKEN
The action to be taken depends on the format of the message.

For Format 1, check file system space on the AMADNS Data Server Application. If the /bafblks file system is out of space check for and remove any non-application related files. Also, use the pkgchk command on the AMADNS Data Server Application to verify that the bafblks directory structure is intact.

For Format 2, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

For Format 3, primary data needs to be transmitted to the data processing and management system (DPMS). Check that a DDI session will occur soon. For sender-initiated DDI, this will happen if transmission is either set to be continuous or is scheduled soon. For receiver-initiated DDI, the DPMS must initiate a DDI session. If transmission is being attempted, but failing, verify the administrative parameters related to DDI transmission with the DPMS administrator. Usage of file sequence numbers can be reduced by having the AMADNS Data Server Application create larger files. File size is controlled by the values of the bill_latency, bill_size, and max_dcni_recs AMADNS Data Server Application administrative parameters.

For Format 4, use the ver-dpms, enter-dpms, and delete-dpms commands on the AMADNS Data Server Application, to check, add, and delete one or more DPMS systems. Use the ver-admnparm and change-admnparm command on the AMADNS Data Server Application to check and correct as necessary all data parameters associated with the connection to each DPMS. These parameters include ddi_login, ddi_password, ddi_passive, and ddi_ftp_port. The values of each of these parameters must agree between the AMADNS Data Server Application and each DPMS.

For Format 5, re-transmission will automatically be attempted at a later time. If the condition persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

For Format 6, previous AMADNS TELEPROCESSING messages will indicate the specific error and the action to be taken.

For Format 7, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

5. ALARMS

For Format 3, the alarm is Critical if the percentage of available storage used or file sequence numbers used is greater than or equal to the value of the amacrit AMADNS Data Server Application administrative parameter. If the percentage of available storage used or file sequence numbers used is greater than or equal to the value of the amamaj parameter then the alarm is Major. If the percentage of available storage used or file sequence numbers used is greater than or equal to the value of the amamin parameter then the alarm is Minor. Format 3 will be printed as an information only message if one of the thresholds is crossed in the decreasing direction.

Major for Formats 1, 2, 4, 5, 6, and 7.

6. REFERENCES

Other Manual(s):
235-200-146 Administrative Services Module (ASM) Data Server Software Operations Guide - NAR

[8] REPT AMADNS TELEPROCESSING
   ERROR STORING BILLING DATA - FILLING EXCEPTION DIRECTORY

2. REASON FOR OUTPUT

To report errors occurring on the automatic message accounting data networking system (AMADNS) data server application that require corrective action.

3. VARIABLE FIELD DEFINITIONS

a = Percentage of storage space occupied by primary data.
b = Percentage of file sequence numbers used by primary data files.
c = Type of data server/data processing management system interface (DDI) session. Valid value(s):
   SENDER INITIATED
4. ACTIONS TO BE TAKEN

The action to be taken depends on the format of the message.

For Format 1, check file system space on the AMADNS data server application. If the /bafblks file system is out of space check for and remove any non-application related files. Also, use the pkgchk command on the AMADNS data server application to verify that the bafblks directory structure is intact.

For Format 2, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

For Format 3, primary data needs to be transmitted to the data processing and management system (DPMS). Check that a DDI session will occur soon. For sender-initiated DDI, this will happen if transmission is either set to be continuous or is scheduled soon. For receiver-initiated DDI, the DPMS must initiate a DDI session. If transmission is being attempted, but failing, verify the administrative parameters related to DDI transmission with the DPMS administrator. Usage of file sequence numbers can be reduced by having the AMADNS data server application create larger files. File size is controlled by the values of the bill_latency, bill_size, and max_dcni_recs AMADNS data server application administrative parameters.

For Format 4, use the ver-dpms, enter-dpms, and delete-dpms commands on the AMADNS Data Server Application, to check, add, and delete one or more DPMS systems. Use the ver-admnparm and change-admnparm command on the AMADNS data server application to check and correct as necessary all data parameters associated with the connection to each DPMS. These parameters include ddi_login, ddi_password, ddi_passive, and ddi_ftp_port. The values of each of these parameters must agree between the AMADNS Data Server Application and each DPMS.

For Format 5, re-transmission will automatically be attempted at a later time. If the condition persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

For Format 6, previous AMADNS TELEPROCESSING messages will indicate the specific error and the action to be taken.

For Format 7, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

For Format 8, check for AMADNS files writing to the /bafblks/billing/exception directory for the AMADNS data server application. Contact technical support for up to date recovery procedures and to avoid potential loss of billing data. Please refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

5. ALARMS

For Format 3, the alarm is Critical if the percentage of available storage used or file sequence numbers used is greater than or equal to the value of the amacrit AMADNS data server application administrative parameter. If the percentage of available storage used or file sequence numbers used is greater than or equal to the value of the amamaj parameter then the alarm is Major. If the percentage of available storage used or file sequence numbers used is greater than or equal to the value of the amamin parameter then the alarm is Minor. Format 3 will be printed as an information only message if one of the thresholds is crossed in the decreasing direction.

Major for Formats 1, 2, 4, 5, 6, 7, and 8.

    ORIGINATOR TERMINATOR
    f              g
    h/i            j/k
    l              m

2. REASON FOR OUTPUT

To print data for an automatic message accounting irregularity (AMAIRR). When this occurs the AMAIRR peg count on the plant measurements reports is incremented. This information can be analyzed as to the source of the billing problem.

The AMAIRR report is written to the AMAERLOG log file. The AMAERLOG log file is always updated even when the AMAIRR report is deactivated.

3. VARIABLE FIELD DEFINITIONS

a = The name of the database relation which could not be read. Valid value(s):
   RLAMCALL = Automatic message accounting (AMA) call type relation.
   RLCHRGRDIDXEXP = Charge index expansion relation.

b = The charge index.

c = The AMA call type. Refer to the Business And Residence Modular Features manual.

d = Special studies in effect on the originating directory number (DN). Valid value(s):
   COMPLAINT = Complaint observing.
   DETAIL = Optional detail billing.
   NONE = No special studies in effect.
   SLUS = Subscriber line usage study.
   TRAFFIC = Traffic sampling.

e = Free termination indicator. Valid value(s):
   NO = No free termination.
   YES = Free termination.

f = The directory number of the call's originator.

g = The dialed directory number.
= The number of the originating switching module (SM).

= The number of the originating port in hexadecimal.

= The number of the terminating SM.

= The number of the terminating port in hexadecimal.

= The originating class of service (COS). Refer to the Translations Data manual for a complete list of possible service classes used in domain SERVCLASS.

= The terminating COS.

4. ACTION TO BE TAKEN

None.

5. ALARMS

If the field AMA ERROR MIN ALRM in RC/V View 8.1 is set to YES, a minor alarm is generated when the AMA irregularity report is written to the ROP.

   COS:         r     s

2. REASON FOR OUTPUT

To report specific information related to a lost automatic message accounting (AMALOST) record when such a loss occurs.

Format 1 is printed when there is no call information available.

Format 2 is printed when call information is available. The AMALOST report is written to the AMAERLOG log file. The AMAERLOG log file is always updated even when the AMALOST report is deactivated.

3. VARIABLE FIELD DEFINITIONS

a = Number of AMA records lost.

b = Reason why the records were lost. Valid value(s):
   COULD NOT FORMAT CARRIER CONNECT TIME FIELD = Refer to the System Description manual and the Billing Features manual.
   COULD NOT FORMAT OPERATOR ACTION FIELD = Refer to the System Description manual and the Billing Features manual.
   COULD NOT FORMAT TERMINATING NUMBER FIELD = Refer to the System Description manual and the Billing Features manual.
   COULD NOT GET CALL RECORD
   COULD NOT LOAD SM BUFFER
   INVALID AMA MESSAGE LENGTH
   INVALID CALL CONDITION = Refer to the Billing Features manual.
INVALID CALL TYPE = Refer to the Billing Features manual.
INVALID EBAF TYPE = Refer to the Billing Features manual.
INVALID STRUCTURE CODE = Refer to the Billing Features manual.
INVALID STRUCTURE CODE FAMILY = Refer to the Billing Features manual.
INVALID STRUCTURE CONDITION = Refer to the Billing Features manual.
LOCAL ANSWER RECORDING INHIBITED = HALTING REPORTS = Office parameter for local answer AMA recording (LOCANSW) set to N (NO). AMA record generation was inhibited. Refer to the Recent Change Procedures Menu Mode manual and the global parameter Gllocans in the Translations Data manual. This feature is automatically halted when LOCANSW is set to N. The AMALOST report that produces this reason for the lost AMA record will have a critical alarm associated with it.

ODB CHANNEL RECORDING INHIBITED = Office parameter for on-demand b-channel recording (ODB AMA) set to N (NO). Refer to the Recent Change Procedures Menu Mode manual and the global parameter Glodbama in the Translations Data manual.

SHARED DATA SEGMENT FULL
SHARED DATA SEGMENT POINTER INVALID
SM STANDALONE MEMORY FULL
TERM ACCESS RECORDING INHIBITED = HALTING REPORTS = Office parameter for terminating interLATA carrier AMA recording (ICTERM) set to N (NO). AMA record generation was inhibited. Refer to the Recent Change Procedures Menu Mode manual and the global parameter Glicterm in the Translations Data manual. This feature is automatically halted when ICTERM is set to N. The AMALOST report that produces this reason for the lost AMA record will have a critical alarm associated with it.

c = AMA record tracing status. Valid value(s):
NOT REQUESTED
REQUESTED - NOT AVAILABLE
REQUESTED - PRINTOUT FOLLOWS = One AMATRC printout will be generated when more than one AMA record is lost in the AM.

d = AMA call type. Refer to the Billing Features manual for a complete list of AMA call types.

e = AMA record structure code. Refer to the Billing Features manual for a complete list of AMA record structure codes.

f = Charge index.

 g = Answer indicator. Valid value(s):
NO = The call was not answered. Circuit time will be given.
YES = The call was answered. Answer time will be given.

h = Modifier (type) of "TIME". Valid value(s):
  ANSWER = Call was answered.
  CIRCUIT = Call was not answered.

i = Time when call was answered or circuit was released (for an unanswered call), in the form hours (two digits):minutes (two digits):seconds (two digits):and tenths of seconds (one digit).
j = Elapsed time of an answered call, in the form minutes (five digits): seconds (two digits): and tenths of seconds (one digit).

k = Special studies in effect on the originating directory number (DN). Valid value(s):
COMPLAINT = Complaint observing.
DETAIL = Optional detail billing.
NONE = No special studies in effect.
SLUS = Subscriber line usage study.
TRAFFIC = Traffic sampling.

l = Directory number of the call's originator (supplied only for line originations).

m = Dialed directory number.

n = Number of the switching module (SM) at which the call originated.

o = Number of the originating port, in hexadecimal.

p = Number of the switching module (SM) at which the call terminated.

q = Number of the terminating port, in hexadecimal.

r = Originating class of service (COS). Refer to the Translations Data manual for a complete list of service classes used in domain SERVCLASS.

s = Terminating COS.

4. ACTION TO BE TAKEN

If a steadily increasing number of AMALOST report messages is generated, then save a copy of the output message(s) and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

AMALOST reports generated due to "LOCAL ANSWER RECORDING INHIBITED" and "TERM ACCESS RECORDING INHIBITED" will cause a critical alarm. If the field AMA ERROR MIN ALRM in RC/V View 8.1 is set to YES, a minor alarm is generated when the AMALOST report is written to the ROP.

Software Release: 5E14 and later
Message Class: AMA
Application: 5
Type: Output

1. FORMAT

[1] REPT AMATAPE COMPLETE FOR STREAM a
    VOL SER NUMBER b
    TAPE DRIVE NUMBER c
    START TIME dd:dd:dd e
    START BLOCK f g
    END BLOCK h i
    RECORDS WRITTEN j
    TAPE SEQUENCE NUMBER k

[2] REPT AMATAPE COMPLETE FOR STREAM a
    TEMPORARY FILE COULD NOT BE CREATED

[3] REPT AMATAPE COMPLETE FOR STREAM a
    COULD NOT CREATE AMA GLOBAL MAP FILE

[4] REPT AMATAPE COMPLETE FOR STREAM a
    COULD NOT WRITE AMA GLOBAL MAP FILE

[5] REPT AMATAPE COMPLETE FOR STREAM a
    COULD NOT CLOSE AMA GLOBAL MAP FILE

2. REASON FOR OUTPUT

To report the termination of an automatic message accounting (AMA) tape writing session. Format 1 indicates the outcome of the tape writing session. Format 2 indicates that the system could not create a temporary file to print the outcome of the tape writing session. Format 3 indicates that the system could not create the AMA global map files during software transitions on the old generic release for AMA tape sessions following the invocation of the CLR:AMA:MAPS; command. Format 4 indicates that the system could not write the AMA global map files during software transitions on the old generic release for AMA tape sessions following the invocation of the CLR:AMA:MAPS; command. Format 5 indicates that the system could not close the AMA global map files during software transitions on the old generic release for AMA tape sessions following the invocation of the CLR:AMA:MAPS; command.

3. VARIABLE FIELD DEFINITIONS

a = Data stream. Valid value(s):
ST1 = The information printed is for the ST1 data stream.
ST2 = The information printed is for the ST2 data stream.
b = Serial number of the tape.

c = Tape drive number.

d = Start time in month, day, hours, minutes, and seconds.

e = Type of data written to tape, primary or secondary.

f = Sequence number of the first block of data written to tape. For secondary data, it is not possible to transmit the oldest 51 blocks of secondary data. Therefore, this number may not reflect the actual first block of secondary data transmitted in the case where the first block falls in that range. To determine the oldest secondary block of data, use OP:AMA-MAPS and determine the FSS from the right side of the maps for the WRITE PARTITION listed at the top of the OP:AMA-MAPS output. This block plus the 50 blocks following cannot be accessed. This is necessary since the oldest secondary AMA data could be overwritten by primary AMA data while a secondary session is in progress.

g = Time stamp for start block in month, day, hour, and minute.

h = Sequence number of the last block of data written to tape.

i = Time stamp for last block in month, day, hour, and minute.

j = Total number of AMA records written to tape.

k = AMA tape sequence number.

l = Text phrases indicating the outcome of the tape writing session. Valid value(s):
NORMAL TERMINATION—MORE DATA REQUESTED THAN AVAILABLE
NORMAL TERMINATION—MORE DATA TO BE WRITTEN MOUNT ANOTHER TAPE AND CONTINUE WITH COPY AMATAPE
NORMAL TERMINATION—NO MORE DATA
TERMINATION REQUESTED VIA STP:AMATAPE MESSAGE
TRAILER LABELS COULD NOT BE WRITTEN
AUTOMATIC TAPE WRITING STOP TIME WAS REACHED
TAPE WRITING STOPPED FOR REX DGNS
NEXT AMA PARTITION UNAVAILABLE
INVALID TERMINATION REASON SPECIFIED

4. ACTIONS TO BE TAKEN

If a normal termination occurs and more AMA data is to be written to tape, then mount, verify, and write a new tape. If the trailer labels could not be written, the tape should be discarded. If the session terminated for any other reason then no action is required.

For Format 2, enter the OP:AMA-SESSION input message to determine the outcome of the tape writing session. Determine the final disposition of the tape based on the text phrase that shows how the tape session was terminated.

If Formats 3, 4, or 5 occur repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS
None.

Software Release: 5E14 and later
Message Class: AMA
Application: 5
Type: Output

1. FORMAT

REPT AMATAPE ERROR-a FOR STREAM b

2. REASON FOR OUTPUT

To report that an error has occurred during the automatic message accounting (AMA) tape writing process. A minor alarm occurs.

3. VARIABLE FIELD DEFINITIONS

a  = Text phrases indicating the AMA tape error that was found. Valid value(s):
  COULDN'T MARK BLOCKS SECONDARY
  DATA IS NOT RETRIEVABLE
  DATA WRITTEN, TAPE NOT READABLE
  NONSTANDARD TAPE LABELS
  TAPE ABORTED BY OPERATOR
  TAPE COULD NOT BE CLOSED
  TAPE COULD NOT BE OPENED
  TAPE COULD NOT BE READ
  TAPE COULD NOT BE WRITTEN
  TAPE HAS NOT EXPIRED
  THIS IS NOT AN AMA TAPE
  AMA PARTITION UNAVAILABLE
  COULD NOT ATTACH TO PAS
  COULD NOT ATTACH TO PORT
  INVALID ERROR CODE RECEIVED

b = Data stream. Valid value(s):
  ST1  = Indicates that the information is for the ST1 data stream.
  ST2  = Indicates that the information is for the ST2 data stream.

4. ACTIONS TO BE TAKEN

Mount and verify another tape before writing any more AMA data. If the output message occurs more than once, then refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

Minor.

6. REFERENCES

Input Message(s):
REPT:AMATAPE-VER

Software Release: 5E14 and later
Message Class: AMA
Application: 5
Type: Output

1. FORMAT

[1] REPT AMATAPE VERIFY FOR STREAM a
   VOL SER NUMBER b
   DATA SET ID cccccccccccccccccc
   EXPIRATION DATE ddd-eee
   TAPE DRIVE NUMBER f
   g

[2] REPT AMATAPE VERIFY FOR STREAM a
   TEMPORARY FILE COULD NOT BE CREATED

2. REASON FOR OUTPUT

To print in response to input message VFY:AMATAPE. Format 1 indicates the outcome of the verification process. Format 2 is used to indicate that the system could not create a temporary file to print the outcome of the verification process.

3. VARIABLE FIELD DEFINITIONS

a  = Data stream. Valid value(s):
    ST1  = Indicates that the information is for the ST1 data stream.
    ST2  = Indicates that the information is for the ST2 data stream.

b  = Serial number of the tape. In the form:
    xx...xx  = Tape header is not in correct format.

c  = Data set ID. In the form:
    xx...xx  = Tape header is not in correct format.

d  = Year of expiration date. In the form:
    xxx  = Tape header is not in correct format.

    The century digit (first of the three digits here) is populated in the tape label with a blank character for expiration dates before 12/31/99 at midnight.

    The century digit may be populated with either a blank or a zero for years falling between 2000 and 2099 inclusive. This is settable via the office database editor (ODBE). Refer to the Billing Features and Specifications document.

    The latest IBM requirement for tape labels mandates the use of 0 to populate the century digit for expiration dates falling after 12/31/99 at midnight.
= Day of expiration (1-365). In the form: 

xxx = Tape header is not in correct format.

= Tape drive number.

= Text phrase that indicates the outcome of the verification process. Valid value(s):

AMA TAPE CAN BE WRITTEN
EXPIRATION DATE HAS NOT BEEN MET
TAPE COULD NOT BE CLOSED
TAPE COULD NOT BE OPENED
TAPE COULD NOT BE READ
TAPE COULD NOT BE WRITTEN
TAPE LABELS ARE INVALID
THIS IS NOT AN AMA TAPE

4. ACTIONS TO BE TAKEN

If an error has been detected, mount and verify another tape. If the automatic message accounting (AMA) tape can be written, manually initiate the writing process using the CPY:AMATAPE input message. If Format 2 prints, re-verify the tape before re-attempting to write the AMA data to it.

5. ALARMS

None.

[ORIGINATING SM/PORT = b/c TERMINATING SM/PORT = d/e]
-------------------------------------------------------------
Field Name  Char.  Value  Meaning
RECORD DESCRIPTOR  1-8  f  RDW
RECORD HEADER     1-2  g
STRUCTURE CODE     1-5  h  Structure Code
i  j  k  l
.  .  .  .
.  .  .  .
.  .  .  .

>>>>>  End of Record
-------------------------------------------------------------

[2] REPT AMATRC PROCESS DID NOT RECOGNIZE STRUCTURE CODE = h

[3] REPT AMATRC a
[ORIGINATING SM/PORT = b/c TERMINATING SM/PORT = d/e]

>>>>>  End of Record

2. REASON FOR OUTPUT

To report an automatic message accounting (AMA) record has been generated for an existing AMATRC entry. One report is normally created for each AMA record as it is generated. Format 2; indicates that the AMA record generated contains a structure code that the AMA trace process does not recognize. One report is normally created for each AMA record as it is generated.

3. VARIABLE FIELD DEFINITIONS

a

= Message qualifier. Valid value(s):
AMA RECORD ON REQUESTED DIRECTORY NUMBER = This is printed when the AMATRC feature is allowed.
OF LOST AMA RECORD = This is printed when an AMATRC report accompanies an AMALOST report. Only one AMATRC printout is generated when the associated AMALOST report indicates that more than one AMA record is lost in the administrative module (AM). The lost record that is reported is the first in the set of lost records.

b

= The number of the originating switching module (SM). The line containing this field will not be printed if the AMATRC was initiated from the administrative module (AM) or if the report is not associated with a port (such as, aggregate AMA record).
c = The number of the originating port in hexadecimal. The line containing this field will not be printed if the AMATRC was initiated from the AM or if the report is not associated with a port (such as, aggregate AMA record).

d = The number of the terminating SM. The line containing this field will not be printed if the AMATRC was initiated from the AM or if the report is not associated with a port (such as, aggregate AMA record).

e = The number of the terminating port in hexadecimal. The line containing this field will not be printed if the AMATRC was initiated from the AM or if the report is not associated with a port (such as, aggregate AMA record).

f = The value of the record descriptor word as it exists in the AMA record.

g = Record header. Valid value(s):
   aa = No fill char expected in this record.
   ab = Fill char expected in this record.

h = Structure code as it exists in the AMA record.

i = Field name. Refer to the Billing Features manual for a complete list of possible AMA field names.

j = The range of characters comprising the field 'i' in the AMA record.

k = The numerical value of the field 'i' in the AMA record.

l = The meaning of the translated field 'i'.

m = A hexadecimal representation of the AMA record.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

Output Message(s):

   OP:AMATRC

Other Manual(s):
REPT: AML-REACH

Software Release: 5E14 and later
Message Class: ATL
Application: 5
Type: Output

1. FORMAT

[1] REPT AML REACHED TG a SZ b OOS c AML d AMLOOS e

   TG a SZ b OOS c AML d AMLOOS e

2. REASON FOR OUTPUT

Format 1 reports that a given two-way or outgoing trunk group's total out-of-service (OOS) count or automatic maintenance limit OOS (AMLOOS) count has reached the automatic maintenance limit (AML) set for that trunk group. No additional trunks in the group can be removed automatically for reasons that count against the AML if the AML has been reached by the AMLOOS count.

Format 2 reports that a given trunk group's total out-of-service (OOS) count has reached 100%. The entire trunk group is out-of-service.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number.
b = Number of trunks in the trunk group.
c = Total number of OOS trunks in the trunk group.
d = Current AML for the trunk group.
e = Number of trunks OOS for reasons that count against the group AML.

4. ACTIONS TO BE TAKEN

Investigate the test equipment for the failure, or confirm the condition of the trunks.

5. ALARMS

The alarm level for format 1 is changeable to minor, major or critical using recent change by updates or inserts on the recent change trunk group view. Refer to the circuit limit (CKTLIM) indicator at the Master Control Center (MCC) display for the alarm level generated.

The alarm level for format 2 is critical.

6. REFERENCES

Input Message(s):

OP : AML
Other Manual(s):
235-105-110  System Maintenance Requirements and Tools
**REPT:ANALY-TLP**

Software Release: 5E14 and later  
Message Class: MTCE  
Application: 5,3B  
Type: Output

1. **FORMAT**

   [1] REPT ANALY TLP NULL PACK LIST

   [2] REPT ANALY TLP CANNOT FIND PACK LOCATION a

   [3] REPT ANALY TLP UNABLE TO OPEN TLDB b

   [4] REPT ANALY TLP UNABLE TO READ HEADER FROM DATA BASE=b

   [5] REPT ANALY TLP ILLEGAL ARGUMENT c

   [6] REPT ANALY TLP CONNSEG FAILED ERRNO d

   [7] REPT ANALY TLP CANNOT OPEN INPUT FILE e

   [8] REPT ANALY TLP CANNOT OPEN DIRECTORY ../datatbl/tlp/misc

   [9] REPT ANALY TLP NO KEYS SET FOR INPUT TO TLP

2. **REASON FOR OUTPUT**

To report error conditions encountered by a trouble locating process (TLP).

Format 1 is printed when a search of the trouble location database (TLDB) found no suspected faulty circuit packs. The fault signature from first failing phase is substantially different from fault signatures in the trouble location database.

Format 2 is printed when a circuit-pack location cannot be found by the TLP.

Format 3 is printed when the TLP search program cannot open the trouble-locating database file associated with the diagnostic phase that failed.

Format 4 is printed when the trouble-locating database could be opened, but the header information was not there.

Format 5 is printed when the diagnostic monitor (DIAMON) passes an illegal argument to TLP.

Format 6 is printed when TLP cannot connect to the diagnostic control block segment.

Format 7 is printed when TLP cannot open the file created by the diagnostic control process, which contains the diagnostic fault signatures.
Format 8 is printed when the directory /diag/datatbl/tp/misc cannot be opened. This directory contains the pack location file for each subunit.

Format 9 is printed when a diagnostic failure did not set any tlp keys and consequently sent a null signature to TLP.

3. VARIABLE FIELD DEFINITIONS

  a = Pack number.
  b = Pathname that specifies the filename of the TLDB.
  c = Illegal argument passed by DIAMON to TLP.
  d = Error code returned by the system function connsseg. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
  e = Name of TLP file containing the diagnostic fault signatures.

4. ACTION TO BE TAKEN

Retry the request to determine if condition is repeatable. If it is, perform the actions below appropriate for each output message format. If that fails to clear the problem, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 1, 2, 5, 6, and 7, check trouble location process file, /diag/dgnc/tp and restore from backup file system.

For Formats 1, 3, and 4, check TLDB file and restore from backup file system. TLDB files are in directory /diag/datatbl/tp/unit[c|e|s|v|x] and are named "unitphase.db", for example: /diag/datatbl/tp/dmac/dca10.db (refer to the unit/subunit UCB mv value and the "tlb" lines in the /diag/util/cu/pu/"unit" file for the TLDB directory).

For Formats 1 and 9, check diagnostic data table file and off line main store file, if applicable, restore from backup file system. Data table files are in directories under /diag/datatbl (refer to the unit/subunit UCB mv value and the "dgn" lines in the unit/subunit util file under /diag/util for the dpt file name, then the dpt file under /diag/dtp for the data table file names). Off line main store files are in directories under /diag/offcode/mas (refer to the "excofl" statements in the diagnostic listing file to identify the off line main store files - executed).

For Formats 5, 6, and 7, check diagnostic monitor process file, /diag/dgnc/ppdiamon, restore from backup file system.

For Format 2, check pack location file, restore from backup file system. Pack location files are in /diag/datatbl/tp/misc and are named "p.unit_number_number", examples: p.cu.0_10 and p.dfc.21_22.

For Format 8, check directory and files exist and have correct permissions. Restore directory and files from backup file system.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Software Release: 5E14 and later
Message Class: PLNT
Application: 5
Type: Output

1. FORMAT

REPT AP COMMUNICATION LOST ON LINK APDLaa

2. REASON FOR OUTPUT

To report the loss of an application processor (AP) communication data link (APDL).

3. VARIABLE FIELD DEFINITIONS

a = Identity of the AP data links. The valid codes are two-digit numbers from 01 to 32.

4. ACTION TO BE TAKEN

Determine the source of failure and repair the link as soon as possible. For more information, refer to MCC display page 117.

5. ALARMS

Major.

6. REFERENCES

Output Message(s):

REPT:SDL

MCC Display Page(s):

117 (IOP AP DATA LINKS)
REPT: AP-COM-PLAN

Software Release: 5E14 and later
Message Class: PLNT
Application: 5
Type: Output

1. FORMAT

[1] REPT AP COMMUNICATION PLANNED DOWN ON LINK APDL aa
   FOR bb HOURS cc MINUTES

__________________________________________________________________

[2] REPT AP COMMUNICATION PLANNED DOWN ON AP aa
   FOR bb HOURS cc MINUTES

__________________________________________________________________

2. REASON FOR OUTPUT

To report that an application processor (AP) is unavailable for a scheduled period.

Format 1 appears when the AP data line (APDL) is affected.
Format 2 appears when the AP itself is affected.

3. VARIABLE FIELD DEFINITIONS

a = Identity of the APDL or the AP. The valid codes are two-digit numbers from 01 to 32 for APDL or from 01 to 99 for AP.
b = Hours of scheduled down-time.
c = Minutes of scheduled down-time.

4. ACTION TO BE TAKEN

If the link is not back up after the scheduled down time, it should be brought up as soon as possible. If the AP hardware is in service, the software on the switch will reconnect the session. Restoring the synchronous data link controller (SDLC) hardware will also initiate a reconnect request. If the AP hardware is not in service, request that it be put back in service.

- **Message Class:** ATL
- **Application:** 5
- **Type:** Output

### 1. FORMAT

```
REPT APT ABANDON TKG a     VOICE ENountered     OPDN b
```

### 2. REASON FOR OUTPUT

To inform the user that automatic (trunk) progression testing (APT) has aborted an entire trunk group because "VOICE" was encountered while testing. This happened because the far end test line number that APT outpulsed was invalid.

If brevity control has not been inhibited for this message class, this message may or may not appear on the receive-only printer (ROP), depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Trunk group that will be skipped (abandoned) from APT testing.
- **b** = Digits that were outpulsed when the result from the test was "VOICE".

### 4. ACTION TO BE TAKEN

Investigate the digits that are being outpulsed over this trunk group. Correct the relation TM_ATTTN if the digits are not correct for this type of trunk. Then verify the correct OPDN with the TST:TRK input message.

### 5. ALARMS

None.

Software Release: 5E14 - 5E16(1)
Message Class: ATL
Application: 5
Type: Output

1. FORMAT

REPT APT ABORTED LAST TKGMN TESTED a b c

2. REASON FOR OUTPUT

To report that the automatic progression testing (APT) was aborted during its scheduled testing session.

If brevity control has not been inhibited for this message class, this message may or may not appear on the receive-only printer (ROP), depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group last tested.
b = Trunk group member number of the last trunk tested.
c = Reason for abort. Valid value(s):
   (blank) = Indicates system resource failure or system is in minimum (MIN) mode.
   MIN MODE = Aborted because the system was in MIN mode at the time the APT session began.
   OVERLOAD = The administrative module (AM) or switching module (SM) is in overload.
   SOFTWARE = Aborted due to internal system problems.
   TERMINAL PROCESS TIMEOUT = Aborted due to APT’s terminal process timing out.

4. ACTION TO BE TAKEN

Reschedule APT at another time.

5. ALARMS

None.

6. REFERENCES

REPT: APT-ABORT-B

Software Release: 5E16(2) and later
Message Class: ATL
Application: 5
Type: Output

1. FORMAT

REPT APT ABORTED LAST TKGMN TESTED a b c

2. REASON FOR OUTPUT

To report that the automatic progression testing (APT) was aborted at the time its session began or during its scheduled testing session.

If brevity control has not been inhibited for this message class, this message may or may not appear on the read-only printer (ROP), depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group last tested.
b = Trunk group member number of the last trunk tested.
c = Reason for abort. Valid value(s):
   (blank) = Indicates system resource failure.
   CMP ABNORMAL = The communication module processor (CMP) is in MIN MODE, overload, initialization or isolation.
   MIN MODE = The administrative module (AM) or any switching module (SM) is in MIN MODE.
   OVERLOAD = The AM or any SM is in overload.
   SOFTWARE = Aborted due to internal system problems.
   TERMINAL PROCESS TIMEOUT = Aborted due to APT's terminal process timing out.

4. ACTIONS TO BE TAKEN

Reschedule APT at another time.

5. ALARMS

None.

Type: Output

1. FORMAT

REPT APT COMPLETE        LAST TKGMN TESTED a b c

2. REASON FOR OUTPUT

To report that the automatic progression testing (APT) has completed testing and ran to completion. The APT session ended because it cycled through to the end of the list of trunks to be tested.

If brevity control has not been inhibited for this message class, this message may or may not appear on the receive-only printer (ROP), depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number of the last trunk tested.
b = Trunk group member number of the last trunk tested.
c = The current trunk group is completely tested. Valid value(s):
   (blank) = Indicates the test has run to completion.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

[2] REPT APT FAILED TKGMN a b DEN c k l m OPDN h TYPE i n

[3] REPT APT FAILED TKGMN a b NEN c p q r s t u v OPDN h TYPE i n

2. REASON FOR OUTPUT

To report that the indicated trunk failed on operational test during automatic progression testing (APT).

If brevity control has not been inhibited for this message class, this message may or may not appear on the receive-only printer (ROP), depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

- a = Trunk group number.
- b = Trunk member number.
- c = Switching module (SM) number.
- d = Trunk unit number.
- e = Service group number.
- f = Channel board number.
- g = Circuit number.
- h = Digits outpulsed for the test call.
- i = Type of test performed. Valid value(s):
  - 103 = 103 operational test.
  - CONT = Continuity test.
  - CTX2 = Centrex phase II test line.
  - CTX3 = Centrex phase III test line.
  - LBK = Loopback test.
  - LBKINV = Loopback inverting test.
  - NSYNC = Nonsynchronous test.
  - PERM = Permanent busy test.
  - SXS = Step-by-step test line.
  - SYNC = Synchronous test.
4. ACTIONS TO BE TAKEN

When a trunk fails an operational test during APT, the trunk is taken out-of-service (OOS) but the trunk maintenance personnel may want to write a trouble report against the trunk if it is faulty. If an internal switch software error occurs repeatedly, refer to the TECHNICAL ASSISTANCE section of the INTRODUCTION.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report that the indicated trunk failed on operational test during automatic progression testing (APT).

If brevity control has not been inhibited for this message class, this message may or may not appear on the read-only printer (ROP), depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Trunk group number.
b = Trunk member number.
c = Switching module (SM) number.
d = Trunk unit number.
e = Service group number.
f = Channel board number.
g = Circuit number.
h = Digits outpulsed for the test call.
i = Type of test performed. Valid value(s):

103 = 103 operational test.
CONT = Continuity test.
CTX2 = Centrex phase II test line.
CTX3 = Centrex phase III test line.
LBK = Loopback test.
LBKINV = Loopback inverting test.
NSYNC = Nonsynchronous test.
PERM = Permanent busy test.
SXS = Step-by-step test line.
SYNC = Synchronous test.

k = Digital line and trunk unit (DLTU) number.
l = Digital facility interface number.
m = Channel number.
n = Reason for failure. For a description of this printout, refer to the TST:TRK output message.
p = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
q = Data group (DG) number.
r = SONET termination equipment (STE) facility number. For OIU-NAR, it is OC-3.
s = Synchronous transport signal (STS) facility number.
t = Virtual tributary group (VTG) number.
u = Virtual tributary member (VTM) number.
v = Digital signal level 0 (DS0) number.
w = Optical Interface Unit (OIU) number.
x = Protection Group number.

4. ACTIONS TO BE TAKEN

When a trunk fails an operational test during APT, the trunk is taken out-of-service (OOS) but the trunk maintenance personnel may want to write a trouble report against the trunk if it is faulty. If an internal switch software error occurs repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

REPT:APT-START-A

Software Release: 5E14 - 5E16(1)
Message Class: ATL
Application: 5
Type: Output

1. FORMAT

REPT APT STARTED FIRST TKGMN TESTED a b c

2. REASON FOR OUTPUT

To indicate that automatic progression testing (APT) has started the testing session. The APT was either scheduled automatically by the switch or manually by the SCHED:APT input messages.

If brevity control has not been inhibited for this message class, this message may or may not appear on the receive-only printer (ROP), depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number of the first trunk tested.

Note: Since APT tests 2 trunk groups at a time, the variable ‘a’ represents the numerically smaller trunk group number that were about to be tested when APT was stopped the last time. Together, ‘a’ and ‘b’ represent the trunk at which testing started for the current running of APT.

b = Trunk group member number of the first trunk tested.

c = Schedule of APT. Valid value(s):
MANUAL = Manual override of normal APT schedule using SCHED:APT messages.
NORMAL = APT started on normal schedule.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

Software Release: 5E16(2) and later
Message Class: ATL
Application: 5
Type: Output

1. FORMAT

REPT APT STARTED      FIRST  TKGMN TESTED a b c

2. REASON FOR OUTPUT

To indicate that automatic progression testing (APT) has started the testing session. The APT was either scheduled automatically by the switch or manually by the SCHED:APT input messages.

If brevity control has not been inhibited for this message class, this message may or may not appear on the read-only printer (ROP), depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number of the first trunk tested.

NOTE: Since APT tests up to 8 trunk groups at a time, the variable 'a' represents the numerically smallest trunk group number that was being tested when APT was stopped the last time. Together, 'a' and 'b' represent the trunk at which testing started for the current running of APT.

The trunk group and member number will each display a 0 the first time APT is run in an office or if APT is initialized (AM init or single process purge of APT system process).

b = Trunk group member number of the first trunk tested.

c = Schedule of APT. Valid value(s):
    MANUAL = Manual override of normal APT schedule using SCHED:APT messages.
    NORMAL = APT started on normal schedule.

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

Type: Output

1. FORMAT

REPT APT STOPPED        LAST TKGMN TESTED a b c

2. REASON FOR OUTPUT

To indicate that automatic progression testing (APT) ran until the duration timer expired. The next APT session begins with the next trunk group and member number specified in variables 'a' and 'b'.

If brevity control has not been inhibited for this message class, this message may or may not appear on the receive-only printer (ROP), depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

a  = Trunk group number of the last trunk tested.

b  = Trunk group member number of the last trunk tested.

c  = The test has stopped. Valid value(s):
   (blank)    = Indicates the test has run until the duration timer expired.

Message Class: ATL
Application: 5
Type: Output

1. FORMAT

REPT APT SUSPENDED        LAST TKGMN TESTED a b c

2. REASON FOR OUTPUT

To report that the automatic progression testing (APT) has been suspended due to an overload or minimum mode (MINMODE) condition. If the system does not return to normal within two hours after the suspension, APT will be aborted. If the system returns to normal within two hours, APT will resume the testing session.

If brevity control has not been inhibited for this message class, this message may or may not appear on the receive-only printer (ROP), depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number of the last trunk tested.
b = Trunk group member number of the last trunk tested.
c = Reason APT has been suspended. Valid value(s):
MIN MODE = Administrative module (AM) or switching module (SM) went into MIN MODE.
OVERLOAD = The AM or an SM is in overload.

Type: Output

1. FORMAT

REPT APT SUSPENDED LAST TKGMN TESTED a b c

2. REASON FOR OUTPUT

To report that the automatic progression testing (APT) has been suspended due to system abnormal conditions, such as overload, minimum mode (MIN MODE), initialization or isolation condition. If the system returns to normal within the session duration, APT will resume the testing session. If not, APT will resume at next scheduled day.

If brevity control has not been inhibited for this message class, this message may or may not appear on the ROP, depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number of the last trunk tested.
b = Trunk group member number of the last trunk tested.
c = Reason APT has been suspended. Valid value(s):
   CMP ABNORMAL = Communication module processor (CMP) is in MIN MODE, overload, initialization or isolation.
   MIN MODE = Administrative module (AM) or any switching module (SM) went into MIN MODE.
   OVERLOAD = AM or any SM is in overload.

   ALGORITHM c d n

5. REPT APT a TKGMN a b TEN c d e f g OPDN h TYPE i
   ALGORITHM c d n

2. REASON FOR OUTPUT

To report that the indicated trunk passed or failed an operational test during automatic progression testing (APT). The trunk selected for testing is based upon the algorithm provisioned on RC/V View 8.1 (OFFICE PARAMETERS (MISCELLANEOUS)). The testing algorithm can also be provisioned on DS1 level to override the office algorithm, which is done on RC/V View 20.4 (DIGITAL LINE/TRUNK UNIT PACK EQUIPMENT) for DLTU/DLTU2, View 20.24 (DIGITAL NETWORKING UNIT SONET VIRTUAL TRIBUTARY (SM2000)) for DNU-S, View 20.27 (PCT LINK TRIBUTARY) for PLTU, and View 20.31 (LOW-LEVEL VIRTUAL CONTAINER) for OIU. For analog trunks, only sequential office algorithm is allowed. The algorithm printed is the effective algorithm used in testing the trunk.

For sequential algorithm, only in-service (IS) trunks are tested. For other (non-sequential) algorithms, APT tests a trunk on a DS1 that has not been tested in this cycle, is not busy and not manually removed from service. For non-sequential algorithm, a 15 seconds camp-on time is used to allow APT waits for the busy trunk to become available.

When a trunk fails an operational test, a failure report will be printed and the trunk will be removed from service up to the AML limit. When a trunk which was previously placed out-of-service (OOS ROTF) by APT passes an operational test, a passed report will be printed and the trunk will be restored to service (for non-sequential algorithms). A trunk that passes an operational test and is IS will not produce a passed report since this would cause large amounts of messages to the ROP.
If brevity control has not been inhibited for this message class, this message may or may not appear on the ROP, depending on whether the threshold of messages for this message class has been reached in a 15-minute interval.

3. VARIABLE FIELD DEFINITIONS

- **a** = Trunk group number.
- **b** = Trunk member number.
- **c** = Switching module (SM) number.
- **d** = Trunk unit number.
- **e** = Service group number.
- **f** = Channel board number.
- **g** = Circuit number.
- **h** = Digits outpulsed for the test call.
- **i** = Type of test performed. Valid value(s):
  - **103** = 103 operational test.
  - **CONT** = Continuity test.
  - **CTX2** = Centrex phase II test line.
  - **CTX3** = Centrex phase III test line.
  - **LBK** = Loopback test.
  - **LBKINV** = Loopback inverting test.
  - **NSYNC** = Nonsynchronous test.
  - **PERM** = Permanent busy test.
  - **SXS** = Step-by-step test line.
  - **SYNC** = Synchronous test.
- **k** = Digital line and trunk unit (DLTU) number.
- **l** = Digital facility interface (DFI) number.
- **m** = Channel number.
- **n** = Reason for failure. For a description of this printout, refer to the TST:TRK output message.
- **p** = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
- **q** = Data group (DG) number.
- **r** = SONET termination equipment (STE) facility number. For OIU-NAR, it is OC-3.
- **s** = Synchronous transport signal (STS) facility number.
- **t** = Virtual tributary group (VTG) number.
- **u** = Virtual tributary member (VTM) number.
- **v** = Digital signal level 0 (DS0) number.
w = Optical interface unit (OIU) number.

x = Protection group number.

y = Peripheral control and timing line and trunk unit (PLTU) number.

z = PCT facility interface (PCTFI) number.

a1 = Test result. Valid value(s):
    FAILED
    PASSED

b1 = Tributary number.

c1 = Algorithm used in testing trunks. Valid value(s):
    FULL = The level of concurrency (number of processes testing trunks) is adjustable from 1 to 8. APT tests trunks of DS1 facility, which have not been tested, not busy and not manually removed from service. If the test passes or fails, APT moves on to the next trunk on the DS1.
    SEQUENTIAL = Two processes are used to test trunks in the office. Trunks which fail the operational test are taken OOS ROTF. Only IS trunks are tested.
    STOP ON SUCCESS = The level of concurrency (number of processes testing trunks) is adjustable from 1 to 8. For each cycle, APT tests one or more members of each DS1 facility, by selecting trunks that have not been tested, not busy and not manually removed from service. If the test fails, APT moves on to the next trunk on the DS1. If the failure continues, APT selects another trunk, until all the trunks on the DS1 have been tried or until one test passes.
    TEST 1 ONLY = The level of concurrency (number of processes testing trunks) is adjustable from 1 to 8. For each cycle, APT tests only one member of each DS1 facility, by selecting trunk that has not been tested, not busy and not manually removed from service. If the test passes or fails, APT moves on to the next DS1.

d1 = Indicate retest or not. Valid value(s):
    (blank) = Normal testing of the trunk.
    RETESTED = Trunk failed the test in previous cycle, its retested and passed in this cycle. This is printed only for non-sequential algorithms.

4. ACTIONS TO BE TAKEN

When a trunk fails an operational test during APT, the trunk is taken OOS but the trunk maintenance personnel may want to write a trouble report against the trunk if it is faulty. If an internal switch software error occurs repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

REPT:ARR-AUTORST

Software Release: 5E14 and later  
Message Class: SWM01  
Application: 5,CNI  
Type: Output

1. FORMAT

[1] REPT ARR AUTORST
   ACTIVATED

[2] REPT ARR AUTORST
   a b FOR c d

[3] REPT ARR AUTORST
   RECOVERY THRESHOLD EXCEEDED FOR c

[4] REPT ARR AUTORST
   TIMEOUT AWAITING MIRA FOR c

[5] REPT ARR AUTORST
   a b FOR c STOPPED

[6] REPT ARR AUTORST
   ACNR CONFIGURATION REQUEST TO INCLUDE c e
     f

2. REASON FOR OUTPUT

To report the result of an automatic ring recovery (ARR) routine of the interprocess message switch (IMS).

Format 1 reports that the timing interval following an IMS level 3 or 4 initialization has expired and that the ARR system of the IMS driver is now active for recovery of inactive nodes. During the timing interval, ARR will recover only those inactive nodes that are designated by application critical node recovery (ACNR).

Format 2 reports the state of an automatic restoration of the specified ring node.

Format 3 reports that the restoration count for the specified ring node has exceeded its threshold value (3). No further action will be taken by ARR. The node is placed in the manual state awaiting user intervention.

Format 4 reports that a timeout has occurred awaiting a reply from the maintenance input request administrator (MIRA) regarding the disposition of a conditional restoration requested by the ARR routine. The node is placed in the manual state awaiting user intervention.

Format 5 reports that a nominated critical node could not be restored, probably because the input message INH:DMQ with the SRC=ALL option has been entered. The ring recovery software cannot proceed until manual action is taken to restore the node or mark it manual.

3. VARIABLE FIELD DEFINITIONS
a  = Source of the recovery. Valid value(s):
    ACNR = Application critical node recovery.
    ARR  = IMS automatic ring recovery.
    CNR  = IMS critical node recovery for inactive beginning of isolated segment and end of isolated segment (BISO/EISO).

b = Type of recovery. Valid value(s):
    CONDRST = Conditional restoration.
    RSTRT   = Restart.
    UCLRST  = Unconditional restoration.

c = Ring node (RN) name (for example, RPCN000).

d = The state of an automatic restoration of the specified ring node. Valid value(s):
    ABORTED = Reports that an automatic restoration requested by an ARR routine has been aborted, but without discovering a problem with the node. ARR will reattempt a restoration of the node at a later time, unless the restoration count for the node has exceeded its threshold value (3).
    FAILED  = Reports that an automatic restoration requested by the ARR routine has failed, due to a failing diagnostic phase. No further action will be taken by ARR. The node is placed in the manual state awaiting user intervention.
    STARTED = Reports that a node recovery has started.
    SUCCEEDED = Reports that a node recovery has succeeded.

e = Configuration inclusion direction. Valid value(s):
    IN BISO DIRECTION = Attempt to configure ACNR node into the BISO end of the active ring.
    IN EISO DIRECTION = Attempt to configure ACNR node into the EISO end of the active ring.
    IN EISO DIRECTION = Normal ring is requested.

f = The value of the real-time clock at the time the report is formatted. The real-time clock has a granularity of 1ms. Used in correlation with other reports.

4. ACTION TO BE TAKEN

For Formats 1 and 2, no action is required.

For Formats 2 and 3, manually diagnose and restore the ring node by using the RST input messages for a restoration on a specified ring node with or without diagnostics being run. The DGN input messages will run diagnostics on the specified node with no restoration.

For Format 4, abort the automatic restoration request by using the OP:DMQ and STOP:DMQ input messages. Then manually diagnose and restore the specified ring node as described for Format 2.

For Format 5, remove the inhibits against ARR or ALL as soon as possible and manually restore the specified node. This is important to restarting the automatic ring recovery software.

For Format 6, none.

5. ALARMS
Minor.

118 (CNI FRAME AND CCS LINK STATUS)
REPT:AS-AMA-DISK
Software Release: 5E14 and later
Message Class: ALRM
Application: 5
Type: Output

1. FORMAT
   REPT AS AMA DISK FULL

2. REASON FOR OUTPUT
   To report that the automatic message accounting CAMA partition on the disk is full. A major alarm occurs.

3. VARIABLE FIELD DEFINITIONS
   None.

4. ACTION TO BE TAKEN
   Determine the reason why data is not being taken off the disk. If localized AMA (LAMA) office, write to tape. If teleprocessing office, use data link to host collector (HOC).

5. ALARMS
   Major.

6. REFERENCES
   None.
1. FORMAT

REPT AS AMA LDC a b
   PORT   MODULE   MID   PID
c      d        e     f - g - h

2. REASON FOR OUTPUT

To report long duration calls (LDCs), which are calls that have been continuously in the talk state at a scheduled record generation time for more than 24 hours.

3. VARIABLE FIELD DEFINITIONS

a = Sequence number of this message.
b = Continuation indicator. Valid value(s):
   + = Yes.
   - = No.
c = Port member number (in hexadecimal).
d = Module number.
e = Number of midnights that have elapsed.
f = Process number of controlling process.
g = Process identifier (PID) of controlling process.
h = Uniqueness field of controlling process.

4. ACTION TO BE TAKEN

Attempt to verify that the call is valid; if not, idle the call. Notify the billing center if the call is idled.

5. ALARMS

None.

REPT:ASM-NI-A

Software Release: 5E14 only
Message Class: ASM
Application: 5
Type: Output

1. FORMAT

REPT ASM NETWORK INTERFACE a b

2. REASON FOR OUTPUT

To report the status of the network interface.

3. VARIABLE FIELD DEFINITIONS

a = Network interface name. Valid value(s):
  hme = This is the port integral to the back plane of the ASM.
  qfe0 = This is the top port of the Quad Fast Ethernet card.
  qfe1 = This is the second from top port of the Quad Fast Ethernet card.
  qfe2 = This is the third from top port of the Quad Fast Ethernet card.
  qfe3 = This is the bottom port of the Quad Fast Ethernet card.

b = Status. Valid value(s):
  FAULT = Indicates either the named network interface was configured in error or the cable connection between the named network interface and the network hub or another processor was broken.
  RESTORED = Indicates either a misconfigured network interface has been removed or a broken connection to the network hub or another processor has been restored.

4. ACTIONS TO BE TAKEN

If 'a' = FAULT and the named network interface was configured in error, delete the /etc/hostname.a file on the ASM. (Refer to definition of 'a' to fill in this information.) If the network interface is intended to be used, check the cable between the network interface and the hub or applicable processor. Make sure the hub or processor is powered on.

If any other status is indicated, no action is required.

REPT: ASP-TIMEOUT

   Software Release: 5E15 and later
   Message Class: TRFM
   Application: 5
   Type: Output

1. FORMAT

   REPT ASP TIMEOUT ALARM a
   [TIMEOUT QUERIES b]
   [TOTAL QUERIES c]
   [TIME INTERVAL d MINUTES]
   [ALARM THRESHOLD e%]

2. REASON FOR OUTPUT

   To report the occurrence of advance services platform (ASP) timeout alarm.
   The craft sets the time interval in range from 5 to 60 minutes in increments of 5 minutes and alarm threshold in range from 1 to 100 percent in increments of 1 using RC/V view 8.49. At the end of each time interval, the ratio of number of ASP timeout queries to the total number of ASP queries is calculated. Depending on the newly and previously calculated ratios, an output message with a Major alarm is reported, or an output message without an alarm is printed or nothing is happened.

3. VARIABLE FIELD DEFINITIONS

   a
   = Alarm status. Valid value(s):
   THRESHOLD EXCEEDED = The newly measured ratio has exceeded the threshold and the ratio from the previous interval was below the threshold. In this case an output alarm message is printed on the ROP with a MAJOR alarm also reported on the MCC and OAP.
   CONTINUED = The measured ratio continues exceeding the threshold (the newly measured ratio and the previous measured ratio has exceeded the threshold). In this case an output message is printed on the ROP without alarms.
   CLEARED = The newly measured ratio is below the threshold while the ratio measured from the previous time interval is above the threshold. In this case an alarm clear message is printed on the ROP.

   b
   = Number of ASP timeout queries.

   c
   = Number of total ASP queries.

   d
   = Time interval. This value represents the time interval that is set on the RC/V view 8.49.

   e
   = Alarm threshold. This value represents the threshold that is set on the RC/V view 8.49.

4. ACTIONS TO BE TAKEN

   This is a warning of a possible problem with the switch. Some investigation may be required to determine the cause of the alarm.

5. ALARMS
6. REFERENCES

RC/V View(s):

ADVANCED SERVICES PLATFORM PARAMETERS
REPT:ASP

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

[1] REPT ASP a TRAPPED b RECEIVED [m]
   k c [d|e] [f] [l]

[2] REPT ASP ASPACGCOMP TRAPPED b RECEIVED [m]
   k c [l]
   ACG OPERATION ACG CAUSE GAP DURATION
   g h i j

2. REASON FOR OUTPUT

To report the occurrence of a service switching point (SSP) advanced services platform (ASP) event trap. This message is in response to a SET:DSE input message when an SSP or service control point (SCP) originated message causes a trap set by the SET:DSE input message to be hit.

Format 1 displays one of the following trappable events: a query blocked by network management (NM), a query or conversation returned by the network, a reply overdue from SCP, a reject, a play announcement, a send notification component, a termination notification, a return error, and an abort.

Format 2 displays the format for an event trap that has an automatic call gap (ACG) component in a unidirectional or response message from the SCP.

3. VARIABLE FIELD DEFINITIONS

a = The event that was trapped. Valid value(s):
   ASPACGCOMP = The trap included an SCP response or unidirectional message with an ACG component received at the switch.

   When the event trap for a received ACG component is set and a test query response or unidirectional message arrives with an ACG component, two messages are sent to the originating input/output channel. The first is a test query response message and the second is an ACG event trap message.

   ASPBADRESP = The trap includes an SCP response message received with invalid data.

   ASPNORTEMSG = The trap includes a reject message, a return error, an abort, and a play announcement received at the switch from the SCP.

   ASPQRYFAIL = The trap includes a query blocked by NM ACG, a returned query or conversation received at the switch or a timeout received in call processing.

   ASPSNCOMP = The trap includes an SCP response message with a send notification component received at the switch.

   ASPTNMSG = The trap includes a termination notification message sent from the switch to the SCP.

b = The subclass of the event trapped. Valid value(s):
ABORT = This is a type of ASPNORTEMSG trap. It occurs when an abort message is received at the switch from the SCP.

ACG_BLK = This is a type of ASPQRYFAIL trap and it occurs when a query is blocked by NM ACG in the administrative module (AM) or direct link node (DLN).

AMORDLN_INV = This is a type of ASPBADRESP trap and it occurs when an SCP response message with invalid data is received in the AM or DLN.

ANNOUNCEMENT = This is a type of ASPNORTEMSG trap and it occurs when a play announcement is received at the switch from the SCP.

NULL = This is a type of ASPACGCOMP trap and it occurs when the SCP sends an ACG component to perform ACG administration (install/update/delete controls) at the SSP.

REJECT = This is a type of ASPNORTEMSG trap and it occurs when a reject message is received at the switch from the SCP.

RETURN ERROR = This is a type of ASPNORTEMSG trap and it occurs when a return error message is received at the switch from the SCP.

RTRN_QRY = This is a type of ASPQRYFAIL trap and it occurs when a query or conversation does not reach the SCP and is returned to the originating switch.

SM_INV = This is a type of ASPBADRESP trap and it occurs when an SCP response message with invalid data is received in the SM.

SN_COMP = This is a type of ASPSNCOMP trap and it occurs when a response message with a send notification component is received at the switch.

TIMEOUT = This is a type of ASPQRYFAIL trap and it occurs when a timeout is received in call processing.

TN_MSG = This is a type of ASPTNMSG trap and it occurs when a termination notification message is sent from the switch to the SCP.

c = The number that caused an event to occur. If 'a' is ASPACGCOMP, then 'c' will be the first 3, 6, 7, 8, 9, or 10 digits of the controlled number.

<table>
<thead>
<tr>
<th>'a' =</th>
<th>'c' =</th>

</tr>
</tbody>
</table>

d = Additional data associated with the trapped event. Valid value(s):
BADLY STRUCTURED COMPONENT PORTION = Unrecognized component in the transaction capability application part (TCAP) message.
BADLY STRUCTURED TRANSACTION PORTION = Unrecognized transaction component in the TCAP message.
DATABASE OVERLOAD = SCP database overload.
DATA UNAVAILABLE = Switch unable to acknowledge SCP request for resource.
DESTINATION MASS CALLING = ACG control due to mass calling.
DUPLICATE INVOKE ID = The ID has already become assigned to another operation in progress.
FAR END SUBSYSTEM CONGESTION = Far end subsystem congestion (refers to SCP).
FAR END SUBSYSTEM PROHIBITED = Far end subsystem prohibited (refers to SCP).
FAR END SUBSYSTEM UNEQUIPPED = Far end subsystem unequipped (refers to SCP).
INCORRECT COMPONENT PORTION = Invalid component received in the TCAP message.
INCORRECT INVOKE PARAMETER = Unrecognized parameter in the TCAP message.
INCORRECT RETURN ERROR PARAMETER = Unrecognized parameter in the return error message.
INCORRECT RETURN RESULT PARAMETER = Unrecognized parameter in the return result message.
INCORRECT TRANSACTION PORTION = Unrecognized transaction portion in the TCAP message.
MESSAGE RETURNED FROM NETWORK INTERFACE = Unable to deliver TCAP message to the network.
MISSING CONDITIONAL PARAMETER = Conditional parameter is missing in the component.
MISSING CUSTOMER RECORD = Service key is missing from the SCP database.
MISSING MANDATORY INVOKE PARAMETER = Mandatory invoke parameter is missing from the invoke component.
MISSING MANDATORY RETURN ERROR PARAMETER = Mandatory return error parameter is missing from the return error component.
MISSING MANDATORY RETURN RESULT PARAMETER = Mandatory return result parameter is missing from the return result component.
NETWORK CONGESTION = Could not route TCAP message to SCP because of congested network.
NETWORK FAILURE = Could not route TCAP message to SCP because of network problems.
NO TRANSLATION FOR GLOBAL TYPE = No translation global type in the TCAP message.
OUT OF BAND = SCP instructed SSP to cut back on calls to nonpurchased numbering plan areas.
PERMISSION TO RELEASE PROBLEM = Permission was not given to release the transaction.
REPLY OVERDUE = SSP did not receive a response from the SCP in the allotted time.
SMS INITIATED = Control initiated by the service management.
TRANSLATION FAIL OF GLOBAL ADDRESS = Unable to decipher global address in the SCCP header.
UNAVAILABLE NETWORK RESOURCE = SCP was unable to access a resource requested at the SSP.
UNEXPECTED COMMUNICATION = SCP received a message with a package type that is not allowed.
UNEXPECTED COMPONENT SEQUENCE = Unexpected component in the TCAP message.
UNEXPECTED DATA VALUE = Unexpected data value in the TCAP message.
UNEXPECTED ERROR = Unexpected error in the TCAP message.
UNEXPECTED MESSAGE = An unexpected message was detected by the SCP.
UNEXPECTED MESSAGE SEQUENCE = The call-related message is not the first message in the TCAP package.
UNEXPECTED PARAMETER SEQUENCE = The parameters in the message are recognized but do not appear in the correct sequence.
UNEXPECTED RETURN ERROR = Unexpected return error message from the SCP.
UNEXPECTED RETURN RESULT = Unexpected return result message from the SCP.
UNRECOGNIZED COMPONENT = Unrecognized component in the TCAP message.
UNRECOGNIZED ERROR = Unrecognized error in the TCAP message.
UNRECOGNIZED INVOKE CORRELATION ID = Unrecognized correlation ID in the TCAP message.
UNRECOGNIZED OPERATION CODE = Unrecognized operation code in the TCAP message.
UNRECOGNIZED PACKAGE TYPE = Unrecognized package type in the TCAP message.
UNRECOGNIZED RETURN ERROR CORRELATION ID = Unrecognized correlation ID in the return error message.
UNRECOGNIZED RETURN RESULT CORRELATION ID = Unrecognized correlation ID in the return result message.
UNRECOGNIZED TRANSACTION ID = Unrecognized transaction ID in the TCAP message.

\( e \) = Additional data associated with the trapped event. Valid value(s):
If 'a' = And 'b' = 'c' = 

<table>
<thead>
<tr>
<th>'a' = ASPSNCOMP or ASPTNMSG</th>
<th>And 'b' = ASPNORTEMMSG =</th>
<th>'c' = ASPQRYFAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASPQRYFAIL or ASPTNMSG</td>
<td>ANN_MSG</td>
<td>ASPQRYFAIL ACG_BLKD</td>
</tr>
</tbody>
</table>

- The SCP subsystem number.
- The play announcement code.
- The SM number.
- The translation type. (No ranges displayed only for ASP 0.1)
- The translation type. (No ranges displayed only for ASP 0.1)

| f = Additional data associated with the trapped event. If 'a' is ASPSNCOMP or ASPTNMSG, then 'c' is the hex value of the SCP point code. |
| g = ACG operation to be performed at the SSP. Valid value(s): DELETE CNTL = Delete an ACG control. INFINITE DUR = Install an infinite ACG duration. INFINITE GAP = Install an infinite ACG gap. INSTALL CNTL = Install an ACG control. |
| h = ACG cause. Valid value(s): DATABASE OVLD = Control initiated by the SCP. SMS INITIATED = Control initiated by the service management system (that is, allow/disallow ASP calls). |
| i = Gap interval in seconds. |
| j = Duration interval in seconds. |
| k = The control digit type. Valid value(s): DIGIT TYPE ANI = Calling number associated with the event that caused an event to occur. DIGIT TYPE CALLED NUMBER = Called number associated with the event that caused an event to occur. DIGIT TYPE DNT = Dialed number trigger associated with the event that caused an event to occur. DIGIT TYPE GTA = Global title address associated with the event that caused an event to occur. NO DIGIT TYPE = No digit type available with the event that caused an event to occur. |
| l = Additional data associated with the trapped event. Valid value(s): |

<table>
<thead>
<tr>
<th>'a' = ASPQRYFAIL</th>
<th>And 'b' = ACG_BLKD</th>
<th>'c' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASPACGCOMP</td>
<td>NULL</td>
<td>ASPACGCOMP NULL</td>
</tr>
</tbody>
</table>

- Processor where the event was trapped. If 'a' is ASPQRYFAIL and 'b' is TIMEOUT then 'm' will be blank. Valid value(s):
  - CNI = The event was trapped on a common network interface (CNI) platform.
  - GSM = The event was trapped on a packet switching unit (PSU) platform but was unable to obtain the global switch module (GSM) number, missing or bad data.
  - GSM=n = The event was trapped on a PSU platform, where 'n' is the number of the GSM where the event was trapped.

4. ACTION TO BE TAKEN

The purpose of this message is to report the result of the action requested by the corresponding manually requested

2. REASON FOR OUTPUT

This is an automatic report of threshold limits being exceeded.

Format 1 is for the ATM quality of service.

Format 2 is ATM QOSPS.
Format 3 is AAL5 links.

Format 4 and 5 are for ATM links.

\section*{3. VARIABLE FIELD DEFINITIONS}

\begin{itemize}
\item \textbf{a} = Date of report - year.
\item \textbf{b} = Date of report - month.
\item \textbf{c} = Date of report - day.
\item \textbf{d} = Time of report - hours.
\item \textbf{e} = Time of report - minutes.
\item \textbf{f} = Time of report - seconds.
\item \textbf{g} = ATM link - SM.
\item \textbf{h} = ATM link - PSU.
\item \textbf{i} = ATM link - link.
\item \textbf{j} = VPI.
\item \textbf{k} = VCI.
\item \textbf{l} = Trunk group number.
\item \textbf{m} = Trunk group member number.
\item \textbf{n} = ATM connection PM direction. Valid value(s):
\begin{itemize}
\item \textbf{I} = Incoming.
\item \textbf{O} = Outgoing.
\end{itemize}
\item \textbf{o} = ATM packet pipe thresholds. Valid value(s):
\begin{itemize}
\item IMPLB
\item SECB

REPT:ATTS

Software Release: 5E14 and later
Message Class: APT, ATL
Application: 5
Type: Output

1. FORMAT

[1] REPT ATTS [SCHED=a] [WEEK=b] [DAY=c] [TGID=d] [STAT=e]
   NO TEST RESULTS MATCH INPUT PARAMETERS

[2] REPT ATTS (SCHED=a|ALL ACTIVE SCHEDULES) (RESTARTED|STOPPED)

[3] REPT ATTS INTERNAL ERROR h

[4] REPT ATTS j
   SCHED=a WEEK=b DAY=c START=k

[5] REPT ATTS LOG FILE m (n|o)

2. REASON FOR OUTPUT

Format 1 reports test results matching the DUMP:ATLOG input request do not exist.

Formats 2 through 5 report automatically-detected internal errors or off-normal system conditions affecting ATTS operation.

3. VARIABLE FIELD DEFINITIONS

a = Schedule number (1 - 20 or none).
b = Schedule week number (1 - 8 or none).
c = Schedule day number (1 - 7 or none).
d = Identity of trunk group to be tested.
e = Status type indicating what results will be printed. Valid value(s):
   A = Print ABORTED trunk test results only.
   FA = Print FAILED or ABORTED trunk tests results only.
   FU = Print FAILED and/or UNAVAILABLE trunk test results only.
   F = Print FAILED trunk test results only.
   PFA = Print all trunk test results.
   P = Print PASSED trunk test results only.

f = Type of operational test executed.
= Description of reported condition.

= Coded numeric data that indicates where ATTS software detected reported condition. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

= Description of reported condition. Valid value(s):

- ERROR IN LOG FILE CONTROL DATA
- ERROR IN LOG FILE I/O -- LOGGING
- ERROR IN LOG FILE I/O -- RETRIEVAL
- ERROR IN SHARED SEGMENT ALLOCATION
- FILE SYSTEM ERROR -- /dev/atts NOT MOUNTED
- INTERPROCESS MESSAGE COMMUNICATION PROBLEM
- INVALID DAY NUMBER
- INVALID SCHEDULE NUMBER
- INVALID TEST DATA
- INVALID TEST TYPE
- MEMORY MANAGEMENT FAULT
- NEW TEST TYPE FOR SCHEDULE
- TEST RESULT MAXIMUM EXCEEDED
- TRUNK GROUP MAXIMUM EXCEEDED
- UNABLE TO CONNECT TO COMMUNICATION PORT
- UNABLE TO SPOOL OUTPUT DATA

= Action as result of reported problem. Valid value(s):

TEST SESSION ABORTING = The indicated ATTS test session is terminating prematurely.

TEST SESSION ABORTING, SESSION DATA PROBLEM = The indicated ATTS test session is terminating prematurely as a result of a problem detected in the session's ATTS test schedule database entry. Severity of the problem could not be automatically minimized. The problem requires manual database administrative action to correct.

TEST SESSION DATA PROBLEM = A problem has been detected in the ATTS test schedule database entry associated with the indicated test session. Severity of the problem has been automatically minimized by ATTS at run time to eliminate need for aborting the session. However, the problem requires manual database administrative action to correct permanently.

= Session's scheduled starting time.

= Description of detected problem.

= Name of LOG file.

= IS APPROACHING MAXIMUM SIZE.

= IS CORRUPT, SOME DATA MAY BE LOST.

4. ACTION TO BE TAKEN

None.

5. ALARMS
None.

**[6]**  
REPT AUDSTAT ABORTED CANNOT CREATE TEMPORARY FILE

__________________________________________________________________

### 2. REASON FOR OUTPUT

Formats 1 and 2 print the status of audits controlled by the system integrity monitor (SIM). Inhibited audits whose mode permissions prevent them from executing in routine or software request modes will not appear in the output message, unless the blocking state causes the audit to appear. In this case, the inhibit source will be enclosed in parentheses.

Blocked audits whose mode permissions prevent them from executing in any mode will not appear in the output message.

Format 3 reports an equipment configuration database (ECD) interface error.

Format 4 reports an error when creating a temporary file.

Format 5 reports an error when writing to a temporary output file.

Format 6 reports an error when unable to create a uniquely-named temporary file.

### 3. VARIABLE FIELD DEFINITIONS
4. ACTION TO BE TAKEN

For Formats 1, 2, and 3, use the OP:AUD input message to obtain additional status on the audits. Use the ALW:AUD input message to allow audits that should be allowed.
For Format 4, all the inodes of the tmp file system are being used. Clean up unused files in the tmp file system using the CLR:FSYS-FILE input message before retrying the input message.

For Format 5, all tmp file system space has been used. Clean up unused files in the tmp file system using the CLR:FSYS-FILE input message before retrying the input message.

For Format 6, system resources do not permit of the OP:AUDERR input message at this time. Retry later. If the command continues to fail, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

235-600-400 Audits
REPT:AUTH

Software Release: 5E14 and later  
Message Class: LINE  
Application: AEWNC  
Type: Output

1. FORMAT

[1] REPT AUTH MANAGEMENT  
AUTHENTICATION FAILURE THRESHOLD EXCEEDED  
DN = a b

[2] REPT AUTH MANAGEMENT  
UPDATE SHARED SECRET DATA RESULT  
DN = a b

2. REASON FOR OUTPUT

To report on the authentication status for a subscriber's wireless handset. The report will indicate either the results of the UPD:SSD input message or that the wireless subscriber has exceeded the number of consecutive authentication failures allowed.

3. VARIABLE FIELD DEFINITIONS

a = Wireless subscriber's directory number.

b = Status. Valid value(s):
  COMPLETED = Update of shared secret data has been successfully completed. The subscriber's wireless handset is available for usage.
  FAILED:RETRY LATER, HANDSET DISABLED = Update of shared secret data has failed. The subscriber's wireless handset remains disabled.
  FAILED:RETRY LATER, HANDSET AVAILABLE = Update of shared secret data has failed. The subscriber's wireless handset remains active.
  HANDSET DISABLED = The subscriber's wireless handset has been disabled. No access attempts to the switch will be allowed until a UPD:SSD input message has been successfully executed.

4. ACTION TO BE TAKEN

Execute the UPD:SSD input message for failure conditions or when the handset has been disabled. If repeated attempts fail, then the wireless subscriber will need to return the handset back to the service provider for repair.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing the autobkup process.

3. VARIABLE FIELD DEFINITIONS

a = Process identification (PID) number for the autobkup process that is currently executing.
b = Last volume in a session on the tape.
c = Moving head disk (MHD) unit number.
d = A file.
e = System error code. Refer to the APP:SYSERR appendix in the Appendices section of the Output Messages manual.
f = PID number of a process that is connected to the field update port.
g = An input message.
h = Status code.
i = Number of disk blocks written to tape by the current backup.
j = Pathname of the tape device specified in the backup option file.
k = Pathname.
l = Number of arguments that need to be specified in the autobkup UNIX® input message.
m = Positioning session number which is used in conjunction with the positioning volume number to determine the position on the tape where the backup is to be written.
n = Positioning volume number which is used in conjunction with the positioning session number to determine the position on the tape where the backup is to be written.
o = Pathname to the backup partition sum file.
p = Checksum calculated for the backup partition file.
q = Library tape error. Refer to the APP:TAPE_LIB appendix in the Appendices section of the Output Messages manual.
r = Volume number associated with a volume being backed up onto tape. Valid value(s):
   1 = AMTEXT.
   2 = AMODD.
   3 = SMTEXT.
   4 = SMODD1 (start of SMODD volumes).
s = Pathname to a disk partition special device file or a backup partition file.
t = The input message used to execute the process that failed. The input message can be in the format of a program documentation standards (PDS) input message or a UNIX® input message depending on the type of process executed, and can be up to three lines long.

u = Number of arguments that were specified in the UNIX® input message used to execute the autobkup process.

v = Mode of the tape device special device file.

w = Keyword associated with an error in the backup option file.

x = Invalid option detected in the backup option file.

y = Last session on the current tape.

z = Session number specified in the backup option file that indicates the session to which the backup is to be written on the tape.

a = PID number returned from the wait() system call for a child process that terminated.

b = PID of the child process that was executed by the autobkup process.

c = Office base and control number for the office in which the backup was performed.

d = Date on which the backup was performed.

e = Generic on which the current office is running.

f = Number of the last BWM that was installed into the current office.

g = Name of the volume that was backed up onto tape.

h = Pathname of the tape device to which the backup was written.

i = VTOC on which the volume that was backed up resides.

j = Disk on which the backup was written.

4. ACTIONS TO BE TAKEN

The table below describes the action that is to be taken for each message that is output by the autobkup process. If an issue cannot be resolved, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

After the issue is resolved, if it is desired to attempt the backup again before the next regularly scheduled time, use the SCHED:BKUP input message to schedule the backup for the second attempt. If scheduling the backup for the second attempt causes it to be scheduled within 8 hours of a previously scheduled backup, the CLR:BKUP input message must first be used to clear the previously scheduled backup, and then the SCHED:BKUP input message can be used to schedule the second backup attempt.

Clearing the previously scheduled backup will result in backups no longer being executed on that day and time. If the original backup schedule needs to be kept intact, then after the second attempt of the backup completes, use the CLR:BKUP input message to unschedule the backup for the second attempt, and use the SCHED:BKUP input message to reschedule the original backup.
The following list contains the format number in the first column along with the corresponding action to be taken for that particular format in the second column.

<table>
<thead>
<tr>
<th>Format</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The autobkup process aborted. Find the REPT:AUTOBKUP error messages that were output and follow the action to be taken for those error messages.</td>
</tr>
<tr>
<td>2</td>
<td>The autobkup process successfully performed the backup.</td>
</tr>
<tr>
<td>3</td>
<td>Another automated system backup is already in progress. Only one automated system backup can be executing at one time. Wait until the backup currently executing completes before attempting to execute another backup.</td>
</tr>
<tr>
<td>4</td>
<td>An automated system backup cannot be performed while a process is connected to the field update port 'PT_FLDUPD'. Wait until the process that is currently attached to the port, identified by the PID number specified in 'r', has completed before attempting the backup again.</td>
</tr>
<tr>
<td>5</td>
<td>An audit completed with errors. The variable 'g' identifies the input message, in PDS format, used to execute the audit that completed with errors. Run the audit manually and correct the errors detected by the audit.</td>
</tr>
<tr>
<td>6</td>
<td>An audit failed to complete. The variable 's' represents the termination status returned in the audit acknowledgement message. The variable 'q' represents the input message, in PDS format, used to execute the audit that did not complete.</td>
</tr>
<tr>
<td>7</td>
<td>An automated system backup was attempted to be executed when backups are inhibited. Investigate the reason for automated system backups being inhibited. If automated system backups need to be allowed, execute the ALW:AUTOBKUP input message, and re-schedule the backup.</td>
</tr>
<tr>
<td>8</td>
<td>An automated system backup cannot be performed while a retrofit is in progress. Wait for the retrofit to complete before attempting to perform another automated system backup.</td>
</tr>
<tr>
<td>9</td>
<td>An automated system backup cannot be performed while a generic backup (genbkup) is in progress. Wait for genbkup to complete before attempting to perform another automated system backup.</td>
</tr>
<tr>
<td>10</td>
<td>An automated system backup cannot be performed while an office-dependent database (ODD) backup is in progress. Wait for the ODD backup to complete before attempting another automated system backup.</td>
</tr>
<tr>
<td>11</td>
<td>An automated system backup cannot be performed while ODD memory growth is in progress. Wait until the ODD memory growth completes before executing another automated system backup.</td>
</tr>
<tr>
<td>12</td>
<td>An automated system backup cannot be performed while the system is booted in minimum configuration mode. An automated system backup can only be performed while the system is booted in full configuration mode.</td>
</tr>
<tr>
<td>13</td>
<td>An automated system backup cannot be performed while temporary software updates exist in the system. The updates must either be backed out or made official before another automated system backup is attempted.</td>
</tr>
<tr>
<td>14</td>
<td>The backup option file could not be found under the directory /no5text/bkup/autobkup. The variable 'u' represents the full pathname of the backup option file that was specified in the autobkup UNIX® input message. Check the cron table (/unixa/spool/cron/crontabs/root) entry for that backup. Verify that the desired backup option file is specified on the autobkup UNIX® input message. If it is not, the cron table entry for that backup is invalid. Use the CLR:BKUP input message to unschedule the invalid backup from the cron table. Use the SCHED:BKUP input message to reschedule the backup with the desired backup option file. Verify that the backup option file exists in the /no5text/bkup/autobkup directory. If it does not, use the SET:BKUP input message to create the backup option file in that directory.</td>
</tr>
<tr>
<td>15</td>
<td>Cannot obtain the minor device chain table (MDCT) record for the tape special device file from the equipment configuration database (ECD). Verify that the MDCT record for the tape device exists in the ECD database.</td>
</tr>
<tr>
<td>16</td>
<td>The file system mount point directory, represented by 'k', cannot be accessed. Verify that the directory exists and has read/write permission.</td>
</tr>
<tr>
<td>17</td>
<td>The unit control block (UCB) record in the ECD could not be accessed for the specified disk or tape</td>
</tr>
</tbody>
</table>
device. Verify that the UCB record exists in the ECD database for the specified disk or tape device.

18 The PSESS and PVOL options (represented by ‘n’ and ‘m’ respectively) specified in the backup option file (represented by ‘d’) indicate that the backup is to be appended onto the tape past the last allowable session/volume which is ‘session9/volume 9’.

Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a backup option file with valid PSESS and PVOL options for the append backup.

19 An error occurred while attempting to attach to the ODD.

20 The lia_dbatt() library call failed to attach to the system generation (SG) database. Verify that the SG database files, /database/appdmert.sg<*>.*, exist with read permission.

21 An error occurred while attempting to attach to the ECD. Verify that the ECD database file, /database/appedc, exists and has read permission.

22 The close() system call failed to close the tape device. Interpret the system error code.

23 The autobkup process could not re-connect to the port after the CMPR:DISK process completed.

24 The autobkup process cannot connect to the field update port ‘PT_FLDUPD’. If the error message contains an ERRNO value, interpret the system error code.

25 The creat() system call failed to create the autobkup status file (represented by ‘d?’).

Verify that all directories in the path to the autobkup status file exist and have read/write permissions.

Verify that the /no5text file system contains enough space for the file. Interpret the system error code.

26 The creat() system call failed to create a temporary file (represented by ‘d?’) when saving the ODD backup schedule.

Verify that the directories leading up to the temporary file exist and have read/write permissions.

Verify that the file system contains enough space for the file. Interpret the system error code.

27 The unit control block (UCB) form for the backup disk (represented by ‘c’) in the ECD could not be accessed to determine the state of the disk.

28 The getport() system call failed. Interpret the system error code.

29 The last_v() function failed to determine what the last volume is in the session represented by ‘m’ on the tape represented by ‘j’. Refer to the APP:TAPE-LIB appendix in the Appendices section of the Output Messages manual for the cause of the error.

Execute the DUMP:BKTAPE input message to determine the sessions/volumes that are currently on the tape.

Verify that the correct tape is specified in the backup option file. Verify that the correct tape is loaded in the tape drive. Verify that the tape special device file has read/write permissions. Verify that session ‘m’ exists on the current tape. Verify that the tape is valid: it is in multi-volume format, the sessions on the tape are in sequential order, and the volumes are in ascending order. Verify that correct options are specified in the backup option file.

If options in the backup option file are incorrect, use the CLR:FSYS-FILE input message to remove the invalid backup option file, and use the SET:BKUP input message to create a valid backup option file.

30 The last_s_v() function could not determine the last session/volume on the current tape. Refer to the APP:TAPE-LIB appendix in the Appendices section of the Output Messages manual for the cause of the error. Verify that the correct tape is loaded in the tape device.

31 The autobkup process could not disconnect from the field update port before executing the CMPR:DISK process.

Interpret the system error code. If desired, the backup can be attempted again since the autobkup process was automatically disconnected from the port when it terminated.

32 The autobkup process could not disconnect from the field update port before executing the COPY:PTN process.

Interpret the system error code. If desired, the backup can be attempted again since the autobkup process was automatically disconnected from the port when it terminated.

33 The autobkup process could not disconnect from the field update port before executing the
<p>| | |</p>
<table>
<thead>

<td>A process that was executed by the autobkup process failed. If the error message contains &quot;COMMAND:&quot;, 'g' represents the input message used to execute the process that failed. The input message can be in either PDS format or UNIX® input message format depending on the type of process executed. Execute the process manually to determine if the process is functioning properly. Verify that the options specified on the input message are correct. Find additional error messages output directly from the failed process for more information on the cause of the failure. If the error message contains &quot;STATUS:&quot;, 'h' represents the termination status returned by a wait() system call that was waiting for a process executed by autobkup to complete. See additional REPT:AUTOBKUP messages for the input message of the failed process.</td>
</tr>
<tr>
<td>76</td>
<td>A process that was executed by the autobkup process failed. The variable 't' represents the input message used to execute the process that failed. The input message can be in either PDS format or UNIX® input message format depending on the type of process executed. Execute the process manually to determine if the process is functioning properly. Verify that the options specified on the input message are correct. Find additional error messages output directly from the failed process for more information on the cause of the failure.</td>
</tr>
</tbody>
</table>
| 77   | The system integrity monitor (SIM) could not execute an audit. The variable 'q' represents the input
message, in PDS format, for the audit that could not be executed. The variable 'h' represents the failing request acknowledgement returned in the audit acknowledgement message. Execute the audit manually to determine if the audit is functioning properly.

78 The unit control block (UCB) record for the tape device in the ECD indicates that the tape device is not a DAT drive. Only DAT drives can be used for an automated system backup.

If the tape device specified in the backup option file is incorrect, use the CLR:FSYS-FILE input message to remove the invalid backup option file, and use the SET:BKUP input message to create a backup option file with a valid tape device.

Verify that the device_type field in the UCB record for the tape device in the ECD specifies 'DAT'.

79 A MHD or a tape device needed for the backup was not in the active state.

MHD0 and MHD1 must always be in the active state before any type of automated system backup can be performed. If the type of backup being performed is a software disk backup, the disk that is being used for the backup (MHD14 or MHD15) must be in the active state. If the type of backup being performed is a tape backup, the tape device must be in the active state.

Restore the disk or tape device to the active state.

80 Either a software disk backup or an update and verify disk backup failed. See additional REPT:AUTOBKUP messages for more information.

81 A duplicate keyword of TYPE, DEST, PSESS, PVOL, SESS, VOL, or TPSIZE was detected in the backup option file (represented by 'd'). Only one instance of each keyword is allowed.

Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a valid backup option file.

82 One of the options for the VOL keyword was specified more than once in the backup option file (represented by 'd').

Valid options for the VOL keyword for tape backups are: AMTEXT, AMODD, SMTEXT, and SMODD. Only one instance of each option is allowed to be specified. The only valid option for the VOL keyword for disk backups is NA.

Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a backup option file with valid VOL options.

83 An error was detected while obtaining information from the backup option file (represented by 'd'). See additional REPT:AUTOBKUP messages for more information.

84 An error was detected while parsing the autobkup UNIX® input message. See additional REPT:AUTOBKUP messages for more information.

85 An error occurred while attempting to allow ODD compression.

86 After the autobkup process executed the ALW:RC input message to allow ODD recent change, an error occurred while the autobkup process attempted to verify that recent change was actually allowed.

87 An error occurred while attempting to backup the administrative module (AM) ODD.

88 An error occurred while attempting to backup the ODD. See additional REPT:AUTOBKUP messages for more information.

89 The ODD backup schedule was not cleared properly.

After the autobkup process executed the CLR:ODDBKUP input message (which removes the backup schedule file), it checked to make sure the backup schedule was actually removed, and found that the backup schedule still existed.

90 The fork() system call failed to create a child process. Interpret the system error code and see additional REPT:AUTOBKUP messages for more information.

91 The recvw() system call failed while waiting for an audit acknowledgement from the system integrity monitor (SIM). Interpret the system error code and see additional REPT:AUTOBKUP messages for more information.

92 An error occurred while validating a file system being backed up. See additional REPT:AUTOBKUP messages for more information.

93 The calculated hash sum for a partition being backed up and its corresponding hash sum found in the backup sum file (/no5text/bkup/bkupsum) were different. See additional REPT:AUTOBKUP messages.
Only one mandatory argument, the name of the backup option file, is allowed on the autobkup UNIX® input message. It can either be specified as a full pathname, or just the file name (relative pathnames are not allowed).

Check the cron table (/unixa/spool/cron/crontabs/root) entry for that backup. If no arguments have been specified, or if more than one argument is specified on the autobkup UNIX® input message, this cron table entry is invalid. Use the CLR:bkup input message to unschedule the invalid backup from the cron table. Use the SCHED:BKUP input message to reschedule the backup.

A full pathname to the backup option file (represented by 'k') was specified on the autobkup UNIX® input message, but the pathname was not /no5text/bkup/autobkup. All backup option files must exist under the directory /no5text/bkup/autobkup.

Check the cron table (/unixa/spool/cron/crontabs/root) entry for that backup. If the full pathname to the backup option file on the autobkup UNIX® input message is not /no5text/bkup/autobkup, this cron table entry is invalid. Use the CLR:bkup input message to unschedule the invalid backup from the cron table. Use the SCHED:BKUP input message to reschedule the backup with a valid backup option file pathname.

Could not read a keyword in the backup option file (represented by 'd'). Verify that all keywords and options in the backup option file are valid. If invalid keywords or options exist, use the CLR:_FSYS-FILE input message to remove the invalid backup option file, and use the SET:BKUP input message to create a valid backup option file.

One of the settings specified in the MODE (represented by 'v') of the tape device is not set correctly. The special device file for the tape device must be a special device record file, must have read/write permissions set for owner and group only, and must not have execute permission for anyone.

If an invalid tape device is specified in the backup option file, use the CLR:FSYS-FILE input message to remove the invalid backup option file, and use the SET:BKUP input message to create a valid backup option file.

An invalid keyword (represented by 'w') was detected in the backup option file (represented by 'd'). Valid keywords are: TYPE, DEST, PSESS, PVOL, SESS, and VOL. Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a backup option file with valid keywords.

An invalid option was detected in the backup option file (represented by 'd') for the TYPE, PSESS, PVOL, SESS, VOL, or TPSIZE keyword.

Valid options for the TYPE keyword for a tape backup are BOT, APPEND, and EOD. The valid option for the TYPE keyword for a disk backup is DISK.

Valid options for the PSESS and SESS keywords are integers between 1 and 9. Valid options for the PVOL keyword are integers between 0 and 9.

Valid options for the VOL keyword for tape backups are AMTEXT, AMODD, SMTEXT, and SMODD. Only one instance of each VOL option is allowed to be specified. The only valid option for the VOL keyword for disk backups is NA.

Valid options for the TPSIZE keyword for tape backups are 90, 120, 125, and 150. The only valid option for the TPSIZE keyword for disk backups is NA.

Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a backup option file with valid TYPE, PSESS, PVOL, SESS, VOL, and TPSIZE options.

The option for the PSESS keyword (represented by 'm') in the backup option file (represented by 'd') is invalid for an append backup (TYPE:APPEND) to the tape currently loaded in the tape device. The PSESS option must be either equal to the LAST SESSION currently on the tape (represented by 'y') or one session before the LAST SESSION.
Execute the DUMP: BKTAPE input message to determine the sessions/volumes that are currently on the tape. Verify that the correct tape is loaded in the tape device.

Verify the correct PSESS option is specified in the backup option file. If not, use the CLR: FSYS-FILE input message to remove the invalid backup option file, and use the SET: BKUP input message to create a backup option file with a valid PSESS option.

101 The PSESS and SESS options (represented by ‘m’ and ‘z’ respectively) specified in the backup option file are inconsistent with the tape currently loaded.

If PSESS is equal to the LAST SESSION currently on the tape (represented by ‘y’):
* The backup is either being written to the LAST SESSION on the tape, or is being appended after the end of the LAST SESSION on the tape.
  - If the backup is being written to the LAST SESSION on the tape, SESS must equal PSESS.
  - If the backup is being appended after the end of the LAST SESSION on the tape, SESS must be one greater than PSESS.

If PSESS is one less than the LAST SESSION on the tape:
* The backup is being appended to the end of the next to the LAST SESSION on the tape causing the LAST SESSION on the tape to be overwritten. Therefore, SESS must equal the LAST SESSION currently on the tape.

Verify that the correct tape is loaded in the tape device. Execute the DUMP: BKTAPE input message to determine the sessions/volumes that are currently on the tape.

Verify the correct PSESS and SESS options are specified in the backup option file. If not, use the CLR: FSYS-FILE input message to remove the invalid backup option file, and use the SET: BKUP input message to create a backup option file with valid PSESS and SESS options.

102 The backup option file (represented by ‘d’) is missing a keyword (represented by ‘w’). Valid keywords are: TYPE, DEST, PSESS, PVOL, SESS, VOL, and TPSIZE. All keywords are mandatory and must exist in the backup option file.

Use the CLR: FSYS-FILE input message to remove the invalid backup option file. Use the SET: BKUP input message to create a backup option file with valid keywords.

103 An error occurred while the mount table was being checked to ensure that all of the file systems that are being backed up are mounted. See additional REPT: AUTOBKUP messages for more information.

104 A value other than 1 was detected in the backup option file (represented by ‘d’) for the SESS keyword. For a BOT backup, the session number must be 1 since a BOT backup is always written as the first session on the tape.

Use the CLR: FSYS-FILE input message to remove the invalid backup option file. Use the SET: BKUP input message to create a backup option file with a valid SESS option of 1 for the BOT backup.

105 An option is missing in the backup option file (represented by ‘d’) for the VOL keyword. For a BOT backup, all volumes (AMTEXT, AMODD, SMTEXT, SMODD) must be specified.

Use the CLR: FSYS-FILE input message to remove the invalid backup option file. Use the SET: BKUP input message to create a backup option file with valid VOL options.

106 The TYPE and DEST options in the backup option file (represented by ‘d’) are inconsistent. The TYPE option specifies a disk backup is being performed, however, the DEST option does not specify a valid disk destination.

For a disk backup, the only valid TYPE option is DISK, and valid DEST options are MHD14, MHD15, and BKPTN.
For a tape backup, valid TYPE options are BOT, APPEND, and EOD, and the only valid DEST option is the path to the tape device.

Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a backup option file with valid TYPE and DEST options.

</tbody>
</table>
An automated system backup cannot be performed while the system is booted on backup partitions. An automated system backup can only be performed while the system is booted on primary partitions.

The checksum (represented by ‘p’) calculated for the backup partition file (represented by ‘s’) does not match the checksum listed in the backup partition sum file (represented by ‘o’). Examine the backup partition sum file to determine if the file has been corrupted.

A precheck on either the tape device specified in the backup option file or a disk device failed. See additional REPT:AUTOBKUP messages for more information.

A backup to tape backup failed. See additional REPT:AUTOBKUP messages for more information.

A tape device was not specified for the DEST keyword in the backup option file (represented by ‘d’) for a tape backup.

Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a valid backup option file with a tape device specified.

The TPSIZE (tape length) option in the backup option file (represented by ‘d’) must specify NA for a DISK backup (system backup disk or base disk pair backup partitions).

Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a backup option file with valid TYPE and TPSIZE options for the desired type of backup.

The TPSIZE (tape length) option in the backup option file (represented by ‘d’) must specify a valid tape length (90, 120, 125, or 150) for a TAPE backup.

Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a backup option file with valid TYPE and TPSIZE options for the desired type of backup.

More than the maximum of four volumes were specified for the VOL keyword in the backup option file (represented by ‘d’).

Valid options for the VOL keyword for tape backups are AMTEXT, AMODD, SMTEXT, and SMODD. Only one instance of each option is allowed to be specified. The only valid option for the VOL keyword for disk backups is NA.

Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a backup option file with valid VOL options for the desired type of backup.

A volume was not specified for the VOL keyword in the backup option file (represented by ‘d’) for a tape backup.

For a BOT tape backup, all volumes must be specified: AMTEXT, AMODD, SMTEXT, and SMODD. For an APPEND or EOD tape backup, at least one volume must be specified.

Use the CLR:FSYS-FILE input message to remove the invalid backup option file. Use the SET:BKUP input message to create a valid backup option file with a valid VOL option(s).

The wait() system call failed while waiting for a process to terminate. Interpret the system error code and see additional REPT:AUTOBKUP messages for more information.

The autobkup process is currently executing and is waiting for another process that it executed to complete. This message is displayed every five minutes until the process completes or times out.

The autobkup process attempted to execute an audit (represented by ‘g’) which was already running. The autobkup process stopped the audit and is now attempting to re-execute it.

The variable ‘d’ represents the full pathname of the backup option file being used for the current backup. Following the output of this message, the autobkup process executes the OP:BKUP input message which displays the contents of the backup option file.

The ODD backup schedule has been cleared.

The disk partition and mount table validation has begun.

The fsbik and fslnk audits were executed and have completed successfully.

The fsbik and fslnk audits are being executed.

The nidata and nmdata audits were executed and have completed successfully.

The nidata and nmdata audits are being executed.

The validation of the file system partitions being backed up and the validation of the mount table have completed successfully.

The ODD backups have been rescheduled.
After a disk has been successfully backed up during a Software disk backup, a disk backup summary is output indicating various information about the backup.

The autobkup process has begun to execute.

The autobkup process stopped executing. Find the error messages that were output and follow the action to be taken for those error messages.

Another backup of the same size will not fit on the current DAT cartridge. Change the DAT cartridge.

This message is a warning indicating that a potential problem was identified for a subsequent backup. This does not affect the current backup. At this point, the backup has completed successfully. The data backed up onto tape can be used to restore an office. Therefore, no action needs to be taken for this backup session. However, action should be taken to change the DAT cartridge before the next backup is performed.

The stat() system call failed to access the DUMP:BKTAPE output file represented by ‘d’. Interpret the system error code. Verify that the /tmp file system is not low on space, and that the output file exists with read permission.

This message is a warning indicating that a problem was detected that did not affect the actual backup. At this point, the backup has completed successfully. The data backed up onto tape can be used to restore an office. Therefore, no action needs to be taken for this backup session. However, the cause of the warning should be investigated and resolved.

The malloc() system call failed while attempting to allocate memory for an internal buffer used to hold information read from the DUMP:BKTAPE output file represented by ‘d’. Interpret the system error code.

This message is a warning indicating that a problem was detected that did not affect the actual backup. At this point, the backup has completed successfully. The data backed up onto tape can be used to restore an office. Therefore, no action needs to be taken for this backup session. However, the cause of the warning should be investigated and resolved.

The creat() system call failed while attempting to create a file (represented by ‘d’) which indicates that a backup task completed. Interpret the system error code. Verify that an inode is available for the new file.

This problem does not affect the actual backup. The backup continued. Unless this message was accompanied by an ERROR, ABORTED, or STOPPED message, the data written onto the tape/disk can be used to restore an office. However, the cause of the warning should be investigated and resolved.

The open() system call failed to open the DUMP:BKTAPE output file represented by ‘d’. Interpret the system error code.

This message is a warning indicating that a problem was detected that did not affect the actual backup. At this point, the backup has completed successfully. The data backed up onto tape can be used to restore an office. Therefore, no action needs to be taken for this backup session. However, the cause of the warning should be investigated and resolved.

The read() system call failed to read the DUMP:BKTAPE output file represented by ‘d’. Interpret the system error code.

This message is a warning indicating that a problem was detected that did not affect the actual backup. At this point, the backup has completed successfully. The data backed up onto tape can be used to restore an office. Therefore, no action needs to be taken for this backup session. However, the cause of the warning should be investigated and resolved.

An error occurred while attempting to restore the ODD backup schedule. See additional REPT:AUTOBKUP messages for more information.
This message is a warning indicating that a problem was detected that did not affect the actual backup. At this point, the backup has completed successfully. The data backed up onto tape/disk can be used to restore an office. Since the data was backed up onto tape/disk successfully, no action needs to be taken for this backup session. However, the cause of the warning should be investigated and resolved.

Since the ODD backup schedule no longer exists, the backups that were scheduled in the ODD backup schedule file will not be executed until the file is restored.

The contents of the DUMP: BKTAPE output file (represented by 'd') could not be read. It is assumed that the output file is corrupt.

This message is a warning indicating that a problem was detected that did not affect the actual backup. At this point, the backup has completed successfully. The data backed up onto tape can be used to restore an office. Therefore, no action needs to be taken for this backup session. However, the cause of the warning should be investigated and resolved.

The autobkp process executed an input message (represented by 'g') which took longer to complete than the maximum time allowed. The input message can be in the format of a PDS input message or a UNIX® input message depending on the type of process executed.

If the input message is "RST:MHD 1!", the restore of MHD1 (initiated by the COPY:SPDISK process which was executed by the autobkp process) took longer to complete than the maximum time allowed. No action needs to be taken. This problem does not affect the actual backup. At this point, the backup has completed successfully. The data written onto the backup disk (MHD14 or MHD15) can be used to restore an office. However, the cause of the MHD1 restore time out should be investigated and resolved.

If the input message is "STOP:AUD", the autobkp process detected that an audit it is trying to execute is already running. The autobkp process attempted to stop the audit, but the "STOP:AUD" input message took longer to complete than the maximum time allowed. No action needs to be taken. The autobkp process will give the audit time to complete on its own and then attempt to re-execute it.

If the input message is "no5text/rcv/oddinfo", the oddinfo process took longer to complete than the maximum time allowed. It was executed to obtain the office base and control number for the tape/disk backup summary. No action needs to be taken. This will not affect the backup. "Not Available" will be output in the backup summary for the missing office base and control number.

If the input message is "bin/tail", the tail process took longer to complete than the maximum time allowed. It was executed to obtain the software release number and the BWM number for the tape/disk backup summary. No action needs to be taken. This will not affect the backup. "Not Available" will be output in the backup summary for the missing software release and BWM numbers.

5. ALARMS

All ERROR, ABORTED, STOPPED, and WARNING output messages are major alarmed.

All STARTED, IN PROGRESS, and COMPLETED output messages are not alarmed.

Other Manual(s):
235-105-210  Routine Operations and Maintenance Procedures
1. FORMAT

REPT AUTOINH a [b] c [CLEARED]

2. REASON FOR OUTPUT

To report an automatic inhibit of a chattering scan point, or to report when the inhibit has been cleared automatically.

3. VARIABLE FIELD DEFINITIONS

a = Alarm type. Valid value(s):
   BPSC = Building/power scan point.
   CNI = Common network interface.
   ESM = External sanity monitor.
   MFFUSE = Miscellaneous frame fuse.
   MISC = Miscellaneous.
   MSGS = Message switch.
   ONTC = Office network and timing complex.
   SCSDC = Scan and signal distributor controller.
   TMS = Time-multiplexed switch.

b = Scan point number or unit number. Valid value(s):

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>'b' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>BPSC or MISC</td>
<td>Scan point number 0 through 47.</td>
</tr>
<tr>
<td>MFFUSE, MSGS, or TMS</td>
<td>Unit number 0 or 1.</td>
</tr>
<tr>
<td>ESM</td>
<td>Null</td>
</tr>
</tbody>
</table>

c = Alarm label (office assigned).

Note: The inhibit will be automatically removed at 15 minute intervals. If the condition still exists, the scan point will be reinhibited. The inhibit may be removed at any time using the ALW:ALM message.

4. ACTION TO BE TAKEN

Investigate alarm conditions and take corrective measures.

The usual causes for chattering are defective wiring and/or bad contacts on the relay that controls this scan point. Corrective action will normally consist of checking the complete circuit.

5. ALARMS

Assigned alarm level of scan point.

a b c d

2. REASON FOR OUTPUT

To report data about originating or terminating blocked calls and metallic access.

3. VARIABLE FIELD DEFINITIONS

a = Date and time in the form YYMMDDhhmmss, where:
   YY = Year.
   MM = Month.
   DD = Day.
   hh = Hour.
   mm = Minutes.
   ss = Seconds.

b = Originating/terminating DN in the form AAAABBBCCCC, where:
   AAA = NPA (area code).
   BBB = NXX (exchange).
   CCCC = Number.

c = SM and originating/terminating LEN in the form SMNUUGHSL, where:
   SMN = Switching module number.
   UU = Unit.
   G = Grid.
   H = Half grid.
   S = Switch.
   L = Level.

d = 4 A-links and blocked side in the form PPQQRRSST, where:
   PP = 1st A-link switch and level.
   QQ = 2nd A-link switch and level.
   RR = 3rd A-link switch and level.
   SS = 4th A-link switch and level.

A switch is in a range 0-7 and a level in 0-3, but these fields may provide additional information:

<table>
<thead>
<tr>
<th>alinks.swX</th>
<th>alinks.levelX</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 7</td>
<td>0 - 3</td>
<td>Switch and level are determined for a blocking A-link and have valid values.</td>
</tr>
<tr>
<td>8</td>
<td>0</td>
<td>Switch and level unknown due to selective initialization.</td>
</tr>
<tr>
<td>8</td>
<td>1</td>
<td>A-link is OOS.</td>
</tr>
</tbody>
</table>
A-link is idle and B-link is blocked.

Switch and level unknown due to other reason/have invalid values.

alinks.swX and alinks.levelX stand for switch and level respectively of one of four the A-links.

T = Blocked access type. Valid value(s):
0 = Originating.
1 = Terminating.
2 = Metallic access 1st path.
3 = Metallic access 2nd path.

4. ACTIONS TO BE TAKEN

REPT:BASIC-911

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT BASIC 911 a TIMEOUT LINE EQPT NO=b-c-d-e-f-g

2. REASON FOR OUTPUT

To indicate that an attempt to originate from a basic 911 (denied origination) line has continued for 6 minutes or more and that it has been placed on the high and wet list, or that a forced-held, line-originated call to the 911 Emergency Service Bureau has been torn down because the calling party has been on-hook for more than 45 minutes.

3. VARIABLE FIELD DEFINITIONS

a = Time-out descriptor. Valid value(s):
   FORCED HOLD = A 45-minute "forced hold" time-out has occurred.
   ORIGINATION = A 6-minute "denied origination" time-out has occurred.

b = Switching module number.

c = Line unit.

d = Grid.

e = Switch board.

f = Switch.

g = Level.

4. ACTION TO BE TAKEN

5. ALARMS

None.

6. REFERENCES

Other Manual(s):
235-190-115  Local and Toll System Features
REPT:BCI

Software Release: 5E14 and later
Message Class: TRFM
Application: 5
Type: Output

1. FORMAT

[1] REPT BCI (ORIG|TERM) (LEN|ILEN)=a-b-c-d{(-e-f)} g/h

[2] REPT BCI (ORIG|TERM) SM=i REPORTING TERMINATED

[3] REPT BCI (ORIG|TERM) REPORTING TERMINATED

2. REASON FOR OUTPUT

To report originating or terminating blocked call indications (BCI), and to indicate when reporting has been completed both for a given switching module (SM) and for the entire switch.

Format 1 reports that a call has experienced A- or B-link blockage in a line unit concentrator [for line equipment numbers (LENs)], or digital signal level 1 (DS1) or peripheral interface controller bus (PID) time slot blockage on an integrated digital carrier unit (IDCU) [for IDCU line equipment numbers (ILENs)]. If the feature is turned on in a given SM, blockages that occur will be reported in four-second cycles. Up to eight equipment numbers (LENs or ILENs) each for originating and terminating calls will be reported as blocked during each cycle. An originating or terminating LEN or ILEN that is blocked more than once during a four-second interval will be reported only once in that interval.

Format 2 reports the number of an SM that has just completed reporting the maximum number of call blockage messages for either originating or terminating calls.

Format 3 reports that all SMs in the selected range of SMs have completed their call blockage reporting, making the feature inactive.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Line unit number or IDCU number.
c = Concentrator number or remote terminal (RT) number.
d = Switch group/half-grid number or RT line number.
e = Switch number.
f = Level number.
g = Sequential number of the message being output from a given SM.
h = Maximum number of messages allowed for each included SM.
i = Number of the SM that has just completed its blocked call reporting.
4. ACTION TO BE TAKEN

None.

H'n o
H'n o
H'n o
H'n o

2. REASON FOR OUTPUT

To report call completion analysis failures from the call monitor.

3. VARIABLE FIELD DEFINITIONS

a = The time interval for the analysis. Valid value(s):
  5 = Five-minute analysis
  15 = Fifteen-minute analysis

b = The print mode of the monitor. Valid value(s):
  NORMAL = Default state prints failures only.
  VERBOSE = Verbose mode prints all reports and per-test-call results.

c = CALLMON state. Valid value(s):
  ALLOWED
  INHIBITED

d = The number of non-CCS test calls that have passed in the indicated time interval.
e = The number of non-CCS test calls that have failed in the indicated time interval.
f = The number of indeterminate non-CCS test call results in the indicated time interval.
g = The number of not attempted non-CCS test call results in the indicated time interval.
= The last non-CCS trunk group number (decimal) that passed a test call. If the number is 2002, then no test calls have passed since the monitor was last initialized.

i = The number of CCS test calls that have passed in the indicated time interval.

j = The number of CCS test calls that have failed in the indicated time interval.

k = The number of indeterminate CCS test call results in the indicated time interval.

l = The number of not-attempted-CCS-test-call results in the indicated time interval.

m = The last CCS trunk group number (decimal) that passed a test call. If the number is 2002, then no test calls have passed since the monitor was last initialized.

n = Failure code. If zero, then no failure code stored. Refer to the APP:CALLMON appendix in the Appendixes section of the Output Messages manual.

o = Number of occurrences for failure code.

4. ACTION TO BE TAKEN

Analyze the output and take action according to the procedures in the System Maintenance Requirements and Tools manual and the Routine Operations and Maintenance manual.

5. ALARMS

The REPT CALLMON CURRENT [5|15] MINUTE REPORT in the normal mode will either print no alarm, a minor alarm, or a major alarm if the call completion analysis fails. The criteria for failure is less than or equal to 50% for the 5 minute report and less than or equal to 90% for the 15 minute report. The criteria for major alarms are greater than or equal to 40% "operational test failures" for the 5 minute report and greater than or equal to 50% for the 15 minute report. The criteria for minor alarms are greater than or equal to 70% "indeterminate" plus "not attempted" failures for both the 5 and 15 minute reports. If no alarm criteria is met no alarm will be printed with the analysis report. In the verbose mode this message will still print even if the analysis passes. The ALARM indicator in the Call Monitor display box on the Miscellaneous page (116) will be backlit. This may be retired by typing the input message RTR:CALLMON,ALARM.

   RESULT = g
   RETURN CODE = h

2. REASON FOR OUTPUT

To report per test call results from the call monitor.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number or 0 if a null SM number.
b = Port number (hexadecimal) or 0 if a null port number.
c = Trunk group number
d = Trunk group member number or 4096 if a null trunk group member number.
e = Signaling type. Valid value(s):
   0 = TOUCH-TONE.
   1 = Multi-frequency.
   2 = Dial pulse.
   10 = Common Channel Interoffice Signaling System 6 (CCIS6) signaling.
   11 = International Telecommunication Union - Telecommunication, Standardization Sector (ITU-TS) (formerly CCITT) common channel signaling system 7 (CCS7) telephone user part (TUP) signaling.
   12 = Integrated services user part (ISUP) signaling.
f = Test type. Valid value(s):
   4 = SYNCHRONOUS test.
   5 = NONSYNCHRONOUS test.
   6 = PERMANENT BUSY test.
   24 = 103 test.
   26 = Code answer test line (CATL) test.
   27 = Voice path assurance (VPA) CONTINUITY test.
   30 = Loopback test.
   31 = Loopback inverted test.
g = Test result. Valid value(s):
   INDETERMINATE - BAD TEST RESULT
   INDETERMINATE - INTERNAL FAILURE
INDETERMINATE - TEST ABORTED
NO ATTEMPT - BAD DATA
NO ATTEMPT - CNI INIT IN PROGRESS
NO ATTEMPT - DSIG OFF NORMAL = Direct signaling (DSIG) is unequipped or out-of-service (OOS).
NO ATTEMPT - RESOURCE FAILURE
NO ATTEMPT - TEST SKIPPED
NO ATTEMPT - TSIG OFF NORMAL = Trunk signaling (TSIG) is unequipped or OOS.
NO CCS TEST - CNI MIN MODE
NO IN-SERVICE IDLE MEMBER FOUND
NO TEST - AM MIN MODE
NO TEST - ASSERT ENCOUNTERED
OPERATIONAL TEST FAILURE
PASSED

= Test result return code. Refer to the APP:CALLMON appendix in the Appendixes section of the Output Messages manual.

REPT: CAMPON-A

Software Release: 5E14 only
Message Class: LINE, TRK
Application: 5
Type: Output

1. FORMAT

REPT CAMPON a [b] [PKT] c [d] [PRIGRP=e]

2. REASON FOR OUTPUT

To report that a camp-on is in progress for the indicated line, trunk, data link, or Operator Services Position System port (OSPSPORT). The camp-on activity has resulted from a manual attempt to remove or restore the line, trunk, data link, or OPSSPORT.

The camp-on can be stopped by using a STP:CAMPON input message. A list of lines, trunks, data links, and OPSSPORTs that have been camped on as a result of a manual request (RMV or RST) can be obtained using the OP:CAMPON input message.

3. VARIABLE FIELD DEFINITIONS

+ = Indicates the line is a party line.

a = Equipment number or identifier. Valid value(s):

| AQEST=f | AQM=g-h | DN=f[-i][+]+ | PKTDN=f | TKGMN=j-k | XDB=g-h |

b = Channel identifier: D, B1, or B2. Used only for integrated services line unit (ISLU) digital subscriber line (DSL) lines.

c = Equipment number or identifier. Valid value(s):

| AIUEN=1-v^1-w^1-x^1 | MLHG=y^1-z^1 |
| DEN=1-m-n-o | NEN=1-h^1-i^1-a^1-j^1-k^1-b^2-l^1 |

| LCKEN=1-s-t-m^1-n^1 | SLEN=1-a^1-q-r |
| LEN=1-s-v-w-x-y | TEN=1-b^1-c^1-d^1-e^1 |

| LTP=1-z |

= Equipment number or identifier. Valid value(s):

| ICB=r^1 |
| ICD=g^1 |

= Primary rate interface (PRI) group number.
f  = Telephone number.
g  = Data link (group) number.
h  = Relative link (member) number.
i  = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.
j  = Trunk group number.
k  = Trunk member number.
l  = Switching module (SM) number.
m  = Digital line and trunk unit (DLTU) number.
n  = Digital facility interface (DFI) number.
o  = Channel number.
p  = IDCU number.
q  = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.
r  = RT line number or PUB43801 channel.
s  = Line unit number.
t  = Line group number.
u  = Line card number.
v  = Line grid number.
w  = Switch board number.
x  = Switch number.
y  = Level number.
z  = Logical test port number.
a^1  = Digital carrier line unit number.
b^1  = Trunk unit number.
c^1  = Service group number.
d^1  = Channel board number.
e^1  = Circuit number.
f^1  = Identifying number of the FGB carrier which can be up to 4 digits. If present, this variable indicates a direct trunk to a carrier.
g^1  = Identifying number of the FGD carrier which can be up to 4 digits. If present, this variable
indicates a direct trunk to a carrier.

\[ h^1 \] = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

\[ i^1 \] = Data group number.

\[ j^1 \] = Synchronous transport signal (STS) number.

\[ k^1 \] = Virtual tributary group number.

\[ l^1 \] = Digital signal level 0 (DS0).

\[ m^1 \] = Line board number.

\[ n^1 \] = Line circuit number.

\[ o^1 \] = PSU unit number.

\[ p^1 \] = PSU shelf number.

\[ q^1 \] = PSU channel group number.

\[ r^1 \] = PSU channel group member number.

\[ s^1 \] = RAF or SAS unit number.

\[ t^1 \] = RAF or SAS announcement channel number.

\[ u^1 \] = Line group controller number.

\[ v^1 \] = Access interface unit (AIU) number.

\[ w^1 \] = AIU pack number.

\[ x^1 \] = AIU circuit number.

\[ y^1 \] = Multi-line hunt group number.

\[ z^1 \] = Multi-line hunt group member number.

\[ a^2 \] = SONET termination equipment (STE) number.

\[ b^2 \] = Virtual tributary member number.

4. ACTIONS TO BE TAKEN

None. Refer to the message output for pertinent status and information, and implement requested action based on the information received, if necessary.

5. ALARMS

None.

4. ACTIONS TO BE TAKEN

None. Refer to the message output for pertinent status and information, and implement requested action based on the information received, if necessary.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

OP:CAMPON
RMV:DATALINK
REPT:CCS-APC

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

REPT CCS APC SM=a OPC=b APC=c d

2. REASON FOR OUTPUT

To report an adjacent point code (APC) that has become accessible or inaccessible to a global switching module (GSM). When the APC becomes inaccessible to a GSM, signalling normally using that office will be rerouted or blocked automatically until the APC becomes accessible again.

Note: This report applies only to APCs connected to links on the packet switching unit (PSU) signaling platform.

3. VARIABLE FIELD DEFINITIONS

a  = Common channel signaling (CCS) GSM number.

b  = Originating point code (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.

c  = Adjacent point code (APC) number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.

d  = APC status. Valid value(s):

   ACCESSIBLE
   INACCESSIBLE

4. ACTION TO BE TAKEN

None, if an APC has become accessible.

If an alarm occurs, determine why the signaling links to the APC are down. To make the APC accessible, the signaling links to the APC must be restored.

5. ALARMS

CRITICAL alarm when an APC becomes inaccessible. No alarm when an APC becomes accessible.

Type: Output

1. FORMAT

REPT CCS AUTOMATIC PROCESSOR OUTAGE PROCEDURE
   GSM=a OPC=b TIME=cc:cc:cc REQUEST=d STATUS=e

2. REASON FOR OUTPUT

To report the status of the common channel signaling (CCS) automatic processor outage procedure. This procedure executes when CCS message transport (CMT) is lost or when it becomes available. This message is automatically generated by the system.

3. VARIABLE FIELD DEFINITIONS

   a = CCS global switching module (GSM) number.
   b = Originating point code number.
   c = Time that the event occurred, in the form hours:minutes:seconds.
   d = The type of processor outage procedure that is executing in GSM 'a'. Valid value(s):
      BLOCK = The processor outage procedure was invoked to block all signaling links that are not manually blocked.
      UNBLOCK = The processor outage procedure was invoked to unblock all signaling links that are not manually blocked.
   e = The status of the processor outage procedure that is executing in GSM 'a'. Valid value(s):
      COMPLETED = The processor outage procedure ran successfully to completion.
      FAILED = The processor outage procedure encountered an error during execution and did not run successfully to completion.
      STARTED = The processor outage procedure has started execution.
      STOPPED = The processor outage procedure was interrupted due to changes in CMT status and did not run to completion.

4. ACTIONS TO BE TAKEN

Refer to the corrective maintenance procedures in the Signaling Gateway Common Channel Signaling manual, 235-200-116, if variable 'd' is BLOCK.

5. ALARMS

None.

1. FORMAT

REPT CCS DOC TIME-OUT
   MCa     TG b

2. REASON FOR OUTPUT

To report that the system has deactivated a dynamic overload control (DOC) because the controlling office has not refreshed this office. This message is only applicable to DOC on CCIS6 trunk groups.

3. VARIABLE FIELD DEFINITIONS

a = DOC level deactivated. Valid value(s):
   1 = Machine congestion level 1.
   2 = Machine congestion level 2.
   3 = Machine congestion level 3.

b = Trunk group number.

4. ACTION TO BE TAKEN

No action is needed for an automatically generated condition.

5. ALARMS

None.

6. REFERENCES

Other Manual(s):
235-190-100 Feature Descriptions Manual
REPT:CCS-DPC
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT CCS DPC SM=a OPC=b DPC=[c] [d]

2. REASON FOR OUTPUT

To report that a destination point code (DPC) has become inaccessible to a global switching module (GSM). When the DPC becomes inaccessible, signaling to that DPC will be blocked automatically until the DPC becomes accessible again.

Note: This report applies only to the accessibility of DPCs associated with a PSU signaling platform.

3. VARIABLE FIELD DEFINITIONS

a = Common channel signaling (CCS) GSM number.
b = Originating point code (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.
c = DPC number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation. This variable will not be printed if multiple DPCs are impacted.
d = DPC status. Valid value(s):
   DPC ACCESSIBLE = States that the specified DPC has become accessible.
   MULTIPLE DPCS INACCESSIBLE = States that multiple DPCs have become inaccessible as a result of some event in the network. Refer to the OP:CCS-DPC input message to determine which DPCs are inaccessible.
   ONE DPC INACCESSIBLE = States that the specified DPC has become inaccessible.
   THE GSM IS ISOLATED = All DPCs associated with the specified GSM/OPC are inaccessible.

4. ACTION TO BE TAKEN

For any report indicating one/more DPCs are unavailable, an attempt should be made locally to restore the primary or alternate signaling route to affected DPCs. Refer to RC/V view 16.10 to determine the primary/alternate link sets associated with a given DPC.

5. ALARMS

A major alarm is produced if one/more DPCs become unavailable, unless the office is completely isolated. In the latter case, a critically alarmed message is produced, and that message is repeated every 15 minutes (also critically alarmed), until at least one DPC becomes accessible. No alarm is produced when DPCs become available.

Software Release: 5E15 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

REPT CCS GSM SM=a OPP=b
   REASON=c  DURATION=d SECONDS

2. REASON FOR OUTPUT

To autonomously report the duration in seconds, when the last link goes down til when the first link comes back up. This outage duration report for the PSU is generated to comply with FCC requirements for reporting signaling outage on the GSM.

3. VARIABLE FIELD DEFINITIONS

a  = Common channel signaling (CCS) GSM number.

b = Originating point code (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.

c = This field contains the reason for the signaling outage. Valid value(s):
   CCSLK TOTAL LOSS

   = Duration in seconds for length of signaling outage.

4. ACTIONS TO BE TAKEN

No action is needed for an automatically generated condition.

5. ALARMS

None.

6. REFERENCES

Output Appendix(es):
   APP:POINT-CODE

Other Manual(s):
235-200-115  CNI Common Channel Signaling
235-200-116  Signaling Gateway Common Channel Signaling
REPT:CCS-MON

Software Release: 5E16(1) and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

[1] REPT CCS MON
   GSM = a                      OPC= b
   MAJOR LINK STATE = c
   MINOR LINK STATE = d e f g h
   CHANNEL GRP NUM = i         TIMESTAMP = j
   LINKSET = k          MEMBER = l    LSNAME = m
   EVENT = n
   [o]

[2] REPT CCS MON
   GSM = a                      OPC = b
   LINKSET = k                  LSNAME = m
   TIMESTAMP   MEMBER    EVENT
   j          l         n
   .          .         .
   .          .         .
   .          .         .

2. REASON FOR OUTPUT

Format 1 is used to report link event data when link monitoring has been turned on. Events are reported in accordance with the mask value used in the command that turned on monitoring.

Format 2 is used to report the data for changeover and changeback events.

3. VARIABLE FIELD DEFINITIONS

a = Common channel signaling (CCS) global switching module (GSM) number.
b = Originating point code number.
c = Major link state. Valid value(s):
   AVAIL    = Link is available.
   UNAVAIL  = Link is unavailable.
d = Minor link state. Valid value(s):
   LCLINH   = Local inhibit.
e = Minor link state. Valid value(s):
   RMTINH   = Remote inhibit.
f = Minor link state. Valid value(s):
**LCLBLK** = Local block.

**g** = Minor link state. Valid value(s):

**RMTBLK** = Remote block.

**h** = Minor link state. Valid value(s):

**FAILED** = Failed.

**i** = Channel group number.

**j** = Timestamp at which the event occurred in the form HH:MM:SS (hours:minutes:seconds).

**k** = CCS link set number.

**l** = Link set member number.

**m** = Link set name.

**n** = Event that occurred. Refer to APP:PSU-SIG-MON appendix in the Appendix section of the Output Messages manual.

**o** = Additional information. Valid value(s):

- **DPC p RECEIVED, EXPECTED p**
- **OPC q RECEIVED, EXPECTED q**
- **SLC r RECEIVED, EXPECTED r**
- **LENGTH INDICATOR s RECEIVED, EXPECTED s**
- **RECEIVED ON LS t MBR u, OPC=q, SLC=r**

**p** = Destination point code.

**q** = Originating point code.

**r** = Signaling link code.

**s** = Length indicator.

**t** = Link set number.

**u** = Member number.

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Output Appendix(es):

   APP:POINT-CODE

Other Manual(s):

235-190-120 Common Channel Signaling Services Features
REPT:CCS-MTC-A
Software Release: 5E14 only
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT CCS MESSAGE TRANSPORT CONNECTIVITY CHANGE
   GSM=a OPC=b ACCESSIBLE
   TIMESTAMP: d
   NGSMS AFFECTED: a

[2] REPT CCS MESSAGE TRANSPORT CONNECTIVITY CHANGE
   GSM=a OPC=b ALL CMT CONNECTIVITY LOST
   TIMESTAMP: c

2. REASON FOR OUTPUT

Format 1 reports when a global switching module (GSM) has regained intra-SM CCS message transport (CMT) connectivity, initializing the intra-SM message delivery (MD) link.

Format 2 reports when CMT associated with a ISLAND GSM becomes totally unavailable. This message will be repeated automatically every 15 minutes until the problem is cleared.

3. VARIABLE FIELD DEFINITIONS

a = GSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

b = Originating point code (9-digit OPC associated with the GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for a description of ANSI and AT&T/UNITEL formats.

c = Timestamp when the initial CMT loss/recovery occurred (hh:mm:ss).

4. ACTIONS TO BE TAKEN

Refer to the corrective maintenance procedures in the Signaling Gateway Common Channel Signaling manual, 235-200-116, if total connectivity loss is reported.

5. ALARMS

For Format 2, the message will usually be CRITICALLY alarmed (no alarm after initial intra-SM MD link provisioning). A critically alarmed message will be repeated automatically every 15 minutes, until the problem is cleared.

6. REFERENCES

Input Message(s):

RST:MD
RMV: MD

Output Message(s):
REPT MD

Output Appendix(es):
APP: RANGES
APP: POINT CODE

Other Manual(s):
235-200-115  CNI Common Channel Signaling
235-200-116  Signaling Gateway Common Channel Signaling

MCC Display Page(s):
1540  GSM CMT STATUS
1. FORMAT

[1] REPT CCS MESSAGE TRANSPORT CONNECTIVITY CHANGE
   GSM=a OPC=b c
   TIMESTAMP: d
   NGSMS AFFECTED: e

[2] REPT CCS MESSAGE TRANSPORT CONNECTIVITY CHANGE
   GSM=a OPC=b ALL CMT CONNECTIVITY LOST
   TIMESTAMP: d

2. REASON FOR OUTPUT

Format 1 reports when a global switching module (GSM) has regained CCS Message Transport (CMT) connectivity to one or more non-global switching modules (NGSMs). It also can report the loss of CMT to one/more (but not all) provisioned NGSMs/NGSM-2000s.

Format 2 reports when a GSM experiences loss of CMT connectivity to all provisioned NGSMs/NGSM-2000s. This message will be repeated automatically on a 15 minute interval, until the problem is cleared.

Both formats are applicable to ISLAND GSM environments. In this case, the only provisioned NGSM is the GSM itself, and CMT transport uses an intra-GSM message delivery link.

3. VARIABLE FIELD DEFINITIONS

a = GSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

b = Originating point code (9-digit OPC associated with the GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for a description of ANSI and AT&T/UNITEL formats.

c = Interconnectivity status. Valid value(s):
   ACCESSIBLE = NGSMs became accessible.
   INACCESSIBLE = The NGSMs became inaccessible.

d = Timestamp when the initial CMT loss/recovery occurred (hh:mm:ss).

e = A list of one/more impacted NGSMs.

4. ACTIONS TO BE TAKEN
Refer to the corrective maintenance procedures in 235-200-116 (Signaling Gateway Common Channel Signaling), if CMT connectivity loss is reported.

5. ALARMS

Format 1 messages will usually be major alarmed if inaccessibility is reported, while Format 2 messages will have a critical alarm.

1. FORMAT

REPT CCS MTPERR a SM=b
DPC
   c [c c c c]
  [ c c c c c]
  [ c c c c c]

2. REASON FOR OUTPUT

To report when one or more outgoing messages are discarded because no provisioned route set(network, cluster, or member) exists to the message's destination.

3. VARIABLE FIELD DEFINITIONS

a = This field contains the reason for the MTPERR report. Valid value(s):
   ROUTING DATA ERROR

b = Common channel signaling (CCS) GSM number.

c = Destination point code (DPC) number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation. A single or list of DPCs that are affected by the CCS MTPERR will be reported.

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT CCS OMAP GSM=a
   b
   c c c c c
   c c c c c

2. REASON FOR OUTPUT

To report when one or more responding MRVR/SRVR messages cannot be sent because no provisioned member route set exists to the message's destination.

3. VARIABLE FIELD DEFINITIONS

a = GSM where the routing failure was discovered.
b = Reason for the report: CANNOT ROUTE MRVR/SRVR TO TEST INITIATOR
c = One or more test initiator point codes for which no MTP route set exists. Unique unknown initiator point codes, up to a maximum of 10 point codes, are to be recorded within 15 seconds of the first detected routing error. See APP:POINT-CODE for formats.

4. ACTIONS TO BE TAKEN

If MRVR or SRVR messages cannot be sent, investigate the MTP routing data based on the fact that no provisioned member route set exists to the message's destination.

5. ALARMS

None.

REPT:CCS-ROUTE

Software Release: 5E15 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

REPT CCS ROUTE SM=a OPC=b
c          d          e

2. REASON FOR OUTPUT

To autonomously report that one or multiple destination point codes (DPC), clusters, and/or networks have become accessible/inaccessible to a global switching module (GSM), or to report that all GSM links are unavailable.

3. VARIABLE FIELD DEFINITIONS

a = Common channel signaling (CCS) GSM number.
b = Originating point code (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.
c = This field contains the name of the route set being reported or an error message. Valid value(s):
   DPC
   CLUSTER
   NETWORK
   MULTIPLE DPCS
   MULTIPLE CLUSTERS
   MULTIPLE NETWORKS
   ALL GSM LINKS UNAVAILABLE
d = DPC, cluster, or network number being reported.
e = Status of the DPC, cluster, or member. Valid value(s):
   ACCESSIBLE
   INACCESSIBLE

4. ACTIONS TO BE TAKEN

For any report when variable 'c' equals MULTIPLE DPCS, CLUSTER, or NETWORK, the OP:CCS,ROUTE input message shall be used to list the specific accessible/inaccessible route. Refer to the OP:CCS-ROUTE input message for additional information.

5. ALARMS

A major alarm is produced when a DPC, network, or cluster becomes inaccessible. A critical alarm is produced when all DPCs, networks, or clusters become inaccessible. This alarm will be repeated every 15 minutes. Both alarms will be removed when the DPC, network, or cluster becomes accessible.

6. REFERENCES

Common Channel Signaling Service Feature
REPT:CCS-SM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT CCS SM=a ODD BACKUP WARNING
   LINKSET-MEMBER b-c HAS BEEN d
   ODD BACKUP IS NEEDED TO PREVENT A RECENT CHANGE
   ROLL FORWARD FAILURE IN CASE OF A FULL INITIALIZATION

[2] REPT CCS SM=a ODD BACKUP WARNING
   MD LINK ON SM a HAS BEEN d
   ODD BACKUP IS NEEDED TO PREVENT A RECENT CHANGE
   ROLL FORWARD FAILURE IN CASE OF A FULL INITIALIZATION

2. REASON FOR OUTPUT

To report a reliability warning that indicates a recent change roll forward failure will result, if a full initialization occurs on this switching module (SM) before an office-dependent data (ODD) backup is conducted.

Format 1 is printed when a signaling link is inserted, deleted, or updated.

Format 2 is printed when a message delivery (MD) link is inserted or deleted.

3. VARIABLE FIELD DEFINITIONS

a = Common channel signaling (CCS) global SM (GSM) number.
b = Linkset number.
c = Linkset member number.
d = Recent change operation performed on a link. Valid value(s):
   DELETED = A signaling or MD link has been deleted.
   INSERTED = A signaling or MD link has been inserted.
   UPDATED = A signaling link has been updated.

4. ACTION TO BE TAKEN

Conduct an ODD backup immediately, to ensure that a full initialization does not cause any recent change roll forward errors.

5. ALARMS

None.

1533 (CCS LINK SET MEMBER)
REPT:CCS7-A

Software Release: 5E14 - 5E15
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

[1] REPT CCS7 POINT CODE a b c d e

[2] REPT CCS7 CLUSTER a b c d

2. REASON FOR OUTPUT

Format 1 reports a change in the condition of a directly connected signaling point in the common channel signaling system 7 (CCS7) network. A directly connected signaling point is an office that is connected to this office with one or more CCS7 trunk groups. The point code itself will be printed in ANSI® format except in the case of an Network Services Division (NSD) office reporting a failure to another NSD office. The point code will then be printed in NSD format.

Format 2 reports a change in the condition of a cluster in the network. This report is printed when all members of the cluster change states due to network connectivity. This report may not be for a cluster containing an office that is directly connected. The cluster code itself will be printed in ANSI® format except in the case of an NSD cluster reporting a failure to an NSD office. The cluster code will then be printed in NSD format.

3. VARIABLE FIELD DEFINITIONS

a = The condition of the affected signaling point. Valid value(s):
   FAILURE = The signaling point has become inaccessible.
   RECOVERED = The signaling point has returned to service.

b = The decimal network indicator of the signaling point.

c = The decimal region indicator of the signaling point. This number will be zero if point code is in ANSI® format.

d = The decimal cluster indicator of the signaling point if in ANSI® format. The decimal cluster ID indicator of the signaling point if in NSD format.

e = The decimal member indicator of the signaling point.

4. ACTION TO BE TAKEN

This message reports a condition in another signaling office or in the CCS7 network which may prevent CCS7 calls from completing. Take appropriate action with signal transfer point (STP) maintenance staff and far end switch maintenance staff to resolve the problem.

5. ALARMS

Major, if the condition being reported is FAILURE.
6. REFERENCES

Software Release: 5E16(1) and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

[1] REPT CCS7 POINT CODE a b c d e

[2] REPT CCS7 CLUSTER a b c d

2. REASON FOR OUTPUT

Format 1 reports a change in the condition of a directly connected signaling point in the common channel signaling system 7 (CCS7) network. A directly connected signaling point is an office that is connected to this office with one or more CCS7 trunk groups. The point code itself will be printed in American National Standards Institute (ANSI) format except in the case of an Network Services Division (NSD) office reporting a failure to another NSD office. The point code will then be printed in NSD format.

Format 2 reports a change in the condition of a cluster in the network. This report is printed when all members of the cluster change states due to network connectivity. This report may not be for a cluster containing an office that is directly connected. The cluster code itself will be printed in ANSI format expect in the case of an NSD cluster reporting a failure to an NSD office. The cluster code will then be printed in NSD format.

3. VARIABLE FIELD DEFINITIONS

a = The condition of the affected signaling point. Valid value(s):
   AVAILABLE FOR BICC = The signaling point has returned to service for BICC protocol messages.
   FAILURE = The signaling point has become inaccessible for ISUP protocol messages.
   INACCESSIBLE FOR BICC = The signaling point has become inaccessible for BICC protocol messages.
   RECOVERED = The signaling point has returned to service for ISUP protocol messages.
   UNEQUIPPED FOR BICC = The signaling point is not equipped to handle BICC protocol messages.
   UNKNOWN FOR BICC = The signaling point can not handle BICC signaling protocol messages for an unknown reason.

b = The decimal network indicator of the signaling point.

c = The decimal region indicator of the signaling point. This number will be zero if point code is in ANSI format.

d = The decimal cluster indicator of the signaling point if in ANSI format. The decimal cluster ID indicator of the signaling point if in NSD format.

e = The decimal member indicator of the signaling point.

4. ACTIONS TO BE TAKEN

This message reports a condition in another signaling office or in the CCS7 network which may prevent CCS7 calls...
from completing. Take appropriate action with signal transfer point (STP) maintenance staff and far end switch maintenance staff to resolve the problem.

5. ALARMS

Major, if the condition being reported is FAILURE.

2. REASON FOR OUTPUT

To report additional information of an RMV:CCSLK or RST:CCSLK input message or an automatic action that changes the state of a common channel signaling (CCS) signaling link.

3. VARIABLE FIELD DEFINITIONS

a = Linkset (LS) number.
b = Linkset member number.
c = CCS global switching module (GSM) number.
d = Link type. Valid value(s):
   A = link connecting to an adjacent home signaling transfer point.
   E = link connecting to an adjacent secondary signaling transfer point.
   F = link connecting to a signaling end point.
e = Originating point code (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.
f = Basic link state. Valid value(s):
   AVAIL = Available (active). Note that the link may still not be capable of carrying traffic due to inhibited or blocked qualifiers.
   UNAVAIL = Unavailable (out-of-service).
g = Source of link reconfiguration. Valid value(s):
   AUTO = Automatic recovery caused the link status change.
   MAN = Link status change was requested manually by a RMV:CCSLK or RST:CCSLK input message.
h = Qualifier. Valid value(s):
   LOCAL BLK = All traffic is locally blocked from using this link.
LOCAL INH = All traffic is locally inhibited on this link except for test and maintenance traffic.

LOCAL UNBLK = Link is locally unblocked.

LOCAL UNINH = Link is locally uninhibited.

MTCE = Link is out-of-service due to maintenance action.

REMOTE BLK = All traffic is remotely blocked from using this link.

REMOTE INH = All traffic is remotely inhibited on this link except for test and maintenance traffic.

REMOTE UNBLK = Link is remotely unblocked.

REMOTE UNINH = Link is remotely uninhibited.

RESTORED, STILL INH = Link is restored to an active state, but it is still inhibited.

SRC-ATT UNINH FAIL = GSM is unable to uninhibit the link.

= Operational restriction. Valid value(s):

DL = No signaling data link (SDL) is available for use.

DACT = Link is manually deactivated.

LKER-L1 = Level one failure (no network time slot available).

LKER-L2 = Level two failure (level two failed alignment).

LKER-L3 = Level three failure (link test failed).

OOSF-PH = Channel group is unassigned.

= Congestion. Valid value(s):

LOCAL CONG LVL1 = The link is in the first level of local congestion using the multiple congestion levels feature.

LOCAL CONG LVL2 = The link is in the second level of local congestion using the multiple congestion levels feature.

LOCAL CONG LVL3 = The link is in the third level of local congestion using the multiple congestion levels feature.

REMOTE CONG = The link is in remote congestion.

= Signal link fail reason. Valid value(s):

EXCESS DELAY ACK = Excessive delay of acknowledgement

EXCESS DURATION CONG = Excessive duration of congestion
EXCESS ERROR RATE AERM = Alignment error rate monitor (AERM) checks an aligning link and prints the error rate message when the threshold level of the monitor is exceeded.

EXCESS ERROR RATE SUERM = Signaling unit error rate monitor (SUERM) checks an active link and prints the error rate message when the threshold level is exceeded.

INVALID BSN THRESHOLD EXCEEDED = The link is out-of-service due to exceeding the invalid backward sequence number (BSN) threshold using the basic error correction method.

INVALID FIB THRESHOLD EXCEEDED = The link is out-of-service due to exceeding the invalid forward indicator bit (FIB) threshold.

INVALID LEVEL 2 LINK STATE = The link is out-of-service due to an invalid level 2 link control state.

INVALID LEVEL 2 PROFILE = The link is out-of-service due to an invalid level 2 profile.

INVALID SU THRESHOLD EXCEEDED = The link is out-of-service due to exceeding the invalid signal unit (SU) threshold using the preventive cyclic retransmission error correction method.

LEVEL 3 LINK TEST FAILURE = The level 3 link test has failed due to either a timeout waiting for the SLTA or the SLTA contained incorrect information.

PH INITIALIZATION = The link is out-of-service due to an initialization occurring on the protocol handler.

REMOTE OUT OF SERVICE = The link is out-of-service due to the reception of an SIOS LSSU from the remote office.

RESOURCE EXHAUSTION—NO FREE RFD = The link is out-of-service due to no available receive frame descriptors.

ROUTING DATA PROBLEM = An inconsistency has been detected between the level 2 link state and the routing data in the PH. The signaling link will be removed and restored to correct the inconsistency.

FAILED LINK CRAFT REFERRAL TIMER EXPIRED = The failed link has not aligned/activated within the desired time provisioned by Recent Change view 16.2 link timer FAILED CRAFT REF (T1.111.4/T19).

FALSE LINK CONGESTION DETECTED = The link is out-of-service because it stayed in the same congestion level for too long and provisioned RC view 16.2 link timer FALSE LNK CON (T1.111.4/T31) has expired. The congestion level is indicated above (field ‘i’).

Note: No signal link fail reason will be reported for manually requested output message.

Note: The PSUPH and EN are printed when the signaling link is restored to the available state.

l = SM number of packet switch unit (PSU).

m = Unit number of PSU in SM.

n = Shelf number in PSU.
4. ACTIONS TO BE TAKEN

If a major alarm occurs, determine the cause of link failure and restore it to service.

5. ALARMS

A major alarm occurs if the link goes out-of-service (which is not as the result of a manual action).

c  = CCS global switching module (GSM) number.
d  = Link type. Valid value(s):
   A  = Link connecting to an adjacent home signaling transfer point.
   E  = Link connecting to an adjacent secondary signaling transfer point.
   F  = Link connecting to an signaling end point.
e  = Originating point code (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.
f  = Adjacent point code (APC) number of the office this link goes to.
g  = Signaling link code (SLC) of the link.
h  = Basic link state. Valid value(s):
   AVAIL = Available (active). Note that the link may still not be capable of carrying traffic due to inhibited or blocked qualifiers.
   UNAVAIL = Unavailable (out-of-service).
i  = Source of link reconfiguration. Valid value(s):
   AUTO = Automatic recovery caused the link status change.
   MAN  = Link status change was requested manually by a RMV:CCSLK or RST:CCSLK input message.
j  = Qualifier. Valid value(s):
   LOCAL BLK = All traffic is locally blocked from using this link.
LOCAL INH = All traffic is locally inhibited on this link except for test and maintenance traffic.
LOCAL UNBLK = Link is locally unblocked.
LOCAL UNINH = Link is locally uninhibited.
MTCE = Link is out-of-service due to maintenance action.
REMOTE BLK = All traffic is remotely blocked from using this link.
REMOTE INH = All traffic is remotely inhibited on this link except for test and maintenance traffic.
REMOTE UNBLK = Link is remotely unblocked.
REMOTE UNINH = Link is remotely uninhibited.
RESTORED,STILL INH = Link is restored to an active state, but it is still inhibited.
SRC-ATT UNINH FAIL = GSM is unable to uninhibit the link.

k = Operational restriction. Valid value(s):
DL = No signaling data link (SDL) is available for use.
DACT = Link is manually deactivated.
LKER-L1 = Level one failure (no network time slot available).
LKER-L2 = Level two failure (level two failed alignment).
LKER-L3 = Level three failure (link test failed).
OOSF-PH = Channel group is unassigned.

l = Congestion. Valid value(s):
LOCAL CONG LVL1 = The link is in the first level of local congestion using the multiple congestion levels feature.
LOCAL CONG LVL2 = The link is in the second level of local congestion using the multiple congestion levels feature.
LOCAL CONG LVL3 = The link is in the third level of local congestion using the multiple congestion levels feature.
REMOTE CONG = The link is in remote congestion.

m = Signal link fail reason. Valid value(s):
EXCESS DELAY ACK = Excessive delay of acknowledgement
EXCESS DURATION CONG = Excessive duration of congestion
EXCESS ERROR RATE AERM = Alignment error rate monitor (AERM) checks an aligning link and prints the error rate message when the threshold level of the monitor is exceeded.
EXCESS ERROR RATE SUERM = Signaling unit error rate monitor (SUERM) checks an active link and prints the error rate message when the threshold level is exceeded.
INVALID BSN THRESHOLD EXCEEDED = The link is out-of-service due to exceeding the invalid backward sequence number (BSN) threshold using the basic error correction method.
INVALID FIB THRESHOLD EXCEEDED = The link is out-of-service due to exceeding the invalid forward indicator bit (FIB) threshold.
INVALID LEVEL 2 LINK STATE = The link is out-of-service due to an invalid level 2 link control state.
INVALID LEVEL 2 PROFILE = The link is out-of-service due to an invalid level 2 profile.
INVALID SU THRESHOLD EXCEEDED = The link is out-of-service due to exceeding the invalid signal unit (SU) threshold using the preventive cyclic retransmission error correction method.
LEVEL 3 LINK TEST FAILURE = The level 3 link test has failed due to either a timeout waiting for the SLTA or the SLTA contained incorrect information.
PH INITIALIZATION = The link is out-of-service due to an initialization occurring on the protocol handler.
REMOTE OUT OF SERVICE = The link is out-of-service due to the reception of an SIOS LSSU from the remote office.

RESOURCE EXHAUSTION= NO FREE RFD = The link is out-of-service due to no available receive frame descriptors.

ROUTING DATA PROBLEM = An inconsistency has been detected between the level 2 link state and the routing data in the PH. The signaling link will be removed and restored to correct the inconsistency.

FAILED LINK CRAFT REFERRAL TIMER EXPIRED = The failed link has not aligned/activated within the desired time provisioned by RC/V View 16.2 (LEVEL 3 TIMER PARAMETERS) link timer FAILED CRAFT REF (T1.111.4/T19).

FALSE LINK CONGESTION DETECTED = The link is out-of-service because it stayed in the same congestion level for too long and provisioned RC/V View 16.2 link timer FALSE LNK CON (T1.111.4/T31) has expired. The congestion level is indicated above (field ‘i’).

Note: No signal link fail reason will be reported for manually requested output message.

n = SM number of packet switch unit (PSU).

o = Unit number of PSU in SM.

p = Shelf number in PSU.

q = PH number on shelf.

r = SM number.

s = Digital line and trunk unit (DLTU) number of the SDL.

t = DFI number of the SDL.

u = DFI Channel number of the SDL.

v = SM number of digital network unit - synchronous optical network (DNU-S) number.

w = DNU-S number of the SDL.

x = DNU-S data group number of the SDL.

y = DNU-S sonet terminating equipment (STE) number of the SDL.

z = DNU-S synchronous transport signal (STS) number of the SDL.
a1 = DNU-S virtual tributary 1.5 group (VTGRP) number of the SDL.
b1 = DNU-S virtual tributary 1.5 member (VTGRM) number of the SDL.
c1 = DNU-S VT1.5 channel number of the SDL.

4. ACTIONS TO BE TAKEN

If a major alarm occurs, determine the cause of link failure and restore it to service.

5. ALARMS
A major alarm occurs if the link goes out-of-service (which is not as the result of a manual action).

</tbody>
</table>
PH INITIALIZATION = The link is out-of-service due to an initialization occurring on the protocol handler.
REMOTE OUT OF SERVICE = The link is out-of-service due to the reception of an SIOS LSSU from the remote office.
RESOURCE EXHAUSTION- NO FREE RFD = The link is out-of-service due to no available receive frame descriptors.
ROUTING DATA PROBLEM = An inconsistency has been detected between the level 2 link state and the routing data in the PH. The signaling link will be removed and restored to correct the inconsistency.
FAILED LINK CRAFT REFERRAL TIMER EXPIRED = The failed link has not aligned/activated within the desired time provisioned by RC/V View 16.2 (LEVEL 3 TIMER PARAMETERS) link timer FAILED CRAFT REF (T1.111.4/T19).
FALSE LINK CONGESTION DETECTED = The link is out-of-service because it stayed in the same congestion level for too long and provisioned RC/V View 16.2 link timer FALSE LNK CON (T1.111.4/T31) has expired. The congestion level is indicated above (variable 'i').
ALIGNMENT GUARD TIMER EXPIITED = The link is out-of-service because the overall guard timer for initial alignment procedure T1 expired while link, following successful alignment proving procedure, is still in aligned/ready state and failed to go to the in-service state.
NOT ALIGNED TIMER T2 EXPIITED = The link is out-of-service during the initial alignment procedure because not aligned timer T2 expired before the link leaves the not aligned state to the aligned state.
ALIGNED TIMER T3 EXPIITED = The link is out-of-service during the initial alignment procedure because aligned timer T3 expired before the link leaves the aligned state to the proving state.

Note: No signal link fail reason will be reported for manually requested output message.

n = SM number of packet switch unit (PSU).
o = Unit number of PSU in SM.
p = Shelf number in PSU.
q = PH number on shelf.
r = SM number.
s = Digital line and trunk unit (DLTU) number of the SDL.
t = DFI number of the SDL.
u = DFI Channel number of the SDL.
v = SM number of digital network unit - synchronous optical network (SONET) (DNU-S) number.
w = DNU-S number of the SDL.
x = DNU-S data group number of the SDL.
y = DNU-S SONET terminating equipment (STE) number of the SDL.
z = DNU-S synchronous transport signal (STS) number of the SDL.
a = DNU-S virtual tributary 1.5 group (VTGRP) number of the SDL.
b = DNU-S virtual tributary 1.5 member (VTGRM) number of the SDL.
c = DNU-S VT1.5 channel number of the SDL.
d = SM number of optical interface unit (OIU).
e = OIU number of the DSL.
f = OIU protection group (PG) number of the SDL.
g = OIU OC-3 STE number of the SDL.
h = OIU STS-1 number of the SDL.
i = OIU virtual tributary group number of the SDL.
j = OIU virtual tributary member number of the SDL.
k = OIU channel number of the SDL.

4. ACTIONS TO BE TAKEN
If a major alarm occurs, determine the cause of link failure and restore it to service.

5. ALARMS
A major alarm occurs if the link goes out-of-service (which is not as the result of a manual action).

2. REASON FOR OUTPUT

To report additional information of an RMV:CCSLK or RST:CCSLK input message or an automatic action that changes the state of a common channel signaling (CCS) signaling link.

3. VARIABLE FIELD DEFINITIONS

  a = Linkset (LS) number.
  b = Linkset member number.
  c = CCS global switching module (GSM) number.
  d = Link type. Valid value(s):
      A = Link connecting to an adjacent home signaling transfer point.
      E = Link connecting to an adjacent secondary signaling transfer point.
      F = Link connecting to a signaling end point.
  e = Originating point code (OPC) number associated with the GSM. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.
  f = Adjacent point code (APC) number of the office this link goes to.
  g = Signaling link code (SLC) of the link.
  h = Time that the link event occurred, in the form hours:minutes:seconds.
  i = Basic link state. Valid value(s):
      AVAIL = Available (active). Note that the link may still not be capable of carrying traffic due to inhibited or blocked qualifiers.
      UNAVAIL = Unavailable (out-of-service).
  j = Source of link reconfiguration. Valid value(s):
      AUTO = Automatic recovery caused the link status change.
      MAN = Link status change was requested manually by a RMV:CCSLK or RST:CCSLK input message.
  k = Qualifier. Valid value(s):
INIT = Link is initializing.
LOCAL BLK = All traffic is locally blocked from using this link.
LOCAL INH = All traffic is locally inhibited on this link except for test and maintenance traffic.
LOCAL UNBLK = Link is locally unblocked.
LOCAL UNINH = Link is locally uninhibited.
MTCE = Link is out-of-service due to maintenance action.
REMOTE BLK = All traffic is remotely blocked from using this link. (Note: This qualifier does not apply to SAAL high speed links.)
REMOTE INH = All traffic is remotely inhibited on this link except for test and maintenance traffic.
REMOTE UNBLK = Link is remotely unblocked. (Note: This qualifier does not apply to SAAL high speed links.)
REMOTE UNINH = Link is remotely uninhibited.
RESTORED,STILL INH = Link is restored to an active state, but it is still inhibited.
SRC-ATT UNINH FAIL = GSM is unable to uninhibit the link.

l = Operational restriction. Valid value(s):
DL = No signaling data link (SDL) is available for use.
DACT = Link is manually deactivated.
LKER-L1 = Level one failure (no network time slot available).
LKER-L2 = Level two failure (level two failed alignment).
LKER-L3 = Level three failure (link test failed).
OOSF-PH = Channel group is unassigned.

m = Congestion. Valid value(s):
LOCAL CONG LVL1 = The link is in the first level of local congestion using the multiple congestion levels feature.
LOCAL CONG LVL2 = The link is in the second level of local congestion using the multiple congestion levels feature.
LOCAL CONG LVL3 = The link is in the third level of local congestion using the multiple congestion levels feature.
REMOTE CONG = The link is in remote congestion. (Note: This qualifier does not apply to SAAL high speed links.)

n = Signal link fail reason. Valid value(s):
ALIGNED TIMER T3 EXPIRED = The link is out-of-service during the initial alignment procedure because aligned timer T3 expired before the link leaves the aligned state to the proving state. (Note: This failure reason does not apply to SAAL high speed links.)
ALIGNMENT GUARD TIMER EXPIRED = The link is out-of-service because the overall guard timer for initial alignment procedure T1 expired while link, following successful alignment proving procedure, is still in aligned/ready state and failed to go to the in-service state.
EXCESS DELAY ACK - TIMER T7 EXPIRED = For an MTP2 link, the remote end has not acknowledged a transmitted message signaling unit (MSU) and timer T.111.3/T7 has expired.
EXCESS DELAY ACK - TIMER_NO_RESPONSE = For a high-speed signaling link (HSL), the local SSCOP process has not received at least one solicited status response (STAT PDU) for its transmitted status request (POLL PDU) message(s) during an interval exceeding the SSCOP Timer_NO-RESPONSE.
EXCESS DURATION CONG = For an MTP2 link, an excessive duration of receipt of status indication busy (SIB) LSSUs has been declared.
EXCESS DURATION CONG - TIMER_NO_CREDIT = For a HSL, a no credit condition, detected by SAAL LM using the receipt of a MAA_ERROR "no credit" indication conveyed from the HSL's SSCOP process, has persisted until the SAAL's LM Timer_NO_CREDIT has expired, resulting in the link being declared failed due to an excessive duration of far-end receiving congestion.

EXCESS ERROR RATE - AERM = Alignment error rate monitor (AERM) checks an aligning link and prints the error rate message when the threshold level of the monitor is exceeded.

EXCESS ERROR RATE - SUERM = Signaling unit error rate monitor (SUERM) checks an active link and prints the error rate message when the threshold level is exceeded.

EXCESSIVE IN-SERVICE ERROR RATE = For a high-speed signaling link (HSL), layer management's (LM's) In-Service Error-Rate Monitor (ISERM) has removed the link from service due to a detected excessive error rate, indicated by the number of retransmitted service-specific connection-oriented protocol (SSCOP) sequenced data (SD) protocol data units (PDUs).

FAILED LINK CRAFT REFERRAL TIMER EXPIRED = The failed link has not aligned/activated within the desired time provisioned by RC/V View 16.2 (LEVEL 3 TIMER PARAMETERS) link timer FAILED CRAFT REF (T1.111.4/T19).

FALSE LINK CONGESTION DETECTED = The link is out-of-service because it stayed in the same congestion level for too long and provisioned RC/V View 16.2 link timer FALSE LNK CON (T1.111.4/T31) has expired. The congestion level is indicated above (variable 'm').

INVALID BSN THRESHOLD EXCEEDED = The link is out-of-service due to exceeding the invalid backward sequence number (BSN) threshold using the basic error correction method.

INVALID FIB THRESHOLD EXCEEDED = The link is out-of-service due to exceeding the invalid forward indicator bit (FIB) threshold.

INVALID LEVEL 2 LINK STATE = The link is out-of-service due to an invalid level 2 link control state.

INVALID LEVEL 2 PROFILE = The link is out-of-service due to an invalid level 2 profile.

INVALID SU THRESHOLD EXCEEDED = The link is out-of-service due to exceeding the invalid signal unit (SU) threshold using the preventive cyclic retransmission error correction method.

LEVEL 3 LINK TEST FAILURE = The level 3 link test has failed due to either a timeout waiting for the SLTA or the SLTA contained incorrect information.

LINK ALIGNMENT FAILURE = A link alignment attempt was not successful.

MTP3 CHANGEORDER MESSAGE RECEIVED = The CCS node has received an MTP level 3 network management (MTP-NM) Changeover order (COO) message from the CCS node at the far-end of the link, has declared the link failed, and has diverted message traffic to other available links.

NOT ALIGNED TIMER T2 EXPIRED = The link is out-of-service during the initial alignment procedure because not aligned timer T2 expired before the link leaves the not aligned state to the aligned state.

PH INITIALIZATION = The link is out-of-service due to an initialization as a result of a software failure/error occurring on the protocol handler.

PSU PIPE ATM LOST = The link is out-of-service because the PSU pipe has detected an error at the asynchronous transfer mode (ATM) layer.

PSU PIPE DS0 OOS = The link is out-of-service because the PSU pipe has detected that a DS0 port that is a member of the PSU pipe is out-of-service.

PSU PIPE INVALID STATE = The link is out-of-service because the PSU pipe is in an invalid state.

PSU PIPE MANUALLY REMOVED = The link is out-of-service due to the manual removal of the PSU pipe.

REMOTE OUT OF SERVICE = The link is out-of-service due to the reception of an SIOS LSSU from...
the remote office.

**RESOURCE EXHAUSTION— NO FREE RFD** = The link is out-of-service due to no available receive frame descriptors.

**ROUTING DATA PROBLEM** = An inconsistency has been detected between the level 2 link state and the routing data in the PH. The signaling link will be removed and restored to correct the inconsistency.

**SAAL LOCAL PROVING NOT SUCCESSFUL** = For a HSL, SAAL has detected that proving was not successful at the near end.

**SAAL LOCAL RELEASE** = For a HSL, SAAL has detected that the signaling connection has been released at the near end.

**SAAL LOCAL STOP** = For a HSL, SAAL was stopped at the near end.

**SAAL REMOTE PROVING NOT SUCCESSFUL** = For a HSL, SAAL has detected that proving was not successful at the far end.

**SAAL REMOTE RELEASE** = For a HSL, SAAL has detected that the signaling connection has been released at the far end.

**SAAL REMOTELY INITIATED STOP** = For a HSL, SAAL was stopped at the far end.

**SSCF LOCAL RELEASE OUT-OF-SERVICE** = For a HSL, the CCS node's local SSCOP process for that HSL has received an SSCOP END (disconnect comment) PDU from the near end with the SSCOP-UU data field conveying out-of-service (OOS) and has released the signaling connection.

**SSCF REMOTE RELEASE MANAGEMENT INITIATED** = For a HSL, the CCS node's SSCOP process for the HSL has received an SSCOP END (disconnect command) PDU from the far end with the SSCOP-UU data field conveying management initiated (MI) and has released the signaling connection.

**SSCF REMOTE RELEASE OUT-OF-SERVICE** = For a HSL, the CCS node's local SSCOP process for that HSL has received an SSCOP END (disconnect command) PDU from the far end with the SSCOP-UU data field conveying OOS and has released the signaling connection.

**SSCF REMOTE RELEASE PROTOCOL ERROR** = For a HSL, the CCS node's SSCOP process for the HSL has received an SSCOP END (disconnect command) PDU from the far end with the SSCOP-UU data field conveying protocol error (PE) and has released the signaling connection.

---

**Note:** No signal link fail reason will be reported for manually requested output message.

- **o** = SM number of packet switch unit (PSU).

- **p** = Unit number of PSU in SM.

- **q** = Shelf number in PSU.

[2] REPT C/D CIA CANNOT GET PROCESS ID OF DAP

__________________________________________________________________

[3] REPT C/D CIA CANNOT SEND A MESSAGE TO DAP

__________________________________________________________________

2. REASON FOR OUTPUT

Format 1 informs the user that the current state of the Switching Control Center (SCC) links indicates that the equipment configuration database (ECD) must be updated in order for the SCC to become active.

Formats 2 and 3 indicate that the critical indicators administrator (CIA) could not communicate with the display administration process (DAP).

3. VARIABLE FIELD DEFINITIONS

a = Device filename.

4. ACTION TO BE TAKEN

For Format 1, the status of the SCC links in the ECD are something other than ACT, STBY, OOS or INIT. If the SCC is not needed, use recent change/verify (RC/V) to delete the ULARP record for CIA to prohibit ULARP from trying to restart the CIA process. If the SCC link is needed, follow growth procedures to activate the link.

For Formats 2 or 3, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

APP:OMDB-X-REF
REPT:CD-ERROR
Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT C/D ERROR 1 a [PID b] [APPLICATION NOTIFICATION FAILURE]

[2] REPT C/D ERROR 2 c d [e]

[3] REPT C/D ERROR 3 f g

[4] REPT C/D ERROR 4 h (i|m) [ERRNO j] [k]

[5] REPT C/D ERROR 5 l DAP EXITING RECEIVED SIGNAL m

2. REASON FOR OUTPUT

To inform the user that control/display (C/D) detected an exceptional condition while trying to process a message or poke request from the maintenance cathode ray terminal (CRT).

For Format 1, error types 1, 2, and 3 indicate severe problems in which DAP died upon initialization and will have been restarted by ULARP. Error types 4, 5, 6, and 7 can be ignored unless persistent, which indicates technical assistance should be obtained. Error type 8 indicates that the display administration process (DAP) was unable to read the ECD CFTINFO form and will initialize using the system default values.

Format 2 indicates that the DAP is overloaded with outstanding writes. This may indicate an iodriver or system overload, or that more requests for change to displays are arriving than DAP can handle.

For Format 3, error types 1, 2, and 4 indicate that DAP could not allocate memory or process a file for the creation of a page; or that DAP could not allocate memory or process the transtab file and that a default translation table will be used. Error type 3 indicates that tty information is missing for a particular terminal and that DAP is using default information for the terminal.

For Format 4, error types 3, 4, 5, and 7 indicate an error while attempting to attach a device. Error type 1 indicates that DAP could not open the translation table and that a default is being used. Error type 2 indicates that DAP incurred a write error and data for a terminal has been lost. Error type 6 indicates that a problem occurred in finding or updating an indicator for a page. Error type 8 indicates that DAP was unable to request new memory to buffer output destined for a terminal and that data has been lost.

Format 5 will occur when DAP dies from a signal and could indicate a problem that should be noted.

3. VARIABLE FIELD DEFINITIONS

a = Error type. Valid value(s):
1 = Unable to attach to C/D port.
2 = Cannot enable message reception.
3 = Unable to get shared segment or fork/exec critical indicator administrator (CIA).
4 = Invalid C/D administrative request received.
5 = Unable to send DAP status to application.
6 = Unable to send message to page owner.
7 = Invalid C/D poke operation request received.
8 = Unable to access ECD CFTINFO form.

b = Process ID of the process which sent the bad message.

c = Error type. Valid value(s):
2 = Write error

d = Text phrase. Valid value(s):

<table>
<thead>
<tr>
<th>'d'</th>
<th>'g'</th>
</tr>
</thead>
<tbody>
<tr>
<td>DAP LOCAL DEVICE I/O BUFFER OVERFLOW</td>
<td></td>
</tr>
<tr>
<td>DAP PROCESS I/O BUFFER OVERFLOW</td>
<td></td>
</tr>
</tbody>
</table>

e = Device ID which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda, then "a" is the device ID.

f = Error type. Valid value(s):
1 = File format error.
2 = File read failure.
3 = Gettrap returned no data.
4 = Memory request failure.

<table>
<thead>
<tr>
<th>'f'</th>
<th>'i'</th>
</tr>
</thead>
<tbody>
<tr>
<td>'CANNOT_ALLOCATE_MEMORY_FOR_PAGE_INITIALIZATION'</td>
<td></td>
</tr>
</tbody>
</table>

g = Valid value(s):

h = Error type. Valid value(s):
1 = File open error.
2 = Write error.
3 = Attach settrap error.
4 = Attach gettrap error.
5 = Attach incore equipment configuration database (ECD) error.
6 = Indicator operation error.
7 = Retrieve incore ECD device record error.
8 = Error when attempting to allocate memory.

<table>
<thead>
<tr>
<th>'h'</th>
<th>'j'</th>
</tr>
</thead>
<tbody>
<tr>
<td>'DAPMALLOC FAILED DATA LOST FOR DEVICE'</td>
<td></td>
</tr>
</tbody>
</table>

i = Valid value(s):

<table>
<thead>
<tr>
<th>'i'</th>
<th>'j'</th>
</tr>
</thead>
<tbody>
<tr>
<td>'DAPMALLOC FAILED DATA LOST FOR DEVICE'</td>
<td></td>
</tr>
</tbody>
</table>

j = System error code; refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
k = Device ID which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda then "a" is the device ID.

l = Signal received.

m = Device ID which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda, then "a" is the device ID.

4. ACTION TO BE TAKEN

For Format 1, error types 1, 2, and 3 indicate severe problems in which DAP died upon initialization and will have been restarted by ULARP. Error types 4, 5, 6, and 7 can be ignored unless persistent, which indicates technical assistance should be obtained. Error type 8 indicates a possible ECD problem; technical assistance should be obtained.

For Format 4, error types 3, 4, 5, and 7 indicate an error while attempting to attach a device. The terminal should be power cycled for these conditions. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 2 - 5, except where noted for Format 4 above, if the message is intermittent, take no action. If the message persists for a local terminal, power cycle the terminal. If it persists for a removed terminal, terminate and re-establish the terminal's connections.

5. ALARMS

None.

APP:OMDB-X-REF
APP:SYSERR
REPT:CD-GETTY

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT C/D GETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT

[2] REPT C/D GETTY UNABLE TO ACCESS ECD FOR a

[3] REPT C/D GETTY FAILED TO OPEN DEVICE a FOR WRITING

[4] REPT C/D GETTY UNABLE TO COMMUNICATE WITH DAP PORT b

[5] REPT C/D GETTY FOR DEVICE a FAILED TO CREATE c

[6] REPT C/D GETTY PATHNAME NOT IN THE ECD FOR a

2. REASON FOR OUTPUT

To inform the user that the CDGETTY process has encountered an error while trying to process initialization information for control/display devices following terminal restores. The messages may appear on the originating device, or the receive-only printer (ROP).

3. VARIABLE FIELD DEFINITIONS

a = Device ID which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda, then "a" is the device ID.

b = Port ID.

c = Pathname of the process to be created.

4. ACTION TO BE TAKEN

Format 1 indicates that the UNIX® process /proc/init is not setting the proper environment for getty. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Format 2 indicates that either it could not attach to the incore database or it failed to get the required record; for example, the getty record. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Format 3 indicates that it cannot open the acknowledgement channel for the listed device. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Format 4 indicates that the display administration process (DAP) is not connected to its port. To verify that the DAP
is currently running, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Formats 5 and 6 indicate that they could not execute the shell listed in the getty record. Verify the correctness of the getty record in the incore database and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. This automatically-generated report requires no action.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[9] REPT C/D POKER FIFO WRITE ERROR, RTN = a ERRNO f

[10] REPT C/D POKER UNABLE TO SEND MSG ERRNO f

[12] REPT C/D POKER OPENCH FAILURE FOR DEVICE e

[13] REPT C/D POKER CSOP FAILED TO CONNECT TO PORT d

2. REASON FOR OUTPUT

To report errors detected by poker associated with control/display devices. Formats 1, 9, and 11 indicate errors in setting up or diverting output to a secondary reader [that is, recent change and verify (RCV)/equipment configuration database (ECD)].
Formats 2, 4 - 8, 12 and 13 indicate poker initialization errors.

Format 10 indicates an error with sending poke input to display administration process (DAP) from a dialogue terminal.

3. VARIABLE FIELD DEFINITIONS

a = Failure return from write().

b = Signal number.

c = File name.

d = Port number.

e = Device ID which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda, then ‘a’ is the device ID.

f = System error numbers. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

For Formats 1, 2, 5, and 7 - 11, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 3 if DAP is running, execute menu 807 from the C/D Update page to restart the poker. If DAP is not running, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 4 verify correctness of 'ttopt' form for this device, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 6 to verify correctness of pagename field found in the 'getty' form for this device, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. If correct, take no action; message was the result of a request to display an uninitialized page at time of request.

For Format 12, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual to verify correctness of channel ID field found in the 'logdev' form for this device.

For Format 13, if the coordinator of spooler output processes (CSOP) is running, display page 103 and execute menu 807 to restart the poker. If CSOP is not running, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. These automatically-generated reports require no action.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:CD-STARTER

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT C/D STARTER SIGNAL TO d FAILED ERRNO f
[2] REPT C/D STARTER DAP REQUEST FAILED PORT e
    ERRNO f
[3] REPT C/D STARTER TMP FILE SYSTEM NOT ACCESSIBLE
    [ERRNO f]
[4] REPT C/D STARTER CHILD TERMINATION STATUS b
    [SIGNAL g]
[5] REPT C/D STARTER FAILED TO OPEN a ERRNO f
[6] REPT C/D STARTER FAILED TO EXECUTE c ERRNO f
[7] REPT C/D STARTER FAILED TO CREATE PIPE a
    ERRNO f
[8] REPT C/D STARTER FORK FAILED ERRNO f
[9] REPT C/D STARTER ALREADY ACTIVE STARTER ON h
[10] REPT C/D STARTER ARGUMENT ERROR

2. REASON FOR OUTPUT

To report the control/display (C/D) starter process encountered an error while attempting to set up the device for a secondary input read process; for example, recent change and verify (RCV).

3. VARIABLE FIELD DEFINITIONS

a = File name.
b = Child exit status.
c = Pathname of secondary input read process (RCV).
d = Poker process ID.
e = Display administration process (DAP) port number.
f = System error number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
g = Signal which terminated the child.
h = Device ID which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda, then "a" is the device ID.

4. ACTION TO BE TAKEN

For Formats 1 and 2, if the message is printed for a local terminal, power cycle the terminal. If the message is printed for a remote terminal, terminate and re-establish the terminal's connection.

For Format 3, if the system initialization is in progress, wait and re-enter the menu later to re-start the STARTER process. If system initialization is not in progress, mount the /tmp filesystem or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Format 4 indicates the child process of STARTER terminated abnormally. If STATUS is specified, then refer to the documentation specific to the process shown in variable 'c'. If SIGNAL is specified, then refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 5 - 10, re-enter the menu to try to restart the STARTER process. If this fails again, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Format 11 indicates that an active child process is running on the named terminal. Use the PF3 key to resume communication with that process.

5. ALARMS

None. This is an automatically-generated report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To respond to a peripheral interface control bus (PICB) control failure interrupt in an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line/trunk unit number.
c = CDFI number.
d = Event number.
e = Error type. Valid value(s):
   CI RECEIVED BAD PARITY = Controller interface received a bad parity bit.
   CI RECEIVED BAD START CODE = Controller interface received a bad start code.
   PER DETECTED BAD ADDRESS = Protocol error record detected a bad address.
   PER DETECTED BAD PARITY = Protocol error record detected bad parity bit.
   PER DETECTED BAD START CODE = Protocol error record detected a bad start code.
   SOFTWARE BAD ADDRESS ERROR = A bad software address was detected.
   g = Indication of whether the fault was transient or hard, as determined by the module controller fault recovery.
   h = System PICB number in hexadecimal that was being written when the failure occurred.
   i = Read/write (uppermost) bit and address in hexadecimal to which the CI was writing when the failure occurred.

f = Recovery action taken. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   INITIALIZE = The failing circuit has been initialized.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A DGN:CDFI message will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:CDFI message will be printed with the result of the diagnostic.
j = Data being written to the periphery by the CI.
k = Contents of the CI error source register.
l = External logical circuit name.

Note: Up to two logical circuit names, recent failure counts, and error thresholds (variables 'm'-n') may be printed.

m = Current decimal number of recent failures of this type recorded.
n = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

4. ACTION TO BE TAKEN
None.

5. ALARMS
None.

6. REFERENCES

Output Message(s):

DGN: CDFI
RST: CDFI

Other Manual(s):
235-105-210 Routine Operations and Maintenance
REPT: CDFI-TRBL

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT CDFI=a-b-c TRBL d EVENT=e
   f RECOVERY ACTION g
   h i j
   [k] . . .

2. REASON FOR OUTPUT

To report the occurrence of a hardware error in an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line/trunk unit number.
c = Circuit number.
d = Error report (refer to Exhibit A).
e = Event number.
f = Error type qualifying the error report (refer to Exhibit A).
g = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   INITIALIZE = The failing circuit has been initialized.
   RMV = The failing circuit will be removed from service. Manual intervention is required to restore the circuit to service.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A DGN:DFI message will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:DFI message will be printed with the result of the diagnostic.
   h = External logical circuit name.
i = Current decimal number of errors of this type recorded.
j = Error count threshold above which the recovery action will be escalated.
k = Register contents.

NOTE: Skip bytes 1 and 2, ‘k’ value starts from byte 3.
### 4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

### 5. ALARMS

An alarm will be displayed if the recovery action results in the circuit being removed from service. CDFIs will display a minor alarm for the first facility which is removed from service and a major alarm if more than one facility is out of service.

   INTERRUPT THRU DFI MASK RECOVERY ACTION e
   [f]
   g h i

2. REASON FOR OUTPUT

To respond to an unexpected service request on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line/trunk unit number.
c = CDFI number.
d = Event number.
e = Recovery action taken. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   INITIALIZE = The failing circuit has been initialized.
   RST AUTO CAMPO N = The failing circuit will be diagnosed when it is available. A DGN:CDFI message will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:CDFI message will be printed with the result of the diagnostic.
f = Source analysis data if available, else line will be blank.
g = Logical circuit ID.
h = Total decimal error count recorded in the last 5 minutes.
i = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

1. FORMAT

REPT CDI=a-b-c TRBL PICB CONTROL FAILURE EVENT=d
  e  RECOVERY ACTION f
g  h  i  j
k  l  m  n

2. REASON FOR OUTPUT

To respond to a peripheral interface control bus (PICB) control failure interrupt in the control data interface (CDI).

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Trunk unit number.
c = Service group number.
d = Event number, which is the time sequence indicator.
e = Error type. Valid value(s):

   CI RECEIVED BAD PARITY
   CI RECEIVED BAD START CODE
   CI TIME OUT
   PER DETECTED BAD ADDRESS
   PER DETECTED BAD PARITY
   PER DETECTED BAD START CODE
   SOFTWARE BAD ADDRESS ERROR

f = Recovery action. Valid value(s):

   ANALYSIS ONLY = A post mortem report is provided.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has
   been notified.
   INITIALIZE = The failing circuit has been reinitialized.
   REPORT TO TERMINAL MAINT = Terminal maintenance has been notified of the failure.
   RMV = The failing circuit will be removed from service. Intervention is required to change
   the state of the circuit. A message from the maintenance request administrator
   (MRA) will be printed after the circuit is removed.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be
   printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
   will be printed with the results of the diagnostic.

g = Indication of whether the fault was transient or hard, as determined by the module controller fault
recovery.
h = System PICB number in hexadecimal that was being written when the failure occurred.

i = Read/write (uppermost) bit and address in hexadecimal to which the control interface (CI) was writing when the failure occurred.

j = Data being written to the periphery by the CI.

k = Contents of the CI error source register.

Note: Up to two logical circuit names, error counts, and error thresholds (variables 'l' - 'n') may be printed.

l = External logical circuit name.

m = Current decimal number of recent failures of this type recorded.

n = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

2. REASON FOR OUTPUT

To respond to a time slot interchange (TSI) interrupt caused by peripheral interface data bus (PIDB) parity errors in the control data interface (CDI).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Trunk unit number.
c = Switch group number.
d = Event number.
e = Error type, which indicates PIDB trouble.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the result of the diagnostic.

g = Common board error count.
h = Common board threshold, above which the recovery action will be escalated.
i = Channel board error count. Left most 'i' refers to board 0.
j = Channel board threshold, above which the recovery action will be escalated.
k = Number of parity errors in frame.
Channel error count.

Channel threshold, above which the recovery action will be escalated.

REPT CDI=a-b-c TRBL SP FAILURE d
   SP FIFO OVERFLOW FAILURE RECOVERY ACTION e
   f g
   h i j

2. REASON FOR OUTPUT

To respond to a signal processor (SP) interrupt caused by the SP first-in first-out (FIFO) overflowing due to showering trunk circuits in the service group.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Trunk unit number.
c = Service group number.
d = Event number, which is the time sequence indicator.
e = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

f = Internal timeslot number.
g = Number of entries in the SP FIFO for this circuit.
h = External logical circuit name.
i = Current decimal number of recent failures of this type recorded.
j = Error count threshold, above which the recovery action will be escalated.

Note: Up to three logical circuit names, error counts, and error thresholds (variables 'i'-'k') may be printed.

Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT CDI=a-b-c TRBL TU SERV REQ FAILURE d e RECOVERY ACTION f g h i j k

2. REASON FOR OUTPUT

To respond to maintenance service requests from the trunk unit control and data interface (CDI) circuit.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Trunk unit number.
c = Service group number.
d = Event number.
e = Error type. Valid value(s):
   CDI CLOCK OR SYNC FAILURE
   GBIT OR START CODE FAILURE
   SERV REQ REPORTED, NOT FOUND
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   INHIBIT HDWCHKS = All maintenance type interrupts are blocked on the circuit.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
                 will be printed with the results of the diagnostic.
g = External logical circuit name.
h = Error count.
i = Error count threshold, above which the recovery action will be escalated.
j = Contents of the trunk unit CDI error source register.
k = Software image of the trunk unit CDI mask data.

4. ACTION TO BE TAKEN
If variable 'e' is GBIT OR START CODE FAILURE, then interrupts are inhibited on the CDI specified by variables 'a', 'b', and 'c' and the test and access circuit (TAC) also specified by variables 'a', 'b', and 'c' is removed from service. A request to restore the TAC will be denied until interrupts are allowed on the CDI.

If the GBIT OR START CODE FAILURE message occurs again, then the CDI should be removed and diagnosed to locate the failure (refer to the RMV:CDI and DGN:CDI input messages). Since the failure of the CDI is not service-affecting, it should be removed when traffic is low.

When the failure is located and corrected, enter the RST:CDI message to restore the CDI. Once this is done the TAC should be restored by entering the RST:TAC input message.

5. ALARMS

None.

[10] REPT CFT-LIB GETSEG FAILED ERRNO b

[11] REPT CFT-LIB UNABLE TO PLACE INPUT MESSAGE IN ENVIRONMENT

[12] REPT CFT-LIB CLEARING SEMAPHORE

[13] REPT CFT-LIB CANNOT ACCESS ECD PDS ASSUMED

2. REASON FOR OUTPUT

To report a craft library (CFT LIB) related occurrence or error.

Format 1 indicates that the craft library could not access the file that contains the currently valid input message authority groups.

Format 2 indicates that the craft library encountered a read error when attempting to read the input message authority groups file.
Format 3 indicates that an error has been detected in the input message authority groups file. This can occur if there are too many authority groups specified (more than the defined maximum, currently 91) or if the wrong file is read.

Format 4 indicates that the craft library could not access the file that contains the current assignments of authority groups to persons and terminals.

Format 5 indicates that the craft library encountered a read error when attempting to read the authority assignment file.

Format 6 indicates that the craft library could not retrieve the date format from the eaiopt record in the equipment configuration database (ECD).

Format 7 prints when the craft library detects an error in the layout of the date found in the eaiopt record in the ECD. The layout must include the desired position of the month (m), day (d), and year (y) with optional separators (for example; ":", ",", "."). Some example layouts include: m:d:y and d-m-y.

Format 8 prints when the craft library is unable to retrieve an input message string from the calling process' environment.

Format 9 indicates that the craft library failed to remove the incore ECD data segment(s) from its address space.

Format 10 indicates that the craft library failed to add the incore ECD data segment(s) to its address space.

Format 11 indicates that the craft library failed to put the input message into the client process environment.

Format 12 indicates that the craft library is releasing a locked semaphore.

Format 13 is printed when the craft library is either unable to attach to the ECD or unable to read the splrinfo record in the ECD to determine whether the system is in PDS or MML mode. PDS mode is assumed.

3. VARIABLE FIELD DEFINITIONS

a = Reason for failure to obtain date format from the ECD. Valid value(s):
1 = Could not attach ECD segment to process.
2 = Failure attaching to database.
3 = Could not get ECD origin.
4 = Could not get UCB record.
5 = Could not get IOPT record.
6 = Could not get EAIOPT record.
7 = Failure releasing database.
8 = Could not remove ECD segment from process.

b = System error number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

For Formats 1 through 11, no action is needed.

For Format 12, check the /cdmp directory for a dump file of the process that had the semaphore locked. If a file is present, save the file for future analysis.

5. ALARMS
None. This alarm is a manually-requested report.

If a minor alarm occurs, take action as indicated in the report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

**REPT:CFTSHL**

*Software Release:* 5E14 and later  
*Message Class:* MAINT  
*Application:* 5,3B  
*Type:* Output

## 1. FORMAT

1. **REPTCFTSHL TERMINAL IN SERVICE *****
   | **f** |
   | CAPABILITY MODE / MML |

2. **REPT CFTSHL EOF ENCOUNTERED**

3. **REPT CFTSHL UNABLE TO READ LINE a OF .pname file**
   | **Install a .pname file in DIRECTORY i AND SHELL WILL RECOVER** |

4. **REPT CFTSHL CANNOT CHANGE DIRECTORY TO b**

5. **REPT CFTSHL SETGID TO c FAILED**

6. **REPT CFTSHL SETUID TO d FAILED**

7. **REPT CFTSHL CANNOT CREATE e AS ALTERNATE SHELL**

8. **REPT CFTSHL INTERRUPT RECEIVED**

9. **REPT CFTSHL INVALID ENVIRONMENT ARGUMENT PASSED TO ALTERNATE SHELL**

10. **REPT CFTSHL UNABLE TO READ LINE a OF .pname FILE FOR ALTERNATE SHELL AND ENVIRONMENT ARGUMENT MISSING**

11. **REPT CFTSHL CANNOT CREATE SEGMENT FOR INPUT AND OUTPUT**

12. **REPT CFTSHL ON MTTY WILL USE DEFAULT .PNAME FILE**

13. **REPT CFTSHL CRAFT SHELL IS IN LIMP CAPABILITY MODE**

14. **REPT CFTSHL HIGH PRIORITY TERMINAL FEATURE HAS BEEN DEACTIVATED**
2. REASON FOR OUTPUT

To report a craft (CFT) shell-related occurrence or error. The messages may appear on the inputting (requesting) terminal, the receive-only printer (ROP), or both depending on the mode (terminal reading/background execution) of the craft shell (CFTSHL). Some messages may be appended to an input message.

Format 1 indicates the CFTSHL is ready to accept input.

Format 2 indicates the CFTSHL has been terminated. This message appears when a key.

Format 9 is printed when CFTSHL is executed from another process (shell) and an improper environment is passed as argument two.

Format 10 is printed when an alternate CFTSHL is invoked and the request environment cannot be read from the .pname file.

Format 11 is printed when CFTSHL fails to allocate a memory segment for I/O buffer using UNIX® RTR system call makeseg().

Format 12 is printed when CFTSHL is invoked for a maintenance terminal and the .pname file cannot be found in the current working directory. The CFTSHL then uses a default .pname file.

Format 13 indicates that the CFTSHL cannot attach to the input message catalog.

Format 14 is printed when CFTSHL deactivates the high priority terminal feature on either a timeout of the SET:HPRI input command or when the feature is manually deactivated from a maintenance terminal.

3. VARIABLE FIELD DEFINITIONS

a = Label of line.
b = Name of the requested directory.
c = Name of the requested group ID.
d = Name of the requested user ID.
e = Pathname of the alternate shell process.
f = CFTSHL capability mode. Valid value(s):

    FULL
    LIMP
    PART

4. ACTION TO BE TAKEN

For Format 3, the input message or the .pname file is in error and must be corrected. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

For Formats 1, 2, 4, 5, 6, and 7, none. These are automatically generated reports.

For Formats 3, 9, and 10, action alarm. Take action as indicated in the report.
For Format 8, manual alarm. This report is the result of manual input.

For Formats 11 and 13, minor alarm. Take action as indicated in the report.

For Format 12, critical alarm. Take immediate action as indicated in the report. If needed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report:

- A carrier group alarm (CGA) event for a facility.

- A threshold crossing for the number of CGA alarms on digital networking unit - synchronous optical network (DNU-S).

- An alarm condition for an analog channel bank (ANCB) or for the digital channel bank (DTCB) for metallic service unit (MSU) scan points.

Format 1 will print messages related to the following: remote integrated services line unit (RISLU) digital facility interface (DFI) handler (DFIH), DFI terminating facility (FAC), MSU scan point number (SPN), integrated digital carrier unit (IDCU) facility (IFAC), and SLC® 96 DFI (SDFI).

Format 2, 3 and 4 are for DNU-S digital facilities. For electrical carrier level 1 SONET termination equipment
(EC1STE) alarms, Format 2 will print. For synchronous transport signal (STS) alarms, Format 3 will print. For virtual tributary (VT1.5) and digital signal 1 (DS1) alarms, Format 4 will print when a threshold has been crossed that changes the alarm level associated with the number of VT1.5/DS1 pairs that are out of service for CGA reasons.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line and trunk unit (DLTU) number.
c = DFI number.
d = FAC number.
e = DCLU number.
f = Reason for message. The following are for DFI-1, DFI-2, DFIH, SDFI, and DNU-S unless stated otherwise. Valid value(s):
   AIS = Alarm indication signal. The AIS alarm has been triggered on a facility. Facilities are removed from service.
   ASC = Alarm signal clear. The AIS alarm has been cleared. Facilities are restored to service provided no other alarms exist which would cause the facility to remain out-of-service.
   LAC = Local alarm clear. The local (red) alarm on a facility has cleared. Facilities are restored to service provided no other alarms exist which would cause the facility to remain out-of-service.
   LCA = Local alarm. The local (red) alarm has been triggered on a facility. Facilities are removed from service.
   RAC = Remote alarm clear. This does not apply to the SDFI or the EC1STE. Facilities are restored to service provided no other alarms exist which would cause the facility to remain out-of-service.
   RMA = Remote alarm. This does not apply to the SDFI or the EC1STE. The remote (yellow) alarm has been triggered on a facility. Facilities are removed from service.
   TRANSIENT = CGA Set and Clear. Software and hardware equipment states now indicate no CGA. There has been a CGA that was set and has already been cleared. This message notifies the user that an automatic reconditioning of RISLU hardware has occurred due to a short duration CGA.

  g = Optional facility name - common language facility identifier (CLFI). CLFI is a customer-supplied variable string. The identifier has a maximum length of 25 characters for DNU facilities and 12 characters for all other types.
  h = MSU number.
  i = Service group number.
  j = Board number.
k = Scan point number.
l = MSU scan point reasons. Valid value(s):
CAC = Carrier group alarm has cleared.
CAR = Carrier group alarm has occurred.
m = MSU type. Valid value(s):
A = Analog.
D = Digital.
n = IDCU number.
o = IFAC number.
p = DNU-S number.
q = Data group (DG) number.
r = SONET termination equipment (STE) number.
s = STS-1 alarm is active. The highest priority alarms will print. If this alarm exists then the 't' and 'u' (a VT1.5 and DS1 alarm) fields will not print. Possible alarms are:
A = AIS alarm active.
L = Local alarm active.
R = Remote alarm active.
t = VT1.5 alarm is active. The highest priority alarms will print. If this alarm exists then the 'u' (a DS1 alarm) field will not print. Possible alarms are:
A = AIS alarm active.
L = Local alarm active.
R = Remote alarm active.
u = DS1 alarm. The highest priority alarm will print. If this alarm exists then the 't' (VT1.5 alarm) field does not print. If a DS1 alarm prints then no VT1.5 alarm exists. Possible alarms are:
A = AIS alarm active.
L = Local alarm active.
R = Remote alarm active.
v = Valid value(s):
SET = Set alarm. A CGA alarm is currently active for identified unit. This does not apply for EC1STE.

CLR = Clear alarm. A CGA alarm has cleared for identified unit. This does not apply for EC1STE.

w = STS number.

x = DNU-S VT/DS1 alarm threshold level. Valid values are:

CRITICAL = If six DNU-S VT1.5 or DS1s or a combination of the two (on the same STS) have CGA events then it is reported as a critical alarm.

MAJOR = If two DNU-S VT1.5, DS1s or a combination of the two (on the same STS) have CGA events then it is reported as a major alarm.

MINOR = If only one DNU-S VT1.5 or DS1 on an STS has a CGA event then it is reported as a minor alarm.

4. ACTIONS TO BE TAKEN

If you have a RMA or AIS alarm, check the status of the far-end switch. A LCA indicates a complete loss of framing except for STS and VT1.5 it is loss of pointer. Multiple LCA indicate a probable transmission facility failure (for example, severed cable). All non-DNU-S VT1.5/DS1s are printed per event. All DNU-S VT1.5/DS1s are summary, where 1 alarm is a minor, two alarms is a major and six alarms is critical. When a CGA clears/occurs an OP:CGA should be executed.

5. ALARMS

A LCA, AIS, or RMA carrier group alarm causes a CGA alarm. Otherwise, none.

2. REASON FOR OUTPUT

To report:
- A carrier group alarm (CGA) event for a facility.
- A threshold crossing for the number of CGA alarm on digital networking unit - synchronous optical network (DNU-S).
- An alarm condition for an analog channel bank (ANCB) or for the digital channel bank (DTCB) for metallic service unit (MSU) scan points.

Format 1 will print messages related to the following: remote integrated services line unit (RISLU) digital facility
interface (DFI) handler (DFIH), DFI terminating facility (FAC), integrated digital carrier unit (IDCU) facility (IFAC), 
SLC® 96 DFI (SDFI), and peripheral control and timing facility interface (PCTFI) tributary.

Format 2,3 and 4 are for DNU-S digital facilities. For electrical carrier level 1 SONET termination equipment 
(EC1STE) alarms, format 2 will print. For synchronous transport signal (STS) alarms, format 3 will print. For virtual 
tributary (VT1.5) and digital signal 1 (DS1) alarms, format 4 will print when a threshold has been crossed that 
changes the alarm level associated with the number of VT1.5/DS1 pairs that are out of service for CGA reasons. 
Format 5 will print message for MSU scan point number (SPN).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line and trunk unit (DLTU) number.
c = DFI number.
d = FAC number.
e = DCLU number.
f = Reason for message. The following are for DFI-1, DFI-2, DFIH, SDFI, and DNU-S unless stated 
otherwise. Valid value(s):

AIS = Alarm indication signal. The AIS alarm has been triggered on a facility. Facilities are 
removed from service.

ASC = Alarm signal clear. The AIS alarm has been cleared. Facilities are restored to 
service provided no other alarms exist which would cause the facility to remain 
out-of-service.

LAC = Local alarm clear. The local (red) alarm on a facility has cleared. Facilities are 
restored to service provided no other alarms exist which would cause the facility to 
remain out-of-service.

LCA = Local alarm. The local (red) alarm has been triggered on a facility. Facilities are 
removed from service.

RAC = Remote alarm clear. This does not apply to the SDFI or the EC1STE. Facilities are 
restored to service provided no other alarms exist which would cause the facility to 
remain out-of-service.

RMA = Remote alarm. This does not apply to the SDFI or the EC1STE. The remote 
(yellow) alarm has been triggered on a facility. Facilities are removed from service.

TRANSIENT = CGA Set and Clear. Software and hardware equipment states now indicate no 
CGA. There has been a CGA that was set and has already been cleared. This 
message notifies the user that an automatic reconditioning of RISLU hardware has 
occurred due to a short duration CGA.

g = Optional facility name - common language facility identifier (CLFI). CLFI is a customer-supplied 
variable string. The identifier has a maximum length of 25 characters for DNU facilities and 12 
characters for all other types.

h = MSU number.
i = Service group number.

j = Board number.

k = Scan point number.

l = MSU scan point reasons. Valid value(s):
   CAC = Carrier group alarm has cleared.
   CAR = Carrier group alarm has occurred.

m = MSU type. Valid value(s):
   A = Analog.
   D = Digital.

n = IDCU number.

o = IFAC number.

p = DNU-S number.

q = Data group (DG) number.

r = SONET termination equipment (STE) number.

s = STS-1 alarm is active. The highest priority alarms will print. If this alarm exists then the 't' and 'u' (a VT1.5 and DS1 alarm) fields will not print. Possible alarms include:
   A = AIS alarm active.
   L = Local alarm active.
   R = Remote alarm active.

t = VT1.5 alarm is active. The highest priority alarms will print. If this alarm exists then the 'u' (a DS1 alarm) field will not print. Possible alarms include:
   A = AIS alarm active.
   L = Local alarm active.
   R = Remote alarm active.

u = DS1 alarm. The highest priority alarm will print. If this alarm exists then the 't' (VT1.5 alarm) field does not print. If a DS1 alarm prints then no VT1.5 alarm exists. Possible alarms includes:
   A = AIS alarm active.
   L = Local alarm active.
\textbf{R} = Remote alarm active.

\textbf{v} = Alarm status. Valid value(s):

\textbf{SET} = Set alarm. A CGA alarm is currently active for identified unit. This does not apply for EC1STE.

\textbf{CLR} = Clear alarm. A CGA alarm has cleared for identified unit. This does not apply for EC1STE.

\textbf{w} = STS number.

\textbf{x} = DNU-S VT/DS1 alarm threshold level. Valid value(s):

\textbf{CRITICAL} = If six DNU-S VT1.5 or DS1s or a combination of the two (on the same STS) have CGA events then it is reported as a critical alarm.

\textbf{MAJOR} = If two DNU-S VT1.5, DS1s or a combination of the two (on the same STS) have CGA events then it is reported as a major alarm.

\textbf{MINOR} = If only one DNU-S VT1.5 or DS1 on an STS has a CGA event then it is reported as a minor alarm.

\textbf{y} = PCT line and trunk (PLTU) number.

\textbf{z} = PCT facility interface number.

\textbf{a} = PCT tributary number.

\textbf{b} = PCTFI valid alarm value(s). Valid value(s):

\textbf{SET} = Set alarm. PCTFI CGA SET. This alarm represents a "summary" event rather than a specific type of CGA. The event indicates that an alarm indication has occurred at the 7R/E-PD.

\textbf{CLR} = Clear alarm. PCTFI CGA clear. This alarm represents a "summary" event rather than a specific type of CGA. The event indicates that summary alarm information from the 7R/E-PD has cleared.

\section*{4. ACTIONS TO BE TAKEN}

If you have a RMA or AIS alarm, check the status of the far-end switch. A LCA indicates a complete loss of framing except for STS and VT1.5 it is loss of pointer. Multiple LCA indicate a probable transmission facility failure (for example, severed cable). All non-DNU-S VT1.5/DS1s are printed per event. All DNU-S VT1.5/DS1s are summary, where 1 alarm is a minor, two alarms is a major and six alarms is critical. When a CGA clears/occurs an OP:CGA should be executed.

\section*{5. ALARMS}

A LCA, AIS, or RMA carrier group alarm causes a CGA alarm. Otherwise, none.

2. REASON FOR OUTPUT

To report:

- A carrier group alarm (CGA) event for a facility.
- A threshold crossing for the number of CGA alarms on a digital networking unit - synchronous optical network (DNU-S).
- An alarm condition for an analog channel bank (ANCB) or for the digital channel bank (DTCB) for metallic service unit (MSU) scan points.

Format 1 will print messages related to the remote integrated services line unit (RISLU) digital facility interface (DFI) host (DFIH), the DFI facility (FAC), the integrated digital carrier unit (IDCU) facility (IFAC), the optical interface unit (OIU) CGA sources (OC3, STS1, VT15, DS1), the SLC® 96 DFI (SDFI), and the peripheral control and timing facility interface (PCTFI) tributary (TRIB). Up to four facilities for any of these CGA sources may be listed in a single REPT CGA Format 1 output message.

Format 2, 3 and 4 are for DNU-S digital facilities. For electrical carrier level 1 SONET termination equipment (EC1STE) alarms, Format 2 will print. For synchronous transport signal (STS) alarms, Format 3 will print. For virtual tributary (VT1.5) and digital signal 1 (DS1) alarms, Format 4 will print when a threshold has been crossed that changes the alarm level associated with the number of VT1.5/DS1 pairs that are out of service for CGA reasons.

Format 5 will print message for MSU scan point number (SPN).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line and trunk unit (DLTU) number.
c = DFI number.
d = FAC number.
e = DCLU number.
f = Reason for message. These values apply to DLTU DFI-1 and DFI-2 (FAC) facilities, DNU-S facilities, IDCU facilities, OIU facilities, RISLU (DFIH) facilities, and SLC® 96 DFI (SDFI) facilities unless stated otherwise. Valid value(s):

AIS = Alarm indication signal. The AIS alarm has been triggered on a facility. Facilities are removed from service.
ASC = Alarm signal clear. The AIS alarm has been cleared. Facilities are restored to service provided no other alarms exist which would cause the facility to remain out-of-service.
BER = Bit error rate (BER) alarm. This value is only used on OIU STE facilities. Facilities are removed from service.
BERC = BER alarm clear. This value is only used on OIU STE facilities when a BER alarm clears. Facilities are restored to service provided no other alarms exist which would cause the facility to remain out-of-service.
LAC = Local alarm clear. The local (red) alarm on a facility has cleared. Facilities are restored to service provided no other alarms exist which would cause the facility to remain out-of-service.
LCA = Local alarm. The local alarm has been triggered on a facility. Facilities are removed from service.
RAC = Remote alarm clear. This does not apply to the SDFI or the EC1STE. Facilities are restored to service provided no other alarms exist which would cause the facility to remain out-of-service.
RMA = Remote alarm. This does not apply to the SDFI or the EC1STE. The remote
(yellow) alarm has been triggered on a facility. Facilities are removed from service.
A = CGA set and clear. Software and hardware equipment states now indicate no
CGA. There has been a CGA that was set and has already been cleared. This
message notifies the user that an automatic reconditioning of RISLU hardware has
occurred due to a short duration CGA.

Optional facility name - Common Language facility identifier (CLFI). CLFI is a customer-supplied
variable string. The identifier has a maximum length of 25 for all facilities.

h = MSU number.
i = Service group number.
j = Board number.
k = Scan point number.
l = MSU scan point reasons. Valid value(s):
CAC = Carrier group alarm has cleared.
CAR = Carrier group alarm has occurred.
m = MSU type. Valid value(s):
A = Analog.
D = Digital.
n = IDCU number.
o = IFAC number.
p = DNU-S number.
q = Data group (DG) number.
r = SONET termination equipment (STE) number.
s = STS-1 alarm is active. The highest priority alarm will print. If this alarm exists then the 't.' and 'u' (a
VT1.5 and DS1 alarm) fields will not print. Valid value(s):
A = AIS alarm active.
L = Local alarm active.
R = Remote alarm active.
t = VT1.5 alarm is active. The highest priority alarm will print. If this alarm exists then the 'u' (a DS1
alarm) field will not print. Valid value(s):
A = AIS alarm active.
L = Local alarm active.
R = Remote alarm active.
u = DS1 alarm. The highest priority alarm will print. If this alarm exists then the 't.' (VT1.5 alarm) field
does not print. If a DS1 alarm prints then no VT1.5 alarm exists. Valid value(s):
A = AIS alarm active.
L = Local alarm active.
R = Remote alarm active.

v = Alarm status. Valid value(s):
SET = Set alarm. A CGA alarm is currently active for the identified unit. This does not apply for EC1STE.
CLR = Clear alarm. A CGA alarm has cleared for the identified unit. This does not apply for EC1STE.

w = STS number.

x = DNU-S VT/DS1 alarm threshold level. Valid value(s):
CRITICAL = If six DNU-S VT1.5 or DS1s or a combination of the two (on the same STS) have CGA events then it is reported as a critical alarm.
MAJOR = If two DNU-S VT1.5, DS1s or a combination of the two (on the same STS) have CGA events then it is reported as a major alarm.
MINOR = If only one DNU-S VT1.5 or DS1 on an STS has a CGA event then it is reported as a minor alarm.

y = PCT line and trunk (PLTU) number.

z = PCT facility interface number.

a = PCT tributary number.

b = PCTFI alarm. Valid value(s):
SET = Set alarm. PCTFI CGA SET. This alarm represents a "summary" event rather than a specific type of CGA. The event indicates that an alarm indication has occurred at the 7R/E-PD.
CLR = Clear alarm. PCTFI CGA clear. This alarm represents a "summary" event rather than a specific type of CGA. The event indicates that summary alarm information from the 7R/E-PD has cleared.

c = Optical interface unit (OIU) number.

d = Protection group (PG) number.
e = OIU STE number.
f = OIU STE side number.
g = Virtual tributary (VTG) group number.
h = Virtual tributary member (VTM) number.

4. ACTIONS TO BE TAKEN

If you have a RMA or AIS alarm, check the status of the far-end switch. A LCA indicates a complete loss of framing except for STS and VT1.5 it is loss of pointer. Multiple LCA indicate a probable transmission facility failure (for example, severed cable). All non-DNU-S VT1.5/DS1s are printed per event. All DNU-S VT1.5/DS1s are summary, where 1 alarm is a minor, two alarms is a major and six alarms is critical. When a CGA clears/occurs an OP:CGA...
should be executed.

5. ALARMS

A LCA, AIS, BER or RMA carrier group alarm causes a CGA alarm. Otherwise, none.

2. REASON FOR OUTPUT

To report:
• A carrier group alarm (CGA) event for a facility.

• A threshold crossing for the number of CGA alarms on a digital networking unit - synchronous optical network (DNU-S).

• An alarm condition for an analog channel bank (ANCB) or for the digital channel bank (DTCB) for metallic service unit (MSU) scan points.

Format 1 will print messages related to the remote integrated services line unit (RISLU) digital facility interface (DFI) host (DFIH), the DFI facility (FAC), the integrated digital carrier unit (IDCU) facility (IFAC), the optical interface unit (OIU) CGA sources (OC3, OC3C, STS3C, STS1, VT15, DS1), the SLC® 96 DFI (SDFI), and the peripheral control and timing facility interface (PCTFI) tributary (TRIB). Up to four facilities for any of these CGA sources may be listed in a single REPT CGA Format 1 output message.

Format 2, 3 and 4 are for DNU-S digital facilities. For electrical carrier level 1 SONET termination equipment (EC1STE) alarms, Format 2 will print. For synchronous transport signal (STS) alarms, Format 3 will print. For virtual tributary (VT1.5) and digital signal 1 (DS1) alarms, Format 4 will print when a threshold has been crossed that changes the alarm level associated with the number of VT1.5/DS1 pairs that are out of service for CGA reasons.

Format 5 will print message for MSU scan point number (SPN).

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.

b  = Digital line and trunk unit (DLTU) number.

c  = DFI number.

d  = FAC number.

e  = DCLU number.

f  = Reason for message. These values apply to DLTU DFI-1 and DFI-2 (FAC) facilities, DNU-S facilities, IDCU facilities, OIU facilities, RISLU (DFIH) facilities, and SLC® 96 DFI (SDFI) facilities unless stated otherwise. Valid value(s):

AIS  = Alarm indication signal. The AIS alarm has been triggered on a facility. Facilities are removed from service.

ASC  = Alarm signal clear. The AIS alarm has been cleared. Facilities are restored to service provided no other alarms exist which would cause the facility to remain out-of-service.

BER  = Bit error rate (BER) alarm. This value is only used on OIU STE facilities. Facilities are removed from service.

BERC = BER alarm clear. This value is only used on OIU STE facilities when a BER alarm clears. Facilities are restored to service provided no other alarms exist which would cause the facility to remain out-of-service.

LAC  = Local alarm clear. The local (red) alarm on a facility has cleared. Facilities are restored to service provided no other alarms exist which would cause the facility to remain out-of-service.

LCA  = Local alarm. The local alarm has been triggered on a facility. Facilities are removed from service.

RAC  = Remote alarm clear. This does not apply to the SDFI or the EC1STE. Facilities are restored to service provided no other alarms exist which would cause the facility
to remain out-of-service.

**RMA**
= Remote alarm. This does not apply to the SDFI or the EC1STE. The remote (yellow) alarm has been triggered on a facility. Facilities are removed from service.

**TRANSIENT**
= CGA set and clear. Software and hardware equipment states now indicate no CGA. There has been a CGA that was set and has already been cleared. This message notifies the user that an automatic reconditioning of RISLU hardware has occurred due to a short duration CGA.

**g**
= Optional facility name - *Common Language®* facility identifier (CLFI). CLFI is a customer-supplied variable string. The identifier has a maximum length of 25 for all facilities.

**h**
= MSU number.

**i**
= Service group number.

**j**
= Board number.

**k**
= Scan point number.

**l**
= MSU scan point reasons. Valid value(s):

- **CAC**
  = Carrier group alarm has cleared.

- **CAR**
  = Carrier group alarm has occurred.

**m**
= MSU type. Valid value(s):

- **A**
  = Analog.

- **D**
  = Digital.

**n**
= IDCU number.

**o**
= IFAC number.

**p**
= DNU-S number.

**q**
= Data group (DG) number.

**r**
= SONET termination equipment (STE) number.

**s**
= STS-1 alarm is active. The highest priority alarm will print. If this alarm exists then the 't' and 'u' (a VT1.5 and DS1 alarm) fields will not print. Valid value(s):

- **A**
  = AIS alarm active.

- **L**
  = Local alarm active.

- **R**
  = Remote alarm active.

**t**
= VT1.5 alarm is active. The highest priority alarm will print. If this alarm exists then the 'u' (a DS1 alarm) field will not print. Valid value(s):

- **A**
  = AIS alarm active.

- **L**
  = Local alarm active.

- **R**
  = Remote alarm active.

**u**
= DS1 alarm. The highest priority alarm will print. If this alarm exists then the 't' (VT1.5 alarm) field
does not print. If a DS1 alarm prints then no VT1.5 alarm exists. Valid value(s):
A = AIS alarm active.
L = Local alarm active.
R = Remote alarm active.

v = Alarm status. Valid value(s):
SET = Set alarm. A CGA alarm is currently active for the identified unit. This does not
apply for EC1STE.
CLR = Clear alarm. A CGA alarm has cleared for the identified unit. This does not apply
for EC1STE.

w = STS number.

x = DNU-S VT/DS1 alarm threshold level. Valid value(s):
CRITICAL = If six DNU-S VT1.5 or DS1s or a combination of the two (on the same STS) have
CGA events then it is reported as a critical alarm.
MAJOR = If two DNU-S VT1.5, DS1s or a combination of the two (on the same STS) have
CGA events then it is reported as a major alarm.
MINOR = If only one DNU-S VT1.5 or DS1 on an STS has a CGA event then it is reported
as a minor alarm.

y = PCT line and trunk (PLTU) number.
z = PCT facility interface number.
a1 = PCT tributary number.
b1 = PCTFI alarm. Valid value(s):
SET = Set alarm. PCTFI CGA SET. This alarm represents a "summary" event rather
than a specific type of CGA. The event indicates that an alarm indication has
occurred at the 7R/E-PD.
CLR = Clear alarm. PCTFI CGA clear. This alarm represents a "summary" event rather
than a specific type of CGA. The event indicates that summary alarm information
from the 7R/E-PD has cleared.

c1 = Optical interface unit (OIU) number.
d1 = Protection group (PG) number.
e1 = OIU STE number.
f1 = OIU STE side number.
g1 = Virtual tributary (VTG) group number.
h1 = Virtual tributary member (VTM) number.

4. ACTIONS TO BE TAKEN

If you have a RMA or AIS alarm, check the status of the far-end switch. A LCA indicates a complete loss of framing
except for STS and VT1.5 it is loss of pointer. Multiple LCA indicate a probable transmission facility failure (for
example, severed cable). All non-DNU-S VT1.5/DS1s are printed per event. All DNU-S VT1.5/DS1s are summary, where 1 alarm is a minor, two alarms is a major and six alarms is critical. When a CGA clears/occurs an OP:CGA should be executed.

5. ALARMS

A LCA, AIS, BER or RMA carrier group alarm causes a CGA alarm. Otherwise, none.

1. FORMAT

REPT CLUCREATE
   CLUSTER/MEMBER INITIALIZATION COMPLETE

2. REASON FOR OUTPUT

This message indicates that new disk files for cluster/member routing data were created with default values. These disk files are read into the administrative module (AM) protected application segment (PAS) during initialization.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

None.
REPT:CM-ISOLATED
Software Release: 5E14 and later
Message Class: MSGS
Application: 5
Type: Output

1. FORMAT
REPT CM ISOLATED FROM AM

2. REASON FOR OUTPUT
To report that the communication module (CM) is isolated from the administrative module (AM). While the switch is operating in this manually initiated mode, the AM cannot communicate with the CM or switching modules (SMs). Call processing functionality that requires the AM (such as common channel signaling calls) is not available. Calls that do not require the AM may still complete.

3. VARIABLE FIELD DEFINITIONS
No variables.

4. ACTION TO BE TAKEN
Take manual action to remedy the problem that required manual isolation of the CM from the AM. Then re-establish AM/CM communication by following the procedure given in the System Recovery manual.

5. ALARMS
Critical.

6. REFERENCES

Software Release: 5E14 and later
Message Class: MSGS
Application: 5
Type: Output

1. FORMAT

REPT CM RE-SYNCHRONIZATION WITH AM ABORTED

2. REASON FOR OUTPUT

To report that an attempt to re-synchronize the communication module (CM) with the administrative module (AM) failed. The CM remains isolated from the AM and the AM cannot communicate with the CM or switching modules (SMs). Call processing functionality that requires the AM (such as common channel signaling calls) is not available. Calls that do not require the AM may still complete.

3. VARIABLE FIELD DEFINITIONS

\( a \) = Additional data qualifying the failure reason. Valid value(s):

- DUE TO MANUAL CM ISOLATION REQUEST = The manual command to set CM isolation was entered while re-synch was in progress and aborted the re-synch.
- FAILURE DUE TO CMP = Could not obtain an active communication module processor (CMP).
- FAILURE DUE TO DLI = Dual link interface configuration process (DLICON) communication failed with re-synch control process (RCON) in the AM.
- FAILURE DUE TO FPC = The original active foundation peripheral controller (FPC) was not found.
- FAILURE DUE TO INTERNAL ERROR = A software error occurred.
- FAILURE DUE TO LACK OF CRITICAL CM FUNCTIONALITY = A check for critical functionality was made at the end of re-synch and determined that no inter-module call processing was possible.
- FAILURE DUE TO MMP and QGP = No active module message processor (MMP) or quad link packet switch gateway processor (QGP) was found.
- FAILURE DUE TO MSCU = No active message switch control unit (MSCU) was found.
- FAILURE DUE TO NC = The original major network clock (NC) was not found.
- FAILURE DUE TO QGP and MMP = No ACT QGP or MMP was found.
- FAILURE DUE TO TMS = Communication with the time multiplexed switch (TMS) failed.
- NO ACTIVE MAJOR ONTC = The original ACTIVE MAJOR office network and timing complex (ONTC) could not be determined.
- ODD FAILURE/BAD DATA = The office dependent data is not internally consistent.
- OVERALL RE-SYNCHRONIZATION TIMER EXPIRED = A long timer (about 2 minutes) which was taken out at the start of normal mode resynch expired. Re-synch could not complete because of a software error.

4. ACTION TO BE TAKEN

Take manual action to remedy the problem that prevented re-synchronization of the CM with the AM. Then re-establish AM/CM communication by following the procedure given in the System Recovery manual.

5. ALARMS
Critical.

**REPT:CMDLOG**

**Software Release:** 5E14 and later  
**Message Class:** PSSWD  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   ```plaintext
   REPT CMDLOG [a] [b] c d 
   e 
   [f]
   ```

2. **REASON FOR OUTPUT**

   To report detailed information about an input request. The report is formatted like a CMDLOG logfile entry. It contains the input request, the requesting user identity, and the date and time of the request. This output message appears only for input requests from command groups that the system administrator has specified to be reported.

   This output message is associated with maintenance interface security. Refer to the Routine Operations and Maintenance manual for further information.

3. **VARIABLE FIELD DEFINITIONS**

   - **a** = Person identity of the user who entered the input request, if known. The person identity was created from the ADD:PAUTH input message.
   - **b** = Teletypewriter (TTY) name of the device from which the input request was entered, if known.
   - **c** = Date of input request (YY-MM-DD).
   - **d** = Time of input request (HH:MM).
   - **e** = Text of input request. If the request was a command poke, the corresponding input message for the command poke is provided.
   - **f** = Input acknowledgement, if the request was rejected because of restrictions.

4. **ACTION TO BE TAKEN**

   If 'f' is "NG – INSUFFICIENT AUTHORITY" or "NG–NO AUTHORITY", verify that user 'a' attempting to execute input request 'e' on tty 'b' is not a security violation. If the user requires permission to execute the input request, authority can be provided from the ADD:PCGRP and/or ADD:TCGRP input messages.

5. **ALARMS**

   The alarm level varies depending on settings in the Equipment Configuration Database (ECD) Authority Definition (authdef) records.

REPT:CMMSDP

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT CMMSDP
a

2. REASON FOR OUTPUT

To report when a system error is encountered or an unexpected problem with CMMSDP. CMMSDP is a kernel level process that accumulates the measurement data into the history files as specified in the measurement output control (MOC) history file descriptor table and generates the reports as specified in the MOC schedule table.

3. VARIABLE FIELD DEFINITIONS

a = The field labeled ‘a’ represents the body of the message. The next section lists all the possible messages, with the action to be taken when each is encountered.

4. ACTION TO BE TAKEN

Below are the possible messages and the appropriate action to be taken for each message.

<table>
<thead>
<tr>
<th>'a' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEASUREMENT REPORTS ARE INHIBITED</td>
<td>This message results if the craft previously input the command INH:REPORT:ON. Consequently, measurement reports that would normally be generated by CNI will not be generated. This message will print about once every 30 minutes from the time the reports are inhibited. The CNI report inhibit flag may be turned on or off using the INH:REPORT input message. Note that CNI measurements will continue to be collected, only the reporting of them is inhibited.</td>
</tr>
<tr>
<td>IMS MEASUREMENTS ARE CURRENTLY INHIBITED</td>
<td>Certain interprocess message switch (IMS) measurements will not be collected or accumulated during the period that IMS measurements are inhibited. The IMS measurement inhibit flag may be turned on or off using the INH:IMSMEAS input message.</td>
</tr>
<tr>
<td>CAN'T ATTACH TO PT_CMMSDP PORT</td>
<td>Was unsuccessful in connecting to the CMMSDP port. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>GOT AN ABORT SIGNAL</td>
<td>Received an abort request, or a fatal error occurred and CMMSDP should abort. Other output displayed on the receive only printer (ROP) will detail the reason. Action to be taken depends on the cause of the abort.</td>
</tr>
<tr>
<td>BAD DISP FIELD IN HFDT FOR history_file_name</td>
<td>The disposition field in the history file descriptor table for the history file name record is not HFDT_STOP or HFDT_CONT. Use recent change to restore the table to its proper value or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>BAD ACTION FIELD IN HFDT FOR history_file_name</td>
<td>The action field in the history file descriptor table for the history file name record is not HFDT_ADD or HFDT_COPY. Use recent change to restore the table to its proper value or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>Error Description</td>
<td>Message Details</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>ACTION FIELD IN HFDT FOR <code>history_file_name</code> MUST BE COPY</td>
<td>The action field in the history file descriptor table for a non-repeatable history file must be ADD_COPY. Use recent change to change the record setting the action to &quot;copy&quot; or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>CAN NOT FORK FOR <code>report_name</code></td>
<td>CMMSDP cannot fork a copy of itself. This error usually occurs if memory space is limited and there is not enough left for a copy of CMMSDP. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>INVALID SCHED ENTRY <code>report_name</code></td>
<td>A history file table (HFDT) entry for the history file name in the source field of the schedule report record (in the scheduler table SCHED) does not exist. Use recent change to add the history file entry or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>THE FILE <code>file_name</code> IS NOT UPDATED</td>
<td>The file named in the message could not be created and the measurements could not be accumulated. This indicated that disk space did not exist for the file. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>FCODE <code>fault_code</code></td>
<td>The fault code received by the fault handler was not FLT_SINIT. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>UPDATE TE:BAD PROTO <code>protocol</code> LINK <code>link_no</code> NOT UPDATED</td>
<td>The protocol for the link specified was not 6 (CCS6) or 7 (CCS7), 8 (D-channel), or 9 (SADC). Verify the link data and recent change if necessary. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>OUT OF PER NODE MEAS BLOCK</td>
<td>The match blocks are all in use. This is a critical error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>BAD PROTO <code>protocol</code> IN <code>file_name</code> RNA <code>ring_node</code></td>
<td>The protocol of the link specified as read from the file was not 6 (CCS6), 7 (CCS7), 8 (D-channel), or 9 (SADC). Verify the link data and recent change is necessary. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>CANNOT CREATE <code>file_name</code> WITH MODE <code>mode</code></td>
<td>The file name specified could not be created and the data could not be accumulated. The disk space is not sufficient for the data to be stored. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>CANNOT EXECUTE <code>file_name</code></td>
<td>The CMMSDP process forked off could not be overlaid with its child process CMNRGEN to produce a measurement report. This indicates there is not enough memory swap space available. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>CANNOT GET PID CONNECTED TO PORT <code>port_number</code></td>
<td>The process ID for the CNIINIT process could not be retrieved. Therefore, the required event could not be sent to CNIINIT which should time out. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>CANNOT OPEN <code>file_name</code> MODE <code>mode</code></td>
<td>The file specified could not be opened. If the priority of action is MAJOR, the file should exist and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. If the priority of action is NONE, the file will be created.</td>
</tr>
<tr>
<td>CANNOT LOCK PROCESS IN MEM. FLAG <code>flag_number</code></td>
<td>This CMMSDP process could not be locked in memory (flag_number is 1) for dart purposes. No action is required.</td>
</tr>
<tr>
<td>CANNOT READ <code>file_name</code></td>
<td>The file specified could not be read. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
</tbody>
</table>
CANNOT SEND TO PID process_id EVENTS  
Xevent_number

An event could not be sent to the CNINIT process which should time out. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

CANNOT SET TRAP FOR SIGNAL signal_number

CMMSDP failed to set a trap for the specified signal. Should this signal be received, the process would terminate. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

CANNOT WRITE file_name

The file specified could not be written. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

[10] REPT CMON INVALID [KILL] SEQUENCE NUMBER (g)

[11] REPT CMON INVALID CONTROL FILE (a)

[12] REPT CMON NO PROCESSES TO MONITOR

[13] REPT CMON PROCESS (h) ACKNOWLEDGMENT FAILED

[14] REPT CMON RECEIVED TERMINATION SIGNAL

[15] REPT CMON FORK FAILED

[16] REPT CMON CHDIR FAILED (i)
2. REASON FOR OUTPUT

To report diagnostic or error information as the result of the craft interface integrity monitor (CMON) process execution.

Formats 1-3 report failures of setting up CMON process itself.

Formats 4-12 report failures on opening or reading the CMON control file (/no5text/hm/cmon.ctl).

Format 13 reports child of the specified process failed to acknowledge.

Format 14 reports a termination signal is received.

Formats 15-17 report failures on starting up a process.

Formats 18-19 require no action.

Formats 20-28 report execution results for a process identified in the CMON control file.

3. VARIABLE FIELD DEFINITIONS
a = Name of the CMON control file.
b = Input line string from the CMON control file.
c = Path of the process.
d = Name of the process file.
e = Identifier of the action.
f = Chain number.
g = Sequence number.
h = The process name.
i = The process directory.
j = Signal type.
l = Process identification number.
k = Kill processes in chain.
m = Other exit codes of the dead process.
n = Take no action if the process dies.
r = Restart the process if it dies.
s = Have CMON commit suicide after killing its child processes.

4. ACTION TO BE TAKEN

For Formats 4-11, check the “/no5text/hm/cmon.ctl” file for correctness. Minimum UNIX® RTR user processes will have been executed.

For Format 25 without option NOT, CMON will be restarted automatically, therefore no action is required.

For Format 25 with option NOT, CMON will have exited and will not be restarted by user level automatic restart process (ULARP). To restart CMON, user initialization or the INIT:ULARP input message must be executed so that CMON can be reinitialized.

For Formats 12-24 or 26-28, no action is required.

5. ALARMS

None.

Input Message(s):

    INIT:ULARP
REPT:CMP-CALL
  Software Release: 5E14 and later
  Message Class: MTCE
  Application: 5
  Type: Output

1. FORMAT

REPT CMP CALL PROCESSING DOWNTIME
DOWNTIME=aa:aa:aa EVENT=b

2. REASON FOR OUTPUT

To report inter-module call processing outages related to recovery actions required for a communication module processor. Minor outages (less than 3-seconds duration) will not be reported by this output message but will be included in the plant measurement 24-hour report.

3. VARIABLE FIELD DEFINITIONS

a = Outage time, in the form hours:minutes:seconds.
b = Event number.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Other Manual(s):
235-105-250   System Recovery
REPT:CMP-ENV-HF

Software Release: 5E14 and later
Message Class: INT
Application: 5
Type: Output

1. FORMAT

REPT CMP=a ENV=b HASHSUM FAILURE [AM-EVENT=d]
   Failing ADDRESS RANGES:
     e   e
     .   .
     .   .

2. REASON FOR OUTPUT

To notify the user that hashsum checks of the communications module processor (CMP) memory failed. Hashsum checks are made during communications module processor pump (automatic or manual) and routinely.

Failure of hashsum checks may indicate that the hashsum tables are in error, or it may be that the memory is bad. The address ranges for the blocks that had bad hashsums are provided.

3. VARIABLE FIELD DEFINITIONS

   a = CMP number.
   b = CMP environment where fault occurred. Valid value(s):
       CMP-AP = Application processor.
       CMP-MSGH = Message handler.
   d = The AM event number. This only prints when the CMP environment is CMP-MSGH.
   e = The starting/ending address pair of the failing address range.

4. ACTION TO BE TAKEN

Investigate the cause of the failure. It may be the result of a bad memory or a bad hashsum table. Make any necessary repairs. This condition may prevent the CMP from going duplex.

If replacing the boards does not clear up the problem, there might be a difference between the ACTIVE memory and the hashsum table. If the CMP mode indicator says HASH ERR, it is very likely that the memory hashsums do not agree with the hashsum table. Resolve any differences between the memory and the hashsum table. This problem can occur when certain utility commands are used that change the contents of memory, but not the hashsum table. Refer to the LOAD:UT-CMP and WHEN:UT-CMP input messages for additional information.

It is possible for a CMP restoration to succeed even when the CMP is reporting hashsum failures when the failures are in certain ranges. That is, a CMP restoration does not check all memory; so if the CMP has ranges failing that are not in the set of memory checked, a restoration may succeed.

5. ALARMS

None.

2. REASON FOR OUTPUT

To provide information about the type and source of an error that occurred in the communications module processor (CMP) and the resulting level of initialization.

3. VARIABLE FIELD DEFINITIONS

a = CMP number.

b = CMP environment where fault occurred. Valid value(s):
CMAP = Applications processor.
CMP-MSGH = Message handler.
CMP-UNK = Environment unknown.

c = Level of CMP initialization. Valid value(s):
FI = Full initialization.
FI,PUMP = Full initialization with full pump.
PGI = Purging initialization.
REL = Raise the error-lead request.
RPI = Return to point of interrupt.
SI = Selective initialization.
SPP = Single process purge.
UNK = Level unknown.
d = Event number.

e = Termination report. Valid value(s):
   ABORTED = The job did not complete before being interrupted by another stimulus.
   COMPLETED = The action has completed.
   IN PROGRESS = The action has started.
   NOT STARTED = The action was not started.

g = Mode of the communication module processor operation. Valid value(s):
   CONSISTENT = Hardware consistent with software.
   ESSENTIAL = Essential jobs operational.
   NORMAL = Normal operation.
   OFFULL = All jobs are operational.
   PHASE_2 = Phase 2 initialization.
   RAMDYN = Dynamic memory consistent.
   RAMTXT = Text and data consistent.
   RAMWP = Write protection has been restored.
   SYSPROC = All system processes initialized.
   UNKNOWN = Mode unknown.

h = Time when the event occurred, in the form minutes: seconds.tenths of a second.

i = Process number of the running background (BG) process.

j = Uniqueness of the running background process.

k = The running background process address.

l = The recovery action taken. Valid value(s):
   blank = No recovery action taken because the target was not active.
   PURGED = The single target job or process was purged.
   RPI = Return to the point of interrupt.

m = Interject state. Valid value(s):
   AMA = Automatic message accounting.
   AML = Automatic maintenance limit.
   BASE = Communication package.
   BCST = Message broadcast.
   CCS = Common channel signaling.
   CICO = CMP integrity control.
   CTST = Communication test processing.
   DD = Data delivery.
   INTMON = Integrity monitor.
   NONE = Interject was not running.
   PC = Peripheral network control.
   PR = Packet routing.
   PS = Packet switching.
RTA = Routing and terminal allocation.
TIME = Operating system time synchronization.

n = State of foreground (FG) activity. Valid value(s):
CM = Communication package was executing.
CM_INTMON = Communication package and integrity monitor was executing.
FAILURE = Unable to determine foreground activity.
INTMON = System integrity monitor was executing.
NONE = Foreground (ID - millisecond interrupt) was not being served.
NONPC = Foreground was being served for an indeterminable job other than PC.
OSDS = OSDS work for 10 millisecond interrupt was executing.
PC = Peripheral control foreground was executing.

o = Foreground recovery action. Valid value(s):
CLEAR = All scheduled jobs were aborted.
PURGED = The indicated process is being purged.
RPI = Return to the point of interrupt.

q = Source of the error that caused the interrupt. Valid value(s):
ADDR-ERROR = A word access was attempted on an odd-byte boundary.
ADDR-OOR = An out-of-range address was detected.
AP-MSGH-SANITY-TIMER = The application processor (AP) has detected a failure by the message handler (MSGH) to update the interprocessor sanity timer bit.
BASE-PRIORITY-QUEUE-ERR-AP = The AP has detected a problem with the base-priority message queue.
BASE-PRIORITY-QUEUE-ERR-MSGH = The MSGH has detected a problem with the base-priority message queue.
BUS-ERROR = A 68030 bus error exception occurred.
BUS-ERR-TRANSLATION-TABLE = A bus error has occurred during an address translation search.
BUS-PARITY-ERR = A read parity error has occurred on the data bus.
CORR-BIT-ERR = A single bit error was detected in memory and corrected by the Hamming code.
EXT-BOARD-ADDR-PARITY-ERR = The memory board has detected bad parity on the address bus.
EXT-BOARD-BUS-ERR = A bus error was detected on an external board.
EXT-BOARD-DATA-PARITY-ERR = The memory board has detected bad parity on data.
EXT-BOARD-NON-CORR-MEM-ERR-ON-ACCESS = A multiple-bit error was detected during memory access on the memory board.
FORMAT-ERROR = A validity check of co-processor state frame format or word stack frame format has failed.
HIGH-PRIORITY-QUEUE-ERR-AP = The AP has detected a problem with the high-priority message queue.
HIGH-PRIORITY-QUEUE-ERR-MSGH = The MSGH has detected a problem with the high-priority message queue.
ILL-ACCESS-SUPV-PROT-REGION = The memory management unit (MMU) has detected illegal access of a supervisor-protected region.
ILLEGAL-AUTOVECTOR = One of the unused interrupt (0-4) counts was incremented at the 68000 processor.
ILLEGAL-INSTRUCTION = The processor attempted to execute an invalid instruction.
LINE-1010-EMULATOR = The processor attempted to execute an invalid instruction. This is an illegal instruction with bits 15 through 12 of the first word of the instruction equal to
0xA.

LINE-1111-EMULATOR = The processor attempted to execute an invalid instruction. This is an illegal instruction with bits 15 through 12 of the first word of the instruction equal to 0xF.

MEM-BOARD-INIT-FAIL = Software has detected that the memory board dynamic random access memory (RAM) controller (DRC) registers are programmed incorrectly on a non-memory clearing reset. This error will result in escalation to a memory-clearing initialization.

MMU-CONFIG-ERR = An attempt was made to move invalid data into an MMU register.

MMU-WRITE-PROT-VIOLATION = The MMU has detected a write-protect violation.

MSGH-AP-SANITY-TIMER = The MSGH has detected a failure by the AP to update the interprocessor sanity timer bit.

NON-CORR-MEM-ERR-ON-ACCESS = A multiple-bit error was detected during memory access.

NON-CORR-MEMORY-ERR-ON-REFRESH = A multiple-bit error was detected during memory refresh cycle.

NON-MASKABLE-INT = A non-maskable interrupt has been detected.

PARITY-ERROR-WHILE-READING-DAM = An error has been detected in dual-access memory (DAM).

PRIVILEGE-VIOLATION = An attempt to execute a privileged instruction while at user privilege level was detected.

SOFTWARE-RESET = The communications module processor software caused an entry to the reset handler.

SPURIOUS-INTERRUPT = A device did not respond to an interrupt acknowledge cycle.

STACK-PROTECT-ERR = The MMU has detected a stack protect error.

UNEXPECTED-INTERRUPT = An unexpected interrupt was received by the fault handler.

UNIDENTIFIED-EXCEPTION = An unidentified exception was received by the fault handler.

UNK = The source of the error cannot be determined.

UNRECOG-UT-TRAP = One of the exceptions assigned to generic utilities was raised, but the utilities (UT) subsystem did not accept the exception.

UNUSED-EXCEPTION = A processor exception that is not used by the software release occurred.

UNUSED-SW-TRAP = A TRAP instruction that is not used by the current software release was executed.

UNUSED-TEXT-EXEC = A bad transfer vector (TV) slot was used or a wild transfer occurred, causing memory not used by the current software release code to be executed.

WATCHDOG-TIMER-EXPRIE = The bus watchdog timer expired.

WRITE-PROT-VIOLATION = The processor attempted to write to an address below the hardware write-protect threshold.

ZERO-DIVIDE = An attempt was made to divide by zero.

r = Pointer to message communications load queue offset.

s = Pointer to message communications unload queue offset.

t = Type of memory referenced by failing address. Valid value(s):

AUX-IO = Address range for accessing memory board hardware.

AUXRAM = Memory board read/write memory.

DAM = Dual-access memory that provides communication between CMP and message switch control unit (MSCU).

DDRAM = Read/write memory using dual dynamic RAM devices.

DSRAM = Read/write memory using dual static RAM devices.

IO = Address range for accessing hardware.

LSRAM = Read/write memory using local static RAM devices.
OOR = Address is outside of a valid range.
ROM = Read-only memory.

u = Identity of queue where error was detected. Valid value(s):
    AP-MSGH = AP-to-MSGH queue (detected by AP).
    MSGH-AP = MSGH-to-AP queue (detected by MSGH).
    MSGH-MSCU = MSGH-to-MSCU (detected by MSGH).

Note: Variables ‘v’ - ‘q1’ are printed in hexadecimal.

v = System stack pointer (SSP) number.
w = Program counter (PC) number.
x = Status register (SR) number.
y = User stack pointer (USP) number.
z = Frame pointer (FP) number.
a1 = Contents of address register 5.
b1 = Contents of address register 4.
c1 = Contents of address register 0.
d1 = Contents of address register 1.
e1 = Contents of address register 2.
f1 = Contents of address register 3.
g1 = Contents of data register 0.
h1 = Contents of data register 1.
i1 = Contents of data register 2.
j1 = Contents of data register 3.
k1 = Contents of data register 4.
l1 = Contents of data register 5.
m1 = Contents of data register 6.
n1 = Contents of data register 7.
o1 = Contents of event source bit register (ESBR).
p1 = Contents of interrupt mask bit register (IMBR).
q1 = Contents of interrupt service request register (ISRR).
4. ACTION TO BE TAKEN

Monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected.

If the error is related to the memory system (variable ‘q’ is CORR-BIT-ERR) and the type of memory referenced is not OOR (variable ‘t’), there may be something wrong with the memory system hardware. A certain number of CORR-BIT-ERR is normal. A CORR-BIT-ERR indicates that one bit within a word of memory was changed, detected and corrected. It may be considered normal if: (1) the errors are scattered randomly among SMs throughout the office and (2) a CMP is not removed due to CORR-BIT-ERR. If the errors recur but without sufficient frequency to invoke the CMP diagnostic, invoke the CMP diagnostic manually.

5. ALARMS

None.

2. REASON FOR OUTPUT

To provide information about specific communications module processor (CMP) hardware registers for trouble analysis. This message is automatically generated by the system when a fault is detected. A REPT:CMP-LVL output message and others will appear with the same event number to report other details of the error.

3. VARIABLE FIELD DEFINITIONS

a = CMP number.
b = Event number.

Note: Variables ‘c’ - ‘a1’ are in hexadecimal, except variable ‘t’.

c = Contents of the cache control register (CACR). Refer to the global header smim/PP_cacr.h for further information.
d = Contents of the dynamic random access memory (RAM) acknowledgement register (DRACK). Refer to the global header smim/PPdr_ack.h for further information.

Output Message(s):

REPT;CMP–ENV–LVL

Other Manual(s):
235-105-250 System Recovery
REPT: CMP-INIT

Software Release: 5E14 and later
Message Class: INT
Application: 5
Type: Output

1. FORMAT

REPT CMP=a-b c INITIALIZATION TRIGGER=d

2. REASON FOR OUTPUT

To report that a communications module processor (CMP) is beginning a high-level initialization and to report the cause of that initialization. This is the first report on the initialization and immediate attention is required.

3. VARIABLE FIELD DEFINITIONS

a = Message switch side (MSGS).
b = Physical CMP number.
c = Processor being reported on. Valid value(s):
   MATE = Mate CMP.
   PRIM = Primary CMP.
d = Phase trigger for the initialization. Valid value(s):
   AM-REQUEST = An administrative module-requested initialization.
   AP-REL = Request to raise the error-lead as a result of a CMP application processor (AP) error.
   ASRT-C-SPP = A count of Assert-C-requested deferred single process purge initializations has exceeded the threshold.
   ASRT-ERR = An error occurred while handling an Assert.
   ASRT-SI = Assert requested selective initialization.
   EX-AUD-SPP = A count of audit requested single process purge initializations has exceeded the threshold.
   EX-DCF-SPP = A count of defensive check failure (Assert) requested single process purge initializations has exceeded the threshold.
   EX-DIR-AUD = Excessive directed audits occurred, forcing a higher level initialization.
   EX-DMD-SPP = An excessive amount of demand single process purges (SPP) has been requested which exceeded the threshold.
   EX-ERR = A count of returning interrupts has exceeded the threshold.
   EX-ERR-50 = 50 stimuli occurred, forcing a higher level initialization.
   EX-ERR-100 = 100 stimuli occurred, forcing a higher level initialization.
   EX-FR-SPP = A count of switch maintenance requested single process purge initializations has exceeded the threshold.
   EX-RPI = A count of return to the point of interrupt initializations has exceeded the threshold.
   EX-SELINIT = A count of excessive selective initializations has exceeded the threshold.
   EX-SPP = A count of single process purge initializations has exceeded the threshold.
   FR-SELINIT = Switch maintenance requested selective initialization.
   HPQ-REL = Fault taken during handling of a high priority queue (HPQ) interrupt.
   LOCK-OUT = Call processing lock-out.
MANUAL-REQUEST = A user-initiated initialization.
MCB-EXHST = Message control block resource exhaustion.
MSGH-REL = Request to raise the error lead as a result of CMP message handler (MSGH) excessive return to the point of interrupt (RPI) errors.
NEG-PROG = Negative progress was detected during an initialization.
NESTD-ASRT = Nested Asserts occurred.
PCB-EXHST = Process control block resource exhaustion.
POWER-UP = The processor was power-cycled.
PRC-TIMOUT = Process initialization time-out.
PROG-LOOP = A program loop was not allowing the integrity monitor to run its background progress.
PURGE-FAIL = Purging initialization failed; the CMP is in an initialization.
REX-REQUEST = Routine exercises (REX) requested initialization.
RSRC-EXHST = Resource shortage error occurred.
SCB-EXHST = Stack control block resource exhaustion.
SCB32EXHST = Big stack control block resource exhaustion.
SFTSW-FAIL = An attempt to soft switch has failed.
SW-REQUEST = CMP switch requested initialization.
TCB-EXHST = Timer control block resource exhaustion.

4. ACTION TO BE TAKEN

Immediately analyze the cause of the initialization and verify that the system recovers properly. Use the output message INIT:CMP-LVL or access MCC display pages 1850/1851 to verify the system recovery.

5. ALARMS

For the primary CMP, this message generates a critical alarm. For the mate CMP, it carries no alarm.

6. REFERENCES

Output Message(s):

2. REASON FOR OUTPUT

To indicate that a communication module processor (CMP) has internally escalated to a high-level initialization. This message describes the state of the CMP at the time of the escalation, the reason for the escalation, and indicates the level of recovery action that was taken.

3. VARIABLE FIELD DEFINITIONS

a  = Message switch side (MSGS).
b  = Physical CMP number.
c  = Processor being reported on. Valid value(s):
   MATE  = Mate CMP.
   PRIM  = Primary CMP.
d  = Description of the software stimulus reason. Valid value(s):
   AM-REQ-POWER-UP = An administrative module-requested power up initialization.
   AM-REQUEST  = An administrative module-requested initialization.
   AP-REL       = Request to raise the error-lead as a result of a CMP application processor (AP) error.
   ASRT-C-SPP   = A count of assert-C-requested deferred single process purge initializations has exceeded the threshold.
   ASRT-ERR     = An error occurred while handling an assert.
   ASRT-SI      = Assert requested selective initialization.
   EX-AUD-SPP   = A count of audit-requested single process purge initializations has exceeded the threshold.
   EX-DCF-SPP   = A count of defensive check failure (assert)-requested single process purge initializations has exceeded the threshold.
   EX-DIR-AUD   = Excessive directed audits occurred, forcing a higher level initialization.
   EX-DMD-SPP   = An excessive number of demand single process purges (SPP) has been requested which exceeded the threshold.
   EX-ERR       = A count of returning interrupts has exceeded the threshold.
   EX-ERR-50    = 50 stimuli occurred, forcing a higher level initialization.
   EX-ERR-100   = 100 stimuli occurred, forcing a higher level initialization.
   EX-FR-SPP    = A count of switch maintenance-requested single process purge initializations has
EX-RPI = A count of return-to-the-point-of-interrupt initializations has exceeded the threshold.

EX-SELINIT = A count of excessive selective initializations has exceeded the threshold.

EX-SPP = A count of single-process purge initializations has exceeded the threshold.

FR-SELINIT = Switch maintenance-requested selective initialization.

HPQ-REL = Fault taken during handling of a high priority queue (HPQ) interrupt.

LOCK-OUT = Call processing lock-out.

MANUAL-REQ-POWER-UP = A user-initiated power up initialization.

MANUAL-REQUEST = A user-initiated initialization.

MCB-EXHST = Message control block resource exhaustion.

MSGH-REL = Request to raise the error lead as a result of CMP message handler (MSGH) excessive return-to-the-point-of-interrupt (RPI) errors.

NEG-PROG = Negative progress was detected during an initialization.

NESTD-ASRT = Nested asserts occurred.

NO-PROGRESS = No progress was detected during an initialization.

PCB-EXHST = Process control block resource exhaustion.

PRC-TIMEOUT = Process initialization time-out.

PROG-LOOP = A program loop was not allowing the integrity monitor to run its background progress.

PURGE-FAIL = Purging initialization failed; the CMP is in an initialization.

REX-REQUEST = Routine exercises (REX)-requested initialization.

RSRC-EXHST = Resource shortage error occurred.

SCB-EXHST = Stack control block resource exhaustion.

SCB32EXHST = Big stack control block resource exhaustion.

SFTSW-FAIL = An attempt to soft switch has failed.

SW-REQUEST = CMP switch requested initialization.

TCB-EXHST = Timer control block resource exhaustion.

e = Event number.

f = Current initialization level. Valid value(s):
   FI = Full initialization.
   FI,PUMP = Full initialization with full pump.
   REL = Raise the error-lead request.
   SI = Selective initialization.

g = Current program type number.

h = Current program counter number.

i = Previous initialization level. Valid value(s):
   FI = Full initialization.
   FI,PUMP = Full initialization with full pump.
   NOINIT = No initialization.
   REL = Raise the error-lead request.
   SI = Selective initialization.

j = Previous program type number.
k = Previous program counter number.

l = Process number of the running background process.

m = Uniqueness of the running background process.

n = The running background process address.

o = The interject state. Valid value(s):
   AMA = Automatic message accounting.
   AML = Automatic maintenance limit.
   BASE = Communication package.
   BCST = Message broadcast.
   CCS = Common channel signaling.
   CICO = CMP integrity control.
   CTST = Communication test processing.
   DD = Data delivery.
   INTMON = Integrity monitor.
   NONE = Interject was not running.
   PC = Peripheral network control.
   PR = Packet routing.
   PS = Packet switching.
   RTA = Routing and terminal allocation.
   TIME = Operating system time synchronization.

p = State of foreground activity. Valid value(s):
   CM = Communication package.
   CM_INTMON = Communication package and integrity monitor.
   FAILURE = Unable to determine foreground activity.
   INTMON = Integrity monitor.
   NONE = Foreground was not being served.
   UNK = Unknown foreground activity.

q = Mode of the communication module processor operation (in the order of occurrence). Valid value(s):
   CONSISTENT = Hardware consistent with software.
   ESSENTIAL = Essential jobs operational.
   NORMAL = Normal operation.
   OPFULL = All jobs are operational.
   RAMDYN = Dynamic memory consistent.
   RAMTXT = Text and data consistent.
   RAMWP = Write protection has been restored.
   SYSPROC = All system processes initialized.
   UNKNOWN = Mode unknown.

4. ACTION TO BE TAKEN

Monitor the progress of the software recovery. Initiate manual actions if the recovery does not proceed as expected.
5. ALARMS

None.

2. REASON FOR OUTPUT

To report common channel signaling (CCS) network critical events (CNCE).
Format 1 prints for signaling link (SLK) events.
Format 2 prints for point code (PTC) events.
Format 3 prints for data routing events.

3. VARIABLE FIELD DEFINITIONS

a = Name of critical event. Refer to the APP:CNI appendix in the Appendixes section of the Output Messages manual.
b = Network time when the event occurred, in the form hours:minutes:seconds:milliseconds.
c = Link protocol: layer 6 or 7.
d = Association field. A 9-character field with blanks padded to the right. This field represents either a signaling link of the form "xx-yy" (where 'x' equals group number and 'y' equals member number), a link set, or a point code.
e = CLLI code. The format of this field is: f_g_h_i_j
f = City abbreviation.
g = State abbreviation.
h = Building abbreviation.
i = Subdivision abbreviation.
j = Link layer number.
k = Link speed. Valid value(s):

Copyright ©2003 Lucent Technologies
4.8 = 4.8 KBS link.
56. = 56 KBS link.

l = Link type. Valid value(s):
A = Switching office to signal transfer point (STP).
E = Switching office to STP in adjacent regions.
F = Switching office to switching office.

m = Voice frequency link (VFL) identifier (A or B).

n = Function number (00001 - 32767).

o = Subsystem number (001 - 255).

p = Declared failure diagnostic code (00000000-ffffffff).

q = Affected destination point code.

r = Service Indicator from the Service Information Octet (SIO).

s = Declared failure diagnostic code. Valid value(s):
   CHANGEBACK
   CHANGEOVER
   REROUTE

235-118-25x Recent Change Reference Manual
235-190-120 Common Channel Signaling Services Features
REPT:CNI-RING-A

Software Release: 5E14 only
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT CNI RING STATUS=START TRAFFIC FAILURE

[2] REPT CNI RING STATUS=a b
   REASON=c   d DURATION=e SECONDS

2. REASON FOR OUTPUT

To indicate a change in status of the common network interface (CNI) ring. This message will appear if the CNI is unable to start handling common channel signaling (CCS) traffic after a CNI initialization (Format 1), the CCS direct signaling, trunk signaling, or transaction capabilities application part (TCAP) signaling is put back into service when some abnormal condition improves (Format 2), the CCS direct signaling, trunk signaling, or TCAP signaling is put back into service but is not fully operational until some abnormal condition improves (Format 2), or the CCS direct signaling, trunk signaling, or TCAP signaling is taken out of service due to some abnormal condition (Format 3).

If CCS signaling is taken out of service or made degraded, the abnormal condition that caused the outage will be listed. Also, CCS signaling may be taken out of service or put into service by an internal audit.

3. VARIABLE FIELD DEFINITIONS

a = Status indicator. Valid value(s):
   DIRECT SIGNALING = CCS direct signaling is being put into service, made degraded or, taken out of service.
   TCAP SIGNALING = CCS TCAP signaling is being put into service, made degraded or, taken out of service.
   TRUNK SIGNALING = CCS trunk signaling is being put into service, made degraded or, taken out of service.

b = Current status of signaling type. Valid value(s):
   IN-SERVICE = Signaling is fully operational.
   DEGRADED = Signaling is available but some condition exists to prevent full signaling capability.
   OUT-OF-SERVICE = Signaling of this type is not available.
   UNEQUIPPED = No data exists for this signaling type.

c = Abnormal condition being reported. Valid value(s):
   AUDIT ERROR = Audit detected an error in the signaling state and has corrected the problem.
   CNI INIT = CNI is performing an initialization.
   DLN CONG/OVRLD = The DLN is either congested or overloaded.
   DLN QUEUE UNAVAIL = Direct link node-administrative module (DLN-AM) queues are not accessible.
   DLN UNAVAIL = Both direct link nodes (DLNs) are out of service.
   GT STP UNAVAIL = A pair of Global Title translation number 2 signal transfer points (2STPs) cannot be accessed.
LINK CONGESTION = One or more CCS links are congested.
LINK UNAVAIL = All CCS links to neighboring 2STPs have failed.
POOL UNAVAIL = All CCIS6 logical connections to neighboring 2STPs have failed.
STP CONGESTION = A pair of neighboring 2STPs are congested.
SUBSYSTEM UNAVAIL = At least one TCAP feature is out-of-service.

d = Previous state of signaling type that a duration is printed. Valid value(s):
    DGR = Degraded.
    OOS = Out-of-service.

e = Duration. Number of seconds that signaling has been affected since the corresponding out-of-service or degraded message.

4. ACTION TO BE TAKEN

No action is required if CCS signaling is being put in service.

If CCS signaling is taken out of service or made degraded, consult the CNI display page for additional information. The action taken depends on the abnormal condition. If the abnormal condition is LINK UNAVAIL, restore all equipped link nodes using the input message RST:LN. If the abnormal condition is DLN UNAVAIL, restore both DLNs using the input message RST:LN.

Normally, no action is required for any other abnormal condition. However, if CCS signaling remains out of service for very long (for example, 5 to 10 minutes), check for failing diagnostics, correct any hardware problems, and then reinitialize the CNI if necessary.

Diagnostics are reported by the DGN:LN and DGN:RPCN output messages. If diagnostics aren't running, the CNI can be diagnosed using the DGN:LN and DGN:RPCN input messages.

If a START TRAFFIC FAILURE occurs, the CNI should be reinitialized. Use the INIT:CNI input message to initialize the CNI. Also, the CNI can be initialized and placed in min mode by using the SET:MINMODE input message with CNI parameter. The CNI can be initialized and taken out of min mode by using the input message CLR:MINMODE with the CNI parameter.

5. ALARMS

Major if 'a' = START TRAFFIC FAILURE, DIRECT SIGNALING OUT OF SERVICE, TRUNK SIGNALING OUT OF SERVICE, or TCAP SIGNALING OUT OF SERVICE.

Otherwise, none.

Output Message(s):

DGN : LN
DGN : RPCN
REPT:CNI-RING-B

Software Release: 5E15 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT CNI RING STATUS=START TRAFFIC FAILURE

[2] REPT CNI RING STATUS=a b
   REASON=c   d DURATION=e SECONDS

2. REASON FOR OUTPUT

To indicate a change in status of the common network interface (CNI) ring.

Format 1 will appear if the CNI is unable to start handling common channel signaling (CCS) traffic after a CNI initialization.

Format 2 is printed when the status of the CCS direct signaling, trunk signaling, or transaction capabilities application part (TCAP) becomes in-service, out-of-service, or degraded due to the changing of an abnormal condition's severity.

If the CCS signaling status becomes out-of-service or degraded, the abnormal condition that caused the change will be given. If the status change is from in-service to either degraded or out-of-service, the duration will not be printed.

CCS signaling may be taken out-of-service or put in-service as a result of an internal audit.

3. VARIABLE FIELD DEFINITIONS

a  = Status indicator. Valid value(s):
   DIRECT SIGNALING = CCS direct signaling is being put into service, made degraded or, taken out-of-service.
   TCAP SIGNALING = CCS TCAP signaling is being put into service, made degraded or, taken out-of-service.
   TRUNK SIGNALING = CCS trunk signaling is being put into service, made degraded or, taken out-of-service.

b  = Current status of signaling type. Valid value(s):
   IN-SERVICE = Signaling is fully operational.
   DEGRADED = Signaling is available but some condition exists to prevent full signaling capability.
   OUT-OF-SERVICE = Signaling of this type is not available.
   UNEQUIPPED = No data exists for this signaling type.

c  = Abnormal condition being reported. Valid value(s):
   AUDIT ERROR = Audit detected an error in the signaling state and has corrected the problem.
   CNI INIT = CNI is performing an initialization.
   DLN CONG/OVRLD = The DLN is either congested or overloaded.
   DLN QUEUE UNAVAIL = Direct link node-administrative module (DLN-AM) queues are not
accessible.
DLN UNAVAIL = Both direct link nodes (DLNs) are out-of-service.
GT STP UNAVAIL = A pair of global title translation number 2 signal transfer points (2STPs) cannot be accessed.
LINK CONGESTION = One or more CCS links are congested.
LINK UNAVAIL = All CCS links to neighboring 2STPs have failed.
STP CONGESTION = A pair of neighboring 2STPs are congested.
SUBSYSTEM UNAVAIL = At least one TCAP feature is out-of-service.

d = Previous signaling state for which this duration is printed. Valid value(s):
DGR = Degraded.
OOS = Out-of-service.
e = Duration. Number of seconds that signaling has been affected since the corresponding out-of-service or degraded message.

4. ACTIONS TO BE TAKEN

No action is required if CCS signaling is being put in service.

If CCS signaling is taken out-of-service or made degraded, consult the CNI display page for additional information. The action taken depends on the abnormal condition. If the abnormal condition is LINK UNAVAIL, restore all equipped link nodes using the input message RST:LN. If the abnormal condition is DLN UNAVAIL, restore both DLNs using the input message RST:LN.

Normally, no action is required for any other abnormal condition. However, if CCS signaling remains out-of-service for very long (for example, 5 to 10 minutes), check for failing diagnostics, correct any hardware problems, and then reinitialize the CNI if necessary.

Diagnostics are reported by the DGN:LN and DGN:RPCN output messages. If diagnostics aren't running, the CNI can be diagnosed using the DGN:LN and DGN:RPCN input messages.

If a START TRAFFIC FAILURE occurs, the CNI should be reinitialized. Use the INIT:CNI input message to initialize the CNI. Also, the CNI can be initialized and placed in min mode by using the SET:MINMODE input message with CNI parameter. The CNI can be initialized and taken out of min mode by using the input message CLR:MINMODE with the CNI parameter.

5. ALARMS

Critical if 'a' = START TRAFFIC FAILURE, DIRECT SIGNALING OUT OF SERVICE, TRUNK SIGNALING OUT OF SERVICE, or TCAP SIGNALING OUT OF SERVICE.

Major if 'a' = DIRECT SIGNALING DEGRADED, TRUNK SIGNALING DEGRADED, or TCAP SIGNALING DEGRADED.

2. REASON FOR OUTPUT

To report on the common network interface database administrator (CNIDBA) process.

Format 1 indicates that the common network interface (CNI) is beginning to activate the recent change request.

Formats 2; and 3 are completion reports for recent change activation in the administrative module (AM) and disk files, respectively.

Format 4 reports failure to activate the recent change request in the disk file. It is followed by output message(s) in Format 8.
Format 5 reports failure to activate the recent change request in the AM file. It is followed by output message(s) in Format 8.

Formats 6; and 7 are reports of failed error checks for recent change activation in the AM and disk files, respectively. They are followed by output message(s) in Format 8.

Format 8 describes the cause of the failed recent change activation. This failure may be caused by failed error checks or problems with the disk files.

Format 9 reports the successful termination (by the application) of an old CNIDBA process. Output messages of Format 9 should occur quite infrequently.

3. VARIABLE FIELD DEFINITIONS

a

- = Type of recent change requested. Valid value(s):
  100  = Link data recent change (AM and nodes).
  101  = Add a virtual link assignment (AM).
  102  = Delete a virtual link assignment (AM).
  103  = Change the office ID data (AM and nodes).
  104  = Add the office ID data (AM and nodes).
  121  = Update a member in a local populated cluster (AM).
  122  = Add a local populated cluster (AM).
  123  = Update a remote populated cluster (AM).
  124  = Use linkset routing for a populated cluster (PC) AM.
  125  = Use combined linkset routing for a PC (AM).
  127  = Update the subsystem tables (AM and nodes).
  128  = Delete a subsystem (AM and nodes).
  129  = Add permanent relations (AM).
  130  = Remove permanent relations (AM).
  131  = Delete a PC and associated permanent relations (AM).
  137  = Update the broadcast list table.
  141  = Add a network identifier.
  142  = Delete a network identifier.
  143  = Update a combined linkset.
  145  = Change the global title translation table.
  146  = Delete entries from the global title translation table for a particular service.
  147  = Add/Delete entries for small network populated cluster.
  201  = Copy the logical-physical tables to disk.
  202  = Update the office ID data on disk.
  203  = Update the link data on disk for a given link.
  209  = Copy the cluster/member routing info to disk.
  210  = Update the subsystem disk files.
  211  = Update the permanent relations disk file.
  212  = Update the broadcast list disk file.
  214  = Update the network interconnect data on disk.
  215  = Update the global title translation data on disk.

b

= Text string describing the failed error checks.

4. ACTION TO BE TAKEN
For Formats 1, 2, and 3, no action is required.

For Formats 4 and 5, correct the problem and re-enter the recent change.

For Formats 6 and 7, no action is required if the recent change was originated from a remote site. However, if the recent change was originated locally, correct the erroneous data and re-enter the recent change.

Format 8 describes the cause of the failed recent change activation noted by an output message of Format 4, 5, 6, or 7.

For Format 9, no action is required.

5. ALARMS

None.

[2] REPT CNIER
   CRITICAL EVENTS LOST BY CONTENTION: b

[3] REPT CNIER
   CRITICAL EVENTS LOST
   CE BUFFER OVERFLOW: a; CONTENTION: b

2. REASON FOR OUTPUT

At intervals of 5-minutes, the CNIER process issues one of these messages if, in the interval just past, at least one attempt to generate a critical event (CE) message failed. The length of an interval can exceed 5 minutes; the interval continues past the 5-minute mark until the next time the CNIER process runs.

For Format 1, one or more attempts by the SLMK process to generate a critical event message failed because the critical event buffer was full.

For Format 2, one or more attempts by an application process to generate a critical event message failed because the SLMK process had a lock on the critical event buffer for the purpose of writing a critical event message of its own.

For Format 3, both of the above events occurred.

3. VARIABLE FIELD DEFINITIONS

a = Number of times in a 5-minute interval that an attempt to generate a critical event message failed because the critical event buffer was full.

b = Number of times in a 5-minute interval that an attempt to generate a critical event message failed because the SLMK process had a lock on the critical event buffer.

[18] REPT CNIINIT
    BEGINNING z initialization at w
2. REASON FOR OUTPUT

The REPT CNIINIT message originates from the CNIINIT process. This message may be output because of errors in common network interface (CNI) detected by CNIINIT, errors internal to CNIINIT itself, or status information.

Format 1 identifies the current CNI generic.

Format 2 is output when all CNIINIT child processes have been created. It should be considered a benchmark during initialization.

Format 3 is output when the user fails to send CNIINIT the message to begin the non-critical initialization. CNIINIT has "timed out" and started the non-critical initialization on its own.

Format 4 provides state information about CNIINIT when a UNIX® RTR system fault is received by CNIINIT. These values are assigned and defined by the UNIX® RTR system.

Format 5 provides additional state information following a UNIX® RTR fault.

Format 6 is printed when the CNIINIT process receives a UNIX® RTR system message in which the message type is not recognized.

Format 7 is printed when the CNIINIT process receives a UNIX® RTR system acknowledgement message that contains an error. Acknowledgement messages are expected following process creations.

Format 8 is printed when CNIINIT has nearly completed an abort sequence. CNIINIT has requested the termination of all its child processes and is about to request termination of itself from the operating system.

For Formats 9-12, some combination of these messages can be printed when CNIINIT is dumping state information. The information concerns state and status information kept by CNIINIT about its child processes. In general, these messages will appear very rarely.

Format 13 is printed when CNIINIT is unable to detect a CNI USER Process at boot time. CNIINIT makes the assumption that it is in a lab and follows through with the initialization on its own. This message should not appear in a field site, if it does, it should be considered an error.

For Formats 14-15, either of these can be printed when CNIINIT is having difficulty recreating a child process. Typically, CNIINIT will reschedule another attempt for later. In some cases, the message will indicate the minimum amount of time that must pass before another attempt can be made.

For Formats 16-17, either of these can be printed when CNIINIT times out while (re)creating a child process. Typically, CNIINIT will reschedule another attempt for later. However, if the process that was being (re)created was
of a critical nature, then a boot initialization may occur.

Format 18 is printed when CNIINIT is beginning some form or level of initialization. The meaning of the message should be self-evident.

Format 19 is printed when CNIINIT completes some form or level of initialization. The meaning of the message should be self-evident.

Format 20 is printed when CNIINIT is unable to complete some form or level of initialization. This could mean that initialization and recovery activities are considered complete, but call handling may not be working.

Format 21 is printed when the non-critical initialization sequence was interrupted for some other level of initialization. The non-critical initialization will be completed at a later time.

3. VARIABLE FIELD DEFINITIONS

a = Present CNI release.
b = The phrase "min-mode" or nothing (spaces).
c = The value of the real-time clock at the time the message was generated.
d = The UNIX® RTR fault code.
e = The location (relative address) where CNIINIT was executing at when the fault occurred.
f = A value representing the event flag at the time the fault occurred.
g = A value representing the contents of the CNIINIT process program status word (PSW).
h = A value representing the contents of the CNIINIT process primary segment base register (PSBR).
i = A value representing the contents of the CNIINIT process secondary segment base register (SSBR).
j-u = General purpose registers 0 through 11.
v = The process ID (PID) of the process that sent the message to CNIINIT.
w = The PID of the receiving process (CNIINIT).
x = The message flags.
y = The message type.
z = The message status field.
a¹ = The old message type.
b¹ = The identification field.
c¹ = The "state" that CNIINIT's finite state machine was in at the time the message was printed.
d¹ = The "state" that CNIINIT's finite state machine was in PRIOR to the current state.
e¹ = Index into CNIINIT's child process table. It points to the entry of one of CNIINIT's child processes.
f = Full pathname of the child process pointed to by 'e'.

g = Timeout value 1, used by all child processes, this is the primary timer value for each process. It is used for process creation timing and general handshake timing.

h = Timeout value 2, used only by the child process "imsdrv.p". It guards the entire boot sequence (early generics) or the critical portion of the boot (later generics).

i = Timeout value 3, used only by the child process "imsdrv.p". It guards the non-critical boot sequence.

j = The PID of the child process identified by 'e'.

k = A value representing the timer ID or "TID" of the process identified by 'e'.

l = The "process state" of the process identified by 'e'.

m = A forward link or index in the process table that points to the next process to be created.

n = A forward link or index in the process table that points to the next process to receive the "START_PROC" event.

o = A forward link or index in the process table that points to the next process to receive the "STOP_PROC" event.

p = A value that represents the "recreation type" of the process.

q = The p-name of the child process pointed to by 'e'.

r = A forward link or index in the process table that points to the next CRITICAL process to be created.

s = A forward link or index in the process table that points to the next NON-CRITICAL process to be created.

t = A forward link or index in the process table that points to the next process to receive the "STOP_PROC" or "START_PROC" event.

u = The utility ID of the process identified by 'e'.

v = A value representing the "track flags" of the process identified by 'e'.

w = The phrase "at c" (refer to variable 'c') or nothing (spaces).

x = One of these phrases: "Will retry later"; "Retry in y seconds"; or "Will retry in y seconds."

y = The minimum number of seconds until the process is retried.

z = Valid value(s):

   CRITICAL
   NON-CRITICAL
   [MINMODE]
   level 0
   level 1
   level 2
level 3
level 4

\[ a^2 \]
= Working counter, used in retry logic.

\[ b^2 \]
= Variable used to select recovery action against a non-critical process.

\[ c^2 \]
= A value (1-6) representing the error condition that prevented CNIINIT from completing some form or level of initialization.

4. ACTION TO BE TAKEN
For Formats 1, 2, 3, 8, 18, and 19, take no action.

For Formats 4 - 7 and 9 - 13, information should be retained. These provide valuable information pertaining to the fault or error that just occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 14, 15, 16, and 17, verify that the process in question ("q") is eventually recreated.

For Format 20, appropriate tests should be made to see if call handling is functional. If it is, then the message may be ignored. If call handling is not functional, then the next higher level of initialization should be manually initiated. In any case, the information should be retained. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 21, insure that the non-critical initialization eventually completes. This can be determined by the presence of the "COMPLETES NON-CRITICAL" message, by full functionality of the CNI display pages and CNI measurements. If the non-critical sequence does not complete, then the next higher level of initialization should be initiated during a period of low traffic.

Note: Information output by CNIINIT may not be useful to the user. This information is intended for use by development/support personnel when diagnosing CNIINIT errors or faults.

5. ALARMS
For Formats 1-17 and 19-21, no alarms are sounded.

For Format 18, a major alarm is sounded with the Level 1 initialization. A critical alarm is sounded with the Level 3 or Level 4 initialization.

6. REFERENCES
None.

2. REASON FOR OUTPUT

To report a fault detected by the interprocess message switch (IMS) driver process.

Format 1 reports that a fault message was received by the IMS driver process. Format 1; messages are normally associated with REPT:IMSDR-FLT messages.

Format 2 reports details of a FLT_QMSAUD fault received by the IMS driver process. This message will normally follow a Format 1; message. This fault type complains of UNIX® RTR message buffers held for an unreasonable length of time.

Format 3 reports that the occurrence of an internal problem or bug.

3. VARIABLE FIELD DEFINITIONS

a = UNIX® RTR fault code.
b = Old message number.
c = Consecutively assigned number, starting from 1, to associate the continuations in proper order.
d = Sending process number.
e = Receiving process number.
= Message size (including header) in blocks.
= Message header flags.
= Message type.
= Message status.
= Message size (including header) in bytes specified by sender.
= Original message type of an acknowledgment message.
= Message sequence number.
= Message identification used by sender.
= Name of process which experienced the trouble.
= Name of source code file where trouble occurred.
= Source code line number where trouble occurred.
= Short statement describing the trouble or conditions existing when the trouble occurred.

4. ACTION TO BE TAKEN

Format 1 messages indicate software problems. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Each line identified by “MSG” shows the contents of the report message header of a message that was held too long. The nature of these messages may implicate particular software modules.

Format 3 messages supplement the REPT:IMSDRV-FLT messages and should be analyzed with those messages.

1. FORMAT

[1] REPT COMMUNICATION FAILURE: CMP=a-b c TO AM
   CMP MODE: d  AUTO RECOVERY REQUESTED

[2] REPT COMMUNICATION FAILURE: SM e TO AM
   LOGICAL LINK:  h [i] [l] [m] [n] [o]
   PHYSICAL LINK: j [k] [p] [q] [r] [s]
   AUTO RECOVERY REQUESTED

2. REASON FOR OUTPUT

To report a communication failure between the administrative module (AM) and a communications module
processor (CMP) or a switching module (SM). Format 1 is used by the AM to report a loss of communication with a
CMP. Format 2 is used for SM communication failures.

3. VARIABLE FIELD DEFINITIONS

a = Message switch side number.
b = Physical CMP address/number.
c = Processor being reported on. Valid value(s):
   MATE = Mate CMP.
   PRIM = Primary CMP.
d = Last known mode of processor operation at the time that communication was lost with the AM.
   Valid value(s):
   CONSISTENT = Hardware consistent with software.
   ESSENTIAL = Essential jobs operational.
   NORMAL = Normal operation.
   OPFULL = All jobs are operational.
   RAMDYN = Dynamic memory consistent.
   RAMTXT = Text and data consistent.
   RAMWP = Write protection has been restored.
   SYSPROC = System processes initialized.
   UNKNOWN = Mode unknown.
e = SM number.
f = Type of SM communication failure. Valid value(s):
   DUPLEX = Both logical communication links (CLNKs) to the AM have failed.
   QUADPLEX = All logical quad-link packet switch (QLPS) links (QLNKs) to the AM have failed.
SIMPLEX = At least one but not all of the logical links to the AM has failed.
TOTAL = Both a DUPLEX and a QUADPLEX link communication failure has occurred.

\( g \) = Failure duration, in the form hours:minutes:seconds.

\( h, i, j, m, n, o \) = The failing logical links. Valid value(s):
0 = Logical CLNK 0.
1 = Logical CLNK 1.
2 = Logical QLNK 2.
3 = Logical QLNK 3.
4 = Logical QLNK 4.
5 = Logical QLNK 5.

\( j, k, p, q, r, s \) = The physical links that are mapped to the failing logical links.

For CLNKs, valid values are:
0A = Time-multiplexed switch 0 (TMS), even time slot.
1A = TMS 1, even time slot.
0B = TMS 0, odd time slot.
1B = TMS 1, odd time slot.

For QLNKs, the following values are valid (certain combinations might be valid only for certain QGP configurations):
0000 = QLPS network 0, ONTC 0, QGP 0, MSCU 0
0001 = QLPS network 0, ONTC 0, QGP 0, MSCU 1
0010 = This combination is currently not allowed.
0011 = This combination is currently not allowed.
0100 = QLPS network 0, ONTC 1, QGP 0, MSCU 0
0101 = QLPS network 0, ONTC 1, QGP 0, MSCU 1
0110 = This combination is currently not allowed.
0111 = This combination is currently not allowed.
1000 = QLPS network 1, ONTC 0, QGP 0, MSCU 0
1001 = QLPS network 1, ONTC 0, QGP 0, MSCU 1
1010 = QLPS network 1, ONTC 0, QGP 1, MSCU 0
1011 = QLPS network 1, ONTC 0, QGP 1, MSCU 1
1100 = QLPS network 1, ONTC 1, QGP 0, MSCU 0
1101 = QLPS network 1, ONTC 1, QGP 0, MSCU 1
1110 = QLPS network 1, ONTC 1, QGP 1, MSCU 0
1111 = QLPS network 1, ONTC 1, QGP 1, MSCU 1

4. ACTION TO BE TAKEN

For CMP communication failures, monitor the progress of automatic CMP recovery actions on the receive-only printer (ROP) and appropriate Master Control Center (MCC) display page (such as, 1850/1851). If the CMP status returns to normal, no further action is needed. However, if the failing CMP does not recover automatically, take appropriate manual actions to restore the failing CMP. These actions are described in the System Recovery manual.

For SM communication failures, monitor the progress of automatic link recovery actions and the SM communication
status on the ROP and appropriate MCC display page (such as, pages 141-144, 1010, 1800, 1900, and so forth). If the SM communication returns to normal, no further action is needed. However, if this message is subsequently followed by a REPT:SM-ISOL message, take appropriate manual actions to restored communication to the isolated SM. These actions are described in the System Recovery manual.

5. ALARMS

For an SM, the alarm level due to a communication failure is dependent on the number of links that fail to the SM. The level is also dependent on whether or not the SM has QLNKS.

For SMs with QLNKs, alarm levels that may occur are:
TOTAL or QUADPLEX failure = Critical alarm.
DUPLEX failure = Major alarm.
SIMPLEX failure = Minor alarm.

For SMs without QLNKs, these alarm levels can occur:
DUPLEX failure = critical alarm
SIMPLEX failure = major alarm

For the first SM communication failure report, an alarm occurs. For subsequent reports until the SM becomes isolated, no alarm occurs.

For CMP communication failures, a major alarm occurs.

Other Manual(s):
235-105-250 System Recovery
REPT:COMM-REST

Software Release: 5E14 and later
Message Class: SED_MON
Application: 5
Type: Output

1. FORMAT

[1] REPT COMMUNICATION RESTORED: AM TO CMP=a-b c
__________________________________________________________________

[2] REPT COMMUNICATION RESTORED: AM TO d=e
__________________________________________________________________

[3] REPT COMMUNICATION RESTORED: d=e TO AM
   SM MODE:[f] EVENTS:{g TO h|NONE} POST MORTEM DUMP:i
   STAND ALONE BILLING DURATION: jj:jj:jj
   BILLING MEMORY SIZE: k, IN USE: l (m PERCENT)
__________________________________________________________________

2. REASON FOR OUTPUT

To report that communication between the administrative module (AM) and the communication module processor (CMP) or a switching module (SM) has been restored. Format 1 is printed by the AM when it detects restored communication to a CMP. Format 2 is printed by the AM when it detects restored communication to an SM. Format 3 is printed when a SM detects restored communication with the AM and transitions from stand alone billing mode to linked billing mode.

3. VARIABLE FIELD DEFINITIONS

a = Message switch side number.
b = Physical CMP address/number.
c = Processor being reported on. Valid value(s):
   MATE = Mate CMP.
   PRIM = Primary CMP.
d = Switching module type. Valid value(s):
   DRM = Distinctive remote switching module.
   HSM = Host switching module.
   LSM = Local switching module.
   ORM = Optically remote switching module.
   PSM = Position switching module.
   RSM = Remote switching module.
   TRM = Two-mile remote switching module.
e = SM number.
f = Mode of processor operation at the time that communication was restored with the AM. Valid value(s):
   <blank> = Mode unknown.
CONSISTENT = Hardware consistent with software.
ESSENTIAL = Essential jobs operational.
NORMAL = Normal operation.
OPFULL = All jobs are operational.
RAMDYN = Dynamic memory consistent.
RAMTXT = Text and data consistent.
RAMWP = Write protection has been restored.
SYSPROC = System processes initialized.

\( g \) = First event that occurred during AM isolation interval (if any).
\( h \) = Last event that occurred during AM isolation interval (if any).
\( i \) = Indicator whether the SM will dump the current post mortem buffers. If events occurred during the AM isolation interval and the buffers are still locked (that is, it has been less than one hour since the last SM initialization), the SM will dump its buffers. To unlock the buffers, refer to the RLS:POSTMORT input message. Valid value(s):
INH = Post mortem dumping is inhibited during AM
NO = No post mortems will be dumped.
YES = Post mortems will be dumped. isolation initiated due to manual actions (such as, software release difference, min-mode, etc.).

\( j \) = Duration of AM isolation, in the form hours:minutes:seconds.
\( k \) = Current size of SM billing memory, in bytes. Minimum size is 50K bytes.
\( l \) = Amount of billing memory used during AM isolation interval, in bytes.
\( m \) = Percentage of billing memory used during AM isolation interval.

4. ACTIONS TO BE TAKEN

Check the amount of billing memory used during AM isolation intervals. If the percentage of memory used is at or near 100%, notify office engineering so that the amount of engineering billing memory can be verified and/or properly configured (refer to the VFY:SAMEM and CFR:SAMEM input messages).

5. ALARMS

None.

Other Manual(s):
235-105-250  System Recovery Procedures
REPT:CONDITIONAL
Software Release: 5E15 and later
Message Class: LG_CORE
Application: 5
Type: Output

1. FORMAT

REPT a=b CONDITIONAL RESTORE c
   PARTIAL INHIBITS APPLIED d=e
   [f]

2. REASON FOR OUTPUT

   To notify the craft that partial inhibits are applied and that a conditional restore has been scheduled. If the conditional restore cannot execute immediately, this report will periodically output to the ROP (receive only printer) until the unit is taken OOS (out-of-service) and diagnosed. The partial inhibits that are applied are listed. These particular inhibits are not indicated on the MMC (master control center) page for the affected unit. The particular inhibits will be allowed after successful ATP (all tests passed) of the diagnostics and restoral of the affected unit. The partial inhibits are for non-critical errors, and do not adversely affect switch operation. The inhibits can be manually allowed at the discretion of the craft.

3. VARIABLE FIELD DEFINITIONS

   a = Affected unit that will be conditionally restored. Valid unit value(s):
      MSGS = Message Switch
      ONTC = Office Network and Timing Complex

   b = Affected unit side that will be conditionally restored. Valid values:
      0 = side 0
      1 = side 1

   c = Initial or periodic conditional restore request. Valid values:
      SCHEDULED = Initial request. Valid values:
      RESCHEDULED = periodic request

   d = Affected unit having partial inhibits applied. Valid unit values:
      MSCU = Message Switch Control Unit
      ONTC = Office Network and Timing Complex

   e = Affected unit side that has partial inhibits applied. Valid values:
      0 = side 0
      1 = side 1

   f = list of errors that are partially inhibited Valid values:
CORRECTABLE BIT ERRORS
THERMAL INTERRUPTS
UPDATE INTERFACE BUS ERRORS
BAD POWER INTERRUPTS
ALL NON-CRITICAL ERRORS

4. ACTIONS TO BE TAKEN

Report is for information purposes only, so no further action may be necessary. In conjunction with other reports, such as diagnostics, this report could aid in isolating a bad CM hardware unit. Therefore, analyze the reports to take appropriate action. See the Corrective Maintenance manual, specifically to the section entitled "ANALYZE COMMUNICATION MODULE PROBLEMS", for detailed repair procedures.

5. ALARMS

Depending on the units and the actions, the alarms can be either critical, major, minor, or none.

1240, 1250 (MSGS 0 & 1 SUMMARY)
REPT:CONFIG-RECON

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT CONFIG RECONFIGURATION TYPE a UNIT b PID = c

2. REASON FOR OUTPUT

To report a successfully executed reconfiguration requested by CONFIG when the indicated unit has exceeded an error threshold and cannot be removed or replaced.

3. VARIABLE FIELD DEFINITIONS

a = Reconfiguration type (or action). Valid value(s):
   SWCU = Softswitch.

b = Name and number of the unit causing reconfiguration.

c = Process ID of the process calling CONFIG.

4. ACTION TO BE TAKEN

The softswitch will eliminate the errors associated with the indicated unit only if the error sources are in the direct memory access (DMA) or the dual serial channel (DSCH) subunits of the now standby control unit (CU) or in the duplex dual serial bus selector (DDSBS) of the unit. If this is the case repair the appropriate DMA, DSCH, or DDSBS.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

6. REFERENCES

OMDB Key(s):

<table>
<thead>
<tr>
<th>Format(s):</th>
<th>Key(s):</th>

</tbody>
</table>

Output Appendix(es):

APP:OMDB-X-REF
REPT:CONFIG

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT CONFIG FAULT TYPE a UNIT = b PID = c ASSERT = d

[2] REPT CONFIG FAULT TYPE a INACCESSIBLE RID = e PID = c
   ASSERT = d

2. REASON FOR OUTPUT

To report a fault condition in the configuration (CONFIG) library.
Format 1 is printed whenever the name of the unit can be determined. If not, Format 2 is printed.

3. VARIABLE FIELD DEFINITIONS

a = One or more fault types. Valid value(s):
   AMB = Could not allocate a message buffer.
   CI = CONFIG internal failure.
   EA = Equipment configuration data base (ECD) access problem.
   ED = ECD data invalid.
   FSM = Could not fault a process or send a message to a process.
   IA = Possible invalid argument.
   PA = Plant measurements data base access problem.
   PS = Unit in protected state.

b = Name and number of unit.

c = Process number of the process which called the CONFIG function.

d = Identification number (ASSERT number) of the fault in CONFIG.

e = Record ID (RID) of the unit control block (UCB) record in the equipment configuration data base (ECD) of the unit.

4. ACTION TO BE TAKEN

Consider bootstrapping for fault types EA, ED, and PA. Fault types AMB and FSM suggest that the system is in overload. In all cases, save a copy of the output message and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:COT-BUF

Software Release: 5E14 and later
Message Class: ASRT
Application: 5
Type: Output

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. FORMAT

REPT COT BUF a PERCENT FULL

2. REASON FOR OUTPUT

To report that local area signaling services (LASS) customer-originated trace (COT) trace buffer is 50% or 100% full.

3. VARIABLE FIELD DEFINITIONS

a = Percentage full of COT message buffer. Valid value(s):
   50 = COT trace buffer is more than 50% and less than 100% full.
   100 = COT trace buffer is 100% full. COT feature is not available to user until COT data link is up.

4. ACTION TO BE TAKEN

Check COT data link status. Put COT data link in service as soon as possible. To check status of the COT data link, poke 199 from the Master Control Center (MCC). Look at the unit control block (UCB), giving a key of TTY45 (all capital). Refer to the SET:COT input message for recovery techniques.

WARNING: DO NOT ATTEMPT TO MODIFY OR REMOVE THE COT BUFFER (/log/COTbuffer).

5. ALARMS

Major or Minor.

6. REFERENCES

Input Message(s):

   OP:COT-STATUS
   SET:COT

Output Message(s):

   REPT:COT-BUF

235-190-130 Local Area Signaling Services
MCC Display Page(s):

199 (RCV ECD PARAMETER INFO)
REPT:COT-MANUAL

Software Release: 5E14 and later
Message Class: ASRT
Application: 5
Type: Output

1. FORMAT

REPT COT MANUAL ACTION

2. REASON FOR OUTPUT

To report that a defensive check failure (assert) has occurred in a local area signaling services (LASS) customer-originated trace (COT) feature that requires manual action.

3. VARIABLE FIELD DEFINITIONS

a = One of the following error types. Valid value(s):

  AScotsys process cannot create /log/COTbuffer.
  AScotsys process cannot open /log/COTbuffer.
  AScotsys process cannot read /log/COTbuffer.
  AScotsys process cannot receive acknowledgement message from CMKP.
  AScotsys process cannot receive message from SMaprts.
  AScotsys process cannot send message to communication package kernel (CMKP) process.
  AScotsys process cannot send message to switch maintenance application real time (SMaprts) process.
  AScotsys process cannot write /log/COTbuffer.
  AScotsys process detects /log is not mounted.
  COT data link is in an invalid state. The COT feature has been disabled, to re-enable COT, correct the state of TTY 45 and enter the INIT:ULARP input message.
  /log/COTbuffer corrupted.

4. ACTION TO BE TAKEN

When AScotsys process can not send/receive messages to/from SMaprts process, verify that SMaprts process is running using OP:ST-PROC input message.

When AScotsys process can not send/receive messages to/from CMKP process, verify that CMKP process is running using OP:ST-PROC input message.

When /log is not mounted or AScotsys process can not create /log/COTbuffer, use the OP:AVAILLOG input message to ensure that /log is mounted and that 27K bytes of disk space is available.

When AScotsys process can not open, read or write /log/COTbuffer, verify that /log/COTbuffer file mode is 0644.

When COT data link is in an unknown state put the COT data link in service.

When AScotsys process terminates due to above errors, COT feature is inactive. After the error is resolved, use INIT:ULARP input message to restart AScotsys process.
When the /log/COTbuffer is corrupted a copy of it is placed into /tmp/COTbuffer, and an empty /log/COTbuffer is created. The /tmp/COTbuffer can be manually examined to see what may have caused it to become corrupted. The main cause of corruption is human modification of the file. Remove /tmp/COTbuffer when done. Do not remove or modify /log/COTbuffer.

5. ALARMS

None.

Software Release: 5E16(1) and later
Message Class: SMCONF
Application: 5
Type: Output

1. FORMAT

REPT CPIA a{=b-c| SM=b}[ VFAC=d] CALL PROCESSING [PARTIALLY ]e SRC=f [EVENT REPORTED=g]

2. REASON FOR OUTPUT

To automatically report call processing inhibit/allow status changes for packet units.

3. VARIABLE FIELD DEFINITIONS

Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

PARTIALLY = This indicates that the call processing status is not completely inhibited or allowed.

a = Packet unit type. The media gateway proxy (MGP) will be identified by the switching module (SM) number. All other unit types will be identified by SM and unit number. Valid value(s):
IWG = Inter-working gateway.
IWU = Inter-working unit.
LAG = Line access gateway.
MGP = Media gateway proxy.
PAG = Packet access gateway.
TAG = Trunk access gateway.

b = SM number for the packet unit.

c = Packet unit number. This is not used for an MGP.

d = Virtual facility (VFAC) number. This is only used for a Trunk access gateway (TAG). When the VFAC is not provided in the output for a TAG, it indicates that the report is for a whole TAG event.

e = Call processing status. Valid value(s):
INHIBITED = Indicates that call processing is inhibited.
ALLOWED = Indicates that call processing is allowed.

f = Source (subsystem) of the call processing status report. Valid value(s):
AU = Audits.
SI = System integrity.
SMIM = Switch maintenance on the interface module.

g = Indicates the event that caused this report. Valid value(s):
NETWORK INTERFACE 1 DOWN = The first relative network interface failed.
NETWORK INTERFACE 1 UP = The first relative network interface was recovered.
NETWORK INTERFACE 1 BLKD = The first relative network interface is blocked.
NETWORK INTERFACE 2 DOWN = The second relative network interface failed.
NETWORK INTERFACE 2 UP = The second relative network interface was recovered.
NETWORK INTERFACE 2 BLKD = The second relative network interface is blocked.
NETWORK INTERFACE 3 DOWN = The third relative network interface failed.
NETWORK INTERFACE 3 UP = The third relative network interface was recovered.
NETWORK INTERFACE 3 BLKD = The third relative network interface is blocked.
NETWORK INTERFACE 4 DOWN = The forth relative network interface failed.
NETWORK INTERFACE 4 UP = The forth relative network interface was recovered.
NETWORK INTERFACE 4 BLKD = The forth relative network interface is blocked.
IWU COMMUNICATION LOST = Communications to the inter-working unit (IWU) was lost.
IWU COMMUNICATION RESTORED = Communications to the IWU was restored.
MGP COMMUNICATION LOST = Communications to the MGP was lost.
MGP COMMUNICATION RESTORED = Communications to the MGP was restored.
PAG COMMUNICATION LOST = Communications to the packet access gateway (PAG) was lost.
PAG COMMUNICATION RESTORED = Communications to the PAG was restored.

4. ACTIONS TO BE TAKEN

The actions depend on the value of variable 'e'.

<table>
<thead>
<tr>
<th>If 'e' =</th>
<th>then</th>
</tr>
</thead>
<tbody>
<tr>
<td>INHIBITED</td>
<td>Reference the appropriate element manager. Valid value(s): ASM = Used for MGP, AQUEFVIEW = Used for IWG, IWU, TAG, INS = Used for PAG, NAM = Used for LAG.</td>
</tr>
<tr>
<td>ALLOWED</td>
<td>No action is needed.</td>
</tr>
</tbody>
</table>

5. ALARMS

Critical or none. Critical alarms may be produced when there is a large scale outage such as MGP isolation.

6. REFERENCES

Other Manual(s):
585-229-854 INS

MCC Display Page(s):
MGP GROWTH
MGP COMPONENT ASSOCIATION
1. **FORMAT**

   REPT CRITICAL PH OVERLOAD CONDITION
   
   PSUPH=a-b-c-d  CHGRP=e
   
   RESOURCE f [f] [f] [f] [f] [f]

2. **REASON FOR OUTPUT**

   To report PHs (protocol handlers) that have exceeded critical resource utilization level and have gone into critical overload.

3. **VARIABLE FIELD DEFINITIONS**

   a = Switching module (SM) number.
   
   b = Packet switching unit (PSU) number.
   
   c = PSU shelf number.
   
   d = PH number.
   
   e = Channel group number (logical PH number).
   
   f = PH resources that are overloaded (up to six). Valid value(s):
   
   - PHCELL = PH Dropped Cell.
   - PHGPBD = PH General Purpose Buffer Descriptor.
   - PHLRFD = PH LAN-side Received Frame Descriptor.
   - PHRT = PH Real-time (based on interject cycles).
   - PHSRFD = PH SPYDER-side Received Frame Descriptor.
   - PHSTFD = PH SPYDER-side Transmit Frame Descriptor.

4. **ACTION TO BE TAKEN**

   If the same PH consistently appears in a critical PH overload report, a reengineering of the signaling links on that PH is required.

   Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

   To find the status of the overloaded packet interface (PI) and/or packet handlers (PHs), use the OP:TRFC30 or OP:ST input messages.

   If hardware checks are inhibited in an SM especially with data cache equipped, the impact could be a real time overload condition. Hardware checks should be allowed unless there is an overriding reason to inhibit the hardware checks.

5. **ALARMS**
Minor.

[9] REPT CSOP FORMATTING
   PROBLEM ALLOCATING MEMORY
   KEY: a PID: b UTILITY ID: c

2. REASON FOR OUTPUT
To report that an error has occurred during the formatting of a format-and-spool request.

3. VARIABLE FIELD DEFINITIONS

a = The key that was requested.
b = The process ID of the requesting process.
c = The utility ID of the requesting process.

All variables for REPT:CSOP-FORMAT messages are taken from the information passed by the requesting (client) process.

4. ACTION TO BE TAKEN

For Formats 1 - 5, a problem in requesting process code is indicated. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 6, coordinator of spooler output process (CSOP) is unable to store the formatted text. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. CSOP will attempt to store the text in a file in /tmp if CSOP’s common segment is full. This message indicates that the attempted use of a file failed.

For Format 7, a software problem with the output message database (OMDB) is indicated. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 8, a software error in the language passed to CSOP is indicated. There are currently two valid values. P

Format 9 indicates a failure in CSOP to allocate memory while processing the output message. This indicates that memory resources are temporarily unavailable resulting in the loss of the requested output message.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

6. REFERENCES

OMDB Key(s):

Type: Output

1. FORMAT

REPT CSOP IN SERVICE
OMDB SEGMENTS:
   TOTAL      ACTIVE
     a          b

2. REASON FOR OUTPUT

To report initialization of the coordinator of spooler output processors (CSOP) process.

3. VARIABLE FIELD DEFINITIONS

a = Total number of segments that the output message database (OMDB) requires.
b = Number of segments that are active (incore).

Note: The number of segments is variable depending on the current state of the system and the equipment configuration database (ECD) setup. When the system is in DUPLEX mode, the number of active segments are determined from the splrinfo record information in the ECD. When the system is in SIMPLEX mode, the number of active segments are in the total number of output buffer segments required by the OMDB.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:CSOP-PRIM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT CSOP PRIMITIVE MODE FOR KEY a
   0xbbbb: cccccccc [cccccccc cccccccc cccccccc]

2. REASON FOR OUTPUT

To report that the output message data base (OMDB) cannot be accessed and therefore a message cannot be formatted. Variables passed by the requesting process are given in the form of a hex dump.

3. VARIABLE FIELD DEFINITIONS

   a = The key that was requested.
   b = The offset of the first byte of the line.
   c = A hex dump of one memory word. (Due to limits of the primitive mode buffer, this may not be a complete dump of all variables.)

4. ACTION TO BE TAKEN

Primitive mode indicates a problem in accessing the incore OMDB. The current status of the file /cft/spl/omdb and disk availability should be checked. If the file exists and the disk is ACTIVE, execute the ACTV:OMDB message. If this is not successful, the problem may be insufficient memory available to bring the OMDB incore; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

2. REASON FOR OUTPUT

To report errors detected by the spooler during initialization.

When formats having no OMDB key value are printed, other output messages may then appear in primitive mode.

Format 1 is printed if the equipment configuration database (ECD) contains inconsistent device definitions.

Formats 2 and 9 are printed if the ACKDB failed to be initialized from the disk or could not be added to the invoking process' address space.
Formats 3, 16, and 21 are printed if coordinator of spooler processes (CSOP) cannot access the plant measurements database.

Formats 4, 5, 7, 8, 9, 10, 13, 14, 15, 17, and 18 are printed if errors occur while trying to read an OMDB key into memory.

Format 6 is printed if there is an inconsistency in the ECD device definition. Either the terminal should be a dialogue device and is not or the SOP should be temporary and is not.

Format 11 is printed is CSOP fails to save the stack in preparation for handling a phase 1.

Format 12 is printed if CSOP is unable to create a dialogue shell.

Format 19 is printed when CSOP cannot remove the output file associated with Format 21.

Format 20 is printed if CSOP cannot send a message to SOP ‘c’.

Formats 22 and 27 are printed when CSOP cannot open or write the output file.

Format 23 is printed when CSOP creates a new spooler output process.

Format 24 is printed when a device record is deleted in the ECD.

Formats 25 and 29 are printed when CSOP is unable to create a new spooler output process.

Format 26 is printed if CSOP is unable to print to the receive-only printer (ROP).

Format 28 is printed if CSOP is unable to remove a file.

Format 29 is printed if CSOP is unable to fork a SOP process.

Formats 30, 43, 44, and 59 indicate a SOP work queue error. In the case of 43, the locations and addresses of the message headers are printed.

Format 31 is printed if memory cannot be allocated for CSOP's master work queue. This is a fatal error since no messages can be stored internally for later output.

Formats 32, 45, and 46 are printed when CSOP is unable to queue incoming messages; therefore, messages will be lost.

Format 33 is printed when the overload condition has been cleared.

Format 34 is printed if CSOP cannot enable the receipt of messages.

Format 35 is printed when a new device record is defined in the ECD.

Format 36 is printed if a class is defined that contains no output devices.

Format 37 is printed when there was no entry in the work queue for ‘a’.

Formats 38 and 41 are printed when a dialogue shell is terminated.

Format 39 is printed if port one is not free. CSOP will attempt to kill the process that is attached to port one and connect itself.

Format 40 is printed when the ECD record for a device or class is changed.

Format 42 is printed when a dialogue shell is created.
Format 47 is printed if the queue size for a device changed and it is not large enough to hold all the current outstanding messages.

Format 48, 49, and 57 indicate ECD record problems.

Format 50 is printed if CSOP can not get enough memory to store the definition of an output device.

Format 51 is printed when CSOP does not have enough memory to store the definition of a class.

Format 52 is printed if CSOP in unable to allocate memory for the work queue associated with a particular SOP.

Format 53 is printed if CSOP was unable to attach to the ECD. If this appears before CSOP initializes the master work queue, the message will go to the spooler log until CSOP is restarted.

Formats 53, 57 and 58 indicate ECD access and/or update errors.

Format 54 is printed when the common segment to exchange work queue information between CSOP and SIP cannot be created.

Format 55 is printed when CSOP is unable to allocate space to store information about a new tty entry.

Format 56 is printed when a tty entry is requested to be removed from CSOP's internal tty list and it cannot find an entry for the specified device or class.

Format 59 is printed by CSOP when cleaning up after a dead SOP if it cannot find a tty entry associated with the SOP.

Format 60 is printed when CSOP finds that the output file is not empty. This is done to ensure that existing files are not destroyed or inappropriately changed.

Formats 61 and 62 go to the spooler log to indicate that a state change has occurred in the system. Format 61 indicates that the system is in the SIMPLEX mode and format 62 indicates that the system is in DUPLEX mode.

Format 63 indicates that CSOP has run out of common segment space. This space is used to store output messages that are being formatted or formatted messages that have not yet been output.

Format 64 indicates that CSOP cannot retrieve the name of a file from its common segment. CSOP needs the filename so that the file can be removed.

3. VARIABLE FIELD DEFINITIONS

a = Name of an output device or class.

b = Reason a device could not be added to CSOP’s device table.

c = Process ID of SOP.

d = String containing additional information.

e = Filename.

f = System error number.

g = Completion code.

h = Job ID.
i = Pathname.

j = Segment name.

k = Spooler output class.

l = Error number assigned by CSOP.

m = Maximum number of active OMDB segments.

n = String identifying where data is stored. "NO TEXT" indicates that there is no data stored.

o = Address in CSOP's common segment.

p = Utility ID.

q = OMDB key of the report.

4. ACTION TO BE TAKEN

For messages appearing on the ROP in the event of a fatal fault, CSOP will be restarted. This clears the problem. No action should be taken unless the message is repeated. To restore system sanity, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Messages written to the spooler log require no action.

For Format 19, the file should be removed manually.

For Format 60, determine the input message that specified this output file and retry that message with a different filename option.

Formats 2, 4 - 11, 13 - 15, 17, 18, 31 - 34, 39, 45, 46, 50 - 54, and 63 do not have OMDB keys. These are output messages that cannot be formatted and spooled, due to the state of the system at the time of printing.

For Format 64, if /tmp space is limited, check for files in the form "/tmp/OM" and remove any of these that do not have a time stamp within the last six hours.

Note: There is one report of Format 64 for each file to be removed.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Input Message(s):

OP:LOG
OP:ST-PORTS

Output Appendix(es):

APP:OMDB-X-REF
REPT:CU

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT CU a b

[2] REPT CU a ERROR INTERRUPT c d

[3] REPT CU a MAINTENANCE INTERRUPT d

2. REASON FOR OUTPUT

To indicate the status of the specified control unit (CU).

Format 1 is printed as the result of a change in the major state of the CU, while Formats 2 and 3 indicate that an error interrupt has occurred.

3. VARIABLE FIELD DEFINITIONS

a  = Member number (0 or 1).
b  = Major state. Valid value(s):
ACTIVE = Processor is online and not in a recovery state.
INITIALIZING = Processor has undergone an initialization, and the initialization interval has not elapsed.
OUT OF SERVICE = Processor is available for use but its memory is not up-to-date.
REMOVED = Processor state has been changed to OUT OF SERVICE or UNAVAILABLE.
STANDBY = Processor is updated and available for use.
UNAVAILABLE = Processor is unavailable under any circumstance (for example, forced off-line).

c  = Interrupt type, in hexadecimal notation. Valid value(s):
02 = Emergency action interface (EAI) error.
08 = Noncorrectable parity failure in main store (my store C).
0B = Invalid maintenance channel order.
0C = Other store controller error (other store A).
0D = Other store refresh or correctable parity failure (other store D).
0E = Other store noncorrectable memory failure (other store C).
0F = Other store timeout.
10 = Channel error.
11 = IO response error.
12 = IO addressing error.
13 = Parity divert error.
14 = Refresh or correctable parity memory failure (my store D).
15 = Protection violation.
16 = Virtual address out of range (very large main memory (VLMM) only).
= Out-of-range memory reference.
18 = Out-of-range memory reference (other store).
19 = Privilege violation.
1A = Bad alignment on memory reference.
1B = Illegal operand.
1C = Illegal instruction.
1D = Illegal stack switch.
1E = No interrupt source set when microcode interrupt handler entered.
20 = Direct memory access (DMA) detected fatal hardware fault in on-line main store.
21 = DMA detected out-of-range memory reference.
22 = DMA detected noncorrectable parity failure in main store.
25 = DMA error: bad parity on direct I/O bus (DIO).
26 = DMA error: bad parity on read.
27 = DMA error: DMA random access memory (RAM) parity failure.
28 = DMA error: DMA incrementer parity failure.
29 = DMA error: DIO ready failure.
2A = DMA error: DIO all seems well failure.
2B = DMA error: DIO acknowledge failure.
2C = DMA error: central control input output (CCIO) data parity failure.
2D = DMA error: CCIO message failure.
2E = DMA error: DMA read only message (ROM) sequencer parity failure.
2F = DMA error: Address error.
30 = DMA error: Channel request error.
32 = Processor error interrupt but no bits are set in error registers.
33 = Bad operating system trap (OST) detected by the kernel.

= If supplemental data is gathered for this error, it will be placed on the appropriate logfile. This identification flag can be used to find the entry on the logfile.

For Format 2, the error data will be in either the ERLOG or MEMLOG logfile. The logfile name is given in the Action To Be Taken for each interrupt type.

For Format 3, the entry is always in the PMLOG file.

Items can be extracted from a logfile using the OP:LOG input message, where ERLOG or MEMLOG is the logfile being searched and the keyword (KW) argument is ‘d’-the sequence number given above.

4. ACTIONS TO BE TAKEN

If a Format 2 message is output, follow the appropriate instructions for the specified interrupt type as given in Table 1.

<table>
<thead>
<tr>
<th>Interrupt Type</th>

This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.

Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.

Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.

Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.

Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.

Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.

If repeated failures occur, run diagnostics on the processor encountering the fault. The error data is recorded in ERLOG.

This error can occur only if hardware checks are blocked. The corresponding ERLOG entry contains the direct memory access (DMA) store data register. This can be used to determine the bad memory location. Diagnose the main store if there are multiple errors of this type.

This is a software error that was detected by the DMA and is a fatal DMA error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.

This error typically implicates a memory array board detected by the DMA and is a fatal DMA error. The error data is recorded in ERLOG. This error typically implicates a memory array board. Refer to the Error Interrupt Handler Faults Table in manual 235-105-220, Corrective Maintenance, to determine the faulty memory array board.

Run all of the phases of the MASC diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.

This error is in a channel under the DMA but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.

This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.

This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.

This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.

This error is in a channel under the DMA but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.

This error is in a channel under the DMA but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
For Format 3 errors, refer to the Corrective Maintenance manual for analysis of maintenance interrupt data. The analysis is done similarly to the postmortem analysis and includes:

- The source will always be software or hardware.
- For software sources, the utility ID and panic code determine the cause (Refer to the Corrective Maintenance manual).
- For hardware sources, examine the MICROCODE SAVE STATE for
  - Stop and switch errors in the error register.
  - A 1 in bits 6 or 7 of the timer register (TMR), indicating the sanity timer fired.
  - A micro-interrupt error with either interrupts blocked system status register (SSR) or execution at level 15 PSW.

Any hardware error implicates the sanity of the faulty CU while, in general, software errors are caused by program malfunctions. However, any recurring error on one CU implicates that CU. Run diagnostics, including demand phases if necessary.

5. ALARMS

For a minor alarm, take action as indicated in the report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:CURSTRMV

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT CURSTRMV FAULT TYPE a UNIT = b ASSERT = c

[2] REPT CURSTRMV FAULT TYPE a UNIT = b
MICROSTORE PUMP FAILED

[3] REPT CURSTRMV FAULT TYPE a UNIT = b
PHYSICAL MEMORY PUMP FAILED

[4] REPT CURSTRMV FAULT TYPE a UNIT = b
UPDATE FAILED IN MEMORY BLOCK d

[5] REPT CURSTRMV FAULT TYPE a INACCESSIBLE RID = e
ASSERT = c

[6] REPT CURSTRMV FAULT TYPE a CHECKSUM FAILED IN SLOT f
ASSERT = c

[7] REPT CURSTRMV CU RESTORE CONTINUING, DIAGNOSTIC
FAILURE IN NDN-CRITICAL UNIT

[8] REPT CURSTRMV FAULT TYPE a UNIT = b
OOS CU FORCED OFFLINE

2. REASON FOR OUTPUT

To report a fault condition in the control unit restore/remove (CURSTRMV) process. Format 5 is printed when the name of the unit can not be determined in response to manual and automatic RMV/RST request.

3. VARIABLE FIELD DEFINITIONS

a = One or more of the following fault types. Valid value(s):
BOOT = Bootfile access problem.
CURS = CURSTRMV internal failure.
ECDA = Equipment configuration data base (ECD) access problem.
ECDD = ECD data invalid.
EEIH = Processor control process error interrupt handler (PCPEIH) error.
EMEM = Memory size from ECD different from equipped memory size.
EMM = EMM straps do not match on both control units (CU).
EPCP = Processor control process maintenance driver (PCPMD) error.
FOFL = Problem with the system status register (SSR) forced offline bit.
IARG = Invalid argument.
MPF = Microstore pump failed.
OPCP = Can't open process control process maintenance driver (PCPMD).
OSPL = Can't open spooler.
PMPF = Physical memory pump failed.
RSTCOD = Restore code access problem.
RTS = Could not send message to RTS.
UCOD = Could not load micro code.
UF = Update failed.
VTOC = Volume table of contents (VTOC) access problem.

b = Name and number of unit.
c = Identification number (ASSERT number) of the fault in the CURSTRMV process.
d = Starting address of the memory block.
e = Record ID (RID) of the unit control block (UCB) record in the equipment configuration data base (ECD).
f = Microstore slot number of failing checksum.

4. ACTION TO BE TAKEN

Messages referring to a microstore pump failure, a physical memory pump failure, or an update failure generally indicate hardware problems with the off-line CU. If the message indicates the off-line CU is forced, clear the force from the emergency action interface (EAI) page on the maintenance terminal. For the EMM type message, make sure the EMM straps are either “on” or “off” on both CUs. For other cases, save a copy of the output message and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Output Appendix(es):

APP:OMDB-X-REF
78. REPT:D
REPT:DAP-ABORT-LE
Software Release: 5E14 and later
Message Class: INT
Application: 5
Type: Output

1. FORMAT

REPT DAP ABORT LIMIT EXCEEDED     DAP = a
    PROCESS WILL ATTEMPT RESTART IN b MINUTES

2. REASON FOR OUTPUT

This message is generated when a DMERT application process (DAP) has aborted and will not be immediately
recreated because a threshold number of attempts has already been attempted.

This message pertains to DAPs that can abort without causing an escalation to a system-wide initialization or can
include these "essential" DAPs if the emergency action interface (EAI) software checks are inhibited.

Initially, when such a DAP aborts, it is restarted immediately; however, when a specified limit on the number
recreations is exceeded, the recreation is delayed in order to conserve system resources. When the DAP is in this
delayed creation state, it can be immediately recreated manually.

3. VARIABLE FIELD DEFINITIONS

a
    DAP aborted. Valid value(s):
    AMDW1   = Automatic message accounting (AMA) disk writer kernel process stream 1.
    AMDW2   = Automatic message accounting (AMA) disk writer kernel process stream 2.
    APDL    = Attached processor data link process.
    CNIINIT = Common network interface initialization kernel process.
    PUCR    = Pump control supervisor process.
    SMDIMP  = Switch maintenance diagnostic input message process.
    SMPSM   = Switch maintenance power switch monitor process.

b
    Restart delay time (in minutes).

4. ACTION TO BE TAKEN

Refer to the output message REPT:DAP-ABORT-LE, and, using the input messages listed in the references section
of the Output Messages manual page as a guide, enter an input message to reinitialize the aborted DAP if
immediate recreation is desired. Otherwise the DAP is restarted automatically in the specified time.

5. ALARMS

Major.

6. REFERENCES

Input Message(s):

INIT:AM-FPI
INIT:CNI
SET:MINMODE-CNI

Other Manual(s):
235-105-250  System Recovery
235-190-120  Common Channel Signaling Services Features
REPT:DAP-INIT
Software Release: 5E14 and later
Message Class: INT
Application: 5
Type: Output

1. FORMAT

REPT DAP INIT FAILURE   DAP = a        EVENT = b
   SEQ STATE = c   REASON = d [e]

2. REASON FOR OUTPUT

To report that a DMERT application process (DAP) has failed to initialize and will not be automatically reinitialized by the application integrity monitor (AIM) process. This message will be generated if a DAP fails to get created due to a process manager error, if a DAP times out while either being created or while initializing, or if a DAP fails to complete some initialization sequence state.

3. VARIABLE FIELD DEFINITIONS

a = DAP that failed. Valid value(s):
   AMDW1 = Automatic message accounting disk writer kernel process Number 1.
   AMDW2 = Automatic message accounting disk writer kernel process Number 2.
   CCSINIT = Common channel signaling initialization kernel process.
   DMAN = Deferred maintenance administration and monitor UNIX® B process.
   PUCR = Pump control supervisor process.

b = Event number. Used to correlate several output messages with a given input message.

c = Sequence state of DAP that failed. Valid value(s):

   COMMUNICATION-LINK-INIT
   CREATE
   ENABLE-FAULT-RECOVERY
   ESSENTIAL-JOBS-OPERATIONAL
   FULLY-OPERATIONAL
   HARDWARE-INIT
   SOFTWARE-INIT

d = Reason for DAP's failure. Valid value(s):

   PMGR-ERROR
   SEQ-STATE-UNSUCC
   TIME-OUT

e = If 'd' = PMGR-ERROR, error code passed to AIM from the process manager. Refer to the REPT:PMGR-ERR output message for an explanation.

4. ACTION TO BE TAKEN

In case of a process manager error, a REPT:PMGR-ERR output message will also be generated. Consult the
REPT:PMGR-ERR manual page for the action to be taken in this case. In case of a time-out or a sequence state failure, the DAP that failed should be reinitialized using one of the input messages listed below.

5. ALARMS

Major.

6. REFERENCES

Input Message(s):

CLR:MINMODE-CNI
INIT:CNI
SET:MINMODE-CNI

Output Message(s):

REPT:PMGR-ERROR
REPT:DATA-A

Software Release: 5E14 only
Message Class: ASRTMON, INT_MON, GENRMON
Application: 5
Type: Output

1. FORMAT

REPT {AM|SM=a|CMP=b-c d|MCTSI=a-b d|QGP=b-e |UNK UNK} DATA=f,g ENV=h SRC=i EVENT=j ADDR=k
l [l...]

2. REASON FOR OUTPUT

To report data automatically after a high-level initialization in the administrative module (AM), switching module (SM), communication module processor (CMP), or quad-link gateway processor (QGP), or after an SM or CMP offline verification during a retrofit.

This message is normally logged, but will also print in response to input message OP:POSTMORT.

During a retrofit the GENRMON message class is used. The ASRTMON message class is used for defensive check failure errors, otherwise, the INT_MON message class is used.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

UNK = Unknown unit.
a = SM number.
b = Message switch (MSGS) side or MCTSI side.
c = Physical CMP number.
d = Processor being reported on. Valid value(s):
   MATE = Mate CMP.
   MH0 = Message handler 0.
   MH1 = Message handler 1.
   MH2 = Message handler 2.
   PRIM = Primary CMP.

e = QGP number

f = Data dump type. Valid value(s):
   ACCSDB = The data dump consists of the toll and assistance automated calling card services data block indicated by the process control block (PCB) and process control block link area (PCBLA) data dumps with the same event number.
   DCF-DATA = The data dump relates to a defensive check in associated output messages.
EIS_LNK = The data dump consists of the External Information System (EIS) data block corresponding to the process identification (PID) indicated by the PCB and PCBLA data dumps with the same event number.

ESCAL-CNTS = The data dump consists of postmortem data from system integrity that identifies the values of escalation counters previous to the last high-level initialization.

INTJ-MSG = The data dump consists of the interject message being processed at the time of either an SPP or high-level initialization when interject was running.

LLCB = Raw data from the logical link control block (LLCB).

LMDB = Raw data from the link map data block (LMDB).

MH0-PM-DUMP = Raw data dump of unrecognizable post mortem messages.

OFFLINE-ESCAL-HIST = The data dump consists of postmortem data from system integrity, that identifies the values of escalation counts logged during the offline verification on the offline side of the SM.

OFFLINE-SPP-HIST = The data dump consists of postmortem data from system integrity that identifies all single process purges (SPPs) that occurred during the offline verification on the offline side of the SM.

PCB = The data dump consists of the process control block of the operating system for distributed switching (OSDS) process whose PID is the block number field.

PCBLA-1 = The data dump consists of part one of the process control block linkage area of the OSDS process whose PID is the block number field.

PCBLA-2 = The data dump consists of part two of the process control block linkage area of the OSDS process whose PID is the block number field.

POSDB = The data dump consists of the position data block of the position corresponding to the PID indicated by the PCB and PCBLA data dumps with the same event number.

SPP-HIST = The data dump consists of postmortem data from system integrity that identifies the SPP events previous to the most recent high-level initialization.

TAPOSDB = The data dump consists of the toll and assistance position data block of the position corresponding to the PID indicated by the PCB and PCBLA data dumps with the same event number.

UNKNOWN = The data dump consists of an unknown type.

g = The sequence number of the data being output in the message.

h = Environment in which the request was stimulated. Refer to the APP:ENVIR appendix in the Appendices section of the Output Messages manual.

i = Source of the dump request. Valid value(s):
   AUDR = Audit of the associated data structure.
   DCF = Defensive check failure request.
   DCFSPP = DCF deferred single process purge.
   FR = Fault recovery.
   SI = System integrity data.
   SPP = Single process purge.
   UNKNOWN = Unknown source.

j = Event number.

k = Physical address in hexadecimal of the block being dumped.

l = Data being reported in hexadecimal. Depending on the data dump type and the amount of data, this output could vary significantly. The greatest number of lines is five, while the greatest number of
columns is eight. Each event is represented by two segments of data; therefore, each message at most contains 20 events worth of information.

4. ACTION TO BE TAKEN

This information should be sent along with any trouble report concerning AM, SM, CMP, or QGP initialization to an appropriate technical support organization. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report data automatically after a high-level initialization in the administrative module (AM), switching module (SM), communication module processor (CMP), message switch (MSGS), office network and timing complex (ONTC), or quad-link gateway processor (QGP), or after an SM or CMP offline verification during a retrofit. This message will also dump data after an assert.

This message is normally logged, but will also print in response to input message OP:POSTMORT.

During a retrofit the GENRMON message class is used. The ASRTMON message class is used for defensive check failure errors, otherwise, the INT_MON message class is used.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Message switch (MSGS), office network and timing complex (ONTC), or MCTSI side.
c = Physical CMP number.
d = Processor being reported on. Valid value(s):
   MATE = Mate CMP.
   MH0 = Message handler 0.
   MH1 = Message handler 1.
   MH2 = Message handler 2.
   PRIM = Primary CMP.

e = QGP number
f = Data dump type. Valid value(s):
   ACCSDB = The data dump consists of the toll and assistance automated calling card services data block indicated by the process control block (PCB) and process control block link area (PCBLA) data dumps with the same event number.
   CDAL = The data dump consists of Control and Diagnostic Access Link fault recovery data.
   DCF-DATA = The data dump relates to a defensive check in associated output messages.
   EIS_LNK = The data dump consists of the External Information System (EIS) data block corresponding to the process identification (PID) indicated by the PCB and PCBLA
data dumps with the same event number.

**ESCAL-CNTS** = The data dump consists of postmortem data from system integrity that identifies the values of escalation counters previous to the last high-level initialization.

**INTJ-MSG** = The data dump consists of the interject message being processed at the time of either an SPP or high-level initialization when interject was running.

**LLCB** = Raw data from the logical link control block (LLCB).

**LMDB** = Raw data from the link map data block (LMDB).

**MH0-PM-DUMP** = Raw data dump of unrecognizable post mortem messages.

**OFFLINE-ESCAL-HIST** = The data dump consists of postmortem data from system integrity, that identifies the values of escalation counts logged during the offline verification on the offline side of the SM.

**OFFLINE-SPP-HIST** = The data dump consists of postmortem data from system integrity that identifies all single process purges (SPPs) that occurred during the offline verification on the offline side of the SM.

**PCB** = The data dump consists of the process control block of the operating system for distributed switching (OSDS) process whose PID is the block number field.

**PCBLA-1** = The data dump consists of part one of the process control block linkage area of the OSDS process whose PID is the block number field.

**PCBLA-2** = The data dump consists of part two of the process control block linkage area of the OSDS process whose PID is the block number field.

**POSDB** = The data dump consists of the position data block of the position corresponding to the PID indicated by the PCB and PCBLA data dumps with the same event number.

**SPP-HIST** = The data dump consists of postmortem data from system integrity that identifies the SPP events previous to the most recent high-level initialization.

**TAPOSDB** = The data dump consists of the toll and assistance position data block of the position corresponding to the PID indicated by the PCB and PCBLA data dumps with the same event number.

**UNKNOWN** = The data dump consists of an unknown type.

**g** = The sequence number of the data being output in the message.

**h** = Environment in which the request was stimulated. Refer to the APP:ENVIR appendix in the Appendixes section of the Output Messages manual.

**i** = Source of the dump request. Valid value(s):

- **AUDR** = Audit of the associated data structure.
- **DCF** = Defensive check failure request.
- **DCFSPP** = DCF deferred single process purge.
- **FR** = Fault recovery.
- **SI** = System integrity data.
- **SPP** = Single process purge.
- **UNKNOWN** = Unknown source.

**j** = Event number.

**k** = Physical address in hexadecimal of the block being dumped.

2. REASON FOR OUTPUT

To report data automatically after a high-level initialization in the administrative module (AM), switching module
(SM), communication module processor (CMP), message switch (MSGS), office network and timing complex
(ONTC), or quad-link gateway processor (QGP), or after an SM or CMP offline verification during a retrofit. This
message will also dump data after an assert.

This message is normally logged, but will also print in response to input message OP:POSTMORT.

During a retrofit the GENRMON message class is used. The ASRTMON message class is used for defensive check
grief errors, otherwise, the INT_MON message class is used.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Message switch (MSGS), office network and timing complex (ONTC), or MCTSI side.
c = Physical CMP number.
d = Processor being reported on. Valid value(s):
   MATE = Mate CMP.
   MH0 = Message handler 0.
   MH1 = Message handler 1.
   MH2 = Message handler 2.
   PRIM = Primary CMP.
e = QGP number
f = Data dump type. Valid value(s):
   ACCSDB = The data dump consists of the toll and assistance automated calling card
services data block indicated by the process control block (PCB) and process
control block link area (PCBLA) data dumps with the same event number.
   CDAL = The data dump consists of control and diagnostic access Link fault recovery data.
   DCF-DATA = The data dump relates to a defensive check in associated output messages.
   EIS_LNK = The data dump consists of the external information system (EIS) data block corresponding to the process identification (PID) indicated by the PCB and PCBLA
data dumps with the same event number.
ESCAL-CNTS = The data dump consists of postmortem data from system integrity that identifies the values of escalation counters previous to the last high-level initialization.
INTJ-MSG = The data dump consists of the interject message being processed at the time of either an SPP or high-level initialization when interject was running.
LLCB = Raw data from the logical link control block (LLCB).
LMDB = Raw data from the link map data block (LMDB).
MH0-PM-DUMP = Raw data dump of unrecognizable post mortem messages.
OFFLINE-ESCAL-HIST = The data dump consists of postmortem data from system integrity, that identifies the values of escalation counts logged during the offline verification on the offline side of the SM.
OFFLINE-SPP-HIST = The data dump consists of postmortem data from system integrity that identifies all single process purges (SPPs) that occurred during the offline verification on the offline side of the SM.
OSCONTEXT = The data dump consists of the value of the pointer to the operating system for distributed switching (OSDS) interrupt context, the value of the OSDS interrupt state, and a portion of the contents of the OSDS interrupt context.
PCB = The data dump consists of the process control block of the OSDS process whose PID is the block number field.
PCBLA-1 = The data dump consists of part one of the the process control block linkage area of the OSDS process whose PID is the block number field.
PCBLA-2 = The data dump consists of part two of the the process control block linkage area of the OSDS process whose PID is the block number field.
POSDB = The data dump consists of the position data block of the position corresponding to the PID indicated by the PCB and PCBLA data dumps with the same event number.
SPP-HIST = The data dump consists of postmortem data from system integrity that identifies the SPP events previous to the most recent high-level initialization.
TAPOSDB = The data dump consists of the toll and assistance position data block of the position corresponding to the PID indicated by the PCB and PCBLA data dumps with the same event number.
UNKNOWN = The data dump consists of an unknown type.

g = The sequence number of the data being output in the message.

h = Environment in which the request was stimulated. Refer to the APP:ENVIR appendix in the Appendixes section of the Output Messages manual.

i = Source of the dump request. Valid value(s):
AUDR = Audit of the associated data structure.
DCF = Defensive check failure request.
DCFSPP = DCF deferred single process purge.
FR = Fault recovery.
SI = System integrity data.
SPP = Single process purge.
UNKNOWN = Unknown source.

j = Event number.

k = Physical address in hexadecimal of the block being dumped.

l = Data being reported in hexadecimal. Depending on the data dump type and the amount of data, this output could vary significantly. The greatest number of lines is five, while the greatest number of
columns is eight. Each event is represented by two segments of data; therefore, each message at most contains 20 events worth of information.

REPT:DATA-DUMP

Software Release: 5E14 and later
Message Class: ASRTMON
Application: 5
Type: Output

1. FORMAT

REPT DATA DUMP REPORT PCR=a EVENT=b
   CALL PROCESSING ERROR OCCURRED AT FUNCTION c LINE d
   A DATA DUMP WAS SENT TO /log/log/CALLPLOG1

2. REASON FOR OUTPUT

To provide information about a data dump being sent to the UNIX® RTR /log/log/CALLPLOG1 file.

3. VARIABLE FIELD DEFINITIONS

   a = Processor where data dump occurred.
   b = Event number.
   c = Function where data dump occurred.
   d = Source line number in function where data dump occurred.

4. ACTION TO BE TAKEN

A data dump was sent to the UNIX® RTR /log/log/CALLPLOG1 file. The data dump information is needed by the technical assistance organization for further analysis of the problem. Use the EVENT number to locate the related data dump(s) in the CALLPLOG1 file. The data dump might follow or precede a craft assert, an assert or an RTA DCF assert. The event number will match between this file message and its corresponding assert.

   NOTE: The total information stored in the CALLPLOG files is 250K bytes. Data dump information might be lost if not retrieved in time. CALLPLOG1 has a size limit of 125K bytes. When CALLPLOG1 reaches its limit, it will be renamed CALLPLOG0(125K bytes); when further information is to be stored, it will be written to an empty version of CALLPLOG1.

5. ALARMS

REPT:DB-INIT

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT DB INIT ERR
   UCB POINTER OF MDCT a IS IDNULL

[2] REPT DB INIT ERR
   RPC UNIT_NUMBER INVALID b

[3] REPT DB INIT ERR
   IUN UNIT_NUMBER INVALID b

[4] REPT DB INIT ERR
   CANNOT CONVERT b TO PNI

[5] REPT DB INIT ERR
   U_DID NUMBER c OUT OF RANGE - b

[6] REPT DB INIT ERR
   DUPLICATED U_DID NUMBER c - b, d

[7] REPT DB INIT ERR
   DUPLICATED PNI e - b, d

2. REASON FOR OUTPUT

To report a discrepancy that was noted in the contents of the equipment configuration database (ECD) records for equipped ring nodes during a system-wide initialization.

Format 1 reports that fields 9 and 10 of the MDCT record identified in the output message contain no pointer to the associated unit control block (UCB) record.

Format 2 reports that a UCB record containing the entry ring processor controller (RPC) in the device_type field has been assigned a member number other than 0 in the unit_number field. RPC member numbers must be 0.

Format 3 reports that a UCB record containing the entry RUN in the device_type field has been assigned the member number 0 in the unit_number field. IUN member numbers must not be 0.

Format 4 reports that the last two characters entered in the UCB record unit_name field are not numbers or are out-of-range, and/or the member number entered in the unit_number field is out-of-range.

Format 5 reports that the entry in the internal_device field of an RPC UCB record is out-of-range.
Format 6 reports that the entry in the internal_device field of an RPC UCB record is a duplicate of the entry in another equipped RPC UCB record. All equipped RPC UCB records must contain different internal_device values.

Format 7 reports that the last two numbers in the UCB record unit_name field and the member number in the unit_number field are identical to those of another equipped ring node UCB record.

3. VARIABLE FIELD DEFINITIONS

a = Identifies the MDCT record name (for example, rpcn00m0).

b = Identifies the ring node group and member (for example, RPCN00=0).

c = A decimal value representing the internal_device field entry found in the UCB record.

d = Same as for 'b'.

e = The converted physical node identifier.

4. ACTION TO BE TAKEN

The detection of any of the above discrepancies will cause the interface or switching module system (IMS or SMS) system-wide initialization to abort. The discrepancy in the ECD must be corrected as follows before a successful system-wide initialization can be performed.

For Format 1, enter the name of the associated UCB record into fields 9 and 10 of the MDCT record using DMERT recent change and verify (RC/V).

For Formats 2-4, delete the UCB record defined by 'b' in the output message from the ECD using DMERT RC/V. Determine the discrepancy in the UCB and insert a corrected version back into the ECD.

For Format 5, update the UCB record defined by 'b' in the output message to the correct device_id value using DMERT RC/V.

For Format 6, determine whether the UCB record defined by 'b' or 'd' is incorrect and update this record to the correct device_id value using DMERT RC/V.

For Format 7, determine whether the UCB record defined by 'b' or 'd' is incorrect and delete this UCB record from the ECD using DMERT RC/V. A corrected version of the UCB record should then be inserted back into the ECD.

5. ALARMS

Major.

   [2] REPT DCGRPT     MANUAL TERMINATION

   [3] REPT DCGRPT     AUTO TERMINATION

2. **REASON FOR OUTPUT**

   To provide originating and terminating information for calls pegging the zero (default) cell group in response to the ALW:DCGRPT input message. The use of the words "zero cell group" and "default cell group" are interchangeable. Cell groups are used for division of revenue traffic separation. Calls pegging the zero cell group are due to division of revenue translation errors. The information provided by this report assists in tracing down the lines with incorrect or unassigned translations.

   Format 1 reports specific information related to calls pegging the default cell group (DCG). This information can be analyzed to find the source of the problem.

   Format 2 reports when the default cell group report was terminated due to a manual request to stop the report.

   Format 3 reports when the default cell group report was terminated automatically. The report terminates automatically after producing 32 reports.

3. **VARIABLE FIELD DEFINITIONS**

   a = The directory number of the call's originator (supplied only for line originations).
   b = The dialed directory number. For trunk originations it will be the four digit line number.
   c = The number of the switching module (SM) where the call originated.
   d = The number of the SM where the call terminated.
   e = The number of the originating port in hexadecimal.
   f = The number of the terminating port in hexadecimal.
   g = The trunk group number where the call originated (supplied only for trunk originations.)
   h = The trunk group number where the call terminated (supplied only for trunk terminations.)

2. REASON FOR OUTPUT

To specify the error condition detected by the dual serial channel interconnect (DCI) driver.

Format 13 consists of up to three segments of dta giving a frequency table of job response times in intervals of one second. Each output segment consists of three lines. The first line gives the time range of the job response times for
that segment. The next two lines give the frequency distribution.

A sample output is:

```
REPT DCI 1 JOB RESP TIMES 0-15 MAX 21 SEGMENT 1 OF 2
   0:   16    0    0    0    1    0    0    0
   8:    0    0    0    0    0    1    0    0

REPT DCI 1 JOB RESP TIMES 16-31 MAX 21 SEGMENT 2 OF 2
  16:    0    0    0    0    1    0    0    0
  24:    0    0    0    0    0    0    0    0
```

Line 1 indicates that DCI 1 has some job responses between 0 and 16 (15+1) seconds, with a maximum reported response time between 21 and 22 seconds and that this is the first of two segments that will be reported. Line 2 shows the job responses received between 0-8 seconds; it indicates that there were 16 job responses received between 0 and 1 seconds and one response received between 4 and 5 seconds. Line 3 shows the job responses received between 8-16 seconds; it indicates that there was one job response received between 13 and 14 seconds.

Line 4 indicated that DCI 1 had some job responses between 16 and 32 (31+1) seconds, with a maximum reported response time between 21 and 22 seconds and that this is the second of two segments that will be reported. Line 5 shows the job responses received between 16-24 seconds; it indicates that there was one job response received between 13 and 14 seconds. Line 6 shows the job responses received between 24-32 seconds; there were no job responses received in this period.

3. VARIABLE FIELD DEFINITIONS

a = An error code or information code number. Refer to the APP:DFC-A appendix in the Appendixes section of the Output Messages manual for the meaning of error or information code.

b = Supplemental data for previous REPT:DCIDRV message, providing further information to Software developer.

c = Supplemental data for previous REPT:DCIDRV message, providing further information to Software developer.

d = DCI unit name

e = DCI unit number

f = One word completion report. It contains information like completion code, job ID (DMA job number), size of data.

g = Can be either CHAN, DBS or BIC register. For more information, refer to variable ‘h’.

h = Supplemental data for the previous message. Valid value(s):

<table>
<thead>
<tr>
<th>'i'</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHAN</td>
<td>Refer to the APP:DCI-C appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
<tr>
<td>DBS</td>
<td>Refer to the APP:DCI-D appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
<tr>
<td>BIC REGISTER</td>
<td>Refer to the APP:DCI-E appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
</tbody>
</table>

i = Fault code, in hexadecimal notation. Refer to the APP:DFC-H appendix in the Appendixes section of the Output Messages manual.

j = In case of software faults in ‘i’, it contains the program address where fault occurred.

k = One word completion report. It contains information like completion code, job ID (DMA job...
number), size of data.

1 = Bic status in hexadecimal notation. Refer to the APP:DCI-E appendix in the Appendixes section of the Output Messages manual.

m = Mask.

n = Expected value of l after being masked with l.

o = Autonomous response special completion code. Refer to the APP:DCI-B appendix in the Appendixes section of the Output Messages manual.

p = Channel number on which error occurred.

q = Can be either INFO on the channel or an ERROR on channel.

r = The unit_name of the device which received unknown message.

s = The number of message in hexadecimal notation.

t = Beginning of the time range indicator.

u = End of the time range indicator.

v = Maximum job response time to be printed.

w = Segment number of this report. Valid value(s):

1
2
3

x = Largest segment number of this report. Valid value(s):

1
2
3

y = Starting time.

z = Number of job timeouts received in the one second time period, 'y' to 'y'+1 seconds.

a^1 = Number of job timeouts received in the one second time period, 'y'+1 to 'y'+2 seconds.

b^1 = Number of job timeouts received in the one second time period, 'y'+2 to 'y'+3 seconds.

c^1 = Number of job timeouts received in the one second time period, 'y'+3 to 'y'+4 seconds.

d^1 = Number of job timeouts received in the one second time period, 'y'+4 to 'y'+5 seconds.

e^1 = Number of job timeouts received in the one second time period, 'y'+5 to 'y'+6 seconds.

f^1 = Number of job timeouts received in the one second time period, 'y'+6 to 'y'+7 seconds.

g^1 = Number of job timeouts received in the one second time period, 'y'+7 to 'y'+8 seconds.
h = Ending time.
i = Number of job timeouts received in the one second time period, 'y'+8 to 'y'+9 seconds.
j = Number of job timeouts received in the one second time period, 'y'+9 to 'y'+10 seconds.
k = Number of job timeouts received in the one second time period, 'y'+10 to 'y'+11 seconds.
l = Number of job timeouts received in the one second time period, 'y'+11 to 'y'+12 seconds.
m = Number of job timeouts received in the one second time period, 'y'+12 to 'y'+13 seconds.
n = Number of job timeouts received in the one second time period, 'y'+13 to 'y'+14 seconds.
o = Number of job timeouts received in the one second time period, 'y'+14 to 'y'+15 seconds.
p = Number of job timeouts received in the one second time period, 'y'+15 to 'y'+16 seconds.

4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

Format 13 is produced when the DCI/VDCI unit has exceeded the threshold for heartbeat timeouts and will be removed from service or if the DCI driver receives a signal (E_USR6). When it receives the signal, it also clears the accumulated job response times after printing the table. This report provides data about the distribution of DCI/VDCI job response times which are used for:
- determining the network performance and delay characteristics.
- diagnosing network problems.
- guiding the setting of appropriate heartbeat timeout ECD parameters to prevent DCI/VDCI timeouts.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Message Class: MAINT
Application: 3B
Type: Output

1. FORMAT

REPT DCIDIP ERROR a [b]

2. REASON FOR OUTPUT

To report an error condition encountered by the DCIDIP process.

3. VARIABLE FIELD DEFINITIONS

a

= Process step or reason. Valid value(s):
f00 = sendw() failed to send message to DMERT application process (DAP).
f06 = Received invalid message type.
f0c = Failed to open the equipment configuration database (ECD).
f12 = Failed to attach the ECD.
f18 = Failed to get minor device configuration table (MDCT) record for physical teletypewriter (TTY).
f1e = MDCT record identification number (RID) for physical TTY not known.
f24 = Failed to get unit control block (UCB) record.
f2a = UCB RID for physical TTY not known.
f30 = No RID in message from DCI driver.
f36 = Failed to get UCB record.
f3c = Unit not supported by DCIDIP.
f42 = Out of range DCI unit number.
f48 = Failed to get DCIOPT record.
f4e = Invalid UCB RID for DCI.
f54 = Invalid UCB RID for physical TTY.
f6a = No data in poke message.
f70 = Too many arguments in poke message.
f76 = Poke number is not supported.
f7c = Option not supported by remove TTY.
f82 = Invalid option for restore TTY.
f88 = Failed to execute craft shell.

b

= System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

This message is printed when the DCIDIP process encounters an error either during initialization or when processing a client process. If the error condition persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS
This alarm is an automatically-generated report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:DCLU-TDSRF
Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT DCLU=a-b-c TRBL DCLU SERVICE REQUEST FAILURE d
   e RECOVERY ACTION f
   [g h][i j k l m n] [o] [p]
   q r s

2. REASON FOR OUTPUT

To report a service request failure on a digital carrier line unit (DCLU) service group.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DCLU number.
c = Service group number.
d = Event number.
e = Error type. Valid value(s):
   DCLU ERROR REPORTED, NOT FOUND = A DCLU service group error was reported but none was
   found. Variables 'g' and 'h' are reported with this error type, but variables 'i' through
   'p' are not.
   IPIDB ERROR REPORTED, NOT FOUND = An internal peripheral interface data bus (PIDB) parity
   error was reported but none was found or it could not be traced to the SLC®96
   digital facility interface (SDFI) using the IPIDB time slot. An internal PIDB is the
   PIDB between the DCLU and the SDFIs. Variables 'g' and 'h' will be reported with
   this error type, while variables 'i' through 'p' may or may not be reported,
   depending on available valid information.
   SDFI SERV. REQ. REPORTED, NOT FOUND = An S-DFI service request was reported but none
   was found. These service requests are sent through the controlling service group.
   Variables 'g' through 'p' are not reported with this error type.

f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   RST PREEMPT = The failing circuit has been preempted and a diagnostic was scheduled. A
                 message will be printed with the results of the diagnostic.

   Note: Fields 'g' through 'p' are reported as hexadecimal data, where each field is a short.

g = Contents of the DCLU error source register (ESR).

h = Contents of the DCLU ESR mask.
i = PIDB 0 time slot 0 to 15 parity status. A bit set means the S-DFI using that PIDB time slot is generating bad parity.

j = PIDB 0 time slot 16 to 31 parity status, similar to 'i'.

k = PIDB 1 time slot 0 to 15 parity status, similar to 'i'.

l = PIDB 1 time slot 16 to 31 parity status, similar to 'i'.

m = DCLU service group internal circuit name.

n = PIDB number (0 or 1). That is, PIDB 0 means the first PIDB assigned to the DCLU. PIDB 1 means the optional second DCLU PIDB.

o = Internal PIDB time slot number. If the variables 'o' and 'p' are not reported, then the DCLU PIDB time slot error registers either contained invalid data or could not be read.

p = SDFI select value assigned to the internal PIDB timeslot; this number is expected to be an illegal value, for example, equal to F or $\leq 1F$ (hexadecimal). If variable 'p' = FF (hexadecimal), then that internal PIDB timeslot was idle when the DCLU timeslot select register was not read. If the 'p' variable is not reported (but the 'o' variable is reported), the DCLU timeslot select register could not be read.

q = External circuit name for the implicated circuit.

r = Current decimal number of recent failures of this type recorded.

s = Decimal error count threshold for this type of error on this circuit, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

No action is necessary if the recovery action is ANALYSIS ONLY.

If the DCLU reaches its threshold such that it is removed and restored several times, the DCLU packs should be replaced, regardless of the diagnostic results.

If replacing the DCLU packs does not clear up the problem and the error type is IPIDB ERROR REPORTED, NOT FOUND or SDFI SERV. REQ. REPORTED, NOT FOUND, most likely one or more of the SDFI packs is at fault and should then be replaced one by one until the problem is cleared.

5. ALARMS

None.

6. REFERENCES

Output Message(s):

REPT:DCLU-TIPPE
REPT:SDFI-TIPP
REPT:DCLU-TIPPE
Software Release: 5E14 and later
Message Class: PFR_MON

Type: Output

1. FORMAT

REPT DCLU=a-b-c TRBL INTERNAL PIDB PARITY ERROR d
   INTERNAL PIDB PARITY ERROR RECOVERY ACTION e
   f g h i j k l m n o p q r s t u
   v
   w x y

2. REASON FOR OUTPUT

To indicate that a parity error has occurred on an internal peripheral interface data bus (PIDB), which is between the digital carrier line unit (DCLU) service group and a SLC® 96 digital facility interface (S-DFI).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DCLU number.
c = Service group number.
d = Event number.
e = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   RST PREEMPT = The failing circuit has been preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

Note: Fields 'f' through 'v' are reported as hexadecimal data, where each field is a short (4 digits).

f = Contents of the DCLU error source register (ESR).
g = Contents of the DCLU ESR mask.
h = PIDB 0 time slot 0 to 15 parity status. A bit set means the S-DFI using the PIDB time slot is generating bad parity.
i = PIDB 0 time slot 16 to 31 parity status, similar to 'h'.
j = PIDB 1 time slot 0 to 15 parity status, similar to 'h'.
k = PIDB 1 time slot 16 to 31 parity status, similar to 'h'.
l = DCLU service group internal circuit name.
m = PIDB (0 or 1). That is, PIDB 0 is the first PIDB assigned to the DCLU. PIDB 1 means the optional second DCLU PIDB.
n = Internal PIDB time slot number.
o = S-DFI select value assigned to the internal PIDB time slot.
p = Internal circuit name of the S-DFI assigned to the internal PIDB time slot.
q = Internal circuit name of the port connected to the internal PIDB time slot. Equal to zero if no port was connected to the time slot.
r = Logical port type of the port connected to the internal PIDB time slot. Equal to zero if no port was connected to the time slot or if the port information could not be accessed.
s = Service class of the port connected to the internal PIDB time slot. Equal to FFFF (hexadecimal) if no port was connected to the time slot or if the port information could not be accessed.
t = Contents of the entry for the internal PIDB time slot in the receive control (RC) random access memory (RAM) of the S-DFI time slot interchanger (TSI). Equal to FFFF (hexadecimal) if the RAM could not be accessed.
u = Contents of the entry for the T1 time slot in the transmit control (XC) RAM in the S-DFI TSI. Equal to FFFF (hexadecimal) if the RAM could not be accessed.
v = S-DFI select value for the same time slot on the other PIDB assigned to the DCLU service group. Equal to FFFF (hexadecimal) if the select value was not the same as the select value in field 'o'.
w = External circuit name for the implicated circuit.
x = Current decimal number of recent failures of this type recorded for this circuit.
y = Decimal error count threshold for this type of error on this circuit, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

No action is necessary if the recovery action is ANALYSIS ONLY.

If the DCLU reaches its threshold such that it is removed and restored several times, the DCLU packs should be replaced, regardless of the diagnostic results.

3. **VARIABLE FIELD DEFINITIONS**

   a = Switching module (SM) number.
   b = DCLU number.
   c = Service group number.
   d = Event number.
   e = Error type. Valid value(s):
      PIDB 0 PARITY TROUBLE = TSI parity errors detected on PIDB 0 of the DCLU service group.
      PIDB 1 PARITY TROUBLE = TSI parity errors detected on PIDB 1 of the DCLU service group.
      PIDB 0 AND 1 PARITY TROUBLE = TSI parity errors detected on both PIDB 0 and PIDB 1 of the DCLU service group.
   f = Recovery action. Valid value(s):
      ANALYSIS ONLY = A post mortem report is generated.
      ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
      RST PREEMPT = The failing circuit has been preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
   g = External logical circuit name.
   h = The number of parity errors in this frame. There may be two lines of data here. If there are, the first line is for errors on PIDB0 and the second line is for errors on PIDB1.
   i = The current count of parity errors against this PIDB.
   j = Error count threshold, above which the recovery action will be taken.

4. **ACTION TO BE TAKEN**

   None.
5. ALARMS

None.

6. REFERENCES

Input/Output Messages:

None.
1. **FORMAT**

   REPT DCLU=a-b-c TRBL SP FAILURE EVENT=d
   SP FIFO OVERFLOW FAILURE RECOVERY ACTION e
   f g
   h i j

2. **REASON FOR OUTPUT**

   To respond to a signal processor (SP) interrupt, caused by the SP first-in first-out (FIFO) overflowing, due to a showering SLC® port.

3. **VARIABLE FIELD DEFINITIONS**

   a = Switching module (SM) number.

   b = Digital carrier line unit (DCLU) number.

   c = Service group number.

   d = Event number.

   e = Recovery action. Valid value(s):
      ANALYSIS ONLY = A postmortem report is generated.
      RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

   f = Internal timeslot number.

   g = Number of entries in the SP FIFO for this circuit.

   h = External logical circuit name.

   i = Decimal number of failures of this type that occurred in the last five minutes.

   j = Error count threshold, above which the recovery action will be escalated.

4. **ACTION TO BE TAKEN**

   None.

   Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:DCLU and RST:DCLU messages indicate success or failure of diagnostic when recovery action (variable 'e') is RST PREEMPT.

5. **ALARMS**

REPT:DCTUCOM-TDM

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT DCTUCOM=a-b TRBL DCTU MESSAGE c
d RECOVERY ACTION e
     DCTUCOM=a-b f g

2. REASON FOR OUTPUT

To respond to a trouble message sent by the directly connected test unit (DCTU) in regard to the DCTU common board. The DCTU common board detected a problem internally and sent a message to indicate the nature of the trouble.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Directly connected test unit number.
c = Event number.
d = Error type. Valid value(s):
  DCTU PROTOCOL FAILURE = A failure occurred in the communication protocol between the DCTU and the switching module.
  EQUIP ERR THRESHOLD FAILURE = A DCTU circuit has exceeded its internal error threshold.
  RESET MESSAGE = The DCTU common board or PMU reset internally.
  TEST FAILURE = An operational test failed while using the DCTU common board.
  TRAP MESSAGE = The DCTU common board or PMU microprocessor trapped.
e = Recovery action. Valid value(s):
  ANALYSIS ONLY = A post mortem report is generated.
  RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
  RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

f = Current decimal number of recent failures of this type recorded.
g = Error count threshold, at which the recovery action will be escalated.

4. ACTION TO BE TAKEN

No action required. Fault recovery automatically requests a conditional restoration of the circuit when the error
threshold is met. Subsequent DGN:DCTUCOM and RST:DCTUCOM messages indicate success or failure of diagnostic when recovery action is RST AUTO CAMPON or RST PREEMPT.

5. ALARMS

   RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

g = External logical circuit name. Two circuits may be listed with this report if both could be the cause of the trouble.
h = Current decimal number of recent failures of this type recorded.
i = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

None.
5. ALARMS
None.

6. REFERENCES

Input/Output Messages:
None.
REPT:DCTUPORT-TDM
Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT DCTUPORT=a-b-c TRBL DCTU MESSAGE d e RECOVERY ACTION f [g h i]

2. REASON FOR OUTPUT

To report a spurious trouble message sent by the directly connected test unit (DCTU) in regard to a DCTU port circuit. The common board detected a problem and sent a message to indicate the nature of the trouble.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Directly connected test unit number.
c = DCTU port number.
d = Event number.
e = Error type. Valid value(s):
   - EQUIPMENT ERROR THRESHOLD EXCEEDED = A DCTU port circuit exceeded its internal error threshold.
   - TEST FAILURE = An operational test failed while using this DCTU port.
f = Recovery action. Valid value(s):
   - ANALYSIS ONLY = A post mortem report is generated.
   - RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
   - RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

h = External logical circuit name. More than one circuit may be listed when multiple circuits can be blamed for the trouble.
i = Current decimal number of recent failures of this type recorded.
i = Error count threshold, at which the recovery action will be escalated.

4. ACTION TO BE TAKEN

No action required. Fault recovery automatically requests a conditional restore on the circuit when the error
threshold is met. Subsequent DGN:DCTU PORT and RST:DCTU PORT messages indicate success or failure of diagnostic when recovery action is RST AUTOCAMPON or RST PREEMPT.

5. ALARMS

None.

RST:DCTUPORT

Output Message(s):

DGN:DCTUPORT
RST:DCTUPORT
REPT:DEBUG

Software Release: 5E14 and later
Message Class: DEBUG
Application: 5
Type: Output

1. FORMAT

REPT DEBUG: a b
[c]

2. REASON FOR OUTPUT

To report that a debugging trap was entered.

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>a</th>
<th>= Filename of the debugging trap.</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>= Line number of the debugging trap.</td>
</tr>
<tr>
<td>c</td>
<td>= Developer-defined data.</td>
</tr>
</tbody>
</table>

4. ACTION TO BE TAKEN

If system personnel are on site, notify them of this output. If not, use recent change/verify (RC/V) to change the equipment configuration database (ECD) to suppress the printing of this message class.

REPT:DEF-CHK-FAIL

Software Release: 5E14 and later
Message Class: IOC,INT
Application: 5
Type: Output

1. FORMAT

REPT {AM|SM=a|CMP=b-c d|MCTSI=a-b d|QGP=b-e} DEF-CHK-FAIL MESSAGE SUMMARY
AUTOMATIC DCF MESSAGE BREVITY CONTROL=f
DEF-CHK-FAIL CODE : NUMBER OF OCCURRENCES : DISCARDED
                          g                   h                              i
[j]

2. REASON FOR OUTPUT

To summarize the status of the assert messages printed during an unspecified interval. The initialization (INT) message class is used when the message is printed as the result of a manual request. The off-normal (IOC) message class is used at all other times.

3. VARIABLE FIELD DEFINITIONS

AM = Administrative module.
CMP = Communication module processor.
MCTSI = Module controller/time slot interchange unit.
QGP = Quad-link gateway processor.
SM = Switching module.
a = SM number.
b = Message switch side (MSGS) or MCTSI side.
c = Physical CMP number.
d = Processor being reported on. Valid value(s):
   MATE = Mate CMP.
   MH0 = Message handler 0.
   MH1 = Message handler 1.
   MH2 = Message handler 2.
   PRIM = Primary CMP.
e = QGP number.
f = Brevity control. Valid value(s):
   INHIBITED = System will not abbreviate the amount of defensive check failure (DCF) printout.
   ON = System will abbreviate the amount of DCF printout.
g = DCF error code.
h = Number of occurrences of the error code.

i = Number of occurrences of the specified error code that have been discarded.
Note: This number, when added to the number of occurrences that printed on the receive-only printer (ROP) or were written on the log file, may not equal the total number of occurrences (variable 'h'). This discrepancy may occur during overload, initialization, or if the communication links are down.

j = Error message. Valid value(s):
DCF MESSAGE OVERFLOW = More codes occurred than could be printed in this report.

4. ACTION TO BE TAKEN
Look up DCF error code in the Asserts manual, and then take corrective action.

5. ALARMS
None.

2. REASON FOR OUTPUT
To report the occurrence of a defensive check failure (assert) in the module controller/time slot interchanger packet interface (MCTSIPI). The message prints only when the printmode is turned on. The message is stored in a buffer and can be printed on request (OP:HISTORY).

3. VARIABLE FIELD DEFINITIONS
a = Assert error code.
b = Switching module (SM) number.
c = Unit number.
d = Event number.
e = MCTSIPI side number in which the event occurred.
f = PSU community address.
g = Active packet bus.
h = Process number
i = Message number.
j = Time of the day the assert occurred, in the form hour:minute.
k = Date the assert occurred, in the form month/day/year.
l = Stimulus of recovery action. Refer to the APP:RCVRY-ACTION appendix in the Appendixes section of the Output Messages manual for a list of recovery action stimulus and their definitions.
m = Recovery action that occurred. Valid value(s):
   FI = Full initialization.
   NONE = No recovery action.
   PRINT = Report only; no escalation.
PSI = Autonomous PS initialization.
RPI = Return to point of interrupt.
SI  = Selective initialization.
SPP = Single process purge.

n = Name of the audits scheduled to clean up after the single process purge. Valid value(s):
  ALCB = The access line control block was scheduled.
  ALDB = The access line data block was scheduled.
  BD   = The buffer descriptor was scheduled.
  DCCB = The D-channel control block was scheduled.
  DCDB = The D-channel data block was scheduled.
  IFD  = The internal frame descriptors was scheduled.
  L2TL = The level 2 timing list was scheduled.
  L3TE = The level 3 timing element was scheduled.
  L3TL = The level 3 timing list was scheduled.
  LCCB = The logical channel control block was scheduled.
  LLCB = The logical link control block was scheduled.
  PSHC = The packet switch head cell was scheduled.
  PVC  = The permanent virtual circuit was scheduled.
  RFD  = The receive frame descriptor was scheduled.
  TFD  = The transmit frame descriptor was scheduled.

o = Failing address where event occurred.

p = Port processor mode. Valid value(s):
  CONSISTENT  = Hardware and software are consistent.
  ESSENTIAL   = Essential jobs operational.
  NORMAL      = Normal operational mode.
  OFFULL      = All jobs operational.
  POST_RCVY   = Post recovery.
  RAMDYN      = Dynamic memory consistent.
  RAMTXT      = Read access memory text consistent.
  RAMWP       = Text and data consistent.
  SW-RCVY     = Software recovery.
  SYSPROC     = System processes operational.
  UNKNOWN     = Unknown source.

q = Assert count (number of nested ASSERTS).

r = Stack trace (up to twelve addresses). (Technical assistance may be required to interpret this field).

s = Image type in the PI at the time of the assert. Valid value(s):
  ERROR IMAGE  = The image contained an error.
  NULL IMAGE   = No image was loaded.
  PI IMAGE     = Image used for PI was loaded.
  PI2 IMAGE    = Image used for PI2 was loaded.
4. ACTIONS TO BE TAKEN

Look up assert error code in the Asserts Manual and take corrective action. If the error code is not listed in the this manual, technical assistance is required.

REPT:DEGROWTH
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT DEGROWTH a b c [ d ]

2. REASON FOR OUTPUT

To indicate that a unit has been dynamically degrown by a user.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.
b = Unit number.
c = Status of report. Valid value(s):
   COMPLETED
   FAILED
   IN PROGRESS

d = Gives the reason for failure. For an IOP unit, refer to the APP:IOP-J appendix in the Appendixes section of the Output Messages manual for an explanation of the error code.

   For a DFC unit refer to the APP:DFC-A appendix in the Appendixes section of the Output Messages manual for an explanation of the error code.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If &quot;c&quot; =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPLETED or IN PROGRESS</td>
<td>No action is needed.</td>
</tr>
<tr>
<td>FAILED</td>
<td>Check the error code to determine action.</td>
</tr>
</tbody>
</table>

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

6. REFERENCES

OMDB Key(s):

   APP:IOP-J
   APP:OMDB-X-REF
REPT:DFC-AUTO

Software Release: 5E14 and later
Message Class: DSKSYS
Application: 5,3B
Type: Output

1. FORMAT

REPT DFC a AUTO PUMP b

2. REASON FOR OUTPUT

To report the result of disk driver (DKDRV) automatically downloading the pumpcode to the disk file controller (DFC).

3. VARIABLE FIELD DEFINITIONS

a = Member number of the DFC.
b = Pump status. Valid value(s):
   ABORTED
   COMPLETED = All directives of the input request were done and no failures were encountered.
   IN PROGRESS
   INHIBITED = The DKDRV will not try to initiate any more pumpcode downloading on this DFC.
   The DFC pump has to be manually requested.
   NOT STARTED
   STARTED

4. ACTIONS TO BE TAKEN

There is no fixed priority of action.

If a termination report specifies that the pump could not be completed, refer to the DKDRV's error messages to determine the reason of the failure. If the problem is caused by the resource limitation, the limitation should be cleared so that the pump can be successfully completed when DKDRV retries.

5. ALARMS

The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Output Appendix(es):

APP: OMDB-X-REF
REPT:DFC-ERROR

Software Release: 5E14 and later
Message Class: DSKSYS
Application: 5,3B
Type: Output

1. FORMAT

REPT DFC a ERROR b

2. REASON FOR OUTPUT

To specify the error condition detected by the disk file controller (DFC).

3. VARIABLE FIELD DEFINITIONS

a = Unit number.
b = Error message. Valid value(s):

   COMPLETION CODE c DEVICE STATUS d
   DEVICE STATUS d
   CHAN STATUS e
   DBS STATUS f
   BIC REGISTER STATUS g
   STATUS g MASK h EXP i
   DATA j

c = Command completion status word in hexadecimal notation. The completion word is eight hexadecimal digits of the form: pqqqrstt.
d = Device status, in hexadecimal notation. Refer to the APP:DFC-C appendix in the Appendixes section of the Output Messages manual.
e = Channel status, in hexadecimal notation. Refer to the APP:DFC-D appendix in the Appendixes section of the Output Messages manual.
f = Bus selector status, in hexadecimal notation. Refer to the APP:DFC-E appendix in the Appendixes section of the Output Messages manual.
g = BIC status, in hexadecimal notation. Refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.
g = Mask.
i = Expected value of ‘f’ after being masked with ‘g’.
j = Supplemental data for a previous REPT:DKDRV output message.

4. ACTIONS TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.
There is no alarm for an automatically-generated report.

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:DFC-PUMP
Software Release: 5E14 and later
Message Class: DSKSYS
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT DFC a AUTO PUMP NOT STARTED
[2] REPT DFC a AUTO PUMP STARTED
[3] REPT DFC a AUTO PUMP IN PROGRESS
[4] REPT DFC a AUTO PUMP ABORTED
[5] REPT DFC a AUTO PUMP COMPLETED
[6] REPT DFC a AUTO PUMP INHIBITED
[7] REPT DFC a PUMPCODE REMOVED

2. REASON FOR OUTPUT

To report the result of disk driver (DKDRV) automatically downloading the pumpcode to the disk file controller (DFC) or the removal of the pumpcode from the small computer system interface (SCSI) host adaptor (HA).

3. VARIABLE FIELD DEFINITIONS

a = Member number of the DFC.

4. ACTION TO BE TAKEN

If a termination report specifies that the pump could not be completed, refer to the DKDRV’s error messages to determine the reason of the failure. If the problem is caused by the resource limitation, the limitation should be cleared so that the pump can be successfully completed when DKDRV retries. A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Format 6 indicates that the DKDRV will not try to initiate any more pumpcode downloading on this DFC. The DFC pump has to be manually requested.

Format 7 informs the user that the pumpcode has been removed from the SCSI HA and the SCSI DFC is running with the operational firmware. This occurred because the SCSI DFC was having operational problem(s) with the running pumpcode. The pumpcode residing on disk should be verified and redownloaded manually.

5. ALARMS
There is no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

    JOB_BCNT c l JOB_PA d l SEG_SZ e l

2. REASON FOR OUTPUT

To specify the error condition detected by the disk file controller (DFC).

3. VARIABLE FIELD DEFINITIONS
= Unit number.

b = Command completion status word in hexadecimal notation. The completion word is eight hexadecimal digits of the form: ppqqrqtt.

c = Device status, in hexadecimal notation. Refer to the APP:DFC-C appendix in the Appendixes section of the Output Messages manual.

d = Channel status, in hexadecimal notation. Refer to the APP:DFC-D appendix in the Appendixes section of the Output Messages manual.

e = Bus selector status, in hexadecimal notation. Refer to the APP:DFC-E appendix in the Appendixes section of the Output Messages manual.

f = BIC status, in hexadecimal notation. Refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.

g = Mask.

h = Expected value of 'f' after being masked with 'g'.

i = Supplemental data for a previous REPT:DKDRV output message.

j = Fault code, in hexadecimal notation. Refer to the APP:DFC-I appendix in the Appendixes section of the Output Messages manual.

k = First word of an unidentifiable completion report. This would normally be the completion word.

l = Second word of an unidentifiable completion report. This would normally be the device status word.

m = Autonomous response special completion code (eight hexadecimal digits). The explanation of the hexadecimal digits is the same as the completion code described previously for variable 'b'. The 'y' hexadecimal digit provides the reason for the autonomous response. Refer to the Autonomous Response Special Completion Code exhibit in the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

o = The small computer system interface (SCSI) host adapter (HA) shadow register status, in hexadecimal notation. Refer to the APP:DFC-P appendix in the Appendixes section of the Output Messages manual.

p = Command completion code. Refer to the DFC Error Codes and the Conditional Success Codes exhibits in the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

q = Number of blocks read or written.

r = Device identification (ID) number.

s = Special completion code; valid only when 'tt' is 00. Refer to the Autonomous Response Special Completion Code exhibit in the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

t = DMA job number (job ID).

s = Information code. Refer to the APP:DFC-A appendix in the Appendixes section of the Output
Messages manual.

\( u \) = DMA job ID number.

\( v \) = Job ID in use indicator. \( Y \) indicates valid job ID.

\( w \) = Message buffer indicator. Valid value(s):

\( N \) = A message buffer was not found and fields \( 'x' \) through \( 'b' \) are not valid.

\( Y \) = A message buffer was found and fields \( 'x' \) through \( 'b' \) are from the message buffer.

\( x \) = Process ID of the process requesting I/O.

\( y \) = Utility ID of the process requesting I/O.

\( z \) = Page table address of I/O memory segment provided by the client.

\( a \) = Offset into the memory segment.

\( b \) = Number of bytes requested by the client for I/O transfer.

\( c \) = Page table address of I/O memory segment used by the driver.

\( d \) = Number of bytes used by the driver for I/O transfer.

\( e \) = Client's I/O memory segment size.

4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

5. ALARMS

There is no alarm for an automatically-generated report.

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Note: There may be from 1 to 16 fields in segment 9.

Values for non-autonomous completion codes are:
X'10000 = Successful completion code.
X'04000 = Verify completed. Errors detected, however.
X'8100 = Peripheral interface controller (PIC) random access memory (RAM) boundary error.
X'8300 = "Seek" error on disk.
X'8500 = No index detected on disk.
X'8900 = MHD status error.
X'8B00 = Uncorrectable data error.
X'8D00 = Disk boundary overflow.
X'8F00 = Head-sector mismatch error.
X'9100 = Wrong disk selected.
X'9300 = No disk selected.
X'9500 = Head positioning error.
X'9700 = Head selection error.
X'9900 = Bus interface controller (BIC) parity error.
X'9B00 = BIC-PIC soft error.
X'9D00 = PIC error.
X'9F00 = DMA setup overwrite.
X'A100 = Early end of tape (EOT) from DMA.
X'A300 = No EOT from DMA.
X'A700 = Parallel serial data interface (PSDI) first-in, first-out (FIFO) parity error.
X'A900 = PSDI FIFO underflow error.
X'AB00 = PSDI FIFO overflow error.
X'AD00 = PSDI acknowledge failure.
X'AF00 = Extra data in PSDI FIFO.
X'B100 = Disk data buffer error.
X'B300 = Main store address error.
X'B500 = Disk time out error.
X'B700 = DMA time out error.
X'B900 = Uncorrectable data error in manufacturer (MFGR) defect table.
X'BF00 = Defect table overflow.
X'BF00 = Command for defective disk.
X'C100 = Unable to create our defect table on the disk.
X'C300 = MFGR specified more than the maximum number of defects allowed.
X'C500 = Uncorrectable data error on area that is guaranteed to be error free.
X'C700 = Invalid data in defect table.
X'C900 = Invalid data in RAM.
X'CB00 = Invalid manufacturer defect table.
X'CD00 = Uncorrectable data error in defect table.
X'CF00 = Unable to read defect table.
X'E100 = Bad version information in pump file.
X'E500 = Pump timeout.
X'D100 = Unable to read MFGR's defect table.
X'D300 = Unable to write defect table on the disk.
X'D500 = ramreg has incorrect value.
X'D700 = Uncorrectable data error and read temp list failed.
X'D900 = Uncorrectable data error and temp list overflow.
X'DA00 = Uncorrectable data error and the attempt to write the temp list failed.

f = Error code status flag. Valid value(s):
X'0 = Instrumentation data has not been saved.
X'4 = Instrumentation data has been saved.

X'056  = Head/sector mismatch (expected != read).
X'057  = Physical address not updated in time.
X'058  = PSDI FIFO time-out (first address word).
X'059  = PSDI FIFO time-out (second address word).
X'05A  = PSDI FIFO time-out (reading data).
X'05B  = PSDI status error during read.
X'05C  = Read gate turn off time out.
X'05D  = Data buffer pointer error (diff> size).
X'05E  = Missed an error correction circuit (ECC) interrupt.
X'05F  = Uncorrectable data error.
X'060  = ECC/Addr buffer full.
X'061  = Address update done too late (during write).
X'062  = Data buffer pointer error (diff> size).
X'063  = No disk acknowledgment received.
X'064  = Multiple disk responded (first select).
X'065  = Wrong or multiple disks responded.
X'066  = Can't clear drive fault.
X'067  = "Seek" error in disk status set.
X'068  = "Seek" did not start.
X'069  = PSDI did not start during a read.
X'06A  = PSDI did not start during a write.
X'06B  = "Seek" time-out (detected by skcylnd).
X'06C  = Sector/index interrupt time-out (read).
X'06D  = Sector/index interrupt time-out (write).
X'06E  = "Seek" error on new cylinder.
X'06F  = Index time out on new cylinder.
X'070  = PSDI FIFO error during write.
X'071  = PSDI FIFO unload time before head select.
X'072  = Job start sector/index interrupt time out.
X'073  = Time-out waiting for ECC (new cylinder).
X'074 = Time-out waiting for write to go off.
X'075 = Uncorrectable data error during verify.
X'076 = Address mismatch failure during verify.
X'077 = Disk access job aborted due to DMA error.
X'078 = "Seek" error detected by select routine.
X'079 = Drive fault during write operation.

h

= Status flags. Bit field definitions are:
X'01 = Multiple drives responded.
X'02 = Wrong drive responded.
X'04 = No drive responded.
X'08 = Cannot clear drive fault.
X'10 = "Seek" error set when drive was selected.
X'20 = Cannot make selected drive "ready."
X'40 = Fatal error during drive select.
X'80 = Some kind of drive select error occurred.

i

= Disk status register. Bit field definitions are:
X'01 = Heads have not been loaded.
X'02 = On cylinder.
X'04 = Unit ready.
X'08 = High temperature warning.
X'10 = "Seek" error.
X'20 = Fault flag.
X'40 = Sector mark flag.
X'80 = Index mark flag.

If the disk status register subfield contains the value FF, then the disk register subfield should be ignored.

j

= Command completion code. Values for autonomous completion codes are:
X'0000 = Instrumentation data.
X'0100 = Diagnostic failure.
X'0200 = MHD exerciser failure.
X'0300 = sysgen response.
X'0400 = Boot complete response.
X'0500 = DFC idle response.
X'0600 = Illegal message/parameters.
X'0700 = High temperature.
X'0800 = Not used.

Values for non-autonomous completion codes are:
X'0000 = Successful completion code.
X'0400 = Verify completed. Errors detected, however.
X'8100 = PIC RAM boundary error.
X'8300 = "Seek" error on disk.
X'8500 = No index detected on disk.
X'8900 = MHD status error.
X'8B00 = Uncorrectable data error.

**k**

- Error code status flag. Valid value(s):
  - X'0': Instrumentation data has not been saved.
  - X'4': Instrumentation data has been saved.
  - X'8': Autonomous response.
  - X'C': Autonomous response with instrumentation data saved.

**l**

- Internal DFC error code. Valid value(s):
  - X'001': REX verify not inserted.
  - X'002': DGN drive number out of range.
X'003 = Defect table read not inserted.
X'004 = Read not inserted.
X'005 = "Seek" not inserted.
X'006 = Verify not inserted.
X'007 = Write not inserted.
X'008 = DFC online when DGN requested.
X'009 = MHD online when DGN requested.
X'00A = Run on board over run.
X'00B = Invalid DGN message pointer.
X'00C = Invalid system requested DGN message.
X'00D = Invalid routine exercise message.
X'00E = Invalid DGN message type.
X'00F = No subroutine requested by diagnostic.
X'010 = Invalid put response table pointer.
X'011 = putrsp in wrong state.
X'012 = RAM board failure.
X'013 = No response from RAM board.
X'014 = Invalid divide masks detected by axlate.
X'015 = Invalid current state for putrsp.
X'016 = Invalid return code for oncyldp.
X'017 = Invalid return code from skcylnd.
X'018 = Invalid return code from skcylnd.
X'019 = Invalid return code from skcylnd.
X'01A = Invalid data in DTSTAT0.
X'01B = Invalid return code from skcylnd
X'01C = Invalid input to dtsetp.
X'01D = schdlr detected invalid DFC state.
X'01E = Error detected by dtsetp.
X'01F = Read RAM boundary error.
X'020 = Write RAM boundary error.
X'021 = Attempt to cmsmhd when DFC offline.
X'022 = Attempt to cmsmhd to online-unit not ready.
X'023 = Select drive in priority sel/rel failed.
X'024 = Unit not ready - priority release.
X'025 = Unclearable fault - priority release.
X'026 = Defect table not in memory (dfctmg).
X'027 = Disk maximum address exceeded - axlate.
X'028 = No end code in RAM defect table (dfctmg).
X'029 = Bad cylinder translation (dfctmg).
X'02A = Bad sector for MFGR head (dmngmt).
X'02B = Bad sector for TEMP head (dmngmt).
X'02C = Bad head for copy request (dmngmt).
X'02D = Bad dtstat0 options (dmngmt).
X'02E = Update defect table write failed (dmngmt).
X'02F = TEMP defect table write failed (dmngmt).
X'030 = Not defect management job (dmngmt).
X'031 = No defects for this drive (cpyupd).
X'032 = max head exceeded in MFGR table (cpyupd).
X'033 = Maximum cylinder exceeded in MFGR table (cpyupd).
X'034 = Maximum sector exceeded in MFGR table (cpyupd).
X'035 = No end code for MFGR defect table (cpyupd).
X'036 = Bad defects order in MFGR table (cpyupd).
X'037 = No end code for TEMP defect table (cpytmp).
X'039 = Bad TEMP defect table start code (cpytmp).
X'03B = No end code for COMB defect table (prcdfj).
X'03C = Defect hash code does not match (prcdfj).
X'03D = Bad COMB defect table start code (prcdfj).
X'03E = Read defect table failed (drdchk).
X'03F = Bad version information in pump data.
X'050 = Missing routine.
X'051 = Time-out no sector/index intr in 600 us.
X'052 = On-cylinder could not select disk.
X'053 = On-cylinder detected "seek" time-out.
X'054 = Maximum cylinder number exceeded.
X'055 = Cylinder mismatch (expected != read).
X'056 = Head/sector mismatch (expected != read).
X'057 = Physical address not updated in time.
X'058 = PSDI FIFO time-out (first address word).
X'059 = PSDI FIFO time-out (second address word).
X'05A = PSDI FIFO time-out (reading data).
X'05B = PSDI status error during read.
X'05C = Read gate turn off time out.
X'05D = Data buffer pointer error (diff < size).
X'05E = Missed an ECC interrupt.
X'05F = Uncorrectable data error.
X'060 = ECC/Addr buffer full.
X'061 = Address update done too late (during write).
X'062 = Data buffer pointer error (diff < size).
X'063 = No disk acknowledgement received.
X'064 = Multiple disk responded (first select).
X'065 = Wrong or multiple disks responded.
X'066 = Can't clear drive fault.
X'067 = "Seek" error in disk status set.
X'068 = "Seek" did not start.
X'069 = PSDI did not start during a read.
X'06A = PSDI did not start during a write.
X'06B = "Seek" time-out (detected by skcyln).
X'06C = Sector/index interrupt time-out (read).
X'06D = Sector/index interrupt time-out (write).
X'06E = "Seek" error on new cylinder.
X'06F = Index time out on new cylinder.
X'070 = PSDI FIFO error during write.
X'071 = PSDI FIFO unload time before head select.
X'072 = Job start sector/index interrupt time out.
X'073 = Time-out waiting for ECC (new cylinder).
X'074 = Time-out waiting for write to go off.
X'075 = Uncorrectable data error during verify.
X'076 = Address mismatch failure during verify.
X'077 = Disk address job aborted due to DMA error.
X'078 = "Seek" error detected by select routine.
X'079 = Drive fault during write operation.
### Status flags

- **X'01**: Multiple drives responded.
- **X'02**: Wrong drive responded.
- **X'04**: No drive responded.
- **X'08**: Cannot clear drive fault.
- **X'10**: "Seek" error set when drive was selected.
- **X'20**: Cannot make selected drive "ready."
- **X'40**: Fatal error during drive select.
- **X'80**: Some kind of drive select error occurred.

### Disk status register

- **X'01**: Heads have not been loaded.
- **X'02**: On cylinder.
- **X'04**: Unit ready.
- **X'08**: High temperature warning.
- **X'10**: "Seek" error.
- **X'20**: Fault flag.
- **X'40**: Sector mark flag.
- **X'80**: Index mark flag.

If the disk status register subfield contains the value FF, then the disk status register subfield should be ignored.

### Data flags

- **X'8000**: Defect table in memory flag (1-in, 0-out).
- **X'4000**: Routine exerciser (REX) allowed flag (1-alw, 0-inh).
- **X'2000**: Drive in-service indicator (1-out, 0-in).
- **X'1000**: Optimization bit (1-on).
- **X'0800**: Uncorrectable data error.
- **X'0400**: Defect management update write job.

### Drive table status word 0

- **X'8000**: Disk access required flag.
- **X'4000**: "Seek" only message flag.
- **X'2000**: Non-disk access message present flag.
- **X'1000**: Defect table setup only. No disk access.
- **X'0800**: "Seek" required flag.
- **X'0400**: Call to dtsetp required.
- **X'0200**: "Seek" pending flag.
- **X'0100**: Do not enter defect management if set [for diagnose (DGN)].
- **X'0080**: No work.

### Drive table status word 1

- **X'8000**: Go indication flag.
- **X'4000**: Not used.
- **X'2000**: Direct memory access (DMA) operation completed successfully.
- **X'1000**: DMA operation detected error.
- **X'0800**: Marker read flag.
- **X'0400**: Boot request active flag.
Segment break flag.
Enable segment breaks.
0-read, boot, verify, 1-write, initialize.
Verify message flag.
Initialization message flag.
No marker read-wait for index flag.
DMA required flag.
Address mismatch flag (read only).
Write gate off flag (write only).
Skip defect management check.
First sector flag for read.

= ID plug number.
= Completion and enhanced error codes.

This field consists of three subfields: the completion code, the error code status flag, and the internal DFC error code.

The meaning of completion code subfield value is found in one of two completion code lists. The list to reference is determined by the value in the error code status flag subfield. If the error code status flag value indicates an autonomous response, then reference the autonomous completion code list; otherwise, reference the non-autonomous completion code list.

The completion and enhanced error code field is eight hexadecimal digits in the form: eeeefggg.

= Disk status register and flags.

This field consists of two subfields, the status flags and the disk status register in the form: hhii.

= Starting cylinder of current job.
= Starting head of current job.
= Starting sector of current job.
= Not used.
= Current cylinder.
= Current head.
= Current DFC related message.
= Previous DFC related message.
= DFC copy of response queue load pointer.

= Version number of the DFC firmware. Layout of version words from left to right are:
4 bits = DFC generic number.
6 bits = DFC issue number.
6 bits = DFC point issue number.
e¹ = Tens digit of DFC EDI.
f¹ = Units digit of DFC EDI.
g¹ = ASCII letter of DFC EDI.
h¹ = DFC code (FFFO).
i¹ = Internal list pointers.
j¹ = Current sector.
k¹ = Number of sectors in current job.
l¹ = Current DFC state. Values the "cstate" may assume are:
  X'0001 = Initial state after a reset.
  X'0002 = Firmware initialization state.
  X'0004 = Normal operating state in the asynchronous mode.
  X'0008 = Normal operating state in the synchronous mode.
  X'0010 = Sleep state in the synchronous mode.
  X'0020 = Sleep state in the asynchronous mode.
  X'0040 = Job completion state in the initialization mode.
  X'0080 = Job completion state in the synchronous mode.
  X'0100 = Job failure state in the asynchronous mode.
  X'FE00 = Invalid state mask.

m¹ = Data flags. Bit field definitions for "dflags" word are:
  X'8000 = Defect table in memory flag (1-in, 0-out).
  X'4000 = REX allowed flag (1-alw, 0-inh).
  X'2000 = Drive in-service indicator (1-out, 0-in).
  X'1000 = Optimization bit (1-on).
  X'0800 = Uncorrectable data error.
  X'0400 = Defect management update write job.

n¹ = Pointer to drive table of currently active drive.

o¹ = Completion and enhanced error codes.

This field consists of three subfields: the completion code, the error code status flag, and the internal DFC error code.

The meaning of the completion code subfield value is found in one of two completion code lists. The list to reference is determined by the value in the error code status flag subfield. If the error code status flag value indicates an autonomous response, then reference the autonomous completion code list; otherwise reference the non-autonomous completion code list.

The completion and enhanced error code field is 8 hexadecimal digits of the form: jjjjklll.

p¹ = Size of disk data buffer (16-bit words).

q¹ = Initialization pattern.

r¹ = Routine trace buffer.
Drive table status word 0. Bit field definitions for "dtstat word 0" are:

- X'8000 = Disk access required flag.
- X'4000 = "Seek" only message flag.
- X'2000 = Non-disk access message present flag.
- X'1000 = Defect table setup only. No disk access.
- X'0800 = "Seek" required flag.
- X'0400 = Call to dtsetp required.
- X'0200 = "Seek" pending flag.
- X'0100 = Do not enter defect management if set (for DGN).
- X'0080 = No work.

Drive table status word 1. Bit field definitions for "dtstat word 1" are:

- X'8000 = Go indication flag.
- X'4000 = Not used.
- X'2000 = DMA operation completed successfully.
- X'1000 = DMA operation detected error.
- X'0800 = Marker read flag.
- X'0400 = Boot request active flag.
- X'0200 = Segment break flag.
- X'0100 = Enable segment breaks.
- X'0080 = 0-read, boot, verify 1-write, initialize.
- X'0040 = Verify message flag.
- X'0020 = Initialize message flag.
- X'0010 = No marker read-wait for index flag.
- X'0008 = DMA required flag.
- X'0004 = Address mismatch flag (read only).
- X'0004 = Write gate off flag (write only).
- X'0002 = Skip defect management check.
- X'0001 = First sector flag for read.

Current drive table message.

Previous drive table message.

Number of cylinders on this drive.

Number of tracks per cylinder.

Division masks for converting block number to cylinder, head, and sector.

Drive number.

Internal list pointers.

Maximum number of readable cylinders.

Maximum number of verifiable cylinders.

Port number associated with this drive.

Data flags. Bit field definitions for "dflags" word are:

- X'8000 = Defect table in memory flag (1-in, 0-out).
X'4000  = REX allowed flag (1-alw, 0-inh).
X'2000  = Drive in-service indicator (1-out, 0-in).
X'1000  = Optimization bit (1-on).
X'0800  = Uncorrectable data error.
X'0400  = Defect management update write job.

f^2  = Current direction of heads.
g^2  = Next cylinder for routine exercises.
h^2  = Next head for routine exercises.
i^2  = Pointer to initialization pattern.
j^2  = Completion and enhanced error codes.

Refer to the "Completion and enhanced error codes" field described in segment 2 of this report for a
description of this field and the completion code values.

k^2  = Disk status register and flags. This field consist of two subfields, the status flags and the disk
status register in the form: mmnn.

l^2  = Starting cylinder of current job.
m^2  = Starting head of current job.
n^2  = Starting sector of current job.
o^2  = Number of sectors in current job.
p^2  = Current cylinder.
q^2  = Current head
r^2  = Current sector.
s^2  = ECC buffer

t^2, u^2, v^2  = Pointers into ECC table.
w^2  = Cylinder from disk.
x^2  = Track from disk.
y^2  = Sector from disk.
z^2  = Expected cylinder.
a^3  = Expected track.
b^3  = Expected sector.
c^3  = Block.
d^3  = Word.
$e^3$ = Correction code.

4. **ACTION TO BE TAKEN**

This report provides supplemental data associated with a response returned to the administrative module (AM). The messages printed on the receive-only printer (ROP) around the report should be checked to determine the significance of the report.

A two-segment report is generated after a SYSGEN message has been received from the AM and before the response for the SYSGEN message is returned to the AM. All of the data in this particular report should be ignored.

5. **ALARMS**

None.

6. **REFERENCES**

   kkkkkkkk kkkkkkkk kkkkkkkkk kkkkkkkk llllllll llllllll llllllll llllllll

[2] REPT DFCI m DATA n-o X’ p

2. **REASON FOR OUTPUT**

To print the enhanced information report (EIR) provided by the small computer system interface (SCSI) disk file controller (DFC).

Format 1 is output when the short form of the EIR is requested and Format 2 is output when the long form is requested.

3. **VARIABLE FIELD DEFINITIONS**

   a  = Command completion word. The completion word is 8 hexadecimal digits of the form: qqrrstuu
   
   b  = Device status word. Refer to the APP:DFC-C appendix in the Appendixes section of the Output Messages manual.
   
   c  = Operational firmware version. Refer to the APP:DFC-O appendix in the Appendixes section of the Output Messages manual.
   
   
   e  = Enhanced completion code. Refer to the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.
   
   f  = Target controller command status byte. Valid value(s):
       0x00  = Good.
       0x02  = Check condition.
       0x04  = Condition met.
       0x08  = Busy.
       0x10  = Intermediate.
       0x14  = Intermediate - condition met.
       0x18  = Reservation conflict.
       0x22  = Command terminated.
       0x28  = Queue full.
       0xFF  = Status not available.
   
   g  = Firmware/driver communications register. Refer to the APP:DFC-B appendix in the Appendixes
section of the Output Messages manual.

h = HA status register. Refer to the APP:DFC-N appendix in the Appendixes section of the Output Messages manual.

i = BIC status register. Refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.

j = Previous command received from the administrative module (AM). Refer to the APP:DFC-M appendix in the Appendixes section of the Output Messages manual. This information may not be useful when pumpcode is running.

k = Failing command received from the AM. Refer to the APP:DFC-M appendix in the Appendixes section of the Output Messages manual.

l = Extended sense data. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.

m = Unit number.

n = Segment number of information report.

If \( n = \) Format =

1

\[
\begin{align*}
\text{h} & = \text{HA status register. Refer to the APP:DFC-N appendix in the Appendixes section of the Output Messages manual.} \\
\text{i} & = \text{BIC status register. Refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.} \\

\]

Copyright ©2003 Lucent Technologies
= Number of segments of information report.

= Sequence number for this report.

Note 1: Variable 'p' is only valid when 'qq' is zero.

= Completion code. Refer to the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

= Number of blocks read/written on short failure of read/write command.

= Bus/device ID number of the device associated with the activity identified by this response. If the activity references the host adapter, this field is not used by the DFC.

= Autonomous completion code. Refer to the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

= Job ID number.

= SCSI bus enabled status. Valid value(s):

0 = Bus is not enabled.
1 = Bus is enabled.

= Host adapter (HA) ID number.

= Command completion word: The completion word is 8 hexadecimal digits of the form: qqrrstuu

= Device status word. Refer to the APP:DFC-C appendix in the Appendixes section of the Output Messages manual.

= Operational firmware version. Refer to the APP:DFC-O appendix in the Appendixes section of the Output Messages manual.

= Enhanced completion code. Refer to the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

= SCSI bus A enabled status and host adapter ID number. It is comprised of 4 bits of the form: 
vwww.

= SCSI bus B status and host adapter ID number. It is comprised of 4 bits of the form: 
vwww.

= Firmware/driver communications register. Refer to the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.
f = Host adapter status register. Refer to the APP:DFC-N appendix in the Appendixes section of the Output Messages manual.

g = BIC status register. Refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.

h = Routine exerciser failing block number.

i = Failing command received from the AM. Refer to the APP:DFC-M appendix in the Appendixes section of the Output Messages manual.

j = Previous command received from the AM. Refer to the APP:DFC-M appendix in the Appendixes section of the Output Messages manual. This information may not be useful when pumpcode is running.

k = Device number.

l = Other device number.

m = Job type pending. Refer to the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

n = Device maintenance mode. Valid value(s):

0 = Device is online.

1 = Device is offline.

o = Last logical block address of the device.

p = Target controller's logical block size in bytes.

q = Extended sense data. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.

r = Inquiry data. Refer to the APP:DFC-L appendix in the Appendixes section of the Output Messages manual.

s = First SCSI job block (SJB) structure. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.

t = SCSI command. Refer to Note 2.

u = Retry count.

v = Second SJB structure. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.

w = Second SCSI command. Refer to Note 2.

x = Location of the routine exerciser on the device in logical blocks.

y = Third SJB structure. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.

z = Command received from the AM. Refer to the APP:DFC-M appendix in the Appendixes section of
the Output Messages manual.

a² = Device "busy condition" at time of job termination. Valid value(s):
0 = Device was not in a "busy condition".
1 = Device was in a "busy condition".

b² = Timer ID associated with "busy condition".

c² = HA data buffer address.

d² = Device number.

e² = Other device number.

f² = Job type pending. Refer to the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

g² = Device maintenance mode. Valid value(s):
0 = Device is online.
1 = Device is offline.

h² = Last logical block address of the device.

i² = Target controller's logical block size in bytes.

j² = Extended sense data. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.

k² = Inquiry sense data. Refer to the APP:DFC-L appendix in the Appendixes section of the Output Messages manual.

l² = First SJB structure. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.

m² = SCSI command. Refer to Note 2.

n² = Retry count.

ɔ² = Second SJB structure. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.

p² = Second SCSI command. Refer to Note 2.

q² = Location of the routine exerciser on the device in logical blocks.

r² = Third SJB structure. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.

s² = Command received from the AM. Refer to the APP:DFC-M appendix in the Appendixes section of the Output Messages manual.

t² = Slow job function pointer.

u² = Sequential access device record information.
\( v^2 \) = Data transfer control information.
\( w^2 \) = Not used.

Note 2: There are normally one, five, or nine segments of data output.

4. ACTION TO BE TAKEN

An information report provides additional information about a condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

If the output contains task entry data or SCSI commands, collect the output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT DFI=a-b-c TRBL DFI CCB ERROR d e RECOVERY ACTION f g h i j k [l]

2. REASON FOR OUTPUT

To report a trouble indication in the digital facility interface (DFI) microprocessor.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line/trunk unit number.
c = DFI number.
d = Event number.
e = Secondary error type. Valid value(s):
  DFI PIDB LOSS OF CLOCK ALARM = Digital facility interface peripheral interface database loss
  of clock alarm.
  INTERNAL CONTROL TROUBLE
  INTERNAL DATA TROUBLE
  REDUNDANT TM SERV REQ = Redundant terminal maintenance service request.
  UNUSED CCB REG ACTIVITY = Unused control communication buffer register activity.

For a further explanation of these error types, refer to variable ‘k’.

f = Recovery action. Valid value(s):
  ANALYSIS ONLY = A post mortem report is generated.
  INITIALIZE = The failing circuit has been reinitialized.
  RMV = The failing circuit will be removed from service. Intervention is required to change
        the state of the circuit. A message from the maintenance request administrator
        (MRA) will be printed after the circuit is removed.
  RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be
        printed with the results of the diagnostic.
  RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
        will be printed with the results of the diagnostic.

h = Current decimal number of errors of this type recorded.
i = Error count threshold, above which the recovery action will be escalated.
j = Code indication whether error is associated with the facility or board, and identifying the DFI hardware type. Valid value(s):
0001 = Facility 0, DFI-1.
0002 = Facility 0, DFI-2.
0102 = Facility 1, DFI-2.
ff01 = Board, DFI-1.
ff02 = Board, DFI-2.

k = Hexadecimal value passed from peripheral control. Valid value(s):

<table>
<thead>
<tr>
<th>'e' =</th>
<th>'k' =</th>
</tr>
</thead>
</table>
| INTERNAL DATA TROUBLE | A hexadecimal number. Valid value(s):
| | 0x95 = Transmit formatter exercise alarm.
| | 0x96 = Receive synchronizer exercise alarm.
| | 0x97 = Framer exercise alarm.
| | 0x98 = Audit latch failure alarm.
| INTERNAL CONTROL TROUBLE | A hexadecimal number. Valid value(s):
| | 0x90 = Firmware fault.
| | 0x9b = Control communication burrer status alarm.
| REDUNDANT TM SERV REQ | 0x1ff
| DFI PIDB LOSS OF CLOCK ALARM | 0x9c
| UNUSED OR UNEXPECTED ACT. | The address of the unused register.

l = CCB register data. This is only valid for INTERNAL DATA TROUBLE and INTERNAL CONTROL TROUBLE.

4. ACTION TO BE TAKEN
Analyze and evaluate the data and take appropriate corrective action.

\[g\] = Recovery action. Valid value(s):
ANALYSIS ONLY = A postmortem report is generated.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
INITIALIZE = The failing circuit has been re-initialized.
RST PREEMPT = The failing circuit has been preempted and a diagnostic has been scheduled. A message will be printed with the results of the diagnostic.

\[h\] = Contents of 1 to 10 registers.

\[i\] = External logical circuit name.

\[j\] = Current decimal number of errors of this type recorded.

\[k\] = Error count threshold above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

If trouble is reported repeatedly, manually diagnose the DFIH and replace the faulty circuit pack as indicated by the diagnostic results. If it is not possible to take the circuit out of service (OOS), it may be necessary to inhibit hardware checks on it using the INH:HDW-DFIH input message. The circuit should not be inhibited any longer than necessary.
If unexpected results occur, refer to the Corrective Maintenance and the System Recovery manuals.

5. ALARMS

A critical, major, or minor alarm can result when either of the recovery actions INITIALIZE or RST PREEMPT fails, leaving the DFIH circuit OOS. There are no alarms associated with the other recovery actions.

   LEXEC DATA
   D = o errno = p
   PHASE DATA
   T = i A = j S = k I = l

2. REASON FOR OUTPUT

Each of the formats has a separate purpose.

Format 1 is used to report a peripheral driver error encountered by the peripheral diagnostic programs.

Format 2 is used to report an error encountered by the peripheral diagnostic programs.

Format 3 is used to report a LEXEC function failure encountered by the peripheral diagnostic programs.

3. VARIABLE FIELD DEFINITIONS

a = Diagnostic reporting the error for the disk file controller (DFC), input/output processor (IOP), and dual serial channel/computer interconnect (DCI).

b = Reason for audit, in hexadecimal notation. Valid value(s):
   41 = Open special device file failed. For storage module drive (SMD) moving head disks (MHDs) with unit control block (UCB) device_id field = 0 (first MHD on DFC, usually MHD 0 or 1): MHD type read from DFC backplane may not agree with MHD UCB equipage field or may not be read correctly by DFC TN65 or UN64 board.
   42 = SETIO failed.
   43 = makeseg failed.
sendpw failed.

Read PC pump file failed.

Driver operation failed.

Open PC pump file failed.

msgenab failure.

msgdisab failure.

Open processor control process maintenance driver (PCPMD) failed.

Write to PCPMD failed.

excof timed out.

Open equipment configuration database (ECD) manager failed.

Function "ugucbn" failed.

Peripheral interface controller (PIC) microstore size not in UCB.

Receive wait failed.

LEXEC function failed.

e_host of UCB not initialized.

Iseek function failure.

Drive size not 5 or 19 tracks.

makeseg failed for disk read/write buffer.

Write/read segment too small.

Function ugetucb failed.

DFC not active.

IOP not active.

Small computer system interface (SCSI) bus not active.

Cannot open data table file or micro program file.

Cannot share DCB from DIAMON.

Error in the data table.

Invalid number of parameters from DIAMON.

Open spooler failed.

Invalid interactive mode command.

Open tlpfile failed.

Signal: illegal instruction.

Signal: bus error.

Signal: segment violation.

Signal: software termination.

Last test executed, in decimal notation.

Data table address, in hexadecimal notation.

Data table statement number, in decimal notation.

Task routine index, in hexadecimal notation.

Peripheral driver error code, in hexadecimal notation. Refer to the APP:DFC-A appendix in the Appendixes section of the Output Messages manual for DFC information/error codes.

Refer to the APP:IOP-G appendix in the Appendixes section of the Output Messages manual for IOP error codes.

Refer to the APP:DCI-A appendix in the Appendixes section of the Output Messages manual for DCI information/error codes.

3. REPLACE EBUS CABLES ONE BAY AT A TIME.

   RETEST FULL TMS DIAGNOSTICS.

4. IF ALL ABOVE HAS BEEN DONE AND PROBLEM STILL PERSISTS, SEEK LUCENT TECHNICAL SUPPORT.

2. **REASON FOR OUTPUT**

To report the result of executing a DGN:TMS input message specifying the TLP option and TMS phase 14 to diagnose the time multiplexed switch (TMS).

This file was created for the newest release. Additional information will be included as it is made available.

3. **VARIABLE FIELD DEFINITIONS**

   a = TMS unit number.

   b = Number of the phase in which the failure occurred.

   c = Number of the segment in which the failure occurred.

   d = Number of the test that failed.

   e = Number of the current report.

   f = Total number of reports to be printed.

   z = String of report data, including E-BUS cable group and its EQLs.

4. **ACTIONS TO BE TAKEN**

Replace the suspected cables, one at a time, in the order specified, and per the printed instructions. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

5. **ALARMS**
Alarms may be triggered because:

1. The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.

2. A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

3. A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

4. The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an “alarm” was requested on failures. These callers have the option of not alarming failures.

ONLINE CU CRITICAL REGISTERS
PSW = u  HSR = v  SSR = x  ER = w
[WARNING: THE OFFLINE CU HAS INITIALIZED ]

2. REASON FOR OUTPUT

To report an error encountered by the control unit (CU) diagnostic programs. Critical registers are displayed for error codes marked.

If the message **WARNING: READ PROBLEMS – SOME REGISTERS MAY BE INCORRECT** appears, maintenance channel failures were encountered while reading some of the offline CU registers. Although the registers involved are not indicated, registers containing all zeroes are particularly suspect.

If the message **WARNING: THE OFFLINE CU HAS INITIALIZED** appears, the ten temporary registers indicated under the variable ‘s’ field will contain a snapshot taken at the time of the reset (maintenance reset function).

3. VARIABLE FIELD DEFINITIONS

- **a** = Error code, in hexadecimal notation. Refer to the description in the Error Code exhibit in the 4ACTION TO BE TAKEN section of this manual page.
- **b** = Index into PCP table.
- **c** = Error number returned from process control process maintenance driver (PCPMD). Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
- **d** = Left half of instruction to PCPMD, in hexadecimal notation.
- **e** = Right half of instruction to PCPMD, in hexadecimal notation.
- **f** = On-line maintenance channel status, in hexadecimal notation.
- **g** = Off-line maintenance channel status, in hexadecimal notation.
- **h** = Last test executed.
- **i** = Data table address.
- **j** = Data table statement number.
- **k** = Task routine index.
- **l** = Maintenance channel buffer.
- **m** = Maintenance channel status.
- **n** = Bidirectional gating bus.
- **o** = Microstore data register high half.
- **p** = Microstore data register low half.
- **q** = Microstore address register.
- **r** = Microstore address stack entry.
- **u** = Processor status word.
v = Hardware status register.
w = Error register.
x = System status register.
y = Destination bus.
z = Source bus.
a¹ = Bidirectional gating register.
b¹ = Pulse point register.
c¹ = Ones register.
d¹ = Channel data register.
e¹ = Interrupt mask.
f¹ = Interrupt source register.
g¹ = Real time counter.
h¹ = Timers register.
i¹ = Store address register.
j¹ = Present address register.
k¹ = Store control register.
l¹ = Address translation buffer.
m¹ = Store data register.
n¹ = Store instruction register.
o¹ = Instruction buffer.
p¹ = Halfword multiplexor.
q¹ = General registers (0-15).
r¹ = Firmware registers (0-15).
s¹ = Temporary registers (0-15). Valid value(s):
T0 = Store address register.
T1 = System status register.
T2 = Processor status word.
T3 = Store control register.
T4 = Error register.
T5 = Pulse point register.
T6 = Hardware status register.
T7 = Store data register.
T10 = Real time counter.
T11 = Timers register.

t1 = Main memory registers. Valid value(s):
BNK0 = MCERT MC bank address register 0.
BNK1 = MCERT MC bank address register 1.
BNK2 = MCERT MC bank address register 2.
BNK3 = MCERT MC bank address register 3.
BNK4 = MCERT MC bank address register 4.
BNK5 = MCERT MC bank address register 5.
BNK6 = MCERT MC bank address register 6.
BNK7 = MCERT MC bank address register 7.
DCMD = MCERT DP message register.
DSTAT = MCERT DP status register.
MADD = MCERT MC error address register.
MCMD = MCERT MC message register.
MDAT = MCERT DP error data register.
MER = MCERT MC error flags register.
MMR = Main memory register.
MSTAT = MCERT MC status register.

u1 = Cache registers. Valid value(s):
CRA = Cache error register A.
CRB = Cache error register B.
CRC = Cache error register C.
CRD = Cache error register D.
CRE = Cache error register E.
CRF = Cache error register F.
CRG = Cache status register G.

4. ACTION TO BE TAKEN

An explanation of the error encountered and the appropriate action to be taken are shown in the following table. Critical registers are displayed for error codes marked with an asterisk (*).

<table>
<thead>
<tr>
<th>Error Codes</th>
<th>Explanation/ Action to be Taken</th>
</tr>
</thead>
<tbody>
<tr>
<td>41</td>
<td>The test count specified at the end of the phase does not agree with number of tests actually executed. Either an errant transfer was taken during the execution of the phase or the phase data table has been mutilated. Rerun the phase. If the problem remains, the data table file may be corrupted refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>*42</td>
<td>Offline diagnostic microcode timed out. A specified time limit is set for running microcode to prevent infinite loops. Problems could be due to the microstore not being loaded properly, an offline maintenance reset function (MRF) occurred, or the microcode got stuck in an infinite loop. Usually a retry will correct any microcode timeout problem. If the central control (CC) diagnostic was not run before the abort occurred, running it might find the problem.</td>
</tr>
<tr>
<td>*43</td>
<td>There is an error in a setarg option at the indicated data table. The number of arguments passed to the offline main store routine does not match the number declared in the setarg option. Rerun the</td>
</tr>
<tr>
<td>Location</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>offline main store object file could not be copied from online processor to offline processor.</td>
<td>Failure to connect to the equipment configuration database (ECD), unit control block (UCB) record ID points to the online control unit (CU), or CU was not OUT OF SERVICE. Make sure the maintenance request is for the offline CU and that the offline CU is out-of-service. If this is not the problem, use the RCV input message to examine the ECD paying particular attention to the UCB for the unit being diagnosed.</td>
</tr>
<tr>
<td>Could not set stack register or argument register in offline CU for offline main store execution.</td>
<td>The online or offline maintenance channel could be faulty. The PCPMD error code, which appears under the heading DRIVER DATA, could help determine the cause of the problem.</td>
</tr>
<tr>
<td>Cannot setup stack argument count and program counter or address pointer in offline main store.</td>
<td>Some of the things to look for are as follows: The offline CU was not OUT OF SERVICE, the pointer to the UCB is not valid or does not point to a CU UCB in the ECD database, the UCB record ID was pointing to the online processor, or the maintenance channel did not execute the expected number of bytes. Make sure the maintenance request is for the offline CU and that the offline CU is out-of-service. If this is not the problem, use the RCV input message to examine the ECD paying particular attention to the UCB for the unit being diagnosed. Also, run CC diagnostic phases 1 through 4 to verify communication between the online and offline maintenance channels.</td>
</tr>
<tr>
<td>The test routine loaded in the offline main store did not execute properly.</td>
<td>The PCPMD function pexecothr is used to start execution. The pointer passed to it from cudiagc was not recognized as a valid pointer or did not point to a CU UCB in the ECD. Retry the maintenance request. If the problem remains, use the RCV input message to examine the ECD paying particular attention to the UCB for the unit being diagnosed.</td>
</tr>
<tr>
<td>Code</td>
<td>Message</td>

### 1. FORMAT

`REPT DIAGC a b`

### 2. REASON FOR OUTPUT

To report that the diagnostic controller (DIAGC) has aborted a diagnostic. This message indicates that the requested diagnostic aborted because of an internal problem and indicates the nature of the problem.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Error number.
- **b** = Reason for error.

235-105-220 Corrective Maintenance
**REPT:DIAMON**

*Software Release:* 5E14 and later  
*Message Class:* MTCE  
*Application:* 5,3B  
*Type:* Output

1. **FORMAT**

   REPT DIAMON  ERROR = a  ERRNO = b

2. **REASON FOR OUTPUT**

   To report that the diagnostic monitor (DIAMON) has aborted one or more diagnostic control processes due to an error condition.

3. **VARIABLE FIELD DEFINITIONS**

   a = Error code, in hexadecimal notation. Refer to Exhibit A for error codes and their explanation.

   b = System error code number. Refer to the system error codes in the APP:SYSERR appendix in the Appendixes section of the Output Messages manual. A system error code of zero means that no system error was reported.

4. **ACTION TO BE TAKEN**

   An explanation of the error encountered and the appropriate action to be taken are shown in Exhibit A.

Type: Output

1. FORMAT

[1] REPT DIOP DIOPNKILL UNSWAP FAILURE a

[2] REPT DIOP DIOPNKILL SWAP FAILURE a

[3] REPT DIOP SIMPLEX UNSWAP FAILURE a
   REPT DIOP SIMPLEX PROCESSING FAILURE

[4] REPT DIOP SIMPLEX PROCESSING COMPLETED

[5] REPT DIOP DUPLEX SWAP FAILURE a

[6] REPT DIOP DUPLEX PROCESSING COMPLETED

[7] REPT DIOP ALL NONESSENTIAL IMS PROCESSES TERMINATED

2. REASON FOR OUTPUT

Format 1 reports that a process has requested that it be made disk independent operation (DIOP) essential while the AM disks are simplex, but the kernel cannot swap it in or make it nonswappable.

Format 2 reports that a process has requested that it be made disk independent operation nonessential, but the kernel cannot make it swappable.

Format 3 reports that a swappable disk independent operation essential process cannot be made nonswappable in the AM disk simplex mode.

Format 4 reports the successful execution of the disk simplex operation. All swappable disk simplex essential processes have been swapped in and made nonswappable.

Format 5 reports that while attempting to reenter AM disk duplex operation, a process that was made nonswappable because it was disk independent operation essential cannot be made swappable.

Format 6 reports that AM disk duplex operation has been restored. All processes that were made nonswappable because of AM disk simplex operation have been made swappable.

Format 7 reports that the switch has been placed in the DIOP mode. All nonessential interprocess message switch (IMS) processes have been terminated. This message is reported every 15 minutes as long as IMS is in the DIOP mode.

3. VARIABLE FIELD DEFINITIONS
a = Pcode portion of the process's utility ID.

4. ACTION TO BE TAKEN

For Format 7, an IMS level 3 or level 4 initialization is required to bring the IMS out of the DIOP mode and restore its full capabilities.

1. FORMAT

REPT DISTRIBUTE=a-b-c-d TRBL PICB CONTROL FAILURE EVENT=e
   f RECOVERY ACTION g
   h i j k
   l m n o

2. REASON FOR OUTPUT

To respond to a peripheral interface control bus (PICB) control failure interrupt on the distribute point board (DISTRIBUTE).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = Board number.
e = Event number.
f = Error type. Valid value(s):

   PER DETECTED BAD ADDRESS
   SOFTWARE BAD ADDRESS ERROR

g = Recovery action. Valid value(s):

   ANALYSIS ONLY = A post mortem report is provided.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

h = Indication of whether the fault was transient or hard, as determined by the module controller fault recovery.
i = System PICB number in hexadecimal that was being written when the failure occurred.
j = Read/write (uppermost) bit and address in hexadecimal to which the control interface (CI) was writing when the failure occurred.
k = Data being written to the periphery by the CI.
l = Contents of the CI error source register.
m = External logical circuit name.
Note: Up to two logical circuit names, recent failure counts, and error thresholds (variables ‘m’–‘o’) may be printed.

n = Current decimal number of recent failures of this type recorded.

o = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the distribute point board from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

REPT:DKDIP

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT DKDIP MESSAGE
    REPT DKDIP ERROR a [b]

[2] REPT DKDIP MESSAGE
    c

2. REASON FOR OUTPUT

Format 1 reports an error condition encountered by the DKDIP process.

Format 2 reports the status of a poke request invoked from the data file system access (DFSA) display page during disk independent operation (DIOP).

3. VARIABLE FIELD DEFINITIONS

a = Process step or reason. Valid value(s):
d04 = DKDIP was restarted due to phase 1.
d08 = Poke 620 aborted due to phase 1.
d0c = Poke 600 or 601 aborted due to phase 1.
d10 = Poke 603 aborted due to phase 1.
d14 = Poke 602 or 604 aborted due to phase 1.
d18 = Received invalid message type. Message ignored.
d30 = Failed to open the equipment configuration database (ECD).
d34 = Failed to attach to the ECD.
d38 = Failed to initialize ackdb segment.
d50 = Failed to get unit control block (UCB) record by record ID (RID).
d60 = Failed to get UCB record by RID.
d63 = UCB returned is not a disk file controller (DFC) UCB.
d66 = Invalid DFC UCB model field.
d70 = Virtual address translation failure.
d80 = Failed to get UCB record by RID.
d83 = Invalid DFC sub-device type.
d86 = Failed to get UCB record by RID.
d89 = Invalid peripheral device type.

b = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

c = Reference to another output message in the Output Messages manual.

4. ACTION TO BE TAKEN
For Format 1, the DKDIP process encounters an error condition either during initialization or when processing a client request. If the error condition persists, contact the next level of technical assistance.

For Format 2, appropriate actions can be found under the appropriate output message pages in the output manual.

5. ALARMS

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

(DISK FILE SYSTEM ACCESS)
REPT:DKDRV
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT DKDRV INFO CODE a
__________________________________________________________________

[2] REPT DKDRV ERROR DATA b
__________________________________________________________________

[3] REPT DKDRV RECEIVED UNKNOWN RCV MESSAGE c d e
__________________________________________________________________

[4] REPT DKDRV WARNING, MHD d PARTITION f IS WRITE RESTRICTED
   VIOLATING PID g
__________________________________________________________________

[5] REPT DKDRV WARNING, MHD d EXCEEDS LONG TERM FAILURE THRESHOLD

2. REASON FOR OUTPUT

Format 1 reports a disk file controller (DFC) or disk driver (DKDRV) related error condition.
Format 2 provides additional data for a preceding REPT:DKDRV output message.
Format 3 reports that the disk driver received notification from recent/change and verify (RCV) that the equipment
configuration database (ECD) changed, but the change type is not recognized.
Format 4 reports the process identifier (PID) of the violating process that tries to access the write restricted partition.
Format 5 reports that the disk exceeds the failure threshold. Action may be necessary to prevent a system outage.

3. VARIABLE FIELD DEFINITIONS

a = Disk driver information code. Refer to the APP:DFC-A appendix in the Appendixes section of the
   Output Messages manual.

b = Supplemental data for previous REPT:DKDRV message.

c = Unit name.

d = Unit number.

e = RCV operation code.

f = Partition number.

g = PID of the violating process.

4. ACTION TO BE TAKEN
For Format 1, reference the disk driver code in the APP:DFC-A appendix in the Appendixes section of the Output Messages manual. If hardware is implicated, replace the faulty hardware using standard maintenance procedures. If a software or data malfunction is indicated, then try to correct the problem, if possible.

For Formats 2, 3, and 4, save the receive-only printer (ROP) output, then contact your technical assistance organization. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 5, refer to the Routine Operations and Maintenance manual for handling disk media access errors.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

235-105-110 System Maintenance Requirements and Tools
REPT:DLGGETTY

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1]  REPT DLGGETTY UNABLE TO ACCESS ECD FOR a

[2]  REPT DLGGETTY CANNOT READ GETTY RECORD FOR a

[3]  REPT DLGGETTY UNABLE TO CHANGE DIRECTORY TO b

[4]  REPT DLGGETTY FAILED TO EXECUTE c

[5]  REPT DLGGETTY FAILED TO OPEN d

[6]  REPT DLGGETTY CHANID FOUND IN LOGDEV RECORD a

[7]  REPT DLGGETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT

2. REASON FOR OUTPUT

To report that the DLGGETTY process has encountered an error while trying to process initialization information for a device. The message will appear on the originating device only.

3. VARIABLE FIELD DEFINITIONS

a  = Teletypewriter (TTY) device against which the dlggetty is executing.
b  = The directory which the dlggetty could not access.
c  = Pathname of the process to be executed.
d  = Special device file which could not be opened.

4. ACTION TO BE TAKEN

For format 1 or 2, verify that the getty record in the equipment configuration database (ECD) for the indicated TTY device is correct.

For Format 3, verify that the directory indicated in the getty record exists.

For Format 4, verify that the process which could not be executed exists and is executable.

For Format 5, 6, or 7, or the errors persist after taking actions indicated above, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
5. ALARMS

None.

REPT:DLGSHL

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT DLGSHL DEVICE a CANNOT ENABLE MESSAGE RECEPTION

[2] REPT DLGSHL DEVICE a CREATE SEGMENT ERROR

[3] REPT DLGSHL DEVICE a UNABLE TO INITIATE I/O

[4] REPT DLGSHL DEVICE a TERMINAL OPEN ERROR

[5] REPT DLGSHL DEVICE a TERMINAL READING ERROR

[6] REPT DLGSHL DEVICE a TERMINAL WRITING ERROR

[7] REPT DLGSHL DEVICE a UNIDENTIFIED ERROR

[8] REPT DLGSHL DEVICE a UNABLE TO FORK CSDIP

[9] REPT DLGSHL DEVICE a UNABLE TO EXECUTE CSDIP

[10] REPT DLGSHL DEVICE a GETTRAP FAILED

[11] REPT DLGSHL DEVICE a SETTRAP FAILED

[12] REPT DLGSHL DEVICE a STATIO FAILED

[13] REPT DLGSHL DEVICE a NO CSDIP PROCESS

[14] REPT DLGSHL DEVICE a UNABLE TO ACCESS ECD DATA

[15] REPT DLGSHL DEVICE a UNABLE TO ACCESS AUTHORITY ADMINISTRATION
2. REASON FOR OUTPUT

To report a dialogue shell (DLGSHL) related occurrence or error.

Format 1 indicates that the DLGSHL cannot receive messages.
Format 2 indicates that the DLGSHL cannot create or open a segment.
Format 3 indicates that a call to setio() failed.
Format 4 indicates that the DLGSHL cannot open the specified device.
Format 5 indicates that the DLGSHL cannot read from the specified device.
Format 6 indicates that the DLGSHL cannot write to the specified device.
Format 7 is printed when the DLGSHL encounters an unknown error, such as an illegal enumeration value.

Format 8 is printed when the synchronous DLGSHL fails to fork the character special device interface process (CSDIP).

Format 9 is printed when the synchronous DLGSHL fails to execute the CSDIP.

Format 10 indicates that the terminal options for the specific device could not be retrieved.

Format 11 indicates that the terminal options for the specified device could not be set.

Format 12 indicates that a call to statio() failed.

Format 13 indicates that the CSDIP process on the specified device has died.

Format 14 indicates that the DLGSHL cannot access the equipment configuration database (ECD).

Format 15 indicates that the DLGSHL cannot access information relating to terminal and personal authority.

Format 16 indicates that the DLGSHL cannot retrieve information relating to input message authority groups.

Format 17 indicates that communication between the coordinator of spooler output processes (CSOP) and the DLGSHL spooler output function (SOF) have been corrupted.

Format 18 is printed when the DLGSHL cannot retrieve the LCHAN environment variable.

Format 19 indicates that the DLGSHL has been terminated.

Format 20 indicates that the DLGSHL has been initiated. A dialogue request character must be typed and, possibly, a password entered before the DLGSHL is ready to accept input messages (refer to the Craft Interface User's Guide).

Format 21 indicates that a message has requested a change to an environment that does not exist in the .pname file (refer to the Craft Interface User's Guide).

Format 22 indicates that a request to change an execution directory as a result of an environment change has not been honored.

Format 23 indicates that an attempt to change the group ID of the DLGSHL failed. This usually occurs as a result of attempts to change the environment.

Format 24 indicates that an attempt to change the user ID of the DLGSHL failed. This usually occurs as a result of attempts to change the environment.

Format 25 indicates that the DLGSHL cannot access the splrinfo record in the ECD.

Format 26 indicates that the DLGSHL cannot attach to the Input Message Catalog.

Format 27 indicates that the DLGSHL attached to the maintenance teletypewriter (MTTY) cannot read the .pname file and will, therefore, use a default .pname file containing the following: "0:.../cmds1:/cft/shl/cmds".

3. VARIABLE FIELD DEFINITIONS

- a = Device name.
- b = DLGSHL capability mode.
FULL
LIMP
PART

c = Input message syntax. Valid value(s):

MML

d = Label of line.

e = Name of the requested directory.

f = Name of the requested group ID.

g = Name of the requested user ID.

4. ACTION TO BE TAKEN

Formats 1-8, 10-14, 17-19, and 22-24 all represent internal errors. Most of these errors cause the dialogue session to be terminated. This should recover from the problem automatically. If the error is printed only once or twice, take no action.

For Format 9, verify that /cft/bin/csdip exists and can be executed using the OP:STATUS-LISTDIR input message. The permissions on the file can be changed using the ALW:FSYS-ACCESS input message.

For Format 15, verify the existence of /etc/dlg/authfile using the OP:STATUS-LISTDIR input message.

For Format 16 indicates a login failure. This usually indicates a typing error. Attempt to initiate another dialogue session.

Format 20 indicates that the dialogue session has been started. Take no action.

For Format 21 to fix either the .pname file or the command which was last executed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 25, verify the existence of the SPLRINFO record using the RCV:MENU-RCVECD input message.

For Format 26, verify the existence of /cft/shl/imcatlg using the OP:STATUS-LISTDIR input message.

For Format 27 to determine if this is a result of a database problem, or if the file should exist, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

If any of these messages persists and the appropriate action has already been taken, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Critical alarm. Take immediate action as indicated in the report. If needed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Minor alarm. Take action as indicated in the report.
Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Output Appendix(es):

APP:OMDB-X-REF

Other Manual(s):

235-105-110  System Maintenance Requirements and Tools
REPT:DLN-CNGST
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,CNI
Type: Output

1. FORMAT

[1] REPT DLN CNGST
    DLN a b CNGST SUMMARY
    CNI c d e f
    APP g h i j

[2] REPT DLN CNGST
    DLN a b CNGST ABATED

2. REASON FOR OUTPUT

To report that the active direct link node (DLN) is or has been in congestion.

Format 1 is printed five minutes after DLN congestion was first detected. The second line indicates the source of the congestion. The third line indicates the common network interface (CNI) level of congestion, and the fourth line indicates the application level of congestion. The application congestion level supersedes the CNI congestion level and it determines how much traffic is throttled by the link nodes. The severity of the congestion is determined by the number of seconds in the congestion levels. Format 2 is printed five minutes after a Format 1 congestion summary message to indicate that DLN congestion has abated.

3. VARIABLE FIELD DEFINITIONS

a = DLN's group number.
b = DLN's member number.
c = The number of seconds of CNI level 1 congestion.
d = The number of seconds of CNI level 2 congestion.
e = The number of seconds of CNI level 3 congestion.
f = The number of seconds of CNI level 4 congestion.
g = The number of seconds of application level 1 congestion.
h = The number of seconds of application level 2 congestion.
i = The number of seconds of application level 3 congestion.
j = The number of seconds of application level 4 congestion.

All numbers are cumulative based on 100ms sampling over the 5-minute interval preceding the report.

4. ACTIONS TO BE TAKEN
The report indicates that the DLN is at or near processing capacity and attempting to shed load. If this message appears consistently, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

6. REFERENCES

None.
REPT:DLN-DATA

Software Release: 5E14 and later
Message Class: INT_MON
Application: 5
Type: Output

1. FORMAT

REPT DLN=a,b DATA=c,d ADDR=e SRC=f EVENT=g

hhhhhhhh hhhhhhh hhhhhhh hhhhhhh hhhhhhh hhhhhhh hhhhhhh hhhhhhh
hhhhhhhh hhhhhhh hhhhhhh hhhhhhh hhhhhhh hhhhhhh hhhhhhh hhhhhhh

2. REASON FOR OUTPUT

To provide additional information about errors detected in the direct link node (DLN). This message may follow other
messages associated with an error detected in the DLN or it may appear alone to provide a postmortem dump in the
event that a fatal error occurred. A total of three of these messages may print out in response to a single defensive
check failure. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion
of the INTRODUCTION section of the Input Messages manual.

3. VARIABLE FIELD DEFINITIONS

a = The ring node (RN) group number of the reporting direct link node (DLN) (00-63).
b = The ring node member number of the reporting DLN (1-15).
c = Data dump type. Valid value(s):
   DCF-DATA = The dump consists of data that relates to a defensive check failure event which is
documented in associated output messages.
   PCB = The data dump consists of the process control block of the operating system for
distributed switching (OSDS) process whose process identification (PID) is the
block number field (refer to variable ‘d’). This dump should follow an INIT DLN
message for which the level of initialization initiated was single process purge
(SPP).
   POST-MORT = The data dump consists of postmortem data from the DLN associated with the
previous fault causing a switch to the standby DLN.
d = The sequence number (1, 2, or 3) of the block as defined for this defensive check failure.
e = Physical address, in hexadecimal, of the block being dumped.
f = Source of the dump request. Valid value(s):
   DCF = Defensive check failure request.
   PE = Processor exception request.
g = Event number.
h = 32-bit word representations of the data in hexadecimal.

4. ACTION TO BE TAKEN

This information should be sent along with any trouble report concerning DLN initialization to the technical support
organization.

5. ALARMS

None.

REPT:DLN-RCF

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

REPT DLN a          RECENT CHANGE FAILURE b
                     TAKE MANUAL RECOVERY ACTION

2. REASON FOR OUTPUT

To report that a problem has been encountered while trying to modify a relation in the direct link node (DLN) during a recent change operation. This output message occurs only in offices equipped with a DLN.

3. VARIABLE FIELD DEFINITIONS

   a = DLN that failed. Valid value(s):
      ACT/STBY
      ACTIVE
      STANDBY

   b = Name of the relation being modified via recent change when the problem occurred. Valid value(s):
      DS_APP = Translates a common channel signaling (CCS) direct signaling appreciation into a subsystem number and translation type.
      DS_SSN = Translates a CCS direct signaling subsystem number into an appreciation.
      LAB6_PCI = Translates a common channel signaling version 6 (CCS6) link pair into a point code index (PCI).
      LAB7_PCI = Translates a common channel signaling version 7 (CCS7) link pair into a PCI.
      MLT_LATA = Translates a LATA number and CCS direct signaling application into a translation type and two destination point codes (DPC) of the signaling transfer point (STP).
      PCI_PRT = Translates the PCI and circuit code of a CCS6 or CCS7 into the module and port of the trunk.

4. ACTION TO BE TAKEN

   Manual recovery action required. If the active DLN failed, switch the standby DLN into active mode and initiate recovery action on the faulty DLN. If only the standby DLN failed, initiate manual recovery action only on the standby DLN. If both the active and standby DLN failed, the DLNs went into recovery during recent change, leaving the DLN database in an unknown state. Initialize both DLNs one at a time and retry recent change after initialization.

5. ALARMS

   None.

1. FORMAT

[1] REPT DMQ INHIBIT a ACTIVE
    [,REMAINING TIME b MIN.]

[2] REPT DMQ ATTEMPT TO DISABLE INHIBIT a FAILED

2. REASON FOR OUTPUT

Format 1 reports inhibited maintenance request sources. The source may have been disallowed for an infinite time span or a finite time span.

Format 2 reports that inhibited maintenance request source 'a' reached the end of its inhibited time, but the clear of the inhibit failed.

3. VARIABLE FIELD DEFINITIONS

a = Source of maintenance requests; for example, automatic diagnostic process (ADP).

b = Time, in minutes, left until requests will be allowed from source 'a'.

4. ACTION TO BE TAKEN

Format 1 requires no action.

For Format 2, use the ALW:DMQ input message to manually allow the inhibited request source 'a'. For the cause of the problem, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

1. FORMAT

REPT DNUSCC=a-b-c [d] TRBL BACKGROUND TEST FAILURE EVENT=e
   f RECOVERY ACTION g
   hhiijjjj kkkkl1ll1 mmmmmnnn nnnnnnnn
   [DNUSCC=a-b-c o p]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a common control (CC) board in the digital networking unit - synchronous optical network SONET (DNU-S). The fault was detected and reported by the routine background test process. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to field ‘g’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = DNU-S unit number.
c = DNU-S CC number.
d = DNU-S CC equipment status. Valid value(s):
   ACTIVE = The CC is in service and a fault has been detected.
   OOS = The CC is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this CC from service. However, fault stimuli are still being detected from the circuit indicating that the CC has not been completely removed from service.
   STANDBY = The CC is in standby and a fault has been detected.
e = Event number.
f = Error type. Valid value(s):
   ACTIVE CC HEART BEAT ERROR = A routine check found that the CC failed to respond to a functional check.
   MATE CC ACCESS BUS VERIFY ERROR = A routine check found that the mate CC failed an access test.
   NO ERROR SOURCE FOUND = A message was sent to peripheral fault recovery (PFR) software indicating a routine background test failure. However, PFR software analysis revealed no such failure condition.
g = Recovery action. Valid value(s):
   ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
   HARD RESET = The circuit has been hard reset without scheduling diagnostics.
INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.
NO RECOVERY ACTION TAKEN = This event needed no recovery action.
PRE-OOS THRESHOLD EXCEEDED = The CC was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The CC has been preempted and is still detecting errors, inhibit has been re-applied on the CC.
RE-INHIBIT ERROR = The CC has been inhibited and error are still detected. Inhibit has been re-applied on the CC.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:DNUSCC output message will be printed with the results of the diagnostic.
SWITCH = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

h = DNU-S message type.
i = Message handler (MH) number and MH channel number, in a bit-packed representation. The first three bits indicate the MH number, and the next five bits indicate the MH channel number.
j = Internal circuit name of DNUSCC.
k = Fault type.
l = Internal circuit index of DNUSCC.
m = Internal DNU-S command return code if field 'f' = 'MATE CC ACCESS BUS VERIFY ERROR'. Otherwise, unused.
n = Currently unused.
o = Number of recent failures of this error type (variable 'f') on this DNUSCC circuit (in decimal).
p = Error count threshold above which the recovery action will become stronger.

4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the DNUSCC from service during a period of low usage and run diagnostics with the trouble locating procedure (TLP) option. This will print a list of circuit packs that are suspected to be faulty if a test fails. This list is ordered so the circuit pack that is most likely to be at fault is at the top of the list. Remove and replace each circuit pack on the list, until the faulty pack is found. If the problem persists, refer to the Maintenance Handbook.

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure in the communication path between the common controller (CC) and common data (CD) boards in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and reported by SM scanning software or by message handler (MH) fault recovery software. Although the fault is pegged against both the CC and CD circuits, recovery was done against the CC circuit to avoid duplex failing the CDs. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to field ‘g’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module number.
b  = DNU-S unit number.
c  = DNU-S CC number.
d  = DNU-S CC equipment status. Valid value(s):
   ACTIVE = The CC is in service and a fault has been detected.
   OOS = The CC is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this CC from service. However, fault stimuli are still being detected from the circuit indicating that the CC has not been completely removed from service.
   STANDBY = The CC is in standby and a fault has been detected.

e  = Event number.
f  = Error type. Valid value(s):

= Recovery action. Valid value(s):
ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or
circuits are failing, but the error counts have not reached a threshold for action.
HARD RESET = The circuit has been hard reset without scheduling diagnostics.
INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling
diagnostics.
NO RECOVERY ACTION TAKEN = No automatic recovery action performed.
PRE-OOS THRESHOLD EXCEEDED = The CC was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The CC has been preempted and is still detecting errors,
inhibit has been re-applied on the CC.
RE-INHIBIT ERROR = The CC has been inhibited and error are still detected. Inhibit has been
re-applied on the CC.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A
DGN:DNUSCC output message will be printed with the results of the diagnostic. 

**SWITCH**

= An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

**Note:** Format 1 only gets printed if field 'f' = 'PCAMB PARITY ERRORS', 'HDLC ERROR AT CD' or 'SANITY TIMER TIMEOUT'. This format is for errors detected by SM scanning software. Otherwise, Format 2 gets printed. This format is for errors detected by MH fault recovery software.

h = DNU-S message type.

i = Currently unused.

j = Internal CC circuit name.

k = Internal CD circuit name.

l = Unmasked peripheral error source information.

m = Raw peripheral error source information.

n = Peripheral error mask information.

**Note:** Fields 'o' through 'r' contain up to twenty of the last MH events. Fields 'o' through 'q' constitute a single MH event, and each block of eight hex characters of field 'r' constitutes an additional MH event, with a similar layout to fields 'o' through 'q'. The MH events are arranged from least recent to most recent, so fields 'o' through 'q' represent the least recent event, and the last eight hex characters of field 'r' is the most recent event.

o = Contains a time stamp.

p = Layer 2 logical link number and MH channel number, in a bit-packed representation. The first three bits indicate the layer 2 logical link number, and the next five bits indicate the MH channel number.

q = MH internal inhibit status and MH error type, in a bit-packed representation. The first bit indicates the MH internal inhibit status, and the next seven bits indicate the MH error type.

r = Up to nineteen additional MH events with a similar layout to fields 'o' through 'q'. The last eight hex characters this field represent the most recent MH event.

s = Number of recent failures of this error type (field 'f') on this DNUSCC circuit (in decimal).

t = Error count threshold if the circuit is a DNUSCC.

u = DNU-S data group number.

v = DNU-S CD number.

w = Number of recent failures of this error type (field 'f') on this DNUSCD circuit (in decimal).

x = Error count threshold if the circuit is a DNUSCD.
4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the DNUSCC from service during a period of low usage and run diagnostics with the trouble locating procedure (TLP) option. This will print a list of circuit packs that are suspected to be faulty if a test fails. This list is ordered so the circuit pack that is most likely to be at fault is at the top of the list. Remove and replace each circuit pack on the list, until the faulty pack is found. If the problem persists, refer to the Maintenance Handbook.

NO RECOVERY ACTION TAKEN = This event needed no recovery action.
PRE-OOS THRESHOLD EXCEEDED = The CC was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The CC has been preempted and is still detecting errors, inhibit has been re-applied on the CC.

RE-INHIBIT ERROR = The CC has been inhibited and error are still detected. Inhibit has been re-applied on the CC.

RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:DNUSCC output message will be printed with the results of the diagnostic.

SWITCH = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

h = DNU-S message type.

i = Message handler (MH) number and MH channel number, in a bit-packed representation. The first three bits indicate the MH number, and the next five bits indicate the MH channel number.

j = Internal DNUSCC circuit name.

k = Unit type.

l = Number of information words sent from DNU-S fault recovery.

m = Information sent from DNU-S fault recovery. The data sent is dependent on the type of error (that is, the value of field ‘f’).

n = Number of recent failures of this error type (field ‘f’) on this DNUSCC circuit (in decimal).

o = Error count threshold above which the recovery action will become stronger.

4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the DNUSCC from service during a period of low usage and run diagnostics with the trouble locating procedure (TLP) option. This will print a list of circuit packs that are suspected to be faulty if a test fails. This list is ordered so the circuit pack that is most likely to be at fault is at the top of the list. Remove and replace each circuit pack on the list, until the faulty pack is found. If the problem persists, refer to the Maintenance Handbook.

   f RECOVERY ACTION g
   ijjkkkk llllmmmm
   [DNUSSC=a-b-c n o]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a common control (CC) board in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and reported by operational software in the SM. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to field ‘g’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = DNU-S unit number.
c = DNU-S CC number.
d = DNU-S CC equipment status. Valid value(s):
   ACTIVE = The CC is in service and a fault has been detected.
   OOS = The CC is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this CC from service. However, fault stimuli are still being detected from the circuit indicating that the CC has not been completely removed from service.
   STANDBY = The CC is in standby and a fault has been detected.
e = Event number.
f = Error type. Valid value(s):
   CC SENT BAD MESSAGE = DNU-S sent garbled message to SM operational software.
   IDLE TASK RESPONDED = Received task return from DNU-S resident software but SM operational software could find no client for task return.
   LAYER TWO DOWN FOR TASK SENDING = Protocol for sending tasks not operational.
   TASK HAS BAD HEADER ON RETURN = Task return from DNU-S contained a garbled header field.
   TASK TIMED OUT = Operational software timed out waiting for return from DNU-S resident software.
   USER TASK PURGED THRESHOLD EXCEEDED = Task sent to DNU-S was purged.
g = Recovery action. Valid value(s):
   ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or
circuit packs are failing, but the error counts have not reached a threshold for action.

**HARD RESET** = The circuit has been hard reset without scheduling diagnostics.

**INHIBIT HDWCHKS** = The circuit has been inhibited because of excessive errors.

**INITIALIZE** = This recovery action is used to re-initialize a circuit without scheduling diagnostics.

**NO RECOVERY ACTION TAKEN** = This event needed no recovery action.

**PRE-OOS THRESHOLD EXCEEDED** = The CC was preempted and is still detecting errors.

**PRE-OOS, RE-INHIBIT HDWCHKS** = The CC has been preempted and is still detecting errors, inhibit has been re-applied on the CC.

**RE-INHIBIT ERROR** = The CC has been inhibited and error are still detected. Inhibit has been re-applied on the CC.

**RST PREEMPT** = The failing circuit was preempted and a diagnostic was scheduled. A DGN:DNUCC output message will be printed with the results of the diagnostic.

**SWITCH** = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

\[i\] = DNU-S message type.

\[j\] = Message handler (MH) number and MH channel number, in a bit-packed representation. The first three bits indicate the MH number, and the next five bits indicate the MH channel number.

\[k\] = DNU-S CC circuit name.

\[l\] = For field \'i\' = 'LAYER TWO DOWN FOR TASK SENDING' or 'TASK TIMED OUT', field \'l\' is the task type. Otherwise field \'l\' bit packs the termination code, fault class, completion code, and task pass/fail indication.

\[m\] = For field \'i\' = 'LAYER TWO DOWN FOR TASK SENDING' or 'TASK TIMED OUT', field \'m\' bit packs a task data block (TDB) uniqueness value with the TDB number. Otherwise, field \'m\' bit packs the task return type, TDB uniqueness value, and TDB number.

\[n\] = Number of recent failures of this error type (field \'z\') on this DNUCC circuit (in decimal).

\[o\] = Error count threshold above which the recovery action will become stronger.

### 4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the DNUCC from service during a period of low usage and run diagnostics with the trouble locating procedure (TLP) option. This will print a list of circuit packs that are suspected to be faulty if a test fails. This list is ordered so the circuit pack that is most likely to be at fault is at the top of the list. Remove and replace each circuit pack on the list, until the faulty pack is found. If the problem persists, refer to the Maintenance Handbook.

REPT DNUSCC=a-b-c [d] TRBL PCT LINK COMMUNICATION FAULT EVENT=e
   f RECOVERY ACTION g
   hhijjjj kkkkllll mmmmnnnn
   [DNUSCC=a-b-c o p]
   [DNUSCD=a-b-q-r s t]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a common control (CC)
board in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and
reported by SM scanning software. The message indicates what recovery action was taken and gives the current
fault counts against the CC circuit and the common data (CD) circuit specified in the message. Refer to field 'g' to
determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = DNU-S unit number.
c = DNU-S CC number.
d = DNU-S CC equipment status. Valid value(s):
   ACTIVE = The CC is in service and a fault has been detected.
   OOS = The CC is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to
   remove this CC from service. However, fault stimuli are still being detected from the
   circuit indicating that the CC has not been completely removed from service.
   STANDBY = The CC is in standby and a fault has been detected.
e = Event number.
f = Error type. Valid value(s):
   HDLC ERROR AT CD = High level data link control errors were detected.
   NO ERROR SOURCE FOUND = A message was sent to peripheral fault recovery (PFR) software
   indicating a scanned communication failure. However, PFR software analysis
   revealed no such failure condition.
   PCAMB PARITY ERRORS = Peripheral control and maintenance bus parity errors were detected.
   SANITY TIMER TIMEOUT = The sanity timer expired on the CC.
   g = Recovery action. Valid value(s):
   ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or
   circuits are failing, but the error counts have not reached a threshold for action.
   HARD RESET = The circuit has been hard reset without scheduling diagnostics.
INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.
NO RECOVERY ACTION TAKEN = This event needed no recovery action.
PRE-OOS THRESHOLD EXCEEDED = The CC was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The CC has been preempted and is still detecting errors, inhibit has been re-applied on the CC.
RE-INHIBIT ERROR = The CC has been inhibited and error are still detected. Inhibit has been re-applied on the CC.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:DNUSCC output message will be printed with the results of the diagnostic.
SWITCH = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

h = DNU-S message type.
i = Currently unused.
j = Internal CC circuit name.
k = Internal CD circuit name or unused, depending on the type of error (field ‘f’).
l = Unmasked peripheral error source information.
m = Raw peripheral error source information.
n = Peripheral error mask information.
o = Number of recent failures of this error type (field ‘f’) on this DNUSCC circuit (in decimal).
p = Error count threshold above which the recovery action will become stronger on the DNUSCC circuit.
q = DNU-S data group number.
r = DNU-S CD number.
s = Number of recent failures of this error type (field ‘f’) on this DNUSCD circuit (in decimal).
t = Error count threshold above which the recovery action will become stronger on the DNUSCD circuit.

4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the DNUSCC from service during a period of low usage and run diagnostics with the trouble locating procedure (TLP) option. This will print a list of circuit packs that are suspected to be faulty if a test fails. This list is ordered so the circuit pack that is most likely to be at fault is at the top of the list. Remove and replace each circuit pack on the list, until the faulty pack is found. If the problem persists, refer to the Maintenance Handbook.

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of the communication path to the common control (CC) board in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and reported by message handler (MH) fault recovery software, and preliminary recovery was taken by MH fault recovery software. The message also indicates what recovery action was taken by peripheral fault recovery and gives the current fault counts against the circuit specified in the message. Refer to field ‘h’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = DNU-S unit number.
c = DNU-S CC number.

h = Recovery action taken by peripheral fault recovery. Valid value(s):
ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or
circuits are failing, but the error counts have not reached a threshold for action.
HARD RESET = The circuit has been hard reset without scheduling diagnostics.
INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling
diagnostics.
NO RECOVERY ACTION TAKEN = No automatic recovery was performed.
PRE-OOS THRESHOLD EXCEEDED = The CC was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The CC has been preempted and is still detecting errors,
inhibit has been re-applied on the CC.
RE-INHIBIT ERROR = The CC has been inhibited and error are still detected. Inhibit has been
re-applied on the CC.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A
DGN:DNUSSC output message will be printed with the results of the diagnostic.
SWITCH = An attempt was made to gain control of the hardware by changing configuration
without removing circuits from service. Its purpose is to avoid removing circuits
from service that normally could remain in service under some fault conditions
and/or to help isolate the fault before isolating customers.

Note: Fields 'i' through 'l' contain up to twenty of the last MH events. Fields 'i' through 'k' constitute a
single MH event, and each block of eight hex characters of field 'l' constitutes an additional MH
event, with a similar layout to fields 'i' through 'k'. The MH events are arranged from least recent to
most recent, so fields 'i' through 'k' represent the least recent event, and the last eight hex
characters of field 'l' is the most recent event.

i = Contains a time stamp.

j = Layer 2 logical link number and MH channel number, in a bit-packed representation. The first
three bits indicate the layer 2 logical link number, and the next five bits indicate the MH channel
number.

k = MH internal inhibit status and MH error type, in a bit-packed representation. The first bit indicates
the MH internal inhibit status, and the next seven bits indicate the MH error type.

l = Up to nineteen additional MH events with a similar layout to fields 'i' through 'k'. The last eight hex
characters this field represent the most recent MH event.

m = Number of recent failures of this error type (field 'g') on this DNUSSC circuit (in decimal).

n = Error count threshold.
4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the DNUSCC from service during a period of low usage and run diagnostics with the trouble locating procedure (TLP) option. This will print a list of circuit packs that are suspected to be faulty if a test fails. This list is ordered so the circuit pack that is most likely to be at fault is at the top of the list. Remove and replace each circuit pack on the list, until the faulty pack is found. If the problem persists, refer to the Maintenance Handbook.

h
= Recovery action. Valid value(s):
ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or
circuits are failing, but the error counts have not reached a threshold for action.
HARD RESET = The circuit has been hard reset without scheduling diagnostics.
INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling
diagnostics.
NO RECOVERY ACTION TAKEN = No automatic recovery was performed.
PRE-OOS THRESHOLD EXCEEDED = The CD was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The CD has been preempted and is still detecting errors,
inhibit has been re-applied on the CD.
RE-INHIBIT ERROR = The CD has been inhibited and error are still detected. Inhibit has been
re-applied on the CD.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A
DGN:DNUUSCD output message will be printed with the results of the diagnostic.
SWITCH = An attempt was made to gain control of the hardware by changing configuration
without removing circuits from service. Its purpose is to avoid removing circuits
from service that normally could remain in service under some fault conditions
and/or to help isolate the fault before isolating customers.

i
= DNU-S message type.
j = Message handler (MH) number and MH channel number, in a bit-packed representation. The first
three bits indicate the MH number, and the next five bits indicate the MH channel number.
k = Internal DNUSCD circuit name.
l = Unit type.
m = Number of information words sent from DNU-S fault recovery.
n = Information sent from DNU-S fault recovery. The data sent is dependent on the type of error (that
is, the value of field ‘g’).
o = Number of recent failures of this error type (field ‘g’) on this DNUSCD circuit (in decimal).
p = Error count threshold.

4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the DNUSCC from service during a period
of low usage and run diagnostics with the TLP (Trouble Locating Procedure) option. This will print a list of circuit
packs that are suspected to be faulty if a test fails. This list is ordered so the circuit pack that is most likely to be at
fault is at the top of the list. Remove and replace each circuit pack on the list, until the faulty pack is found. If the
problem persists, consult the 235-105-500.

g RECOVERY ACTION h
iiiiiiii jjjjjjjj kkkkllll mmmmnnnn oooooooo oooooooo oooooooo oooooooo
 oooooooo oooooooo
[DNUSCD=a-b-c-d  p  q]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a peripheral link interface (PLI) which services a common data (CD) board in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and reported by module control unit fault recovery (MCUFR). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to field ‘h’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = DNU-S unit number.
c = DNU-S data group number.
d = DNU-S CD number.
e = DNU-S CD equipment status. Valid value(s):
   ACTIVE = The CD is in service and a fault has been detected.
   OOS = The CD is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this CD from service. However, fault stimuli are still being detected from the circuit indicating that the CD has not been completely removed from service.
   STANDBY = The CD is in standby and a fault has been detected.
f = Event number.
g = Error type. Valid value(s):
   IF CRC ERR ON DATA RECEIVED FROM PLI = The module controller detected a bad CRC on the PLI servicing the CD.
   IF LOSS OF CLOCK FROM THE PLI = The module controller detected a loss of data clock on the PLI servicing the CD.
   IF LOSS OF CLOCK REFERENCE = The module controller detected a loss of clock reference on the PLI servicing the CD.
   IF PAR ERR ON OVERHEAD BYTES FROM PLI = The module controller detected a parity error on the overhead bytes from the PLI servicing the CD.
   IF SYNCHRONIZATION ERROR WITH PLI = The module controller detected a synchronization error with the PLI servicing the CD.
NO ERROR SOURCE FOUND = A message was sent to peripheral fault recovery (PFR) software indicating a PLI fault is present. However, PFR software analysis revealed no such fault indication.

PCT LOOP BACK FAIL SMP TO CD = The CD failed to respond to an SMP direct communication check.

PLI BAD FRAME WORD ON INCOMING LINK = A bad frame word has been detected on the incoming PLI.

PLI BAD PARITY INCOM OVERHEAD BYTES = Parity error has been detected on overhead data received from the TSI.

PLI BAD SUPERFRAME ON INCOMING LINK = A bad superframe byte has been detected on the incoming PLI.

PLI DETECTED BAD CRC FROM ACTIVE MCTSI = A bad CRC has been detected from the MCTSI at the PLI.

PLI INTERNAL DATA PARITY ERROR = PLI has detected an internal parity error.

PLI IS SOURCING BAD CRC = A PLI servicing the CD has detected it is sourcing a bad CRC.

PLI LINK TO BE OUT-OF-FRAME = Proper framing cannot be established on the incoming PLI.

PLI OUTGOING BUFFER CHECK ERROR = Buffer check error has been detected on the PLI.

PLI PARITY ERRORS ON DATA FROM CD = PLI has detected a parity error in data it receives from the CD.

h = Recovery action. Valid value(s):

ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.

HARD RESET = The circuit has been hard reset without scheduling diagnostics.

INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.

INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.

NO RECOVERY ACTION TAKEN = This event needed no recovery action.

PRE-OOS, RE-INHIBIT HDWCHKS = The CD has been preempted and is still detecting errors, inhibit has been re-applied on the CD.

PRE-OOS THRESHOLD EXCEEDED = The CD was preempted and is still detecting errors.

RE-INHIBIT ERROR = The CD has been inhibited and error are still detected. Inhibit has been re-applied on the CD.

RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:DNUSCD output message will be printed with the results of the diagnostic.

SWITCH = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

i = IF error source register.

j = IF error mask register.

k = PLI error source register.

l = PLI error mask register.

m = DNU-S message type.

n = Number of PLI fault messages sent from MCUFR to peripheral fault recovery, contained in field 'o'.

Copyright ©2003 Lucent Technologies
o = Up to six PLI fault messages sent from MCUFR to peripheral fault recovery. Each PLI fault message consists of eight hex characters.

p = Number of recent failures of this error type (variable 'g') on this DNUSCD circuit (in decimal).

q = Error count threshold above which the recovery action will become stronger.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the DNUSCD from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

None.

   [DNUSCC=a-b-p q r] 
   [DNUSCD=a-b-c-d s t] 
   ```

2. **REASON FOR OUTPUT**

   To indicate fault recovery activity within the switching module (SM) caused by failure of a common data (CD) board in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and reported by SM scanning software. The message indicates what recovery action was taken and gives the current fault counts against the common control (CC) circuit and the CD circuit specified in the message. Refer to field 'h' to determine the effect the fault recovery activity had on the system.

3. **VARIABLE FIELD DEFINITIONS**

   - **a** = Switching module number.
   - **b** = DNU-S unit number.
   - **c** = DNU-S data group number.
   - **d** = DNU-S CD number.
   - **e** = DNU-S CD equipment status. Valid value(s):
     - **ACTIVE** = The CD is in service and a fault has been detected.
     - **OOS** = The CD is marked as out-of-service, but fault stimuli are still being detected.
     - **PRE-OOS** = Fault recovery has notified the maintenance request administrator (MRA) to remove this CD from service. However, fault stimuli are still being detected from the circuit indicating that the CD has not been completely removed from service.
     - **STANDBY** = The CD is in standby and a fault has been detected.
   - **f** = Event number.
   - **g** = Error type. Valid value(s):
     - **HDLC ERROR AT CD** = High level data link control errors were detected.
     - **IF LOSS OF CLOCK REFERENCE** = Peripheral Link Interface receive errors were detected.
     - **NO ERROR SOURCE FOUND** = A message was sent to peripheral fault recovery (PFR) software indicating a scanned communication failure. However, PFR software analysis revealed no such failure condition.
     - **PCAMB PARITY ERRORS** = Peripheral control and maintenance bus parity errors were detected.
     - **PCT LOOP BACK FAIL SMP TO CD** = The CD failed to respond to an SMP direct communication check.
     - **PLI OUTGOING BUFFER CHECK ERROR** = Peripheral Link Interface transmit errors were detected.
SANITY TIMER TIMEOUT = The sanity timer expired on the CD.

h = Recovery action. Valid value(s):
ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
HARD RESET = The circuit has been hard reset without scheduling diagnostics.
INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.
NO RECOVERY ACTION TAKEN = This event needed no recovery action.
PRE-OOS THRESHOLD EXCEEDED = The CD was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The CD has been preempted and is still detecting errors, inhibit has been re-applied on the CD.
RE-INHIBIT ERROR = The CD has been inhibited and error are still detected. Inhibit has been re-applied on the CD.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:DNUSCD output message will be printed with the results of the diagnostic.
SWITCH = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

i = DNU-S message type.
j = Currently unused.
k = Internal CC circuit name.
l = Internal CD circuit name or unused, depending on the type of error (field 'g').
m = Unmasked peripheral error source information.
n = Raw peripheral error source information.
o = Peripheral error mask information.
p = DNU-S CC circuit number.
q = Number of recent failures of this error type (field 'g') on this DNUSCC circuit (in decimal).
r = Error count threshold above which the recovery action will become stronger on the DNUSCC circuit.
s = Number of recent failures of this error type (field 'g') on this DNUSCD circuit (in decimal).
t = Error count threshold above which the recovery action will become stronger on the DNUSCD circuit.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the DNUSCD from service during a period of low usage and perform trouble locating procedures.
5. ALARMS

None.

[DNUSCD=a-b-c-d n o]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of the communication path to
the common control (CC) board in the digital networking unit - synchronous optical network (SONET) (DNU-S). The
fault was detected and reported by message handler (MH) fault recovery software, and preliminary recovery was
taken by MH fault recovery software. The message also indicates what recovery action was taken by peripheral fault
recovery and gives the current fault counts against the circuit specified in the message. Refer to field 'i' to
determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = DNU-S unit number.
c = DNU-S data group number.
d = DNU-S CD number.
e = DNU-S CD equipment status. Valid value(s):
  ACTIVE = The CD is in service and a fault has been detected.
  OOS = The CD is marked as out-of-service, but fault stimuli are still being detected.
  PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to
             remove this CD from service. However, fault stimuli are still being detected from the
             circuit indicating that the CD has not been completely removed from service.
  STANDBY = The CD is in standby and a fault has been detected.

f = MH preliminary recovery action. Valid value(s):

  MH CHANNEL DEACTIVATED
  MH CRITICAL ERROR
  MH ERROR REPORT
  MH INACTIVE CHAN INIT
  MH INITIATED OSR
  MH RESTART OF CHANNEL
  MH RESTART OF LAYER 2
  MT EVENT REPORT
g = Event number.

h = Error type. Valid value(s):
- LOGICAL LINK RESTART FROM CC END
- MH BAD CRC
- MH CHAN TRACKS VAR SET DURING OSR
- MH END OF IDLE DETECTED
- MH EXPECTED INFO FIELD NOT PRESENT
- MH FRAME ABT DURING RECEIVE/TRANS
- MH FRAME REJECT RECEIVED
- MH IDLE DETECTED
- MH IDLE TIMER EXPIRED
- MH ILLEGAL ADDRESS
- MH INFO FIELD EXCEEDED MAX SIZE
- MH INVALID COMMAND/RESPONSE FIELD
- MH INVALID EA BIT
- MH INVALID HEADER FIELD
- MH INVALID INFORMATION FIELD
- MH INVALID POLL/FINAL FIELD
- MH INVALID SAPI
- MH INVALID TEI
- MH LAYER 2 ESTABLISHED INDICATION
- MH LAYER 2 RELEASED INDICATION
- MH LOGICAL LINK TRACKS VAR DURING OSR
- MH LONG/SHORT FRAME OR BAD BIT COUNT
- MH LOST LAYER 2—NO RESP FROM FAR END
- MH MAXIMUM FRAME SIZE EXCEEDED
- MH OUT OF SEQUENCE
- MH SEQUENCE FIELD INVALID
- MH TRANS RETRY COUNT EXCEEDED
- MH UNEXPECTED FRAME
- MH UNEXPECTED FRM CURR LOG LINK STATE
- MH UNEXPECTED INFORMATION FIELD
- MH UNEXPECTED UNNUMBERED FRAME
- MH UNKNOWN FRAME TYPE
- NO ERROR SOURCE FOUND
- PCT LOOP BACK FAIL SMP TO CD = This error may cause the DNUSCCs to duplex fail. The
  DNUSCCs duplex failing will not effect customer service on the DNUS. The
  DNUSCCs should recover and recovery action on the DNUSCD will occur. If the
  DNUSCC do not recover on their own replace the DNUSCD=a-b-c-d in the fault
  report. refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION
  section of the Output Messages manual.

i = Recovery action taken by peripheral fault recovery. Valid value(s):
- ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or
  circuits are failing, but the error counts have not reached a threshold for action.
- HARD RESET = The circuit has been hard reset without scheduling diagnostics.
- INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
- INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling
  diagnostics.
- NO RECOVERY ACTION TAKEN = This event needed no recovery action.
- PRE-OOS THRESHOLD EXCEEDED = The CD was preempted and is still detecting errors.
- PRE-OOS, RE-INHIBIT HDWCHKS = The CD has been preempted and is still detecting errors,
  inhibit has been re-applied on the CD.
RE-INHIBIT ERROR = The CD has been inhibited and error are still detected. Inhibit has been re-applied on the CD.

RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:DNUSCD output message will be printed with the results of the diagnostic.

SWITCH = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

Note: Fields 'j' through 'm' contain up to twenty of the last MH events. Fields 'j' through 'l' constitute a single MH event, and each block of eight hex characters of field 'm' constitutes an additional MH event, with a similar layout to fields 'j' through 'l'. The MH events are arranged from least recent to most recent, so fields 'j' through 'l' represent the least recent event, and the last eight hex characters of field 'm' is the most recent event.

j = Contains a time stamp.
k = Layer 2 logical link number and MH channel number, in a bit-packed representation. The first three bits indicate the layer 2 logical link number, and the next five bits indicate the MH channel number.
l = MH internal inhibit status and MH error type, in a bit-packed representation. The first bit indicates the MH internal inhibit status, and the next seven bits indicate the MH error type.
m = Up to nineteen additional MH events with a similar layout to fields 'j' through 'l'. The last eight hex characters this field represent the most recent MH event.
n = Number of recent failures of this error type (field 'n') on this DNUSCD circuit (in decimal).
o = Error count threshold above which the recovery action will become stronger.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the DNUSCD from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

None.

   SP FIFO OVERFLOW FAILURE RECOVERY ACTION g
   h i j
   kkkkl11ll mmmmnnnn oooopp pp

2. REASON FOR OUTPUT

To respond to a signal processor (SP) error caused by the SP first-in first-out (FIFO) buffer’s overflowing due to a showering digital networking unit - synchronous optical network (SONET) (DNU-S) number digital signal level 1 SONET facility (DS1SFAC).

3. VARIABLE FIELD DEFINITIONS

- a = Switching module number.
- b = DNU-S unit number.
- c = Data group number.
- d = SONET termination equipment (STE) facility number.
- e = Synchronous transport signal (STS) number.
- f = Event number.
- g = Recovery action. Valid value(s):
  ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
  RMV = The failing facility was removed from service.
- h = External logical circuit name.
- i = Number of recent failures of this type recorded against this circuit, in decimal.
- j = Error count threshold, above which the recovery action will become stronger, in decimal.
- k = Time slot number that had the most entries in the FIFO, in hexadecimal.
- l = Total number of entries in the FIFO for time slot ‘k’, in hexadecimal.
- m = Total number of time slots on the high-runner time slot interchange (TSI) link with entries in the FIFO, in hexadecimal.
- n = Contents of the current internal fault recovery error counter, in hexadecimal.
- o = Total number of failures reported on unlinked timeslots, in hexadecimal.
p = SP number, in hexadecimal.
q = Virtual tributary group (VTG) number.
r = Virtual tributary member (VTM) number.

4. ACTIONS TO BE TAKEN

Monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected.

5. ALARMS

None.

**REPT:DSE**

**Software Release:** 5E14 and later  
**Message Class:** CCS  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   ```plaintext
   REPT DSE [a] INC TRK=[b]  
   c
   ```

2. **REASON FOR OUTPUT**

   To report the occurrence of a direct signaling event (DSE), that may be an inward wide area telecommunications service (INWATS) event or a network call denial (NCD) event. These events will be reported only in response to the input message SET:DSE.

3. **VARIABLE FIELD DEFINITIONS**

   - **a** = Digits associated with the call that caused the event to occur. For an INWATS event, these digits are the INWATS number and the originating numbering plan area (NPA). For an NCD event, these digits are the billing number contained in the original query, if available. If the billing number for the original query for an NCD event is not available, variable ‘a’ is blank. If the event is a call denied due to NCD, only the NPA-NXX of the billing number are available.
   
   - **b** = For INWATS events, this is the incoming trunk associated with the call triggering this event. For NCD events, this is blank.
   
   - **c** = Text phrase describing the event that occurred. Valid value(s):
     - **AT&T—C CALL DENIED AFTER ANSWER** = An NCD deny reply was received and the call was killed after the answer occurred.
     - **AT&T—C CALL DENIED BEFORE ANSWER** = An NCD deny reply was received and the call was killed before the answer occurred.
     - **INWATS ALL LINES BUSY** = All lines to the INWATS database are busy.
     - **INWATS CCIS FAILURE-DESTINATION UNEQUIPPED** = An INWATS query was returned by the common channel signaling (CCS) network indicating the destination is unequipped.
     - **INWATS CCIS FAILURE-NETWORK BLOCKAGE** = An INWATS query was returned by the CCS network indicating blockage.
     - **INWATS CCIS FAILURE-NETWORK OVERLOAD** = An INWATS query was returned by the CCS network indicating overload.
     - **INWATS CCIS FAILURE-NO TRANSLATION DATA** = An INWATS query was returned by the CCS network indicating no data to translate the 800 number.
     - **INWATS DATABASE OVERLOAD** = An INWATS query was returned due to INWATS database overload.
     - **INWATS INVALID ORIGINATING NPA** = The originating NPA in the INWATS query is nonexistent or invalid.
     - **INWATS NONPURCHASED NPA** = The NPA where the 800 number originated is not purchased for the INWATS service.
     - **INWATS QUERY BLOCKED DUE TO CODE CONTROL FOR INWATS/NCP OVERLOAD** = The INWATS query was not sent because of a code control installed in response to an INWATS network management (NM) message indicating INWATS/NCP overload.
     - **INWATS QUERY BLOCKED DUE TO DIRECT SIGNALING CODE CONTROL** = The INWATS query was not sent because of a code control installed in response to a CCIS6 network overload.
failure reply.

**NCD CCIS FAILURE-DESTINATION UNEQUIPPED** = An NCD query was returned by the CCS network indicating the destination is unequipped.

**NCD CCIS FAILURE-NETWORK BLOCKAGE** = An NCD query was returned by the CCS network indicating blockage.

**NCD CCIS FAILURE-NETWORK OVERLOAD** = An NCD query was returned by the CCS network indicating overload.

**NCD CCIS FAILURE-NO TRANSLATION DATA** = An NCD query was returned by the CCS network indicating no data to translate the 800 number.

**NCD DENY REPLY RECEIVED** = An NCD deny reply was received in response to the NCD query.

**NCD QUERY BLOCKED DUE TO CODE CONTROL FOR NCD/NCP OVERLOAD** = The NCD query was not sent due to a code control installed in response to NCD/NCP overload.

**NCD QUERY BLOCKED DUE TO DIRECT SIGNALING CODE CONTROL** = The NCD query was not sent due to a code control installed in response to a CCIS6 network failure reply.

**NCD QUERY RETURNED BY THE NCD/NCP** = An NCD query was returned by the NCD/NCP and was not processed.

**TIMEOUT WHILE WAITING FOR A RESPONSE FROM INWATS DATABASE** = A response to the INWATS query was not received within the time limit.

**VACANT LINE NUMBER IN 800 NUMBER** = The line number, XXXX, dialed in the 800-NXX-XXXX number is a vacant number.

**VACANT NXX IN 800-NXX-XXXX** = The NXX in the 800 number of the INWATS query is vacant.

SM SUMMARY COMPLETED

2. REASON FOR OUTPUT

To report the automatic mismatch test result. (Refer to the input message ALW:MISMATCH for more information.)
This message prints the list of U-Interface digital subscriber lines (DSLs) with inconsistencies between the circuit type listed in the office-dependent data (ODD) and the type of line card (LC) and network termination (NT) or first basic rate interface transmission extension (BRITE) channel unit (CU) installed. If there are no mismatches nothing is printed.

3. VARIABLE FIELD DEFINITIONS

NEW = Is printed to indicate that this is the first time mismatch has been detected on this particular LCEN, since the last running of the automatic mismatch test.

T/R-REV = This is not a mismatch. A tip and ring reversal has been detected on the line. This is only valid for AMI-U type of LC.

a = Switching module (SM) number.

b = Segment number. There can be up to 8 lines listed in each segment.

c = Line card equipment number (LCEN) or line circuit equipment number (LCKEN). Valid value(s):

LCEN=SM-ISLU-LGC-LC
LCKEN=SM-ISLU-LG-LB-LCKT

d = Type of U card recorded in ODD. Valid value(s):

AMI-U = LC type of the DSL is alternate mark inversion (AMI) U interface.
ANSI-U = LC type of the DSL is ANSI® U-interface.

e = Type of LC installed in the ISLU. Valid value(s):

AMI-U = LC type of the DSL is AMI U interface.
ANSI-U = LC type of the DSL is ANSI® U-interface.
T = LC type of the DSL is T interface.
Z = LC type is Z card.

f = Type of NT that the LC is connected to. Valid value(s):
AMI-U = Type of NT or first BRITE CU is AMI U interface.
ANSI-U = Type of NT or first BRITE CU is ANSI® U-interface.
UNKNOWN = The NT type is unknown.

g = Integrated services line unit (ISLU) number.
h = Line group number.
i = Line card number.

4. ACTION TO BE TAKEN
First, check ODD for the correct type of LC. Depending on the type of mismatch found, either install the correct type of LC, correct type of NT|CU, or correct both.

5. ALARMS
None.

6. REFERENCES
Input Message(s):

Type: Output

1. FORMAT

[1] REPT DUI a {ERROR b [COMPL CODE c] | UNIDENTIFIED RESPONSE WD1=d WD2=e)

[2] REPT DUI a STARTED

[3] REPT DUI a STOPPED

2. REASON FOR OUTPUT

Format 1 reports a direct user interface (DUI) subdevice-related software or hardware error.

Format 2 reports that the DUI has changed state from standby (STBY) to active (ACT). A DUI will change to ACT state when the level 2 connection is established and the data link is in information transfer state.

Format 3 reports that the DUI has changed state from ACT to STBY. A DUI will change to STBY state when the level 2 connection is terminated and the level 1 connection remains established.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.

c = Hardware error type. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.

d = First word of an unidentified completion report.

e = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

The error message in Format 1 indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

The messages in Formats 2 and 3 are informational messages and indicate that the DUI has changed states. No action is necessary.

5. ALARMS

Format 1 has an alarm level of INFO. Formats 2 and 3 have alarm levels of VAR. This is a variable alarm to be
determined by the client process. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[2] REPT DUIC a CODE VERSION X'f

2. REASON FOR OUTPUT

Format 1 reports a direct user interface controller (DUIC) related software or hardware error.

Format 2 is output during the restoration of the unit.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies point within input/output processor driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.

c = Hardware error error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.

d = First word of an unidentifiable completion report.

e = Second word of an unidentifiable completion report.

f = Peripheral controller pump code version.

4. ACTION TO BE TAKEN

These error messages indicate error conditions that could cause the removal of a unit. Any removed unit must be repaired and restored to service. No action is necessary for the message in Format 2 unless the controller and/or its subdevices are not acting normal, or could not be restored. Contact the service organization with the code version which was used.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REMOTE CLOCK a STATUS X'  
  y5z5a6b6 c6d6e6f6 00000000 00000000 00000000 00000000 00000000
```

2. **REASON FOR OUTPUT**

To dump the specified remote clock (RCLK) communication control buffer and communication link receiver/transmitter (CCB/CLRT) registers and status data in response to a request.

The first 5 fields in the dump message (’f’-’j’) deal with the CLRT subaddresses and status.

The rest of the dump message concerns the contents of the CCB. The data in the fields contains information about location and cause of errors, as well as data on the configuration of the remote clock.

Fields ’k’ and ’m’ through ’t’ will indicate if there are errors reported by the RCLK to the control interface (CI).

3. **VARIABLE FIELD DEFINITIONS**

- **a** = Switching module (SM) number.
- **b** = Remote clock (RCLK) side (0 or 1).
- **c** = Status. Valid value(s):
  - COMPLETED = Dump completed normally.
  - STOPPED = Dump aborted due to a communication fault with the RCLK.
- **d** = Text string further explaining the error.
- **e** = Event number for requested action.
- **f** = CLRT subaddress 0.
- **g** = CLRT subaddress 1.
- **h** = CLRT subaddress 2.
- **i** = CLRT status upper byte.
- **j** = CLRT status lower byte.
k = Summary of the flag vectors (fields 'm' through 't'). Valid value(s):
  nonzero = Errors have been reported by the RCLK hardware. Refer to variables 'm' through 't'.
  0 = No errors have been reported by the RCLK hardware.

The bits set in 'k' point to a specific flag vector. Refer to Exhibit A.

Exhibit A: Values For Flag Vectors

<table>
<thead>
<tr>
<th>If 'k' =</th>
<th>(bit set)</th>
<th>flag field</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>40</td>
<td>b6</td>
<td>s</td>
</tr>
<tr>
<td>80</td>
<td>b7</td>
<td>t</td>
</tr>
</tbody>
</table>

By examining the flag fields specified by the summary vector, 'k', you may determine the exact location of the error. The combination of the location and the hexadecimal value in the flag vector will point to the field which contains the error report. The bits set serve as flags to the locations; therefore, there may be more than one bit set in any flag field. The values shown below assume only one bit is set at a time in the flag vector. If more than one bit is set, investigate the field pointed to by each flag.

l = Not used.

m–t = Flag vector fields. These show any errors reported by the RCLK to the control interface (CI). The flag vectors tell which location of the communication control buffer (CCB) is reporting the error.

The report location is found by intersecting the row corresponding to the flag vector location ('m' through 't') with the value or bit set in that field. Refer to Exhibit B.

Exhibit B: Field Value

</tr>
</tbody>
</table>

Example: Field 'k' contains the value '02' which points to flag vector 'n'. Then, field 'n' holds the value '08'. By intersecting row 'n' of the above table with column '08' (bit 3 set) you are directed to report location '11'. The value in field '11' is '04', or bit 2 is set. By looking at the explanation for '11', [the reference summary error source register (ESR)], if bit 2 is set, then there is an error on reference 3, and the last step of the investigation is to look at field 'h3' for the type of error reported.

The values in the information bytes of the dump are keyed off of bit position in the data. A byte has its most significant bit (left-most position) as 'b7', and least significant (right-most position) as b0.
Remote clock configuration.

<tr>
<td>b4-b5</td>
<td>Give status of remote (other side) oscillator. Valid value(s): 0 = Out of service. 1 = In warmup state. 2 = Active. 3 = Standby.</td>
</tr>
</tbody>
</table>
b6-b7 = Not used.

d1 = Inverted talkback location. The value in this location should have the logically inverted value from field 'a5'. This indicates that the communications to and from the clock are operating properly.

e1 = Active reference byte. The active reference(s) for the clock side are indicated by a set bit in this field. b0 set means RCREF1 is active, b1 set means RCREF2 is active, etc., for all eight references.

f1 = Not used.

g1 = Not used.

h1 = Not used.

i1 = Hardware error source register (ESR). A set bit means an error of the noted type has occurred. These errors are detected from the remote clock controller (CNTL) or synchronization (SYNC) circuit pack. Valid value(s):

- b0 = Digital/analog converter (DAC) or voltage-controlled crystal oscillator (VCXO) register error (CNTL).
- b1 = Memory error/firmware fault (CNTL).
- b2 = Local oscillator energy detector error (SYNC0).
- b3 = Remote oscillator energy detector error (SYNC0).
- b4 = Local oscillator energy detector error (SYNC1).
- b5 = Remote oscillator energy detector error (SYNC1).
- b6-b7 = Not used.

j1 = Oscillator ESR. A set bit means that an error of the noted type has occurred. These errors are detected on the remote clock oscillator circuit pack. Valid value(s):

- b0 = Local oscillator energy detector.
- b1 = Local oscillator frequency.
- b2 = Local oscillator inner oven bit (loss of temperature stability on high stability oscillator).
- b3 = Local oscillator outer oven bit (loss of temperature stability on high stability oscillator).
- b4 = Remote oscillator energy detector.
- b5 = Remote oscillator frequency.
- b6-b7 = Not used.

k1 = Source ESR. A set bit means that an error of the noted type has occurred. These errors are detected on the remote clock controller circuit pack. Valid value(s):

- b0 = 8 KHz return signal phase difference.
- b1 = Not used.
- b2 = 8 KHz return signal energy detector.
- b3 = Cross-couple energy detector.
- b4 = Cross-couple phase difference.
- b5-b7 = Not used.

l1 = Reference summary ESR. A set bit means that there is an error on the corresponding reference. For more information, refer to the following fields:

- b0 = RCREF1 refer to 'z1'.
b1 = RCREF2 refer to 'd2'.
b2 = RCREF3 refer to 'h2'.
b3 = RCREF4 refer to 'l2'.
b4 = RCREF5 refer to 'p2'.
b5 = RCREF6 refer to 't2'.
b6 = RCREF7 refer to 'x2'.
b7 = RCREF8 refer to 'b3'.

m1 = Invalid command address. Indicates that an internal error has occurred and the firmware has received an invalid request. The location is an internal CCB address (refer to 'n1').

n1 = Invalid command data. This is the data that was passed to the firmware in the invalid address (‘m1’).

o1 = Not used.

p1 = Not used.

q1 = Time base offset calculation status. This byte indicates what action is taken on the time base offset for the local and remote side.

<table>
<thead>

l^4 = Reference 1 ESR pests.

p^4 = Reference 2 ESR pests.

t^4 = Reference 3 ESR pests.

x^4 = Reference 4 ESR pests.

b^5 = Reference 5 ESR pests.

f^5 = Reference 6 ESR pests.

j^5 = Reference 7 ESR pests.

n^5 = Reference 8 ESR pests. Individual reference error source registers (ESRs) pests. A set bit in the field means that an error of this type is pested on this reference. Valid value(s): b0 = Out-of-range of allowed frequency.
b1 = Phase step.
b2 = Excess jitter on the reference.
b3 = Local alarm (loss of reference).
b4 = Low error rate threshold.
b5 = High error rate threshold.
b6 = Low out of frame threshold.
b7 = High out of frame threshold.

m4 = Reference 1 coefficient.
q4 = Reference 2 coefficient.
u4 = Reference 3 coefficient.
y4 = Reference 4 coefficient.
c5 = Reference 5 coefficient.
g5 = Reference 6 coefficient.
k5 = Reference 7 coefficient.
o5 = Reference 8 coefficient. Used to provide the "reference priority". In master/slave synchronization this means that the order of preference from 1 to 'n' (with 'n' the number of equipped references) should be in the appropriate reference coefficient. The most preferred reference should be '1' and the least preferred should be 'n'. Automatic actions will switch from reference '1' to reference '2' on detection of errors, and so on through all equipped references.

In mutual synchronization this value is a weighting parameter, where the larger the value, the more a reference is taken into consideration when calculating a phase to lock to.

n4 = Reference 1 data.
r4 = Reference 2 data.
v4 = Reference 3 data.
z4 = Reference 4 data.
d5 = Reference 5 data.
h5 = Reference 6 data.
l5 = Reference 7 data.
p5 = Reference 8 data. Used in double-ended mutual synchronization only. No meaning for master/slave or single-ended mutual synchronization schemes.

q5-r5 = Phase buildout value (upper and lower bytes, respectively). Used to quickly lock the active major side to the external reference. Can be loaded as a desired value for testing. Internal use only.

s5-t5 = Digital/analog converter (DAC) value (upper and lower bytes, respectively). Used to give an analog value to run the voltage controlled oscillator. Internal use only.
u5 = Not used.
v<sup>5</sup> = Data written to test communications from CI to RCLK. Should have the inverted value from field 'd<sup>1</sup>'.

w<sup>5</sup> = Not used.

x<sup>5</sup> = Not used.

y<sup>5</sup> = ESR vector summary flag. A set bit means an error has been detected in the corresponding ESR. Valid value(s):

- b<sub>0</sub> = Error detected in location 'a<sup>1</sup>'.
- b<sub>1</sub> = Error detected in location 'b<sup>1</sup>'.
- b<sub>2</sub> = Error detected in location 'c<sup>1</sup>'.
- b<sub>3</sub> = Error detected in location 'd<sup>1</sup>'.
- b<sub>4</sub> = Error detected in location 'e<sup>1</sup>'.
- b<sub>5</sub>-b<sub>7</sub> = Not used.

z<sup>5</sup> = ESR vector summary flag. A set bit means an error has been detected in the corresponding ESR. Valid value(s):

- b<sub>0</sub> = Error detected in location 'i<sup>1</sup>'.
- b<sub>1</sub> = Error detected in location 'j<sup>1</sup>'.
- b<sub>2</sub> = Error detected in location 'k<sup>1</sup>'.
- b<sub>3</sub> = Error detected in location 'l<sup>1</sup>'.
- b<sub>4</sub> = Error detected in location 'm<sup>1</sup>'.
- b<sub>5</sub> = Error detected in location 'n<sup>1</sup>'.
- b<sub>6</sub>-b<sub>7</sub> = Not used.

a<sup>6</sup> = ESR vector summary flag. A set bit means an error has been detected in the corresponding ESR. Valid value(s):

- b<sub>0</sub> = Error detected in location 'q<sup>1</sup>'.
- b<sub>1</sub> = Error detected in location 'r<sup>1</sup>'.
- b<sub>2</sub> = Error detected in location 's<sup>1</sup>'.
- b<sub>3</sub> = Error detected in location 't<sup>1</sup>'.
- b<sub>4</sub> = Error detected in location 'u<sup>1</sup>'.
- b<sub>5</sub> = Error detected in location 'v<sup>1</sup>'.
- b<sub>6</sub> = Error detected in location 'w<sup>1</sup>'.
- b<sub>7</sub> = Error detected in location 'x<sup>1</sup>'.

b<sup>6</sup> = ESR vector summary flag. A set bit means an error has been detected in the corresponding ESR. Valid value(s):

- b<sub>0</sub> = Error detected in location 'y<sup>1</sup>'.
- b<sub>1</sub> = Error detected in location 'z<sup>1</sup>'.
- b<sub>2</sub> = Error detected in location 'a<sup>2</sup>'.
- b<sub>3</sub> = Error detected in location 'b<sup>2</sup>'.
- b<sub>4</sub> = Error detected in location 'c<sup>2</sup>'.
- b<sub>5</sub> = Error detected in location 'd<sup>2</sup>'.
- b<sub>6</sub> = Error detected in location 'e<sup>2</sup>'.
- b<sub>7</sub> = Error detected in location 'f<sup>2</sup>'.
c^6 = ESR vector summary flag. A set bit means an error has been detected in the corresponding ESR.
Valid value(s):
- b0 = Error detected in location 'g^2'.
- b1 = Error detected in location 'h^2'.
- b2 = Error detected in location 'i^2'.
- b3 = Error detected in location 'j^2'.
- b4 = Error detected in location 'k^2'.
- b5 = Error detected in location 'l^2'.
- b6 = Error detected in location 'm^2'.
- b7 = Error detected in location 'n^2'.

d^6 = ESR vector summary flag. A set bit means an error has been detected in the corresponding ESR.
Valid value(s):
- b0 = Error detected in location 'o^2'.
- b1 = Error detected in location 'p^2'.
- b2 = Error detected in location 'q^2'.
- b3 = Error detected in location 'r^2'.
- b4 = Error detected in location 's^2'.
- b5 = Error detected in location 't^2'.
- b6 = Error detected in location 'u^2'.
- b7 = Error detected in location 'v^2'.

e^6 = ESR vector summary flag. A set bit means an error has been detected in the corresponding ESR.
Valid value(s):
- b0 = Error in location 'w^2'.
- b1 = Error in location 'x^2'.
- b2 = Error in location 'y^2'.
- b3 = Error in location 'z^2'.
- b4 = Error in location 'a^3'.
- b5 = Error in location 'b^3'.
- b6 = Error in location 'c^3'.
- b7 = Error in location 'd^3'.

f^6 = ESR vector summary flag. A set bit means an error has been detected in the corresponding ESR.
Valid value(s):
- b0 = Error in location 'e^3'.
- b1 = Error in location 'f^3'.
- b2 = Error in location 'g^3'.
- b3 = Error in location 'h^3'.
- b4 = Error in location 'i^3'.
- b5 = Error in location 'j^3'.
- b6−b7 = Not used.

4. ACTION TO BE TAKEN

When an error condition triggers this, an accompanying REPT:RCLK output message related to the error type specified by the variable 'd' prints to the receive only printer (ROP). Consult the appropriate REPT:RCLK error
message and the explanation for the dumped registers for additional information.

5. ALARMS

None.

6. REFERENCES

Output Message(s):

REPT:RCLK-[unit]
REPT:E-BUS-FAD

Software Release: 5E15 and later
Message Class: SMCONFG
Application: 5
Type: Output

1. FORMAT

REPT E-BUS FAULT ANALYSIS DATA PAGE a OF b
LAST HAPPENED AT: c
FIRST HAPPENED AT: d
LAST SELECTED AT: e
ERROR COUNT: f
REPAIRED EQUIPMENTS: g

TMS = h LINK INFORMATION:

2. REASON FOR OUTPUT

To print for record for the active/archived TMS E-BUS fault analysis data (FADATA).

3. VARIABLE FIELD DEFINITIONS

a = Number of this page.
b = Total number of pages in the report.
c = The last happened time stamp of this FADATA.
d = The first happened time stamp of this FADATA.
e = The last selected time stamp of this FADATA for trouble shooting.
f = Total count of this FADATA which had happened.
g = Associated repaired equipments list.
h = TMS side.
i = These fields indicate the CM2 TMSLNK(s) affected by the reported errors. There are 2 rows of TMSLNK data. The first 4 words of the first row correspond to TMSLNKs 127 - 0, the second 4 words of the first row correspond to TMSLNKs 255 - 128. For the second row, the first 4 words correspond to TMSLNKs 383 - 256, and the second 4 words correspond to TMSLNKs 511 - 384. There are 16 4-byte TMSLNK data blocks. Each block contains 32 TMSLNKs and the TMSLNK numbers increase sequentially. For example, the first 4 byte block (4th word in 1st row) contains TMSLNKs 0-31, the next word (3rd word in 1st row) contains TMSLNKs 32-63, and so on. Each byte is 8 bits for eight TMSLNKs and 4 bytes equals 32 TMSLNKs. Each byte is read in reverse. For example, the first byte of a TMSLNK block contains bits for TMSLNKs 7-0, the next byte contains bits for TMSLNKs 15-8, the next byte contains bits for TMSLNKs 23-16, and the last byte contains bits for TMSLNKs 31-24.

Normally the "TMSLNKS AFFECTED" field will contain the TMSLNK(s) that are detecting the errors.
4. ACTIONS TO BE TAKEN

Continue the TMS E-BUS trouble shooting, if one is already in progress. Otherwise, keep this report for your records.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   RCV:M–FATLP
REPT:E911

Software Release: 5E14 and later
Message Class: ALRM
Application: 5
Type: Output

1. FORMAT

[1] REPT E911=MDII a TKGMN b c
[2] REPT E911=ASRT d PORT e f
[3] REPT E911=ASRT d PCRID g
[4] REPT E911=TKGOOS TKG h

2. REASON FOR OUTPUT

To indicate that an E911 error has occurred and that output at the read-only printer (ROP) should be checked for additional details.

This output message is applicable to the E911 feature and the E911 Call Error Detection and Alarm feature.

Format 1 reports that a machine-detected interoffice irregularity (MDII) has occurred during an E911 call. The trunk group and member associated with the MDII is identified in the message.

Format 2 reports that an assert has occurred during an E911 call. The assert was associated with a physical port and the port is identified in the message.

Format 3 reports that an assert has occurred during an E911 call. The assert was not associated with a physical port. The processor associated with the assert is identified in the message.

Format 4 reports that the switch has detected an out-of-service trunk group during an E911 call. The trunk group number is identified in the message.

3. VARIABLE FIELD DEFINITIONS

a = MDII mnemonic. Refer to the APP:MDII appendix in the Appendixes section of the Output Messages manual.

b = Trunk group number (group identifier of TKGMN) on which the error occurred.

c = Trunk group member number (member identifier of TKGMN) on which the error occurred.

d = Assert number. Refer to the Asserts manual.

e = Switching module (SM) number.

f = Port member number, in hexadecimal.

g = Processor identifier (PCRID). The variable will contain either the SM number, or the administrative module (AM) number, or the communications module processor (CMP) number, to identify the processor in which the assert occurred.

h = Trunk group number on which the error occurred.
4. ACTIONS TO BE TAKEN

Obtain the error message that appears at the ROP. Analyze the trunk group, MDII or assert data and take corrective action.

5. ALARMS

Minor.

[9] REPT EAI BOOT DISK SELECTION CHANGED ON EAI PAGE
   MHD=i STATUS=j [X'k]
   MHD=i STATUS=j [X'k]
2. REASON FOR OUTPUT

Format 1 reports that the sanity timers are inhibited.

**WARNING:** The system's ability to recover from errors is reduced when the sanity timers are inhibited. The sanity timers are not inhibited in normal operation.

Formats 2, 3, and 4 report that root, backup root, or minimum configuration is selected and the system is not currently running in that mode. To avoid inadvertently booting the system in the wrong mode, these selections should only be made just prior to booting the system.

Format 5 is applicable only for the 3B21D machines. This has four different messages. These messages are output as a result of either inhibiting emergency action interface (EAI) hardware error reporting using an input message or inhibiting EAI hardware error interrupt due to excessive errors.

<table>

<td>This indicates that the EAI error reporting has been inhibited by a software message for over 24 hours. Fault recovery software within the system is automatically enabling this reporting.</td>
</tr>
</tbody>
</table>

Format 6 reports that an application parameter has been entered, but not followed by a manual initialization. To avoid inadvertently performing a manual initialization with an unknown application parameter set, application parameters should only be input just prior to a manual initialization.

Format 7 reports EAI off-normal selections. One or more fields are displayed whenever an off-normal condition is detected. This message can only be displayed when the hardware platform is configured with the recovery from alternate boot disk feature.

Format 8 reports an inconsistency between the MTTYC0 and MTTYC1 hardware or firmware. This message can
only be displayed when the hardware platform is configured with the recovery from alternate boot disk feature.

Formats 9 and 10 report that an alternate boot disk was selected or deselected and the status of the selected disks. Format 10 indicates that the alternate boot disk selection is different from the disks with which the system was booted. Format 9 is generated when an alternate boot disk selection is changed to be the same as the current duplexed boot disks. This message can only be displayed when the hardware platform is configured with the recovery from alternate boot disk feature.

3. VARIABLE FIELD DEFINITIONS

a = A string defining one of three possible error types. Valid value(s):
   ** WARNING ** EAI ERROR THRESHOLD EXCEEDED ON CU b.
   ** WARNING ** EAI INTERRUPT INHIBITED ON CU b.
   ** WARNING ** EAI ERROR REPORTING INHIBITED FOR OVER 24 HOURS ON CU b.

b = CU member number.

c = A string defining one of four possible error types. Valid value(s):
   ** WARNING ** ATTEMPTED SOFT SWITCH FAILED.
   ** WARNING ** SOFT SWITCH COMPLETED.
   ** WARNING ** USE ALW:EAIINT COMMAND TO ENABLE THE INTERRUPT.
   ** WARNING ** AUTOMATICALLY ENABLING EAI ERROR REPORTING.

d = Blank line or a string defining one of two possible error types. Valid value(s):
   ** WARNING ** EAI ERROR REPORTING INHIBITED.
   ** WARNING ** DIAGNOSE AND REPLACE FAULTY CC BOARD.

e = Blank line or the following string. Valid value(s):
   ** WARNING ** DIAGNOSE AND REPLACE FAULTY CC BOARD.

f = Application parameter that is currently set.

g = Off-normal selection displaying one or more types. Valid value(s):
   ALT BOOT DEV = An alternate boot device has been selected. View the EAI screen to determine the boot device.
   APPL PARAM = An application parameter has been entered on the EAI.
   BACKUP ROOT SELECTION IS CLR = The backup root option has been cleared while running in BROOT.
   BACKUP ROOT SELECTION IS SET = The backup root option has been selected while running in ROOT.
   CU FORCED ONLINE = Indicates that a CU is forced on-line. View the EAI screen to determine which CU is selected.
   INH CACHE = The inhibit cache option has been selected.
   INH ERRCHK = The inhibit error check option has been selected.
   INH HDWCHK = The inhibit hardware check option has been selected.
   INH SFTCHK = The inhibit software check option has been selected.
   INHIBIT SANITY TIMER = The inhibit sanity timer option has been selected.
   MIN CONFIG = The min config option has been selected.
   PRI/SEC DISK = Either the primary or secondary disk has been selected. View the EAI screen to determine which option has been selected.
h = Equippage status of the MTTYC boards provided by the I/O driver to PCPAUD and an audit of the in-core ECD MTTY UCB equipage field. The equipage status word is eight hexadecimal digits of the form `aabbccc`.

- `aa` = Equippage value for MTTYC 0.
- `bb` = Equippage value for MTTYC 1.
- `ccc` = Bitfield. Valid value(s):

  - 0001 = The recovery from alternate boot disk (ABD) feature is available.
  - 0002 = System is operating with ABD selected.
  - 0004 = One MTTYC does not have ABD; the other MTTYC does have ABD.

i = MHD unit number. Refer to the APP:MEM-NUM appendix in the Appendixes section of the Output Messages manual.

j = MHD status. Valid value(s):

- `BOOTABLE` = The MHD can be used as a boot disk.
- `NBOOTABLE` = The MHD is not bootable. Variable `k` provides additional information.
- `RESERVED` = The MHD is currently reserved by a system level process. This situation can occur when a maintenance action is in progress, for example, when an MHD is being restored.
- `UNKNOWN` = The status of the MHD could not be obtained. Check the ROP for error output messages that may help resolve the reason for this status occurring.

k Error code when variable `j` is equal to `NBOOTABLE`. Refer to the APP:BOOTDISKCHK appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

For Format 1, remove the inhibit sanity timer selection on the EAI page of the maintenance terminal.

For Formats 2, 3, and 4, remove the root, backup root, or minimum configuration selection on the emergency action interface (EAI) page of the maintenance terminal.

For Format 5, do the following:

<table>
<thead>
<tr>
<th>Message Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Restore the other CU and switch to that CU. Run diagnostics on the faulty CU. If the diagnostic fails, replace the CC pack that contains the EAI circuitry and restore the CU. Save the diagnostic results, the information from the ERLOG, and the receive only printer (ROP) output. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>2</td>
<td>Restore the other CU and switch to that CU. Run diagnostics on the faulty CU. If the diagnostic fails, replace the CC pack that contains the EAI circuitry and restore the CU. Save the diagnostic results, the information from the ERLOG, and the receive only printer (ROP) output. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>3</td>
<td>Re-enable reporting of the EAI hardware errors.</td>
</tr>
<tr>
<td>4</td>
<td>No action is needed.</td>
</tr>
</tbody>
</table>

For Format 6, clear the application parameter using poke 43 (clr Appl Param) or poke 14 (CLR EAI).
For Format 7, no action is necessary.

For Format 8, the MTTYC0 and MTTYC1 should be consistent in terms of the type of hardware circuit packs and the flash memory downloaded on the circuit packs. Determine which circuit pack is causing the inconsistency and either replace it with an MTTYC that supports the recovery from alternate boot disk feature; or, if the circuit pack is the same type, execute diagnostics to download the flash memory. If the ECD contains an invalid equipage value, correct the ECD record.

For Formats 9 and 10, take action based on the description of the error. If the description of the error is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

Minor alarm. Take action as indicated in the report.

Major alarm. May not be service affecting, but take immediate action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

APP:OMDB-X-REF
APP:BOOTDISKCHK
1. FORMAT

REPT EAN=a-b TRBL DCTU SPURIOUS MESSAGE c
   EQUIPMENT ERROR THRESHOLD EXCEEDED RECOVERY ACTION d
   [e f g]
.
.
.

2. REASON FOR OUTPUT

To report a spurious trouble message sent by the directly connected test unit (DCTU) indicating an equipment access network (EAN) in the DCTU. The DCTU common board detected a problem internally and sent a message to indicate the nature of the trouble.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DCTU number.
c = Event number.
d = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
e = External logical circuit name. More than one circuit may be listed when multiple circuits can be blamed for the trouble.
f = Current decimal number of recent failures of this type recorded.
g = Error count threshold, at which the recovery action will be escalated.

4. ACTION TO BE TAKEN

No action required. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN EAN and RST EAN messages indicate success or failure of diagnostic when recovery action is RST AUTO CAMPON or RST PREEMPT.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to a signal processor (SP) error caused by the SP first-in first-out (FIFO) buffer’s overflowing due to a showering digital networking unit-synchronous optical network (SONET) (DNU-S) termination equipment (STE) facility.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Digital Networking Unit - SONET (DNU-S) number.
c = Data group (DG) number.
d = SONET Termination Equipment (STE) facility number.
e = Event number.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
   RMV = The failing facility was removed from service.
g = External logical circuit name.
h = Number of recent failures of this type recorded against this circuit, in decimal.
i = Error count threshold, above which the recovery action will become stronger, in decimal.
j = Time slot number that had the most entries in the FIFO, in hexadecimal.
k = Total number of entries in the FIFO for time slot ’j’, in hexadecimal.
l = Total number of time slots on the high-runner time slot interchange (TSI) link with entries in the FIFO, in hexadecimal.
m = Contents of the current internal fault recovery error counter, in hexadecimal.
n = Total number of failures reported on unlinked timeslots, in hexadecimal.
4. ACTIONS TO BE TAKEN

Monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected.

Output Appendix(es):

APP:OMDB-X-REF
REPT: EMERGENCY

Software Release: 5E14 and later
Message Class: SED
Application: 5
Type: Output

1. FORMAT

REPT EMERGENCY 911 CALL ERROR
    ORGINATING SM(s):
        a a a a a a a a a a

2. REASON FOR OUTPUT

To indicate that an E911 call error has been detected and that output at the receive-only printer (ROP) should be checked for additional details.

Above format reports that an E911 call error has been detected and all originating SMs that have detected an E911 call error are listed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

4. ACTIONS TO BE TAKEN

See the ROP. Investigate the cause of the alarm and take corrective action.

5. ALARMS

Critical.

</tbody>
</table>

2. REASON FOR OUTPUT

To report warnings resulting from the input of the 701 command poke from Master Control Center (MCC) Display Page 124 - GENERIC RETROFIT. The 701 command poke generates the UPD:G-ENTER input message used to load tapes during a software release retrofit, update, or large terminal growth (LTG). Warnings are output when the retrofit MCC display page process, Suprint, detects that either the required number of tapes for the listed destination is insufficient, or that the listed destination is not in the required duplex state.

3. VARIABLE FIELD DEFINITIONS

a = The destination device file (such as, /dev/vtoc) that this warning is output for.

b = Description of problem with destination device file. Valid value(s):

   MHD PAIR c NOT ACTIVE
   MHD PAIR c SIMPLEX
   MISSING DATA SEQUENCE
   MISSING TAPE SEQUENCE
   MISSING TEXT SEQUENCE

c = Moving head disk (MHD) pair number.

4. ACTION TO BE TAKEN

Follow the software release retrofit, update, or LTG manual for the transition type being performed.

5. ALARMS

None.

REPT:EON5-DRA
Software Release: 5E14 and later
Message Class: MDII
Application: 5
Type: Output

1. FORMAT

REPT EON5 DEFAULT ROUTING APPLIED
   REASON= a
   TRANS_ID= b
   PC-SSN= c - d
   CLLI= e
   TRKGRP= f
   CHGNUM= g
   CLGNUM= h
   DIALNUM= i

2. REASON FOR OUTPUT

This message reports data associated with default routed calls. This data is presented in a standard format from all SMs.

3. VARIABLE FIELD DEFINITIONS

a = Reason code string.
b = Transaction ID information.
c = Destination point code.
d = Subsystem number.
e = CLLI code string.
f = Trunk group number.
g = Charge number.
h = Calling Party Number.
i = Dialed Number.

4. ACTIONS TO BE TAKEN

The data presented in the REPT:EON5-DRA message may be used to determine the reason for default routing.

5. ALARMS

None.

2. REASON FOR OUTPUT

Format 1 reports data associated with a general QLPS protocol handler (GQPH) link (GQPHLNK) error reported by
non-global switching module (NGSM-2000) message handler (MH). This message will only be produced, if both the
GQPHLNK's parent GQPH QPIPE and MH QPIPE are still in-service.

Format 2 reports data associated with a GQPHLNK error reported by the GQPH. This message will only be
produced, if both the GQPHLNK's parent GQPH QPIPE and MH QPIPEs are still in-service.

All of the variables 'k' through 'v' are represented in hexadecimal.

3. VARIABLE FIELD DEFINITIONS

a = Global switching module (GSM) number.
b = Packet switch unit (PSU) number.
c = PSU shelf.
d = GQPH channel group.
e = Quad-link packet switch (QLPS) network.
f = Non-global switching module (NGSM-2000) number.
g = Not used.
h = QLPS network.
i  = If field \( v \) is 10, this is the unknown endpoint number. Otherwise, it is far-end QLPS endpoint number (GQPH QPIPE internal designation in the QLPS network).

j  = Far-end QLPS endpoint number (the NGSM-2000).

k  = NGSM-2000 number (the SM reporting the error).

l  = GSM number (the SM reporting the error).

m  = GQPH index value (internal software index for the GQPH).

n  = Error that exceeded fault recovery threshold. Valid value(s):
   0B  = MH-detected full transmit queue.
   0C  = RR frame re-try threshold exceeded.
   0D  = Frame with invalid poll/final bit.
   0E  = Frame with invalid message/response bit.
   0F  = Frame with unknown packet type.
   10  = Frame with unknown frame type.
   11  = Frame with inconsistent packet and frame types.
   12  = Set asynchronous balanced mode (SABM) on a link in the multi-frame establish or timer recovery state.
   13  = Valid frame on a link that was in a state for which the frame was not expected.
   15  = Out-of-sequence frame received.
   16  = MH-detected frame reject condition.
   17  = Attempt to send a frame to an endpoint that is not available in the MH routing table.

o  = Error that exceeded fault recovery threshold. Valid value(s):
   0B  = GQPH-detected full transmit queue.
   0C  = RR frame re-try threshold exceeded.
   0D  = Frame with invalid poll/final bit.
   0E  = Frame with invalid message/response bit.
   0F  = Frame with unknown packet type.
   10  = Frame with unknown frame type.
   11  = Frame with inconsistent packet and frame types.
   12  = SABM on a link in the multi-frame establish or timer recovery state.
   13  = Valid frame on a link that was in a state for which the frame was not expected.
   15  = Out-of-sequence frame received.
   16  = GQPH-detected frame reject condition.
   17  = Attempt to send a frame to an endpoint that is not available in the GQPH routing table.

p  = GQPHLNK layer 3 state for QLPS network 0. Valid value(s):
   0  = OOS - The GQPHLNK is out-of-service. Level 2 is down and is not available for routing messages.
   1  = IS - The GQPHLNK is in-service and available to message routing.
   2  = OOS-PEND - The GQPHLNK is expected to lose level 2 shortly, due to a pending CM/GQPH QPIPE/MH QPIPE reconfiguration.
   3  = OOS-WR - Both GQPHLNKs on the GQPH are unavailable for routing messages. All messages destined for the affected GSM are being buffered external to GQPHLNK queues, and are waiting retrieval for distribution to other GQPHs.
which have access to that GSM.

\[ q \] = GQPHLNK layer 3 state for QLPS network 1. Valid value(s):
0  = OOS - The GQPHLNK is out-of-service. Level 2 is down and is not available for routing messages.
1  = IS - The GQPHLNK is in-service and available to message routing.
2  = OOS-PEND - The GQPHLNK is expected to lose level 2 shortly, due to a pending CM/GQPH QPIPE/MH QPIPE reconfiguration.
3  = OOS-WR - Both GQPHLNKs on the GQPH are unavailable for routing messages. All messages destined for the affected GSM are being buffered external to GQPHLNK queues, and are waiting retrieval for distribution to other GQPHs which have access to that GSM.

\[ r \] = GQPHLNK layer 2 state for QLPS network 0. Valid value(s):
2  = The link disconnect (LD) state is a stable out of service state.
3  = The establish wait (EW) state is a transient state that is used while a QLPS logical link is attempting to establish the Multi-frame mode of transmission.
4  = The release wait (RW) state is a transient state that is used while a QLPS logical link is attempting to release the Multi-frame mode of transmission.
5  = The recovery establish (RE) state is a transient state that is used while a QLPS logical link is attempting to re-establish the Multi-frame mode of transmission.
6  = The multiframe established (ME) state is a stable state indicating the QLPS logical link is active between two endpoints.
7  = The timer recovery (TR) state indicates that an acknowledgment from the far endpoint for an Information-Frame or Receive Ready (RR) has not been received.
8  = The change back (CB) CB state is used to allow the mate QLPS logical link to drain when a new logical link comes up.

\[ s \] = GQPHLNK layer 2 state for QLPS network 1. Valid value(s):
2  = The LD state is a stable out of service state.
3  = The EW state is a transient state that is used while a QLPS logical link is attempting to establish the Multi-frame mode of transmission.
4  = The RW state is a transient state that is used while a QLPS logical link is attempting to release the Multi-frame mode of transmission.
5  = The RE state is a transient state that is used while a QLPS logical link is attempting to re-establish the Multi-frame mode of transmission.
6  = The ME state is a stable state indicating the QLPS logical link is active between two endpoints.
7  = The TR state indicates that an acknowledgment from the far endpoint for an Information-Frame or Receive Ready (RR) has not been received.
8  = The CB state is used to allow the mate QLPS logical link to drain when a new logical link comes up.

\[ t \] = Routing state for this endpoint. Valid value(s):
0  = No route is available.
1  = Routing is on for network 0 only.
2  = Routing is on for network 1 only.
3  = Routing is on for both network 0 and 1.
4  = Buffering is enabled.
u = Count of active GQPHLNKs on both networks.

v = Count of equipped GQPHLNKs.

w = The error classification. Valid value(s):
01 = QLPS loopback failure.
02 = GQPH loopback failure.
03 = Level 1 error thresholding.
04 = GQPH QPIPE failure(s) due to PH initialization.
0A = Bad routing RAM.
0B = Bad QLPS broadcast message.
0C = Unknown endpoint.

x = PH state for pipe 0. Valid value(s):
00 = Out of service.
01 = Autonomous recovery enabled.
02 = Autonomous recovery disabled.
03 = Active.

y = PH state for pipe 1. Valid value(s):
00 = Out of Service.
01 = Autonomous recovery enabled.
02 = Autonomous recovery disabled.
03 = Active.

z = The SMP-resident state of the GQPH QPIPE on network 0. Valid value(s):
1 = ACT - GQPH QPIPE is active and functioning normally.
2 = INIT - A GQPH QPIPE initialization is in-progress.
3 = OOS-DACT - The GQPH QPIPE has been manually removed.
4 = OOS-LVL1-PATH - The TSI-QPH path could not be established during a GQPH QPIPE restoration attempt.
5 = OOS-LVL1-FRAME - The SPORT channel associated with this GQPH QPIPE encountered framing errors.
6 = OOS-QLPSLB - The GQPH QPIPE has level 1 resources available and periodic attempts to pass a loopback test to the active QLPS are scheduled.
7 = OOS-QPHLB - An error internal to the SPORT channel was detected.
8 = OOSF-PH - The QPH channel group is unassigned.

a¹ = Number of MH-detected transmit queue full errors (SMQTQUEFULL).

b¹ = Number of times the RR frame re-try threshold was exceeded (SMQTXRETRY).

c¹ = Number of frames received with an invalid poll/final bit (SMQTINVPF).

d¹ = Number of frames received with an invalid message/response bit (SMQTINVCR).

e¹ = Number of frames received with an unknown packet type (SMQTUNKPKT).

f¹ = Number of frames received with an unknown frame type (SMQTUNKFRM).
\( g^1 \) = Number of frames received with inconsistent packet and frame types (SMQTINCPKT).

\( h^1 \) = Number of SABMs received while the link was in the multi-frame establish or timer recovery state (SMQTRESTART).

\( i^1 \) = Number of valid frames received on a link that was in a state for which the frame was not expected (SMQTUXPFRM).

\( j^1 \) = Approximate time of error detection the form hours:minutes:seconds.

\( k^1 \) = Number of out-of-sequence frames received (SMQTUXPSEQ).

\( l^1 \) = Number of MH-detected frame reject conditions (SMQTFRAMREJ).

\( m^1 \) = Number of attempts to send a frame to an endpoint that is not available in the MH link map (routing table) (SMQLMRFSH).

\( n^1 \) = Summary count of MH level 2 transmit errors (SMQSL2SEND).

\( o^1 \) = Summary count of MH level 2 receive errors (SMQSL2RECV).

\( p^1 \) = Summary count of MH level 2 synchronization errors (SMQSL2SYNCH).

\( q^1 \) = Number of GQPH-detected transmit queue full errors (SMQTQUEFULL).

\( r^1 \) = Number of GQPH-detected frame reject conditions (SMQTFRAMREJ).

\( s^1 \) = Number of attempts to send a frame to an endpoint that is not available in the MH link map (routing table) (SMQLMRFSH).

\( t^1 \) = Summary count of GQPH level 2 transmit errors (SMQSL2SEND).

\( u^1 \) = Summary count of GQPH level 2 receive errors (SMQSL2RECV).

\( v^1 \) = Summary count of GQPH level 2 synchronization errors (SMQSL2SYNCH).

\( w^1 \) = Number of frames received with CRC errors.

\( x^1 \) = Number of frames received with bad bit/byte count.

\( y^1 \) = Number of status changes or double status changes to idle.

\( z^1 \) = Number of excessively long frames received.

\( a^2 \) = Number of aborts received.

\( b^2 \) = Number of times the GQPH received a frame addressed to a different destination.

\( c^2 \) = Number of times the GQPH received an invalid QLPS broadcast packet.

\( d^2 \) = Number of times the GQPH received a frame associated with an unknown endpoint.

\( e^2 \) = The SMP-resident state of the GQPH QPIPE on network 1. Valid value(s):

1   = ACT - GQPH QPIPE is active and functioning normally.
2   = INIT - A GQPH QPIPE initialization is in-progress.
3   = OOS-DACT - The GQPH QPIPE has been manually removed.
4   = OOS-LVL1-PATH - The TSI-QPH path could not be established during a GQPH
QPIPE restoration attempt.
5 = OOS-LVL1-FRAME - The SPORT channel associated with this GQPH QPIPE encountered framing errors.
6 = OOS-QLPSLB - The GQPH QPIPE has level 1 resources available and periodic attempts to pass a loopback test to the active QLPS are scheduled.
7 = OOS-QPHLB - An error internal to the SPORT channel was detected.
8 = OOSF-PH - The QPH channel group is unassigned.

\[ f^2 \] = Count of active QPHLNKs on network 0.
\[ g^2 \] = Count of active QPHLNKs on network 1.

4. ACTIONS TO BE TAKEN
Interpreting this data requires detailed knowledge of switch internals. Retain this information for further reference. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS
None.

2. REASON FOR OUTPUT

Format 1 reports data associated with a QLPS protocol handler (QPH) link (QPHLNK) error reported by non-global switching module (NGSM-2000) message handler (MH). This message will only be produced, if both the QPHLNK's parent QPH QPIPE and MH QPIPE are still in-service.

Format 2 reports data associated with a QPHLNK error reported by the QPH. This message will only be produced, if both the QPHLNK's parent QPH QPIPE and MH QPIPEs are still in-service.

Format 3 reports data associated with a quad-link packet switch protocol handler (QPH) QPIPE error reported by fault recovery in a global switching module (GSM) QPH. A QPH QPIPE is a communication path between the QLPS and a QPH.

All of the variables 'k' through 'p2' are represented in hexadecimal.

3. VARIABLE FIELD DEFINITIONS

a = Global switching module (GSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
b = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
c = PSU shelf. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
d = QPH channel group. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
e = Quad-link packet switch (QLPS) network. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
f = Non-global switching module (NGSM-2000) number. Refer to the APP:RANGES appendix in the...
Appendixes section of the Output Messages manual.

**HH:MM:SS** = Approximate time of error detection.

**HH** = Hours (24 hour format).

**MM** = Minutes.

**SS** = Seconds.

**g** = Not used.

**h** = QLPS network.

**i** = If field 'w' is 10, this is the unknown endpoint number. Otherwise, it is far-end QLPS endpoint number (QPH QPIPE internal designation in the QLPS network).

**j** = Far-end QLPS endpoint number (the NGSM-2000).

**k** = NGSM-2000 number (the SM reporting the error).

**l** = GSM number (the SM reporting the error).

**m** = QPH index value (internal software index for the QPH).

**n** = Error that exceeded fault recovery threshold. Valid value(s):

- **0B** = MH-detected full transmit queue.
- **0C** = RR frame re-try threshold exceeded.
- **0D** = Frame with invalid poll/final bit.
- **0E** = Frame with invalid message/response bit.
- **0F** = Frame with unknown packet type.
- **10** = Frame with unknown frame type.
- **11** = Frame with inconsistent packet and frame types.
- **12** = Set Asynchronous Balanced Mode (SABM) on a link in the multi-frame establish or timer recovery state.
- **13** = Valid frame on a link that was in a state for which the frame was not expected.
- **15** = Out-of-sequence frame received.
- **16** = MH-detected frame reject condition.
- **17** = Attempt to send a frame to an endpoint that is not available in the MH routing table.

**a1** = Number of MH-detected transmit queue full errors (SMQTQUEFULL).
a2 = Number of QPH-detected transmit queue full errors (SMQTQUEFULL).
b1 = Number of times the RR frame re-try threshold was exceeded (SMQTXRETRY).
c1 = Number of frames received with an invalid poll/final bit (SMQTINVPF).
d1 = Number of frames received with an invalid message/response bit (SMQTINVCR).
e1 = Number of frames received with an unknown packet type (SMQTUNKPKT).
f1 = Number of frames received with an unknown frame type (SMQTUNKFRM).
g1 = Number of frames received with inconsistent packet and frame types (SMQTINCPKT).
h1 = Number of SABMs received while the link was in the multi-frame establish or timer recovery state (SMQTRESTART).
i1 = Number of valid frames received on a link that was in a state for which the frame was not expected (SMQTUXPFRM).
k1 = Number of out-of-sequence frames received (SMQTUXPSEQ).
l1 = Number of MH-detected frame reject conditions (SMQTFRAMREJ).
l2 = Number of QPH-detected frame reject conditions (SMQTFRAMREJ).
m1 = Number of attempts to send a frame to an endpoint that is not available in the MH link map (routing table) (SMQTLMRFSH).
m2 = Number of attempts to send a frame to an endpoint that is not available in the QPH link map (routing table) (SMQTLMRFSH).
n1 = Summary count of MH level 2 transmit errors (SMQSL2SEND).
n2 = Summary count of QPH level 2 transmit errors (SMQSL2SEND).
o1 = Summary count of MH level 2 receive errors (SMQSL2RECV).
o2 = Summary count of QPH level 2 receive errors (SMQSL2RECV).
p1 = Summary count of MH level 2 synchronization errors (SMQSL2SYNCH).
p2 = Summary count of QPH level 2 synchronization errors (SMQSL2SYNCH).
o = Error that exceeded fault recovery threshold. Valid value(s):

0B = QPH-detected full transmit queue.
0C = RR frame re-try threshold exceeded.
0D = Frame with invalid poll/final bit.
0E = Frame with invalid message/response bit.
0F = Frame with unknown packet type.
10 = Frame with unknown frame type.
= Frame with inconsistent packet and frame types.

= Set Asynchronous Balanced Mode (SABM) on a link in the multi-frame establish or timer recovery state.

= Valid frame on a link that was in a state for which the frame was not expected.

= Out-of-sequence frame received.

= QPH-detected frame reject condition.

= Attempt to send a frame to an endpoint that is not available in the QPH routing table.

p

= QPHLNK layer 3 state for QLPS network 0. Valid value(s):

0  = OOS - The QPHLNK is out-of-service. Level 2 is down and is not available for routing messages.

1  = IS - The QPHLNK is in-service and available to message routing.

2  = OOS-PEND - The QPHLNK is expected to lose level 2 shortly, due to a pending CM/QPH QPIPE/MH QPIPE reconfiguration.

3  = OOS-WR - Both QPHLNKs on the QPH are unavailable for routing messages. All messages destined for the affected GSM are being buffered external to QPHLNK queues, and are waiting retrieval for distribution to other QPHs which have access to that GSM.

q

= QPHLNK layer 3 state for QLPS network 1. Valid value(s):

0  = OOS - The QPHLNK is out-of-service. Level 2 is down and is not available for routing messages.

1  = IS - The QPHLNK is in-service and available to message routing.

2  = OOS-PEND - The QPHLNK is expected to lose level 2 shortly, due to a pending CM/QPH QPIPE/MH QPIPE reconfiguration.

3  = OOS-WR - Both QPHLNKs on the QPH are unavailable for routing messages. All messages destined for the affected GSM are being buffered external to QPHLNK queues, and are waiting retrieval for distribution to other QPHs which have access to that GSM.

r

= QPHLNK layer 2 state for QLPS network 0. Valid value(s):

2  = Link Disconnect (LD) - The LD state is a stable out of service state.

3  = Establish Wait (EW) - The EW state is a transient state that is used while a QLPS logical link is attempting to establish the Multi-frame mode of transmission.

4  = Release Wait (RW) - The RW state is a transient state that is used while a QLPS logical link is attempting to release the Multi-frame mode of transmission.
5 = Recovery Establish (RE) - The RE state is a transient state that is used while a QLPS logical link is attempting to re-establish the Multi-frame mode of transmission.

6 = Multiframe Established (ME) - The ME state is a stable state indicating the QLPS logical link is active between two endpoints.

7 = Timer Recovery (TR) - The TR state indicates that an acknowledgment from the far endpoint for an Information-Frame or Receive Ready (RR) has not been received.

8 = Change Back (CB) - The CB state is used to allow the mate QLPS logical link to drain when a new logical link comes up.

s = QPHTLKNK layer 2 state for QLPS network 1. Valid value(s):
2 = Link Disconnect (LD) - The LD state is a stable out of service state.
3 = Establish Wait (EW) - The EW state is a transient state that is used while a QLPS logical link is attempting to establish the Multi-frame mode of transmission.
4 = Release Wait (RW) - The RW state is a transient state that is used while a QLPS logical link is attempting to release the Multi-frame mode of transmission.
5 = Recovery Establish (RE) - The RE state is a transient state that is used while a QLPS logical link is attempting to re-establish the Multi-frame mode of transmission.
6 = Multiframe Established (ME) - The ME state is a stable state indicating the QLPS logical link is active between two endpoints.
7 = Timer Recovery (TR) - The TR state indicates that an acknowledgment from the far endpoint for an Information-Frame or Receive Ready (RR) has not been received.
8 = Change Back (CB) - The CB state is used to allow the mate QLPS logical link to drain when a new logical link comes up.

t = Routing state for this endpoint. Valid value(s):
0 = No route is available
1 = Routing is on for network 0 only
2 = Routing is on for network 1 only
3 = Routing is on for both network 0 and 1
4 = Buffering is enabled

u = Count of active QPHTLKNKs on both networks.
v = Count of equipped QPHLNKs.

w = The error classification. Valid value(s):
  01 = QPH QPIPE loopback failure.
  0C = Unknown endpoint.
  0B = Bad QLPS broadcast message.
  0A = Framing error.

x = PH state for pipe 0 Valid value(s):
  00 = Out of Service.
  01 = Autonomous recovery enabled.
  02 = Autonomous recovery disabled.
  03 = Active.

y = PH state for pipe 1 Valid value(s):
  00 = Out of Service.
  01 = Autonomous recovery enabled.
  02 = Autonomous recovery disabled.
  03 = Active.

z = The SMP-resident state of the QPH QPIPE on network 0. Valid value(s):
  1 = ACT - QPH QPIPE is active and functioning normally.
  2 = INIT - A QPH QPIPE initialization is in-progress.
  3 = OOS-DACT - The QPH QPIPE has been manually removed.
  4 = OOS-LVL1-PATH - The TSI-QPH path could not be established during a QPH QPIPE restoral attempt.
  5 = OOS-LVL1-FRAME - The SPORT channel associated with this QPH QPIPE encountered framing errors.
  6 = OOS-QLPSLB - The QPH QPIPE has level 1 resources available and periodic attempts to pass a loopback test to the active QLPS are scheduled.
  7 = OOS-QPHLB - An error internal to the SPORT channel was detected.
  8 = OOSF-PH - The QPH channel group is unassigned.
a4 = The SMP-resident state of the QPH QPIPE on network 1. Valid value(s):
  1 = ACT - QPH QPIPE is active and functioning normally.
  2 = INIT - A QPH QPIPE initialization is in-progress.
  3 = OOS-DACT - The QPH QPIPE has been manually removed.
  4 = OOS-LVL1-PATH - The TSI-QPH path could not be established during a QPH QPIPE restoral attempt.
  5 = OOS-LVL1-FRAME - The SPORT channel associated with this QPH QPIPE encountered framing errors.
  6 = OOS-QLPSLB - The QPH QPIPE has level 1 resources available and periodic attempts to pass a loopback test to the active QLPS are scheduled.
  7 = OOS-QPHLB - An error internal to the SPORT channel was detected.
  8 = OOSF-PH - The QPH channel group is unassigned.

b4 = Count of active QPHLNKs on network 0.

c4 = Count of active QPHLNKs on network 1.

a3 = Number of frames received with CRC errors.

b3 = Number of frames received with bad bit/byte count

c3 = Number of status changes or double status changes to idle

d3 = Number of excessively long frames received.

e3 = Number of aborts received.

f3 = Number of times the QPH received a frame addressed to a different destination.

g3 = Number of times the QPH received an invalid QLPS broadcast packet.

h3 = Number of times the QPH received a frame associated with an unknown endpoint.

4. ACTIONS TO BE TAKEN

Interpreting this data requires detailed knowledge of switch internals. Retain this information for further reference. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

None.
Output Message(s):

   REPT QPHPIPE RECOVERY

Output Appendix(es):

   APP: RANGES

Other Manuals:

   235-200-116   Signaling Gateway Common Channel Signaling
REPT:ERROR-RCL
Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

REPT ERROR RCL=a-b-c-d ERROR=e RCVY ACTION=f

2. REASON FOR OUTPUT

To report the occurrence of an error in a remote switching module (RSM) inter-RSM communication link (RCL) and any re-configurations or recovery actions taken on that RCL. An RCL resides on an inter-RSM communication link digital facilities interface (CDFI) circuit.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line and trunk unit (DLTU) number.
c = CDFI number.
d = RCL number.
e = Error type reported. Valid value(s):
   INVALID DATA IN PACKET HEADER = This error indicates that some of the information in the header used by the level 3 communication process has been corrupted. If the problem persists the user should consider removing the associated CDFI and diagnosing it.
   LOW LEVEL LINK ASSURANCE FAILURE = A periodic check called "low level link assurance" sends packets across to the other RSM where it is immediately acknowledged. This acknowledgment did not occur. This can be due to problems in this side's CDFI or on the other side's CDFI.
   NOTHING ARRIVING OVER THIS RCL = This indicates that the level 3 process has identified an RCL which is not receiving packets even though other RCLs on that set of RCLs are receiving packets. If the problem persists the user should consider removing the associated CDFI and diagnosing it.
   PACKET OUT OF SEQUENCE ON THIS RCL = This error indicates that some packets between two RSMs in a multi-module remote switching system (MMRSM) were lost. If the problem persists the user should consider removing the associated CDFI and diagnosing it.
   RECEIVED PACKET GREATER THAN 22 BYTES = This error indicates that the level 3 communication process which handles the RSM to RSM communication while in standalone has received a packet which is too big. If this problem persists the user should consider removing the associated CDFI and diagnosing it.
   RECEIVED PACKET LESS THAN 4 BYTES = This error indicates that the level 3 communication process which handles the RSM to RSM communication while in standalone has received a packet which is too small. If this problem persists the user should consider removing the associated CDFI and diagnosing it.
   RESET RECEIVED = This indicates that the far end has requested a reset of the logical channel.
   X.25 MESSAGE FLAG NOT CLEARING ON CDFI = This indicates that the level 3 process has...
identified an RCL that is overflowing. This could be because the far end is not accepting messages. If this persists the user should consider removing the associated CDFI and diagnosing it.

**f**  
= Recovery action taken on the error. Valid value(s):

CDFI REMOVED = This indicates that an automatic request has been made to remove the CDFI and diagnose it. This will only be requested if the RSM has communication with the host complex.

CFAC REMOVED = This indicates that an automatic request has been made to remove the communication facility (CFAC) from service. An attempt will be made to restore it to service automatically at a later time.

RCL HARDWARE INITIALIZED = This action will result in packets timing out and their messages being re-transmitted.

RCL REMOVED = This indicates that an automatic request has been made to remove the RCL from service. An attempt will be made to restore it to service automatically at a later time.

REPORT ONLY = This action is self explanatory.

**g**  
= A hexadecimal dump of post mortem information, typically the X.25 level 3 packet header.

4. **ACTION TO BE TAKEN**

Monitor the status of the RCL and if necessary remove and diagnose the associated CDFI.

5. **ALARMS**

If a recovery action is taken on the RCL due to the error threshold being reached, a minor alarm will be associated with this message.

6. **REFERENCES**

Input Message(s):

DGN: CDFI  
RMV: CDFI  
RST: CDFI

Other Manual(s):

235-105-220 Corrective Maintenance  
235-600-500 Asserts
REPT:ERROR

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

[1] REPT ERROR #Ka
   b (c d e) f
g

[2] REPT ERROR #Ua
   b (c d e) f
g

[3] REPT ERROR NP:h #Na
   g

2. REASON FOR OUTPUT

To report a condition, such as a program bug, which can only be resolved by a program change.

Format 1 reports an error from an AM kernel level process.
Format 2 reports an error from an AM user level process.
Format 3 reports an error from a node processor.

3. VARIABLE FIELD DEFINITIONS

a = Decimal ERRLOG sequence number.
b = Trace subsystem assigned by an initialization macro at the beginning of the process. Subsystem names are defined in file 'ims/head/tr_stcb.h'.
c = Process name assigned by an initialization macro at the beginning of the process.
d = Source file name.
e = Source file line number.
f = Source file SCCS version number.
g = User message as ASCII text.
h = Node processor number.

4. ACTION TO BE TAKEN

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
5. ALARMS

Depending on the source of the error, no alarms, a minor alarm, or a major alarm may be sounded.

6. REFERENCES

None.
REPT:ERRPORT

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT ERRPORT OPEN FAILURE ERRNO a

[2] REPT ERRPORT READ FAILURE ERRNO a

[3] REPT ERRPORT b MESSAGES LOST

[4] REPT ERRPORT PREPHASE MESSAGE

2. REASON FOR OUTPUT

Format 1 is to report that the administrative module (AM) error logging process (errport) is not able to open its special file /dev/errport.

Format 2 is to report that the AM error logging process (errport) has encountered an error in its special file /dev/errport.

Format 3 is to report that the AM error logging process (errport) has received output messages after its internal queue was full. These messages have been lost.

Format 4 is to report that a message existed in the low core first-in, first-out (FIFO) queue before AM phased.

3. VARIABLE FIELD DEFINITIONS

a = File access error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

b = Number of messages lost.

4. ACTION TO BE TAKEN

For Formats 1 and 2, check the status of the file and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. (/dev/errport should be present; it should be a FIFO special file and have read and write permissions.)

For Formats 3 and 4, no action is necessary.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report error interrupts handled by the error interrupt handler (EIH) that are not associated with the main memory. Among the errors handled are input/output (I/O) errors, direct memory access (DMA) errors, other control unit (CU) hardware errors, and software errors.

Format 1 indicates that the kernel determined that a process attempted an operating system trap (OST) with a bad argument.

Format 2 indicates that a faulty unit encountered a fatal error condition. The channel status and channel address are provided.

Format 3 has six error types (variable 'j'1).

Format 4 has six error types (variable 'k'1).

Format 5 has eleven error types (variable 'o'1).

Format 6 has two error types (variable 'p'1).

Format 7 has three error types (variable 'q'1).

Format 8 indicates that the maintenance channel is faulty, or a maintenance channel order has been sent to a processor that is not disabled or marked off-line.

Format 9 indicates the off-line CU memory controller has not responded to a memory access.

Format 10 indicates EIH was dispatched to handle an error, but no error bit in the error registers was set.

Format 11 indicates an error type that EIH does not recognize occurred.

Formats 12 and 13 indicate that a non-correctable parity error has occurred during a direct memory access (DMA) read of the memory location on the currently running CU.

Formats 14 and 15 indicate that an error has occurred because the memory controller of the mate processor had a store error A condition. This error occurs in the off-line CU but is detected by the on-line CU.

Formats 16 and 17 have four error types (variable 'y'2).

Format 18 indicates that an error has occurred in the common controller (CC) emergency action interface (EAI) hardware.
3. VARIABLE FIELD DEFINITIONS

a = Date and time, in the form month/day/year hour:minute:second.
b = CU number.
c = The program address (in hexadecimal) at the time of error interrupt. For software-requested
initializations, this is the address of the PHASE OST, not the address where the problem was
detected.
d = The processor status word (in hexadecimal). Among the information it contains are the execution
level and the processor mode: the kernel mode, kernel process, supervisor process, or user
process. Refer to the APP:REGISTER appendix, PROCESSOR STATUS WORD (PSW)
REGISTER Exhibit, in the Appendixes section of the Output Messages manual.
e = The contents of the primary segment base register (in hexadecimal).
f = The contents of the secondary segment base register (in hexadecimal).
g = The contents of the 16 general-purpose registers (in hexadecimal). Valid value(s):
   R9    = Argument pointer.
   RA    = Frame pointer.
   RB    = Stack pointer.
h = The contents of the UER1 (in hexadecimal). Refer to the APP:REGISTER appendix,
MICROINTERRUPT ERROR REGISTER 1 (UER1) (NOTE) Exhibit, in the Appendixes section of
the Output Messages manual.
i = Process number (in hexadecimal).
j = Operating system trap (OST) code (in hexadecimal).
k = OST arguments (in hexadecimal).
l = Unit name.
m = Member number.
n = The input/output address of the channel that caused the problem (in hexadecimal).
o = The contents of the dual serial channel (DSCH) channel status register (in hexadecimal). Refer to
the APP:REGISTER appendix, DUAL SERIAL CHANNEL (DSCH) STATUS REGISTER Exhibit, in the Appendixes section of the Output Messages manual.
p = The input/output address of the DMAC that encountered the fault (in hexadecimal).
q = The contents of the DMA status register (in hexadecimal). Refer to the APP:REGISTER appendix,
DIRECT MEMORY ACCESS CONTROLLER (DMAC) STATUS REGISTER Exhibits, in the
Appendixes section of the Output Messages manual.
r = First word entry in the DMA RAM for the device that failed (in hexadecimal). 0x12345678, when
invalid.
s = Second word entry in the DMA RAM for the device that failed (in hexadecimal). 0x12345678,
when invalid.

t = Third word entry in the DMA RAM for the device that failed (in hexadecimal). 0x12345678, when invalid.

u = Fourth word entry in the DMA RAM for the device that failed (in hexadecimal). 0x12345678, when invalid.

v = Internal DMAC register contents (in hexadecimal). This data represents the last data word either written or read from main store.

w = Internal DMAC register contents (in hexadecimal). This data represents the value of the DMA counter, which is a counter used by the DMAC to increment the physical address, map address and the transfer count during the store operation.

x = Internal DMAC register contents (in hexadecimal). This register is used as a scratch register by microcode during the virtual to physical translation in a DMA access.

y = Contents of the channel data register (CDR), also known as the CCIO bus data register (in hexadecimal).

z = Value of the real time clock (RTC), in milliseconds and hexadecimal, at the time of the error interrupt.

a¹ = Contents of the hardware status register (in hexadecimal).

b¹ = On-line maintenance channel master status (in hexadecimal).

c¹ = Community name.

d¹ = Community number.

e¹ = The invalid error interrupt type.

f¹ = The contents of the error register (ER) (in hexadecimal). Refer to the APP:REGISTER appendix, ERROR REGISTER (ER) (NOTE) Exhibit, in the Appendixes section of the Output Messages manual.

g¹ = The contents of the microinterrupt error register (UER) (in hexadecimal). Refer to the APP:REGISTER appendix, MICROINTERRUPT ERROR REGISTER (UER) (NOTE) Exhibit, in the Appendixes section of the Output Messages manual.

h¹ = Process utility ID (in hexadecimal). Refer to the Postmortem Dump Process/Problem Identification Exhibit in the Corrective Maintenance manual.

i¹ = The invalid error number (in decimal).

j¹ = A string defining possible error types. Valid value(s):

BAD PARITY ON DMA READ = The DMAC detected bad parity on its internal bus. This can be caused by a DMAC failure or a request from a device that has not had its DMAC random access memory (RAM) block initialized.

DMA RAM PARITY FAILURE = A parity error occurred on the DMAC internal RAM.

DMA - ROM PARITY FAILURE = A parity error was detected in the DMAC ROM.

CCIO - DATA PARITY FAILURE = A message received by the DMAC on a processor I/O (PIO) operation had bad parity.
MY STORE A DURING DMA = The DMA controller (DMAC) encountered a fatal main memory problem during DMA transfer. Refer to the Corrective Maintenance manual for a description of error bit 6.

MY STORE B DURING DMA = A process attempted to access a location in memory that is not physically equipped. Refer to the Corrective Maintenance manual for a description of error bit 23.

k^1 = A string defining possible error types. Valid value(s):
- **BAD PARITY ON DIO BUS** = The DMAC received bad parity from the named CHANNEL ADDRESS device on data destined for the main memory during a DMA transfer.
- **DIO - ACKNOWLEDGE FAILURE** = Either more than one or no channels responded to the DMAC.
- **DIO - READY FAILURE** = The named channel did not return a READY signal to the DMAC.
- **DMA - ADDRESS ERROR** = During the virtual to physical address translation, the DMAC found that the requested I/O access to physical memory was not permitted, or, during the data transfer, the data would have been written beyond the end of a segment.
- **DMA - ASW FAILURE** = The named channel did not return all-seems-well (ASW) to the DMAC.
- **DMA - CHANNEL REQUEST ERROR** = A device made a request with an invalid DMA RAM entry.

l^1 = Valid value(s):

<table>
<thead>
<tr>
<th>For:</th>
<th>'l1' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model 1</td>
<td>DMA CHANNEL STATUS REGISTER: m^1 m^1 m^1 m^1 m^1 m^1 m^1 m^1 m^1</td>
</tr>
<tr>
<td>Model 2</td>
<td>CHANNEL STATUS REGISTER: n^1 n^1 n^1 n^1 n^1 n^1 n^1 n^1 n^1</td>
</tr>
</tbody>
</table>

m^1 = Status of the channel under the DMAC that encountered the fault (in hexadecimal). Refer to the APP:REGISTER appendix, DIRECT MEMORY ACCESS CHANNEL (DMCH) STATUS REGISTER Exhibit, in the Appendixes section of the Output Messages manual.

n^1 = The contents of the faulted channels data register (in hexadecimal).

o^1 = A string defining possible error types. Valid value(s):
- **BAD ALIGNMENT ON MEMORY REFERENCE** = This indicates a software fault - the instruction executed with the wrong address (for example, a full-word instruction executed with a half-word address).
- **CCIO - COMMAND FAILURE** = A second programmed I/O order was sent to the DMAC before the first one was completed.
- **ILLEGAL INSTRUCTION** = The data in the instruction buffer did not correspond to a valid instruction.
- **ILLEGAL OPERAND** = One of the operands specified in an instruction is invalid for the opcode.
- **ILLEGAL STACK SWITCH** = The program attempted to switch to a private stack while running on a private stack, or attempted to switch to the kernel stack while it was already running on the kernel stack.
- **OUT OF RANGE MEMORY REFERENCE** = A program tried to access unequipped memory.
- **OUT OF RANGE MEMORY REFERENCE (OTHER STORE)** = The off-line main memory considered the address to be out of range while the on-line memory did not. This usually indicates a problem with the off-line memory.
- **PARITY DIVERT ERROR** = The named unit returned a word with bad parity.
- **PRIVILEGED INSTRUCTION VIOLATION** = The program tried to execute one of the special instructions without a corresponding privilege bit set in the processor status word (PSW).
- **PROTECTION VIOLATION** = A program tried to execute from a segment that did not have execute permission, or tried to write into a segment that did not have write permission.
VIRTUAL ADDRESS OUT OF RANGE = Microcode has determined that a virtual address is not mappable in a process's address space.

A string defining possible error types. Valid value(s):

3/6 MAIN CHANNEL ADDRESS SEQUENCING ERROR = Either an illegal 3-out-of-6 (3/6) code on the central control input/output (CCIO) bus, or more than one I/O pulse point was active in the message to the channel. Refer to the Corrective Maintenance manual for a description of error bit 18.

3/6 MAIN CHANNEL I/O RESPONSE ERROR = More than one device responded to an input/output address. Refer to the Corrective Maintenance manual for a description of error bit 17.

A string defining possible error types. Valid value(s):

PINV - PAGE INVALID = A process attempted to access a page that is not in its page table.

SIND - SEGMENT INDEX TOO LARGE = Microcode detected a segment index too large for the segment being accessed.

SINV - SEGMENT INVALID = A process attempted to access a segment that is not in its segment table.

The sequence number (in hexadecimal) at the time of the report.

Internal DMAC register contents (in hexadecimal). This register contains the last main store memory accessed by DMA for either a read or write.

Internal DMAC register contents (in hexadecimal). This register contains the data being passed between the DMAC and the channels.

Internal DMAC register contents (in hexadecimal). This register contains the current channel mask mask set-up.

Valid value(s):

For:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>3B21D</td>
<td>One-line maintenance channel slave status (in hexadecimal).</td>

<tr>
<td>3B20D</td>
<td>This field is meaningless. It is set to 0xffffffff.</td>
</tr>
</tbody>
</table>

Off-line maintenance channel slave status (in hexadecimal).

Off-line maintenance channel buffer (in hexadecimal).
b2 = If bit 27 of the main store controller 0 trapped address register (TAR0) is set, TAR0 contains the address where the fault occurred (in hexadecimal).

c2 = The contents of the main store controller 0 error register 1 (ER01) (in hexadecimal). Refer to the APP:REGISTER appendix in the Appendixes section of the Output Messages manual.

d2 = The contents of the main store controller 0 error register 2 (ER02) (in hexadecimal). Refer to the APP:REGISTER appendix in the Appendixes section of the Output Messages manual.

e2 = The contents of the main store controller 1 trapped address register (TAR1) (in hexadecimal).

f2 = The contents of the main store controller 1 error register 1 (ER11) (in hexadecimal). Refer to the APP:REGISTER appendix in the Appendixes section of the Output Messages manual.

g2 = The contents of the main store controller 1 error register 2 (ER12) (in hexadecimal). Refer to the APP:REGISTER appendix in the Appendixes section of the Output Messages manual.

h2 = Error data (in hexadecimal).

i2 = Physical memory address (in hexadecimal).

j2 = The contents of the memory controller (MCERT) error address register. This is the address where the error occurred.

k2 = The contents of the MCERT error register. This register has all the relevant information that caused an error B.

l2 = The contents of the MCERT status register. This indicates the banks that are present, the size of each bank, and the result of the march test.

m2 = The contents of the MCERT message register.

n2 = The contents of the MCERT strobe shape register. This register encodes the timing requirements for various operations in the MCERT circuit.

o2 = The contents of the MCERT main memory register. This register has all the relevant error information.

p2 = The contents of the data path MCERT error data register. This register contains the data when the error occurred.

q2 = The contents of the data path MCERT status register. This register contains information that caused the error A, C, or D.

r2 = The contents of the MCERT data path message register. This register contains application specific information.

s2 = The bank number corresponding to the physical memory address (in hexadecimal). A value of 0xFF is invalid. This indicates an error in accessing the MCERT.

t2 = Contents of the EAI error register. This indicates the actual error on the EAI hardware.

x2 = Valid value(s):

<table>
<thead>
<tr>
<th>For:</th>
<th>x2 =</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model 1</td>
<td>CHANNEL STATUS REGISTER: n1 n1 n1 n1 n1 n1 n1 n1</td>
</tr>
</tbody>
</table>

Copyright ©2003 Lucent Technologies
y\textsuperscript{2} = Error type. Valid value(s):
- **MEMORY PARITY FAILURE** = Indicates a correctable memory failure in the on-line processor (my store D).
- **NONCORRECTABLE PARITY ERROR ON MEMORY REFERENCE** = Indicates noncorrectable memory parity failure in on-line control unit (CU).
- **OTHER STORE READ PARITY ERROR** = Indicates a noncorrectable memory error (other store C) in the mate processor. This type of error can only occur if the mate processor is in the standby state.
- **OTHER STORE REFRESH PARITY ERROR** = Indicates a correctable parity error (other store D) in the mate processor. This type of error can only occur if the mate processor is in the standby state.

### 4. ACTION TO BE TAKEN

For Format 1, save the receive-only printer (ROP) output. Note the utility ID (UID) of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 2, examine the DSCH channel status register layout to determine the error type, and run diagnostics on the unit.

For Format 3, for all six error types, run diagnostics on the indicated unit.

For Format 4, for all six error types, run diagnostics on the indicated unit.

For Format 5, run diagnostics on the indicated unit for error types:
- **CCIO - COMMAND FAILURE**
- **PARITY DIVERT ERROR**

Forward the software log entry information from ERRLOG to the next level of support for error types:
- **BAD ALIGNMENT ON MEMORY REFERENCE**
- **ILLEGAL INSTRUCTION**
- **ILLEGAL OPERAND**
- **ILLEGAL STACK SWITCH**
- **OUT OF RANGE MEMORY REFERENCE**
- **PRIVILEGED INSTRUCTION VIOLATION**
- **PROTECTION VIOLATION**

For error type, 'OUT OF RANGE MEMORY REFERENCE (OTHER STORE),' check the fuses in the off-line memory and replace as needed. Run diagnostics on the off-line memory.

For error type, 'VIRTUAL ADDRESS OUT OF RANGE,' save the information from ERRLOG output. Note the UID of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 6, run diagnostics on the processor encountering the fault.

For Format 7, save the information from /etc/log/ERRLOG output. Note the UID of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.
For Format 8, if the error occurs more than once in 24 hours, run diagnostics on the off-line processor. If no problem is found, switch processors and run diagnostics on the off-line processor.

For Format 9, check the update cables on both processors and run diagnostics on the off-line processor.

For Format 10, run diagnostics on the CU in which the error occurred and forward the information from ERLOG and ROP output to the next level of support.

For Format 11, if possible, switch the processors so that the faulty CU can be diagnosed. Forward the diagnostic results and the information from ERRLOG to the next level of support.

For Formats 12 and 13, if the processor switched as a result of the error, run diagnostics on the processor encountering the fault.

For Formats 14 and 15, diagnose the fault and forward the diagnostic results and the information from ERLOG to the next level of support.

For Formats 16 and 17, if the error occurred on the off-line CU, check the update cable on both the processors. In all cases run diagnostics on the faulty processor. Note that to run CU diagnostics the CU that is being diagnosed should be out of service and the other CU active.

Format 18 indicates a fault in the EAI hardware of the CC pack.

Some classes of EAI faults cause hard failures for which there is no automatic recovery of the EAI. An example of this is a stuck microprocessor address/data bit that will cause indeterminate code execution and block internal recovery. Invalid error register contents reported in the error log (such as 00) are an indication that the EAI hardware has detected a fault but is not able to perform fault recovery functions for the EAI. As a result of this hard fault, administrative module (AM) fault recovery code is not able to access the EAI hardware, including the EAI error register. The main symptom of this problem is that the EAI hardware routinely reports errors even after automatic recovery. When this type of error occurs and if the CUs are in ACT/STBY state, a CU switch occurs and the machine continues to run on the non-faulty CU (a CU switch does not occur if the CUs are in ACT/OOS state). Also, all other system functions should continue as normal.

Ensure that the machine is running on the other (non-faulty) CU and run diagnostics on the faulty CU. If the diagnostic fails, replace the CC pack that contains the EAI circuitry and restore the CU. Forward the diagnostic results, the information from the ERLOG, and the ROP output to the next level of support.

5. ALARMS

None.

Format 18 has a major alarm. If a major alarm occurs, it may not be service affecting. Take appropriate action as indicated in the alarm.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

1. FORMAT

REPT ESA
   a
   [PRIMARY ESA: APID=b STATE=c HEALTH=d]
   [SECONDARY ESA: APID=b STATE=c HEALTH=d]

2. REASON FOR OUTPUT

Notification from an automatic enhanced 911 emergency service adjunct (ESA) switch or health status update that indicates what action has taken place and reports the current status of the primary and secondary ESAs.

3. VARIABLE FIELD DEFINITIONS

a
   = Informational text describing what action has occurred. Valid value(s):
   FORCED ACTIVE PRIMARY ESA DELETED – FORCE CLEARED = The primary ESA that was forced active has been deleted by means of RC/V. The force has been removed. No ESAs are currently defined in the ODD.
   FORCED ACTIVE SECONDARY ESA DELETED – FORCE CLEARED = The secondary ESA that was forced active has been deleted by means of RC/V. The force has been removed and the primary has been made active.
   NO INFORMATION TEXT = The informational text was not set correctly in the message. This should be reported as a problem.
   PRIMARY AND SECONDARY ESA HEALTH STATUS INITIALIZED = Two ESAs are defined in the ODD. The health status for both ESAs were initialized. This could happen because the CMP or system process was initialized or because the data was corrupted.
   PRIMARY ESA DELETED = The primary ESA has been removed using RC/V. No ESAs are currently defined in the ODD.
   PRIMARY ESA HEALTH STATUS CHANGED = The health status of the primary ESA has changed. The active/inactive designation of the two ESAs has not changed. The current status of the ESAs will be printed.
   PRIMARY ESA HEALTH STATUS CHANGED – ACTIVE SWITCHED = The health status of the primary ESA has changed. The active/inactive designation of the two ESAs has changed. The current status of the ESAs will be printed.
   PRIMARY ESA HEALTH STATUS INITIALIZED = Only the primary ESA is defined in the ODD. The health status for the ESA was initialized. This could happen because the CMP or system process was initialized or because the data was corrupted.
   PRIMARY ESA INSERTED = The primary ESA was inserted using RC/V.
   SECONDARY ESA DELETED = The inactive, secondary ESA was removed using RC/V.
   SECONDARY ESA DELETED – DEFAULTING TO PRIMARY ESA = The secondary ESA was active and has been removed using RC/V. The primary is automatically made active. The current status of the primary ESA will be printed.
   SECONDARY ESA HEALTH STATUS CHANGED = The health status of the secondary ESA has changed. The active/inactive designation of the two ESAs has not changed. The current status of the ESAs will be printed.
   SECONDARY ESA HEALTH STATUS CHANGED – ACTIVE SWITCHED = The health status of the
secondary ESA has changed. The active/inactive designation of the two ESAs has changed. The current status of the ESAs will be printed.

**SECONDARY ESA INSERTED** = The secondary ESA was inserted using RC/V. The primary was healthier than or as healthy as the secondary; therefore, the primary remained active.

**SECONDARY ESA INSERTED AND SWITCH COMPLETED** = The secondary ESA was inserted using RC/V. The secondary is healthier than the primary; therefore, the secondary was made active.

**SWITCH DENIED - NO ESA TO SWITCH TO** = A time-based switch attempt was made, but only one ESA was defined so no switch was possible.

**TIME BASED SWITCH COMPLETED** = The hour of the day to automatically switch the active and inactive ESA designations was reached and the switch was successfully completed. The current status will be printed.

**TIME BASED SWITCH NOT DONE - ACTIVE FORCED** = The hour of the day to automatically switch the active and inactive ESA designations was reached and the active ESA was forced active so the switch was not done. The current status will be printed.

**TIME BASED SWITCH NOT DONE - ACTIVE HEALTHIER** = The hour of the day to automatically switch the active and inactive ESA designations was reached and the active ESA was healthier so the switch was not done. The current status will be printed.

b = Applications processor identifier (APID) of the ESA. If the APID for the ESA (GLE911APID or GLE911SEC office parameter) is 0, no data for that ESA will be printed.

c = Current state of the ESA. Valid value(s):
- **ACTIVE** = The ESA is active and receiving queries.
- **FORCED** = The ESA is in the forced active state and is receiving queries and cannot be switched to inactive until the force has been removed.
- **INACTIVE** = The ESA is not active and is not currently receiving queries.

d = Current health value of the ESA. Valid value(s):
- **COMM LOST** = The switch is not currently able to send queries to the ESA.
- **CRITICAL** = The ESA has a critical alarm.
- **MAJOR** = The ESA has a major alarm.
- **MINOR** = The ESA has a minor alarm.
- **NORMAL** = The ESA is functioning normally with no alarms.
- **UNKNOWN** = The health status of the ESA is unknown.

4. ACTION TO BE TAKEN

When the message is printed with the following informational texts, the ESA mentioned has been inserted or deleted through recent change. These messages are printed to inform the craft that this has taken place and mention any other effect it has had - that is, force cleared.

- **FORCED ACTIVE PRIMARY ESA DELETED - FORCE CLEARED**
- **FORCED ACTIVE SECONDARY ESA DELETED - FORCE CLEARED**
- **PRIMARY ESA DELETED**
- **PRIMARY ESA INSERTED**
- **SECONDARY ESA DELETED**
- **SECONDARY ESA DELETED - DEFAULTING TO PRIMARY ESA**
- **SECONDARY ESA INSERTED**
SECONDARY ESA INSERTED AND SWITCH COMPLETED

The following informational text values indicate that the health status has been initialized. If this is due to memory corruption, report this as a problem.

PRIMARY AND SECONDARY ESA HEALTH STATUS INITIALIZED
PRIMARY ESA HEALTH STATUS INITIALIZED

The following informational text values indicate that the health status of the mentioned ESA has changed. If the change is due to a degradation in the health of the ESA, action may need to be taken to correct the problem. This message gives information on the health status only. Other output messages on the switch or the ESA may be available to determine the problem causing the health change.

PRIMARY ESA HEALTH STATUS CHANGED
PRIMARY ESA HEALTH STATUS CHANGED – ACTIVE SWITCHED
SECONDARY ESA HEALTH STATUS CHANGED
SECONDARY ESA HEALTH STATUS CHANGED – ACTIVE SWITCHED

The following informational text values indicate that either a successful or unsuccessful attempt was made to switch the active and inactive ESA designations at the time specified.

SWITCH DENIED – NO ESA TO SWITCH TO
TIME BASED SWITCH COMPLETED
TIME BASED SWITCH NOT DONE – ACTIVE FORCED
TIME BASED SWITCH NOT DONE – ACTIVE HEALTHIER

If NO INFORMATION TEXT is the informational text value, report this as a problem.

5. ALARMS

This message will have variable alarm levels.

For health status changes, including health-based switches, the alarm level will correspond to the new health of the ESA. The following table shows the alarm level for each health value:

<table>
<thead>
<tr>
<th>HEALTH VALUE</th>
<th>ALARM LEVEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMM LOST</td>
<td>Critical</td>
</tr>
<tr>
<td>NORMAL</td>
<td>Automatic</td>
</tr>
<tr>
<td>MINOR</td>
<td>Minor</td>
</tr>
<tr>
<td>MAJOR</td>
<td>Major</td>
</tr>
<tr>
<td>CRITICAL</td>
<td>Critical</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Critical</td>
</tr>
</tbody>
</table>

When an ESA is inserted or deleted, the health status of that ESA will then be "UNKNOWN", and the alarm level of those messages will be Critical.

For time-based switching, the message will not be alarmed.

8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]  
24.7 [DSL APPLICATIONS PROCESSOR COMMUNICATION DATA]
1. **FORMAT**

REPT EVENTHIST (SM=a | CMP=b-c d | MCTSI=a-b d | QGP=b-e | UNK UNK) DATA=f, g EVENT=h

2. **REASON FOR OUTPUT**

To report data automatically because:

- After a high-level initialization in the switching module (SM) or in the communication module processor (CMP).
- After an SM or CMP offline verification during a retrofit.
- As part of a message handler (MH) or quad-link gateway processor (QGP) escalating from a critical error.

This message is normally logged, but will also print in response to input message OP:POSTMORT.

During a retrofit the GENRMON message class is used, otherwise, the INT_MON message class is used.

3. **VARIABLE FIELD DEFINITIONS**

- **MCTSI** = Module controller/time slot interchange.
- **a** = SM number.
- **b** = Message switch (MSGS) side or MCTSI side.
- **c** = Physical CMP number.
- **d** = Processor being reported on. Valid value(s):
  - MATE = Mate CMP.
  - MH0 = Message handler 0.
  - MH1 = Message handler 1.
  - MH2 = Message handler 2.
  - PRIM = Primary CMP.
- **e** = QGP number.
- **f** = Data dump type. Valid value(s):
  - OFFLINE = The data dump consists of postmortem data from system integrity, that identifies all events that occurred during the offline verification on the offline side of the SM.
  - ONLINE = The data dump consists of postmortem data from system integrity that identifies
events leading up to the last high-level initialization. Refer to the APP:EVENT-HIST appendix in the Appendixes section of the Output Messages manual for further explanation on interpreting the data dump.

\[ \text{g} \] = The sequence number of the data being output in the message.

\[ \text{h} \] = Event number.

\[ \text{i} \] = Data being reported in hexadecimal. Each event is represented by three segments of data and each message has 8 lines; therefore, each message contains 16 events worth of information.

4. ACTION TO BE TAKEN

This information should be sent along with any trouble report concerning SM or CMP initialization to an appropriate technical support organization.

5. ALARMS

None.

[10] REPT FAC ALERT SLM STSFAC=a-e1-f1-g1-h1 (SET|CLR) RCV=j1 [p1] EXP=k1...
    ...[OVERFLOW]
2. REASON FOR OUTPUT

To report that a transmission facility performance monitoring count alert threshold or error rate threshold has been exceeded. Two types of alert threshold crossing reports can be generated: 15-minute and daily alerts. A 15-minute alert is generated when a facility exceeds a 15-minute alert threshold. A daily alert is generated when a facility exceeds a daily alert threshold.

This message is also used to report one of the following autonomous facility alerts from the digital networking unit - synchronous optical network (SONET) (DNU-S) number:

- Line far end receive failure (FERF) on a STE facility.
- Signal label mismatch on a synchronous transport signal (STS-1) facility.
- Signal label mismatch on a virtual tributary level 1 (VT1FAC) facility.
- VT group size mismatch on a VT1.5 facility.

Format 1 reports a digital signal level 1 SONET facility (DS1SFAC) performance count alert event for a digital facility interface (DFI) facility terminating on a digital line and trunk unit (DLTU).

Format 2 reports a DS1SFAC performance count alert event for a DFI model 2 (DFI-2) facility (DFAC) terminating on a DLTU model 2 (DLTU-2).

Format 3 reports a DS1SFAC performance count alert event for a remote integrated services line unit (RISLU) host DFI (DFIH) facility terminating on a DLTU.

Format 4 reports a DS1SFAC performance count alert event for an integrated digital carrier unit (IDCU) facility (IFAC) or a DNU-S DS1SFAC far end (FE) facility. Alerts may be generated from the remote terminal (RT) or IDCU end of the facility.

Format 5 reports a DS1SFAC performance count alerts for a SLC® DFI facility terminating on a digital carrier line unit (DCLU).

Format 6 reports a performance count alert event for a digital networking unit - synchronous optical network (SONET) (DNU-S) SONET termination equipment (STE) facility number.

Format 7 reports a performance count alert event for a DNU-S VT1FAC facility.

Format 8 reports a performance count alert event for a DNU-S DS1SFAC facility.

Format 9 reports a Line FERF on a STE facility.

Format 10 reports a signal label mismatch on a STS-1 facility.

Format 11 reports a signal label mismatch on a VT1FAC facility.

Format 12 reports a VT group size mismatch on a VT1FAC facility.
### 3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>15MIN</td>
<td>15-minute alert threshold crossing. These alerts could be reported up to 2 minutes after their actual occurrence.</td>
</tr>
<tr>
<td>24HR</td>
<td>24-hour alert threshold crossing. These alerts could be reported up to 17 minutes after their actual occurrence.</td>
</tr>
<tr>
<td>CI</td>
<td>Corruption indicator (CI). Indicates whether the counts for the alerting interval are invalid or incomplete. When a ** is present on the column below CI, it means at least one PM count is invalid for this interval.</td>
</tr>
<tr>
<td>CLR</td>
<td>Autonomous facility alert has been cleared.</td>
</tr>
<tr>
<td>FI</td>
<td>Failure indicator (FI). When a ** is present on the column below FI, it means there was a failure during this interval. For example, a CGA occurred during the interval is a failure.</td>
</tr>
<tr>
<td>L</td>
<td>Line counts. The type of counts being output is line counts.</td>
</tr>
<tr>
<td>OVERFLOW</td>
<td>Autonomous facility alerts overflow indicator. OVERFLOW indicates that some facility alerts have been lost due to excessive alerts being reported by the DNU-S.</td>
</tr>
<tr>
<td>P</td>
<td>Path counts. The type of counts being output is path counts.</td>
</tr>
<tr>
<td>RATE</td>
<td>A rate based performance monitoring event.</td>
</tr>
<tr>
<td>S</td>
<td>Section counts. The type of counts being output is section counts.</td>
</tr>
<tr>
<td>SET</td>
<td>Autonomous facility alert has been set.</td>
</tr>
<tr>
<td>THR</td>
<td>Threshold. This field provides the current PM threshold for the PM count name to its immediate left.</td>
</tr>
<tr>
<td>*</td>
<td>If present, this indicates that at least one PM count is invalid for this interval.</td>
</tr>
<tr>
<td>a</td>
<td>Switching module (SM) number.</td>
</tr>
<tr>
<td>b</td>
<td>DLTU number.</td>
</tr>
<tr>
<td>c</td>
<td>DFI number.</td>
</tr>
<tr>
<td>d</td>
<td>Facility number.</td>
</tr>
<tr>
<td>e</td>
<td>Facility name [a customer-defined string through recent change/verify (RC/V)].</td>
</tr>
<tr>
<td>f</td>
<td>Count that exceeded threshold or reason for alert. Valid value(s):</td>
</tr>
<tr>
<td>BES</td>
<td>Bursty errored seconds. The facility BES threshold has been reached.</td>
</tr>
<tr>
<td>BPV</td>
<td>Bi-polar violations. The facility BPV threshold has been reached.</td>
</tr>
<tr>
<td>BPVC</td>
<td>BPV clear. BPV condition clear.</td>
</tr>
<tr>
<td>CFAH</td>
<td>Change of frame alignment (COFA) high. This event is only for DFI-1 facilities. The facility COFA counter high threshold (511), has been reached. A COFA counter is pegged once for each 10-second interval with one or more COFA events.</td>
</tr>
</tbody>
</table>
CFAL = Change of frame alignment low. This event is only for DFI-1 facilities. The facility COFA low threshold (17), has been reached.

COFA = Change of frame alignment. The facility COFA threshold has been reached.

CRC6 = Cyclic redundancy check-6 errors. The facility CRC6 threshold has been reached.

CSS = Controlled slip seconds errors. The facility CSS threshold has been reached.

DDL = Derived data link. A loss of the derived data link has occurred.

DDLc = Derived data link cleared. Loss of the derived data link has been cleared.

ERR3 = Bit error rate has exceeded 1 error in 1,000 bits. ERR3 is based on a 480-millisecond interval for D4 mode and a 1.008 second interval for extended framing (FE) mode. Facilities are removed from service for SLC® DFIs (SDFIs), but are not removed from service for DFI-1, DFI-2 and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

ERR4 = Bit error rate has exceeded 1 error in 10,000 bits. ERR4 is based on a 96-millisecond interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

ERR5 = Bit error rate has exceeded 1 error in 100,000 bits. ERR5 is based on a 96-millisecond interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

ERR6 = Bit error rate has exceeded 1 error in 1,000,000 bits. ERR6 is based on a 672-millisecond interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

ERR7 = Bit error rate has exceeded 1 error in 10,000,000 bits. ERR7 is based on a 6.48-seconds interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

ER3C = Bit error rate is no longer above 1 error in 1,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR3 are restored provided no other alarms exist which would cause the facility to remain out-of-service (OOS).

ER4C = Bit error rate is no longer above 1 error in 10,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR4 are restored provided no other alarms exist which would cause the facility to remain OOS.

ER5C = Bit error rate is no longer above 1 error in 100,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR5 are restored provided no other alarms exist which would cause the facility to remain OOS.

ER6C = Bit error rate is no longer above 1 error in 1,000,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR6 are restored provided no other alarms exist which would cause the facility to remain OOS.

ER7C = Bit error rate is no longer above 1 error in 10,000,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR7 are restored provided no other alarms exist which would cause the facility to remain OOS.

ES = Errored seconds. The facility ES threshold has been reached.

ESH = ES high. This event is only for DFI-1 and DFIH facilities. The facility ES high threshold has been reached. An errored second is defined as a second with at least one CRC6 errors, or at least one loss of frame alignment (LOFA), or at least one slip. The high 15-minute threshold is 75. The high 24-hour threshold is 1706.

ESL = ES low. This event is only for DFI-1 and DFIH facilities. The facility ES low threshold has been reached. The low 15-minute threshold is 14. The low 24-hour threshold is 864. DFH facilities only support a 24-hour threshold.

FLS = Frame loss seconds. This event is only for IDCU facilities. The facility FLS
threshold has been reached.

FS  = Failed seconds. The facility FS threshold has been reached.
SEFS = Severely errored framing seconds. The facility SEFS threshold has been reached.
SES  = Severely errored seconds. The facility SES threshold has been reached.
SESH = SES high. This only applies to DFI-1 in FE mode and DFIH facilities. The facility SES threshold, of 255, has been reached. A CRC6 count is pegged for each 3-millisecond interval with one or more CRC6 errors. An SES is a second with at least 320 CRC6 counts, or at least one LOFA, or at least one slip. This SES report is generated when the number of SESes reaches 255 in a 24-hour period on a DFI-1 facility.
SESL = SES low. This only applies to DFI-1 facilities. The facility SES low threshold has been reached.
SLH  = Slip seconds high. This event is only for DFI-1 and DFIH facilities. The facility slip count high threshold has been reached. A slip counter is pegged for each 10-second interval with at least one slip. The SLH threshold is 255.
SLL  = Slip seconds low. This event is only for DFI-1 and DFIH facilities. The facility slip count low threshold has been reached. The SLL threshold is 4.
SS   = Slip seconds. The facility slip count threshold has been reached.
UAS  = Unavailable seconds. This event is only for IDCU and DNU-S facilities. The facility UAS threshold has been reached.

g = Number of bursty errored seconds (BESs) for this interval.
h = Current BES threshold for this interval.
i = Number of BPVs for this interval.
j = Current BPV threshold for this interval.
k = Number of COFAs for this interval.
l = Current COFA threshold for this interval.
m = Number of CRC6s for this interval.
n = Current CRC threshold for this interval.
o = Number of ES for this interval.
p = Current ES threshold for this interval.
q = Number of FSes for this interval.
r = Current FS threshold for this interval.
s = Number of SES for this interval.
t = Current SES threshold for this interval.
u = Number of SS or CSS for this interval.
v = Current SS or CSS threshold for this interval.
$w$ = IDCU number.

$x$ = IFAC number.

$y$ = Which end of the facility an alert originated from. Valid value(s):
  - $FE$ = Far end. The alert originated from the remote end of the facility.
  - $NE$ = Near end. The alert originated from the switch end of the facility.

$z$ = Number of unavailable seconds (UAS) for this interval.

$a^1$ = Current UAS threshold for this interval.

$b^1$ = Number of FLS or SEFS for this interval.

$c^1$ = Current FLS or SEFS threshold for this interval.

$d^1$ = DCLU number.

$e^1$ = DNU-S number.

$f^1$ = Data group number.

$g^1$ = STE facility number.

$h^1$ = Synchronous transport signal (STS) facility number.

$i^1$ = Virtual tributary group (VTG) number.

$j^1$ = STS signal label received. Valid value(s):
  - $ASYNC-DS3$ = Asynchronous DS3 mapping (hex value 4).
  - $ASYN-DS4NA$ = Asynchronous DS4 for North America mapping (3 DS3’s to form one 139.264 Mb/s DS4NA) (12).
  - $ASYNC-FDDI$ = Asynchronous fiber distributed data interface mapping (hex value 15).
  - $ATM-MAP$ = Asynchronous transport mode mapping (hex value 13).
  - $BYTE-SYNC$ = Byte observable synchronous (DS3) transmission (SYNTRAN) (hex value 5).
  - $DQDB-MAP$ = Distributed queue dual bus mapping (hex value 14).
  - $EQ-NONSP$ = Equipped non-specific payload (hex value 1).
  - $FLOAT-VT$ = Floating VT (virtual tributary) mode (hex value 2).
  - $LOCK-VT$ = Locked VT (virtual tributary) mode (hex value 3).
  - $UNEQUIP$ = Unequipped mode (hex value 0).
  - $UNK-STS-SL$ = Unknown STS signal label.

$k^1$ = STS signal label expected. Valid value(s):
  - $FLOAT-VT$ = Floating VT (virtual tributary) mode (hex value 2).

$l^1$ = VT1.5 signal label received. Valid value(s):
  - $ASYNC-DS1$ = Asynchronous DS1SFAC mapping (hex value 2).
  - $BIT-SYNC$ = Bit synchronous DS1SFAC mapping (hex value 3).
  - $BYTE-SYNC$ = Byte synchronous DS1SFAC mapping (hex value 4).
  - $EQ-NONSP$ = Equipped non-specific payload (hex value 1).
  - $UNEQUIP$ = Unequipped mode (hex value 0).
  - $UNK-VT-SL$ = Unknown VT signal label.
m 1 = VT1.5 signal label expected. Valid value(s):
    ASYNC=DS1 = Asynchronous DS1SFAC mapping (hex value 2).

n 1 = VT group size received. Valid value(s):
    UNK-VTSZ = Unknown VT group size
    VT1.5 = Group size of VT1.5 (bit pattern 11)
    VT2 = Group size of VT2 (bit pattern 10)
    VT3 = Group size of VT3 (bit pattern 01)
    VT6 = Group size of VT6 (bit pattern 00)

o 1 = VT group size expected. Valid value(s):
    VT1.5 = Group size of VT1.5 (bit pattern 11)

p 1 = Numeric representation of an unknown received STS signal label value. This field only appears when accompanied by RCV=UNK-STS-SL.

q 1 = Numeric representation of an unknown received VT signal label value. This field only appears when accompanied by RCV=UNK-VT-SL.

r 1 = Virtual tributary member (VTM) number.

4. ACTIONS TO BE TAKEN

Inspect the output message for performance monitoring information indicating possible facility (STE, VT1FAC, DS1SFAC) problems. Further information can be gained from executing the OP:FAC input message on the alerting facility.

For Formats 9, 10, 11, and 12:
- If this message contains a SET indication, correct the configuration mismatch between the sending and receiving equipment.
- If this message contains a CLR indication of a signal label mismatch (SLM), by the DNU-S, the following comment applies.

A received signal label value of RCV=EQ-NONSP (equipped non-specific payload) will match any legal expected signal label value except EXP=UNEQUIP (unequipped). In this situation, even though the received and expected signal label values are different, a CLR indication may be sent from the DNU-S. The signal label values are read from hardware registers. The values are a direct reflection of the bit pattern currently being received.

5. ALARMS

2. REASON FOR OUTPUT
To report that a transmission facility performance monitoring count alert threshold or error rate threshold has been exceeded. Two types of alert threshold crossing reports can be generated: 15-minute and daily alerts. A 15-minute alert is generated when a facility exceeds a 15-minute alert threshold. A daily alert is generated when a facility exceeds a daily alert threshold.

This message is also used to report one of the following autonomous facility alerts from the digital networking unit - synchronous optical network (SONET) (DNU-S) number:

- Line far end receive failure (FERF) on a STE facility.
- Signal label mismatch on a synchronous transport signal (STS-1) facility.
- Signal label mismatch on a virtual tributary level 1 (VT1FAC) facility.
- VT group size mismatch on a VT1.5 facility.

Format 1 reports a digital signal level 1 SONET facility (DS1SFAC) performance count alert event for a digital facility interface (DFI) facility terminating on a digital line and trunk unit (DLTU).

Format 2 reports a DS1SFAC performance count alert event for a DFI model 2 (DFI-2) facility (DFAC) terminating on a DLTU model 2 (DLTU-2).

Format 3 reports a DS1SFAC performance count alert event for a remote integrated services line unit (RISLU) host DFI (DFIH) facility terminating on a DLTU.

Format 4 reports a DS1SFAC performance count alert event for an integrated digital carrier unit (IDCU) facility (IFAC) or a DNU-S DS1SFAC far end (FE) facility. Alerts may be generated from the remote terminal (RT) or IDCU end of the facility.

Format 5 reports a DS1SFAC performance count alerts for a SLC® DFI facility terminating on a digital carrier line unit (DCLU).

Format 6 reports a performance count alert event for a DNU-S STE facility number.

Format 7 reports a performance count alert event for a DNU-S VT1FAC facility.

Format 8 reports a performance count alert event for a DNU-S DS1SFAC facility.

Format 9 reports a line FERF on a STE facility.

Format 10 reports a signal label mismatch on a STS-1 facility.

Format 11 reports a signal label mismatch on a VT1FAC facility.

Format 12 reports a VT group size mismatch on a VT1FAC facility.

Format 13 reports OIU OC3 STE performance count TCA report.

Format 14 reports OIU STS-1 and VT1.5 performance count TCA report.

Format 15 reports OIU DS1 performance count TCA report.

Format 16 reports a signal label mismatch on an OIU STS-1 Facility.

Format 17 reports a signal label mismatch on an OIU VT1.5 Facility.
Format 18 reports a trace identifier mismatch on a OIU STS-1 Facility.

3. VARIABLE FIELD DEFINITIONS

CI = Corruption indicator (CI). Indicates whether the counts for the alerting interval are invalid or incomplete. When a ‘*’ is present on the column below CI, it means at least one PM count is invalid for this interval.

FI = Failure indicator (FI). When a ‘*’ is present on the column below FI, it means there was a failure during this interval.

For example, a CGA occurred during the interval is a failure.

L = Line counts. The type of counts being output is line counts.

OVERFLOW = Autonomous facility alerts overflow indicator. OVERFLOW indicates that some facility alerts have been lost due to excessive alerts being reported by the DNU-S.

P = Path counts. The type of counts being output is path counts.

S = Section counts. The type of counts being output is section counts.

THR = Threshold. This field provides the current PM threshold for the PM count name to its immediate left.

* = If present, this indicates that at least one PM count is invalid for this interval.

a = Switching module (SM) number.

b = DLTU number.

c = DFI number.

d = Facility number.

e = Facility name [a customer-defined string through recent change/verify (RC/V)].

f = Count that exceeded threshold or reason for alert. Valid value(s):

BES = Bursty errored seconds. The facility BES threshold has been reached.

BPV = Bi-polar violations. The facility BPV threshold has been reached.

BPVC = BPV clear. BPV condition clear.

CFAH = Change of frame alignment (COFA) high. This event is only for DFI-1 facilities. The facility COFA counter high threshold (511), has been reached. A COFA counter is pegged once for each 10-second interval with one or more COFA events.

CFAL = Change of frame alignment low. This event is only for DFI-1 facilities. The facility COFA low threshold (17), has been reached.

COFA = Change of frame alignment. The facility COFA threshold has been reached.

CRC6 = Cyclic redundancy check-6 errors. The facility CRC6 threshold has been reached.

CSS = Controlled slip seconds errors. The facility CSS threshold has been reached.

CV = Code Violation.

DDL = Derived data link. A loss of the derived data link has occurred.

DDLC = Derived data link cleared. Loss of the derived data link has been cleared.

ERR3 = Bit error rate has exceeded 1 error in 1,000 bits. ERR3 is based on a 480-millisecond interval for D4 mode and a 1.008 second interval for extended
framing (FE) mode. Facilities are removed from service for SLC® DFIs (SDFIs), but are not removed from service for DFI-1, DFI-2 and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

ERR4 = Bit error rate has exceeded 1 error in 10,000 bits. ERR4 is based on a 96-millisecond interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

ERR5 = Bit error rate has exceeded 1 error in 100,000 bits. ERR5 is based on a 96-millisecond interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

ERR6 = Bit error rate has exceeded 1 error in 1,000,000 bits. ERR6 is based on a 672-millisecond interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

ERR7 = Bit error rate has exceeded 1 error in 10,000,000 bits. ERR7 is based on a 6.48-seconds interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

ER3C = Bit error rate is no longer above 1 error in 1,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR3 are restored provided no other alarms exist which would cause the facility to remain out-of-service (OOS).

ER4C = Bit error rate is no longer above 1 error in 10,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR4 are restored provided no other alarms exist which would cause the facility to remain OOS.

ER5C = Bit error rate is no longer above 1 error in 100,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR5 are restored provided no other alarms exist which would cause the facility to remain OOS.

ER6C = Bit error rate is no longer above 1 error in 1,000,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR6 are restored provided no other alarms exist which would cause the facility to remain OOS.

ER7C = Bit error rate is no longer above 1 error in 10,000,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR7 are restored provided no other alarms exist which would cause the facility to remain OOS.

ES = Errored seconds. The facility ES threshold has been reached.

ESH = ES high. This event is only for DFI-1 and DFIH facilities. The facility ES high threshold has been reached. An errored second is defined as a second with at least one CRC6 errors, or at least one loss of frame alignment (LOFA), or at least one slip. The high 15-minute threshold is 75. The high 24-hour threshold is 1706.

ESL = ES low. This event is only for DFI-1 and DFIH facilities. The facility ES low threshold has been reached. The low 15-minute threshold is 14. The low 24-hour threshold is 864. DFIH facilities only support a 24-hour threshold.

FLS = Frame loss seconds. This event is only for IDCU facilities. The facility FLS threshold has been reached.

FS = Failed seconds. The facility FS threshold has been reached.

SEFS = Severely errored framing seconds. The facility SEFS threshold has been reached.

SES = Severely errored seconds. The facility SES threshold has been reached.

SESH = SES high. This only applies to DFI-1 in FE mode and DFIH facilities. The facility SES threshold, of 255, has been reached. A CRC6 count is pegged for each 3-millisecond interval with one or more CRC6 errors. An SES is a second with at least 320 CRC6 counts, or at least one LOFA, or at least one slip. This SES report
is generated when the number of SESes reaches 255 in a 24-hour period on a DFI-1 facility.

**SESL**
- SES low. This only applies to DFI-1 facilities. The facility SES low threshold has been reached.

**SLH**
- Slip seconds high. This event is only for DFI-1 and DFIH facilities. The facility slip count high threshold has been reached. A slip counter is pegged for each 10-second interval with at least one slip. The SLH threshold is 255.

**SLL**
- Slip seconds low. This event is only for DFI-1 and DFIH facilities. The facility slip count low threshold has been reached. The SLL threshold is 4.

**SS**
- Slip seconds. The facility slip count threshold has been reached.

**UAS**
- Unavailable seconds. This event is only for IDCU and DNU-S facilities. The facility UAS threshold has been reached.

\( g \) = Number of bursty errored seconds (BESs) for this interval.
\( h \) = Current BES threshold for this interval.
\( i \) = Number of BPVs for this interval.
\( j \) = Current BPV threshold for this interval.
\( k \) = Number of COFAs for this interval.
\( l \) = Current COFA threshold for this interval.
\( m \) = Number of CRC6s for this interval.
\( n \) = Current CRC threshold for this interval.
\( o \) = Number of ES for this interval.
\( p \) = Current ES threshold for this interval.
\( q \) = Number of FSes for this interval.
\( r \) = Current FS threshold for this interval.
\( s \) = Number of SES for this interval.
\( t \) = Current SES threshold for this interval.
\( u \) = Number of SS or CSS for this interval.
\( v \) = Current SS or CSS threshold for this interval.
\( w \) = IDCU number.
\( x \) = IFAC number.
\( y \) = Which end of the facility an alert originated from. Valid value(s):
  - **FE** = Far end. The alert originated from the remote end of the facility.
  - **NE** = Near end. The alert originated from the switch end of the facility.
\( z \) = Number of unavailable seconds (UAS) for this interval.
$a^1$ = Current UAS threshold for this interval.

$b^1$ = Number of FLS or SEFS for this interval.

$c^1$ = Current FLS or SEFS threshold for this interval.

$d^1$ = DCLU number.

$e^1$ = DNU-S number.

$f^1$ = Data group number.

$g^1$ = STE facility number.

$h^1$ = Synchronous transport signal (STS) facility number.

$i^1$ = Virtual tributary group (VTG) number.

$j^1$ = STS signal label received. Valid value(s):
- ASYNC-DS3 = Asynchronous DS3 mapping (hex value 4).
- ASYN-DS4NA = Asynchronous DS4 for North America mapping (3 DS3’s to form one 139.264 Mb/s DS4NA) (12).
- ASYNC-FDDI = Asynchronous fiber distributed data interface mapping (hex value 15).
- ATM-MAP = Asynchronous transport mode mapping (hex value 13).
- BYTE-SYNC = Byte observable synchronous (DS3) transmission (SYNTRAN) (hex value 5).
- DQDB-MAP = Distributed queue dual bus mapping (hex value 14).
- EQ-NONSP = Equipped non-specific payload (hex value 1).
- FLOAT-VT = Floating virtual tributary (VT) mode (hex value 2).
- VT-STR-STS = VT structured STS1 SPE (for OIU).
- LOCK-VT = Locked VT mode (hex value 3).
- UNEQUIP = Unequipped mode (hex value 0).
- UNK-STS-SL = Unknown STS signal label.

$k^1$ = STS signal label expected. Valid value(s):
- FLOAT-VT = Floating VT mode (hex value 2).

$l^1$ = VT1.5 signal label received. Valid value(s):
- ASYNC-DS1 = Asynchronous DS1SFAC mapping (hex value 2).
- BIT-SYNC = Bit synchronous DS1SFAC mapping (hex value 3).
- BYTE-SYNC = Byte synchronous DS1SFAC mapping (hex value 4).
- EQ-NONSP = Equipped non-specific payload (hex value 1).
- UNEQUIP = Unequipped mode (hex value 0).
- UNK-VT-SL = Unknown VT signal label.

$m^1$ = VT1.5 signal label expected. Valid value(s):
- ASYNC-DS1 = Asynchronous DS1SFAC mapping (hex value 2).

$n^1$ = VT group size received. Valid value(s):
- UNK-VTSZ = Unknown VT group size
- VT1.5 = Group size of VT1.5 (bit pattern 11)
VT2 = Group size of VT2 (bit pattern 10)
VT3 = Group size of VT3 (bit pattern 01)
VT6 = Group size of VT6 (bit pattern 00)

o
VT group size expected. Valid value(s):
VT1.5 = Group size of VT1.5 (bit pattern 11)

p
= Numeric representation of an unknown received STS signal label value. This field only appears when accompanied by RCV=UNK-STS-SL.

q
= Numeric representation of an unknown received VT signal label value. This field only appears when accompanied by RCV=UNK-VT-SL.

r
= Virtual tributary member (VTM) number.

s
Timeframe. Valid value(s):
15MIN or 15MN = 15-minute alert threshold crossing. These alerts could be reported up to 2 minutes after their actual occurrence.
24HR = 24-hour alert threshold crossing. These alerts could be reported up to 17 minutes after their actual occurrence.
RATE = A rate based performance monitoring event.

t
= Autonomous facility. Valid value(s):
CLR or CLEARED = Alert has been cleared.
SET = Alert has been set.

u
= CV counts.

v
= CV threshold.

w
= INVALID DATA or nothing.

x
= QUEUE OVERFLOW or nothing.

y
PLM Alert type. Valid value(s):
HVC PAYLOAD MISMATCH = HVC PLM CGA.
HVC PAYLOAD UNEQUIPPED = HVC UNEQUIPPED CGA.
LVC PAYLOAD MISMATCH = LVC PLM CGA.
LVC PAYLOAD UNEQUIPPED = LVC UNEQUIPPED CGA.

z
= OIU number.

a
= Protection group (PG) number.

b
= OC-3 SONET termination equipment (STE) number.

c
TIM alert type. Valid value(s):
HVC TRACE IDENTIFIER MISMATCH
d² = Received trace identifier. The string is included in a pair of square brackets, in order that any leading or tailing spaces in the string can be observed.

e² = Expected trace identifier. The string is included in a pair of square brackets, in order that any leading or tailing spaces in the string can be observed.

4. ACTIONS TO BE TAKEN

Inspect the output message for performance monitoring information indicating possible facility (STE, VT1FAC, DS1SFAC) problems. Further information can be gained from executing the OP:FAC input message on the alerting facility. For Formats 9, 10, 11, and 12 (DNU-S) and 16, 17 and 18 (OIU):

- If this message contains a SET indication, correct the configuration mismatch between the sending and receiving equipment.
- If this message contains a CLR indication of a signal label mismatch (SLM), the following comment applies.

A received signal label value of RCV=EQ-NONSP (equipped non-specific payload) will match any legal expected signal label value except EXP=UNEQUIP (unequipped). In this situation, even though the received and expected signal label values are different, a CLR indication may be sent from the DNU-S or OIU. When received UNEQUIP, it's not a signal mismatch, it's an UNEQUIPPED CGA (for OIU). The signal label values are read from hardware registers. The values are a direct reflection of the bit pattern currently being received.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report that a transmission facility performance monitoring count alert threshold or error rate threshold has been exceeded. Two types of alert threshold crossing reports can be generated: 15-minute and daily alerts. A 15-minute alert is generated when a facility exceeds a 15-minute alert threshold. A daily alert is generated when a facility exceeds a daily alert threshold.

This message is also used to report one of the following autonomous facility alerts from the digital networking unit (DNU) - synchronous optical network (SONET) (DNU-S) number:

- Line far end receive failure (FERF) on a STE facility.
- Signal label mismatch on a synchronous transport signal level 1 (STS1) facility.
- Signal label mismatch on a virtual tributary level 1.5 (VT1.5) facility (VT1FAC).
- VT group size mismatch on a VT1.5 facility.

This message is also used to output automatically once a day the vacant digital signal level 1 (DS1) trunking facilities terminated on a digital line and trunk unit (DLTU), peripheral control and timing (PCT) line and trunk unit (PLTU), DNU-S, or optical interface unit (OIU).

Format 1 reports a DS1 facility performance count alert event for a digital facility interface (DFI) facility terminating on a DLTU.

Format 2 reports a DS1 performance count alert event for a DFI model 2 (DFI-2) facility (DFAC) terminating on a DLTU model 2 (DLTU-2).

Format 3 reports a DS1 performance count alert event for a remote integrated services line unit (RISLU) host DFI.
Format 4 reports a DS1 performance count alert event for an integrated digital carrier unit (IDCU) facility (IFAC) or a DNU-S DS1 SONET facility (DS1SFAC) far end (FE) facility. Alerts may be generated from the remote terminal (RT) or IDCU end of the facility.

Format 5 reports a DS1 performance count alerts for a SLC® DFI facility terminating on a digital carrier line unit (DCLU).

Format 6 reports a performance count alert event for a DNU-S SONET termination equipment (STE) facility number.

Format 7 reports a performance count alert event for a DNU-S VT1FAC facility.

Format 8 reports a performance count alert event for a DNU-S DS1SFAC facility.

Format 9 reports a line FERF on a STE facility.

Format 10 reports a signal label mismatch on a STS1 facility.

Format 11 reports a signal label mismatch on a VT1FAC facility.

Format 12 reports a VT group size mismatch on a VT1FAC facility.

Format 13 reports OIU optical carrier level 3 (OC3) or OC3 concatenated (OC3C) STE performance count threshold crossing alert (TCA) report.

Format 14 reports OIU STS1, synchronous transport signal level 3 concatenated (STS3C), or VT1.5 performance count TCA report.

Format 15 reports OIU DS1 performance count TCA report.

Format 16 reports a signal label mismatch on a OIU STS1 or STS3C Facility.

Format 17 reports a signal label mismatch on a OIU VT1.5 Facility.

Format 18 reports a trace identifier mismatch on a OIU STS1 or STS3C Facility.

Format 19 outputs the vacant DS1 trunking facilities for DLTU, PLTU, DNU and OIU.

Format 20 reports a point-to-point (PPP) protocol layer performance monitoring count TCA report associated with the OIU PPP link.

Format 21 reports a IP protocol layer performance monitoring count TCA report associated with the OIU PPP link. The user agent server (UAS) counts listed in this format are actually related to the PPP layer and UAS TCAs will only be reported at the PPP layer.

Format 22 reports an internet control message protocol (ICMP) protocol layer performance monitoring count TCA report associated with the OIU PPP link. The UAS counts listed in this format are actually related to the PPP layer and UAS TCAs will only be reported at the PPP layer.

Format 23 reports a user datagram protocol (UDP) protocol layer performance monitoring count TCA report associated with the OIU PPP link. The UAS counts listed in this format are actually related to the PPP layer and UAS TCAs will only be reported at the PPP layer.

Format 24 reports a real time transfer protocol (RTP) protocol layer performance monitoring count TCA report associated with the OIU PPP link. The UAS counts listed in this format are actually related to the PPP layer and UAS TCAs will only be reported at the PPP layer.
Format 25 reports the timeslot group (TSGRP) performance count alerts for the extended access interface unit (EAIU).

Format 26 reports an Ethernet (ETH) protocol layer performance monitoring count TCA report associated with the session initiation protocol (SIP) protocol handler (PH).

Format 27 reports an IP protocol layer performance monitoring count TCA report associated with the SIP PH. The UAS counts listed in this format are actually related to the ETH layer and UAS TCAs will only be reported at the ETH layer.

Format 28 reports an ICMP protocol layer performance monitoring count TCA report associated with the SIP PH. The UAS counts listed in this format are actually related to the ETH layer and UAS TCAs will only be reported at the ETH layer.

Format 29 reports an SCTP protocol layer performance monitoring count TCA report associated with the SIP PH. The UAS counts listed in this format are actually related to the ETH layer and UAS TCAs will only be reported at the ETH layer.

Format 30 reports a SIPT protocol layer performance monitoring count TCA report associated with the SIP PH. The UAS counts listed in this format are actually related to the ETH layer and UAS TCAs will only be reported at the ETH layer.

3. VARIABLE FIELD DEFINITIONS

CI = Corruption indicator (CI). Indicates whether the counts for the alerting interval are invalid or incomplete. When a '*' is present on the column below CI, it means at least one PM count is invalid for this interval.

ETH = Ethernet link layer.

ICMP = Internet control message protocol layer.

IP = Internet protocol layer.

FI = Failure indicator (FI). When a '*' is present on the column below FI, it means there was a failure during this interval.

For example, a CGA occurred during the interval is a failure.

L = Line counts. The type of counts being output is line counts.

OVERFLOW = Autonomous facility alerts overflow indicator. OVERFLOW indicates that some facility alerts have been lost due to excessive alerts being reported by the DNU-S.

P = Path counts. The type of counts being output is path counts.

PPP = Point-to-point protocol layer.

RTP = Real-time transport protocol layer.

S = Section counts. The type of counts being output is section counts.

SCTP = Stream control transmission protocol layer.

SIPT = Session initiation protocol for telecommunication layer.
**THR** = Threshold. This field provides the current PM threshold for the PM count name to its immediate left.

**UDP** = User datagram protocol layer.

* = If present, this indicates that at least one PM count is invalid for this interval.

a = Switching module (SM) number.

b = DLTU number.

c = DFI number.

d = Facility number.

e = Facility name [a customer-defined string through recent change/verify (RC/V)].

f = Count that exceeded threshold or reason for alert. Valid value(s):

- **BES** = Bursty errored seconds. The facility BES threshold has been reached.
- **BPV** = Bi-polar violations. The facility BPV threshold has been reached.
- **BPVC** = BPV clear. BPV condition clear.
- **CER** = Chunk error received (CER) count. This event is only for the SCTP layer associated with an SIP PH. The SCTP layer CER threshold has been reached.
- **CFAH** = Change of frame alignment (COFA) high. This event is only for DFI-1 facilities. The facility COFA counter high threshold (511), has been reached. A COFA counter is pegged once for each 10-second interval with one or more COFA events.
- **CFAL** = Change of frame alignment low (CFAL). This event is only for DFI-1 facilities. The facility COFA low threshold (17), has been reached.
- **COFA** = Change of frame alignment (COFA). The facility COFA threshold has been reached.
- **CRC** = Cyclic redundancy check (CRC) errors. The facility CRC threshold has been reached.
- **CRC6** = Cyclic redundancy check-6 (CRC6) errors. The facility CRC6 threshold has been reached.
- **CSS** = Controlled slip seconds (CSS) errors. The facility CSS threshold has been reached.
- **CV** = Code violation (CV).
- **DDL** = Derived data link (DDL). A loss of the derived data link has occurred.
- **DDLC** = Derived data link cleared (DDLC). Loss of the derived data link has been cleared.
- **ERR** = Invalid RTP datagram received count. This event is only for the RTP layer associated with an OIU PPP link. The RTP layer ERR threshold has been reached.
- **ERR3** = Bit error rate has exceeded 1 error in 1,000 bits. ERR3 is based on a 480-millisecond interval for D4 mode and a 1.008 second interval for extended framing (FE) mode. Facilities are removed from service for SLC® DFIs (SDFIs), but are not removed from service for DFI-1, DFI-2 and DFIH. IFACs may be removed from service depending on the way service ordering has been done.
- **ERR4** = Bit error rate has exceeded 1 error in 10,000 bits. ERR4 is based on a 96-millisecond interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.
- **ERR5** = Bit error rate has exceeded 1 error in 100,000 bits. ERR5 is based on a 96-millisecond interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.
service depending on the way service ordering has been done.

**ERR6**
- Bit error rate has exceeded 1 error in 1,000,000 bits. ERR6 is based on a 672-millisecond interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

**ERR7**
- Bit error rate has exceeded 1 error in 10,000,000 bits. ERR7 is based on a 6.48-seconds interval. Facilities are removed from service for SDFIs, but are not removed from service for DFI-1, DFI-2, and DFIH. IFACs may be removed from service depending on the way service ordering has been done.

**ER3C**
- Bit error rate is no longer above 1 error in 1,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR3 are restored provided no other alarms exist which would cause the facility to remain out-of-service (OOS).

**ER4C**
- Bit error rate is no longer above 1 error in 10,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR4 are restored provided no other alarms exist which would cause the facility to remain OOS.

**ER5C**
- Bit error rate is no longer above 1 error in 100,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR5 are restored provided no other alarms exist which would cause the facility to remain OOS.

**ER6C**
- Bit error rate is no longer above 1 error in 1,000,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR6 are restored provided no other alarms exist which would cause the facility to remain OOS.

**ER7C**
- Bit error rate is no longer above 1 error in 10,000,000 bits. Any IDCU or SLC®96 facilities removed from service due to an ERR6 are restored provided no other alarms exist which would cause the facility to remain OOS.

**ES**
- Errored seconds. The facility ES threshold has been reached.

**ESH**
- ES high. This event is only for DFI-1 and DFIH facilities. The facility ES high threshold has been reached. An errored second is defined as a second with at least one CRC6 errors, or at least one loss of frame alignment (LOFA), or at least one slip. The high 15-minute threshold is 75. The high 24-hour threshold is 1706.

**ESL**
- ES low. This event is only for DFI-1 and DFIH facilities. The facility ES low threshold has been reached. The low 15-minute threshold is 14. The low 24-hour threshold is 864. DFIH facilities only support a 24-hour threshold.

**EUR**
- Errored UDP datagram received count. This event is only for the UDP layer associated with an OIU PPP link. The UDP layer EUR threshold has been reached.

**FLS**
- Frame loss seconds. This event is only for IDCU facilities. The facility FLS threshold has been reached.

**FS**
- Failed seconds. The facility FS threshold has been reached.

**ICD**
- ICMP destination unreachable message received count. This event is only for the ICMP layer associated with an OIU PPP link. The ICMP layer ICD threshold has been reached.

**ICE**
- ICMP echo request message received count. This event is only for the ICMP layer associated with an OIU PPP link. The ICMP layer ICE threshold has been reached.

**ICP**
- ICMP parameter problem message received count. This event is only for the ICMP layer associated with an OIU PPP link. The ICMP layer ICP threshold has been reached.

**ICR**
- Invalid ICMP datagram received count. This event is only for the ICMP layer associated with an OIU PPP link. The ICMP layer ICR threshold has been reached.

**ICT**
- ICMP TTL exceeded message received count. This event is only for the ICMP layer associated with an OIU PPP link. The ICMP layer ICT threshold has been reached.

**IEH**
- Invalid Ethernet header received count. This event is only for the ETH layer.
IIF = Incoming fragmented IP datagram received count. This event is only for the IP layer associated with an OIU PPP link. The IP layer IIF threshold has been reached.

IIH = Invalid IP header received count. This event is only for the IP layer associated with an OIU PPP link. The IP layer IIH threshold has been reached.

IIQ = Incoming IP queue congestion count. This event is only for the IP layer associated with an OIU PPP link. The IP layer IIQ threshold has been reached.

IFD = Incoming ethernet frames discarded count. This event is only for the ETH layer associated with an SIP PH. The ETH layer IFD threshold has been reached.

INVALID TCA = Invalid TCA. An invalid TCA has been received from the peripheral resident software.

IPC = Invalid PPP checksum received count. This event is only for the PPP layer associated with an OIU PPP link. The PPP layer IPC threshold has been reached.

IPH = Invalid PPP header received count. This event is only for the PPP layer associated with an OIU PPP link. The PPP layer IPH threshold has been reached.

ISH = Invalid SCTP header (ISH) received count. This event is only for the SCTP layer associated with an SIP PH. The SCTP layer ISH threshold has been reached.

MSE = MAC sublayer error counts. This event is only for the ETH layer associated with an SIP PH. The ETH layer MSE threshold has been reached.

OFD = Outgoing ethernet frames discarded count. This event is only for the ETH layer associated with an SIP PH. The ETH layer OFD threshold has been reached.

RDL = RTP datagrams lost count. This event is only for the RTP layer associated with an OIU PPP link. The RTP layer RDL threshold has been reached.

SEFS = Severely errored framing seconds. The facility SEFS threshold has been reached.

SES = Severely errored seconds. The facility SES threshold has been reached.

SESH = SES high. This only applies to DFI-1 in FE mode and DFIH facilities. The facility SES threshold, of 255, has been reached. A CRC6 count is pegged for each 3-millisecond interval with one or more CRC6 errors. An SES is a second with at least 320 CRC6 counts, or at least one LOFA, or at least one slip. This SES report is generated when the number of SESes reaches 255 in a 24-hour period on a DFI-1 facility.

SESL = SES low. This only applies to DFI-1 facilities. The facility SES low threshold has been reached.

SLH = Slip seconds high. This event is only for DFI-1 and DFIH facilities. The facility slip count high threshold has been reached. A slip counter is pegged for each 10-second interval with at least one slip. The SLH threshold is 255.

SLL = Slip seconds low. This event is only for DFI-1 and DFIH facilities. The facility slip count low threshold has been reached. The SLL threshold is 4.

SS = Slip seconds. The facility slip count threshold has been reached.

UAS = Unavailable seconds. This event is for IDCU, DNU-S facilities, OIU facilities, the OIU PPP packet layer and SIP PH. The facility UAS threshold has been reached.

UPV = Unknown/unsupported protocol version count. This event is only for the SIPT layer associated with an SIP PH. The SIPT layer UPV has been reached.

URU = Unknown/unsupported request URI count. This event is only for the SIPT layer associated with an SIP PH. The SIPT layer URU has been reached.

USM = Unknown/unsupported SIP method count. This event is only for the SIPT layer associated with an SIP PH. The SIPT layer USM has been reached.

UUR = Unexpected UDP datagram received count. This event is only for the UDP layer associated with an OIU PPP link. The UDP layer UUR threshold has been reached.
= Number of bursty errored seconds (BESs) for this interval.

= Current BES threshold for this interval.

= Number of BPVs for this interval.

= Current BPV threshold for this interval.

= Number of COFAs for this interval.

= Current COFA threshold for this interval.

= Number of CRC6s for this interval.

= Current CRC threshold for this interval.

= Number of ES for this interval.

= Current ES threshold for this interval.

= Number of FSes for this interval.

= Current FS threshold for this interval.

= Number of SES for this interval.

= Current SES threshold for this interval.

= Number of SS or CSS for this interval.

= Current SS or CSS threshold for this interval.

= IDCU number.

= IFAC number.

= Which end of the facility an alert originated from. Valid value(s):
FE = Far end. The alert originated from the remote end of the facility.
NE = Near end. The alert originated from the switch end of the facility.

= Number of unavailable seconds (UAS) for this interval.

= Current UAS threshold for this interval.

= Number of FLS or SEFS for this interval.

= Current FLS or SEFS threshold for this interval.

= DCLU number.

= DNU-S number.

= Data group number.

= STE facility number.
Synchronous transport signal (STS) facility number.

Virtual tributary group (VTG) number.

STS signal label received. Valid value(s):
- ASYNC-DS3 = Asynchronous DS3 mapping (hex value 4).
- ASYN-DS4NA = Asynchronous DS4 for North America mapping (3 DS3's to form one 139.264 Mb/s DS4NA) (12).
- ASYNC-FDDI = Asynchronous fiber distributed data interface mapping (hex value 15).
- ATM-MAP = Asynchronous transport mode mapping (hex value 13).
- BYTE-SYNC = Byte observable synchronous (DS3) transmission (SYNTRAN) (hex value 5).
- DQDB-MAP = Distributed queue dual bus mapping (hex value 14).
- EQ-NONSP = Equipped non-specific payload (hex value 1).
- FLOAT-VT = Floating virtual tributary (VT) mode (for DNU-S) (hex value 2).
- PPPWOS = Point-to-Point Protocol without scrambling (hex value cf).
- PPPWS = Point-to-Point Protocol with scrambling (hex value 16).
- VT-STR-STS = VT structured STS1 SPE (for OIU) (hex value 2).
- LOCK-VT = Locked VT mode (hex value 3).
- UNEQUIP = Unequipped mode (hex value 0).
- UNK-STS-SL = Unknown STS signal label.

STS signal label expected. Valid value(s):
- FLOAT-VT = Floating VT mode (for DNU-S) (hex value 2).
- VT-STR-STS = VT structured STS1 SPE (for OIU) (hex value 2).
- PPPWS = Point-to-Point Protocol with scrambling (hex value 16).

VT1.5 signal label received. Valid value(s):
- ASYNC-DS1 = Asynchronous DS1SFAC mapping (hex value 2).
- BIT-SYNC = Bit synchronous DS1SFAC mapping (hex value 3).
- BYTE-SYNC = Byte synchronous DS1SFAC mapping (hex value 4).
- EQ-NONSP = Equipped non-specific payload (hex value 1).
- UNEQUIP = Unequipped mode (hex value 0).
- UNK-VT-SL = Unknown VT signal label.

VT1.5 signal label expected. Valid value(s):
- ASYNC-DS1 = Asynchronous DS1SFAC mapping (hex value 2).

VT group size received. Valid value(s):
- UNK-VTSZ = Unknown VT group size
- VT1.5 = Group size of VT1.5 (bit pattern 11).
- VT2 = Group size of VT2 (bit pattern 10).
- VT3 = Group size of VT3 (bit pattern 01).
- VT6 = Group size of VT6 (bit pattern 00).

VT group size expected. Valid value(s):
- VT1.5 = Group size of VT1.5 (bit pattern 11).

Numeric representation of an unknown received STS signal label value. This field only appears

Copyright ©2003 Lucent Technologies
when accompanied by RCV=UNK-STS-SL.

q¹ = Numeric representation of an unknown received VT signal label value. This field only appears when accompanied by RCV=UNK-VT-SL.

r¹ = Virtual tributary member (VTM) number.

s¹ Timeframe. Valid value(s):
15MIN = 15-minute alert threshold crossing. These alerts could be reported up to 2 minutes after their actual occurrence.
24HR = 24-hour alert threshold crossing. These alerts could be reported up to 17 minutes after their actual occurrence.
RATEx = A rate based performance monitoring event.

Autonomous facility. Valid value(s):
CLR or CLEARED = Alert has been cleared.
SET = Alert has been set.

u¹ = CV counts.

v¹ = CV threshold.

w¹ = INVALID DATA or nothing.

x¹ = QUEUE OVERFLOW or nothing.

y¹ PLM Alert type. Valid value(s):
HVC PAYLOAD MISMATCH = HVC PLM CGA.
HVC PAYLOAD UNEQUIPPED = HVC UNEQUIPPED CGA.
LVC PAYLOAD MISMATCH = LVC PLM CGA.
LVC PAYLOAD UNEQUIPPED = LVC UNEQUIPPED CGA.

z¹ = OIU number.

a² = Protection group (PG) number.

b² = OC-3 SONET termination equipment (STE) number.

c² = TIM alert type. Valid value(s):
HVC TRACE IDENTIFIER MISMATCH

d² = Received trace identifier. The string is included in a pair of square brackets, in order that any leading or trailing spaces in the string can be observed.

e² = Expected trace identifier. The string is included in a pair of square brackets, in order that any leading or trailing spaces in the string can be observed.

f² = OC3C SONET termination equipment (STE) number.

g² = The result of the request. Valid value(s):
COMPLETED = The request was successfully completed.
CONTINUED = Intermediate output report.
STARTED = Initial output report.
SYSTEM ERROR = The output has terminated incompletely.
UNAVAILABLE = One or more of the requested SMs are not available and therefore the output may be incomplete.

\[ h^2 \]
= Unit. Valid value(s):
- DS1=a-z^1-a^2-b^2-h^1-i^1-r^1
- DS1SFAC=a-e^1-f^1-g^1-h^1-i^1-r^1
- FAC=a-b-c-d
- TRIB=a-i^2-j^2-k^2

\[ i^2 \]
= PLTU number.

\[ j^2 \]
= PCT facility interface.

\[ k^2 \]
= PCT tributary number.

\[ l^2 \]
= Number of IPH for this interval.

\[ m^2 \]
= Current IPH threshold for this interval.

\[ n^2 \]
= Number of IPC for this interval.

\[ o^2 \]
= Current IPC threshold for this interval.

\[ p^2 \]
= Number of IIH for this interval.

\[ q^2 \]
= Current IIH threshold for this interval.

\[ r^2 \]
= Number of IIQ for this interval.

\[ s^2 \]
= Current IIQ threshold for this interval.

\[ t^2 \]
= Number of IIF for this interval.

\[ u^2 \]
= Current IIF threshold for this interval.

\[ v^2 \]
= Number of ICR for this interval.

\[ w^2 \]
= Current ICR threshold for this interval.

\[ x^2 \]
= Number of ICD for this interval.

\[ y^2 \]
= Current ICD threshold for this interval.

\[ z^2 \]
= Number of ICP for this interval.

\[ a^3 \]
= Current ICP threshold for this interval.

\[ b^3 \]
= Number of ICE for this interval.

\[ c^3 \]
= Current ICE threshold for this interval.
\( d^3 \) = Number of ICT for this interval.
\( e^3 \) = Current ICT threshold for this interval.
\( f^3 \) = Number of UUR for this interval.
\( g^3 \) = Current UUR threshold for this interval.
\( h^3 \) = Number of EUR for this interval.
\( i^3 \) = Current EUR threshold for this interval.
\( j^3 \) = Number of RDL for this interval.
\( k^3 \) = Current RDL threshold for this interval.
\( l^3 \) = Number of ERR for this interval.
\( m^3 \) = Current ERR threshold for this interval.
\( n^3 \) = OC3/OC3C STE side number.
\( o^3 \) = EAIU number.
\( p^3 \) = Common data and control controller (COMDAC) number.
\( q^3 \) = TSGRP number.
\( r^3 \) = PSU number.
\( s^3 \) = Shelf number.
\( t^3 \) = Protocol handler number
\( u^3 \) = Number of IFD for this interval.
\( v^3 \) = Current IFD threshold for this interval.
\( w^3 \) = Number of OFD for this interval.
\( x^3 \) = Current OFD threshold for this interval.
\( y^3 \) = Number of IEH for this interval.
\( z^3 \) = Current IEH threshold for this interval.
\( a^4 \) = Number of MSE for this interval.
\( b^4 \) = Current MSE threshold for this interval.
\( c^4 \) = Number of ISH for this interval.
\( d^4 \) = Current ISH threshold for this interval.
\( e^4 \) = Number of CER for this interval.
\( f^4 \) = Current CER threshold for this interval.
$g^4$ = Number of UPV for this interval.

$h^4$ = Current UPV threshold for this interval.

$i^4$ = Number of USM for this interval.

$j^4$ = Current USM threshold for this interval.

$k^4$ = Number of URU for this interval.

$l^4$ = Current URU threshold for this interval.

4. ACTIONS TO BE TAKEN

Inspect the output message for performance monitoring information indicating possible facility (STE, VT1FAC, DS1SFAC) problems. Further information can be gained from executing the OP:FAC input message on the alerting facility.

For Formats 9, 10, 11, and 12 (DNU-S) and 16,17 and 18 (OIU):

— If this message contains a SET indication, correct the configuration mismatch between the sending and receiving equipment.

— If this message contains a CLR indication of a signal label mismatch (SLM), the following comment applies.

A received signal label value of RCV=EQ-NONSP (equipped non-specific payload) will match any legal expected signal label value except EXP=UNEQUIP (unequipped). In this situation, even though the received and expected signal label values are different, a CLR indication may be sent from the DNU-S or OIU. When received UNEQUIP, it's not a signal mismatch, it's an UNEQUIPPED CGA (for OIU). The signal label values are read from hardware registers. The values are a direct reflection of the bit pattern currently being received.

5. ALARMS

The following alerts may be alarmed using RC/V View 8.29: OIU IP layer IIF TCA, OIU ICMP layer ICE TCA, OIU UDP layer UUR TCA, SIP PH IP layer IIF TCA, and SIP PH ICMP layer ICE TCA. The RC/V view can be used to have these events provide a minor alarm or no alarm if a threshold crossing alert occurs.

For all other events described here, no alarm is provided.

APP:OMDB-X-REF
REPT:FAN

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT FAN INHIBITS CLEARED a b

[2] REPT FAN INHIBITS NOT CLEARED a b

[3] REPT FAN INHIBIT TIMER HAS EXPIRED a b

[4] REPT FAN INHIBITS CLEARED c CABINET

[5] REPT FAN INHIBITS NOT CLEARED c CABINET

[6] REPT FAN INHIBIT TIMER HAS EXPIRED c CABINET

[7] REPT FAN ALARM c CABINET

[8] REPT FAN ALARM CLEARED c CABINET

2. REASON FOR OUTPUT

To report on fan alarm scan points.

Formats 1 and 4 report that the fan alarm scan points are no longer inhibited. This is a result of a 30-minute inhibit timer expiring.

Formats 2 and 5 report that the power switch monitor (PSM) failed to remove scan point inhibits.

Formats 3 and 6 report that the inhibit timer has expired and PSM is taking action to allow the points.

Format 7 reports a scan point transition which indicates a fan alarm in one of the cabinets of the administrative module (AM).

Format 8 reports a scan point transition which indicates the fan alarm in one of the cabinets of the AM was cleared.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.
b = Unit number.
c = Basic or growth cabinet.
4. ACTION TO BE TAKEN

For Formats 1 - 6, if inhibits could not be cleared, information from the REPT:PSM output message will indicate the reason for the failure. Maintenance on the fan units may be required.

For Format 7, determine if the fan units in the indicated cabinet of the AM need to be repaired. If all fan units are operational, the fan alarm is the result of the fan circuitry experiencing excessive heat. This causes the fan to run at high speeds. If necessary, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 8, no action is required.

5. ALARMS

Format 2 can also have a major alarm level for multiple fan failures or a minor alarm level for single fan failures.

Format 5 can also have a critical alarm level for fan alarms within the basic cabinet of the AM or a major level for a fan alarms within the growth cabinet of the AM.

Format 7 has a critical alarm level for fan alarms within the basic cabinet of the AM or a major alarm level for fan alarms within the growth cabinet of the AM.

For a critical alarm, take immediate action to clear the problem. If needed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. For a major alarm, the problem may not be service affecting, but take immediate action as indicated in the report. For a minor alarm, take action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

    RPCNa 0, FLTCODE X'c

[8] REPT FAULT
    RCVD FAULT TYPE FLT_NXXXX, CODE X'c, TIME b

2. REASON FOR OUTPUT

Format 1 prints when a node hardware fault indication is dispatched to the fault module and the device has been identified. This message also reports the time stamp, the fault code, as well as the current administrative module (AM) interface (3BI) status.

Format 2 reports that the interprocess message switch (IMS) driver received a fault sent from the config library. The time stamp is also printed.
Format 3 reports that the IMS driver received a fault sent from the config library. At the time of the fault arrival, the node involved was not in the out-of-service (OOS) status.

Format 4 prints when a hardware fault indication is dispatched to the fault module while it was handling a fault on the same node.

Format 5 reports the return status from the ring peripheral controller direct memory access (RPC DMA) restart. In this case a bad RPC DMA sequence number is found when the restart process begins.

Format 6 reports the return status from the RPC DMA restart. In this case the RPC has not completed its current DMA job when the restart process begins.

Format 7 reports the return status from the RPC DMA restart. In this case the RPC has completed its current DMA job when the restart process begins.

Format 8 reports that the IMS driver received a fault indication of type FLT_NXXXX. The "XXXX" can be DREP, ADRP or PICP depending on the code value.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Node group name in the form RPCNxx, where xx is either the group number 00 or 32.
- **b** = Real-time clock stamp (in milliseconds).
- **c** = Fault code in hexadecimal.
- **d** = 3BI status in hexadecimal.
- **e** = Number of recursive faults received.

### 4. ACTION TO BE TAKEN

For format 1, if the node is removed, the node should be diagnosed and then restored to service using normal maintenance procedures.

Note: The automatic ring recovery (ARR) routine, unless inhibited, will attempt (up to 3 times) automatic recovery of OOS nodes if the node maintenance state is not marked MANUAL.

The nodes will self-recover from an occasional transient fault unless the error threshold is exceeded. If the threshold is exceeded, the node is removed and the above recommended maintenance action should be taken. Keep a history of such fault occurrences to help in planning maintenance decisions. When clusters of faults occur and the system is not recovering reasonably, save the receive-only printer (ROP) output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 2 and 3, these messages accompany message Format 1 when config library faults are involved. No action is required.

For Format 4, this message accompanies message Format 1 when a fault occurs while the IMS driver is handling a previous fault on the same node. No action is required.

For Formats 5, 6, and 7, these messages accompany message Format 1 when the fault threshold is not exceeded. No action is required.

For Format 8, this message is for data collection purposes only. No action is required.
5. ALARMS

None.

1. FORMAT

REPT FCG SUPP INFO a FAULT (PCxray bit 4)  
TST DATA:b[i],c[i],d[i]  
e f g h  

2. REASON FOR OUTPUT

To report supplemental information associated with false cross or ground (FCG) detection on an analog line unit (model 2 or 3) gated diode cross point (GDX) matrix. The primary output message is  
REPT LUCHAN TRBL LU OPERATIONAL TEST FAILURE - FCG  
The supplemental message described here is output if the FCG supplemental print flag is set (PCxray bit 4 = 1).

3. VARIABLE FIELD DEFINITIONS

a  
= Type of FCG test failure. Valid value(s):  
HDWE GND  = No GDX cross points were found left up or a hardware problem was detected while attempting to open a GDX cross point. The failing FCG test detected foreign battery or ground on the tip or ring (tested with +50 volts applied to tip and ring using 20k ohms with a 4 milliampere threshold). This is the first FCG test.  
HDWE SHORT  = No GDX cross points were found left up or a hardware problem was detected while attempting to open a GDX cross point. The failing FCG test detected a tip to ring short (tested with -50 volts applied to the ring and ground applied to the tip using 2.5k ohms with a 6 milliampere threshold). This is the second FCG test.  
SOFTWARE  = A GDX cross point was found left up as the cause of the FCG. An attempt was made to open it except as noted by RAW data. The cause is expected to be software rather than hardware.  

b  
= The results of H link tests executed in function JB2fgc_h, called from functions JB2orig or JB2term. Valid value(s):  
FWD  = The forward GDX cross point associated with the channel of the failing path was found left up when it should not have been.  
H-NONE  = No H link GDX cross points were left up.  
Hj&Bjj  = The GDX cross point at the intersection of the indicated H- and B-links was found left up when it should not have been.  
REV  = The reverse GDX cross point associated with the channel of the failing path was found left up when it should not have been.  

b  
= The results of B-link tests executed in function JB2fgc_b, called from function JB2disc. Valid value(s):  
B-NONE  = No B-link GDX cross points were left up.  
Bkk&Akk,GBk-k  = The GDX cross point at the intersection of the indicated B- and A-links was found left up when it should not have been. GBx-x refers to the grid and board of the indicated A-link.  
Bkk&Hk  = The GDX cross point at the intersection of the indicated B- and H-links was found
left up when it should not have been.

d = The results of A-link tests executed in function JB2fgc_a, called from function JB2disc. Valid values:
- A-NONE = No A-link GDX cross points were left up.
- All&Bll = The GDX cross point at the intersection of the indicated A- and B-links was found left up when it should not have been.
- All&GBSLll-l-l-l = The GDX cross point at the intersection of the indicated A-link and line equipment number (LEN) was found left up when it should not have been.
  GBSLll-l-l-l refers to the grid, board, switch and level of the LEN.

e = Line unit channel (LUCHAN) number.

f = Line unit high level service circuit (LUHLSC) number.

g = Line unit A-link (ALINK) number.

h = Line equipment number.

i = Raw test data in hexadecimal format. RAWx - x is a hexadecimal number, it must be converted to binary.

j = The H- and B-link numbers.

k = The B-link, A-link, grid and board number.

l = the A-link, B-link, grid, board, switch and level number.

4. ACTION TO BE TAKEN

Messages can be inhibited by using:

DUMP:UT:SM=x,GVAR="PCxray",l=4;

Where 'x' = The SM being controlled. Expect a response with the contents of PCxray in hexadecimal. Do the next step only if bit 4 of PCxray = 1 (to prevent other control bits from being changed).

COPY:UT:SM=x,GVAR1="PCxray",eq,GVAR2="PCxray",MINUS,VAL3=h'00000010;

Messages can be allowed by using:

DUMP:UT:SM=x,GVAR="PCxray",l=4;

Where 'x' = The SM being controlled. Expect a response with the contents of PCxray in hexadecimal. Do the next step only if bit 4 of PCxray = 0 (to prevent other control bits from being changed).

COPY:UT:SM=x,GVAR1="PCxray",eq,GVAR2="PCxray",PLUS,VAL3=h'00000010;

Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT FIELD MAINT a

2. REASON FOR OUTPUT

To report that a poked input message from a field maintenance message page has failed.

3. VARIABLE FIELD DEFINITIONS

a = Reason for failure. Valid value(s):
   DISPLAY PAGE FAILED = A request for the display administration process to display the input page failed.
   INPUT BUFFER LIMIT EXCEEDED = Fmctrl could not store all of the input message line in the message buffer.
   INPUT TEXT EXECUTION FAILED = Failure to communicate with the craft shell when passing the input message for processing.
   MESSAGE NOT RECEIVED = An attempt to update the screen by sending a message string to the display administration process has failed.
   UNABLE TO SEND MESSAGE TO DAP = An attempt to communicate with the display administration process failed.
   UNKNOWN INDICATOR = The input message was not found in the fmctrl message table.

4. ACTION TO BE TAKEN

If the error does not involve the display administration process, retry the message. If the error does involve display administration process (DAP), restart DAP. If this does not correct the problem, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

APP:OMDB-X-REF
REPT:FILESYS

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT FILESYS a OVERFLOW   b

2. REASON FOR OUTPUT

To report that a UNIX® RTR file system is full or nearly full.

3. VARIABLE FIELD DEFINITIONS

   a = Severity of overflow condition. Valid value(s):
      CRITICAL = File system is completely full.
      WARNING = File system is in danger of overflowing, possibly within two hours.

   b = File system name.

4. ACTION TO BE TAKEN

Manual action may be required to remove data from the file system named. In order to remove data safely, the user must know which files in the file system are permanent and which are temporary. Refer to application's specific document for file system maintenance and trouble-clearing procedures.

After the files are removed, the amount of free space in the file system can be displayed by using the UNIX® message 'df' or the OP:ST-FREEDISK input message. If the free space is still low, or if the file system overflow condition continues, it is likely that some active processes have opens on files in the file system. The removal of files will not take effect until all opens to the files are closed.

The processes with active opens can be identified by using the UNIX® message 'umount' or the INH:FSYS-UMOUNT input message. The 'umount' message and the INH:FSYS-UMOUNT input message will fail to unmount if these are open files in the system.

The processes with active opens may have to be terminated to remove the overflow condition, but discretion is advised. In case of uncertainty, the next level of support personnel should be consulted.

In particular, when an overflow condition is reported for /dev/tmp, it is recommended that a corrective measure be taken to clear the overflow condition. A shortage in /dev/tmp free space may result in loss or mutilation of ROP messages, or other unforeseen malfunctions in the system.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

REPT:FMGR-ECD

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT FMGR ECD a PID=b UID=c d

2. REASON FOR OUTPUT

To report that the file manager attempted to access an equipment configuration database (ECD) record defining a special device file and in the attempt, something malfunctioned.

3. VARIABLE FIELD DEFINITIONS

a = Text phrase. Valid value(s):
   BAD-DCN = The major device number is invalid for the specified driver type.
   BAD-DRIVER = The driver type is undefined.
   BAD-FIFO = The partition number exceeded the maximum allowed for a fifo device.
   BAD-PERM = One or more of the file permissions exceeded the value of seven.
   RETURN-xx = The ila access function failed, returning 'xx'. This would normally indicate that the special device file is not in the database.

b = Process ID of the process that sent the message to the FMGR.

c = Utility ID of the process that sent the message to the FMGR.

d = Fully qualified pathname for which the ECD access occurred.

4. ACTION TO BE TAKEN

The driver required information normally extracted from the ECD will instead be used as specified in the special device file contained in the file system. If the special device file information (the mdct-rid, partition, and dcn) is inappropriate, then the ECD must be corrected.

5. ALARMS

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT FMGR a TABLE b FAIL
    ERROR = c DATA X’d

2. REASON FOR OUTPUT

To report an alteration or a failed attempt to alter the size of the file manager (FMGR) table.

3. VARIABLE FIELD DEFINITIONS

a  = Name of the FMGR table. Valid value(s):
    CAPABILITY = Capability table.
    FILE       = File table.
    INODE      = Node table.

b = Action taken on FMGR table. Valid value(s):
    DEGROWTH   = Resources has decreased in size.
    GROWTH     = Resource has increased in size.

c = Reason FMGR was unable to grow. Valid value(s):
    1 = System is currently in disk independent operation (DIOP).
    2 = Insufficient time has passed since the last unsuccessful growth attempt.
    3 = Resource is already at its maximum size
    4 = Cannot allocate a message buffer for message to the memory manager.
    5 = Cannot allocate additional memory.
    6 = Cannot send the message to the memory manager.
    7 = Another task is growing the resource.

d = Status. If non-zero, the status indicates why the memory manager could not allocate memory. If zero, not used.

4. ACTION TO BE TAKEN

In case of resource growth failure, attempt to reduce system load. In case of resource degrowth failure, no action is necessary. The file manager will attempt to deallocate the resource, as needed, at a later time.

5. ALARMS

None.

Type: Output

1. FORMAT

[1] REPT FMGR a UNMOUNTED DUE TO DISK REMOVAL

[2] REPT FMGR UNMOUNT FAILED:
   PROCESS b HAS OPEN FOR INODE c FOR d

2. REASON FOR OUTPUT

Format 1 reports that the file manager has unmounted the named file system due to disk removal (by fault or request).

Format 2 reports that an unmount request failed because the file system is busy, and to specify which processes have locks on files in the file system to be unmounted.

3. VARIABLE FIELD DEFINITIONS

a  = The name of the file system unmounted.

b  = The process ID of the process which has the inode open.

c  = The busy inode number.

d  = The name of the file system.

4. ACTION TO BE TAKEN

For Format 1, no action needs to be taken.

For Format 2, support processes such as recent change, audits and measurements may be killed. Kill the processes that have the inodes open and try the unmount again. Some processes affect call processing and should never be killed. If the unmount still does not succeed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual for assistance in determining which processes may be killed.

5. ALARMS

Formats 1 and 2 are automatically-generated reports. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

**Type:** Output

1. **FORMAT**

   [1] REPT FUSE ALARM a CABINET

   [2] REPT FUSE ALARM CLEARED a CABINET

2. **REASON FOR OUTPUT**

   To report on fuse alarm scan points.

   Format 1 reports a scan point transition which indicates a fuse alarm in one of the cabinets of the administrative module (AM).

   Format 2 reports a scan point transition which indicates a fuse alarm was cleared in one of the cabinets of the AM.

3. **VARIABLE FIELD DEFINITIONS**

   a = Basic or growth cabinet.

4. **ACTION TO BE TAKEN**

   For Format 1, determine if any of the fuses, within the indicated cabinet of the AM, needs to be repaired.

   For Format 2, no action is needed.

5. **ALARMS**

   Format 1 has a major alarm. The problem may not be service affecting, but take immediate action as indicated in the report.

   Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

**REPT:GDSUCOM-TDDS**

**Software Release:** 5E14 and later  
**Message Class:** PFR_MON  
**Application:** 5  
**Type:** Output

1. **FORMAT**

REPT GDSUCOM=a-b-c TRBL DSU DSC SERV REQ FAILURE d e RECOVERY ACTION f g h i j k l m n o p q r s t

2. **REASON FOR OUTPUT**

To respond to a maintenance service request from a digital service unit (DSU) subtending circuit on the global digital service unit common (GDSUCOM) board.

3. **VARIABLE FIELD DEFINITIONS**

- **a** = Switching module (SM) number.  
- **b** = Global digital service unit number.  
- **c** = Service group number.  
- **d** = Event number.  
- **e** = Error type. Valid value(s):
  - DSC CLOCK FAILURE = There are problems with the distribution of the 4MHz clock or the 8KHz sync to the DSU subtending circuit (DSC).  
  - DSC DETECTED TS PARITY ERROR = The DSC detected a parity error on data received from the DSU common board.  
  - DSC FLT REPORTED, NONE FOUND = A DSC fault is indicated on the DSU common board, but no bits are set in the DSC fault register.  
  - DSC INTERNAL FAILURE = An internal failure is detected on the DSC.  
  - DSC TSSR FAILURE INDICATION = There is a failure pertaining to the time slot select register (TSSR) on the DSC.  
  - NO DSC PARITY ERROR FOUND = A DSC parity error is indicated on the DSU common board, but no bits are set in the DSC parity error register.  
- **f** = Recovery action. Valid value(s):
  - ANALYSIS ONLY = A post mortem report is generated.  
  - ASSERT TO SYSTEM INTEGRITY = Software failure has been detected and system integrity has been notified.  
  - INITIALIZE = The failing circuit has been reinitialized.  
  - RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.  
  - RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.  
  - RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
g = DSU common board error source register (ESR).
h = DSU common board DSC fault register.
i = DSU common board DSC parity error register.
j = DSU common board parity register for DSU common board time slots 16-31.
k = DSU common board parity register for DSU common board time slots 0-15.
l = Software copy of the DSU common board ESR mask register. The mask register cannot be read.
m = Software copy of the DSU common board DSC fault mask register. The mask register cannot be read.
n = Software copy of the DSU common board DSC parity error mask register. The mask register cannot be read.
o = Fault register on the failing DSU subtending circuit.
p = Parity register for the data coming to the DSU subtending circuit on DSU time slots 16-31.
q = Parity register for the data coming to the DSU subtending circuit on DSU time slots 0-15.
r = External logical circuit name.
Note: Up to six logical circuit names, error counts, and error thresholds (variables 'r'- 't') may be printed.
s = Current decimal number of recent failures of this type recorded.
t = Error count threshold, above which the recovery action will be escalated.

None.
REPT:GDXACC-TGPA

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT GDXACC=a-b-c TRBL GDXAXS POWER ALARM d e RECOVERY ACTION f g h i [j k l]

2. REASON FOR OUTPUT

To respond to a line unit (LU) fault recovery action on the gated diode crosspoint access (GDXACC).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Service group number.
d = Event number.
e = Secondary error type. Valid value(s):
   SR = Reported but not found.
   VO = Source GDXAXS voltage failure.
   VP = Source GDXAXS voltage failure.
   VPP = Source GDXAXS voltage failure.
   Note: If ONLY a VPP alarm is present, the circuit will remain in service but will be marked "DEGRADED" (DGR) as mate GDXACC will supply VPP. If any other errors are present, the GDXACC recovery will advance to the 'RST PREEMPT' state.

f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = Software failure has been detected and system integrity has been notified.
   INHIBIT INTERRUPTS = All maintenance type interrupts inhibited.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

   Note: Up to two lines of variables 'g'-i' may be printed.

g = Hexadecimal printout of LU error source mask register (COMMSK).
h = Hexadecimal printout of LU error source register (COMESR).
4. ACTION TO BE TAKEN

If the circuit is marked "DEGRADED" due to an VPP error report, replace the faulty pack at first opportunity. The mate will supply power until the faulty pack is replaced. It is not advisable to run extended periods in the degraded condition. When circuit is removed, replaced, diagnosed, and restored, the "DEGRADED" state will be cleared. The "DEGRADED" state will keep circuit on off normal status list.

## REPT:GKCCR

**Software Release:** 5E14 and later  
**Message Class:** DB, ODD  
**Application:** 5  
**Type:** Output

### 1. FORMAT

1. **FORMAT**

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>REPT GKCCR {SM=a|CMP=b-c {PRIM|MATE}</td>
</tr>
<tr>
<td>2</td>
<td>REPT GKCCR SUMMARY {SM=a|CMP=b-c {PRIM|MATE}</td>
</tr>
</tbody>
</table>

### 2. REASON FOR OUTPUT

Format 1 reports errors found by both manual execution (following an EXC:GKCCR input message) and automatic execution of the generated key collection and compression routine (GKCCR) in an individual processor. One or more instances of this message may occur for a single GKCCR if errors are found, and these messages are followed by a single REPT:GKCCR summary message (Format 2).

Format 2 reports a summary which contains the total number of each error type found during an execution of GKCCR in an individual processor. It does not indicate which relations are in error. One instance of this message will occur for each processor on which the GKCCR is executed.

The ODD message class applies to Format 1. The DB message class applies to Format 2.

### 3. VARIABLE FIELD DEFINITIONS

- **AM** = Administrative module.
- **MATE** = Mate CMP.
- **PRIM** = Primary CMP.
- **a** = Switching module (SM) number.
- **b** = Message switch side of the communication module (CM) for the specified communications module processor (CMP) (0,1).
- **c** = CMP number.
- **d** = Number of occurrences of the type of error found.
- **e** = Type of error found in one or more generated key relations. Valid value(s): **CORRUPTED FREE GK TUPLE REFERENCES TO RELATION** = While searching relations that have an attribute containing a generated key (GK) to another relation, the GKCCR found one or more tuples using GK values corresponding to unassigned GK tuples on the free list. This message requires manual recovery of data corruption. Refer to
the Corrective Maintenance manual for appropriate recovery procedures.

**CORRUPTED GK BUCKET LIST TUPLES COLLECTED IN RELATION** = The GKCCR found one or more GK tuples marked as corrupt on a bucket list. Since the GK tuple was not being referenced by other relations, the GKCCR successfully collected the corrupted tuple and placed it on the free list. No manual corrective action is required.

**CORRUPTED GK TUPLES COLLECTED IN RELATION** = The GKCCR found one or more GK tuples marked as corrupt, but that did not exist on either a bucket or free list. Since the GK tuple was not being referenced by other relations, the GKCCR successfully collected the corrupted tuple and placed it on the free list. No manual corrective action is required.

**CORRUPTED GK TUPLE REFERENCES TO RELATION** = While searching relations that have an attribute containing a generated key (GK) to another relation, the GKCCR found one or more tuples with invalid GK values beyond the value of the acc_lastagk rIDBACCGK dictionary attribute. This message requires manual recovery of data corruption. Refer to the Corrective Maintenance manual for appropriate recovery procedures.

**FREE LIST GKS MARKED AS BEING USED IN RELATION** = The GKCCR found one or more GK tuples residing on the free list to be marked as being in use. Because the GKCCR did not find any references to the tuple, it was able to properly recover the GK tuple. No manual corrective action is required.

**GKCCR ABORTED BY GK REORG ROLL FORWARD OF GK RELATION** = The GKCCR has been aborted by the generated key bucket reorg (GKBR) function in the case where the GKBR is in roll forward. Because the GKBR and GKCCR were working on the same relation, and the GKCCR took too much time, the GKBR had to abort GKCCR or otherwise the roll forward would fail. This will not cause any other errors. No manual correction action is required.

**INCOMPLETE GK COLLECTION FOR RELATION** = The GKCCR could not complete collection for the relation indicated. This message may appear in conjunction with other REPT:GKCCR output messages for this same relation. The collection of this relation will be deferred to the next execution of the GKCCR. No manual correction action is required.

**INVALID LINK FIELDS FOUND IN FREE LIST OF RELATION** = The GKCCR found one or more tuples on a free list with either a corrupted forward or backward link value. The list is recovered by terminating the linked list following the last properly linked GK tuple. No manual corrective action is required.

**INVALID LINK FIELDS FOUND IN RELATION** = The GKCCR found one or more tuples on a bucket list with corrupted forward link values. The link value will be set to the link termination value. No manual corrective action is required.

**MISSING DATA PAGES ADDED TO RELATION** = The GKCCR was unable to access one or more data pages in a GK relation. The data page will be inserted into the relation and all tuples with references to them from other relations will be marked as corrupt. Any tuples marked as corrupt will be identified in subsequent REPT:GKCCR output messages. No manual corrective action is required.

**NON-EXISTENT GK TUPLE REFERENCES TO RELATION** = The GKCCR could not retrieve the address of one or more generated key tuples whose GK values are correct. This usually indicates a missing or invalid data page exists in the GK relation. This message requires manual recovery of data corruption. Refer to the Corrective Maintenance manual for appropriate recovery procedures.

**NON-LINKED GK TUPLES COLLECTED IN RELATION** = The GKCCR found one or more GK tuples do not exist on either a bucket or a free list. Since the GK tuple was determined to not contain any references to it, the GKCCR was able to recover the GK tuple. No manual corrective action is required.
NON-LINKED GK TUPLES RE-INSERTED IN RELATION = The GKCCR found one or more GK tuples do not exist on either a bucket or a free list. Since the GK tuple has one or more tuples from other relations referencing it, the GKCCR re-inserted the GK tuple back into a bucket list. No manual corrective action is required.

OLD READ TRANSACTION BLOCKED COLLECTION OF GK RELATION = The GKCCR could not collect the specified GK relation because the parent relation specified in the output message has a read-only transaction opened on a version of the parent relation that has since been updated. The GKCCR timed out waiting for this transaction to commit. The collection of the GK relation will be deferred to the next execution of the GKCCR. No manual corrective action is required.

TUPLES SUCCESSFULLY COLLECTED IN RELATION = The GKCCR found one or more GK tuples that were no longer being referenced by tuples in other relations. These GK tuples have been placed into the free list. This report message does not indicate an error and will only be generated following the EXC:GKCCR input message. No manual corrective action is required.

UNRECOVERABLE GK TUPLES FOUND IN RELATION = The GKCCR found one or more GK tuples marked as corrupt, but that did not exist on either a bucket or free list. Because the GK tuple is referenced by one or more tuples in other relations, the GKCCR cannot recover the GK tuples. This message requires manual recovery of data corruption. Refer to the Corrective Maintenance manual for appropriate recovery procedures.

UNRECOVERABLE GK TUPLES FOUND ON BUCKET LIST OF RELATION = The GKCCR found one or more GK tuples marked as corrupt that also existed on a bucket list. Because the GK tuple is referenced by one or more tuples in other relations, the GKCCR cannot fully recover the GK tuples. Action is taken to terminate the bucket linked list prior to the corrupted GK tuple. This message requires manual recovery of data corruption. Refer to the Corrective Maintenance manual for appropriate recovery procedures.

UNRECOVERABLE GK TUPLES ON FREE LIST OF RELATION = The GKCCR found one or more GK tuples marked as corrupt that also existed on the GK relation's free list. Because the GK tuple is referenced by one or more tuples in other relations, the GKCCR cannot fully recover the GK tuples. Action is taken to terminate the free linked list prior to the corrupted GK tuple. This message requires manual recovery of data corruption. Refer to the Corrective Maintenance manual for appropriate recovery procedures.

USED GK TUPLES FOUND MARKED AS FREE IN RELATION = The GKCCR found one or more GK tuples, marked as being free, on a bucket-linked list. The GKCCR changes the GK tuple to be marked as being used. No manual corrective action is required.

f = Name of the relation referencing the message.

g = Name of the parent relation for relation in named in ‘f’. This name occurs only when corruption is detected in the parent of relation named in ‘f’.

h = Type of error found in one or more generated key relations. Each error type in the summary has a one-to-one correspondence with an error type in ‘e’. Refer to variable ‘e’ for details.

CORRUPTED FREE GK TUPLES REFERENCED = Total number of errors of type CORRUPTED FREE GK TUPLE REFERENCES TO RELATION for entire GKCCR.

CORRUPTED GK BUCKET LIST TUPLES COLLECTED = Total number of errors of type CORRUPTED GK BUCKET LIST TUPLES COLLECTED IN RELATION for entire GKCCR.

CORRUPTED GK TUPLES COLLECTED = Total number of errors of type CORRUPTED GK TUPLES
COLLECTED IN RELATION for entire GKCCR.
CORRUPTED GK TUPLES REFERENCED = Total number of errors of type CORRUPTED GK TUPLE REFERENCES TO RELATION for entire GKCCR.
FREE LIST GKS MARKED AS BEING USED = Total number of errors of type FREE LIST GKS MARKED AS BEING USED IN RELATION for entire GKCCR.
GK COLLECTIONS BLOCKED BY OLD READ TRANSACTIONS = Total number of errors of type OLD READ TRANSACTION BLOCKED COLLECTION OF GK RELATION for entire GKCCR.
INCOMPLETE GK COLLECTION = Total number of errors of type INCOMPLETE GK COLLECTION FOR RELATION for entire GKCCR.
INVALID LINK FIELDS FOUND = Total number of errors of type INVALID LINK FIELDS FOUND IN RELATION for entire GKCCR.
INVALID LINK FIELDS FOUND IN FREE LIST = Total number of errors of type INVALID LINK FIELDS FOUND IN FREE LIST OF RELATION for entire GKCCR.
MISSING DATA PAGES ADDED = Total number of errors of type MISSING DATA PAGES ADDED TO RELATION for entire GKCCR.
NON-EXISTENT GK TUPLES REFERENCED = Total number of errors of type NON-EXISTENT GK TUPLE REFERENCES TO RELATION for entire GKCCR.
NON-LINKED GK TUPLES COLLECTED = Total number of errors of type NON-LINKED GK TUPLES COLLECTED IN RELATION for entire GKCCR.
NON-LINKED GK TUPLES RE-INSERTED = Total number of errors of type NON-LINKED GK TUPLES RE-INSERTED IN RELATION for entire GKCCR.
TUPLES SUCCESS FULLY COLLECTED = Total number of occurrences of TUPLES SUCCESSFULLY COLLECTED IN RELATION for entire GKCCR.
UNRECOVERABLE GK TUPLES FOUND = Total number of errors of type UNRECOVERABLE GK TUPLES FOUND IN RELATION for entire GKCCR.
UNRECOVERABLE GK TUPLES FOUND ON BUCKET LIST = Total number of errors of type UNRECOVERABLE GK TUPLES FOUND ON BUCKET LIST OF RELATION for entire GKCCR.
UNRECOVERABLE GK TUPLES FOUND ON FREE LIST = Total number of errors of type UNRECOVERABLE GK TUPLES FOUND ON FREE LIST OF RELATION for entire GKCCR.
USED GK TUPLES FOUND MARKED AS FREE = Total number of errors of type USED GK TUPLES FOUND MARKED AS FREE IN RELATION for entire GKCCR.

4. ACTION TO BE TAKEN

The appropriate action to be taken is indicated for each type of report message. For any manual recovery actions required, refer to the Corrective Maintenance manual for appropriate recovery procedures.

Application: 5
Type: Output

1. FORMAT

REPT  GLOBAL FUNCTIONALITY a          TYPE=SIG GTWY   GSM=b
[c[ c...]]

2. REASON FOR OUTPUT

This report is automatically generated by the system when the status of one or more global functionality components for a signaling gateway global switching module (GSM) change.

3. VARIABLE FIELD DEFINITIONS

a = The global functionality status. Valid value(s):
IMPAIRED = One or more global functionality components for a GSM are off-normal. The global functionality of the GSM is impaired.
NORMAL = No global functionality components are off-normal. The global functionality of the GSM is normal.

b = Common channel signaling (CCS) GSM number.

c = Off-normal condition(s) existing in GSM 'b'. Valid value(s):
CCS_LNK = Some or all CCS signaling links are unavailable.
CMT_LOST = All CCS message transport (CMT) paths provisioned for the GSM are unavailable.
CMT_OFFN = Some, but not all, CMT paths are available.
QPH_OFFN = Some or all quad-link packet switch protocol handler (QPH) endpoints are inaccessible.
SM STATUS UNAVAILABLE = The GSM status is unavailable.

4. ACTIONS TO BE TAKEN

Refer to the corrective maintenance procedures in the Signaling Gateway Common Channel Signaling manual, 235-200-116, if off-normal conditions are reported.

5. ALARMS

A major alarm is produced when the global functionality is impaired. No alarm is produced when the global functionality is normal.

Message Class: SIP
Application: 5
Type: Output

1. FORMAT

[1] REPT GENERAL MESSAGE TRANSPORT CONNECTIVITY CHANGE
   GSM=a SERV=b c
   TIMESTAMP: d
   NGSMS AFFECTED: e

[2] REPT GENERAL MESSAGE TRANSPORT CONNECTIVITY CHANGE
   GSM=a SERV=b ALL GMT CONNECTIVITY LOST
   TIMESTAMP: d

2. REASON FOR OUTPUT

To report when a global switching module (GSM) has lost or regained general message transport (GMT) connectivity.

Format 1 reports when a GSM has regained GMT connectivity to one or more non-global switching modules (NGSMs). It also can report the loss of GMT to one/more provisioned NGSM-2000s.

Format 2 reports when a GSM experiences loss of GMT connectivity to all provisioned NGSMs. This message will be repeated automatically on a 15 minute interval, until the problem is cleared.

3. VARIABLE FIELD DEFINITIONS

a = GSM number.
b = Service type. For packet trunking, the value is SIP.
c = Interconnectivity status. Valid value(s):
   ACCESSIBLE = NGSMs become accessible.
   INACCESSIBLE = the NGSMs become inaccessible.
d = Timestamp when the initial GMT loss/recovery occurred (hours:minutes:seconds).
e = A list of one/more impacted NGSMs.

4. ACTIONS TO BE TAKEN

Refer to the corrective maintenance procedures in the packet trunking manual if GMT connectivity loss is reported.

5. ALARMS

Format 1 messages will usually be major alarmed if inaccessibility is reported, while Format 2 messages will have a critical alarm.

   REPT GRASP CONDITION TRIGGERED c

[2] REPT GRASP RMBPT d COMPLETED
   BREAKPOINT CLEARED SYSTEM DIRECTIVE #e

[3] REPT GRASP BREAKPOINT f IN CRITICAL PLACE REMOVED

[4] REPT GRASP BREAKPOINT FIRED
   UTILID=g   PID=h   BREAKPOINT=i   FIRENUM=j

[5] REPT GRASP COMPLETED

[6] REPT GRASP NOT STARTED
   INVALID ACTION FIELD

[7] REPT GRASP NOT STARTED
   INVALID ID FIELD k

[8] REPT GRASP NOT STARTED
   RETRY LATER

2. REASON FOR OUTPUT

To report on generic access package (GRASP) conditions of a general or emergency nature.

3. VARIABLE FIELD DEFINITIONS

a = Condition reported. Valid value(s):
   DATABUF = GRASP dump data is affected.
   DYNAMIC = The status of the dynamic timer is changing.
   FLDOP = There are other field operation processes with which GRASP cannot coexist.
   MESSAGEBUF = GRASP completion messages are affected.
   STATIC = The static memory area internal to GRASP is affected.
   UC = The utility circuit is affected.

b = Status. Valid value(s):
ABORT = GRASP is being terminated. Stop issuing additional commands immediately. Expect no additional message.

FULL = The trace was stopped as requested in the INIT:UMEM input message. Trace memory is full.

LOST = If 'a' = DYNAMIC, then the timer override has been lost and the default will take effect with the next debugging session. If 'a' = STATIC, then the static memory area used by GRASP is full, or an internal error occurred in trying to allocate memory from this area.

OVFL = More data is being produced than can be printed. The oldest data is overwritten with the newest data.

RESET = The default value of the timer is in effect.

UNAV = The facility in 'a' is not available.

c = CONDITION RUNNING WAS RUNNING NOW STOPPED. The trace was stopped. Printed only if 'a' = UMEM and 'b' = FULL, or 'l' = "condition triggered."

d, f, i = Numeric identifier (one or more decimal digits) for the breakpoint affected.

e = Generic access package (GRASP) execution sequence number.

g = Utility ID (UID) of the target process.

h = Process ID (PID) of the target process.

j = Firing number (one or more decimal digit) of breakpoint.

k = Range error. Valid value(s):

   RANGE ERROR (DTIME)
   RANGE ERROR (UNTIL)

4. ACTION TO BE TAKEN

None.

5. ALARMS

Manual alarm.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[6] REPT GRC HISTORY

[7] REPT GRC NAME = e SECTION = f

GRC NAME=e
v
.
2. REASON FOR OUTPUT

To report the global recent change (GRC) and batch job schedules. Several formats are available depending on the options used on the REPT:GRC input message.

If a GRC NAME is specified on the REPT:GRC input message, only information pertaining to that GRC job will be printed. If GRC NAME is not specified on the REPT:GRC input message, information on all GRC jobs will be printed.

If the GRC job has been split and the SECT is specified on the REPT:GRC input message, only the information about the requested section is printed, otherwise information on all sections is printed.

Format 1 prints when the BATCH option of the REPT:GRC command is specified and there are no batch jobs scheduled.

Format 2 prints when the BATCH option of the REPT:GRC command is specified and there are batch jobs scheduled. It lists each batch job for each clerk name and when they are scheduled to run.

Format 3 prints information GRC jobs. When GRC_NAME is not specified on the REPT:GRC input message, all GRC jobs in the system are listed with the current status for each one. If GRC_NAME is specified on the REPT:GRC input message, only information about that GRC job is printed.

Format 4 prints when there are no GRC jobs scheduled.

Format 5 prints when GRC_NAME is specified on the REPT:GRC input message. It tells how many lines cannot be updated with GRC, how many lines have not had updates applied yet, how many updates failed, how many backouts were successful, how many updates were successful, and how many backouts failed. Subtotals of the number of remaining updates and the number of updated lines are provided as well as a total of the number of lines that matched the query criteria for this job.

Format 6 prints when the HISTORY option of the REPT:GRC command is specified. It gives a history of the scheduling, update, and backout operations for the GRC job(s).

Format 7 prints when the QUERY option of the REPT:GRC command is specified. It lists the query criteria specified for the GRC job(s).
Format 8 prints when the UPDATE option of the REPT:GRC command is specified. It lists the line attributes to be updated by the GRC job.

3. VARIABLE FIELD DEFINITIONS

a = Information about batch jobs.
b = Clerk name for batch job.
c = Scheduled release date, in the form month/day/year.
d = Scheduled release time, in the form hour:minute.
e = GRC name.
f = GRC section number.
g = Clerk ID for GRC job.
j = Jobs' operational status.
k = Lines remaining to be updated.
l = Information about GRC jobs.
m = Number of lines that cannot be updated using GRC.
n = Number of lines that have not had updates applied yet.
o = Number of lines with updates that failed.
p = Number of lines with updates backed out successfully.
q = Number of lines remaining to be updated.
r = Number of lines successfully updated.
s = Number of lines with backout failures.
t = Number of lines with updates successfully applied.
u = Total number of lines in the keys (or keys.sect) that matched the query criteria.
v = History of GRC work done.
w = Query criteria specified for GRC job.
x = View number used for GRC job.
y = Update information for GRC job.

4. ACTION TO BE TAKEN

None.
5. ALARMS

2. REASON FOR OUTPUT

To respond to a peripheral interface control bus (PICB) control failure interrupt on a line unit in the gated diode crosspoint grid (GRID).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit (LU) number.
c = Grid number.
d = Event number.
e = Error type. Valid value(s):
PER DETECTED BAD ADDRESS = The peripheral hardware has detected software writing to an address which is not valid for the peripheral. This is assumed to be a software error.
SOFTWARE BAD ADDRESS ERROR = The peripheral hardware has erroneously reported the detection of a bad address. This is assumed to be a hardware problem.

f = Recovery action. Valid value(s):
ANALYSIS ONLY = A post mortem report is generated.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit (refer to the 4ACTION TO BE TAKEN section). A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

h = System PICB number in hexadecimal that was being written when the failure occurred.

Copyright ©2003 Lucent Technologies
i = Read/write (uppermost) bit and address in hexadecimal to which the control interface (CI) was writing when the failure occurred.

j = Data being written to the periphery by the CI.

k = Contents of the CI error source register.

l = External logical circuit name.

Note: Up to three logical circuit names, error counts, and error thresholds (variables 'i' through 'n') may be printed.

m = Current decimal number of recent failures of this type recorded.

n = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

4. ACTION TO BE TAKEN

This is a service-affecting message. If the automatic diagnostic fails, replace the appropriate circuit pack. If intervention is required, follow diagnostic procedures found in the Corrective Maintenance manual.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit (LU) number.
c = Grid number.
d = Grid board number.
e = Event number.
f = Secondary error type. Valid value(s):
   SR = Reported but none found.
   VO = Source GRID voltage failure (minus 5 volt power supply).
   VP = Source GRID voltage failure (280 volt power supply).
   VPP = Source GRID voltage failure (320 volt power supply).
g = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = Software failure has been detected and system integrity has been notified.
   INHIBIT INTERRUPT = All maintenance type interrupts will be inhibited.
   RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

Note: Up to three lines of variables 'h' through 'l' may be printed.

h = Hexadecimal printout of LU error source mask register (COMMSK).
i = Contents of LU error source register (COMESR) in hexadecimal.

j = Contents of LU GDXCTRL grid power alarm mask register (GRDALMMR) in hexadecimal.

k = Contents of LU GDXCTRL grid power alarm register (GRDALMR) in hexadecimal.

l = Contents of LU GDXCOM voltage monitor register (GRDVMR) in hexadecimal.

m = External logical circuit name.

n = Current decimal number of recent failures of this type recorded.

o = Error count threshold, at which the recovery action will be escalated.

4. ACTION TO BE TAKEN

This is a service-affecting message. If the automatic diagnostic fails, replace the appropriate circuit pack.

5. ALARMS

A major alarm is brought up upon the removal of a grid circuit because 32 lines are taken out of service.

2. REASON FOR OUTPUT

To report that a peripheral unit has failed hashsum checks during its initialization.

To report that an MCTSI subunit has failed hashsum checks during routine checks or during circuit initialization.

Failure of hashsum checks may indicate that the hashsum tables are in error, or that the memory is bad. The address range(s) for the block(s) that had a bad hashsum is provided.

3. VARIABLE FIELD DEFINITIONS

- \(a\) = The SM number associated with the unit.
- \(b\) = The unit number.
- \(c\) = The unit service group number.
- \(d\) = MH number Valid value(s):
  - MH0
  - MH1
  - MH2
- \(e\) = Unit side. The valid values are:
  - ACTIVE
  - MATE
- \(f\) = Event number. If this field is displayed, then it can be correlated to a related maintenance activity.
- \(g\) = The starting address of the failing address range.
- \(h\) = The ending address of the failing address range.

4. ACTION TO BE TAKEN

Investigate the cause of the failure by running diagnostics on the unit side that took the fault. To access the MCC page for any unit, go to the 1000 page and then choose the page that corresponds to the unit of interest.

5. ALARMS

Major alarm.

1. FORMAT

```
REPT HDFI=a-b-c TRBL d  EVENT=e
   f RECOVERY ACTION g
   h i j
[k] . . .
```

2. REASON FOR OUTPUT

To report the occurrence of a hardware error in a host digital facilities interface (HDFI) circuit.

3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = Digital line/trunk unit number.
- **c** = Circuit number.
- **d** = Error report - refer to Exhibit A.
- **e** = Event number.
- **f** = Error type qualifying the error report - refer to Exhibit A.
- **g** = Recovery action. Valid value(s):
  - ANALYSIS ONLY = A post mortem report is generated.
  - INITIALIZE = The failing circuit has been initialized.
  - RMV = The failing circuit will be removed from service. Manual intervention is required to restore the circuit to service.
  - RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A DGN:DFI message will be printed with the results of the diagnostic.
  - RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:DFI message will be printed with the result of the diagnostic.
- **h** = External logical circuit name.
- **i** = Current decimal number of errors of this type recorded.
- **j** = Error count threshold above which the recovery action will be escalated.
- **k** = Register contents - refer to Exhibit A.

Note: Skip bytes 1 and 2, ‘k’ value starts from byte 3.
### Control Buffer (CCB) Error

- **DFI UCI ERR =** A unified control interface (UCI) error was detected by the DFI.

- **DFI CCB ERR =** A communication control buffer (CCB) error was detected by the DFI.

### FDI Status Error

- **FIDB PARITY FAILURE =** Remote link interface (RLI) [in particular a facility interface (FI)] interrupt caused by facility interface data bus (FIDB) errors on an inter-RSM communication link CDFI or an RDFI circuit.

### FIDI Parity Failure

- **FIDB PARITY FAILURE =** Remote link interface (RLI) [in particular a facility interface (FI)] interrupt caused by facility interface data bus (FIDB) errors on an inter-RSM communication link CDFI or an RDFI circuit.

### Alarm Data

- **0x0090 =** Firmware fault register data.
- **0x0096 =** Receive synchronizer exercise alarm data.
- **0x0097 =** Framer exercise alarm data.

### Sanitary Timeout

- **SANITY TIMEOUT =** Illegal derived data link (DDL) message occurring between HSM-RSM digital facility interface (DFI) circuits, or between CDFI circuits.

### Interrupt Thru DFI Mask

- **INTERUPT THRU DFI MASK =** Source analysis data 24 bytes. Bytes three and four contain the number of DDL bytes received by PERFR. Bytes 5 to 24 contain data.

### Action to Be Taken

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

### Alarms

**4. ACTION TO BE TAKEN**

**5. ALARMS**
An alarm will be displayed if the recovery action results in the circuit being removed from service. HDFIs will display a minor alarm for the first facility which is removed from service and a major alarm if more than one facility is out of service.

Other Manual(s):

235-105-220  Corrective Maintenance  
235-600-500  Asserts
REPT:HMMCC
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT HMMCC CAN NOT ACCESS ACKDB

[2] REPT HMMCC CM INIT SENDPW FAIL

[3] REPT HMMCC CM INIT RECVW FAIL

[4] REPT HMMCC CM INIT FAILED

[5] REPT HMMCC SENDPW TO SM a FAILED

[6] REPT HMMCC RECEIVED FAILURE CODE -1 from lcalllez

[7] REPT HMMCC - UXaddr_alloc() could not allocate space and returned NULL

2. REASON FOR OUTPUT

To report an initialization or communication failure in the HMmcc process.

Format 1 indicates that HMmcc failed to initialize the acknowledgment database (ackdb). The probable cause is a missing or corrupted /cft/shl/ackdb file. Input request (poke) processing will continue to work but "NA BAD ACKDB" acknowledgments may be returned for some input requests.

Formats 2 through 4 indicate that HMmcc failed to initialize the communication path between HMmcc and the Operating System for Distributed Switching (OSDS) through the communication kernel process (CMKP).

Format 5 indicates that HMmcc failed to send an update message to the HMcc process in the switching module (SM).

Format 6 indicates that HMmcc failed to send a initialization request to ULARP via the lcalllez() function.

Format 7 indicates that HMmcc failed to allocate space for the address of an incoming message.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

4. ACTIONS TO BE TAKEN

For Format 1, verify that the file /cft/shl/ackdb exists using the OP:ST-LISTDIR input message. If ackdb exists, enter 15 (end user initialization) on the emergency action interface (EAI) page to restart all processes that use ackdb. If
ackdb does not exist or if it exists but the end user initialization does not eliminate the problem, the file system may be corrupted which requires further investigation.

For Formats 2 through 6, no action is required.

For Format 7 obtain technical assistance to clear the trouble.

5. ALARMS

None.

REPT H/RDFI=a-b-c TRBL H/RDFI STATUS ERROR d
   SANITY TIMEOUT RECOVERY ACTION e
   f
   g h i

2. REASON FOR OUTPUT

To respond to a trouble indication in the status registers of the digital facility interface (DFI) microprocessor.

3. VARIABLE FIELD DEFINITIONS

SANITY TIMEOUT = Secondary error type. The internal microprocessor failed to reset the timer, which indicates that either the program is not functioning or the microprocessor is insane.

a = Switching module (SM) number.
b = Digital line/trunk unit (DLTU) number.
c = DFI number.
d = Event number.
e = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   INITIALIZE = The failing circuit has been initialized.
   RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

f = Hexadecimal value of the DFI status register.
g = External logical circuit name.
h = Current decimal number of errors of this type recorded.
i = Error count threshold, above which the recovery action will be escalated.

REPT:HSD

Software Release: 5E14 and later
Message Class: MTCE,MAIPR,SPERR
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT HSD a {ERR b [c] [COMPL CODE d] | UNIDENTIFIED RESPONSE WD1=e WD2=f}

[2] REPT HSD a WARNING LAST LINK IN DUPEX GROUP BEING REMOVED

[3] REPT HSD a STARTED

[4] REPT HSD a STOPPED

2. REASON FOR OUTPUT

Format 1 reports a high-speed synchronous data (HSD) link related software or hardware error.

Format 2 reports that the last available link in a duplex link group being removed from service.

Format 3 reports that the HSD has changed state from standby (STBY) to active (ACT). An HSD will change to ACT state when the level 2 connection is established and the data link is in information transfer state.

Format 4 reports that the HSD has changed state from ACT to STBY. An HSD will change to STBY state when the level 2 connection is terminated and the level 1 connection remains established.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies point within input/output processor driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.

c = Character string giving more information about the error identified in variable ‘b’. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual for additional explanation.

d = Hardware error type in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.

e = First word of an unidentified completion report.

f = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN
The error message in Format 1 indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

For Format 2, removal of the last available link in a duplex link group indicates that no data transmission can take place over the link facility. One of the links in the group should be repaired and restored to service.

Formats 3 and 4 are informational messages and indicate that the HSD has changed states. No action is necessary.

5. ALARMS

Formats 1 has no alarm. This is an automatically generated report.

Format 2 has a major alarm. A major alarm may not be service affecting, but take immediate action as indicated in the report.

Formats 3 and 4 have no fixed priority of action. The software process that generates the message can determine the alarm level.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[2] REPT HSDC a CODE VER X’f

[3] REPT HSDC a FLASH RAM VERSION X’g

2. REASON FOR OUTPUT

Format 1 reports a high-speed synchronous data link controller (HSDC) related software or hardware error.

Format 2 is output during the restoration of the unit.

Format 3 is output prior to the update of flash RAM on the unit as requested.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Identifies point within input/output processor driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.
c = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.
d = First word of an unidentifiable completion report.
e = Second word of an unidentifiable completion report.
f = Peripheral controller pump code version.
g = Peripheral controller flash RAM version.

4. ACTION TO BE TAKEN

These error messages indicate error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service. No action is necessary for the messages in Formats 2 and 3 unless the controller and/or its subdevices are not acting normal, or could not be restored. Contact the service organization with the code version and/or flash RAM which were used.

5. ALARMS
Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

83. REPT:I
1. FORMAT

REPT IDCU=a-b-c d TRBL BACKGROUND TEST FAILURE EVENT=e 
 f RECOVERY ACTION g 
 hhhhhhhh 
 IDCU=a-b-c i j

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure in the integrated digital carrier unit (IDCU). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable 'g' to determine the effect the fault recovery had on the system.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = IDCU unit number.
c = IDCU service group number.
d = IDCU status. Valid value(s):
   ACTIVE = The IDCU is in service and a fault has been detected.
   STANDBY = The mate (standby) IDCU service group detected a fault.
e = Event number.
f = Error type. Valid value(s):
   ACTIVE CC RAM HASHSUM FAILURE = Active IDCU service group's random access memory (RAM) has failed hash checks on its contents.
   ACTIVE CC ROM HASHSUM FAILURE = Active IDCU service group's read only memory (ROM) has failed hash checks on its contents.
   CC HEART BEAT FAILURE = A routine check found that the IDCU failed to respond to a functional access check.
   CLEAR CC ERROR COUNTS = Internal error counts have not been automatically cleared within a prescribed time.
   MATE PICB VERIFY FAILED = This error was detected when the active IDCU wrote to the standby IDCU and got an unexpected response.
   STANDBY CC RAM HASHSUM FAILURE = Mate's RAM has failed a hash check on its contents.
   STANDBY CC ROM HASHSUM FAILURE = Mate's ROM has failed a hash check on its contents.
   SUSPECT LATENT FAULTS WHEN ACTIVE = Internal IDCU operations have detected troubles that should be cleared by IDCU resident code but have not after five minutes.
g = Recovery action. Valid value(s):
   ANALYSIS ONLY = This post mortem report is generated.
   RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A
message will be printed with the results of the diagnostic.

h = Hexadecimal dump containing test type value in upper half corresponding to error type (field ‘t’).

i = Number of recent failures of this error type (field ‘f’) on this IDCU circuit.

j = Error count threshold equal to or above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:IDCU and RST:IDCU messages indicate success or failure of diagnostic when recovery action is 'RST PREEMPT'.

5. ALARMS

Critical alarm only if IDCU possibly failed duplex.

  IDCU=a-b-c i j

2. REASON FOR OUTPUT

To indicate fault recovery activity within a switching module (SM). A parity error was detected on a directly
connected peripheral interface data bus (DPI DB) connected to an integrated digital carrier unit (IDCU). The
message indicates what recovery action was taken and gives the current fault counts against the circuit specified in
the message. Refer to variable 'g' to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = IDCU unit number.
c = IDCU service group number.
d = IDCU status. Valid value(s):
   ACTIVE = The IDCU is in service and a fault has been detected.
   OOS = The IDCU is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to
              remove this IDCU from service. However, fault stimuli are still being detected from
              the circuit indicating that the IDCU has not been completely removed from service.
   STANDBY = The mate (standby) IDCU service group detected a fault.
e = Event number.
f = Error type. Valid value(s):
   D CHANNEL PARITY ERROR = A parity error occurred for a D channel on a DPI DB connected to
                              the IDCU.
   MULTIPLE PIDB PARITY ERROR = A parity error occurred on more than one DPI DB connected to
                                the IDCU.
   PIDB ERROR EOC TIMESLOT = A parity error occurred for an embedded operations channel on a
                              DPI DB connected to the IDCU.
   PIDB ERROR TMC TIMESLOT = A parity error occurred for a timeslot management channel on a
                              DPI DB connected to the IDCU.
   PIDB PARITY ERROR B CHANNEL = A parity error occurred for a B channel on a DPI DB
                                 connected to the IDCU.
   PIDB PARITY ERRORS MULTIPLE TIMESLOTS = A parity error occurred for more than one
timeslot on a DPI DB connected to the IDCU.
g = Recovery action. Valid value(s):
ANALYSIS ONLY = This post mortem report is generated.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
RST AUTO CAMPON = The failing circuit will be restored and diagnosed when it is available. A message will be printed with the results of the diagnostic.
RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

h = Hexadecimal dump containing information (that is, DPIDB name, port name) regarding the fault.

i = Number of recent failures of this error type (field 'f' ) on this IDCU circuit.

j = Error count threshold equal to or above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:IDCU and RST:IDCU messages indicate success or failure of diagnostic when recovery action is 'RST AUTO CAMPON' or 'RST PREEMPT'.

5. ALARMS

Critical alarm only if IDCU possibly failed duplex.

= Recovery action. Valid value(s):
ANALYSIS ONLY = This post mortem report is generated.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
RST AUTO CAMPOS = The failing circuit will be restored and diagnosed when it is available. A message will be printed with the results of the diagnostic.
RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

= The fault message type.

i = The IDCU peripheral interface control bus (PICB) number.

j = The mailbox number.

k = The fault report type.

l = The mailbox entry count.
m = The mailbox header word with the fault type in the lower three characters.

n = The internal IDCU event number.

o = The task type if one is running.

p = The data of specific error that are sometimes filled in.

q = Number of recent failures of this error type (‘t’) on this IDCU circuit.

r = Error count threshold equal to or above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:IDCU and RST:IDCU messages indicate success or failure of diagnostic when recovery action is 'RST AUTO CAMFON' or 'RST PREEMPT'.

5. ALARMS

Critical alarm only if IDCU possibly failed duplex.

c = IDCU service group number.
d = IDCU status. Valid value(s):
   ACTIVE = The IDCU is in service and a fault has been detected.
   OOS = The IDCU is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to
                  remove this IDCU from service. However, fault stimuli are still being detected from
                  the circuit indicating that the IDCU has not been completely removed from service.
e = Event number.
f = Error type. Valid value(s):
   CC ADDRESSED NON-EXISTENT UCI ADDRESS = The IDCU processor attempted to address a
                                             invalid memory location in the UCI.
   CC HALTED = The IDCU service group’s processor has been placed into a hold state and is no
                 longer processing code.
   DUPLEX UNIT FAILED DURING RECOVERY = The switch of the IDCU service groups failed to
                                             clear the errors and escalated to a duplex failure.
   FIFO A OPERATED INCORRECTLY = Invalid instruction to first-in-first-out (FIFO) queue A.
   FIFO A OVERFLOW = FIFO A was written when full.
   FIFO A UNDERFLOW = FIFO A was read when empty.
   FIFO B OPERATED INCORRECTLY = Invalid instruction to FIFO B.
   FIFO B OVERFLOW = FIFO B was written when full.
   FIFO B UNDERFLOW = FIFO B was read when empty.
   INHIBIT ALL HARDWARE CHECKS = The IDCU detected many errors and has set internal error
                                  masks in order to prevent rolling error recoveries.
   SANITY TIMER TIME OUT = The IDCU processor was unable to satisfy an internal integrity timer.
   The RTX operating system has a 15-millisecond job cycle. Once each cycle, it must...
strobe this timer.
SMP ADDRESSED NON-EXISTENT UCI ADDRESS = The SMP processor attempted to address an invalid memory location in the UCI.
SMP UCI PARITY FAILURE = A SMP instruction to the IDCU UCI has caused a parity error.

  OOS = The IDCU is marked as out-of-service, but fault stimuli are still being detected.
  PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this IDCU from service. However, fault stimuli are still being detected from the circuit indicating that the IDCU has not been completely removed from service.
e = Event number.
f = Error type. Valid value(s):
  CALL FAILED DUE TO PLS IN PROGRESS = The IDCU protection line switch (PLS) process was active too long and resulted in excessive call blocking.
  CC SENT BAD MESSAGE = The task information block returned from the IDCU contains bad data.
  CCP FAILED TASK TIMEOUT TO LSI = A task sent from the IDCU processor to the loop side interface (LSI) pack did not return an acknowledgement.
  IDLE TASK RESPONDED = The task reply was returned late to the mailbox.
  IFAC DDL MSG OVERFLOW = A data delivery link (DDL) on an IDCU facility sent too many messages and overflowed the receiving buffers. The link will be inhibited for 15 minutes since these are transient states only.
  LSI TASK FAILED = LSI ran requested task but returned a failure code to the IDCU processor.
  PLS DATA POSSIBLY CORRUPT - AUDIT SCHED = The protection line switch process has detected bad data in its facility information.
  SMP DETECTED BAD MESSAGE SEQUENCE = The SMP received a reply to an IDCU task in the wrong mailbox location than expected.
  TASK BLOCKING IN MAILBOX = The SMP has more messages to send than the IDCU can receive.
TASK FAILED = The IDCU accepted the requested task but has returned a failure indicating that the task did not complete the operation successfully.

TASK TIMED OUT = Each task is given a certain amount of time to complete its job. If the task fails to complete within this time, it is aborted and fault recovery is notified of this.

USER DETECTED SOFTWARE ERROR = The IDCU resident software has detected a problem during the execution of a requested task.

g = Recovery action. Valid value(s):
ANALYSIS ONLY = This post mortem report is generated.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
RST AUTO CAMPON = The failing circuit will be restored and diagnosed when it is available. A message will be printed with the results of the diagnostic.
RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

h = Hexadecimal dump containing error information of the faulted circuit.

i = Number of recent failures of this error type (field 'r') on this IDCU circuit.

j = Error count threshold equal to or above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:IDCU and RST:IDCU messages indicate success or failure of diagnostic when recovery action is 'RST AUTO CAMPON' or 'RST PREEMPT'.

   LAST REQUEST e MS AGO - LAST REPLY f MS AGO CODE = c

2. REASON FOR OUTPUT

Format 1 is printed when an audit requested by the interprocess message switch (IMS) driver process could not be started and the reply code indicates the reason is not transient.

Format 2 is printed when the IMS driver process could not block or unblock an audit.

Format 3 is printed when an audit requested by the IMS driver process was aborted before completion.

Format 4 is printed when the IMS driver process exceeded a time limit in the process of attempting to run an audit.

3. VARIABLE FIELD DEFINITIONS

a = Audit class name. Valid value(s):
   CNC = Central node control
   NODEST = Node state (node availability map)

b = Audit member number (1).

c = Acknowledgment code from UNIX® RTR operating system. Valid value(s):
   1 = IMS has received no replies (acknowledgements).
   3 = Audit system initialization in progress.
   4 = Audit system initialization failed.
   5 = Access to audit record in the equipment configuration database (ECD) failed.
   6 = Requested audit is running.
Another kernel process requested audit is running.

Maximum number of supervisor audits are running.

Requested audit instance is blocked.

Attempt to initialization or dispatch audit failed.

An audit with the same name is running.

A user-requested audit is running, cannot stop and block.

A system-requested audit is running, cannot stop and block.

Requested audit or instance is inhibited.

System integrity output formatter is dead.

Invalid audit specified.

Invalid audit instance specified.

Mode of request not permitted.

Cannot stop an audit that is not running.

Cannot stop a non-segmented kernel audit.

Request resulted in no change.

The termination status from UNIX® RTR. Valid value(s):

Aborted by the user.

Aborted by the audit.

Aborted by fault -- data integrity in the kernel is now questionable (refer to the 4ACTION TO BE TAKEN section).

System integrity monitor (SIM) abort -- failed to dispatch audit.

SIM abort -- audit control/interface failure.

SIM abort -- audit exceeded time or segment limit.

SIM abort -- aborted by stop-and-block request.

Transient audit process died.

Segmented audit exceeded an error threshold.

Time duration (milliseconds) before the timeout the last request was sent.

Time duration (milliseconds) before the timeout the last reply was received.

4. ACTION TO BE TAKEN

For Format 1,

<table>
<thead>
<tr>
<th>'c'</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>Issue the ALW AUD command for the audit specified in the fields 'a' and 'b' to allow the audit to be run.</td>
</tr>
<tr>
<td>19</td>
<td>Check the audit class name and member number specified in the “auderr”, “audinst”, and “audrec” records in the ECD for the audit indicated by the fields 'a' and 'b'.</td>
</tr>
<tr>
<td>20</td>
<td>Check the audit instance name specified in the “audinst” record in the ECD for the audit indicated by the fields 'a' and 'b'.</td>
</tr>
</tbody>
</table>

If any other value for 'c' is printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 2,

<table>
<thead>
<tr>
<th>'c'</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>19</td>
<td>Check the audit class name and member number specified in the “auderr”, “audinst”, and “audrec” records in the ECD for the audit indicated by the fields 'a' and 'b'.</td>
</tr>
<tr>
<td>20</td>
<td>Check the audit instance name specified in the “audinst” record in the ECD for the audit indicated by the fields 'a' and 'b'.</td>
</tr>
</tbody>
</table>
If any other value for 'c' is printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 3,

<table>
<thead>
<tr>
<th>'d'</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Should only occur while IMS is aborting.</td>
</tr>
<tr>
<td>4</td>
<td>Rerun the audit and verify that it completes with no errors. If errors are seen after rerunning the audit then refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>6</td>
<td>Can be caused by ECD errors, such as indicating not segmented for a segmented audit in the &quot;audrec&quot; form for the audit indicated in fields 'a' and 'b'.</td>
</tr>
</tbody>
</table>

If any other value for 'd' is printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 4, if 'e' is less than 'f' then the timeout occurred because no reply was received for the last request to run the audit. A reply is expected when the request is rejected or completed.

If 'e' is greater than 'f' then the last request to run the audit was rejected for reason 'c' and the time limit on retrying was exceeded.

If 'e' is equal to 'f' and 'c' is equal to 1 then all attempts to send the request failed and time limit on retrying was exceeded.

If any other value for 'e' is printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

   Minor.

   RTC=g

[3] REPT IMSDRV FLT
   REGISTERS AT RTC=g
   0 'X'h i j k
   4 'X'l m n o
   8 'X'r p q r s

2. REASON FOR OUTPUT

To report that the interprocess message switch (IMS) driver process has encountered a hardware or software fault.

3. VARIABLE FIELD DEFINITIONS

   a = Hexadecimal sum of the codes for all UNIX® RTR events outstanding for the IMS driver process.

   b = UNIX® RTR fault code.

   c = Virtual address where the IMS driver process was in execution when the fault was encountered.

   d = Contents of administrative module (AM) register PSW.

   e = Contents of AM register PSBR.

   f = Contents of AM register SSBR.

   g = Contents of AM real time clock register in 1-msec units.

   h-s = Contents of AM registers r0-r10, respectively.

4. ACTION TO BE TAKEN

Analyze the fault code (refer to the appendixes listed in this manual page). If the fault is associated with input or output from the ring peripheral controller nodes (RPCNs), there will be message(s) to that effect.

5. ALARMS
Minor alarm.

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT IMSDRV INIT
    STARTED a [b]
    REQ c ESCF X'd
    AT e

[2] REPT IMSDRV INIT
    COMPLETED a [b]
    AT e

[3] REPT IMSDRV INIT
    ABORTED a IN PHASE f SQS g FCODE h
    AT e

[4] REPT IMSDRV INIT
    IMS LEVEL 2 INITIALIZATION NOT IMPLEMENTED - RUNNING LEVEL 3
    AT e

[5] REPT IMSDRV INIT
    MIN-MODE INHIBITED a
    REQ c
    AT e

2. REASON FOR OUTPUT

Formats 1 - 4 provide progress reports for initialization and abort sequences of the interprocess message switch (IMS).

Format 5 indicates that the IMS encountered a situation which would normally have resulted in an initialization, but the initialization was inhibited because IMS was in min-mode.

3. VARIABLE FIELD DEFINITIONS

a = Initialization or abort sequence. Valid value(s):

  ABORT SEQUENCE
  BOOT INITIALIZATION PROLOGUE
  CRITICAL LEVEL 2 INITIALIZATION
  CRITICAL LEVEL 3 INITIALIZATION
  CRITICAL LEVEL 4 INITIALIZATION
  FPI INITIALIZATION PROLOGUE
  LEVEL 0 INITIALIZATION
  LEVEL 1A INITIALIZATION
LEVEL 1B INITIALIZATION
NON-CRITICAL PROCESS CREATIONS

b = Indication whether IMS is in MIN-MODE. If 'a' = BOOT INITIALIZATION PROLOGUE or FPI INITIALIZATION PROLOGUE, this variable will not print because it isn't known at that time.

c = Request code. Reason initialization sequence was requested. Refer to the APP:CNI appendix in the Appendixes section of the Output Messages manual.

d = Escalation flags. If variable 'd' is not zero, it indicates the reason(s) that a request (refer to variable 'c') for an initialization sequence resulted in a more severe initialization or abort than requested. Refer to the APP:CNI appendix in the Appendixes section of the Output Messages manual.

e = The value of the administrative module’s (AM’s) real-time clock register in 1 millisecond units. The time elapsed between two events which print these messages can be determined by subtracting the time values from the two messages.

f = Name of the failing phase of the initialization sequence. Refer to the APP:CNI appendix in the Appendixes section of the Output Messages manual.

g = Progress indicator. Valid value(s):
0 = Sequence requested but not started.
1 = Starting or ending phase.
2 = Waiting for phase completion.
3 = Pausing after completion of phase.
4 = Pausing before retry of phase.
5 = No sequence in progress.

h = A failure code indicating the type of failure that caused the initialization sequence to abort. Refer to the APP:CNI appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

Analyze this message in the context of the surrounding messages, including initializations of other subsystems. In many cases these output messages will be the expected results of initializations of UNIX® RTR or other subsystems.

When successful, the BOOT INITIALIZATION PROLOGUE and the FPI INITIALIZATION PROLOGUE sequence lacks a completion message because it leads directly into one of the other sequences.

When these messages are found unexpectedly (not in response to a manual request), refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

For Format 1:

<table>
<thead>
<tr>
<th>Format</th>
<th>Alarm</th>
</tr>
</thead>
<tbody>
<tr>
<td>LEVEL 1B INITIALIZATION, ABORT SEQUENCE, or FPI INITIALIZATION PROLOGUE</td>
<td>Major</td>
</tr>
<tr>
<td>LEVEL 1A INITIALIZATION</td>
<td>Minor</td>
</tr>
</tbody>
</table>
For Format 3:

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>Alarm:</th>
</tr>
</thead>
<tbody>
<tr>
<td>LEVEL 1B INITIALIZATION, CRITICAL LEVEL 2 INITIALIZATION, CRITICAL LEVEL 3 INITIALIZATION, or CRITICAL LEVEL 4 INITIALIZATION</td>
<td>Major</td>
</tr>
<tr>
<td>LEVEL 1A INITIALIZATION</td>
<td>Minor</td>
</tr>
</tbody>
</table>

For Format 5:

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>Alarm:</th>
</tr>
</thead>
<tbody>
<tr>
<td>LEVEL 1B INITIALIZATION, CRITICAL LEVEL 2 INITIALIZATION, CRITICAL LEVEL 3 INITIALIZATION, or CRITICAL LEVEL 4 INITIALIZATION</td>
<td>Major</td>
</tr>
<tr>
<td>LEVEL 1A INITIALIZATION</td>
<td>Minor</td>
</tr>
</tbody>
</table>

No alarm will be sounded for Formats 2 and 4.

6. REFERENCES

Input Message(s):

OP:RING

Output Message(s):

REPT:MIN-MODE

Output Appendix(es):

APP:CNI

Other Manual(s):

235-190-120 Common Channel Signaling Services Features

MCC Display Page(s):

118 (CNI FRAME AND CCS LINK STATUS)
REPT:IMSDRV-RPCM
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,CNI
Type: Output

1. FORMAT

[1] REPT IMSDRV RPCM
   RPCa MESSAGE BUFFER OVERFLOW

[2] REPT IMSDRV RPCM
   NO RPC HEARTBEAT

2. REASON FOR OUTPUT

Format 1 reports that the common network interface (CNI) ring peripheral controller (RPC) has been in overflow level 2 or greater for more than 20 seconds. If the RPC remains in this overflow state, this message will be output once every five minutes.

Format 2 reports that there has been no communication between either of the two RPCs and the administrative module (AM) processor for more than twenty seconds (that is, the last four RPC to AM five-second heartbeat messages are missing). If the RPCs both remain in this state beyond the initial output of this message, this message will be output once every minute until a Full Processor Initialization (FPI) is allowed.

3. VARIABLE FIELD DEFINITIONS

   a  = RPC node identifier. Valid value(s):
   00 0  = Group 00, node 0.
   32 0  = Group 32, node 0.

4. ACTION TO BE TAKEN

For Format 1, investigate this overflow condition and clear as soon as possible; this condition can result in lost common channel signaling (CCS) messages.

For Format 2, investigate this condition and clear as soon as possible as this can be a symptom of a CCS signaling outage. This condition indicates that communications have been lost between the RPC and the AM. This could have been caused by turning the ring token audit off.

5. ALARMS

A major alarm sounds for all forms of this message.

6. REFERENCES

None.
REPT:IMSRMVRST

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT IMSRMVRST ERROR a b

2. REASON FOR OUTPUT

To report an error condition in the interprocess message switch remove/restore (IMSRMVRST) user process. An operating system function call is failing.

3. VARIABLE FIELD DEFINITIONS

a = Function call failure type. Valid value(s):
3 = Send to port.

b = Error code returned by the failing function call. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

Obtain technical assistance to clear the trouble.

5. ALARMS

None.

APP: SYSERR
REPT:INHADM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT INHADM UNABLE TO MAINTAIN INHIBITS

[2] REPT INHADM FAULTED FCODE a

[3] REPT INHADM UNABLE TO SEND INHIBIT MESSAGE TO DRIVER b

[4] REPT INHADM CANNOT GET UCB RECORD

[5] REPT INHADM MINOR ALARM FROM INHIBIT ADMINISTRATOR

2. REASON FOR OUTPUT

For Format 1, to report that the inhibit administrator process attempted to maintain consistency of the error interrupt inhibits between the emergency action interface (EAI) and the unit control blocks (UCBs) in the equipment configuration database (ECD) during an initialization, but failed to access the ECD or could not send a message to a driver. The error interrupt inhibit options selected by the EAI must be propagated to the ECD, on any initialization, to insure consistency.

For Format 2, the inhibit administrator received the fault 'a'

For Format 3, the inhibit administrator does not inhibit a device directly, it sends a message to the corresponding driver. This error indicates that the "queueemn" system call failed when sending to the driver with process ID (PID) 'a'

For Format 4, an ECD access function (either lla_opensq or lla_nextseq) failed when accessing a UCB record.

For Format 5, inhibiting hardware checks, software checks, and error interrupts can prevent the system from recovering automatically from hardware or software faults. This error is printed when any of the checks are inhibited as a warning to the user.

3. VARIABLE FIELD DEFINITIONS

a = Fault code received by INHADM. Refer to the APP:FAULT-CODE appendix in the Appendixes section of the Output Messages manual.

b = PID of driver.

4. ACTION TO BE TAKEN

For Formats 1-4, run ECD audits. If there are no errors in the ECD, refer to the TECHNICAL ASSISTANCE portion
of the INTRODUCTION section of the Output Messages manual.

For Format 5, no action is required.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:INHIBIT
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT INHIBIT SCAN POINT a ON SCSD b

2. REASON FOR OUTPUT

To report that the scanner and signal distributor administrator (SCSDA) has detected a scan point which is chattering (greater than 4 transitions a second).

3. VARIABLE FIELD DEFINITIONS

a = Physical scan point number.
b = Member number.

4. ACTION TO BE TAKEN

This message indicates that a scan point is changing state continually. This could cause a message buffer overload for the clients of the SCSDA monitoring that point. This scan point should be investigated to determine why it is changing state frequently.

5. ALARMS

Minor.

6. REFERENCES

None.
REPT:INIT-3BN
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B CNI
Type: Output

1. FORMAT

[1] REPT INIT 3BN ERR

[9] REPT INIT 3BN ERR
    a b DMA INITIALIZATION TIMEOUT, STATUS = g (c)

[10] REPT INIT 3BN ERR
    IMS APPLICATION DID NOT PROVIDE ADDRESS FOR NODE a b

    UNEXPECTED ERR WHEN SHUT DOWN a b, STATUS = h, PIOFLG = i

[12] REPT INIT 3BN ERR
    UNEXPECTED ERR AFTER TEST DMA PASSED, NODE=a b, STATE=j, SOURCE = f
2. REASON FOR OUTPUT

Format 1 prints when the shutdown direct memory access (DMA) job fails.

Format 2 prints when an interrupt is received by the administrative module (AM) with an illegal internal interrupt number.

Format 3 prints when an interrupt is received by the AM with an illegal physical node identification.

Format 4 prints when the command clear interrupt fails.

Format 5 prints when the command sense AM interface (3BI) status fails.

Format 6 prints if test DMA fails for the specified node.

Format 7 prints when the direct link node (DLN) interrupts the AM while it is undergoing the DMA initialization sequence yet the internal substate of this node does not appear to expect such an interrupt.

Format 8 prints when the DLN interrupts the AM yet the node is not currently undergoing the DMA initialization sequence.

Format 9 prints when the DMA initialization sequence on the specified node times out.

Format 10 prints when the DMA initialization sequence detects that the interprocess message switch (IMS) application did not provide the address for the expanded DMA map table.

Format 11 prints if any of the hardware commands executed during the DMA shutdown sequence fails.

Format 12 prints if any of the hardware commands executed fails right after the test DMA procedure has passed.

Format 13 prints if any of the hardware commands executed fails before a node processor (NP) restart DMA fails.

3. VARIABLE FIELD DEFINITIONS

\[ a \] = The AM node name (such as DLN) and group number.

\[ b \] = Member number.

\[ c \] = Internal sequence number for technical error tracking.

\[ d \] = Internal interrupt number for this DLN. This will probably be an illegal number.

\[ e \] = Physical node identification for this DLN. This will probably be an illegal identification.

\[ f \] = Source of the request for the DMA init job. Valid value(s):

\[ g \] = Reason for timeout. Valid value(s):

2 = Test DMA timeout.
4 = NP restart DMA timeout.
8 = Overall job timeout.
h = Error status. Valid value(s):
1 = Detach interrupt failure.
2 = Clear duplex dual serial bus selector (ddsbs) failure.
3 = Cannot send reset 3BI peripheral input/output (PIO).
4 = Sense status command failure.
5 = Unused.
6 = If 'i' has the value of 0, send STOP DMA PIO failure. If 'i' has a value other than 0, the overall timer cannot be cancelled.
7 = If 'i' has the value of 0, the overall timer cannot be cancelled. If 'i' has a value other than 0, the DMA restart timer cannot be cancelled.
8 = DMA restart timer cannot be cancelled. Only valid when 'i' has the value of 0.

i = Leftover PIO indicator. If the value is 0, there was no leftover PIO command in the 3BI register for the NP when DMA shutdown took place. Otherwise, there was some leftover PIO command.

j = Error status. Valid value(s):
1 = If 'f' has the value of 8, the timer cannot be set up. If 'f' has the value of 2, the memory administration center (MAC) failed to be programmed to the user's area.
2 = DMA acknowledgement (ACK) PIO cannot be sent. Only valid when 'f' has the value of 2.
3 = The interrupt handler cannot be switched. Only valid when 'f' has the value of 2.
4 = The timer cannot be set up. Only valid when 'f' has the value of 2.

k = Error status. Valid value(s):
1 = Attach interrupt handler.
2 = Clear ddsbs failure.
3 = Cannot send reset 3BI PIO.
4 = Enable interrupt failure.
5 = Cannot send NP restart DMA PIO.
6 = Cannot set up timer.

4. ACTION TO BE TAKEN

For Formats 1, 4, 5, 7 and 8, using normal maintenance procedures, diagnose the DLN and restore it to service.

For Formats 2 and 3, if any DLN is removed as a result of the interrupt, use normal maintenance procedures, diagnose and restore to service. Messages of Format 8 can also be printed as a result of a node initiated restart. If this is the case, there should be other automatic ring recovery/automatic critical node restoration (ARR/ACNR) messages indicating this fact; there is no action needed to be taken.

For Formats 6 and 10, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 9, 11, 12 and 13, use normal maintenance procedures and diagnose the DLN. If all tests pass (ATP), contact technical personnel and restore the DLN to service.

Note: The automatic ring recovery (ARR) routine, unless inhibited, will attempt (up to 3 times) automatic recovery of the out-of-service (OOS) DLN if the node maintenance state is not marked MANUAL.

5. ALARMS

REPT INVALID MSU RECEIVED ON a b
DISCARD REASON: c TIME: d e
MSU INFORMATION: NI=f SIC=g [H1H0=h] LENGTH=i
OPC=j DPC=k [CIC=l] [SLC=m] [BICC_CIC=n]

2. REASON FOR OUTPUT

To report on invalid information contained within a message signaling unit (MSU), that results in that MSU being discarded. Provides reason why MSU was considered invalid, and prints other information that was contained in the MSU. The information contained in the MSU may be helpful in identifying and correcting the cause of the original invalid message.

3. VARIABLE FIELD DEFINITIONS

a = Packet switching unit protocol handler (PSUPH) identification number.
b = Logical protocol handler (PH) number.
c = Reason MSU was discarded. Valid value(s):
   INVALID H1/H0 VALUE = Received a signaling network management (SNM) or signaling network
   traffic management (SNTM) message with invalid H1/H0 value.
   INVALID NETWORK INDICATOR = Received a MSU with invalid network indicator.
   INVALID SERVICE INDICATOR CODE = Received a MSU with invalid service indicator code.
   SIO+SIF OF MSU TOO SHORT = Received a short MSU at a signaling point. There are fewer than
   8 octets in the combined service information octet (SIO) service information field
   (SIF).
   STP NOT ALLOWED IN SEP OFFICE = The destination point code (DPC) indicated in the MSU
   label does not correspond to this office's point code, and this office does not
   support signal transfer point (STP) functionality.
   UNEQUIPPED LABEL = Received a MSU with an unequipped circuit identification code (CIC).
   INVALID BICC CIC = Received a Bearer Independent Call Control (BICC) MSU with invalid CIC.
   UNEQUIPPED BICC CIC = Received a BICC MSU with unequipped CIC.
   UNKNOWN POINT CODE = Received a MSU from an unknown destination.
d = Time that event occurred, in hour:minute format.
e = Date that event occurred, in month/day/year format.
f = Network indicator contained in the discarded MSU.
g = Service indicator code contained in the discarded MSU.
h = H1/H0 field contained in the discarded MSU.
i = Length of the discarded MSU.
j = OPC number specified in the discarded MSU. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.

k = DPC number specified in the discarded MSU. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.

l = CIC number specified in the discarded MSU.

m = Signaling link code (SLC) number specified in the discarded MSU.

n = BICC CIC number.

4. ACTIONS TO BE TAKEN

2. REASON FOR OUTPUT

To report an input/output processor (IOP) related software or hardware error, or the occurrence of an abnormal IOP related event.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies the point within the input/output driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.

c = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.

d = Returned channel status, in hexadecimal notation. Refer to the APP:IOP-B appendix in the
Appendixes section of the Output Messages manual.

\( e \) = Returned bus interface controller (BIC) status, in hexadecimal notation. Refer to the APP:IOP-C appendix in the Appendixes section of the Output Messages manual.

\( f \) = Returned duplex bus selector (DBS) status, in hexadecimal notation. Refer to the APP:IOP-D appendix in the Appendixes section of the Output Messages manual.

\( g \) = Unit name of missing PC.

\( h \) = Member number of missing PC.

\( i \) = Pack position of missing PC.

\( j \) = Identifies PC community that is powered down.

\( k \) = First word of an unidentifiable completion report.

\( l \) = Second word of an unidentifiable completion report.

\( m \) = Version number of code that exists in the device.

\( n \) = Number of bytes received.

\( p \) = Number of bytes requested.

\( q \) = Character string giving more information about the error.

4. ACTION TO BE TAKEN

For Formats 1 through 5 and 8 through 10, the error messages indicate error conditions that could cause the removal of a unit. Any removed unit should be repaired and restored to service.

Formats 6 and 7 indicate improper manual operations.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

STACK:   f [f] [f] [f] [f] [f]
        .    .    .    .    .

HARDWARE CALL TRACE g

2. REASON FOR OUTPUT

To report specific information related to an integrated services digital network (ISDN) loop cutoff when allowed. This information can be analyzed to locate the source of the problem. Each ISDN loop cutoff that occurs will be printed on the receive-only printer (ROP).

This output message is used to inform the user when an ISDN process has been torn down due to loss of layer 2 protocol.

3. VARIABLE FIELD DEFINITIONS

a = The ISDN cutoff. Valid value(s):
   ORIGINATOR
   TERMINATOR

b = Event number.

c = The directory number of the port where the call was cut off.

d = The number of the switching module (SM) where the call was cut off.

e = The number of the port, in hexadecimal, where the call was cut off.

f = List of addresses of the functions called which resulted in the loop cutoff call. These function addresses are in hexadecimal.

g = Hardware call trace status. Valid value(s):
   IN PROGRESS = An ALW:SCORPT,TRC input message was entered
   NOT REQUESTED = An ALW:SCORPT input message was entered.

OP: TRC

Output Message(s):

TRC: UTIL-LINE
REPT:ISLUCC-TE

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT ISLUCC=a-b-c [d] TRBL e EVENT=f
g RECOVERY ACTION h
  iiiijjjj kkkkl1lll mmmmnnnn oooopppp qqqqrrrr ssssstttt uuuuuvvv
  w  x  y
  .  .  .
  .  .  .
  .  .  .

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a common controller (CC) board in the integrated services line unit (ISLU). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to field 'h' to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = ISLU line unit number.
c = ISLU service group number.
d = ISLU CC equipment status. Valid value(s):
ACTIVE = The CC is in service and a fault has been detected
DEGRADED = The last CC that is in service is detecting faults and is in the process of CC
duplex failure.
OOS = The CC is marked as out-of-service, but fault stimuli are still being detected.
PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to
remove this CC from service. However, fault stimuli are still being detected from the
circuit indicating that the CC has not been completely removed from service.
STANDBY = The CC is in standby and a fault has been detected.
e = High level error types. Valid value(s):
BACKGROUND TEST FAILURE = An error was detected during a routine background test process
being run by fault recovery.
CONTROL ORDER FAILURE = An error occurred when sending information to a circuit within the
ISLU.
FAULT MESSAGE = Error detected by ISLU resident software.
MAINTENANCE SERVICE REQUEST = An error was detected on a scheduled routine maintenance
service request on the ISLU.
OPERATIONAL FAILURE = Error detected by ISLU call processing.
f = Event number.
g

= Error type. Valid value(s):
ACTIVE CC ROM HASHSUM FAILURE = Detected bad hashsum check on the active CC that was cycling in read-only memory (ROM).
ACTIVE CC RAM HASHSUM FAILURE = Detected bad hashsum check on the active CC that was cycling in random access memory (RAM).
ACTIVE DEGRADED STANDBY STATE TIMED OUT = The CC degraded state did not clear within the required time.
CC UCI PARITY FAILURE = The CC processor attempted to address a non-existent memory location in the unified control interface (UCI).
CONTROL ORDER PARITY ERROR = Bad parity was detected on an order sent to a CC.
CONTROL SEQUENCER FAILURES = The control sequencer in the CC lost control of the line group.
CC ADDRESSED NON-EXISTENT UCI ADDRESS = The CC processor attempted to address a non-existent memory location in the UCI.
CC DETECTED BAD MESSAGE SEQUENCE = The mailbox protocol between the switching module processor (SMP) and the ISLU has been violated. The ISLU will resynchronize with the SMP, but a message may have been lost.
CC SENT BAD MESSAGE = The CC unloading driver determined that the information in the message header received from the CC was bad.
CC Halted = The CC was illegally halted.
CC ILLEGAL MATE ACCESS = An attempt was made to access the mate CC without first getting ownership.
CC HEART BEAT FAILURE = A routine check found that the CC failed to respond to a functional check.
CLEAR CC ERROR COUNTS = The CC error counts are clear because the faults implicate the active CC instead of the standby CC.
CC USER PROCESS HUNG = Active CC background test process has timed out due to failure of CC user process to respond.
CORRELATE CD FAILURES FOUND IN CC = The active CC lost its clock synchronization from the active or active major control data (CD).
DUPLEX UNIT FAILED DURING RECOVERY = The switch of the CC failed to clear the errors and escalated to a CC duplex failure.
ENABLE CONTROLLER FAILURES = Multiple ‘enables’ were returned in response to a peripheral order.
FIFO B OPERATED INCORRECTLY = This first in, first out (FIFO) was incorrectly operated. This fault could have been caused by the CC or the SMP. FIFO B is the CC’s fault reporting mechanism for errors detected on the CC’s peripherals.
FIFO B UNDERFLOW = The SMP popped the FIFO when it was empty.
FIFO B OVERFLOW = The CC put too much data into this FIFO.
FIFO A OPERATED INCORRECTLY = This FIFO was incorrectly operated. This fault could have been caused by the CC or the SMP. FIFO A is the mechanism used by the SMP to send tasks and associated data to the CC.
FIFO A UNDERFLOW = The SMP popped the FIFO when it was empty.
FIFO A OVERFLOW = The CC put too much data into this FIFO.
HASHSUM FAILURE ON ROUTINE CHECK = The hashsum check between the SMP and the ISLU does not match.
IDLE TASK RESPONDED = The task reply was returned late to the mailbox.
INTERNAL MEMORY PARITY ERROR = Bad parity was detected on one or more of the internal memory configurations in the CC.
IO TIMER VIOLATION = The CC has a special write protection over registers considered critical to its operation. This protocol was violated.
INHIBIT ALL HARDWARE CHECKS = The ISLU detected a massive number of errors and inhibit hardware checks were applied in the ISLU before sending a preempt message to
the SMP.

**INTERRUPT EXCEPTION** = This is a general purpose error for errors that the 80188 processor has the ability to detect within itself. Some should never occur unless the processor has gone completely insane and others may occur under somewhat less insane conditions. In either case, the processor is in trouble.

**LG INTERRUPT THRU MASK** = An error was detected at the line group (LG) level, but no source was found for interrupt.

**LINE GROUP ERROR** = An error occurred when sending control information to a line group.

**MATE MEMORY PARITY FAILURE** = The CC detected bad parity when accessing the mate CC memory.

**MATE NOT IN HOLD** = The mate CC was not in hold.

**MATE PICB VERIFY FAILED** = This error was detected when the active CC wrote to the standby CC and expected a correct response.

**MATE FAILED DURING SWITCH** = Switch to the mate CC failed. The switch was never completed.

**MATE WRITE PROTECT VIOLATION** = A write-protected location in the mate CC has been violated.

**MEMORY PARITY FAILURE** = The CC detected bad parity when accessing the CC memory.

**MESSAGE PROTOCOL FAILURE** = Fault recovery received a fault message containing an unexpected value.

**MULTIPLE TASKS REQUESTED SAME TDB** = Multiple tasks are assigned to the same task data block (TDB) number.

**OVERLOAD DETECTION** = Overload occurs when a CC is unable to complete all of its assigned work within the 15-millisecond scheduler. This is defined as any critical or routine process was running when the 15-millisecond timer expires. The CC will provide hit timing by counting the number of consecutive RTX cycles that this condition persists for. When the hit time has been exceeded, the overload bit in the UCI is set.

**PIC INTERRUPT THRU MASK** = An error was detected at the peripheral interface controller (PIC), but no source was found for interrupt.

**PICB FAILURE** = A fault has been detected involving the peripheral interface control bus (PICB) that terminates on the ISLUCC.

**RISLU HOST PICB FAILURE** = A fault has been detected involving the remote ISLU (RISLU) CC PICB that terminates on the host-1 digital facility interface (DFI) in the RISLU host digital line and trunk unit (DLTU).

**RISLU REMOTE PICB FAILURE** = A fault has been detected on the PICB that extends from the remote-1 DFI in the RISLU remote DLTU to the RISLU CC.

**SRC INTERRUPT THRU MASK** = An error was detected at the processor source bus (SRC) group level, but no source was found for interrupt.

**STANDBY COMMUNICATION FAILURE** = The active CC detected faults on the standby CC. The fault could be either a parity error on the address or data bus, or a write protect violation on RAM or IO. The data passed here is a code indicating what particular fault the detector is complaining about. If more than one error detector is complaining, the error code should indicate that, but does not have to specify which one was complaining.

**STUCK MAILBOX FLAG** = The mailbox flag was not cleared after the ISLU unloaded the mailbox.

**SMP UCI PARITY FAILURE** = A parity error was detected in the UCI when the SMP was addressing either the RAM or one of the FIFOs.

**SANITY TIMER TIME OUT** = The processor was unable to satisfy an internal integrity timer. The RTX operating system has a 15-millisecond job cycle. Once each cycle, it must strobe this timer.

**STUCK READY LEAD** = The processor ready lead for the internal bus is not being released by some peripheral device. Therefore, external processor circuitry is forcing the processor to
the next instruction in an attempt to continue running.

SYSTEM DETECTED SOFTWARE PROBLEM = This is a form of assert that ISLU resident software sends.

SMP Addressed Non-Existent UCI Address = The SMP processor attempted to address a non-existent memory location in the UCI.

SMP Detected Bad Message Sequence = This is a form of assert that ISLU resident software sends.

Standby CC ROM Hashsum Failure = Detected bad hashsum check on the standby CC ROM.

Standby CC RAM Hashsum Failure = Detected bad hashsum check on the standby CC RAM.

Suspect Latent Faults When Active = An error was still detected after a CC switch.

Soft Reset Threshold Exceeded = An excessive number of soft resets were detected by the ISLU.

Software Bad Address Error = A test address is out of range and an error was generated.

Sanity Timer Failure = The ISLU sanity timer was not updated within the required time (400 milliseconds).

Task Timed Out = Each task is given a certain amount of time to complete its job. If the task fails to complete within this time, it is aborted and fault recovery is notified of this.

Task Blocking in Mailbox = The SMP has more messages to send than the ISLU can receive.

Task Failed = The task is returning a failure.

User Detected Software Error = These are faults should have implicated the standby CC, but instead blamed the active CC.

User Task Purged Threshold Exceeded = An error was detected when an ISLU task was purged.

Write Protect Violation = Write protection is provided within the CC memory to protect text, stacks, and other static data. A corrupted software pointer accessed an illegal memory address or write protection was mismanaged by the CC.

f = Recovery action. Valid value(s):

Analysis Only = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.

Hard Reset = The circuit has been hard reset without scheduling diagnostics.

Inhibit HDWCHKS = The circuit has been inhibited because of excessive errors.

Initialize = This recovery action is used to re-initialize a circuit without scheduling diagnostics.

No Recovery Action Taken = This report is generated.

Pre-OOS Threshold Exceeded = The CC was preempted and is still detecting errors.

Pre-OOS, Re-Inhibit HDWCHKS = The CC has been preempted and is still detecting errors, re-inhibit has been re-applied on the CC.

Re-Inhibit Error = The CC has been inhibited and error are still detected. Re-inhibit has been re-applied on the CC.

RST Preempt = The failing circuit was preempted and a diagnostic was scheduled. A DGN:ISLUCC output message will be printed with the results of the diagnostic.

Switch = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

i = ISLU message type.

j = PICB number.
k = Mail box data.
l = Fault report type in the mail box.
m = Number of entries in the block.
n = ISLU internal: Peripheral fault type.
o = ISLU internal: Fault event number.
p = ISLU internal: Process ID.
q = ISLU internal: CC circuit number.
r = ISLU internal: Sub-circuit.
s = ISLU internal: Data written to CC.
t = ISLU internal: Return data from CC.
u = ISLU internal: Unused.
v = ISLU internal: Recovery action.
w = External logical circuit name. More than one circuit may be listed when multiple circuits can be implicated in the trouble.
x = Number of recent failures of this error type (variable 'e') on this ISLUCC circuit (in decimal).
y = Error count threshold above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the ISLUCC from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

None.

6. REFERENCES

Output Message(s):

DGN:ISLUCC
RMV:ISLUCC
RST:ISLUCC

Other Manual(s):
235-105-220  Corrective Maintenance
235-600-500  Asserts
REPT:ISLUCD-TFME

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT ISLUCD=a-b-c TRBL FAULT MESSAGE EVENT=d
   e RECOVERY ACTION f
   g h i
   . . .
   . . .
   . . .

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a common data (CD) circuit in the integrated services line unit (ISLU). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to field ‘f’ to determine the effect the fault recovery had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = ISLU line unit number.
c = Service group number.
d = Event number.
e = Error type. Valid value(s):
   CLOCK FAILURE = A loss of clock was detected on a CD circuit.
   CONTROL FAILURE = An error occurred when sending information to the CD.
   CONTROL ORDER PARITY = Bad parity was detected on an order sent to the CD.
   INTERNAL MEMORY PARITY ERROR = Bad parity was detected on one or more of the internal memory configurations in a circuit.
   LINE GROUP LOST CLOCK SOURCE = A loss of clock was detected by a line group.

f = Recovery action. Valid value(s):
   ANALYSIS ONLY = This post mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
   RST AUTO CAMPON = The failing circuit will be restored and diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

g = External logical circuit name of ISLU circuit types. More than one circuit may be listed when multiple circuits can be blamed for the trouble.
\[\begin{align*}
    h &= \text{Number of recent failures of this error type (variable 'e') on this ISLUCD circuit (in decimal).} \\
    i &= \text{Error count threshold above which the recovery action will be escalated.}
\end{align*}\]

4. ACTION TO BE TAKEN

None. No action required. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:ISLUCD and RST:ISLUCD messages indicate success or failure of diagnostic when recovery action is RST AUTO CAMPON or RST PREEMPT.

5. ALARMS

None.

- RMV:ISLUCD
- RST:ISLUCD
REPT:ISLUCD-TPPE
Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT ISLUCD=a-b-c TRBL PIDB PARITY ERROR EVENT=d e RECOVERY ACTION f
g h i . . .

2. REASON FOR OUTPUT

To indicate fault recovery activity within a switching module (SM). A parity error was detected on a peripheral interface data bus (PIDB) connected to an integrated services line unit (ISLU) common data (CD) board. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable ‘f’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = ISLU line unit number.
c = Service group number.
d = Event number.
e = Error type. Valid value(s):
  D CHANNEL PARITY ERROR = A parity error occurred on a peripheral interface data bus (PIDB) connecting the ISLUCD to the packet switch interface unit.
  MULTIPLE PIDB PARITY ERROR = A parity error occurred on more than one PIDB attached to the ISLUCD.

f = Recovery action. Valid value(s):
  ANALYSIS ONLY = This post mortem report is generated.
  ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
  RST AUTO CAMPON = The failing circuit will be restored and diagnosed when it is available. A message will be printed with the results of the diagnostic.
  RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

g = External logical circuit name of ISLU circuit types. More than one circuit may be listed when multiple circuits can be blamed for the trouble.
h = Number of recent failures of this error type (variable ‘e’) on this ISLUCD circuit (in decimal).
Error count threshold above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:ISLUCD and RST:ISLUCD messages indicate success or failure of diagnostic when recovery action is RST AUTO CAMPON or RST PREEMPT.

5. ALARMS

None.

g RECOVERY ACTION h
i
j k l
| . . |
| . . |
| . . |
```

### 2. REASON FOR OUTPUT

To report fault recovery activity within the switching module (SM) due to a high level service circuit (HLSC) board from the integrated service line unit (ISLU).

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module number.
- **b** = ISLU number.
- **c** = ISLU service group number.
- **d** = ISLU high level service circuit number.
- **e** = Line card equipment status. Valid value(s):
  - **ACTIVE** = This line card has/can set up calls to the customer assigned to its ports through this ISLU.
  - **DSPARE** = This line card is a designated spare line card. It has received its port assignment from another line card in this ISLU, using recent change. There is a metallic connection between this line card and the line card that is being spared. This line card provides the interface to the ISLU and the rest of the system. The line card being spared provides the interface between the system and the customer. The metallic connection provides the interface between the two line cards.
  - **PRE-OOS** = Fault recovery has notified the maintenance request administrator (MRA) to remove this line card from service. However, fault stimuli are still being detected from the circuit indicating that the line card has not been completely removed from service.
  - **OOS** = The line card is marked as out-of-service, but fault stimuli are still being detected.
  - **SPARED** = This line card's port assignment(s) have been transferred, using recent change, to a designated spare (refer to DSPARE) line card in this ISLU.
  - **STANDBY** = This line card is available for service (as a designated spare, refer to DSPARE and SPARED) if an active line card fails in this ISLU.

- **f** = Event number.
- **g** = Error type. Valid value(s):
CONTROL FAILURE
CONTROL ORDER PARITY ERROR

h = Recovery action. Valid value(s):
ANALYSIS ONLY = This report is generated.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

i = Source analysis data.

j = External logical circuit name. More than one circuit may be listed when multiple circuits can be blamed for the trouble.

k = Number of recent failures of this error type (variable ‘g’) on the ISLUHLSC circuit (in decimal).

l = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the ISLUHLSC from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

None.

USER SOFTWARE VIOLATED HLSC PROTOCOL

h = Recovery action. Valid value(s):
ANALYSIS ONLY = This report is generated.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
REPORTED TO TERMINAL MAINT = Terminal maintenance has been notified of the software failure.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

i = Source analysis data.

j = External logical circuit name. More than one circuit may be listed when multiple circuits can be blamed for the trouble.

k = Number of recent failures of this error type (variable ‘g’) on this ISLUHLSC circuit (in decimal).

l = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

If the ISLUHLSC pack fails diagnostic, replace it with a new pack. Restore the new ISLUHLSC pack into service by using conditional restore command. If the ISLUHLSC firmware function not completed is occurring frequently, proceed with trouble locating procedures.
5. ALARMS

None.

STUCK ONHOOK FAILURE
SUPERVISION TRANSFER FAILURE

i = Recovery action. Valid value(s):
ANALYSIS ONLY = This post mortem report is printed to provide information for analysis.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has
been notified by an assert. Refer to the Asserts manual.
HARD RESET = A hard reset was executed.
INHIBIT HDWCHKS = Hardware checks are inhibited.
NO RECOVERY ACTION TAKEN = No recovery action was taken.
PRE-OOS THRESHOLD EXCEEDED = The out-of-service (OOS) threshold was exceeded.
PRE-OOS, RE-INHIBIT HDWCHKS = The circuit was previously OOS. Hardware checks are
re-inhibited.
RE-INHIBIT ERROR = An error was found during re-inhibit.
REMOVE = The circuit is removed from service.
RST CAMP-ON = The failing circuit is restored and diagnosed when it is available. A report prints
with the result of the diagnostic.
RST PREEMPT = The failing circuit was preempted and restored, then a diagnostic was scheduled.
SOFT RESET = A soft reset was executed.
UNCONDITIONAL RST PREEMPT = The circuit is restored unconditionally.

j = Hexadecimal numbers presenting internal registers containing additional troubleshooting
information.

k = External logical circuit name. More than one circuit may be listed when multiple circuits can be
implicated in the trouble.

l = Number of recent failures of this error type (variable 'l') on this ISLULBD circuit (in decimal).

m = Error count threshold above which the recovery action will be to restore the circuit.

4. ACTION TO BE TAKEN
None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:ISLULBD and RST:ISLULBD reports indicate success or failure of diagnostic when recovery action (variable 'i') is RST AUTO CAMP-ON or RST PREEMPT.

5. ALARMS
None.

2. REASON FOR OUTPUT

To report that initialization of a D-channel failed or that loss of communication to the D-channel was detected.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Integrated switching line unit (ISLU) number.
c = Line group controller (LGC) number.
d = Line card number.
e = Event number.
f = External circuit name of the implicated circuit.
g = Current decimal number of failures of this type recorded.
h = Error count threshold, above which the recovery action will be escalated.

Note: Variables 'i' through 's' will be reported as hexadecimal data, where each field is 4 digits.
i = The number of the active ISLU.
j = The number of the active control data (CD).
k = The number of the LGC.
l = The circuit name of the unit connected to the protocol handler (PH).
m = The number of the active packet switching unit common controller (PSUCOM) side.
n = The number of the faulty PH.
o = The channel group assigned to the PH at the time of the error.
p = The member number within the channel group.
q = The number representing the circuit type connected to the PH. Valid value(s):
   0x00 = Connected to a digital facility interface (DFI).
0x01 = Connected to a different switch.
0x02 = Connected to another PH.
0x03 = Connected to a T-card.
0x04 = Connected to a U-card.

r = The implicated PH image type. Valid value(s):
0 = Null PH image.
1 = PH 1 gateway image.
2 = PH 2 gateway image.
3 = PH 2 access image.

s = The implicated PH hardware type. Valid value(s):
0 = PH 1 hardware.
1 = PH 2 hardware.

4. ACTION TO BE TAKEN

None. Automatic diagnostics will be run on the ISLU line card (LC).

5. ALARMS

None.

To indicate fault recovery activity within the switching module (SM) caused by failure of a ISLU2 line group (ISLULG). The report indicates what recovery action was taken and gives the current fault counts against the circuit specified in the report.

3. VARIABLE FIELD DEFINITIONS

a  = SM number.
b  = ISLU line unit number.
c  = Line group number.
d  = ISLULG equipment status. Valid value(s):
  ACTIVE = The common controller (CC) is in service and a fault has been detected
  OOS    = The CC is marked as out-of-service, but fault stimuli are still being detected.
  PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to
             remove this CC from service. However, fault stimuli are still being detected from the
             circuit indicating that the CC has not been completely removed from service.

e  = High level error types. Valid value(s):
  FAULT MESSAGE = There was an ISLULG fault.
  DPIDB PARITY FAILURE = There was a D-channel parity error.

f  = Event number.
g  = Error type. Valid value(s):
  CONTROL FAILURE = An error occurred when sending information to a circuit within the ISLU.
  INTERNAL MEMORY PARITY ERROR = Bad parity was detected on one or more of the internal
                                 memory configurations in the CC.
  LINE GROUP CONTROL FAILURE = An error occurred when sending control information to a line
                                group.
  LINE GROUP DATA PARITY ERROR = A parity error was detected on the line group.
  LINE GROUP INTERRUPT THRU MASK = An error was detected at the line group (LG) level, but
                                    no source was found for interrupt.
  LINE GROUP LOST CLOCK SOURCE = Line group lost clock source.
  MESSAGE PROTOCOL FAILURE = An error occurred in the message that was not within protocol.
                              Fault recovery received a fault message containing an unexpected value.
h = Recovery action. Valid value(s):
ANALYSIS ONLY = This post mortem report is printed to provide information for analysis.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has
been notified by an assert. Refer to the Asserts manual.
RST CAMP-ON = The failing circuit is restored and diagnosed when it is available. A report prints
with the result of the diagnostic.
RST PREEMPT = The failing circuit was preempted and restored, then a diagnostic was scheduled.
A report prints with the results of the diagnostic.

i = External logical circuit name. More than one circuit may be listed when multiple circuits can be
implicated in the trouble.

j = Number of recent failures of this error type (variable 'e') on this ISLULG circuit (in decimal).

k = Error count threshold above which the recovery action will be to restore the circuit.

4. ACTION TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met.
Subsequent DGN:ISLULG and RST:ISLULG reports indicate success or failure of diagnostic when recovery action
(variable 'h') is RST AUTO CAMPON or RST PREEMPT.

5. ALARMS

None.

   . . .
   . . .
   . . .

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a line group controller (LGC) board from the integrated services line unit (ISLU). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable 'f' to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = ISLU line unit number.
c = Service group number.
d = Event number.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = This post mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
   RST AUTO CAMPON = The failing circuit will be restored and diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

g = External logical name of ISLU circuit types. More than one circuit may be listed when multiple circuits can be blamed for the trouble.
h = Number of recent failures of this error type (variable 'e') on this ISLULGC circuit (in decimal).
i = Error count threshold above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:ISLULGC and RST:ISLULGC messages indicate success or failure of the diagnostic when
recovery action is RST AUTO CAMPON or RST PREEMPT.

REPT ISLULGC=a-b-c TRBL PIDB PARITY ERROR EVENT=d
e RECOVERY ACTION f
g h i
. . .
. . .

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a common controller (CC) board in the integrated services line unit (ISLU). A parity error was detected on a peripheral interface data bus (PIDB) connected to an ISLU. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable "f" to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = ISLU line unit number.
c = Service group number.
d = Event number.
e = Error type. Valid value(s):
   D CHANNEL PARITY ERROR = Bad parity was detected by the packet switch interface unit on a directly connected PIDB.
   DATA PARITY ERROR = Bad parity was detected on data transmitted by the line card in this line group.
   LINE GROUP DATA PARITY ERROR = Bad parity was detected on data transmitted by more than one line card in the line group.
   MULTIPLE CIRCUIT FAILURE = Bad parity was detected on more than one connection to line cards in this line group.

f = Recovery action. Valid value(s):
   ANALYSIS ONLY = This post mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
   RST AUTO CAMPON = The failing circuit will be restored and diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
g = External logical circuit name of ISLU circuit types. More than one circuit may be listed when multiple circuits can be blamed for the trouble.

h = Number of recent failures of this error type (variable 'e') on this ISLULGC circuit (in decimal).

i = Error count threshold above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:ISLULGC and RST:ISLULGC messages indicate success or failure of diagnostic when recovery action is RST AUTO CAMPON or RST PREEMPT.

5. ALARMS

None.

1. FORMAT

REPT ISLULGC=a-b-c [d] TRBL SP FAILURE EVENT = e
   SP FIFO OVERFLOW FAILURE RECOVERY ACTION f
   g h
   i j k

2. REASON FOR OUTPUT

To report a signal processor (SP) interrupt caused by the SP first-in first-out (FIFO) overflowing due to multiple on-hook and off-hook transitions in integrated service line unit line group controller (ISLULGC).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Integrated service line unit (ISLU) number.
c = Line group controller number.
d = Line card equipment status. Valid value(s):
   ACTIVE = This line card has/can set up calls to the customer assigned to its ports through this ISLU.
   STANDBY = This line card is available for service (as a designated spare, refer to DSPARE and SPARED) if an active line card fails in this ISLU.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this line card from service. However, fault stimuli are still being detected from the circuit indicating that the line card has not been completely removed from service.
   OOS = The line card is marked as out-of-service, but fault stimuli are still being detected.
   SPARED = This line card's port assignment(s) have been transferred, using recent change, to a designated spare (refer to DSPARE) line card in this ISLU.
   DSPARE = This line card is a designated spare line card. It has received its port assignment from another line card in this ISLU, using recent change. There is a metallic connection between this line card and the line card that is being spared. This line card provides the interface to the ISLU and the rest of the system. The line card being spared provides the interface between the system and the customer. The metallic connection provides the interface between the two line cards.

e = Event number.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = This report is generated.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
g = Internal time slot number.

h = Number of entries in the SP FIFO for this circuit.

i = External logical circuit name. More than one circuit may be listed when multiple circuits can be blamed for the trouble.

j = Current decimal number of recent failures of this error type recorded.

k = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the line group controller from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

None.

REPT ISLURG=a-b-c [d] TRBL FAULT MESSAGE FAILURE EVENT = e
f RECOVERY ACTION g

2. REASON FOR OUTPUT

To report fault recovery activity within the switching module (SM) due to a ringing generator (RG) board from the integrated service line unit (ISLU).

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Integrated service line unit number.
c = ISLU service group of RG number.
d = Line card equipment status. Valid value(s):
   ACTIVE = The RG is in service and a fault has been detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this RG from service. However, fault stimuli are still being detected from the circuit indicating that the RG has not been completely removed from service.
   OOS = The RG is marked as out-of-service, but fault stimuli are still being detected.
e = Event number.
f = Error type. Valid value(s):
   BUS CONNECT FAILURE = An attempt was made to connect two ringing output buses to the same input bus.
   CONTROL FAILURE = The ISLU common controller (CC) detected an error when an order sent to the RG was not returned.
   FALSE RING TRIP = The RG hardware detected an off-hook and the software detected an on-hook.
   OUTPUT BUS FAILURE = No ringing current was detected at the output bus of the RG.
   PRIMARY BRIDGE OVER CURRENT FAILURE = The primary bridge on the RG has sensed a large current drain indicating a possible short across the tip and ring.
   SANITY TIMER FAILURE = The sanity time on the RG has not been satisfied in the time requested.
g = Recovery action. Valid value(s):
ANALYSIS ONLY = This report is generated.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
will be printed with the results of the diagnostic.
UNCONDITIONAL RST PREEMPT = The failing circuit was preempted and restored without
scheduling any diagnostic.

h = ISLU message type.
i = Peripheral interface control bus (PICB) number.
j = Mail box data.
k = Fault report type in the mail box.
l = Number of entries in the block.
m = ISLU internal peripheral fault type.
n = ISLU internal fault event number.
o = ISLU internal process ID.
p = ISLU internal RG circuit number.
q = ISLU internal sub-circuit.
r = ISLU internal data written to the RG.
s = ISLU internal return data from the RG.
t = ISLU internal unused field.
u = ISLU internal recovery action.
v = External logical circuit name. More than one circuit may be listed when multiple circuits can be
blamed for the trouble.
w = Number of recent failures of this error type ('f') on the ISLU RG circuit (in decimal).
k = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN
If the problem persists and no automatic recovery is attempted, remove the ISLU RG from service during a period of
low usage and perform trouble locating procedures.

5. ALARMS
None.

2. REASON FOR OUTPUT

To report the occurrence of an intergrated services digital network (ISDN) user part (ISUP) event.

3. VARIABLE FIELD DEFINITIONS

ATPUUI = Access transport parameter (ATP) user-to-user information (UUI).

b = Trunk group number.
c = Trunk member number.
d = Direction of event. Valid value(s):
   INCOMING = Event was moving in the incoming direction when trapped.
   OUTGOING = Event was moving in the outgoing direction when trapped.
e = Origination point code.
f = Destination point code.
g = Circuit identification code.
h = Length of ISUP message in bytes.
i = Access transport parameter length in bytes.
j = User-to-user information length in bytes.
k = ISUP message type. Valid value(s):
   ADDRESS COMPLETE = A message sent in the backward direction indicating that all the address
   signals required for routing the call to the called party have been received.
   ANSWER = A message sent in the backward direction indicating that the call has been
   answered.
   CALL PROGRESS = A message sent in the backward direction indicating that an event has occurred
   during call setup which should be relayed to the calling party.
   INFORMATION = A message sent to convey additional call related information.
   INITIAL ADDRESS = A message sent in the forward direction to initiate seizure of an outgoing
   circuit and to transmit address and other information relating to the routing and
handling of a call.

RELEASE = A message sent in either direction indicating that the circuit identified in the message is being released due to the reason (cause) supplied and is ready to be put in the idle state on receipt of the Release Complete message.

1 = State call was in when ATPUUI was dropped. Valid value(s):

   IDLE
   INCOMING CIRCUIT ANSWERED
   INCOMING CIRCUIT NETWORK SUSPEND
   OUTGOING CIRCUIT ANSWERED
   OUTGOING CIRCUIT NETWORK SUSPEND
   WAIT FOR ADDRESS COMPLETE
   WAIT FOR ANSWER
   WAIT FOR CONTINUITY
   WAIT FOR CONTINUITY REPORTS
   WAIT FOR RELEASE COMPLETE
   WAIT FOR OUTGOING CIRCUIT SELECTION
   WAIT FOR OUTGOING CIRCUIT COMPLETE

4. ACTION TO BE TAKEN

235-070-100   Administration and Engineering Guidelines
REPT:IUN-INIT

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT IUN INIT
   IUN LEVEL 2-3 INITIALIZATION COMPLETED
   a IUNS PLACED IN ACTIVE STATE b IUNS IN THE SYSTEM

[2] REPT IUN INIT
   IUN LEVEL 4 INITIALIZATION STARTED

[3] REPT IUN INIT
   INITIALIZATION OF IUNS OF TYPE c COMPLETED
   d IUNS PLACED IN THE ACTIVE STATE e IUNS EQUIPPED

[4] REPT IUN INIT
   IUN LEVEL 4 INITIALIZATION COMPLETED

[5] REPT IUN INIT
   IUN INITIALIZATION IN PROGRESS

2. REASON FOR OUTPUT

Format 1 reports, during an interprocess message switch (IMS) level 2 or 3 initialization, the conclusion of the IMS user node (IUN) initialization sequence.

Format 2 prints at the start of the level 4 IUN initialization (pump - download - of IUN(s)) sequence, which is part of an IMS level 4 initialization.

Format 3 prints when the restore of a group of IUN(s), all having one or more files in common, has completed. There may be one or more occurrences of this message. The first instance of a Format 3 message will follow a Format 2 message. This message will only be printed during an IMS level 4 initialization.

Format 4 prints when the level 4 IUN initialization (pump - download - of IUN(s)), which is part of an IMS level 4 initialization, is finished.

Format 5 prints when an initialization of a group of IUN(s), all having one or more files in common, is in progress and has not completed. This message will occur approximately every 2 minutes until the initialization of this group of IUN(s) is finished.

3. VARIABLE FIELD DEFINITIONS

a = Number of IUNs placed in the active state.
b = Number of equipped IUNs in the system.
c = Name of a group of IUN(s), all having one or more files in common (generic spec file name).

d = Number of IUN(s), in this group, placed in the active state.

e = Number of equipped IUN(s) in this group.

4. ACTION TO BE TAKEN

For Formats 2, 4 and 5, no action is required.

For Formats 1 and 3, if the number of IUN(s) placed in the active state is less than the number of IUN(s) equipped, normal maintenance procedures should be used, after the initialization is finished, to restore any out-of-service (OOS) IUN(s).

Note: The automatic ring recovery (ARR) routine, unless it is inhibited, will attempt automatic recovery of OOS IUN(s) shortly after the level 4 IMS initialization has completed.

5. ALARMS

None.

   ABORTED PUMP OF IUN a b
   REASON = c, CONTROL CODE = d

[2] REPT IUN PUMP
   ABORTED PUMP OF IUN ???e b
   REASON = c, CONTROL CODE = d

2. REASON FOR OUTPUT

Format 1 prints if a pump of the operational code or the diagnostic code to a single interprocess message switch user node (IUN) is aborted.

Format 2 prints if a pump of the operational code or the diagnostic code to a single IUN is aborted and the ring node name could not be determined.

3. VARIABLE FIELD DEFINITIONS

a = The ring node (RN) name (such as, LN) and group name.
b = The ring node member number.
c = Reason why the pump job has aborted. Valid value(s):
   1 = Received a source-matched pump message.
   2 = Received a returned pump message.
   3 = Insufficient message switch buffer space.
   4 = Failed to get message switch buffer space.
   5 = Failed to determine best route to node.
   6 = Obtained a bad channel from best route.
   7 = Failed to build relay header.
   8 = Failed to build interprocess message switch (IMS) message header.
   9 = Failed to write message.
  10 = Failed to relay message.
  11 = Timed out waiting for relay response message.
d = Internal control code.
e = Group number.

4. ACTION TO BE TAKEN
If 'c' =

<table>

    ERROR CODE (C S) = d e

[3] REPT IUN RESTRT
    RSTRT FOR IUN a b AP FAILED
    ERROR NUMBER = f

2. REASON FOR OUTPUT

Format 1 prints when the attached processor (AP) of an interprocessor message switch user node (IUN) has started to perform a restart.

Format 2 prints if an IUN restart failed.

Format 3 prints if an IUN's AP restart failed.

3. VARIABLE FIELD DEFINITIONS

a = Ring node (RN) name and group number.
b = RN member number.
c = IUN restart failure code. Valid value(s):
   0  = Failed to unquarantine the IUN.
   1  = Failed to allocate internal timer.
   2  = Failed to send administrative module (AM) path's data.
   3  = Failed to allocate internal timer.
   4  = Failed to send ring interface (RI) path's data.
   5  = Failed to allocate internal timer.
   6  = Restart timed out waiting for node processor (NP) response.
   7  = Failed to change IUN major state to INIT.
   8  = Failed to allocate internal timer.
   9  = Failed to allocate internal timer.
  10  = Failed the direct memory access (DMA) initialization request.
  11  = Failed to change IUN major state to ACT.
  12  = Failed the DMA initialization request.
  13  = Failed the DMA initialization due to a fault.
  14  = Failed the DMA initialization request.
  15  = Failed the DMA initialization request.
16  = Restart timed out waiting for AP response.
17  = Failed due to an AP error.
18  = Failed to allocate internal timer.
19  = IUN not in active ring.
20  = IUN restart aborted by request.
21  = Failed to allocate internal timer.
22  = IUN restart guard timer expired.
23  = Failed to change IUN major state to INIT.
24  = Failed to change IUN major state to INIT.

d  = Internal error code.

e  = Internal error code.

f  = IUN AP restart failure code. Valid value(s):
50  = AP restart threshold has been exceeded.
51  = AP restart failed.
52  = AP restart timed out.
53  = AP restart aborted by request.
54  = Failed to allocate internal timer.
56  = Failed to change IUN major state to INIT.
57  = IUN does not have major state of ACT.
58  = IUN not in the active ring.
59  = AP restart timed out.
60  = Failed to change IUN major state to ACT.
61  = Failed to allocate internal timer.
62  = Failed the DMA initialization request.
63  = Failed the DMA initialization request.
64  = Failed the DMA initialization due to a fault.
65  = Failed to change IUN major state to ACT.
66  = Failed the DMA initialization.

4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Formats 2 and 3, using normal maintenance procedures, the IUN should be restored to service.

Note: The automatic ring recovery (ARR) routine, unless it is inhibited, will attempt automatic recovery of out of service (OOS) IUN(s) shortly after the level 4 inter-process message switch (IMS) initialization has completed.

5. ALARMS

    [g]

2. REASON FOR OUTPUT
To report the reason one or more interprocessor message switch (IMS) user nodes (IUN) failed to be restored to service.

Format 1 is printed if a single IUN failed to be restored to service.

Format 2 is printed if a single IUN failed to be restored to service and the ring node name could not be determined.

Format 3 is printed of a group of IUN(s) file to be restored to service during a level 4 IMS initialization.

Format 4 is printed of there are zero node processor(s), NP(s) in this group of IUN(s) eligible to be sent a message which will cause the IUN NP(s) to be available for service. This message will only be printed during a level 4 IMS initialization.

Format 5 is printed if there are zero attached processor(s), AP(s), in this group of IUN(s) eligible to be sent a message which will cause the IUN AP(s) to be available for service. This message will only be printed during a level 4 IMS initialization.

Format 6 is printed of an IUN is undergoing a DMA channel initialization while being restored during a Level 1A or 1B IMS initialization. The IUN will be left out-of-service.

Format 7 is printed if an IUN is undergoing a DMA channel initialization while being restored during a Level 1A or 1B IMS initialization and the ring node name could not be determined. The IUN will be left out-of-service.

Format 8 is printed of a restore is in progress and IMS is notified that a DMA channel error, associated with the IUN has occurred. The IUN will be left out-of-service.

Format 9 is printed if a restore is in progress and IMS is notified that a DMA channel error, associated with the IUN has occurred and the ring node name could not be determined. The IUN will be left out-of-service.

Format 10 is printed if a restore of an IUN is started using the \texttt{RST:a b:GSFN "filename";UCL} command and the restore is stopped before completing. In most cases the IUN will be left out-of-service.

3. VARIABLE FIELD DEFINITIONS

\(a\) = The ring node (RN) name (such as LN) and group number.

\(b\) = RN member number.

\(c\) = Failure code. Valid value(s):
1 = the IUN restoration job failed to complete.
15 = the IUN restoration job was aborted.
43 = the IUN restoration job was stopped, but a retry of the restoration may succeed.

\(d\) = The internal job state at the time of restore failure. The possibilities are:
1 - Waiting for an IUN NP reset command to complete.
2 - Trying to unquarantine the IUN NO(s).
3 - Trying to send the IUN NP its read only memory (ROM) patch load.
4 - Sending (downloading) the IUN NP(s) a common program or data file.
5 - Sending (downloading) the IUN NP a file or files destined only for that IUN (such as an IUN specific date file).
6 - Sending the IUN NP(s) a command to execute the down loaded program.
7 - Sending the IUN NP the name of the Generic Spec File it was downloaded from, AM paths data and RI paths data.
8,16 - Waiting for the IUN NP(s) to receive a selective broadcast setup message.
9 - Sending the IUN NP(s) the name of the generic spec file they were downloaded from.
10 - Sending the IUN NP(s) AM paths data.
11 - Sending the IUN NP(s) RI paths data.
12 - Done with executing IUN NP(s).
13 - Waiting for the IUN application processor (AP) reset to complete.
14 - Polling the IUN AP reset status.
15 - Done with the IUN(s) AP reset.
17 - Sending (downloading) the IUN AP(s) a common program or date file.
18 - Sending (downloading) the IUN AP a file or files destined only for that IUN (for example, an IUN specific data file).
19 - Sending the IUN AP(s) a command to execute the downloaded program.
20 - Done with executing IUN AP(s).
21 - Changing the IUN(s) major state to the active state.
22 - Initializing an IUN's direct memory access (DMA) channel.
23 - Auditing the IUN(s) major and minor states.
24 - Failed to restore a group of IUN(s); place all IUN(s) out of service.
25 - Aborting this restoration job.

\[ e \] = The group number.

\[ f \] = Name of a group of IUN(s) (all having one or more files in common, generic spec filename).

\[ g \] = The reason the restore of the IUN was stopped. Valid value(s):
MIRA ABORTED RESTORE BY REQUEST
MIRA FAILED - ABORT REQUEST OR ERROR
MIRA FAILED - CAN'T SPAN DIAMON
MIRA FAILED - INTERNAL PROBLEM
MIRA FOUND DUPLICATE RESTORE REQUEST ALREADY QUEUED
MIRA OUT OF BUFFERS
MIRA RESTORE SOURCE INHIBITED
RESTORE REQUEST TIMED OUT

4. ACTIONS TO BE TAKEN

For Formats 1, 2, 6, 7, 8, 9, diagnose and restore the IUN to service.

For Formats 3, 4, 5, if the number of IUNs placed in the active state is less than the number of IUNs equipped, as reported by the level 4 IMS IUN initialization message (refer to the REPT:IUN-INIT output message), when the initialization is finished, diagnose and restore any out-of-service (OOS) IUNs.

For Format 10:

<table>
<thead>
<tr>
<th>( g ) =</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIRA RESTORE SOURCE INHIBITED</td>
<td>The RST:a b:GSFN &quot;filename&quot;;UCL command is inhibited. Use the ALW:DMQ input message and resubmit restoration request.</td>
</tr>
<tr>
<td>MIRA OUT OF BUFFERS</td>
<td>The maintenance input request administrator (MIRA) subsystem is out of buffers (slots) to queue maintenance requests. When a buffer becomes free then resubmit the restore request. Use the OP:DMQ input message to see the contents of MIRA's buffers.</td>
</tr>
</tbody>
</table>
| MIRA FOUND DUPLICATE RESTORE REQUEST ALREADY QUEUED | The restoration request is a duplicate or an
already-queued maintenance request. No action need be taken, since the link node (LN) will be restored by the existing maintenance request.

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIRA FAILED - CAN'T SPAN DIAMON, MIRA FAILED - ABORT REQUEST OR ERROR, or MIRA FAILED - INTERNAL PROBLEM</td>
<td>An error was encountered by the MIRA subsystem. Verify that it is working correctly, then resubmit restoration request.</td>
</tr>
<tr>
<td>MIRA ABORTED RESTORE BY REQUEST</td>
<td>The restoration request was aborted by request (such as, STOP:DMQ). Resubmit the restoration request.</td>
</tr>
<tr>
<td>RESTORE REQUEST TIMED OUT</td>
<td>The restoration did not finish before a timer expired. This may be due to other LN maintenance activity. An attempt will be made to abort the restore request. The status of the restoration can be verified with the OP:DMQ command. If the original restoration request is still active it should be stopped using the STOP:DMQ command. Also check (OP:DMQ) for other LN maintenance activity (active or requested). If there is LN maintenance activity, wait until it has completed, then resubmit the restoration request. Otherwise, resubmit the restoration request.</td>
</tr>
</tbody>
</table>

Note: The automatic ring recovery (ARR) routine, unless it is inhibited, will attempt automatic recovery of OOS IUN(s) shortly after the level 4 IMS initialization has completed.

5. ALARMS
None.

Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT IUN STRT
CAN NOT RESTART IUN(S) OF TYPE a

2. REASON FOR OUTPUT

To report that there are zero interprocessor message switch (IMS) user node (IUNs) in this group. All of these IUNs are eligible to be restarted and have one or more files in common.

This is caused by one of the following factors in any combination:

- A pump (down load) of an IUN’s data file failed. This could occur for multiple IUN(s).
- At least one IUN is in the isolated ring segment.
- At least one IUN is faulty and no attempt will be made to pump (down load) it.

This message will only be printed during an IMS Level 4 initialization.

3. VARIABLE FIELD DEFINITIONS

a = Name of a group of IUNs having one or more files in common.

4. ACTION TO BE TAKEN

After the initialization is finished, diagnose and restore any out-of-service (OOS) IUNs.

5. ALARMS

None.

6. REFERENCES

Output Message(s):

   REPT:IUN-INIT

Other Manual(s):
235-190-120   Common Channel Signaling Services Features
REPT:IWGLI-TBTF

Software Release: 5E15 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

  g RECOVERY ACTION h
  iiii jj jj kkkk ll lll mmmm nnnnnn nnnnnnnn
  IWGLI=a-b-c-d q r
```

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure in the inter-working gateway (IWG). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable ‘h’ to determine the effect the fault recovery had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switch module (SM) number.
b = Inter-working gateway (IWG) unit number.
c = Data group (DG) number.
d = Inter-Working gateway link interface (IWGLI) number.
e = Inter-working gateway link interface (IWGLI) status. Valid value(s):
   ACTIVE = The IWGLI is in-service and a fault has been detected.
   OOS = The IWGLI is marked as out-of-service, but fault stimuli are still been detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this IWGLI from service. However, fault stimuli are still being detected from the circuit indicating that the IWGLI has not been completely removed from service.
   STANDBY = The IWGLI is in standby and a fault has been detected.

f = Event number.
g = Error type. Valid value(s):
   PCT LOOP BACK FAIL SMP TO CD = IWGLI failed to respond to an SMP direct communication check.
   INCONSISTANCY CHECK FAIL BETWEEN SMP AND IWG = Inconsistency between SMP and IWG are detected by MRA.

h = Recovery action. Valid value(s):
   RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

i = Hexadecimal dump containing message type.

j = Hexadecimal dump containing circuits name.
k = Hexadecimal dump containing high level error type.
l = Hexadecimal dump containing IWGLI circuit name.
m = Hexadecimal dump containing TSI link number.
n = Hexadecimal dump containing miscellaneous data.
q = Number of recent failures of this error type.
r = Error count threshold equal to or above which the recovery action will be escalated.

4. ACTIONS TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:IWGLI and RST:IWGLI messages indicate success or failure of diagnostic when recovery action is 'RST PREEMPT'.

5. ALARMS

A MAJOR Alarm is generated for an IWGLI simplex failure. A CRITICAL Alarm is generated for an IWGLI duplex failure. Alarms are suppressed if problems are due to the far end.

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure in the inter-working gateway (IWG). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable ‘h’ to determine the effect the fault recovery had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switch module (SM) number.
b = Inter-working gateway (IWG) unit number.
c = Data group (DG) number.
d = Inter-working gateway link interface (IWGLI) number.
e = Inter-working gateway link interface (IWGLI) status. Valid value(s):
ACTIVE = The IWGLI is in-service and a fault has been detected.
f = Event number.
g = Error type. Valid value(s):
IF LOSS OF CLOCK REFERENCE = Peripheral Link Interface (PLI) has detected loss of clock.
IF SYNCHRONIZATION ERROR WITH PLI = PLI cannot synchronize with IF.
IF LOSS OF CLOCK FROM THE PLI = IF has detected loss of clock.
IF PAR ERR ON OVERHEAD BYTES FROM PLI = IF has detected bad parity on the overhead bytes.
PLI BAD PARITY INCOM OVERHEAD BYTES = PLI has detected bad parity on the overhead bytes.
IF CRC ERR ON DATA RECEIVED FROM PLI = IF has detected bad CRC.
PLI LINK TO BE OUT-OF-FRAME = PLI cannot frame up.
PLI BAD SUPERFRAME ON INCOMING LINK = PLI cannot frame up on superframe.
PLI BAD FRAME WORD ON INCOMING LINK = PLI has detected a bad fram word.
PLI OUTGOING BUFFER CHECK ERROR = PLI failed outgoing buffer check.
PLI INTERNAL DATA PARITY ERROR = PLI has detected bad internal parity.
PLI PARITY ERRORS ON DATA FROM IWGLI = PLI has detected parity errors from far end.
PLI IS SOURCING BAD CRC = Far end is reporting bad CRC.
PLI DETECTED BAD CRC FROM ACTIVE MCTSI = PLI detected bad CRC from the active MCTSI side.
PLI IMPLICATED BY BACKGROUND CHECK = Background test failure has implicated the PLI.
NO ERROR SOURCE FOUND = No error reported with the interrupt.

h = Recovery action. Valid value(s):
ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or
circuits are failing, but the error counts have not reached a threshold for action.
INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
NO RECOVERY ACTION TAKEN = This event needs no recovery action.
RE-INHIBIT ERROR = The circuit has been inhibited and errors are still detected. Inhibit has been
re-applied on the IWGLI circuit.
RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A
message will be printed with the results of the diagnostic.

i = Highlevel upper bytes of the IF error source in hexadecimal format.
j = Highlevel lower bytes of the IF error source in hexadecimal format.
k = Highlevel upper bytes of the IF error mask in hexadecimal format.
l = Highlevel lower bytes of the IF error mask in hexadecimal format.
m = PLI error source in hexadecimal format.
n = PLI error mask in hexadecimal format.
o = Internal message type in hexadecimal format.
p = Number of PLI entries passed in hexadecimal format.
q = Miscellaneous data in hexadecimal format.
r = Number of recent failures of this error type.
s = Error count threshold equal to or above which the recovery action will be escalated.

4. ACTIONS TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met.
Subsequent DGN:IWGLI and RST:IWGLI messages indicate success or failure of diagnostic when recovery action
is 'RST PREEMPT'.

5. ALARMS

A MAJOR Alarm is generated for a IWGLI simplex failure. A CRITICAL Alarm is generated for a IWGLI duplex
failure. Alarms are suppressed if problems are due to the far end.

\( r \)  = Error count threshold equal to or above which the recovery action will be escalated.

4. ACTIONS TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:IWGLI and RST:IWGLI messages indicate success or failure of diagnostic when recovery action is 'RST PREEMPT'.

5. ALARMS

A MAJOR Alarm is generated for a IWGLI simplex failure. A CRITICAL Alarm is generated for a IWGLI duplex failure. Alarms are suppressed if the problems are due to the far end.

Type: Output

1. FORMAT

REPT LDSF=a-b TRBL DSC3 COM SERV REQ FAILURE c
d RECOVERY ACTION e
f g h
i j k
ERROR ANALYSIS l m n

2. REASON FOR OUTPUT

To respond to a maintenance service request pertaining to a digital service circuit-model 3 (DSC3) of the local digital services function (LDSF).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = LDSF number.
c = Event number, which is the time sequence indicator.
d = Error type. Valid value(s):
   DSC ERROR REPORTED, NONE FOUND = The software copy of the circuit (DSC3) fault or DSC3 parity error mask does not match the hardware, or the mask is ineffective.
   DSCCOM CLOCK FAILURE = There are problems with the distribution of the 4 Mhz clock or the 8 kHz sync to the DS3 circuit.
   DSCCOM TS ERR, NO SOURCE DET = The DSC3 error source register (variable 'f') indicates a DSCCOM time slot parity error, but no bit is set in the parity error register.
   DSCCOM TS PARITY ERROR = There is a failure of the time slot select register on the DSC3.
   DSCCOM TSSR FAILURE = There is a failure of the time slot select register on the DSC3.
   DSC3 INTERRUPT TEST BIT SET = This bit should never be set. It is for diagnostic purposes only.
   INTERRUPT THROUGH MASK FAILURE = The software copy of the DSC3 error source mask register (variable 'k') does not match the hardware or the mask is ineffective.
   MULTIPLE FAILURE INDICATIONS = More than one failure was found for a single service request.
   PICB FAILURE DURING DSC3 SRCE ANAL = A PICB failure occurred while attempting to read registers on a DSC3.
   PICB FAILURE IN DSCCOM SRCE ANAL = A PICB failure occurred while attempting to read registers on the DSC3. Register information is not valid.

e = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is provided for additional information.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
   INITIALIZE = The failing circuit has been reinitialized.
RMV = The failing circuit is removed from service. Intervention is required to change the state of the circuit. A report from the maintenance request administrator (MRA) prints after the circuit is removed.

RST AUTO CAMPON = The failing circuit is diagnosed when it is available. A report prints with the results of the diagnostic.

RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A report prints with the results of the diagnostic.

f = DSC3 error source register (ESR).

g = DSC3 fault register.

h = DSC3 parity error register.

i = Software copy of the DSC3 ESR mask register. The mask register cannot be read.

j = Software copy of the DSC3 fault mask register. The mask register cannot be read.

k = Software copy of the DSC3 parity error mask register. The mask register cannot be read.

l = External logical circuit name.

Note: Up to nine logical circuit names, error counts, and error thresholds (variables 'n'-'p') may be printed.

m = Current decimal number of recent failures of this type recorded.

n = Error count threshold, above which the unit is conditionally removed.

4. ACTION TO BE TAKEN
Use the Corrective Maintenance manual to determine what action should be taken with the faulty unit and with any receive-only printer (ROP) output.

5. ALARMS
None.

   i

2. REASON FOR OUTPUT

To respond to an operational error on the local digital services function - model 3 (LDSF3). This report is for SM-2000 only.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = LDSF number.
c = Event number (the time sequence indicator).
d = Error type. Valid value(s):
   DSC3 TERMINAL PROCESS TIMEOUT = A peripheral control process timed out waiting for a response from LDSF.
   DSC3 FIFO UNDERFLOW – UCI FIFO = An attempt was made to read an empty first in first out (FIFO) universal control interface (UCI) mode register.
   DSC3 INVALID FIFO REPORT = A FIFO report was received for a non-existent LDSF subtending circuit.
   DSC3 INVALID TONE DECODER REPORT = The contents of the report, received by peripheral control (PC) from a tone decoder was invalid.
   DSC3 INVALID TONE GENERATOR REPORT = The contents of the report, received by PC from a tone generator was invalid.
   DSC3 INVALID TONE TRANSCEIVER RPT = An invalid report was received by PC from a tone transceiver.
   DSC3 UNEXPECTED TONE DECODER REPORT = A service request was received on an idle tone decoder.
   DSC3 UNEXPECTED TONE GENERATOR REPORT = A service request was received on an idle tone generator.
   DSC3 UNEXPECTED TONE TRANSCEIVER RPT = A service request was received on an idle tone transceiver.
   DSC3 UNEXPECTED FIRST PULSE = This fault indicates that two (or more) first dial pulse messages have been received for a single dial pulse reception session.
   DSC3 ERROR TYPE 2 = Control order failure during SA.

e = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is provided for additional information.
   RMV = The failing circuit is removed from service. Intervention is required to change the...
state of the circuit. A report prints after the circuit is removed.

**RST AUTO CAMPON** = The failing circuit is diagnosed when it is available. A report prints with the results of the diagnostic.

**RST PREEMPT** = The failing circuit was preempted and a diagnostic was scheduled. A report prints with the results of the diagnostic.

| f | = External logical circuit name. |
| g | = Current decimal number of recent failures of this type recorded. |
| h | = Error count threshold, above which the unit is conditionally removed. |
| i | = Hexadecimal numbers representing internal registers containing additional troubleshooting information. |

   PICB FAILURE IN DSU COM SA = A PICB failure occurred while attempting to read registers on the DSU common board. Register information is not valid.
   DSCCOM CLOCK FAILURE = There are problems with the distribution of the 4 MHz clock or the 8KHz sync to the DSU common board.
   DSCCOM TS ERR, NO SOURCE DET = The DSU error source register (variable 'g') indicates a DSCCOM time slot parity error, but no bit is set in the parity error register.
   DSCCOM TS PARITY ERROR = There is a failure of the time slot select register on the DSU common board.
   DSCCOM TSSR FAILURE = There is a failure of the time slot select register on the DSU common board.
   DSC ERROR REPORTED, NONE FOUND = The software copy of the DSU subtending circuit (DSC) fault or DSC parity error mask does not match the hardware, or the mask is ineffective.
   INTERRUPT THROUGH MASK FAILURE = The software copy of the DSU common board error source mask register (variable 'i') does not match the hardware or the mask is ineffective.
   MULTIPLE FAILURE INDICATIONS = More than one failure was found for a single service request.
   PICB FAILURE DURING DSC SA = A PICB failure occurred while attempting to read registers on a DSC board.
   PICB FAILURE IN DSU COM SA = A PICB failure occurred while attempting to read registers on the DSU common board. Register information is not valid.

f = Recovery action. Valid value(s):
ANALYSIS ONLY = A post mortem report is generated.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
INITIALIZE = The failing circuit has been reinitialized.
RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

\[\begin{align*}

[5] REPT LIBC ERROR FORK PFORK2 FAILED  
PNAME:a PID:b UTID:c

2. REASON FOR OUTPUT

To report that an error prevented a UNIX® process from creating a new process with the fork system call.

Format 1 is printed when the process could not duplicate all segments of its address space.

Format 2 is printed when the process could not add the new process control block (PCB) segment to its address space.

Format 3 is printed when the process could not create a copy of its PCB segment.

Formats 4 and 5 are printed if the new process could not be created because of other system limitations. This condition may be temporary.

3. VARIABLE FIELD DEFINITIONS

a = Process name from the PCB.  
b = Process number.  
c = Utility ID.  
d = Return value from an unsuccessful request.

4. ACTION TO BE TAKEN
If the condition persists, file an operational trouble report accompanied with the output message.

5. ALARMS

    FNAME:d PNAME:a PID:b UTID:c
2. REASON FOR OUTPUT

To report that a UNIX® process was overlaying itself with another image and an unexpected error occurred.

Format 1 is printed when a new segment could not be added to the address space.

Format 2 is printed when a new segment could not be allocated.

Format 3 is printed when the process attributes could not be changed.

Format 4 is printed when the process class could not be set.

Format 5 is printed when CHGPCB failed when setting the profiling address. MAXSEG error occurs when the CHGPCB OST fails to change the segment list size when executing a child with a different number of segments than the parent. PCBSIZE error occurs when the PCB could not be grown or shrunk for the new process identified in FNAME.

Format 6 is printed when a shared library file header contained bad data.

Format 7 is printed when a shared library file could not be read.

Format 8 is printed when a shared library file could not be opened.
Format 9 is printed when the new process image's file contained invalid shared library data.

Format 10 is printed when a segment name template could not be obtained for a shared library file.

Format 11 is printed when a segment index in the file header was invalid.

Format 12 is printed when a segment overlay in the process being executed.

Format 13 is printed when the PCB data in the file header was invalid.

Format 14 is printed when a segment image could not be read from a file.

Format 15 is printed when a segment number for a new segment could not be found.

Format 16 is printed when the stack data in the file header was invalid.

Format 17 is printed when a temporary segment could not be added to the address space.

Format 18 is printed when a temporary segment could not be allocated.

3. VARIABLE FIELD DEFINITIONS

a = Process name from the process control block (PCB). For some cases, this may be NULL.
b = Process number.
c = Utility ID.
d = Name of the file in which the error happened. In some cases, the name will have the utility ID as a prefix.
e = Segment number of the one that could not be attached.
f = Size of the requested segment.
g = Name of the requested segment.
h = Static or dynamic priority indicator.
i = Priority requested.
j = Time slice requested.
k = Shared library bits.
l = Shared library bits.
m = Class requested.
n = Name of the shared library.
o = System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
p = Invalid path data.
q = File's invalid segment descriptor.
4. **ACTION TO BE TAKEN**

File an operational trouble report accompanied by the message. Many conditions indicate a file whose data have been damaged.

5. **ALARMS**

None.

6. **REFERENCES**

Output Appendix(es):

   APP: SYSERR
REPT:LIBC-FAULT
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT LIBC FAULT IN d FLTCODE e PA f
   PNAME:a PID:b UTID:c

2. REASON FOR OUTPUT

To report that a UNIX® process caused a software fault that made it terminate.

3. VARIABLE FIELD DEFINITIONS

   a  = Process name from the process control block (PCB).
   b  = Process number.
   c  = Utility ID of the process that faulted.
   d  = A general indicator of what caused the fault. Valid value(s):
       LIB  = The UNIX® portion of the library.
       SBTRACE = The stack back trace execution.
       USER  = The process itself.
   e  = Fault number. Refer to the APP:FAULT-CODE appendix in the Appendixes section of the Output Messages manual.
   f  = Program address at which the fault occurred. In some cases, this value may point at the next instruction.

4. ACTION TO BE TAKEN

File an operational trouble report accompanied by a REPT:LIBC-PROGRAM, REPT:LIBC-SAVE, REPT:LIBC-ARGU or another REPT:LIBC-FAULT output message. In some cases, a file will be created in /cdmp that contains an image of the process when it terminates. The file's name will be the same as variable field 'a' in the output message.

If variable field 'd' equals USER and variable field 'e' equals 0xe1 (H'e1), a phase 1 has occurred, and the currently running supervisor or UNIX® process (indicated by variable field 'a') is killed by sending it a phase fault (0xe1). This is part of the phase 1 recovery process, and the process is reporting that it has received a fault. The postmortem should be analyzed to determine the cause of the phase 1. If bit 31 of the process status word (PSW) in the postmortem is 0xa1 and the process indicated in variable field 'a' was dumped into /cdmp, then save the core dump for analysis.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

b = List of program addresses on the stack (to a maximum of 15) when the fault occurred. Listed in order of most recent to first.

4. ACTION TO BE TAKEN

This is a supplementary message to REPT:LIBC-FAULT. No separate action is required if actions are taken for the REPT:LIBC-FAULT message.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Software Release: 5E14 and later
Message Class: MAINT
Application: 3B
Type: Output

1. FORMAT

REPT LIBC SAVE REGISTERS UTID: a
  0-5: b c d e f g
  6-B: h i j k l m

2. REASON FOR OUTPUT

To report save-state registers (0 through 12) for the fauluting process.

3. VARIABLE FIELD DEFINITIONS

a = Utility ID of the process that faulted.
b-g = Save-state registers RO, R1, R3, R4, R5.
h-m = Save-state registers R6, R7, R8, R9, R10, R11.

4. ACTION TO BE TAKEN

This is a supplementary message to REPT:LIBC-FAULT. No separate action is required if actions are taken for the REPT:LIBC-FAULT output message.

5. ALARMS

None. This is an automatically generated report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

APP:OMDB-X-REF
**REPT:LINE-PST**

**Software Release:** 5E14 and later  
**Message Class:** CP  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   REPT LINE PST THRESH a MINUTES b LPST OCCURRENCES

2. **REASON FOR OUTPUT**

   This message reports that the number of line permanent signals has exceeded a reporting threshold. Either the 5-minute interval permanent signal threshold or the variable interval (15, 30, 45, or 60 minute) permanent signal threshold has been exceeded.

   A permanent signal is defined as a line that has been placed in the out-of-service maintenance high-and-wet (OOS MTCE HW) state. HW indicates that a line has gone off-hook and has not gone back on-hook.

   Permanent signal treatment is a term that defines the actions taken after dial tone has been given and the system has timed out waiting for digits. Permanent signal treatment can be a recorded announcement followed by the receiver off-hook (ROH) tone, just the ROH tone, or no announcement or ROH tone. Once permanent signal treatment has been completed on a line, the line will be placed OOS MTCE HW if the line is still off-hook.

   Not all lines that are placed OOS MTCE HW receive permanent signal treatment. They can be placed HW as a result of other call failures.

   This message reports all occurrences of lines being placed OOS MTCE HW, whether or not permanent signal treatment was given.

3. **VARIABLE FIELD DEFINITIONS**

   a  = The threshold interval period, in minutes, that has been exceeded. Valid value(s):
      5  = The five-minute interval threshold was exceeded.
      15 = The 15-minute variable interval threshold was exceeded.
      30 = The 30-minute variable interval threshold was exceeded.
      45 = The 45-minute variable interval threshold was exceeded.
      60 = The 60-minute variable interval threshold was exceeded.

   b  = The number of line permanent signals (LPST) that have occurred in the reported interval.

   The interval used for the variable interval is determined by a recent-changeable global office parameter. The threshold values for the 5-minute interval and the variable interval reports are also determined by global office parameters.

4. **ACTION TO BE TAKEN**

   Determine the cause of the excessive number of permanent signals. This message may indicate a damaged cable. It may be helpful to obtain a list of lines in the permanent signal (high and wet) state by using the input message OP:LIST.

   If this switch is monitored by a Switching Control Center (SCC) and a repair service bureau (RSB), then the following may be done: During hours when the RSB is staffed, the SCC may inhibit this alarm from appearing on the alarm.
monitor at the SCC. During unstaffed hours at the RSB, however, refer this alarm to the regional RSB which provides twenty-four hour service.

5. ALARMS

Major.

6. REFERENCES

Input Message(s):

   OP: LIST
REPT:LINKED-CALL
  Software Release: 5E14 and later
  Message Class: MTCE
  Application: 5
  Type: Output

1. FORMAT

REPT a b LINKED CALL PROCESSING RESUMED
   STANDALONE DURATION cc:cc:cc EVENTRANGE d–e

2. REASON FOR OUTPUT

To inform the user that a switching module (SM) that was previously in stand-alone operation is now linked to the administrative module, and that the SM is able to do communication-linked call processing.

3. VARIABLE FIELD DEFINITIONS

a = SM type. Valid value(s):
   DRM = Distinctive remote switching module.
   HSM = Host switching module.
   LSM = Local switching module.
   ORM = Optical remote switching module.
   RSM = Remote switching module.
   TRM = Two-mile optical remote switching module.

b = SM number.

c = Length of time the SM was in the stand-alone mode, in hours, minutes, and seconds.

d = First event number of the range.

e = Last event number of the range.

4. ACTIONS TO BE TAKEN

Back up customer-originated recent changes as soon as possible.

5. ALARMS

None.

6. REFERENCES

Other Manual(s):

REPT:LN

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT LNa b IS c

2. REASON FOR OUTPUT

To report the new state of a link node (LN). The new state change may only be entered through a manual request from the UNIX® RTR recent change and verify system (RC/V).

3. VARIABLE FIELD DEFINITIONS

a = Ring node (RN) group number.
b = Ring node member number.
c = New state. Valid value(s):
  IN THE GROWTH STATE
  OFFLINE
  OUT OF SERVICE
  UNAVAILABLE
  UNEQUIPPED

4. ACTION TO BE TAKEN

None.

5. ALARMS

Minor alarm whenever a LN is removed from service.

   LNUPD LN STOPPED
      c (d)

[8] REPT LNUPD LN
   LNUPD LN ABORTED
      c (d)

2. REASON FOR OUTPUT

To print a response to a LNUPD:LN input message. Format 1 prints when ALL is specified in the input message and there are no SS7 nodes equipped. Format 2 prints when LNa b is specified in the input message and LNa b is a non-SS7 node. Format 3 prints when SS7 node LNa b was successfully updated. Format 4 prints when an update attempt on SS7 node LNa b was aborted. This will occur if the node is not an active SS7 node. If the node is active, it will continue to operate on the original node software. That is, a transfer to newly pumped software did
not occur. Other than not being an active node, some of the reasons a node update abort can occur are:

- A stop update request was received for this node.
- The pumper process reported an error in pumping new software to this node.
- A checksum made over newly pumped node software failed or was not reported to the Administrative Module (AM).
- A failure occurred in reading the node's generic specification file identification.
- The node moved out of the active state during its update.
- Communication with the SLMK process failed.
- An update software error (ERRLOG condition) occurred.

Format 5 prints when an update attempt on SS7 node LNa b failed. Here, an attempt to transfer node operation to newly pumped node software failed, resulting in the removal of the node from service, or something caused the node to be removed from service immediately after a successful transfer to the new software. Format 6 prints when the SS7 node update initiated by a LNUPD:LN input message has completed. This refers to the aggregate update attempt on every SS7 node for which an update was requested. An update attempt has been made on either all SS7 nodes or a single SS7 node as specified in the LNUPD:LN input message. Note that COMPLETED does not imply that all, or even any, of the SS7 node update attempts were successful. It simply means that an update attempt on every SS7 node requested has completed. Format 7 prints when the SS7 node update initiated by a LNUPD:LN input message is stopped by the STOP:LNUPD input message. Note that a STOP:LNUPD will not undo a node update that has already been completed. This refers to the aggregate update attempt on every SS7 node for which an update was requested. Format 8 prints when the SS7 node update initiated by a LNUPD:LN input message is aborted by some undesirable event. This refers to the aggregate update attempt on every SS7 node for which an update was requested. Some of the undesirable events that can cause a SS7 update to be aborted are:

- Excessive (two) SS7 node update failures.
- Excessive number of ring failures/recoveries during the update.
- Node pumper process creation failures or excessive pumper process deaths/recreations during the update.
- Excessive SS7 node pump time.
- Communication failures with the SLMK process.
- Update software error (ERRLOG condition).

3. VARIABLE FIELD DEFINITIONS

\[a\] = Link node group number.
\[b\] = Link node member number.
\[c\] = A 32-bit hexadecimal word containing internal update information primarily intended for Lucent Technologies, Bell Laboratories use.
\[d\] = The AM real-time millisecond clock value when the update completed/stopped/aborted output
message was produced.

4. ACTIONS TO BE TAKEN

For Format 1, no action is necessary. There are no equipped SS7 nodes.

For Format 2, check the node identification used in the LNUPD:LN input message since it is not recognized as being a SS7 node.

For Format 3, no action is necessary. The update on this SS7 node was successful.

For Format 4, use the OP:LNUPD input message to determine why the update on this SS7 node was aborted.

For Format 5, use the OP:LNUPD input message to determine why the update on this SS7 node failed.

For Format 6, this output message is printed when the SS7 node update has completed. To determine whether any additional action is needed, review the results of each SS7 node update attempt. Either review the individual LNUPD LN output messages for each SS7 node update attempt or use the OP:LNUPD input message to obtain a summary of the update attempt on all SS7 nodes.

For Format 7, no action is necessary. This output message is printed to confirm that the update has been stopped in response to the STOP:LNUPD input message.

For Format 8, some undesirable event has caused an abort of the SS7 node update. This must be evaluated and understood before any further updates are initiated.

5. ALARMS

None.

REPT:LOADMCCPASSW
Software Release: 5E15 and later
Message Class: MAINT
Application: 5,RTR
Type: Output

1. FORMAT

REPT LOADMCCPASSWD ERROR a [b]

2. REASON FOR OUTPUT

To report conditions that occurred during the execution of the loadmccpasswd process.

3. VARIABLE FIELD DEFINITIONS

a          = Process error codes. Valid value(s):
  01          = Feature not supported on this platform.
  02          = Unable to receive messages.
  03          = Failed to allocate data segment.
  04          = Unknown command line option.
  05          = Failed to open the ECD.
  06          = Duplicate command line option.
  07          = Invalid value for auto lock time out.
  08          = Invalid command line option.
  09          = Maximum number of user records exceeded.
  20          = Failed to open /etc/dlg/authfile.
  21          = No users records defined in /etc/dlg/authfile.
  22          = IODRV returned error.
  23          = MTTYC 0 is not active.
  24          = MTTYC 1 is not active.
  25          = No ucb record for MTTYC 0.
  26          = No ucb record for MTTYC 1.
  27          = Failed to read /etc/dlg/authfile.
  2a          = Unable to send message to IODRV.
  2b          = Failed to receive message from IODRV.
  2c          = Failed to attach to the ECD.
  2d          = Failed to read eaiopt record.
  2e          = Failed to read getty record for ttya.
  2f          = Feature not supported for this application.

b          = If a = 09, then this is the number of user records not processed. Otherwise, it is a system error number. Refer to the APP:SYSERR output appendix.

4. ACTIONS TO BE TAKEN

<table>
<thead>
<tr>
<th>If a = &quot;&quot;</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>01 or 2f</td>
<td>De-activate the MCC login protection feature in the ECD.</td>
</tr>
<tr>
<td>04, 06, 07 or 08</td>
<td>Refer to the PMV 3 System Interfaces, UNIX RTR Commands documentation on loadmccpasswd.</td>
</tr>
<tr>
<td>09, 20, 21 or 27</td>
<td>Execute the VFY:PAUTH input message to verify the user records currently defined in the /etc/dlg/authfile file. The MCC login protection feature is not in effect if there are no user records</td>
</tr>
</tbody>
</table>
defined in the /etc/dlg/authfile file. When user records are defined, only 1023 records are processed for the feature.

For all other process error codes, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.
