Format 2 reports that the login process failed to access the authority administration database (/etc/dlg/authfile) that is used to verify a user's identity and password. The login attempt failed and the login prompt is redisplayed.

Format 3 reports that the login process failed to access the user accounting database (/etc/utmp) that is used to record user login activity. The login procedure continued but user is not subject to any person authority (PAUTH) restrictions that may have been assigned to the user identity using the ADD:PCGRP input message.

Format 4 reports that the MCC and/or SCC TTY device is configured to run the login process. Login is not supported on the MCC and SCC devices. This report will print once every minute until login is disabled on the MCC and SCC devices.

Format 5 reports that the login process successfully completed for the specified user.

3. VARIABLE FIELD DEFINITIONS

a = Teletypewriter (TTY) name of the device on which login was running.

b = User identity.

4. ACTION TO BE TAKEN

For Format 1, verify that the user attempting to login on TTY ‘a’ is authorized. If the user is authorized, remove and restore the TTY. If the identity of the user cannot be determined, assume that the user is attempting to gain
Unauthorized access to the system by systematically entering login and password combinations.

For Format 2, check that the content of the getty records in the equipment configuration database (ECD) is appropriate for the TTY device suffix for which the message is generated. Also check that the /etc/dlg/authfile authority database exists and that the file permissions are set for read and write by root.

For Format 3, verify that user 'b' operating with no person authority (PAUTH) restrictions presents no security risk. If the user should be restricted according to his or her person authority, remove and restore the TTY to terminate the login session. A user's person authority can be verified using the VFY:PCGRP input message.

For Format 4, disable login on the MCC and SCC devices by following Authority Management procedures documented in the System Control Operations Description section of Routine Operations and Maintenance.

5. ALARMS

None. For Format 1, a major alarm is generated because an attempt by unauthorized persons to logon to the system may have occurred.

    [p q]
    r s [t]

2. REASON FOR OUTPUT

To respond to an operational test failure (during call setup or disconnect) on a line unit where the channel (LUCHAN) is suspect.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Line unit number.
c = Service group number.
d = Channel board number.
e = Channel number.
f = Event number.
g = Secondary error type. Valid value(s):
    CHANNEL STUCK OFF HOOK = During a call set up, the channel failed to report ON HOOK.
    CHANNEL STUCK ON HOOK = During a call set up, the channel failed to report OFF HOOK.
    CUTOFF GDX NTWK LATCH = During line disconnect, a gated diode crosspoint (GDX) network latch was found to be open indicating a suspected cut off call. Plant measurement report 'CUT OFF CALLS, GDX' is pegged in function PCflt_rpt. Refer to variable field 't'.
    Note: Not available for model 1 line unit.
    FCG TEST FAILURE = During a call set up the GDX network was found to have a false cross or ground condition (First stage GDX cross points are open during the test so customer line trouble should not cause a failure.)
    OPEN GDX NTWK PATH = (Not available for model 1 line unit.) During line disconnect, a GDX network path was found to be open but the associated GDX latches were closed. Refer to variable field 't'.
    SST FAILURE = Report of a short supervisory transition (call answered for less than two seconds). This report is manually enabled by loading the value h'5e1 into location PCalwsst and requires SM verbose mode.

h = Recovery action. Valid value(s):
ANALYSIS ONLY = A post mortem report is generated.

ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.

REPORT TO TERMINAL MAINT = Terminal maintenance has been notified of the failure.

RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.

RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.

RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

i = High level service circuit number.

j = Grid number.

k = A-link number.

l = Switch board number.

m = Switch number.

n = Level number.

o = External logical circuit name.

p = Current decimal number of errors recorded.

q = Error count threshold, above which the recovery action will be escalated.

r = Hexadecimal data in the form xxxxyyyy.

xxxx = LUCHAN attribute 'name' as identified in relation CKTDATA.

yyyy = LUHLSC attribute 'name' as identified in relation CKTDATA.

s = Hexadecimal data in the form xxxxyyyy.

xxxx = Ignore.

yyyy = Line equipment number (LEN) hexadecimal port name.

t = When variable 'g' = OPEN GDX NTWK PATH or CUTOFF GDX NTWK LATCH, a network path test executed upon disconnect for GDX type Line Units has performed a series of tests (see note in function JB2disc for more information). The first and second characters (xx) of the format xxxyyzzzz identify the type of call being disconnected, the third and fourth characters (yy) identify the test results (must be converted to binary), the fifth to eight characters (zzzz) are not significant. Following is an explanation of the format:

xx = Type of call being disconnected. Valid value(s):

02 = Normal originating or unanswered terminating call.
04 = Supervision transfer detected in function JB2orig.
08 = Terminating answered call.
10 = Abandon during dialing.
40 = Ringing current failure detected in LPstop_r.
= Test results. If the corresponding binary bit = 1, the associated test results are true, else if the bit = 0, the test results are false. Valid value(s) (if the binary bit value = 1):

<table>
<thead>
<tr>
<th>Bit Nbr</th>
<th>Test Results:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The TN335 channel break circuit opened during GDX grid d/c testing, but closed OK during subsequent tests. The test is run if the customer's telephone set tested on hook at the Channel and the GDX grid path tested open. A pattern of errors pointing to one channel could indicate a defective TN335 Channel circuit.</td>
</tr>
<tr>
<td>1</td>
<td>Customer's telephone tested off hook via the Channel (tested first) or the Scanner (tested second if the Channel tests on hook). The Channel test is run before any other tests or hardware configuration changes.</td>
</tr>
<tr>
<td>2</td>
<td>Restore verify (RVF) d/c path test failed (indicating an open GDX grid path or defective Scanner) - Test is run if at initial entrance to JB2disc the customer's telephone tested on hook at the Channel and the Scanner. Test is run on loop start lines via high level service circuit (HLSC) 619 ohm T-R short, and ground start lines via HLSC 2.2k ring ground - the scanner is expected to test off hook.</td>
</tr>
<tr>
<td>3</td>
<td>GDX grid (first and second stage cross points) d/c path unexpectedly tested open. Test is run if at entrance to JB2disc, the customer's telephone tests on hook at the Channel. Tested via reversed channel into scanner if customer's telephone tested off hook at the Scanner, else it is tested via RVF.</td>
</tr>
<tr>
<td>4</td>
<td>GDX access (fwd/rev cross points) d/c path unexpectedly tested open. Test is run if at entrance to JB2disc, the customer's telephone tested on hook at the Channel. Tested via HLSC 619 ohm T-R short toward the channel - channel is expected to test off hook.</td>
</tr>
<tr>
<td>5</td>
<td>First stage GDX latch unexpectedly reads open. Test is run if GDX grid d/c path tests open. *</td>
</tr>
<tr>
<td>6</td>
<td>Second stage GDX latch unexpectedly reads open. Test is run if GDX grid d/c path tests open. *</td>
</tr>
<tr>
<td>7</td>
<td>Access (fwd and rev) GDX latch unexpectedly reads open. Test is run if GDX grid d/c path tests open. *</td>
</tr>
</tbody>
</table>

**Note** = * Plant measurement report "CUT OFF CALLS, GDX" is pegged.

zzzz = Ignore.

4. ACTIONS TO BE TAKEN

Use pattern analysis to determine possible faulty hardware or software related problems. Use input message TST:LEN to verify open path failures. TST:LEN requires the B-link number as part of the input. The B-link number is computed by multiplying the channel number (variable 'e') by 4, and then adding the channel board number (variable 'd'). For example, channel number 6 and channel board number 2 correspond to B-link number 26 (6*4+2=26). Refer to the Corrective Maintenance manual, sections: "Hardware Procedures", "Clear Diagnostic Failure in Hardware".

5. ALARMS

d = Channel board number.
e = Channel number.
f = Event number.
g = Error type. Valid value(s):
    PER DETECTED BAD ADDRESS
    SOFTWARE BAD ADDRESS ERROR

h = Recovery action. Valid value(s):
    ANALYSIS ONLY = A post mortem report is provided.
    ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has
    been notified.
    RE-INHIBIT ERROR = The failing circuit has been inhibited and error is still detected.
    RMV = The failing circuit will be removed from service. Intervention is required to change
    the state of the circuit. A message from the maintenance request administrator
    (MRA) will be printed after the circuit is removed.
    RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
    will be printed with the results of the diagnostic.

i = Indication of whether the fault was transient or hard, as determined by the module controller fault
   recovery.

j = System PICB number in hexadecimal that was being written when the failure occurred.
k = Read/write (uppermost) bit and address in hexadecimal to which the control interface (CI) was
   writing when the failure occurred.
1 = Data being written to the periphery by the CI.

m = Contents of the CI error source register.

Note: Up to two logical circuit names, error counts, and error thresholds (variables 'n'-'p') may be printed.

n = External logical circuit name.

o = Current decimal number of recent failures of this type recorded.

p = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

USER SOFTWARE VIOLATED HLSC PROTOCOL

Note: The failure previously described applies to both model one and model two line unit high level service circuits. The following errors apply only to the model two line unit high level service circuit (TN844).
Valid value(s):
C/D = Common data
FCG = False cross and grown
FLT = Fault
GDXAXS = Gated diode crosspoint access
HLSC = High level service circuit
RQT = Request
XP = Crosspoint

Recovery action. Valid value(s):
ANALYSIS ONLY = A post mortem report is generated.
ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
REPORT TO TERMINAL MAINT = Terminal maintenance has been notified of the failure.
RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

Logical circuit name, in order of output. Valid value(s):
LEN = Line equipment number.
LUALINK = Line unit A-link.
LUCHAN = Line unit channel.
LUHLSC = Line unit high level service circuit.

Up to three logical circuit names will print. Variables 'i' and 'j' are optional depending on the error type.

External logical circuit name.

Current decimal number of errors recorded.

Error count threshold, above which the recovery action will be escalated.

Internal circuit name representation of LUCHAN, LUHLSC, LUALINK, or LEN.

PC foreground job that this error occurred on. Valid value(s):
0x1 = Coin fault.
0x2 = False cross and grown.
0x3 = Power cross.
0x4 = Party test.
0x5 = Ringing.
0x6 = Pre-trip.
0x7 = False cross and ground on ringing.
0x8 = Bridge.

Note: This data is valid only on the TN844 high level service circuit.

n = Contents of the high-level service circuit high-level mode register.

Note: This data is valid only on the TN844 high level service circuit.

4. ACTION TO BE TAKEN

When unit is removed from service and it fails diagnostics, replace it with a new pack. Use the restore conditional message when putting the new pack into service. If HLSC FIRMWARE FUNCTION NOT COMPLETED (variable 'f') message is occurring frequently, notify the next level of switch maintenance support.

   been notified.
   INITIALIZE = The failing circuit has been reinitialized.
   RMV = The failing circuit will be removed from service. Intervention is required to change
   the state of the circuit. A message from the maintenance request administrator
   (MRA) will be printed after the circuit is removed.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be
   printed with the results of the diagnostic.
   RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message
   will be printed with the results of the diagnostic.

h = Source analysis data (optional).
i = External logical circuit name.
j = Current decimal number of recent failures of this type recorded.
k = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

When unit is removed from service and it fails diagnostics, replace it with a new pack. Use the restore conditional
message when putting the new pack into service. If intervention is required, follow diagnostic procedures found in the Corrective Maintenance manual.

5. ALARMS

REPT:MA-TMPSF

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT MA=a-b-c-d TRBL MSU PATH SETUP FAILURE e
   FAILURE IN PROTO TEST RECOVERY ACTION f
   MTB=g
   MA=a-b-c-d h i
   MSUCOM=a-b-c h i

2. REASON FOR OUTPUT

To report a trouble with a metallic access (MA) circuit which resides in a metallic service unit (MSU). A protocol test failed while checking the integrity of a metallic connection to the MA circuit. The metallic test bus (MTB) number, the MA circuit and the MSU common circuit board (MSUCOM) are printed to aide in locating the faulty equipment.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = MSU number.
c = Service group number.
d = MSU board position number.
e = Event number.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = This post-mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
   RST AUTO CAMPON = The failing circuit will be diagnosed as soon as it becomes available. A message (RST:MA or DGN:MA) will then be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message (RST:MA or DGN:MA) will be printed with the results of the diagnostic.
g = Metallic test bus number.
h = Number of recent failures of this error type (FAILURE IN PROTO TEST) on this circuit (in decimal).
i = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

No action required. When recovery action variable 'f' is 'RST PREEMPT' or 'RST AUTO CAMPON' a subsequent DGN:MA or RST:MA message will indicate the success or failure of the restore request.
5. ALARMS

None.

1. FORMAT

REPT MA=a-b-c-d TRBL PICB CONTROL FAILURE EVENT=e
   f RECOVERY ACTION g
   h i j k
   l m n o

2. REASON FOR OUTPUT

To respond to a peripheral interface control bus (PICB) control failure interrupt on the metallic access (MA) board.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = Board number.
e = Event number.
f = Error type. Valid value(s):
   CI RECEIVED BAD PARITY
   CI RECEIVED BAD START CODE
   CI TIME OUT
   PER DETECTED BAD ADDRESS
   PER DETECTED BAD PARITY
   PER DETECTED BAD START CODE
   SOFTWARE BAD ADDRESS ERROR

g = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is provided.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has
   been notified.
   RST PREEPMT = The failing circuit was preempted and a diagnostic was scheduled. A message
   will be printed with the results of the diagnostic.

h = Indication of whether the fault was transient or hard, as determined by the module controller fault
   recovery.
i = System PICB number in hexadecimal that was being written when the failure occurred.
j = Read/write (uppermost) bit and address in hexadecimal to which the control interface (CI) was
   writing when the failure occurred.
k = Data being written to the periphery by the CI.

l = Contents of the CI error source register.

Note: Up to two logical circuit names, recent failure counts, and error thresholds ("m","n") may be printed.

m = External logical circuit name.

n = Current decimal number of recent failures of this type recorded.

o = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the MA board from service during a period of low usage and perform trouble locating procedures.

235-600-500  Asserts
REPT:MANUAL-RING
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT MANUAL RING MODE
   WARNING: ECD SPECIFIES MANUAL RING MODE

2. REASON FOR OUTPUT

To report that the interprocessor message switch (IMS) automatic ring recovery (ARR) routine is inhibited. This message reports periodically when the IMS is in the manual ring mode, but the common network interface (CNI) ring is no longer down, and the CNI ring initialization has been completed successfully. It is printed when the condition stated above is first met and every 30 minutes thereafter as long as the condition remains the same.

Inhibiting ARR means that the automatic restoration of nodes and the escalation, if needed, to higher levels of ring fault recovery will not take place unless manually requested. Placing the CNI ring into this mode is typically part of a CNI ring growth procedure. Verify that there is no CNI ring growth procedure in progress before returning the CNI ring to its normal mode. An in-service CNI ring that is not undergoing a ring growth should not be left in manual ring mode since, if a CNI problem should occur while in manual ring mode, there is no automatic recovery and an SS7 service outage could result.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTIONS TO BE TAKEN

When the user is ready to return to normal mode, the equipment configuration data base (ECD) manual ring mode flag must be reset to null (off). This is done by modifying the ECD recent change/verify (RC/V) UCB form. Key field 3 (k_unit_name) is UNODS and key field 4 (k_unit_number) is 0. Change field number 22 (equipage) to null.

5. ALARMS

   cccccccc cccccccc cccccccc cccccccc cccccccc cccccccc cccccccc cccccccc

__________________________________________________________________

2. REASON FOR OUTPUT

To print system message buffer data when the disk driver message buffer contains invalid data.

Format 1 prints when the disk driver message buffer pointer is NULL.

Format 2 prints when a critical field in the disk driver message buffer is considered to be invalid.

The message buffer dump (MBD) will always contain the disk driver message buffer that is considered invalid. If it exists, message buffer data preceding the disk driver message buffer will also be printed.

The maximum amount of data printed is the size of the largest message buffer plus the size of the smallest message buffer followed by the disk driver message buffer. The boundaries between message buffers contained in the dump are determined by interpreting the data.

3. VARIABLE FIELD DEFINITIONS

a = Current print segment number.
b = Total number of print segments in the report.
c = Message buffer data in hexadecimal notation.

4. ACTION TO BE TAKEN

Save a copy of the receive-only printer (ROP) and contact the next higher level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

2. REASON FOR OUTPUT

To indicate that the message handler (MH) has taken an error. This message describes what error occurred, the
state of the processor at the time the error occurred, and the recovery action taken.

3. VARIABLE FIELD DEFINITIONS

   a  = Switching module (SM) number.

   b  = MCTSI side.

   c  = Reporting message handler identifier. Valid value(s):
       MH0  = Message handler 0.
       MH1  = Message handler 1.
       MH2  = Message handler 2.

   d  = Recovery action. Valid value(s):
       CEI  = Critical error interrupt.
       OSR  = Operational software restart.
       UNK  = Unknown recovery action requested.

   e  = MH event number.

   f  = Termination report. Valid value(s):
       ABORTED  = The indicated recovery action did not complete before being interrupted by
                   another stimulus.
       COMPLETED = The indicated or requested action has completed.
g  = SM event number.

h  = Failing address.

i  = Operational software job that was executing at the point the error was taken. Valid value(s):
  AU  = Routine audits.
  CM  = Communication package.
  INIT = Processor initialization.
  MTUP = Mate update.
  OE  = Operating environment.
  PLNK = Peripheral link for MH1 or MH2.
  QL  = Quad-link layer 2 manager.
  RHS = Routine hashsum checks.
  SI  = System integrity.
  UNK = Unknown or indeterminable running job.

j  = Source of the error that caused the interrupt. Valid value(s):
  ADDR-ERROR  = A word access was attempted on an odd-byte boundary.
  ADDR-OOR    = An out-of-range address was detected.
  APC-INTERFACE-DATA-PARITY-ERROR = An application-specific controller (APC) interface data parity error has occurred.
  APC-LOST-CLOCK-ERROR = An APC lost clock error has occurred.
  APC-LOST-SYNC-ERROR = An APC lost sync error has occurred.
  AUTOVECTOR 1 = A level 1 interrupt autovector was received by the fault handler.
  AUTOVECTOR 2 = A level 2 interrupt autovector was received by the fault handler.
  AUTOVECTOR 3 = A level 3 interrupt autovector was received by the fault handler.
  AUTOVECTOR 4 = A level 4 interrupt autovector was received by the fault handler.
  AUTOVECTOR 5 = A level 5 interrupt autovector was received by the fault handler.
  AUTOVECTOR 6 = A level 6 interrupt autovector was received by the fault handler.
  AUTOVECTOR 7 = A level 7 interrupt autovector was received by the fault handler.
  BLL-SANITY-TIMER-TIME-OUT = The base level loop (BLL) sanity timer has expired.
  BUS-ERROR = A 68040 bus error exception occurred.
  BUS-ERR-TRANSLATION-TABLE = A bus error has occurred during an address translation search.
  FORMAT-ERROR = A validity check of co-processor state frame format or word stack frame format has failed.
  ILLEGAL-INSTRUCTION = The processor attempted to execute an invalid instruction.
  ILL-ACCESS-SUPV-PROT-REGION = The memory management unit (MMU) has detected illegal access of a supervisor-protected region.
  LINE-1010-EMULATOR = Unimplemented A-line opcode.
  LINE-1111-EMULATOR = Unimplemented F-line opcode.
  LP-READ-DATA-PARITY = A local processor (LP) read parity error has occurred on the data bus.
  MATE-READY-TIME-OUT-ERROR = A mate ready timeout error has occurred.
  MH-SANITY-TIMER-ERROR = Switching module processor (SMP) sanity timer for the MH has expired.
  MMU-WRITE-PROT-VIOLATION = The MMU has detected a write-protect violation.
  PRIVILEGE-VIOLATION = An attempt to execute a supervisor only instruction while the processor was in user mode.
  READY-TIMER-TIME-OUT = The bus watchdog (ready) timer expired.
  SMP-MULTIPLE-RESPONSE-ERROR = A SMP multiple response error has occurred.
  SMP-WRITE-ADDRESS-PARITY-ERROR = A SMP write address parity error has occurred.
  SMP-WRITE-DATA-PARITY-ERROR = A SMP write data parity error has occurred.
SPURIOUS-INTERRUPT = A spurious interrupt was received by the fault handler.

SPYDER-T-READ-DATA-PARITY-ERROR = A SPYDER-T read parity error has occurred.

STACK-PROTECT-ERR = The MMU has detected a stack protect error.

UNEXPECTED-INTERRUPT = An unexpected interrupt was received by the fault handler.

UNIDENTIFIED-EXCEPTION = An unidentified exception was received by the fault handler.

UNINITIALIZED-INTERRUPT = An uninitialized interrupt was received by the fault handler.

UNK = The source of the error cannot be determined.

UNRECOG-UT-TRAP = An unrecognized trap instruction was received by the fault handler.

UNUSED-SW-TRAP = A trap instruction that is not used by the current software release was executed.

UNUSED-TEXT-EXEC = A bad transfer vector (TV) slot was used or a wild transfer occurred, causing memory not used by the current software release code to be executed.

UPDATE-BUS-DATA-PARITY-ERROR = An update bus parity error interrupt was received by the fault handler.

ZERO-DIVIDE = An attempt was made to divide by zero.

k = Type of memory referenced by failing address. Valid value(s):

BRAM = Read/write memory using buffer random access memory (RAM) device.

IO = Input/output memory.

LSRAM = Read/write memory using local static RAM device.

MATE-BRAM = Read/write mate memory using buffer RAM device.

MATE-IO = Input/output mate memory.

MATE-LSRAM = Read/write mate memory using local static RAM device.

OOR = Read/write memory using local static RAM device.

l = Critical error trigger reason. Valid value(s):

EX-FR-ERR = Fault recovery critical error request.

EX-OSR-ERR = Excessive error stimulus.

m = State of the communication package for communication links. Valid value(s):

ACTIVE = Communication package was active but the link and action cannot be determined.

BASE = CM was called from the base level environment.

A-TRANS = Communication link A was transmitting.

B-TRANS = Communication link B was transmitting.

A-RECV = Communication link A was receiving.

B-RECV = Communication link B was receiving.

INACTIVE = Communication package was not active.

n = The QLPS network number.

o = The logical link control block in use when the error occurred.

p = The direction of message transmission. Valid value(s):

RCV = Receive.

SND = Send.

q = The far end network address or endpoint specified when the error occurred.
4. ACTION TO BE TAKEN

Monitor the progress of the recovery. Initiate manual actions if the recovery does not proceed as expected.

5. ALARMS

____________________________________________________________________

2. REASON FOR OUTPUT

To indicate that the message handler (MH) has taken an error. This message describes what error occurred, the state of the processor at the time the error occurred, and the recovery action taken.

Format 1 prints when equipped with a 68040-based MH.

Format 2 prints when equipped with a PowerPC®-based MH.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = MCTSI side.
c = Reporting message handler identifier. Valid value(s):
   MH0 = Message handler 0.
   MH1 = Message handler 1.
   MH2 = Message handler 2.
d = Recovery action. Valid value(s):
   CEI  = Critical error interrupt.
OSR  = Operational software restart.
UNK  = Unknown recovery action requested.

Environment in which this request was stimulated. Refer to the APP:ENVIR appendix in the Appendixes section of the Output Messages manual for a list of environments and their definitions.

MH event number.

Termination report. Valid value(s):
ABORTED  = The indicated recovery action did not complete before being interrupted by another stimulus.
COMPLETED = The indicated or requested action has completed.

SM event number.

Failing address.

Operational software job that was executing at the point the error was taken. Valid value(s):
AU  = Routine audits.
CM  = Communication package.
INIT = Processor initialization.
MTUP = Mate update.
OE  = Operating environment.
PAUD = Parity audit.
PLNK = Peripheral link for MH1 or MH2.
QL  = Quad-link layer 2 manager.
RHS = Routine hashsum checks.
SI  = System integrity.
UNK = Unknown or indeterminable running job.

Source of the error that caused the interrupt. Valid value(s):
8-CONSECUTIVE-SANITY-TIMEOUT = This indicates that the sanity timer has timed-out 8 times in a row. This causes a hard reset to the processor. Fault recovery determines the hard reset reason by examining the STAT1 register (printed in the REPT:MCTSI-MESE output message).
ACCESS-VIOLATION = An Access violation has occurred.
ADDR-ERROR = A word access was attempted on an odd-byte boundary.
ADDR-OOR = An out-of-range address was detected.
ADDRESS-BUS-PARITY-ERROR-DETECTED = This indicates that the dynamic RAM controller system (DRCS) has detected a memory address parity error. The memory address parity error occurred on the interface between the DRCS and SDRAM array. This error is autonomous to the rest of the system.
ALIGNMENT-ERROR = An alignment error was detected.
APC-INTERFACE-DATA-PARITY-ERROR = An application-specific controller (APC) interface data parity error has occurred.
APC-LOST-CLOCK-ERROR = An APC lost clock error has occurred.
APC-LOST-SYNC-ERROR = An APC lost sync error has occurred.
AUTOVECTOR 1 = A level 1 interrupt autovector was received by the fault handler.
AUTOVECTOR 2 = A level 2 interrupt autovector was received by the fault handler.
AUTOVECTOR 3 = A level 3 interrupt autovector was received by the fault handler.
AUTOVECTOR 4 = A level 4 interrupt autovector was received by the fault handler.
<table>
<thead>
<tr>

<td>A memory address parity error has occurred.</td>
</tr>
</tbody>
</table>
MH-SANITY-TIMER-ERROR = Switching module processor (SMP) sanity timer for the MH has expired.

MMU-WRITE-PROT-VIOLATION = The MMU has detected a write-protect violation.

PRIVILEGE-VIOLATION = An attempt to execute a supervisor only instruction while the processor was in user mode.

NO-MMU-FAULT-FOUND-AFTER-ANALYSIS = After analysis, no MMU fault was found.

NON-CORRECTABLE-BIT-ERROR = This indicates that the DRCS device has detected a non-correctable bit error (NCE) in the dynamic RAM arrays. These NCE errors are not corrected by hardware and will be reported on every processor access until the data is re-written with good hamming codes. The DRCS shadow address (SA) register printed in the REPT:MCTSI-MESE output message contains additional information about the non-correctable bit error. This error is autonomous to the rest of the system.

PAGE-FAULT-OR-INVALID-ACCESS = A page fault or invalid access has occurred.

PCI-ADDR-PARITY-ERROR-PCI-BRIDGE-IS-MASTER = A PCI address parity error has occurred when the PCI bridge was master.

PCI-BRIDGE-DETECTED-ADDRESS-PARITY-EXCEPTION = This indicates that the PPC/PCI bridge (PCIBP) device has detected an address parity error on its 60x bus interface. Address parity is checked on every address transaction, whether it is to this device or not, and this device will not terminate the bus cycle. A no response/bus timeout error (SS_NRBTO) should also be generated.

PCI-BRIDGE-DETECTED-DATA-PARITY-ERROR = This indicates that the PCIBP device has detected a write data parity error on the MI or CI bus. The write cycle will be blocked and the cycle terminated normally if this was an IO cycle to PCIBP. If the bus cycle, with the write data parity error, is destined for the PCI bus then the cycle will be passed on to the PCI bus and the PCI bus will detect and flag the data parity error. This PCI error will set the PCIPER bit in the SESR register.

PCI-BUS-ARBITRATION-ERROR = This indicates that an arbitration violation occurred on the PCI bus. A PCI client requested the PCI bus, but failed to start a cycle within 4 us.

PCI-BUS-DMA-TIME-OUT-ERROR = A PCI bus DMA timeout occurred.

PCI-BUS-LOCK-UP = This indicates that a PCI bus cycle failed to terminate. The PCI cycle could not be terminated by any means. This error may indicate that a device on the PCI bus did not follow the protocol.

PCI-BUS-NO-RESPONSE-ERROR = This indicates that no PCI client on the PCI bus claimed a cycle. The PCI bus protocol requires that the PCI interface must claim a PCI cycle within 8 PCI clocks after the address phase on the PCI bus. If no devices claim the cycle, the master of the cycle must master abort the cycle. The bus is NOT in an unknown state on this error, it is an indication that either an unequipped address was used or the base register in one of the devices has been incorrectly programmed.

PCI-DATA-PARITY-ERROR = A PCI data parity error has occurred.

PCI-DATA-PARITY-ERROR-PCI-BRIDGE-IS-MASTER = A PCI data parity error has occurred when the PCI bridge was master.

PCI-DETECTED-DATA-PARITY-ERROR = A PCI detected data parity error has occurred.

PCI-ILLEGAL-ACCESS = A PCI illegal access error has occurred.

PCI-MASTER-ABORT = A PCI master abort has occurred.

PCI-MEMORY-ADDRESS-PARITY-ERROR = A PCI memory address parity error has occurred.

PCI-PARITY-ERROR = This indicates that the parity error (PERR) signal was asserted on the PCI bus due to a read or a write data parity error.

PCI-RECEIVE-TARGET-ABORT = A PCI receive target abort has occurred.

PCI-SYSTEM-ERROR = This indicates that the system error (SERR) signal was asserted on the PCI bus. The SERR signal indicates that a parity error may have occurred on the address phase of the cycle, a parity error may have occurred on the data phase of
the cycle, or the PCI device detected some error other than a parity error. There is no mechanism for hardware to automatically generate a PCI reset in response to an SERR.

PCI-SYSTEM-ERROR-FROM-EXTERNAL-PCI-AGENT = A PCI system error has been detected from an external PCI agent.

PCI-TARGET-ABORT = A PCI target abort has occurred.

PCI-TIMEOUT-EXCEPTION = A PCI timeout exception has occurred.

PERFORMANCE-MONITORING-EXCEPTION = A performance monitoring exception has occurred.

PERIPHERAL-BREAKPOINT-EXCEPTION = A peripheral breakpoint exception has occurred.

PRIVILEGE-VIOLATION = An attempt to execute a supervisor only instruction while the processor was in user mode.

PROGRAM-EXCEPTION--FLOATING-POINT = A floating point program exception has occurred.

PROGRAM-EXCEPTION--UNEXPECTED-TRAP = An unexpected program exception has occurred.

PROGRAM-TRAP-EXCEPTION = A program trap exception has occurred.

RAM-CONTROLLER-DETECTED-ADDRESS-PARITY-ERROR = This indicates that the DRCS device has detected an address parity error on its 60x bus interface. Address parity is checked on every address transaction, whether it is to this device or not, and this device will not terminate the bus cycle. A SS_NRBTO should also be generated.

RAM-CONTROLLER-DETECTED-DATA-PARITY-ERROR = This indicates that the DRCS device has detected a write data parity error on the MI or CI bus. The write cycle will be blocked and the cycle terminated normally. This is for either IO or memory cycles.

READY-TIMER-TIME-OUT = The bus watchdog (ready) timer expired.

RS-BUS-ADDRESS-PARITY-ERROR = An RS bus address parity error has occurred.

RS-BUS-DATA-PARITY-ERROR = An RS bus data parity error has occurred.

RS-BUS-MULTIPLE-RESPONSE = An RS bus multiple response error has occurred.

SANITY-TIMER-EXCEPTION = A hardware sanity timeout has occurred.

SINGLE-TRACE-EXCEPTION = A single trace exception has occurred.

SMI-EXCEPTION--SESR-RESERVE-BIT-FAULT = An SMI exception has occurred due to a reserved bit getting set.

SMP-MULTIPLE-RESPONSE-ERROR = A SMP multiple response error has occurred.

SMP-WRITE-ADDRESS-PARITY-ERROR = A SMP write address parity error has occurred.

SMP-WRITE-DATA-PARITY-ERROR = A SMP write data parity error has occurred.

SPURIOUS-INTERRUPT = A spurious interrupt was received by the fault handler.

SPYDER-T-READ-DATA-PARITY-ERROR = A SPYDER-T read parity error has occurred.

STACK-PROTECT-ERR = The MMU has detected a stack protect error.

SUPERVISOR-PRIVILEGE-PROTECTION-VIOLATION = An attempt to access a supervisor-only memory region while in user mode.

TEXT-FILL-EXCEPTION = A text fill exception has occurred.

THERMAL-EXCEPTION = A thermal exception has occurred.

THERMAL-EXCEPTION-THROUGH-MASK = A thermal exception has occurred even though it was inhibited.

TRACE-EXCEPTION = A trace exception has occurred.

UNEXPECTED-BRANCH-TRACE-BREAKPOINT = An unexpected branch trace breakpoint occurred.

UNEXPECTED-EXCEPTION = An unexpected machine check has occurred.

UNEXPECTED-INTERRUPT = An unexpected interrupt was received by the fault handler.

UNIDENTIFIED-EXCEPTION = An unidentified exception was received by the fault handler.

UNINITIALIZED-INTERRUPT = An uninitialized interrupt was received by the fault handler.

UNK = The source of the error cannot be determined.

UNKNOWN-EI-INTERRUPT = An unknown external interrupt has occurred. No bits found in the IRR register.

UNKNOWN-SOFT-RESET-EXCEPTION = An unknown soft reset exception has occurred.

UNKNOWN-SMI-INTERRUPT = An unknown SMI interrupt has occurred.
UNKNOWN-SYSERR-INTERRUPT = An unknown system error interrupt has occurred. No bits were set in the SESR register.
UNKNOWN-TRACE-EXCEPTION = An unknown trace exception has occurred.
UNRECOG-UT-TRAP = An unrecognized trap instruction was received by the fault handler.
UNRECOGNIZED-MATCHER-ERROR = An unrecognized matcher error has occurred.
UNUSED-SW-TRAP = A trap instruction that is not used by the current software release was executed.
UNUSED-TEXT-EXEC = A bad transfer vector (TV) slot was used or a wild transfer occurred, causing memory not used by the current software release code to be executed.
UPDATE-BUS-DATA-PARITY-ERROR = An update bus parity error interrupt was received by the fault handler.
UPDATE-BUS-INTERFACE-PARITY-ERROR = An update bus interface parity error has occurred. This is a mate MH error.
UPDATE-BUS-LOSS-OF-SYNC = An update bus interface loss of sync error has occurred. This is a mate MH error.
UPDIO-ADDRESS-PARITY-ERROR = An address parity error has been detected by the UPDIO device.
UPDIO-WRITE-DATA-PARITY-ERROR = A write data parity error has been detected by the UPDIO device.
WRITE-PROTECT-VIOLATION = A write protect violation has occurred. The failing address will indicate the access address.
ZERO-DIVIDE = An attempt was made to divide by zero.

1 = Type of memory referenced by failing address. Valid value(s):
   BRAM = Read/write memory using buffer random access memory (RAM) device.
   DRAM = Read/write random access memory.
   IO = Input/output memory.
   LSRAM = Read/write memory using local static RAM device.
   MATE-BRAM = Read/write mate memory using buffer RAM device.
   MATE-DRAM = Read/write random access mate memory.
   MATE-IO = Input/output mate memory.
   MATE-LSRAM = Read/write mate memory using local static RAM device.
   OOR = Read/write memory using local static RAM device.

m = Critical error trigger reason. Valid value(s):
   EX-FR-ERR = Fault recovery critical error request.
   EX-OSR-ERR = Excessive error stimulus.

n = State of the communication package for communication links. Valid value(s):
   ACTIVE = Communication package was active but the link and action cannot be determined.
   BASE = CM was called from the base level environment.
   A-TRANS = Communication link A was transmitting.
   B-TRANS = Communication link B was transmitting.
   A-RECV = Communication link A was receiving.
   B-RECV = Communication link B was receiving.
   INACTIVE = Communication package was not active.

o = The QLPS network number.
p = The logical link control block in use when the error occurred.

q = The direction of message transmission. Valid value(s):
   RCV = Receive.
   SND = Send.

r = The far end network address or endpoint specified when the error occurred.

s = Contents of supervisor stack pointer (SSP).

t = Contents of program counter (PC).

u = Contents of status register (SR).

v = Contents of user stack pointer (USP).

w = Contents of frame pointer (FP).

x = Contents of the address registers 0-5.

y = Contents of the data registers 0-7.

z = Contents of the event source bit register (ESBR).

a1 = Contents of the interrupt mask bit register (IMBR).

b1 = Contents of the interrupt service request register (ISRR).

4. ACTIONS TO BE TAKEN

Monitor the progress of the recovery. Initiate manual actions if the recovery does not proceed as expected.

REPT: MCTSI-TADH

Software Release: 5E14 and later
Message Class: HW
Application: 5
Type: Output

1. FORMAT

REPT MCTSI=a-b TRBL AUDIT DETECTED HARDWARE ERROR [EVENT=]c
   BTSR/PUMP HW SELF CHK FAILURE RECOVERY ACTION INHIBIT HDWCHKS

2. REASON FOR OUTPUT

To indicate that the bootstrapper hardware self check failed on a simplex module controller and timing unit model 2 (MCTU2). The recovery action taken was to inhibit the active module controller and time slot interchanger (MCTSI's) bootstrapper hardware self check.

3. VARIABLE FIELD DEFINITIONS

   a = Switching module number.
   b = MCTSI side.
   c = Event number.

4. ACTION TO BE TAKEN

Conditionally restore the mate MCTSI using the RST:MCTSI input message. Then conditionally restore the MCTSI side reported in the output message.

Note: It is possible that after restoring the mate, an automatic MCTSI side switch may occur; diagnostics for the previously active MCTSI may also be queued. If this occurs, a REPT:TRBL-REMOVE output message may be observed.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

Output Message(s):
   REPT: TRBL-REMOVE

Other Manual(s):
   235-105-220 Corrective Maintenance
REPT:MCTSI-TPPC

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

REPT MCTSI=a-b TRBL PORT PROCESSOR COMMUNICATION LOSS EVENT=c
   PP LOSS OF LAYER 2 RECOVERY ACTION d
e f g[e f g]
hi jk lm no pq rs tu vw
xy z

2. REASON FOR OUTPUT

To report the loss of communication from the switching module processor (SMP) to a port processor (PP). A PP can either be a protocol handler (PH) or a packet interface (PI). End-to-end (ETE) check messages detect faults from the SMP through the PI on the packet bus to the PHs. Idle link assurance (ILA) messages detect faults between the PI and the PHs through the packet bus.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = SM processor side.
c = Event number.
d = Recovery action. Valid value(s):
   ANALYSIS ONLY = No recovery action was taken.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

   Note: An additional circuit name, error count, and error threshold ('e'-'g') may be printed. Recovery action will be taken only on the first circuit in the list to reach its error threshold.

e = External circuit name of the implicated circuit.
f = Current decimal number of failures of this type recorded.
g = Decimal error count threshold, above which the recovery action will be taken.
   Note: Variables 'h' through 'z' will be reported as hexadecimal data, where each field is 4 digits.

h = Detection source. Valid value(s):
   0 = ETE check failure which is a periodic communication check between the SMP and the PPs.
   1 = ILA failure which ensures layer 2 is up and messages can be sent to the PHs.
i = The number of implicated faulty PPs.

j = The implicated PH image type. Valid value(s):
0 = Null PH image.
1 = PH 2 access image.
2 = PH 2 gateway image.
3 = PH 3 common image.
4 = PH 3 input/output processor (IOP) image.

k = The implicated PH hardware type. Valid value(s):
1 = PH 2 hardware.
2 = PH 3 hardware.

l = The number of the faulty PP. For ILA failures only. Valid value(s):
0xaf00-0xaf4f = PH numbers.
0x60 = PI side 0.
0x61 = PI side 1.

NOTE: Fields 's' - 'z' are not used for ILA failures. Any data in these fields should be ignored for ILA.

m = For ETE failures: Bitmap of PHs that a response is expected from on shelf 0 (15 -> 00).

For ILA failures: Packet bus enable masks for PHs on shelf 0 (15 -> 00).

n = For ETE failures: Bitmap of PHs that a response is expected from on shelf 1 (15 -> 00).

For ILA failures: Packet bus enable masks for PHs on shelf 1 (15 -> 00).

o = For ETE failures: Bitmap of PHs that a response is expected from on shelf 2 (15 -> 00).

For ILA failures: Packet bus enable masks for PHs on shelf 2 (15 -> 00).

p = For ETE failures: Bitmap of PHs that a response is expected from on shelf 3 (15 -> 00).

For ILA failures: Packet bus enable masks for PHs on shelf 3 (15 -> 00).

q = For ETE failures: Bitmap of PHs that a response is expected from on shelf 4 (15 -> 00).

For ILA failures: Packet bus enable masks for PHs on shelf 4 (15 -> 00).

r = Reserved for future or temporary data.

s = For ETE failures: Bitmap of PIs that a response is expected from.

t = For ETE failures: Bitmap of PH acknowledgement on shelf 0 (15 -> 00). A zero indicates that the PH did acknowledge. A one indicates that the PH did not acknowledge.

u = For ETE failures: Bitmap of PH acknowledgement on shelf 1 (15 -> 00). A zero indicates that the PH did acknowledge. A one indicates that the PH did not acknowledge.

v = For ETE failures: Bitmap of PH acknowledgement on shelf 2 (15 -> 00). A zero indicates that the
PH did acknowledge. A one indicates that the PH did not acknowledge.

\[w\] = For ETE failures: Bitmap of PH acknowledgement on shelf 3 (15 -> 00). A zero indicates that the PH did acknowledge. A one indicates that the PH did not acknowledge.

\[x\] = For ETE failures: Bitmap of PH acknowledgement on shelf 4 (15 -> 00). A zero indicates that the PH did acknowledge. A one indicates that the PH did not acknowledge.

\[y\] = Reserved for future or temporary data.

\[z\] = For ETE failures: Bitmap of PI acknowledgement. A zero indicates that the PI did acknowledge. A one indicates that the PI did not acknowledge.

1. FORMAT

REPT MCTSI=a-b TRBL PIDB PARITY TROUBLE c
d RECOVERY ACTION INHIBIT HDWCHKS

2. REASON FOR OUTPUT

To respond to a time-slot interchange (TSI) interrupt caused by peripheral interface data bus (PIDB) parity errors in
the pump hardware of the switching module processor (SMP) board. This output message is used by SMP20
equipped switching modules (SM)s.

3. VARIABLE FIELD DEFINITIONS

INHIBIT HDWCHKS = Pump hardware PIDB parity errors have been inhibited at the TSI.

a = Switching module (SM) number.
b = Module processor side.
c = Event number, which is the time sequence indicator.
d = Error type, which indicates PIDB parity trouble.

4. ACTION TO BE TAKEN

The module controller time-slot interchange (MCTSI) should be diagnosed. Refer to DGN:MCTSI input message.

[2] REPT MDII ALARM SM a1 INTERVAL t THRESHOLD u

2. REASON FOR OUTPUT

To report machine-detected interoffice irregularities (MDIIs) that occur on trunks during a call set-up. This message
appears on the receive-only printer (ROP) and is also sent to the Switching Control Center (SCC) to provide the
trunk maintenance package (TRUMP) with information concerning the performance of the switch.

Format 1 indicates a MDII has occurred. Format 2 indicates that an alarm has been generated due to the number of
MDII messages output within an interval has met the threshold.

3. VARIABLE FIELD DEFINITIONS

a = The MDII type reported on a trunk group. Refer to the APP:MDII appendix in the Appendixes
section of the Output Messages manual for a list of MDIIs.

b = Signaling type. Valid value(s):
CCS = CCIS6.
DP = Dial pulse.
ISDN = ISDN D-channel signaling.
ISUP = ISDN user part (ISUP).
MF = Multi-frequency.
NULL = No signalling.
RPEO = Revertive pulsing, end office.
RPTO = Revertive pulsing, tandem office.
TT = Touch tone.
TUP = International Telecommunication Union - Telecommunication, Standardization
Sector (ITU-TS) (formerly CCITT) common channel signaling system 7 (CCS7)
telephone user port (TUP) signaling.

c = Service circuit. Valid value(s):

LDS=a1-b1-c1
RVPT=a1-b1-c1-d1
UTD=a1-b1-c1-d1
d-e = Trunk group and member number identification.
f = Trunk group size.
g = Out-of-service trunk group.

= Number of out-of-service (OOS) trunks in the trunk group counted against the automatic maintenance limit (AML). Note that this count is only for the switching module that reported the MDII. OP:AML input command can be used to get the AML data for the entire trunk group.

h = Trunk supervision. Valid value(s):
E&M = 2-wire or 4-wire ear and mouth (E&M).
RB = Reverse battery.

For CCS trunks nothing will be printed.
i = Time the report was prepared, in the form hours:minutes:seconds.
j = Trunk or digital equipment number. Valid value(s):

k = Trial number.
l = Carrier flag. Valid value(s):
ICB = Connect to a feature group B (FGB) carrier over a direct trunk.
ICD = Connect to a feature group D (FGD) carrier over a direct trunk.
NC = Connect not carrier-related.
TICB = Connect to an FGB carrier over a tandem trunk.
TICD = Connect to an FGD carrier over a tandem trunk.

m = Identifying number of the FGB or FGD interLATA or international carrier, if any. For FGB and FGD carrier, the number can be up to 4 digits.

n = Call direction. Valid value(s):
ICT = Incoming trunk.
OGT = Outgoing trunk.

o = Test call indicator. Valid value(s):
NORMAL = Plain old telephone service (POTS) call.
TEST = Test call.

p = Called number. This field indicates the digits outpulsed when the MDII was detected. This is
typically the number dialed, however, it is possible this field contains the ANI digit string.

= Calling number. For the ANF2 MDII, the calling number is the automatic number identification (ANI) that was collected by an operator following a failure to receive ANI on an incoming centralized automatic message accounting (CAMA) trunk. Refer to the APP:MDII appendix in the Appendixes section of the Output Messages manual for a description of the ANF2 MDII.

= Number of MDII messages discarded since midnight. For example, if the number printed in this field is 2, then it indicates that two REPT:MDII messages were discarded (not printed) in that SM since midnight.

= Interval in minutes to count MDII messages.

= Threshold value of MDII messages met to generate the alarm.

= Origination point code (OPC). This field is printed only for both narrow band (DS0) and wideband (NxDS0) ISUP calls. This field will always contain the point code of the switch.

= Destination point code (DPC). This field is printed only for both narrow band (DS0) and wideband (NxDS0) ISUP calls. This field will always contain the point code of the far end switch.

= Circuit identification code (CIC). For a wideband call, this is the lowest CIC of a call. This field is printed only for both narrow band (DS0) and wideband (NxDS0) ISUP calls.

= Number of channel associated with a wideband call (N). This field is printed only for wideband (NxDS0) ISUP calls.

= Lowest affected CIC. The lowest CIC for which a reset circuit (RSC) or group reset (GRS) message has been received for a wideband call. This field is printed only for wideband (NxDS0) ISUP calls. This field is used exclusively for CRR and RST MDII.
n = Trunk unit number.

o = Channel board number.

p = Channel circuit number.

q = Number of affected channels. Number of channels for which a reset circuit or group reset message has been received for a wideband call. This field is printed only for wideband (NxD0) ISUP calls. This field is used exclusively for circuit reset reception (CRR) and reset (RST) MDII.

r = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

s = Data group (DG).

t = Synchronous transport signal (STS) facility number.

u = Virtual tributary group (VTG) number.

v = Digital signal level 0 (DS0) number.

w = Location routing number (LRN). A 10 digit number used to uniquely identify a switch or a switch/rate center that has ported numbers. Note that LRN is subject to digit prefixing and deleting (that is, sometimes it may contain fewer or more than 10 digits).

x = Local number portability (LNP) query indicator. Valid value:

DONE = LNP processing has been done.

y = Jurisdiction information parameter. This is the indication of geographic origination of the call. It represents NPA and NXX.

z = Terminating network selection code. This value is used for routing calls over MINT trunks.

a = SONET termination equipment (STE) facility number.

b = Virtual tributary member (VTM) number.

4. ACTIONS TO BE TAKEN

Refer to the APP:MDII appendix in the Appendixes section of the Output Messages manual for corrective actions. Analyze and detect possible faulty trunks.

5. ALARMS

Format 1 does not generate an alarm.

Format 2 generates either a minor or major alarm.

2. REASON FOR OUTPUT

To report machine-detected interoffice irregularities (MDIIs) that occur on trunks during a call set-up. This message
appears on the ROP and is also sent to the switching control center (SCC) to provide the trunk maintenance
package (TRUMP) with information concerning the performance of the switch.

Format 1 indicates a MDII for non-IP call has occurred.

Format 2 indicates a MDII for IP call has occurred.

Format 3 indicates a MDII for routing failure has occurred.
Format 4 Indicates a MDII for SIP call has occurred.

Format 5 indicates that an alarm has been generated due to the number of MDII messages output within an interval has met the threshold.

3. VARIABLE FIELD DEFINITIONS

NOTE: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a  = The MDII type reported on a trunk group. Refer to the APP:MDII appendix in the Appendixes section of the Output Messages manual for a list of MDIIs.

b  = Signaling type. Valid value(s):
   BICC  = Bearer independent call control.
   CCS  = CCIS6.
   DP  = Dial pulse.
   ISDN  = ISDN D-channel signaling.
   ISUP  = ISDN user part (ISUP).
   MF  = Multi-frequency.
   NULL  = No signaling.
   RPEO  = Revertive pulsing, end office.
   RPTO  = Revertive pulsing, tandem office.
   SIP  = Session initiation protocol.
   TT  = Touch tone.
   TUP  = International Telecommunication Union - Telecommunication, Standardization Sector (ITU-TS) (formerly CCITT) common channel signaling system 7 (CCS7) telephone user port (TUP) signaling.

c  = Service circuit. Valid value(s):
   LDSU=a1-b1-c1
   RVPT=a1-b1-c1-d1
   UTD=a1-b1-c1-d1
   UTG=a1-b1-c1-d1

d  = Trunk group and member number identification. For BICC MDII these values will represent the BICC group and normalized CIC.
e  = Trunk group size.

f  = Number of out-of-service (OOS) trunks in the trunk group counted against the automatic maintenance limit (AML). Note that this count is only for the switching module that reported the MDII. OP:AML input message can be used to get the AML data for the entire trunk group.

h  = Trunk supervision. Valid value(s):
   E&M  = 2-wire or 4-wire ear and mouth (E&M).
   RB  = Reverse battery.

For CCS trunks nothing will be printed.

i  = Time the report was prepared, in the form hours:minutes:seconds.
j = Trunk or digital equipment number. Valid value(s):
    DEN=a₁-e₁-f₁-g₁
    ILEN=a₁-h₁-i₁-j₁
    INEN=a₁-r₁-t₁-j₁
    NEN=a₁-r₁-s₁-a₂-t₁-u₁-b₂-v₁
    OIUN=a₁-i₂-j₂-k₂-t₁-u₁-b₂-v₁
    PLTEN=a₁-c₂-d₂-e₂-f₂
    SLEN=a₁-k₁-l₁-m₁
    TEN=a₁-n₁-c₁-o₁-p₁

k = Trial number.

l = Carrier flag. Valid value(s):
    ICB = Connect to a feature group B (FGB) carrier over a direct trunk.
    ICD = Connect to a feature group D (FGD) carrier over a direct trunk.
    NC = Connect not carrier-related.
    TICB = Connect to an FGB carrier over a tandem trunk.
    TICD = Connect to an FGD carrier over a tandem trunk.

m = Identifying number of the FGB or FGD interLATA or international carrier, if any. For FGB and FGD
    carrier, the number can be up to 4 digits.

n = Call direction. Valid value(s):
    ICT = Incoming trunk.
    OGT = Outgoing trunk.

o = Test call indicator. Valid value(s):
    NORMAL = Plain old telephone service (POTS) call.
    TEST = Test call.

p = Called number. This field indicates the digits outpulsed when the MDII was detected. This is
    typically the number dialed, however, it is possible this field contains the ANI digit string.

q = Calling number. For the ANF2 MDII, the calling number is the automatic number identification
    (ANI) that was collected by an operator following a failure to receive ANI on an incoming centralized
    automatic message accounting (CAMA) trunk. Refer to the APP:MDII appendix in the Appendixes
    section of the Output Messages manual for a description of the ANF2 MDII.

r = Number of MDII messages discarded since midnight. For example, if the number printed in this
    field is 2, then it indicates that two REPT:MDII messages were discarded (not printed) in that SM
    since midnight.

t = Interval in minutes to count MDII messages.

u = Threshold value of MDII messages met to generate the alarm.

v = Origination point code (OPC). This field is printed only for both narrow band (DS0) and wideband
    (NxDS0) ISUP calls. This field will always contain the point code of the switch.
w = Destination point code (DPC). This field is printed only for both narrow band (DS0) and wideband (NxDS0) ISUP calls. This field will always contain the point code of the far end switch.

x = Circuit identification code (CIC). For a wideband call, this is the lowest CIC of a call. This field is printed only for both narrow band (DS0) and wideband (NxDS0) ISUP calls. For a BICC call this value will represent a 32 bit CIC.

y = Number of channel associated with a wideband call (N). This field is printed only for wideband (NxDS0) ISUP calls.

z = Lowest affected CIC. The lowest CIC for which a reset circuit (RSC) or group reset (GRS) message has been received for a wideband call. This field is printed only for wideband (NxDS0) ISUP calls. This field is used exclusively for CRR and RST MDII.

a1 = Switching module number.

b1 = Local digit service unit number.

c1 = Service group number.

d1 = Digital service unit number.

e1 = Digital line and trunk unit (DLTU) number.

f1 = Digital facility interface number.

g1 = Channel number.

h1 = Integrated digital carrier unit (IDCU) number.

i1 = Remote terminal number.

j1 = Remote terminal line number.

k1 = Digital carrier line unit number.

l1 = Remote terminal number.

m1 = Remote terminal line number.

n1 = Trunk unit number.

o1 = Channel board number.

p1 = Channel circuit number.

q1 = Number of affected channels. Number of channels for which a reset circuit or group reset message has been received for a wideband call. This field is printed only for wideband (NxDS0) ISUP calls. This field is used exclusively for circuit reset reception (CRR) and reset (RST) MDII.

r1 = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

s1 = Data group (DG).

t1 = Synchronous transport signal (STS) facility number.
u^1 = Virtual tributary group (VTG) number.

v^1 = Digital signal level 0 (DS0) number.

w^1 = Location routing number (LRN). A 10 digit number used to uniquely identify a switch or a switch/rate center that has ported numbers. Note that LRN is subject to digit prefixing and deleting (that is, sometimes it may contain fewer or more than 10 digits).

x^1 = Local number portability (LNP) query indicator. Valid value(s):
DONE = LNP processing has been done.

y^1 = Jurisdiction information parameter. This is the indication of geographic origination of the call. It represents NPA and NXX.

z^1 = Terminating network selection code. This value is used for routing calls over MINT trunks.

a^2 = SONET termination equipment (STE) facility number.

b^2 = Virtual tributary member (VTM) number.

c^2 = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

d^2 = PCT facility interface (PCTFI) number.

e^2 = Tributary number (T1FAC).

f^2 = Channel number (CHAN).

g^2 = UNI4.0 cause indicator for BICC protocol. A hex value 0xabcd where a is the raw UNI4.0 coding standard value, b is the raw UNI4.0 location value and cd is the raw UNI4.0 cause value. For SIPTTO, SIPTSE, SIPTSD MDIIs, this field represents SIP call state. For CVN, CAI, EXD, VCA MDIIs on SIP signaling, this field represents what 4xx-6xx message was sent or received.

h^2 = Reason indicator for UNI4.0 related MDII types. The failure reasons include time out waiting for STATUS message, call mismatch on STATUS ENQUIRY procedure, UNI timer expired and RELEASE COMPLETE message received. For SIPTTO MDII, this field represents the timer type. (INVITE transaction timer, non-INVITE transaction timer, WAIT FOR UPDATE timer, WAIT FOR ACK timer) For SIPTSE MDII, this field represents the ISUP message type. For SIPTSD MDII, this field represents the reason for call failing.

i^2 = Optical interface unit (OIU) number.

j^2 = Protection group (PG) number.

k^2 = OC-3 STE number.

l^2 = User diagram protocol port number (0 - 65535).

m^2 = Message type. Valid value(s):
APM = Application transport message.
IAM = Initial address message.
INVITE = SIP invite message.
UPDATE = SIP update message.
CANCEL = SIP cancel message.
BYE = SIP bye message.
INFO = SIP information message.
ACK = SIP acknowledgement message.
INTERRUPT = SIP interrupt message.
PRACK = SIP provisional response acknowledgement message.
RECOVER = SIP recover message.
OPTIONS = SIP options message.
UNK-METHOD = Unknown message.

n^2 = Packet information type. Valid value(s):
BCTP = BCTP version indication.
TUNNELED = Tunneled protocol indicator.
SDP = SDP protocol version.
ORI NETWORK = Originating network type.
ORI ADDR = Originating address type.
CONN NETWORK = Connection network type.
CONN ADDR = Connection address type.
IPADDR = IP address.
SESS ATTR = Session attribute version.
MEDIA = Media announcement media.
TRAN = Media announcement transport.
TIME = Packetization time in milliseconds.
SIP-HEADER = SIP header.
INV_ISUP = Invalid ISUP version.
IP-ADDR = IP address and port.
SDP-VER = SDP version.
SDP-NET = SDP network.
SDP-NEDIA = SDP media type.
SDP-TRAN = SDP transport.
SDP-CODEC = SDP format codec ID.
SDP-INT = SDP packaging interval.
SIP-UNEXP-EVNT = Unexpected event.

o^2 = Packet information data. Valid value(s):
METHOD = If it is a SIPTSE MDII, an INVITE request was received and the ALLOW message header is missing a METHOD that the 5ESS® switch requires to be supported (where METHOD is either INVITE, UPDATE, CANCEL, INFO, BYE). An INVITE response was received with an ALLOW message header that was missing UPDATE method in its list of methods that are supported where variable 'm^2' is INVITE and variable 't^2' is 0 or blank. If it is a SIPTSD MDII, where "METHOD" is a string that identifies the method that the 5ESS® switch currently doesn't recognize. An unrecognized request was received where variable 'm^2' is UNK-METHOD.
No Matched Req = A response as indicated in variable 't^2' was received for a request indicated in variable 'm^2' and the dialog was not found. Variable 'm^2' is INVITE, UPDATE, BYE or CANCEL and variable 't^2' is 1xx, 2xx, or 4xx-6xx.
Unexpected ACK = An ACK was received unexpectedly where variable 'm^2' is ACK and variable 't^2' is 0 or blank.
Unexpected BYE = A BYE was received unexpectedly where variable 'm^2' is BYE and variable 't^2' is 0 or blank.
Bad Conn Add = Address type should be "IP". SDP mime failed screening in either REQUEST or
RESPONSE.

Bad Conn Net = Network type should be "IN". SDP mime failed screening in either REQUEST or RESPONSE.

Bad Direction = A response as indicated in variable 't^2' was received for a request indicated in variable 'm^2' in the wrong direction where variable 'm^2' is INVITE, UPDATE, BYE or CANCEL and variable 't^2' is either 1xx or 2xx.

Bad Encoding = An SDP Mime was received, but was encoded in a form that is not recognized. variable 'm^2' is INVITE or UPDATE and variable 't^2' is 1xx or 200.

Bad ISUP Vers = Invalid ISUP version was received. Valid values are ansi00, ansi88, and gr317. ISUP mime failed screening in either REQUEST or RESPONSE.

Bad Media = Media type is invalid. Valid value is audio. SDP mime failed screening in either REQUEST or RESPONSE.

Bad Origin Add = Address type should be "IP4". SDP mime failed screening in either REQUEST or RESPONSE.

Bad Origin Net = Network type should be "IN". SDP mime failed screening in either REQUEST or RESPONSE.

Bad SDP IP Form = The format of the IP address was incorrect. SDP mime failed screening in either REQUEST or RESPONSE.

Bad SDP IP Ran = IP address is out of range. SDP mime failed screening in either REQUEST or RESPONSE.

Bad SDP Port = SDP port is out of range. Valid ranges are 1024 to 65535 and even. SDP mime failed screening in either REQUEST or RESPONSE.

Bad SDP PTIME = Ptime value is invalid. Valid values are 10, 20, or 30. SDP mime failed screening in either REQUEST or RESPONSE.

Bad SDP Version = Valid value is 0. SDP mime failed screening in either REQUEST or RESPONSE.

Bad Sequence = A response as indicated in variable 't^2' was received for a request listed in variable 'm^2' that was out of sequence where variable 'm^2' was INVITE, UPDATE, BYE or CANCEL and variable 't^2' was 1xx, 2xx, or 4xx-6xx.

Bad SIP Version = A response as indicated in variable 't^2' was received for a request indicated in variable 'm^2' with incorrect SIP version. The correct SIP version is 2.0. Variable 'm^2' is INVITE, UPDATE, BYE or CANCEL and variable 't^2' is 1xx, 2xx, or 4xx-6xx.

Bad Trans Type = Transport should be "RTP/AVP". SDP mime failed screening in either REQUEST or RESPONSE.

Bad URI Scheme = An INVITE was received with an unsupported URI scheme. Valid values are TEL and SIP where variable 'm^2' is INVITE.

Incomplete RURI = An INVITE requests was received with an incomplete request URI. One of the values is either missing or "user" value is invalid. The only valid value for "user" field is "phone" where variable 'm^2' is INVITE and variable 't^2' is 0.

ISUP too large = ISUP MIME length exceeds 263 bytes. ISUP mime failed screening in either REQUEST or RESPONSE.

ISUP too small = ISUP MIME length has to be at least 1. ISUP mime failed screening in either REQUEST or RESPONSE.

Missing ISUP = A request/response was received without a mandatory ISUP MIME where variable 'm^2' is INVITE and variable 't^2' is 0, 1xx or 200.

Missing SDP = A request/response was received without a mandatory SDP MIME where variable 'm^2' is INVITE or UPDATE and variable 't^2' is 0, 1xx or 200.

Msg too long = A request was received that exceeded 2048 byte limit where variable 'm^2' is INVITE or UPDATE and variable 't^2' is 0 or blank.

No Contact Hdr = A mandatory header CONTACT was missing where variable 'm^2' is either INVITE or UPDATE and variable 't^2' is either 1xx or 200.
No Content Len = A mandatory header CONTENT LENGTH was missing where variable 'm2' is either INVITE, UPDATE, INFO or OPTIONS and variable 't2' is either 1xx or 200.

No G711 Codec = Invalid payload type. Valid value is 0 (G.711). SDP mime failed screening in either REQUEST or RESPONSE.

No ISUP Version = ISUP version is missing. ISUP mime failed screening in either REQUEST or RESPONSE.

No Max Forwards = A matched SIP request as indicated in variable 'm2' was missing a mandatory header MAX FORWARDS where variable 'm2' can be either INVITE, UPDATE, INFO or OPTIONS.

No Precond = Precondition Information was missing. SDP mime failed screening in either REQUEST or RESPONSE.

No precond tag = An INVITE request/response was received without a "Precondition" procedure listed in either the REQUIRE or SUPPORTED headers where variable 'm2' is INVITE and variable 't2' is 0, blank, or 183.

No SDP Time = The time interval is missing from the SDP session information. SDP mime failed screening in either REQUEST or RESPONSE.

No TO TAG = An INVITE response (other than 100) was received without a TO TAG where variable 'm2' is INVITE and variable 't2' is 18X, 200, 4xx-6xx.

SDP Addr Mismat = SDP IP address is different from the initial offer. SDP mime failed screening in either REQUEST or RESPONSE.

SDP Port Mismat = SDP port is different from the initial offer SDP mime failed screening in either REQUEST or RESPONSE.

Too Many Media = Only one media indication is allowed. SDP mime failed screening in either REQUEST or RESPONSE.

Unexp Response = A response to an unsupported METHOD was received where variable 'm2' is any SIP METHOD that the 5ESS® switch doesn't send, for example OPTIONS and variable 't2' is any value.

Unsup procedure = An INVITE request was received with an unsupported procedure listed in the REQUIRE header where variable 'm2' is INVITE and variable 't2' is 0, blank, or 183.

Unsup resp code = A 3XX INVITE was received. The 5ESS® switch does not currently support re-direction where variable 'm2' is INVITE and variable 't2' any 3xx.

Update not sup = A INVITE response was received with an ALLOW message header that was missing UPDATE method in it's list of methods that are supported where variable 'm2' is INVITE and variable 't2' is 183.

p^2 = Internet protocol address field.
q^2 = Routing type. Valid value(s):
MC = MFC routing.
NORMAL = Port hunt.

r^2 = Psootopn in routing index. Valid value(s):
FIRST = First in routing index.
LAST = Last in routing index.

s^2 = Routing index.
t^2 = SIP response code.
u^2 = IP address for SCTP near end.
v² = Port for SCTP near end.
w² = IP address for SCTP far end.
x² = Port for SCTP far end.
y² = SIP call ID.
z² = Local tag. Valid value(s):
a³-b³-c³-d³-e³

a³ = Global SM index.
b³ = Processor group in decimal.
c³ = Call processing SM in decimal.
d³ = Index of SIP map.
e³ = Process ID on the call processing SM.
f³ = Second identifying number of the FGB or FGD inter-LATA or international carrier.

4. ACTIONS TO BE TAKEN

Refer to the APP:MDII appendix in the Appendixes section of the Output Messages manual for corrective actions. Analyze and detect possible faulty trunks.

5. ALARMS

Format 1 does not generate an alarm.

Format 2 generates either a minor or major alarm.

6. REFERENCES

Input Message(s):

REPT:MEASUREMENTS

Software Release: 5E14 and later
Message Class: PLNT
Application: 5
Type: Output

1. FORMAT

REPT MEASUREMENTS (CLCT|PRINT) AUTO INH

2. REASON FOR OUTPUT

To report an automatic-inhibit action caused by either the print or memory usage exceeding the allocated amount for measurement reports.

3. VARIABLE FIELD DEFINITIONS

CLCT = The data collection allocation for the 30-minute traffic report had too many sections allowed; some were automatically inhibited.

PRINT = The output print allocation for measurements had too many reports or sections allowed; some were automatically inhibited.

4. ACTION TO BE TAKEN

Use the OP:MEASTAT or OP:ST-TRFC30 input message to request the status of either the PRINT or COLLECT allocation usage. If the status report indicates that the desired report or section is inhibited, choose a report (or section) which is not desired and inhibit it. Follow up with the appropriate ALW request to permit collection or printing of the desired report (section).

5. ALARMS

None.

REPT:METALLIC-A

Software Release: 5E14 only
Message Class: METACC
Application: 5
Type: Output

1. FORMAT

REPT METALLIC a
   DN=b-c [MLHG=d-e] [TKGMN=f-g] [h] [i]
   FILE=j   LINE=k
   TEST SOURCE: l   JOB TYPE=m [LTP TKGMN=f-g]
   n  .
   .

2. REASON FOR OUTPUT

To report the blockage, failure, or success of a metallic path setup request. This message is only printed if ALW:DEBUG,METALLMSG, ALW:DEBUG,METRESBLK, ALW:DEBUG,METSWBLK, ALW:DEBUG,METHWFAIL, or ALW:DEBUG,METSUCCESS has been entered.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a
   = Indicates the category of the failure. Valid value(s):
      HARDWARE FAILURE = The metallic path setup was unsuccessful because a hardware failure was detected. This category is activated by input message ALW:DEBUG,METHWFAIL or ALW:DEBUG,METALLMSG.
      RESOURCE BLOCKAGE = The metallic path setup was unsuccessful because a resource needed was in use, out of service, or unavailable. A resource needed for the metallic path was unavailable. This category is activated by input message ALW:DEBUG,METRESBLK or ALW:DEBUG,METALLMSG.
      SOFTWARE BLOCKAGE = The metallic path setup was unsuccessful because of a software or database problem. This category is activated by input message ALW:DEBUG,METSWBLK or ALW:DEBUG,METALLMSG.
      SUCCESSFUL SETUP = The metallic path setup completed successfully and used the listed metallic resources. This category is activated by input message ALW:DEBUG,METSUCCESS.

b
   = Telephone number.
c = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

d = Multi-line hunt group number.

e = Hunt group member number.

f = Trunk group number.

g = Trunk member number.

h = Equipment number. Valid value(s):

j = File name where problem detected.
k = Line number in file where problem detected.
l = Indicates where the metallic setup request, which was unsuccessful, originated from. Valid value(s):
   ALIT
   CSTL
   DCTU TO DFTAC
   IMLT DCTU
   TEST TRUNK
   TLWS DC JACK
   TLWS DCTU
   TLWS SLIM

m = Diode protocol test job type that failed. Valid value(s):
P1_2W = Protocol part 1 for 2-way connection.
P1_1W = Protocol part 1 for 1-way connection.
P2_2W = Protocol part 2 for 2-way connection.
P2_1W = Protocol part 2 for 1-way connection.
SLCPX_1W = SLC power cross via protocol circuit for 1-way connection.
P1_2W_NDP = Protocol part 1 for 2-way connection with no diode protocol towards terminating end.
SP1_1W = Shorted protocol part 1 for a 1-way connection.
SP1_2W_F1 = Facility 1 shorted protocol part 1 for a 2-way connection.
SP1_2W_F2 = Facility 2 shorted protocol part 1 for a 2-way connection.
P1_2W_TBCU = Part 1 of a 2-way TBCU open diode protocol where facility 1 is grounded on both tip and ring.
P2_2W_TBCU = Part 2 of a 2-way TBCU open diode protocol where facility 1 is open and facility 2 has a ground on both tip and ring.

Note: Part 1 of protocol contains the protocol circuitry self test, junctor and mtb power cross and continuity tests. Part 1 requires the diode relay at the far end of the mtb(s) to be closed. Part 2 of the protocol tests the metallic path to ensure that the far end diode-resistor's relay is actually open. Part 2 requires the diode relay at the far end of the mtb(s) to be open.

n = List of resources owned when failure or blockage occurred. Valid value(s):
ALIT=o-m^1-n^1-o^1
ORIG MTB=o-m^1-n^1-p^1-q^1
TERM MTB=o-m^1-n^1-p^1-q^1

o = Switching module (SM) number.
p = Access interface unit (AIU) number.
q = AIU line pack number.
r = AIU line circuit number.
s = IDCU number.
t = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.
u = RT line number or PUB43801 channel.
v = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
w = Line unit number.
x = Line group number.
y = Line card number.
z = Line board number.
a = Line circuit number.
b = Grid number.
c = Switch board number (LU1, LU2, or LU3).
d = Switch number.
e = Level number.
f = Digital carrier line unit number.
g = RT number.
h = RT line number.
i = Trunk unit number.
j = Service group number.
k = Channel board number.
l = Circuit number.
m = Metallic service unit number.
n = Service group number.
o = Metallic service unit board number.
p = Metallic access board number.
q = Metallic access test bus number.
r = MTIB number.
s = Scan point board number.
t = Distribute board number.
u = Subscriber line instrument measuring (SLIM) unit number.
v = Access interface unit (AIU) number.
\( w^1 \) = Line pack (LP) number.
\( x^1 \) = DCTU number.
\( y^1 \) = MAB board number.

4. ACTIONS TO BE TAKEN

Investigate the problem reported.

5. ALARMS

None.

235-105-220  Corrective Maintenance
REPT:METALLIC-B

Software Release: 5E15 and later
Message Class: METACC
Application: 5
Type: Output

1. FORMAT

REPT METALLIC a
   [DN=b-c] [MLHG=d-e] [TKGMN=f-g] [h]
   FILE=j   LINE=k
TEST SOURCE: l   [JOB TYPE=m] [LTP TKGMN=f-g]
   [n]
   .
   .
   .

2. REASON FOR OUTPUT

To report the blockage, failure, or success of a metallic path setup request. This message is only printed if
ALW:DEBUG,METALLMSG, ALW:DEBUG,METRESBLK, ALW:DEBUG,METSWBLK, ALW:DEBUG,METHWFAIL,
or ALW:DEBUG,METSUCCESS has been entered.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms
shown in the format.

a  = Indicates the category of the failure. Valid value(s):
   HARDWARE FAILURE = The metallic path setup was unsuccessful because a hardware failure was
detected. This category is activated by input message ALW:DEBUG,METHWFAIL
   or ALW:DEBUG,METALLMSG.
   RESOURCE BLOCKAGE = The metallic path setup was unsuccessful because a resource needed
   was in use, out of service, or unavailable. A resource needed for the metallic path
   was unavailable. This category is activated by input message
   ALW:DEBUG,METRESBLK or ALW:DEBUG,METALLMSG.
   SOFTWARE BLOCKAGE = The metallic path setup was unsuccessful because of a software or
database problem. This category is activated by input message
   ALW:DEBUG,METSWBLK or ALW:DEBUG,METALLMSG.
   SUCCESSFUL SETUP = The metallic path setup completed successfully and used the listed metallic
   resources. This category is activated by input message
   ALW:DEBUG,METSUCCESS.

b  = Telephone number.

c  = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1
   represents the lead line and a member number of 2 represents the associate line.

d  = Multi-line hunt group number.

e  = Hunt group member number.
f  = Trunk group number.
g  = Trunk member number.
h  = Equipment number. Valid value(s):
   AIUN=o-p-q-r
   ILEN=o-s-t-u
   INEN=o-v-t-u
   LCEN=o-w-x-y
   LCKEN=o-w-x-z-a
   LEN=o-w-b\textsuperscript{1}-c\textsuperscript{1}-d\textsuperscript{1}-e\textsuperscript{1}
   SLEN=o-f\textsuperscript{1}-g\textsuperscript{1}-h\textsuperscript{1}
   TEN=o-i\textsuperscript{1}-j\textsuperscript{1}-k\textsuperscript{1}-l\textsuperscript{1}
i  = Indicates the blockage or failure reason. Valid value(s):
   AC SCAN POINT TEST FAILURE
   ALL IDLE DCTUPORTS HAD OOS MTBS
   ALL JUNCTORS ON THE GDXC SHELF WERE IN USE OR OOS
   ALL JUNCTORS ON THE GIVEN SHELF AND SERVICE GROUP WERE IN USE OR OOS

UNKNOWN FAILURE/BLOCKAGE REASON

j = File name where problem detected.
k = Line number in file where problem detected.
l = Indicates where the metallic setup request, which was unsuccessful, originated from. Valid value(s):
   ALIT
   CSTL
   DCTU TO DFTAC
   IMLT DCTU
   TEST TRUNK
   TLWS DC JACK
   TLWS DCTU
   TLWS SLIM

m = Diode protocol test job type that failed. Valid value(s):
   P1_2W = Protocol part 1 for 2-way connection.
   P1_1W = Protocol part 1 for 1-way connection.
   P2_2W = Protocol part 2 for 2-way connection.
   P2_1W = Protocol part 2 for 1-way connection.
   SLCPX_1W = SLC power cross via protocol circuit for 1-way connection.
   P1_2W_NDP = Protocol part 1 for 2-way connection with no diode protocol towards terminating end.
   SP1_1W = Shorted protocol part 1 for a 1-way connection.
   SP1_2W_F1 = Facility 1 shorted protocol part 1 for a 2-way connection.
   SP1_2W_F2 = Facility 2 shorted protocol part 1 for a 2-way connection.
   P1_2W_TBCU = Part 1 of a 2-way TBCU open diode protocol where facility 1 is grounded on both tip and ring.
   P2_2W_TBCU = Part 2 of a 2-way TBCU open diode protocol where facility 1 is open and facility 2 has a ground on both tip and ring.

NOTE: Part 1 of protocol contains the protocol circuitry self test, junctor and mtb power cross and continuity tests. Part 1 requires the diode relay at the far end of the mtb(s) to be closed. Part 2 of the protocol tests the metallic path to ensure that the far end diode-resistor’s relay is actually open. Part 2 requires the diode relay at the far end of the mtb(s) to be open.

n = List of resources owned when failure or blockage occurred. Valid value(s):
   ALIT=o-m^l-n^l-o^1
   ORIG MTB=o-m^l-n^l-p^l-q^1
   TERM MTB=o-m^l-n^l-p^l-q^1
   GDXC=o-m^l-n^l-o^1
   PROTOCOL CIRCUIT PROTO=o-m^l-n^l
   MTB=r^1
   TBCU SCAN=o-m^l-n^l-s^1
   TBCU DIST=o-m^l-n^l-t^1
   PGTC MTB=o-m^l-n^l-p^l-q^1
SLIM=0-m\textsuperscript{1}-n\textsuperscript{1}-u\textsuperscript{1}

\textbf{o} = Switching module (SM) number.
\textbf{p} = Access interface unit (AIU) number.
\textbf{q} = AIU line pack number.
\textbf{r} = AIU line circuit number.
\textbf{s} = IDCU number.
\textbf{t} = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.
\textbf{u} = RT line number or PUB43801 channel.
\textbf{v} = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
\textbf{w} = Line unit number.
\textbf{x} = Line group number.
\textbf{y} = Line card number.
\textbf{z} = Line board number.
\textbf{a}\textsuperscript{1} = Line circuit number.
\textbf{b}\textsuperscript{1} = Grid number.
\textbf{c}\textsuperscript{1} = Switch board number (LU1, LU2, or LU3).
\textbf{d}\textsuperscript{1} = Switch number.
\textbf{e}\textsuperscript{1} = Level number.
\textbf{f}\textsuperscript{1} = Digital carrier line unit number.
\textbf{g}\textsuperscript{1} = RT number.
\textbf{h}\textsuperscript{1} = RT line number.
\textbf{i}\textsuperscript{1} = Trunk unit number.
\textbf{j}\textsuperscript{1} = Service group number.
\textbf{k}\textsuperscript{1} = Channel board number.
1^1 = Circuit number.
m^1 = Metallic service unit number.
n^1 = Service group number.
o^1 = Metallic service unit board number.
p^1 = Metallic access board number.
q^1 = Metallic access test bus number.
r^1 = MTIB number.
s^1 = Scan point board number.
t^1 = Distribute board number.
u^1 = Subscriber line instrument measuring (SLIM) unit number.
v^1 = Access interface unit (AIU) number.
w^1 = Line pack (LP) number.
x^1 = DCTU number.
y^1 = MAB board number.

Message Class: DSKSYS
Application: 5
Type: Output

1. FORMAT

REPT MHD CONFIGURATION
  MDCT   DEVICES
  a       MHD b [*]    [[MHD c] *]
  .
  .
  .
  d
  .
  .

2. REASON FOR OUTPUT

To report on the system's disk configuration. If it is non-standard, this message provides a periodic warning and is normally printed on the receive-only printer (ROP) approximately every 15 minutes.

3. VARIABLE FIELD DEFINITIONS

- a = A normal minor device configuration table (MDCT) form name.
- b = A moving head disk (MHD) that is related to the specified MDCT.
- c = A MHD that is also related to the specified MDCT.
- d = One or more lines of text explained as follows.
  AUTO MHD CONFIGURATION IS INHIBITED = Automatic MHD configuration for this office is inhibited office wide.
  AUTO MHD CONFIGURATION IS INHIBITED ON MHD(s) ... = The specified moving head disks (MHDs) have been blocked from automatic MHD configuration by manual input message.
  AUTO MHD CONFIGURATION IS NOT PERMITTED = The default state of automatic MHD configuration for this office is off.
  INDICATES RECONFIGURED MHD = MHDs with an asterisk ('*') are not associated with their normal MDCT form.
  WARNING SYSTEM NOT BOOTABLE = If the system takes a level 52 or higher recovery, it will likely not recover.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'd' =</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTO MHD CONFIGURATION IS INHIBITED ON MHD(s) ...</td>
<td>Verify that this is inhibited for a valid reason (for example, some procedure requires it to be inhibited). If not, allow it with the ALW-AUTOCFG input message.</td>
</tr>
<tr>
<td>AUTO MHD CONFIGURATION IS NOT PERMITTED</td>
<td>No action required.</td>
</tr>
</tbody>
</table>
If any non-spare MHDs are defective, repair or replace defective MHD(s). Restore MHDs to standard configuration when all the replaced MHDs have been repaired.

If either MHD 0 or MHD 1 is non-defective, use SW:MHD input message to configure one of them as a system primary disk. If both MHD 0 and MHD 1 are defective, repair or replace one of them immediately.

5. ALARMS

Minor if any MHD is reconfigured or if inhibited.

Major if system is not bootable.

[11] REPT MHD a GROWTH {FAILED|COMPLETED}

[12] REPT MHD a DEGROWTH {FAILED|COMPLETED}

[13] REPT MHD a OUT OF SERVICE

2. REASON FOR OUTPUT

To specify an error condition detected on a moving head disk (MHD).

3. VARIABLE FIELD DEFINITIONS

a = Unit number.

b Command completion status word in hexadecimal notation. The completion word is eight hex digits
in the form: \texttt{rrsstuvv}

c = Status, in hexadecimal notation. Refer to the APP:DFC-C appendix in the Appendixes section of the Output Messages manual.

d = Channel status, in hexadecimal notation. Refer to the APP:DFC-D appendix in the Appendixes section of the Output Messages manual.

e = Bus selector status, in hexadecimal notation. Refer to the APP:DFC-E appendix in the Appendixes section of the Output Messages manual.

f = Bus interface controller (BIC) status, in hexadecimal notation. Refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.

g = Bus interface controller status, in hexadecimal notation. Refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.

h = Mask.

i = Expected value of \texttt{g} after being masked with \texttt{h}.

j = Supplemental data for previous REPT:DKDRV message.

k = Fault code, in hexadecimal notation. Refer to the APP:DFC-I appendix in the Appendixes section of the Output Messages manual.

l = First word of an unidentifiable completion report.

m = Second word of an unidentifiable completion report.

n = Autonomous response special completion code (8 hex digits). The explanation of the hex digits is the same as the completion code described in variable \texttt{b}. The \texttt{u} hex digit provides the reason for the autonomous response. Refer to Table 3 in the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

r = Command completion code. Refer to Tables 1 and 2 in the APP:DFC-A appendix in the Appendixes section of the Output Messages manual.

s = Number of disk blocks read or written.

t = Device ID number.

u = Special completion code; valid only when \texttt{vv} is 00. Refer to Table 3 in the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

v = DMA job number (job ID).

4. \textbf{ACTION TO BE TAKEN}

Formats 1 - 12 indicate an error condition which could cause the removal of a unit.

Format 13 indicates that an MHD was found in an out-of-service state after an initialization. Any out-of-service unit should be repaired and restored to service. Additional messages may be output which provide useful data.

5. \textbf{ALARMS}
Formats 1 - 12 report no alarms.

Format 13 will report a minor alarm if MHD 14 or 15 (software backup disk) is found out of service, and a major alarm if other MHDs are found out of service, since failure to repair these disks could result in an outage if another initialization occurs.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[14] REPT MIRA INVALID UNIT ID IN DIAGNOSTIC ABORT REQUEST
   c d [e f]

[15] REPT MIRA INVALID MESSAGE COMMAND RECEIVED

[16] REPT MIRA a c d [e f] ABORT REQUESTED REASON h
2. REASON FOR OUTPUT

To report one of the following conditions encountered by the maintenance input request administrator (MIRA).

Format 1 indicates that all slots in the MIRA queue are taken.

Format 2 indicates that the unit control block (UCB) for the unit is reserved.

Format 3 indicates that MIRA could not change to a different UNIX® priority.

Format 4 indicates that MIRA could not to open the equipment configuration database (ECD) manager.

Format 5 indicates that the ECD manager failed to locate the top UCB for the request.

Format 6 indicates that the UCB for the requested unit was not found by the ECD manager.

Format 7 indicates that MIRA could not create a child process.

Format 8 indicates that a STOP input message has been received but there are no units queued.

Format 9 indicates that MIRA could not enable message reception.

Format 10 indicates that the message tag is invalid.

Format 11 indicates that an error in the message reception occurred.

Format 12 indicates that MIRA could not send a message to a process.

Format 13 indicates that MIRA could not connect to port 2.

Format 14 indicates that the UCB for the unit ID in a diagnostic abort was not found by the ECD manager.

Format 15 indicates that MIRA could not execute the input message in a message.

Format 16 indicates that an abort of an active diagnostic has been initiated by MIRA.

Format 17 indicates that the input message ALW:DMQ was entered while normal execution of diagnostics was allowed.

Format 18 indicates that the unit cannot be diagnosed or restored because it is a software device.

Format 19 indicates that there is no unit queued of the type requested in the STOP message.
Format 20 indicates that the UCB for the unit ID in the EX request was not matched, no action was taken.

Format 21 is the same as Format 2.

### 3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Type of input request.</td>
</tr>
<tr>
<td>b</td>
<td>System error number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.</td>
</tr>
<tr>
<td>c</td>
<td>Unit name.</td>
</tr>
<tr>
<td>d</td>
<td>Unit number.</td>
</tr>
<tr>
<td>e</td>
<td>Subunit name.</td>
</tr>
<tr>
<td>f</td>
<td>Subunit number.</td>
</tr>
<tr>
<td>g</td>
<td>Name of process in directory /diag/dgnc.</td>
</tr>
<tr>
<td>h</td>
<td>Reason code for the diagnostic abort. Valid value are:</td>
</tr>
<tr>
<td></td>
<td>0 = MML STP:DMQ input message was entered.</td>
</tr>
<tr>
<td></td>
<td>1 = Abort request received from the DMERT fault recovery process.</td>
</tr>
<tr>
<td></td>
<td>2 = Software diagnostic abort request was received.</td>
</tr>
<tr>
<td></td>
<td>3 = Operating system signal received by MIRA.</td>
</tr>
<tr>
<td></td>
<td>4 = Timeout message received from diagnostic timer (dgntimer) process.</td>
</tr>
</tbody>
</table>

### 4. ACTION TO BE TAKEN

For Format 1, wait until a slot is available (refer to the OP:DMQ input message) or remove a request from the queue. Refer to the STOP:DMQ or STP:DMQ input message. If problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 2 and 21, one of the following actions should be taken in the order given in the following Exhibit. If the problem persists, do the next action on the list:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Wait until the UCB is no longer reserved. The unit specified in the diagnostic request may be in use by another process. Both INIT:MHD (initialize moving head disk) and UPD:GEN (software release update) reserve units. Verify that these processes are not active. Retry the maintenance request.</td>
</tr>
<tr>
<td>2</td>
<td>Enter: RMV:unit=a; where unit is the unit name and a is the unit number from the original maintenance request. Retry the maintenance request.</td>
</tr>
<tr>
<td>3</td>
<td>Enter: AUD:ECDOWN=1 to run the ECD audit. Retry the maintenance request.</td>
</tr>
<tr>
<td>4</td>
<td>Enter: OP:STATUS:DATA,PROCESS,ALL;</td>
</tr>
</tbody>
</table>
Record the identifications for all processes named "ppdiamon," "cudiagc," "iodiag," and "dfdiag."

Enter:

\[ \text{STOP:EXC:DATA,ANY,PID=a;} \]

to kill these processes. Enter:

\[ \text{AUD:ECDOWN=1} \]

to run the ECD audit. Try the maintenance request again.

5. Repeat Step 4 using the following input messages:

Enter:

\[ \text{STOP:EXC:DATA,USER,PID=a,SIG=9;} \]

This generates a kill that cannot be caught or ignored. Use of this input message will result in the need to reinitialize ularp. INIT:ULARP will restart all monitored processes.

6. If problems persist, Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 3, MIRA can change its priority if it is spawned with an input message line parameter of \( prty=x \), where \(-39(\leq x(\leq 39 \). MIRA’s priority then becomes default priority minus 6x. When ‘x’ is negative, the priority increases. When ‘x’ is positive, the priority decreases. In no case will MIRA’s priority rise above 191 or go below zero. MIRA’s input message line can be found in the file /etc/ularpfile. The typical error causing this output will be an out-of-range input message line ‘prty’ value.

For Format 4, verify that the file /dev/ecd exists and the access permissions are correct.

For Formats 5 and 6, verify that a valid unit name was entered on the input request. Examine the UCB of the unit requested for correctness, using the recent change and verify input message RCV:M-BROWSE.

For Format 7, verify that process ‘\( g \)’ exists in the directory /diag/dgnc and is executable. This failure also occurs if insufficient swap space exists.

For Formats 8, 12, 14, 16 - 18, and 20, no action is required.

For Formats 9 and 13, no action is required. MIRA will terminate and be restarted by ULARP.

For Formats 10 and 11, if a manual input message preceded this message, retry the input message.

For Formats 15 and 19, if a manual input message preceded this message, retry the input message.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

235-105-220 Corrective Maintenance
235-105-210 Routine Operations and Maintenance
REPT: MKDSK

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT MKDSK PLEASE MOUNT NEXT TAPE IN SEQUENCE
   REMEMBER TO PLACE TAPE DROVE ONLINE
   TO RESTART TYPE MKSTART

[2] MKDSK STILL WAITING FOR NEXT TAPE IN SEQUENCE
   REMEMBER TO PLACE TAPE DROVE ONLINE
   TO RESTART TYPE MKSTART

2. REASON FOR OUTPUT

Format 1 reports that another tape should be mounted (multiple tapes are being read).
Format 2 reports that mkdsk has not terminated yet, and there is still a chance to mount the next tape.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

Mount the next tape in the sequence. If a user waits longer than five minutes before mounting the next tape, the
process will terminate and the procedure will have to be restarted.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

**REPT:MMGR001**

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5,3B  
**Type:** Output

1. **FORMAT**

   REPT MMGR001 BAD DKDRV STAT a

2. **REASON FOR OUTPUT**

   To report that the memory manager has received an acknowledgement message with an invalid response field from the disk driver. Legal responses are: success, failure, retry or bad message. The memory manager, not sure of how to proceed, will retry the Input/Output request.

3. **VARIABLE FIELD DEFINITIONS**

   a = Offending status code, in decimal notation.

4. **ACTION TO BE TAKEN**

   There is apparently a software coding error. Unless the condition causing the unusual return clears spontaneously, recovery in the field is remote. Submit an operational trouble report accompanied by the printout of this message.

5. **ALARMS**

   None.

   Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:MMGR002
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT MMGR002 EXCESSIVE RETRIES FOR I/O SWAP
SEGID a RETRIED b TIMES

2. REASON FOR OUTPUT

To report that the disk driver has returned a message status of 'retry' an unexpectedly large number of times. This message is repeated every 20 times a retry message is received until the Input/Output request is satisfied.

3. VARIABLE FIELD DEFINITIONS

a = Segment ID of the segment being swapped. (This might be useful in debugging.)
b = Number of times this was retried.

4. ACTION TO BE TAKEN

There is trouble in the disk driver. The swapping function of memory management is probably not working while this condition continues. Diagnose the moving head disk.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Output Appendix(es):
REPT:MMGR003

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT MMGR003 ADD [EXTENDED] MEMORY FAILED. AVAILABLE MEMORY = a PAGES
   ATTEMPTED TO GROW MEMORY TO b PAGES
   [MUST REGEN SYSTEM TO ADD MEMORY]

2. REASON FOR OUTPUT

To report that a request to make some added memory available for system use failed. Recent change/verify had requested that the memory manager make some added memory available for system use.

3. VARIABLE FIELD DEFINITIONS

   a = Amount of usable memory, in pages. One page equals 2048 bytes.
   b = Number of pages that recent change/verify attempted to make available for system use.

4. ACTION TO BE TAKEN

If recent change/verify attempts to increase the memory size beyond the maximum memory size specified during system generation, the memory manager will attempt to grow memory to 'a' pages (variable 'a' should equal the system generation specified maximum memory size). To increase this size, the system must be resysgened, and the administrative module (AM) rebooted to use the additional memory. However, if this is not desirable, then the system can be left to run with the original amount of memory.

If recent change/verify attempts to add memory beyond the physical size of memory the attempt will fail. For VLMM the physical size of memory is 32786; for EMM it is 16384; otherwise, it is 8192. This indicates a faulty recent change/verify request.

If 'b' is less than or equal to 'a', then a request was made to add memory with the memory size being equal to the old size or smaller. This could be caused by an error when entering recent change/verify commands.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Output Appendix(es):

APP: OMDB-X-REF
REPT:MMGR004
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT MMGR004 SWAP SPACE REQUEST FAILED
   AVAIL BLKS = b REQUESTED BLKS = a

2. REASON FOR OUTPUT

Swap disk space is allocated to new segments as they are created, and each segment must get contiguous blocks on the disk. This raises the possibility of fragmentation. That is, there might be enough free space for any given segment, but no single set of contiguous free blocks is large enough by itself. Instead of denying a space request immediately, the Memory Manager will attempt to re-arrange the disk space of existing segments. This can be done reasonably cheaply for all segments that happen to be in main memory at the time.

This message is produced when such a compaction has been done. However, the request that triggered the compaction could NOT be satisfied, even after the compaction.

3. VARIABLE FIELD DEFINITIONS

a = The size, in 512-byte disk blocks, of the failing request.

b = The size, in 512-byte disk blocks, of the largest free contiguous extent ("hole") after compaction.

4. ACTION TO BE TAKEN

If this message occurs, a request for swap space has been denied. This implies that some process was unable to function properly. Possible urgent action to be taken includes:
   - Request a more effective but more expensive compaction using the AUD:MMGR input message. This may be postponed until a time when the load is lighter.
   - If the message persists, more disk space may be required. This entails a regeneration of the system, and a re-boot.

Note: The automatic compaction will not be attempted, and this message will not appear, if the system is in a state of absolute swap disk overload (output message REPT SIMCHK 602 A6 has appeared).

5. ALARMS

[24] REPT MON_TRAP
   MTRP: CAN'T SEND RTR MSG; NO EBD OUTPUT; ERRNO = o
2. REASON FOR OUTPUT

To report the status of the message trap feature (as seen from the MON_TRAP process).

Note: MON_TRAP refers to the permanent message trap process at the administrative module (AM). EBD refers to the enhanced buffer dump process at the AM. The EBD process mentioned in this OM page is a child process of MON_TRAP.

For Format 1, a SET:TRAP input message was entered and processed successfully. When it was time to start the trap, MON_TRAP could not for the reason being displayed. Any trap entry belonging to this trap was removed from the message trap database.

For Format 2, a SET:TRAP input message was entered and processed successfully. When it was time to start the trap, an attempt was made to start the trap on all the given link nodes. However, one of the link nodes sent a negative acknowledgement back to the AM with the reason being displayed. Hence, MON_TRAP removed that link node from the list of link nodes belonging to this trap.

For Format 3, a SET:TRAP input message was entered and processed successfully. When it was time to start the trap, an attempt was made to start the trap on all the link nodes specified in the SET:TRAP input message, but MON_TRAP was not able to start a trap on one or more of the given link nodes. This format gives a listing of the nodes that MON_TRAP fails to start the trap on. The trap would have started on the remaining nodes.

For Format 4, a SET:TRAP input message was entered and processed successfully. MON_TRAP was able to start the trap successfully on one or more of the link nodes specified in the SET:TRAP input message. The trap is in an active state.

For Format 5, a trap has gone to completion gracefully. One of the completion criteria (that is, message count and duration) has been satisfied. The trap is in a completed state.

For Format 6, a trap and its trap entry have been removed from the message trap database. Its trapped results, if any, have been lost. For instance, this will occur when a completed, aborted or terminated trap has been on the message trap database for more than 24 hours.

For Format 7, a trap has terminated with the reason of termination being displayed. The trap is in a terminated state.

For Format 8, a trap has aborted with the reason of termination being displayed. The trap is in an aborted state.

For Format 9, MON_TRAP has removed the last link node from the list of link nodes belonging to this trap due to the
reason being displayed, thereby causing the trap to abort.

For Format 10, during a status check procedure, MON_TRAP found that the trap ID recorded in the link node was
different from the trap ID recorded for that link node in the message trap database at the AM. MON_TRAP then
aborted the trap.

For Format 11, a SET:TRAP input message was entered and processed successfully. When it was time to start
the trap, an attempt was made to start the trap on all the link nodes specified in the SET:TRAP input message.
MON_TRAP expects acknowledgements from all the link nodes within certain time interval. MON_TRAP will remove
those link nodes that give no acknowledgements or negative acknowledgements from the list of the link nodes
belonging to this trap. The trap should have started on the remaining nodes. If all nodes give no or negative
acknowledgements, MON_TRAP will abort the trap. This format gives a summary of the condition when
MON_TRAP does not receive any acknowledgement from one or more of the given link nodes.

For Format 12, any trap on a node will be disabled when the node has gone from an in-service (IS) state to an
out-of-service (OOS) state. This format results when MON_TRAP found that one or more link nodes, which was
supposed to have trap on, had gone from IS to OOS at least once during the previous one-minute interval.

Format 13 prints when one of the link nodes belonging to a trap was removed from the trap for the reason displayed.

Format 14 prints when a link node with trap on has sent an abort trap message along with a reason to the AM.
MON_TRAP then removes the link node from the list of link nodes belonging to the trap. The reason is printed.

Format 15 prints when an OP:TRAP input message with ID given is being processed and MON_TRAP finds that all
the trapped results belonging to the specified trap have been overwritten. The number of lost trapped messages,
that belonged to this trap, is printed.

Format 16 prints when an OP:TRAP input message with ID given was being processed and MON_TRAP found that
some of the trapped results belonging to the specified trap have been overwritten. The number of lost trapped
messages, that belonged to this trap, is printed. The remaining trapped messages should have been displayed.

Format 17 prints when all the message trap incore buffers become unavailable at the AM. These incore buffers are
used for collecting trapped results before the results are written to the disk file for long term storage. This condition
may be due to a high volume of trapped results, not expected to be handled by this tool, being sent to the AM in a
short interval. Hence, MON_TRAP aborts all the traps to stop the excessive incoming traffic.

Format 18 prints when the overwrite option has been disabled and the disk file has been filled with trapped results.

Format 19 reports the percentage usage of the disk file.

Format 20 prints when an application of the message trap feature has tuned one of the application tunable
parameters to a value larger than the internal limit allowed by the feature. The value of the parameter is then set to
the value of the internal limit that is displayed in this format.

Format 21 prints when an error occurs in the real-time display of trapped results. Part of the results to be displayed
is lost.

Format 22 prints when an unexpected UNIX® RTR operating system signal is received by MON_TRAP.

Format 23 prints when MON_TRAP aborts. Other message formats may precede this format to explain the reason
why MON_TRAP has aborted.

Format 24 prints when MON_TRAP cannot send any a UNIX® RTR operating system message to enhanced buffer
dump (EBD) due to the unavailability of RTR buffers. Since EBD is responsible for printing out the trap information
and results, no output is expected from EBD because MON_TRAP cannot instruct EBD regarding the output of trap
information and results.
Format 25 prints when the following scenario occurs. Before MON_TRAP sends a UNIX® RTR operating system message to EBD, it checks if EBD exists. If yes, MON_TRAP will build the UNIX® RTR message and send it out. EBD is then killed for some reason during this time frame when MON_TRAP is building the UNIX® RTR message.

Format 26 prints when MON_TRAP cannot execute the EBD object module using the UNIX® RTR operating system call "execl()".

Format 27 prints when MON_TRAP cannot find enough contiguous disk space in the system. Normally, MON_TRAP uses the UNIX® RTR operating system call "falloc()" to create the disk file, which contains the contiguous disk space, at the appropriate directory. Message trap cannot carry out its normal trapping activities without enough contiguous disk space.

For Format 28, this output results when a System 7 link node performs an automatic data dump. The MON_TRAP process receives this data and writes it to the file /etc/log/LNDMP_DATA.

3. VARIABLE FIELD DEFINITIONS

a = Trap identification number.
b = Reason for not starting the trap. Valid values are:

   ALL LN OCCUPIED
   ALL LN OOS OR OCCUPIED
   TOO MANY ATTRIBUTES
   TRAPPING ON MORE THAN s LINKS

c = Number of link nodes.
d = Ring node address.
e = Trap ID recorded at the AM.
f = Status of traps. Valid values are:

   MTRP: TRAP ABORTED DUE TO NO ACK; ID = a
   MTRP: TRAP SET ON REMAINING c NODE(S); ID = a

g = Number of messages lost. Valid values are:

   ALL = Number of messages lost = number of messages collected.
   SOME = Number of messages lost = number of messages collected minus the number of messages printed.

h = Percentage use of disk space.
i = Overwrite status. Valid values are:

   OVERWRITE ENABLED = Disk file overwrite is enabled.
   OVERWRITE DISABLED = Disk file overwrite is disabled.

j = Maximum parameters. Valid values are:

   MAX DUR (MINUTES) = Maximum duration.
   MAX MGSZE (BYTES) = Maximum message size.
   MAX MCNT = Maximum message count.

k = UNIX® RTR operating system signal .
l = Reason used in abort trap message or negative acknowledgement message from link node. Valid values are:

   1 = A different trap is already running.
   2 = Same trap is already running.
   3 = Ring write for a response failed.
= Ring write for a report message failed.
* = Command's trap ID not matching node's.
* = Node state is same as the command received.
* = Undefined command.
* = Message trap buffer unavailable.
* = XMIT mbox level 1 or higher congestion.
* = Real-time level 1 or higher overload.
* = IMS ring receive buffer (RRB) level 1 or higher congestion.
* = Ring peripheral control (RPC) level 1 or higher congestion.
* = Trap buffer at node congested.
* = Received a AM returned message.
* = Received a source-matched msg.
* = RCV mbox level 1 or higher congestion.

\[ m \] = Reason for removal of a link node from trap. Valid values are:
1 = Link node been through a state transition.
2 = Received an abort_trap message from link node.
3 = Received a returned message destined to link node.
4 = Received an SRC-matched message destined to link node.
5 = Link node occupied by other trap.
6 = Status check indicates link node has aborted trap.
7 = Have not received acknowledgement (of start_trap) from link node.
8 = Received a negative acknowledgement (of start_trap) from link node.

\[ n \] = Reason for termination. Valid values are:
0 = Unspecified.
1 = The trap has gone to completion gracefully (due to message count).
2 = The trap has gone to completion gracefully (due to duration).
3 = User initiated STOP:TRAP.
4 = Inhibited for too long; abort trap.
5 = Resource problem at the AM.
6 = Frequency of disk write at the AM exceeds threshold.
7 = Disk space exhausted in "no overwrite" mode.
8 = MTRP incore buffers unavailable during disk_write.
9 = CNI level 1 initialization has occurred.
10 = Trap aborted at all concerned link node(s); due to resource or congestion.
11 = All concerned link nodes are OOS.
12 = All concerned link nodes are either OOS or have aborted the trap.
13 = Problem occurred during status check or audit.

\[ o \] = UNIX® RTR error number given when a UNIX® RTR operating system call fails.
\[ p \] = Path and file name of the message trap contiguous disk file.
\[ q \] = Trap ID recorded at the node.
\[ r \] = Trap state. Valid values are:
0 FRE = Trap entry is free (not a trap state)
1 ACT = Trap is active
2 PND = Trap has never been started; pending to be activated
3 INH = Trap has been started; is inhibited
4 CMP = Trap has gone to completion as specified in message count/duration
5 ABT = Trap has been aborted prior to the specified completion criteria due to congestion/resource/node_removal problems at link nodes or resource problem at AM

UNIX® is a registered trademark of Sun Microsystems, Inc.
= Trap has been explicitly terminated prior to the specified completion criteria by a
STOP:TRAP input message

s = Maximum number of links allowed to be trapped on at any time.

4. ACTION TO BE TAKEN

Note: Some actions require more specific knowledge than others. In these instances the user should refer
to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages
manual.

For Format 1,

<table>

</tr>
<tr>
<td></td>
<td>parameters given in the SET:TRAP input message exceeds that limit. Reduce the number of</td>
</tr>
<tr>
<td></td>
<td>input parameters given in the SET:TRAP input message.</td>
</tr>
<tr>
<td>TRAPPING ON MORE THAN xx LINKS</td>
<td>Maximum number of links that can have trap on at any time has been reached (including this</td>
</tr>
<tr>
<td></td>
<td>trap). Attempt to:</td>
</tr>
<tr>
<td></td>
<td>- Retry SET:TRAP input message with fewer links.</td>
</tr>
<tr>
<td></td>
<td>- Use STOP:TRAP input message to stop any unwanted active or inhibited trap.</td>
</tr>
<tr>
<td>ALL LN OOS</td>
<td>All the link nodes of the links specified in the SET:TRAP input message are out of service.</td>
</tr>
<tr>
<td>ALL LN OCCUPIED</td>
<td>All the links specified in the SET:TRAP input message are occupied by other traps.</td>
</tr>
<tr>
<td>ALL LN OOS OR OCCUPIED</td>
<td>Message is self-explanatory. Refer to previous two items.</td>
</tr>
</tbody>
</table>

For Formats 2, 8-11, 13, 14, 18, message is self-explanatory take appropriate action.

For Formats 3-7, 12, 15, 16, 17, 19, 20, 23, 25, no action is required.

For Format 21, the condition may be due to a relatively high rate of incoming trapped results for this trap which has
real-time display on. The message trap real-time display print buffers may become unavailable or EBD is not able to
output the trapped results as fast as the trapped results are given to it. May consider turning off the real-time display
mode.

For Formats 22 and 24, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the
Output Messages manual.

For Format 26, check if the object module of the process EBD is in the correct directory; if yes, check if it is executable.

For Format 27, check if the appropriate directory has been created for the disk file that is supposed to contain the
contiguous disk space; and check if enough contiguous disk space has been partitioned (or allocated) for the file
system related to the directory. If there is no directory but there is enough contiguous disk space in the file system,
create the directory and kill the MON_TRAP process which will then be re-created by the CNIINIT process. If there
is not enough contiguous disk space in the filesystem, partition enough contiguous disk space (may need to initialize
CNI). Initializing the CNI causes call processing downtime. Proper consideration should be taken before this is done.

Type: Output

1. FORMAT

REPT MOP CANNOT UNMOUNT DEVICE a ERROR = b

2. REASON FOR OUTPUT

To report that the process mop is unable to unmount the off-line partition mounted as device a due to error 2b.

3. VARIABLE FIELD DEFINITIONS

a = Name of device.

b = Error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If mop is unable to unmount device 'a' because a file on the device is open (busy), close the file and mop will unmount device 'a' approximately two minutes after most recent report time.

If mop is unable to unmount the device due to an input/output error, kill the current mop process before executing a Format 2 MOP message as documented in administrative module (AM) messages.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

1. FORMAT

REPT:MRVR
   a [b]
   c

2. REASON FOR OUTPUT

To report the receipt of an unexpected message transfer part (MTP) route verification test (MRVR) message. The output will be directed to the standard output associated with the initiator of the test, and also to those specified for the MTCE message class. If they are the same device, only one printout will occur.

3. VARIABLE FIELD DEFINITIONS

   a = Text phrase based on the information received in the MRVR message. Valid value(s):

   EXCESSIVE LENGTH ROUTE
   LOOP
   INACCESSIBLE SIGNALING POINT
   STPS CROSSED - SIGNALING TRANSFER POINTS CROSSED
   TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS
   TIMER EXPIRED
   UNKNOWN ERROR CODE
   UNKNOWN INITIATOR POINT CODE
   UNKNOWN TERMINATOR POINT CODE

   b = Error number. Note that if 'a' is STPS CROSSED, this item will not be included in the output message. Valid value(s):

   1 = Detected loop.
   2 = Excessive length route.
   3 = Unknown resource instance.
   4 = Route inaccessible.
   5 = Processing failure.
   6 = Unknown initiating signaling point (SP).
   7 = Timer expired.

   c = Point code(s) associated with the failure being reported. Valid value(s):

2. **REASON FOR OUTPUT**

   To report the occurrence of a Message Service System (MSS) trap. This message is in response to the input message SET:DSE.

3. **VARIABLE FIELD DEFINITIONS**

   a = The event trapped. Valid value(s):
      MSFAILRCVD = The trap includes a reject message or a return error message received at the "Client's Switch/VM's Switch" from the "VM's Switch/Client's Switch" respectively.
      MSFAILSENT = The trap includes a reject message or a return error message sent to "Client's Switch/Voice Message System's (VM) Switch" from the "VM's Switch/Client's Switch" respectively.
      MSQRYFAIL = The trap includes a returned query received at the near switch, a time out received in the MSS or failure to send the query.

   b = The subclass of the event trapped. Valid value(s):
      REJECT = This is either a MSFAILSENT or MSFAILRCVD trap and it occurs when a reject message is received at or sent from the switch.
      RERR_MSG = This is either a MSFAILSENT or MSFAILRCVD trap and it occurs when a return error message is received at or sent from the switch.
      RTRN_QRY = This is a type of MSQRYFAIL trap and it occurs when a returned query is received at the near switch or failure to send a query.
      TIMEOUT = This is a type of MSQRYFAIL trap and it occurs when a time out is received in MSS.

   c = Client's ten-digit directory number (DN) associated with the event.

   Note: If 'a' is MSQRYFAIL and 'b' is TIMEOUT then no other reasons are applicable.

   d = Additional data associated with the trapped event. Valid value(s):
      BADLY STRUCTURED COMPONENT PORTION
      BADLY STRUCTURED TRANSACTION PORTION
      DUPLICATE INVOKE ID

\( e \) = The decimal value of the inter-switch voice message (ISVM) subsystem number.

\( f \) = The hexadecimal value of the service transfer point (STP) point code.

\( g \) = The type of activation request made. Valid value(s):
- ACTIVATE = Message lamp is activated.
- DEACTIVATE = Message lamp is deactivated.

\( h \) = Processor where the event was trapped. If 'a' is MSQRYFAIL and 'b' is TIMEOUT then 'h' will be blank. Valid value(s):
- CNI = The event was trapped on a common network interface (CNI) platform.
- GSM = The event was trapped on a packet switching unit (PSU) platform but was unable to obtain the global switch module (GSM) number, missing or bad data.
- GSM=i = The event was trapped on a PSU platform, where 'i' is the number of the GSM where the event was trapped.

__________________________________________________________________

2. REASON FOR OUTPUT

To report that the interprocessor message switch (IMS) fault report measurement process (MSDC) has encountered a hardware or software fault.

3. VARIABLE FIELD DEFINITIONS

a = Hexadecimal number that is the sum of the codes for all UNIX® RTR operating system events outstanding for the IMS measurement process.
b = UNIX® RTR operating system fault code.
c = If a value is present, then the IMS measurement process was in execution at this virtual address when the fault was encountered.
d = Hexadecimal values contained in administrative module (AM) control unit (CU) register R0.
e = Hexadecimal values contained in AM CU register R7.
f = Hexadecimal values contained in AM CU register R8.

4. ACTION TO BE TAKEN

If the fault is not attributed to a hardware problem, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

Minor alarm.

2. REASON FOR OUTPUT

To provide information about the type and source of an error that occurred in the message switch (MSGS) and the resulting level of recovery. Additional output messages (of various types) may be printed to provide detailed data about the error.

3. VARIABLE FIELD DEFINITIONS

a = MSGS side.
b = MSGS environment where the error occurred. Valid value(s):
   AP = Application processor.
   IP = Input/output processor.
   AP-CMP = Application processor with in service Communication module processor (CMP).
c = Software recovery level. Valid value(s):
   RPI = Return to point of interrupt.
   SPP = Single process purge if CMP is in service
   OSR = Operational software restart.
   REL = Raise error level.
   PGI = Purging initialization.
   SI = Selective initialization.
   FI = Full initialization.
   UNK = Unknown recovery level.
d = MSGS event number (associated with the environment specified in field "b").
e = Termination status. Valid value(s):
   ABORTED = Processing of the event did not complete before being interrupted by another stimulus.
   COMPLETED = Processing of the event was completed.
f = Exception vector number.
g = Time when the event occurred, in the form minutes:seconds.tenths of a second.
### Error Type Description

- **h**: Error type description.
- **i**: Failing address.
- **j**: Type of memory associated with failing address. Valid values:
  - 860IO = MPC860 memory-mapped internal I/O space.
  - ALT-ROM = Alternate read-only or flash memory space.
  - CMD-ONLY = Command only space.
  - DRAM = Dynamic random access memory (DRAM) space.
  - IO = Asset memory-mapped I/O space.
  - IP-DRAM = IP DRAM mirrored memory space.
  - IP-NETROM = IP NetROM mirrored memory space.
  - JTAG = Boundary scan master memory space.
  - MATE-DRAM = Mate DRAM space.
  - MATE-IO = Mate asset memory-mapped I/O space.
  - MATE-IP-DRAM = Mate IP DRAM mirrored memory space.
  - MATE-IP-NETROM = Mate IP NetROM mirrored memory space.
  - MATE-PCI = Mate memory-mapped peripheral component interconnect (PCI) bus space.
  - MATE-TEXT = Mate DRAM text space.
  - NETROM = NetROM memory space.
  - PCI = Memory-mapped PCI bus space.
  - PCI-MAP = PCI map register space.
  - RESET-CTRL = Reset control register space.
  - ROM = Read-only or flash memory space.
  - TEXT = Text space.
  - UNK-MEM = Unknown memory space.

### Currently Executing Background Job

- **k**: Currently executing background job when the CMP is not in-service. Valid values:
  - AU = Audits.
  - CM = Communication package (CM).
  - DGN = Diagnostics.
  - FLASH = Flash update.
  - INIT = Initialization.
  - OE = Operational environment (routine maintenance work).
  - PPC = Pump peripheral controller.
  - PPC-IIA-AUDIT = Pump peripheral controller inhibit interrupt administrator audits.
  - PPC-MTCE = Pump peripheral controller maintenance.
  - RHS = Routine hashsum checks.
  - SI = System integrity.
  - SMMS = Switch maintenance.
  - UNK = Unknown.

### Currently Executing Foreground Job

- **l**: Currently executing foreground (one millisecond interrupt) job. Valid values:
  - CMP = Communication module processor.
  - FPC = Foundation peripheral controller.
  - MMP0 = Module message processor 0.
  - MMP1 = Module message processor 1.
  - MSCU = Message switch control unit.
  - NONE = No functionality is active.
  - PPC = Pump peripheral controller.
QGP = Quad-link gateway processor.

m = Currently executing CM job. Valid value(s):
   ACTIVE = CM software is executing but the specific task cannot be determined.
   BASE = CM foreground software is executing but the specific task cannot be determined.
   BP AP-TO-IP = Accessing AP to IP base priority message queue.
   BP IP-TO-AP = Accessing IP to AP base priority message queue.
   BG-TO-FG = Accessing background to foreground message queue.
   ENET-RECV = Ethernet link receive.
   ENET-TRANS = Ethernet link transmit.
   FG-TO-BG = Accessing foreground to background message queue.
   HP AP-TO-IP = Accessing AP to IP high priority message queue.
   HP IP-TO-AP = Accessing IP to AP high priority message queue.
   MMP0-RECV = MMP0 CLNK (CM3) is receiving.
   MMP0-TRANS = MMP0 CLNK (CM3) is transmitting.
   MMP1-RECV = MMP1 CLNK (CM3) is receiving.
   MMP1-TRANS = MMP1 CLNK (CM3) is transmitting.
   NONE = No active CM job.

n = QLPS network.

o = Logic link control bus index.

p = Specifies the direction of the message being processed at the time of the assert or fault. Valid value(s):
   RCV = In the state of processing a message received from the network.
   SND = In the state of sending a message to the network.

q = End point number.

r = ONTC side at the far end of the control and diagnostic access link (CDAL) for which CM is currently performing work. This field is only applicable to the MSGS-AP environment.

s = CDAL message transport direction. Valid value(s):
   CDAL RCV = CDAL messages are being received.
   CDAL SND = CDAL messages are being sent.

t = Process number of the running background (BG) process. This information is provided only when the CMP is in-service.

u = Uniqueness of the running background process. This information is provided only when the CMP is in-service.

v = The running background process address. This information is provided only when the CMP is in-service.

w = The recovery action taken. This information is provided only when the CMP is in-service. Valid value(s):
   blank = No recovery action taken because the target was not active.
   PURGED = The single target job or process was purged.
RPI = Return to the point of interrupt.

x = Interject state. Valid value(s):
BASE = Communication package.
BCST = Message broadcast.
CICO = CMP integrity control.
CTST = Communication test processing.
DD = Data delivery.
INTMON = Integrity monitor.
NONE = Interject was not running.
PC = Peripheral network control.
PR = Packet routing.
PS = Packet switching.
RTA = Routing and terminal allocation.

y = Mode of the communication module processor operation (in the order of occurrence). Valid value(s):
CONSISTENT = HW/SW consistent.
ESSENTIAL = Essential jobs operational.
NORMAL = Normal.
OFFFULL = Operational jobs operational.
RAMDYN = All dynamic memory consistent.
RAMTXT = Text and data consistent.
RAMWP = All write protected memory consistent.
SYSPROC = All system processes initialized.
UNKNOWN = No RAM available.

4. ACTIONS TO BE TAKEN
None.

5. ALARMS
None.

6. REFERENCES
Output Message(s):

REPT:MSGS-RDE
REPT:STACK-FRAME
REPT:STACK-TRACE

Other Manual(s):
235-105-220 Corrective Maintenance Procedures
REPT:MSGS-HF

**Software Release:** 5E15 and later  
**Message Class:** MSGS  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   REPT MSGS=a ENV=b HASHSUM FAILURE [AM-EVENT=c]  
   FAILING ADDRESS RANGES:  
   [d]  
   e f  
   . .  
   . .  

2. **REASON FOR OUTPUT**

   To notify the user that hashsum checks of the message switch (MSGS) processor memory failed. Hashsum checks are made during message switch processor pump (automatic or manual) and routinely.

   Failure of hashsum checks may indicate that the hashsum tables are in error, or it may be that the memory is bad. The address ranges for the blocks that had bad hashsums are provided.

3. **VARIABLE FIELD DEFINITIONS**

   a = MSGS side.  
   b = Environment in which the stimulus occurred. Valid value(s):  
       AP = Application processor.  
       IP = Input/output processor.  
       APDGN = Application processor, diagnostics image.  
       IPDGN = Input/output processor, diagnostics image.  
   c = The AM event number.  
   d = Total number of failing ranges only used during an MSGS pump if more than 5 failing ranges.  
   e = Starting address of the range.  
   f = Ending address of the range.

4. **ACTIONS TO BE TAKEN**

   Investigate the cause of the failure. It may be the result of a bad memory or a bad hashsum table. Make any necessary repairs. This condition may prevent the MSGS from going duplex.

   If replacing the boards does not clear up the problem, there might be a difference between the ACTIVE memory and the hashsum table. It is very likely that the memory hashsums do not agree with the hashsum table. Resolve any differences between the memory and the hashsum table. This problem can occur when certain utility commands are used that change the contents of memory, but not the hashsum table. Refer to the LOAD:UT-MSGS input manual page for additional information.
It is possible for a MSGS restoration to succeed even when the MSGS is reporting hashsum failures when the failures are in certain ranges. That is, a MSGS restoration does not check all memory. If the MSGS has ranges failing that are not in the set of memory checked, a restoration may succeed.

2. REASON FOR OUTPUT

All of these reports provide information about specific Message Switch (MSGS) hardware registers for trouble analysis. These messages are automatically generated by the system when a fault is detected. The messages can
be correlated with REPT:MSGS-ELE output messages by using the MSGS event number.

Format 1 provides information about specific MSGS hardware Application Processor (AP) registers.

Format 2 provides information about specific MSGS hardware Input/Output Processor (IP) side registers.

Format 3 provides information about specific memory management unit (MMU) hardware registers.

Format 4 provides information about specific MSGS synchronous protocol data formatter Chip-256 (SPYDER-256) hardware registers.

Format 5 provides information about specific MSGS duplex dual bus interface controller (DDBIC) pump and control message advancement node (PACMAN) hardware registers.

Format 6 provides information about specific MSGS ethernet controller, AM79C972, hardware registers.

Format 7 provides information about specific MSGS pump and control message advancement node (PACMAN) hardware registers.

Format 8 provides information about specific MSGS synchronous protocol data formatter chip-256 (SPYDER-256) phase lock loop (PLL) hardware registers.

3. VARIABLE FIELD DEFINITIONS

a = MSGS side.

b = MSGS environment where the error occurred:
   AP = Application processor.
   IP = Input/output processor.
   AP–CMP = Application processor with in-service communication module processor (CMP).

c = MSGS event number.

d = SPYDER-256 number. Valid value(s):
   SPYDER-256 0 = SPYDER-256 number 0.
   SPYDER-256 1 = SPYDER-256 number 1.
   SPYDER-256 2 = SPYDER-256 number 2.
   SPYDER-256 3 = SPYDER-256 number 3.

e = Ethernet controller number. Valid value(s):
   0
   1

f = Contents of the register. Register definition:
   ACTRL = Asset control register.
   AID = Asset identification register.
   AP_CAR = Peripheral component interconnect (PCI) configuration address register.
   AP_CDR = PCI configuration data register.
   APCTL = Application control register.
   APSAR0 = Shadow address 0 register.
   APSAR1 = Shadow address 1 register.
   APSHDH = Shadow high data register.
APSHDL = Shadow low data register.
APSOR = Shadow operation register.
APSTAT = Application status register.
BCR = Bus control register.
CHLLERR = Channel linked list error information register.
CCLOSS = Channel cache loss register.
CSR0 = Controller status and control register
CSR3 = Interrupt masks and deferral control register.
CSR4 = Test and features control register.
CSR5 = Extended control and interrupt 1 register.
CSR7 = Extended control and interrupt 2 register.
DABR = Data address breakpoint register.
DAR = Data address register.
DBAT0L = Lower data block address translation register 0.
DBAT0U = Upper data block address translation register 0.
DBAT1L = Lower data block address translation register 1.
DBAT1U = Upper data block address translation register 1.
DBAT2L = Lower data block address translation register 2.
DBAT2U = Upper data block address translation register 2.
DBAT3L = Lower data block address translation register 3.
DBAT3U = Upper data block address translation register 3.
DRC_A1 = Dynamic ram controller actual signature register 1.
DRC_A2 = Dynamic ram controller actual signature register 2.
DRC_SA = Dynamic ram controller shadow address.
DRC_X1 = Dynamic ram controller expected signature register 1.
DRC_X2 = Dynamic ram controller expected signature register 2.
DSISR = Data storage interrupt register.
EIIIMR = External interrupt interim interrupt mask register.
EIMR = External interrupt mask register.
EMR = Error source mask register.
ESR = Error source register.
HID0 = Hardware implementation dependent 0.
IBAT0L = Lower instruction block address translation register 0.
IBAT0U = Upper instruction block address translation register 0.
IBAT1L = Lower instruction block address translation register 1.
IBAT1U = Upper instruction block address translation register 1.
IBAT2L = Lower instruction block address translation register 2.
IBAT2U = Upper instruction block address translation register 2.
IBAT3L = Lower instruction block address translation register 3.
IBAT3U = Upper instruction block address translation register 3.
IP_ESR = IP Error source and mask register.
IP_ESR_MSK = PACMAN event summary mask register.
IP_PAR = IP PCI address register.
IP_PCIPA = PCI address shadow register.
IP_PCIPD = PCI data shadow register.
IP_PCIPS = PCI operation shadow register.
IP_PCR = IP PCI control register.
IP_PDR0 = PCI data read xfer register 0.
IP_PDR1 = PCI data read xfer register 1.
IP_PDR2 = PCI data read xfer register 2.
IP_PDR3 = PCI data read xfer register 3.
IP_PDR4 = PCI data read xfer register 4.
IP_PDR5 = PCI data read xfer register 5.
IP_PDR6 = PCI data read xfer register 6.
IP_PDR7 = PCI data read xfer register 7.
IP_SHADDR = IP Shadow address register.
IRR = Interrupt request register.
M_TWB = MMU tablewalk base register.
MCONFIG = Master configuration register.
MCONTROL = Master control register.
MD_AP = Data MMU access protection register.
MD_CTR = Data MMU control register.
MD_EPN = Data MMU effect page number register.
MI_AP = Instruction MMU address protection register.
MI_CTR = Instruction MMU control register.
MI_EPN = Instruction MMU effect page number register.
MSR = Machine state register.
MSTAT = Master status register.
PAC_ESR = PACMAN event summary register.
PAC_HRDWD = PACMAN hardware identification register.
PAC_MNTCE = PACMAN maintenance register.
PAC_STATUS = PACMAN status register.
PC = Program counter.
PCIPA_S = PCI address shadow register.
PCIPD_S = PCI data shadow register.
PCIPS_O = PCI shadow operation register.
PCIS = PCI event status register.
PORTC = Port c data register.
PORTD = Port d data register.
SDR1 = Storage descriptor register 1.
SEMR = System error mask register.
SESR = System error source register.
SHBCR = Shadow bus control register.
SIMASK = System interface unit (SIU) interrupt mask register.
SIPEND = SIU interrupt pending register.
SIVEC = SIU interrupt vector register.
SMIIMR = System maintenance interrupt interim interrupt mask register.
SMIMR = System maintenance interrupt mask register.
SP = Stack pointer.
SPRG3 = Special purpose register 3.
SRC08 = DDBIC status flags register.
SRC09 = DDBIC error register.
SRC10 = Command high register.
SRC11 = Command low register.
SRC15 = DDBIC sanity timer register.
SR0 = Segment register 0.
SR1 = Segment register 1.
SR2 = Segment register 2.
SR3 = Segment register 3.
SR4 = Segment register 4.
SR5 = Segment register 5.
SR6 = Segment register 6.
SR7 = Segment register 7.
SR8 = Segment register 8.
SR9 = Segment register 9.
SR10 = Segment register 10.
SR11 = Segment register 11.
SR12 = Segment register 12.
SR13 = Segment register 13.
SR14 = Segment register 14.
SR15 = Segment register 15.
SYNCCTL = Sync control register.
TBL = Time base low register.
TBU = Time base high register.
TESR = Transfer error status register.
THRM1 = Thermal register 1.
THRM2 = Thermal register 2.
UPDAR = Update direct memory access address register.
UPDCR = Update direct memory access count register.
UPDRA = Update read address register.
UPDRO = Update read operation register.

2. REASON FOR OUTPUT

To report an error or fault in a unit or software environment.

Format 1 reports a software error or hardware failure detected by the specified unit handler (field 'a'). The error code identifies a unique point in a message switch kernel process (MSKP) where the error was detected.

Format 2 reports an abnormal completion report or asynchronous error report on the specified unit.

Format 3 reports that the specified handler was faulted.

Format 4 reports a dual serial channel (DSCH) error (hardware failure) during a programmed I/O operation.

Format 5 reports a bus interface controller (BIC) status failure (hardware failure).

Format 6 reports that a message switch peripheral unit (MSPU) has lost power.

Format 7 reports that MSKP was faulted by the UNIX™ RTR system (hardware failure or software error).

Format 8 reports that the diagnostic handler was faulted (software error or hardware error).

Format 9 reports that the software error threshold in MSKP was exceeded (four back-to-back faults) and a higher level of escalation has been initiated.
Format 10 reports a software error or hardware failure detected by the MSKP environment. The error code identifies a unique point in MSKP where the error was detected.

Format 11 reports a fault detected in the MSKP environment which is not associated with a particular handler or unit.

Format 12 reports the time it took for the CMP to finish the phase 1 initialization (INIT) (INIT for CMP read-only memory (ROM)) and phase 2 INIT ("little boot" INIT, possibly including pump). It also reports what type of INIT occurred.

Format 13 reports the time it took for the CMP to finish the phase 3 INIT (INIT for CMP INIT for the rest of the INIT). It also reports what type of INIT occurred.

Note: This message is logged for all of the above formats, except Formats 7 and 9. The logged message can print up to five lines each line having a different format. Formats 7 and 9 print one line per message and appear on the receive-only printer (ROP) as well as being logged.

Format 14 reports that the 3BCMSIM handler was faulted (software error or hardware failure).

Format 15 reports that the 3BCMSIM AWMSKP handler was faulted (software error or hardware failure).

Format 16 reports that the EIB link has been restarted due to corrupt messages in queue.

Format 17 reports a download of the eib "coff" Common object format file, is in progress or failed.

Format 18 reports that the ping from the EIB ram failed, no communication is established.

Format 19 reports that the 3BCMSIM process restarted due to an unexpected signal/power failure.

3. VARIABLE FIELD DEFINITIONS

- **a** = Unit name. Valid value(s):
  - 3BCMSIM = 3B Communication module simulator
  - AWMSKP = Automatic workstation message switch kernel processor
  - CMP = Communication module processor
  - FPC = Foundation peripheral controller
  - MMP = Module message processor
  - MSCU = Message switch control unit
  - MSKP = Message switch kernel process
  - PPC = Pump peripheral controller
  - QGP = Quad-link gateway processor

- **b** = Unit member side.

- **c** = MMP, QGP or CMP number.

- **d** = Error code. (Refer to the APP:HANDLER-ERR or APP:FC-MSKP-DMRT appendixes in the Appendixes section of the Output Messages manual.)

- **e** = Supplementary data word 1.

- **f** = Supplementary data word 2.

- **g** = Event number.
h = Abnormal response or asynchronous report. Each ‘h’ in this format represents a WORD of data.

The format of an abnormal response format for an MSCU-detected error is:

```
----ttuu -------- -------- --------
```

The dashes indicate data to be ignored. This format is valid only if ‘u’ is greater than H’f0. (Refer to Exhibits A and B for specifics of an MSCU-detected error.)

### Exhibit A

i = UNIX™ RTR operating system or internal message switch kernel process (MSKP) fault code. (Refer to the APP:FC-MSKP-DMRT appendix in the Appendixes section of the Output Messages manual.)

j = Supplementary data.

k = Message switch side number.

l = DSCH status. (Refer to the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.)

m = Failing bus interface controller (BIC) status. (Refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.)
n = UNIX™ RTR operating system fault code. (Refer to the APP:FC-MSK-P-DMRT appendix in the Appendixes section of the Output Messages manual.)

o = Program address in hexadecimal where fault occurred (for software faults only).

p = The group of peripheral controllers (PCs) sharing a common power source.

q = Time to complete in milliseconds (expressed in hex).

r = Type of INIT that was requested. Valid value(s):

- H'0 = Purging INIT with re-isolation. Used during AM INIT to query information in the CMP.
- H'1 = Purging INIT to link the CMP.
- H'2 = No pump selective INIT.
- H'3 = No pump full INIT.
- H'4 = Partial pump of phase 2 and phase 3 and office-dependent data (ODD) with full INIT.
- H'5 = Full pump of phase 2 with partial pump of phase 3 and ODD with full INIT.
- H'6 = Full pump of ODD with partial pump of phase 2 and phase 3 with full INIT.
- H'7 = Full pump of ODD and phase 2 with partial pump of phase 3 with full INIT.
- H'8 = Full pump of ODD, phase 2, and phase 3 with full INIT.
- H'9 = Memory clear CMP then a full pump of ODD, phase 2, and phase 3 with full INIT.
- H'a = Off-line pump of CMP with active MHD. Memory clear CMP then a full pump of ODD, phase 2, and phase 3 with full INIT.
- H'b = Off-line pump of CMP with off-line MHD. Memory clear CMP then a full pump of ODD, phase 2, and phase 3 with full INIT.

4. ACTION TO BE TAKEN

This information can be found in the daylog under LMSGS message class. Use the OP:LOG input message to retrieve the information. The event numbers are used as sequencing and not used to tie hardware events with software events.

5. ALARMS

None.

Type: Output

1. FORMAT

REPT MSUCOM=a-b-c TRBL MSU PATH SETUP FAILURE d e RECOVERY ACTION f
[MTB=g]
{MA=a-b-c-h|MSUCOM=a-b-c} i j

2. REASON FOR OUTPUT

To report a trouble with a metallic service unit common circuit board (MSUCOM). An error occurred while trying to setup or test a metallic connection. More than one circuit may be listed when multiple circuits can be blamed for the trouble.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = MSU number.
c = Service group number.
d = Event number.
e = Error type. Valid value(s):
   ALIT FAILED IN PATH SETUP = An automatic line insulation test (ALIT) circuit failed.
   FAILURE IN PROTO TEST = A protocol test failed.
   GDXC FAILED IN PATH SETUP = A gated diode crosspoint compensator (GDXC) circuit failed.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = This post-mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified by an assert.
   RST AUTO CAMPON = The failing circuit will be diagnosed as soon as it becomes available. A message (RST:MSUCOM or DGN:MSUCOM) will then be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message (RST:MSUCOM or DGN:MSUCOM) will be printed with the results of the diagnostic.

g = Metallic test bus (MTB) number. This is only printed when the external logical circuit name is a metallic access (MA) circuit.
h = MSU board position number.
i = Number of recent failures of this error type (‘e’) on this MSUCOM circuit (in decimal).
\( j \) = Error count threshold, at which the recovery action will be escalated.

4. ACTION TO BE TAKEN

No action required. When recovery action variable ‘\( \epsilon \)’ is RSTPREEMPT or RSTAUTOCAMPON, a subsequent DGN:MSUCOM or RST:MSUCOM message will indicate the success or failure of the restore request.

5. ALARMS

None.

Type: Output

1. FORMAT

REPT MSUCOM=a-b-c TRBL PICB CONTROL FAILURE EVENT=d e RECOVERY ACTION f g h i j k l m n

2. REASON FOR OUTPUT

To respond to a peripheral interface control bus (PICB) control failure interrupt on the metallic service unit common (MSUCOM) board.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit number.
c = Service group number.
d = Event number.
e = Error type. Valid value(s):
   CI RECEIVED BAD PARITY
   CI RECEIVED BAD START CODE
   CI TIME OUT
   PER DETECTED BAD ADDRESS
   PER DETECTED BAD PARITY
   PER DETECTED BAD START CODE
   SOFTWARE BAD ADDRESS ERROR

f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is provided.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

g = Indication of whether the fault was transient or hard, as determined by the module controller fault recovery.

h = System PICB number in hexadecimal that was being written when the failure occurred.
i = Read/write (uppermost) bit and address in hexadecimal to which the control interface (CI) was writing when the failure occurred.
= Data being written to the periphery by the CI.

k = Contents of the CI error source register.

l = External logical circuit name.

m = Current decimal number of recent failures of this type recorded.

n = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the MSUCOM board from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

None.

1. FORMAT

REPT MSUCOM=a-b-c TRBL UNEXPECTED SERVICE REQUEST d
   INTERRUPT THROUGH MSU MASK RECOVERY ACTION e
   f
   g    h    i

2. REASON FOR OUTPUT

To report an unexpected service request on the metallic service unit common (MSUCOM) board.

3. VARIABLE FIELD DEFINITIONS

a    = Switching module (SM) number.

b    = Metallic service unit (MSU) number.

c    = Service group number.

d    = Event number.

e    = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has
   been notified.
   INITIALIZE = The failing circuit has been reinitialized.
   RMV = The failing circuit will be removed from service. Intervention is required to change
   the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be
   printed with the results of the diagnostic.
   RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message
   will be printed with the results of the diagnostic.

f    = Source analysis data (optional).

g    = External logical circuit name.

h    = Current decimal number of recent failures of this type recorded.

i    = Error count threshold, above which the recovery action will be escalated.

[14] REPT MT a INFO CODE r

[15] REPT MT a SJR DATA s t u v w

2. REASON FOR OUTPUT

To report a magnetic-tape (MT) related software or hardware error.
Format 15 provides small computer system interface (SCSI) job response (SJR) information when an explicit SCSI command, built by the disk file controller (DFC) driver, fails. The SJR data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.
c = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.
d = First word of an unidentifiable completion report.
e = Second word of an unidentifiable completion report.
f = Command completion status word. The completion word is eight hexadecimal digits of the form: rrsstuvv. Valid value(s):
   r = Command completion code. Refer to the "DFC Error Codes" table and the "Conditional Success Codes" table in the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.
   s = Number of blocks read or written.
   t = Device ID number.
   u = Special completion code. Valid only when 'v' is 00. Refer to the "Conditional Success Codes" table in the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.
   v = DMA job number (job ID).
g = Device status, in hexadecimal notation. Refer to the APP:DFC-C appendix in the Appendixes section of the Output Messages manual.
h = Channel status, in hexadecimal notation. Refer to the APP:DFC-D appendix in the Appendixes section of the Output Messages manual.
i = Bus selector status, in hexadecimal notation. Refer to the APP:DFC-E appendix in the Appendixes section of the Output Messages manual.
j = BIC status, in hexadecimal notation. Refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.
k = BIC status, in hexadecimal notation. Refer to the APP:DFC-F appendix in the Appendixes section of the Output Messages manual.
l = Mask.
m = Expected value of k after being masked with l.
n = Supplemental data for the previous REPT:DKDRV message.
o = Fault code, in hexadecimal notation. Refer to the APP:DFC-I appendix in the Appendixes section of the Output Messages manual.
p = Autonomous response special completion code (eight hexadecimal digits). The explanation of the hexadecimal digits is the same as the command completion code described for variable f. The u hexadecimal digit provides the reason for the autonomous response. Refer to the "Autonomous Response Special Completion Code" table in the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

q = The SCSI host adapter (HA) shadow register status, in hexadecimal notation. Refer to the APP:DFC-P appendix in the Appendixes section of the Output Messages manual.

r = Information code. Refer to the APP:DFC-A appendix in the Appendixes section of the Output Messages manual.

s = Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBC. Valid value(s):
   A = SCSI job block (SJB) completion code. Refer to "Job completion code" under "General Job Information" in the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.
   B = Status byte. Refer to "Target SCSI status byte" under "SCSI Command Information" in the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.
   C = Fill. Not used.

t = First word of extended sense data (ESD). Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. This word is structured as eight hexadecimal digits of the form AABBCCDD. Valid value(s):
   A = Byte 0 of ESD.
   B = Byte 1 of ESD.
   C = Byte 2 of ESD.
   D = Byte 3 of ESD.

u = Second word of ESD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. This word is structured as eight hexadecimal digits of the form AABBCCDD. Valid value(s):
   A = Byte 4 of ESD.
   B = Byte 5 of ESD.
   C = Byte 6 of ESD.
   D = Byte 7 of ESD.

v = Third word of ESD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. This word is structured as eight hexadecimal digits of the form AABBCCDD. Valid value(s):
   A = Byte 8 of ESD.
   B = Byte 9 of ESD.
   C = Byte 10 of ESD.
   D = Byte 11 of ESD.

w = Fourth word of ESD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. This word is structured as eight hexadecimal digits of the form AABBCCDD. Valid value(s):
A = Byte 12 of ESD.
B = Byte 13 of ESD.
C = Byte 14 of ESD.
D = Byte 15 of ESD.

4. ACTIONS TO BE TAKEN

These error messages indicate error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

5. ALARMS

There is no alarm for an automatically-generated report that is for information only.

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT MTB=a-b-c-d-e TRBL MSU PATH SETUP FAILURE f
   FAILURE IN PROTO TEST RECOVERY ACTION g
   MTB=a-b-c-d-e h i
   MA=a-b-c-d h i
   MSUCOM=a-b-c h i

2. REASON FOR OUTPUT

To report a trouble with a metallic test bus (MTB) circuit which resides on a metallic access (MA) board in a metallic
service unit (MSU). A protocol test failed while checking the integrity of a metallic connection to the MTB circuit. The
MTB number, the MA circuit and the MSU common circuit board (MSUCOM) are printed to aide in locating the faulty
equipment.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = MSU number.
c = Service group number.
d = MSU MA board position number.
e = Metallic test bus number.
f = Event number.
g = Recovery action. Valid value(s):
   ANALYSIS ONLY = This post-mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has
   been notified by an assert.
   RST AUTO CAMPON = The failing circuit will be diagnosed as soon as it becomes available. A
   message (RST:MTB or DGN:MTB) will then be printed with the results of the
diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
   (RST:MTB or DGN:MTB) will be printed with the results of the diagnostic.

h = Number of recent failures of this error type (FAILURE IN PROTO TEST) on this circuit
   expressed in decimal.
i = Error count threshold, above which the recovery action will be escalated.
4. ACTIONS TO BE TAKEN

No action required.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT MTC a{ERROR b[COMPL CODE c]| UNIDENTIFIED RESPONSE WD1=d WD2=e}

[2] REPT MTC a CODE VERSION X'f

2. REASON FOR OUTPUT

Format 1 reports a magnetic-tape-controller (MTC) related software or hardware error.
Format 2 is output during the restoration of the unit.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.
c = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.
d = First word of an unidentifiable completion report.
e = Second word of an unidentifiable completion report.
f = Peripheral controller pump code version.

4. ACTION TO BE TAKEN

These error messages indicate error conditions that could cause the removal of a unit. Any removed unit must be repaired and restored to service. No action is necessary for the message in Format 2 unless the controller and/or its subdevices are not acting normally or could not be restored. Contact the service organization with the code version which was used.

5. ALARMS

None.

   FAILURE IN PROTO TEST RECOVERY ACTION f
   g  h  i
   .  .  .
   .  .  .
   .  .  .

2. REASON FOR OUTPUT

To indicate a trouble with a metallic test interconnect bus (MTIB) which resides in a metallic service unit (MSU). A protocol test failed while checking the integrity of a metallic connection to the MTIB.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = MSU number.
c = Service group number.
d = MTIB number.
e = Event number.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY- = This post-mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
   RST AUTO CAMPON = The failing circuit will be diagnosed as soon as it becomes available. A message will then be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

  g = External logical circuit name. More than one circuit may be listed when multiple circuits can be blamed for the trouble.

  h = Current decimal number of recent failures of this error type (FAILURE IN PROTO TEST) on this circuit (MTIB).

  i = Error count threshold, at which the recovery action will be escalated.

4. ACTION TO BE TAKEN

<table>
<thead>

Where 'x' is the release-specific version of the document.
235-900-113 Product Specification
1. FORMAT

[1] REPT MTTY a (ERROR b [c] [COMPLETED CODE d] | UNIDENTIFIED RESPONSE WD1=e WD2=f)

[2] REPT MTTY a STARTED

[3] REPT MTTY a STOPPED

2. REASON FOR OUTPUT

Format 1 reports a maintenance-teletypewriter (MTTY) related software or hardware error.

Format 2 reports that the MTTY has changed state from standby (STBY) to active (ACT). An MTTY will change to ACT state when data terminal ready (DTR) is ON.

Format 3 reports that the MTTY has changed state from ACT to STBY. An MTTY will change to STBY state when DTR is OFF.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.

c = Character string giving more information about the error identified in variable ‘b’. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual for additional explanation.

d = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.

e = First word of an unidentified completion report.

f = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

The error messages in Format 1 indicate error conditions that could cause the removal of a unit. Any removed unit must be repaired and restored to service.

The messages in Formats 2 and 3 indicate that the MTTY has changed states. These messages will be output when the currently active MTTY changes state to STBY, and the currently standby MTTY changes state to ACT. An
active MTTY will change state to STBY if powered off, and a standby MTTY will change state to ACT when powered up. No action is necessary.

5. ALARMS

Format 1 has an alarm level of INFO. This is an automatically generated report. Formats 2 and 3 have alarm levels of VAR. This is a variable alarm to be determined by the client process.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

87. REPT:N
REPT:NAILUP-A

Software Release: 5E14 - 5E16(1)
Message Class: NAILUP
Application: 5
Type: Output

1. FORMAT

[1] REPT NAILUP - CONNECTION FAILURE - REASON a
    PORT: {DEN=b c d e|TEN=b f g h i|SLEN=b j k l|ILEN=b m n o|...}
    ...NEN=b p q r s t u v|INEN=b p k l}

[2] REPT NAILUP - CONNECTION RESTORAL ATTEMPTED
    PORT: {DEN=b c d e|TEN=b f g h i|SLEN=b j k l|ILEN=b m n o|...}
    ...NEN=b p q r s t u v|INEN=b p k l}

2. REASON FOR OUTPUT

To report the status of a nail-up connection. A nail-up connection is a connection between two ports which is either set up at system initialization or through recent change.

Format 1 indicates that a nail-up connection cannot be established because of the reason given. This message prints the name of the originating port for the nail-up connection. Format 2 indicates that the nail-up monitor found a connection down and attempted to restore it.

3. VARIABLE FIELD DEFINITIONS

a = Reason for failure. Valid value(s):
   BLOCKED = No network path available.
   INTERRUPTED = Preempted by maintenance.
   PATHLOST = Digital path failure.
   PORT UNAVAILABLE = Nail-up software could not get control of port to establish nail-up connection.
   ROUTING TROUBLE = Unexpected conditions during setup.
   TIMEOUT = Route request timeout.

b = Switching module (SM) number.

c = Digital line trunk unit (DLTU) number.

d = Digital facility interface (DFI) number.

e = Channel number.

f = Trunk unit number.

g = Service group number.

h = Channel board number.

i = Circuit number.
4. ACTIONS TO BE TAKEN

Format 1 results from nail-up port connection problems. Use the OP:NAILUP input message to verify the port status of the affected port connection.

Format 2 requires no action.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

REPT:NC-CTNCF

Software Release: 5E14 and later
Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

REPT NC a CP TO NC COMMUNICATION FAULT EVENT = b

2. REASON FOR OUTPUT

To indicate when message are not being successfully transferred from the central processor (CP) to the office network and timing complex (ONTC) network clock (NC) communication buffer, or are not being understood correctly by the NC.

3. VARIABLE FIELD DEFINITIONS

a = Unit side.
b = Event number.

4. ACTION TO BE TAKEN

If one report of this nature is printed to the receive only printer (ROP) then the problem is most likely transient or 'soft' and no action is required. If two or more messages are printed with the same event number, then there is probably a hardware problem. Check the input/output driver, the foundation peripheral controller (FPC) and the ONTC for cabling and communication difficulty. If the problem persists, the FPC and NC should be diagnosed (see References).

5. ALARMS

Minor.

6. REFERENCES

Input Message(s):

DGN:FPC
DGN:NC
REPT:NC-FRM

Software Release: 5E14 and later
Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

REPT NC a FREE RUN MODE ENTERED EVENT = b

2. REASON FOR OUTPUT

To indicate that phase lock was not achieved and the last control value cannot hold the oscillator to a reliable frequency.

3. VARIABLE FIELD DEFINITIONS

a = Unit side (0 or 1).
b = Event number.

4. ACTION TO BE TAKEN

Make a brief inspection of the office network timer complex (ONTC) backplane to ensure that all the connectors are securely attached. Manually restore the primary reference, then restore the secondary reference. These activities will attempt to phase lock the active major network clock (NC).

If the NC fails to phase lock, switch ONTCs and determine if the other ONTC can lock to either external reference.

If the ONTC becoming active major can phase lock, the problem probably lies in the NC hardware. Remove the active minor ONTC and diagnose it.

If the active major NC cannot lock on the switch, check the T1 links starting at the ONTC back to the reference source and verify that a reliable DS1 signal is being received.

5. ALARMS

None.

REPT:NC-HME
Software Release: 5E14 and later
Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

REPT NC a HOLDOVER MODE ENTERED EVENT = b

2. REASON FOR OUTPUT

To indicate that the operation of the phase-locked loop of the office network timer complex (ONTC) network clock (NC) ceased and that the oscillator was running at the last fixed frequency.

3. VARIABLE FIELD DEFINITIONS

a = Unit side (0 or 1).
b = Event number.

4. ACTION TO BE TAKEN

If the NC has not been manually set to holdover, determine why phase lock was lost. Check previous reports to isolate the fault. Make a brief inspection of the ONTC backplane making sure all the connectors are securely attached. Manually restore the primary reference; then restore the secondary references. This will attempt to phase lock the active major NC.

If the NC fails to phase lock, switch ONTCs and determine if the other ONTC can lock to either external reference.

If the ONTC becoming active major can phase lock, the problem probably lies in the NC hardware. Remove the active minor ONTC and diagnose it.

If the active major NC cannot lock on the switch, check the T1 links starting at the ONTC back to the reference source and verify that a reliable DS1 signal is being received.

REPT:NC-LPL

Software Release: 5E14 and later
Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

REPT NC a LOST PHASE LOCK EVENT = b

2. REASON FOR OUTPUT

To report that a transient clear disabled phase lock on the network clock (NC).

3. VARIABLE FIELD DEFINITIONS

a = Unit side (0 or 1).

b = Event number.

4. ACTION TO BE TAKEN

Monitor the reports concerning the office network timer complex (ONTC) network clock. If the phase lock is not achieved, make a brief inspection of the ONTC backplane to ensure that all the connectors are securely attached. Restore the reference.

If the NC fails to relock, switch ONTCs and determine if the other ONTC can phase lock. If it can lock, the problem probably lies in the NC hardware. Remove and diagnose the ONTC that does not phase lock.

If the active major NC cannot lock on the switch, check the reference source and verify that a reliable DS1 signal is being received.

5. ALARMS

None.

4. ACTIONS TO BE TAKEN

Monitor the reports for other office network timer complex (ONTC) fault to help isolate the unit. Then repair and restore the ONTC.

5. ALARMS

None.

6. REFERENCES

IM/OM References:

None.

Other Manual(s):
235-105-210 Routine Operations and Maintenance
235-105-220 Corrective Maintenance
1. **FORMAT**

[1] \[\text{REPT NC a NO EXTERNAL REF EVENT = b}\]

[2] \[\text{REPT NC a NO EXTERNAL REF EVENT = b} \]
\[\text{ASYNCHRONOUS REPORT X'}\]
\[\text{ccddeeff gghiijjj kkllmmnn ooppqqrr ss000000}\]
\[\text{FPC STATUS X'}\]
\[\text{ttuuvvww xxyyzzaa^1 bl^1dl^1el^1 fl^1hl^1il^1 jl^000000}\]

2. **REASON FOR OUTPUT**

To report that on initialization or restoration of the office network timer complex (ONTC), no external reference was detected as a reliable timing source (Format 1).

Format 2 is printed only if an asynchronous report occurs.

3. **VARIABLE FIELD DEFINITIONS**

\[a\] = Unit side.
\[b\] = Event number.
\[c\] = Foundation peripheral controller (FPC) to network clock communication error.
\[d\] = Flag vector 0.
\[e\] = Flag vector 1.
\[f\] = Flag vector 2.
\[g\] = Flag vector 3.
\[h\] = Flag vector 4.
\[i\] = Flag vector 5.
\[j\] = Flag vector 6.
\[k\] = Flag vector 7.
\[l\] = Summary flag.
\[m\] = Configuration.
\[n\] = Mode.
4. ACTION TO BE TAKEN

Make a brief inspection of the ONTC backplane to ensure that all the connectors are securely attached. Manually restore the primary reference; then restore the secondary reference. This will attempt to phase lock the active major network clock (NC).

If the NC fails to phase lock, switch ONTCs and determine if the other ONTC can lock to either external reference.

If the NC becoming active major can phase lock, then the problem probably lies in the NC hardware. Remove the standby ONTC and diagnose it.

If the active major NC cannot lock on the switch, check the T1 links starting at the ONTC back to the reference.
source and verify that a reliable DS1 signal is being received.

235-105-210 \hspace{1em} \textit{Routine Operations and Maintenance}
235-105-220 \hspace{1em} \textit{Corrective Maintenance}
1. FORMAT

REPT NC a NCOSC WARMUP.PERIOD b EVENT=c

2. REASON FOR OUTPUT

To report the status of the warmup period for the network clock (NC) 2; oscillator (NCOSC). For the high-stability oscillator (TN1283), a warmup period of 16 hours is required after power is restored to the unit. In the case of the medium-stability oscillator (TN1285), a warmup period of one hour is required.

This message may occur automatically at the end of the warmup period to inform the user that the oscillator is now ready for use. It may also occur in response to a manual request for a change in oscillator state, to explain why the request has been denied.

3. VARIABLE FIELD DEFINITIONS

a = Network clock (NC) side.

b = Warmup period status. Valid value(s):
COMPLETED = Warmup is complete, and oscillator may be used.
IN PROGRESS = Warmup is not completed. The oscillator has not reached its specified frequency stability.

c = Event number.

4. ACTION TO BE TAKEN

If warmup is complete, the oscillator may be restored to service for normal operation. If warmup is still in progress, use the other oscillator for the time base, if possible. If this is not possible, the oscillator may be set forced. This action may cause the NC to operate outside the frequency stability range specified for the office and should only be done if the other oscillator is faulty.

5. ALARMS

1. FORMAT

REPT NC a NCOSC WARMUP PERIOD b EVENT=c

2. REASON FOR OUTPUT

To report the status of the warmup period for the network clock (NC2) oscillator (NCOSC), or the network clock 3 (NC3) oscillator. For the high-stability NC2 oscillator (TN1283), a warmup period of 16 hours is required after power is restored to the unit. In the case of the medium-stability NC2 oscillator (TN1285), a warmup period of one hour is required. The high stability NC3 oscillator (MMB100) requires a one and a half hour warmup period.

This message may occur automatically at the end of the warmup period to inform the user that the oscillator is now ready for use. It may also occur in response to a manual request for a change in oscillator state, to explain why the request has been denied.

### 4. ACTIONS TO BE TAKEN
Determine the reason for the ONTC link interface to ONTC network clock feedback signal outage from the diagnostic results and restore the ONTC when feasible.

5. ALARMS

None.

6. REFERENCES

IM/OM References:

None.

Other Manual(s):
235-105-210  Routine Operations and Maintenance
235-105-220  Corrective Maintenance
1. FORMAT

REPT NC a ONTC TMS NOT SYNCHRONIZED WITH ONTC NC EVENT=b

2. REASON FOR OUTPUT

To indicate when the return signal sent from the office network and timing complex (ONTC) time multiplexed switch (TMS) is not in phase with the output from the ONTC network clock (NC). This problem could be caused by a fault in either the TMS or the NC.

3. VARIABLE FIELD DEFINITIONS

a = Unit side.
b = Event number.

4. ACTION TO BE TAKEN

If the ONTC side has been automatically removed from service and diagnosed, determine the reason for synchronization difficulty from the diagnostic results. Restore the ONTC to service when the fault is repaired (using the RST:ONTC input message). If the problem repeats itself, but the ONTC is not removed from service, then manually remove the side and diagnose the TMS and NC.

5. ALARMS

Minor.

   None.

Other Manual(s):

235-105-210   Routine Operations and Maintenance
235-105-220   Corrective Maintenance
REPT:NC-PLNA

Software Release: 5E14 and later
Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

REPT NC a PHASE LOCK NOT ACHIEVED EVENT = b

2. REASON FOR OUTPUT

To indicate that phase lock could not be achieved by the office network timer complex (ONTC) network clock (NC).

3. VARIABLE FIELD DEFINITIONS

a = Unit side.
b = Event number.

4. ACTION TO BE TAKEN

Make a brief inspection of the ONTC backplane to ensure that all the connectors are securely attached. Manually restore the references that are out of service if the active minor NC's cross-couple is out, then restore the ONTC.

If phase lock is not achieved on the active major ONTC, switch ONTCs and determine if the other NC can phase lock to an external reference. Monitor the receive-only printer (ROP) for additional reports concerning the active major NC.

5. ALARMS

None.

Application: 5
Type: Output

1. FORMAT

REPT NC a PHASE SHIFT EVENT = b

2. REASON FOR OUTPUT

To report that a phase difference between the output of the network clock (NC) and the reference to which the NC is phase locked exceeded a certain threshold.

3. VARIABLE FIELD DEFINITIONS

a = Unit side.
b = Event number.

4. ACTION TO BE TAKEN

Note that a phase shift occurred and how frequently this message is printed.

5. ALARMS

None.

6. REFERENCES

Input/Output Messages:
None.

Other Manual(s):
235-105-210  Routine Operations and Maintenance
235-105-220  Corrective Maintenance
REPT:NC-REF
Software Release: 5E14 and later
Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

REPT NC a (d)
(FREQ TOLERANCE|JITTER) EXCEEDED EVENT = b

2. REASON FOR OUTPUT

To report that the office network timer complex (ONTC) network clock primary, secondary, or cross-couple reference frequency or jitter exceeded an acceptable tolerance.

3. VARIABLE FIELD DEFINITIONS

   a = Unit side.
   b = Event number.
   c = Reference number.
   d = Error source register. Valid value(s):
   FREQ TOLERANCE = The frequency error source register of the reference exceeded acceptable tolerance.
   JITTER = The jitter error source register (ESR) of the reference exceeded acceptable tolerance.
   PRIM = Error source register of the primary reference exceeded acceptable tolerance.
   REFc = Error source register of the secondary reference exceeded acceptable tolerance.
   SEC = Error source register of the cross-couple reference exceeded acceptable tolerance.

4. ACTION TO BE TAKEN

   Make a brief inspection of the ONTC backplane to ensure that all the connectors are securely attached. Manually restore the external references if the active major ONTC lost phase lock or restore the ONTC if the active minor ONTC lost phase lock.

   If the active major network clock (NC) fails to phase lock, switch ONTCs and determine if the other NC can lock to an external reference.

   If the other NC can phase lock to an external reference after the switch, the problem probably is in the NC hardware. Remove the active minor ONTC and diagnose it.

   If the active major NC cannot lock on the switch, check the T1 links starting at the ONTC back to the reference source and verify that a reliable DS1 signal is being received.

   If the active minor ONTC cannot phase lock, determine the problem from the diagnostic results.

5. ALARMS
None.

2. REASON FOR OUTPUT

To report the occurrence of a reference error (REFERR) on the network clock. Format 1 marks the fact that the error occurred. Format 2 will be used along with the DUMP:NC output message that will follow to analyze the error.

3. VARIABLE FIELD DEFINITIONS

a = Network clock side.
b = Network clock reference. Valid value(s):

<table>
<thead>
<tr>
<th>For</th>
<th>Definitions</th>
</tr>
</thead>
</table>
| NC1 | PRIM = Primary reference.  
|     | SEC = Secondary reference.  
|     | X-COUPLE = Cross-couple reference.  |
| NC2 | Refn = Reference number.  
|     | X-COUPLE = Cross-couple reference.  |

c = Error type. Valid value(s):

| FREQ TOLERANCE = The frequency of the reference is outside the allowable limits. If an error of this type is reported more than twice per hour, the reference will be removed automatically.  |
| HIGH ERROR RATE = The high error rate threshold has been exceeded. The reference will be removed automatically.  |
| HIGH OOF = The high out-of-frame threshold has been exceeded. The reference will be removed automatically.  |
| JITTER = The reference has exceeded the acceptable jitter tolerance. If an error of this type is reported more than twice per hour, the reference will be removed automatically.  |
| LOW ERROR RATE = The low error rate threshold has been exceeded. This is a non-critical error, but the user may choose to investigate.  |
| LOW OOF = The low out-of-frame rate threshold has been exceeded. This is a non-critical error, but the user may choose to investigate.  |
| REF OUT = A local alarm (loss of signal) has occurred on the reference. It will be removed automatically.  |
d = Event number.  
   Note: All dump fields are given as hexadecimal values. For an explanation of the 
   variables refer to DUMP:NC output message manual page.

e = Foundation peripheral controller (FPC) to network clock communication error.

f = Flag vector 0.

g = Flag vector 1.

h = Flag vector 2.

i = Flag vector 3.

j = Flag vector 4.

k = Flag vector 5.

m = Flag vector 7.

n = Summary vector.

o = Valid value(s):

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

t = Communication link receiver/transmitter (CLRT) scan point status- first reading.

u = CLRT scan point status-second reading.

v = Peripheral controller sub-device maskable interrupt level.

w = Contents of interrupt controller A status register.
4. ACTION TO BE TAKEN

Inspect the office network timing complex (ONTC) backplane to ensure that all the connectors are securely attached. Restore the external references by the RST:NCREF input message if the active major ONTC lost phase lock or restore the ONTC by the RST:ONTC input message if the active minor ONTC lost phase lock.

If the active major network clock (NC) fails to phase lock, switch ONTCs (using the SW:ONTC input message) and determine if the other NC can lock to an external reference.

If the other NC can phase lock to an external reference after the switch, the problem is probably in the NC hardware. Remove the active minor ONTC and diagnose it (using the DGN:NC input message).

If neither NC can lock to the reference, check the T1 links starting at the ONTC back to the reference source (D4 channel bank or DFI) and verify that a reliable DS1 signal is being received. For more information on this procedure refer to the Routine Operations and Maintenance manual.

5. ALARMS

Minor.

Software Release: 5E14 only
Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

REPT a NCOSC b

2. REASON FOR OUTPUT

To report a change in the power status of the network clock 2 oscillator (NCOSC).

3. VARIABLE FIELD DEFINITIONS

a = Power status. Valid value(s):
   POWER OFF
   POWER ON

b = NCOSC unit side.

4. ACTION TO BE TAKEN

If power is reported to be lost, check direct power feed and power fuse to the network clock oscillator on the given side of the clock.

A high stability oscillator (stratum 2 office- TN1283/TN1285) will require a warmup period of 16 hours after power has been restored and before the unit may be restored to service. The warmup period for a medium stability oscillator (stratum 3 office- TN1284/TN1286) will be one hour. If necessary, an oscillator may be able to be forced active before the warmup time has been completed by the SET:FRC-NCOSC input message. This implies that the oscillator may be used for synchronization, but could cause the network clock (NC) to operate outside of the specified frequency tolerance for the office stratum specifications. This should only be done in the case of a faulty oscillator on the other NC side.

5. ALARMS

Minor.

2. REASON FOR OUTPUT

To report a change in the power status of the network clock 2 (NC2) or network clock 3 (NC3) oscillator (NCOSC).

3. VARIABLE FIELD DEFINITIONS

a = Power status. Valid value(s):
   POWER OFF
   POWER ON

b = NCOSC unit side.

4. ACTIONS TO BE TAKEN

If power is reported to be lost, check direct power feed and power fuse to the network clock oscillator on the given side of the clock.

A high stability NC2 oscillator (stratum 2 office- TN1283/TN1285) will require a warmup period of 16 hours after power has been restored and before the unit may be restored to service. The warmup period for a medium stability NC2 oscillator (stratum 3 office- TN1284/TN1286) will be one hour. The high stability stratum 2 NC3 oscillator (MMB100) has a warmup period of 1.5 hours. If necessary, an oscillator may be able to be forced active before the warmup time has been completed by the SET:FRC-NCOSC input message. This implies that the oscillator may be used for synchronization, but could cause the network clock (NC) to operate outside of the specified frequency tolerance for the office stratum specifications. This should only be done in the case of a faulty oscillator on the other NC side.

Application: 5
Type: Output

1. FORMAT

REPT NIPMP SM=a IMAGE=b c

2. REASON FOR OUTPUT

To report progress or reason for termination of a non-interfering pump.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Peripheral image name.
c = Status. Valid value(s):
   ALREADY IN PROGRESS = A non-interfering pump request is already in progress.
   COMPLETED = The non-interfering pump has completed successfully.
   REQUEST IGNORED: IMAGE ALREADY LOADED = The non-interfering pump request was not executed because the image has been previously loaded.
   REQUEST IGNORED: OFFLINE PUMP IN PROGRESS = The non-interfering pump request was not executed because an offline pump request is currently running.
   REQUEST IGNORED: RIM REGENERATION NOT COMPLETE = The non-interfering pump request was not executed because the relocatable image map has not been updated since the SM memory was last reconfigured. An ODD backup is required.
   REQUEST IGNORED: SM NOT FULLY OPERATIONAL = The non-interfering pump request was not executed because the SM has not yet fully recovered from an initialization.
   STOPPED: ASSERT LOGGED = The non-interfering pump has terminated abnormally and an assert has been triggered.
   STOPPED: INVALID DATA MESSAGE RECEIVED = The non-interfering pump has terminated abnormally because two many data messages used to transfer the image were bad.
   STOPPED: NO MEMORY FOR REQUESTED IMAGE = The non-interfering pump has terminated abnormally since the SM memory layout was not manually configured to include a section for the image requested.
   STOPPED: NOTHING PUMPED = The non-interfering pump has terminated abnormally because data messages used to transfer the image were empty.
   STOPPED: REQUESTED = The non-interfering pump has terminated due to a manual request.
   STOPPED: TEXT/DATA REQUEST FAILED = The non-interfering pump has terminated abnormally due to a failure to send the TEXT/DATA request to the AM.
   STOPPED: TIMED OUT WAITING FOR DATA MESSAGE = The non-interfering pump has terminated abnormally because the SM timed out waiting for receipt of a data message used to transfer the image.
   STOPPED: TOO MANY FAILING RANGES = The non-interfering pump has terminated abnormally because hashsum errors were present over more than the maximum number of contiguous ranges.
   STOPPED: TOO MANY PARTIAL PUMPS = The non-interfering pump has terminated abnormally because hashsum errors were still present after the maximum number of partial
pumps had been attempted.

4. ACTION TO BE TAKEN

Resolve errors as indicated and retry the input message. If errors continue, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. For a minor alarm, take action as indicated in the report.

[1] REPT NS a TRAPPED [b RECEIVED] [g]
c [d|e [f]]

__________________________________________________________________
[2] REPT NS NSBADRESP TRAPPED AMORDLN_INV RECEIVED [g]

__________________________________________________________________

2. REASON FOR OUTPUT

To report the occurrence of a service switching point (SSP) number service (NS) trap. This message is in response to the input message SET:DSE.

Format 1 is the general output response. Format 2 is the output response specific to the trap NSBADRESP with AMORDLN_INV; a trap exists either in the administrative module (AM) or the direct link node (DLN) at the switch, which has no additional data displayed.

3. VARIABLE FIELD DEFINITIONS

a = The event trapped. Valid value(s):
   NSACGCOMP = The trap includes an SCP response message with an ACG component received at the switch.
   NSBADRESP = The trap includes an SCP response message with invalid data.
   NSNONRTEMSG = The trap includes a reject message, a return error and a play announcement received at the switch from the service control point (SCP).
   NSQRYFAIL = The trap includes a query blocked by network management (NM) automatic call gap (ACG), a returned query received at the switch and a time out received in feature control (FC).

   When the trap for a query blocked by NM ACG is set, the output for this trap will also be generated by SSP test queries when a response with an ACG component from the service control point (SCP) is received at the switch.
   NSSNCOMP = The trap includes an SCP response message with a send notification received at the switch.
   NSTNMSG = The trap includes a termination notification message sent from the switch to the SCP.

b = The subclass of the event trapped. Valid value(s):
   ACG_BLK = This is a type of NSQRYFAIL trap and it occurs when a query is blocked by NM ACG in the administrative module (AM) or direct link node (DLN).
   AMORDLN_INV = This is a type of NSBADRESP trap and it occurs when an SCP response message with invalid data is received in the administrative module (AM) or the direct link node (DLN) at the switch.
   ANN_MSG = This is a type of NSNONRTEMSG trap and it occurs when a play announcement is received at the switch from the SCP.
NULL = This is associated with the type of NSACGCOMP and it occurs when the SCP sends an ACG component to perform ACG administration (install/update/delete controls).

REJECT = This is a type of NSNONRTEMSG trap and it occurs when a reject message is received at the switch from the SCP.

RERR_MSG = This is a type of NSNONRTEMSG trap and it occurs when a return error message is received at the switch from the SCP.

RTRN_QRY = This is a type of NSQRYFAIL trap and it occurs when a returned query is received at the switch.

SM_INV = This is a type of NSBADRESP trap and it occurs when an SCP response message with invalid data is received in the switching module (SM) at the switch.

SN_COMP = This is a type of NSSNCOMP trap and it occurs when a response message with a send notification component is received at the switch.

TIMEOUT = This is a type of NSQRYFAIL trap and it occurs when a time out is received in FC.

TN_MSG = This is a type of NSTNMSG trap and it occurs when a termination notification message is sent from the switch to the SCP.

c = 10-digit dialed number which causes the event to occur.

Note: If 'a' is NSACGCOMP, 'c' is a 6- or 10-digit control number.

d = Additional data associated with the trapped event. Valid value(s):

<td>The hex value of the SCP point code.</td>
</tr>
</tbody>
</table>

g = Processor where the event was trapped. If 'a' is NSQRYFAIL and 'b' is TIMEOUT then 'g' will be blank. Valid value(s):

CNI The event was trapped on a common network interface (CNI) platform.
GSM The event was trapped on a packet switching unit (PSU) platform but was unable to obtain the global switch module (GSM) number, missing or bad data.
GSM=h The event was trapped on a PSU platform, where 'h' is the number of the GSM where the event was trapped.

4. ACTION TO BE TAKEN

None. This message is in response to a manual input request.

5. ALARMS

None.

1. FORMAT

[1] REPT NTTU TRUNK HARDWARE FAILURE
   TKGMN=a-b DEN=c-d-e-f  TYPE: g NTT
   NTTU FACILITY: FAC=c-d-e-h
   FAILING AI-TDB: i  CH: j

[2] REPT NTTU TRUNK HARDWARE FAILURE
   TKGMN=a-b NEN=c-k-l-m-n-o-p-q  TYPE: g NTT
   NTTU FACILITY: DS1SFAC=c-k-l-m-n-o-p
   FAILING AI-TDB: i  CH: j

2. REASON FOR OUTPUT

To report the occurrence of a hardware failure condition on a no-test test trunk unit (NTTU) trunk or trunk board. This failure condition could have been caused by either a failed circuit on a NTTU trunk board, loss of power to a NTTU trunk board, blown fuse on a NTTU trunk board, an improperly seated NTTU trunk board, or a NTTU trunk board that was manually removed.

This message was output when the failure condition affecting the NTTU trunk occurred, and the NTTU trunk was placed out of service (OOS) and will stay OOS while the failure condition remains. Incoming trunks were placed high and wet (OOS MTCE HW AUTO) and outgoing trunks were placed blocked (OOS BLKD AUTO).

No output message will be generated when the failure condition clears. The OOS state that was added to the trunk will be removed once the failure condition clears and the trunk is on-hook. The OP:STATUS input command can be used to check the current state of the trunk to help in determining if the failure condition has cleared.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Trunk group number.
b = Trunk member number.
c = Switching module (SM) number.
d = Digital line and trunk unit (DLTU) number.
e = Digital facility interface (DFI) number.
f = Digital signal level 0 (DS0) channel number. Facility 0 supports channels 1-24; facility 1 (when it exists) supports channels 25-48. The NTTU uses (at most) the first 13 channels on a facility. The first channel is for the NTTU control channel, the next 12 channels can be used (if provisioned) to provide test trunk functionality.
g = Trunk type. Valid value(s):
INCOM = The trunk which failed is an incoming test trunk.
OUTGO = The trunk which failed is an outgoing test trunk (for example, connected to a coin-station test line).

h = Facility (FAC) number.

i = NTTU trunk board number (1-6).

j = NTTU trunk channel number (2-13). Channel 1 is used to control the NTTU. The first trunk on the first board is channel 2, with two trunks per NTTU trunk board, the maximum channel used for an NTTU trunk is channel 13.

k = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

l = Data group (DG) number.

m = SONET termination equipment (STE) facility number.

n = Synchronous transport signal (STS) facility number.

o = Virtual tributary group (VTG) number.

p = Virtual tributary member (VTM) number.

q = Digital signal level 0 (DS0) channel number. The NTTU uses (at most) the first 13 DS0 channels. The first channel is for the NTTU control channel, the next 12 channels can be used (if provisioned) to provide test trunk functionality.

4. ACTIONS TO BE TAKEN

Locate and check the failing NTTU trunk board identified in the message. If the trunk board is not properly inserted in the NTTU, re-insert it properly. If the trunk board has been removed from the NTTU, locate and install a replacement NTTU trunk board. If the trunk board is present and inserted properly, a circuit on the board has most likely failed, so replace the defective board.

Verify that the trunk type switch (incoming vs. outgoing) on the physical board matches the switch database type printed in the message.

Verify that the test trunk is again operational by using OP:STATUS to verify that the OOS state has been removed, and the trunk is back in service.

5. ALARMS

A major alarm occurs.

6. REFERENCES

Input Message(s):

   REASON = h

[4] REPT OC3=a-b-c-d-e RESIDENT AUTOMATIC PROTECTION SWITCH EVENT=i
   SOFTWARE HAS PERFORMED AN OC3 APS

2. REASON FOR OUTPUT

To indicate that an automatic protection switch (APS) or an APS event has taken place or an APS alarm has occurred.

Format 1: For unidirectional APS, it will display APS status information for both the reporting OC3, as given in the first time of the report, and the mate OC3.

Format 2: For bidirectional APS, it will display APS status information for both the reporting OC3, as given in the first time of the report, and the mate OC3.

Format 3: For bidirectional APS, it will display APS alarm information for the reporting OC3.

Format 4: For unidirectional or bidirectional APS, it will display that a switch of the facilities had taken place and which OC3 the APS had switched away from.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = OIU number.
c = Protection group number.
d = OC3 number.
e = Side number.
f = Current dynamic APS protocol state. This field will be blank if the OC3 circuit has been manually
removed out of service (OOS) or if the parent optical facility interface (OFI) circuit is OOS. Valid value(s):
DNR = Do not revert.
FS = Force switch.
LP = Lock out of protection.
MS = Manual switch.
NR = No request.
SD = Signal degrade.
SF = Signal fail.

\( g \) = APS state qualifier. This field will be blank if the APS state is NR or DNR. Valid value(s):
AIS-L = Alarm indication signal - line.
BABBLING = High occurrence of facility failures in a short period of time.
BER 10 \(-3\) = Bit error rate 10-3.
BER 10 \(-4\) = Bit error rate 10-4.
BER 10 \(-5\) = Bit error rate 10-5.
BER 10 \(-6\) = Bit error rate 10-6.
BER 10 \(-7\) = Bit error rate 10-7.
BER 10 \(-8\) = Bit error rate 10-8.
BER 10 \(-9\) = Bit error rate 10-9.
LOF = Loss of frame.
LOS = Loss of signal.
MODE_MISMATCH = APS architecture mode mismatch (bidirectional only).
PSBF = Protection switch byte failure (bidirectional only).
RDI-L = Remote defect indication - line (unidirectional only).

\( h \) = APS alarm reason. Valid value(s):
CHANNEL MISMATCH = Detected a far end channel mismatch.
FAR-END PROTECTION LINE FAILURE = Detected a signal failure of the far end protection line.

\( i \) = Event number.

\( j \) = Current dynamic APS protocol remote state (bidirectional only). Valid value(s):
DNR = Do not revert.
EX = Exercise.
FS = Force switch.
LP = Lock out of protection.
MS = Manual switch.
NR = No request.
RR = Reverse request.
SD = Signal degrade.
SF = Signal fail.
WTR = Wait to restore.
- = Unknown state.

\( k \) = Alarm action. Valid value(s):
CLEAR = Alarm was cleared.
SET = Alarm was set.
4. ACTIONS TO BE TAKEN

For Format 1, use reporting OC3 equipment number to help isolate and resolve network transmission problems for unidirectional APS.

For Format 2, use reporting OC3 equipment number to help isolate and resolve network transmission problems for bidirectional APS.

For Format 3, if the output includes "CHANNEL MISMATCH", execute the SET:OC3 input message with either the MS parameter (for manual switch) or the FS parameter (for forced switch).

No action is required for the "FAR-END PROTECTION LINE FAILURE" alarm.

5. ALARMS

Minor = Non-service affecting failure on reporting OC3 side has occurred.

Major = Service affecting failure on reporting OC3 side has occurred.

Critical = Service affecting failure on both OC3 sides has occurred.

LOF = Loss of frame.
LOS = Loss of signal.
MODE_MISMATCH = APS architecture mode mismatch (bidirectional only).
PSBF = Protection switch byte failure (bidirectional only).
RDIL-L = Remote defect indication - line (unidirectional only).

h = APS alarm reason. Valid value(s):
CHANNEL_MISMATCH = Detected a far end channel mismatch.
FAR-END_PROTECTION_LINE_FAILURE = Detected a signal failure of the far end protection line.
i = Event number.
j = Current dynamic APS protocol remote state (bidirectional only). Valid value(s):
DNR = Do not revert.
EX = Exercise.
FS = Force switch.
LP = Lock out of protection.
MS = Manual switch.
NR = No request.
RR = Reverse request.
SD = Signal degrade.
SF = Signal fail.
WTR = Wait to restore.
4. ACTIONS TO BE TAKEN

For Format 1, use reporting OC3C equipment number to help isolate and resolve network transmission problems for unidirectional APS.

For Format 2, use reporting OC3C equipment number to help isolate and resolve network transmission problems for bidirectional APS.

For Format 3, if the output includes "CHANNEL MISMATCH", execute the SET:OC3C input message with either the MS parameter (for manual switch) or the FS parameter (for forced switch).

No action is required for the "FAR-END PROTECTION LINE FAILURE" alarm.

5. ALARMS

Minor = Non-service affecting failure on reporting OC3C side has occurred.

Major = Service affecting failure on reporting OC3C side has occurred.

Critical = Service affecting failure on both OC3C sides has occurred.

Input Message(s):

SET:OC3C
REPT:ODD-FILE  
Software Release: 5E14 and later  
Message Class: MTCE  
Application: 5  
Type: Output

1. FORMAT
REPT a ODD FILE IS CORRUPT.

2. REASON FOR OUTPUT
To report that the administrative module (AM), communications module processor (CMP) or the scratch office-dependent data (ODD) file is corrupt. Immediate technical assistance is needed.

3. VARIABLE FIELD DEFINITIONS

a = ODD file type. Valid value(s):
   CPODD.OUT = The AM ODD file is corrupt.
   CMPODD.OUT = The CMP ODD file is corrupt.
   AMCMPODD.SCR = The scratch ODD file is corrupt.

4. ACTION TO BE TAKEN
Immediate technical assistance is needed. It may be necessary to recover the AM or CMP ODD from tape.

5. ALARMS
Major.

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT OFFLINE BOOT IN PROGRESS

[2] REPT OFFLINE BOOT a

2. REASON FOR OUTPUT

These messages are output to report information about the execution of the offline boot feature.

Format 1 is printed every 5 minutes, after the off-line side has booted successfully, to indicate that the system is still in offline boot and is still logically split.

Format 2 is printed after the off-line side has booted successfully and offline boot is being stopped. Whether devices moved to the off-line side are restored or not depends on the abort type.

3. VARIABLE FIELD DEFINITIONS

a = Abort type. Valid value(s):
  ABORTED = Application request to stop the oflboot procedure; devices moved to the off-line side will be restored.
  STOPPED = Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the off-line side will be restored.
  TERMINATED = Administrative module (AM) software-initiated termination of the oflboot procedure; devices moved to the off-line side will not be restored.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None. For a minor alarm, take action as indicated in the report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the number of output messages entering the DAYLOG file.

3. VARIABLE FIELD DEFINITIONS

a = The alphabetic name of the output message class. Refer to the APP:MSGCLS appendix in the Appendixes section of the Output Messages manual for a list of all message class names.

b = Number of messages in this class that have been logged in the last 15-minute interval.

c = Alarm level of the messages logged are MAJOR, MINOR, NONE.

4. ACTION TO BE TAKEN

No action taken locally under normal circumstances. However, personnel in the Switching Control Center (SCC) or Technical Assistance Center (TAC) may investigate unusually large numbers of output messages by using either the DUMP:DAYLOG or OP:LOG input message.

5. ALARMS

The alarm could be NONE, MINOR, or MAJOR depending on the alarms of the messages within the reported message classes.

REPT OFI=a-b-c-d [e] TRBL BACKGROUND TEST FAILURE EVENT=f
   g RECOVERY ACTION h
   iijjkkkk lllllllll lllllllll lllllllll
   [OFI=a-b-c-d m n]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of the optical facility interface (OFI) circuit in the optical interface unit (OIU). The fault was detected and reported by background test software in the SM. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable "h" to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = OIU unit number.
c = OFI protection group number.
d = OFI side.
e = OFI equipment status. Valid value(s):
   ACTIVE = The OFI circuit is in service and a fault has been detected.
   OOS = The OFI circuit is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this OFI circuit from service. However, fault stimuli are still being detected from the circuit indicating that the OFI circuit has not been completely removed from service.

f = Event number.
g = Error type. Valid value(s):
   HEARTBEAT FAILURE = Operational software timed out waiting for return from resident code for heartbeat check.
   PCT LOOP BACK FAIL SMP TO FAR END = The OFI failed to respond to an SMP direct communication check.

h = Recovery action taken by peripheral fault recovery. Valid value(s):
   ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
   HARD RESET = The circuit has been hard reset without scheduling diagnostics.
   INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.

NO RECOVERY ACTION TAKEN = This event needed no recovery action.

PRE-OOS THRESHOLD EXCEEDED = The OFI circuit was preempted and is still detecting errors.

PRE-OOS, RE-INHIBIT HDWCHKS = The OFI circuit has been preempted and is still detecting errors. Inhibit has been re-applied on the OFI circuit.

RE-INHIBIT ERROR = The OFI circuit has been inhibited and errors are still detected. Inhibit has been re-applied on the OFI circuit.

RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN OFI output message will be printed with the results of the diagnostic.

SWITCH = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

i = Message type, in hexadecimal.

j = Message handler (MH) and MH channel number in a bit packed representation. The first three bits indicate the MH number. The next five bits indicate the MH channel number, in hexadecimal.

k = Internal circuit name of the OFI, in hexadecimal.

l = Failing task information, in hexadecimal.

m = Number of recent failures of this error type this circuit, in decimal.

n = Error count threshold above which the recovery action will become stronger.

4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the OFI from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of the communication path through the optical facility interface (OFI) circuit in the optical interface unit (OIU). The fault was detected and reported by message handler (MH) fault recovery software, and preliminary recovery was taken by MH fault recovery software. The message also indicates what recovery action was taken by peripheral fault recovery and gives the current fault counts against the circuit specified in the message. Refer to variable "h" to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = OIU unit number.
c = OFI protection group number.
d = OFI side.
e = OFI equipment status. Valid value(s):
   ACTIVE = The OFI circuit is in service and a fault has been detected.
   OOS = The OFI circuit is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this OFI circuit from service. However, fault stimuli are still being detected from the circuit indicating that the OFI circuit has not been completely removed from service.
f = Event number.
g = Error type. Valid value(s):
   MH BAD CRCs = The event needed no recovery action.
   PRE-OOS THRESHOLD EXCEEDED = The OFI circuit was preempted and is still detecting errors.
   PRE-OOS, RE-INHIBIT HDWCHKS = The OFI circuit has been preempted and is still detecting errors. Inhibit has been re-applied on the OFI circuit.
RE-INHIBIT ERROR = The OFI circuit has been inhibited and errors are still detected. Inhibit has been re-applied on the OFI circuit.

RST PREEMPT = The failing circuit was preempted.

SWITCH = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

i = Contains a time stamp.

j = Layer 2 logical link number and MH channel number, in a bit-packed representation. The first three bits indicate the layer 2 logical link number, and the next five bits indicate the MH channel number.

k = MH internal inhibit status and MH error type, in a bit-packed representation. The first bit indicates the MH internal inhibit status, and the next seven bits indicate the MH error type.

l = Up to nineteen additional MH events with a similar layout to variables ‘i’ through ‘k’. The last eight hex characters of this variable represent the most recent MH event.

m = Number of recent failures of this error type (variable ‘g’) on this OFI circuit (in decimal).

n = Error count threshold above which the recovery action will become stronger.

o = Recovery level. Valid value(s):

MH CHANNEL INIT INACTIVE CHANNELS
MH CRITICAL ERROR
MH DEACTIVATED A CHANNEL
MH INIT OF ACTIVE CHANNELS
MH INITIATED OSR
MH ERROR REPORT
MH EVENT FROM FAR END REPORT
MH RESTART OF LAYER 2

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a peripheral link interface (PLI) which services a optical facility interface (OFI) circuit in the optical interface unit (OIU). The fault was detected and reported by module control unit fault recovery (MCUFR). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable 'h' to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = OIU unit number.
c = OFI protection group number.
d = OFI side.
e = OFI equipment status. Valid value(s):
   ACTIVE = The OFI circuit is in service and a fault has been detected.
   OOS = The OFI circuit is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this OFI circuit from service. However, fault stimuli are still being detected from the circuit indicating that the OFI circuit has not been completely removed from service.
f = Event number.
g = Error type. Valid value(s):
   IF DETECTED CRC ERROR ON DATA RECEIVED FROM PLI = The module controller detected a bad CRC on the PLI servicing the OFI.
   IF DETECTED LOSS OF CLOCK FROM THE PLI = The module controller detected a loss of data clock on the PLI servicing the OFI.
   IF DETECTED LOSS OF CLOCK REFERENCE = The module controller detected a loss of clock reference on the PLI servicing the OFI.
   IF DETECTED PARITY ERROR ON OVERHEAD BYTES FROM PLI = The module controller detected a parity error on the overhead bytes from the PLI servicing the OFI.
   IF DETECTED SYNCHRONIZATION ERROR WITH PLI = The module controller detected a
synchronization error with the PLI servicing the OFI.

**NO ERROR SOURCE FOUND** = A message was sent to PFR (peripheral fault recovery) software indicating a PLI fault is present. However, PFR software analysis revealed no such fault indication.

**PLI DETECTED A BAD FRAME WORD ON THE INCOMING LINK** = A bad frame word has been detected on the incoming PLI.

**PLI DETECTED PARITY ERROR ON INCOMING OVERHEAD BYTES** = Parity error has been detected on overhead data received from the TSI.

**PLI DETECTED A BAD SUPERFRAME BYTE ON THE INCOMING LINK** = A bad superframe byte has been detected on the incoming PLI.

**PLI DETECTED BAD CRC FROM ACTIVE MCTS** = A bad CRC has been detected from the MCTSI at the PLI.

**PLI DETECTED INTERNAL DATA PARITY ERROR** = PLI has detected an internal parity error.

**PLI DETECTED THAT IT IS SOURCING BAD CRC** = A PLI servicing the OFI circuit has detected it is sourcing a bad CRC.

**PLI DETECTED LINK TO BE OUT-OF-FRAME** = Proper framing cannot be established on the incoming PLI.

**PLI DETECTED OUTGOING BUFFER CHECK ERROR** = Buffer check error has been detected on the PLI.

**PLI DETECTED PARITY ERRORS ON DATA FROM THE PERIPHERAL**

- Recovery action taken by peripheral fault recovery. Valid value(s):  
  **ANALYSIS ONLY** = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
  **INHIBIT HDWCHKS** = The circuit has been inhibited because of excessive errors.
  **INITIALIZE** = This recovery action is used to re-initialize a circuit without scheduling diagnostics.
  **NO RECOVERY ACTION TAKEN** = This event needed no recovery action.
  **PRE-OOS THRESHOLD EXCEEDED** = The OFI circuit was preempted and is still detecting errors.
  **PRE-OOS, RE-INHIBIT HDWCHKS** = The OFI circuit has been preempted and is still detecting errors. Inhibit has been re-applied on the OFI circuit.
  **RE-INHIBIT ERROR** = The OFI circuit has been inhibited and errors are still detected. Inhibit has been re-applied on the OFI circuit.
  **RST PREEMPT** = The failing circuit was preempted.
  **SWITCH** = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

- IF error source register.
- IF error mask register.
- PLI error source register.
- PLI error mask register.
- Message type.
- Number of PLI fault messages sent from MCUFR to peripheral fault recovery, contained in variable 'o'.
4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the OFI from service during a period of low usage and perform trouble locating procedures.

= Recovery action taken by peripheral fault recovery. Valid value(s):
ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or
circuits are failing, but the error counts have not reached a threshold for action.

- **HARD RESET** = The circuit has been hard reset without scheduling diagnostics.
- **INHIBIT HDWCHKS** = The circuit has been inhibited because of excessive errors.
- **INITIALIZE** = This recovery action is used to re-initialize a circuit without scheduling diagnostics.
- **NO RECOVERY ACTION TAKEN** = This event needed no recovery action.
- **PRE-OOS THRESHOLD EXCEEDED** = The OFI circuit was preempted and is still detecting errors.
- **PRE-OOS, RE-INHIBIT HDWCHKS** = The OFI circuit has been preempted and is still detecting errors. Inhibit has been re-applied on the OFI circuit.
- **RE-INHIBIT ERROR** = The OFI circuit has been inhibited and errors are still detected. Inhibit has been re-applied on the OFI circuit.
- **RST PREEMPT** = The failing circuit was preempted and a diagnostic was scheduled. A DGN OFI output message will be printed with the results of the diagnostic.
- **SWITCH** = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

- **i** = Message type, in hexadecimal.
- **j** = Message handler (MH) number (upper 3 bits) and MG channel (lower 5 bits).
- **k** = Internal circuit name for PCT link 0, in hexadecimal.
- **l** = Unit type, in hexadecimal.
- **m** = Number of information bytes which follow, in hexadecimal.
- **n** = Information bytes, in hexadecimal.
- **o** = Number of recent failures of this error type this circuit, in decimal.
- **p** = Error count threshold above which the recovery action will become stronger.
- **q** = Recovery level. Valid value(s):
  - CRITICAL HARDWARE FAILURE
  - NON-CRITICAL SOFTWARE FAILURE

---

4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the OFI from service during a period of low usage and perform trouble locating procedures.

[OFI=a-b-c-d o p]

2. REASON FOR OUTPUT

To report fault recovery activity within the switching module (SM) caused by a failure of the optical facility interface (OFI) circuit in the optical interface unit (OIU). The fault was detected and reported by resident OFI code fault recovery software. The message also indicates what recovery action was taken by peripheral fault recovery and gives the current fault counts against the circuit specified in the message. Refer to variable "h" to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = OIU unit number.
c = OFI protection group number.
d = OFI side.
e = OFI equipment status. Valid value(s):
  ACTIVE = The OFI circuit is in service and a fault has been detected.
  OOS = The OFI circuit is marked as out-of-service, but fault stimuli are still being detected.
  PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this OFI circuit from service. However, fault stimuli are still being detected from the circuit indicating that the OFI circuit has not been completely removed from service.
  STANDBY = The OFI circuit is in standby and a fault has been detected.

REPT OFI=a-b-c-d [e] TRBL PCT LINK FAILURE EVENT=f
g RECOVERY ACTION h
ppppqqqq iiiirrrr jjjjkkkk llllmmmm
nnnnnoooo
[OFI=a-b-c-d s t]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a peripheral link interface (PLI) which services a optical facility interface (OFI) circuit in the optical interface unit (OIU). The fault was detected and reported by module control unit fault recovery (MCUFR). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable 'h' to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = OIU unit number.
c = OFI protection group number.
d = OFI side.
e = OFI equipment status. Valid value(s):
   ACTIVE = The OFI circuit is in service and a fault has been detected.
   OOS = The OFI circuit is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this OFI circuit from service. However, fault stimuli are still being detected from the circuit indicating that the OFI circuit has not been completely removed from service.

f = Event number.
g = Error type. Valid value(s):
   HDLC PROTOCOL ERROR = High level data link protocol errors were detected.
   NO ERROR SOURCE FOUND = A message was sent to peripheral fault recovery (PFR) software indicating a scanned failure. However, PFR software analysis revealed no such failure condition.
   OVERHEAD PARITY ERROR DETECTED BY THE FAR-END = The far-end has detected a parity error on control information it has received and is reporting the problem.
   OIU LINK MARKED UNAVAILABLE BY THE FAR-END = The far-end has marked a link unavailable that the switch has marked available.
   PROCESSOR SANITY TIMER EXPIRED = The processor sanity timer has timed out.
SYNCHRONIZATION ERROR DETECTED BY THE FAR-END = The far-end has detected a problem (i.e., CRC error, loss of clock, etc.) on its incoming link and is reporting the problem.

- h = Recovery action taken by peripheral fault recovery. Valid value(s):
  - ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
  - INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
  - INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.
  - NO RECOVERY ACTION TAKEN = This event needed no recovery action.
  - PRE-OOS THRESHOLD EXCEEDED = The OFI circuit was preempted and is still detecting errors.
  - PRE-OOS, RE-INHIBIT HDWCHKS = The OFI circuit has been preempted and is still detecting errors. Inhibit has been re-applied on the OFI circuit.
  - RE-INHIBIT ERROR = The OFI circuit has been inhibited and errors are still detected. Inhibit has been re-applied on the OFI circuit.
  - RST PREEMPT = The failing circuit was preempted.
  - SWITCH = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

- i = Internal circuit name of PCT link that is reporting the error.
- j = Selected side error source and error mask register combined.
- k = Selected side error source register.
- l = Selected side error mask register.
- m = Non-Selected side error source and error mask register combined.
- n = Non-Selected side error source register.
- o = Non-Selected side error mask register.
- p = Internal circuit name of PCT link 0.
- q = Physical time slot interchanger (TSI) link number for PCT link 0.
- r = Physical TSI link number for the PCT link that is reporting the error.
- s = Number of recent failures of this error type (variable 'g') on this OFI circuit (in decimal).
- t = Error count threshold above which the recovery action will become stronger on the OFI circuit.

4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the OFI from service during a period of low usage and perform trouble locating procedures.

REPT:OFLBOOT-ACT

Software Release: 5E14 and later
Message Class: CLNK,MSGS, MTCE,ONTC
Application: 5
Type: Output

1. FORMAT

REPT OFLBOOT a [b] ACTIVITY: c EVENT=d 
[e] f

2. REASON FOR OUTPUT

To report information regarding the execution of the off-line boot procedure. This message is related to one of three message classes, depending upon the unit identified by variable ‘e’. If the unit is associated with the office network and timing complex (ONTC) unit, the message class will be ONTC. If the unit is associated with a communication link (CLNK), the message class will be CLNK. If the unit is associated with a message switch unit (CMP, FPC, MMP, MSCU, or PPC), the message class will be MSGS.

3. VARIABLE FIELD DEFINITIONS

a = The processor environment reporting the information. Valid value(s):
   AIM = Application integrity monitor kernel process.
   MSKP = Message switch kernel process.
   RINGMON = Ring monitor kernel process.
   SMKP = Switch maintenance kernel process.

b = Type of report. Valid value(s):
   FAILURE = A failure has occurred. The off-line boot procedure is stopped.
   TRBL = A trouble has been detected.

c = The current or last off-line boot activity executed. Valid value(s):
   CALL PROCESSING OFF = Call processing is not being processed in the AM.
   CALL PROCESSING ON = Call processing is being processed in the AM.
   OFF-LINE INITIALIZATION = The current or last activity on the off-line AM side is an initialization.
   POST SWITCH = The off-line side is performing operations associated with the SW:OFLBOOT input message.
   PRECHECK = Preliminary checks were executed to determine if a condition exists that may fail the off-line boot.
   PRESPLIT CONFIG = The system is preparing to split into an on-line and an off-line side.
   PRINT STATUS = Print the results of a previous check obtained from the off-line AM processor.
   REDUPLEX = The system is being reconfigured to the duplex configuration.
   SPLIT TO SIMPLEX = The AM, CM, and CNI is being split.

d = Event number.

e = Unit identification.

f = Additional data qualifying the report referenced by the reporting process indicated in field "a". This field provides additional information about why the off-line boot procedure detected an error.
SMKP or MSKP =  Valid value(s):
AIM

ACTIVITY EXECUTING ON WRONG SIDE = The requested OFLBOOT activity was found to be executing on an inappropriate side.
AIM REPORTS ERROR = The AIM process is reporting an error for the current activity. (A report detailing the specific error should follow)
AIM REPORTS SUCCESS = The AIM process is reporting success for the current activity.
AM INIT IN PROGRESS = The OFLBOOT cannot continue because the on-line side AM is currently initializing.
BAD APPLICATION PARAMETER = The application parameter given on the input message is not compatible with the OFLBOOT procedure.
CNIINIT INITIALIZING = The CNIINIT process is currently initializing, OFLBOOT cannot proceed.
CNIINIT NOT ATTACHED TO PORT = The CNIINIT process is not attached to its communications port. This usually indicates that the process does not exist.
CNIINIT REPORTS ERROR = The CNIINIT process is reporting an error to AIM for the current activity. (A report detailing the specific error should follow)
CNIINIT REPORTS SUCCESS = The CNIINIT process is reporting success to AIM for the current activity.
COULD NOT OBTAIN A REASON = AIM was interrupted before a valid reason could be established.
COULD NOT SEND MESSAGE TO CNIINIT = A failure occurred while trying to send an OFLBOOT related message to CNIINIT. AIM will request an abort of OFLBOOT.
COULD NOT SEND MESSAGE TO EIH = A failure occurred while trying to send an OFLBOOT related message to the EIH process. AIM will request that OFLBOOT not proceed.
COULD NOT SEND MESSAGE TO RINGMON = A failure occurred while trying to send an OFLBOOT related message to the RINGMON process. AIM will request that OFLBOOT not proceed.
COULD NOT SEND MESSAGE TO SMKP = A failure occurred while trying to send an OFLBOOT related message to the SMKP process. AIM will request that OFLBOOT not proceed.
DAP CRITICAL TO OFLBOOT FAILED = An application process critical to OFLBOOT was found in a failed or initializing state. AIM will request that OFLBOOT not proceed.
DAP INITIALIZING = An application process which is not critical to OFLBOOT was found to be initializing. OFLBOOT will not proceed unless the UCL option is specified.
LOGIC FLOW ERROR = AIM discovered inconsistent logic flow in a message which was received.
PREVIOUS BOOT FAILED = AIM determined that the off-line side initialization has failed.
RINGMON INITIALIZING = The RINGMON process is currently initializing, OFLBOOT cannot proceed.
RINGMON NOT ATTACHED TO PORT = The RINGMON process is not attached to its communications port. This usually indicates that the process does not exist.
RINGMON REPORTS ERROR = The RINGMON process is reporting an error to AIM
RINGMON REPORTS SUCCESS = The RINGMON process is reporting success to AIM for the current activity.
SMKP INITIALIZING = The SMKP process is currently initializing, OFLBOOT cannot proceed.
SMKP NOT ATTACHED TO PORT = The SMKP process is not attached to its communications port. This usually indicates that the process does not exist.
SMKP REPORTS ERROR = The SMKP process is reporting an error to AIM for the current activity. (A report detailing the specific error should follow)
SMKP REPORTS SUCCESS = The SMKP process is reporting success to AIM for the current activity.
SUCCESS = Activity completed successfully.

RINGMON = Valid value(s):
DLN AUDIT ERROR = An audit found errors with DLN data. RINGMON will request an abort of OFLBOOT.
DLN CONGESTED = The DLN is congested, OFLBOOT cannot proceed.
DLN RECOVERY REQUESTED = An error has occurred and the mate DLN is needed. RINGMON will request an abort of OFLBOOT.
OFF-LINE DLN NOT AVAILABLE = The off-line side DLN will not be available during the OFLBOOT. OFLBOOT cannot proceed.
ON-LINE DLN NOT AVAILABLE = The on-line side DLN will not be available during the OFLBOOT. OFLBOOT cannot proceed.
ON-LINE DLN NOT FOUND = The on-line side DLN could not be determined. OFLBOOT cannot proceed.
RETURNED MESSAGE THRESHOLD EXCEEDED = The returned-message threshold has been exceeded and recovery must take place. RINGMON will request an abort of OFLBOOT.
RING SILENCE RECOVERY REQUESTED = RINGMON has detected that the CNI ring is not transmitting messages. Recovery is required. RINGMON will request an abort of OFLBOOT.
RINGMON INITIALIZING = The RINGMON process is currently initializing, OFLBOOT cannot proceed.
SW DLN FAILURE = A switch of the DLNs has failed to complete. OFLBOOT cannot proceed.

4. ACTION TO BE TAKEN

This message is usually informational only, so no further action may be necessary. Wait for error to clear, then retry the EXC:OFLBOOT or SW:OFLBOOT input message.

It is possible to use the unconditional (UCL) or out-of-service (OOS) option to override the error and continue the procedure. However, be aware that if these options are specified, the system ignores internal requests to abort the procedure and reduplex the system for subsequent failures.

5. ALARMS

2. REASON FOR OUTPUT

Reports error(s) encountered in an offline boot procedure. Precheck failures would appear after either an execute (EXC:OFLBOOT) or switch (SW:OFLBOOT) UNIX® RTR input message. Split and boot failures would occur after an execute input message. A split failure reports difficulty the online side had in splitting the system, while a boot failure reports a problem encountered by the offline side during its boot. The monitor reports would occur for network and link related failures experienced by the online side of a split system. The system will attempt to recover from those failures by aborting the procedure, unless the unconditional (UCL) option was specified on the command line. For that case, the system will remain split. The duplex failures report a problem the online side experienced while reduplexing the system. The system is reduplexed due to either the stop (STOP:OFLBOOT) UNIX® RTR input
message or an internal request.

All output from the offline boot procedure should be carefully analyzed to determine the severity of the failure. These messages should be used in conjunction with other system indicators to determine how to proceed.

3. VARIABLE FIELD DEFINITIONS

a = Error encountered during IMS's offline boot precheck. With a few exceptions, these error types are non-overridable. A non-overridable error results in the command with which this precheck is associated being rejected. The exceptions are error types involving ring hardware availability that do not involve total loss of the nodes on the online side. These exceptions, however, may lead to a non-overridable error in other subsystem prechecks.

INIT IN PROGRESS ON CU:  i = An OFLBOOT may not be performed while an initialization is in progress.

MAINTENANCE OPERATION IN PROGRESS ON CU:  i, OPERATION:  n = An OFLBOOT should be performed on a stable system. The system is not considered stable when the named operation is in progress.

NODE IN GROW STATE FOUND, NODE:  m = An OFLBOOT is not permitted while nodes are in the grow state.

RING HARDWARE AVAILABILITY PARTIAL LOSS ON SIDE:  i = If the ring has not been split, there would be partial loss of the ring nodes on side 'i' upon splitting the ring. If the ring has been split, partial loss of the ring nodes on side 'i' has occurred.

RING HARDWARE AVAILABILITY PARTIAL LOSS ON SIDE:  i, PARTIAL LOSS ON SIDE:  j = If the ring were to be split, there would be partial loss of the ring nodes on both sides 'i' and 'j'.

RING HARDWARE AVAILABILITY PARTIAL LOSS ON SIDE:  i, TOTAL LOSS ON SIDE:  i = If the ring were to be split, there would be partial loss of the ring nodes on side 'i' and total loss of the ring nodes on side 'j'.

RING HARDWARE AVAILABILITY TOTAL LOSS ON SIDE:  i, TOTAL LOSS ON SIDE:  j = If the ring were to be split, there would be total loss of the ring nodes on both sides 'i' and 'j'.

RING NOT STABLE = The ring is undergoing either a recovery from a ring failure or a reconfiguration.

RING NOT STABLE = The ring is undergoing either a recovery from a ring failure or a reconfiguration.

RING SIDE IDENTIFICATION FAILED = Either the system is unstable, the ring is down, or there is a software problem.

UNKNOWN FAIL CODE, CODE:  o DATA1:  p, DATA2:  q

b = Error encountered during CNI's offline boot precheck. This error can either be associated with a specific side or with the entire system. Careful analysis of surrounding output to determine the extent of the problem and, if appropriate, which side of the system is implicated, is important. Valid value(s):

FAIL TO ACCESS POINT CODE:  t ON BOTH SIDES
FAIL TO ACCESS POINT CODE:  t ON MY SIDE
FAIL TO ACCESS POINT CODE:  t ON OTHER SIDE
LOCAL LINK:  r-s CONGESTION ON MY SIDE
LOCAL LINK:  r-s CONGESTION ON OTHER SIDE
MY SIDE LINK:  r-s NOT IN SERVICE
NO CCS7 NODES FOR MY SIDE
NO CCS7 NODES FOR OTHER SIDE
OFFLINE LINK: r-s NOT USABLE FOR SIDE SWITCH = The link identified is either ring out-of-service or has a link related problem. Either problem prevents this link from being activated to an in-service state on a side switch.
OTHER SIDE LINK: r-s NOT IN SERVICE
SLMK CONGESTED, CSGlobal = The link identified is either ring out-of-service or has a link related problem. Either problem prevents this link from being activated to an in-service state on a side switch.
TFC RECEIVED ABOUT POINT CODE: t
TFF RECEIVED ABOUT POINT CODE: t ON BOTH SIDES
TFF RECEIVED ABOUT POINT CODE: t ON MY SIDE
TFF RECEIVED ABOUT POINT CODE: t ON OTHER SIDE
TOTAL ERRORS FOUND: w, REPORTED: x
UNKNOWN FAIL CODE: o, DATA: p

Error encountered during IMS's attempt to split the ring. The system will automatically be reduplexed. There are no fail codes associated with these messages. Valid value(s):
ATTEMPT TO REMOVE A NODE FAILED = A software problem is indicated.
CANNOT ESTABLISH WORKING RING = Either a working ring cannot be established due to having no RPCs or not enough ring capacity, or there is a software problem.
JOB TO ISOLATE RING FAILED = The ring config job to isolate the offline side of the ring failed. Ring EAR will attempt to establish a working ring.
JOB TO ISOLATE RING TIMED OUT = A software problem is indicated.
JOB TO MOVE OTHER SIDE NODES TO GROW FAILED = Indicates either depletion of critical software resource or a software problem.
JOB TO MOVE OTHER SIDE NODES TO GROW TIMED OUT = A software problem is indicated.
MAINTENANCE OPERATION IN PROGRESS, OPERATION: n = An OFLBOOT should be performed on a stable system. The system is not considered stable when the named operation is in progress.
RING CONFIG REJECTED ISOLATION REQUEST = A variety of system or ring conditions can result in a ring config job being rejected. Refer to the CFR RING OM for a list of these conditions.
RING SIDE IDENTIFICATION FAILED = Either the system is unstable, the ring is down, or there is a software problem.
SPLIT STATE CORRUPTED = A software problem is indicated.
UNABLE TO ALLOCATE TIMER = Indicates critical software resources are depleted.

Aborted: y PHASE: z = The initialization of IMS on the offline CU failed. The level and phase (step) of the initialization are given.
COULD NOT RECOVER ALL IUNS IN A NODE TYPE = One or more IMS user nodes (IUNs) of a particular type on the offline side were not made active (ACT).
COULD NOT RECOVER ALL IUNS = One or more IUNs on the offline side were not made ACT.
COULD NOT RECOVER ANY IUNS IN A NODE TYPE = No IUNs of a particular type on the offline side were made ACT.
COULD NOT RECOVER ANY IUNS = No IUNs on the offline side were made ACT.
FAULTY NODE FOUND, NODE: m = Initialization procedures found the node indicated to be ring interface faulty.
IUN TEST FAILURE, NODE: m = Initialization procedures failed to establish communications with the node indicated.
LOST WORKING RING = Initialization procedures established a working ring on the offline side, but a subsequent ring failure resulted in that ring going down.
UNKNOWN FAIL CODE, CODE: o DATA1: p, DATA2: q

**WORKING RING NOT ESTABLISHED** = Initialization procedures failed to establish a working ring on the offline side. This is most likely due to ring hardware problems.

**e**

= Error encountered during CNI's attempt to boot on the offline side. Valid value(s):

- MEMBER MEMORY ALLOCATION FAILED FOR POINT CODE: t
- MSACK ERROR, MSTYPE: d
- NETWORK OR CLUSTER FOR POINT CODE: t INVALID
- NOT ENOUGH MEMORY ALLOCATED FOR LINK DATA
- SLMK INITIALIZATION REQUEST, REASON: a
- TOTAL ERRORS FOUND: w, REPORTED: x
- UNKNOWN FAIL CODE: o, DATA: p

**f**

= Potentially service-affecting problem encountered by CNI's online side monitor during an offline boot procedure. This monitor evaluates network and link-related events, and makes an assessment as to their impact on providing service. These messages are throttled so as not to flood the output devices. If the UCL option was specified on either the execute (EXC:OFLBOOT) or switch (SW:OFLBOOT) UNIX® RTR input message, recovery requires manual intervention. There are no fail codes associated with these messages. Valid value(s):

- DUE TO LINK SET: f FAILURE, POINT CODE: t INACCESSIBLE
- LOCAL LINK: r-s CONGESTION FAILURE
- NO CCS7 NODES FOR MY SIDE
- TCP RECEIVED ABOUT POINT CODE: t
- TFP RECEIVED WITH CONG LEVEL: g ABOUT POINT CODE: t
- TFP RECEIVED ABOUT POINT CODE: t

**g**

= Error encountered during IMS's attempt to reduplex the ring. IMS will continue to execute its reduplexing procedure in spite of experiencing any of the difficulties reported here, so that the ring is reduplexed to the fullest extent possible. This contrasts with the handling of errors encountered while splitting the ring. In that case, the splitting procedure is terminated upon the first error. There are no fail codes associated with these messages. Valid value(s):

- RING CONFIG JOB TO RECLAIM OFFLINE NODES FAILED, CODE: h

---

Copyright ©2003 Lucent Technologies
establish a working ring.

STATE OF DUPLEX JOB CORRUPTED = A software problem is indicated.

STEP TO QUARANTINE ISOLATED NODES FAILED, CODE: h¹ = The attempt to quarantine all the isolated nodes before including them into the active ring failed. However, this should not be cause for alarm, because the ring config job that includes them will quarantine them.

TRANSITION OF GROW NODES TO OOS, AUTO FAILED, CODE: h¹ = A software problem is indicated.

TRANSITION OF GROW NODES TO OOS, MANUAL FAILED, CODE: h¹ = A software problem is indicated.

TRANSITION OF OOS NODES TO AUTO FAILED, CODE: h¹ = A software problem is indicated.

UNABLE TO ALLOCATE TIMER = Indicates critical software resources are depleted.

h¹ = Valid value(s):

BOOT
PRECHECK

i = Error message. Valid value(s):

APPL NOT ATTACHED TO PT_USER = During the early stages of an initialization, CNIINIT discovered that its parent process (an application process) was not attached to its port.

CANNOT PROCESS REQUEST, TRY LATER = CNIINIT received a request for an OFLBOOT activity while it was processing some other CNIINIT job. CNIINIT cannot accept the OFLBOOT request until the other job is complete.

MSG NOT FROM AIM = CNIINIT received a request for an OFLBOOT from a process other than the AIM process.

MSG NOT FROM IMSDRV = CNIINIT was in the middle of processing some OFLBOOT activity. CNIINIT was expecting a message from IMSDRV, but received a message from some other process.

MSG NOT FROM SLMK = CNIINIT was in the middle of processing some OFLBOOT activity. CNIINIT was expecting a message from SLMK, but received a message from some other process.

NO TEXT AVAILABLE FOR THIS PRM = This PRM appears infrequently, therefore, the text for it has not been stored in the program.

T/O, CNIINIT CHILD PROCESS = CNIINIT was in the middle of processing some OFLBOOT activity. CNIINIT was expecting a message from SLMK or IMSDRV, but a guard timer fired instead.

UNABLE TO ALLOCATE A TIMER = CNIINIT was attempting to allocate a timer to guard a message exchange with either SLMK or IMSDRV. No timers were available.

UNABLE TO ALLOCATE AN RTR MSG BUF = CNIINIT was attempting to allocate an RTR message buffer to send a message to either AIM, SLMK or IMSDRV. No message buffers were available.

UNABLE TO GET PID FROM CLIENT PORT = CNIINIT was attempting to get the process identifier (PID) for AIM, SLMK or IMSDRV from the process’s port. A failure was returned by the operating system.

UNABLE TO READ LOW CORE = CNIINIT was unable to read low core during the execution of an OFLBOOT request.

UNABLE TO SEND A MESSAGE TO CLIENT = CNIINIT attempted to send a message to AIM, SLMK or IMSDRV. A failure was returned by the CNIINIT function "sendmsg".

UNABLE TO WRITE LOW CORE = CNIINIT was unable to write low core during the execution of an
OFLBOOT request.

\[j\] = A processor recovery message (PRM) digit. Refer to the Processor Recovery Message manual to decode this PRM.

\[k\] = Transfer prohibited (TFP) messages indicate that connectivity between the 5ESS® switch and the indicated office have been severed.

ON BOTH SIDES - During OFLBOOT TFP's received on both sides will not stop the initialization.
ON MY SIDE - During OFLBOOT TFP's received on my side will not stop the initialization.
ON OTHER SIDE - During OFLBOOT TFP's received on the other side will stop the OFLBOOT procedure because communications can be established through the mate link on the other side on the ring. The boot will be stopped and the CNI RING duplexed in order to get access to the working link.

\[l\] = CU identity.

\[m\] = Group and member number.

\[n\] = Description of operation in progress. Valid value(s):

- IUN REMOVE
- IUN RESTART
- IUN RESTORE
- NODE DIAGNOSTIC
- OP:NPMEM
- OPERATION UNKNOWN
- RING CHANGE
- RING INIT OR RING EAR
- RPC REMOVE, RESTORE, OR RESTART

\[o\] = An unknown fail code. Refer to the corresponding section of the updated REPT OFLBOOT ERR OM provided with the new release to find the meaning of this code.

\[p\] = Data associated with unknown fail code.

\[q\] = Data associated with unknown fail code.

\[r\] = Group number of the link node.

\[s\] = Member number of the link node.

\[t\] = Point code. Valid value(s):

\[j^1k^1l^1\] = ANSI® standard.
\[j^1m^1n^1l^1\] = AT&T standard.

\[u\] = SLMK process congestion indicators (1-7). SLMK process congestion 0 is normal, and the offline boot can proceed. Nonzero values indicate the SLMK process is under an unusually heavy load.

\[v\] = SLMK process state (0-23). SLMK process 14 is normal, and the offline boot can proceed. Other values indicate an initialization is in progress.

\[w\] = Number of errors found in decimal.
x = Number of errors reported in decimal.
y = Level of IMS initialization that was aborted while booting the offline CU.
z = Phase of the initialization that was aborted.
a\(^1\) = SLMK requested an initialization while attempting to boot on the offline side.
b\(^1\) = File name.
c\(^1\) = Type of file error. Valid value(s):
   | BAD VERSION NUMBER |
   | SIZE WRONG         |

d\(^1\) = Check point number, error code, message type, return code, or file descriptor number.
e\(^1\) = Network identification number (1-255).
f\(^1\) = Link set number (1-511).
g\(^1\) = Congestion level (1-3).
h\(^1\) = Code associated with the named failure.
i\(^1\) = Side of ring. Side 0 is LN00-1 through RPCN32-0. Side 1 is LN32-1 through RPCN00-0.
j\(^1\) = Side of ring which is the opposite of side h\(^1\).
k\(^1\) = The network identifier (1-255).
l\(^1\) = The cluster identifier (0-255).
m\(^1\) = The member identifier (0-255).
n\(^1\) = The region identifier (0-31).
o\(^1\) = The cluster identifier (0-7).

4. ACTION TO BE TAKEN

Failures reported by the offline boot procedure can be significant and difficult to analyze out of context. When these errors occur, the subsystem implicated should be examined to determine the degree and extent of the problem. If a software problem is indicated or suspected, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 1, correct the problem or wait for it to clear, then retry the execute (EXC:OFLBOOT) or switch (SW:OFLBOOT) UNIX RTR input message.

For Format 2, for local problems, correct the node or local link trouble before proceeding or use the UCL option. For remote network problems, either wait for the problem to clear or use the UCL option.

It is possible to use the UCL option to override the failure and continue the procedure. However, be aware that if this option is specified, the system will ignore internal requests to abort the procedure and reduplex the system for
subsequent failures. These failures could be more serious in nature. Therefore, when using this option, one should monitor the operation of the system closely and take manual action for failures significant in nature.

A summary report will be given. Take action on errors reported. Absence of this line indicates no errors either found or reported. However, if there are reports of lost output messages, one should not assume there were no errors. If possible, rerun the procedure to ensure there were no errors. Also, make other system checks, such as running audits and viewing measurements reports and critical events, to determine how to proceed.

For Format 3, correct the problem or wait for it to clear, then retry the execute (EXC:OFLBOOT) UNIX® RTR input message.

For Format 4, assess the condition of the system. If it is acceptable, no further action is needed. If it is an unacceptable condition on the offline side, either attempt to correct the condition or use the stop (STOP:OFLBOOT) UNIX® RTR input message to reduplex the system.

For Format 5, verify the correctness of both the software release and office-dependent data (ODD) being used for the offline boot and reattempt the input message. Most errors will be caused by an incorrect database. If the error occurs while attempting to update to a new software release, ensure that any retrofit procedure was done correctly. If the error occurs verifying back-up copies of the system, look for missing or out-of-date files.

A summary report will be given. Take action on errors reported. Absence of this line indicates no errors either found or reported. However, if there are reports of lost output messages, one should not assume there were no errors. If possible, rerun the procedure to ensure there were no errors. Also, make other system checks, such as running audits, verifying retrofit procedures, and checking ODD to determine how to proceed.

<table>
<thead>
<tr>
<th>Error code:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>For either SIZE WRONG or BAD VERSION NUMBER file error, verify that the database of the system being used for the offline side is correct.</td>
</tr>
<tr>
<td>-14,32-33</td>
<td>The system encountered a problem when attempting to read the named file while booting on the offline side. The error is indicated by the ‘z’ field. If attempting to upgrade software releases, rerun the generic retrofit procedure. If doing a system backup check, verify the integrity of the file system.</td>
</tr>
<tr>
<td>5-22</td>
<td>Correct and retry.</td>
</tr>
<tr>
<td>23-30</td>
<td>Failures of this variety are indicators of major problems while attempting to boot on the offline side. Look for other indicators of failure to determine how to proceed. No attempt should be made to switch to this side until the cause of these errors is resolved.</td>
</tr>
<tr>
<td>34-36</td>
<td>The system encountered a problem while attempting to open the named file while booting on the offline side. If attempting to upgrade software releases, rerun the generic retrofit procedure. If doing a system backup check, verify the integrity of the file system. Verify that the named file exists and is readable.</td>
</tr>
</tbody>
</table>

For Format 6, immediately evaluate the reported error’s impact on service. If the UCL option was used on either the execute (EXC:OFLBOOT) or switch (SW:OFLBOOT) UNIX® RTR input message, automatic recovery by the system is inhibited. Consider using the stop (STOP:OFLBOOT) UNIX® RTR input message to manually recover.

For Format 7, assess the condition of the system. If it is acceptable, no further action is needed. If not, issue the stop (STOP:OFLBOOT) UNIX® RTR input message again (perhaps using the RST option) or take other appropriate action.

For Format 8, refer to the PRM manual for an explanation of the PRM.

<table>
<thead>
<tr>
<th>Error code:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Take no immediate action. The message may have been “left over” from a previous OFLBOOT execution that failed. If the condition persists, then call your support organization for help.</td>
</tr>
<tr>
<td>3,4</td>
<td>There is a fundamental operating system error. Retry the OFLBOOT input message. If you get the same failure again, then call your support organization for help.</td>
</tr>
<tr>
<td>5,6</td>
<td>A sequencing error occurred during the execution of OFLBOOT. Wait a few minutes and retry the OFLBOOT input message. If you get the same failure again, then call your support organization for help.</td>
</tr>
<tr>
<td>7</td>
<td>IMSDRV or SLMK took longer than the prescribed time to perform the OFLBOOT activity. Wait a few minutes and retry the OFLBOOT input message. If you get the same failure again, then call your support organization for help.</td>
</tr>
<tr>
<td>Minutes</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>8</td>
<td>Wait until CNIINIT completes the job it has in progress and then try the OFLBOOT input message again.</td>
</tr>
<tr>
<td>9</td>
<td>The OFLBOOT activity that was in progress will fail. Retry the input message. If it fails once again, then force CNI into a full process initialization (FPI) to clear up old timers. Then try the OFLBOOT input message again.</td>
</tr>
<tr>
<td>10</td>
<td>The OFLBOOT activity that was in progress will fail. Retry the input message. If it fails once again, then call your support organization for help to restore message buffers to the system.</td>
</tr>
<tr>
<td>11</td>
<td>The OFLBOOT activity that was in progress will fail. Retry the input message. If it fails once again, then force CNI into a FPI initialization. Then try the OFLBOOT input message again.</td>
</tr>
<tr>
<td>12</td>
<td>The OFLBOOT activity that was in progress will fail. The operating system was unable to send the message to the process requested by CNIINIT. Retry the input message. If it fails once again, then call your support organization for help.</td>
</tr>
<tr>
<td>13</td>
<td>Until this problem is corrected, there will be a loss of CCS7 capability. A major application initialization level should probably be initiated since the problem appears to be in the application. Call your support organization for help.</td>
</tr>
</tbody>
</table>

For Format 9, take no action, the switch will abort the OFLBOOT when indicated to recover CNI RING hardware used by the off-line side during the procedure. If this condition persists and the OFLBOOT procedure fails repeatedly, Call your support organization for help.

5. **ALARMS**

A major alarm sounds when online monitoring messages are output Format 6.

6. **REFERENCES**

Software Release: 5E14 and later  
Message Class: CLNK, MSGS, MTCE, ONTC  
Application: 5  
Type: Output

1. FORMAT

REPT OFLBOOT TRACE a ACTIVITY: b EVENT=c  
d

2. REASON FOR OUTPUT

To report program trace information regarding the execution of the off-line boot procedure.

3. VARIABLE FIELD DEFINITIONS

a = The processor environment reporting the information. Valid value(s):
   AIM = Application integrity monitor kernel process.
   MSKP = Message switch kernel process.
   RINGMON = Ring monitor kernel process.
   SMKP = Switch maintenance kernel process.

b = The current or last off-line boot activity executed. Valid value(s):
   CALL PROCESSING OFF = Call processing is not being processed in the AM.
   CALL PROCESSING ON = Call processing is being processed in the AM.
   OFF-LINE INITIALIZATION = The current or last activity on the off-line AM side is an initialization.
   POST SWITCH = The off-line side is performing operations associated with the SW:OFLBOOT command.
   PRECHECK = Preliminary checks were executed to determine if a condition exists that may fail the off-line boot.
   PRESPLIT CONFIG = The system is preparing to split into an on-line and an off-line side.
   PRINT STATUS = Print the results of a previous check obtained from the off-line AM processor.
   REDUPLEX = The system is being reconfigured to the duplex configuration.
   SPLIT TO SIMPLEX = The AM, CM, and CNI is being split.

c = Event number.

d = Program trace data.

4. ACTION TO BE TAKEN

This report is produced only if the TRACE option is used on the EXC:OFLBOOT, SW:OFLBOOT, or STOP:OFLBOOT input messages. This report is expected to be used only if technical assistance is required.

5. ALARMS

None.

</table>
2. REASON FOR OUTPUT

These messages are output to report information regarding the execution of the offline boot feature.

3. VARIABLE FIELD DEFINITIONS

a  = Message type.
ABORTED = Application requested to stop the oflboot procedure; devices moved to the off-line side will be restored.
COMPLETED = Indicates offline side boot has completed.
INFO = Informational dump.
STOPPED = Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the off-line side are restored.
TERMINATED = UNIX® RTR software-initiated termination of the oflboot procedure; devices moved to the off-line side will not be restored.

b = Text line. Valid value(s):
1  ABORT DENIED DURING SWITCH = Application-initiated aborts are ignored while SW:OFLBOOT is running.
2  ADP IS NOT RUNNING, CANNOT RESTORE g h = Automatic diagnostic process (ADP) is not running, so the automatic restore of the specified unit will not be done.
3  AIM PRINTING OF PRE-CHECKS OR POST-CHECKS TIMED OUT = Offline boot did not receive results of activities before the timers expired.
4  AIM REPORTED FAILURE TO REDUXPLEX = Application integrity monitor (AIM) reported failure to put the system back to its state previous to the offline boot.
5  AIM REPORTED FAILURE TO SPLIT = AIM reported failure to split in preparation for booting off-line.
6  AIM REPORTED FAILURE TO TURN CALL PROCESSING OFF = AIM reported call origination could not be turned off in preparation for side switching. If retrofit was not specified, SW:OFLBOOT will fail.
7  AIM REPORTED FAILURE TO TURN CALL PROCESSING ON = AIM reported call origination could not be turned on.
8  AIM REPORTED PRE-CONFIGURATION FAILURES = AIM reported pre-configuration errors in preparation for booting off-line.
9  CANNOT ACCESS A DIAGNOSTIC/MAINTENANCE SPECIAL DEVICE FILE = There were problems in obtaining a special device file; therefore, a disk file controller (DFC) cannot be removed. Offline boot will be terminated.
10 CANNOT ACCESS ECD = Device information cannot be accessed from the RC/V equipment configuration database (ECD) while booting off-line or side switching. Depending on the function ‘e’ printed, there are different consequences: CHECK_OOS = Cannot get a UCB record to verify that the unit has indeed been
removed as part of UNIX® RTR offline boot pre-configuration. Offline boot will be automatically terminated.

CHG_DFC = Cannot get a DFC UCB or a DFC sub-unit UCB record before moving it to the out-of-service (OOS) state as part of stopping the offline boot. The DFC or its sub-unit will remain in the GROW state.

CHG_IOPS = Cannot get an input/output processor (IOP) UCB or an IOP sub-unit UCB record before moving it to the OOS state as part of stopping the offline boot. The IOP or its sub-unit will remain in the GROW state.

DEGROW_DFC = Cannot get a DFC UCB record before unequipping it. The DFC will remain in the OOS state. Offline boot will be automatically terminated.

DEGROW_IOP = Cannot get an IOP UCB record before unequipping it. The IOP will remain in the OOS state. Offline boot will be automatically terminated.

EQUIP_CU = Cannot get control unit (CU) UCB when equipping the CU community as part of stopping the offline boot. The complete CU community or some of its sub-units will remain in the UNEQIP state.

GROW_DFC = Cannot get a DFC UCB or a DFC sub-unit UCB record before equipping it as part of stopping the offline boot. The DFC or its sub-unit will remain in the UNEQIP state.

GROW_IOPS = Cannot get an IOP UCB or an IOP sub-unit UCB record before moving it to the OOS state as part of stopping the offline boot. The IOP or its sub-unit will remain in the UNEQIP state.

OLBCONTROL = Cannot get CU UCB record before removing the CU community. Offline boot will be automatically terminated.

RMV_DFC = Cannot get a DFC UCB record before removing it. Offline boot will be automatically terminated.

RMV_IOPS = Cannot get an IOP UCB record before removing it. If more than one IOP was specified in the EXC_OFLBOOT command line, then one or more IOPs may have been moved to the OOS state and remain that way even though offline boot has been automatically terminated. This is because one or more messages to remove IOP may have already been dispatched to the input/output driver (IODRV) before this failure occurred.

RSTFCN = Cannot get a CU UCB record before sending ADP a message to restore the CU as part of stopping offline boot. The DFC will remain in the OOS state.

RST_DFC = Cannot get a DFC UCB record before sending ADP a message to restore the DFC as part of stopping offline boot. The DFC will remain in the OOS state.

RST_IOPS = Cannot get an IOP UCB record before sending ADP a message to restore it as part of stopping offline boot. If more than one IOP was specified in the EXC_OFLBOOT command line, then one or more IOPs may have been restored despite this failure. This is because one or more messages to ADP may have already been dispatched.

TIM_UNIT = Cannot get an IOP UCB record or an IOP sub-unit UCB record to report that the IODRV timed out when growing the device. The unknown device will remain in the UNEQIP or GROW state.

UNRESERVE = Cannot get a UCB record while stopping offline boot. Some units'
CANNOT CLOSE SPECIAL DEVICE FILE = Disk driver (DKDRV) could not close a special device file. Consequently, its internal tables are corrupt and indicate a DFC is undergoing maintenance forever.

CANNOT COPY MEMORY AREA FROM OFFLINE CU TO ONLINE CU = Information cannot be transferred either from the on-line CU to the off-line side or vice versa.

CANNOT COPY MEMORY AREA FROM ONLINE CU TO OFFLINE CU = Information cannot be transferred either from the on-line CU to the off-line side or vice versa.

CANNOT CREATE VFYDISKECD PROCESS = The process that checks to see if a disk RC/V ECD session is in progress cannot be created.

CANNOT DETERMINE ACT IOP FOR MTTY OR ROP = Either the system is missing its maintenance teletypewriter (MTTY) or receive-only printer (ROP) or the RC/V ECD is corrupt. Offline boot cannot be guaranteed under these conditions.

CANNOT DETERMINE IF OFFLINE SIDE IS RUNNING = The on-line CU cannot determine if the off-line CU is running or not. Before the on-line CU tries to access the off-line CU for a memory copy, it needs to know whether the off-line CU is running. This is done by reading the off-line CU system status register (SSR) through a series of maintenance channel (MCH) instructions. These instructions failed, which indicates problems with the MCH. This condition sometimes results in automatic termination of offline boot.

CANNOT GROW g h = Prints if a device cannot be grown.

CANNOT OUTPUT POST MORTEM, REASON v = Error interrupt handler (EIH) could not output the post-mortem for reason 'v'.

CANNOT PORT SWITCH MTTY = A message could not be sent to the IODRV to port switch an MTTY or ROP device.

CANNOT PORT SWITCH MTTY OR ROP = The IODRV did not respond to the port switch message in the allotted time frame. When the timer expired, EIH checked the MTTY and ROP devices and found that they had not been port switched.

CANNOT PORT SWITCH ROP = A message could not be sent to the IODRV to port switch an MTTY or ROP device.

CANNOT READ OFFLINE CU SSR = The on-line CU cannot determine if the off-line CU is running. Periodically, the on-line CU checks the off-line CU's SSR to know whether the off-line CU is running or not. This is done by reading the off-line CU SSR through a series of MCH instructions. The instructions failed which indicates problems with the MCH. This condition will result in the automatic termination of offline boot.

CANNOT RECONFIGURE CU COMMUNITY = Devices could not be reconfigured due to RC/V ECD access or update failures. Another possibility is that the device was properly reconfigured, but a message could not be sent to real time status (RTS) to
update the display pages information.

24 CANNOT RELEASE AN MDCT RECORD = While trying to release a minor device chain table (MDCT) RC/V ECD record of type diagnostic that is associated with the disk community, the RC/V ECD could not be accessed or updated.

25 CANNOT REMOVE DFC = Units could not be removed in preparation for booting off-line.

26 CANNOT REMOVE IOP = Units could not be removed in preparation for booting off-line.

27 CANNOT RESET SANITY TIMERS = Sanity timers cannot be reset or cleared.

28 CANNOT RESTORE TO ORIGINAL STATE g h = Devices could not be reconfigured due to RC/V ECD access or update failures. Another possibility is that the device was properly reconfigured, but a message could not be sent to RTS to update the display pages information.

29 CANNOT RESTORE g h = A message could not be sent to ADP to unconditionally restore a CU, DFC, or IOP community.

30 CANNOT SEND DEGROWTH MESSAGE TO IODRV = Degrowth requests cannot be sent to IODRV in preparation for booting off-line.

31 CANNOT SEND GROWTH MESSAGE TO DKDRV = Growth requests cannot be sent to DKDRV in order to reduplex the system.

32 CANNOT SEND GROWTH MESSAGE TO IODRV = Growth requests cannot be sent to IODRV in order to reduplex the system.

33 CANNOT SEND IOCLOSE MESSAGE TO DKDRV = A message cannot be sent to DKDRV requesting it to close a special device file. If the message prints twice, it means DKDRV will not have a chance to close a special device file. Consequently, its internal tables are corrupt and indicate a DFC is undergoing maintenance forever.

34 CANNOT SEND IOOPEN MESSAGE TO DKDRV = Message cannot be sent to DKDRV. Usually the reason is that a message buffer cannot be allocated for the message.

35 CANNOT SEND MESSAGE TO PMPRC = Message cannot be sent to PMPRC. Usually the reason is that a message buffer cannot be allocated for the message.

36 CANNOT SEND MESSAGE TO USER PROCESS, PID i = Message cannot be sent to a user process identified by its process ID. Usually the reason is that a message buffer cannot be allocated for the message.

37 CANNOT SEND OLBCPOFF MESSAGE TO AIM ERROR o = Message requesting AIM to turn call origination off failed. Reason for the failure is given by ‘o’.

38 CANNOT SEND OLBCPON MESSAGE TO AIM ERROR o = EIH could not send a message to AIM of activity OLBCPON. This message is serious; the system does not have call origination. Reason for the failure is ‘o’.
CANNOT SEND OLBDUPLEX MESSAGE TO AIM ERROR o = Message requesting AIM to reduplex failed. Reason for the failure is given by 'o'.

CANNOT SEND OLBPOSTSW MESSAGE TO AIM ERROR o = Message requesting AIM to take post-switch actions failed. Reason for the failure is given by 'o'.

CANNOT SEND OLBPRECFG MESSAGE TO AIM ERROR o = Message requesting AIM to pre-configure for an offline boot failed. Reason for the failure is given by 'o'.

CANNOT SEND OLBPRECHK MESSAGE TO AIM ERROR o = Message requesting AIM to perform offline boot pre-checks failed. Reason for the failure is given by 'o'.

CANNOT SEND OLBPRINT MESSAGE TO AIM ERROR o = Message requesting AIM to print the results of a previous check failed. Reason for the failure is given by 'o'.

CANNOT SEND OLBSPLIT MESSAGE TO AIM ERROR o = Message requesting AIM to unequip application hardware RC/V ECD UCBs failed. Reason for the failure is given by 'o'.

CANNOT SEND REC_UPDATE MESSAGE TO DKDRV = Message cannot be sent to DKDRV to update its disk display pages. Usually the reason is that a message buffer cannot be allocated for the message.

CANNOT SEND UNTRMV MESSAGE TO DKDRV = DFC remove request cannot be sent to DKDRV in preparation for booting off-line.

CANNOT SEND UNTRMV MESSAGE TO IODRV = IOP remove request cannot be sent to IODRV in preparation for booting off-line.

CANNOT SEND UNTRST MESSAGE TO IODRV = EIH could not send a message during a side switch to restore an MTTY, ROP, or Switching Control Center (SCC) device.

CANNOT UNEQIP DEVICES = CU community devices cannot be unequipped.

CANNOT UNEQIP g h = DFC and IOP devices and their sub-units cannot be unequipped.

CANNOT UPDATE ECD = The RC/V ECD cannot be updated. The reason is dependent on the function 'e' printed:

DFS = Could not reserve a unit's UCB record as part of EXC:OFLBOOT pre-checks.

UNRESERVE = Could not unreserve a UCB record while stopping offline boot. Some units' UCB records may remain reserved.

CC_OTHA IN THE ON-LINE = A level 1 interrupt has occurred. The other central control (CC) hardware has reported a store hardware fault error (ER12). Refer to the APP:REGISTER appendix, ERROR REGISTER (ER) (NOTE), in the Appendixes section of the Output Messages manual for more information on ER12. Offline boot will be terminated because of faulty hardware.

CC_OTHC IN THE ON-LINE = A level 1 interrupt has occurred. The other CC hardware has reported a read parity fault hardware error (ER14). Refer to the
APP:REGISTER appendix, ERROR REGISTER (ER) (NOTE), in the Appendixes section of the Output Messages manual information on ER14. Offline boot will be terminated because of faulty hardware.

54 CC_OTHD IN THE ON-LINE = A level 1 interrupt has occurred. The other CC hardware has reported a refresh parity fault hardware error (ER13). Refer to the APP:REGISTER appendix, ERROR REGISTER (ER) (NOTE), in the Appendixes section of the Output Messages manual for more information on ER13. Offline boot will be terminated because of faulty hardware.

55 CC_OTHO IN THE ON-LINE = A level 1 interrupt has occurred. The other CC hardware has reported a store time-out hardware error (ER15). Refer to the APP:REGISTER appendix, ERROR REGISTER (ER) (NOTE), in the Appendixes section of the Output Messages manual for more information on ER15. Offline boot will be terminated because of faulty hardware.

56 CHANGED DISK FORCES = The DFC that is now forced on-line is not the same DFC that was forced on-line when the offline boot procedure was started. Offline boot is terminated.

57 CORRUPT TIMER SLOT = EIH found that the timer slot did not correspond to the ongoing action. Because EIH cannot use the corrupt time value from the slot, it uses a best guess of the time value instead.

58 CORRUPT VALUE FOR ABORT TIMER = The offline boot stop sequence can be started when EIH is performing an action that:
- Does not need a timer to monitor it (NOTIMER).
- Needs a timer to monitor it, but the timer has not been started (NEEDTIMER).
- Needs a timer to monitor it and the timer has been started (RUNNING).

This information (NOTIMER, NEEDTIMER, or RUNNING) has been found to be inconsistent or corrupted in comparison with the ongoing action. EIH will assume the worst case (a timer is RUNNING) and continue with the stop sequence. This assumption may result in this text line printing several times.

59 COULD NOT PORT SWITCH = The IODRV returned a port switch request message with a failure code.

60 COULD NOT TELL SIM TO BLOCK ECD 1 AUDITS = The EIH process could not tell the system integrity monitor (SIM) process to block the ECD 1 audits.

61 COULD NOT TELL SIM TO BLOCK ECD 3 AUDITS = The EIH process could not tell the SIM process to block the ECD 3 audits.

62 COULD NOT TELL SIM TO BLOCK ECD 2 (APPECD) AUDITS = The EIH process could not tell the SIM process to block the ECD 2 (appecd) audits.

63 COULD NOT TELL SIM TO BLOCK ECD 2 (ECD) AUDITS = The EIH process could not tell the SIM process to block the ECD 2 (ecd) audits.

64 COULD NOT TELL SIM TO UNBLOCK ECD 1 AUDITS = The EIH process could
not tell the SIM process to unblock the ECD 1 audits.

65 COULD NOT TELL SIM TO UNBLOCK ECD 3 AUDITS = The EIH process could not tell the SIM process to unblock the ECD 3 audits.

66 COULD NOT TELL SIM TO UNBLOCK ECD 2 (APPECD) AUDITS = The EIH process could not tell the SIM process to unblock the ECD 2 (appecd) audits.

67 COULD NOT TELL SIM TO UNBLOCK ECD 2 (ECD) AUDITS = The EIH process could not tell the SIM process to unblock the ECD 2 (ecd) audits.

68 DFC PRECHECKS FAILED = DFC-related checks failed. Offline boot will be terminated.

69 DISK RC/V ECD SESSION IN PROGRESS = A disk RC/V ECD session is in progress. Offline boot will be terminated.

70 DKDRV HAS NOT CLOSED SPECIAL DEVICE FILE FOR g h = Indicates that Unix® RTR pre-configuration has not completed because the DKDRV has not closed a file used in removing the specified device.

71 ILLEGAL SW OFLBOOT COMMAND = A side switch was requested outside of offline boot (that is, offline boot is not running).

72 INCORRECT OLBSTATE c = When EIH was processing a system initialization fault, it found that it had to resume offline boot activities. However, the state information was corrupt. Hence, EIH will not be able to resume the offline boot.

73 INTERNAL DFC NUMBER CORRUPT = Indicates corruption of EIH's internal offline boot data.

74 INTERNAL DFC TABLE CORRUPT = Indicates corruption of EIH's internal offline boot data.

75 INTERNAL ERROR, BAD OLBSTATE c SEEK TECHNICAL ASSISTANCE = An illegal instruction in EIH was found during the offline boot procedure.

76 INTERNAL INITLEVEL CORRUPT = A system wide initialization (FLT_SINIT) was processed by EIH. EIH found it had to resume offline boot activities, but could not because the specified initialization level (2) might use a corrupt RC/V ECD. Offline boot will be terminated.

77 INTERNAL IOP TABLE CORRUPT = Indicates corruption of EIH's internal offline boot data.

78 INTERNAL LOGIC ERROR = Indicates a logic error has been encountered. Offline boot will be terminated.

79 INTERNAL UNITS TABLE CORRUPT = EIH used an RC/V ECD RID stored internally to read a RC/V ECD UCB record into a local buffer. When EIH tried to verify the buffer information, it found the device type field to be inconsistent. This situation indicates that, although the RID used by EIH was a valid one, it pointed to the incorrect UCB. That is, EIH's RID storage is corrupt. Also this could mean that the RC/V ECD UCB record itself is corrupt.
INVALID MESSAGE RECEIVED = Invalid message was received from the process identified by its process ID.

INVALID MESSAGE RECEIVED FROM AIM, ACTIVITY j = Invalid message was received from AIM.

INVALID MESSAGE RECEIVED FROM IODRV, TYPE k = Invalid message was received from IODRV.

INVALID OLBSTATUS FOR MESSAGE RECEIVED FROM AIM, ACTIVITY j = The activity carried out by AIM is inconsistent with the current OLBSTATE.

LAST OLBSTATE d INVALID = During the stop offline boot sequence, state information used to determine how much work needs to be done was found to be corrupt. The stop sequence will assume the highest level of work is needed and continue.

LAST OLBSTATE d INVALID FOR ABORT = During the stop offline boot sequence, state information used to determine how much work needs to be done was found to be corrupt. The stop sequence will assume the highest level of work is needed and continue.

LATE MESSAGE RECEIVED = A message was received too late from the process identified by its process ID.

LOW CORE AMODE CORRUPT = Indicates corruption of low core.

LOW CORE IOPMASK CORRUPT = EIH cannot interpret the contents of the lowcore IOPMASK value because the contents of lowcore ORIGSIDE is corrupt.

LOW CORE ORIGSIDE CORRUPT = Indicates corruption of low core.

MEMORY COPY FAILED = A memory-to-memory copy failed because either the off-line CU never halted to allow the copy or there was a CC_OTHC or CC_OTHTO fault.

MESSAGE FROM PMPRC TOO LATE -- DISCARDING = Message was received out of time from PMPRC. EIH took a default action, which could include terminating the offline boot procedure.

MESSAGE FROM DKDRV TOO LATE -- DISCARDING = Message was received out of time from DKDRV. EIH took a default action, which could include terminating the offline boot procedure.

MESSAGE FROM VFYDISKECD TOO LATE -- DISCARDING = Message was received out of time from the VFYDISKECD process. EIH took a default action, which could include terminating the offline boot procedure.

MESSAGE FROM AIM TOO LATE -- DISCARDING = Message was received out of time from AIM. EIH took a default action, which could include terminating the offline boot procedure.

MTTY OR ROP NOT ACTIVE FOR ONLINE SIDE = MTTY, or ROP, or both are not active for the on-line CU. Offline boot is not supported without an MTTY and a ROP. Offline boot will be terminated.
MUST BE ACT TO REMOVE = A device is in the wrong state to remove. The incorrect state is given by 'p' which immediately precedes this text line.

MUST BE IN ACT OR INIT STATE TO DEGROW = A device is in the ACT or INIT states when it should be in a state valid for the degrowth operation (OOS state). The incorrect state is given by 'p' which immediately precedes this text line.

MUST BE IN ACT OR INIT STATE TO REMOVE = A device is in the wrong state to remove. The incorrect state is given by 'p' which immediately precedes this text line.

MUST BE OOS TO RESTORE = A device is not in the state that the offline boot procedure expects it to be. The incorrect state is given by 'p' which immediately precedes this text line.

NO DISK FORCED = There is no DFC forced on-line.

NO TIMER SLOTS AVAILABLE = Indicates internal timer slots are all used up. Timer slots are freed at this point and the "no timer slots available" message is printed.

NOT ALL UNITS ARE OOS = Indicates not all units are OOS. Before offline boot moves a device to the off-line side, it first puts the device in the OOS state. One or more of the devices that are to be moved to the off-line side are not in the OOS state. Offline boot will be terminated.

NOT IN GROW STATE = During the stop offline boot process, a unit has been found that is not in the correct state to allow it to be reconfigured back into service, or the unit in question has already been moved (not by offline boot) to some other unexpected state. In either case, the reconfiguration sequence is not followed for this device. The incorrect state is given by 'p' which immediately precedes this text line.

NOT IN UNEQIP STATE = A device is not in the state that the offline boot procedure expects it to be. The incorrect state is given by 'p' which immediately precedes this text line.

NOT OOS = EIH is expecting all the devices going to the off-line side to be in the OOS state. However, it has found that one or more of these devices are not in the OOS state. Offline boot will be terminated. The incorrect state is given by 'p' which immediately precedes this text line.

OFFLINE AIM REPORTED CHECKS FAILURE = AIM reported pre-check errors.

OFFLINE BOOT TIMED OUT = The timer set for booting off-line has expired. Another timer will be set with the original timeout value and offline boot will continue until manually stopped or off-line AIM writes the completion word in low core.

OFFLINE CU NOT RUNNING = Output by the on-line CU, this message indicates that the off-line CU is not running. Offline boot will be terminated.

OFFLINE LOW CORE BOOT STATUS IS CORRUPT = The periodic monitor that checks whether AIM has written the boot completion word in the off-line low core found the contents of the word corrupt. It will assume that the boot is not done.
OFFLINE RTR CHECKS FAILED ERROR  q = UNIX® RTR encountered pre-check errors. Error is given in variable ‘q’.

OFFLINE RTR-AIM COMMUNICATION FAILED = Indicates EIH could not send a message to AIM in the off-line side or that AIM did not reply on time.

OFFLINE SIDE DID NOT COMPLETE THE LBOOT STEP = If failure PRMs are present, they will indicate that the disk unit (MHD 0 or MHD 1) used to boot the offline side is bad. Examples of corruption are a bad or non-existent volume table of contents (VTOC) or junk in the LBOOT partition. If failure PRMs are not present, there may be a problem with the MCH or the CU complex.

OLBABORT EVENT RECEIVED -- ABORTING = Indicates EIH has received an abort event; procedures to stop the offline boot have begun. Procedures will attempt to restore units.

OLBCONFIG EVENT RECEIVED -- ABORTING = Indicates EIH has received an abort event because an essential device like an SCC or MHD is not active or equipped; procedures to stop the offline boot have begun. Procedures will attempt to restore units.

OLBSTATE c EXPECTED EXC_BOOT OR SW_PRCHK = A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

OLBSTATE c NOT EXC_AIMECD = A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

OLBSTATE c NOT EXC_CFGAIM = A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

OLBSTATE c NOT EXC_POSTSW = A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

OLBSTATE c NOT EXC_RMV = A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

OLBSTATE c NOT STOP_IOPS = A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action is taken on the message; it is discarded.

PORT SWITCH NOT DONE = The IODRV returned a port switch request message with a success code. However, when EIH verified this against the ECD, it found that the devices had not really been port switched.

RC/V ECD SESSION IN PROGRESS = An incore RC/V ECD session is in progress. Offline boot will be terminated.

RESTORE OF MTTY, ROP, SCC AND/OR SCSDC FAILED AFTER SIDE SWITCH = During a side-switch, EIH received a message from the IODRV saying that it could not restore an MTTY, ROP, SCC, or scanner and signal distributor controller.
SCSDC device.

RETROFIT NOT SPECIFIED -- REDUPELEXING = Call origination could not be turned on in the new on-line side during a side switch. Since the RETROFIT option was not specified, offline boot will be terminated immediately.

RETROFIT SPECIFIED -- CONTINUING = Call origination could not be turned on in the new on-line side during a side switch. Since the RETROFIT option was specified, the side switch will continue its normal sequence. Note however, there is no call origination going on.

SANITY TIMER NOT CLEARED = The off-line sanity timer cannot be cleared.

SIM COULD NOT BLOCK r s t AUDITS REASON u = SIM reported to EIH that it could not block the requested audits. The requested audit name is 'r' with member number 's' and the audit instance name is 't'. The reason is explained by the code 'u'.

SIM COULD NOT UNBLOCK r s t AUDITS REASON u = SIM reported to EIH that it could not unblock the requested audits. The requested audit name is 'r' with member number 's' and the audit instance name is 't'. The reason is explained by the code 'u'.

SOME TERMINAL(S) UNDER OFF-LINE IOP MAY BE LOCKED = Some IOP assigned to the off-line side will not have all its subdevices equipped, and as a consequence, some terminal in the office, if any, will appear to be locked, that is, the information displayed is out-dated, and no input is accepted.

STOP DENIED DURING SWITCH = Offline boot cannot be stopped manually or through application requests during a side switch.

SWITCH CALL PROCESSING OFF FAILED = AIM reported call origination could not be turned off in preparation for side switching. If retrofit was not specified, SW:OFLBOOT will fail.

SWITCH CALL PROCESSING ON FAILED = AIM reported call origination could not be turned on.

SWITCH POSTSW FAILED = AIM reported post-switch work failed. There may be some application recovery needed. For example, it is possible that call origination is still turned off.

SWITCH POSTSW TIMED OUT = AIM post-switch work timed out. There may be some application recovery needed. For example, it is possible that call origination is still turned off.

SWITCH PRE-CHECK ONLY COMPLETED = The pre-check only option was specified in the application message requesting the side switch (that is, not a manual request to side switch).

SWITCH TERMINATED = The side switch was terminated. There may be some application recovery needed. For example, it is possible that call origination is still turned off.

SYSTEM STATUS INCONSISTENT WITH COMMAND LINE OPTIONS =
Command line options do not match system status. This message will be output if any of the following conditions are true:
- Required unit is OOS and neither OOS nor UCL was specified.
- Specified TTY does not exist.
- Specified IOP does not exist.
- Both IOP 0 and IOP 1 are selected for moving to the off-line side.
- A primary disk was not forced.
- A CU is forced.
- Only one bootable disk is available or one of the bootable disks is not equipped.
- Mate CU state is not STBY or OOS.
- If any RC/V ECD UCB record is reserved.

This list is not exhaustive. Another output message has been output prior to this output message describing the problem.

138 TIME OUT - AIM POST-BOOT CHECKS = EIH did not receive results of activities before timers expired. Either the on-line side or the off-line side timer to receive the results from the off-line AIM post-boot checks has expired. These post-boot results will not be available.

139 TIME OUT - AIM PRECONFIGURATION = EIH did not receive results of activities before timers expired.

140 TIME OUT - CANNOT REMOVE EITHER CU, DFC AND/OR IOP = EIH did not receive all the successful removal confirmation messages when the timer expired. It verified against the RC/V ECD that not all of the units were in the OOS state as expected.

141 TIME OUT DUPLEX ECD: AIM REPORTED x, RTR REPORTED y = This message always results in continuing the stop sequence in progress to the point where IOPs are duplexed and to the end part of the STOP. Although AIM is involved in the STOP sequence, it did not cause the timeout. Therefore, the AIM duplex completion value 'x' is printed. If it is NOTHING, AIM had not finished its duplexing at the moment the timeout occurred. If it is SUCCESS, AIM had successfully finished its STOP sequence. If it is FAILURE, AIM reported errors during its STOP sequence. This timeout was caused by RTR problems when growing DFC units. A value of NOTHING for 'y' means RTR did not complete or report to EIH the status of the grow operations for the DFC units involved in the STOP sequence. A value of failure for 'y' means RTR failed to complete the grow operations for the DFC units involved in the STOP sequence. A value of SUCCESS for 'y' means RTR indicated a successful grow of the DFC units involved in a side switch; a logic error occurred.

142 TIME OUT FOR RECEIVING RESULTS OF POST-BOOT CHECKS = EIH did not receive results of activities before timers expired. Either the on-line side or the off-line side timer to receive the results from the off-line AIM post-boot checks has expired. These post-boot results will not be available.

143 TIME OUT RTR GROW: AIM REPORTED x, RTR REPORTED y = This message always results in termination of the offline boot procedure. AIM is not involved in the side switch growth of units, so, the value of 'x' is always NOTHING; otherwise, a logic error occurred. A value of NOTHING for 'y' means RTR did not complete or did
not report to EIH the status of the grow operations for the MTTY, ROP, SCC, and SCSDC units involved in a side switch. A value of FAILURE for 'y' means RTR failed to complete the grow operations for the MTTY, ROP, SCC, and SCSDC units involved in a side switch. A value of SUCCESS for 'y' means RTR indicated a successful grow of the units involved in a side switch; a logic error happened.

144 TIME OUT SPLIT ECD: AIM REPORTED x, RTR REPORTED y = This message always results in termination of the offline boot procedure. A value of NOTHING for 'x' or 'y' means AIM or RTR or both did not complete or did not report to EIH the status of the split operation. A value of FAILURE for 'x' or 'y' means AIM or RTR or both failed to complete the split operation. A value of SUCCESS for 'x' or 'y' means AIM or RTR or both indicated a successful split of its units. If both are SUCCESS a logic error happened.

145 TIME OUT WHEN GROWING g h = EIH did not receive the result of growing an IOP unit or sub-unit. The specified unit and its sub-units, if any, are left in the UNEQIP state.

146 TRYING TO WRITE INVALID BOOTSTATUS TO LOW CORE = EIH is trying to write an invalid value to low core.

147 TRYING TO WRITE INVALID IOPMASK TO LOW CORE = EIH is trying to write an invalid value to low core.

148 TRYING TO WRITE INVALID IOPSUBUNIT TO LOW CORE = EIH is trying to write an invalid value to low core.

149 TRYING TO WRITE INVALID MODE TO LOW CORE = EIH is trying to write an invalid value to low core.

150 TRYING TO WRITE INVALID MODIFIED ECD TO LOW CORE = EIH is trying to write an invalid value to low core.

151 TRYING TO WRITE INVALID OFLT TY TO LOW CORE = EIH is trying to write an invalid value to low core.

152 TRYING TO WRITE INVALID OLBACK TO LOW CORE = EIH is trying to write an invalid value to low core.

153 TRYING TO WRITE INVALID OLBDFC TO LOW CORE = EIH is trying to write an invalid value to low core.

154 TRYING TO WRITE INVALID OLBTRACE TO LOW CORE = EIH is trying to write an invalid value to low core.

155 TRYING TO WRITE INVALID OLBUCL TO LOW CORE = EIH is trying to write an invalid value to low core.

156 TRYING TO WRITE INVALID ORIGSIDE TO LOW CORE = EIH is trying to write an invalid value to low core.

157 TRYING TO WRITE INVALID VALUE TO LOW CORE = EIH is trying to write an invalid value to low core.

158 UNEXPECTED MESSAGE FROM AIM = EIH received a message from AIM (type
OFLBOOT) whose activity was OLBPRECHK. However, EIH's internal state information (OLBSTATE) was inconsistent with the value specified in lowcore MODE for the specified activity (OLBPRECHK). This situation indicates either an illegal message was received from AIM or that a message buffer was overwritten and corrupted. EIH drops this message and does not take action on it.

159

UNEXPECTED MESSAGE RECEIVED FROM = EIH received a message it cannot identify. The process ID and message type are provided to help identify the message.

160

UNIT REMOVAL FAILURE = During a side switch, the following devices are removed from the on-line side: MTTY, ROP, SCC, and SCSDs. The IODRV returned a message stating that one or more of these devices could not be moved to the OOS state. The side switch will continue. Furthermore, to prevent the IODRV from stealing these devices from the new on-line side, their RC/V ECD UCB records will be unequipped and messages are sent to the IODRV to move them to the DEGROW state.

c = Current offline boot state.

d = Previous offline boot state.
e = Name of the function from which the output message originated. This field is used by UNIX® RTR in diagnosing offline boot problems.
f = Line number in the function ‘f’ from which the output message originated. This field is used by UNIX® RTR, in conjunction with fields ‘c’, ‘d’, and ‘e’, to diagnose offline boot problems.
g = String giving device type information; CU, DFC, IOP, MHD, TTY, TTYC, and DSCH, for example. Unit names are listed in the APP:MEM-NUM-UNIT Appendix, in this document.
h = Device number. A value of zero, which used with ‘g’, could form DFC0, for example.
i = Process identification number.
j = Activity defined in message sent from the AIM process.
k = Message type in message sent from the IODRV, AIM, or any other unknown process.
l = Memory location where the invalid value ‘n’ is being written.
m = Invalid value that is being written to low core.
n = RID of the RC/V ECD UCB record for the unit that cannot be removed.
o = Reason message could not be sent. Valid value(s):

-1 = Cannot allocate system message buffer.
0 = Process is not attached to its port or port is invalid.
8192 = Process cannot queue more messages.
p = Device state.

q = Pre-check errors. Valid value(s):
1 = Offline side is running in minimum configuration mode. System must be in full configuration mode for a side switch.
2 = Internal DFC table corrupt. Indicates corruption of EIH's internal offline boot data.
3 = Cannot get a DFC UCB record to get information for running pre-checks.
4 = An offline side DFC or DFC sub-unit is in the INIT state.
5 = Corrupt ECD UCB record for a DFC or DFC sub-unit. The device is in the STBY state which is not supported for DFC communities.
6 = An offline side DFC or DFC sub-unit either has a non-supported essential field or it is an essential or no_man_rmv device that is not active. For the latter, it could be UNAV, OFL, OOS or GROW.
7 = Corrupt ECD UCB record for a DFC or DFC sub-unit. The device has an unsupported major state field in its UCB.
10 = Low core IOPMASK corrupt. EIH cannot interpret the contents of the low core IOPMASK value because the contents of low core ORIGSIDE are corrupt.
11 = No IOP in the off-line side. Indicates that IOP 0 and IOP 1 are both on the on-line side. The switch will fail because it will not have an MTTY or ROP on the other side.
12 = No IOP in the off-line side. Indicates that IOP 0 and IOP 1 are both on the on-line side. The switch will fail because it will not have an MTTY or ROP on the other side.
13 = Low core ORIGSIDE corrupt. Indicates corruption of low core.
14 = Internal IOP table corrupt. Indicates corruption of EIH's internal offline boot data.
15 = Cannot get IOP 0 or 1 UCB record to get information for running pre-checks.
16 = Internal units table corrupt. EIH used an RC/V ECD RID stored internally to read a RC/V ECD UCB record into a local buffer. When EIH tried to verify the buffer information, it found the device type field to be inconsistent. This situation indicates that, although the RID used by EIH was a valid one, it pointed to the incorrect UCB. That is, EIH's RID storage is corrupt. Also this could mean that the RC/V ECD UCB record itself is corrupt.
17 = Not ACT. The IOP is not in the ACT state.
18 = Diagnostics running. Indicates the specified IOP 0 or 1 RC/V ECD UCB record is marked "reserved". Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.
19 = The off-line side is running in full disk independent operation (DIOP) mode. The offline boot procedure cannot side switch to an impaired side.
20 = Cannot get MTTYC 0 or 1 UCB record to get information for running pre-checks.
21 = Internal units table corrupt. EIH used an RC/V ECD RID stored internally to read an MTTY controller RC/V ECD UCB record into a local buffer. When EIH tried to verify the buffer information, it found the device type field to be inconsistent. This situation indicates that, although the RID used by EIH was a valid one, it pointed to the
incorrect UCB. That is, EIH's RID storage is corrupt. Also this could mean that the RC/V ECD UCB record itself is corrupt.

22 = Not ACT. MTTYC 0 or 1 is not in the ACT state.
23 = Diagnostics running. Indicates MTTYC 0 or 1 RC/V ECD UCB record is marked "reserved". Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.

r = Audit name, such as ECD.

s = Audit member number.

t = Audit instance.

u = Possible error codes returned by SIM to the EIH request to block or unblock an ECD audit. Valid value(s):
3 = Audit system initialization in progress.
4 = Audit system initialization failed.
5 = Access to audit record in the ECD failed.
9 = Requested audit instance is blocked.
19 = Invalid audit specified.
20 = Invalid audit instance specified.
30 = Request resulted in no change.

v = Possible reason codes why EIH could not output post-mortem report. Valid value(s):
10 = Cannot copy post-mortem slots from offline CU - the on-line CU is holding information in its slots.
11 = RMF is not running.
12 = Cannot copy offline post-mortem slots.

w = RID of the RC/V ECD UCB record for the unit that cannot be restored automatically.

x = Valid value(s):
   FAILURE
   NOTHING
   SUCCESS

y = Valid value(s):
   FAILURE
   NOTHING
   SUCCESS

4. ACTION TO BE TAKEN
Text Line: Action to be Taken:
Indicates AIM tried to abort the offline boot while SW:OFLBOOT was executing.

1

Indicates AIM tried to abort the offline boot while SW:OFLBOOT was executing.

2

Restore the unit manually.

3

No action is required.

4

Wait for offline boot to terminate. Some application devices may be in an incorrect state. If so issue a STOP:OFLBOOT input message with the RST option within one hour. Once the hour is passed, manual actions will be required to restore the application devices to their original states.

5

Wait for offline boot to terminate, clear the problem with the application, and try offline boot again.

6

If retrofit was not specified, offline boot will be terminated on the current on-line side. If retrofit was specified, wait for the side switch to complete, then manually stop offline boot. In either case, after offline boot is stopped or terminated, take whatever manual recovery steps are needed to re-establish call origination.

7

If retrofit was not specified, offline boot will be terminated on the new on-line side. If retrofit was specified, wait for the side switch to complete, then manually stop offline boot. In either case, after offline boot is stopped or terminated, take whatever manual recovery steps are needed to re-establish call origination.

8

Wait for offline boot to terminate, then try offline boot again.

9

Wait for offline boot to terminate, then try offline boot again.

10

Wait for offline boot to be terminated, then run RC/V ECD audits.

11

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

12

Wait for offline boot to terminate, then try offline boot again.

13

Wait for offline boot to terminate, then try offline boot again.

14

Wait for offline boot to terminate, then try offline boot again.

15

If there is no active MTTY or ROP, restore them and try off-line boot again. Otherwise, RC/V ECD is corrupt and RC/V ECD audits must be run. If the audits pass, try off-line boot again.

16

If the message did not result in an automatic termination of offline boot, manually stop the procedure. Once offline boot is stopped, run the CU diagnostics, phases 1 through 4, 11, and 62; if successful, try offline boot again.

17

Manual recovery is needed to restore the device to its pre-offline boot state.

18

If the reported reason was 10 or 12, the problem is that either the output slot is being used by a higher priority message or EIH is unable to complete the requested copy. In either case, no action is required. A reason of 11 indicates that the recovery message formatter (RMF) process is not running; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

19

Indicates there were errors in port switching a device. Check device state and restore if needed.

20

Manual recovery is needed to restore the device to its pre-offline boot state.
Manual recovery is needed to restore the device to its pre-offline boot state.

Wait for offline boot to terminate, then run the CU diagnostics, phases 1 through 4, 11, and 63, to check the maintenance channel. If these particular phases do not reveal anything, then run the complete CU diagnostics before trying offline boot again.

Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.

A scarce system resource (an MDCT record of type diagnostic) has been lost. To recover it, run the ECDOWN audit or manually unreserve the RC/V ECD MDCT record.

Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

No action is required.

Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.

Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.

Wait for offline boot to terminate, then try offline boot again.

Manual recovery is needed to restore the device to its pre-offline boot state.

Manual recovery is needed to restore the device to its pre-offline boot state.

This message can occur twice. The first time this message occurs, ignore it; no action is required. The second time this message prints, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Wait for offline boot to terminate, then try offline boot again.

Wait for offline boot to terminate, then try offline boot again.

No action is required.

If retrofit was not specified, the system will remain in offline boot. The side switch may be retried, if desired. If retrofit was specified, the side switch will continue; no action is required.

If retrofit was not specified, offline boot will be terminated on the new on-line side. If retrofit was specified, wait for the side switch to complete, then manually stop offline boot. In either case, after offline boot is stopped or terminated, take whatever manual recovery steps are needed to re-establish call origination.

Application recovery must be carried out manually.

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Wait for offline boot to terminate, then try offline boot again.
The action to be taken depends on the function 'e' output with the message:

**HDL_OLB_OPCODE** = The off-line side EIH could not ask AIM to perform post-boot checks. No action is required.

**OLBCONTROL** = The off-line side EIH could not ask AIM to perform side switch pre-checks; try the side switch again.

No action is required.

Wait for offline boot to terminate, then try offline boot again.

DKDRV did not have a chance to update its disk display pages. Restart the DKDIP process to have the pages show the correct information.

Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.

Check to see why the device cannot be unequipped, resolve the problem, and try offline boot again.

Check to see why the device cannot be unequipped, resolve the problem, and try offline boot again.

The action to be taken depends on the function 'e' output with the message:

**DFS** = Run RC/V ECD audits. If the audits pass, try offline boot again.

**UNRESERVE** = If diagnostics are not running, then the RC/V ECD UCB record is corrupted; in which case, the UCB record needs to be unreserved manually or through the ECDOWN audit.

To run diagnostics, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

To run diagnostics, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

To run diagnostics, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

To run diagnostics, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Wait for offline boot to terminate, force a DFC, and try again to boot offline.

Notify technical assistance about this occurrence. No other action needs to be taken for STOP:OFLBOOT to complete.

Notify technical assistance about this occurrence. No other action needs to be taken for STOP:OFLBOOT to complete.

Indicates there were errors in port switching a device. Check device state and restore if needed.

No action is required.
61 No action is required.

62 No action is required.

63 No action is required.

64 Save the ROP output and report this incident to technical assistance.
   Note: The audits are automatically unblocked in six hours.

65 Save the ROP output and report this incident to technical assistance.
   Note: The audits are automatically unblocked in six hours.

66 Save the ROP output and report this incident to technical assistance.
   Note: The audits are automatically unblocked in six hours.

67 Save the ROP output and report this incident to technical assistance.
   Note: The audits are automatically unblocked in six hours.

68 Investigate the cause of the pre-check error, resolve the problem indicated, and try offline boot again.

69 Wait for the RC/V ECD session to complete, then try offline boot again.

70 No action is required.

71 If an offline boot was underway, then the low core value of MODE has been corrupted; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Otherwise, boot off-line and then side switch.

72 A manual STOP:OFLBOOT will be necessary because offline boot will not continue. Depending on the amount of state information corrupted, the STOP:OFLBOOT may result in cascading error messages; the stop process will complete, however.

73 The action to be taken depends on the function 'e' output with this message:
   DEGROW_DFC, RMV_DFC = Wait for offline boot to be terminated. Run RC/V ECD audits, then retry offline boot.
   CHG_DFC = The device will remain in the GROW state. If this was not its original state, wait for offline boot to be terminated, then manually change the device community to the OOS state and restore it to service.
   RST_DFC = The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.

74 The action to be taken depends on the function 'e' output with this message:
   DEGROW_DFC, RMV_DFC = Wait for offline boot to be terminated. Run RC/V ECD audits, then retry offline boot.
   CHG_DFC = The device will remain in the GROW state. If this was not its original state, wait for offline boot to be terminated, then manually change the device community to the OOS state and restore it to service.
   RST_DFC = The device will remain in the OOS state. If this was not its original state, wait for
offline boot to be terminated, then manually restore the device community to service.

75 Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

76 Wait for offline boot to be terminated, restore the CU community, and try offline boot again.

77 The action to be taken depends on the function 'e' output with this message:
   DEGROW_IOPS, RMV_IOPS = Wait for offline boot to be terminated. Run RC/V ECD audits, then retry offline boot.
   GROW_IOPS = The device will remain in the UNEQIP state. If this was not its original state, wait for offline boot to be terminated, then manually grow the device community and restore it to service.
   RST_IOPS = The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.

78 Save the ROP output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

79 The action to be taken depends on the function 'e' output with this message:
   CHECK_OOS, DEGROW_DFC, DEGROW_IOPS, RMV_DFC, RMV_IOPS = Wait for offline boot to be terminated. Run RC/V ECD audits, then retry offline boot.
   CHG_DFC = The device will remain in the GROW state. If this was not its original state, wait for offline boot to be terminated, then manually change the device community to the OOS state and restore it to service.
   EQUIP_CU, GROW_DFC, GROW_IOPS = The device will remain in the UNEQIP state. If this was not its original state, wait for offline boot to be terminated, then manually grow the device community and restore it to service.
   RST_DFC = The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.
   SWPRECHECK = The side switch will not succeed. To retry the side switch, first, stop offline boot manually; second, start another offline boot; third, try the side switch again once offline boot is complete.

80 Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.

81 Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.

82 Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.

83 Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.

84 No action is required.

85 Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
Messages manual.

86 No action is required.

87 Save the ROP output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

88 If OLBSTATE is EXC_ONLECD, wait for offline boot to be terminated, then try it again.

If the function ‘e’ is SWPRECHECK, the side switch will not succeed. To retry to side switch, first, stop offline boot manually; second, start another offline boot; and third, try the side switch again after offline boot completes.

Otherwise, this is happening during the offline boot stop sequence. Some DFCs or IOPs belonging to the off-line side will remain in the UNEQIP, GROW, or OOS state. If these were not the original states, manually move the devices to their original states.

89 If OLBSTATE is EXC_ONLECD, wait for offline boot to be terminated, then try it again.

If the function ‘e’ is SWPRECHECK, the side switch will not succeed. To retry to side switch, first, stop offline boot manually; second, start another offline boot; and third, try the side switch again after offline boot completes.

Otherwise, this is happening during the offline boot stop sequence. Some DFCs or IOPs belonging to the off-line side will remain in the UNEQIP, GROW, or OOS state. If these were not the original states, manually move the devices to their original states.

90 No action is required.

91 No action is required.

92 No action is required.

93 No action is required.

94 No action is required.

95 Check the status of the MTTY and ROP, restore the device that is not in the ACT state, and try offline boot again.

96 Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

97 This message should read 'CANNOT BE IN ACT OR INIT STATE TO DEGROW'. Stop offline boot manually, change the state of the device, and try offline boot again.

98 Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

99 Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.

100 If printed while executing EXC:OFLBOOT, wait for offline boot to terminate, force a DFC, and try again to boot off-line. If this message is printed as part of SW:OFLBOOT, wait for the side switch to fail, force the DFCs as they were at the beginning of the offline boot, and try to side switch again.

101 No action is required.
Wait for offline boot to be terminated. Check on why the DFC and all the IOPs to be moved to the off-line side are not in the OOS state. Resolve the problem, and then try offline boot again.

After the off-line boot process is terminated, check whether this device requires manual action to be brought back to its original state.

No action is required.

Wait for offline boot to be terminated. Then, check the states of the devices that were going to the off-line side. If any device is not in the OOS state, investigate why. After resolving any problem, try offline boot again.

If post-boot checks failed, no action is required. If side switch pre-checks failed, investigate what caused the pre-check error, resolve the problem, and try the side switch again.

Either manually stop offline boot or let it run until it completes. If this message is seen twice or more, offline boot may not complete and manually stopping it is recommended.

Check the on-line CU to see why it terminated. There may be some information in the off-line side post-mortem dump if one was output as part of the offline boot termination. If nothing is determined, try offline boot again after the termination is complete.

If the failure is part of a side switch, the side switch is aborted if the RETROFIT option is not specified. If the RETROFIT option was specified the system is booted on the side targeted for switching and offline boot terminates.

Note: If the reason for failure indicates bad hardware, it is recommended to stop the offline boot procedure and reschedule it when the hardware has been repaired.

The action to be taken depends on the value of ‘g’.

1. To side switch, stop oflbtdt and execute EXC:OFLBOOT without specifying the MINCONFIG option. When this second offline boot completes, try the side switch again.

2. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

3. The error is in the off-line side ECD which cannot be audited; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

4. Wait for the INIT operation to complete and run SW:OFLBOOT again.

5. The error is in the off-line side ECD which cannot be audited; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

6. If the error is an invalid field then it is in the offline ECD which cannot be audited; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. ESSENTIAL or NOMANRMV devices in GROW and OFL will always fail the switch; stop offline boot manually and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. ESSENTIAL or NOMANRMV devices in UNAV and OOS should be restored, then run SW:OFLBOOT again. If the restore operations fail, the switch will always fail; stop offline boot manually and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

7. The error is in the off-line side ECD which cannot be audited; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
Messages manual.

10 = Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
11 = Stop offline boot; wait for it to terminate. Try offboot with IOP 0 or IOP 1 specified. Wait for the off-line side to be booted, then try SW:OFLBOOT again.
12 = Stop offline boot; wait for it to terminate. Try offboot with IOP 0 or IOP 1 specified. Wait for the off-line side to be booted, then try SW:OFLBOOT again.
13 = Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
14 = Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
15 = The error is in the off-line side ECD which cannot be audited; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
16 = Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
17 = Restore the IOP and run SW:OFLBOOT again.
18 = Run SW:OFLBOOT again after diagnostics complete.
19 = Stop offboot, repair the equipment that caused the off-line side to go into DIOP and execute EXC:OFLBOOT. When this second off-line boot completes, try the side switch again.
20 = The error is in the off-line side ECD which cannot be audited; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
21 = If there is no active MTTY controller, restore it and try off-line boot again. Otherwise, RC/V ECD is corrupt and RC/V ECD audits must be run. If the audits pass, try off-line boot again.
22 = Restore the MTTY controller diagnostics complete.
23 = Run SW:OFLBOOT again after MTTY controller diagnostics complete.

Check OLBLOG files on the off-line side to determine if AIM has a problem. Do not start a side switch if it does. Also, recover OLBLOG files and send them to technical assistance. If the message was part of a retrofit side switch, watch for correct operation on the new on-line side as AIM was having problems and it may not support call origination.

Wait for offline boot to terminate. If a disk is bad do not boot from it. Booting from a corrupted disk can cause an outage; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. If the CU or MCH appears to be the problem, then run the CU diagnostics, phases 1 through 4, 11, and 63, to check the maintenance channel. If these particular phases do not reveal anything, then run the complete CU diagnostics before trying offline boot again.

No action is required.

Restore or unequip the affected essential device before trying offline boot again.

Save the ROP output and notify technical assistance of this occurrence.

Save the ROP output and notify technical assistance of this occurrence.

Save the ROP output and notify technical assistance of this occurrence.

Save the ROP output and notify technical assistance of this occurrence.
Save the ROP output and notify technical assistance of this occurrence.

Save the ROP output and notify technical assistance of this occurrence.

Indicates there were errors in port switching a device. Check device state and restore if needed.

Wait for the RC/V ECD session to complete, then try offline boot again.

Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.

Indicates offline boot has encountered fatal errors and the RETROFIT option was not specified, so offline boot is terminated and the system is immediately reduplexed. When offline boot has terminated, perform whatever manual recovery steps are needed to re-establish call origination.

If function 'e' is TIM_CPON, call origination is down. Wait for the side switch to finish, manually stop offline boot, and then take whatever actions are needed to re-establish call origination.

No action is required.

No action is required.

Save the ROP output and report this incident to technical assistance.

NOTE: The audits are automatically unblocked in six hours.

No action is required.

Wait until the side switch is finished, try STOP:OFLBOOT again on the new on-line side.

If retrofit was not specified, the system will remain in offline boot. The side switch may be retried, if desired. If retrofit was specified, the side switch will continue; no action is required.

Check OLBLOG files on the off-line side to determine if AIM has a problem. If call origination is turned off, take whatever actions are needed to re-establish call origination.

Check to see if manual recovery is needed.

Check to see if manual recovery is needed.

No action is required.

Check to see if manual recovery is needed. It is possible that call origination is still turned off.

If this message is preceded by a pre-check failure message, follow the action to be taken specified by the preceding message. If not, then an initialization level of 2 was specified and the CU is in the OOS state. In this case, offline boot cannot continue because the OOS CU memory will be used for booting and it may be corrupt. Either specify a higher initialization level or restore the CU before trying the offline boot again.

No action is required.

Wait for offline boot to terminate, then try offline boot again.

Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.
Wait for offline boot to terminate. Check the ROP for previous messages detailing what could not be grown. Manually grow those units, move them to OOS through RC/V, and restore them. If the message indicates a logic error, save the ROP output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

No action is required.

Wait for offline boot to terminate. Check the ROP for previous messages detailing what could not be grown. Manually grow those units, move them to OOS through RC/V, and restore them. If the message indicates a logic error, save the ROP output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Wait for offline boot to terminate. Check the ROP for previous messages detailing what could not be split. Correct the problems and try offline boot again. If the message indicates a logic error, save the ROP output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

To recover the units, wait for offline boot to terminate, use RC/V to move the units to GROW and then to OOS. Restore the units manually.

Save the ROP output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Save the ROP output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

REPT:OLBCONFIG
Software Release: 5E14 and later
Message Class: MAINT
Application: 3B
Type: Output

1. FORMAT

[1] REPT OLBCONFIG FAULT TYPE a UNIT = b PID = c LOCID = d

[2] REPT OLBCONFIG FAULT TYPE a INACCESSIBLE RID = e PID = c
LOCID = d

2. REASON FOR OUTPUT

To report a fault condition in the error interrupt handler (EIH) olbconfig function.
Format 1 is printed whenever the name of the unit can be determined. If not, Format 2 is printed.

3. VARIABLE FIELD DEFINITIONS

a = One or more fault types. Valid value(s):
   AMB = Could not allocate a message buffer.
   CI  = olbconfig internal failure.
   EA  = Equipment configuration database (ECD) access problem.
   ED  = ECD data invalid.
   FSM = Could not fault a process or send a message to a process.
   IA  = Possible invalid argument.
   PA  = Plant measurements database access problem.
   PS  = Unit in protected state.

b = Name and number of unit.

c = Process number of the process which called the olbconfig function.

d = Identification number (LOCID number) of the fault in olbconfig.

e = Record ID (RID) of the unit control block (UCB) record in the ECD of the unit.

4. ACTION TO BE TAKEN

If OFLBOOT is automatically terminated, run ECD audit.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Output Appendix(es):

APP:OMDB-X-REF
REPT:ONTC-ELE
Software Release: 5E15 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

REPT ONTC=a ENV=b LVL=c EVENT=d e VECTOR-NUM=f TIME=gg:gg.g
{SUB-ER-TYPE=h | i j} FAILING-ADDR=k ADDR-RNG=l OSJ=m[,n] [BG-CLIENT=o]
FGSTATE:FGJOB=p [FG-CLIENT=q] CM=r [CDAL FAR-END=s,t]

2. REASON FOR OUTPUT

To provide information about the type and source of an error that occurred in the office network and timing complex (ONTC) and the resulting level of recovery. Additional output messages (of various types) may be printed to provide detailed data about the error. These messages can be correlated with REPT:ONTC-ELE output messages by using the ONTC event number.

3. VARIABLE FIELD DEFINITIONS

a

b = ONTC environment where the error occurred. Valid value(s):
   AP = Application processor.
   IP = Input/output processor.

c = Software recovery level. Valid value(s):
   OSR = Operational software restart.
   RPI = Return to point of interrupt.
   UNK = Unknown recovery level.

d = ONTC event number (associated with the environment specified in field "b").

e = Termination report. Valid value(s):
   ABORTED = Processing of the event did not complete before being interrupted by another stimulus.
   COMPLETED = Processing of the event was completed.

f = Exception vector number. A value of zero indicates that the event was not associated with a maintenance exception.

g = Time when the event occurred, in the form minutes:seconds.tenths of a second.
h = Error sub-type for errors associated with the MCA-740 "asset" hardware or the synchronous/asynchronous protocol data formatter with 256 channels (SPYDER-256) device within the ONTC.

i = ONTC application hardware component(s) associated with the error report. Valid value(s):
   NC = The network clock (NC), including the NC component of the ONTC common (ONTCCOM) hardware, the cross couples (XCs), the oscillators (NCOSCs), and the external timing references (NCREFs).
   ONTC = The ONTC core hardware (which includes hardware mask registers shared by the other ONTC application hardware components).
   TMS = The time multiplexed switch (TMS), including the TMS and message link interface (MLI) components of the ONTCCOM and the TMSLNKs.
   QLPS = The quad link packet switch (QLPS), including the QLPS units and associated QLPS TMS links (QTMSLNKs) and QLPS gateway links (QGLs).

MULTIPLE UNITS = More than one of the above application hardware components are reporting errors.

NONE = No application hardware component(s) could be identified.

j = Error sub-type for errors associated with the application hardware component(s) identified in field "i".

k = Failing address.

l = Type of memory associated with failing address. Valid value(s):
   860IO = MPC860 memory-mapped internal I/O space.
   ALT-ROM = Alternate read-only or flash memory space.
   CMD-ONLY = Command only space.
   DRAM = Dynamic random access memory (DRAM) space.
   IO = Asset memory-mapped I/O space.
   IP-DRAM = IP DRAM mirrored memory space.
   IP-NETROM = IP NetROM mirrored memory space.
   JTAG = Boundary scan master memory space.
   MATE-DRAM = Mate DRAM space.
   MATE-IO = Mate asset memory-mapped I/O space.
   MATE-IP-DRAM = Mate IP DRAM mirrored memory space.
   MATE-IP-NETROM = Mate IP NetROM mirrored memory space.
MATE-PCI = Mate memory-mapped peripheral component interconnect (PCI) bus space.
MATE-TEXT = Mate DRAM text space.
NETROM = NetROM memory space.
PCI = Memory-mapped PCI bus space.
PCI-MAP = PCI map register space.
RESET-CTRL = Reset control register space.
ROM = Read-only or flash memory space.
TEXT = DRAM text space.
UNK-MEM = Unknown memory space.

m = Currently executing background job. Valid value(s):
AU = Audits.
CM = Communication package (CM).
DGN = Diagnostics.
INIT = Initialization.
OE = Operational environment (routine maintenance work).
RHS = Routine hashsum checks.
SI = System integrity.
SMMS = Switch maintenance for the ONTC.
UNK = Unknown.

n = If field "m" is "SMMS", this field indicates the specific ONTC switch maintenance background task that is executing. Valid value(s):
MICE-AUDITS = ONTC-resident maintenance audits.
NCT-ERR-CNTS = Clearing of network control and timing (NCT) link hardware error counters.
NONE = No ONTC switch maintenance background task.
ONTC-CORE = ONTC core routine maintenance software.
PSM = Power switch monitor (PSM).
SYNC-MON = Network clock synchronization monitor.

o = Background software client that is currently processing a message. Valid value(s):
AU = Audits.

CALL-PROC = Call processing.

CDAL = Control and diagnostic access link (CDAL) maintenance.

CM = Communication package.

DGN = Diagnostics.

FAB-UPD = TMS fabric update.

FIRMWARE = Firmware.

FLASH-CTL = Flash memory update control.

FPC = Foundation peripheral controller (FPC).

NC = Network clock.

OFLBOOT = Offline boot.

ONTC-CORE = ONTC core software.

OSDS = Operating system for distributed switching.

PSM = Power switch monitor.

QLPS = Quad link packet switch.

TMS = Time multiplexed switch.

UP = Program update.

UT = Generic utilities.

p = Currently executing foreground (one millisecond interrupt) job. Valid value(s):

BG-SYNC-MON = Background network clock synchronization monitor (invoked from foreground to guarantee execution frequency).

CALL-PROC = Call processing.

CM = Communication package.

FAB-UPD = TMS fabric update.

FG-SYNC-MON = Foreground network clock synchronization monitor.

HP-MSG = High priority maintenance message processing.

NONE = No foreground task was executing.

ONTC-CORE = ONTC core software.

TMS-BG-REQ = Processing a TMS-related request from background.
TMS-FR-POLLING = Polling for TMS-related faults.

UT = Generic utilities.

q = Foreground software client that is currently processing a message. Refer to field "q" for a description of the possible clients.

r = Currently executing CM job. Valid value(s):

NONE = No active CM job.
ACTIVE = CM software is executing but the specific task cannot be determined.
BASE = CM foreground software is executing but the specific task cannot be determined.
FG-TO-BG = Accessing foreground to background message queue.
BG-TO-FG = Accessing background to foreground message queue.
BP IP-TO-AP = Accessing IP to AP base priority message queue.
BP AP-TO-IP = Accessing AP to IP base priority message queue.
HP IP-TO-AP = Accessing IP to AP high priority message queue.
HP AP-TO-IP = Accessing AP to IP high priority message queue.

s = Message switch (MSGs) side at the far end of the control and diagnostic access link (CDAL) for which CM is currently performing work. This field is only applicable to the ONTC-IP environment.

t = CDAL message transport direction.

RCV = Messages are being received.
SND = Messages are being sent.

2. REASON FOR OUTPUT

To report the data associated with a fault found by the office network and timing complex (ONTC) resident network clock (NC) software in the application processor (ONTC-AP).

3. VARIABLE FIELD DEFINITIONS

a = ONTC side.
b = ONTC event number.
= Part number. Multiple REPT ONTC “FAULT DATA” output messages may be printed (following a single REPT:ONTC-ELE output message) to report the data associated with a single fault recovery event.

d = Total number of parts.

e = ONTC fault classification.

f = Contents of the ONTC-AP’s interrupt request register (IRR).

g = Contents of the ONTC-AP’s application control register (APCTL).

h = Contents of the ONTC-AP’s external interrupt mask register (EIMR).

i = Contents of the ONTC-AP’s application status register (APSTAT).

j = Contents of the ONTC-AP’s system management interrupt mask register (SMIMR).

k = Contents of the ONTC-AP’s bus control register (BCR).

l = Contents of the system timing and reference synchronization (STARS) device voltage-controlled crystal oscillator (VCXO) frequency control register (FRQCTL).

m = Contents of the STARS device direct memory access (DMA) start register (DMAST).

n = Contents of the STARS device line interface configuration register (LITERM).

o = Contents of the STARS device phase locked loop (PLL) control register (PLLCTL).

p = Contents of the STARS device DMA end register (DMAEND).

q = Contents of the STARS device diagnostic control register (DCR).

r = Contents of the STARS device test signal control register (TSTCTL).

s = Contents of the STARS device phase counter input multiplexer control register (INCTL).

t = Contents of the STARS device version number register (SVER).

u = Line framer (LFRMR) device number (0-3). The line framer devices terminate digital external network clock references (NCREFS).

v = Contents of general register 0 (GREG0) on LFRMR device "u". This is the primary block interrupt status register.

w = Contents of general register 1 (GREG1) on LFRMR device "u". This is the primary block interrupt enable register.

x = Contents of the framer mode option register for the first digital reference interface on LFRMR device "u" (FMODEA).

y = Contents of line interface unit (LIU) register 0 for the first digital reference interface on LFRMR device "u" (LIU0A). This is the alarm status register for this NCREF.

z = Contents of LIU register 1 for the first digital reference interface on LFRMR device "u" (LIU1A). This is the alarm interrupt enable register for this NCREF.
a\(^1\) = Contents of the framer mode option register for the second digital reference interface on LFRMR device "u" (FMODEB).

b\(^1\) = Contents of LIU register 0 for the second digital reference interface on LFRMR device "u" (LIU0B). This is the alarm status register for this NREF.

c\(^1\) = Contents of LIU register 1 for the second digital reference interface on LFRMR device "u" (LIU1B). This is the alarm interrupt enable register for this NREF.

d\(^1\) = Status of the network clock on this ONTC side at the time of the fault:
- **MAJOR** = The network clock on this ONTC side is major (i.e. it is the master source of timing for the switch).
- **MINOR** = The network clock on this ONTC side is minor. It is synchronized to the timing signal from the major (master) network clock via the network clock cross couple (XC).

e\(^1\) = The "active" external NREF, from the perspective of this network clock side. The active reference is the one to which the major (master) network clock is synchronized. Therefore, if the network clock on this side is not major, the concept of an active reference is not applicable.

   - **REF1,DGTL** = Digital reference 1.
   - **REF2,DGTL** = Digital reference 2.
   - **REF3,DGTL** = Digital reference 3.
   - **REF4,DGTL** = Digital reference 4.
   - **REF5,DGTL** = Digital reference 5.
   - **REF6,DGTL** = Digital reference 6.
   - **REF7,DGTL** = Digital reference 7.
   - **REF8,DGTL** = Digital reference 8.
   - **REF1,10M** = 10 MHz analog reference 1.
   - **REF2,10M** = 10 MHz analog reference 2.
   - **REF1,2M** = 2.048 MHz analog reference 1.
   - **REF2,2M** = 2.048 MHz analog reference 2.
   - **REF1,CC** = 64K composite clock reference 1.
   - **REF2,CC** = 64K composite clock reference 2.
   - **NONE** = There is currently no active reference.
   - **N/A** = Not applicable, since the major (master) network clock is not on this ONTC side.

f\(^1\) = A bitmap indicating which NREFs and network clock oscillators (NCOSCs) are equipped. Each set bit corresponds to an equipped NREF or NCOSC. Viewing the bits as "15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0", bits 0 thru 7 are associated with digital references 1 thru 8. Bits 8 and 9 are associated with 10 MHz analog references 1 and 2. Bits 10 and 11 are associated with 2.048 MHz analog references 1 and 2. Bits 12 and 13 are associated with 64K composite clock references 1 and 2. Finally, bits 14 and 15 are associated with NCOSC 0 and 1 (which are always equipped).

g\(^1\) = A bitmap (in the same format as field "f\(^1\)") indicating which NREFs and NCOSCs are in-service.

h\(^1\) = A bitmap (in the same format as field "f\(^1\)") indicating which NREFs and NCOSCs have taken errors.

i\(^1\) = The network clock mode, from the AM's perspective, at the time the error was reported by the ONTC.

   - **NORMAL** = After synchronization with a reference has been achieved, the network clock will
be in the normal mode.

**FAST** = While in the process of achieving synchronization with a reference, the network clock will be in the fast mode.

**HOLDOVER** = After synchronization with a reference has been lost, the network clock will be in holdover mode.

**FREE RUN** = If the network clock has never been synchronized to a reference, it will be in free run mode.

**DISABLED** = If a fatal error occurs, the network clock synchronization monitoring software may be disabled. This is a transient condition that can only occur while recovering from a fault.

**INVALID** = The network clock mode could not be determined.

The network clock mode, from the ONTC's perspective, at the time the error was reported by the ONTC. This field reflects any autonomous mode change performed within the ONTC in order to maintain stable timing during the interval before a re-configuration action can be initiated by fault recovery software in the administrative module (AM). Refer to field "j" for a description of the possible values.

The NCOSC being utilized by this ONTC side, from the AM's perspective, at the time the error was reported by the ONTC.

The NCOSC being utilized by this ONTC side, from the ONTC's perspective, at the time the error was reported by the ONTC. This field reflects any autonomous change in NCOSC utilization performed within the ONTC in order to maintain stable timing during the interval before a re-configuration action can be initiated by fault recovery software in the AM.

= Unit for which a fault was detected.

= ONTC fault type.

= The "error source byte" (a bitmap indicating all existing error conditions) associated with the unit specified in field "m".

2. REASON FOR OUTPUT

To report the data associated with a fault found by the office network and timing complex (ONTC) resident quad link packet switch (QLPS) software in the application processor (ONTC-AP). For communication module model 3 (CM3), the ONTC-resident QLPS hardware for each network is implemented within a packet routing for intra-switch messaging (PRISM) device.

3. VARIABLE FIELD DEFINITIONS

a = ONTC side.
b = ONTC event number.
c = Part number. Multiple REPT ONTC “FAULT DATA” output messages may be printed (following a single REPT:ONT-C-ELE output message) to report the data associated with a single fault recovery event.
d = Total number of parts.
= QLPS network.

= ONTC fault classification.

= Contents of the control and synchronization interface expansion (CSIX) summary error source register (SESR).

= Contents of the CSIX PRISM error source register (PRISM ESR).

= Contents of the CSIX summary error source register mask (SESRM).

= Contents of the PRISM error summary register (ESR).

= Contents of the PRISM service request register (SRR).

= Contents of the PRISM device control register (DCR).

= Contents of the PRISM packet random access memory (PRAM) pointer underrun counter (PRPUNC).

= Contents of the PRISM error summary register mask (ESRM).

= Contents of the PRISM service request register mask (SRRM).

= Contents of the PRISM diagnostic register (DIAG).

= Contents of the PRISM channel queue overflow counter (CQOVF).

= Contents of the PRISM high-level data link control (HDLC) error register for link 0 (HDLC0).

= Contents of the PRISM HDLC error register for link 1 (HDLC1).

= Contents of the PRISM HDLC error register for link 2 (HDLC2).

= Contents of the PRISM HDLC error register for link 3 (HDLC3).

= Contents of the PRISM HDLC error register for link 4 (HDLC4).

= Contents of the PRISM HDLC error register for link 5 (HDLC5).

= Contents of the PRISM HDLC error register for link 6 (HDLC6).

= Contents of the PRISM HDLC error register for link 7 (HDLC7).

= Contents of the PRISM current pointer counter (PCNT).

= Contents of the PRISM maximum used packet buffer counter (MXUSD).

= Contents of the PRISM PRAM access address register (PRADD).

= Contents of the PRISM PRAM access data register (PRDAT).

= Contents of the PRISM pointer first-in/first-out (FIFO) load register (PFLD).

= Contents of the PRISM maximum pointer load register (MXPLD).
f = Contents of the PRISM pointer monitor timer register (PMTMR).
g = Contents of the PRISM diagnostic destination counter (DDCNT).
h = Contents of the PRISM receive data position register (RXPOS).
i = Contents of the PRISM transmit data position register (TXPOS).
j = Contents of the PRISM control and synchronization interface (CSI) out-of-sync error threshold register (COOSET).
k = Contents of the PRISM physical fault insertion register (PFI).
l = Contents of the PRISM constant register (CNST).
m = Contents of the PRISM built-in self test (BIST) signature register (BSIG).
n = Contents of the fabric and message interface (FMI) receive QLPS time multiplexed switch link (QTMSLNK) parity error register (RQ_PER).
o = Contents of the FMI fabric output parity error source register 1 (FOPE1).
p = Contents of the FMI receive QTMSLNK parity error register mask (RQ_PERM).
q = Contents of the FMI fabric output parity error source register 1 mask (FOPE1M).
r = State of the affected QLPS at the time of the fault:
   ACT = Active.
   STBY = Standby.
   OOS = Out-of-service.

s = A bitmap indicating the status of the QLPS gateway links (QGLs) and QTMSLNKs associated with the affected QLPS at the time of the fault. Viewing the bits as 276543210, bit 0 (the least significant bit) is associated with the QGL to message switch (MSGS) 0, bit 1 with the QGL to MSGS 1, bit 2 with QTMSLNK 0, bit 3 with QTMSLNK 1, etc.

t = The time multiplexed switch (TMS) fault recovery mode at the time the fault was detected:
   PROCESSING AN ERROR INTERRUPT = The fault was detected via a maintenance exception (ONTC hardware checks were allowed).
   POLLING PRIOR TO FAULT DATA REQUEST = The fault was detected by polling while ONTC hardware checks were temporarily inhibited. This occurred during the interval after an earlier error was reported to the foundation peripheral controller (FPC) and before the FPC requested data about that error.
   POLLING PRIOR TO DEGRADE INFO REQUEST = The fault was detected by polling while ONTC hardware checks were temporarily inhibited. This occurred during the interval after the FPC was informed that TMSLNK errors had occurred and before the administrative module (AM) requested the identity of the TMSLNKs with errors.
   POLLING WHILE ONTC IS INHIBITED = The fault was detected by polling while ONTC hardware checks were inhibited and automatic timeslot switching (AUTISS) was enabled.

u = Unit for which a fault was detected.
\( v^1 \) = ONTC fault type.

4. ACTIONS TO BE TAKEN

2. REASON FOR OUTPUT

To report the data associated with a fault found by the office network and timing complex (ONTC) resident time multiplexed switch (TMS) software in the application processor (ONT-C-AP).

Format 1 is printed to provide data that is common to all TMS-related faults.
Formats 2 and 3 are printed to provide additional information about TMS fabric faults.

3. VARIABLE FIELD DEFINITIONS

a = ONTC side.
b = ONTC event number.
c = Part number. Multiple REPT:ONTC-FD-ONTC output messages may be printed, following a single REPT:ONTC-ELE output message, to report the data associated with a single fault recovery event.
d = Total number of parts.
e = ONTC fault type associated with this event.
f = If this output message is reporting multiple TMS errors detected at different times, this variable contains the ONTC-AP event number associated with the first error detected.
g = If the TMS errors were reported to fault recovery software in the administrative module (AM), this variable contains the ONTC-AP event number that was used to report them.
h = A bitmap indicating TMS fabric status at the time of the fault, where a set bit indicates that the fabric has been initialized. The least significant bit (bit 0) is associated with the even fabric and the next least significant bit (bit 1) is associated with the odd fabric.
i = A bitmap indicating the TMS fabrics for which errors are being reported (refer to variable "h").
j = Contents of the ONTC-AP’s interrupt request register (IRR).
k = Contents of the network clock and control (NCC) control and synchronization interface (CSI) device’s (NCC-CSI) TMS foundation (TMSF) loss of clock status register, CLKERR.
l = Contents of the NCC-CSI's TMSF error status register, TMSERR.
m = Contents of the ONTC-AP's external interrupt mask register, EIMR.
n = Contents of the NCC-CSI's TMSF loss of clock status register mask, CLKMSK.
o = Contents of the NCC-CSI's TMSF error status register mask, TMSMSK.
p = Contents of the NCC-CSI's error source register, NCC ESR.
q = Contents of the NCC-CSI's TMSF synchronization lock status register, SYNCER.
r = Contents of the NCC-CSI's TMSF parity error register, PARERR.
s = Contents of the NCC-CSI's error mask register, NCC EMR.
t = Contents of the NCC-CSI's TMSF synchronization lock status register mask, SYNCMK.
u = Contents of the NCC-CSI's TMSF parity error register mask, PARMSK.
v = Contents of the NCC-CSI's CSI address register, CSI ADDR.
w = Contents of the NCC-CSI's CSI data register, CSI DATA.
x = Contents of the NCC-CSI's timer and status register, TSTAT.
y = TMS fabric identifier.
z = ONTC fault type associated with the TMS fabric specified in variable "y".
a¹ = Contents of the CSI expansion (CSIX) summary error source register, CSIX SESR.
b¹ = Contents of the CSIX fabric and message interface (FMI) error source register, CSIX FMI ESR.
c¹ = Contents of the FMI message link interface (MLI) error source register, MLI ESR.
d¹ = Contents of the CSIX summary error source register mask, CSIX SEMR.
e¹ = Contents of the FMI error summary register, FMI SUM ESR.
f¹ = Contents of the FMI MLI error source register mask, MLI EMR.
g¹ = Contents of the CSIX secondary CSI bus enable register, SCSIBEN.
h¹ = Contents of the FMI error summary register mask, FMI SUM EMR.
i¹ = Contents of the FMI device control register, FMI DCR.
j¹ = Contents of the FMI diagnostic register, FMI DIAG.
k¹ = FMI fabric output parity error source register number. There are eight such registers (0-7), each providing a summary of whether fabric output parity errors exist on a subset of the TMS fabric output ports.
l¹ = Contents of FMI fabric output parity error source register "k¹".
m¹ = FMI fabric output parity error mask register number.
n¹ = Contents of FMI fabric output parity error mask register "m¹".
o¹ = Contents of the CSIX packet routing for intra-switch messaging (PRISM) error source register, PRISM ESR.
p¹ = Contents of the CSIX TMSF error source register, TMSF ESR.
q¹ = Contents of the CSIX TMS expansion (TMSX) 2 error source register, TMSX2 ESR.
r¹ = Contents of the CSIX TMSX 1 error source register, TMSX1 ESR.
s¹ = Contents of the CSIX TMSX 3 error source register, TMSX3 ESR.
t¹ = Contents of the CSIX secondary CSI bus reset register, SCSIRST.
u¹ = Contents of the CSIX diagnostic control register, DIAG CTRL.
v¹ = Contents of the CSIX miscellaneous control register, MISC CTRL.

2. REASON FOR OUTPUT

To report the data associated with a fault found by the office network and timing complex (ONTC) resident time
multiplexed switch (TMS) software in the application processor (ONTC-AP).
Format 1 is printed to provide data that is common to all TMS-related faults.

Formats 2 and 3 are printed to provide additional information about TMS fabric faults.

3. VARIABLE FIELD DEFINITIONS

a = ONTC side.
b = ONTC event number.
c = Part number. Multiple REPT:ONTC-FD-ONTC output messages may be printed, following a single REPT:ONTC-ELE output message, to report the data associated with a single fault recovery event. If the amount of fault data collected will not fit into the maximum possible number of parts, a “PARTIAL DATA” indication will be printed.
d = Total number of parts.
e = ONTC fault type associated with this event.
f = If this output message is reporting multiple TMS errors detected at different times, this variable contains the ONTC-AP event number associated with the first error detected.
g = If the TMS errors were reported to fault recovery software in the administrative module (AM), this variable contains the ONTC-AP event number that was used to report them.
h = A bitmap indicating TMS fabric status at the time of the fault, where a set bit indicates that the fabric has been initialized. The least significant bit (bit 0) is associated with the even fabric of TMSFP 0, the next least significant bit (bit 1) with the odd fabric of TMSFP 0, the next (bit 2) with the even fabric of TMSFP 1, and so forth.
i = A bitmap indicating the TMS fabrics for which errors are being reported (refer to variable “h.”).
j = Contents of the ONTC-AP’s interrupt request register (IRR).
k = Contents of the network clock and control (NCC) control and synchronization interface (CSI) device’s (NCC-CSI) TMS foundation (TMSF) loss of clock status register, CLKERR.
l = Contents of the NCC-CSI’s TMSF error status register, TMSERR.
m = Contents of the ONTC-AP’s external interrupt mask register, EIMR.
n = Contents of the NCC-CSI’s TMSF loss of clock status register mask, CLKMSK.
o = Contents of the NCC-CSI’s TMSF error status register mask, TMSMSK.
p = Contents of the NCC-CSI’s error source register, NCC ESR.
q = Contents of the NCC-CSI’s TMSF synchronization lock status register, SYNCER.
r = Contents of the NCC-CSI’s TMSF parity error register, PARERR.
s = Contents of the NCC-CSI’s error mask register, NCC EMR.
t = Contents of the NCC-CSI’s TMSF synchronization lock status register mask, SYNCMK.
u = Contents of the NCC-CSI’s TMSF parity error register mask, PARMSK.
= Contents of the NCC-CSI's CSI address register, CSI ADDR.

= Contents of the NCC-CSI's CSI data register, CSI DATA.

= Contents of the NCC-CSI's timer and status register, TSTAT.

= TMS fabric pair (TMSFP) number.

= TMS fabric identifier (0 for the even fabric and 1 for the odd fabric).

= ONTC fault type associated with the TMS fabric specified by variables "y" and "z".

= Contents of the CSI expansion (CSIX) summary error source register, CSIX SESR.

= Contents of the CSIX fabric and message interface (FMI) error source register, CSIX FMI ESR.

= Contents of the FMI message link interface (MLI) error source register, MLI ESR.

= Contents of the CSIX summary error source register mask, CSIX SEMR.

= Contents of the FMI error summary register, FMI SUM ESR.

= Contents of the FMI MLI error source register mask, MLI EMR.

= Contents of the CSIX secondary CSI bus enable register, SCSIBEN.

= Contents of the FMI error summary register mask, FMI SUM EMR.

= Contents of the FMI device control register, FMI DCR.

= Contents of the FMI diagnostic register, FMI DIAG.

= FMI fabric output parity error source register number. There are eight such registers (0-7), each providing a summary of whether fabric output parity errors exist on a subset of the TMS fabric output ports.

= Contents of FMI fabric output parity error source register "l1".

= FMI fabric output parity error mask register number.

= Contents of FMI fabric output parity error mask register "n1".

= Contents of the CSIX packet routing for intra-switch messaging (PRISM) error source register, PRISM ESR.

= Contents of the CSIX TMSF error source register, TMSF ESR.

= Contents of the CSIX TMS expansion (TMSX) 2 error source register, TMSX2 ESR.

= Contents of the CSIX TMSX 1 error source register, TMSX1 ESR.

= Contents of the CSIX TMSX 3 error source register, TMSX3 ESR.

= Contents of the CSIX secondary CSI bus reset register, SCSIRST.

= Contents of the CSIX diagnostic control register, DIAG CTRL.
 Contents of the CSIX miscellaneous control register, MISC CTRL.

2. REASON FOR OUTPUT

To report the data associated with time multiplexed switch (TMS) link (TMSLNK) faults found by the Office Network
and Timing Complex (ONTC) resident software in the application processor (ONTC-AP). Format 1 is printed for
TMSLNK faults detected by the fabric and message interface (FMI) device, while format 2 is printed for TMSLNK
faults detected by the link interface transceiver (LIT) device.

3. VARIABLE FIELD DEFINITIONS
= ONTC side.
b = ONTC event number.
c = Part number. Multiple REPT ONTC "FAULT DATA" output messages may be printed (following a single REPT:ONT-C-ELE output message) to report the data associated with a single fault recovery event.
d = Total number of parts.
e = TMSLNK number (if only one TMSLNK is affected).
f = TMS fabric number (0 for the even fabric and 1 for the odd fabric).
g = ONTC fault type.
h = Contents of the control and synchronization interface (CSI) expansion (CSIX) summary error source register (CSIX SESR).
i = Contents of the CSIX FMI error source register (CSIX FMI ESR).
j = Contents of the FMI error summary register (FMI SUM ESR).
k = Contents of the CSIX summary error source register mask (CSIX SEMR).
l = Contents of the CSIX secondary CSI bus enable register (SCSIBEN).
m = Contents of the FMI error summary register mask (FMI SUM EMR).
n = Contents of the FMI device receive fabric data interconnect (RFDI) link error source register for the TMS foundation (TMSF) board (TMSF RFDI ESR).
o = Contents of the FMI device RFDI link error source register for TMS expansion (TMSX) board 1 (TMSX1 RFDI ESR).
p = Contents of the FMI device RFDI link error source register mask for the TMSF board (TMSF RFDI EMR).

Output Message(s):

REPT: ONTC-ELE

Other Manuals:
235-105-220  Corrective Maintenance Procedures
**REPT: ONTC-HF**

**Software Release:** 5E15 and later  
**Message Class:** ONTC  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   REPT ONTC=a ENV=b HASHSUM FAILURE [AM-EVENT=c]  
   FAILING ADDRESS RANGES:  
   [[d]]  
   e f  
   . .  
   . .  
   . .

2. **REASON FOR OUTPUT**

   To notify the user that hashsum checks of the office network and timing complex (ONTC) processor memory failed. Hashsum checks are made during ONTC processor pump (automatic or manual) and routinely.

   Failure of hashsum checks may indicate that the hashsum tables are in error, or it may be that the memory is bad. The address ranges for the blocks that had bad hashsums are provided.

3. **VARIABLE FIELD DEFINITIONS**

   a = ONTC side.  
   b = Environment in which the stimulus occurred. Valid value(s):  
   AP = Application processor.  
   IP = Input/output processor.  
   APDGN = Application processor, diagnostics image.  
   IPDGN = Input/output processor, diagnostics image.  
   c = The AM event number.  
   d = Total number of failing ranges only used during an ONTC pump if more than 5 failing ranges.  
   e = Starting address of the range.  
   f = Ending address of the range.

4. **ACTIONS TO BE TAKEN**

   Investigate the cause of the failure. It may be the result of bad memory or a bad hashsum table. Make any necessary repairs. This condition may prevent the ONTC from going duplex.

   If replacing the boards does not clear up the problem, there might be a difference between the ACTIVE memory and the hashsum table. It is very likely that the memory hashsums do not agree with the hashsum table. Resolve any differences between the memory and the hashsum table. This problem can occur when certain utility commands are used that change the contents of memory, but not the hashsum table. Refer to LOAD:UT-ONTC input manual page for additional information.
It is possible for a ONTC restoration to succeed even when the ONTC is reporting hashsum failures when the failures are in certain ranges. That is, a ONTC restoration does not check all memory. If the ONTC has ranges failing that are not in the set of memory checked, a restoration may succeed.

5. ALARMS

6. REFERENCES

Input Message(s):

LOAD:UT-ONTC
1. FORMAT

REPT ONTC a NC {PRIM REF|SEC REF|REFc}{LOW|HIGH} ERROR RATE EXCEEDED EVENT=b

2. REASON FOR OUTPUT

To report that the framer for the office network timer complex (ONTC) network clock (NC) primary or secondary reference exceeded either the minimum or maximum error rate threshold.

3. VARIABLE FIELD DEFINITIONS

HIGH = Higher error rate threshold was exceeded.
LOW = Lower error rate threshold was exceeded.
PRIM = Primary reference exceeded the error rate threshold.
REFc = Reference 'c' exceeded the error rate threshold.
SEC = Secondary reference exceeded the error rate threshold.
a = Unit side.
b = Event number.
c = Reference number.

4. ACTION TO BE TAKEN

Monitor the reports for other details concerning the reference and eliminate the reason for the fault when feasible.

5. ALARMS

None.

Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

REPT ONTC a NC {PRIM REF|SEC REF|REFc}{LOW|HIGH} OOF EVENT=b

2. REASON FOR OUTPUT

To report that the out-of-frame counter for the office network timer complex (ONTC) network clock (NC) primary or secondary reference reached either the minimum or maximum threshold.

3. VARIABLE FIELD DEFINITIONS

HIGH = Higher threshold was reached.
LOW = Lower threshold was reached.
PRIM = Primary reference reached the threshold.
REFc = Reference 'c' reached the threshold.
SEC = Secondary reference reached the threshold.
a = Unit side.
b = Event number.
c = Reference number.

4. ACTION TO BE TAKEN

Determine whether the reason for the erroneous number of out-of-frames can be eliminated. Monitor the reports for other details pertaining to the reference.

2. REASON FOR OUTPUT

All of these reports provide information about specific office network and timing complex (ONTC) hardware registers for trouble analysis. These messages are automatically generated by the system when a fault is detected. The messages can be correlated with REPT:ONTC-ELE output messages by using the ONTC event number.

Format 1 provides information about specific ONTC hardware Application Processor (AP) registers.

Format 2 provides information about specific ONTC hardware Input/Output Processor (IP) side registers.

Format 3 provides information about specific memory management unit (MMU) hardware registers.

Format 4 provides information about specific ONTC synchronous protocol data formatter chip-256 (SPYDER-256) hardware registers.

3. VARIABLE FIELD DEFINITIONS

a = ONTC side.

b = ONTC event number.

c = SPYDER-256 number. Valid value(s):
SPYDER-256 0 = SPYDER-256 number 0.
SPYDER-256 1 = SPYDER-256 number 1.
SPYDER-256 2 = SPYDER-256 number 2.
SPYDER-256 3 = SPYDER-256 number 3.

d = Contents of the register. Register definition:
ACTRL = Asset control register.
AID = Asset identification register.
AP_CAR = Peripheral component interconnect (PCI) configuration address register.
AP_CDR = PCI Configuration data register.
APCTL = Application control register.
APSAR0 = Shadow address 0 register.
APSAR1 = Shadow address 1 register.
APSHDH = Shadow high data register.

   OP:LOG
REPT:OP-PMCR-ERR
Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

REPT OP PMCR ERROR a[, ERRNO = b]

2. REASON FOR OUTPUT

To report errors encountered during the execution of the processes which comprise the plant measurements common report (PMCR) capability.

3. VARIABLE FIELD DEFINITIONS

a = Four-digit error code. This code consists of a one-digit number that indicates the PMCR process in which the error was detected, a two-digit number that indicates the error type, and a one-digit number that shows the location of the error within the specific process.

Process values are:
1 = PMCR craft interface.
2 = PMCR manager.
3 = PMCR collector.
4 = PMCR report generator.

Error type values are:
01 = Could not connect to system port.
02 = Could not send or receive message.
03 = Failed 'plib' call.
04 = Failed 'pl_init' call.
05 = Failed 'pl_attrec' call.
06 = Failed 'pl_update' call.
07 = Failed 'pl_read' call.
08 = Failed 'lla_iatt' call.
09 = Failed 'lla_iirel' call.
10 = Failed 'lla_rdget' call.
11 = Failed 'lla_opensq' call.
12 = Failed 'lla_nextseq' call.
13 = Could not execute PMCR collector or PMCR report generator.
14 = Could not get equipment configuration database (ECD) segments.
15 = Could not get reporting office name from ECD.
16 = Computation of maintenance usage time for the specified unit resulted in a time greater than 86,400 seconds (one day).
17 = Bad arguments received by PMCR report generator.
18 = Spool error during output of report.
19 = No data has been collected to output a retained/demand report.
20 = “fopen” UNIX operating system call failed trying to open the "/etc/pmcrtab" file to initialize the hourly/daily report option flags.

When this error is output, the hourly/daily report flags will be set to the default. This
means that the hourly reports will be output every hour, and the daily reports at midnight.

21
= "create" UNIX® call failed trying to create the "/etc/pmcrtab" file.

This will cause the hourly/daily report flags to be reset to the default values, if the PMCR process "/prc/pmcrman" is re-initialized (for example, if a PHASE 2 occurs).

22
= PMDB initialization time reset to current time.
23
= Start time reset to 0.
24
= Start time reset to current time.
25
= Change reason for start time and reset start time to 0.
26
= Start time reset to top unit start time.
27
= Change reason for start time to top unit reason and reset start time to top unit start time.
28
= Hour limit exceeded - time reset to one hour.
29
= Negative time count - time reset to 0.
30
= Day limit exceeded - time reset to one day.
31
= Current value (for example, alarm count) is less than count recorded from previous hour or previous count was invalid.
32
= Open of /etc/log/pmcrllog file failed.
33
= Could not execute pmdbcopy.

Note: For messages 23 through 32, refer to /etc/log/pmcrllog for record name information. These error messages indicate that the count or time for the unit may not be valid.

The log file (/etc/log/pmcrllog) is reset every time a scheduled report runs.

b = Error code returned by the failing function call. Valid value(s):

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>'b' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>x01x, x02x, x03x, x13x, x14x, x15x, x16x, x181, or x182</td>

**REPT OP PMCR REPORT z 2 COMPLETED**
= Number of alarms of the specified type.

= Number of system initializations of the specified type and level.

= Number of processor interrupts of the following types. Valid value(s):

- 0 = Active CC.
- 1 = Other CC.
- 2 = Software.
- 3 = EAI.

Type does not indicate priority level.

= Audit name.

= Audit member number.

= Number of audit attempts.

= Number of audit failures.

= Quantity of units of the specified type which have the plant bit set in the appropriate unit control block (UCB).

= Number of requests for the given unit to go to a non-active state due to an error threshold having been exceeded.

= Number of transient errors.

= Number of routine automatic diagnostics.

= The amount of time the unit is in a non-active state due to adp time.

= The amount of time the unit is in a non-active state due to a manual request. Units that are unequipped for offline boot will be reported as non-active due to a manual request on the original online side. On the original offline side, unequipped units for offline boot will not be reported on.

= The amount of time the unit is in a non-active state due to an error threshold having been exceeded.

= The amount of time that the unit is forced active. Valid for CU unit only.

= Unit name.

= Unit number.

= Text. Valid value(s):

REPT: OSPS-ACQS

Software Release: 5E14 and later
Message Class: OVLD
Application: 5
Type: Output

1. FORMAT

REPT OSPS ACQS a

2. REASON FOR OUTPUT

To report telephone company administration (TCA) specified queue threshold violations, queue overflows and
recovery events involving Operator Services Position System (OSPS) automated charge quotation service (ACQS)
message queue.

3. VARIABLE FIELD DEFINITIONS

a  = Text describing the event that occurred. Valid value(s):
  QUEUE OVERFLOW CONTINUED = The OSPS ACQS message queue
      continued to overflow.
  b MESSAGES PURGED = The OSPS ACQS message queue

b  = The number of messages purged from the queue since the onset of the previous 'QUEUE
  OVERFLOW OCCURRED'.
  QUEUE OVERFLOW OCCURRED = The OSPS ACQS message queue overflow occurred and a
      message was purged.
  QUEUE RETURNED TO NORMAL = The OSPS ACQS message queue became normal and the
      number of messages in the queue is below the TCA-specified threshold.
  TCA THRESHOLD VIOLATION CONTINUED = The OSPS ACQS message queue continued to
      exceed the TCA-specified threshold for a TCA-specified time interval.
  TCA THRESHOLD VIOLATION OCCURRED = The OSPS ACQS message queue has exceeded the
      TCA-specified threshold.

4. ACTION TO BE TAKEN

Verify and restore faulty digital subscriber lines (DSLs) serving either a Hotel Billing Information System (HOBIS) or
hotel billing information center (HOBIC). If the threshold violation occurs and the DSLs are in service, the threshold
may be set too low for the ACQS call volume.

REPT: OSPS-ALARM

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

REPT OSPS ALARM a b

2. REASON FOR OUTPUT

To report that an Operator Services Position System (OSPS) feature had its successful query rate fall below a threshold. This is a violation of the threshold. The threshold for each feature is an office parameter.

3. VARIABLE FIELD DEFINITIONS

a = Feature whose threshold was violated. Valid value(s):
   89CC = ANS® TCAP 89/CCC validation application.
   AILS = Automated inward line screening (AILS).
   BBNS = Billing validation application (BVA) billed number screening.
   BCRD = BVA calling card.
   CAS = Customer account services (CAS).
   CAS7 = CAS common channel signaling 7 (CCS7).
   LBNS = Line information database (LIDB) billed number screening.
   LCRD = LIDB calling card.
   LNP = OSPS Local Number Portability (LNP).
   OLNS = OSPS originating line number screening (OLNS).
   ONAI = OSPS network access interrupt (NAI).
   RATE = Real-Time Rating System (RTRS).

b = The present query success rate threshold value (from 0 to 100 percent).

4. ACTIONS TO BE TAKEN

This message indicates that too many queries are failing. The successful query rate threshold for each feature is an office parameter. The value should be checked for correctness. Its recent change default value is recommended, though not required. If the value is correct, there may be a problem with the database associated with the feature. Contact the database administrator for assistance.

    [j]

2. REASON FOR OUTPUT

To report the occurrence of an Operator Services Position System (OSPS) direct signaling event (DSE) that may be either a line applications for consumers (LAC) event, a calling card (CCRD) event, a customer account services (CAS) event, a CAS common channel signaling 7 (CCS7) event, an international credit card validation (ICCV) event, an OSPS local number portability (LNP) event, an automated inward line screening (AILS) event, a billed number screening (BNS), or a rating event.

3. VARIABLE FIELD DEFINITIONS

a = Digits associated with the call that triggered the event to occur. For an NCD event these numbers are the first six digits of the billing number. For a CCRD event the digits are the first six digits of the calling card number. For a BNS event the digits are the numbering plan area (NPA) and office code (NXX) of the billing number. For a rating event the digits are the NPA and NXX of the originating directory number. For a CAS event the digits are the first six digits of the individual account number. For an AILS event the digits are the first six digits of the billing number. This field will not be printed if the complete calling card number is available; the complete card number, excluding the personal identification number (PIN), is instead printed in field 'b'. When the change handling of indeterminate reply codes feature (secure feature ID 81) has been activated the full ten digit billing number is printed for a CCRD event and/or BNS event.

b = Complete calling card number, excluding PIN, of CAS CCS7 or ICCV events.

c = Time of day when the event occurred, in the form hours:minutes:seconds.

d = Text describing the event that occurred. Valid value(s):
    AILS  GARBLED  MESSAGE = An AILS message received garbled.
    AILS  MISROUTED  QUERY = An AILS error - misrouted query.
    AILS  TIMEOUT = An AILS message returned because of timeout.
    AILS  TASK  REFUSED = An AILS error - task refused.
    AILS  UNEXPECTED  INPUT  DATA  VALUE = An AILS error - message received with an unexpected input data value.
    CAS  DATA  BASE  OVERLOAD = A CAS message returned because of database overload.
    CAS  DATA  BASE  UNABLE  TO  PROCESS = A CAS message returned because the database was unable to process.
    CAS  GARBLED  REPLY = A CAS message received garbled.
    CAS  NETWORK  BLOCKAGE = A CAS message returned because of network blockage.
    CAS  NETWORK  CONGESTION = A CAS message returned because of network congestion.
CAS NO ROUTING DATA = A CAS message returned because of no routing data.
CAS TIMEOUT = A CAS message returned because of timeout.
CAS UNEQUIPPED DESTINATION = A CAS message returned because of unequipped destination.
CAS UNEXPECTED REPLY = A CAS message received with an unexpected reply.
CAS7 ABORT MESSAGE = A CAS CCS7 abort message received.
CAS7 ACG COMPONENT = A CAS CCS7 ACG invoke component received.
CAS7 GARBLED MESSAGE = A CAS CCS7 message received with invalid format reply.
CAS7 GATEWAY ERROR = A CAS CCS7 error - gateway error.
CAS7 MISROUTED QUERY = A CAS CCS7 error - misrouted query.
CAS7 MISSING PARAMETER = A CAS CCS7 error - message received with missing parameter.
CAS7 REJECT COMPONENT = A CAS CCS7 reject component received.
CAS7 TASK REFUSED = A CAS CCS7 error - task refused.
CAS7 TIMEOUT = A CAS CCS7 query timed out before a reply was received.
CAS7 UDS NETWORK CONGESTION = A CAS CCS7 message returned because of network congestion.
CAS7 UDS NETWORK FAILURE = A CAS CCS7 message returned because of network failure.
CAS7 UDS NO ADDRESS NATURE = A CAS CCS7 message returned - no translation data for address of such nature.
CAS7 UDS NO ADDRESS SPECIFIC = A CAS CCS7 message returned - no translation data for this specific address.
CAS7 UDS SUBSYSTEM CONGESTION = A CAS CCS7 message returned because of subsystem congestion.
CAS7 UDS SUBSYSTEM FAILURE = A CAS CCS7 message returned because of subsystem failure.
CAS7 UDS UNEQUIPPED USER = A CAS CCS7 message returned - unequipped user.
CAS7 UDS UNQUALIFIED = A CAS CCS7 message returned - unqualified - unknown failure reason.
CAS7 UNEXPECTED INPUT DATA VALUE = A CAS CCS7 error - message received with an unexpected input data value.
CAS7 UNEXPECTED PARAMETER = A CAS CCS7 error - message received with unexpected parameter.
CAS7 UNEXPECTED REPLY = A CAS CCS7 message received with unexpected reply.
CAS7 VACANT CODE = A CAS CCS7 error - vacant code.
CCRD DATA BASE OVERLOAD = A BVA CCRD message returned because of database overload.
CCRD DATA BASE UNABLE TO PROCESS = A BVA CCRD message returned because the database was unable to process.
CCRD GARBLED MESSAGE = A BVA CCRD message received garbled.
CCRD NETWORK BLOCKAGE = A BVA CCRD message returned because of network blockage.
CCRD NETWORK CONGESTION = A BVA CCRD message returned because of network congestion.
CCRD NO ROUTING DATA = A BVA CCRD message returned because of no routing data.
CCRD UNEQUIPPED DESTINATION = A BVA CCRD message returned because of unequipped destination.
CCRD UNEXPECTED REPLY = A BVA CCRD message received with an unexpected reply.
ICCV ABORT MESSAGE = An ICCV abort message received.
ICCV DATA BASE UNAVAILABLE = An ICCV error - message returned - database unavailable.
ICCV ERROR IN MESSAGE FORMAT = An ICCV error in message format.
ICCV GARBLED MESSAGE = An ICCV message received with invalid format reply.
ICCV MISSING PARAMETER = An ICCV error - message received with missing parameter.
ICCV MISROUTED QUERY = An ICCV error - misrouted query.
ICCV REJECT COMPONENT = An ICCV reject component received.
ICCV TIMEOUT = An ICCV query timed out before a reply was received.
ICCV UDS NETWORK CONGESTION = An ICCV message returned because of network congestion.
ICCV UDS NETWORK FAILURE = An ICCV message returned because of network failure.
ICCV UDS NO ADDRESS NATURE = An ICCV message returned - no translation data for address of such nature.
ICCV UDS NO ADDRESS SPECIFIC = An ICCV message returned - no translation data for this specific address.
ICCV UDS SUBSYSTEM CONGESTION = An ICCV message returned because of subsystem congestion.
ICCV UDS SUBSYSTEM FAILURE = An ICCV message returned because of subsystem failure.
ICCV UDS UNEQUIPPED USER = An ICCV message returned - unequipped user.
ICCV UDS UNQUALIFIED = An ICCV message returned - unqualified - unknown failure reason.
ICCV UNEXPECTED INPUT DATA VALUE = An ICCV error - message received with unexpected input data value.
ICCV UNEXPECTED PARAMETER = An ICCV error - message received with unexpected parameter.
ICCV UNEXPECTED REPLY = An ICCV message received with unexpected reply.
LAC ABORT MESSAGE = LAC abort message received.
LAC ACG COMPONENT = LAC invoke component received.
LAC GARBLED MESSAGE = LAC message received with invalid format.
LAC MISROUTED QUERY = LAC error - misrouted query.
LAC MISSING PARAMETER = LAC error - message received with missing parameter.
LAC REJECT COMPONENT = LAC reject component received.
LAC TASK REFUSED = LAC error - task refused.
LAC TIMEOUT = LAC query timed out before a reply was received.
LAC UDS NETWORK CONGESTION = LAC message returned because of network congestion.
LAC UDS NETWORK FAILURE = LAC message returned because of network failure.
LAC UDS NO ADDRESS SPECIFIC = LAC message returned - no translation data for this specific address.
LAC UDS NO ADDRESS NATURE = LAC message returned - no translation data for address of such nature.
LAC UDS SUBSYSTEM CONGESTION = LAC message returned because of subsystem congestion.
LAC UDS SUBSYSTEM FAILURE = LAC message returned because of subsystem failure.
LAC UDS UNEQUIPPED USER = LAC message returned - unequipped user.
LAC UDS UNQUALIFIED = LAC message returned - unqualified.
LAC UDS UNQUALIFIED = LAC message returned - unqualified - unknown failure reason.
LAC UDS UNEXPECTED INPUT DATA VALUE = LAC error - message received with unexpected input data value.
LAC UDS UNEXPECTED PARAMETER = LAC error - message received with unexpected parameter.
LAC UDS UNEXPECTED REPLY = LAC unexpected reply.
LAC VACANT CODE = LAC error - vacant code.
LIDB CALL GAPPING = Received a line information database (LIDB) message with a call gapping indicator present.
LIDB GARBLED MESSAGE = Received a LIDB garbled message.
LIDB MISSING GROUP OR MISROUTED = Received a LIDB message with return value missing group or misrouted.
LIDB NETWORK CONGESTION = Received a LIDB message with return value network congestion.
LIDB NETWORK FAILURE = Received a LIDB message with return value network failure.
LIDB NO ADDRESS NATURE = Received a LIDB message with return value no translation for an address of such nature.
LIDB NO ADDRESS SPECIFIC = Received a LIDB message with return value no translation for this specific address.
LIDB NON PARTICIPATING GROUP = Received a LIDB message with return value nonparticipating group.
LIDB REJECT MESSAGE RECEIVED = LIDB reject message received.
LIDB SUBSYSTEM CONGESTION = Received a LIDB message with return value subsystem congestion.
congestion.

LIDB SUBSYSTEM FAILURE = Received a LIDB message with return value subsystem failure.
LIDB TIMEOUT = LIDB message missed because of timeout.
LIDB UNEQUIPPED USER = Received a LIDB message with return value unequipped user.
LIDB UNEXPECTED REPLY = Received a LIDB message that was a unexpected reply.
LNP ABORT MESSAGE = OSPS LNP abort message received.
LNP ACG COMPONENT = OSPS LNP ACG invoke component received.
LNP ERROR CODE = OSPS LNP error code received.
LNP GARBLED MESSAGE = OSPS LNP message received with invalid format reply.
LNP REJECT COMPONENT = OSPS LNP reject component received.
LNP TIMEOUT = OSPS LNP query which timed out before reply received.
LNP UDS NETWORK CONGESTION = OSPS LNP message returned because of network congestion.
LNP UDS NETWORK FAILURE = OSPS LNP message returned because of network failure.
LNP UDS NO ADDRESS NATURE = OSPS LNP message returned - no translation data for address of such nature.
LNP UDS NO ADDRESS SPECIFIC = OSPS LNP message returned - no translation data for this specific address.
LNP UDS SUBSYSTEM CONGESTION = OSPS LNP message returned because of subsystem congestion.
LNP UDS SUBSYSTEM FAILURE = OSPS LNP message returned because of subsystem failure.
LNP UDS UNEQUIPPED USER = OSPS LNP message returned - unequipped user.
LNP UNEXPECTED REPLY = OSPS LNP message received with unexpected reply.
RATE DATA BASE OVERLOAD = A rating message returned because of database overload.
RATE DATA BASE UNABLE TO PROCESS = A rating message returned because database unable to process.
RATE GARBLED REPLY = A rating message received garbled.
RATE TIMEOUT = A rating message returned because of timeout.
RATE UNEXPECTED REPLY = A rating message received with an unexpected reply.

= Three-digit revenue accounting office (RAO) number.

f = Database error type. Valid value(s):
  CHARGE OVERFLOW
  DATABASE OVERLOAD
  MISCELLANEOUS
  NO RATING DATA
  SHORT TERM OVERLOAD
  TRANSIENT ERROR
  UNRECOGNIZED MESSAGE

g = Network control point (NCP) function number.

h = Rating reply type. Valid value(s):
  BUSY LINE VERIFY
  END OF CALL
  INITIAL COIN
  INTERIM COIN
  PURCHASE LIMITS INITIAL
PURCHASE LIMITS SUBSEQUENT
PURCHASE LIMITS BLV = Busy line verify purchase limits.

RATE QUOTE

i = Originating point code (OPC). This field will print only for LIDB BNS, LIDB CCRD, LIDB OLNS, CAS, CAS CCS7, OSPS LNP or ICCV events. The OPC is the point code of the network node which sent the response.

j = Reject problem code or abort cause. Valid value(s):
CAS U-ABORT - APPLICATION PROTOCOL VIOLATION
CAS U-ABORT - REJECT RECEIVED
CAS U-ABORT - UNKNOWN USER PROBLEM
ICCV U-ABORT - MISTyped COMPONENT
ICCV U-ABORT - BADLY STRUCTURED COMPONENT
ICCV U-ABORT - UNRECOGNIZED COMPONENT
P-ABORT - BADLY FORMATTED TRANSACTION PORTION
P-ABORT - INCORRECT TRANSACTION PORTION
P-ABORT - RESOURCE LIMITATION
P-ABORT - UNRECOGNIZED MESSAGE TYPE
P-ABORT - UNRECOGNIZED TRANSACTION ID
REJECT - BADLY STRUCTURED COMPONENT
REJECT - DUPLICATE INVOKE ID
REJECT - INITIATING RELEASE
REJECT - MISTyped COMPONENT
REJECT - MISTyped PARAMETER
REJECT - RESOURCE LIMITATION
REJECT - UNRECOGNIZED COMPONENT
REJECT - UNRECOGNIZED OPERATION

k = LIDB query type. Valid value(s):
BNS
CCRD
OLNS

4. ACTIONS TO BE TAKEN

This message indicates a problem with a database external to the switch. This message may print because of problems with the database or the network connecting the switch to the database.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

Application: 5
Type: Output

1. FORMAT

REPT OSPS ICCV ALARM [a] [b]  
DBNAME DBNUMBER QSENT RRECVD THRSHLD  
[c] [d] [e] [f] [g]

2. REASON FOR OUTPUT

The output message reports query success rate threshold violations for international credit card validation (ICCV) databases. Sixteen database identifiers are specified, with database 0 representing all ICCV databases not specifically associated with any of the sixteen specified identifiers.

3. VARIABLE FIELD DEFINITIONS

a = Indicates if this message contains more than one part.
b = The message part number.
c = The name of the database.
d = The number of the database.
e = The number of queries sent.
f = The number of queries received.
g = The query success rate threshold value.

4. ACTION TO BE TAKEN

This message indicates that too many queries are failing. The query success rate threshold is specified for each issuer ID. The value should be checked for correctness. Verify RC/V View 27.60. If the value is correct, there may be a problem with the database.

5. ALARMS

Major.

1. FORMAT

REPT OSPS ICE   a bb:bb:bb
   c TTYPE=d
   e CDBS=[f]      OPC=[g]
   SDN=[h]        SINTYP=[i]
   CCC=[i]        OPCODE=[k]
   LOP=[l]

2. REASON FOR OUTPUT

To report an Operator Services Position System (OSPS) unexpected parameter combination event that occurred during customer account services (CAS) Common Channel Signaling System 7 (CCS7), international credit card validation (ICCV), or line information database (LIDB).

3. VARIABLE FIELD DEFINITIONS

a = The card number used for the call, excluding personal identification number (PIN).
b = The time of day that the event occurred, in the form hours:minutes:seconds.
c = The card type. Valid value(s):
   CAS CARD
   COMMERCIAL CREDIT CARD
   LEC CARD
   NON-AT&T 89C CARD

d = The translation type. This field is used in the translation capabilities application part (TCAP) query to indicate to the signaling transfer point (STP) which translation tables should be used to obtain routing information for the query.
e = The text describing the event that occurred. Valid value(s):
   CALLING NUMBER RESTRICTIONS ON INWARD CALLS = Calling number restrictions are not allowed on inward calls.
   CCC AUTHORIZATION CODE IN AN 89C REPLY = A commercial credit card (CCC) authorization code in an 89C reply.
   CDBS NUMBER WITH EXPIRATION DATE HANDLING = A query reply was received with a customer defined billing segmentation (CDBS) number and expiration date handling. The call will continue with expiration date handling.
   CDBS NUMBER WITH FTS ROUTING NUMBER = A CDBS number with a federal telecommunication system (FTS) routing number.
   CDBS NUMBER WITH INCOMPATIBLE OPERATION CODE = CDBS code in reply to an ICCV query containing an incompatible operation code.
   CDBS NUMBER WITH SDN ROUTING NUMBER = A CDBS number with a software defined network.
(SDN) routing number.

CDC INFO RECEIVED WITH CDC OFF = Call duration and charge (CDC) information received with CDC office parameter off. The call will continue as a non-card limit call. Refer to RC View 8.9.

CGNR RESTRICTIONS ON INWARD CALL = The calling number restrictions (CGNR) deny reply received from CAS/NCP on inward calls for which calling numbers are not available.

DL INFO RECEIVED WITH DL OFF = Duration limit (DL) information received with the DL office parameter off. The call will continue as a non-card limit call. Refer to RC View 8.9.

FTS NUMBER IN REPLY TO CCC QUERY = An FTS routing number in reply to a query containing a commercial credit card.

FTS NUMBER IN REPLY TO NON-AT&T 89C QUERY = An FTS routing number in reply to a query containing a non-AT&T 89C card.

FTS NUMBER WITH PL INFORMATION = An FTS routing number in reply to a query containing PL information.

FTS ROUTING NUMBER CONFLICT = The most recently received query either did not contain an FTS routing number or the routing number returned did not match any of the internally stored FTS routing numbers. For a call identified as an FTS call, a valid FTS routing number must be returned.

LOP NOT SUPPORTED BY OSPS = The LOP received is greater than the maximum value allowed by OSPS. Refer to RC View 8.9.

LOP ON INWARD CALL = The LOP is received on inward calls.

LOP WITH INVALID PIN OR INVALID CCC = The LOP is received with invalid PIN or invalid CCC reply code.

NO SDFN RETURNED ON SPEED DIAL CALL = A speed dial code (SDC) was sent to the card validation database, but a speed dial forward number (SDFN) was not returned in the reply. Speed dial calls cannot be routed to the forward party without an SDFN.

PLBQ CALL WITH MISSING OR INVALID CARD LIMIT INFO = A purchase limit balance quotation (PLBQ) call with missing or invalid card limit (CL) information. The call will continue as a non-card limit call.

PL INFO RECEIVED WITH PL OFF = PL information received with the PL office parameter off. The call will continue as a non-card limit call. Refer to the RC/V View 8.9 (OSPS OFFICE PARAMETERS).

SDN NUMBER IN REPLY TO CCC QUERY = An SDN routing number in reply to a query containing a commercial credit card.

SDN NUMBER IN REPLY TO NON-AT&T 89C QUERY = An SDN routing number in reply to a query containing a non-AT&T 89C card.

SDN NUMBER WITH PL INFORMATION = An SDN routing number in reply to a query containing PL information.

SEQUENCE CALL PIN/CDBS GROUP CONFLICT = The most recently received query did not contain a CDBS code, but a previous call in this sequence did. For a given account number, if any PIN is associated with a CDBS code, then all PINs for that account number must have a CDBS code. Contact card database administration associated with the specific card mentioned in the output message.

SL AND CL INFO RECEIVED IN SAME REPLY = SL and other CL information received in the same reply. The CL information will be ignored but the call will continue as an SL call.

SL INFO RECEIVED WITH EL OFF = Single limit (SL) information received with the enhanced limit (EL) office parameter off. The call will continue as a non-card limit call. Refer to RC/V View 8.9.

VL INFO RECEIVED WITH VL OFF = Volume limit (VL) information received with the VL office parameter off. The call will continue as a non-card limit call. Refer to RC/V View 8.9.
f = The CDBS number or none.
g = The originating point code (OPC). The OPC is the point code of the network node sending the response.
h = The SDN or FTS routing number or NONE.
i = The CCC authorization number or NONE.
j = The signaling type. Valid value(s):
   AT1 = ANSI® type 1 signaling.
   CCS6 = Common channel signaling system 6.
   CCS7 = Common channel signaling system 7.
   ICCV = International credit card validation.
   LIDB = line information database.
   MAN = Manual.
   NONE = No signaling type applicable.

k = The operation code. The operation code specifies which ICCV features are active in the switch. Each bit of the 8-bit operation code indicates whether the corresponding ICCV features are activated or not in the switch. The bits in order form low to high and their associated features are:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Bit Value</th>
<th>Bit Position</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic Validation</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CDM</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>CDBS</td>
<td>4</td>
<td>2</td>
</tr>
<tr>
<td>Not used</td>
<td>8</td>
<td>3</td>
</tr>
<tr>
<td>Geographic restriction</td>
<td>16</td>
<td>4</td>
</tr>
<tr>
<td>Not used</td>
<td>32</td>
<td>5</td>
</tr>
<tr>
<td>Not used</td>
<td>64</td>
<td>6</td>
</tr>
<tr>
<td>Not used</td>
<td>128</td>
<td>7</td>
</tr>
</tbody>
</table>

The operation code is a sum of the bit values of all applicable ICCV features. For example, if basic validation, CDBS, and geographic restrictions are active, the operation code has a value of 21. This is the sum of 1, 4, and 16. For inward calls, only values 1, 5, 17 and 21 are allowed. The operation code value only applies for ICCV queries. For all other signaling types, this field is not applicable.

l = The language value. The LOP parameter received in the reply indicates the language to be used for announcements. The maximum value of the language value is specified in RC/V View 8.9 (refer to the MAX LOP field).

4. ACTION TO BE TAKEN

This message indicates a problem with a database external to the switch. This message may print because of problems with the database or the network connecting the switch to the database. Contact the database administrator for assistance.

5. ALARMS

Minor alarm.

2. REASON FOR OUTPUT

To print operator trouble reports (OTR) in response to a keying action of an operator from an operator terminal or operator terminal position. OTRs are used to report an occurrence of trouble that an operator may have experienced while handling a call. The trouble code (TRBLCD) is used to identify the trouble experienced.

3. VARIABLE FIELD DEFINITIONS

a = Date that the report was requested, in the form month/day/year.
b = Time of day that the report was requested, in the form hours:minutes:seconds.
c = Trouble codes, indicators of the type of trouble encountered, are defined by the telephone company administration, except for trouble code 090 which is generated automatically by the system to indicate an automatic number identification failure.
d = Identification of the operator that keyed in the trouble report.
e = Identification of the operator service center.
f = Identification of the operator position at which the operator was working when the trouble report was created.
g = Forward number to which the call was connected when the trouble occurred. In the event that there was no outgoing port, a blank will be printed.
h = Identification of the incoming port to which the operator was connected when the trouble occurred.
i = Identification of the incoming line/trunk to which the operator was connected when the trouble occurred.
j = Identification of the incoming line/trunk member number.
k = Feature group identifier of the carrier used when the call was connected to the operator when the
trouble occurred. This will be a "D" for feature group D carriers, and a "B" for feature group B carriers. A "U" in this field means that the feature group of the carrier is unknown, and it is possible that the carrier identification code in field "l" is unknown or invalid.

l = Identification of the carrier used (when the call was connected to the operator) when the trouble occurred.

m = Back number of the incoming call to which the operator was connected when the trouble occurred.

n = Identification of the outgoing port to which the call was connected when the trouble occurred.

o = Identification of the outgoing line/trunk to which the call was connected when the trouble occurred.

p = Identification of the outgoing line/trunk member number to which the call was connected when the trouble occurred.

q = Indicates if the call is a system or transfer centralized automatic message accounting (CAMA) call. A value of zero indicates the call is a system CAMA call and a value of one indicates the call is a transfer CAMA call.

r = Indicates if the call is to an overseas area. A value of zero indicates no and a value of one indicates yes.

s = Identification of the Operator Services Position System (OSPS) where the call originated. In the event the call was interflowed, the ID will be that of the sending OSPS.

t = Identification of the B-channel trunk group on the receiving interflow switch, if the call was interflowed. In the event the call was not interflowed, a blank will be printed.

u = Identification of the B-channel trunk group member on the receiving interflow switch, if the call was interflowed. In the event the call was not interflowed, a blank will be printed.

v = Identification of the operator who gave the call more efficient call handling (MECH) treatment. In the event the call did not receive MECH treatment, a blank will be printed.

w = Identification of the OSPS that is associated with the operator who gave the call MECH treatment. In the event the call did not receive MECH treatment, a blank will be printed.

x = Identification of the Automated Position that was first associated with the call. This field will only be printed if the "OSPS OTR with APS ID" secure feature has been turned on.

y = Identification of the OSPS to which the Automated Position System is connected. This field will only be printed if the "OSPS OTR with APS ID" secure feature has been turned on.

z = Identification of the Location Routing Number (LRN) associated with the back (calling) number to which the operator was connected when the trouble occurred. The label is printed if the LNP secure feature has been activated and the LRN in OTRs parameter is set to Y. If the label is printed, the data field under it contains the LRN of the back number if one exists; otherwise the data field is blank.

a = Identification of the LRN associated with the forward (called) number to which the operator was connected when the trouble occurred. The label is printed if the LNP secure feature has been activated and the LRN in OTRs parameter is set to Y. If the label is printed, the data field under it contains the LRN of the forward number if one exists; otherwise the data field is blank.
4. ACTION TO BE TAKEN

The use and definition of trouble codes are the responsibility of the OSPS administration. Standard procedures set forth by the OSPS administration for a particular trouble code should be consulted.

5. ALARMS

[MORE OVERLOADED THAN REPORTED]

2. REASON FOR OUTPUT

To report that an overload occurred in the administrative module (AM), switching module (SM), communications module processor (CMP), direct link node processor (DLN), or quad-link gateway processor (QGP). This message will repeat every 15 minutes, as long as the overload persists. Throttling of call processing or maintenance work may occur. If there were more than 16 switching modules in overload, the report will note this fact.

3. VARIABLE FIELD DEFINITIONS

a = Processor modules. Valid value(s):
AM
CMP e-f,g
DLN h-i
QGP j-k
SM d

b = Real-time overload status. Valid value(s):
CRITICAL = Critical real-time overload.
MAJOR = Major real-time overload.
MINOR = Minor real-time overload.
NONE = No real-time overload.

c = Resources that are overloaded (up to seven). Refer to the APP:RESOURCES appendix in the Appendixes section of the Output Messages manual.

d = SM number that has experienced an overload.

e = Message switch control unit (MSCU) side in which the CMP resides.

f = CMP number that has experienced an overload.

g = Processor being reported on. Valid value(s):
MATE = Mate CMP.
PRIM = Primary CMP.
4. ACTIONS TO BE TAKEN

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

To find the status of the overloaded packet interface (PI) and/or packet handlers (PHs), use the OP:TRFC30 or OP:ST input messages.

If hardware checks are inhibited in an SM especially with data cache equipped, the impact could be a real time overload condition. Hardware checks should be allowed unless there is an overriding reason to inhibit the hardware checks.

5. ALARMS

Critical, major, or minor.

89. REPT:P
REPT:PASSWORD
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT PASSWORD BREAK ATTEMPT
"a" NON-EXISTING PASSWORDS OFFERED AT
TERMINAL 'b' BY UNKNOWN USER.

2. REASON FOR OUTPUT

To report a possible password break attempt.

3. VARIABLE FIELD DEFINITIONS

a = Number of passwords entered that do not exist.
b = Terminal identity.

4. ACTION TO BE TAKEN

Investigate.

5. ALARMS

Minor.

6. REFERENCES

None.
REPT:PCPAUD
Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

REPT PCPAUD FAULT TYPE a ASSERT = b
[.]
[.]
[.]

2. REASON FOR OUTPUT

To report an error during the administrative sequences of processor control process audit (PCPAUD) which are run separate from the audit controller or to report internal errors not concerning the audit controller, during CUSTAT or CUMEM.

3. VARIABLE FIELD DEFINITIONS

a = Type of fault found.

If the assert number 'b' is 0x4002. Refer to the APP:FAULT-CODE appendix in the Appendixes section of the Output Messages manual for fault type information.

If the assert number, variable 'b', is 0x3b02 or 0x3b03, refer to the fault type description for a translation of the fault type, variable 'c'.

Possible faults (in hexadecimal notation). Valid value(s):

- 0x0 = Bad data in equipment configuration database (ECD) for a control unit (CU) or subunit.
- 0x2 = Bad data in equipment configuration database (ECD) for a control unit (CU) or subunit.
- 0x4 = Could not access the ECD. Possibly a bad record ID (RID).
- 0x6 = Maintenance channel failed.
- 0x8 = Could not read the offline mainstore.
- 0xA = A call to the KCONFIG library failed.
- 0xC = Erroneous major state for a CU unit or subunit.
- 0xE = Bad on-line system status register (SSR) value.
- 0x10 = Bad off-line SSR value.
- 0x12 = Bad on-line hardware status register (HSR) value.
- 0x14 = Bad off-line HSR value.
- 0x18 = Plant measurement library call failed.
- 0x1a = Audit control library call failed.
- 0x1c = Internal error.
- 0x1e = Off-line store access failed.
- 0x20 = Memory audit internal error.
- 0x28 = Failure to allocate or queue message.
- 0x2a = Expanded main memory (EMM) straps do not match on both CUs.
- 0x2c = SSR values inconsistent between CUs.
- 0x2d = Failure to attach to ECD or to get ECDORG data.
- 0x2e = Failure is related to pcreating another process.
 Assert number associated with the specific cause of the error. Assert numbers 0x3000 to 0x3fff report an error detected during the CU administrative sequences of the PCPAUD process. Assert numbers 0x4000 to 0x4ffff report errors in calling the PCPAUD process or internal logic errors within the PCPAUD process.

0x401e  Call to lla_rdget unsuccessful (system error). Unable to read new ECD org structure.

0x401f  Call to alocmmsg unsuccessful (system error). PCPAUD could not allocate space for the message to terminate the bootdiskchk process.

0x4020  Call to queuemn unsuccessful (system error). PCPAUD could not queue the message to terminate the bootdiskchk process.

0x4021  Timed out while waiting for results from the bootdiskchk process.

0x4022  Timed out while waiting for results from the bootdiskchk process.

0x4023  Call to lla_rdget unsuccessful (system error). Unable to read ECD btparm structure used with REPT: ECD report.

0xc0010000z  Call to lla_rdget failed. Unable to get the MHD UCB for the MHD number in field z.

0xc0020000z  Call to lla_rdget failed. Unable to get the SBUS UCB for the MHD number in field z.

0xc0030000z  Call to lla_rdget failed. Unable to get the DFC UCB for the MHD number in field z.

0xc0040000z  Call to lla_rdget failed. Unable to get the SBUS UCB for the MHD number in field z.

0xc0050000z  The SBUS device ID for MHD z did not match that in the SBUS UCB.

0xc0060000z  Call to lla_rdget failed. Unable to get the MHD UCB for the MHD number in field z.

0xc0070000z  The MHD device ID for MHD z did not match that in the MHD UCB.

0xc0080000z  The unit number in the MHD UCB did not match MHD z.

4. ACTIONS TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, there is no readily available means for correcting the problem. If the message persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Some possible actions to specific error types are listed below.

<table>
<thead>
<tr>
<th>Fault Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x4, 0x2d</td>
<td>Run ECD 1 audit.</td>
</tr>
<tr>
<td>0x6</td>
<td>Check maintenance channel cable. Run CC diagnostics. The problem could also be in the online maintenance channel. The problem is serious and should be taken care of as soon as possible.</td>
</tr>
<tr>
<td>0xe</td>
<td>Take action on this error only if it occurs repeatedly. Switch CUs, run CU diagnostics.</td>
</tr>
<tr>
<td>0x10</td>
<td>Take action on this error only if it occurs repeatedly. Run CU diagnostics.</td>
</tr>
<tr>
<td>0x12</td>
<td>Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited on-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.</td>
</tr>
<tr>
<td>0x14</td>
<td>Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited off-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.</td>

Output Appendix(es):

APP:FAULT-CODE
APP:OMDB-X-REF
REPT:PCPMD

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT PCPMD FAULT TYPE a UNIT = b ASSERT = c

[2] REPT PCPMD FAULT TYPE a INACCESSIBLE RID = d ASSERT = c

2. REASON FOR OUTPUT

To report an error condition in the processor control process maintenance driver (PCPMD). Format 1 is printed whenever the name of the unit can be determined. If not, Format 2 is printed.

3. VARIABLE FIELD DEFINITIONS

a = Fault type. Valid value(s):
   BOFL = Maintenance channel (MCH) buffer overflow.
   ECDA = Equipment configuration database (ECD) access problem.
   EMCH = Incorrect number of MCH orders executed.
   EONL = Bad return from on-line diagnostic.
   ESIM = Could not fault system integrity monitor (SIM).
   IARG = Invalid argument.
   IDCP = PCPMD internal error.
   SPRC = Slave processor.
   WAKE = Supervisor wakeup failed.

b = Unit name.

c = Identification number (ASSERT number) of the FAULT in PCPMD.

d = Record ID (RID) of the unit control block (UCB) record in the ECD.

4. ACTION TO BE TAKEN

Consider bootstrapping for fault type ECDA. For other cases, save a copy of the output message and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

APP:OMDB-X-REF
REPT:PCTDX-TBTF

Software Release: 5E14 and later  
Message Class:  PFR_MON  
Application:  5  
Type:  Output

1. FORMAT

REPT PCTDX=a-b-c d TRBL BACKGROUND TEST FAILURE EVENT=e  
   f RECOVERY ACTION g  
   hhhhiiiii jjjjkkkk llllmmmm nnnnoooo  
   PCTDX=a-b-c p q

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure in the PDXU. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable 'g' to determine the effect the fault recovery had on the system.

3. VARIABLE FIELD DEFINITIONS

a  = Switch module (SM) number.  
b  = Peripheral control and timing data exchanger unit (PDXU) number.  
c  = Peripheral control and timing data exchanger (PCTDX) number.  
d  = Peripheral control and timing data exchanger (PCTDX) status. Valid value(s):  
   ACTIVE  = The PCTDX is in-service and a fault has been detected.  
e  = Event number.  
f  = Error type. Valid value(s):  
   PCT LOOP BACK FAIL SMP TO CD  = PCTDX loop back word failure.  
g  = Recovery action. Valid value(s):  
   RST PREEMPT  = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.  
h  = Hexadecimal dump containing message type.  
i  = Hexadecimal dump containing circuits name.  
j  = Hexadecimal dump containing high level error type.  
k  = Hexadecimal dump containing PCTDX circuit name.  
l  = Hexadecimal dump containing TSI link number.  
m  = Hexadecimal dump containing miscellaneous data.
4. ACTIONS TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:PCTDX and RST:PCTDX messages indicate success or failure of diagnostic when recovery action is 'RST PREEMPT'.

5. ALARMS

Critical alarm only if both PCTDX's on a PDXU are out-of-service.

### 2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure in the PDXU. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable ‘g’ to determine the effect the fault recovery had on the system.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switch module (SM) number.
- **b** = Peripheral control and timing data eXchanger unit (PDXU) number.
- **c** = Peripheral control and timing data eXchanger (PCTDX) number.
- **d** = Peripheral control and timing data eXchanger (PCTDX) status. Valid value(s):
  - **ACTIVE** = The PCTDX is in-service and a fault has been detected.
- **e** = Event number.
- **f** = Error type. Valid value(s):
  - **IF LOSS OF CLOCK REFERENCE** = PLI has detected loss of clock.
  - **IF SYNCHRONIZATION ERROR WITH PLI** = PLI cannot synchronize with IF.
  - **IF LOSS OF CLOCK FROM THE PLI** = IF has detected loss of clock.
  - **IF PAR ERR ON OVERHEAD BYTES FROM PLI** = IF has detected bad parity on the overhead bytes.
  - **PLI BAD PARITY INCOM OVERHEAD BYTES** = PLI has detected bad parity on the overhead bytes.
  - **IF CRC ERR ON DATA RECEIVED FROM PLI** = IF has detected bad CRC.
  - **PLI LINK TO BE OUT-OF-FRAME** = PLI cannot frame up.
  - **PLI BAD SUPERFRAME ON INCOMING LINK** = PLI cannot frame up on superframe.
  - **PLI BAD FRAME WORD ON INCOMING LINK** = PLI has detected a bad frame word.
  - **PLI OUTGOING BUFFER CHECK ERROR** = PLI failed outgoing buffer check.
  - **PLI INTERNAL DATA PARITY ERROR** = PLI has detected bad internal parity.
  - **PLI PARITY ERRORS ON DATA FROM CD** = PLI has detected parity errors from far end.
  - **PLI IS SOURCING BAD CRC** = Far end is reporting bad CRC.
  - **PLI DETECTED BAD CRC FROM ACTIVE MCTSI** = PLI detected bad CRC from the active MCTSI side.
  - **PLI IMPLICATED BY BACKGROUND CHECK** = Background test failure has implicated the PLI.
  - **NO ERROR SOURCE FOUND** = No error reported with the interrupt.
= Recovery action. Valid value(s):
ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
NO RECOVERY ACTION TAKEN = This event needed no recovery action.
RE-INHIBIT ERROR = The circuit has been inhibited and errors are still detected. Inhibit has been re-applied on the PCTDX circuit.
RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

h = Hexadecimal dump containing the highlevel upper bytes of the IF error source.
i = Hexadecimal dump containing the highlevel lower bytes of the IF error source.
j = Hexadecimal dump containing the highlevel upper bytes of the IF error mask.
k = Hexadecimal dump containing the highlevel lower bytes of the IF error mask.
l = Hexadecimal dump containing the PLI error source.
m = Hexadecimal dump containing the PLI error mask.
n = Hexadecimal dump containing the internal message type.
o = Hexadecimal dump containing the number of PLI entries passed.
p = Hexadecimal dump containing miscellaneous data.
q = Hexadecimal dump containing miscellaneous data.
r = Number of recent failures of this error type.
s = Error count threshold equal to or above which the recovery action will be escalation.

4. ACTIONS TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:PCTDX and RST:PCTDX messages indicate success or failure of diagnostic when recovery action is 'RST PREEMPT'.

5. ALARMS

Critical alarm only if both PCTDX’s on a PDXU are out-of-service.

1. FORMAT

REPT PCTDX=a-b-c d TRBL PCT LINK COMMUNICATION FAULT EVENT=e
 f RECOVERY ACTION g
 hhhhiii jjjikkkk llllmmmm nnnnoooo
 PCTDX=a-b-c p q

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure in the PDXU. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable ‘g’ to determine the effect the fault recovery had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switch module (SM) number.
b = Peripheral control and timing data eXchanger unit (PDXU) number.
c = Peripheral control and timing data eXchanger (PCTDX) number.
d = Peripheral control and timing data eXchanger (PCTDX) status. Valid value(s):
ACTIVE = The PCTDX is in-service and a fault has been detected.
f = Event number.
f = Error type. Valid value(s):
PCT LOOP BACK FAIL SMP TO CD = The loop back test failed on this PCTDX.
CD OUT-OF-FRAME ERR = The PCTDX has detected an out-of-frame condition.
CD LINK CRC ERR = The PCTDX has detected a CRC error.
NO ERROR SOURCE FOUND = The PCTDX found no error source.
g = Recovery action. Valid value(s):
ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
NO RECOVERY ACTION TAKEN = This event needed no recovery action.
RE-INHIBIT ERROR = The circuit has been inhibited and errors are still detected. Inhibit has been re-applied on the PCTDX circuit.
RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
h-o = Hexadecimal dumps containing data. The size of the dump will vary.
p = Number of recent failures of this error type.
q = Error count threshold equal to or above which the recovery action will be escalated.
4. ACTIONS TO BE TAKEN

None. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGN:PCTDX and RST:PCTDX messages indicate success or failure of diagnostic when recovery action is 'RST PREEMPT'.

5. ALARMS

Critical alarm only if both PCTDX's on a PDXU are out-of-service.

REPT:PCTF-SUMMARY

Software Release: 5E14 and later
Message Class: PCTFSUM
Application: 5
Type: Output

1. FORMAT

[1] REPT PCTF SUMMARY SEGMENT a b
   LLR LSS PX RCF RVF TTF
   [[[DNc[-d][+]][e] t t t t t t]
    . .
    . .
    . .
   __________________________________________________________________

[2] REPT PCTF SUMMARY - DATA FROM THE FOLLOWING SM’s WAS NOT REPORTED
   u [u] [u] [u] [u] [u] [u] [u]
    .
    .
   __________________________________________________________________

2. REASON FOR OUTPUT

To periodically print a summary list of all per-call test failures (PCTFs). Each port or high-level service circuit (HLSC)
identified in the summary (Format 1) has been implicated in at least one PCTF occurrence since the last automatic
PCTF summary was generated. The list, if long, will be broken into segments.

The interval for PCTF summary reports generation is specified on the RC/V 8.1, field number 137 (office parameters
view). Refer to the Recent Change manuals for further information.

Format 2 identifies switching modules (SMs) that were not reported in the associated REPT:PCTF-SUMMARY
output because they could not be queried for PCTF data.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms
shown in the format.

+ = Indicates the line is a party line.

a = Segment number of this segment of the list. Segments are numbered sequentially starting from 1.

b = Completion report. Valid value(s):
   COMPLETED = All the PCTF information has been output.
   CONTINUED = Identifies second and subsequent segments of a list that was too long to be
                 printed in a single segment.
   NO PCTFS = No per-call test failures have occurred since the previous periodic report was
               generated.
   STARTED = Indicates the first segment in the list. This does not necessarily imply that
              additional segments will be required.
   STOPPED = The list was stopped by manual action.
   SYSTEM ERROR = An unspecified internal system error occurred which prevented further
processing.

c = Telephone number of the line.

d = Member number of the line time slot bridging (LT SB) line. For LT SB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

e = Valid value(s):
   AIUEN f w x y
   ILEN f v p q
   INEN f z p q
   ISLUHLSC f g r s
   LCEN f g h i
   LEN f j k l m n
   LUHLSC f j r s
   SLEN f o p q

f = SM number.

g = Integrated services line unit (ISLU) number. The summary counts indicate the number of PCTF occurrences that involved the identified HLSC.

h = Line group number.

i = Line card number.

j = Line unit number.

k = Grid number.

l = Switch board number (LU1, LU2, or LU3).

m = Switch number.

n = Level number.

o = Digital carrier line unit.

p = Remote terminal (RT).

q = RT line.

r = Service group number.

s = HLSC number. The summary counts indicate the number of PCTF occurrences that involved the identified HLSC.

t = The number of occurrences of a given PCTF type.

u = SM number for which PCTF data could not be obtained.

v = IDCU number.

w = Access interface unit equipment number.
4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

235-118-25x Recent Change Reference
1. FORMAT

REPT PCTF [a] b DN c[-d][f][+] e [MLHG=s-t] [u]

2. REASON FOR OUTPUT

To report per-call test failures (PCTFs) that occur on lines during call set-ups.

The output message generated in response to a PCTF occurrence depends on whether the PCTF verbose mode is inhibited (INH:PCTF) or allowed (ALW:PCTF) on the switching module (SM) where the PCTF occurred. On an SM which has the PCTF verbose mode inhibited, only the first and tenth PCTF occurrences of a given type on a line will be reported daily. The first PCTF occurrence will result in a "REPT PCTF FIRST" output message, and the tenth PCTF occurrence will result in a "REPT PCTF TENTH" output message. An SM which has the PCTF verbose mode allowed will generate a REPT:PCTF report for each occurrence. This applies to all the PCTFs except the TOUCH-TONE fraud (TTF) PCTF.

The ring continuity failure (RCF) PCTF uses a separate message class PCTFRCF (classdef 85). The default for this class is DAYLOG. The routing can be changed to go to the equipment configuration database (ECD) destinations using the CHG:LPS-MSGCLS input message. The default ECD destinations for this message class are switching control center system (SCCS) and repair service bureau (RSB). The receive-only printer (ROP) can be added as a destination if the REPT:PCTF message needs to be printed on the ROP. Having a separate message class for RCF PCTF gives the user the provision to turn off the RCF PCTFs from printing especially as the RCF PCTFs sometimes can be in large numbers.

All PCTFs except the RCF and the TTF PCTF use the message class PCTFINDV (classdef 86), whose default destination is DAYLOG.

The reporting of TTF failures is slightly different from the other PCTF types in that all TTF failures are always reported, even when the PCTF verbose mode is inhibited. TTF failures use the SCCS message class (classdef 174).

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

+ = Indicates the line is a party line.

a = Specific PCTF incident for which this report was generated. Used only when the PCTF verbose mode is inhibited on the SM where the PCTF occurred. Valid value(s):
FIRST = First occurrence of this type of fault today.
TENTH = Tenth occurrence of this type of fault today.

b = PCTF type. Valid value(s):
LLR = Low line resistance failure.
LSS = Line security scan failure.
PX = Power cross failure.
RCF = Ringing continuity failure.
RVF = Restore and verify failure.
TTF = TOUCH-TONE fraud failure.

c = Telephone number.
d = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.
e = Valid value(s):
   AIUEN f x y z
   ILEN f r p q
   INEN f a l p q
   LCEN f g h i
   LEN f j k l m n
   SLEN f o p q
f = SM number.
g = Integrated services line unit (ISLU) number. The HLSC is not identified for per-call test failures for which an HLSC is not associated at the time of the failure.
h = Line group number.
i = Line card number.
j = Line unit number.
k = Grid number.
l = Switch board number (LU1, LU2, or LU3).
m = Switch number.
n = Level number.
o = Digital carrier line unit.
p = Remote terminal (RT) number.
q = RT line number.
r = IDCU number.
s = Multi-line hunt group number.
t = Multi-line hunt member number.
u = Valid value(s):
   ISLUHLSC f g v w
   LUHLSC f j v w
v = Service group number.
w = HLSC number. The HLSC is not identified for per-call test failures for which an HLSC is not
associated at the time of the failure.

\( x \) = Access interface unit equipment number.

\( y \) = AIU pack number.

\( z \) = AIU circuit number.

\( a^1 \) = Digital network unit - synchronous optical network (SONET) (DNU-S) number.

4. ACTION TO BE TAKEN

This message is intended to be used for analysis purposes to detect problems associated with individual lines.

Power cross (PX) failures indicate the existence of a dangerous voltage present on the line and should be investigated promptly.

RCF indicate that the line appeared as a DC open when trying to ring the line. This could be caused by a cut loop and should be investigated if a large number of RCF suddenly begin occurring, since this could indicate a cut cable. Normally, an RCF simply indicates that an individual phone has been disconnected at the customer's premises, and should be ignored.

A TTF failure indicates that a TOUCH-TONE phone has been used on a line that is not marked as a TOUCH-TONE line. TTF's should be handled according to local practice.

[MORE PERIPHERALS IN OVERLOAD HISTORY THAN CAN BE PRINTED, DISCARDED = f]

2. REASON FOR OUTPUT

To report overload conditions that have occurred in one or more peripheral units on the switching module (SM) during the last 15 minute interval. If an optical facility interface (OFI) is in overload, controls are applied to inhibit path hunting for all traffic on the link served by the OFI protection group. This message will repeat every 15 minutes, as long as the overload persists.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = Peripheral unit. Valid value(s):
   OFI = a-g-h
   PSUPH = a-i-j-k

c = Channel group. Valid value(s):
   [0-15] = Channel group number for PSUPH.
   NA = Not applicable for OFI.
   OOS = PSUPH is out-of-service.
   STBY = PSUPH is standby.
   UNEQ = PSUPH is unequipped.

d = Level of overload. Valid value(s):
   CRIT = Critical overload.
   MAJOR = Major overload.
   MINOR = Minor overload.

e = Resource in overload. Valid value(s):
   DRFCL = PH dropped cell.
   GPBD = General purpose buffer descriptors in PSUPH.
   LKOcc = OFI incoming link occupancy.
   LRFD = PH LAN-side received frame descriptor.
   MORE = More resources in overload on this peripheral unit than can be printed.
   RT = PH real-time.
SRFD = PH SPYDER-side received frame descriptor.
STFD = PH SPYDER-side transmit frame descriptor.

\( f \) = Number of peripheral units in overload that were discarded from the report. There were more than 19 peripheral units in overload on this SM.

\( g \) = Optical interface unit unit number.

\( h \) = OFI protection group number.

\( i \) = Packet switching unit unit number.

\( j \) = PSU shelf number.

\( k \) = PSU slot number.

2. **REASON FOR OUTPUT**

   To report errors discovered by pldmon while attempting to update the administrative module (AM) Plant Measurements System (PMS) database.

3. **VARIABLE FIELD DEFINITIONS**

   a  = Error code. Valid value(s):
      1  = Cannot initialize PMS database.
      2  = Cannot update setid record.
      3  = Cannot read maintenance usage records.
      4  = Cannot attach to maintenance usage record.
      5  = Cannot update maintenance usage record.
      6  = ptimer call failed.
      7  = Negative maintenance usage time found for the out-of-service (OOS) unit named or the plant database record for the OOS unit named was updated more than fifteen minutes ago.
      8  = Cannot allocate message buffer for scheduling hourly report.
      9  = Cannot get process ID for plant measurement common report (PMCR) port.
     10  = Cannot queue message for scheduling hourly report.
     11  = Unknown fault message buffer released.

   b  = Error type returned for technical evaluation. For interpretation, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

   c  = Unit name.

   d  = Unit number.

4. **ACTION TO BE TAKEN**

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>7</td>
<td>If the error is printed due to a negative maintenance usage time for an OOS unit, it may be because of a change in the system clock. The start time for that unit in the database will be set to the current time. No action is needed. The error message is printed to warn that a discrepancy might be reflected for that unit in</td>
</tr>
</tbody>
</table>
the daily and hourly OP:PMCR report.

This error code may also print due to an OOS unit record in the plant database not being updated for more than 15 minutes. Upon a boot and every quarter hour (4:15, 4:30, 4:45, for example) pldmon audits the database to ensure that records for OOS units have been updated every 15 minutes. When the system boots, a copy of the plant database is copied from the disk into memory. If the database on disk has a timestamp more than 15 minutes older than the system clock at boot time, pldmon assumes that records for OOS units have not been updated for more than 15 minutes and the error will print out. The incore database is copied to disk once an hour on the hour. You should not see this error message again if you do not plan to boot before the top of the hour. If you do plan to boot before the top of the hour and do not want to see this error message, you can copy the incore database to disk by executing 

"/prc/pmdbcopy" from the UNIX® RTR shell.

8 - 10 A problem exists with pldmon sending a message to pmcrman to collect data (pmrcol). Copy the incore PMS database to disk using the "/prc/pmdbcopy" UNIX® shell message and manually run the hourly scheduled reports. If the error persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

11 An unknown fault message (other than a message buffer audit fault) was found and removed from the buffer. If the error persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

The output is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of the communication path through the peripheral control and timing facility interface (PCTFI) circuit in the PCT line and trunk unit (PLTU). The fault was detected and reported by message handler (MH) fault recovery software, and preliminary recovery was taken by MH fault recovery software. The message also indicates what recovery action was taken by peripheral fault recovery and gives the current fault counts against the circuit specified in the message. Refer to parameter ‘i’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = PLTU unit number (0-35).
c = PCTFI number (0-2).
d = PCTFI side (0-1).
e = PCTFI circuit equipment status. Valid value(s):
   ACTIVE = The PCTFI circuit is in service and a fault has been detected.
   OOS = The PCTFI circuit is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this PCTFI circuit from service. However, fault stimuli are still being detected from the circuit indicating that the PCTFI circuit has not been completely removed from service.
   STANDBY = The mate (standby) PCTFI circuit service group detected a fault.

f = MH preliminary recovery action. Valid value(s):
   MH CHANNEL DEACTIVATED
   MH CRITICAL ERROR
   MH ERROR REPORT
   MH INACTIVE CHAN INIT
   MH INITIATED OSR
   MH RESTART OF CHANNEL
   MH RESTART OF LAYER 2
   MT EVENT REPORT
= Event number.

h = Error type. Valid value(s):
  LOGICAL LINK RESTART FROM CC END
  MH BAD CRC
  MH CHAN TRACKS VAR SET DURING OSR
  MH END OF IDLE DETECTED

  and the last eight hex characters of parameter 'm' is the most recent event.

j = Contains a time stamp.

k = Layer 2 logical link number and MH channel number, in a bit-packed representation. The first three bits indicate the layer 2 logical link number, and the next five bits indicate the MH channel number.

l = MH internal inhibit status and MH error type, in a bit-packed representation. The first bit indicates the MH internal inhibit status, and the next seven bits indicate the MH error type.

m = Up to nineteen additional MH events with a similar layout to parameters 'j' through 'l'. The last eight hex characters this parameter represent the most recent MH event.

n = Number of recent failures of this error type (parameter 'h') on this PLTLK circuit (in decimal).
Error count threshold above which the recovery action will become stronger.

4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the PLTLK from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

None.

1. FORMAT

REPT PLTLK=a-b-c-d [e] TRBL PLI FAILURE EVENT=f
  g RECOVERY ACTION h
  iiiiiiii jjjjjjjj jkkkkllll mmmnnnn oooooooo oooooooo oooooooo
  oooooooo oooooooo oooooooo [PLTLK=a-b-c-d p q]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a peripheral link interface (PLI) which services a peripheral control and timing facility interface (PCTFI) circuit in the PCT line trunk unit (PLTU). The fault was detected and reported by module control unit fault recovery (MCUFR). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to parameter ‘h’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = PLTU unit number (0-35).
c = PCTFI number (0-2).
d = PCTFI side (0-1).
e = PCTFI circuit equipment status. Valid value(s):
   ACTIVE = The PCTFI circuit is in service and a fault has been detected.
   OOS = The PCTFI circuit is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this PCTFI circuit from service. However, fault stimuli are still being detected from the circuit indicating that the PCTFI circuit has not been completely removed from service.
   STANDBY = The mate (standby) PCTFI circuit service group detected a fault.

f = Event number.
g = Error type. Valid value(s):
   IF CRC ERR ON DATA RECEIVED FROM PLI = The module controller detected a bad CRC on the PLI servicing the PCTFI.
   IF LOSS OF CLOCK FROM THE PLI = The module controller detected a loss of data clock on the PLI servicing the PCTFI.
   IF LOSS OF CLOCK REFERENCE = The module controller detected a loss of clock reference on the PLI servicing the PCTFI.
   IF PAR ERR ON OVERHEAD BYTES FROM PLI = The module controller detected a parity error on the overhead bytes from the PLI servicing the PCTFI.
IF SYNCHRONIZATION ERROR WITH PLI = The module controller detected a synchronization error with the PLI servicing the PCTFI.

NO ERROR SOURCE FOUND = A message was sent to peripheral fault recovery (PFR) software indicating a PLI fault is present. However, PFR software analysis revealed no such fault indication.

PCT LOOP BACK FAIL SMP TO FAR-END = The PCTFI circuit failed to respond to an SMP direct communication check.

PLI BAD FRAME WORD ON INCOMING LINK = A bad frame word has been detected on the incoming PLI.

PLI BAD PARITY INCOMING OVERHEAD BYTES = Parity error has been detected on overhead data received from the TSI.

PLI BAD SUPERFRAME ON INCOMING LINK = A bad superframe byte has been detected on the incoming PLI.

PLI DETECTED BAD CRC FROM ACTIVE MCTSI = A bad CRC has been detected from the MCTSI at the PLI.

PLI INTERNAL DATA PARITY ERROR = PLI has detected an internal parity error.

PLI IS SOURCING BAD CRC = A PLI servicing the PCTFI circuit has detected it is sourcing a bad CRC.

PLI LINK TO BE OUT-OF-FRAME = Proper framing cannot be established on the incoming PLI.

PLI OUTGOING BUFFER CHECK ERROR = Buffer check error has been detected on the PLI.

PLI PARITY ERRORS ON DATA FROM FAR-END = PLI has detected a parity error in data it receives from the far-end.

Recovery action. Valid value(s):

ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.

INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.

INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.

NO RECOVERY ACTION TAKEN = This event needed no recovery action.

PRE-OOS, RE-INHIBIT HDWCHKS = The PCTFI circuit has been preempted and is still detecting errors, inhibit has been re-applied on the PCTFI circuit.

PRE-OOS THRESHOLD EXCEEDED = The PCTFI circuit was preempted and is still detecting errors.

RE-INHIBIT ERROR = The PCTFI circuit has been inhibited and error are still detected. Inhibit has been re-applied on the PCTFI circuit.

RST PREEMPT = The failing circuit was preempted, restored, and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

SWITCH = An attempt was made to gain control of the hardware by changing configuration without removing circuits from service. Its purpose is to avoid removing circuits from service that normally could remain in service under some fault conditions and/or to help isolate the fault before isolating customers.

IF error source register.

IF error mask register.

PLI error source register.

PLI error mask register.

Message type.
n = Number of PLI fault messages sent from MCUFR to peripheral fault recovery, contained in parameter 'o'.

o = Up to six PLI fault messages sent from MCUFR to peripheral fault recovery. Each PLI fault message consists of eight hex characters.

p = Number of recent failures of this error type (variable 'g') on this PCTFI circuit (in decimal).

q = Error count threshold above which the recovery action will become stronger.

4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the PCTFI circuit from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the raw data associated with communication link (CLNK) errors. The module message processor in a CM1 environment (MMP1) is reporting the error. All the variables 'f' through 'b2' are represented in hexadecimal.

3. VARIABLE FIELD DEFINITIONS

FE10 = Processor identifier and uniqueness number for the MMP.
0000 = Error source -- '0000' indicates the MMP.
05090010 = Message type, priority, and length.
06 = Unit type (MMP).
a = Switching module (SM) number.
b = Time multiplex switch (TMS) side.
c = MMP side. Valid value(s):
0 = Even.
1 = Odd.
d = Message switch (MSGS) side.
e = Event number.
f = MSCU side.
g = Physical MMP number.
h = Not used.
i = Not used.
j = The error threshold exceeded. Valid value(s):
0x00 SM_XMIT_INTR = Early transmit interrupt.
0x01 SM_DMA_UND = Direct memory access (DMA) underrun.
0x02 SM_CLR_ERR = Clear to send error.
0x03 SM_CMP_ABORT = Abort complete.
0x04 SM_CRC_ERR = Check sum (CRC) error.
0x05 SM_DET_ABORT = Abort detected.
0x06 SM_IDLE_DET = Idle detect.
0x07 SM_EOL_DETE = End of protocol (EOP) detected.
0x08 SM_ILL_FRAME = Frame less than 32 bits.
0x09 SM_R_DMA_OVR = DMA overrun detected.
0x0a SM_BUF_OVRF = Memory buffer overflow.
0x0b SM_CARR_FAIL = Carrier detect failure.
0x0c SM_RCV_INTR = Receive interrupt overrun.
0x0d SM_TRANSINTR = Abnormal transmit interrupt.
0x0e SM_REC_INTR = Abnormal receive interrupt.
0x0f SM_TIM_TMOUT = Message timer timeout.
0x10 SM_INVALLOC = Sequence error.
0x11 SM_SABM_TMOUT = Set asynchronous balanced mode (SABM) timer timeout.
0x12 SM_RET_HD_EX = Retransmission threshold exceeded.
0x13 SM_DISCN_REQ = Disconnect request.
0x14 SM_LK_RE_REQ = Link restart request.
0x15 SM_LK_PROTOC = Link protocol restart.
0x16 SM_LEV3_FAIL = Level 3 failure.
0x17 SM_FRMRREC = Frame reject (FRMR) received.
0x18 SM_FRMR_SABM = SABM received after a FRMR.
0x19 SM_UA_REC = Received a UA while the link is up.
0x1a SM_TM_P_SDLC = Timeout while programming the synchronous data link controller (SDLC).
0x1b SM_SDLC_XMINT = SDLC interrupt timeout.
0x1c SM_SABM_TIMOUT = Set asynchronous balanced mode (SABM) timer timeout.
0x1d SM_NULIF = Null information (I) frame received.
0x1e SM_FRMRREC = Frame reject (FRMR) received.
0x1f SM_XIDR = Password exchange.
0x20 SM_FRMR_SABM = SABM received after a FRMR.
0x21 SM_UA_REC = Received a UA while the link is up.
0x22 SM_LEV2UP = Only level 2 is up.

k = Action taken. Valid value(s):
0x00 SMLKRESTART = The CLNK was restarted.
0x01 SMLKREMOVE = The CLNK was removed.

l = The SDLC number.

m = Not used.

n = Hexadecimal address of the MMP buffer that contained the level 2 protocol error counts for this SDLC.

o = The size of the MMP buffer (in bytes).

p = Number of early transmit interrupts.

q = Number of DMA underruns.

r = Number of clear to send errors.
s = Number of abort complete errors.
t = Number of CRC errors.
u = Number of aborts detected.
v = Number of idles detected.
w = Number of EOPs detected.
x = Number of frames less than 32 bits.
y = Number of DMA overruns detected.
z = Number of memory buffer overflows.
a₁ = Number of carrier detect failures.
b₁ = Number of receive interrupt overruns.
c₁ = Total number of abnormal transmit interrupts.
d₁ = Total number of abnormal receive interrupts.
e₁ = Number of message timer timeouts.
f₁ = Number of message sequence errors.
g₁ = Number of SABM timer timeouts.
h₁ = Number of retransmission thresholds exceeded.
i₁ = Number of disconnect requests.
j₁ = Number of link restarts.
k₁ = Number of link protocol restarts.
l₁ = Number of level 3 failures.
m₁ = Number of unrecognizable frames.
n₁ = Number of timeouts while programming the SDLC.
o₁ = Number of SDLC interrupt timeouts.
p₁ = Number of message queue overflows.
q₁ = Number of data loopbacks.
r₁ = Number of RLI fault recovery requests.
s₁ = Number of null I frames.
t₁ = Number of frame rejects.
u₁ = Number of password exchanges.
\( v^1 \) = Number of SABMs received after a FRMR.

\( w^1 \) = Number of UAs received a while the link is up.

\( x^1 \) = Number of indications that only level 2 is up (end-to-end is down).

\( y^1 \) = Not used.

\( z^1 \) = Physical link associated with logical link 0 in the administrative module (AM).

\( a^2 \) = Physical link associated with logical link 1 in the AM.

\( b^2 \) = AM status of physical links 0-7 (one digit/link). Valid value(s):

- 0 = Idle (link hardware is available).
- 1 = MI switches are set.
- 2 = Ready for level 2 protocol.
- 3 = RSM standby.
- 4 = Active.
- 5 = Out-of-service (OOS) due to CLNK fault recovery.
- 6 = OOS due to associated hardware.
- 7 = OOS due to a manual request.
- 8 = SM is in special growth.
- 9 = Unequipped.

To report the raw data associated with communication link (CLNK) errors. System integrity (SI) in the administrative module (AM) is reporting the error. All of the variables 'f' through 'p' are represented in hexadecimal.

3. VARIABLE FIELD DEFINITIONS

C100 = Processor identifier and uniqueness for the operational kernel process (OKP) in the AM.
0B = Unit type (CLNK).
002C = Error source -- 002C indicates SI.
050C060C = Message type, priority, and length.
a = Switching module (SM) number.
b = Time multiplex switch (TMS) side.
c = Module message processor (MMP) side. Valid value(s):
   0 = Even.
   1 = Odd.
d = Message switch (MSGS) side.
e = Event number.
f = SM number.
g = Physical link number.
h = Not used.
i = Not used.
j = Error type. Valid value(s):
   0x00 - SMLKFAIL = Level 3 communication failure.
   0x01 - SMLOGLKM = Logical link map reversal.
   0x02 - SMSMLKD = SM dangling logical link.
   0x03 - SMAMLKD = AM dangling logical link.
0x04 – SMONTCBD = Remote SM (RSM) logical link on incorrect ONTC.
0x05 – SMCRC_LK = Test message on CLNK corrupted in transit.

k = Physical link. Valid value(s):
   0x00 = Link 0A.
   0x01 = Link 0A.
   0x02 = Link 0B.
   0x03 = Link 0B.
   0x04 = Link 1A.
   0x05 = Link 1A.
   0x06 = Link 1B.
   0x07 = Link 1B.

l = Logical link. Valid value(s):
   0x00 – SMLOG0 = Logical link 0.
   0x01 – SMLOG1 = Logical link 1.

m = Not used.

n = Physical link associated with logical link 0 in the AM.

o = Physical link associated with logical link 1 in the AM.

p = AM status of physical links 0-7 (one digit/link). Valid value(s):
   0 = Idle (link hardware is available).
   1 = Message interface (MI) switches are see.
   2 = Ready for level 2 protocol.
   3 = RSM standby.
   4 = Active.
   5 = Out-of-service (OOS) due to CLNK fault recovery.
   6 = OOS due to associated hardware.
   7 = OOS due to a manual request.
   8 = SM is in special growth.
   9 = Unequipped.

4. ACTION TO BE TAKEN

Since this message is logged, analyze the logged data by retrieving information off of the disk. To dump the daylog see the OP:LOG input message. Correlate the error event with the REPT:TRBL output message.

5. ALARMS

None.

b2b2b2b2

__________________________________________________________________

2. REASON FOR OUTPUT

To report the raw data associated with communication link (CLNK) errors. The switching module (SM) is reporting
the error. All of the variables ‘f’ through ‘d2’ are hexadecimal numbers.

Format 1 prints in most cases, except when variable field ‘i’ has a value of 34.

Format 2 prints when variable field ‘i’ has a value of 34, which indicates the contents of a test message received in
the SM was corrupted. This format dumps the contents of the test message instead of the protocol error record
(PER) error counts.

3. VARIABLE FIELD DEFINITIONS

FFFF = Error source indicates the SM.
0000 = Processor identifier and uniqueness number for the SM.
05080058 = Message type, priority, and length.
a = SM number.
b = Time multiplex switch (TMS) side.
Module message processor (MMP) side. Valid value(s):
0 = Even.
1 = Odd.

Message switch (MSGS) side.

Event number.

The SM read-only memory (ROM) software release retrofit ID.

The SM RAM software release retrofit ID.

The first byte is the physical ID of the module message processor (MMP) that received the error message. The second byte is the synchronous data link controller (SDLC) (CM-1) or X.25 protocol controller (XPC) (CM-2) number within the MMP.

The error threshold exceeded. Valid value(s):
00 = Early transmit interrupt.
01 = Direct memory access (DMA) underrun.
02 = Clear to send error.
03 = Abort complete.
04 = Check sum (CRC) error.
05 = Abort detected.
06 = Idle detected.
07 = End of protocol (EOP) detected.
08 = Frame less than 32 bits.
09 = DMA overrun detected.
0a = Memory buffer overflow.
0b = Carrier detect failure.
0c = Receive interrupt overrun.
0d = Abnormal transmit interrupt.
e0 = Abnormal receive interrupt.
0f = Message timer timeout.
10 = Sequence error.
11 = Set asynchronous balanced mode (SABM) timer timeout.
12 = Retransmission threshold exceeded.
13 = Disconnect request.
14 = Link restart request.
15 = Link protocol restart.
16 = Level 3 failure.
17 = Unrecognizable frame.
18 = Timeout while programming the synchronous data link controller (SDLC).
19 = SDLC interrupt timeout.
1a = Command queue overflow.
1b = Data loopback.
1c = Remote link interface (RLI) has bad reference.
1d = Null information (I) frame received.
1e = Frame reject (FRMR) received.
1f = Password exchange.
20 = SABM received after FRMR.
21 = Received an unnumbered acknowledgement (UA) while link is up.
22 = Only level 2 is up.
A test message on the CLNK was corrupted in transit.

j = Not used.
k = Number of early transmit interrupts.
l = Number of DMA underruns.
m = Number of clear to send errors.
n = Number of aborts complete.
o = Number of CRC errors in the message.
p = Number of aborts detected.
q = Number of idles detected.
r = Number of EOPs detected.
s = Number of frames less than 32 bits.
t = Number of DMA overruns detected.
u = Number of memory buffer overflows.
v = Number of carrier detect failures.
w = Number of receive interrupt overruns.
x = Total number of abnormal transmit interrupts.
y = Total number of abnormal receive interrupts.
z = Number of message timer timeouts.
a = Number of message sequence errors.
b = Number of SABM timer timeouts.
c = Number of retransmission thresholds exceeded.
d = Number of disconnect requests.
e = Number of link restarts.
f = Number of link protocol restarts.
g = Number of level 3 failures.
h = Number of unrecognizable frames.
i = Number of timeouts while programming the SDLC chip.
j = Number of SDLC interrupt timeouts.
k
  = Number of message queue overflows.

l
  = Number of data loopbacks.

m
  = Number of RLI fault recovery requests.

n
  = Number of null I frames.

o
  = Number of frame rejects.

p
  = Number of password exchanges.

q
  = Number of SABMs received after a FRMR.

r
  = Number of UAs received while the link is up.

s
  = Number of indications that only level 2 is up (end-to-end is down).

t
  = Not used.

u
  = Action taken on the CLNK. Valid value(s):
     0 = The CLNK was restarted.
     1 = The CLNK was removed.

v
  = Active module processor (MP) side (0 or 1).

w
  = The SM's SDLC ID. Valid value(s):
     0 = SDLC A.
     1 = SDLC B.

x
  = The link ID. Valid value(s):
     0 = Link 0A.
     1 = Link 1A.
     2 = Link 0B.
     3 = Link 1B.

y
  = Not used.

z
  = Physical link associated with logical link 0 in the administrative module (AM).

a
  = Physical link associated with logical link 1 in the AM.

b
  = AM status of physical links 0-7 (one digit/link). Valid value(s):
     0 = Idle (link hardware is available).
     1 = MI switches are set.
     2 = Ready for level 2 protocol.
     3 = RSM standby.
     4 = Active.
     5 = Out-of-service (OOS) due to CLNK fault recovery.
     6 = OOS due to associated hardware.
     7 = OOS due to a manual request.
     8 = SM is in special growth.
9 = Unequipped.

c^2 = The logical link the test message was sent on.

d^2 = The contents of the test message that was corrupted. The test message is a sequence of bytes incremented by 1 (that is, 0102030405060708090A.....). If the message is corrupted, the portion of the message surrounding the error is dumped.

4. ACTION TO BE TAKEN

Since this message is logged, analyze the logged data by retrieving information off of the disk. The input message for dumping the daylog is OP:LOG. Correlate the event number with the REPT:TRBL message. Refer to these manual pages for additional information.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report a communication module processor (CMP) error associated with communication module (CM) 1 or CM 2. This post-mortem data is put in the log file. To dump this, refer to the OP:LOG input message for additional information.

Format 1 prints when the post-mortem originator identification is read-only memory (ROM), Phase 2 random access memory (RAM), or Phase 3 RAM.

Format 2 prints when the post-mortem originator identification is from the CMP during the administrative module (AM) initialization.

Format 3 prints when a CMP fails to link during AM initialization.

Format 4 prints level 3 error information.

Format 5 prints when the contents of a test message received in the CMP was corrupted. This format dumps the contents of the test message.

3. VARIABLE FIELD DEFINITIONS

- a = Message switch side number.
- b = CMP number.
- c = AM event number.
- d = Post-mortem originator identification. Valid value(s):
  - X'00000001-X'000000ff = Read-only memory.
  - X'00000100-X'000001ff = Phase 2 RAM.
  - X'00000200-X'000002ff = Phase 3 RAM.
- e = Error type.
- f = Number of bytes of post-mortem data.
- g = CMP event number.
- h = Post-mortem data, in hexadecimal. This data contains post mortem header information, CMP fault recovery messages, stack frames, stack traces, and event histories.
- i = Unused data.
- j = CMP number.
- k = Generic ID.
= Status of hardware and software checks. Expand to binary form and interpret as shown

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>1 = CMP is abnormal. 0 = CMP is normal.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

= CMP maintenance state. Valid value(s):
00 = Out-of-service (OOS).
01 = Active (ACT).
05 = Standby (STBY).
0f = Initialization (INIT).
29 = Standby update.
2b = Standby deactivation.
30 = Level 4 initialization during retrofit.
31 = Level 4 initialization.

= Event number for CMP.

**NOTE:** If event number is equal to zero, then the software failed to retrieve query for this CMP.

= CMP unit name.

= Primary CMP system side.

= Mate CMP system side.

= Base state for primary CMP. Valid value(s):
01 = OOS state.
02 = ACT state.
04 = STBY state.
05 = Unavailable (UNAV) state.
06 = INIT state.

= First state qualifier for primary CMP. Valid value(s):
03 = Manual (MAN).
04 = Automatic (AUTO).
0d = Deactivated (DACT). (Used for generic retrofit.)

= Second state qualifier for primary CMP. Valid value(s):
0x00 = None (NULL).
01 = Diagnosing (DGN).
02 = Exercise (EX).
03 = Family of equipment (FE).
04 = Diagnostic found faulty (FLT).
08 = Power Off (PWROFF).
09 = Routine exercise (REX).
0a = Removed (RMV).
0b = Trouble analysis (TBLA).
0d = Power alarm (PWRALM).
0f = Updating (UPD).
10 = System initialization in progress (INIT)

v = Base state for mate CMP. Refer to variable 's' for values.
w = First state qualifier for mate CMP. Refer to variable 'c' for values.
x = Second state qualifier for mate CMP. Refer to variable 'u' for values.
y = Logical link map (LLM) entry zero for primary CMP.
z = LLM entry one for primary CMP.
a¹ = LLM entry zero for mate CMP.
b¹ = LLM entry one for mate CMP.
c¹ = Message switch controller unit translation table (MTT) entry zero for system side zero for the primary CMP.
d¹ = MTT entry one for system side zero for the primary CMP.
e¹ = MTT entry zero for system side zero for the mate CMP.
f¹ = MTT entry one for system side zero for the mate CMP.
g¹ = MTT entry zero for system side one for the primary CMP.
h¹ = MTT entry one for system side one for the primary CMP.
i¹ = MTT entry zero for system side one for the mate CMP.
j¹ = MTT entry one for system side one for the mate CMP.
k¹ = The contents of the test message that was corrupted. The test message is a sequence of bytes incremented by 1 (that is 0102030405060708090A.....). If the message is corrupted the portion of the message surrounding the corrupted byte(s) is dumped.

4. ACTION TO BE TAKEN

Interpreting this data requires detailed knowledge of switch internals. Retain this data for further reference. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the foundation peripheral controller (FPC) post mortem memory as a result of an error.

Note: All variables are printed in hexadecimal. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

3. VARIABLE FIELD DEFINITIONS

a = FPC side.
b = Event number.
c = Contents of 8086 accumulator register (register name - ax).
d = Contents of 8086 base register (register name - bx).
e = Contents of 8086 count register (register name - cx).
f = Contents of 8086 data register (register name - dx).
g = Contents of 8086 stack segment register (register name - ss).
  MD = (Monitor debugger) 0x1000
  PC = (Peripheral controller) 0x1600

h = Contents of 8086 extra segment register (register name - es).
  MD = 0x1000.
  PC = 0x2600.

i = Contents of 8086 data segment register (register name - ds). Valid value(s):
  MD = 0x1000.
  PC = 0x1600.

j = Contents of 8086 stack pointer register (register name - sp). Valid value(s):
  MD = 0x4fxx.
  PC = 0x1fxx.

k = Contents of 8086 base pointer register (register name - bp).
l = Contents of 8086 source index register (register name - si).
m = Contents of source index register (register name - si).
n = Contents of 8086 instruction pointer register (register name - ip).
o = Contents of 8086 code segment register (register name - cs). Valid value(s):
  MD = 0x1000.
  PC = 0x0000.
p = Contents of 8086 flags register (register name - fg).
q = Contents of most recent stack frames.
r = Interrupt level error in 8086 processor. Valid value(s):
0x0 = Divide by zero-invalid division.
0x2 = Non-maskable interrupt (NMI) in 8086 processor - hardware error.
0x4 = Interrupt on overflow.
0xFD = Defensive check failure.
0xFE = 10-millisecond interrupts not occurring.
0xFF = Unassigned vector table entry.
s = Error code. Values for FPC maintenance. Valid value(s):
0x22 = Invalid subdevice unit name (CDACBADSD).
0x23 = Bad subdevice side given (CDBADSID).
0x25 = High priority queue pointer out of range.
0x26 = Address not within bounds (CDADDR_OOB).
0x2a = Subdevice byte count invalid (CDBBCNT).
0x2b = Either a bad subdevice or a bad or side was given to subdevice i/o (CDCALLERR).
0x3c = CDAC fault in FPC (some bits set in control data access circuit (CDAC) ESR).
0x3f = CDAC error source register (ESR) cannot clear.
0x44 = FPC RAM detected QLPS sequence error (CDQLSEQERR). QLPS global data is corrupted. The QLPS global data is displayed in fields 'x' through 'h' of the FPC post mortem.
0x50 = FPC subdevice state (sdstate) is invalid (CDSDSTNG), while the FPC was completing an ONTC read block or write block DMA action.
0x80 = CDAC busy too long.
0x28a = The FPC ROM code has detected an hardware non maskable/maskable interrupt.

All other error codes are assert numbers. Refer to the Asserts Manual for detailed information concerning each assert.
t = Contents of circuit pack TN856 status 1 register.
u = Contents of circuit pack TN856 status 2 register.
v = Contents of circuit pack TN856 ESR register (low byte, high byte).
w = Contents of circuit pack TN856 ESR mask register (low byte).
x = Peripheral controller identity (PCID). Valid value(s):
  0 = FPC 0.
  1 = FPC 1.

y = System state. Valid value(s):
  0x00 = Normal standby.
  0x7b = Normal active.
  0x7d = Out-of-service.

z = Pump state. Valid value(s):
  0x7b = Normal.
  0x7d = Not pumped.
a¹ = Sanity timer flag. Valid value(s):
0x7f = Idle.
0x7e = Reset sanity timer.

b¹ = Timed job indicator. Valid value(s):
0x7f = Idle.
0xd = In progress (IP).

c¹ = Diagnostics (DGN) in progress flag. Valid value(s):
0x7f = Idle.
0xd = Diagnostics in progress.

d¹ = Sanity timer count (used to reset sanity timer).
e¹ = 10-millisecond count (used to check if 10-millisecond interrupts are occurring).
f¹ = PC subdevice interrupt level.
g¹ = Contents of interrupt controller A status register - ESR.
h¹ = Contents of controller A request register.
i¹ = Contents of interrupt controller A service register.
j¹ = Contents of interrupt controller A mask register.
k¹ = Contents of interrupt controller A auto clear register.
l¹ = Contents of interrupt controller B status register - ESR.
m¹ = Contents of interrupt controller B request register.
n¹ = Contents of interrupt controller B service register.
o¹ = Contents of interrupt controller B mask register.
p¹ = Contents of interrupt controller B auto clear register.
q¹ = Contents of low 8 bits of CDAC address register (CDACD40).
r¹ = Contents of high 4 bits of CDAC address register (CDACD41).
s¹ = Address location for data memory xmit-rcv (CDACD42).
t¹ = Status of CDAC active leads and TMs active leads (CDACD43).
u¹ = Contents of low 8 bits of programmable ROM (PROM) sequencer (CDACD46).
v¹ = Contents of high 8 bits of PROM sequencer (CDACD47).
w¹ = Contents of CDAL error source register (ESR) (CDACD48).
x¹ = The meaning of this variable depends on the value of variable 's'. Valid value(s):

CMFBADMSG

CMFTMSTOPC, CMFTMSTCNT, CMFTMS2OPC, CMFTMS2CNT, or CMFSSOPC

FPC code data dump - CDtmsconn (ONTC "side" to send connect orders to 0, 1, 2 = both) or tms_op (connect order TMS opcode). This corresponds with the error code detected by the FPC.

CMFINVRET

FPC code data dump - CDtmsconn (ONTC "side" to send connect orders to 0, 1, 2 = both).

CMFFPCCNT

FPC code data dump - Assert code of 16 byte message (CMFTMSTOPC) or 32 byte (CMFTMS2OPC) message received in the FPC.

CDOLSEQERR

FPC code data dump - side (TMS side the FPC was working on).

\( g^2 \) = The meaning of this variable depends on the value of variable 's'. Valid value(s):

\( h^2 \) = The meaning of this variable depends on the value of variable 's'. Valid value(s):

\( i^2 \) = Contents of post mortem for the base level loop count (PMBASCNT).

\( j^2 \) = Not used.

2. REASON FOR OUTPUT

To report data associated with a quad link packet switch (QLPS) inter-switching module communication link (ISMQLNK) error reported by QLNK fault recovery (QLFR) in a switching module (SM). All of the variables 'i' through 'c2' are represented in hexadecimal.

3. VARIABLE FIELD DEFINITIONS

14FB = Message type (MGQLSP2AM) indicating that the error was reported by a switching module.
3C = Unit type (ISMQLNK).
a = SM number.
b = Active module controller/time slot interchange (MCTSI) side at the time the error was reported.
c = QLPS network.
d = Office network and timing complex (ONTC) side.
e = Far-end SM number.
f = Far-end SM's active MCTSI side at the time the error was reported.
g = Administrative module (AM) event number.
h = Not used.
i = The error classification. Valid value(s):
   0D  = ISMQLNK level 2 error.
   1A  = ISMQLNK establishment sequence error.
   3E  = ISMQLNK level 3 error.

j = ONTC side (SM perspective at time error was reported).
k = QLPS network.
l = Far-end QLPS endpoint (SM) number.
\[ m \] = Error source. Valid value(s):
  CC = Switching module processor (SMP).
  FF = Message handler (MH).

\[ n \] = Error that exceeded fault recovery threshold. Valid value(s):

<table>
<thead>

</tr>
<tr>
<td></td>
<td>0A = The SM received a new ISMQLNK LE message after acknowledging receipt of a previous LE message. This implies the far-end SM either didn't receive the acknowledgement on time or re-started the ISMQLNK.</td>
</tr>
<tr>
<td></td>
<td>0B = The SM received a new ISMQLNK LE message on an ISMQLNK that successfully completed the link establishment protocol. This implies the far-end SM re-started the ISMQLNK.</td>
</tr>
<tr>
<td></td>
<td>0C = ISMQLNK LE sequence timed out.</td>
</tr>
<tr>
<td>3E</td>
<td>0F = Level 3 error reported by integrity monitor in the SMP.</td>
</tr>
</tbody>
</table>

\[ o \] = SM number (the SM reporting the error).

\[ p \] = Active MCTSI side at the time the error occurred.

\[ q \] = QLFR-SMP flag indicating status of post-mortem data.

<table>
<thead>
<tr>
<th>If 'n' =</th>
<th>'q' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>FF</td>
<td>Valid value(s):</td>
</tr>
<tr>
<td></td>
<td>00 = Post-mortem data was already sent to the AM. Multiple errors have occurred, and some data associated with this error may be reported by a previous REPT POST MORTEM output message.</td>
</tr>
<tr>
<td></td>
<td>01 = Post-mortem data was not sent to the AM previously (normal case).</td>
</tr>
<tr>
<td>CC</td>
<td>This field is not used.</td>
</tr>
</tbody>
</table>

\[ r \] = QLFR-SMP post-mortem over-write counter.

\[ s \] = Recovery action performed by QLFR-SMP. Valid value(s):
  00 = No action.
  03 = Request level 3 re-start.
  04 = Request level 2 re-start.
  05 = Request removal (with deferred re-start).
t.  = Recovery action performed by QLFR-MH. Valid value(s):
  00  = No action.
  02  = Notify SM of loss of level 2 communication and periodically attempt to
       re-establish it.
  06  = Initiate level 2 protocol re-start due to level 2 errors.

u  = The SMP-resident state of the MH QPIPE at the time the error occurred. Valid value(s):
  0   = the QPIPE is unequipped.
  1   = A QPIPE initialization failed and autonomous recovery is in progress.
  2   = The QPIPE is active.
  3   = The QPIPE is out-of-service due to a suspected communication module (CM)
       problem.
  4   = The QPIPE is out-of-service due to a software problem and autonomous recovery
       is in progress.
  5   = The QPIPE is out-of-service and periodic attempts to pass a loopback test to the
       active QLPS are in progress.
  6   = The QPIPE is out-of-service and is configured for fault isolation testing
       [attempting to pass a local loopback test to the time slot interchange (TSI)].
  7   = The QPIPE is out-of-service due to a local loopback test failure.
  8   = The QPIPE has been implicated in causing a MH operational software restart
       (OSR) and will be re-initialized after software recovery completes.

v  = The SM-resident ISMQLNK level 3 state at the time the error occurred. Valid value(s):
  0   = The ISMQLNK is unequipped.
  1   = The ISMQLNK is in-service (routing is enabled).
  2   = The ISMQLNK is out-of-service (level 2 is down and routing is disabled).
  3   = An LE message has been sent to the far-end and the SM is waiting for an
       acknowledgement.
  4   = An LE acknowledgement message has been sent to the far-end in response to
       an LE message, but an LE acknowledgement has not yet been received.
  5   = An LE acknowledgement message has been received from the far-end and an
       MH routing update is in progress.
  6   = Routing has been disabled due to a pending manual request that will cause the
       ISMQLNK to go out-of-service. This is a transient state.

w  = The SM-resident ISMQLNK level 2 state at the time the error occurred. Valid value(s):
  0   = The ISMQLNK is unequipped.
  1   = Level 2 is up.
  2   = Level 2 is down.

x  = Number of times QLFR-MH reported establishment of level 2 communication on an ISMQLNK
     when the SMP thought level 2 was already up (SMQTSEQERR).

y  = Number of times the SM received a new ISMQLNK LE message after acknowledging receipt of a
     previous LE message. This implies that the far-end SM either didn't receive the acknowledgement
     on time or re-started the ISMQLNK (SMQTELERR).

z  = Number of times the SM received a new ISMQLNK LE message on an ISMQLNK that
     successfully completed the link establishment protocol. This implies that the far-end SM re-started
the ISMQLNK (SMQTEISERR).

a = Number of ISMQLNK link establishment (LE) sequence timeouts (SMQTESTOUT).
b = Number of level 3 errors reported by integrity monitor in the SMP (SMQTDQL3FAIL).
c = Summary count of SM-detected ISMQLNK LE sequence errors (SMQSLESEQ).
d = Number of SMP-initiated level 3 re-starts (or level 3 re-starts escalated to more severe recovery actions) performed (SMQIL3RSTRT).
e = Number of SMP-initiated level 2 re-starts (or level 2 re-starts escalated to more severe recovery actions) performed (SMQIL2RSTRT).
f = Number of SMP-initiated ISMQLNK removals (with deferred level 2 re-start) (SMQIRMVDFR).
g = Number of MH-initiated level 2 protocol re-starts due to level 2 errors (SMQILLRSTRT).
h = Number of MH-detected transmit queue full errors (SMQTQUEFULL).
i = Number of times the RR frame re-try threshold was exceeded (SMQTXRETRY).
j = Number of frames received with an invalid poll/final bit (SMQTINVPF).
k = Number of frames received with an invalid message/response bit (SMQTINVCR).
l = Number of frames received with an unknown packet type (SMQTUNKPKT).
m = Number of frames received with an unknown frame type (SMQTUNKFRM).
n = Number of frames received with inconsistent packet and frame types (SMQTINCPKT).
o = Number of SABMs received while the link was in the multi-frame establish or timer recovery state (SMQTRESTART).
p = Number of valid frames received on a link that was in a state for which the frame was not expected (SMQTUXPFRM).
q = Number of out-of-sequence frames received (SMQTUXPSEQ).
r = Number of MH-detected frame reject conditions (SMQTFRAMREJ).
s = Number of attempts to send a frame to an endpoint that is not available in the MH link map (routing table) (SMQTLMRFSH).
t = Summary count of MH level 2 transmit errors (SMQSL2SEND).
u = Summary count of MH level 2 receive errors (SMQSL2RECV).
v = Summary count of MH level 2 synchronization errors (SMQSL2SYNCH).
w = SM event number.
x = SM-reported alarm level. Valid value(s):
    01 = Information only.
    03 = Minor.
05 = Major.
06 = Critical.

\( y^1 \) = AM state of the reporting SM's parent MH QPIPE.

\( z^1 \) = AM state of the far-end SM's parent MH QPIPE.

\( a^2 \) = Initial QLFR-AM error sub-type. Valid value(s):

- 0D = ISMQLNK level 2 error.
- 13 = MH link map refresh.
- 1A = ISMQLNK establishment sequence error.
- 3E = ISMQLNK level 3 error.

\( b^2 \) = Number of equipped QGPs (Gl_qgp).

\( c^2 \) = Operational QGP configuration (Glqgpoper).

4. ACTION TO BE TAKEN

Since this message is logged, analyze the logged data by retrieving information off of the disk. The input message for dumping the daylog is `OP:LOG:LG="DAYLOG",MSGCLS=CLNKMON`. Correlate the event number with the REPT:TRBL message.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

IMAGE=p

2. REASON FOR OUTPUT

To report the occurrence of an initialization in the module controller/time slot interchanger packet interface (MCTSIP). The message prints only when the printmode is turned on. The message is stored in a buffer and can be printed on request (OP:HISTORY).

3. VARIABLE FIELD DEFINITIONS

PS DATA PRESERVING = Packet switching data was preserved.

a = Switching module (SM) number.
b = MCTSI side number.
c = Event number.
d = MCTSIP side number.
e = PSU community address.
f = Active packet bus.
g = Process number.
h = Message number.
i = Time of the day the assert occurred, in the form hour:minute.
j = Date the assert occurred, in the form month/day/year.
k = Stimulus of recovery action. Refer to the APP:RCVRY-ACTION appendix in the Appendixes section of the Output Messages manual for a list of recovery action stimulus and their definitions.
l = Recovery action that occurred. Valid value(s):
   FI = Full initialization.
   NONE = No recovery action.
   PRINT = Report only; no escalation.
   PSI = Autonomous PS initialization.
   RPI = Return to point of interrupt.
SI = Selective initialization.
SPP = Single process purge.

m = Failing address where event occurred.
n = Port processor mode. Valid value(s):
   CONSISTENT = Hardware and software are consistent.
   ESSENTIAL = Essential jobs operational.
   NORMAL = Normal operational mode.
   OFFULL = All jobs operational.
   POST RCVY = Post recovery.
   RAMDYN = Dynamic memory consistent.
   RAMTXT = Read access memory text consistent.
   RAMNP = Text and data consistent.
   SW-RCVY = Software recovery.
   SYSPROC = System processes operational.
   UNKNOWN

o = Number of nested ASSERTS.
p = Image type in the PI at the time of the assert. Valid value(s):
   ERROR IMAGE = The image contained an error.
   NULL IMAGE = No image was loaded.
   PI IMAGE = Image used for PI was loaded.
   PI2 IMAGE = Image used for PI2 was loaded.

4. ACTIONS TO BE TAKEN

Monitor the progress of the software recovery. Initiate manual actions if the recovery does not proceed as expected. Retain this information along with any trouble report concerning the initialization/recovery and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

------------------------------------------------------------------

2. REASON FOR OUTPUT

To report the raw data associated with module controller/time slot interchange (MCTSI)-based ethernet link (MELNK) events and errors. All of the variables e through y2 are represented in hexadecimal.

Format 1 prints when the source of the error is the message handler (MH). Format 2 prints when the source of the
error is fault recovery software in the switching module processor (SMP). Format 3 prints when the source of the error is the MEPIPE/MELNK status audit initiated by the SMP.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = MCTSI-based ethernet pipe (MEPIPE) number.
c = MELNK number.
d = Event number.
e = The type of error that is being reported. Valid values for format 1 are:
   0x01  = MELNK recovery required by MH audit or data integrity check.
   0x02  = MELNK recovery required due to MH operational software restart (OSR).
   0x03  = Loopback (ping) to far end failed.
   0x06  = Connection establishment time out on a MELNK port.
   0x07  = Far end dropped the protocol connection on a MELNK port.
   0x08  = Near end (the 5ESS® Switch) dropped the protocol connection on a MELNK port.
   0x09  = Protocol connection on a MELNK port dropped due to timeout.

Valid values for format 2 are:
   0x01  = Excessive MELNK fault recovery events from the MH.
   0x02  = Excessive fault recovery events from the MH for all MELNKs associated with the parent MEPIPE.
   0x03  = Excessive out-of-date MELNK events from the MH. Such events are normally ignored because they occurred prior to a SMP-initiated recovery action.
   0x04  = MELNK recovery failure or timeout.
   0x05  = SMP/MH MELNK data inconsistency detected.
   0x07  = Excessive unexpected MELNK events. These events are normally valid, but they are not expected to occur for a MELNK in a particular state or condition.

Valid values for format 3 are:
   0x05  = SMP/MH MELNK data inconsistency detected.

f = MCTSI side that was active when the error was reported.
g = Not used.
h = Number of MELNK recoveries required by MH-resident audits and/or data integrity checks.
i = Number of MELNK recoveries required due to MH OSRs.
j = Number of far end loopback (ping) failure transitions.
k = Number of far end loopback (ping) success transitions.
l = Number of times a protocol connection was established on a MELNK port.
m = Number of times protocol connection establishment timed out on a MELNK port.
n = Number of times a protocol connection on a MELNK port was dropped by the far end.

o = Number of times a protocol connection on a MELNK port was dropped by the near (5ESS® Switch) end.

p = Number of times a protocol connection on a MELNK port was dropped due to timeout.

q = Number of parent MEPIPE recoveries required by MH-resident audits.

r = Number of parent MEPIPE recoveries required due to MH OSRs.

s = Number of ethernet hub loopback (ping) failure transitions.

t = Number of ethernet hub loopback (ping) success transitions.

u = Number of mate ethernet hub loopback (ping) failure transitions.

v = Number of mate ethernet hub loopback (ping) success transitions.

w = Number of byte count mismatch errors.

x = Number of times carrier sense was lost during transmission.

y = Number of excessive deferral errors.

z = Number of collision detection heartbeat lost errors.

a = Number of monitored packet bad errors.

b = Number of no carrier sense errors.

c = Number of out-of-window collision errors.

d = Number of transmit FIFO underruns.

e = Number of excessive collision errors.

f = Number of cyclic redundancy check (CRC) errors.

g = Number of frame alignment errors.

h = Number of receive FIFO overruns.

i = Number of collision during reception errors.

j = Number of runt (small) packet errors.

k = Summary count of parent MEPIPE receive errors.

l = Summary count of parent MEPIPE transmit errors.

m = Status of the parent MEPIPE in the MH at the time the error was reported. Valid values are:
   0x00 = Unequipped. A child MELNK had not been provisioned (or had never been restored to service).
   0x01 = Disabled. The SONIC device in the MH was turned off.
   0x02 = Enabled. The SONIC device in the MH was turned on. The MH was performing
periodic loopback (ping) tests to the hub (if the hub is managed).

0x03 = Disregard MH MEPIPE status.

definition

n<sup>1</sup> = Status of the MELNK in the MH at the time the error was reported. Valid values are:

0x00 = Unequipped. This MELNK had not been provisioned (or had never been restored to service).
0x01 = Disabled. The MH was not performing periodic loopback (ping) tests to the far end and was not attempting to establish a protocol connection.
0x02 = Enabled. The MH was performing periodic loopback (ping) tests to the far end. A protocol connection was either established or the MH was actively attempting to establish one.
0x03 = Disregard MH MELNK status.

o<sup>1</sup> = The MH-resident version of the internet protocol (IP) address associated with the far end system to which the MH was transmitting. A value of 0xffffffff indicates that the address could not be determined at the time the error was reported.

p<sup>1</sup> = Unless field o<sup>1</sup> is 0xffffffff, this is the MH-resident version of the other (inactive) IP address associated with the far end system. This field will always be 0 if the configuration of the far end system is simplex.

q<sup>1</sup> = SMP-resident version of the first IP address associated with the far end system to which the active MCTSI/MH side transmits.

r<sup>1</sup> = SMP-resident version of the second IP address associated with the far end system to which the active MCTSI/MH side transmits. This field will always be 0 if the configuration of the far end system is simplex.

s<sup>1</sup> = Maintenance state of the parent MEPIPE (in the SMP) at the time the error was reported. Valid values are:

0x00 = UNEQ (the MEPIPE is unequipped).
0x01 = ACT (the MEPIPE is active).
0x02 = OOSFLT (the MEPIPE is out-of-service [OOS] due to fault recovery).
0x03 = INIT (the MEPIPE is being initialized).
0x04 = OOSL1 (the MEPIPE is OOS due to a layer 1 [physical layer] problem).
0x05 = OOSLBK (the MEPIPE is OOS due to loopback [ping] failures).
0x06 = OOSMAN (all child MELNKs are manually removed).

t<sup>1</sup> = MEPIPE action in progress at the time the error was reported. Valid values are:

0x00 = No action was in progress.
0x01 = The MEPIPE/MELNK status audit was in progress.
0x04 = A resynchronization of MEPIPE/MELNK status was in progress following a MCTSI soft switch.

u<sup>1</sup> = The number of MELNKs equipped on the parent MEPIPE.

v<sup>1</sup> = The last recovery action taken on the parent MEPIPE during the current invocation of the MEPIPE/MELNK recovery strategy. Valid values are:

0x00 = No action taken.
0x01 = Enter autonomous recovery interval.
0x02 = Run the MEPIPE/MELNK status audit to verify SMP/MH data consistency.
0x03 = Restore the MEPIPE.
0x05 = Initiate MCTSI and/or MH recovery actions.
0x06 = Leave the MEPIPE in its current state (recovery may still occur if the MEPIPE is enabled in the MH).
0x07 = Unconditionally remove the MEPIPE and disable autonomous recovery in the MH.

\( w^1 \) = The number of recovery actions of type \( v^1 \) that have been performed during the current invocation of the MEPIPE/MELNK recovery strategy.

\( x^1 \) = Number of parent MEPIPE fault recovery events received from the MH.

\( y^1 \) = Number of fault recovery events on any child MELNK of the parent MEPIPE (for thresholding MELNK errors on a MEPIPE basis).

\( z^1 \) = Number of out-of-date parent MEPIPE events received from the MH.

\( a^2 \) = Number of parent MEPIPE recovery actions that failed or timed out.

\( b^2 \) = Number of times a SMP/MH parent MEPIPE data inconsistency was detected.

\( c^2 \) = Number of times invalid data was received from the MH.

\( d^2 \) = Number of unexpected parent MEPIPE events.

\( e^2 \) = Maintenance state of the MELNK (in the SMP) at the time the error was reported. Valid values are:
0x00 = UNEQ (the MELNK is unequipped).
0x01 = ACT (the MELNK is active -- all ports are in service).
0x02 = DGR (the MELNK is degraded -- some but not all ports are OOS).
0x03 = OOSFE (the MELNK is OOS family-of-equipment because the parent MEPIPE is OOS).
0x04 = OOSFLT (the MELNK is OOS due to fault recovery).
0x05 = OOSL2 (the MELNK is OOS due to a layer 2 [protocol] problem -- no ports are in service).
0x06 = OOSLBK (the MELNK is OOS due to loopback [ping] failures).
0x07 = OOSMAN (the MELNK is manually removed).

\( f^2 \) = MELNK action in progress at the time the error was reported. Valid values are:
0x00 = No action was in progress.
0x02 = An MELNK remove was in progress.
0x03 = An MELNK restore was in progress.
0x04 = A resynchronization of MELNK status was in progress following a MCTSI soft switch.

\( g^2 \) = Manual request indicator. Valid values are:
0x00 = The action indicated in field \( f^2 \) was not manually requested.
0x01 = The action indicated in field \( f^2 \) was manually requested.

\( h^2 \) = Last known active far end side. Valid values are:
0x00 = Far end system side 0 was active.
0x01 = Far end system side 1 was active.
0x02 = The active far end system side cannot be determined.

i = Number of active ports on the MELNK at the time the error was reported.

j = Number of active ports on the MELNK during status resynchronization following a MCTSI soft switch (used to determine whether all ports came back up after the switch). This field is only used if field i has the value 0x04.

k = The last recovery action taken on the MELNK during the current invocation of the MEPIPE/MELNK recovery strategy. Valid values are:
   0x00 = No action taken.
   0x01 = Enter autonomous recovery interval.
   0x02 = Run the MEPIPE/MELNK status audit to verify SMP/MH data consistency.
   0x03 = Restore the MELNK.
   0x04 = Implicate the parent MEPIPE.
   0x06 = Leave the MELNK in its current state (recovery may still occur if the MELNK is enabled in the MH).
   0x07 = Unconditionally remove the MELNK and disable autonomous recovery in the MH.

l = The number of recovery actions of type k that have been performed during the current invocation of the MEPIPE/MELNK recovery strategy.

m = Number of MELNK fault recovery events received from the MH.

n = Number of out-of-date MELNK events received from the MH.

o = Number of MELNK recovery actions that failed or timed out.

p = Number of times a SMP/MH MELNK data inconsistency was detected.

q = Number of unexpected MELNK events.

r = Current status of MCTSI/MH recovery actions requested by the MEPIPE/MELNK recovery strategy. Valid values are:
   0x00 = MCTSI/MH recovery is not in progress.
   0x01 = MCTSI/MH short-term recovery is in progress. Recovery actions are actively being performed in an effort to restore the MEPIPE and/or MELNK to service.
   0x02 = MCTSI/MH long-term recovery is in progress. All recovery actions that can be performed by the recovery strategy have either been attempted or cannot be performed (because the MCTSI is simplex). Recovery actions will be re-tried periodically.

s = MH initialization indicator (for MCTSI side 0). Valid values are:
   0x00 = The MH supporting the MEPIPE/MELNK on MCTSI side 0 has not been initialized as part of MEPIPE/MELNK recovery.
   0x01 = The MH has been initialized.

t = MH initialization indicator (for MCTSI side 1). Valid values are:
   0x00 = The MH supporting the MEPIPE/MELNK on MCTSI side 1 has not been initialized
as part of MEPIPE/MELNK recovery.

0×01 = The MH has been initialized.

\[ u^2 = \text{The number of times an automatic MEPIPE restore has been attempted on MCTSI side 0 as part of the recovery strategy.} \]

\[ v^2 = \text{The number of times an automatic MEPIPE restore has been attempted on MCTSI side 1 as part of the recovery strategy.} \]

\[ w^2 = \text{The number of times a MCTSI soft switch has been requested as part of the recovery strategy.} \]

\[ x^2 = \text{The number of MELNK ports with established protocol connections in the MH at the time an SMP/MH data inconsistency was detected.} \]

\[ y^2 = \text{The far end system side (0 or 1) with which the MH was attempting to communicate at the time an SMP/MH data inconsistency was detected. This should always be 0 if the far end system configuration is simplex.} \]

### 4. ACTIONS TO BE TAKEN

Since this message is logged, when an error occurs retrieve the logged data from the log files using the input message `OP:LOG:LG="DAYLOG", MSGCLS=SM_MON`. Correlate the event number with the event number in the associated `REPT:TRBL-MELNK` output message.

### 5. ALARMS

None.

2. REASON FOR OUTPUT

To report the raw data associated with module controller/time slot interchange (MCTSI)-based ethernet pipe (MEPIPE) events and errors. All of the variables d through z1 are represented in hexadecimal.

Format 1 prints when the source of the error is the message handler (MH). Format 2 prints when the source of the
error is fault recovery software in the switching module processor (SMP). Format 3 prints when the source of the error is the MEPIPE/MELNK status audit initiated by the SMP.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = MEPIPE number.
- **c** = Event number.
- **d** = The type of error that is being reported. Valid values for format 1 are:
  - 0xb = MEPIPE recovery required by MH audit.
  - 0xc = MEPIPE recovery required due to MH operational software restart (OSR).
  - 0xd = Loopback (ping) to ethernet hub failed.
  - 0xf = Loopback (ping) to mate ethernet hub failed.
  - 0x11 = Byte count mismatch. The total number of bytes in a packet given to the ethernet transceiver to be transmitted did not match the sum of the packet fragments given to the ethernet transceiver.
  - 0x12 = Carrier sense was lost during transmission of a packet.
  - 0x13 = The ethernet transceiver deferred (waited to be able to transmit) too long and packet transmission was aborted.
  - 0x14 = The ethernet transceiver did not get a collision pulse (heartbeat) during the first part of the interframe gap after transmission.
  - 0x15 = The packet monitored by the ethernet transceiver during transmission did not agree with what was transmitted.
  - 0x16 = Carrier sense was never detected during the entire transmission of a packet.
  - 0x17 = A collision occurred too long after the start of packet transmission. This probably indicates an ethernet transceiver is going bad, or a cable segment is too long.
  - 0x18 = The ethernet transceiver could not access the processor bus before its transmit FIFO emptied.
  - 0x19 = Excessive (16) collisions occurred while trying to transmit a single frame.
  - 0x1a = A cyclic redundancy check (CRC) error occurred in an incoming packet.
  - 0x1b = An incoming packet was not framed on an 8-bit boundary.
  - 0x1c = The ethernet transceiver could not access the processor bus before its receive FIFO overflowed.
  - 0x1d = A collision occurred during reception of a frame.
  - 0x1e = A received packet was smaller than the minimum packet length.
  - 0x20 = Excessive MEPIPE receive errors.
  - 0x21 = Excessive MEPIPE transmit errors.

Valid values for format 2 are:
- 0x01 = Excessive MEPIPE fault recovery events from the MH.
- 0x02 = Excessive child MELNK fault recovery events.
- 0x03 = Excessive out-of-date MEPIPE events from the MH. Such events are normally ignored because they occurred prior to a SMP-initiated recovery action.
- 0x04 = MEPIPE recovery failure or timeout.
- 0x05 = SMP/MH MEPIPE data inconsistency detected.
- 0x06 = Invalid data was received from the MH.
- 0x07 = Excessive unexpected MEPIPE events. These events are normally valid, but they are not expected to occur for a MEPIPE in a particular state or condition.
Valid values for format 3 are:

- **0x05** = SMP/MH MEPIPE data inconsistency detected.

- **e** = MCTSI side that was active when the error was reported.
- **f** = Not used.
- **g** = Number of MEPIPE recoveries required by MH-resident audits.
- **h** = Number of MEPIPE recoveries required due to MH OSRs.
- **i** = Number of ethernet hub loopback (ping) failure transitions.
- **j** = Number of ethernet hub loopback (ping) success transitions.
- **k** = Number of mate ethernet hub loopback (ping) failure transitions.
- **l** = Number of mate ethernet hub loopback (ping) success transitions.
- **m** = Number of byte count mismatch errors.
- **n** = Number of times carrier sense was lost during transmission.
- **o** = Number of excessive deferral errors.
- **p** = Number of collision detection heartbeat lost errors.
- **q** = Number of monitored packet bad errors.
- **r** = Number of no carrier sense errors.
- **s** = Number of out-of-window collision errors.
- **t** = Number of transmit FIFO underruns.
- **u** = Number of excessive collision errors.
- **v** = Number of CRC errors.
- **w** = Number of frame alignment errors.
- **x** = Number of receive FIFO overruns.
- **y** = Number of collision during reception errors.
- **z** = Number of runt (small) packet errors.
- **a** = Summary count of MEPIPE receive errors.
- **b** = Summary count of MEPIPE transmit errors.
- **c** = Status of the MEPIPE in the MH at the time the error was reported. Valid values are:
  - **0x00** = Unequipped. A child MELNK had not been provisioned (or had never been restored to service).
  - **0x01** = Disabled. The SONIC device in the MH was turned off.
0x02 = Enabled. The SONIC device in the MH was turned on. The MH was performing periodic loopback (ping) tests to the hub (if the hub is managed).
0x03 = Disregard MH MEPIPE status.

d1 = Bit array of MELNKs, if any, affected by the event. This array is only populated when field d has the value 0x0f, in which case any set bits correspond to mate hub MELNKs restarted as a result of the event.

e1 = The MH-resident version of the internet protocol (IP) address of the hub associated with the active MCTSI side. This field will be 0 if the hub is not managed.

f1 = The MH-resident version of the IP address of the hub associated with the mate (inactive) MCTSI side. This field will be 0 if the hub is not managed and equal to the address in field e1 if the hub configuration is simplex.

g1 = The SMP-resident version of the IP address of the hub associated with the active MCTSI side. This field will be 0 if the hub is not managed.

h1 = The SMP-resident version of the IP address of the hub associated with the mate (inactive) MCTSI side. This field will be 0 if the hub is not managed or if the hub configuration is simplex.

i1 = Maintenance state of the MEPIPE (in the SMP) at the time the error was reported. Valid values are:
   0x00 = UNEQ (the MEPIPE is unequipped).
   0x01 = ACT (the MEPIPE is active).
   0x02 = OOSFLT (the MEPIPE is out-of-service [OOS] due to fault recovery).
   0x03 = INIT (the MEPIPE is being initialized).
   0x04 = OOSL1 (the MEPIPE is OOS due to a layer 1 [physical layer] problem).
   0x05 = OOSLBK (the MEPIPE is OOS due to loopback [ping] failures).
   0x06 = OOSMAN (all child MELNKs are manually removed).

j1 = MEPIPE action in progress at the time the error was reported. Valid values are:
   0x00 = No action was in progress.
   0x01 = The MEPIPE/MELNK status audit was in progress.
   0x04 = A resynchronization of MEPIPE/MELNK status was in progress following a MCTSI soft switch.

k1 = The number of MELNKs equipped on the MEPIPE.

l1 = The last recovery action taken on the MEPIPE during the current invocation of the MEPIPE/MELNK recovery strategy. Valid values are:
   0x00 = No action taken.
   0x01 = Enter autonomous recovery interval.
   0x02 = Run the MEPIPE/MELNK status audit to verify SMP/MH data consistency.
   0x03 = Restore the MEPIPE.
   0x05 = Initiate MCTSI and/or MH recovery actions.
   0x06 = Leave the MEPIPE in its current state (recovery may still occur if the MEPIPE is enabled in the MH).
   0x07 = Unconditionally remove the MEPIPE and disable autonomous recovery in the MH.
m = The number of recovery actions of type 1 that have been performed during the current invocation of the MEPIPE/MELNK recovery strategy.

n = Number of MEPIPE fault recovery events received from the MH.

o = Number of fault recovery events on any child MELNK (for thresholding MELNK errors on a MEPIPE basis).

p = Number of out-of-date MEPIPE events received from the MH.

q = Number of MEPIPE recovery actions that failed or timed out.

r = Number of times a SMP/MH MEPIPE data inconsistency was detected.

s = Number of times invalid data was received from the MH.

t = Number of unexpected MEPIPE events.

u = Current status of MCTSI/MH recovery actions requested by the MEPIPE/MELNK recovery strategy. Valid values are:
0x00 = MCTSI/MH recovery is not in progress.
0x01 = MCTSI/MH short-term recovery is in progress. Recovery actions are actively being performed in an effort to restore the MEPIPE and/or MELNK to service.
0x02 = MCTSI/MH long-term recovery is in progress. All recovery actions that can be performed by the recovery strategy have either been attempted or cannot be performed (because the MCTSI is simplex). Recovery actions will be re- tried periodically.

v = MH initialization indicator (for MCTSI side 0). Valid values are:
0x00 = The MH supporting the MEPIPE/MELNK on MCTSI side 0 has not been initialized as part of MEPIPE/MELNK recovery.
0x01 = The MH has been initialized.

w = MH initialization indicator (for MCTSI side 1). Valid values are:
0x00 = The MH supporting the MEPIPE/MELNK on MCTSI side 1 has not been initialized as part of MEPIPE/MELNK recovery.
0x01 = The MH has been initialized.

x = The number of times an automatic MEPIPE restore has been attempted on MCTSI side 0 as part of the recovery strategy.

y = The number of times an automatic MEPIPE restore has been attempted on MCTSI side 1 as part of the recovery strategy.

z = The number of times a MCTSI soft switch has been requested as part of the recovery strategy.

4. ACTIONS TO BE TAKEN

Since this message is logged, when an error occurs retrieve the logged data from the log files using the input message `OP:LOG:LG="DAYLOG", MSGCLS=SM_MON`. Correlate the event number with the event number in the associated REPT:TRBL-MEPIPE output message.
5. ALARMS

None.

2. REASON FOR OUTPUT

To report data associated with an MH QPIPE error reported by fault recovery in a switching module (SM). An MH QPIPE is a communication path between the quad link packet switch (QLPS) and an SM's message handler (MH). All of the variables 'f' through 'y1' are represented in hexadecimal.

3. VARIABLE FIELD DEFINITIONS

14FB = Message type (MGQLSP2AM) indicating that the error was reported by a switching module.  
a = SM number.  
b = Active module controller/time slot interchange (MCTSI) side at the time the error was reported.  
c = QLPS network.  
d = Office network and timing complex (ONTC) side.  
e = Administrative module (AM) event number.  
f = Not used.  
g = The error classification. Valid value(s):  
23 = MH QPIPE failure.  
27 = Unknown endpoint.  
28 = Bad QLPS broadcast message.  
h = ONTC side (SM perspective at time error was reported).  
i = QLPS network.  
j = If field 'g' is 27, this is the unknown endpoint number. Otherwise, it is the reporting SM number.  
k = Fault location. Valid value(s):  
00 = The near-end (MCTSI complex) is suspected of causing the QPIPE failure.  
01 = The far-end (QLPS) is suspected of causing the QPIPE failure.  
l = Not used.
m = Post-mortem data collection flag. Valid value(s):
  0000 = There is no post-mortem data associated with this MH QPIPE error. Ignore fields 'n' through '11'.
  AA3A = Fields 'n' through '11' contain data associated with an MH QPIPE error detected by the MH.
  BB3A = Fields 'n' through 'y' and field '11' contain data associated with an MH QPIPE error detected by the SMP. If the MH QPIPE was initially out-of-service, this error indicates that an SMP-initiated recovery action failed to restore the MH QPIPE.

n = MH QPIPE error that exceeded fault recovery threshold. Valid value(s):
  00 = QPIPE loopback failure (to the QLPS) occurred.
  05 = Audits detected a problem with QPIPE state information.
  07 = If field 'm' is AA3A, the QPIPE went down due to an MH operational soft restart (OSR). Otherwise, a QPIPE initialization failure occurred.
  08 = SM received a frame addressed to a different destination. The QLPS routing RAM is suspect.
  09 = SM received an invalid broadcast packet from the QLPS.
  0A = A protocol event that occurred in the MH (such as an incoming frame) was associated with an unknown endpoint.
  12 = QPIPE removed due to SMP/MH link map mis-match.
  18 = SM received a frame too large for a buffer.
  19 = Cyclic redundancy check (CRC) error.
  1A = SM received an excessively long frame (indicated by hardware).
  1B = Abort received.
  1C = Transmitter aborted.

o = SM number (the SM reporting the error).

p = Near/far failure indication from QLFR-MH.

q = Active MCTSI side at the time the error occurred.

r = QLFR-SMP flag indicating status of post-mortem data. Valid value(s):
  00 = Post-mortem data was already sent to the AM. Multiple errors have occurred, and some data associated with this error may be reported by a previous REPT POST MORTEM output message.
  01 = Post-mortem data was not sent to the AM previously (normal case).

s = QLFR-SMP post-mortem over-write counter.

t = Not used.

u = The SMP-resident state of the MH QPIPE at the time the error occurred. Valid value(s):
  0 = The QPIPE is unequipped.
  1 = A QPIPE initialization failed and autonomous recovery is in progress.
  2 = The QPIPE is active.
  3 = The QPIPE is out-of-service due to a suspected communication module (CM) problem.
  4 = The QPIPE is out-of-service due to a software problem and autonomous recovery is in progress.
  5 = The QPIPE is out-of-service and periodic attempts to pass a loopback test to the...
active QLPS are in progress.

6 = The QPIPE is out-of-service and is configured for fault isolation testing [attempting to pass a local loopback test to the time slot interchange (TSI)].

7 = The QPIPE is out-of-service due to a local loopback test failure.

8 = The QPIPE has been implicated in causing a MH OSR and will be re-initialized after software recovery completes.

v = Not used.

w = Number of QPIPE initialization failures (SMQTFINIT).

x = Number of failed attempts to remove a QPIPE (SMQTFRMV).

y = Number of times the QPIPE was removed due to a link map mis-match (routing data corruption) (SMQTL3LMMM).

z = Not used.

a = Number of times a frame was received that was too large to store in a buffer (SMQTFM2LONG).

b = Number of frames received with CRC errors (SMQT CRCERR).

c = Number of excessively long frames received (SMQTLGF MRCV).

d = Number of aborts received (SMQTABORT).

e = Number of transmitter aborts (SMqttABORT).

f = Number of times the SM received a frame addressed to a different destination (SMQTBADRRAM). This error implies that the QLPS routing RAM may be invalid.

g = Number of times the SM received an invalid QLPS broadcast packet (SMQTBADBCAST). This error implies that the QLPS broadcast packets may have been improperly programmed.

h = Number of times MH protocol events occurred (such as receipt of an incoming frame) that were associated with an unknown endpoint (SMQTUNKENDPT).

i = Summary count of MH level 1 (QPIPE) transmit errors (SMQSL1TRAN).

j = Summary count of MH level 1 (QPIPE) receive errors (SMQSL1RECV).

k = Not used.

l = SM event number.

m = Not used.

n = AM's MH QPIPE state.

o = AM's parent QTMSLNK state.

p = AM's parent TMSLNK state.

q = Not used.
= Initial QLFR-AM error sub-type. Valid value(s):
 24 = Near-end (MH) QPIPE failure.
 25 = Far-end (QLPS) QPIPE failure.
 27 = Unknown endpoint.
 28 = Bad QLPS broadcast message.

= Error count for error sub-type 'r1'.

= Not used.

= QLFR-AM error sub-type that exceeded threshold, resulting in a QLPS recovery action.

= Error count for QLPS error sub-type 'u1'.

= Not used.

= Number of equipped QGPs (Gl_qgp).

= Operational QGP configuration (Glqgpoper).

4. ACTION TO BE TAKEN

Since this message is logged, analyze the logged data by retrieving information off of the disk. The input message for dumping the daylog is OP:LOG:LG="DAYLOG",MSGCLS=CLNKMON. Correlate the event number with the REPT:TRBL message.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report a module message processor (MMP) error associated with communications module (CM) 1 or CM 2. This
post-mortem data is put in the log file. To dump this, refer to the OP:LOG input message. You may not have the
resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of
the Output Messages manual.

3. VARIABLE FIELD DEFINITIONS

a = CM side.
b = MMP number (logical).
c = Event number associated with a certain error. This field is used to correlate the switch trouble
reports.
d = Contents of the 8086 accumulator (ax).
e = Contents of the 8086 base register (bx).
f = Contents of the 8086 count register (cx).
g = Contents of the 8086 data register (dx).
h = Contents of the 8086 stack segment register (ss). Valid value(s):
   0x1000 = Monitor/debugger (MD).
   0x1600 = Peripheral controller (PC).
i = Contents of the 8086 extra segment register (es). Valid value(s):
   0x1000 = MD
   0x2600 = PC
j = Contents of the 8086 data segment register (ds). Valid value(s):
   0x1000 = MD
   0x1600 = PC
k = Contents of the 8086 stack pointer (sp). Valid value(s):
   0x4fxx = MD
$0x1f$xx = PC

l = Contents of the 8086 base pointer (bp).

m = Contents of the 8086 source index (si).

n = Contents of the 8086 destination index (di).

o = Contents of the 8086 instruction pointer (ip).

p = Contents of the 8086 code segment register (cs). Valid value(s):
   $0x1000 = MD$
   $0x0000 = PC$

q = Contents of the 8086 flags register (fg).

r = Contents of the most recent stack frames.

s = Post-mortem level. Valid value(s):
   $0x0 = Divide by zero.$
   $0x2 = Non-maskable interrupt (NMI) (hardware error).$
   $0x4 = Interrupts on overflow.$
   $0xFD = Defensive check failure.$
   $0xFE = 10-millisecond interrupts not occurring.$
   $0xFF = Unassigned vector table entry.$

t = Error code. Valid value(s):
   $0x1-0x8 = Communication link fault recovery codes.$
   $0x25 = High priority queue pointers out of range.$
   $0x3A00 = Interprocessor communications assert code.$

u = Contents of the TN856 status 1 register.

v = Contents of the TN856 status 2 register.

w = Not used.

x = Contents of the TN856 error source register (ESR) (low byte, high byte). Refer to Exhibit A.

y = Contents of the TN856 ESR mask (low byte, high byte).

z = PC physical ID.

$0x7B = System state. Valid value(s):$
   $0x7B = Normal.$
   $0x7D = Not pumped.$

$0x7B = Pump state. Valid value(s):$
   $0x7B = Normal.$
   $0x7D = Not pumped.$
c¹ = Sanity timer flag. Valid value(s):
   0x7f = Idle.
   0x7e = Reset sanity timer.

d¹ = Timed job indicator. Valid value(s):
   0x7f = Idle.
   0xd = In progress.

e¹ = Diagnostic (DGN) in progress. Valid value(s):
   0x7f = Idle.
   0xd = Diagnostics in progress.

f¹ = Sanity timer counter (used to reset sanity timer).

g¹ = 10-millisecond count (used to check if 10-millisecond interrupts are occurring).

h¹ = The meaning of this variable depends on whether it is CM 1 or CM 2.

<table>

2. REASON FOR OUTPUT

To report that the message switch control unit (MSCU) postmortem memory was logged as a result of an error. This information is normally used by the software developer.

Format 1 reports general MSCU errors logged on the postmortem memory.

Format 2 reports that an MSCU error was detected by the operational kernel process (OKP).

Format 3 reports that the MSCU detected the administrative module (AM) sending a base priority message to an out of service control time slot and to dump relevant postmortem data.

STIMULUS=n RCVY=o [PS DATA PRESERVING]
FAIL-ADDR=p PP-MODE=q ASSERT-COUNT=r
IMAGE=s [t]

2. REASON FOR OUTPUT

To report the occurrence of an initialization in the packet switch unit protocol handler (PSUPH). The message prints only when the printmode is turned on. The message is stored in a buffer and can be printed on request (OP:HISTORY).

3. VARIABLE FIELD DEFINITIONS

PS DATA PRESERVING = Packet switching data as preserved.

a = Switching module (SM) number.
b = Packet switching unit (PSU) number.
c = PSU shelf number.
d = PSUPH number.
e = Channel group (CHNG) number.
f = Event number
g = PSUPH number in which the event occurred.
h = PSU community address.
i = Active packet bus.
j = Process number.
k = Message number.
l = Time of the day the assert occurred, in the form hour:minute.
m = Date the assert occurred, in the form month/day/year.
n = Stimulus of recovery action. Refer to the APP:RCVRY-ACTION appendix in the Appendixes section of the Output Messages manual for a list of recovery action stimulus and their definitions.
**4. ACTIONS TO BE TAKEN**

Monitor the progress of the software recovery. Initiate manual actions if the recovery does not proceed as expected. Retain this information along with any trouble report concerning the initialization/recovery and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**5. ALARMS**

None.

2. REASON FOR OUTPUT

To report data associated with a quad link packet switch (QLPS) gateway link (QGL) error. A QGL is the physical communication path between the QLPS and the QLPS gateway processor (QGP). The error may have been reported by QLPS link fault recovery (QLFR) in a QGP or by the QLPS link fault recovery configuration process (QLFR CON) in the switch maintenance kernel process (SMKP). All of the variables 'e' through 'g' are represented in hexadecimal.

3. VARIABLE FIELD DEFINITIONS

14D6 = Message type (MGSMQLERR) indicating that the error was reported by QLFR-QGP or QLFR CON.
2B = The error type (QGL fault).
a = Message switch (MSGS) side.
b = Logical QGP number.
c = QGL number.
d = Administrative module (AM) event number.
e = Not used.
f = Error source. Valid value(s):
36 = QLFR-QGP report of a QGL hardware error.
38 = QLFR CON report of a QGL configuration failure. Ignore fields 'm' through 'q'.
g = MSGS side.
h = Physical QGP number.
i = If 't' is 38, this is the QGL number. Otherwise, not used.
j = Not used.
k = The error classification. Valid value(s):
2C = QGP-reported QGL hardware error.
2F = QLFR CON-reported QGL re-configuration failure.

1 = Not used.

m = QGL error that exceeded fault recovery threshold. Valid value(s):
1A = QGP received a frame too large for a buffer.
1B = QGP received a frame too short to be valid.
1C = Transmit first-in, first-out (FIFO) not being emptied.
1E = An invalid PBMAC interrupt occurred.
1F = Loss of synchronization.
20 = Input parity error.
21 = PBMAC reported loss of clock.
22 = PBMAC reported loss of clear-to-send.
23 = Bibble bus parity error.
24 = PBMAC throttle out latched error.
25 = PBMAC throttle in latched error.
26 = PBMAC throttle out error.
27 = PBMAC throttle in error.
28 = PBMAC transmit FIFO overrun.
29 = PBMAC transmit FIFO underrun.
2A = PBMAC receive FIFO overrun.
2B = PBMAC receive FIFO underrun.
2C = PBMAC reported loss of carrier sense.
2D = PBMAC FIFO status parity error.
2E = PBMAC write protect error.
2F = FIFO BIST complete error.
30 = Bad frame due to receive FIFO overflow.
31 = Bad frame due to disabled receiver.
32 = Bad frame due to byte alignment.
33 = Bad frame due to cyclic redundancy check (CRC) error.
34 = Bad frame due to the PBMAC not setting the "good frame" indication.
35 = PBMAC BIST complete error.
36 = System data bus parity error.
37 = PBMAC transmit FIFO BIST error.
38 = PBMAC receive FIFO BIST error.
39 = PBMAC receive data ready interrupt.
3A = PBMAC end-of-frame flag was not set correctly.
3B = Bad frame due to lost carrier sense.
3C = PBMAC VALID bit was not set correctly.
3D = Frame received using STBY QGL.
3E = PBMAC bus error (an attempt was made to access a de-activated PBMAC).

n = QLPS network.

o = QLPS endpoint number. Valid value(s):
C1 = A QGP on MSGS 0.
C2 = A QGP on MSGS 1.

p = Not used.
q = QGP event number.

r = AM's QGL state.

s = Post-mortem data collection flag. Valid value(s):

0000 = There is no QGP post-mortem data associated with this error. Ignore message fields 't' through 'w'.

AA38 = Obtained valid QGP post-mortem data for a QGL. Refer to fields 't' through 'w' for the data.

AAAA = Timed out waiting for QGP post-mortem data. Ignore message fields 't' through 'w'.

EEEE = Data collection was preempted by a new error or event. Ignore message fields 't' through 'w'.

FFFF = Could not send request for post-mortem data. Ignore message fields 't' through 'w'.

Any other value reports a failure result and reason from the QGP handler in the message switch kernel process (MSKP), indicating that post-mortem data could not be collected. Ignore message fields 't' through 'w'.

t = QGL error that exceeded fault recovery threshold (same as field 'm').

u = QLPS endpoint number (reported by the QGP). Valid value(s):

C1 = A QGP on MSGS 0.
C2 = A QGP on MSGS 1.

v = Not used.

w = MSGS side (reported by the QGP).

x = QLFR-QGP flag indicating status of post-mortem data. Valid value(s):

00 = Post-mortem data was already sent to the AM. Multiple errors have occurred, and some data associated with this error may be reported by a previous REPT POST MORTEM output message.

01 = Post-mortem data was not sent to the AM previously (normal case).

y = QLFR-QGP post-mortem over-write counter.

z = Not used.

a = This 2-digit field contains information about the QGP's internal QGP QPIPE configuration at the time the error occurred.

The first digit indicates the ONTC side to which the network's QGP QPIPE was configured (the side supporting the active QLPS). Valid value(s):

0 = Network 0 QPIPE configured to ONTC 0.
1 = Network 1 QPIPE configured to ONTC 0.
2 = Network 0 QPIPE configured to ONTC 1.
3 = Network 1 QPIPE configured to ONTC 1.
F = The QPIPE was out-of-service.
The second digit indicates the QGP-resident state of the network's QGP QPIPE. Valid value(s):

- 0 = the QPIPE is unequipped.
- 1 = a QPIPE initialization failed and autonomous recovery is in progress.
- 2 = the QPIPE is active.
- 4 = the QPIPE's PBMAC is de-activated due to QPIPE/QGL hardware or software errors.
- 5 = the QPIPE's PBMAC is enabled and periodic attempts to pass a loopback test to the active QLPS are in progress.
- 8 = the QPIPE has been implicated in causing a QGP operational software restart (OSR) and will be re-initialized after software recovery completes.

b\(^1\) = This 2-digit field contains more information about the QGP's internal QGL and QGP QPIPE configuration at the time the error occurred.

The first digit indicates the QGP-resident QGL state. Valid value(s):

- 0 = The QGL is unequipped.
- 1 = The QGL is active.
- 2 = The QGL is standby (connected to the network's standby QLPS).
- 3 = The QGL is out-of-service.
- 4 = The QGL is being used by diagnostics.

The second digit indicates the QGP's internal status of the PBMAC associated with the QGL. Valid value(s):

- 0 = The PBMAC is unequipped.
- 1 = The PBMAC is enabled and associated with an in-service QGL.
- 3 = The PBMAC is disabled or, if the QGL is standby, a QGP QPIPE loopback test previously failed using the PBMAC.

c\(^1\) = Number of QPIPE initialization failures (SMQTFINIT).
d\(^1\) = Number of failed attempts to remove a QPIPE (SMQTFRMV).
e\(^1\) = Number of times a frame was received that was too large to store in a buffer (SMQTFM2LONG). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.

f\(^1\) = Number of times a frame was received that was too short to be valid (SMQTFM2SHRT). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.

g\(^1\) = Number of times the PBMAC transmitter was found to be stuck (SMQTXMTSTK). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.

h\(^1\) = Number of times an invalid PBMAC interrupt occurred (SMQTINTQGL).
i\(^1\) = Number of times the PBMAC reported loss of synchronization (SMQTLOSQGL).
j\(^1\) = Number of PBMAC input parity errors (SMQTPEQGL).
k\(^1\) = Number of times the PBMAC reported loss of clock (SMQTLOCQGL).
l\(^1\) = Number of times the PBMAC reported loss of clear-to-send (SMQTCTSPBM).
m = Number of bibble bus parity errors detected (SMQTBPPEPBM).
n = Number of PBMAC throttle out latched errors detected (SMQTTOLPBM).
o = Number of PBMAC throttle in latched errors detected (SMQTTLIPBM).
p = Number of PBMAC throttle out errors detected (SMQTTOPBM).
q = Number of PBMAC throttle in errors detected (SMQTTPBM).
r = Number of PBMAC transmit FIFO overruns (SMQTTORPBM). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.
s = Number of PBMAC transmit FIFO underruns (SMQTTURPBM). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.
t = Number of PBMAC receive FIFO overruns (SMQTRORPBM). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.
u = Number of PBMAC receive FIFO underruns (SMQTRURPBM). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.
v = Number of times the PBMAC reported loss of carrier sense (SMQTCRSPBM).
w = Number of PBMAC FIFO status parity errors detected (SMQTSPPEPBM). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.
x = Number of PBMAC write protect errors detected (SMQTWPEPBM).
y = Number of FIFO BIST complete errors detected (SMQTBISPBM).
z = Number of bad frames due to receive FIFO overflow (SMQTOVFLW).
a = Number of bad frames due to the receiver being disabled (SMQTRCV_DSB). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.
b = Number of bad frames due to byte alignment (SMQTBADALIGN). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.
c = Number of bad frames due to cyclic redundancy check (CRC) errors (SMQTBADCRC). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.
d = Number of bad frames due to the PBMAC not setting the "good frame" indication (SMQTGOODBAD).
e = Number of PBMAC BIST complete errors detected (SMQTBCCPBM).
f = Number of system data bus parity errors detected (SMQTDBPPBM).
g = Number of PBMAC transmit FIFO BIST errors detected (SMQTTFBPBM).
h = Number of PBMAC receive FIFO BIST errors detected (SMQTRFBPBM).
i = Number of PBMAC receive data ready interrupts (SMQTRDRRPBM).
j = Number of times the PBMAC end-of-frame flag was not set correctly (SMQTNOEOF). This is
normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.

\( k^2 \) = Number of bad frames due to lost carrier sense (SMQTLOSTCRS). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.

\( l^2 \) = Number of times the PBMAC VALID bit was not set correctly (SMQTNOVALID). This is normally a QPIPE error. It is considered to be a QGL error if it occurs on an out-of-service QPIPE.

\( m^2 \) = Number of frames received using a STBY QGL (SMQTSTBYPBM).

\( n^2 \) = Number of PBMAC bus errors detected (SMQTBUSPBM).

\( o^2 \) = Number of times the QGP received a frame addressed to a different destination (SMQTBADRRAM). This error implies that the QLPS routing RAM may be invalid.

\( p^2 \) = Number of times the QGP received an invalid QLPS broadcast packet (SMQTBADBCAST). This error implies that the QLPS broadcast packets may have been improperly programmed.

\( q^2 \) = Number of times QGP protocol events occurred (such as receipt of an incoming frame) that were associated with an unknown endpoint (SMQTUNKENDPT).

\( r^2 \) = Number of times a message from the MSCU could not be routed, because no path to the destination was available (SMQTTRTSF).

\( s^2 \) = Summary count of level 1 transmit errors (SMQSL1TRAN).

\( t^2 \) = Summary count of level 1 QPIPE receive errors (SMQSL1RECV).

\( u^2 \) = Summary count of level 1 QGL hardware errors (SMQSL1HARD).

\( v^2 \) = Summary count of level 1 QPIPE receive errors requiring long term thresholding in the QGP (SMQSL1QPRCV).

\( w^2 \) = Summary count of level 1 QGL receive errors requiring long term thresholding in the QGP (SMQSL1GLRCV).

\( x^2 \) = Not used.

\( y^2 \) = Initial QLFR-AM error sub-type. Valid value(s):

2C = QGP-reported QGL hardware error on an in-service QGL.
2D = QGP-reported QGL hardware error on an out-of-service QGL.
2E = QGP-reported QGL hardware error on an unequipped QGL.
2F = QLFR CON-reported QGL re-configuration failure.
34 = Error from an out-of-service QGP.

\( z^2 \) = Error count for error sub-type 'y^2'.

\( a^3 \) = Not used.

\( b^3 \) = QLFR-AM error sub-type that exceeded threshold, resulting in a QGP recovery action.

\( c^3 \) = Error count for QGP error sub-type 'b^3'.

\( d^3 \) = Not used.
e³ = Number of times the QGP recovery action associated with error sub-type 'b³' has been requested. Escalation strategies may result in a higher level recovery action being performed.

f³ = Number of equipped QGPs (Gl_qgp).

g³ = Operational QGP configuration (Glagpoper).

4. ACTION TO BE TAKEN

Since this message is logged, analyze the logged data by retrieving information off of the disk. The input message for dumping the daylog is OP:LOG:LG="DAYLOG",MSGCLS=CLNKMON. Correlate the event number with the REPT:TRBL message.

5. ALARMS

None.

    t1ttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttt

2. REASON FOR OUTPUT

To dump the quad-link gateway processor (QGP) postmortem memory as a result of an error. The message class in the equipment configuration database (ECD) is usually set to both logging and printing.

3. VARIABLE FIELD DEFINITIONS

a = Message switch (MSGS) side the QGP is on.
b = QGP number.
c = Event number associated with a certain error. This field is used to correlate the switch trouble reports.
d–t^1 = From parameter 'd' through 't^1' represent debug data. Used for extensive software analysis. The parameters with a subscript of 1 represents two hexadecimal characters. The parameters without a subscript represents one hexadecimal character.

4. ACTIONS TO BE TAKEN

Analyze the dump according to the appropriate dump analysis procedure.

2. REASON FOR OUTPUT

To report data associated with a QGP QPIPE error reported by fault recovery in a quad link packet switch (QLPS) gateway processor (QGP). A QGP QPIPE is the communication path between the QLPS and the QGP. All of the variables 'f' through 'i3' are represented in hexadecimal.

3. VARIABLE FIELD DEFINITIONS

14D6 = Message type (MGSMQLERR) indicating that the error was reported by a QGP.
2C = The error type (QPIPE fault).
36 = Unit type (QGP).
a = Message switch (MSGS) side.
b = Logical QGP number.
c = QLPS network.
d = Office network and timing complex (ONTC) side.
e = Administrative module (AM) event number.
f = Not used.
g = MSGS side.
h = Physical QGP number.
i = Not used.
j = The error classification. Valid value(s):
   1B = QGP QPIPE failure.
   20 = Bad QLPS broadcast message.
   21 = Unknown endpoint.

k = Not used.
l = QGP QPIPE error that exceeded fault recovery threshold. Valid value(s):
QPIPE loopback failure (to the QLPS) occurred.

QGP internal audits reported a QPIPE software state problem.

A QPIPE initialization failure occurred.

A QPIPE initialization was required during a QGP operational soft restart (OSR).

QGP received a frame addressed to a different destination. The QLPS routing RAM is suspect.

QGP received an invalid broadcast packet from the QLPS.

A protocol event that occurred in the QGP (such as an incoming frame) was associated with an unknown endpoint.

QGP received a frame too large for a buffer.

QGP received a frame too short to be valid.

Transmit first-in, first-out (FIFO) not being emptied.

An invalid PBMAC interrupt occurred.

Loss of synchronization.

Input parity error.

PBMAC reported loss of clock.

PBMAC reported loss of clear-to-send.

Bibble bus parity error.

PBMAC throttle out latched error.

PBMAC throttle in latched error.

PBMAC throttle out error.

PBMAC throttle in error.

PBMAC transmit FIFO overrun.

PBMAC transmit FIFO underrun.

PBMAC receive FIFO overrun.

PBMAC receive FIFO underrun.

PBMAC reported loss of carrier sense.

PBMAC FIFO status parity error.

PBMAC write protect error.

FIFO BIST complete error.

Bad frame due to receive FIFO overflow.

Bad frame due to disabled receiver.

Bad frame due to byte alignment.

Bad frame due to cyclic redundancy check (CRC) error.

Bad frame due to the PBMAC not setting the "good frame" indication.

PBMAC BIST complete error.

System data bus parity error.

PBMAC transmit FIFO BIST error.

PBMAC receive FIFO BIST error.

PBMAC receive data ready interrupt.

PBMAC end-of-frame flag was not set correctly.

Bad frame due to lost carrier sense.

PBMAC VALID bit was not set correctly.

Frame received on a standby QGL.

PBMAC bus error (an attempt was made to access a de-activated PBMAC).

m = QLPS network.

n = QLPS endpoint number. Valid value(s):

C1 = A QGP on MSGS 0.

C2 = A QGP on MSGS 1.
o = Not used.

p = QGP event number.

q = AM's QGP QPIPE state.

r = AM's parent QGL state.

s = Post-mortem data collection flag. Valid value(s):
   0000 = There is no QGP post-mortem data associated with this error. Ignore message fields 't' through 'x2'.
   AA3A = Obtained valid QGP post-mortem data for a QGP QPIPE. Refer to fields 't' through 'x2' for the data.
   AAAA = Timed out waiting for QGP post-mortem data. Ignore message fields 't' through 'x2'.
   EEEE = Data collection was preempted by a new error or event. Ignore message fields 't' through 'x2'.
   FFFF = Could not send request for post-mortem data. Ignore message fields 't' through 'x2'.

Any other value reports a failure result and reason from the QGP handler in the message switch kernel process (MSKP), indicating that post-mortem data could not be collected. Ignore message fields 't' through 'x2'.

t = QGP QPIPE error that exceeded fault recovery threshold (same as field '1').

u = QLPS endpoint number (reported by the QGP). Valid value(s):
   C1 = A QGP on MSGS 0.
   C2 = A QGP on MSGS 1.

v = Not used.

w = MSGS side (reported by the QGP).

x = QLFR-QGP flag indicating status of post-mortem data. Valid value(s):
   00 = Post-mortem data was already sent to the AM. Multiple errors have occurred, and some data associated with this error may be reported by a previous REPT POST MORTEM output message.
   01 = Post-mortem data was not sent to the AM previously (normal case).

y = QLFR-QGP post-mortem over-write counter.

z = Not used.

a1 = This 2-digit field contains information about the QGP's internal QGP QPIPE configuration at the time the error occurred.

The first digit indicates the ONTC side to which the network's QGP QPIPE was configured (the side supporting the active QLPS). Valid value(s):
   0 = Network 0 QPIPE configured to ONTC 0.
1 = Network 1 QPIPE configured to ONTC 0.
2 = Network 0 QPIPE configured to ONTC 1.
3 = Network 1 QPIPE configured to ONTC 1.
F = The QPIPE was out-of-service.

The second digit indicates the QGP-resident state of the network's QGP QPIPE. Valid value(s):
0 = The QPIPE is unequipped.
1 = A QPIPE initialization failed and autonomous recovery is in progress.
2 = The QPIPE is active.
4 = The QPIPE's PBMAC is de-activated due to QPIPE/QGL hardware or software errors.
5 = The QPIPE's PBMAC is enabled and periodic attempts to pass a loopback test to the active QLPS are in progress.
8 = The QPIPE has been implicated in causing a QGP operational software restart (OSR) and will be re-initialized after software recovery completes.

b = This 2-digit field contains more information about the QGP's internal QGL and QGP QPIPE configuration at the time the error occurred.

The first digit indicates the QGP-resident parent QGL state. Valid value(s):
0 = The QGL is unequipped.
1 = The QGL is active.
2 = The QGL is standby (connected to the network's standby QLPS).
3 = The QGL is out-of-service.
4 = The QGL is being used by diagnostics.

The second digit indicates the QGP's internal status of the PBMAC associated with the parent QGL. Valid value(s):
0 = The PBMAC is unequipped.
1 = The PBMAC is enabled and associated with an in-service QGL.
3 = The PBMAC is disabled or, if the QGL is standby, a QGP QPIPE loopback test previously failed using the PBMAC.

c = Number of QPIPE initialization failures (SMQTFINIT).
d = Number of failed attempts to remove a QPIPE (SMQTFRMV).
e = Number of times a frame was received that was too large to store in a buffer (SMQTFM2LONG).
f = Number of times a frame was received that was too short to be valid (SMQTFM2SHRT).
g = Number of times the PBMAC transmitter was found to be stuck (SMQTXMTSTK).
h = Number of times an invalid PBMAC interrupt occurred (SMQTINTQGL). This is normally a QGL error. It is considered to be a QPIPE error if it occurs on an inhibited QGP.
i = Number of times the PBMAC reported loss of synchronization (SMQTLOSQGL). This is normally a QGL error. It is considered to be a QPIPE error if it occurs on an inhibited QGP.
j = Number of PBMAC input parity errors (SMQTPEQGL). This is normally a QGL error. It is considered to be a QPIPE error if it occurs on an inhibited QGP.

</tbody>
</table>
= Number of system data bus parity errors detected (SMQTDBPPBM). This is normally a QGL error. It is considered to be a QPIPE error if it occurs on an inhibited QGP.

g = Number of PBMAC transmit FIFO BIST errors detected (SMQTTFBPBM). This is normally a QGL error. It is considered to be a QPIPE error if it occurs on an inhibited QGP.

h = Number of PBMAC receive FIFO BIST errors detected (SMQTRFBPBM). This is normally a QGL error. It is considered to be a QPIPE error if it occurs on an inhibited QGP.

i = Number of PBMAC receive data ready interrupts (SMQTRDRPBM). This is normally a QGL error. It is considered to be a QPIPE error if it occurs on an inhibited QGP.

j = Number of times the PBMAC end-of-frame flag was not set correctly (SMQTNOEOF).

k = Number of bad frames due to lost carrier sense (SMQTLOSTCRS).

l = Number of times the PBMAC VALID bit was not set correctly (SMQTNOVALID).

m = Number of frames received using a STBY QGL (SMQTSTBYPBM). This is normally a QGL error. It is considered to be a QPIPE error if it occurs on an inhibited QGP.

n = Number of times the QGP received a frame addressed to a different destination (SMQTBADRRAM). This error implies that the QLPS routing RAM may be invalid.

o = Number of times the QGP received an invalid QLPS broadcast packet (SMQTBADBCAST). This error implies that the QLPS broadcast packets may have been improperly programmed.

p = Number of times QGP protocol events occurred (such as receipt of an incoming frame) that were associated with an unknown endpoint (SMQTUNKENDPT).

q = Number of times a message from the MSCU could not be routed, because no path to the destination was available (SMQTTRTRFSH).

r = Number of PBMAC bus errors detected (SMQTBUSPBM). This is normally a QGL error. It is considered to be a QPIPE error if it occurs on an inhibited QGP.

s = Summary count of level 1 transmit errors (SMQSL1TRAN).

t = Summary count of level 1 QPIPE receive errors (SMQSL1RECV).

u = Summary count of level 1 QGL hardware errors (SMQSL1HARD).

v = Summary count of level 1 QPIPE receive errors requiring long term thresholding in the QGP (SMQSL1QPRCV).

w = Summary count of level 1 QGL receive errors requiring long term thresholding in the QGP (SMQSL1GLRCV).

x = Not used.

y = Initial QLFR-AM error sub-type. Valid value(s):

1D = QGP QPIPE failure (far end).
20 = Bad QLPS broadcast message.
21 = Unknown endpoint.
22 = Error on an unequipped QPIPE.
34 = Error from an out-of-service QGP.
z^2 = Error count for error sub-type 'y^2.'
a^3 = Not used.
b^3 = QLFR-AM error sub-type that exceeded threshold, resulting in a QGP recovery action.
c^3 = Error count for QGP error sub-type 'b^3.'
d^3 = QLFR-AM error sub-type that exceeded threshold, resulting in a QLPS recovery action.
e^3 = Error count for QLPS error sub-type 'd^3.'
f^3 = Not used.
g^3 = Number of times the QGP recovery action associated with error sub-type 'b^3' has been requested. Escalation strategies may result in a higher level recovery action being performed.
h^3 = Number of equipped QGPs (Gl_qgp).
i^3 = Operational QGP configuration (Glqgpoper).

4. ACTION TO BE TAKEN

Since this message is logged, analyze the logged data by retrieving information off of the disk. The input message for dumping the daylog is OP:LOG:LG="DAYLOG",MSGCLS=CLNKMON. Correlate the event number with the REPT:TRBL message.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report data associated with a quad link packet switch (QLPS) communication link (QLNK) link establishment (LE) sequence error reported by QLPS link fault recovery (QLFR) in the administrative module (AM). All of the variables 'h' through 'o' are represented in hexadecimal.

3. VARIABLE FIELD DEFINITIONS

1E1E = Indication that this is a link establishment (LE) sequence error reported by QLFR-AM.

a = Switching module (SM) number.
b = Active module controller/time slot interchange (MCTSI) side.
c = QLPS network.
d = Office network and timing complex (ONTC) side.
e = Logical QLPS gateway processor (QGP) number.
f = Message switch (MSGS) side.
g = Administrative module (AM) event number.
h = Not used.
i = Unit type. Valid value(s):
36 = QGP.
3B = QLNK.

j = If field 'i' is 36, this is the MSGS side associated with the QLNK. Otherwise, it is the SM number.
k = If field 'i' is 36, this is the physical QGP number associated with the QLNK. Otherwise, it is the physical QLNK number (0-15).
l = Not used.
m = The error type. Valid value(s):
47 = QLFR switch maintenance error recognition process (SMER) received a report of level 2 establishment for a QLNK that is not in the expected state.
= QLFR configuration process (CON) received a link establishment (LE) or QGP routing update acknowledgement message for a QLNK that is not in the expected state.

n = The error classification. Valid value(s):
    01 = QLFR SMER received an unexpected report of level 2 establishment.
    15 = QLFR CON received an unexpected LE message.
    16 = QLFR CON received an unexpected QGP routing update acknowledgement message.

o = Not used.

p = Logical link map (LLM) entry for logical link 2.

q = LLM entry for logical link 3.

r = LLM entry for logical link 4.

s = LLM entry for logical link 5.

t = DDQLINKMAP (SM) value for logical link 2.

u = DDQLINKMAP (SM) value for logical link 3.

v = DDQLINKMAP (SM) value for logical link 4.

w = DDQLINKMAP (SM) value for logical link 5.

x = MSCU translation table (MTT) side 0 contents.

y = MTT side 1 contents.

z = Demand (CLNK) MSCU translation table (DMTT) side 0 contents.

a1 = DMTT side 1 contents.

b1 = AM's parent QGP QPIPE state.

c1 = AM's parent MH QPIPE state.

d1 = AM's physical QLNK state. Valid value(s):
    00 = Idle (supporting hardware available).
    01 = Level 2 up (AM waiting for link establish message).
    02 = QGP routing update in progress.
    03 = QLNK on STBY QLPS with level 2 up on mate.
    04 = Active (QLNK in use for message routing).
    05 = Out-of-service due to supporting hardware.
    06 = Unequipped.

e1 = SM's QLPS routing state (SMqlmcst).

f1 = Not used.
\( g^1 \) = Initial QLFR-AM error sub-type. Valid value(s):
14 = Unexpected report of level 2 establishment.
15 = Unexpected LE message.
16 = Unexpected QGP routing update acknowledgement.
48 = Link establishment sequence error summary count over threshold.

\( h^1 \) = Error count for error sub-type \('g^1'\).

\( i^1 \) = QLFR-AM error sub-type that exceeded threshold, resulting in a QLNK recovery action.

\( j^1 \) = Error count for QLNK error sub-type \('i^1'\).

\( k^1 \) = Not used.

\( l^1 \) = Number of times the QLNK recovery action associated with error sub-type \('i^1'\) has been requested. Escalation strategies may result in a higher level recovery action being performed.

\( m^1 \) = Not used.

\( n^1 \) = Number of equipped QGPs (Gl_qgp).

\( o^1 \) = Operational QGP configuration (Glqgpoper).

4. ACTION TO BE TAKEN

Since this message is logged, analyze the logged data by retrieving information off of the disk. The input message for dumping the daylog is \( \text{OP:LOG:LG="DAYLOG", MSGCLS=CLNKMON} \). Correlate the event number with the \( \text{REPT:TRBL} \) message.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report data associated with a quad link packet switch (QLPS) communication link (QLNK) error reported by QLNK fault recovery (QLFR) in a QLPS gateway processor (QGP). All of the variables 'h' through 'u^2' are represented in hexadecimal.

3. VARIABLE FIELD DEFINITIONS

14D6 = Message type (MGSMQLERR) indicating that the error was reported by a QGP.
36 = Unit type (QGP).
47 = The error type (QLNK level 2).
a = Switching module (SM) number.
b = Active module controller/time slot interchange (MCTSI) side.
c = QLPS network.
d = Office network and timing complex (ONTC) side.
e = Logical QGP number.
f = Message switch (MSGS) side.
g = Administrative module (AM) event number.
h = Not used.
i = MSGS side.
j = Physical QGP number.
k = Not used.
l = The error classification. Valid value(s):
   02 = QLNK level 2 error
   08 = QL request for link map refresh due to attempts to send messages using QLNKs that are not in an appropriate state.
   09 = CM request for link map refresh due to attempts to send messages using QLNKs
that QGP routing indicates are not available.

\[ m \] = Not used.
\[ n \] = Information from QLFR-QGP about affected QLNKs. Valid value(s):

<table>
<thead>
<tr>
<th>If 'l' =</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>02</td>
<td>This is a set of eight one-byte fields indicating SMs associated with QLNK errors reported in a single error message from the QGP. Bytes containing &quot;FF&quot; indicate that the QGP reported errors on fewer than eight QLNKs.</td>
</tr>
<tr>
<td>08, 09</td>
<td>The third byte of this field contains the QLPS network associated with the QLNK and the fourth byte contains the SM number. The other bytes are not used.</td>
</tr>
</tbody>
</table>

\[ o \] = Valid value(s):

<table>
<thead>
<tr>
<th>If 'l' =</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>02</td>
<td>This is a set of eight 2-bit fields associated with each QLNK error indicated by a non-&quot;FF&quot; SM number in field 'n' (with the least significant 2-bit field corresponding to the first SM reported in field 'n'). The low-order bit of each 2-bit field is the QLPS network. The high-order bit is 1 if the QGP received a DISConnect frame from the far-endpoint, and 0 otherwise.</td>
</tr>
<tr>
<td>08, 09</td>
<td>This field is not used.</td>
</tr>
</tbody>
</table>

\[ p \] = QGP event number.
\[ q \] = Logical link map (LLM) entry for logical link 2.
\[ r \] = LLM entry for logical link 3.
\[ s \] = LLM entry for logical link 4.
\[ t \] = LLM entry for logical link 5.
\[ u \] = DDQLINKMAP (SM) value for logical link 2.
\[ v \] = DDQLINKMAP (SM) value for logical link 3.
\[ w \] = DDQLINKMAP (SM) value for logical link 4.
\[ x \] = DDQLINKMAP (SM) value for logical link 5.
\[ y \] = Message switch control unit (MSCU) translation table (MTT) side 0 contents.
\[ z \] = MTT side 1 contents.
\[ a^1 \] = Demand (CLNK) MSCU translation table (DMTT) side 0 contents.
\[ b^1 \] = DMTT side 1 contents.
\[ c^1 \] = AM's parent QGP QPIPE state.
\[ d^1 \] = AM's parent MH QPIPE state.
\[ e^1 \] = AM's physical QLNK state. Valid value(s):

- 00 = Idle (supporting hardware available).
- 01 = Level 2 up (AM waiting for link establishment message).
- 02 = QGP routing update in progress.
- 03 = QLNK on STBY QLPS with level 2 up on mate.
04 = Active (QLNK in use for message routing).
05 = Out-of-service due to supporting hardware.
06 = Unequipped.

f = SM's QLPS routing state (SMqlmcst).

~g = Not used.

h = Post-mortem data collection flag. Valid value(s):
0000 = There is no QGP post-mortem data associated with this error. Ignore message fields 'i' through 'j'.
AAAA = Timed out waiting for QGP post-mortem data. Ignore message fields 'i' through 'j'.
EEEE = Data collection was preempted by a new error or event. Ignore message fields 'i' through 'j'.
FF3B = Obtained valid QGP post-mortem data for a QLNK. Refer to fields 'i' through 'j' for the data.
FFFF = Could not send request for post-mortem data. Ignore message fields 'i' through 'j'.

Any other value reports a failure result and reason from the QGP handler in the message switch kernel process (MSKP), indicating that post-mortem data could not be collected. Ignore message fields 'i' through 'j'.

i = Error that exceeded fault recovery threshold. Valid value(s):
02 = Far-end response timeout (no response to RR or SABM frames).
06 = QLFR-QGP detected a discrepancy between the QLFR-QGP QLNK data and level 2 data structures.
0D = QGP detected full transmit queue.
0E = RR frame re-try threshold exceeded.
0F = Frame with invalid poll/final bit.
10 = Frame with invalid message/response bit.
11 = Frame with unknown packet type.
12 = Frame with unknown frame type.
13 = Frame with inconsistent packet and frame types.
14 = SABM on a link in the multi-frame establish or timer recovery state.
15 = Valid frame on a link that was in a state for which the frame was not expected.
17 = Out-of-sequence frame received.
18 = QGP-detected frame reject condition.
19 = Attempt to send a message using a QLNK that was not in an appropriate state.
1D = Attempt to send a message using a QLNK that was not in the QGP routing table.

j = QLPS endpoint number (reported by the QGP). Valid value(s):
C1 = A QGP on MSGS 0.
C2 = A QGP on MSGS 1.

k = Not used.

l = MSGS side (reported by the QGP).
m\(^1\) = QLFR-QGP flag indicating status of post-mortem data. Valid value(s):
00 = Post-mortem data was already sent to the AM. Multiple errors have occurred, and some data associated with this error may be reported by a previous REPT POST MORTEM output message.
01 = Post-mortem data was not sent to the AM previously (normal case).

n\(^1\) = QLFR-QGP post-mortem over-write counter.

o\(^1\) = Not used.

p\(^1\) = Recovery action performed by QLFR-QGP. Valid value(s):
00 = No action.
02 = Notify AM of loss of level 2 communication and periodically attempt to re-establish it.
06 = Initiate level 2 protocol re-start due to level 2 errors.

q\(^1\) = This 2-digit field contains information about the QGP's internal configuration at the time the error occurred.

The first digit indicates the ONTC side to which the network's QGP QPIPE was configured (the side supporting the active QLPS). Valid value(s):
0 = Network 0 QPIPE configured to ONTC 0.
1 = Network 1 QPIPE configured to ONTC 0.
2 = Network 0 QPIPE configured to ONTC 1.
3 = Network 1 QPIPE configured to ONTC 1.
F = The QPIPE was out-of-service.

The second digit indicates the QGP-resident state of the network's QGP QPIPE. Valid value(s):
0 = The QPIPE is unequipped.
1 = A QPIPE initialization failed and autonomous recovery is in progress.
2 = The QPIPE is active.
4 = The QPIPE's PBMAC is de-activated due to QPIPE/QGL hardware or software errors.
5 = The QPIPE's PBMAC is enabled and periodic attempts to pass a loopback test to the active QLPS are in progress.
8 = The QPIPE has been implicated in causing a QGP operational software restart (OSR) and will be re-initialized after software recovery completes.

r\(^1\) = This 2-digit field contains more information about the QGP's internal configuration at the time the error occurred.

The first digit indicates the QGP-resident QGL state. Valid value(s):
0 = The QGL is unequipped.
1 = The QGL is active.
2 = The QGL is standby (connected to the network's standby QLPS).
3 = The QGL is out-of-service.
4 = The QGL is being used by diagnostics.

The second digit indicates the QGP's internal QLNK level 2 status. Valid value(s):
0  = The QLNK is unequipped.
1  = Level 2 is up.
2  = Level 2 is down.

s¹  = Number of QGP-detected transmit queue full errors (SMQTQUEFULL).
t¹  = Number of times the RR frame re-try threshold was exceeded (SMQTXRETRY).
u¹  = Number of frames received with an invalid poll/final bit (SMQTINVPF).
v¹  = Number of frames received with an invalid message/response bit (SMQTINVCR).
w¹  = Number of frames received with an unknown packet type (SMQTUNKPKT).
x¹  = Number of frames received with an unknown frame type (SMQTUNKFRM).
y¹  = Number of frames received with inconsistent packet and frame types (SMQTINCPKT).
z¹  = Number of SABMs received while the link was in the multi-frame establish or timer recovery state (SMQTRESTART).
a²  = Number of valid frames received on a link that was in a state for which the frame was not expected (SMQTUXPFRM).
b²  = Not used.
c²  = Number of out-of-sequence frames received (SMQTUXPSEQ).
d²  = Number of QGP-detected frame reject conditions (SMQTFRAMREJ).
e²  = Number of attempts to send a message using a QLNK that is not in an appropriate state (SMQTLMRFSH).
f²  = Summary count of QGP level 2 transmit errors (SMQSL2SEND).
g²  = Summary count of QGP level 2 receive errors (SMQSL2RECV).
h²  = Summary count of QGP level 2 synchronization errors (SMQSL2SYNCH).
i²  = Number of attempts to send a message using a QLNK that is not available in the QGP routing table (SMQTRTRFSH).
j²  = Not used.
k²  = Initial QLFR-AM error sub-type. Valid value(s):
    02  = QLNK level 2 error.
    04  = Level 2 error on an out-of-service QLNK (level 2 was already down).
    06  = QLNK level 2 error on an unequipped QLNK.
    07  = DISConnect frame received on an unequipped QLNK.
    08  = QL request for link map refresh.
    09  = CM request for link map refresh.
    34  = Error from an out-of-service QGP.
    46  = Summary threshold exceeded for QLNK level 2 errors.
    47  = Summary threshold exceeded for level 2 errors on an out-of-service QLNK (level
2 was already down).

\[ l^2 \] = Error count for error sub-type 'k^2'.

\[ m^2 \] = QLFR-AM error sub-type that exceeded threshold, resulting in a QLNK recovery action.

\[ n^2 \] = Error count for QLNK error sub-type 'm^2'.

\[ o^2 \] = QLFR-AM error sub-type that exceeded threshold, resulting in a QGP recovery action.

\[ p^2 \] = Error count for QGP error sub-type 'o^2'.

\[ q^2 \] = Not used.

\[ r^2 \] = Number of times the QLNK recovery action associated with error sub-type 'm^2' has been requested. Escalation strategies may result in a higher level recovery action being performed.

\[ s^2 \] = Number of times the QGP recovery action associated with error sub-type 'o^2' has been requested. Escalation strategies may result in a higher level recovery action being performed.

\[ t^2 \] = Number of equipped QGPs (Gl_qgp).

\[ u^2 \] = Operational QGP configuration (Glqgpoper).

4. ACTION TO BE TAKEN

Since this message is logged, analyze the logged data by retrieving information off of the disk. The input message for dumping the daylog is \texttt{OP:LOG:LG="DAYLOG",MSGCLS=CLNKMON}. Correlate the event number with the \texttt{REPT:TRBL} message.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report data associated with a quad link packet switch (QLPS) communication link (QLNK) error reported by
integrity monitor in the administrative module (AM). All of the variables 'h' through 'o' are represented in
hexadecimal.

3. VARIABLE FIELD DEFINITIONS

050C  = Message type (MGSMSILK) indicating that the error was reported by OKP integrity monitor.
3B   = Unit type (QLNK).
a   = Switching module (SM) number.
b   = Active module controller/time slot interchange (MCTSI) side.
c   = QLPS network.
d   = Office network and timing complex (ONTC) side.
e   = Logical QLPS gateway processor (QGP) number.
f   = Message switch (MSGS) side.
g   = Administrative module (AM) event number.
h   = Not used.
i   = SM number.
j   = Physical QLNK number.
k   = Not used.
l   = Error type. Valid value(s):
   00   = End-to-end (level 3) failure
   01   = Logical link map inconsistency
   05   = Test message on QLNK corrupted in transit.
m   = Physical QLNK number.
n = Logical QLNK number.
o = Not used.
p = Logical link map (LLM) entry for logical link 2.
q = LLM entry for logical link 3.
r = LLM entry for logical link 4.
s = LLM entry for logical link 5.
t = DDQLINKMAP (SM) value for logical link 2.
u = DDQLINKMAP (SM) value for logical link 3.
v = DDQLINKMAP (SM) value for logical link 4.
w = DDQLINKMAP (SM) value for logical link 5.
x = Message switch control unit (MSCU) translation table (MTT) side 0 contents.
y = MTT side 1 contents.
z = Demand (CLNK) MSCU translation table (DMTT) side 0 contents.
a1 = DMTT side 1 contents.
b1 = AM's parent QGP QPIPE state.
c1 = AM's parent MH QPIPE state.
d1 = AM's Physical QLNK state. Valid value(s):
   00 = Idle (supporting hardware available).
   01 = Level 2 up (AM waiting for link establish message).
   02 = QGP routing update in progress.
   03 = QLNK on STBY QLPS with level 2 up on mate.
   04 = Active (QLNK in use for message routing).
   05 = Out-of-service due to supporting hardware.
   06 = Unequipped.
e1 = SM's QLPS routing state (SMqlmcst).
f1 = Not used.
g1 = Initial QLFR-AM error sub-type. Valid value(s):
   35 = QLNK level 3 error.
   36 = Level 3 error on an out-of-service QLNK (level 2 was already down).
   37 = Level 3 error on an un-equipped QLNK.
   3F = Link map inconsistency - AM dangling QLNK.
   40 = Link map inconsistency - SM dangling QLNK.
   41 = Link map inconsistency - No dangling QLNKs.
   42 = Logical link map inconsistent with SMqlmcst.
Logical link map contains incorrect network.
Logical link map contains incorrect MSGS.
AM reported corrupted message error.

\[ h^1 \] = Error count for error sub-type 'g^1'.
\[ i^1 \] = QLFR-AM error sub-type that exceeded threshold, resulting in a QLNK recovery action.
\[ j^1 \] = Error count for QLNK error sub-type 'i^1'.
\[ k^1 \] = Not used.
\[ l^1 \] = Number of times the QLNK recovery action associated with error sub-type 'i^1' has been requested. Escalation strategies may result in a higher level recovery action being performed.
\[ m^1 \] = Not used.
\[ n^1 \] = Number of equipped QGPs (Gl_qgp).
\[ o^1 \] = Operational QGP configuration (Glqgpoper).

   ____________________________________________________________________

2. REASON FOR OUTPUT

To report data associated with a quad link packet switch (QLPS) communication link (QLNK) error reported by QLNK fault recovery (QLFR) in a switching module (SM). All of the variables 'i' through 'm3' are hexadecimal numbers.

Format 1 prints in most cases, except when variable field 'i' has a value of 4A.

Format 2 prints when variable field 'i' has a value of 4A, which indicates the contents of a test message received in the SM was corrupted. This format dumps the contents of the test message.

3. VARIABLE FIELD DEFINITIONS

14FB = Message type (MGQLSP2AM) indicating that the error was reported by a switching module.
3B   = Unit type (QLNK).
a    = SM number.
b    = Active module controller/time slot interchange (MCTSI) side at the time the error was reported.
c    = QLPS network.
d    = Office network and timing complex (ONTC) side.
e    = Logical QLPS gateway processor (QGP) number.
f    = Message switch (MSGS) side.
g    = Administrative module (AM) event number.
h    = Not used.
i  = The error classification. Valid value(s):
   0C  = QLNK level 2 error.
   0E  = SM received a DISConnect frame.
   13  = MH link map refresh.
   17  = QLNK establishment sequence error.
   38  = QLNK level 3 error.
   3B  = QLNK level 2+ report.
   45  = SM/MH link map inconsistency.
   4A  = Test message on the QLNK was corrupted in transit.

j  = ONTC side (SM perspective at time error was reported).

k  = QLPS network.

l  = Far-end QLPS endpoint number. Valid value(s):
   00C1  = A QGP on MSGS 0.
   00C2  = A QGP on MSGS 1.

m  = Not used.

n  = Post-mortem data source. Valid value(s):
   00  = No post-mortem data associated with this error. Ignore fields '3B' through 'e2'.
   CC  = Switching module processor (SMP).
   FF  = Message handler (MH).

o  = Error that exceeded fault recovery threshold. Valid value(s):

<table>
<thead>
<tr>
<th>(i)</th>
<th>(o)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0C</td>
<td>Valid value(s):</td>
</tr>
<tr>
<td></td>
<td>02  = Far-end response timeout (no response to RR or SABM frames).</td>
</tr>
<tr>
<td></td>
<td>06  = QLFR-SMP or the logical link control block (LLCB) audit in the MH detected invalid or inconsistent SMP/MH QLNK data.</td>
</tr>
<tr>
<td></td>
<td>0B  = MH detected full transmit queue.</td>
</tr>
<tr>
<td></td>
<td>0C  = RR frame re-try threshold exceeded.</td>
</tr>
<tr>
<td></td>
<td>0D  = Frame with invalid poll/final bit.</td>

<tr>
<td></td>
<td>16  = MH-detected frame reject condition.</td>
</tr>
<tr>
<td></td>
<td>17  = Attempt to send a frame to an endpoint that is not available in the MH link map (routing table).</td>
</tr>
</tbody>
</table>

| 17  | Valid value(s): |
|     | 09  = QLFR-MH reported establishment of level 2 communication on a QLNK when the SMP thought level 2 was already up. |
|     | 0B  = The SM received a QLNK link establishment (LE) acknowledgement message on a QLNK that successfully completed the link establishment protocol. This implies that the level 2 protocol was re-started. |
|     | 0C  = QLNK LE sequence timed out. |
| Dec 38 | Valid value(s): | 0D = Level 3 error reported by integrity monitor in the SMP. |
| Dec 3B | Valid value(s): | 0E = Level 2+ report from integrity monitor in the SMP, indicating that message switch control unit (MSCU) loopback was successful with level 3 failing. |
| Dec 45 | Valid value(s): | 10 = SMP/MH link map inconsistency where the SMP thinks the QLNK is down. 11 = SMP/MH link map inconsistency where the MH thinks the QLNK is down. |

- **p** = SM number.
- **q** = Not used.
- **r** = Active MCTSI side at the time the error occurred.
- **s** = QLFR-SMP flag indicating status of post-mortem data.

### If "s" = FF

<table>
<thead>
<tr>
<th>Dec FF</th>
<th>Valid value(s):</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Post-mortem data was already sent to the AM. Multiple errors have occurred, and some data associated with this error may be reported by a previous REPT POST MORTEM output message.</td>
</tr>
<tr>
<td>01</td>
<td>Post-mortem data was not sent to the AM previously (normal case).</td>
</tr>
<tr>
<td>00, CC</td>
<td>This field is not used.</td>
</tr>
</tbody>
</table>

- **t** = QLFR-SMP post-mortem over-write counter.
- **u** = Recovery action performed by QLFR-SMP. Valid value(s):
  - 00 = No action.
  - 03 = Request level 3 re-start.
  - 04 = Request level 2 re-start.
  - 05 = Request removal (with deferred re-start).
  - 0C = Notify AM of communication status.

- **v** = Recovery action performed by QLFR-MH. Valid value(s):
  - 00 = No action.
  - 02 = Notify SM of loss of level 2 communication and periodically attempt to re-establish it.
  - 06 = Initiate level 2 protocol re-start due to level 2 errors.

- **w** = Not used.
- **x** = The SMP-resident state of the MH QPIPE at the time the error occurred. Valid value(s):
  - 0 = The QPIPE is unequipped.
  - 1 = A QPIPE initialization failed and autonomous recovery is in progress.
  - 2 = The QPIPE is active.
  - 3 = The QPIPE is out-of-service due to a suspected communication module (CM) problem.
  - 4 = The QPIPE is out-of-service due to a software problem and autonomous recovery is in progress.
  - 5 = The QPIPE is out-of-service and periodic attempts to pass a loopback test to the...
active QLPS are in progress.

- The QPIPE is out-of-service and is configured for fault isolation testing [attempting to pass a local loopback test to the time slot interchange (TSI)].
- The QPIPE is out-of-service due to a local loopback test failure.
- The QPIPE has been implicated in causing a MH operational software restart (OSR) and will be re-initialized after software recovery completes.

\[ y \]

- The SM-resident QLNK level 3 state at the time the error occurred. Valid value(s):
  - 0 = The QLNK is unequipped.
  - 1 = The QLNK is in-service (routing is enabled).
  - 2 = The QLNK is out-of-service (level 2 is down and routing is disabled).
  - 3 = An LE message has been sent to the AM and the SM is waiting for an acknowledgement.
  - 4 = An LE acknowledgement message has been received from the AM and an MH routing update is in progress.
  - 5 = Routing has been disabled due to a pending manual request that will cause the QLNK to go out-of-service. This is a transient state.

\[ z \]

- The SM-resident QLNK level 2 state at the time the error occurred. Valid value(s):
  - 0 = The QLNK is unequipped.
  - 1 = Level 2 is up.
  - 2 = Level 2 is down.

\[ a \]

- Number of times QLFR-MH reported establishment of level 2 communication on a QLNK when the SMP thought level 2 was already up (SMQTSEQERR).

\[ b \]

- Not used.

\[ c \]

- Number of times the SM received an LE acknowledgement message from the AM on a QLNK that successfully completed the link establishment protocol (SMQTLEISERR). This is expected to occur if the QGP autonomously re-starts the QLNK.

\[ d \]

- Number of LE sequence timeouts (SMQTLESTOUT).

\[ e \]

- Number of level 3 errors reported by integrity monitor in the SMP (SMQTQL3FAIL).

\[ f \]

- Number of "level 2+" reports from integrity monitor in the SMP, indicating that MSCU loopback was successful with level 3 failing (SMQTQL2UP).

\[ g \]

- Not used.

\[ h \]

- Number of SMP/MH link map inconsistencies detected where the SMP thinks the QLNK is down (SMQTL3LSMM).

\[ i \]

- Number of SMP/MH link map inconsistencies detected where the MH thinks the QLNK is down (SMQTL3LMHM).

\[ j \]

- Summary count of SM-detected QLNK LE sequence errors (SMQSLESEQ).

\[ k \]

- Number of SMP-initiated level 3 re-starts (or level 3 re-starts elevated to more severe recovery actions) performed (SMQIL3RSTRT).
l\textsuperscript{1} = Number of SMP-initiated level 2 re-starts (or level 2 re-starts elevated to more severe recovery actions) performed (SMQIL2RSTRT).

m\textsuperscript{1} = Number of SMP-initiated QLNK removals (with deferred level 2 re-start) (SMQIRMVDFR).

n\textsuperscript{1} = Number of MH-initiated level 2 protocol re-starts due to level 2 errors (SMQILLRSTRT).

o\textsuperscript{1} = Not used.

p\textsuperscript{1} = Number of MH-detected transmit queue full errors (SMQTQUEFULL).

q\textsuperscript{1} = Number of times the RR frame re-try threshold was exceeded (SMQTXRETRY).

r\textsuperscript{1} = Number of frames received with an invalid poll/final bit (SMQTINVPF).

s\textsuperscript{1} = Number of frames received with an invalid message/response bit (SMQTINVCR).

t\textsuperscript{1} = Number of frames received with an unknown packet type (SMQTUNKPKT).

u\textsuperscript{1} = Number of frames received with an unknown frame type (SMQTUNKFRM).

v\textsuperscript{1} = Number of frames received with inconsistent packet and frame types (SMQTINCPKT).

w\textsuperscript{1} = Number of SABMs received while the link was in the multi-frame establish or timer recovery state (SMQTRESTART).

x\textsuperscript{1} = Number of valid frames received on a link that was in a state for which the frame was not expected (SMQTUXPFRM).

y\textsuperscript{1} = Not used.

z\textsuperscript{1} = Number of out-of-sequence frames received (SMQTUXPSEQ).

a\textsuperscript{2} = Number of MH-detected frame reject conditions (SMQTFRAMREJ).

b\textsuperscript{2} = Number of attempts to send a frame to an endpoint that is not available in the MH link map (routing table) (SMQTLMRFSH).

c\textsuperscript{2} = Summary count of MH level 2 transmit errors (SMQSL2SEND).

d\textsuperscript{2} = Summary count of MH level 2 receive errors (SMQSL2RECV).

e\textsuperscript{2} = Summary count of MH level 2 synchronization errors (SMQSL2SYNC).

f\textsuperscript{2} = Not used.

g\textsuperscript{2} = SM event number.

h\textsuperscript{2} = Not used.

i\textsuperscript{2} = SM-reported alarm level. Valid value(s):

01 = Information only.
03 = Minor.
05 = Major.
06 = Critical.
\(j^2\) = Not used.

\(k^2\) = Logical link map (LLM) entry for logical link 2.

\(l^2\) = LLM entry for logical link 3.

\(m^2\) = LLM entry for logical link 4.

\(n^2\) = LLM entry for logical link 5.

\(o^2\) = DDQLINKMAP (SM) value for logical link 2.

\(p^2\) = DDQLINKMAP (SM) value for logical link 3.

\(q^2\) = DDQLINKMAP (SM) value for logical link 4.

\(r^2\) = DDQLINKMAP (SM) value for logical link 5.

\(s^2\) = MSCU translation table (MTT) side 0 contents.

\(t^2\) = MTT side 1 contents.

\(u^2\) = Demand (CLNK) MSCU translation table (DMTT) side 0 contents.

\(v^2\) = DMTT side 1 contents.

\(w^2\) = AM's parent QGP QPIPE state.

\(x^2\) = AM's parent MH QPIPE state.

\(y^2\) = AM's physical QLNK state. Valid value(s):

- 00 = Idle (supporting hardware available).
- 01 = Level 2 up (AM waiting for link establishment message).
- 02 = QGP routing update in progress.
- 03 = QLNK on STBY QLPS with level 2 up on mate.
- 04 = Active (QLNK in use for message routing).
- 05 = Out-of-service due to supporting hardware.
- 06 = Unequipped.

\(z^2\) = SM's QLPS routing state (SMqlmcst).

\(a^3\) = Not used.

\(b^3\) = Initial QLFR-AM error sub-type. Valid value(s):

- 0C = QLNK level 2 error.
- 0E = DISConnect frame received.
- 10 = Level 2 error on an out-of-service QLNK (level 2 was down in the AM).
- 11 = DISConnect frame received on an out-of-service QLNK (level 2 was down in the AM).
- 12 = QLNK level 2 error on an unequipped QLNK or a DISConnect frame received on an unequipped QLNK.
- 13 = MH link map refresh.
- 17 = QLNK establishment sequence error.
- 18 = QLNK establishment sequence error on an out-of-service QLNK (level 2 was
down in the AM).

19  = QLNK establishment sequence error on an unequipped QLNK.
38  = QLNK level 3 error.
39  = Level 3 error on an out-of-service QLNK (level 2 was down in the AM).
3A  = QLNK level 3 error on an unequipped QLNK.
3B  = QLNK level 2+ report.
3C  = QLNK level 2+ report on an out-of-service QLNK (level 2 was down in the AM).
3D  = QLNK level 2+ report on an unequipped QLNK.
45  = SM/MH link map inconsistency.
46  = Summary threshold exceeded for level 2 errors on a QLNK.
47  = Summary threshold exceeded for level 2 errors on an out-of-service QLNK (level 2 was down in the AM).

c^3  = Error count for error sub-type 'b^3'.
d^3  = QLFR-AM error sub-type that exceeded threshold, resulting in a QLNK recovery action.
e^3  = Error count for QLNK error sub-type 'd^3'.
f^3  = Not used.
g^3  = Number of times the QLNK recovery action associated with error sub-type 'd^3' has been requested. Escalation strategies may result in a higher level recovery action being performed.
h^3  = Not used.
i^3  = Number of equipped QGPs (Gl_qgp).
j^3  = Operational QGP configuration (Glqgpoper).
k^3  = The logical link the test message was sent on.
l^3  = The contents of the test message that was corrupted. The test message is a sequence of bytes incremented by 1 (that is, 0102030405060708090A.....). If the message is corrupted the portion of the message surrounding the corrupted byte(s) is dumped.
m^3  = Not used.

4. ACTION TO BE TAKEN

Since this message is logged, analyze the logged data by retrieving information off of the disk. The input message for dumping the daylog is OP:LOG. Correlate the event number with the REPT:TRBL message. Refer to these messages for additional information.

5. ALARMS

None.

1. FORMAT

[1] REPT PMDBCOPY ERROR a [ERRNO = b]
__________________________________________________________________

[2] REPT PMDBCOPY NO COPY
__________________________________________________________________

[3] REPT PMDBCOPY COMPLETED
__________________________________________________________________

2. REASON FOR OUTPUT

To report the status of the plant measurements system (PMS) database copy program.

Format 1 is printed when errors are found.

Format 2 indicates that the PMS database audit program is conducting corrective action on the database and, therefore, the database will not be copied to disk.

Format 3 is printed if 'p' option is specified. As a default, the message is not printed at the end of the report.

3. VARIABLE FIELD DEFINITIONS

a = Error type. One of the following. Valid value(s):
1 = Failed plib function call.
2 = Could not attach to PMS database.
3 = Could not initialize lla_audit routines.
4 = Error detected by the lla_audit function.
5 = Error detected by the lla_audit function.
6 = Unknown return from lla_audit function.
7 = Could not get setid record from PMS database.
8 = Could not open secondary disk copy of PMS database.
9 = Could not write incore PMS database to secondary disk database.
10 = Could not release.
11 = Request to audit the PMS database did not complete successfully. The incore database will not be copied.
12 = After the incore database was copied to disk, an audit on the disk database failed. Refer to additional errors. The secondary disk database may be bad.
13 = The primary disk database does not exist. Attempt to move the secondary copy to primary failed. Run AUD:PMS 1.
14 = Attempt to switch primary and secondary disk databases failed. The primary may be bad. Run AUD:PMS 1.
15 = falloc failed to create a contiguous file for PMS disk database.
16 = makeseg failed to create a temporary segment for the incore database.

b = Number of errors detected by audit. For error types 2, 3, 7, 10-14, and 16, do not report an error
number.

4. ACTION TO BE TAKEN

For Format 1, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 2 and 3, take no action.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Output Message(s):

AUD : PMS

Output Appendix(es):

APP : OMDB-X-REF
REPT:PMGR-ERROR
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT PMGR ERROR a b [c] [d]

2. REASON FOR OUTPUT

To report process-manager (PMGR) related software errors. The errors are detected during the creation and termination of a supervisor or a kernel process or during a field update to a shared library.

The message identifies the type of problem encountered. There are two error types:

Failure = Causes the termination of the process under creation.
Warning = Notifies the user of the problem but does not terminate the process under creation.

3. VARIABLE FIELD DEFINITIONS

a

Valid value(s):

51 = Message type not recognized.
53 = Library file does not exist.
55 = Failure to load a kernel process because of insufficient memory.
56 = All segment descriptor entries (SDEs) are allocated or there is no swap space left.
57 = Unable to read a pfie or library file.
58 = Segment too big for virtual address space available.
59 = Can't add a shared segment to the process.
60 = Incarnation count too big for a process.
62 = Can't acquire a process control block (PCB) of a terminating process.
63 = PMGR faulted, entered fault routine.
64 = NUB faulted, entered fault routine.
67 = Bad acknowledgment resulting from copyseg operating system trap (OST).
68 = Pfie (LDP output) doesn't exist, or does not have correct magic number, or wrong supervisor or kernel mode.
70 = Can't open dump file specified in terminate message.
71 = Unable to write out a segment of a process being dumped.
72 = Can't get capability for working directory.
73 = Unable to close a file.
75 = Can't open or get segment name of device process.
76 = Message from unauthorized process.
77 = Segment index overlay warning.
78 = Unable to lock shared library in memory.
80 = Process termination has already been completed by the process administration process termination audit.
81 = Pfie requests protected application segment (PAS); no PAS specified on sgen1 form.
82 = Could not duplicate pfie capabilities for the NUB.
83 = Could not create process because system is in disk independent operation.
84 = Shared segment index specifies different physical module than that specified by segid.
85 = Invalid PCB index.
86 = Pfile does not specify PCB segment.
87 = An expected acknowledgement message was not received within the five-minute wait interval.
88 = Pfile specifies a segment whose virtual address is beyond the range supported on this hardware.

b–d = Valid value(s):

4. ACTION TO BE TAKEN

Use the Error/Action Exhibit to determine which of the following actions should be taken.

1. Call application system support.
2. Application system support should call DMERT system support.
3. Check the displayed pathname for accuracy.
4. Possible system generation (SYSGEN) specification change required.
5. Possible process specification file error.

To respond to a trouble detected by the operational software that uses the precision measurement unit (PMU).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DCTU number.
c = Precision measurement unit (PMU) number.
d = Event number.
e = Error type. Valid value(s):
   DCTU EQUIPMENT MALFUNCTION = A DCTU trouble was detected by the operational software using the PMU.
   DCTU TIMEOUT FAILURE = The operational software timed out while waiting for a response from the PMU.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
g = External logical circuit name. Two circuits may be listed with this report if two circuits could be causing the problem.
h = Current decimal number of recent failures of this type recorded.
i = Error count threshold, above which the recovery action will be escalated.

[g h i]

2. REASON FOR OUTPUT

To report receiving a trouble message from the directly connected test unit (DCTU) in regard to the precision measurement unit (PMU). The PMU or the DCTU common board detected a problem internally and sent a message to indicate the nature of the trouble.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DCTU number.
c = Precision measurement unit (PMU) number.
d = Event number.
e = Error type. Valid value(s):
  CALIBRATION FAILURE = This indicates that the PMU is operating outside normal limits. Line or trunk measurements which use this PMU may be slightly skewed.
  EQUIPMENT ERROR THRESHOLD EXCEEDED = A PMU circuit exceeded its internal error threshold.
  RESET = The PMU reset internally.
  TEST FAILURE = An operational test failed while using the PMU.
  TRAP = The PMU microprocessor trapped.

f = Recovery action. Valid value(s):
  ANALYSIS ONLY = A post mortem report is generated.
  RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
  RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

g = External logical circuit name. More than one circuit may be listed when multiple circuits can be blamed for the trouble.

h = Current decimal number of recent failures of this type recorded.
i = Error count threshold at which the recovery action will be escalated.
4. ACTION TO BE TAKEN

No action required. Fault recovery automatically requests a conditional restore on the circuit when the error threshold is met. Subsequent DGNPMU and RSTPMU messages indicate success or failure of diagnostic when recovery action is RST AUTO CAMPON or RST PREEMPT.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the communication module (CM) hardware maintenance states after an administrative module (AM) and CM initialization.

3. VARIABLE FIELD DEFINITIONS

a = The event number associated with the initialization.
b = The software initialization level (6 or 7).
c = The hardware initialization level. Valid value(s):
   3 = The communication module hardware was initialized. Stable calls were preserved.
   4 = The communication module hardware (including the time multiplexed switch (TMS) fabric) was initialized. Stable calls were torn down.
d = Action taken with regard to CM hardware check (HDWCHK) inhibits. Valid value(s):
   ALLOWED = CM HDWCHKS were allowed after the initialization.
   INHIBITED = CM HDWCHKS were inhibited during and after the initialization.
e = Unit identification.
f = Unit maintenance state.
g = The number of active MMPs on side 0.
h = The number of active MMPs on side 1.
i = The number of switching modules (SMs) (not including remote switching modules) to which at least one communication link exists.

2. REASON FOR OUTPUT

To report the communication module (CM) hardware maintenance states after an administrative module (AM)
re-synchronization with the CM.

The maintenance states (stored in the AM) were either checked for consistency or re-derived by reading the actual
hardware status.

3. VARIABLE FIELD DEFINITIONS

a = The event number associated with the re-synchronization.
b = The software initialization level.
c = The hardware initialization level. Valid values are:
   2 = Communication was re-established between the administrative module (AM) and
       the CM. No CM hardware initialization was performed.
d = Action taken with regard to CM hardware check (HDWCHK) inhibits. Valid value(s):
   ALLOWED = CM HDWCHKS were allowed after the AM/CM re-synchronization.
   INHIBITED = CM HDWCHKS were inhibited after the AM/CM re-synchronization.
   RE-SYNCHRONIZED = CM HDWCHKS were re-synchronized (not changed) by the AM/CM
                   re-synchronization.
e = Unit identification.
f = Unit maintenance state.
g = The number of active MMPs on system side 0.
h = The number of active MMPs on system side 1.
i = The number of switching modules (SMs) (not including remote switching modules) to which at
   least one communication link exists.
4. ACTION TO BE TAKEN

Type: Output

1. FORMAT

REPT POWER a b=c [COMMUNITY=d]
[e=c[-f]]

2. REASON FOR OUTPUT

To indicate that a specified communication module (CM) unit has been powered on or powered off by a manual request at the unit's power switch. This report also indicates that a power alarm has been detected by scanning the power switch. For these cases, an automatic remove (RMV) message for the unit will accompany this message. This report also indicates that scanning of power-related scan points has been inhibited for the specified unit.

3. VARIABLE FIELD DEFINITIONS

a = The events reported. Valid value(s):
  ALARM = A power alarm has been detected.
  INHIBITING ON IOP 0 = Scanning has been inhibited on input/output processor (IOP) side 0.
  INHIBITING ON IOP 1 = Scanning has been inhibited on IOP side 1.
  OFF = The unit has been powered off.
  OFF MOR = The active unit has been powered off.
  ON = The unit has been powered up.

b = Unit type. Valid value(s):
  MICU = Message interface and clock unit.
  MSGS = Message switch.
  MSCU = Message switch control unit.
  NCOSC = Network clock oscillator.
  ONTCCOM = Office network timing and control common circuitry.
  TMS = Time multiplexed switch.

c = System side number.

d = MSGS community number.

e = Message switch peripheral controller (PC) type. Valid value(s):
  CMP = Communication module processor.
  FPC = Foundation peripheral controller.
  MMP = Module message processor.
  PPC = Pump peripheral processor.

f = Logical MMP or CMP number.
4. ACTION TO BE TAKEN

None.

5. ALARMS

A major or minor alarm can occur on an automatic power down. No alarm can occur on a user-requested action.

REPT:POWER

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT POWER {RESTORED|REMOVED} a b [c d]

[2] REPT POWER FAULT a b [c d]

[3] REPT POWER DISTRIBUTION FRAME e f ALARM

2. REASON FOR OUTPUT

Format 1 indicates that a unit has been powered up or powered down by a manual request at a unit's power switch. The removal of power from a unit may be the result of a normal power down, a manual override power down, or the occurrence of faults where power is removed, such as a blown fuse.

Format 2 indicates that a power fault has been detected by scanning the unit's power switch (ABB1).

Format 3 indicates the occurrence of a major or minor alarm on the power distribution frame as detected by a scan point on the unit alarm circuit.

3. VARIABLE FIELD DEFINITIONS

a = Unit name.
b = Unit number.
c = Subunit name.
d = Subunit number.
e = Identification number. This number is arbitrary and is retrieved from the logical group name in the scsdbody form found in the equipment configuration database (ECD). If no number identification is in the group name, no number will be output.
f = Type of alarm. Valid value(s):
   MAJOR = Service is interrupted due to a power problem on another frame which resulted in a feeder fuse being blown on the power distribution frame.
   MINOR = A local fuse on the power distribution frame has blown, but service is not interrupted.

4. ACTION TO BE TAKEN

For Format 1, take no action unless power removed. Check for blown fuses and take appropriate action to restore power.
For Format 2, establish and repair the cause of the fault. Check the status of alarm LEDs on unit, diagnose, and repair.

For Format 3, if a major alarm, determine the cause by looking at the accompanying messages. Fix the problem and replace the necessary output fuses on the power distribution frame. If a minor alarm, replace fuses on the power distribution frame charging or filtering circuits.

5. ALARMS

None.

Minor alarm. Take action as indicated in the report.

Major alarm. May not be service affecting, but take immediate action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   .    .    .    .    .    .

2. REASON FOR OUTPUT

To print a hexadecimal data dump of the event history log from the specified peripheral, where depending on the peripheral type, a different format is printed out.

In format 1, the peripheral is the protocol handler (PH). The message prints only when the printmode is turned on (CHG:PRNTMODE).

In format 2, the peripheral is either the control fanout (CF) or the packet fanout (PF) unit on the enhanced packet switching unit (PSU2E).

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Packet switching unit (PSU) number.
c  = PSU shelf number.
d  = Physical protocol handler (PH) slot number.
e  = Channel group (CHNG) number.
f  = Packet switching unit common board (PSUCOM) side number.
g  = Packet fanout (PF) shelf number.
h  = Number of first event for which data is dumped in this message.
i  = Number of this data block in the sequence of data blocks needed to dump the entire peripheral.
event history, where the peripheral could be PH, CF, or PF.

\( j \) = Number of this message in the sequence of all output messages generated by this peripheral, where the peripheral could be PH, CF, or PF. The message number is typically reset to zero when the hardware unit is initialized.

\( k \) = PH data being reported in hexadecimal. Each data segment contains 4 bytes of data. There are 3 such data segments (12 bytes total) reported for each event. Each message dumps 7 lines of data segments, with 6 data segments (2 events) per line. Therefore, each message reports information for up to 14 PH events. Refer to the APP:EVENT-HIST appendix in the Appendices section of the Output Messages manual.

\( l \) = PF/CF Data being reported in hexadecimal. Each data segment contains 4 bytes of data. There are 6 such data segments (24 bytes total) reported for each event. Each message dumps 7 lines of data segments, with 6 data segments (1 event) per line. Therefore, each message reports information for up to 7 PF/CF events. Refer to the APP:EVENT-HIST appendix in the Appendices section of the Output Messages manual.

   PRINT = Report only; no escalation.
   PSI = Autonomous PS initialization.
   RPI = Return to point of interrupt.
   SI = Selective initialization.
   SPP = Single process purge.

r = Failing address where event occurred.
s = Port processor mode. Valid value(s):
   CONSISTENT = Hardware and software are consistent.
   ESSENTIAL = Essential jobs operational.
   NORMAL = Normal operational mode.
   OFFULL = All jobs operational.
   POST_RCVY = Post recovery.
   RAMDYN = Dynamic memory consistent.
   RAMTXT = Read access memory text consistent.
   RAMWP = Text and data consistent.
   SW--RCVY = Software recovery.
   SYSPROC = System processes operational.
   UNKNOWN =

t = Error count.
u = Error threshold.
v = Stack trace (up to twelve addresses). If assistance is required to interpret this field, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
manual.

\( w \) = Contents of hardware registers. If assistance is required to interpret this field, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

\( x \) = Image type in the PI. Valid value(s):

- **ERROR IMAGE** = The image contained an error.
- **NULL IMAGE** = No image was loaded.
- **PI IMAGE** = Image used for PI was loaded.
- **PI2 IMAGE** = Image used for PI2 was loaded.

### 4. ACTIONS TO BE TAKEN

Monitor the progress of the software recovery. Initiate manual actions if the recovery does not proceed as expected. Retain this information along with any trouble report concerning the initialization/recovery and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

2. **REASON FOR OUTPUT**

To report the occurrence of an interrupt in the packet switch unit protocol handler (PSUPH). The message prints only when the printmode is turned on. The message is stored in a buffer and can be printed on request (OP:HISTORY).

3. **VARIABLE FIELD DEFINITIONS**

- **a** = Interrupt number.  
- **b** = Switching module (SM) number.  
- **c** = Packet switching unit (PSU) number.  
- **d** = PSU shelf number.  
- **e** = PSUPH number.  
- **f** = Channel group (CHNG) number.  
- **g** = Event number.  
- **h** = PSUPH number in which the event occurred.  
- **i** = PSU community address.  
- **j** = Active packet bus.  
- **k** = Packet bus on which an error occurred.  
- **l** = Process number.
m = Message number.
n = Time of the day the assert occurred, in the form hour:minute.
o = Date the assert occurred, in the form month/day/year.
p = Stimulus of recovery action. Refer to the APP:RCVRY-ACTION appendix in the Appendixes section of the Output Messages manual for a list of recovery action stimulus and their definitions.
q = Recovery action that occurred. Valid value(s):
   FI = Full initialization.
   NONE = No recovery action.
   PRINT = Report only; no escalation.
   PSI = Autonomous PS initialization.
   RPI = Return to point of interrupt.
   SI = Selective initialization.
   SPP = Single process purge.

r = Failing address where event occurred.
s = Port processor mode. Valid value(s):
   CONSISTENT = Hardware and software are consistent.
   ESSENTIAL = Essential jobs operational.
   NORMAL = Normal operational mode.
   OPFULL = All jobs operational.
   RAMDYN = Dynamic memory consistent.
   RAMTXT = Read access memory text consistent.
   RAMWP = Text and data consistent.
   SYSPROC = System processes operational.
   UNKNOWN

t = Error count.
u = Error threshold.
v = Stack trace (up to twelve addresses). Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual if assistance is required to interpret this field.
w = Contents of hardware registers. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual if assistance is required to interpret this field.

x = Image type in the PH.
y = PH IOP image type.
z = Image type expected.
a¹ = Identifier of a packet switching data structure that is recovered as part of the non-returning fault recovery action. Valid value(s):
   LOGICAL CHANNEL
RECEIVING ACCESS LINE
RECEIVING LOGICAL LINK
SENDING ACCESS LINE
SENDING LOGICAL LINK

\[ a_2 \]

Given data structure type, this numerical value is the index into the data structure array. If the implicated data structure type is the receiving or sending logical link, this is to be an index into the logical link control block (LLCB) data structure array. If the implicated data structure type is the receiving or sending access line, this is an index into the access line control block (ALCB) data structure array. If the implicated data structure type is the logical channel, this is an index into the logical channel control block (LCCB).

Note: In fields 'a_1' and 'a_2', a maximum of five packet switching data structures can be recovered as part of the assert recovery action.

4. ACTIONS TO BE TAKEN

Monitor the progress of the software recovery. Initiate manual actions if the recovery does not proceed as expected. Retain this information along with any trouble report concerning the initialization/recovery and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

To respond to a point to point protocol (PPP) transition to down.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Optical interface unit number.
c = Optical facility interface (OFI) protection group (PG) number.
d = Optical carrier - level 3 concatenated (OC3C) number.
e = Synchronous transport signal - level 3 concatenated (STS3C) number.
f = Event number.
g = Recovery action. Valid value(s):
    RMV = The PPP link went down and stayed down too long. The PPP link will be removed
         and all calls over the interface will be preempted.
    NO RECOVERY ACTION TAKEN = The PPP link recovered before any recovery action was
         necessary.

h = Link control protocol (LCP) state when reported by the OFI or zero when generated by the SM due
   to an SM initiated switch resulting in the loss of the PPP link.
i = Internet protocol control protocol (IPCP) state when reported by the OFI or zero when generated
   by the SM due to an SM initiated switch resulting in the loss of the PPP link.
j = PPP phase when reported by the OFI or zero when generated by the SM due to an SM initiated
   switch resulting in the loss of the PPP link.
k = OC3C loop back state when reported by the OFI or zero when generated by the SM due to an SM
   initiated switch resulting in the loss of the PPP link.

DN o NOC p SI q DI r PI s ROUTETYPE t RI u
ORIGPORT a1 b1 OPARTY c1 TERMPORT d1 e1 TPARTY f1
GRP g1 GRPTYPE h1 SIZE i1 HUNT j1

2. REASON FOR OUTPUT

To provide information about a defensive check failure (DCF) that occurred in the ISDN packet routing (PR) software during routing.

3. VARIABLE FIELD DEFINITIONS

a
  = PR internal error event number.

b
  = Processor error occurred in. Valid value(s):
    AM = Administrative module
    HSM = Host switching module.
    LSM = Local switching module.
    RSM = Remote switching module.

c
  = Processor number.

d
  = Function where failure occurred. Refer to the APP:PR-DCF appendix in the Appendixes section of the Output Messages manual for function name cross reference.

e
  = Source line number in above function where failure occurred. Refer to the APP:PR-DCF appendix in the Appendixes section of the Output Messages manual.

f
  = Type of error as defined/explained in file pr/hdr/PRerrtype.h. This field is used in conjunction with the cause of error field. These two fields are meaningful when, for example, the error type is RDSTATIC_DATA and the cause is TRKG. This means that a failure occurred when trying to read the trunk group relation PR_TRKG.
    ACCDYNAMIC_DATA = Dynamic data access failure.
    BAD_DATA_IN_MESSAGE = Invalid message data field.
    INTERNAL = PR internal software failure.
    MISSING_FEATURE = Far end SM is in abnormal state.
    ODD_BADB = Bad office dependent data.
    RDSTATIC_DATA = Static data read failure.
    REAL_TIME_EXCEEDED = Finite state machine failure.

    = Cause of error as defined/explained in file pr/hdr/PRrtgerr.h. The cause of type of error that occurred. If this field is ‘NULL’, then the cause was unknown and additional data in the message
needs to be looked at (look at the internal code variables 'k' and 'l').

\textbf{h} = PR routing state. This refers to the internal routing state for PR.

\textbf{i} = Routing sequence type. This refers to the type of routing that PR is doing.

\textbf{j} = Message type being processed.

\textbf{k} = Type of request being processed. It is always '0' in PR.

\textbf{l} = Interface return value. Valid value(s):

\begin{align*}
0 & \text{ Indicates success.} \\
<0 & \text{ Indicates failure.}
\end{align*}

The return value is a system return value. The failure code tells where the failure occurred. For example, each failure code should be in the software subsystem’s range.

\textbf{m} = Route indexes count for alternate routes tried by PR.

\textbf{n} = Route retries count. PR always sets this variable to '0'.

Note: Variable 'o' with the last four digits of variable 'p' are the key into the PR_DNTRAN relation.

If the originating port, identified by variables 'a' and 'b', is an ISDN port, a fault in the ISDN originating equipment may cause non-numeric digits to appear in variable 'o'.

\textbf{o} = Dialed digits.

\textbf{p} = Normalized office code.

Note: Variables 'q', 'z', and 's' are used as the keys into the PR_SCRNING relation.

\textbf{q} = Screening index.

\textbf{r} = Destination index.

\textbf{s} = Prefix.

\textbf{t} = Route type as defined in file hdr/db/DMroute.h.

\textbf{u} = Route index. This is the key into the PR_ROUTING relation.

\textbf{a} = Origination port involved in error.

\textbf{b} = Origination module involved in error.

\textbf{c} = Origination party involved in error. PR always sets this to '0'.

\textbf{d} = Termination port involved in error.

\textbf{e} = Termination module involved in error.

\textbf{f} = Termination party involved in error.
g\textsuperscript{1} = Termination group number.

h\textsuperscript{1} = Termination group type. It is either 'LINE' or 'TRUNK'.

i\textsuperscript{1} = Termination group size.

j\textsuperscript{1} = Termination group hunt type. There are two hunt types: 'PSUCD' and 'PSLGUCD'. Packet switching uniform call distribution (PCUSD) indicates the size of trunk group (TRUNK) or multi-line hunt group (LINE) is less than 64. The hunt type PSLGUCD indicates that the size of TRUNK or LINE is greater than 64.

Note: Not all of the data printed may be relevant to the call in which the failure occurred. The data in the first two lines will always be relevant to the failure, and the values there will help determine which other data is valid.

4. ACTION TO BE TAKEN

Verify the reason for the defensive check failure and take corrective action.

5. ALARMS

None.

a = The event number associated with the initialization.

b = The unit type. Valid value(s):
FPC = Foundation peripheral controller.
MSCU = Message switch control unit.
ONTC = Office network and timing complex.
PPC = Pump peripheral controller.

= The maintenance status of the unit. Valid value(s):
---,---,--- = Null state (due to a DMERT level 4 initialization or duplex fail situations).
ACT = Active (MSCU, FPC, and PPC only).
ACT,MAJOR = Active major (ONTC only).
ACT,MAJOR,MIP = Active major with TMS fabric update in progress (ONTC only).
ACT,MINOR = Active minor (ONTC only).
ACT,MINOR,DFRIP = The unit may be supporting stable calls through the automatic time slot switching (AUTISS) mechanism. However, the unit has actually been taken out of service due to duplex failure recovery in progress in progress (ONTC only).
ACT,MINOR,MIP = Active minor with TMS fabric update in progress (ONTC only).
DGRD,MAJOR = Degraded major (ONTC only).
DGRD,MAJOR,MIP = Degraded major with TMS fabric update in progress (ONTC only).
DGRD,MINOR = Degraded minor (ONTC only).
DGRD,MINOR,DFRIP = The unit may be supporting stable calls through the automatic time slot switching (AUTISS) mechanism. However, the unit has actually been taken out of service due to duplex failure recovery in progress (ONTC only).
DGRD,MINOR,MIP = Degraded minor with TMS fabric update in progress (ONTC only).
OOS,AUTO,DGN = Out of service for automatically triggered diagnostics.
OOS,AUTO,FE = Out of service because the MSCU was automatically taken out of service (FPC and PPC only).
**OOS, AUTO, FLT** = Out of service due to failed and automatically triggered diagnostics.

**OOS, AUTO, DFRI** = Out of service due to duplex failure recovery in progress.

**OOS, AUTO, PWRAL** = Out of service due to an automatically detected power failure alarm.

**OOS, AUTO, REX** = Automatically removed from service for routine exercises.

**OOS, AUTO, RMV** = Automatically removed from service (a transient state).

**OOS, AUTO, TBLA** = Out of service due to faults other than those that could be identified by diagnostics (trouble analysis). Note that this does not necessarily imply that diagnostics were run.

**OOS, AUTO, TEMP** = Out of service because the unit is being used as a helper unit for automatically triggered diagnostics (MSCU, FPC, or PPC only).

**OOS, MANUAL, DGN** = Removed from service for manually triggered diagnostics.

**OOS, MANUAL, EX** = Removed from service for manual exercises.

**OOS, MANUAL, FE** = Out of service because the MSCU was manually taken out of service (family of equipment) (FPC and PPC only).

**OOS, MANUAL, FLT** = Out of service due to fault identified by manually triggered diagnostics.

**OOS, MANUAL, REX** = Manually removed from service for routine exercises.

**OOS, MANUAL, RMV** = Manually removed from service.

**OOS, MANUAL, TEMP** = Out of service because the unit is being used as a helper unit for manually triggered diagnostics (MSCU, FPC, MMP, or PPC only).

**STBY** = Unit is on standby (FPC and PPC only).

**UNAV, FRCD, DGN** = The unit is manually forced unavailable and is being diagnosed.

**UNAV, FRCD, FLT** = The unit is manually forced unavailable and diagnostics have failed on the unit.

**UNAV, FRCD, PWRAL** = The unit is manually forced unavailable and a power failure was automatically detected.

**UNAV, FRCD, PWRDWN** = The unit is manually forced unavailable and was manually powered down.

**UNAV, FRCD, RMV** = The unit is manually forced unavailable.

**UNAV, FRCD, TEMP** = The unit is manually forced unavailable but is being used as a helper unit for manually triggered diagnostics (MSCU only).

**UNAV, MANUAL, PWRDWN** = The unit is out of service due to manual power down.

      CREATION SCHEDULED IN b MINUTES.

   [5] REPT PROC DEATH/CREATE  
      CREATION FOR PROCESS a FAILED.  
      CREATION DENIED.

2. REASON FOR OUTPUT

   This message reports the creation (including recreation), failure to create and death of interprocess message switch (IMS) processes, imsrts.p, msdc.p, npp.p, op_rtm.p, and tdcp.p. These processes provide the following capabilities auxiliary to IMS.

   - **imsrts.p** = 118 page and node status reports.
   - **msdc.p** = Measurement data collection.
   - **npp.p** = Node pumping.
   - **op_rtm.p** = Realtime usage monitor.
   - **tdcp.p** = Trace, node ERRLOG, and, for IMS 3.2 and later, craft output messages from recorded announcement ports (RAPs) (Smart Nodes).

   These events are not reported during IMS aborts or when they are probably caused by an IMS boot or full process initialization (FPI). The initial creation of each of these processes due to such initializations is not reported if it is successful on the first try.

   The capability is lost temporarily between the Format 1 and Format 3 messages or until an IMS level 3 or 4
initialization for the Format 2 and Format 5 messages.

Following the Format 1 and Format 4 messages any remaining instances of the processes are terminated, the delay specified in the message is taken, any process then attached to the process' port is terminated, and recreation of the process is requested.

3. VARIABLE FIELD DEFINITIONS

a = Path name for process, ending in the process name.
b = The minimum number of minutes before creation of the process will be requested.

4. ACTION TO BE TAKEN

For Format 1, if the reason for process death is not understood, notify technical support. Recovery will be automatic.

A UNIX® RTR level 1 initialization will sometimes kill imsrts.p, npp.p and/or tdcp.p.

Field update of any of these processes could involve manually killing them.

For Format 2, this message is expected only in IMS when disk-independent operation is fully operational.

The REPT:DIOP message should also be printed and the disk outage is the real problem. Otherwise, look for REPT:PMGR-ERROR messages and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Recovery will require at least an IMS boot.

For Format 3, normal operation of the process has resumed.

For Format 4, refer to the REPT:PMGR-ERROR messages for the same process for specific error codes and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Occasional failures could be due to operating system resource shortages.

Repeated failure to create a process could indicate a bad or incompatible process file, 'a'. A process built for the wrong version of shared libraries could corrupt the libraries and might require an IMS boot after the proper file is in place.

File access problems could indicate a bad field update, such as wrong permissions on a file or wrong file name.

The delay 'b' in retrying process creation is intended to allow time for resource problems to abate or for correction of file problems.

For Format 5, this message is expected only in IMS when disk independent operation is fully operational. The REPT:DIOP message should also be printed and the disk outage is the real problem. Otherwise, look for REPT:ERROR messages and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Recovery will require at least an IMS boot.

REPT:PROTO-TMPSF

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT PROTO=a-b-c TRBL MSU PATH SETUP FAILURE d
   FAILURE IN PROTO TEST RECOVERY ACTION e
   PROTO=a-b-c f g
   MSUCOM=a-b-c f g

2. REASON FOR OUTPUT

To report a trouble with a metallic access (PROTO) circuit which resides in a metallic service unit (MSU). A protocol
test failed while checking the integrity of a protocol connection to the PROTO circuit. The PROTO circuit and the
MSU common circuit board (MSUCOM) are printed to aide in locating the faulty equipment.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = MSU number.
c = Service group number.
d = Event number.
e = Recovery action. Valid value(s):
   ANALYSIS ONLY = This post-mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has
   been notified by an assert.
   RST AUTO CAMPO = The failing circuit will be diagnosed as soon as it becomes available. A
   message (RST:PROTO or DGN:PROTO) will then be printed with the results of the
   diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
   (RST:PROTO or DGN:PROTO) will be printed with the results of the diagnostic.
f = Metallic test bus number.
g = Number of recent failures of this error type (FAILURE IN PROTO TEST) on this circuit (in
decimal).
h = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

No action required.

<table>
<thead>
<tr>
<th>If &quot;f&quot; =</th>

__________________________________________________________________

[2] REPT PSM ERROR X'a  SYSTEM ERROR d GRPN b
STATE X'c
__________________________________________________________________

[3] REPT PSM ERROR X'a  GRPN b
__________________________________________________________________

2. REASON FOR OUTPUT

Format 1 is to report the power switch monitor (PSM) encountered an error while trying to perform an operation.

Format 2 is to report the PSM encountered an error while attempting to send a message to the scanner and signal distributor administrator (SCSDA).

Format 3 is to report an unidentified group has been requested to be operated upon.

3. VARIABLE FIELD DEFINITIONS

a = Error code. Valid value(s):
0xe0 = Error in unit control block (UCB) pointer. Check addressing flags in the message.
0xe1 = Error in unit number. Specified unit is not identified by the SCSDA.
0xe2 = Error in logical group name. SCSDA cannot find reference to a group. Logical group unit may have been degrown. Check message. Possible save area corruption. Verify group in database.
0xe3 = Error in duplex identification. Check message. Possible PSM save area corruption. Check database records.
0xe4 = Scanner and signal distributor controller (SCSDC) is possibly out-of-service (OOS). Check status of SCSDC.
0xe5 = Invalid point number. Check message. Possible PSM save area corruption. Check database record to verify that the point is included in the group.
0xe6 = Address type not specified in message. Check message.
0xe7 = Scanner and signal distributor handler (SCSDH) failed to complete the operation. Check status of SCSDC and SCSDA. Check SCSDH error messages to determine the problem.
0xe8 = Illegal class requested. Class cannot be monitored. Check message. Refer to ecd.h for legal classes.
0xe9 = SCSDA cannot add client to list. Check for multiple occurrences of processes.
0xea = Unknown message type. Check message.
0xeb = SCSDA is in incorrect state to perform operations on the SCSDC. Check status of SCSDC.
0xec = Point from database record retrieved by SCSDA is illegal. Review database forms.
0xed = SCSDA could not update database.
0xee = No error.
0xef = Illegal operation requested. Check message.
0xf0 = Illegal number of operations requested per message. Check ad_count in message.
0xf1 = SCSDA could not find the class requested to be monitored by PSM in any of the database forms. Check database forms and SCSDC equipage.
0xf2 = Operation could not be completed by SCSDH. Additional information can be obtained from SCSDH error message.
0xf3 = Unknown message type has been received by SCSDA from the SCSDH.
0xf4 = SCSDA cannot update database.
0x100 = PSM failed to send message to SCSDA. Refer to msgport.
0x101 = PSM could not get a timing chain entry.
0x102 = PSM could not complete operation.
0x103 = Invalid message received by PSM from SCSDA. Check the record identification (RID) of unit specified in the database. Check message.
0x104 = PSM could not get UCB information for logical group. Possible corrupted RID in message. Review database form.
0x105 = PSM has determined group save area is corrupted. Reinitialize PSM.
0x106 = PSM could not identify group. Check message. Possible PSM corruption. In addition, check if group was rejected upon initialization.

b = Logical group name.

c = PSM mode of logical group. Valid value(s):
0x10 = Group is unavailable. PSM has encountered multiple internal errors.
0x11 = Group is idle.
0x12 = PSM is performing a directed scan operation.
0x13 = PSM is performing a distribute operation.
0x14 = PSM is performing an allow operation.
0x15 = PSM is waiting for inhibits to be cleared.

d = System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

For Formats 1 and 2, locate the offending code or hardware from the error code. Check the status of the hardware by using the OP:OOS input message. Verify that the SCSDC is equipped. Verify that the database forms contain the proper data. If corrupted areas are found in PSM, the processes should be restarted to reinitialize. If PSM is suspected of being corrupted, procedures should be taken to produce a dump of the process and forward information to the service organization.

For Format 3, verify that the database forms contain the proper logical group name. Verify that the correct logical group was input.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Application: 5
Type: Output

1. FORMAT

REPT PSUCOM=a-b-c TRBL BACKGROUND TEST FAILURE d e RECOVERY ACTION f
   g h i
   [g h i]
   j k l

2. REASON FOR OUTPUT

To report a background test failure pertaining to a packet switching unit common controller (PSUCOM).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Packet switching unit (PSU) number.
c = PSUCOM side.
d = Event number.
e = Error type. Valid value(s):
   CF MISCELLANEOUS = Took a CF related error.

f = Recovery Action: Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated. No recovery action was taken.
   CRITICAL RST PREEMPT = The failing circuit was preempted and an unconditional restore to
   ACTIVE was attempted on the mate PSUCOM service group side. A diagnostic will
   be scheduled on the preempted side if the unconditional restore of the mate side
   completes successfully. This recovery action is only valid when a fault occurs while
   PSUCOMs are simplex and the PSUCOM is provisioned to be a critical unit.
   PSU RECOVERY = An MCTSI reconfiguration action has been performed in an attempt to resolve a
   PSUCOM fault condition. The action can vary from MCTSI switch to Switching
   Module initialization, depending upon whether or not the PSUCOM is provisioned to
   be a critical unit.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
   will be printed with the results of the diagnostic.
   SWITCH CONTROLLERS = PSUCOM service groups were switched in an attempt to resolve a fault
   condition. PSUCOMs will remain duplex after the switch has completed.

Note: An additional circuit name, error count, and error threshold (variables 'g'-'i') may be printed. A
recovery action will be taken only on the first circuit in the list to reach its error threshold.

g = External circuit name for the implicated circuit.
h = Current decimal number of failures of this type recorded.

i = Decimal error count threshold, at which a recovery action will be taken.

Note: Variables 'j' through 'l' will be reported as hexadecimal data, where each field is 4 digits.

j = PSUCOM Circuit name.

k = Test number that failed. Valid value(s):

0x0

l = Return value from PC primitive.

4. ACTIONS TO BE TAKEN

No action is necessary if the recovery action (variable 'i') is ANALYSIS ONLY. If it is RST PREEMPT, automatic diagnostics are run on the PSUCOM. If they pass, run the module control time slot interchange (MCTSI) diagnostics (DGN:MCTSI).

5. ALARMS

None.

2. REASON FOR OUTPUT

To report that a parity error occurred on a packet switching unit (PSU) directly connected peripheral interface data bus (DPIDB) serving an integrated services line unit (ISLU), or an unknown unit.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = PSU number.
c = PSU common control (PSUCOM) side.
d = Event number.
e = Error type. Valid value(s):
   DF DPIDB PARITY ERROR = Parity error was detected on a data fanout (DF) PIDB which is
directly connected to an ISLU control data (CD).
   DF DPIDB UNLINKED TIMESLOT = A parity error was detected on a DF PIDB but there was not
   enough linkage information found to determine which protocol handler (PH) and
   channel group the timeslot was assigned to.

f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   CRITICAL RST PREEMPT = The failing circuit was preempted and an unconditional restore to
   ACTIVE was attempted on the mate PSUCOM service group side. A diagnostic will
   be scheduled on the preempted side if the unconditional restore of the mate side
   completes successfully. This recovery action is only valid when a fault occurs while
   PSUCOMs are simplex and the PSUCOM is provisioned to be a critical unit.
   PSU RECOVERY = An MCTSI reconfiguration action has been performed in an attempt to resolve a
   PSUCOM fault condition. The action can vary from MCTSI switch to Switching
   Module initialization, depending upon whether or not the PSUCOM is provisioned to
   be a critical unit.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
   will be printed with the results of the diagnostic.
   SWITCH CONTROLLERS = PSUCOM service groups were switched in an attempt to resolve a fault
   condition. PSUCOMs will remain duplex after the switch has completed.

g = External logical circuit name of the implicated circuit.
h = Current decimal number of failures of this type recorded.

i = Decimal error count threshold, at which the recovery action will be taken.

Note: Fields 'j' through 'k' will be reported as hexadecimal data, where each field is 4 digits.

j = The PSU shelf number (left-hand 8 bits) and the PICB number the DPIDB is connected to (right-hand 8 bits.)

k = The implicated DPIDB number (left-hand 8 bits) and the timeslot number in the DPIDB (right-hand 8 bits.)

Note: Additional DPIDB/timeslot numbers (variable 'k') may be printed.

[jjjjjjjjj j jjjjjjjj j jjjjjjjj j jjjjjjjj j jjjjjjjj]

2. REASON FOR OUTPUT

To report that a parity error occurred on a packet switching unit (PSU) protocol handler data bus (PHDB).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = PSU number.
c = PSU common control (PSUCOM) side.
d = Event number.
e = Error type. Valid value(s):
   DF PHDB PARITY ERROR = Parity error was detected on a PHDB between a data fanout (DF) and a protocol handler (PH).
   DF2 PHDB PARITY ERROR = Parity error was detected on a PHDB between a data fanout - version 2 (DF2) and a protocol handler (PH).
   DF-MCTSI LINK PARITY ERROR = Parity error was detected on the link connecting the DF to the module control time slot interchange (MCTSI).
   DF PHDB UNLINKED TIMESLOT FAILURE = A parity error was detected on a PHDB between a DF and a PH but not enough linkage information was found to determine which PH and channel group the timeslot was assigned to.

f = Recovery action. Valid value(s):
   ANALYSIS ONLY = No recovery action was taken. A postmortem report was printed.
   CRITICAL RST PREEMPT = The failing circuit was preempted and an unconditional restore to ACTIVE was attempted on the mate PSUCOM service group side. A diagnostic will be scheduled on the preempted side if the unconditional restore of the mate side completes successfully. This recovery action is only valid when a fault occurs while PSUCOMs are simplex and the PSUCOM is provisioned to be a critical unit.
   PSU RECOVERY = An MCTSI reconfiguration action has been performed in an attempt to resolve a PSUCOM fault condition. The action can vary from MCTSI switch to switching module initialization, depending upon whether or not the PSUCOM is provisioned to be a critical unit.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
SWITCH CONTROLLERS = PSUCOM service groups were switched in an attempt to resolve a fault condition. PSUCOMs will remain duplex after the switch has completed.

\( g \) = External logical circuit name of the implicated circuit.

\( h \) = Current decimal number of failures of this type recorded.

\( i \) = Decimal error count threshold, at which the recovery action will be taken.

**NOTE:** An additional circuit name, error count, and error threshold (variables ‘\( g \)’-’\( i \)’) may be printed. A recovery action will be taken only on the first circuit in the list to reach its error threshold. Variable field ‘\( j \)’ is reported as hexadecimal data.

\( j \) = Data specific to the error is printed in these fields. The data content and the amount of data printed is dependent on the error. If further analysis is necessary, please collect this output message, and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

REPT PSUCOM=a-b-c TRBL PICB CONTROL FAILURE EVENT=d
   e RECOVERY ACTION f
g h i
j k l m n

2. REASON FOR OUTPUT

To respond to a peripheral interface control bus (PICB) control failure interrupt on the packet switching unit (PSU).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = PSU number.
c = PSU common controller (PSUCOM) side.
d = Event number.
e = Error type. Valid value(s):
   CI RECEIVED BAD PARITY = A peripheral reply message has bad parity.
   CI RECEIVED BAD START CODE = A peripheral reply message has a bad start code.
   CI TIME OUT = A peripheral unit failed to reply to a message from the control interface (CI).
   PER DETECTED BAD ADDRESS = A peripheral detected an addressing error in its own circuitry while attempting to do a scan or distribute operation requested by the CI.
   PER DETECTED BAD PARITY = A peripheral received bad parity in a message from the CI.
   PER DETECTED BAD START CODE = A peripheral received a bad start code in a message from the CI.
   SOFTWARE BAD ADDRESS ERROR = The address does not exist in relation RLcktdata or the address being accessed is in the software bad address range.

f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is provided.
   CRITICAL RST PREEMPT = The failing circuit was preempted and an unconditional restore to ACTIVE was attempted on the mate PSUCOM service group side. A diagnostic will be scheduled on the preempted side if the unconditional restore of the mate side completes successfully. This recovery action is only valid when a fault occurs while PSUCOMs are simplex and the PSUCOM is provisioned to be a critical unit.
   PSU RECOVERY = An MCTSI reconfiguration action has been performed in an attempt to resolve a PSUCOM fault condition. The action can vary from MCTSI switch to Switching Module initialization, depending upon whether or not the PSUCOM is provisioned to be a critical unit.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A read-only printer (ROP) message will be printed with the results of the diagnostic.
   SWITCH CONTROLLERS = PSUCOM service groups were switched in an attempt to resolve a fault
condition. PSUCOMs will remain duplex after the switch has completed.

g = External circuit name for the implicated circuit.

h = Current decimal number of failures of this type recorded.

i = Decimal error count threshold, a fix decimal value above which the intensity of the fault recovery action will increase.

Note: Fields 'j' through 'n' will be reported as hexadecimal data, where each field is 4 digits.

j = Print whether the fault was transient or hard, as determined by the module controller fault recovery.

k = System PICB number in hexadecimal that was being written when the failure occurred.

l = Read/write (uppermost) bit and address to which the CI was writing when the failure occurred.

m = Data being written to the periphery by the CI.

n = CI error source register. Valid value(s):
    0x1 = Multiplexor selection error.
    0x2 = Improper address select.
    0x4 = Address parity error.
    0x8 = Data parity error.
    0x10 = Link address error.
    0x20 = Time out error.
    0x40 = Peripheral bad start code.
    0x80 = Peripheral bad parity.
    0x100 = Peripheral detected bad parity.
    0x200 = Peripheral detected bad address.
    0x400 = Peripheral detected bad start code.
    0x8000 = Remote source interrupt.

1. FORMAT

REPT PSUCOM=a-b-c TRBL PLI ERROR EVENT=d
e RECOVERY ACTION f

PSUCOM=a-b-c g h
iiiiiiii jjjjjjjjj kkkkl1111 mmmmnnnn oooooooo oooooooo oooooooo
 oooooooo

2. REASON FOR OUTPUT

To indicate an error reported by fault recovery within the switching module (SM) caused by failure of a Peripheral Link Interface (PLI) which services a Data Fanout 2 (DF2) board in the Packet Switch Unit (PSU). The fault was detected and reported by module control unit fault recovery (MCUFR). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to field ‘f’ to determine the fault recovery action.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = PSU number.
c = PSU common control (PSUCOM) side.
d = Event number.
e = Error type. Valid value(s):
IF CRC ERR ON DATA RECEIVED FROM PLI = The Module Controller (MCTSI) has detected a CRC error on the data received from the PLI servicing the PSUCOM.
IF LOSS OF CLOCK FROM THE PLI = The MCTSI has lost the 8Khz data clock signal from the PLI servicing the PSUCOM.
IF LOSS OF CLOCK REFERENCE = The MCTSI has detected a loss of clock reference on the PLI servicing the PSUCOM.
IF PAR ERR ON OVERHEAD BYTES FROM PLI = The MCTSI has detected bad parity on the 64 byte/frame overhead channel on the PLI servicing the PSUCOM.
IF SYNCHRONIZATION ERROR WITH PLI = The MCTSI has lost the 30msec synchronization pulse from the PLI servicing the PSUCOM.
NO ERROR SOURCE FOUND = A message was sent to peripheral fault recovery (PFR) software indicating a PLI fault is present. However, PFR software analysis revealed no such fault indication.
PLI BAD FRAME WORD ON INCOMING LINK = A bad frame word has been detected on the incoming data stream from the PLI servicing the PSUCOM.
PLI BAD PARITY INCOM OVERHEAD BYTES = The PLI servicing the PSUCOM has detected bad parity on the 64 byte/frame overhead channel received from the TSI.
PLI BAD SUPERFRAME ON INCOMING LINK = A bad superframe byte has been detected on the incoming data stream of the PLI servicing the PSUCOM.
PLI DETECTED BAD CRC FROM ACTIVE MCTSI = CRC errors have been detected at the PLI servicing the PSUCOM on data received from the active MCTSI.

PLI IMPlicated BY BACKGROUND CHECK = The PLI servicing the PSUCOM has been declared faulty because the background select check function has determined that it is either taking control from the standby MCTSI service group or has been programmed incorrectly to prevent taking control from the standby MCTSI.

PLI INTERNAL DATA PARITY ERROR = The PLI servicing the PSUCOM has detected an internal parity error on the data it received correctly from the active MCTSI.

PLI IS SOURCING BAD CRC = The PLI servicing the PSUCOM has detected it is sourcing bad CRC.

PLI LINK TO BE OUT-OF-FRAME = The incoming PLI has detected the PCTLNK connected with the PSUCOM has been out-of-frame for at least four consecutive frames.

PLI OUTGOING BUFFER CHECK ERROR = The PLI servicing the PSUCOM has detected that the data it received correctly from the active MCTSI is failing buffer checks because of an internal PLI fault.

PLI PARITY ERRORS ON DATA FROM DF = The PLI servicing the PSUCOM has detected parity errors on the data received from the PSUCOM.

f = Recovery Action. Valid values are:
ANALYSIS ONLY = A post mortem report is provided for analysis only.

CRITICAL RST PREEMPT = The failing circuit was preempted and an unconditional restore to ACTIVE was attempted on the mate PSUCOM service group side. A diagnostic will be scheduled on the preempted side if the unconditional restore of the mate side completes successfully. This recovery action is only valid when a fault occurs while PSUCOMs are simplex and the PSUCOM is provisioned to be a critical unit.

PSU RECOVERY = An MCTSI reconfiguration action has been performed in an attempt to resolve a PSUCOM fault condition. The action can vary from MCTSI switch to Switching Module initialization, depending upon whether or not the PSUCOM is provisioned to be a critical unit.

RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:PSUCOM output message will be printed with the results of the diagnostic.

SWITCH CONTROLLERS = PSUCOM service groups were switched in an attempt to resolve a fault condition. PSUCOMs will remain duplex after the switch has completed.

g = Current decimal number of errors of type in field 'e' recorded.

h = Decimal error count threshold where recovery action will be taken.

i = IF error source register data.

j = IF error mask register data at time of error.

k = PLI error source register.

l = PLI error source mask register.

m = PSUCOM internal message type.

n = Number of PLI fault messages sent from MCUFR to peripheral fault recovery. These messages are printed in field 'o'.

o = Up to six PLI fault messages sent from MCUFR to peripheral fault recovery may be printed. Each
PLI fault message consists of eight hexadecimal characters.

       kkkkkkk kkkk

2. REASON FOR OUTPUT

To report the loss of communication from the switching module processor (SMP) to a port processor (PP). A PP can either be a protocol handler (PH) or a packet interface (PI).

End-to-end (ETE) check messages detect faults from the SMP through the PI on the packet bus to the PHs.

Idle link assurance (ILA) messages detect faults between the PI and the PHs through the packet bus.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Packet switching unit (PSU) number.
c = PSU common control (PSUCOM) side.
d = Event number.
e = Recovery action. Valid value(s):
   ANALYSIS ONLY = No recovery action was taken. A postmortem report was printed.
   CRITICAL RST PREEMPT = The failing circuit was preempted and an unconditional restore to
                             ACTIVE was attempted on the mate PSUCOM service group side. A diagnostic will be
                             scheduled on the preempted side if the unconditional restore of the mate side
                             completes successfully. This recovery action is only valid when a fault occurs while
                             PSUCOMs are simplex and the PSUCOM is provisioned to be a critical unit.
   PSU RECOVERY = An MCTSI reconfiguration action has been performed in an attempt to resolve a
                   PSUCOM fault condition. The action can vary from MCTSI switch to switching
                   module initialization, depending upon whether or not the PSUCOM is provisioned to
                   be a critical unit.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message
                  will be printed with the results of the diagnostic.
   SWITCH CONTROLLERS = PSUCOM service groups were switched in an attempt to resolve a fault
                         condition. PSUCOMs will remain duplex after the switch has completed.

f = External circuit name of the implicated circuit.
g = Current decimal number of failures of this type recorded.

h = Decimal error count threshold, above which the recovery action will be taken.

**NOTE:** An additional circuit name, error count, and error threshold (variables 'f'-'h') may be printed. Recovery action will be taken only on the first circuit in the list to reach its error threshold. Variables 'i' through 'k' is reported as hexadecimal data.

i Detection source. Valid value(s):
0 = ETE check failure which is a periodic communication check between the SMP and the PPs.
1 = ILA failure which ensures layer 2 is up and messages can be sent to the PHs.

j = The number of implicated faulty PPs.

k = Data specific to the error is printed in these fields. The data content and the amount of data printed is dependent on the error. If further analysis is necessary, please collect this output message, and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

2. REASON FOR OUTPUT

To report a maintenance service request pertaining to a packet switching unit common controller (PSUCOM).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Packet switching unit (PSU) number.
c = PSUCOM side.
d = Event number.
e = Error type. Valid value(s):
   CF ARBITER CLOCK FAILURE = The 16 Mhz clock which drives the control fanout (CF) arbiter failed.
   CF ARBITER TIME OUT = A protocol handler (PH) or packet interface (PI) has held the packet bus for more than 4 milliseconds.
   CF CLOCK LOSS TO PACKET BUS = The CF detected loss of clock to the packet bus.
   CF INTERRUPT THRU MASK ERROR = The CF detected an error on a circuit which should be inhibited.
   CF INVALID BOARD TYPE = A message from the switching module processor (SMP) could not be processed by the CF because it contained an invalid board type. It was not the data fanout (DF), packet fanout (PF) or CF itself.
   CF INVALID ERROR REPORT FROM SHELF = The CF received an error report from a DF or PF that it could not recognize.
   CF POLLING RAM PARITY ERROR = An internal parity error occurred when the polling random access memory (RAM) containing packet bus client addresses is read by the CF packet bus arbiter state machine.
   CF SANITY TIME OUT = The CF micro-controller failed to toggle a specific address within a certain interval. This implies micro-controller hardware failure.
   CF SHELF OUT OF RANGE = A message from the SMP could not be processed by the CF because it specified an out of range shelf number. (Not within 0 - 4).
   CF TIMEOUT = The CF timed out waiting for a response to a message it sent to a DF or PF.
   CF UC R-W AT BAD ADDRESS = The micro-controller has attempted to read or write to an invalid unified control interface (UCI) chip address.
   CF UCI LP PARITY ERROR = A read or write to the UCI RAM by the CF micro-controller caused a parity error.
CF UCI MP PARITY ERROR = A read or write to the UCI RAM by the SMP caused a parity error.
DF CLOCK FAILURE = A DF detected a 4 Mhz clock failure.
DF MATE CLOCK FAILURE = A DF detected an error from its mate's DF clock.
DF INCOMING CLOCK FAILURE = A DF detected an error on the clock signal from the MCTSI.
DF INCOMING FRAME ERROR = A DF detected a frame error on the link from the MCTSI.
DF INTERNAL PARITY ERROR = A parity error occurred internally in DF hardware.
DF PARITY COUNTER OVERFLOW = A DF detected an overflow of the counter used to generate walking parity. Indicates a DF timing problem.
DF SYNCH FAILURE = A DF detected a 8 Mhz sync failure.
DF TSI ACCESS PARITY = A parity error occurred when attempting to access the DF time slot interchanger (TSI) chip.
NO ERROR SOURCE FOUND = A service request was received by PSU fault recovery, but no error source bits were set to indicate what the exact source of the error was.
PH FAILURE = A PH has exceeded its internal error threshold and has asserted its error lead. The error lead is asserted to notify PSU fault recovery that the PH is faulty.
SHELF CIB BREAK RECEIVED = A break signal was received from a DF or PF. This indicates that the DF of PF has had a serious error such as loss of control interconnect bus (CIB) clock, loss of board clock or pack removal.
SHELF CIB CHECKFAIL ERROR = A diagnostic message was sent to a shelf but no response was received.
SHELF CIB FRAMING ERROR = A framing error was detected on a CIB between a CF and a DF or PF. This occurs when a start code is detected on a CIB, but no stop code is received to end the frame which contains a message or response.
SHELF CIB OVERRUN ERROR = Too many messages or responses were received on a CF, DF or PF which means that some may have been lost.
SHELF CIB PARITY FAILURE = A parity error occurred on a CIB between the CF and a DF or PF.
SHELF RECEIVED AN INVALID COMMAND = A DF or PF received an invalid message from the CF.

f = Recovery Action: Valid value(s):
ANALYSIS ONLY = No recovery action was taken.
CRITICAL RST PREEMPT = The failing circuit was preempted and an unconditional restore to ACTIVE was attempted on the mate PSUCOM service group side. A diagnostic will be scheduled on the preempted side if the unconditional restore of the mate side completes successfully. This recovery action is only valid when a fault occurs while PSUCOMs are simplex and the PSUCOM is provisioned to be a critical unit.
PSU RECOVERY = An MCTSI reconfiguration action has been performed in an attempt to resolve a PSUCOM fault condition. The action can vary from MCTSI switch to Switching Module initialization, depending upon whether or not the PSUCOM is provisioned to be a critical unit.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
SWITCH CONTROLLERS = PSUCOM service groups were switched in an attempt to resolve a fault condition. PSUCOMs will remain duplex after the switch has completed.

h = External circuit name for the implicated circuit.

i = Current decimal number of failures of this type recorded.

j = Decimal error count threshold, at which a recovery action will be taken.
**NOTE 1:** An additional circuit name, error count, and error threshold (variables 'g'-'i') may be printed. A recovery action will be taken only on the first circuit in the list to reach its error threshold.

**NOTE 2:** Variables 'j' through 's' are reported as hexadecimal data.

= CF LP hardware error source mask register. Valid value(s):
0x40 = Mask LP UCI address error.
0x80 = Mask MP UCI address error.
0x100 = Mask FIFO B error.
0x200 = Mask FIFO A error.
0x400 = Mask FIFO B overflow.
0x800 = Mask FIFO B underflow.
0x1000 = Mask FIFO A overflow.
0x2000 = Mask FIFO A underflow.
0x4000 = Mask LP UCI read parity error.
0x8000 = Mask MP UCI read parity error.

= CF firmware error source register. Valid value(s):
0x1 = Arbiter errors.
0x2 = CIB errors.
0x4 = PH errors.
0x8 = DF parity.
0x10 = DF timing.
0x20 = Invalid command.

= CF firmware error source mask register. Valid value(s):
0x1 = Mask arbiter errors.
0x2 = Mask CIB errors.
0x4 = Mask PH errors.
0x8 = Mask DF parity.
0x10 = Mask DF timing.
0x20 = Mask invalid command.

= Internal circuit name in which first error was found.

= Error detection source: Zero for CF, one for DF, two for PF.

= Data specific to the error is printed in these fields. The data content and the amount of data printed is dependent on the error. If further analysis is necessary, please collect this output message, and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

No action is necessary if the recovery action (variable 'f') is ANALYSIS ONLY. If it is RST PREEMPT, automatic diagnostics are run on the PSUCOM. If they pass, run the module control time slot interchange (MCTSI) and the PH diagnostics using DGN:MCTSI and DGN:PSUPH, respectively.

5. ALARMS

None.

2. REASON FOR OUTPUT

To provide the contents of the protocol handler (PH) registers as information for trouble analysis at the time of an interrupt.

Format 1 prints when PH employs M68030 as its processor.

Format 2 prints when PH employs M68040 as its processor.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Unit number.
c = Shelf number.
d = Slot number.
e = Event number.
f = Contents of hardware registers, in hexadecimal.

For the M68030/M68040 hardware register, valid values are:
A0–A5 = Address registers.
CAAR  = Cache address register.
CACR  = Cache control register.
D0–D7 = Data registers.
DFC   = Destination function code register.
DTT0  = Data transparent translation 0.
DTT1  = Data transparent translation 1.
EXCEP = Exception vector number.
HCRP  = High central processing unit (CPU) root pointer register.
HSRP  = High supervisor root pointer.
ISP   = Interrupt stack pointer.
ITT0  = Instruction transparent translation 0.
ITT1  = Instruction transparent translation 1.
LCRP  = Low CPU root pointer register.
LSRP  = Low supervisor root pointer.
MMUSR = Memory management unit (MMU) SR.
MSP   = Master stack pointer.
PC    = Program counter.
SFC   = Source function code register.
SR    = Status register.
SRP   = Supervisor root pointer register.
SSP   = System stack pointer.
TC    = Translation control register.
TT0   = Transparent translation 0.
TT1   = Transparent translation 1.
USP   = User stack pointer.
VBR   = Vector base register.

For the BRICPIT status register, valid values are:
ECLR  = Event configuration level register.
ESBR  = Event source bit register.
IMBR  = Interrupt mask bit register.
ISRR  = Interrupt service request register.
PBOESR = Packet bus media access control (PBMAC) 0 error source register (ESR).
PBIESR = PBMAC 1 ESR.
PBE2ESR = PBMAC 2 ESR.
PBE3ESR = PBMAC 3 ESR.
RSBR  = Reset/set bit register.
SPRESR = Shared protocol receiver/transmitter (SPORT) receive ESR.
SPTESR = SPORT transmit ESR.
STKPTR = Stack pointer.
VISAESR = Vocoder interrupt and serial access error source register (ESR).
VISAEMR = Vocoder interrupt and serial access error mask register (EMR).
WPSR = Write protect shadow register.

g = Current port processor image. Valid value(s):
ERROR IMAGE = The image contained an error.
NULL IMAGE = No image was loaded.
PH3 CCS IMAGE = Image used for common channel signaling (CCS) features on a PH3 was loaded.
PH3 ISDN IMAGE = Image used for ISDN features on a PH3 was loaded.
PH4 ISDN AP IMAGE = Image used for PH4 ISDN AP was loaded.
PH4 ISDN IOP IMAGE = Image used for PH4 ISDN IOP was loaded.
PH4 FRPH IOP IMAGE = Image used for PH4 FRPH IOP was loaded.

4. ACTION TO BE TAKEN
None.

2. REASON FOR OUTPUT

To provide the contents of the protocol handler (PH) registers as information for trouble analysis at the time of an interrupt.

Format 1 prints when PH employs a M68030 as its processor.
Format 2 prints when PH employs a M68040 as its processor.
Format 3 prints when PH employs a M68060 as its processor.
Format 4 prints when PH employs a PowerPC as its processor and has PHV-specific hardware.
Format 5 prints when PH employs a PowerPC as its processor.
Format 6 prints when PH employs a PHA-specific hardware.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = PSU unit.
c = Shelf number.
d = Slot number.
e = Event number.
f = Current port processor image.
g = Exception vector number, in decimal.
h = Contents of hardware registers, in hexadecimal.

For the M68030/M68040/M68060 hardware, the valid registers are:
A0-A5 = Address registers.
CAAR = Cache address register.
CACR = Cache control register.
D0-D7 = Data registers.
DFC = Destination function code register.
DTT0 = Data transparent translation 0.
DTT1 = Data transparent translation 1.
EXCEP = Exception vector number.
FSLW = Fault status long word.
HCRP = High central processing unit (CPU) root pointer register.
HSRP = High supervisor root pointer.
ISP = Interrupt stack pointer.
ITT0 = Instruction transparent translation 0.
ITT1 = Instruction transparent translation 1.
LCRP = Low CPU root pointer register.
LSRP = Low supervisor root pointer.
MMUSR = Memory management unit (MMU) SR.
MSP = Master stack pointer.
PC = Program counter.
SFC = Source function code register.
SR = Status register.
SRP = Supervisor root pointer register.
SSP = System stack pointer.
TC = Translation control register.
TCR = Translation control register.
TT0 = Transparent translation 0.
TT1 = Transparent translation 1.
USP = User stack pointer.
VBR = Vector base register.

For the BRICPIT device the valid registers are:
ECLR = Event configuration level register.
ESBR = Event source bit register.
IMBR = Interrupt mask bit register.
ISRR = Interrupt service request register.
PB0ESR = Packet bus media access control (PBMAC) 0 error source register (ESR).
PB1ESR = Packet bus media access control (PBMAC) 1 error source register (ESR).
RSBR = Reset/set bit register.
SPRESR = Shared protocol receiver/transmitter (SPORT) receive ESR.
SPTESR = SPORT transmit ESR.
STKPTR = Stack pointer.
VISAESR = Vocoder interrupt and serial access error source register (ESR).
VISAEMR = Vocoder interrupt and serial access error mask register (EMR).
WPSR = Write protect shadow register.

For the CUSTOM device the valid registers are:
PBOESR = Packet bus media access control (PBMAC) 0 error source register (ESR).
PB1ESR = Packet bus media access control (PBMAC) 1 error source register (ESR).

For the PBMAC SPORT device the valid registers are:
PBOESR = Packet bus media access control (PBMAC) 0 error source register (ESR).
PB1ESR = Packet bus media access control (PBMAC) 1 error source register (ESR).
SPRESR = Shared protocol receiver/transmitter (SPORT) receive ESR.
SPTESR = SPORT transmit ESR.

For the MPC755 hardware, the valid registers are:
DAR = Data address register.
DSISR = Data storage interrupt register.
EXC = Exception vector number.
HID0 = Hardware implementation-dependent register 0.
HID2 = Hardware implementation-dependent register 2.
SPRG3 = Special-purpose register used for general purpose 3.
SRR0 = Machine status save/restore register 0.
SRR1 = Machine status save/restore register 1.
TBL = Lower time base register.
For the MPC107 hardware register, the valid values are:

- **CBESR** = CPU bus error status register.
- **COMR** = PCI command register.
- **DHEC** = Data high error capture register.
- **DELC** = Data low error capture register.
- **EAR** = CPU/PCI error address register.
- **EDR1** = Error detection register 1.
- **EDR2** = Error detection register 2.
- **EER1** = Error enabling register 1.
- **EER2** = Error enabling register 2.
- **ESBEC** = ECC single bit error counter register.
- **ESBET** = ECC single bit error trigger register.
- **ESR** = Error source register.
- **IACK** = Processor interrupt acknowledge register.
- **PCTPR** = Processor current task priority register.
- **PECM** = Parity error capture monitor register.
- **PIC1** = Processor interface configuration 1.
- **PIC2** = Processor interface configuration 2.
- **STATR** = PCI status register.
- **REV** = Revision ID.

For the CUB device, the valid registers are:

- **CSR** = Control status register.
- **FAR** = Full address register.

For the PBMAX device, the valid registers are:

- **COMR** = PCI command register.
- **ER** = Error register.
- **MER** = Mask register for ER bits.
- **STATR** = PCI status register.

For the VISA device, the valid registers are:

- **COMR** = PCI command register.
- **ESR** = Error source register.
- **ESRM** = Error source register mask.
- **DSPINT1** = Interrupt register 1.
- **DSPINT2** = Interrupt register 2.
- **STATR** = PCI status register.

For the PCI-DSP BRIDGE device, the valid registers are:

- **COMRO** = PCI command register 0.
- **COMR1** = PCI command register 1.
- **CONR0** = Configuration register 0.
- **CONR1** = Configuration register 1
- **STATR0** = PCI status register 0.
- **STATR1** = PCI status register 1.

For the POWERPC, the valid registers are:
RO-R31 = General purpose registers.
XER    = Extended request register.
CTR    = Count register.
CR     = Condition register.
LR     = Link register.

For the PHA-specific hardware, the valid registers are:
CTRL50 = Control for transmit.
DEVID  = Device ID register.
DLTA05-06 = Delta register.
EVNT00-11 = Event register.
MASK12-18 = Mask register.
STAT19-20 = Status register.
STAT22 = Automatic protection switching value.
STAT40 = AIS/ferf status register.

For the AMEX device register, the valid registers are:
AXESR = Error source register.
AXEMR = Error mask register.

For the SPI device register, the valid registers are:
SPESR = Error source register.
SPEMR = Error mask register.

For the TRAC device register, the valid registers are:
TAESR = Error source register.
TAEMR = Error mask register.

1. **FORMAT**

   ```
   REPT PSUPH=a-b-c-d TRBL CRITICAL HARDWARE FAILURE EVENT=e
   PHV VOCODER FAILURE RECOVERY ACTION f
g h i
j k l m
   ```

2. **REASON FOR OUTPUT**

   To output a report from a PHV indicating that one of its VOCODER had failed to respond properly to a set of commands.

3. **VARIABLE FIELD DEFINITIONS**

   - **a** = Switching module (SM) number.
   - **b** = Packet switching unit (PSU) number.
   - **c** = PSU shelf number.
   - **d** = Protocol handler (PH) number.
   - **e** = Event number.
   - **f** = Recovery action. Valid value(s):
     - **ANALYSIS ONLY** = No recovery action was taken.
     - **RST PREEMPT** = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
   - **g** = External circuit name of the implicated circuit.
   - **h** = Current decimal number of failures of this type recorded.
   - **i** = Error count threshold.

   **Note:** Variable 'j' through 'm' will be reported as hexadecimal data, where each field is 4 digits.

   - **j** = The number of the faulty PH.
   - **k** = The channel group assigned to the PH at the time of the error.
   - **l** = The port name of the channel group member.
   - **m** = The member number within the channel group.

4. **ACTION TO BE TAKEN**
No action is necessary if the recovery action (variable 'f') is "ANALYSIS ONLY". If it is "RST PREEMPT", automatic diagnostics are run on the PH.

1. FORMAT

REPT PSUPH=a-b-c-d TRBL DF PARITY ERROR EVENT=e
  f RECOVERY ACTION g
  h i j
  kkkkllll mmmnnnnn nnnnnnnn nnnnnnnn nnnnnnnn nnnnnnnn

2. REASON FOR OUTPUT

To report that a parity error occurred on a packet switching unit (PSU) protocol handler data bus (PHDB).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = PSU number.
c = Packet switching unit common control (PSUCOM) side.
d = PH number.
e = Event number.
f = Error type. Valid value(s):
  DF PHDB PARITY ERROR = Parity error was detected on a PHDB between a data fanout (DF) and a protocol handler (PH).
  DF2 PHDB PARITY ERROR = Parity error was detected on a PHDB between a data fanout - version 2 (DF2) and a protocol handler (PH).
  DF PHDB UNLINKED TIMESLOT FAILURE = A parity error was detected on a PHDB between a DF and a PH but not enough linkage information was found to determine which PH and channel group the timeslot was assigned to.

  g = Recovery action. Valid value(s)*
  ANALYSIS ONLY = No recovery action was taken. A postmortem report was printed.
  RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

  h = External logical circuit name of the implicated circuit.
i = Current decimal number of failures of this type recorded.
j = Decimal error count threshold, at which the recovery action will be taken.

Note: An additional circuit name, error count, and error threshold (variables 'h'-'j') may be printed. A Recovery action will be taken only on the first circuit in the list to reach its error threshold. Variables 'k' through 'n' will be reported as hexadecimal data.
k = The PSU shelf number (left-hand 8 bits) and the Data Fanout timeslot number (right-hand 8 bits).

l = The internal PHDB timeslot where the error was detected (left-hand 8 bits) and the contents of the TSI control RAM register (right-hand 8 bits).

m = The PIDB timeslot data block (PTSB) usage number.

n = Information specific to the error is printed in these fields. The data content and the amount of data printed is dependent on the PTSB time slot usage.

iiii jjjjkkkkllll mmmmnnnn oooooooo oooooooo oooooooo

2. REASON FOR OUTPUT

To report that initialization of a D-channel failed or that loss of communication to the D-channel was detected.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Packet switching unit (PSU) number.
c = PSU shelf number.
d = Protocol handler (PH) number.
e = Event number.
f = External circuit name of the implicated circuit.
g = Current decimal number of failures of this type recorded.
h = Error count threshold.

Note: Variables 'i' through 'o' will be reported as hexadecimal data, where each field is 4 digits.
i = The circuit name of the unit connected to the PH.
j = The number of the active packet switching unit common controller (PSUCOM) service group.
k = The active Packet Interface (PI).
0x29 = PI service group 0 is ACT.
0x49 = PI service group 1 is ACT.
l = The number of the channel group assigned to the PH at the time of the error.
m = The member number within the channel group.
n = The number representing the circuit type connected to the PH. Valid value(s):
0x00 = Connected to a digital facility interface (DFI).
0x01 = Connected to a different switch.
0x02 = Connected to another PH.
0x03 = Connected to a T-card.
0x04 = Connected to a Custom U-card.
0x05 = Connected to an ANSI U-card.

○ = Information specific to the error will be reported in this variable length field.

4. ACTIONS TO BE TAKEN

Automatic diagnostics will be run on the PH. If they pass, run the PSUCOM diagnostics using DGN:PSUCOM.

5. ALARMS

None.

```

2. REASON FOR OUTPUT

To report the loss of communication from the switching module processor (SMP) to a port processor (PP). A PP can either be a protocol handler (PH) or a packet interface (PI).

End-to-end (ETE) check messages detect faults from the SMP through the PI on the packet bus to the PHs. Idle link assurance (ILA) messages detect faults between the PI and the PHs through the packet bus.

3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = Packet switching unit (PSU) number.
- **c** = Packet switching unit common control (PSUCOM) side.
- **d** = PH number.
- **e** = Event number.
- **f** = Recovery action. Valid value(s):
  - **ANALYSIS ONLY** = No recovery action was taken. The postmortem report was printed.
  - **NO RECOVERY ACTION TAKEN** = A PH momentarily lost communication with the switch module processor, but communication was re-established. The PH will not be taken out of service. This was reported for information purposes only.
  - **RST PREEMPT** = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
- **g** = External circuit name of the implicated circuit.
- **h** = Current decimal number of failures of this type recorded.
- **i** = Decimal error count threshold, above which the recovery action will be taken.

**NOTE 1:** An additional circuit name, error count, and error threshold (variables 'g'-'i') may be printed. Recovery action will be taken only on the first circuit in the list to reach its error threshold.
NOTE 2: Variables 'j' through 'l' is reported as hexadecimal data.

\[ j = \] Detection source. Valid value(s):
- 0 = ETE check failure which is a periodic communication check between the SMP and the PPs.
- 1 = ILA failure which ensures layer 2 is up and messages can be sent to the PHs.

\[ k = \] The number of implicated faulty PPs.

\[ l = \] Data specific to the error is printed in these fields. The data content and the amount of data printed is dependent on the error. If further analysis is necessary, please collect this output message, and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

No action is necessary if the recovery action (variable 'f') is "ANALYSIS ONLY". If it is "RST PREEMPT", automatic diagnostics are run on the PH. If they pass, run the PSUCOM and the MCTSI diagnostics using DGN:PSUCOM and DGN:MCTSI.

5. ALARMS

None.

To report a maintenance service request pertaining to a packet switching unit common controller (PSUCOM) protocol handler (PH).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Packet switching unit (PSU) number.
c = PSU shelf number.
d = PH number.
e = Event number.
f = Error type. Valid value(s):
    CF ARBITER TIME OUT = A PH or packet interface (PI) has held the packet bus for more than 4 milliseconds.
    PH FAILURE = A PH has exceeded its internal error threshold and has asserted its error lead.
g = Recovery action. Valid value(s):
    ANALYSIS ONLY = No recovery action was taken. The postmortem report was printed.
    NO RECOVERY ACTION TAKEN = The PH raised its error lead, but when checked by the SMP, was found to be functioning normally. Hence, no recovery action was taken. This was reported for information purposes only.
    RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A read-only printer (ROP) message will be printed with the results of the diagnostic.

h = External circuit name for the implicated circuit.
i = Current decimal number of failures of this type recorded.
j = Decimal error count threshold at which a recovery action will be taken.

NOTE 1: A recovery action will be taken only on the first circuit in the list to reach its error threshold.
NOTE 2: Variables ‘k’ through ‘t’ is reported as hexadecimal data.

k = Control fanout (CF) summary scan register. Valid value(s):
0x1 = First in, first out (FIFO) B contains information.
0x2 = FIFO A contains information.
0x4 = Mailbox flags 0 - 3 summary bit.
0x8 = Mailbox flags 4 - 7 summary bit.
0x10 = Mailbox flags 8 - 11 summary bit.
0x20 = Mailbox flags 12 - 15 summary bit.
0x100 = Hardware error summary bit.
0x200 = Firmware error summary bit.

l = CF summary scan mask register. Valid value(s):
0x1 = FIFO B contains information.
0x2 = FIFO A contains information.
0x4 = Mailbox flags 0 - 3 summary bit.
0x8 = Mailbox flags 4 - 7 summary bit.
0x10 = Mailbox flags 8 - 11 summary bit.
0x20 = Mailbox flags 12 - 15 summary bit.
0x100 = Hardware error summary bit.
0x200 = Firmware error summary bit.

m = CF hardware error source register. Valid value(s):
0x40 = Local processor (LP) unified control interface (UCI) address error.
0x80 = Micro processor (MP) UCI address error.
0x100 = FIFO B error.
0x200 = FIFO A error.
0x400 = FIFO B overflow.
0x800 = FIFO B underflow.
0x1000 = FIFO A overflow.
0x2000 = FIFO A underflow.
0x4000 = LP UCI read parity error.
0x8000 = MP UCI read parity error.

n = CF hardware error source mask register. Valid value(s):
0x40 = Mask LP UCI address error.
0x80 = Mask MP UCI address error.
0x100 = Mask FIFO B error.
0x200 = Mask FIFO A error.
0x400 = Mask FIFO B overflow.
0x800 = Mask FIFO B underflow.
0x1000 = Mask FIFO A overflow.
0x2000 = Mask FIFO A underflow.
0x4000 = Mask LP UCI read parity error.
0x8000 = Mask MP UCI read parity error.

o = CF LP hardware error source mask register. Valid value(s):
0x40 = Mask LP UCI address error.
0x80 = Mask MP UCI address error.
0x100 = Mask FIFO B error.
0x200 = Mask FIFO A error.
0x400 = Mask FIFO B overflow.
0x800 = Mask FIFO B underflow.
0x1000 = Mask FIFO A overflow.
0x2000 = Mask FIFO A underflow.
0x4000 = Mask LP UCI read parity error.
0x8000 = Mask MP UCI read parity error.

p = CF firmware error source register. Valid value(s):
  0x1 = Arbiter errors.
  0x2 = Control interconnect bus (CIB) errors.
  0x4 = Protocol handler (PH) errors.
  0x8 = Data Fanout (DF) parity.
  0x10 = DF timing.
  0x20 = Invalid command.

q = CF firmware error source mask register. Valid value(s):
  0x1 = Mask arbiter errors.
  0x2 = Mask CIB errors.
  0x4 = Mask PH errors.
  0x8 = Mask DF parity.
  0x10 = Mask DF timing.
  0x20 = Mask invalid command.

r = Internal circuit name in which first error was found.

s = Error detection source: Zero for CF, one for DF, two for PF.

t = Data specific to the error is printed in these fields. The data content and the amount of data printed is dependent on the error. If further analysis is necessary, please collect this output message, and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

No action is necessary if the recovery action (variable 'g') is "ANALYSIS ONLY." If it is "RST PREEMPT," automatic diagnostics are run on the PSUCOM. If they pass, run the PH diagnostics using DGN:PSUPH.

5. ALARMS

None.

Input Message(s):

DGN:PSU
RST:PSUCOM
1. FORMAT

REPT PSUSHELF=a-b-c-d TRBL PLI ERROR EVENT=e
    f RECOVERY ACTION g

    PSUSHELF=a-b-c-d  h  i
    jjjjjjjj kkkkkkkk lllllmmmm nnnnooooo pppppppp pppppppp pppppppp pppppppp
    pppppppp pppppppp

2. REASON FOR OUTPUT

To indicate an error reported by fault recovery within the switching module (SM) caused by failure of the Peripheral Link Interface (PLI) which services the Data Fanout 2 (DF2) board on the Packet Switch Unit (PSU) Shelf. The fault was detected and reported by module control unit fault recovery (MCUFR). The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to field 'g' to determine the fault recovery action.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Packet Switch Unit (PSU) number.
c = PSU Common Control (PSUCOM) service group.
d = Shelf number.
e = Event number.
f = Error type. Valid value(s):
    IF CRC ERR ON DATA RECEIVED FROM PLI = The Module Controller (MCTSI) has detected a CRC error on the data received from the PLI servicing the PSUCOM Shelf.
    IF LOSS OF CLOCK FROM THE PLI = The MCTSI has lost the 8Khz data clock signal from the PLI servicing the PSUCOM Shelf.
    IF LOSS OF CLOCK REFERENCE = The MCTSI detected a loss of clock reference on the PLI servicing the PSUCOM Shelf.
    IF PAR ERR ON OVERHEAD BYTES FROM PLI = The MCTSI has detected bad parity on the 64 byte/frame overhead channel on the PLI servicing the PSUCOM Shelf.
    IF SYNCHRONIZATION ERROR WITH PLI = The MCTSI has lost the 30msec synchronization pulse from the PLI servicing the PSUCOM Shelf.
    NO ERROR SOURCE FOUND = A message was sent to peripheral fault recovery (PFR) software indicating a PLI fault is present. However, PFR software analysis revealed no such fault indication.
    PLI BAD FRAME WORD ON INCOMING LINK = A bad frame word has been detected on the incoming data stream from the PLI servicing the PSUCOM Shelf.
    PLI BAD PARITY INCOM OVERHEAD BYTES = The PLI servicing the PSUCOM Shelf has detected bad parity on the 64 byte/frame overhead channel received from the TSI.
    PLI BAD SUPERFRAME ON INCOMING LINK = A bad superframe byte has been detected on the
incoming data stream of the PLI servicing the PSUCOM Shelf.

PLI DETECTED BAD CRC FROM ACTIVE MCTSI = CRC errors have been detected at the PLI servicing the PSUCOM Shelf on the data received from the active MCTSI.

PLI IMPLICATED BY BACKGROUND CHECK = The PLI servicing the PSUCOM Shelf has been declared faulty because the background select check function has determined that it is either taking control from the standby MCTSI service group or has been programmed incorrectly to prevent taking control from the standby MCTSI.

PLI INTERNAL DATA PARITY ERROR = The PLI servicing the PSUCOM Shelf has detected an internal parity error on the data it received correctly from the active MCTSI.

PLI IS SOURCING BAD CRC = The PLI servicing the PSUCOM Shelf has detected it is sourcing bad CRC.

PLI LINK TO BE OUT-OF-FRAME = The incoming PLI has detected the PCTLNK connected with the PSUCOM Shelf has been out-of-frame for at least four consecutive frames.

PLI OUTGOING BUFFER CHECK ERROR = The PLI servicing the PSUCOM Shelf has detected that the data it received correctly from the active MCTSI is failing buffer checks because of an internal PLI fault.

PLI PARITY ERRORS ON DATA FROM DF = The PLI servicing the PSUCOM Shelf has detected parity errors on the data received from the PSUCOM Shelf.

\[ \text{g} \] = Recovery Action. Valid values are:

\[ \text{REMOVE} \] = The failing circuit was removed. A RMV:PSUSHELF COMPLETED output message will be printed. There are no PSU shelf diagnostics.

\[ \text{h} \] = Current decimal number of errors of type in field ‘i’ recorded.

\[ \text{i} \] = Decimal error count threshold where recovery action will be taken.

\[ \text{j} \] = IF error source register data.

\[ \text{k} \] = IF error mask register data at time of error.

\[ \text{l} \] = PLI error source register.

\[ \text{m} \] = PLI error source mask register.

\[ \text{n} \] = PSUCOM Shelf internal message type.

\[ \text{o} \] = Number of PLI fault messages sent from MCUFR to peripheral fault recovery. These messages are printed in field ‘o’.

\[ \text{p} \] = Up to six PLI fault messages sent from MCUFR to peripheral fault recovery may be printed. Each PLI fault message consists of eight hexadecimal characters.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If ‘g’ =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>REMOVE</td>
<td>There are no diagnostics on the PSUCOM shelf. To restore the shelf to service, the Out of Service PSUCOM service group has to be restored, and the shelf will then automatically restore.</td>
</tr>
</tbody>
</table>

5. ALARMS
None.

REPT PSUSHELF=a-b-c-d TRBL PORT PROCESSOR COMMUNICATION LOSS EVENT=e
PH LOSS OF LAYER 2 RECOVERY ACTION f
g h i
j k l

2. REASON FOR OUTPUT

To report the loss of communication from the switching module processor (SMP) to a port processor (PP). A PP can either be a protocol handler (PH) or a packet interface (PI).

3. VARIABLE FIELD DEFINITIONS

a = switching module (SM) number.
b = packet switch unit (PSU) number.
c = PSUCOM side.
d = Shelf number.
e = Event number.
f = Recovery action. Valid value(s):
  ANALYSIS ONLY = No recovery action was taken. A postmortem report is printed.
  RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A report prints with the results of the diagnostic.

g = External circuit name of the implicated circuit.
Note: An additional circuit name, error count (variable 'i5'), and error threshold (variable 'j5') may be printed. Recovery action is taken only on the first circuit in the list to reach its error threshold.

h = Current decimal number of failures of this type recorded.
i = Decimal error count threshold, above which the recovery action is taken.
j = A 4-digit hexadecimal representing indicated detection source. Valid value(s):
  0 = ETE check failure which is a periodic communication check between the SMP and the PPs.
  1 = ILA failure which ensures layer 2 is up and messages can be sent to the PHs.

k = A 4-digit hexadecimal representing the number of implicated faulty PPs.
Additional PP numbers (variable 'l5') may be printed up to a maximum of 17. This depends on the
number of implicated PPs in variable 'k5'.

\[ l = \text{A 4-digit hexadecimal representing the number of the faulty PP. Valid value(s):} \]
\[ \begin{array}{ll}
0 \cdots 4f & = \text{PH numbers.} \\
60 & = \text{PI side 0.} \\
61 & = \text{PI side 1.} \\
\end{array} \]

4. ACTION TO BE TAKEN

No action is necessary if the recovery action is ANALYSIS ONLY. If it is RST PREEMPT, automatic diagnostics are run on the PSUCOM. If they pass, run the module controller/time slot interchange (MCTSI) and the PH diagnostics, using DGN:MCTSI and DGN:PSUPH, respectively.

2. REASON FOR OUTPUT

To report a maintenance service request pertaining to a shelf of a packet switch unit common controller (PSUCOM).

Format 1 reports a parity error occurred on a shelf of a packet switch unit (PSU) peripheral interface data bus (PIDB) to the time slot interchange (TSI).

Format 2 reports a parity error occurred on a shelf of a PSU directly connected peripheral interface data bus (DPIDB) serving an integrated services line unit (ISLU) or an unknown unit.

Format 3 reports a parity error occurred on a faulty shelf of a PSU DPIDB that is not in use.
Format 4 reports a parity error occurred on a shelf of a packet switch unit protocol handler data bus (PHDB).

Format 5 reports all other errors occurred on a shelf of a PSUCOM.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Packet switch unit (PSU) number.
c = PSUCOM side.
d = Shelf number.
e = Event number.
f = DF DPIDB error type. Valid value(s):
   DF DPIDB PARITY ERROR = Parity error was detected on a data fanout (DF) PIDB which is
directly connected to an ISLU control data (CD).
   DF DPIDB UNLINKED TIMESLOT = A parity error was detected on a DF PIDB, but there was not
even linkage information found to determine which protocol handler (PH) and
channel group the time slot was assigned to.

h = External logical circuit name of the implicated circuit.
i = Current decimal number of failures of this type recorded.
j = Decimal error count threshold, at which the recovery action is taken.

NOTE: Additional circuit names, error counts (variables 'i'), and error thresholds (variables 'j')
may be printed. A recovery action is taken only on the first circuit in the list to reach its
error threshold.

k = A 4-digit hexadecimal representing the PSU shelf number (left-hand 4 bits) and the PICB number
the DPIDB is connected to (right-hand 12 bits).

l = A 4-digit hexadecimal representing the implicated DPIDB number (left-hand 8 bits) and the time
slot number in the DPIDB (right-hand 8 bits).

m = A 4-digit hexadecimal representing the PSU shelf number.

n = A 4-digit hexadecimal representing the input-output (IO) of the implicated DPIDB. Valid value(s):
   1 = DPIDB 0
   2 = DPIDB 1
   3 = DPIDB 2
   4 = DPIDB 3
   5 = DPIDB 4
   6 = DPIDB 5
7 = DPIDB 6
8 = DPIDB 7

o = A 4-digit hexadecimal representing the PSU shelf number (left-hand 8 bits) and the timeslot number (right-hand 8 bits).

p = A 4-digit hexadecimal representing the PH number the parity error occurred on.

q = A 4-digit hexadecimal representing the PTSB (PSU time slot block) usage number. Valid value(s):
0 = Nothing is assigned to the PTSB.
1 = Directly connected D channel.
2 = PSU cut through D channel part.
3 = Integrated switching line unit (ISLU) cut through D channel part.
4 = ISLU to time slot interchange unit (TSIU) duplex B channel.
6 = Unavailable due to remote ISLU remoting hardware.
7 = Maintenance activity on PTSB.
8 = PSU cut through for inter-SM use.
9 = Directly connected B-channel.
A = PSU cut through B-channel.
B = Duplex B-channel with packet switching service.
C = PSU cut through on an Inter-Switch Trunk.

r = A 4-digit hexadecimal representing the DSL group number assigned to the PH at the time the error was taken.

s = A 4-digit hexadecimal representing the DSL group member number assigned to the first channel.

t = A 4-digit hexadecimal representing the D-channel status of the first channel in the left-hand 8 bits. Valid value(s):
0 = D channel idle.
1 = D channel tear down.
2 = D channel setup.
3 = D channel stable.
4 = D channel not cleared.
5 = This D channel is 64KB.

The enable of the first channel in the right-hand 8 bits:
0 = Channel is off.
1 = Channel is on.

u = A 4-digit hexadecimal representing the DSL group member number assigned to the second channel.

v = A 4-digit hexadecimal representing the D-channel status of the second channel in the left-hand 8 bits. The state of the second channel in the right-hand 8 bits. This is similar to variable 's'.

w = A 4-digit hexadecimal representing the DSL group member number assigned to the third channel.

x = A 4-digit hexadecimal representing the D-channel status of the third channel (left-hand 8 bits). The state of the third channel in the right-hand 8 bits. This is similar to variable 's'.

Copyright ©2003 Lucent Technologies
\(y\) = A 4-digit hexadecimal representing the DSL group member number assigned to the fourth channel.

\(z\) = A 4-digit hexadecimal representing the D-channel status of the fourth channel in the left-hand 8 bits. The state of the fourth channel in the right-hand 8 bits. This is similar to variable ‘t’.

\(a\) = A 4-digit hexadecimal representing the CF summary scan register. Valid value(s):

1 = First in, first out (FIFO) B contains information.
2 = FIFO A contains information.
4 = Mailbox flags 0-3 summary bit.
8 = Mailbox flags 4-7 summary bit.
10 = Mailbox flags 8-11 summary bit.
20 = Mailbox flags 12-15 summary bit.
100 = Hardware error summary bit.
200 = Firmware error summary bit.

\(b\) = A 4-digit hexadecimal representing the CF summary scan mask register. Valid value(s):

1 = Mask FIFO B contains information.
2 = Mask FIFO A contains information.
4 = Mask mailbox flags 0-3 summary bit.
8 = Mask mailbox flags 4-7 summary bit.
10 = Mask mailbox flags 8-11 summary bit.
20 = Mask mailbox flags 12-15 summary bit.
100 = Mask hardware error summary bit.
200 = Mask firmware error summary bit.

\(c\) = A 4-digit hexadecimal representing the CF hardware error source register. Valid value(s):

40 = Local processor (LP) UCI address error.
80 = Micro processor (MP) UCI address error.
100 = FIFO B error.
200 = FIFO A error.
400 = FIFO B overflow.
800 = FIFO B underflow.
1000 = FIFO A overflow.
2000 = FIFO A underflow.
4000 = LP UCI read parity error.
8000 = MP UCI read parity error.

\(d\) = A 4-digit hexadecimal representing the CF hardware error source mask register. Valid value(s):

40 = Mask LP UCI address error.
80 = Mask MP UCI address error.
100 = Mask FIFO B error.
200 = Mask FIFO A error.
400 = Mask FIFO B overflow.
800 = Mask FIFO B underflow.
1000 = Mask FIFO A overflow.
2000 = Mask FIFO A underflow.
4000 = Mask LP UCI read parity error.
8000 = Mask MP UCI read parity error.
e = A 4-digit hexadecimal representing the CF LP hardware error source mask register. Valid value(s):

- 40 = Mask LP UCI address error.
- 80 = Mask MP UCI address error.
- 100 = Mask FIFO B error.
- 200 = Mask FIFO A error.
- 400 = Mask FIFO B overflow.
- 800 = Mask FIFO B underflow.
- 1000 = Mask FIFO A overflow.
- 2000 = Mask FIFO A underflow.
- 4000 = Mask LP UCI read parity error.
- 8000 = Mask MP UCI read parity error.

f = A 4-digit hexadecimal representing the CF firmware error source register. Valid value(s):

- 1 = Arbiter errors.
- 2 = CIB errors.
- 4 = PH errors.
- 8 = DF parity.
- 10 = DF timing.
- 20 = Invalid command.

g = A 4-digit hexadecimal representing the CF firmware error source mask register.

- 1 = Mask arbiter errors.
- 2 = Mask CIB errors.
- 4 = Mask PH errors.
- 8 = Mask DF parity.
- 10 = Mask DF timing.
- 20 = Mask invalid command.

h = A 4-digit hexadecimal representing the internal circuit name in which first error was found.

i = A 4-digit hexadecimal representing the error detection source. Valid value(s):

- 0 = CF.
- 1 = DF.
- 2 = PF.

j = A 4-digit hexadecimal representing the DF timing error mailbox.

k = Data specific to the error is printed in these fields. The data content and the amount of data printed is dependent on the error. If further analysis is necessary, please collect this output message, and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

l = DF PHDB error type. Valid value(s):

- DF PHDB PARITY ERROR = A parity error was detected on a protocol handler data bus (PHDB) between a data fanout (DF) and a protocol handler (PH).
- DF2 PHDB PARITY ERROR = A parity error was detected on a protocol handler data bus (PHDB) between a data fanout - version 2 (DF2) and a protocol handler (PH).
- DF-MCTSI LINK PARITY ERROR = A parity error was detected on the link connecting the DF to
the module control time slot interchange (MCTSI).

DF PHDB UNLINKED TIMESLOT FAILURE = A parity error was detected on a PHDB between a DF and a PH but not enough linkage information was found to determine which PH and channel group the time-slot was assigned to.

m¹ = Error type. Valid value(s):
CF INVALID ERR REPORT FROM SHELF = The control fanout (CF) received an error report from a data fanout (DF) or packet fanout (PF) that it could not recognize.
CF SHELF OUT OF RANGE = A message from the switching module processor (SMP) could not be processed by the CF because it specified an out-of-range shelf number.
CF TIMEOUT WAITING FOR RESPONSE = The CF timed out waiting for a response to a message it sent to a DF or PF.
DF CLOCK FAILURE = A DF detected a 4 MHz clock failure.
DF MATE CLOCK FAILURE = A DF detected an error from its mate's DF clock.
DF INCOMING CLOCK FAILURE = A DF detected an error on the clock signal from the MCTSI.
DF INCOMING FRAME ERROR = A DF detected a frame error on the link from the MCTSI.
DF INTERNAL PARITY ERROR = A parity error occurred internally in DF hardware.
DF PARITY COUNTER OVERFLOW = A DF detected an overflow of the counter used to generate walking parity. It indicates a DF timing problem.
DF SYNCH FAILURE = A DF detected an 8 MHz synchronization failure.
DF TSI ACCESS CHIP ACCESS PARITY = A parity error occurred when attempting to access the DF time slot interchanger (TSI) chip.
NO ERROR SOURCE FOUND = A service request was received by PSU fault recovery, but no error source bits were set to indicate the exact source of the error.
PH FAILURE = A PH has exceeded its internal error threshold and has asserted its error lead. The error lead is asserted to notify PSU fault recovery that the PH is faulty.
SHELF CIB BREAK RECEIVED = A break signal was received from a DF or PF. This indicates that the DF of PF has had a serious error such as loss of control interconnect bus (CIB) clock, loss of board clock, or pack removal.
SHELF CIB CHECKFAIL = A diagnostic message was sent to a shelf but no response was received.
SHELF CIB FRAMING ERROR = A framing error was detected on a CIB between a DF and a DF or PF. This occurs when a start code is detected on a CIB, but no stop code is received to end the frame which contains a message or response.
SHELF CIB OVERRUN ERROR = Too many messages or responses were received on a DF or PF indicating that some may have been lost.
SHELF CIB PARITY FAIL = A parity error occurred on a CIB between the DF and a DF or PF.
SHELF RECEIVED INVALID COMMAND = A DF or PF received an invalid message from the CF.

4. ACTIONS TO BE TAKEN

No action is necessary if the recovery action is ANALYSIS ONLY. If it is RST PREEMPT, automatic diagnostics are run on the PSUCOM. If they pass, run the module controller/time slot interchange (MCTSI) and the PH diagnostics, using DGN:MCTSI and DGN:PSUPH, respectively.

5. ALARMS

None.

- **Message Class:** TRCEMON
- **Application:** 5
- **Type:** Output

### 1. FORMAT

```
REPT PTRACE: a AT LINE b PCRID c [d]
```

### 2. REASON FOR OUTPUT

To report program trace information for certain software detected error conditions.

### 3. VARIABLE FIELD DEFINITIONS

- `a` = Filename of the program trace.
- `b` = Line number of the program trace.
- `c` = Processor identification number of the program trace.
- `d` = Program trace data.

### 4. ACTION TO BE TAKEN

If output persists, refer to the program listing specified in the output to determine the cause of the error or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

### 5. ALARMS

None.

### 6. REFERENCES

Other Manual(s):

REPT:PUMP

Software Release: 5E14 and later
Message Class: INT
Application: 5
Type: Output

1. FORMAT

REPT PUMP: a b

2. REASON FOR OUTPUT

To sound a major alarm and notify the user that a pump cannot proceed without the needed file or that a pump is skipping a section in a relocatable file because it is not in the relocatable image map.

3. VARIABLE FIELD DEFINITIONS

\begin{itemize}
\item[a=] Reason for message. Valid value(s):
\begin{itemize}
\item CAN NOT OPEN = The file needed by pump does not exist or does not have the right access permissions.
\item CORRUPTED FILE = The file accessed by pump is not in the proper format or the file is empty.
\item IMAGE NOT IN RIM = Displayed image name from a relocatable file does not have a corresponding entry in the relocatable image map (rim.out).
\end{itemize}
\item[b=] Full path name of file needed by pump or name of image being skipped.
\end{itemize}

4. ACTION TO BE TAKEN

There are various files used by pump and different circumstances that could affect these files; therefore, each situation may need special consideration. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Do not attempt to recover the switching module with a pump until the affected file is restored.

REPT:PWR-RCLK
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT PWR a RCLK=b-c [d]

2. REASON FOR OUTPUT

To report the power status of a remote clock (RCLK) side.

3. VARIABLE FIELD DEFINITIONS

a = Power status. Valid value(s):
   REMOVED
   RESTORED

b = Switching module (SM) number.

c = RCLK side.

d = Type of request (applies only if the power status is REMOVED):
   FUSE = Fuse alarm.
   MAN = Manual.
   MOR = Manual override.

4. ACTION TO BE TAKEN

If power is lost, try to restore power manually to the RCLK. Unlike the oscillator, the warmup period for the RCLK is not necessary.

5. ALARMS

If type of request is FUSE, major alarm.

REPT:PWR-RCOSC
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT
REPT PWR a RCOSC=b-c [d]

2. REASON FOR OUTPUT
To report the status of a manual request for power in a remote clock oscillator (RCOSC).

3. VARIABLE FIELD DEFINITIONS
a = Power status. Valid value(s):
   REMOVED
   RESTORED
   
b = Switching module (SM) number.

c = RCOSC side.

d = Type of request (applies only if the power status is removed). Valid value(s):
   FUSE       = Fuse alarm.
   MAN        = Manual.
   MOR        = Manual override.

4. ACTION TO BE TAKEN
If power is lost, try to restore power to the direct oscillator power feed. For the high stability (stratum 2) oscillator, a warmup period of 16 hours is required to ensure proper operation.

5. ALARMS
If FUSE or power fail, major alarm.

2. REASON FOR OUTPUT

To indicate an error occurred on the quad-link gateway processor (QGP). This message describes what error occurred, the state of the processor at the time of the error, and the recovery action taken.

3. VARIABLE FIELD DEFINITIONS

a = Message switch (MSGS) side the QGP is on.
b = Logical QGP number.
c = QGP environment where fault occurred. Valid value(s):
  QGP-AP = Applications processor.
  QGP-MSGH = Message handler.
  UNK = Environment unknown.
d = Software recovery action. Valid value(s):
  CBI = Critical error interrupt.
  OSR = Operational software restart
  RPI = Return to the point of interrupt.
  UNK = Unknown software recovery action.
e = QGP event number. The event number comes from the QGP message handler processor.
(QGP-MSGH) if MSGH-EVENT is the parameter name and from the QGP application processor (QGP-AP) if EVENT is the parameter name.

- **f**
  - **Termination status. Valid value(s):**
  - **ABORTED** = The job did not complete before being interrupted by another stimulus.
  - **COMPLETED** = The action has completed.

- **g**
  - **Failing address.**

- **h**
  - **Type of memory referenced by the failing address. Valid value(s):**
  - **DAM** = Dual access memory between the message switch control unit (MSCU) and the QGP-MSGH.
  - **DSRAM** = Dual access static random access memory between the QGP-AP and the QGP-MSGH.
  - **GWLB** = Gateway link board user space.
  - **GWLB-IO** = Gateway link board input/output space.
  - **IO** = Core board input/output space.
  - **LSRAM** = Local static random access memory.
  - **OOR** = Out of range address. The failing address does not map to any known memory type.
  - **ROM** = Read only memory.
  - **UNK** = The memory type of the failing address is unknown or indeterminable, or the failing address and address range are inapplicable to the current error source.

- **i**
  - **Operational software job executing when the error occurred. Valid value(s):**
  - **AU** = Routine audits.
  - **CM** = Communication package.
  - **INIT** = Processor initialization.
  - **MTUP** = Mate update.
  - **OE** = Operating environment.
  - **QGLDG** = Overall quad-link packet switch (QLPS) gateway link (QGL) diagnostics.
  - **QGLPT** = QGL packet test diagnostic.
  - **QGLSW** = QGL switch.
  - **QL** = Quad-link layer 2 manager.
  - **QLLUD** = Quad-link packet switch logical link (QLL) up/down.
  - **QL0GP** = Network 0 quad-link fault recovery (QLFR) general purpose work.
  - **QL1GP** = Network 1 QLFR general purpose work.
  - **QP0IN** = Network 0 quad-link packet switch pipe (QPIPE) initialization.
  - **QP0LB** = Network 0 QPIPE loop back.
  - **QP1IN** = Network 1 QPIPE initialization.
  - **QP1LB** = Network 1 QPIPE loop back.
  - **RHS** = Routine hashsum checks.
  - **SI** = System integrity.
  - **UNK** = Unknown or indeterminable running job.

- **j**
  - **Software recovery escalation reason. Valid value(s):**
  - **AP-REL** = QGP application processor raised the error lead.
  - **EX-DCF-ERR** = Excessive defensive check failures.
  - **EX-FR-ERR** = Excessive fault recovery errors.
  - **EX-OSR-ERR** = Excessive operational software restarts.
MSGH-REL = QGP message handler processor raised the error lead.

k = Source of the error. Valid value(s):
ADDRESS-ERROR = An attempt was made to execute an instruction at an odd address.
ADDRESS-OUT-OF-RANGE = The memory management unit (MMU) detected an attempt to read from or write to an out of range or otherwise invalid address.
AP-BASE-PRIORITY-QUEUE-ERROR = The QGP-AP detected a problem with its base priority message queue.
AP-HIGH-PRIORITY-QUEUE-ERROR = The QGP-AP detected a problem with its high priority message queue.
AP-TO-MSGH-SANITY-TIMER-EXPIRATION = The QGP-AP detected a failure by the QGP-MSGH to acknowledge the inter-processor sanity check in the allotted time interval.
BLL-SANITY-TIMER-EXPIRATION = The base level loop sanity timer expired.
BUS-ERROR = A bus error exception occurred.
CHANNEL-ATTENTION-0-INTERRUPT = A channel attention 0 interrupt exception occurred.
CHANNEL-ATTENTION-1-INTERRUPT = A channel attention 1 interrupt exception occurred.
CHANNEL-ATTENTION-2-INTERRUPT = A channel attention 2 interrupt exception occurred.
CHANNEL-ATTENTION-3-INTERRUPT = A channel attention 3 interrupt exception occurred.
COPROCESSOR-PROTOCOL-VIOLATION = A co-processor protocol violation exception occurred.
DAM-PARITY-ERROR = A parity error was detected on data read from the dual access memory (DAM) by the QGP-MSGH.
DIVIDE-BY-ZERO = An attempt was made to divide by zero.
EXCESSIVE-QGL-ERRORS = Too many QGL hardware errors occurred in the allotted time interval.
EXTERNAL-BOARD-BUS-ERROR = A bus error exception occurred on the gateway link board.
FORMAT-ERROR = The processor detected an illegal exception stack frame format or illegal co-processor state frame format.
GATEWAY-LINK-BOARD-INTERRUPT = An error occurred on the gateway link board.
GPITS-NMI = A general purpose integrated test system (GPITS) non-maskable interrupt (NMI) exception occurred.
HARDWARE-WRITE-PROTECT-ERROR = An attempt was made to write to a hardware write-protected memory address.
ILLEGAL-INSTRUCTION = An attempt was made to execute an opcode that is not a valid processor instruction opcode.
IOMI-COMMAND-INTERRUPT = An input output message interface (IOMI) message interrupt exception occurred.
IOMI-ISOLATED = The processor was isolated from IOMI communication with the MSCU.
LINE-1010-EMULATOR = An attempt was made to execute an unimplemented A-line opcode (an instruction with H'A in bits 15 through 12 of its first word).
LINE-1111-EMULATOR = An attempt was made to execute an unimplemented F-line opcode (an instruction with H'F in bits 15 through 12 of its first word).
MMU-CONFIGURATION-ERROR = An attempt was made to load invalid data into an MMU register.
MMU-SUPERVISOR-PROTECT-VIOLATION = The MMU detected an attempt to access supervisor-protected data while the processor was in user mode.
MMU-TRANSLATION-TABLE-BUS-ERROR = A bus error occurred during an MMU address translation table search.
MMU-WRITE-PROTECT-VIOLATION = The MMU detected an attempt to write to an MMU write-protected memory address.
MSGH-BASE-PRIORITY-QUEUE-ERROR = The QGP-MSGH detected a problem with one of its base priority message queues.
MSGH-HIGH-PRIORITY-QUEUE-ERROR = The QGP-MSGH detected a problem with one of its high
priority message queues.
MSGH-TO-AP-SANITY-TIMER-EXPIRATION = The QGP-MSGH detected a failure by the
QGP-AP to acknowledge the inter-processor sanity check in the allotted time
interval.
PIT-0-INTERRUPT = The time interval in programmable interval timer (PIT) 0 expired.
PIT-1-INTERRUPT = The time interval in PIT-1 expired.
PIT-2-INTERRUPT = The time interval in PIT-2 expired.
PIT-4-INTERRUPT = The time interval in PIT-4 expired.
PRIVILEGE-VIOLATION = An attempt was made to execute a supervisor-privileged instruction
while the processor was in user mode.
SPURIOUS-INTERRUPT = An interrupting device did not respond to an interrupt acknowledge bus
cycle.
STACK-PROTECT-ERROR = The MMU detected an attempt to write to an MMU write-protected
stack address.
SYSTEM-BUS-PARITY-ERROR = A parity error was detected on data read from local static random
access memory (LSRAM), dual access static random access memory (DSRAM), or
the gateway link board.
TWO-RESETS-WITHIN-A-WINDOW = Either the processor core board was powered up or two
processor resets occurred within some software-specified time interval.
UNEXPECTED-AUTOVECTOR = An unexpected, unsupported autovector exception occurred.
UNEXPECTED-INTERRUPT = An unexpected, unsupported interrupt exception occurred.
UNEXPECTED-SOFTWARE-TRAP = A TRAP instruction was executed that is not supported in the
current software release.
UNIDENTIFIED-EXCEPTION = An exception occurred that could not be uniquely identified.
UNINITIALIZED-INTERRUPT = An uninitialized interrupt exception occurred.
UNKNOWN-ERROR = The source of the error could not be determined.
UNRECOGNIZED-TRACE-INTERRUPT = A trace (single step) interrupt exception occurred that was
not recognized by GPITS.
UNUSED-TEXT-EXECUTED = An attempt was made to execute memory not used by the current
software release.
WATCHDOG-TIMER-EXPIRATION = An attempt was made to access an unequipped memory
location or write to a read only memory (ROM) address.

l = Contents of the message queue load pointer when a message queue error was detected.
m = Contents of the message queue unload pointer when a message queue error was detected.
n = Message queue where the error was detected. Valid value(s):
AP-MSGH = Message queue between the QGP-AP and QGP-MSGH.
MSGH-AP = Message queue between the QGP-MSGH and QGP-AP.
MSGH-MSCU = Message queue between the QGP-MSGH and MSCU.
o = State of the communication package for communication links if CLNK is shown, otherwise state of
the QLPS link. Valid value(s):
ACTIVE = Communication package was active but the link and action could not be
determined.
BASE = CM was called from the base level environment.
A-TRANS = Communication link A was transmitting.
B-TRANS = Communication link B was transmitting.
A-RECV = Communication link A was receiving.
B-RECV = Communication link B was receiving.
INACTIVE = Communication package was not active.

p = The QLPS network number.
q = The logical link control block in use when the error occurred.
r = Specifies the direction of the message being processed at the time of the fault:
   RCV = In the state of processing a message received from the network.
   SND = In the state of sending a message to the network.
s = The far end network address or endpoint specified when the error occurred.
t = Contents of the supervisor stack pointer (SSP).
u = Contents of the program counter (PC).
v = Contents of the status register (SR).
w = Exception vector number.
x = Contents of the user stack pointer (USP).
y = Contents of the frame pointer (FP).
z = Contents of processor address registers 0-5.
a\textsuperscript{1} = Contents of processor data registers 0-7.
b\textsuperscript{1} = Contents of the event source bit register (ESBR).
c\textsuperscript{1} = Contents of the interrupt mask bit register (IMBR).
d\textsuperscript{1} = Contents of the interrupt service request register (ISRR).
e\textsuperscript{1} = Contents of the gateway link event register (LEVR).
f\textsuperscript{1} = Contents of the gateway link mask register (LMSKR).
g\textsuperscript{1} = Contents of the gateway link interrupt service request register (LISR).

4. ACTION TO BE TAKEN

Monitor the progress of the recovery. Initiate manual actions if the recovery does not proceed as expected.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report when a quad-link packet switch protocol handler (QPH) QPIPE autonomously transitions from an ACT to an OOS state or vice versa. Reports are also produced when parent hardware is returned to service, or after a global switching module (GSM) full initialization, regardless of the resultant state of the QPH QPIPE. Excluded are state transitions associated with manual reconfigurations of QPH QPIPEs.

3. VARIABLE FIELD DEFINITIONS

a = GSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

b = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

d = QPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

e = Quad-link packet switch (QLPS) network number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

f = OPC (9-digit primary originating point code associated with the GSM). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for a description ANSI and AT&T/UNITEL formats.

g = Initial action (that is, the event that triggered the QPH QPIPE recovery report). Valid value(s): QLPS LOOPBACK = A QLPS loopback test on an ACT QPH QPIPE has failed (either due to periodic execution, or due to recovery as one/more QPHLNKs are lost). FRAMING ERROR = Framing errors detected by the PH22 SPORT circuitry on an ACT QPH QPIPE have exceeded thresholds. BAD ROUTING RAM = Bad routing RAM errors (incoming frames destined to another QPH endpoint were misrouted to this one) on an ACT QPH QPIPE have exceeded thresholds. QPH UNASSIGN = The parent QPH channel group is being unassigned (either manual or fault recovery removal of the PH22 serving the QPH channel group, when there is no STBY PH22 available on the same shelf).
AUTO RESTORE = Indicates an OOS QPH QPIPE was restored by autonomous recovery.
INITIALIZATION = Results of QPH QPIPEs scheduled for restoral following a full SM initialization or
due to audit recovery.
INFO ONLY = When a QPH QPIPE is removed from service, the status of the mate QPH
QPIPE on the same QPH is reported for information only, if it is OOS. The loss of
the last QPH QPIPE on a QPH will reduce capacity of CCS message transport.

h = Time stamp of initial event being reported to the SMP (or when an ISPA terminal process is
scheduled for a restore during an initialization). Format is hh:mm:ss (where hh is the hour in 24
hour format, mm is minutes and ss is seconds).

i = QPH QPIPE recovery actions taking place during 10 second consolidation interval. Valid value(s):
TRANSIENT OUTAGE = The QPH QPIPE was removed due to the specified initial event, but was
recovering autonomously this could be due to a "true" transient error, or timeslot
mapping errors between the TSI and QPH. The resultant QPH QPIPE state will be
ACT.
QLPS SWITCH = The QPH QPIPE was removed due to the specified initial event, but the QLPS on
the corresponding network was switched as an integral part of the recovery,
removing the source of the fault. The resultant QPH QPIPE state will be
ACT.
FRAMING ERROR = The affected QPH QPIPE is experiencing a permanent framing error condition
(probably due to undetected parent CM hardware errors), and the source of the
errors cannot be reconfigured. The resultant QPH QPIPE state will be
OOS-LVL1-FRAME.
QLPS LOOPBACK FAIL = The affected QPH QPIPE is experiencing a permanent QLPS loopback
failure condition (probably due to undetected parent CM hardware errors), and the
source of the errors cannot be reconfigured. The resultant QPH QPIPE state will be
OOS-QLPSLB.
QPH LOOPBACK FAIL = The original QPH QPIPE error detected is actually due to a PH SPORT
error, and the parent PH cannot be switched/removed. The resultant QPH QPIPE
state will be OOS-QPHLB.
QPH SWITCH = The original QPH QPIPE error detected is actually due to a PH fault, but the QPH
QPIPE was recovered due to a PH switch. The resultant QPH QPIPE state will be
ACT.
QPH UNASSIGNED = The QPH channel group was unassigned, due to a PH removal (manual/fault
recovery action) when no STBY PH22 on the same shelf is unavailable. The
resultant QPH QPIPE state will be OOSF-PH.
CM HARDWARE OUTAGE = The QPH QPIPE outage was actually due to parent CM hardware
(QLTMSLNK/TMSLNK) removals, when QLPSs in that network cannot be switched
probably, the original detected error was a QLPS loopback failure or framing error.
The resultant QPH QPIPE state will be OOSF-CM.
MAN QPIPE REMOVE = The initial fault was stabilized by manual QPH QPIPE removal. The
resultant QPH QPIPE state will be OOS-DACT.
PATH FAILURE = During recovery of the initial QPH QPIPE fault, the TSI-QPH path could not be
established. The resultant QPH QPIPE state will be OOS-LVL1-PATH.
AUTO RECOVERY = The QPH QPIPE has been autonomously recovered (either due to autonomous
recovery actions, including initializations or the recovery of parent
QLTMSLNK/TMSLNK hardware, or QPH channel group assignment). The resultant
QPH QPIPE state will be ACT.

j = Resultant QPH QPIPE state. Valid value(s):
INIT = QPH QPIPE restore should be scheduled, but is not (only valid during GSM
minimum mode operation).
ACT = The QPH QPIPE is functioning normally. A loopback test to the ACT QLPS has passed and child QPHLNKs may be established.

OOS-DACT = The QPH QPIPE has been manually deactivated (removed from service). Exit from this state requires a manual QPH QPIPE restore (or occurs during a full GSM initialization).

OOS-LVL1-PATH = The QPH QPIPE is OOS because a TSI-QPH path could not be established during a QPH QPIPE restore attempt (probably due to database read failures or other resource problems). SMP-controlled periodic retries or external events will attempt to automatically recover such a QPH QPIPE.

OOS-LVL1-FRAME = The QPH QPIPE is OOS because SPORT circuitry on the PH has detected framing errors (probably due to undetected QLPS network hardware errors or TSI faults). A local loopback test (at the PH) has passed, but framing errors persisted when the QPH QPIPE was reconnected to the QLPS network/TSI. SMP-controlled periodic retries or external events will attempt to automatically recover such a QPH QPIPE, or a transition to a more stable OOS state will occur as hardware errors are detected by fault recovery.

OOS-QLPSLB = The QPH QPIPE has its associated TSI-QPH path established, and the QPH SPORT channel is activated (including a local loopback test in the PH), and periodic attempts to pass a loopback test to the ACT QLPS are scheduled. However, the QPH QPIPE is still OOS, as the QLPS loopback test has not yet passed (probably due to undetected QLPS network or TSI faults). QPH-controlled periodic retries or external events will attempt to automatically recover such a QPH QPIPE, or a transition to a more stable OOS state will occur as hardware errors are detected by fault recovery.

OOS-QPHLB = The QPH QPIPE is OOS, as a local loopback test (at the PH) was performed and failed, indicating the problem is within the resident PH hardware. Another source of this status is the inability of the SPORT to be activated (a hardware failure). An automatic QPH switch was requested, but no STBY spare PH22 is available on the same shelf the QPH remains in-service, as the mate QPH QPIPE is ACT. A spare PH22 on the same shelf must be restored, or the faulty PH containing the OOS-QPHLB QPH QPIPE must be manually removed/repairs, to recover the QPH QPIPE.

OOSF-PH = The QPH is OOS due to "family-of-equipment" reasons because the channel group associated with this QPH QPIPE is unassigned (due to a manual or fault recovery removal of a PH22, when there was no STBY spare PH22 available on the same shelf). Automatic attempts to restore the affected QPH QPIPE will occur, when a PH22 is repaired and/or restored, and the parent QPH channel group is reassigned.

OOSF-CM = The QPH QPIPE is OOS due to "family-of-equipment" reasons associated with a parent TMSLNK/QTMSLNK outage (communication module or CM hardware). Automatic attempts to restore the affected QPH QPIPE will occur, when the OOS TMSLNK/QTMSLNK is repaired and/or restored. Note that OOS-LVL1-PATH, OOS-QPHLB, OOS-DACT and OOSF-PH are of higher priority (as they reflect local conditions associated with the QPH endpoint), and an OOSF-CM state will not be reported in this case, even if parent TMSLNK/QTMSLNK hardware is OOS.

4. ACTIONS TO BE TAKEN

If the final QPH QPIPE state reported is not ACT, or even if the state is ACT and the recovery specified was
TRANSIENT OUTAGE, corrective maintenance actions are required. Refer to the 235-200-116 for additional information.

5. ALARMS

This message is accompanied by a MINOR alarm only if the resultant state of any QPH QPIPE in the report is equal to OOS-LVL1-PATH/FRAME, OOS-QLPSLB or OOS-QPHLB.

2. REASON FOR OUTPUT

To respond to a previously entered REPT:RCHIST input message. Format 1 is the starting and completion message for all types of RC batch history message. Format 2 is the activity report. Format 3 is the summary report. Format 4 is the detail report.

3. VARIABLE FIELD DEFINITIONS
a = Clerk name as input in REPT:RCHIST input message.

b = Completion code of REPT:RCHIST input message. Valid value(s):
   ABORTED = Input request was aborted after starting. Refer to variable "c" for the reason that
              the message was not started.
   COMPLETED = Input message has completed and report has been generated.
   NOT_STARTED = Input message was not started. Message-text provides the reason why.
   STARTED = Input message was started and requested report should be generated.
   STOPPED = Input request was stopped after starting. An STP:RCHIST message initiated stop.

c = Expanded reason for completion code.

d = Clerk name of each RC batch file in the system.

e = Number of RCs.

f = Status of RC. Valid value(s):
   C = Complete.
   D = Demand.
   E = Error.
   P = Pending.

g = Service order number, used for RC batch time release.

h = Item number, used for RC batch time release.

i = Message number, used for RC batch time release.

j = Month the RC was released. For RC batch time release, the month the RC is to be released
   (activated).

k = Day the RC was released. For RC batch time release, the day the RC is to be released
   (activated).

l = Year the RC was released. For RC batch time release, the year the RC is to be released
   (activated).

m = Hour the RC was released. For RC batch time release, the hour the RC is to be released
   (activated).

n = Minute the RC was released. For RC batch time release, the minute the RC is to be released
   (activated).

o = RC view name.

p = Operation of RC. Valid value(s):
   D = Delete.
   I = Insert.
   U = Update.

q = Key data.
r = RC view.

REPT:RCL

Software Release: 5E14 and later
Message Class: SM
Application: 5
Type: Output

1. FORMAT

[1] REPT RCL GROUP BETWEEN RSM=a AND RSM=b AT SITE=c
    INTRA-SITE COMMUNICATION { LOST | RESTORED }

[2] REPT RCL GROUP ON RSM=a TOWARD RSM=b AT SITE=c
    REPORTING ERROR: d
    RECOVERY ACTION TAKEN: e

2. REASON FOR OUTPUT

To report the occurrence of an error in a multi-module remote switching module (MMRSM) on the set of remote communication links (RCLs). These links are used to handle message traffic in an MMRSM while in standalone, and the re-configurations or recovery actions taken on that RCL group. In addition this reports when all communication through these links has been lost. The facilities (FACS) and the communication digital facility interfaces (CDFIs) must be in service for the RCLs to be in service.

3. VARIABLE FIELD DEFINITIONS

a = Number of the reporting remote switching module (RSM).
b = Number of the RSM connected to the other end of this link group.
c = Name of the MMRSM site.
d = Error type. Valid value(s):
    CM OVERFLOWING ITS QUEUES = This indicates that CM is overloaded and is running out of storage for outgoing packets. This problem is self clearing but this message indicates that some messages may have been lost.
    FAR END REQUESTED RESTART = The other RSM's level 3 communication process requested a restart. Messages in their process of reception or transmission will be lost.
    ICST MESSAGE GARBLED = This indicates that the ICST message was corrupted. If the system does not recover from this take each CDFI between the two RSMs out in turn and diagnose it.
    ICST TIMING OUT = ICST is a routine message whose purpose is to verify the RCLs while the MMRSM is communicating with the host. This message is not being received. Check the DLTU page for the two RSMs and verify that there are RCLs and CDFIs in service between the two RSMs.
    INVALID DATA IN PACKET HEADER = This indicates that the level 3 communication process has detected illegal data in the packet header. This is most likely caused by corruption of the data by a CDFI in the link group interconnecting the two RSMs.
    LEVEL 3 SEQUENCE NUMBER INVALID = This most likely indicates that a packet was lost. The message it was part of will be retransmitted.
    PACKET ALREADY ON INPUT LIST = A packet was received twice. If the error persists remove each of the CDFIs in turn and diagnose them.
RECEIVED PACKET GREATER THAN 22 BYTES = This indicates that the level 3 communication process has detected a packet that is greater than 22 bytes long. This large a packet is illegal and indicates that there is a problem in the one or more of the CDFIs that connect these two RSMs. This can be in either this RSM or the other RSM.

RECEIVED PACKET LESS THAN 4 BYTES = This indicates that the level 3 communication process has detected a packet that is less than 4 bytes long. This small a packet is illegal and indicates that there is a problem in the one or more of the CDFIs that connect these two RSMs.

SESSION LAYER RCV SEQ NUMBER INVALID = A packet was received out of sequence. The message that this packet was part of will be retransmitted. This can be in either this RSM or the other RSM.

SPP OF CM SYSTEM PROCESS OCCURRED = The level 3 communication process was purged. All messages in the process of transmission or reception have been lost.

TIMEOUT IN PACKET ACKNOWLEDGE = This indicates that no acknowledgement has been received for a packet sent to the other RSM. The entire message that this packet is a part of will be retransmitted. This can occur due to problems in CDFIs, problems in the other RSM (such as initializations), or due to problems in this RSM. Check the DLTUs on the RSMs and verify that all the hardware is in an operational state.

e = Recovery action taken. Valid value(s):
CDFI REMOVED = An automatic request to remove and diagnose the CDFI was made. This will only occur if the MMRSM is communicating with the host.
NONE = Self explanatory.
RCL GROUP RESET = All messages in the process of transmission or reception were lost and all resources idled.
RCL GROUP RESTART = A message in the process of transmission was lost and all the associated resources idled.
RCL HARDWARE INITIALIZED = The portion of the CDFI associated with the RCLs was re-initialized.
RCL REMOVED = The RCL was removed from service.

f = Optional post-mortem information.

4. ACTION TO BE TAKEN

Monitor the status of the RCLs between the two RSMs and diagnose the CDFIs if necessary.

5. ALARMS

Minor.

Input/Output Messages:
None.
REPT:RCLK-ERE

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT RCLK=a-b {RCREF c|RCXC} {HIGH|LOW} ERROR RATE EXCEEDED [EVENT d]

2. REASON FOR OUTPUT

To report that the remote clock (RCLK) reference at the specified switching module (SM) exceeded error rate tolerances.

3. VARIABLE FIELD DEFINITIONS

HIGH = The high error rate threshold has been exceeded. The reference will be removed.
LOW = The low error rate threshold has been exceeded. This is a non-critical error, but the user may choose to investigate.
RCXC = Cross-couple reference exceeded the tolerance.
a = Switching module (SM) number.
b = Remote clock (RCLK) side.
c = Remote clock reference number.
d = Event number for requested action.

4. ACTION TO BE TAKEN

Make a brief inspection of the remote clock (RCLK) complex backplane to ensure that all the connectors are securely attached. Manually restore the external references if the active RCLK lost phase lock or restore the RCLK if the standby RCLK lost phase lock.

If the active RCLK fails to phase lock, switch RCLKs and determine if the other RCLK can lock to an external reference.

If the other RCLK can phase lock to an external reference after the switch, the problem probably is in the RCLK hardware. Remove the standby RCLK and diagnose it.

If the active RCLK cannot lock on the switch, check the T1 links starting at the RCLK back to the reference source and verify that a reliable DS1 signal is being received.

If the standby RCLK cannot phase lock, determine the problem from the diagnostic results.

REPT RCLK=a-b RCOSC FAULT EVENT c
   ASYNCHRONOUS REPORT X'
   eefggghh iijjkkll mmnnoopp qqrrsstt uuvv0000

2. REASON FOR OUTPUT

To report that the remote clock oscillator (RCOSC) has experienced a fault.

3. VARIABLE FIELD DEFINITIONS

   RCOSC = Remote clock oscillator (RCOSC).
   a  = Switching module (SM) number.
   b  = Remote clock (RCLK) side.
   c  = Event number for requested action.
   e–v = Contents of RCLK registers. Refer to the APP:RCLK appendix in the Appendixes section of the Output Messages manual for a definition of these values.

4. ACTION TO BE TAKEN

Check the receive-only printer (ROP) for past actions. (Could possibly indicate defective oscillator.) If no further errors on oscillator, take no action. If errors are present, consider replacing the oscillator.

Output Appendix(es):

APP:RCLK
REPT:RCLK-RLO

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT RCLK=a-b RREF c LOW OOF EVENT d
   ASYNCHRONOUS REPORT X'
   eeffgghh iijjjkkk llmmnnoopp qrrssstt uuvv0000

2. REASON FOR OUTPUT

To report that the remote clock (RCLK) reference has experienced a low out-of-frame error.

3. VARIABLE FIELD DEFINITIONS

LOW = The low out-of-frame threshold has been exceeded. This is a noncritical error, but the user may choose to investigate.

a = Switching module (SM) number.

b = RCLK side.

c = Remote clock reference (RREF) number.

d = Event number for requested action.

e-v = Contents of RCLK registers. Refer to the APP:RCLK appendix in the Appendixes section of the Output Messages manual for a definition of these values.

4. ACTION TO BE TAKEN

Make a brief inspection of the RCLK complex backplane to ensure all connectors are securely attached. Manually restore the external references if the active RCLK lost phase lock or restore the RCLK if the standby RCLK lost phase lock.

If the active RCLK fails to phase lock, switch RCLKs and determine if the other RCLK can lock to an external reference.

If the other RCLK can phase lock to an external reference after the switch, the problem probably is the RCLK hardware. Remove the standby RCLK and diagnose it.

If the active RCLK cannot lock on the switch, check the T1 links starting at the RCLK back to the reference source and verify that a reliable DS1 signal is being received.

If the standby RCLK cannot phase lock, determine the problem from the diagnostic results.

Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT RCV: a

2. REASON FOR OUTPUT

To report that the recent change log (RCLOG) space is 100 percent in use. All recent changes are disabled.

3. VARIABLE FIELD DEFINITIONS

a = Status of request. Valid value(s):
   DB_LGCLDIS = RC is disabled, the log is full.
   DBLGFPWSET = RC logs content is over the warning threshold.
   DBLGFPWCLR = RC logs content is below the warning threshold.

4. ACTION TO BE TAKEN

When a = DB_LGCLDIS an office-dependent data (ODD) back-up operation is required as soon as the system real-time resources allow.

When a = DBLGFPWSET this means one of the AM, SM, RED, CMP, and CORC log spaces is over the 85% warning threshold. Run the OP:RCSTAT command to determine which log space is over 85% full.
   An office-dependent data (ODD) back-up operation is required as soon as the system real-time resources allow.

When a = DBLGFPWCLR this means that the log spaces are in normal condition. No action is required.

1. FORMAT

REPT RDFI=a-b-c TRBL d EVENT=e
   f RECOVERY ACTION g
   h i j
   [k] . . .

2. REASON FOR OUTPUT

To report the occurrence of a hardware error in a remote digital facilities interface (RDFI) circuit.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Digital line/trunk unit number.
c  = Circuit number.
d  = Error report. Refer to Exhibit A.
e  = Event number.
f  = Error type qualifying the error report (refer to Exhibit A).
g  = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   INITIALIZE  = The failing circuit has been initialized.
   RMV         = The failing circuit will be removed from service. Manual intervention is required to
                  restore the circuit to service.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A DGN:DFI message
                    will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:DFI
                  message will be printed with the result of the diagnostic.

h  = External logical circuit name.
i  = Current decimal number of errors of this type recorded.
j  = Error count threshold above which the recovery action will be escalated.
k  = Register contents (refer to Exhibit A).

Note: Skip bytes 1 and 2, \( k \) value starts from byte 3.
### Exhibit A

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0095</td>
<td>Transmit formatter exercise alarm data.</td>
</tr>
<tr>
<td>0x0096</td>
<td>Receive synchronizer exercise alarm data.</td>
</tr>
<tr>
<td>0x0097</td>
<td>Framer exercise alarm data.</td>
</tr>
<tr>
<td>0x0090</td>

<td>Total number of errored channels.</td>
</tr>
<tr>
<td>DFI STATUS ERROR</td>
<td>= Trouble indication in the DFI circuit microprocessor.</td>
</tr>
</tbody>
</table>
4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

5. ALARMS

An alarm will be displayed if the recovery action results in the circuit being removed from service. RDFIs will display a minor alarm for the first facility which is removed from service and a major alarm if more than one facility is out of service.

Type: Output

1. FORMAT

REPT RDFI=a-b-c TRBL REMOTING FACILITY PATH FAULT d
e EBIT CONTINUITY FAILURE RECOVERY ACTION f

2. REASON FOR OUTPUT

To respond to the E-bit parity errors occurring between the network side of a remote switching module time-slot interchange (RSM-TSI) and the peripheral side of the host switching module time-slot interchange (HSM-TSI).

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Digital line/trunk unit (DLTU) number.
c = Service group number.
d = Event number.
e = Error type that indicates EBIT continuity failure.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
   INITIALIZE = The failing circuit has been initialized.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input/Output Messages:

None.
REPT:REAL-TIME

Software Release: 5E14 and later
Message Class: AMA
Application: 5
Type: Output

1. FORMAT

REPT REAL TIME BILLING MEMORY THRESHOLD a
SM = b THRESHOLD = c% OCCUPANCY = d%

2. REASON FOR OUTPUT

To report that the real time billing memory (RTBM) occupancy has crossed one of its pre-defined threshold levels. The RTBM stores the real time call detail (RTCD) records when they are cannot be transmitted off the switch. If the RTBM occupancy level is 100%, all new RTCD records will be discarded.

3. VARIABLE FIELD DEFINITIONS

a = Threshold direction. Valid value(s):
  INCREASED = The occupancy threshold has increased.
  DECREASED = The occupancy threshold has decreased.
  NO CHANGE = The occupancy threshold has not changed.

b = Switching module (SM) number.

c = Threshold level crossed. A new report will be printed each time a threshold level is crossed. Valid value(s):
  50% = RTBM occupancy increased beyond 50%.
  80% = RTBM occupancy increased beyond 80%.
  100% = RTBM occupancy increased to 100%.
  99% = RTBM occupancy decreased below 99%.
  79% = RTBM occupancy decreased below 79%.
  49% = RTBM occupancy decreased below 49%.

d = Current percentage of RTBM occupied with untransmitted records.

4. ACTION TO BE TAKEN

The path to the billing collector may be down. Please verify the integrity of each portion of the path, including:
- The path between this SM and the global billing SM (such as, QLPS connectivity, CTS links).
- The path between the global billing SM and the ethernet hub.
- The path between the ethernet hub and the collector system billing collector.

If any of these paths are down, take corrective action to bring them back up.

In addition, consider increasing the RTBM memory size to allow storage of more real time call detail records.

5. ALARMS
If the RC/V View 8.1 indicates that RTBM alarms are turned on, then the following alarms will apply:

Minor = A minor alarm indicates that the RTBM occupancy increased above 50%.
Major = A major alarm indicates that the RTBM occupancy increased above 80%.
Critical = A major alarm indicates that the RTBM occupancy increased 100%. All new RTCD records will be discarded until the occupancy level decreases.

In all other cases, no alarm will be generated.

FIRST HAPPENED AT: b
LAST SELECTED AT: c
ERROR COUNT: d
REPAIRED EQUIPMENTS: e

TMS = f LINK INFORMATION:
gggggggg gggggggg gggggggg gggggggg gggggggg gggggggg gggggggg gggggggg
gggggggg gggggggg gggggggg gggggggg gggggggg gggggggg gggggggg gggggggg

THERE MAY BE POTENTIAL E-BUS ERROR
PLEASE CONTACT LUCENT CUSTOMER SUPPORT

IF YOU DO NOT WANT TO SEE THIS MESSAGE HOURLY
PLEASE GO TO RCV:MENU:FATLP TO TURN IT OFF

2. REASON FOR OUTPUT
This is the daily prints after 6 a.m. to indicate that this fault analysis data (FADATA) has recurred.

3. VARIABLE FIELD DEFINITIONS

a = The last happened time stamp of this FADATA.
b = The first happened time stamp of this FADATA.
c = The last selected time stamp of this FADATA for trouble shooting.
d = Total count of this FADATA which had happened.
e = Associated repaired equipments list.
f = TMS side.
g = These fields indicate the CM2 TMSLNK(s) affected by the reported errors. There are 2 rows of TMSLNK data. The first 4 words of the first row correspond to TMSLNKs 127 - 0, the second 4 words of the first row correspond to TMSLNKs 255 - 128. For the second row, the first 4 words correspond to TMSLNKs 383 - 256, and the second 4 words correspond to TMSLNKs 511 - 384.

There are 16 4-byte TMSLNK data blocks. Each block contains 32 TMSLNKs and the TMSLNK numbers increase sequentially. For example, the first 4 byte block (4th word in 1st row) contains TMSLNKs 0-31, the next word (3rd word in 1st row) contains TMSLNKs 32-63, and so on. Each byte is 8 bits for eight TMSLNKs and 4 bytes equals 32 TMSLNKs. Each byte is read in reverse. For example, the first byte of a TMSLNK block contains bits for TMSLNKs 7-0, the next byte contains bits for TMSLNKs 15-8, the next byte contains bits for TMSLNKs 23-16, and the last byte contains...
bits for TMSLNKs 31-24.

Normally the "TMSLNKS AFFECTED" field will contain the TMSLNK(s) that are detecting the errors.

4. ACTIONS TO BE TAKEN

As indicated, there may be potential TMS E-BUS problem. Contact the Lucent customer technical support to conduct trouble shooting. refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

RCV:M\-FATLP
REPT:REGISTER-A

Software Release: 5E14 only  
Message Class: ASRTMON, INT_MON  
Application: 5  
Type: Output

1. FORMAT

REPT {AM|SM=a|CMP=b-c d|MCTSI=a-b d|QGP=b-e} REGISTER DUMP ENV=f SRC=g EVENT=h  
REGISTER DATA: i i i i

. . . .  
. . . .

2. REASON FOR OUTPUT

To report the contents of the processor registers associated with a previous REPT:STACK-FRAME output message.

The register data is dependent upon the reporting processor type.

The ASRTMON message class is used for defensive check failure error, otherwise the INT_MON message class is used.

This message is normally logged, but will also print in response to the input message OP:POSTMORT.

3. VARIABLE FIELD DEFINITIONS

AM = Administrative module.

CMP = Communication module processor.

MCTSI = Module controller/time slot interchange unit.

SM = Switching module.

QGP = Quad-link gateway processor.

a = SM number.

b = Message switch side (MSGS) or MCTSI side.

c = Physical CMP number.

d = Processor being reported on. Valid value(s):

MATE = Mate CMP.

MH0 = Message handler 0.

MH1 = Message handler 1.

MH2 = Message handler 2.

PRIM = Primary CMP.

e = QGP number.

f = Environment in which this request was stimulated. Refer to the APP:ENVIR appendix in the
Appendixes section of the Output Messages manual for a list of environments and the associated definitions.

\[ g \] = Source of the stack trace request. Valid value(s):

- \[ AUD \] = Audit.
- \[ DCF \] = Defensive check failure.
- \[ FR \] = Fault recovery.
- \[ UNKNOWN \] = Unknown source.
- \[ SI \] = System integrity.
- \[ SPP \] = Single process purge.

\[ h \] = Event number.

\[ i \] = Hexadecimal value of the contents of the processor registers in the following order:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AM</td>
<td>r0, r1, r2, r3, r4, r5, r6, r7, r8, r9, r10, r11, r12, r13, r14, r15</td>

### 2. REASON FOR OUTPUT

To report the contents of the processor registers associated with a previous REPT:STACK-FRAME output message.

The register data is dependent upon the reporting processor type.

Format 1 is used for all register dump messages except for the CM3 (CMP, MSGS, and ONTC) register dump messages.

Format 2 is used for the CM3 register dump messages.

The ASRTMON message class is used for defensive check failure error, otherwise the INT_MON message class is used.

This message is normally logged, but will also print in response to the input message OP:POSTMORT.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = SM number.
- **b** = Message switch (MSGS), office network and timing complex (ONTC), or MCTSI side.
- **c** = Physical CMP number.
- **d** = Processor being reported on. Valid value(s):
  - MATE = Mate CMP.
MH0 = Message handler 0.
MH1 = Message handler 1.
MH2 = Message handler 2.
PRIM = Primary CMP.

e = QGP number.

f = Environment in which this request was stimulated. Refer to the APP:ENVIR appendix in the Appendixes section of the Output Messages manual for a list of environments and the associated definitions.

g = Source of the stack trace request. Valid value(s):
   AUD = Audit.
   DCF = Defensive check failure.
   FR = Fault recovery.
   UNKNOWN = Unknown source.
   SI = System integrity.
   SPP = Single process purge.

h = Event number.
i = Hexadecimal value of the contents of the processor registers.

The registers for format 1 messages are arranged in the following order:

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Output Message(s):

   ADDITIONAL REGISTER DATA:
   XER=n CTR=n LR=n CR=n

2. REASON FOR OUTPUT

To report the contents of the processor registers associated with a previous REPT:STACK-FRAME output message.

The register data is dependent upon the reporting processor type.

Format 1 is used for all register dump messages except for the CM3 (CMP, MSGS, and ONTC), PowerPC packet switching unit protocol handler (PSUPH) register dump messages.

Format 2 is used for the CM3 and PowerPC PSUPH register dump messages.

The ASRTMON message class is used for defensive check failure error, otherwise the INT_MON message class is used.

The CP message class is used for defensive check failure error on the PSUPH.

This message is normally logged, but will also print in response to the input message OP:POSTMORT. For the PSUPH, register dump report will also be printed out in response to the input message OP:HISTORY.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = Message switch (MSGS), office network and timing complex (ONTC), or MCTSI side.
c  = Physical CMP number.

d  = Processor being reported on. Valid value(s):
   MATE  = Mate CMP.
   MH0   = Message handler 0.
   MH1   = Message handler 1.
   MH2   = Message handler 2.
   PRIM  = Primary CMP.

  = QGP number.  = PSU unit number.  = PSU shelf number.  = PSUPH unit number.
  = CHNG number. = Environment in which this request was stimulated. Refer to the
  APP:ENVIR appendix in the Appendixes section of the Output Messages manual for a list of
  environments and the associated definitions.

  = Source of the stack trace request. Valid value(s):
   AUD  = Audit.
   DCF  = Defensive check failure.
   FR   = Fault recovery.
   UNKNOWN  = Unknown source.
   SI  = System integrity.
   SPP  = Single process purge.

  = Event number.

  = Message number.

  = Hexadecimal value of the contents of the processor registers.

The registers for format 1 messages are arranged in the following order:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AM CMP/QGP PSUPH</td>
<td>r0, r1, r2, r3, r4, r5, r6, r7, r8, r9, r10, r11, r12, r13, r14, r15</td>
</tr>
<tr>
<td>SM/CM2 CMP/QGP PSUPH</td>
<td>a0, a1, a2, a3, a4, a5, a6, a7, d0, d1, d2, d3, d4, d5, d6, d7</td>
</tr>
</tbody>
</table>

Messages in format 2 are arranged according to the labels on the left side of the register dump. The
general purpose registers are organized so that r0 is the first entry in the first line and r31 is the last
entry in the sixth line. Additional registers (xer, ctr, lr, and cr) are printed in the last line of the
register dump and are individually labeled.

  = Valid value(s):

   AM  
   CMP=b-c  
   MCTSI=a-b  
   QGP=b-e  
   SM=a  
   MSGS=b  
   ONTC=b  
   PSUPH=a-f-g-h

4. ACTIONS TO BE TAKEN

   APP:ENVIR
REPT:REMACS

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,CNI
Type: Output

1. FORMAT

REPT REMACS
  WARNING: REMACS DATA AUDITS ARE INHIBITED

2. REASON FOR OUTPUT

To report status information concerning the remote access subsystem (REMACS).

3. VARIABLE FIELD DEFINITIONS

No variables

4. ACTION TO BE TAKEN

This message indicates that the status of the REMACS data audits is inhibited. It results if the user previously executed the input message to manually inhibit the REMACS data audits. Refer to the EXC:REMACS input message in the Input Messages manual. This message will print about once every 5 minutes from the time the REMACS data audits were inhibited.

REMACS data audits correct data inconsistencies between the AM and the CNI nodes. While the REMACS data audits are inhibited, any inconsistencies will not be detected.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

EXC:REMACS

Output Message(s):

EXC REMACS
REPT:REORD
Software Release: 5E14 and later
Message Class: PLNT
Application: 5
Type: Output

1. FORMAT

[1] REPT REORD: PART a OF b

<td>d</td>
<td>e</td>
<td>f</td>
<td>g</td>
<td>h</td>
</tr>
</tbody>
</table>

[2] REPT REORD: {NO REORDER DATA COLLECTED | MANUAL TERMINATION W/O DATA REPORTING}

2. REASON FOR OUTPUT

To respond to an ALW:REORD-SM input message upon the expiration of an associated 15-minute timer, or to an INH:REORD prior to the expiration of the timer.

Format 1 is used when there is collected reorder data to be printed on the receive-only printer (ROP).

Format 2 is used when no reorder data is collected, or in response to an INH:REORD without the print option specified.

3. VARIABLE FIELD DEFINITIONS

a

b = Total number of reports.

c = Time of reorder, in the form hours:minutes:seconds.

d = Originating switching module (SM) number.

e = Originating port number in hexadecimal.

f = Call state as seen from the originating customer. Valid value(s):
   A = Audible ringing.
   D = Dial.
   T = Transient.
   U = Other (unspecified).

g = Call type. Valid value(s):
   IW = Operator Support Position System inward.
   LL = Line-to-line.
   LT = Line-to-trunk.
   TL = Trunk-to-line.
   TT = Trunk-to-trunk.
NA = Not available.

h = Called directory number. This is a switch-translated directory number, not necessarily the dialed digit string.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

ALW:REORD-SM
INH:REORD
REPT:REORDER
Software Release: 5E14 and later
Message Class: SED
Application: 5
Type: Output

1. FORMAT

REPT REORDER THRESHOLD SM=a RCR=b LEVEL=c

2. REASON FOR OUTPUT

To alert maintenance personnel that the reorder count ratio, as calculated by measurements, has exceeded the limits set by recent change in RC/V 8.1. If the feature has been activated, a message containing the switching module (SM) number, reorder count ration (RCR), and threshold level (minor, major, or critical) will be sent to the receive-only printer (ROP) every 5 minutes.

3. VARIABLE FIELD DEFINITIONS

a = The number of the SM that sent the counts.
b = Reorder count ratio (RCR). This value represents the number of reorder calls divided by the number of completed calls.
c = Reorder threshold level (minor, major, or critical).

4. ACTION TO BE TAKEN

This is an advance warning of a possible problem with the switch. Some investigation may be required to determine the cause of the alarm. No specific recovery strategy or user actions are planned.

5. ALARMS

Minor, major, or critical.

REPT:REORG

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT REORG a RELATION = {b|ALL|g} {AM|SM= c|CMP= d} [e] [f]

2. REASON FOR OUTPUT

To report the status or need of database relation reorganization. If the reorganization failed, the failing reason is also shown. The ODDWARN lamp on the 116 MCC page for AM, the 1800,x MCC page for SM, and the 1850, 1851 MCC pages for CMP, also will be lit if the reorganization is not completed.

3. VARIABLE FIELD DEFINITIONS

ALL = Relation reorganization completed on all relations for the specified processor unless manually inhibited or roll forward in progress. Refer to definition of variable field 'g'.

AM = Relation is only on the administrative module (AM).

a = Reorganization states. Valid value(s):
ABORTED = Relation could not be reorganized due to corrupted data in current copy of relation.
CANCELED = Relation could not be reorganized due to overflow in new copy of relation.
COMPLETED = Relation has been reorganized.
COMPLETED CONDITIONALLY = Relation has been reorganized but failed to log for communications module processor (CMP) generated key relation.
FAILED = Relation could not be reorganized due to system failure.
INHIBITED = Reorganization was inhibited. Roll forward was in progress.
INHIBITED TUPLES IN OVERFLOW = Reorganization was run under inhibit mode, and relation has tuples in overflow.
STOPPED = Relation could not be reorganized due to low ODD space.

b = Name of the database relation.

c = Switching module (SM) number.

d = CMP number.

e = Reason for failing reorganization. Valid value(s):
BAD STATE FOR GENERATED KEY REORG
CAN NOT BEGIN TRANSACTION
CAN NOT COUNT TUPLES IN RELATION
CAN NOT CREATE RELATION
CAN NOT END TRANSACTION
CAN NOT FREE RELATION
CAN NOT GET OPEN DICTIONARY
CAN NOT LOG FOR CMP
CAN NOT OPEN RELATION
4. **ACTION TO BE TAKEN**

<table>
<thead>
<tr>

- EXC:REORG
- INH:REORG
- SET:REORG
OP : ODDWARN

Output Message(s):

OP : ODDWARN

Other Manual(s):
235-105-220   Corrective Maintenance
REPT:RETROFIT

Software Release: 5E14 and later
Message Class: SED_MON
Application: 5
Type: Output

1. FORMAT

[1]  REPT RETROFIT TOTAL SYSTEM DOWNTIME
    DOWNTIME=aa:aa:aa  b  EVENT=c

[2]  REPT RETROFIT PARTIAL SYSTEM DOWNTIME
    WEIGHTED DOWNTIME=aa:aa:aa  b  EVENT=c
    RETROFIT PARTIAL SYSTEM OUTAGE: d

2. REASON FOR OUTPUT

The retrofit downtime reports are printed approximately 10 minutes after the switch forward to the new software release.

Format 1 indicates the period of total loss of origination and termination capability. If a switch module fails to report its downtime, " - TIME MAY BE INVALID - " will be printed. If all switch modules fail to report downtime, then the outage time will be zeros and " - TIME NOT AVAILABLE - " will be printed.

Format 2 indicates the period of reduced call processing capability. If a switch module fails to report its downtime, " - TIME MAY BE INVALID - " will be printed. If all switch modules fail to report downtime, then the outage time will be zeros and " - TIME NOT AVAILABLE - " will be printed. If a switch module reports an outage of greater than 30 seconds, then a partial outage has occurred even though weighted downtime may be less.

3. VARIABLE FIELD DEFINITIONS

a = Outage time, in the form hours:minutes:seconds.

b = Time status. Valid values:
blank
TIME MAY BE INVALID
TIME NOT AVAILABLE

c = Event number.

d = System outage. Valid values:
YES
NO

4. ACTIONS TO BE TAKEN

- **Type**: Output

1. **FORMAT**

   ```
   REPT RETRY RPC DMA
   RETRY DMA ON RPCNa 0, RETRY COUNT = b
   TIME = c
   ```

2. **REASON FOR OUTPUT**

   The message switch module (MSW) in the administrative module (AM) detects a ring peripheral control (RPC) not responding to it for a predetermined number of message switch cycles. The module attempts to recover from that by cleaning up the path between the AM and the RPC and issuing a processor input output (PIO) to inform the RPC to retry the last direct memory access (DMA) job.

3. **VARIABLE FIELD DEFINITIONS**

   - `a` = A ring node (RN) group number.
   - `b` = Number of times the AM MSW retries the DMA.
   - `c` = AM real-time stamp when the retry occurs.

</tr>
</thead>
<tbody>
<tr>
<td>LINE</td>
<td>b</td>
<td>c</td>
<td>d</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To summarize electronic loop segregation (ELS) tests of routine exercise for hardware based in one or all switching modules (SMs) and the administrative module.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
   Note: If this field is blank, all SM ELS test summaries are to be printed.

b = Number of lines for which the tests are completed.

c = Number of lines skipped for reasons such as the lines were unassigned, out of service, or private branch exchange (PBX) lines.

d = Number of lines for which the tests were not started for reasons such as unavailability of resource, failure to release resources, or database error.

Note: If a summary of all test types (DGN, ELS, and FAB) is requested. If no electronic loop segregation (ELS) tests are run, variables 'a', 'b', and 'c' will all be reported as zero after a 24-hour summary.

4. ACTION TO BE TAKEN

None.

6. REFERENCES

None.
REPT:REX-SUM

Software Release: 5E14 and later
Message Class: REX
Application: 5,3B
Type: Output

1. FORMAT

REPT REX SUMMARY {IN PROGRESS | COMPLETED}
TIME         EQUIPMENT ID                  RESULT  RET     STATE
aa:aa:aa     b        c  [d      e]        f       [g]     h

2. REASON FOR OUTPUT

To report a summary of routine exercise (REX) results for all hardware units that were exercised.

3. VARIABLE FIELD DEFINITIONS

a = Local time when the exercise of this unit was completed (in hours, minutes and seconds).
b = Unit name.
c = Unit number.
d = Subunit name.
e = Subunit number.
f = Result of exercising the specified unit. Valid value(s):
   ABT = Diagnostics were aborted.
   ATP = All tests passed.
   CATP = Conditional ATP.
   ERR = Error return code received from maintenance input request administration (MIRA).
   FAULT = Unit was excessively faulty.
   INH = REX was inhibited for this unit.
   MAN = Unit was removed manually.
   NODGN = No diagnostic phases exist for this unit.
   NRPY = No reply received from MIRA.
   NTR = No tests were run.
   OOS = Unit was out-of-service (OOS); could not be exercised.
   PORTSW = Could not portswitch.
   STF = Some tests failed.
   TIMEOUT = Timeout occurred.

   g = Return codes. Valid value(s):
   2 = Request inhibited.
   3 = MIRA out of buffers.
   4 = MIRA cannot spawn diagnostic monitor (DIAMON) program.
   5 = Duplicate request already in queue.
   6 = Request aborted by STOP:DMQ or STP:DMQ input message.
   7 = Internal problem; request aborted.
= Remove attempt failed.
= Restore attempt failed.

h = The state of the unit after REX exercised it. Valid value(s):
ACT = Active.
GROW = Grow state.
INIT = Initializing.
OFL = Off-line.
OOS = Out-of-service.
STBY = Standby.
UNAV = Unavailable.
UNEQUIP = Unequipped.

Note: This field reflects the state of the unit when the exercise is finished, which may not be the current state of the unit. If external events result in the removal of a unit (that is, manually removed, removed from a fault, softswitch, and so forth), after REX has exercised it, the new state is not reflected in this variable.

4. ACTION TO BE TAKEN

If any units failed diagnostics or were left OOS, manual action is required to restore them.

5. ALARMS

None. This is an automatically generated report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:REX-UNABLE

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT REX UNABLE TO SEND MESSAGE TO APPLICATION REX PORT

[2] REPT REX UNABLE TO REQUEST PORTSWITCH FOR IOP DIAGNOSIS

[3] REPT REX ROP PORTSWITCH REQUEST DENIED

[4] REPT REX MTTY PORTSWITCH REQUEST DENIED

[5] REPT REX MAJOR ALARM a

[6] REPT REX CANNOT OPEN b

[7] REPT REX TERMINATED-INTERNAL REQUEST

[8] REPT REX MINOR ALARM a

2. REASON FOR OUTPUT

For Format 1, before REX removes the input/output processors (IOPs) for diagnosis, it will send a message to PT_REX to notify the applications of the removal. The applications can then gracefully stop their datalink transmission. If no process is connected to this port, this message will be printed and execution will continue normally.

For Format 2, before REX removes an IOP for diagnosis, it must make sure the portswitches for the maintenance terminal (MTTY) or receive-only printer (ROP) are not active. This message indicates REX had a problem locating the unit control block (UCB) for the ROP or MTTY.

For Format 3, REX sent a request to portswitch the ROP and it was denied or could not be executed.

For Format 4, REX sent a request to portswitch the MTTY and it was denied or could not be executed.

For Format 5, essential unit found to be out-of-service (OOS).

For Format 6, REX could not open the specified file to output the REX report.

For Format 7, REX received a sigterm signal and is terminating. For

Format 8, REX found an OOS unit with a controlling unit that is an IOP. This is a condition to signal a minor alarm.
3. VARIABLE FIELD DEFINITIONS

a = Name and number of the essential unit found to be OOS.
b = Name of the output file for REX report.

4. ACTION TO BE TAKEN

For Format 1, this report can be ignored if the application does not wish to receive the message from the UNIX® RTR REX process.

For Format 2, check the states of IOP subunits and portswitches (ROP and MTTY). Verify that a portswitch can be executed.

For Format 3, check to see if a manual portswitch can be requested.

For Format 4, check to see if a manual portswitch can be requested. Also check the states of the IOP subunits.

For Format 5, request a restoration on the hardware unit or community. No further action is required if the restore is successful. If the hardware unit or community actually failed to restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

For Format 6, determine if the specified file system is full, and remove unneeded files.

For Format 7 no action is required.

For Format 8, request a restoration on the hardware unit or community. No further action is required if the restore is successful. If the hardware unit or community actually failed to restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

5. ALARMS

This alarm may be a manually-requested report, or an automatically-generated report.

If a minor alarm occurs, take action as indicated in the report.

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Output Appendix(es):

APP : OMDB–X–REF
REPT:RG1AUD

Software Release: 5E14 and later
Message Class: CSS
Application: 5,CNI
Type: Output

1. FORMAT

[1] REPT RG1AUD
    RING 1 AUDIT ACTIVE FOR a MINUTES
    X'bbbbcccc X'dddddddd X'eeeeeeee

[2] REPT RG1AUD
    RG1AUD COMPLETED, f MINUTE DURATION EXPIRED
    X'bbbbcccc X'dddddddd X'eeeeeeee

[3] REPT RG1AUD
    RG1AUD ABORTED: IMS INITIALIZATION DETECTED

[4] REPT RG1AUD
    RG1AUD ABORTED: RING RECONFIGURATION DETECTED

2. REASON FOR OUTPUT

Prints as a result of a EXC:RG1AUD input message.

Format 1 prints after each 3 minute interval in which the Ring 1 Audit has been running. Format 2 prints after the Ring 1 Audit has run to completion. Format 3 prints when an IMS initialization occurs while the Ring 1 Audit is running. Format 4 prints when the CNI ring is re-configured while the Ring 1 Audit is running.

3. VARIABLE FIELD DEFINITIONS

a = The duration in minutes the Ring 1 Audit has been running (updated every 3 minutes)
b = The message sending rate in HEXADECIMAL (HIGH=X'0001, MED=X'000a, LOW=X'0064)
c = Requested duration of Ring 1 Audit in minutes (1-480 minutes)
d = The test pattern used in Ring 1 Audit message
e = Count of messages sent
f = The completed Ring 1 Audit duration in minutes (1-480 minutes).
4. ACTIONS TO BE TAKEN
None.

5. ALARMS
None.

[8] REPT RGP_PRT CIALIVE FAILURE
   RPG_PRT TERMINATING, PARENT ID = f, RETURN CODE = g

2. REASON FOR OUTPUT

Indicates anomalies with the print process of the RGRASP tool. The RGRASP kernel has gone away.

The print process has provided the RGRASP kernel with invalid argument values, or that the kernel buffer
management has detected an illegal buffer pointer condition. The RGRASP kernel has returned an unrecognized
error return code from the print processes operating system trap function call. A non-RGRASP message has been
encountered by the RGRASP tool. A number of RGRASP messages were lost. The RGP_PRT process failed to
connect to a port. The RGP_PRT process call to Clalive() failed.

3. VARIABLE FIELD DEFINITIONS

a = Operating system trap (OST) return code.

b = Non-RGRASP message type.
c = Number of RGRASP messages lost.

d = PT_RGPU process ID.

e = RGP_PRT process ID.

f = Parent process ID of RGP_PRT

g = Return code from the Clalive() function call.

4. ACTIONS TO BE TAKEN

For Formats 1, 5, 7, and 8, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 6, indicate that due to some overflow condition, some messages from the node were thrown away. Messages that were not discarded are still printed.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the status of a ring configuration after automatic ring recovery (ARR). Format 1 or 2 prints whenever a new ring configuration was successfully established, either manually or automatically.

Format 1 reports that a normal ring configuration was established.

Format 2 reports that one or more ring nodes were isolated from the active ring forming an isolated ring segment. The indicated beginning of isolation (BISO) and end of isolation (EISO) nodes bound the isolated ring segment on each side. The convention used is as follows. Ring 0 identifies the ring that propagates messages around the ring, following the ring nodes in ascending order (such as, LN32 1 to LN32 2 to LN32 3 and so forth). Similarly, ring 1 identifies the ring that propagates messages around the ring, following ring nodes in descending order. As ring 0 is traversed in the direction of message propagation, the BISO node is the last node encountered in the active ring segment before entering the isolated ring segment. Similarly, the EISO node is the first node encountered in the active ring segment as ring 0 is traversed of the isolated ring segment.

Formats 3 or 4 print whenever an attempt to establish a new ring configuration was unsuccessful. Automatic fault recovery is activated and will attempt to establish a working ring configuration.

Format 3 reports that an attempt to establish a normal ring configuration failed.

Format 4 reports that an attempt to establish an active ring segment with the indicated BISO and EISO nodes failed.

Format 5 reports whenever automatic fault recovery requests a ring configuration of level 2 or less in an attempt to establish a working ring. The request is made as a result of a fault associated with one or more ring nodes, or a failure of an ongoing configuration. Level 0 represents an attempt to establish the previous ring configuration. Level 1 indicates a configuration based on reported ring errors. Level 2 indicates an escalation from a Level 1 configuration that includes isolating additional nodes.

Format 6 prints whenever automatic fault recovery requests a base level configuration that is rejected immediately. The reason for the rejection and the rejection code are specified. This report is issued in lieu of Format 5. Escalation to level 3 is made immediately.
Format 7 prints whenever automatic fault recovery requests a level 3 or greater ring configuration. This can occur in response to a failure of a lower base level reconfiguration attempt, or in response to nondeterministic failures such as loss of ring token.

Format 8 report is issued following a ring EAR level 4 or 5 recovery where the recovery procedure did not identify any faulty nodes beyond those already believed to exist. In other words, there was no trouble found in the level 4 or 5 testing. When a ring EAR level 4 completes in this manner, the normal 5 second ring EAR confidence interval is extended to 30 seconds. This is done so that any subsequent ring failure within 30 seconds will cause escalation to a ring EAR level 5 recovery. Here, the level 5 recovery may identify an intermittent failure missed by the level 4 recovery.

Format 9 report is issued following either a ring EAR level 5 recovery or the ring initialization phase of a level 4 IMS initialization where a ring problem was detected, but its exact location could not be resolved. Problems exhibiting an intermittent failure behavior pattern can cause this. When this report is issued, ring EAR has isolated a range of nodes which is believed to contain the faulty equipment. This range of isolated nodes may at times be quite large.

Format 10 prints when the ring is split using the EXC:OFLBOOT input message and either a level 0 recovery fails to establish a working ring, or the ring fails during the confidence interval following a successful level 0 recovery.

Format 11 prints whenever a BISO or EISO node becomes inactive. After the first message, subsequent messages of this format will be printed periodically until the inactive BISO and/or EISO node or another nearby node is restored.

Format 12 reports whenever an excessive number of attempts to reconfigure the ring fail within the specified time interval.

Format 13 prints when only one RPCN is active, and communications with this RPCN have failed. The system’s response is dependent upon whether or not IMS is performing a level 4 initialization, the ring has been split using the EXC:OFLBOOT input message, or manual ring mode is set. Responses are as follows:

**EAR REQUESTS FPI =** This will be the action taken when IMS is not within a level 4 initialization, the ring has not been split using the EXC:OFLBOOT input message, or manual ring mode is set.

**EAR FORCES RING TO DOWN STATE =** This action will be taken when IMS is within a level 4 initialization and/or manual ring mode is set.

**EAR REQUESTS OFLBOOT ABORT OR FPI =** The action taken here is that the RTR operating system is requested to re-duplex a split ring which was established using the EXC:OFLBOOT input message. If the RTR operating system does not respond to this request within several seconds, a full process initialization of IMS is initiated.

Format 14 reports that a ring blockage, due to ring congestion, may occur when the ring capacity is less than a safe threshold. After the first message, subsequent messages of this format will be printed at ten-minute intervals until the ring configuration is changed.

Format 15 prints when a ring configuration is established that has a ring capacity greater than the safe threshold. In addition, this message is only printed if the previous ring configuration caused output message Format 14 to print.

Format 16 is printed whenever the ring tracker mode requests isolation of node ‘s’ in an attempt to establish a service-providing ring. The ring tracker mode is entered, either automatically or using the EXC:RTRACK input message, to assume responsibility for ring recovery when ring EAR is unable to stabilize a failing ring. The objective of the ring tracker feature is to provide a stable, service-providing ring in the presence of a single intermittent ring failure that could not be located and isolated by ring EAR. Once the ring tracker mode has been entered, manual action or a high level system boot is required to exit it. Manual action is either 1) the STOP:RTRACK input message.
or 2) another input message, such as RST:LN or RST:RPCN, that triggers a change in the current ring configuration.

Format 17 is printed when the ring tracker mode requests a half ring boot. This will occur when ring tracker was unable to stabilize the ring by iteratively isolating a single ring node at a time. The half ring boot isolates one half of the ring in an attempt to reach a stable service-providing ring.

Format 18 prints once every 15 minutes when the ring tracker mode is active and available to respond to ring failures. Note that if the current ring configuration has been stable for a period longer than the ring tracker confidence interval, a Format 19 message will accompany this Format 18 message.

Format 19 prints, along with Format 18, when the ring tracker is active and the current ring configuration has been stable for a period longer than the ring tracker confidence interval. The confidence interval is stated in the report. When this report is printed, it signifies that it is likely, but not guaranteed, that an intermittent ring problem has been identified and isolated. The behavior of the ring tracker mode is not altered when this condition is reached nor does it cause the ring tracker mode to be exited. Note that the ring tracker may calculate new values for the confidence interval if ring problems persist and continue to disrupt ring communications over a long period of time.

Format 20 prints when the ring tracker mode is exited due to either 1) the STOP:RTRACK input message, or 2) another input message such as RST:LN or RST:RPCN that triggers a change in the current ring configuration.

Format 21 prints every 15 minutes when entry into the ring tracker mode has been inhibited using the INH:RTRACK input message.

Format 22 prints when the ALW:RTRACK input message has successfully moved entry into the ring tracker mode out of the inhibited state. It does not imply that the ring tracker mode has been activated.

3. VARIABLE FIELD DEFINITIONS

a = Ring node name of BISO node.
b = Ring node name of EISO node.
c = Failure code returned by ring configuration.
d = Reason for failure. Valid value(s):
  2 = IMS ring configuration program error.
  3 = Illegal configuration request from ring.init file.
  4 = Candidate controlling RPC node not available.
  5 = Can't isolate ACT or INIT node(s).
  6 = Can't isolate additional nodes.
  7 = Active ring segment not long enough.
  8 = Illegal isolation request from diagnostics.
  9 = Illegal configuration request from ring.ear file.
 10 = BISO and/or EISO node OOS, must be restored first.
 11 = Can't isolate entire ring.
 12 = Can't fragment existing isolated segment.
 13 = Can't include grow or faulty nodes.
 14 = Candidate BISO and/or EISO node not available.
 15 = Improper use of movflt option.
 16 = Illegal request.
 17 = Requested ring configuration already exists.
 26 = OFLBOOT split in progress.
 27 = Exit from rtrack failed.
Reason for the requested configuration. Valid value(s):

- CNFG RQST = A normal ring configuration failed and started automatic fault recovery.
- EAR = Ring transport ERRS have been received, or an escalation of an ongoing config attempt failed.
- INTRNL RQST = The previous BISO or EISO was not active.
- IUN TEST = During initialization, the interprocessor message switch user node (IUN) test phase caused ring blockage.

Internal state information.

Real-time clock value when the report was formatted. The Real-time clock has the granularity of the IMS. Used in correlation with other reports.

Approximate ring silence time (in milliseconds).

Level of ring recovery currently being undertaken.

Reason code for the config job failure. Valid value(s):

- 3 = IMS ring configuration program error.
- 4 = DMA failure at RPC node.
- 5 = Preparation for ring configuration attempt.
- 6 = System failed to restore after configuration was established.
- 7 = Job aborted, guard timer fired.
- 8 = Ring errors reported after configuration was established.
- 9 = RPC CONFIG completion message not received.
- 10 = Forced read operation failed.
- 11 = Operation to quarantine isolated node failed.
- 12 = Operation to quarantine node failed.
- 13 = Ring silence operation failed.
- 14 = Operation to clear isolation failed.
- 15 = Operation to establish isolated segment failed.
- 16 = Operation to shrink/remove isolated segment failed.
- 17 = Ring test failed.
- 18 = Writing of tokens failed.
- 19 = Isolator integrity test failed.
- 20 = Ring test failed; have NORM, expected ISO.
- 21 = Ring test failed; have ISO, expected NORM.
- 22 = Ring initialization failed, ring is down.

Status of restoration activity on the OOS BISO/EISO node. Valid value(s):

- WAITING FOR NODE a TO BE RESTORED = This does not imply that a restore is in progress on node restored, either manually or automatically, before the system can return to a stable state.
- ACTIVE RING SEGMENT NOT LONG ENOUGH = There is insufficient ring capacity to allow the isolated segment to be extended.
- NO BISO/EISO CANDIDATES AVAILABLE = There are no nodes in a suitable state to serve as a BISO/EISO node.
- NEW BISO/EISO SELECTION BLOCKED BY OFLBOOT SPLIT RING = There may be other nodes in a suitable state that could be considered to be BISO/EISO candidates. However, a ring configuration change cannot be made when the ring has been split.
using the EXC:OFLBOOT input message. Therefore, selection of a new BISO/EISO node is blocked.

\[ l \]
- The real-time clock value when the ring configuration job started. Used in correlation with other reports.

\[ m \]
- The real-time clock value when the ring configuration job completed (or aborted). Used in correlation with other reports.

\[ n \]
- The ring capacity in bytes of the current ring configuration.

\[ o \]
- The ring capacity "safe" threshold. If the ring capacity is greater than this value, ring blockage due to ring congestion will not occur.

\[ p \]
- Hour(s) component of the ring tracker confidence interval.

\[ q \]
- Minute(s) component of the ring tracker Confidence interval.

\[ r \]
- Identifies a ring node name (such as, RPCN320, LN323).

4. ACTION TO BE TAKEN

For Format 1, no action is necessary; a normal ring configuration exists.

For Format 2, no action is necessary; an isolated segment exists.

For Format 3 and 4, no action is necessary. Automatic fault recovery is activated and will attempt to establish a working ring. A Format 5 output message should precede this message for every ring configuration attempt requested by automatic fault recovery, followed by a Format 1, 2, 3, or 4 output message, until a working ring configuration is successfully established, indicated by a Format 1 or Format 2 output message.

For Format 5, if this output message precedes either a Format 1, 2, 3, or 4 output message, automatic fault recovery is in progress and attempting to establish a working ring configuration. No action is necessary.

For Format 6, the requested base level configuration failed for the reason given. Escalation is made immediately to a level 3 configuration. No action is necessary.

For Format 7, a level of configuration greater than or equal to 3 has been requested by automatic fault recovery. This involves visiting every ring peripheral controller node (RPCN) and determining if continuity exists between it and its neighbor RPCNs. A usable ring configuration is determined from the results of these tests. No action is necessary.

For Format 8, a level 4 or 5 ring EAR recovery yielded no trouble found. No action is necessary. However, be aware that there may be an intermittent problem somewhere in the ring. Transient problems that are difficult to locate may sometimes be identified by monitoring ring performance over an extended period of time.

For Format 9, this report indicates that ring EAR procedures for locating a ring problem are insufficient. It is probable that the problem is within the range of isolated nodes. Unfortunately, at times this may involve many nodes. Problems exhibiting an intermittent failure where the time between failures is greater than 5 seconds can cause this. Physical stressing of interframe buffer cable connections, ring node circuit pack seating, and so forth, may stimulate the problem to occur frequently enough to be detected by ring node diagnostics. Also, past ring maintenance history may give some indication as to a suspect area of the isolated range of nodes. Finally, a last ditch and tedious effort to localize the problem could be done with repeated applications of the following procedure. Given a range of
isolated nodes, remove the ring node circuit packs at a subset of this range, conditionally restore the other isolated nodes to service, and monitor the ring performance for instability.

For Format 10, no action is necessary. The RTR operating system determines whether or not to re-duplex the ring when it is notified of this event.

For Format 11, if critical node restoration (CNR) is active, no action is necessary. The inactive BISO/EISO node or a suitable replacement will be automatically restored to service and the ring configured if necessary. If CNR is inhibited (should never be unless all diagnostics are inhibited, such as, using the INH:DMQ input message with the SRC ALL option), manual action must be taken. Use the OP:DMQ input message to verify CNR is inhibited. Use the status field in this message or the OP:RING input message to determine which node (BISO or EISO) is inactive, and attempt to restore the node manually. If this is unsuccessful, attempt to restore the unisolated node adjacent to the inactive BISO/EISO node. If the restore is successful, the ring will be automatically reconfigured. If the restore fails, continue to manually restore nearby unisolated nodes until a configuration with active BISO and EISO nodes is established.

For Format 12, internal fault recovery strategies have failed. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual to determine the cause of the ring problems. If this occurs during a high level IMS initialization, the ring will remain in the down state pending manual intervention. Otherwise, the ensuing IMS boot will determine the state of the ring and the application.

For Format 13, in most cases, manual action will be required to determine the cause of communications failure with the RPCN. RPCN diagnostics can be executed after the system stabilizes.

For Format 14, operation with the ring capacity below the safe threshold for an extended period of time should be avoided. The most likely situation where this can occur is when an integrated ring node (IRN) is grown or retrofitted into a previously all small scale integration (SSI) node ring. When this occurs, the safe ring capacity threshold is automatically adjusted upwards. If the proper padded interframe buffer (IFB) hardware has not been retrofitted into the ring, output message Format 11 may be printed following the growth/retrofit procedure. It is important to provide the proper padded IFBs when IRNs are introduced into a previously all SSI node ring. In another situation, the isolation of multiple ring nodes can reduce ring capacity to the point where output message Format 11 will print. Every effort should be made to restore the ring to a normal configuration.

For Format 15, no action is necessary.

For Format 16, no action is necessary. ring tracker mode is attempting to locate and isolate a single intermittent ring hardware problem. If a single intermittent ring problem has caused ring instability, the ring tracker mode should eventually locate and isolate the node associated with the problem. Unfortunately, this could take minutes or days to occur, depending on the frequency of ring disruptions caused by the intermittent problem.

For Format 17, no action is necessary. ring tracker mode has failed in its iterative search for a single intermittent ring problem and is escalating by requesting a half ring boot. A half ring boot will attempt to isolate one half of the ring and provide service with the other half. A typical 5ESS® switch ring will have RPCN32 0 associated with nodes in group 0 on one side of the ring and RPCN00 0 associated with the nodes in group 32 on the other side. After a half ring boot is attempted on one side, if problems continue to exist, a half ring boot will be attempted on the other side. If all problems exist on one side of the ring, the ring should stabilize on the other side.

For Format 18, no action is necessary.

Format 19 indicates that the ring tracker mode has stabilized the ring by isolating the intermittent ring problem and the questionable hardware can now be replaced. Determining when the ring has been stabilized can be difficult. ring node diagnostics executed on the isolated hardware may yield an all tests passed (ATP), yet the hardware may continue to fail in an intermittent manner if it is put back into service. Thus, it may be difficult to determine when the ring tracker mode has correctly identified the offending ring hardware. Identifying this hardware is even more difficult if ring tracker had to revert to a half ring boot to stabilize the ring. This report suggests that the hardware with the
intermittent failure may be isolated from the active ring. The history of node isolations generated by the ring tracker mode along with their ring stability times can provide insight into whether the current ring configuration is stable. This information can be obtained using the OP:RTRACK input message.

For Formats 20, 21, and 22, no action is necessary.

5. ALARMS

Formats 2, 4-10, 12, 13, 16, and 17 produce minor alarms. All other formats cause no alarms.

[12] REPT RING GROWTH
2. REASON FOR OUTPUT

To report on a ring growth procedure that was made through recent change. Format 1 prints when an improper change of the major state of a ring node is made through the UNIX® RTR recent change and verify (RC/V) system.

Formats 2-7 print when the major state of a ring node has been changed from UNEQIP to GROW through UNIX® RTR RC/V, and the interprocess message switch (IMS) driver process detects a unit control block (UCB) data entry that prevents the IMS driver process from honoring the change. The data discrepancy detected for each of these formats is as follows.

Format 2 reports that a UCB containing the entry RPC in the device_type field has been assigned a member number other than 0 in the unit_number field. RPC member numbers must be 0.

Format 3 reports that a UCB containing the entry RUN in the device_type field has been assigned the member number 0 in the unit_number field. IUN member numbers must be in the range 1-15.

Format 4 reports that the last two characters entered in the UCB unit_name field are not numbers or are out of range (above 63), and/or the member number entered in the unit_number field is out of range (above 15).

Format 5 reports that the entry in the internal_device field of an RPC UCB is out of range (above 15).

Format 6 reports that the entry in the internal_device field of an RPC UCB is a duplicate of the entry in an already equipped RPC UCB. All equipped RPC UCBs contain different internal_device values.

Format 7 reports that the last two numbers in the UCB unit_name field and the number in the unit_number field are...
identical to those of an already equipped ring node UCB.

Format 8 reports that a node UCB containing the entry RUN in its device_type field has been recent changed out of the GROW major state. These nodes must remain in the GROW state.

Format 10 reports that a program failure has occurred in accessing the ECD.

Format 11 reports when a mismatch of the UCB HV field between the RPC.DLN UCB and the IUN.DLN UCB has been detected.

Format 12 reports when IMS internal DLN information table already has an entry for the node undergoing growth.

Format 13,14 reports that the specified node is in the state specified. Informational only.

Format 15 reports when the IUN.DLN UCB was degrown before degrowing the RPC.DLN UCB in a degrowth procedure.

Format 16,18 are reminder messages.

Format 17 reports that IMS detected duplicate entries with specified node ID in the buffer description table supplied by the IMS applications.

Format 19 reports that after degrowth, the IMS internal DLN information table still contains an entry(s) with the same node ID.

3. VARIABLE FIELD DEFINITIONS

a = How the erroneous change request was handled. Valid value(s):
   REJECTED = IMS refused to recognize the request. The state in the equipment configuration data base (ECD) is inconsistent with IMS's internal state.
   TOLERATED = The change was accepted.

b = Ring node member name (example: RPCN00 0). If the node name starts with "???", either there is no ECD record corresponding to this node or the IMS private record indicated that this node is UNEQUIP.

c = Old major state claimed by UNIX® RTR RC/V. Valid value(s):
   ACT = Active.
   BADVAL = Illegal value.
   GROW = Grow.
   INIT = Initialization.
   OFL = Off-line.
   OOS = Out of service.
   STBY = Standby.
   UNAV = Unavailable.
   UNEQIP = Unequipped.

d = New major state requested through UNIX® RTR RC/V. Refer to variable 'c'.

e = Old major state claimed by IMS subsystem. Refer to variable 'c'.
f = If present, variable ‘f’ identifies a conflicting situation; otherwise, the state change itself is in error. Valid value(s):
DURING IMS INIT OR ABORT = IMS was being initialized or was aborting.
DURING RING CFR = The ring was being reconfigured. This is normally very brief and may be caused by diagnostics, the CFR:RING input message, or various problems.
FOR DLN RPC-LINK RECORD = A DLN node has two UCB records. The state change shown is illegal for the UCB which shows the DLN RPC-like properties. (That record should always be in the GROW or UNEQIP state. The major state of the DLN in user displays is controlled by the other UCB, which defines the IUN aspects of the DLN.)
WHILE NODE IN ACT RING SEG = Growth and degrowth are not permitted while the node is in the active segment of the ring.

g = Decimal value representing the internal_device entry found in the UCB.

h = Ring node member name. (Same as for variable ‘b’).

i = Decimal value representing the physical node ID of the given node.

4. ACTION TO BE TAKEN

For Format 1, if ‘a’ = REJECTED, the node's major state as represented in the ECD is inconsistent with IMS's view of the node's state. The node's state in the ECD must be changed through UNIX® RTR RC/V interface to agree with the value shown in the 'e' variable. If the change was rejected due to a conflicting situation, it must be retried later when the situation has changed. If 'a'= TOLERATED, steps of the growth procedures have been skipped and the user should ensure that the ring cabling actually reflects the new major state shown in the 'd' variable. If it does not, it may be necessary to change the state back to its original value through UNIX® RTR RC/V.

For Formats 2, 3, 4, and 7, the UCB defined by ‘b’ in the output message should be immediately changed from the GROW to the UNEQIP major state through UNIX® RTR RC/V, and then deleted from the ECD. The discrepancy in the UCB should be determined and a corrected version inserted back into the ECD.

For Formats 5 and 6, the UCB defined by ‘b’ in the output message should be immediately changed from the GROW to the UNEQIP major state through UNIX® RTR RC/V. The discrepancy in the UCB should be determined and the UCB updated to correct it.

For Format 8, the UCB defined by ‘b’ in the output message should be changed immediately to the GROW major state through UNIX® RTR RC/V.

For Format 9, take action specified for ERRLOG. If ring node growth is currently in progress, and a UNIX® RTR recent change transaction had been executed immediately prior to receipt of the output message, a new recent change transaction should be entered to restore the ECD to its previous state.

For Format 10, verify that the ECD action was in fact a corrective action.

For Formats 11-19, upon an error, the growth/degrowth procedure must be thoroughly undone before progressing further. The basic rule of growing a DLN is to change the major state of the RPC.DLN UCB from UNEQIP to GROW first, then change the major state of the IUN.DLN UCB from UNEQIP to GROW and then from GROW to OOS. The basic rule of degrowing a DLN is to change the IUN.DLN UCB major state from OOS to GROW, then from GROW to UNEQIP, and then change the major state of the RPC.DLN UCB from GROW to UNEQIP.

For messages concerning the IMS application, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
For messages concerning the IMS internal information table, check the ECD to make sure there is no duplication of node ID.

2. REASON FOR OUTPUT

To report the results of a ring initialization. This message will repeat for each level of initialization.
Format 1 or 2 prints at the conclusion of the ring initialization sequence in an interprocess message switch (IMS) initialization when ring communications were successfully established. Format 1 reports that a normal ring configuration was established. Format 2 reports that one or more ring nodes were isolated from the active ring, forming an isolated ring segment. The indicated beginning of isolation (BISO) and end of isolation (EISO) nodes bound the isolated ring segment on each side. The convention used is as follows: Ring 0 identifies the ring that propagates messages around the ring, following the ring nodes in ascending order (such as, LN32 1 to LN32 2 to LN32 3). Similarly, ring 1 identifies the ring that propagates messages around the ring, following ring nodes in descending order. As ring 0 is traversed in the direction of message propagation, the BISO node is the last node encountered in the active ring segment before entering the isolated ring segment. Similarly, the EISO node is the first node encountered in the active ring segment as ring 0 is traversed out of the isolated ring segment.

Formats 3, 4, 5 and 6 print at the conclusion of the ring initialization sequence in an IMS initialization when ring communications were not successfully established.

Format 3 reports that all available standby ring peripheral controller nodes (RPCNs) are used to communicate with the ring during ring initialization. When there are no standby RPCNs available, there are no communications paths to the ring. This results in ring initialization failure.

Format 4 reports that one or several ring nodes or sections of the ring must be isolated from the active ring, and that the remaining portions of the ring define one or more ring segments that are candidates for the active ring segment. In order for a candidate ring segment to be acceptable for use as the active ring segment, it must contain:

- At least one STANDBY RPC node.
- An acceptable combination of ring nodes and interframe buffer circuits so that the ring segment exceeds the minimum for IMS message length buffer capacity.

When there is more than one acceptable active ring segment candidate, the number of ring nodes in the segment is used as a selection criterion to choose the best candidate. Output message Format 4 is printed when there is no acceptable ring segment candidate available for the active ring segment.

Format 5 reports that the ring initialization sequence found no ring nodes in the GROW state and no ring faults associated with any ring node. An attempt to establish a normal ring configuration failed for an unknown reason.

Format 6 reports that the ring initialization sequence found that one or more ring nodes must be isolated. For this to occur, either one or more ring nodes are in the GROW state and/or the following occurred:

- Level 4 IMS initialization - A ring fault was found to be associated with one or more ring nodes.
- Level 3 IMS initialization - The ring query operation failed and RPCN to RPCN communications tests failed across one or more RPCN to RPCN ring segments.

An attempt to establish an active ring segment with the indicated BISO and EISO nodes failed for an unknown reason.

Format 7 prints when the ring initialization sequence in an IMS level 4 initialization has discovered a ring fault associated with one or more ring nodes. These nodes are identified by this output message.

Format 8 prints when ring initialization's query of the ring in an IMS level 3 initialization sequence could not determine the ring configuration. Ring initialization has escalated to performing communications tests on the ring in an attempt to find a usable active ring segment.

Format 9 prints at the conclusion of the ring initialization sequence in an IMS level 4 initialization when one or more link nodes have failed a ring communications test. The faulty link nodes are identified by this output message. This communications test is performed immediately following the establishment of communications on the ring and...
before link nodes are downloaded. Link nodes reported by the output message Format 7 were found to be faulty while still in quarantine while link nodes reported by this message were found to be faulty during the communications test with the nodes unquarantined.

3. VARIABLE FIELD DEFINITIONS
   a  = Ring node name (such as, RPCN320, LN325).
   b  = Ring node name.
   c  = Ring node name.

4. ACTION TO BE TAKEN

For Format 1, no action is necessary because a normal ring configuration exists.

For Format 2, level 4 IMS initialization - no action is necessary. A ring node will be isolated either because it is in the GROW state or because a ring fault is associated with it. If any node was isolated as a result of a fault, a Format 7 output message will accompany this message.

For Format 2, level 3 IMS initialization - the ring is queried to determine what the bounds, if any, are on the active ring segment. The results of the query are used to redefine the active ring segment in the administrative module (AM) processor data. However, if this query finds the ring to be nonoperational or it reports some inconsistency, the query is declared a failure and the following procedure is performed. The ring is partitioned into ring segments where the STANDBY RPC nodes define the segment endpoints. RPCN to RPCN communication tests are performed across each of these ring segments. Nodes that are in the GROW state or RPCN to RPCN ring segments that do not pass the communications test will be isolated. No action is necessary if this message is not preceded by a Format 8 output message. In this situation, the query has discovered the bounds of the existing active ring segment. However, if a Format 8 output message does precede this message, the IMS system will automatically execute diagnostics on the isolated ring segment in an attempt to restore the isolated ring nodes (except in min-mode). This will occur following IMS initialization completion. The results of the diagnostics should provide information on one or more ring faults within the isolated ring segment. These faults must be cleared before a restoration of the isolated nodes can be successful.

For Format 3, determine why the restoration of out-of-service RPCNs was unsuccessful. At least one of these ring nodes must be capable of being restored before ring initialization can be successful.

For Format 4, in an IMS level 4 initialization, this message will usually be accompanied by a Format 7 output message. Some, if not all, of these ring faults must be cleared before ring initialization can be successful. In an IMS level 3 or 4 initialization, verify that none of the equipped ring nodes are in the GROW state. Also, improper interframe buffer circuit information in the equipment configuration database (ECD) could be the cause of this output message. It is also possible that RPC to RPC ring segments determined to be faulty in a level 3 initialization have fragmented the ring such that an acceptable active ring segment does not exist. In this situation, an IMS level 4 initialization is required.

For Formats 5 and 6, the IMS system has determined what it thought the bounds on the active ring segment should be. However, an attempt to establish this as the active ring failed. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 7 and 9, an IMS level 4 initialization has discovered a ring fault associated with these nodes. These faults must be cleared before these nodes, as well as nodes isolated because of these faults, can be restored.

For Format 8, this output message may precede output message Formats 1, 2, 4, 5 or 6 in a level 3 IMS initialization. No action should be taken based on this output message alone. Action should be taken as indicated under output message Format 2 when this message precedes a Format 2 output message.

2. REASON FOR OUTPUT

Format 1 error messages report problems involving ring or ring node communications. The TRANSIENT RAC ERROR and SOURCE MATCH error types will not disrupt ring communications while other error types will. When ring communications are disrupted, error analysis and recovery (EAR) will initiate ring reconfiguration activity to reestablish a working ring. The recovery action taken when a ring failure occurs depends on the recent history of ring stability. EAR operates in one of two modes. In the "stable" mode, EAR will assume that all ring failure events are transient in nature. Consequently, on a ring failure, the first recovery action attempted will be to restore the ring to the configuration that existed prior to the failure (using EAR recovery level 0). If this fails, EAR will escalate to a
recovery action that usually isolates the faulty portion of the ring (using EAR recovery level 1 or 3).

EAR will keep track of the number of ring failures that occur. This is done by remembering ring failures over the recent past, typically for one hour. If the failure rate in this timed interval becomes excessive, EAR will switch its mode of operation to the “quasi-instable” or seemingly-unstable mode. In this mode, EAR will assume that all ring failure events are not transient in nature. The first recovery action attempted here will usually isolate the faulty portion of the ring (through EAR recovery level 1 or 3). It should be noted that there are rare exceptions to this rule where a level 0 recovery attempt will be tried first. For example, if a level 1 recovery attempt would cause the last RPCN to be removed from service, a level 0 will be attempted first. Once in the quasi-instable mode of operation, EAR will automatically switch back to the stable mode when the ring has remained error free for a timed stability period, again typically one hour.

Format 2 reports a READ FORMAT ERROR message when a node receives a message that is shorter than the length indicated in the message's header. The shortened or truncated message must be at least the length of an IMS header (8 bytes), or else a READ TOO SHORT ERROR would be reported. If a READ FORMAT ERROR occurs with a broadcast message, only RPCs report the error so that the administrative module (AM) is not flooded with READ FORMAT ERROR reports. When a READ FORMAT ERROR occurs, the specific ring locality that triggered the problem is not identified by the error message. Ring communications are not stopped when this error occurs.

Format 3 error message indicates that a threshold has been exceeded for the types of errors which are thresholded. Ring communications are not stopped when this error occurs.

Format 4 error message indicates that ring communications have been disrupted and no Format 1 error messages that report ring communications disruption were received in the AM. EAR will initiate ring reconfiguration activity to restore a working ring as described above under the Format 1 error message. Note that it is possible to have a two ring configuration (a normal ring) and experience loss of the token message on both rings, yet receive a Format 4 message for only one ring. Since almost all ring traffic occurs on ring 0, ring 0 is more likely to be reported than ring 1 when this occurs. Also, when a single ring configuration exists (an isolated ring), there is only one token message present on the looped-back ring. Yet, it is possible to receive a Format 4 message specifying ring 0, ring 1 or both rings.

Format 5 reports a node problem that is either internal (reporting node not given in report) or that is detected by another node. In the case of RPC ISOLATION, multiple ring faults elsewhere on the ring have caused this node to become isolated. It is presumed that the node itself is not faulty.

Format 6 error message indicates that the node audit has detected a loss of ring messages. The audit sends a ring message from the UNIX® RTR, through a control RPC, around the ring, and back through the same control RPC to the UNIX® RTR. If this message does not return, the audit checks the ring path through a second control RPC. If this second check also fails, this message is printed. If no second RPC is available, the node audit can not differentiate between an RPC problem and a ring problem, so it assumes a ring problem and includes the ambiguity in the message.

Format 7 error message indicates that the node audit has detected an intermittent loss of ring messages. This message is printed when approximately one-fourth of the audit ring messages are lost over a sample size of at least 12 messages or 36 seconds. This count is implemented with a leaky bucket.

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>Type of error</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLOCKAGE</td>
</tr>
</tbody>
</table>

 BLOCKAGE = Type of error that has occurred. Valid value(s):
 BLOCKAGE = A node's blockage timer has timed out while waiting for a ring data byte transfer to the downstream node or interframe buffer (IFB) to occur. The node's blockage recovery action will drain the ring by reading all data from the ring, including the token message, into node processor memory. A BLOCKAGE ring transport error message is then sent to inform the AM of a ring problem somewhere downstream.
DEQUEUED TOKEN = A non-RPC node reports this error if the token message is found in its ring receive buffers. It is intended to detect failures that cause a node to inadvertently read data from the ring.

GENERAL RAC ERROR = A "catch all" error type used to report an unexpected node hardware or software condition. A node reporting this error will not accept ring data from its upstream node, thereby forcing the upstream node to detect blockage.

INTERFRAME BUFFER PARITY ERROR = The upstream interframe buffer has detected a ring parity error. The IFB will not accept any more data, thereby forcing blockage in the node upstream from the IFB.

MSG RELAY FAILURE = This is very similar to the RING WRITE FAILURE. An RPC failed in relaying a message from the AM onto one of the rings during ring maintenance activity. This error will cause the RPC to be removed from service.

NAUD CONTROL RPC FAILURE = The node audit operation failed to pass ring traffic from the UNIX® RTR through a given control RPC. A second control RPC did pass ring traffic, so the first RPC will be removed from service.

NAUD FAILURE = The node audit operation failed in one of it's communication tests with a node. The node will be removed from service.

NODE CKSUM ERROR = The node checksum audit over a range of node memory failed. The node will be removed from service.

PIO FAILURE = A programmed IO operation at an RPC from the AM failed. This error will cause the RPC to be removed from service and isolated.

RAC CONTROL FAILURE = Control from the AM of an RPC's ring access circuit (RAC), which is part of the ring interface circuit, failed. This error, which can only occur during ring maintenance activity, will cause the RPC to be removed from service.

RAC OUTPUT PARITY ERROR = A node attempted to transmit bad parity to the downstream node or IFB. Since bad parity is not accepted by the downstream node or IFB, the transmitting node eventually detects blockage and reads the data with bad parity into memory as part of the blockage recovery process. Upon recognizing the bad parity, the transmitting node will take the same recovery action as is done with BLOCKAGE, except that this error is reported instead of BLOCKAGE.

RAC PARITY/FORMAT ERROR = A node reporting this error will not accept data from its upstream neighbor, thereby forcing the upstream node to detect ring blockage because:

- A ring data byte with bad parity has been offered to the node. The node recovery action could not clear the error and the upstream node will eventually detect blockage. The attempted recovery action is simply to resample the ring bus data to see if bad parity is still present. If bad parity were due to a transient error condition, this resampling operation should clear the error.

- An "orphan byte" has been offered to the node. An orphan byte condition occurs when the node expects a control byte but the byte offered is not a control byte. The control byte is the first byte of data in an interprocess message switch (IMS) message. A special signal lead on the ring bus is asserted only during the control byte, thereby allowing the receiving node to identify the control byte from all other message bytes.

READ INHIBIT ERROR = Blockage occurred while receiving a message from the ring or while propagating a message and the operation to drain the ring did not complete as expected. The node will take the same recovery action as is done with BLOCKAGE.

READ TOO SHORT ERROR = A partial message, shorter than an IMS header, has been detected on the ring at the reporting node. The partial message header is discarded.

RING INTERFACE FAILURE = Ring maintenance activity found an RPC's ring interface to be
faulty. This error will cause the RPC to be removed from service and isolated.

RING \texttt{READ FAILURE} = An RPC failed in reading a message from the ring during ring maintenance activity. This error will cause the RPC to be removed from service.

RING \texttt{WRITE FAILURE} = An RPC failed in writing a message to the ring during ring maintenance activity. This error will cause the RPC to be removed from service.

RPC \texttt{ISOLATION} = An RPC was removed from service because it became isolated during ring reconfiguration. The RPC may or may not be an innocent victim.

RPC \texttt{PANIC} = This is an "I give up" condition in the RPC node software and will cause the RPC to be removed from service.

RPC \texttt{STATE CHANGE FAILURE} = The RPC failed to follow a AM directive to move into a particular software state during ring maintenance activity. This error will cause the RPC to be removed from service.

SOURCE MATCH = A ring message returned to the sending node because the destination node did not remove the message from the ring. The AM will remove the indicated destination node from service.

SRC MATCH = Essentially the same as the SOURCE MATCH error, described under Format 1, except the detection was made by the node audit (NAUD) operation.

TRANSIENT RAC ERROR = A ring data byte with bad parity was offered to the node and node recovery action (resampling the ring bus data) cleared the error. Had the error not been cleared, a RAC PARITY/FORMAT ERROR would have been reported. If this error occurs a predetermined number of times over a period of time, the node will be removed from service.

UNXPCTD SET QUAR = An RPC was unexpectedly put into quarantine.

WRITE FORMAT ERROR = Some error occurred while a node was attempting to write a message to the ring. For example, the message may have had a source address that does not match that of the writing node, or the message specified an improper message length. A node reporting this error will not accept ring data from its upstream node, thereby forcing the upstream node to detect blockage.

\begin{itemize}
  \item[b] \hspace{2em} Name of the reporting node.
  \item[c] \hspace{2em} The RAC on which the error occurred, either 0 or 1.
  \item[d] \hspace{2em} The source of a message involved in a \texttt{READ FORMAT ERROR}. This is extracted from the header of the message read from the ring. The message header is given in the first two 32-bit words of variable 'h' accompanying the \texttt{READ FORMAT ERROR} message. If the node could not recover the message that was read from the ring, these two words will be set to X' ffffffff' and 'd', the source of the message, will be printed as "??".
  \item[e] \hspace{2em} The type of message involved in a \texttt{READ FORMAT ERROR}: NORMAL, BROADCAST, SEL, BROADCAST or TAKE. If the node could not recover the message that was read from the ring, variable 'e' will be printed as "??".
  \item[f] \hspace{2em} The ring where token message loss was discovered. Valid value(s):
    \begin{itemize}
      \item[\texttt{BOTH RINGS}] = Loss of the token message was observed on both rings.
      \item[\texttt{RING 0}] = Loss of the token message was observed on ring 0.
      \item[\texttt{RING 1}] = Loss of the token message was observed on ring 1.
    \end{itemize}
  \item[g] \hspace{2em} The name of the defective node which, in some cases, is also the reporting node.
  \item[h] \hspace{2em} A 32-bit word passed by the reporting node.
\end{itemize}
The value of the AM real-time clock at the time the report is formatted. The real-time clock has a granularity of 1 millisecond. This is used to identify when the output message was issued relative to other output messages.

4. ACTION TO BE TAKEN

For Format 1, except for the TRANSIENT RAC ERROR and SOURCE MATCH errors, ring configuration activity will be initiated to reestablish a working ring. Either the configuration that existed before the error(s) occurred will be reestablished, or one or more nodes will be isolated. Refer to the REPT RING CFR output message that will accompany the Format 1 error message(s).

When a node or nodes are isolated, automatic ring recovery (ARR) will schedule diagnostics on the isolated node(s) to verify the presence of a problem. When the diagnostic result is all tests passed (ATP), or the original ring configuration was successfully established following the errors, the Format 1 error messages should be logged for future reference. The failure may have been caused by a transient hardware problem or a software fault. However, hardware causing intermittent ring failures can sometimes be identified by pattern matching Format 1 error messages over multiple failure events. Similarly, the TRANSIENT RAC ERROR, which does not stop ring communications, may identify intermittent hardware problems when patterned over multiple failure events. The SOURCE MATCH ERROR will cause a node to be removed from service. When diagnostics run on such a node go ATP, it is difficult to determine whether a hardware or software fault caused the problem.

For Format 2, the READ FORMAT ERROR report does not implicate the reporting node. It is likely that a ring message was truncated somewhere between the MSG SRC node reported in the error message and the node reporting the error. Logging these error reports and pattern matching over multiple failure events can sometimes lead to identifying problem hardware.

For Format 3, the node will be removed from service and ARR will schedule diagnostics to be run. If the diagnostic result is ATP, ARR will restore the node to service. A ring hardware problem should be suspected on repeated FORMAT 3 failures, even if the diagnostics run ATP.

For Format 4, as with the Format 1 error messages, ring configuration activity will be initiated to reestablish a working ring. Either the ring configuration that existed before the UNEXPLAINED LOSS OF TOKEN occurred will be reestablished, or a level 3 EAR recovery will perform ring communications tests to find and establish a working ring. Refer to the REPT:RING-CFR Output Message that will accompany the UNEXPLAINED LOSS OF TOKEN error. Also, the REPT:TOKEN-TRACK output message, which will accompany the UNEXPLAINED LOSS OF TOKEN error, may be useful for identifying the location on the ring where the token message was lost.

For Format 5, the defective or debilitated node is removed from service without reconfiguring the ring. ARR will schedule diagnostics on this node to determine the nature of the problem. In cases where the diagnostic goes ATP, it is difficult to determine whether a hardware or software fault caused the problem. As with the Format 1 error reports, logging the report may be useful in future pattern matching to identify weak hardware. In the case of RPC ISOLATION, no diagnostics will be run. ARR will unconditionally restore the node once the isolation surrounding it is cleared.

For Format 6, a level 3 EAR recovery will perform ring communications tests to find and establish a working ring.

For Format 7, a level 3 EAR recovery will perform ring communications tests to find and establish a working ring.

5. ALARMS

Minor.

1. FORMAT

REPT RINGMON AUDIT SIGNALING TYPE=a
   ITEM=b CHANGED TO=c TIME=dd:dd.d

2. REASON FOR OUTPUT

To report that the common channel signaling (CCS) ring monitor process (RINGMON) has detected and corrected a discrepancy in the CCS signaling indicators during its audit.

3. VARIABLE FIELD DEFINITIONS

a = Type of CCS signaling affected. Valid value(s):
   DSIG = CCS direct signaling.
   TCAP = CCS transaction capabilities application part (TCAP) signaling.
   TSIG = CCS trunk signaling.

b = Signaling indicator that was inconsistent. Valid value(s):
   CCSCCS7 = Global status indicator for TCAP signaling.
   CCSCCNI = Global status indicator for direct signaling.
   CCSCNITS = Global status indicator for trunk signaling.
   DDCCS7OOS = Data delivery (DD) bit for TCAP signaling.
   DDCNIOOS = DD bit for direct signaling.
   DDCNITSOOS = DD bit for trunk signaling.
   EQUIPAGE = Equipage of the CCS signaling type in variable 'a'.

c = New setting of the indicator. Valid value(s):
   EQUIPPED = Equipped.
   IS = In service.
   OOS = Out of service.
   UNEQUIPPED = Unequipped.

d = Time that the inconsistency was corrected, in the form minutes:seconds.tenths of seconds.

REPT:RINGMON-DAD

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT RINGMON DLN ACTION=a DLN={00|32}-2
   TIME=bb:bb.b DURATION={cc:cc.c|00:00.0}

2. REASON FOR OUTPUT

To report that the common channel signaling (CCS) ring monitor process (RINGMON) has performed some action upon a direct link node (DLN).

3. VARIABLE FIELD DEFINITIONS

   a = The action performed. Valid value(s):
      DATA-READY    = RINGMON has queried the DLN to determine whether a pump is needed.
      PUMP-COMPLETE = RINGMON has successfully completed a pump of the DLN.
      RESTART-COMPLETE = The DLN has successfully completed an automatic restart.
      START-SCAN    = RINGMON has sent a message to the DLN to cause it to start processing the
                      CCS message queues.
      SWITCH-COMPLETE = A switch to this DLN was completed.

   b = Time at which the action was reported, in the form minutes:seconds.tenths of seconds.

   c = Duration of the action, in the form minutes:seconds.tenths of seconds.

4. ACTION TO BE TAKEN

2. REASON FOR OUTPUT

To print direct link node (DLN) data when the common network interface (CNI) ring monitor process, RINGMON, detects an error that was reported by a DLN.

3. VARIABLE FIELD DEFINITIONS

a = Event number.
b = Internal DLN time, in the form minutes:seconds.tenths of seconds.
c = Hexadecimal dump of the contents of the interprocess message switch (IMS) return code, if the error type is direct memory access fail (DMAFAIL); otherwise, it will be empty.
d = Flag indicating whether DLN is active. Valid value(s):
  1 = Yes.
  0 = No.
e = The state of the DLN. Valid value(s):
  0 = DLN is in standby state.
  1 = DLN is in active state.
2 = DLN is in transition from standby to active.
3 = DLN is in transition from active to standby.

f = State of DLN's direct memory access (DMA) state machine. Valid value(s):
0 = Waiting for pending DMA job to clear.
1 = Ready to begin a new cycle.
2 = Waiting for DMA event 1 - header read completion.
3 = Waiting for DMA event 2 - queue 0 data read completion.
4 = Waiting for DMA event 2 - queue 1 data read completion.
5 = Waiting for DMA event 3 - pointer write completion.
6 = DMA failure or error state.

g = DMA read job completion flag. Valid value(s):
1 = Yes.
0 = No.

h = DMA write job completion flag. Valid value(s):
1 = Yes.
0 = No.

i = DMA write job pending flag. Valid value(s):
1 = Yes.
0 = No.

j = DMA read job pending flag. Valid value(s):
1 = Yes.
0 = No.

k = Completion of the administrative module (AM) queue header read. Valid value(s):
1 = Yes.
0 = No.

l = Completion of DMA read of queue 0. Valid value(s):
1 = Yes.
0 = No.

m = Completion of DMA read of queue 1. Valid value(s):
1 = Yes.
0 = No.

n = Completion of DMA write of the AM-queue pointers. Valid value(s):
1 = Yes.
0 = No.

o = The address where the DLN will write messages to the CNI ring.
4. ACTION TO BE TAKEN

Save the printer output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report an error detected by the common network interface (CNI) ring monitor process (RINGMON).

3. VARIABLE FIELD DEFINITIONS

a = The type of error that occurred. Valid value(s):
ACTION-CONFLICT = A direct link node (DLN) had an internal state of “active”, but the
    DLN-administrative module (AM) queue header indicated that a different DLN was active.
AUDIT-ERROR = The RINGMON audit of the DLN variables revealed an error.
BAD-MSG-IN-QUEUE = The DLN found a message in the IN-queue with an inconsistent message
    size, indicating either a corrupted message or a corrupted pointer.
DLN-QUEUE-PTR-RANGE = MSCU detected that a DLN-controlled queue pointer was out of range.
DLNACK-NO-DLNS = RINGMON received a CNI message to acknowledge DLNs, but no DLN was active.
DMA-JOB-FAILED = A direct memory access (DMA) job request in the DLN failed.
DMA-STOPPED = DLN's DMA job state failed to progress within 750 milliseconds.
HB-DLN-NOT-ACTIVE = The DLN heartbeat test failed because the tested DLN was not in the
    active state.
HB-FAIL-LLM = The test for call completion through the communication path for common channel
signaling (CCS) call processing (DLN heartbeat) failed after several attempts due to inconsistencies in the DLN's version of the logical link map (LLM). This indicates that the DLN may be having problems updating the LLM.

**HB-MSCU-NOT-ACTIVE** = The DLN heartbeat could not access the message switch control unit (MSCU). This error will be recovered by MSCU recovery software.

**HB-NO-SM-RESPONSE** = The DLN heartbeat failed due to the lack of response from the switching module (SM) after four attempts. No recovery action will be initiated.

**HB-TIMED-OUT** = The DLN heartbeat test timed out after several attempts. This indicates that the DLN was not communicating with the AM and/or SM.

**IN-QUEUE-FULL** = The DLN's IN-queue overflowed.

**INTERNAL-ESCALATION** = DLN system integrity reported an escalation of DLN internal error recovery.

**MSCU-QUEUE-PTR-INVALID** = An MSCU-controlled pointer in the DLN-AM queue header was out of range (these are the IN-queue unload, IN-queue load, and IN-queue end pointers).

**NOTE:** This error indicates an MSCU problem, not a DLN problem.

**NO-CNI-INIT** = RINGMON detected that it was being initialized without a concurrent CNI initialization.

**NO-STARTACK-RECEIVED** = A STARTACK message was not received by RINGMON in response to a STRTSCN message.

**OUT-MSG-INVALID** = The MSCU found a message in the OUT-queue with an inconsistent message size, indicating either a corrupted message or a corrupted pointer.

**OUT-QUEUE-FULL** = The DLN's OUT-queue was full of messages.

**NOTE:** This error indicates an MSCU error, not a DLN error.

**RING-SILENCE** = The DLN has been kept in a ring silence state for too long.

**THRESHOLD-CNI-MSGS** = RINGMON exceeded its threshold of returned CNI messages.

**TIMED-OUT-DLN-EVENT** = RINGMON timed out waiting for a CNI DLN event message.

**TIMED-OUT-STM** = RINGMON timed out waiting for a start traffic message.

**TIMED-OUT-STS-COM** = RINGMON timed out waiting for a start traffic sequence to complete.
1 = Active.
2 = Off line.
3 = Standby.
4 = Neither, or not applicable.

g = Interprocess message switch (IMS) state of DLN00-2. Valid value(s):
0   = Out of service.
1   = Active.

h = CNI state of DLN32-2. Refer to variable `\( r \)`.

i = IMS state of DLN32-2. Refer to variable `\( g \)`.

j = Hexadecimal dump of the identifier of the next message expected in start traffic sequence.

k = Hexadecimal dump of the identifier of the last message sent in start traffic sequence.

l = Hexadecimal dump of the identifier of the last message received in start traffic sequence.

m = DLN00-2 pump pending indicator. Valid value(s):
1   = True.
0   = False.

n = DLN00-2 pump indicator. Valid value(s):
0   = The DLN is not being pumped.
1   = The DLN is being pumped.
-1  = The DLN failed its pump.

o = RINGMON state of DLN00-2. Valid value(s):
0   = Normal active state.
1   = Normal standby state.
2   = Out of service.
3   = Off-line (post-pump).
4   = RINGMON pump in progress.
5   = Waiting for STARTACK response.
6   = Switching from active to standby.
7   = Switching from standby to active.
8   = Removal has been requested.
9   = Restart has been requested.

p = DLN32-2 pump pending indicator. Valid value(s):
1   = True.
0   = False.

q = DLN32-2 pump indicator. Refer to variable `\( n \)`.

r = RINGMON state of DLN32-2. Refer to variable `\( o \)`.

s = Number of STARTSCANS during the recovery action due to an error detected by RINGMON,
maximum of 4. After 4 STARTSCANS, the recovery action will escalate to a hard switch. Refer to variable ‘c’.

t = Number of hard switches during the recovery action due to an error detected by RINGMON, maximum of 2. After 2 hard switches, the recovery action will escalate to a restart. Refer to variable ‘u’.

u = Number of restarts during the recovery action due to an error detected by RINGMON, maximum of 3. After 3 restarts, the recovery action will advance to an ODD repump. Refer to variable ‘v’.

v = Number of ODD repumps during recovery action due to an error detected by RINGMON, maximum of 2. After 2 ODD repumps, the recovery action will advance to an unconditional restore.

w = Number of unconditional restores due to an error detected by RINGMON, maximum of 2. After 2 restores, the recovery action will escalate to a level 2 CNI initialization.

x = Flag indicates RINGMON waiting for initialization. Valid value(s):
1 = True.
0 = False.

y = SM number for last heartbeat test.

z = Ring silence state. Valid value(s):
NONE = Normal ring operator.
USER = Only IMS can communicate with the ring.
TOTAL = No communication with the ring is possible.

a1 = Hexadecimal dump of the contents of the AM snapshot of DLN-AM queue header 0.

b1 = Hexadecimal dump of the contents of the AM snapshot of DLN-AM queue header 1.

4. ACTION TO BE TAKEN

Save the printer output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report an error detected by the common network interface (CNI) ring monitor process (RINGMON).

3. VARIABLE FIELD DEFINITIONS

a = The type of error that occurred. Valid value(s):
   ACTION-CONFLICT = A direct link node (DLN) had an internal state of “active”, but the
                   DLN-administrative module (AM) queue header indicated that a different DLN was
                   active.
   AUDIT-ERROR = The RINGMON audit of the DLN variables revealed an error.
   BAD-MSG-IN-QUEUE = The DLN found a message in the IN-queue with an inconsistent message
                      size, indicating either a corrupted message or a corrupted pointer.
   DLN-QUEUE-PTR-INVALID = A DLN-controlled pointer in the DLN-AM queue Header was out of
                           range (these are the IN-queue unload, OUT-queue load, and OUT-queue end
                           pointers).
   DLN-QUEUE-PTR-RANGE = MSCU detected that a DLN-controlled queue pointer was out of range.
   DLNACK-NO-DLNS = RINGMON received a CNI message to acknowledge DLNs, but no DLN was
                   active.
   DMA-JOB-FAILED = A direct memory access (DMA) job request in the DLN failed.
   DMA-STOPPED = DLN’s DMA job state failed to progress within 750 milliseconds.
   HB-DLN-NOT-ACTIVE = The DLN heartbeat test failed because the tested DLN was not in the
                      active state.
   HB-FAIL-LLM = The test for call completion through the communication path for common channel
signaling (CCS) call processing (DLN heartbeat) failed after several attempts due to inconsistencies in the DLN's version of the logical link map (LLM). This indicates that the DLN may be having problems updating the LLM.

**HB-MSCU-NOT-ACTIVE** = The DLN heartbeat could not access the message switch control unit (MSCU). This error will be recovered by MSCU recovery software.

**HB-MSGS-LOST** = RINGMON has not received response messages for multiple DLN heartbeat tests. The trouble might be in the DLN but the heartbeat test results are indeterminate. Switching DLNs (SW:DLN) may resolve the problem. Review ROP and MCC pages for indications of trouble in the AM, MSCU, CMP, ONTCCOM, and/or QLPS equipment.

**HB-NO-SM-RESPONSE** = The DLN heartbeat failed due to the lack of response from the switching module (SM) after four attempts. No recovery action will be initiated.

**HB-SM-ERROR-DLN-ERROR** = The SM received the DLN heartbeat message but it contained errors. The response message to the DLN also contained errors.

**HB-SM-ERROR-DLN-OK** = The SM received the DLN Heartbeat message but it contained errors. The response message to the DLN was OK.

**HB-SM-OK-DLN-ERROR** = The SM received the DLN Heartbeat message OK but the response message to the DLN contained errors.

**HB-SM-UNKNOWN-DLN-ERROR** = The SM received the DLN Heartbeat message but we can not determine if the message had errors. The response message to the DLN contained errors.

**HB-SM-UNKNOWN-DLN-OK** = The SM received the DLN Heartbeat message but we can not determine of the message had errors. The response message to the DLN was OK.

**HB-TIMED-OUT** = The DLN heartbeat test timed out after several attempts. This indicates that the DLN was not communicating with the AM and/or SM.

**IN-QUEUE-FULL** = The DLN's IN-queue overflowed.

**INTERNAL-ESCALATION** = DLN system integrity reported an escalation of DLN internal error recovery.

**MSCU-QUEUE-PTR-INVALID** = An MSCU-controlled pointer in the DLN-AM queue header was out of range (these are the IN-queue unload, IN-queue load, and IN-queue end pointers).

**NOTE:** This error indicates an MSCU problem, not a DLN problem.

**NO-CNI-INIT** = RINGMON detected that it was being initialized without a concurrent CNI initialization.

**NO-STRTACK-RECEIVED** = A STARTACK message was not received by RINGMON in response to a STRTSCN message.

**OUT-MSG-INVALID** = The MSCU found a message in the OUT-queue with an inconsistent message size, indicating either a corrupted message or a corrupted pointer.

**OUT-QUEUE-FULL** = The DLN's OUT-queue was full of messages.

**NOTE:** This error indicates an MSCU error, not a DLN error.

**RING-SILENCE** = The DLN has been kept in a ring silence state for too long.

**THRESHOLD-CNI-MSG** = RINGMON exceeded its threshold of returned CNI messages.

**TIMED-OUT-DLN-EVENT** = RINGMON timed out waiting for a CNI DLN event message.

**TIMED-OUT-STM** = RINGMON timed out waiting for a start traffic message.

**TIMED-OUT-STS-COM** = RINGMON timed out waiting for a start traffic sequence to complete.

The recovery action that was performed. Valid value(s):

- **CNI-INIT** = Execute level 2 CNI initialization.
- **DATA-PUMP** = Repump ODD data to the affected DLN.
- **NO-ACTION** = No action taken by RINGMON.
RESTART  = Restart the affected DLN.
STARTSCAN = Send STARTSCAN message to affected DLN.
SWITCH    = Switch DLN and remove the affected DLN.

c = Event number.
d = ID of the DLN-AM queue that was affected by this error. Valid value(s):
   0    = DLN-AM queue 0.
   1    = DLN-AM queue 1.
   2    = Neither, or not applicable.

e = Time the error occurred, in the form minutes:seconds:tenths of a second.
f = CNI state of DLN00-2. Valid value(s):
   0    = Out-of-service.
   1    = Active.
   2    = Off line.
   3    = Standby.
   4    = Neither, or not applicable.

g = Interprocess message switch (IMS) state of DLN00-2. Valid value(s):
   0    = Out-of-service.
   1    = Active.

h = CNI state of DLN32-2. Refer to variable 'f'.
i = IMS state of DLN32-2. Refer to variable 'g'.
j = Hexadecimal dump of the identifier of the next message expected in start traffic sequence.
k = Hexadecimal dump of the identifier of the last message sent in start traffic sequence.
l = Hexadecimal dump of the identifier of the last message received in start traffic sequence.
m = DLN00-2 pump pending indicator. Valid value(s):
   1    = True.
   0    = False.

n = DLN00-2 pump indicator. Valid value(s):
   0    = The DLN is not being pumped.
   1    = The DLN is being pumped.
   -1   = The DLN failed its pump.

o = RINGMON state of DLN00-2. Valid value(s):
   0    = Normal active state.
   1    = Normal standby state.
   2    = Out-of-service.
   3    = Off-line (post-pump).
   4    = RINGMON pump in progress.
Waiting for STARTACK response.  
Switching from active to standby.  
Switching from standby to active.  
Removal has been requested.  
Restart has been requested.

\[ p \]
= DLN32-2 pump pending indicator. Valid value(s):
1 = True.
0 = False.

\[ q \]
= DLN32-2 pump indicator. Refer to variable `n'.

\[ r \]
= RINGMON state of DLN32-2. Refer to variable `o'.

\[ s \]
= Number of STARTSCANs during the recovery action due to an error detected by RINGMON, maximum of 4. After 4 STARTSCANs, the recovery action will escalate to a hard switch. Refer to variable `t'.

\[ t \]
= Number of hard switches during the recovery action due to an error detected by RINGMON, maximum of 2. After 2 hard switches, the recovery action will escalate to a restart. Refer to variable `u'.

\[ u \]
= Number of restarts during the recovery action due to an error detected by RINGMON, maximum of 3. After 3 restarts, the recovery action will advance to an ODD repump. Refer to variable `v'.

\[ v \]
= Number of ODD repumps during recovery action due to an error detected by RINGMON, maximum of 2. After 2 ODD repumps, the recovery action will advance to an unconditional restore.

\[ w \]
= Number of unconditional restores due to an error detected by RINGMON, maximum of 2. After 2 restores, the recovery action will escalate to a level 2 CNI initialization.

\[ x \]
= Flag indicates RINGMON waiting for initialization. Valid value(s):
1 = True.
0 = False.

\[ y \]
= SM number for last heartbeat test.

\[ z \]
= Ring silence state. Valid value(s):
NONE = Normal ring operator.
USER = Only IMS can communicate with the ring.
TOTAL = No communication with the ring is possible.

\[ a^1 \]
= Hexadecimal dump of the contents of the AM snapshot of DLN-AM queue header 0.

\[ b^1 \]
= Hexadecimal dump of the contents of the AM snapshot of DLN-AM queue header 1.

4. ACTIONS TO BE TAKEN

Save the printer output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
5. ALARMS

Major.

6. REFERENCES

Input Message(s):

   SW: DLN
REPT:RMF

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT RMF a [b]

2. REASON FOR OUTPUT

To report that the recovery message formatter (RMF) encountered an error condition while attempting to output an error or postmortem recovery message.

3. VARIABLE FIELD DEFINITIONS

a = Error code specifying the error condition detected. Valid value(s):
   1 = Premature end of file (EOF) detected on /dev/pmem.
   2 = File /dev/pmem could not be opened.
   3 = Plant measurement library could not be opened.
   4 = Could not attach to plant measurement data base.
   5 = Could not retrieve plant measurement record.
   6 = Could not update plant measurement record.
   7 = "Seek" error on file /dev/pmem.
   8 = Read error on file /dev/pmem.
   9 = Could not open intermediate file to spool message.
  10 = Could not spool intermediate file.
  11 = Spooled orphaned intermediate file.
  12 = Bad interrupt type read from erslot.

b = Valid value(s):

<table>
<thead>
<tr>
<th>a</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Error code returned by plib call. Printed only if a premature EOF was detected.</td>
</tr>
<tr>
<td>9 or 10</td>
<td>OMDB key of the postmortem dump or error slot which could not be spooled.</td>
</tr>
<tr>
<td>11</td>
<td>Sequence number of the postmortem dump or error log file &quot;presumed to have been orphaned&quot; that will be spooled. The contents of the log file will be appended to one of the system logfiles (ERLOG, MEMLOG, PMLOG) and printed on the receive-only printer (ROP). The information in the log file may be a duplication of information already spooled and likely not current.</td>
</tr>
<tr>
<td>12</td>
<td>Data printed for error may be incorrect.</td>
</tr>
</tbody>
</table>

4. ACTION TO BE TAKEN

None.

APP:OMDB-X-REF
**REPT:RMTGETTY**

*Software Release:* 5E14 and later  
*Message Class:* MTCE  
*Application:* 5,3B  
*Type:* Output

1. **FORMAT**

[1] `REPT RMTGETTY UNABLE TO ACCESS ECD FOR a`
[2] `REPT RMTGETTY CANNOT READ GETTY RECORD FOR a`
[3] `REPT RMTGETTY UNABLE TO CHANGE DIRECTORY TO b`
[4] `REPT RMTGETTY FAILED TO EXECUTE c`
[5] `REPT RMTGETTY FAILED TO OPEN d`
[6] `REPT RMTGETTY CHANID FOUND IN LOGDEV RECORD`
[7] `REPT RMTGETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT`
[8] `REPT RMTGETTY UNABLE TO RETRIEVE TERMINAL OPTIONS FROM APH`
[9] `REPT RMTGETTY CANNOT READ LOGDEV RECORD FOR d`

2. **REASON FOR OUTPUT**

To report that the RMTGETTY process has encountered an error while trying to process initialization information for a device.

3. **VARIABLE FIELD DEFINITIONS**

- **a** = Teletypewriter (TTY) device against which the rmtgetty is executing.
- **b** = The directory which the rmtgetty could not access.
- **c** = Pathname of the process to be executed.
- **d** = Special device file for which the problem occurred.

4. **ACTION TO BE TAKEN**

If Format 1 or 2, verify that the getty record in the equipment configuration database (ECD) for the indicated TTY device is correct.
If Format 3, verify that the directory indicated in the getty record exists.

If Format 4, verify that the process which could not be executed exists and is executable.

If Format 5, 6, 7, 8, or 9, or the errors persist after taking actions indicated above, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

MCC Display Page(s):

113 (OS LINKS)
**REPT:ROP**

**Software Release:** 5E14 and later  
**Message Class:** MAINT,MAIPR  
**Application:** 5,3B  
**Type:** Output

1. **FORMAT**

   [1] \text{REPT ROP a \{ERROR b \[c\] \[COMPL CODE d\] | UNIDENTIFIED RESPONSE WD1=e WD2=f}}

   \[2\] \text{REPT ROP a STARTED}

   \[3\] \text{REPT ROP a STOPPED}

2. **REASON FOR OUTPUT**

   Format 1 reports a receive-only printer (ROP) related software or hardware error.

   Format 2 reports that the ROP has changed state from STBY to ACT. A ROP will change to ACT state when data terminal ready (DTR) is ON.

   Format 3 reports that the ROP has changed state from ACT to STBY. A ROP will change to STBY state when DTR is OFF.

3. **VARIABLE FIELD DEFINITIONS**

   a = Member number.

   b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.

   c = Character string giving more information about the error identified in variable ‘b’. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual for additional explanation.

   d = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.

   e = First word of an unidentified completion report.

   f = Second word of an unidentified completion report.

4. **ACTION TO BE TAKEN**

   The error messages in Format 1 indicate error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

   The messages in Formats 2 and 3 are informational messages and indicate that the ROP has changed states. These messages will be output when the currently active ROP changes state to STBY, and the currently standby
ROP changes state to ACT. An active ROP will change state to STBY if powered off, and a standby ROP will change state to ACT when powered up. No action is necessary.

5. ALARMS

Format 1 has an alarm level of INFO. This automatically-generated report is generated. Formats 2 and 3 have alarm levels of VAR. This is a variable alarm to be determined by the client process. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:RPC-ERINT
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT RPC ERINT ERR
   ERROR INTERRUPT FOR RPCNa 0 CODE = b, CH STATUS = c
   DSB ST = d, DEV ST = e, _RML3RST = f

2. REASON FOR OUTPUT

To report that an error interrupt was received from a ring peripheral controller (RPC).

3. VARIABLE FIELD DEFINITIONS

a = Ring node (RN) group number.

b = Error code. Valid value(s):
   0 = No error.
   1 = Program I/O failed.
   2 = Error in one of the status words (fields 'c', 'd', or 'e').
   3 = Node processor (NP) insane.
   4 = RPC maintenance channel incoming buffer header size is zero.
   5 = RPC maintenance channel incoming buffer header size is corrupted. Refer to the ERRLOG file for more detail.

c = Dual serial channel (DSCH) channel status Refer to the APP:IOP-B appendix in the Appendixes section of the Output Messages manual.

d = Status. Duplex dual serial bus selector (D2SBS) status. Refer to the APP:IOP-D appendix in the Appendixes section of the Output Messages manual.

e = AM interface (3BI) status word in hexadecimal format.

f = RPC.MTCE mode indicator. Valid value(s):
   0 = RPC.MTCE is neither in the level 3 restart mode nor in the level 3 restore mode.
   2 = RPC.MTCE is in the level 3 restart mode.
   4 = RPC.MTCE is in the level 3 restart mode.

4. ACTION TO BE TAKEN

Run diagnostics to see if there is any problem with the hardware.

5. ALARMS

None.

118 (CNI FRAME AND CCS LINK STATUS)
REPT:RPC-INIT
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,CNI
Type: Output

1. FORMAT
[1] REPT RPC INIT ERR
   a, RPCN b 0 _RML3RST = c

   __________________________________________________________________________________

[2] REPT RPC INIT ERR
   CONNECT TO CONFIG LIB FAILED, LV = d

   __________________________________________________________________________________

2. REASON FOR OUTPUT

To report an initialization error during the restoration or restarting of a ring peripheral controller (RPC).

3. VARIABLE FIELD DEFINITIONS

a = Error. Valid value(s):
   3BI RESET FAILED = Administrative module (AM) interface reset failed.
   ATTACH INTERRUPT FAILED
   CLEAR D2SBS FAILED
   ENABLE INTERRUPT FAILED
   INIT DMAC FAILED
   NP RESET FAILED = Node processor reset failed.
   SYSGEN SEND FAILED
   READ ADDRESS FAILED

b = Ring node (RN) group number.

c = RPC.MTCE mode indicator (debugging purpose). Valid value(s):
   0 = RPC.MTCE is neither in the level 3 restart mode nor in the level 3 restore mode.
   2 = RPC.MTCE is in the level 3 restart mode.
   4 = RPC.MTCE is in the level 3 restore mode.

d = Interprocess message switch (IMS) initialization level.

4. ACTION TO BE TAKEN

For Format 1, run diagnostics to see if there is any problem with the hardware.

For Format 2, this will cause IMS initialization to fail. If problem persists, refer to the refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.
6. REFERENCES

Other Manual(s):
235-190-120  Common Channel Signaling Services Features

MCC Display Page(s):

118 (CNI FRAME AND CCS LINK STATUS)
REPT:RPC-STAT-ALM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,CNI
Type: Output

1. FORMAT

[1] REPT RPC STAT ALM
    ZERO RPCS! ACCESS TO CCIS NETWORK LOST! RECOVERY REQUIRES MANUAL ACTION!

[2] REPT RPC STAT ALM
    WARNING: ONLY ONE ACTIVE RPC REMAINING

2. REASON FOR OUTPUT

To automatically report when all ring peripheral controllers (RPC)s have been removed and consequently there is no access to the common channel signaling (CCS) network.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

For Format 1, this critical message requires immediate manual action as follows:

1 Attempt to recover and restore a single RPC:
   If possible, try to determine which RPC would be most easily restored and restore that one first; getting one RPC back to a normal working state is CRITICAL!

2 Make the following checks on link status and system state:
   For common channel interoffice signaling system 6 (CCIS6) (such as, - 2.4, 4.8 kilobyte (KB)) links, make the following checks and take steps if necessary:
   A. Take corrective action to ensure restoration of any down mate-links.
   B. If an emergency restart exists, follow necessary procedures to facilitate recovery.
   For common channel signaling system 7 (CCS7) (such as, - 56KB) links, make the following checks and take steps if necessary:
   A. Take corrective action to ensure restoration of any down mate-links.
   B. If a link-set failure exists, follow necessary procedures to facilitate recovery.
   C. If a combined-link-set failure exists, follow necessary procedures to facilitate recovery.

3 Once steps 1 and 2 have been followed, proceed as in step 1 and restore the remaining RPCs by attempting to recover first those RPCs that appear to be most easily recoverable (that is, - almost normal state).
For Format 2, the second message format is output when the system has only one remaining RPC. It is essential that this condition be cleared as soon as possible. Loss of the last RPC will result in a CCS signaling outage.

5. ALARMS

Critical.

6. REFERENCES

None.
REPT:RPCN
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT RPCNa b IS c

2. REASON FOR OUTPUT

To report the new state of a ring peripheral controller node (RPCN). The new state change may only be entered through a manual request from the UNIX® RTR recent change and verify system (RC/V).

3. VARIABLE FIELD DEFINITIONS

a = Ring node (RN) group number.
b = Ring node member number.
c = New state. Valid value(s):
   - IN THE GROWTH STATE
   - OFFLINE
   - OUT OF SERVICE
   - UNAVAILABLE
   - UNEQUIPPED

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input/Output Messages:

None.

235-190-120 Common Channel Signaling Services Features
235-600-31x ECD/SG
REPT:RRCLK-TRBL
Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT RRCLK=a-b-c TRBL d e f RECOVERY ACTION g
    [h]
    i j k

2. REASON FOR OUTPUT

To report a trouble indication occurring in a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RISLU number.
c = RRCLK side.
d = Error report. Valid value(s):
   
   RISLU RCLK CCB ERROR
   RISLU RCLK STATUS ERROR
   UNEXPECTED SERVICE REQUEST

e = Event number.
f = Error type qualifying the error report. Valid value(s):
   
   DCO OUT OF RANGE
   FIRMWARE FAULT
   IMPROPER CCB REG DATA
   IMPROPER OPERATING MODE
   INTERNAL CONTROL TROUBLE
   LOSS OF CROSS-COUPLE
   LOSS OF LOCAL OSCILLATOR
   LOSS OF REFERENCE 0
   LOSS OF REFERENCE 1
   NO CLOCK OUTPUT
   REMOTE-1 CI RECEIVED BAD PARITY
   REMOTE-1 CI RECEIVED BAD START CODE
   REMOTE-1 CI TIMEOUT
   RCLK DETECTED BAD START CODE
   RCLK DETECTED BAD PARITY
   RCLK DETECTED BAD ADDRESS
   SANITY TIMEOUT
   UNEXPECTED CCB FLAG
4. ACTION TO BE TAKEN

If trouble is reported repeatedly, manually diagnose the RRCLK and replace the faulty circuit pack as indicated by the diagnostic results. If it is not possible to take the circuit out of service (OOS), it may be necessary to inhibit hardware checks on it using the INH:HDW-RRCLK input message. The circuit should not be inhibited any longer than necessary.

If unexpected results occur, refer to the Corrective Maintenance manual or the System Recovery manual.

5. ALARMS

A critical or major alarm can result when either of the recovery actions INITIALIZE or RST PREEMPT fails, leaving the RRCLK circuit OOS. There are no alarms associated with the other recovery actions.

REPT: RSM-ISOL

Software Release: 5E14 and later
Message Class: LG_SED
Application: 5
Type: Output

1. FORMAT

REPT RSM a ISOLATED FROM HSM b

2. REASON FOR OUTPUT

To report that the integrity monitor detected a lack of communication between a host switching module (HSM) and a remote switching module (RSM).

3. VARIABLE FIELD DEFINITIONS

a = RSM number.
b = HSM number.

4. ACTION TO BE TAKEN

Study any link-related activity (1900 page) that occurred prior to the loss of communication and take manual recovery actions to restore the communication through the links.

5. ALARMS

Critical.

6. REFERENCES

None.
REPT:RSM-LCPR
Software Release: 5E14 and later
Message Class: SED_MON
Application: 5
Type: Output

1. FORMAT

REPT RSM a LINKED CALL PROCESSING RESUMED
   STANDALONE DURATION bb:bb:bb EVENT RANGE: c-d

2. REASON FOR OUTPUT

To inform the user that the stated remote switching module (RSM) is now linked to the administrative module (AM) or the central processor (CP) and that the host interface module (HIM) or host switching module (HSM) is able to do call processing. The RSM has left the stand-alone mode of operation.

3. VARIABLE FIELD DEFINITIONS

a = RSM number.
b = Stand-alone duration, in the form hours:minutes:seconds.
c = Stand-alone entry event number.
d = Stand-alone exit event number.

4. ACTION TO BE TAKEN

A data base backup at central processor (CP) or administrative module (AM) should be performed in order to insure that any customer originated recent changes (CORCs) initiated during the stand-alone interval will be logged. Failure to do so may result in a loss of the CORCs if that area of memory is initialized or pumped.

5. ALARMS

None.

6. REFERENCES

REPT:RST-PERF

Software Release: 5E14 and later
Message Class: GENR
Application: 5
Type: Output

1. FORMAT

REPT RST PERF SM=a b

2. REASON FOR OUTPUT

To report progress or reason for termination of an offline pump request for a switching module (SM).

3. VARIABLE FIELD DEFINITIONS

a  = SM number.
b  = Outcome of the request. Valid value(s):
  COMPLETED   = The restoration of the duplexed peripheral unit has been successfully completed.
  FAILED      = A restoration to a duplexed state was attempted, and the restoration failed, either
                 because one side of duplexed unit was not out of service, or because severe
                 hardware errors were encountered.

4. ACTION TO BE TAKEN

Issue an OP:OPUMP input message to determine which peripherals failed to restore on a given SM. Check
indicated error source and follow the recommended recovery action for that failure.

Attempt a manual restore of the indicated peripheral, either conditionally or unconditionally. If the failure still occurs,
refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT RST RPC ERR
TIME OUT IN RST RPCNa 0, ISTATE = b, jobst = c, _RML3RST = d

[2] REPT RST RPC ERR
PUMPER NOT AVAILABLE WHEN RESTORING RPCNa 0

2. REASON FOR OUTPUT

For Format 1, to report that a ring peripheral controller (RPC) restoration has been aborted by the driver. The RPC restoration job may be part of a boot or manually initiated.

For Format 2, to report that the pumper is not available during a single RPC restoration.

3. VARIABLE FIELD DEFINITIONS

a = Ring node (RN) group number.

b = Internal state when the job was aborted. Valid value(s):
0 = Unknown state.
1 = Direct memory access controller (DMAC) has been initialized, AM interface (3BI) and duplex dual serial bus selector (D2SBS) have been reset, and interrupt has been attached (but not enabled yet). The node processor of a RPC is being reset.
2 = Node processor reset is done.
3 = Maintenance channel between RPC and AM is ready while the node processor is in the read-only memory (ROM) mode.
4 = Program downloaded.
5 = Download started.

c = Job state. Valid value(s):
0 = No job.
3 = Wait for 3BI interrupt.
8 = Wait for pumper to acknowledge.
12 = Wait for node processor to interrupt.

d = RPC.MTCE mode indicator (debugging purpose). Valid value(s):
0 = RPC.MTCE is neither in the level 3 restart mode nor in the level 3 restore mode.
2 = RPC.MTCE is in the level 3 restart mode.
4 = RPC.MTCE is in the level 3 restore mode.
4. ACTION TO BE TAKEN

For Format 1, run diagnostics to see if there is any problem with the hardware. Check to see whether the RPC ROM code is good. Check whether the RPC random access memory (RAM) load is good.

For Format 2, if the restoration was a manual request, retry the job again. Pumper may be recreated.

| [2]    | REPT RSTRT RPC ERR  
        | CHANNEL INIT FAILED WHEN RESTART RPCNb 0 |

2. REASON FOR OUTPUT

Format 1 reports when a program input/output (PIO) is sent to the node processor (NP) of a ring peripheral controller (RPC) after the channel is properly reinitialized. The RPC restart is part of the RPC fault recovery action.

Format 2 reports when the initialization of the direct memory access (DMA) channel failed during the restart of an RPC. Usually an REPT:RPC-INIT output message will accompany this message to pin point the reason.

3. VARIABLE FIELD DEFINITIONS

<table>

235-105-110 System Maintenance Requirements and Tools
**REPT:RT-SID**

**Software Release:** 5E14 and later  
**Message Class:** SLC_RSP, SLC  
**Application:** 5  
**Type:** Output

1. **FORMAT**

```
REPT RT SID=a {DCLURT=b-c-d|IDCURT=b-c-d|DNUSRT=b-c-d} [e] [f] EVENT=g [h] [i] [j] [k]
```

2. **REASON FOR OUTPUT**

To report alarms and off-normal conditions on the integrated TR008/TR303 remote terminal (RT) system. TR008 RTs can be the SLC® 96, Series 5 Feature Package B, and Enhanced B. TR303 RTs can be the Series 5 feature package 303G. This message is generated automatically.

3. **VARIABLE FIELD DEFINITIONS**

- **a** = Site identification (SID) number.
- **b** = Switching module (SM) number.
- **c** = Digital carrier line unit (DCLU) or integrated digital carrier unit (IDCU) number or digital networking unit - synchronous optical network (DNU-S).
- **d** = Local RT number.
- **e** = System alarms that are active for this integrated TR008/TR303 RT (any combination of the following). Valid value(s):  
  - **ALL OKAY** = Entire RT system is working properly, that is, there are no alarms active. Variables 'h' through 'k' will not accompany this type of system alarm.  
  - **CRITICAL** = Critical alarm is active.  
  - **MAJOR** = Major alarm is active.  
  - **MINOR** = Minor alarm is active.  
  - **PWR/MISC** = Power/miscellaneous alarm is active.  
  
  **Note:** If nothing is printed in this field, no alarms are active.

- **f** = Source of alarm if an alarm is indicated in variable 'e'. Valid value(s):  
  - **CARRIER LINE** = The T1 carrier facility is suspected of being faulty.  
  - **FAR END** = The RT is suspected of being faulty, or manual action at the RT caused the alarm.  
  - **NEAR END** = The equipment at the office is suspected of being faulty, or manual action at the office caused the alarm. Given the situation where near end and far end caused alarms, only near end will be reported.

- **g** = Event number.
h = Fault location. Valid value(s):
DIGROUP = Digroup (TR008 RT).
DUAL DIGROUP = Dual Digroup (TR008 RT).
FAC = Facility.
RT = Remote terminal.
SHELF = Shelf (TR008 RT).
SHFGRP = Shelf group or bank (TR008 RT).

i = Specific unit that has an alarm status change. Valid value(s):
EOC = Embedded operations channels for TR303 RT.
TMC = Time slot management channels for TR303 RT.

j = Alarm types. Valid value(s):
BANK LOOP BACK = Bank loop back request.
CTU = Channel test unit (CTU) alarm.
CTU DATA READ FAIL = CTU alarm data read failure, that is, unable to determine the state of the CTU alarm.
CTU/DLU DATA READ FAIL = CTU and data link unit (DLU) alarm data read failure, that is, unable to determine the state of the CTU or DLU alarm.
DATA READ FAIL = Data read failure, which means a failure to access the facility information from the associated RT digital facility interface.
DEGRADED = Facility is taking bit-errors.
DEGRADED STATE CLEARED = Either the rate of bipolar violations (BPVs) on a facility has dropped below 1E-4, or the facility has gone out-of-service.
DLU FAIL = The DLU is unable to frame on the data it is receiving.
DLU DATA READ FAIL = The system is unable to determine the state of the DLU alarm.
DUPLEX FAILURE = Duplex failure of the EOC or TMC.
FAR END LOOP = Far end loop back sustained request is active.
IN DEGRADED STATE = The rate of BPVs on a facility is greater than 1E-4 and the protection line is unavailable.
INHIBIT DDL = The maintenance fields of the derived data link (DDL) are inhibited on the A and/or P facility. This implies that no maintenance information can be received from the RT over the A and/or P facility.
LINE ON PROT = Line on protection.
LOSS OF DDL = The RT alarm information is not available due to a problem with the A and/or the P facility. RT alarm information is sent to the switch through the derived data link (DDL), which in turn is carried on both the A facility and, when equipped, the P facility.
LOSS OF DDL–RT ALARM INFORMATION UNAVAILABLE = Cannot read DDL alarm information (refer to LOSS OF DDL).
RECEIVE LINE FAIL = The system has detected a problem with the T1 facility: loss of framing, loss of signal, or loss of the DDL.
SIMPLEX FAILURE = Simplex failure of the EOC or TMC.
SWITCH DISABLED = A sustained request to disable protection line switching for the specified facility or facilities is active.
SWITCH TO PROT = A sustained request to switch the specified facility or facilities to the protection line is active.
TAU COT = TAU COT alarm.
TAU RT = TAU alarm has been detected at the RT.
message text = TR303 RT defined text that reports a problem that has occurred or cleared at the
RT.

k = States. Valid value(s):
ALARM OFF = An alarm condition does not exist.
ALARM ON = An alarm condition exists.
REQUESTED = A switch to protection or far end loop (SET:RT-FAC) sustained request has been entered but cannot be honored.

4. ACTIONS TO BE TAKEN

<table>
<thead>
<tr>
<th>Action</th>
<th>Action Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FAR END LOOP</td>
<td>The sustained request can be turned off by using the CLR:RT-FAC input message.</td>
</tr>
<tr>
<td>SWITCH DISABLED</td>
<td>The sustained request can be turned off by using the ALW:RT-FAC input message.</td>
</tr>
<tr>
<td>SWITCH TO PROT</td>
<td>The sustained request can be turned off by using the CLR:RT-FAC input message.</td>
</tr>
<tr>
<td>LOSS OF DDL - RT ALARM</td>
<td>Action should be taken to resolve the problem with the A facility, and the P facility where equipped.</td>
</tr>
<tr>
<td>INFORMATION UNAVAILABLE</td>
<td></td>
</tr>
</tbody>
</table>

Otherwise, no action is required.

These messages can be inhibited from printing at the read-only printer (ROP) and the switching control center (SCC) with the input message INH:RT-REPT.

5. ALARMS

Minor or major.

ORIGPORT a1 b1 OPARTY c1 TERMFORT d1 e1 TPARTY f1
GRP g1 GRPTYPE h1 SIZE i1 HUNT j1 LFCR k1 LPID l1 LUNQ m1
RTGSTS n1

2. REASON FOR OUTPUT

To provide information about a defensive check failure (DCF) that occurred in the routing and terminal allocation (RTA) software during routing, specifically within the RTA finite state machine. The output information is a snapshot of what the values of various internal variables were when the exception occurred.

3. VARIABLE FIELD DEFINITIONS

a = Error event number. Uses the standard event number sequence. In some cases, the event number associated with this dump will be the same or 1 number offset to another output message (such as a manual action assert) and should be considered as 1 error event.

b = Processor error occurred in. Valid value(s):
   AM = Administrative module.
   CMP = Communication module processor.
   HSM = Host switching module.
   LSM = Local switching module.
   ORM = Optical-remote switching module.
   RSM = Remote switching module.
   TRM = Two mile optical remote switching module.
   UNK = Processor not specified or unknown.

c = Processor number. This refers to the module number if the processor type is a switching module. If the reporting processor is the CMP, the form will be A-B C: where A is the message switch side, B is the physical CMP number, and C is MATE for the mate CMP or PRIM for the primary CMP.

d = Name of the source file containing the function where the defensive check occurred.

e = Line number where the defensive check occurred in the source file containing the function where the failure occurred.

f = Type of error. This field is used in conjunction with the cause of error field. These two fields are meaningful when, for example, the error type is RDSTATIC_DATA and the cause is TRKG. This means that a failure occurred when trying to read the trunk group relation RT_TRKG. However, these two fields are not always meaningful by themselves. For example, if the error type is BAD_PARAM and the cause is NULL, an invalid parameter was passed to an RTA function. The
cause for this is unknown. The internal code variables ‘k’ and ‘l’ are then used to refer back to the
function code to analyze the error.

g = Cause of error. The cause of type of error that occurred. If this field is NULL, then the cause was
unknown and additional data in the message needs to be looked at (that is, look at the internal code
variables ‘k’ and ‘l’).

h = RTA routing state. This refers to the internal routing state for RTA.

i = Routing sequence type. This refers to the type of routing that RTA is doing.

j = Message type being processed.

k = Type of request being processed.

l = Interface return value. The value is taken from an RTA global variable, RTretval, used for holding
return values from function calls.

Need to look in function which filled in RTretval and trace back to determine its meaning.

m = Number of route indexes (RIC).

n = Number of route retries (RETRY).

Note: Variable ‘o’ with the last four digits of variable ‘p’ are the key into the RT_DNTRAN
relation.

If the originating port, identified by variables ‘a1’ and ‘b3’, is an ISDN port, a fault in the ISDN
originating equipment may cause non-numeric digits to appear in variable ‘o’.

o = Dialed digits (DN).

p = Normalized office code (NOC).

Note: Variables ‘q’, ‘r’, and ‘s’ are used as the keys into the RT_SCRNING relation.

q = Screening index (SI).

r = Destination index (DI).

s = Prefix (PI). Valid value(s):
0 = Don't care about any prefix digits.
1 = No prefix digits dialed.
2 = Dialed a prefix of 0.
3 = Dialed 0 only.
4 = Dialed a prefix of 1.
5 = Dialed a prefix of 01 (for international).
6 = Dialed a prefix of 011 (for international).

t = Route type.

u = Route index (RI). This is the key into the RT_ROUTING relation.

a1 = Origination port involved in error, in hexadecimal.
b = Origination module involved in error.
c = Origination party involved in error.
d = Termination port involved in error, in hexadecimal.
e = Termination module involved in error.
f = Termination party involved in error.
g = Termination group number.
h = Termination group type.
i = Termination group size. If the value here is 0, then the values in the GRP and GRPTYPE fields are invalid. Also, the HUNT field should be NONE.
j = Termination group hunt type. If the value in here is NONE, then the data in the GRP and GRPTYPE fields are invalid. Also, the SIZE field should be 0.
k = The processor from which the current message (that is, found in MSGTYPE) was sent from LPCR.
l = The process value of the process that sent the current message (LPID).
m = The uniqueness value of the process that sent the current message (LUNQ).
n = The sequence of routing states that have been entered up to this moment in the RTA finite state machine. Up to 30 states (on 2 lines) can be entered and they are read from left to right, second line after the first line. These values are in decimal and translate to states.

Type: Output

1. FORMAT

REPT RTMTB SID=a LRT=b-c-d MTB DIODE PROTOCOL FAILURE - TEST BUS OPEN

2. REASON FOR OUTPUT

To report that a metallic test bus (MTB) failure occurred when the MTB between the test bus control unit (TBCU) and the remote terminal (RT) was found to be open during metallic setup to the RT. This message is generated automatically.

3. VARIABLE FIELD DEFINITIONS

a = Site identification (SID) number.
b = Switching module (SM) number.
c = Digital carrier line unit (DCLU) or integrated digital carrier unit (IDCU) number.
d = RT local number.

4. ACTION TO BE TAKEN

Allow additional metallic setups to an RT with the input message ALW:RTMTBOVR. To inhibit metallic setup with this condition present, use the input message INH:RTMTBOVR. Inhibit the printing of the MTB failure message with the input message INH:RTMTBPRT. Allow the printing of the MTB failure message with the input message ALW:RTMTBPRT. Consider carefully what configuration is desired in the office.

The system defaults allow metallic setup override and allow the printing of the MTB failure message. Refer to the appropriate input message manual pages for additional details.

2. REASON FOR OUTPUT

All formats report an error condition encountered by the ring generic access package (RGRASP) kernel process (RGP_KER).

Format 1 indicates a byte count error in a request to print an output message.

Format 2 indicates that the kernel failed to attach to a port.

Format 3 indicate error return codes from the call to clalive().

Format 4 indicate error return codes from the call to clstart().

Format 5 indicate error return codes from the call to cIstop().

Format 6 indicates that the RGRASP RGP_KER process is terminating.

Format 7 indicates that the RGRASP RGP_KER process is terminating.

Format 8 indicates that the RGRASP RGP_KER has been faulted by the operating system.

Format 9 indicates a message was returned to the RGP_KER from the node.

Format 10 indicates that the RGP_PRT port is invalid.

Format 11 indicates that the RGP_PRT port is not connected.

Format 12 indicates a node response block error.

Format 13 indicates that no space is left to store node response messages.

Format 14 indicates the RGP_KER process could not wake up the RGP_PRT process.

Format 15 indicates that no response was received from the node.

3. VARIABLE FIELD DEFINITIONS

a = Byte count.
b = Port number.
c = Process ID.

1. FORMAT

REPT RVPT=a-b-c-d TRBL DSU DSC SERV REQ FAILURE e f RECOVERY ACTION g h i j k l m n o p q r s t u . . .

2. REASON FOR OUTPUT

To respond to a maintenance service request from a digital service unit (DSU) subtending circuit on the revertive pulsing transceiver (RVPT) board.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Local digital service unit (DSU) number.
c = Service group number.
d = DSU board position number.
e = Event number.
f = Error type. Valid value(s):
   DSC CLOCK FAILURE = There are problems with the distribution of the 4MHz clock or the 8 KHz sync to the DSU subtending circuit (DSC).
   DSC DETECTED TS PARITY ERROR = The DSC detected a parity error on data received from the DSU common board.
   DSC FLT REPORTED, NONE FOUND = A DSC fault was indicated on the DSU common board, but no bits were set in the DSC fault register.
   DSC INTERNAL FAILURE = An internal failure was detected on the DSC.
   DSC TSSR FAILURE INDICATION = There was a failure pertaining to the time slot select register (TSSR) on the DSC.
   NO DSC PARITY ERROR FOUND = A DSC parity error was indicated on the DSU common board, but no bits were set in the DSC parity error register.

  = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = Software failure has been detected and system integrity has been notified.
   INITIALIZE = The failing circuit has been reinitialized.
   RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator
(MRA) will be printed after the circuit is removed.

**RST AUTO CAMPO**N - The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.

**RST PREEMT** - The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

h = DSU common board error source register (ESR) contents.
i = DSU common board DSC fault register contents.
j = DSU common board DSC parity error register contents.
k = Contents of DSU common board parity register for DSU common board time slots 16-31.
l = Contents of DSU common board parity register for DSU common board time slots 0-15.
m = Copy of the DSU common board ESR mask register contents. The mask register cannot be read.
n = Copy of the DSU common board DSC fault mask register contents. The mask register cannot be read.
o = Copy of the DSU common board DSC parity error mask register contents. The mask register cannot be read.
p = Contents of fault register on the failing DSU subtending circuit.
q = Contents of parity register for the data coming to the DSU subtending circuit on DSU time slots 16-31.
r = Contents of parity register for the data coming to the DSU subtending circuit on DSU time slots 0-15.
s = External logical circuit name.
Note: Up to two logical circuit names, error counts, and error thresholds (variables ‘s’-‘u’) may be printed.

t = Current decimal number of recent failures of this type recorded.
u = Error count threshold, above which the recovery action will be escalated.

  - **PER DETECTED BAD ADDRESS** = The peripheral hardware has detected an addressing error. This is assumed to be a software fault.  
  - **SOFTWARE BAD ADDRESS ERROR** = The peripheral has reported an addressing error; however, fault recovery has determined that the address was valid. This is assumed to be a hardware fault.  
- **g** = Recovery action. Valid value(s):  
  - **ANALYSIS ONLY** = A post mortem report is provided.  
  - **RMV** = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.  
  - **RST AUTO CAMPON** = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.  
  - **RST PREEMPT** = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.  
- **h** = Retry status. Valid value(s):  
  - **RETRY FAILED** = The automatic retry failed and this should be considered a hard fault.
RETRY SUCCESSFUL = The automatic retry was successful and this should be considered a transient fault.

i = System PICB number in hexadecimal that was being written when the failure occurred.

j = Read/write (uppermost) bit and address in hexadecimal to which the control interface (CI) was writing when the failure occurred.

k = Data being written to the periphery by the CI.

l = Contents of the CI error source register.

Note: Up to three logical circuit names, error counts, and error thresholds (variable 'm'-’o’) may be printed.

m = External logical circuit name.

n = Current decimal number of recent failures of this type recorded.

o = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

2. REASON FOR OUTPUT

To report the status of the observation protocols, type, and scope, and are printed after an S7RPT command is processed successfully.

Format 1 reports the OPC and DPC scope.

Format 3 reports no active scope.

Format 4 reports observations will terminate in 10 minutes.

Format 5 reports observations are terminated.

Formats 6 through 10 prints the viewing of CCS (common channel signaling) maintenance messages.

In these formats, inbound and outbound CCS Maintenance messages matching the specified scope are printed.

Inbound CCS Maintenance messages received from a point code are tagged as RECEIVED.

Outbound CCS Maintenance messages sent to a point code are tagged as SENT.

Format 6 prints an individual CIC message.

Format 7 prints a group message without status bits.

Format 8 prints a group message with status bits.

Format 9 prints a continuity message with result indicator.

Format 10 prints a circuit validation response with result indicator.

3. VARIABLE FIELD DEFINITIONS

a = Protocol. Valid value(s):
   ISUP7

b = Observation types. Valid value(s):
   BLOCK = Blocking is active.
   NONE = No active observation type.
   RESET = Reset is active.
   UNBLOCK = Unblocking is active.
   COT = Continuity is active.
   CQ = Circuit query is active.
   CVT = Circuit validation is active.

c = OPC identification.

d = DPC identification.
e  = CIC identification.

f  = CIC message type. Valid value(s):
BLA  = Blocking acknowledgment.
BLO  = Blocking.
CCR  = Continuity Check Request.
CVT  = Circuit Validation Test Message.
LPA  = Loopback Attachment Acknowledge.
RLC  = Release Complete.
RSC  = Reset.
UBA  = Unblocking acknowledgment.
UBL  = Unblocking.
UCIC = Unequipped label.

g  = Group message type. Valid value(s):
CQM  = Circuit query message.
CQR  = Circuit Query Response message.
GRA  = Group reset acknowledge.
GRS  = Group reset send.
HGB  = Hardware group blocking.
HGBA = Hardware group blocking acknowledgement.
HGU  = Hardware group unblocking.
HGUA = Hardware group unblocking acknowledgement.
MGB  = Maintenance group blocking.
MGBA = Maintenance group blocking acknowledgement.
MGU  = Maintenance group unblocking.
MGUA = Maintenance group unblocking acknowledgement.
SGB  = Software group blocking.
SGBA = Software group blocking acknowledgement.
SGU  = Software group unblocking.
SGUA = Software group unblocking acknowledgement.

h  = Message transmission direction. Valid value(s):
SENT = outbound message sent from the inter-office OPC specified destined for the
       inter-office DPC specified
RECEIVED = Inbound message received by the inter-office DPC specified originating from the
            inter-office OPC specified. For inter-office RECEIVED messages, the OPC and
            DPC are switched to reflect the message direction. This means that the
            EXC:S7RPT,OPC=a,DPC=b will show a REPT S7RPT RECEIVED output report
            that has the OPC=b and the DPC=a. For inter-module and Intra-module trunks, the
            OPC will remain the same in the REPT S7RPT RECEIVED output report. The DPC
            will change to reflect the message direction. This means that the
            EXC:S7RPT,OPC=a,DPC=000SSMRSM (where SSM is the sending SM and RSM
            is the receiving SM) will show a REPT S7RPT RECEIVED report that has the
            OPC=a and the DPC=000RSMSSM.

Note: For Inter-module and Intra-module trunk maintenance messages, the OPC is not used to
indicate the originating point code. The DPC format contains both the originating and terminating
Inter-module and Intra-module trunk SMs. See APP-POINTCODE for IMT DPC formats.
= SS7 trunk group member range.

j = First 128 status bits in the message being reported, in hexadecimal.

k = Remaining status bits (up to 256) in hexadecimal.

l = Continuity indicator values. Valid value(s):
   00 = Passed.
   01 = Failed.
   02–FF = Spare.

m = Response indicator values. Valid value(s):
   00 = Success.
   01 = Failure.
   02–FF = Spare.

n = Binary encoded field (HGFEDCBA).
   BA = circuit group carrier indicator. Valid value(s):
       00 = unknown.
       01 = analog.
       10 = digital.
       11 = analog and digital.
   DC = double seizing control indicator. Valid value(s):
       00 = no circuit control.
       01 = odd CIC control.
       10 = even CIC control.
       11 = all circuit control.
   FE = alarm carrier indicator. Valid value(s):
       00 = unknown.
       01 = software carrier handling.
       10 = hardware carrier handling.
       11 = spare.
   HG = continuity check requirements indicator. Valid value(s):
       00 = unknown.
       01 = none.
       10 = statistical.
       11 = per call.

o = Optional 26 ANSI character Circuit Identification code.

p = Optional 11 ANSI character CLLI Code.

1. FORMAT

REPT SCAN=a-b-c-d TRBL UNEXPECTED SERVICE REQUEST e
    MSU OPERATIONAL SERV REQ RECOVERY ACTION f
    g
    h i j

2. REASON FOR OUTPUT

To report an unexpected service request on the scan point board (SCAN). A showering scan point may exist on this board.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = Board number.
e = Event number.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
   INITIALIZE = The failing circuit has been reinitialized.
   RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

g = The number of the scan point which may be showering.
h = External logical circuit name.
i = Current decimal number of recent failures of this type recorded.
j = Error count threshold, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN
Check the scan point assignments to determine whether a circuit attached to the scan board is showering.

5. ALARMS

6. REFERENCES

Output Message(s):

DGN: SCAN
RMV: SCAN
RST: SCAN

Other Manual(s):
235-900-113   Technical Specification
REPT:SCC

Software Release: 5E14 and later
Message Class: MAINT,MAIPR
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT SCC a (ERROR b [COMPLETED CODE c] | UNIDENTIFIED RESPONSE WD1=d WD2=e)

[2] REPT SCC a STARTED

[3] REPT SCC a STOPPED

2. REASON FOR OUTPUT

To report when the Switching Control Center (SCC) has changed state or if there is a hardware or software error.

Format 1 reports an SCC related software or hardware error.

Format 2 reports that the SCC has changed state from standby (STBY) to active (ACT). An SCC will change to ACT state when the level 2 connection is established, the data link is in information transfer state, and the other SCC is not in the ACT state.

Format 3 reports that the SCC has changed state from ACT to STBY. An SCC will change to STBY state when the level 2 connection has been terminated, and the level 1 connection remains established.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.
c = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.
d = First word of an unidentified completion report.
e = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

The error message in Format 1 indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

The messages in Formats 2 and 3 indicate that the SCC has changed states. These messages will be output if a problem is sensed on the active SCC. The administrative module (AM) will then initiate recovery on the SCC with a problem and start the mate SCC by changing its state from STBY to ACT.
5. ALARMS

Format 1 has an alarm level of INFO.

Formats 2 and 3 have an alarm level of VAR. This is a variable alarm to be determined by the client process.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   REPT SCF DN a LCEN=b-m-n-o TYPE p CT q
   .
   REPT SCF r

[2] REPT SCF NO COINS STUCK

2. REASON FOR OUTPUT

To periodically print a list of lines for which stuck coin failures have been reported since the last automatically printed list. The list is zeroed after each automatic printing.

Format 1 is printed when there have been stuck coin failures to report. The first line of the format indicates the start of the list, all following lines indicate a line with a stuck coin reported (one line per coin line) except the last line, which indicates the end of the list.

Format 2 is printed when there are no stuck coin failures to report (NO COINS STUCK).

The frequency of the automatic printing of the list is set by an office parameter and can be set to every 15, 30, or 60 minutes.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Telephone number of the coin line that has had a stuck coin reported during the last interval.
b = Switching module (SM) number.
c = Line unit number.
d = Grid number.
e = Switch board number.
f = Switch number.
g = Level number.
i = Digital carrier line unit.
j = Remote terminal (RT).

k = RT line number.

m = Integrated services line unit (ISLU) number.

n = Line group number.

o = Line card number.

p = The type of the stuck coin count. Valid value(s):
   1F = The count (variable ‘q’) represents the number of first-try-only failures reported on this coin line. This indicates that only first try failures occurred for this coin line.
   1+2F = The count (variable ‘q’) represents the number of first and second try failures reported on this coin line. In this case the count of first-try-only stuck coin failures is not printed.

q = The count of stuck coin failures reported. The type of count (first-try-only/first and second try failures) is given by variable ‘p’. To meet feature specification document (FSD) requirements, only the first 15 coin failures for a particular coin line are recorded between the automatic list printings.

r = Termination report indicating outcome. Valid value(s):
   COMPLETED = The list of stuck coin lines that contained at least one stuck coin report was successfully printed.
   SYSTEM ERROR = An unexpected error occurred during processing of the list and the printed list is likely to be incomplete. The internal list of stuck coin counts has been zeroed.

4. ACTION TO BE TAKEN

The stuck coins should be cleared (in accordance with local practice). Depending upon the particular problem, it is sometimes possible to clear a stuck coin from the trunk and line work station (TLWS). To do this, seize the line in question and perform coin detect, coin return, coin collect and home totalizer operations. If this does not clear the problem, dispatch a repair person to repair the phone in question. Particular attention should be placed on dial tone first (DTF) coin lines since attempts are automatically made to clear a stuck coin on these lines every 10 seconds.

5. ALARMS

None.

STARTS AT: dd:dd DURATION: e HOURS
[f] [g] [h] . .
. . .
. . .
. . .

[4] REPT SCHED ERROR

2. REASON FOR OUTPUT

To print an automatic line insulation test (ALIT) and/or routine exercise (REX) schedule summary, and warning message if necessary, in response to an EXC:SCHED input message.

Format 1 reports an ALIT schedule. Only one report is generated.

For a REX schedule, it is further divided into a communication module (CM) and switching module (SM) summary.

Format 2 reports the CM REX summary.

Format 3 reports the SM REX summary. Three sub-reports are generated: diagnostics (DGN), fabric exercise (FAB) and electronic loop segregation (ELS).

Format 4 is used to report warning messages when a viable schedule is not able to be generated. It always comes out before the normal summary reports.

3. VARIABLE FIELD DEFINITIONS
a = SM summary report types. Valid value(s):
   DGN
   FAB

b = Section number of the report.

c = Total number of sections in the report.

d = Time the test started, in the form hour:minute.

e = Duration of the test.

f = Day which REX is scheduled to be run. Valid value(s):
   MON
   TUE
   WED
   THU
   FRI
   SAT
   SUN

g = Type of CM REX tests run or a '-' for the SM REX reports. The three types of CM REX tests are.
   Valid value(s):
   P  = Partial diagnostic.
   F  = Full diagnostic.
   N  = No diagnostic.

h = SM number, which can be repeated up to 14 times.

i = There are nine possible warning messages for the scheduler program:
   REX SCHEDULER ABORTED - DATA BASE READ ERROR
   CANNOT MAKE SCHEDULE BASED ON CURRENT PARAMETERS
   REX SCHEDULER UNABLE TO PROVIDE COMPLETE COVERAGE
   x PERCENT COVERAGE OF EQUIPMENT DURING ONE WEEK PERIOD= (where x is the percentage)
   NO ALIT PACKS PRESENT. CANNOT SCHEDULE ALIT
   CURRENT SCHEDULE CAUSES CONFLICT BETWEEN AM AND CM REX
   PROBABLE REX/ALIT CONFLICT WITH CURRENT SCHEDULE
   CANNOT COMPLETE ALIT/REX SCHEDULE UPDATES
   AUTO REX/ALIT SCHEDULER TIME OUT
   RC/V INHIBITED - CANNOT COMPLETE ALIT/REX SCHEDULE UPDATES

4. ACTION TO BE TAKEN

If there is a warning message and/or you are not satisfied with the coverage of the schedule, you can re-type the
EXC:SCHED input message along with the desired options, for example, change the number of testing hours or
days. To resolve RC/V inhibited warning, RC/V changes need to be allowed first. All the other messages require no
actions.
5. ALARMS

REPT SCHEDULED INTERFLOW {ACTIVATION|DEACTIVATION} RECORD:

SENDING OFFICE ID   :  a
RECEIVING OFFICE ID :  b

SENDING OFFICE
SERVING TEAM
--------------
c

2. REASON FOR OUTPUT

To report that Operator Services Position System (OSPS) scheduled interflow is activated (or deactivated) for serving teams of a sending office.

3. VARIABLE FIELD DEFINITIONS

a = Sending OSPS ID.
b = Receiving OSPS ID.
c = Serving team numbers of sending office.

4. ACTION TO BE TAKEN

The interflow activation/deactivation reports the scheduled interflow patterns made from RC/V View 21.8 that have been turned on or off. Compare this message to RC/V 21.8 and 21.9 and check for consistency.

1. FORMAT

[1] REPT SCMG
   WARNING:  SETTING a OUT OF SERVICE

[2] REPT SCMG
   WARNING:  a IS OUT OF SERVICE

[3] REPT SCMG
   a NOW BEING MARKED IN SERVICE

2. REASON FOR OUTPUT

To report that a message transport part (MTP) user that sends periodic user part check-in (UPCKIN) messages to signaling connection control part (SCCP) has stopped sending them.

In the case of ISDN-UP, the communication module processor (CMP) originates a UPCKIN message and sends it to the administrative module (AM). The AM forwards the UPCKIN message on to the common network interface (CNI). If, for any reason, the CNI fails to receive two consecutive UPCKIN messages within a 4-8 second window, CNI declares ISDN-UP out of service.

Format 1 is printed when SCCP has stopped receiving UPCKIN messages from the MTP user and has marked the subsystem number (SSN) corresponding with this user out-of-service.

Format 2 is printed when the MTP user has not resumed sending the UPCKIN messages in the last 5 minutes and the SSN is still marked out-of-service.

Format 3 is printed when the MTP user has resumed sending periodic UPCKIN messages to SCCP.

3. VARIABLE FIELD DEFINITIONS

a = MTP user (ISDN-UP or TUP or service indicator of MTP user from SIO field).

4. ACTIONS TO BE TAKEN

Immediately, notify your next level of technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Formats 1 and 2 indicate that SS7 call processing has ceased. Determine status of CMP/AM/CNI and initiate recovery actions, if appropriate.

5. ALARMS

Critical alarm for Formats 1 and 2.

REPT SCREEN a [- b]
[USE POKE 194 FROM c]
[d]

2. REASON FOR OUTPUT

To report the status of the screen program or to report the command lines that were entered while using the screen program.

3. VARIABLE FIELD DEFINITIONS

a = Status of the request to run the screen program. Valid value(s):
   ABORTED = The screen program was unable to run from the current terminal. Use poke 194 from the terminal specified by variable 'c'.
   COMPLETED = The screen program has completed on the terminal specified by variable 'b'.
   INPUT LOG = All the commands that were entered within the previous screen program session from the terminal specified by variable 'b' are printed on the following lines (variable 'd').
   STARTING = The screen program has been started on the terminal specified by variable 'b'.

b = The name of the terminal the screen command was run from.

c = The name of the terminal the screen command was attempted from.

d = User input. This is a copy of all the command lines that were entered while running the screen program.

4. ACTION TO BE TAKEN

If the status is 'ABORTED', use poke 194 to run the screen program. Otherwise, the message is informational only and no action is required.

[UNIT f] [PID = d] [UID h] [RID e] [FAULT CODE a]

[3] REPT SCSDA UNIDENTIFIED MESSAGE FROM d TYPE g

2. REASON FOR OUTPUT

To report the occurrence of either a scanner and signal distributor (SCSD) administrator (SCSDA) related software error, or of an abnormal event.

Format 1 reports the receipt of an SCSDA fault code. (A message with supplemental data may accompany this report.)

Format 2 reports an SCSDA error.

Format 3 reports the receipt of an unrecognized message sent to the SCSDA.

3. VARIABLE FIELD DEFINITIONS

a = Fault code. Refer to the APP:DFC-I appendix in the Appendices section of the Output Messages manual.

b = Virtual address within the SCSDA where the fault occurred (in hexadecimal).

c = SCSDA error code (in hexadecimal). Valid value(s):
50 = SCSDA cannot process request. Unit is unknown.
51 = Unrecognized fault code.
52 = Received notification that client process has terminated. Reason for termination is unknown.
53 = Message overload condition exists for an SCSDA client process.
54 = Cannot initialize an SCSDC unit.
55 = SCSDA is in an improper state to process request.

d = Process number of SCSDA client (in decimal).

e = Record ID (RID) number of SCSDC (in hexadecimal).

f = Unit number of SCSDC (in decimal).

g = Unrecognized message type (in hexadecimal).
Utility ID (UID) of SCSDA client (in hexadecimal).

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'c' =</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>50</td>
<td>This is caused by either corruption of the SCSDA unit save area or the maximum number of SCSDC units that can be monitored by the SCSDA has been exceeded. Enter the equipment configuration database (ECD) to verify that the unit is equipped and the RID was not corrupted in the memory of the SCSDA. If the RID is not corrupted and the maximum number of SCSDC units by the SCSDA has not been exceeded, regrow the SCSDC unit. In either case, report that an error has occurred to the service support organization.</td>
</tr>
<tr>

[2] REPT SCSD a FLASH RAM VERSION X'f

2. REASON FOR OUTPUT

Format 1 reports a scanner and signal distributor (SCSD) related software or hardware error.
Format 2 is output prior to the update of flash RAM on the unit as requested by diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.
c = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.
d = First word of an unidentifiable completion report.
e = Second word of an unidentifiable completion report.
f = Peripheral controller flash RAM version.

4. ACTION TO BE TAKEN

These error messages indicate error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

No action is necessary for the message in Format 1 unless the controller is not acting normal, or could not be restored. Contact the service organization with the flash RAM version that was used.

REPT SDFI=a-b-c TRBL AUDIT DETECTED HARDWARE ERROR d
e RECOVERY ACTION f
g h i

2. REASON FOR OUTPUT

To respond to audits detecting a SLC® 96-digital facility interface (S-DFI) being in an improper configuration. The audit detecting this condition is the digital facility interface module processor (DFIMP) audit. The S-DFI is removed from service, diagnosed, and placed back in service if the diagnostics are all tests passed (ATP). Placing the circuit back in service will initialize the S-DFI to either a model or modeII configuration as required by the RLcktdata tuple for the circuit.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital carrier line unit (DCLU) number.
c = S-DFI number.
d = Event number.
e = SDFI CONFIGURATION ERROR - Error type.
f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
   RST PREEMPT = The failing circuit has been preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.
g = External logical circuit name.
h = The current decimal number of recent failures of this type recorded.
i = Error count threshold, above which the recovery action will be taken.

REPT: SDFI-TIPP

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT SDFI=a-b-c TRBL INTERNAL PIDB PARITY ERROR d
   INTERNAL PIDB PARITY ERROR RECOVERY ACTION e
   f g h i j k l m n o p q r s t u
   v
   w x y
   [w x y]

2. REASON FOR OUTPUT

To indicate that a parity error has occurred on an internal peripheral interface data bus (PIDB), which is between the
digital carrier line unit (DCLU) service group and a SLC® 96 digital facility interface (S-DFI). Both the service group
and the S-DFI are implicated.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DCLU number.
c = S-DFI number.
d = Event number.
e = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   RST PREEMPT = The failing circuit has been preempted and a diagnostic was scheduled. A
   message will be printed with the results of the diagnostic.

Note: Fields ‘f’ through ‘y’ will be reported as hexadecimal data, where each field is a short (4 digits).
f = Contents of the DCLU error source register (ESR).
g = Contents of the DCLU ESR mask.
h = PIDB0 time slot 0 to 15 parity status. A bit set means the S-DFI using that PIDB time slot is
generating bad parity.
i = PIDB0 time slot 16 to 31 parity status, similar to field ‘h’ above.
j = PIDB1 time slot 0 to 15 parity status, similar to field ‘h’ above.
k = PIDB1 time slot 16 to 31 parity status, similar to field ‘h’ above.
l = DCLU service group internal circuit name.
m = PIDB. Valid value(s):
PIDB 0 = The first PIDB assigned to the DCLU.
PIDB 1 = The optional second DCLU PIDB.

n = Internal PIDB time slot number.
o = S-DFI select value assigned to the internal PIDB time slot.
p = Internal circuit name of the S-DFI assigned to the internal PIDB time slot.
q = Internal circuit name of the port connected to the internal PIDB time slot. Equal to zero if no port was connected to the time slot.
r = Logical port type of the port connected to the internal PIDB time slot. Equal to zero if no port was connected to the time slot or if the port information could not be accessed.
s = Service class of the port connected to the internal PIDB time slot. Equal to FFFF (hexadecimal) if no port was connected to the time slot or if the port information could not be accessed.
t = Contents of the entry for the internal PIDB time slot in the receive control (RC) random access memory (RAM) of the S-DFI time slot inter changer (TSI). Equal to FFFF (hexadecimal) if the RAM could not be accessed.
u = Contents of the entry for the T1 time slot in the transmit control (XC) RAM in the S-DFI TSI. Equal to FFFF (hexadecimal) if the RAM could not be accessed.
v = S-DFI select value for the same time slot on the other PIDB assigned to the DCLU service group. Equal to FFFF (hexadecimal) if the select value was not the same as the select value in field ‘o’.
w = External circuit name for the implicated circuit.
x = Current decimal number of recent failures of this type recorded for this circuit.
y = Decimal error count threshold, for this type of error on this circuit, above which the recovery action will be escalated.

4. ACTION TO BE TAKEN

No action is necessary if the recovery action is ANALYSIS ONLY.

If the S-DFI reaches its threshold such that it is removed and restored several times, the S-DFI packs should be replaced, regardless of the diagnostic results.

5. ALARMS

None.

REPT SDFI=a-b-c TRBL SDFI CCB REPORTED FAILURE EVENT=d  
e RECOVERY ACTION f  
g h i  
j k

2. REASON FOR OUTPUT

To report a SLC® 96 digital facility interface (SDFI) error detected by the SDFI microprocessor in the control communications buffer (CCB).

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Digital carrier line unit (DCLU) number.
c  = SDFI number.
d  = Event number.
e  = Error type. Valid value(s):
SDFI INVALID CCB ACTIVITY = An unrecognized error was reported by the SDFI.
SDFI FIRMWARE FAULT = An abnormal state has been detected in the SDFI firmware. The value in variable 'k' gives further resolution of what the specific error was.
SDFI TRANS. FORMATTER EXER. ALARM = A routine background exercise of the TF has failed, that is, the response was not as expected. The specific errors are broken down in variable 'k'.
SDFI RCV. SYN. EXER. ALARM = A routine background exercise of the RS has failed, that is, the response was not as expected. The specific errors are broken down in variable 'k'.
SDFI FRAMER EXER. ALARM = A routine background exercise of the framer has failed, that is, the response was not as expected. The specific errors are broken down in variable 'k'.
SDFI AUDIT LATCH ALARM = At least one of the internal audit latches returned an incorrect value. Variable 'k' gives further break down of this error.
SDFI CCB ALARM STATE FAULT = An internal CCB error has occurred. Variable 'k' gives further break down of this error.
SDFI LOOP MONITOR/CLOCK LOSS ALARM = The status of the SDFI's internal data loop has changed, which may also indicate that the SDFI has lost clock (since it is automatically looped when clock loss occurs). The specific status is broken down in variable 'k'.
SDFI TSI ERROR = Either an error or exercise failure has occurred in the time slot interchanger (TSI) on the SDFI. The specific errors are broken down in variable 'k'.
SDFI SANITY TIMER ERROR = The microprocessor’s sanity timer has expired, which indicates that the microprocessor went insane and stopped maintaining its sanity timer.
f = Recovery action. Valid value(s):
ANALYSIS ONLY = A post mortem report is generated.
RST PREEMPT = The failing circuit has been preempted and a diagnostic was scheduled. A
message will be printed with the results of the diagnostic.

Note: Variables 'j' and 'k' will be reported as hexadecimal data, where each variable is a
short, that is, four digits.

g = External logical circuit name.

h = Current decimal number of recent failures of this type recorded.

i = Error count threshold, above which the recovery action will be escalated.

j = SDFI register address where failure was reported.

k = Data value in register specified by variable 'j'. Valid value(s):

If error type (variable 'e') is SDFI FIRMWARE FAULT, then interpret variable 'k' as follows:
0001 = Incoming-USART process overflow (USART is the universal
synchronous/asynchronous receiver/transmitter).
0002 = Outgoing-USART process overflow.
0004 = Read-CCB process overflow.
0008 = Framer report stream process overflow.
0010 = Receive synchronizer (RS) report stream process overflow.
0020 = Transmit formatter (TF) report stream process overflow.
0040 = CCB pointer error.
0080 = Checksum failure.

If error type (variable 'e') is SDFI TRANS. FORMATTER EXER. ALARM, then interpret variable 'k'
as follows; one will appear in the bit position that mismatched. Bit assignments are:
Bit 0 = Loss of clock alarm.
Bit 1 = Superframe synchronization alarm.
Bit 2 = Internal parity alarm.
Bit 3 = Input parity alarm.
Bit 4 = Input idle code alarm (that is, stuffed time slots do not carry idle code).
Bit 5 = Mode parity alarm.

Other bits are not used.

If error type (variable 'e') is SDFI RCV. SYN. EXER. ALARM, then interpret variable 'k' as follows;
one will appear in the bit position that mismatched. Bit assignments are:
Bit 0 = Loss of clock alarm.
Bit 1 = Signaling parity alarm.
Bit 2 = Pseudorandom pattern alarm.
Bit 3 = RAM parity alarm.
Bit 4 = Time slot counter alarm.
Bit 5 = Stuff circuit alarm.
Bit 6 = Control stream parity alarm.
Bit 7 = Frame counter alarm.
Other bits are not used.

If error type (variable 'e') is SDFI FRAMER EXER. ALARM, then interpret variable 'k' as follows; one will appear in the bit position that mismatched. Bit assignments are:

- Bit 0 = Loss of superframe alignment (from the USART).
- Bit 1 = Pseudorandom pattern error or loss of system clock or loss of receive clock.
- Bit 2 = Line format violation mismatch or control stream parity error.
- Bit 3 = Frame alignment signal error mismatch or superframe resync-pulse mismatch.
- Bit 4 = Remote frame (yellow) alarm mismatch or alarm indication signal mismatch.
- Bit 5 = Transmit/receive data-link clock mismatch.
- Bit 6 = Receive data-link data mismatch or transmit positive-rail time division multiplexing (TDM) mismatch.
- Bit 7 = Transmit negative-rail TDM mismatch or receive TDM mismatch.

Other bits are not used.

If error type (variable 'e') is SDFI AUDIT LATCH ALARM, then interpret variable 'k' as follows. A value of hexadecimal 00FF in this variable indicates that the firmware sanity timer has expired and that the firmware has rewritten the mode to the framer. Otherwise, the bit assignments are:

- Bit 0 = TF mode audit.
- Bit 1 = TF exercise audit.
- Bit 2 = RS mode audit.
- Bit 3 = RS exercise audit.
- Bit 4 = Framer mode audit.
- Bit 5 = Framer exercise audit.
- Bit 6 = Framer action audit.
- Bit 7 = Framer action mask audit.

Other bits are not used. If a bit equals one, there is an error.

If error type (variable 'e') is SDFI CCB ALARM STATE FAULT, then interpret variable 'k' as follows. Bit assignments are:

- Bit 0 = Not used.
- Bit 1 = Address error.
- Bit 2 = Parity error.
- Bit 3 = Match error.

Other bits are not used. A bit equal to one means the alarm is active.

If error type (variable 'e') is SDFI LOOP MONITOR/CLOCK LOSS ALARM, then interpret variable 'k' as follows. Bit assignments are:

- Bits 0,1 = Not used.
- Bit 2 = 1=Loss of internal peripheral data bus (IPIDB) clock 0.
- Bit 3 = 1=Loss of IPIDB clock 1.
- Bits 4–6 = Not used.
- Bit 7 = Loop status: 0=Unlooped, 1=Looped.

Other bits are not used.
If error type (variable ‘e’) is SDFI TSI ERROR, then interpret variable ‘k’ as follows. Bit assignments are:

Bit 0 = 1 = 8 KHz sync missing.
Bit 1 = 1 = Transmit or receive data RAM parity error.
Bit 2 = 1 = Read activity parity error or receive idle signaling (RIS) RAM parity error.
Bit 3 = 1 = Mode select register parity error.
Bit 4 = 1 = Transmit idle signaling (XIS) RAM parity error.
Bit 5 = 1 = Transmit control RAM parity error.
Bit 6 = 1 = Receive control RAM parity error.
Bit 7 = 1 = RIS RAM bits 5, 6, & 7 parity error.

Other bits are not used.

4. ACTIONS TO BE TAKEN

These errors usually indicate a problem in the SDFI hardware, but they can also occur because of problems in the DCLU hardware or because of firmware or software faults.

If the errors do not automatically cause the SDFI to be diagnosed, remove the SDFI from service and diagnose it. If the SDFI passes diagnostics, try diagnosing the DCLU service group that controls that SDFI. If diagnostics pass, you may want to replace the SDFI and/or the DCLU.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT SDFI=a-b-c TRBL SDFI SERVICE REQUEST FAILURE d
e RECOVERY ACTION f
g h i

2. REASON FOR OUTPUT

To respond to the failure to find a SLC® 96-digital facility interface (SDFI) service request when one is indicated at the next higher level of hardware. Both the SDFI and the controlling digital carrier line unit (DCLU) service group may be implicated.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DCLU number.
c = SDFI number.
d = Event number.
e = Error type. Valid value(s):
   SDFI ESR ACT. REPORTED, NOT FOUND = Both the SDFI and the DCLU service group are implicated.
   SDFI EXCESSIVE OPR. SERV. REQ. = Too many SDFI service requests were made. They cannot be processed in the amount of time allowed for processing them.
   SDFI FLG ACT. REPORTED, NOT FOUND = Only the SDFI is implicated. The flag register (FLG) is empty.
   SDFI SFV ACT. REPORTED, NOT FOUND = Only the SDFI is implicated. The summary flag vector (SFV) is empty.

f = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   RST PREEMPT = The failing circuit has been preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

g = External logical circuit name. (There may be two lines of data here.)
h = The current decimal number of the recent failures of this type recorded.
i = Error count threshold, above which the recovery action will be taken.

4. ACTION TO BE TAKEN
If \( f \) = Action:

| ANALYSIS ONLY                  | The circuit named in variable \( g \) has not exceeded a threshold and is not faulty. No action needs to be taken. |
| RST PREEMPT                    | Verify that diagnostics have been run. If the diagnostics failed, begin trouble clearing procedures. If the diagnostics passed, the fault was transient. No action needs to be taken. |

5. ALARMS

1. FORMAT

REPT SDFI=a-b-c TRBL UNEXPECTED SERVICE REQUEST d
   SDFI SP ERROR RECOVERY ACTION e
   f g h
   i j k

2. REASON FOR OUTPUT

To report an unexpected service request on a SLC® 96-digital facility interface (S-DFI).

3. VARIABLE FIELD DEFINITIONS

SDFI SP ERROR = An S-DFI signal processor error has occurred and was detected by call processing.
   a = Switching module (SM) number.
   b = Digital carrier line unit (DCLU) number.
   c = S-DFI number.
   d = Event number.
   e = Recovery action. Valid value(s):
       ANALYSIS ONLY = A post mortem report is generated.
       ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has
          been notified.
       RST PREEMPT = The failing circuit has been preempted and a diagnostic was scheduled. A
          message will be printed with the results of the diagnostic.
   f = S-DFI circuit name.
   g = T1 time slot used.
   h = Remote terminal (RT) shelf name.
   i = External logical circuit name.
   j = Current decimal number of recent failures of this type recorded.
   k = Error count threshold, above which the recovery action will be escalated.

6. REFERENCES

Input/Output Messages:
None.
REPT:SDL

Software Release: 5E14 and later
Message Class: MAINT,MAIPR,SPERR
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT SDL a { [ERROR] b [c] [COMPL CODE d] | UNIDENTIFIED RESPONSE WD1=e WD2=f }

[2] REPT SDL a WARNING LAST LINK IN DUPLEX LINK GROUP BEING REMOVED

[3] REPT SDL a STARTED

[4] REPD SDL a STOPPED

2. REASON FOR OUTPUT

Format 1 reports a synchronous data link (SDL) related software or hardware error or an unauthorized attempt to use a secure dial-up data link.

Format 2 reports that the last available link in a duplex link group being removed from service.

Format 3 reports that the SDL has changed state from standby (STBY) to active (ACT). An SDL will change to ACT when the level 2 connection is established and the data link is in information transfer state.

Format 5 reports that the SDL has changed state from ACT to STBY. An SDL will change to STBY state when the level 2 connection is terminated and the level 1 connection remains established.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Can be either hexadecimal notation or a message. The hexadecimal notation identifies the point within the input/output driver (IODRV) where a software or hardware error was detected. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.

The message identifies which security check failed in an attempt to use a secure dial-up link. Valid value(s):

INCORRECT PASSWORD
INCORRECT PASSWORD DESTINATION ADDRESS LENGTH
INCORRECT PASSWORD DESTINATION IDENTIFICATION
INCORRECT PASSWORD LINK IDENTIFICATION
INCORRECT PASSWORD MODIFIER
INCORRECT PASSWORD ORIGINATION ADDRESS LENGTH
INCORRECT PASSWORD ORIGINATION IDENTIFICATION
INSUFFICIENT PASSWORD INFORMATION
PASSWORD NOT REQUIRED INHIBITED
PASSWORD PACKET NOT RECEIVED
PASSWORD REQUIRED
PASSWORD TEST BIT ON
PASSWORD VALID INHIBITED
UNKNOWN PASSWORD MODIFIER 2
UNKNOWN PASSWORD MODIFIER 7
UNKNOWN PASSWORD MODIFIER 10
UNKNOWN PASSWORD MODIFIER 11
UNKNOWN PASSWORD MODIFIER 15

\[c\] = Character string giving more information about the error (in hexadecimal notation) identified in variable ‘b’. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual for additional explanation.

\[d\] = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.

\[e\] = First word of an unidentified completion report.

\[f\] = Second word of an unidentified completion report.

4. ACTION TO BE TAKEN

Format 1 either indicates, through the software or hardware error messages, error conditions which could cause the removal of a unit, or it indicates the unauthorized attempt to use a secure dial-up link message by someone who is not authorized to access the administrative module (AM) through a synchronous data link. Notify the person in charge of security for the AM of any unauthorized access. In the case of software or hardware error messages, any removed unit should be repaired and restored to service.

For Format 2, removal of the last available link in a duplex link group indicates that no data transmission can take place over the link facility. One of the links in the group should be repaired and restored to service.

Formats 3 and 4 indicate that the SDL has changed states. No action is necessary.

5. ALARMS

Format 1 has no alarm.

Format 2 has a major alarm. A major alarm may not be service affecting, but take immediate action as indicated in the report.

Formats 3 and 4 have no fixed priority of action. The software process that generates the message can determine the alarm level. If the alarm level is not specified, a report is generated.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[2] REPT SDLC a CODE VERSION X'f

[3] REPT SDLC a FLASH RAM VERSION X'g

2. REASON FOR OUTPUT

Format 1 reports a synchronous data link controller (SDLC) related software or hardware error.
Format 2 is output during the restoration of the unit.
Format 3 is output prior to the update of flash RAM on the unit as requested by diagnostics.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Identifies point within the input/output driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. Refer to the APP:IOP-F appendix in the Appendixes section of the Output Messages manual.
c = Hardware error type, in hexadecimal notation. Refer to the APP:IOP-A appendix in the Appendixes section of the Output Messages manual.
d = First word of an unidentifiable completion report.
e = Second word of an unidentifiable completion report.
f = Peripheral controller pump code version.
g = Peripheral controller flash RAM version.

4. ACTION TO BE TAKEN

These error messages indicate error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service. No action is necessary for the messages in Formats 2 and 3 unless the controller and/or its subdevices are not acting normal, or could not be restored. Contact the service organization with the code version and/or flash RAM that were used.

5. ALARMS
None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

REPT:SECURITY

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT SECURITY UNRESTRICTED ACCESS a

2. REASON FOR OUTPUT

To report the status of a system unrestricted access request. Unrestricted access means disabling authority checking on Master Control Console (MCC) and Switching Control Center (SCC) devices. Unrestricted access is controlled by the ‘+’ application parameter on the Emergency Action Interface (EAI) page.

This output message is used in administering security of the maintenance interface. Refer to the Authority Management section of the Routine Operations and Maintenance manual for authority administration information.

3. VARIABLE FIELD DEFINITIONS

a = Status of unrestricted access. Valid value(s):
   AUTOMATICALLY DISABLED = 60 minutes has expired without a manual disable since the original unrestricted access request or a software release retrofit process has completed. Unrestricted access is automatically disabled and can be requested again by entering another ‘+’ application parameter on the EAI page.
   ENABLED FOR RETROFIT = Unrestricted system access was automatically enabled as part of the software release retrofit process. Unrestricted access is enabled on MCC and SCC devices until the retrofit process is complete.
   MANUALLY DISABLED = Unrestricted system access, previously enabled by the ‘+’ application parameter, was manually disabled by another ‘+’ application parameter before the 60 minute automatic disable period expired.
   REQUESTED = Unrestricted system access was requested using the ‘+’ application parameter on the EAI page. Unrestricted access is enabled on MCC and SCC devices until 60 minutes has expired or until manually disabled by another ‘+’ application parameter, whichever occurs first.

4. ACTION TO BE TAKEN

If 'a' = REQUESTED, check that unrestricted access is authorized. An unauthorized request constitutes a security violation. Otherwise no action is necessary.

5. ALARMS

If 'a' = REQUESTED, a critical alarm is generated to alert office personnel that authority checking is disabled on the MCC and SCC devices. Otherwise no alarm is generated.

REPT SERV PCRGRP=a-b PSUPH=a-c-d-e f g
[PSUPH=a-c-d-e f]

2. REASON FOR OUTPUT

To report the result of an automatic or manual action that resulted in a processor group changing its service selection.

This message identifies the processor group (PCRGRP) involved, the specific processors (PSUPH), a maximum of two, the service selection state that resulted and the reason for the service selection change.

3. VARIABLE FIELD DEFINITIONS

a = Global services module (GSM) number.
b = Processor group number.
c = Packet switching unit (PSU) number.
d = PSU shelf number.
e = Protocol handler (PH) position number.
f = Current service selection state for the processor identified. Valid value(s):
  NONSERVING = The processor is not serving but can take over when needed.
  SERVING = The processor is serving the signaling needs of the processor group.
  UNAVAILABLE = The processor is unavailable and cannot support any processing activity.
g = Reason for the service selection change. Valid value(s):
  AUTO RMV = A processor was automatically removed.
  AUTO RST = A processor was automatically restored.
  ELNK DOWN = The ethernet link on a processor has gone down.
  ELNK UP = The ethernet link on a processor has come up.
  FAILED = The service selection change failed due to an unexpected software problem.
  MAN RMV = A processor was manually removed.
  MAN RST = A processor was manually restored.

4. ACTIONS TO BE TAKEN

<table>
<thead>
<tr>

Software Release: 5E14 and later
Message Class: HW_MON, PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT SFI=a-b-c-d [e] TRBL BACKGROUND TEST FAILURE EVENT=f
   g RECOVERY ACTION h
   iijjkkkk llllmmmm nnnnoooo oooooooo
   [SFI=a-b-c-d p q]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a synchronous transport signal facility interface (SFI) circuit in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and reported by the routine background test process.

The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable 'h' to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = DNU-S unit number.
c = DNU-S data group number.
d = DNU-S SFI circuit number.
e = SFI equipment status. Valid value(s):
   ACTIVE = The SFI is in service and a fault has been detected.
   OOS = The SFI is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this SFI from service. However, fault stimuli are still being detected from the circuit indicating that the SFI has not been completely removed from service.
   STANDBY = The SFI is in standby and a fault has been detected.
f = Event number.
g = Error type. Valid value(s):
   HEART BEAT ERROR = A routine check found that the SFI failed to respond to a functional check.
h = Recovery action. Valid value(s):
   ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
   HARD RESET = The circuit has been hard reset without scheduling diagnostics.
   INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
   INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.
NO RECOVERY ACTION TAKEN = This event needed no recovery action.
PRE-OOS THRESHOLD EXCEEDED = The SFI was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The SFI has been preempted and is still detecting errors,
inhibit has been re-applied on the SFI.
RE-INHIBIT ERROR = The SFI has been inhibited and error are still detected. Inhibit has been
re-applied on the SFI.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:SFI
output message will be printed with the results of the diagnostic.

i = DNU-S message type.

j = Message handler (MH) number and MH channel number, in a bit-packed representation. The first
three bits indicate the MH number, and the next five bits indicate the MH channel number.

k = Internal circuit name of SFI.

l = Fault type.

m = Internal circuit index of SFI.

n = Internal DNU-S return code.

o = Currently unused.

p = Number of recent failures of this error type (variable 'g') on this SFI circuit (in decimal).

q = Error count threshold above which the recovery action will become stronger.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the SFI from service during a period of low
usage and perform trouble locating procedures.

5. ALARMS

None.

  [SFI=a-b-c-d p q]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a synchronous transport signal facility interface (SFI) circuit in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and reported by the DNU-S resident software.

The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable ‘i’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = DNU-S unit number.
c = DNU-S data group number.
d = DNU-S SFI circuit number.
e = SFI equipment status. Valid value(s):
   ACTIVE = The SFI is in service and a fault has been detected.
   OOS = The SFI is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this SFI from service. However, fault stimuli are still being detected from the circuit indicating that the SFI has not been completely removed from service.
   STANDBY = The SFI is in standby and a fault has been detected.

f = High level error types. Valid value(s):
   RESIDENT AUTO SWITCH = An error was detected and recovered by DNU-S resident fault recovery software.
   FAULT MESSAGE = Error detected by DNU-S resident software.

g = Event number.
h = Error type. Valid value(s):
   DATA PATH INCONSISTENCY
   DECODER VIOLATION
   FAULT TABLE ENTRY ERROR
   FORCED INTERRUPT EXCEPTION
ICB TIMED OUT ERROR
INTERRUPT THRU MASK
INVALID INTERRUPT EXCEPTION

i = Recovery action. Valid value(s):
ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
HARD RESET = The circuit has been hard reset without scheduling diagnostics.
INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.
NO RECOVERY ACTION TAKEN = No automatic recovery was performed.
PRE-OOS THRESHOLD EXCEEDED = The SFI was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The SFI has been preempted and is still detecting errors, inhibit has been re-applied on the SFI.
RE-INHIBIT ERROR = The SFI has been inhibited and error are still detected. Inhibit has been re-applied on the SFI.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:SFI output message will be printed with the results of the diagnostic.

j = DNU-S message type.

k = Currently unused.

l = Internal circuit name.

m = Unit type.
\( n = \) Number of information words sent from DNU-S fault recovery.

\( o = \) Information sent from DNU-S fault recovery. The data sent is dependent on the type of error (the value of variable \( h \)).

\( p = \) Number of recent failures of this error type (variable \( h \)) on this SFI circuit (in decimal).

\( q = \) Error count threshold.

4. **ACTION TO BE TAKEN**

If the problem persists and no automatic recovery is attempted, remove the SFI from service during a period of low usage and perform trouble locating procedures.

5. **ALARMS**

None.

[6] REPT SHLGETTY FAILED TO EXECUTE d

[7] REPT SHLGETTY FAILED TO OPEN e

[8] REPT SHLGETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT

2. REASON FOR OUTPUT
To report a failure that occurred during shlgetty process execution.

3. VARIABLE FIELD DEFINITIONS

a = Teletypewriter (TTY) device which shlgetty is executing against.
b = DMERT error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
c = The idir file suffix entry CFTSHL executing directory.
d = Pathname of the process which could not be executed.
e = Special device file which could not be opened.

4. ACTION TO BE TAKEN
For Formats 1-4, verify that the getty and ttopt records in the equipment configuration database (ECD) for the indicated TTY device are correct.
For Format 5, check that the directory indicated in the getty record exists.

For Format 6, verify that the process which could not be created exists and is executable.

For Format 7 or 8, or the error persists after taking action indicated above, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of this manual.

System Maintenance Requirements and Tools
REPT:SIM-UTILITY

Software Release: 5E14 and later
Message Class:
Application: 5,3B
Type: Output

1. FORMAT

REPT SIM UTILITY IDS OF PROCESSES KILLED DURING CFT INIT
   a a a a a a a a a

2. REASON FOR OUTPUT

To report the utility IDs of processes killed during a level 2 or level 3 user initialization.

3. VARIABLE FIELD DEFINITIONS

   a = Utility ID in hexadecimal of a killed process.

4. ACTION TO BE TAKEN

This message lists the utility IDs of processes killed during a user initialization. To identify the process associated with the utility ID, use the OP:ST-PROC input message with the ALL option after the recovery of the user interface. If some processes were not restarted after user initialization, the UNIX® RTR Operating System Software Troubleshooting Guide will relate the utility IDs to specific processes.

5. ALARMS

None.

Input Message(s):

   OP:ST-PROC
REPT:SIMCHK
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

REPT SIMCHK a [b]

2. REASON FOR OUTPUT

To report error conditions that occurred while executing the system integrity monitor (SIM).

3. VARIABLE FIELD DEFINITIONS

a = System integrity error code. Code numbers labeled with an "*" indicate conditions that may result in a system initialization phase unless software checks are inhibited.
  *1 = System initialization failure.
  2 = System initialization status message received with unknown process number.
  *12 = Unexpected fault received by SIM.
  01 = Audit control subsystem initialization failure.
  02 = Audit record initialization error.
  03 = The system integrity output formatter (SIOF) program is not running. Some output messages were lost.
  04 = Routine audit scheduling was not allowed.
  21 = Failure to get an audit record from the equipment configuration database (ECD) using its record ID (RID).
  22 = Failure to update an audit record in the ECD.
  23 = Failure to open a keyed sequence of audit records in the ECD.
  24 = Failure to get a record in a sequence of audit records.
  25 = Failure to get an audit record using the audit name and member number.
  26 = Failure to read the SIM control record.
  27 = Failure to update the SIM control record.
  28 = Failure to open a sequence of audit instance records in the ECD.
  29 = Failure to get a record in a sequence of audit instance records.
  30 = Failure to get an audit instance record using its RID.
  31 = Failure to update an audit instance record in the ECD.
  32 = Failure to get an audit instance record using its instance name and the RID of the associated audit record.
  41 = Audit marked active in its ECD record when it is not running.
  42 = Invalid message received from the process manager or the utility manager regarding an audit process.
  43 = Audit reply received from an inactive audit.
  44 = Timeout occurred for an inactive audit.
  45 = Invalid reply received from an active audit.
  46 = SIOF output buffer overflow; some audit output messages were lost.
  47 = Failure to find one and only one audit process for the specified utility ID.
  48 = Audit error report received from an inactive audit.
  49 = Invalid request to inform an audit process when the audit's ECD record is modified.
  50 = Invalid request to run or stop an audit.
51 = Audit blocking condition cleared because it was invalid.
52 = Failure to create a transient audit process.
53 = Unable to take recovery action for an audit failure.
54 = Audit inhibited by SIM because it could not be run, timed out, died or was faulted while correcting errors.
55 = Routine audit scheduling malfunctioned and is being reinitialized. All routine audits are temporarily inhibited.
56 = Failure to reinitialize routine audit scheduling after it had malfunctioned.
57 = Routine audit scheduling has been temporarily inhibited because SIOF is not running.
58 = Failure to reinitialize routine audit scheduling after SIOF stopped running.
59 = Unknown error category in an error report from and audit process.
60 = Audit system reinitializing due to error found in kernel level audit scheduling.
61 = Audit system reinitializing due to error found for a kernel level audit timeout.
62 = Audit system reinitializing due to error found for a routine supervisory level audit timeout.
63 = Audit system reinitializing due to error found for a requested supervisory level audit timeout.
64 = Audit system reinitializing due to error found for a requested supervisory level audit timeout.
65 = Audit system reinitializing because SIM received a reply from an inactive audit.
66 = Audit system reinitializing because SIM received a timeout for a non-running audit.
67 = Audit system reinitializing because SIM received a raw data report from an inactive audit.
68 = Audit system reinitializing because SIM received an unexpected fault.
69 = Audit system reinitializing because SIM found eligible audits not dispatched.
70 = Failure to access an audit record in the plant measurements database.
71 = Failure to create an audit record in the plant measurements database.
72 = Failure to open the plant measurements database.
73 = Audit has taken too much time to execute.
74 = Failure of the application integrity monitor (AIM) process to reset the application sanity timer within the timeout interval.
75 = Failure to activate or de-activate the application sanity timer.
76 = AIM was not connected to port PT_AIM when a PHASE0 was requested.
77 = Failure to change craft initialization inhibit status.
78 = AIM not connected to port PT_AIM for reception of overload faults.
79 = AIM not connected to port PT_AIM for soft-switch request.
80 = AIM not connected to port PT_AIM for notification of CU switch completion.
81 = Faulty AIM port during craft initialization.
82 = Faulty IOP port during craft initialization.
83 = AIM not connected to port PT_AIM for notification of completion of diverge request.
84 = AIM not connected to port PT_AIM for converge request.
85 = AIM not connected to port PT_AIM for notification of completion of converge request.
86 = Unrecognized acknowledgement message received by SIM.
87 = Unrecognized USRACK message received by SIM.
88 = Message with invalid type received by SIM.
89 = Unrecognized MSFAULT message received by SIM.
90 = Unrecognized operating system trap (OST) entry received by SIM.
91 = Failure to respond to a request from another process for information about the most recent system initialization.
92 = Overload status change.
605 = Kernel-level overload monitor process failed to initialize.
606 = Supervisor-level overload monitor process failed to initialize.

b = Up to 3 words of optional hexadecimal data, associated with specific error conditions:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Hexadecimal Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Boot progress indicators, from left to right (hexadecimal digit 0 to hexadecimal digit 7):</td>

</tbody>
</table>
8F = Overload cleared on one disk file controller (DFC).

### Overload fault code continued:
- **90** = A DFC is overloaded.
- **91** = File manager overload cleared.
- **92** = File manager overloaded.
- **95** = Supervisor/user level lockout cleared.
- **96** = Supervisor/user level process lockout.
- **97** = Timed entry overload cleared.
- **98** = Kernel process timed entries slow.
- **99** = Kernel level lockout cleared.
- **9A** = Kernel level process lockout.
- **9C** = Module 1 memory allocation reduced to 60%.
- **9D** = Module 1 memory at 80% allocated (only for software releases with EMM feature).
- **9E** = Insufficient memory available to grant a memory allocation (module 1) (only for software releases with EMM feature).
- **9F** = Dispatcher control table (DCT) overload cleared.

#### Overload fault code continued:
- **A0** = DCT table 70% full. (For 5E10 and later, the DCT table is 85% full.)
- **A1** = DCT table overflow.
- **A2** = Segment descriptor entry (SDE) table overload cleared.
- **A3** = SDE table nearly full.
- **A4** = SDE table overflow.
- **A5** = Disk swap space overload cleared.
- **A6** = Disk swap space 80% full.
- **A7** = Memory overload cleared.
- **A8** = Kernel process memory has grown to within 1/4 megabyte of its maximum size. This has reduced the size of swappable memory to within 1/4 megabyte of its minimum size.
- **A9** = Kernel process memory overflow. Swappable main memory is at minimum size.
- **AC** = Message buffer overload cleared
- **AD** = Message buffer 70% full
- **AE** = Message buffer 90% full

### 4. ACTION TO BE TAKEN

For audit system initialization failures (error codes 101, 103, 104, 126, 127, 156, 158, and 183), refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

If the data printed with the output message includes an audit or instance RID, the audit name, member number and instance name associated with the RID may be found by using the OP:AUD input message with the ALL option. If the specified RID is not listed in the OP:AUD output message, the RID is invalid. If the error message is associated with a valid record, then an AUD output message may have been printed for the audit. If the audit aborted, the abort code printed in the output message will help in analyzing the failure.

For error code 141, use the STOP:AUD or STP:AUD input message to clear the audit record.

For error code 146, use the OP:ST-PROC input message to determine whether or not the system integrity output formatter (SIOF) program is running. The file name of SIOF is /etc/siof. If it is running, no further action is required. If it is not running, to determine the cause of the problem and what additional actions need to be taken, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For failures that involve an audit process (error codes 147, 152, and 154), verify that a valid process file exists for
that audit. For transient audits, the process file should be stored in directory /audprc and its file name should be listed in the audit's ECD record. Use the RCV:M-RCV3B input message to read the record. For quasi-killable audits, the process may be identified from its utility ID number.

For error code 154, use the STOP:EXC-ANY or STP:EXC-ANY input message to terminate the audit process (if it is still running and is quasi-killable or transient). Then attempt to run the audit manually by using the AUD input message. If the problem does not recur, then use ALW:AUD to allow the audit.

For error code 159, use OP:AUD to identify the audit causing the problem. This error is due to a missing auderr form.

For error code 190, use OP:AUD to identify the audit causing the problem. There are two possible reasons for the audit taking too much time to execute: the audit may be incorrectly reporting actual time instead of CPU time or the audit may need to be broken down into several audits. Unless corrected, supervisor audit scheduling could be adversely affected resulting in the irregular scheduling of lower frequency level supervisor audits. A maximum of nine of these REPTs will be printed in one 24 hour period of time.

A history of audit activity may be found in the most recent plant measurements report (REPT:OP-PMCR-ERR output message).

Additional information about the audit control subsystem may be found in the Audits manual.

If an overload monitor process failed to initialize (error codes 605 and 606), it may be executed manually with the EXC:ENVIR-PROC input message. The file names of these processes are /prc/klmon (kernel-level monitor) and /prc/supvprc (supervisor-level monitor).

5. ALARMS

This alarm is automatically-generated and action may or may not be required.

Minor alarm. Take action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   SSIZE X'o SFLAGS X'p

[15] REPT SIOF ERROR - INVALID SUPPLEMENTARY DATA FORMAT X'q

[16] REPT SIOF ERROR - CANNOT READ FILE a
2. REASON FOR OUTPUT

Format 1 indicates SIOF cannot open input file.

Format 2 indicates SIOF cannot open output file.

Format 3 indicates size of supplementary data block passed to SIOF is not an integral multiple of the structure to be formatted.

Format 4 indicates SIOF cannot add the segment containing the supplementary data to its address space.

Format 5 indicates SIOF cannot set the access permission modes on the segment virtual address.

Format 6 indicates SIOF cannot add segment ID to the process segment list.

Format 7 indicates the segment identity stamp does not match the audit supplementary data segment identity stamp.

Format 8 indicates SIOF cannot free the supplementary data segment.

Format 9 indicates SIOF cannot get a segment index in the segment list.

Format 10 indicates that SIOF does not recognize the supplementary data type.

Format 11 indicates that SIOF does not recognize the format type of the output message.

Format 12 indicates that the maximum number of the message which can be passed at one time from SIM to SIOF has been exceeded.

Format 13 indicates that an invalid alarm level has been specified for the audit report, and hence a space will be substituted.

Format 14 indicates that the supplementary data segment sent to SIOF is invalid.

Format 15 indicates that SIOF does not recognize the supplementary data format type.

Format 16 indicates that SIOF is unable to read the OMDB key from file.

Format 17 indicates that SIOF is unable to write first line of audit error report.

3. VARIABLE FIELD DEFINITIONS

a = Pathname of the file.

b = Name of the structure to be formatted.

c = Value of the segment ID.

d = Function return code.

e = Memory module identifier.

f = Segment name identifier.
g = Process ID.

h = Segment index.

i = Invalid supplementary data format type passed to SIOF in a suptype field from audit process.

j = Invalid output format type passed to SIOF by SIM.

k = Number of blocks.

l = Alarm level.

m = Size of supplementary data segment.

n = Starting point in supplementary data segment of data.

o = Amount of supplementary data to be processed.

p = Location of status switch in supplementary data format.

r = Invalid supplementary data format passed to SIOF in a format field from audit process.

4. ACTION TO BE TAKEN

For Formats 1-17, send a copy of the message, including the previous page and the subsequent page, to the field support center. No corrective action by the user is possible.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the status of the signaling link (SLK) in response to an OP:SLK input message.

3. VARIABLE FIELD DEFINITIONS

a = Signaling links. Range of link numbers. Valid value(s):
   ALL = All the link numbers from the input request.

b = Group number (0-63).

c = Member number (1-15).

d = Far end CLLI code of this link.

e = Major state. Valid value(s):
   AVL = Available.
   UNA = Unavailable.
   UNE = Unequipped.

f = Minor state. Valid value(s):
   ACT = Active.
   GROW = Growth.
   MOOS = Manual out of service.
   OOS = Out of service.
   TEST = Test.
= Link failure indicators.
h = Link status indicators.
i = First failure indicators.
j = Link monitor status (ON or OFF).
k = Alarm inhibit status (ON or OFF).
l = Far end manual changeover status. Valid value(s):
   CLEAR
   FAR W2
   NEAR W
   ON
   TRAF C
   WAIT F
m = Near end manual changeover status. Valid value(s):
   CLEAR
   FAR W2
   NEAR W
   ON
   TRAF C
   WAIT F
n = Prove-in mode. Valid value(s):
   E = Emergency.
   N = Normal.
o = VFL force. Valid value(s):
   A = VFL A forced.
   B = VFL B forced.
   - = No VFL forced.
p = VFL act. Valid value(s):
   A = A VFL.
   B = B VFL.
   - = Unknown.
q = Diagnostic requested. Valid value(s):
   N = No.
   Y = Yes.
r = Encryption state.
s = Periodic rekey status. Valid value(s):
   N = Inactive.
Y = In progress.

t = Protocol. Valid value(s):
6 = Common Channel Interoffice Signaling System 6 (CCIS6) protocol.
7 = Common Channel Signaling System 7 (CCS7) protocol.

u = Link type (A-E).

v = Link speed. Valid value(s):
024 = 2.4 KBS link.
048 = 4.8 KBS link.
560 = 56 KBS link.

w = Encryption option. Valid value(s):
E = Encrypted.
N = Nonencrypted.

x = Mate link group number.

y = Mate link member number.

z = Far end signal transfer point (STP). Valid value(s):
E = Even.
N = Not connected to an STP.
O = Odd.

a = Far end function number.

b = Normal prove-in error threshold. Valid value(s):
010 = 2.4 KBS link.
021 = 4.8 KBS link.
240 = 56 KBS link.

c = Emergency prove-in error threshold. Valid value(s):
002 = 2.4 KBS link.
004 = 4.8 KBS link.
048 = 56 KBS link.

d = Leaky bucket threshold. Valid value(s):
30 = 2.4 KBS link.
60 = 4.8 KBS link.

e = SYNC unit (SYU) code. Valid value(s):
E = Even.
O = Odd.
S = Self-looped.
f\(^1\) = Dataset or digital service type.

g\(^1\) = Far end region number of this link.

h\(^1\) = Voice frequency link (VFL) code. Valid value(s):
    D = Dual.
    S = Simplex.

i\(^1\) = Changeover limit. Valid value(s):
    01 = 2.4 KBS link.
    202 = 4.8 KBS link.

j\(^1\) = Receive buffer threshold.

k\(^1\) = Break-in option. Valid value(s):
    A = Allowed.
    N = Not allowed.

l\(^1\) = Pool number.

m\(^1\) = Combined pool number.

n\(^1\) = Link layer.

o\(^1\) = Number.

SLK NO.        CLLI        STATUS
    ALL LINKS: ALARM INHIBIT = OFF
********** END SLK INHIBIT ALARM REPORT **********

2. REASON FOR OUTPUT

To report the status of the signaling link (SLK) inhibit alarm.

Format 1 prints the SLK inhibit alarm hourly status report.

Format 2 prints in response to a request for a status report of all SLK inhibit alarm flags set (ON).

3. VARIABLE FIELD DEFINITIONS

a = Ring node group number.
b = Member number.
c = Far end CLLI code.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):
INH:SLK
Other Manual(s):
235-190-120 Common Channel Signaling Services Features
REPT:SLM-DUMP-MSG

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT SLM DUMP MSG
   a
   b

[2] REPT SLM DUMP MSG
   a (continued)
   b

[3] REPT SLM DUMP MSG
   THE MESSAGE:
   "b"
   OCCURRED c TIMES IN THE PAST d MINUTES

2. REASON FOR OUTPUT

To report that an unexpected message has been received. This output may result when the SS7 protocol is changed to support new features. Protocol changes are normally done in such a way that changes need not be implemented simultaneously in all network sites. As sites are updated they may begin to transmit new messages which are not recognized by network sites that have not yet been updated. In such cases, the site prints the REPT SLM DUMP MSG to make it known that it can not recognize the message and is discarding it. This is a normal reaction.

Format is used for short messages. It will accommodate messages up to 14 words. If a message is longer than 14 words it will be continued with another message of Format 2;

Format 2; accommodates continuations of up to 14 words and will be repeated as many times as necessary to dump the complete message.

Format 3; prints when the limit of 5 messages per minute period has been exceeded. To limit the number of messages being printed on the ROP, a limit has been placed on the total number of message that will be printed within a particular time period. This limit has been set to 5 messages per 5 minute period. If the total number of requests for a particular description of an error exceeds this limit, the message will not be printed and this format will be printed at the end of the period.

3. VARIABLE FIELD DEFINITIONS

a = Description of error.

b = The message dumped in hexadecimal.

c = The number of times the message should have been printed during the last time period.

d = The time period over which the message should have been printed.
4. ACTION TO BE TAKEN

This message is an indication that the SLMK process has received a message which it can not decipher or an extremely rare or unexpected event has occurred. The contents of this message may simplify the analysis of certain service effecting events and as such may be of benefit to field support organizations. In the case of an "Unexpected TFP Received" message, it is recommended that the CNI routing data be verified. For repeated instances, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

The "Unexpected TFP Received" message is a MINOR alarm. All other messages are not alarmed.

6. REFERENCES

None.
REPT:SLM-NDERR

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,CNI
Type: Output

1. FORMAT

[1] REPT SLM NDERR
   NODE a- b ACTION= c FUNCAREA=d OTHERDATA= e
__________________________________________________________________

[2] REPT SLM NDERR
   f CLNODERR () ACTIONS NOT PRINTED
__________________________________________________________________

2. REASON FOR OUTPUT

Format 1 reports events that indicate trouble in the link node. Signaling link management (SLM) uses this message for some of these events, SLM will remove the node from service. This format will be printed for manual or automatic requests.

Format 2 is used when the number of Format 1 reports become excessive. The number of dropped messages are given in this report.

3. VARIABLE FIELD DEFINITIONS

a = Link node group number.
b = Link node member number.
c = The action taken by the system on the node. Valid value(s):
   NDRMV = No system action, node currently removed.
   NOACT = No system action initiated, error report only.
   RAD = Remove and diagnose the node.
   RAPD = Remove and partial diagnose the node.
   RAR = Remove and restore the node.
   RST = Restart the node.

d = The subsystem reporting the node trouble. Valid value(s):
   APPL = Common network interface (CNI) user software.
   DBASE = Database.
   LI = Link interface.
   LISNTY = Link interface sanity.
   LNC = Link and node control.
   MEAS = Measurements.
   MH = Message handling.
   MTCE = Maintenance.
   NM = Network management.
   SCCP = Signaling connection control part.
   SYS = System control/interface.
   TOOLS = Tools.

Copyright ©2003 Lucent Technologies
= Other data. This code is unique to each subsystem reporting the error and identifies the error.

Valid value(s):

### 4. ACTION TO BE TAKEN

Dependent upon the description of the error.
As a general step, the LKBDST audit can be requested to verify the condition of the node and links (refer to the AUD:LKBDST input message). If the audit indicates errors, retry the audit. If the errors do not clear, remove and diagnose the node.

Some errors may be cleared by using the CHG:SLK input message to change the minor state of the link. For example, an OOS link can be changed first to manually OOS (MOOS), and then back to in-service (IS) (or OOS) (refer to the CHG:SLK input message). Further error messages indicate that the node should be removed and diagnosed.

5. ALARMS

Minor alarm if node is removed.

6. REFERENCES

Input Message(s):

AUD: LKBDST
CHG: SLK
DGN: LN
DGN: RPCN

Other Manual(s):
235-190-120 Common Channel Signaling Services Features
REPT:SLMK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT SLMK INIT
   GOING FROM INIT STATE a TO b

[2] REPT SLMK AUTO INH
   LINK REMOVAL INHIBIT c

[3] REPT SLMK CES
   d CRITICAL EVENTS DROPPED IN THE LAST HOUR

[4] REPT SLMK PSLT
   PERIODIC SLT INHIBIT ON, FIRST NODE e-f

2. REASON FOR OUTPUT

Format 1: To report progress for initialization and abort sequences of signaling link maintenance kernel (SLMK) in the common network interface (CNI) subsystem.

Format 2: To report the status of the automatic link removal inhibit. This inhibit is separate and distinct from the manual inhibit for link removals.

Format 3: To report the number of critical events messages missed within the last hour due to incomplete processing within the SLMK process. The incomplete processing can be caused by two situations. One is initializations. SLMK does not fully process critical events during initializations. Thus one of these reports can be expected one hour after SLMK reaches its steady operating state (currently the state is 14). Secondly, when critical event throttling is selected, this report indicates the number of critical events not processed when the throttle threshold is exceeded for the last hour.

Format 4: To report periodic signaling link test (PSLT) is inhibited for some links in the office. The report gives the group and member numbers of the first link found in the data base with the PSLT inhibited. A complete list of the links inhibited can be obtained by using the "INH:PSLT" command.

3. VARIABLE FIELD DEFINITIONS

a = The last state. Valid value(s):
   1 = Normal process start using the E_INIT event.
   2 = Abort state, shared library initialization incomplete.
   3 = Interprocessor message switch (IMS) channels open, shared libraries not initialized.
   4 = Shared libraries initialized.
   5 = IMS channels closed after previous open, shared libraries not initialized.
   6 = IMS channels opened, shared libraries initialized.
   7 = IMS channels opened, received first IMS boot message from CNI application.
= Abort state, shared libraries initialized.
= Shared libraries initialized, IMS channels opened.
= Shared libraries initialized, IMS channels closed.
= Shared libraries initialized, IMS channels opened, received first IMS boot message from CNI application, pump of remote data started.
= Received second IMS boot message from CNI application and remote data pump complete.
= Initialization of CCS6/CCS7 links complete.
= Received last IMS boot message from CNI application.
= IMS channels closed, start of level 1 initialization.
= Reopened IMS channels during level 1.
= Received first IMS boot message from CNI application during level 1.
= Recovery state of SLMK, shared library contents reused.
= Start of internal level 1 initialization.
= Received first IMS boot message during internal level 1 initialization.
= Received second IMS boot message from CNI application but remote data pump incomplete.
= Remote data pump complete, waiting second IMS boot message from CNI application.

b = The new state. Refer to variable 'a'.

c = The inhibit state. Valid value(s):
OFF = Inhibit off.
ON = Inhibit on.

2. REASON FOR OUTPUT

To provide status information to identify the current common network interface (CNI) point release. The REPT:SLMSHR message originates from the SLMSHR process.

Note: Information output by SLMSHR may not be useful to the user. This information is intended for use by development/support personnel when diagnosing CNI errors or faults.

3. VARIABLE FIELD DEFINITIONS

a = Present CNI software release.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

None.
REPT:SLT

Software Release: 5E14 and later
Message Class: SWMO1
Application: 5,CNI
Type: Output

1. FORMAT

[1] REPT SLT
   SLK a b RECEIVED SLTM IN ERROR
   RCV_DPC: c RCV_OPC: d RCV_SLC: e
   EXP_DPC: f EXP_OPC: g EXP_SLC: h

[2] REPT SLT
   SLK a b RECEIVED SLTA IN ERROR
   RCV_DPC: c RCV_OPC: d RCV_SLC: e RCV_LI: i
   EXP_DPC: f EXP_OPC: g EXP_SLC: h EXP_LI: j

[3] REPT SLT
   SLK a b EXPECTED TEST PATTERN IN SLTA WAS NOT RECEIVED

[4] REPT SLT
   SLK a b RECEIVED SLTM DISCARDED, NOT IN AVAILABLE STATE

[5] REPT SLT
   SLK a b SLTA WARNING: 'SLTCHK OFF' AND LINK APPEARS SELF LOOPED

[6] REPT SLT
   SLK a b SLTA WARNING: 'SLTCHK OFF' YET LINK IS NOT SELFLOOPED

2. REASON FOR OUTPUT

To report when an SLT fails or a self-loop is detected by an SLT.

The report can be generated for common channel signaling 7 (CCS7) links. Because a persistent SLT failure can result in large amounts of output, the reports are limited to five (5) in any given fifteen (15) minute interval. In that interval, the first five reported will be output.

3. VARIABLE FIELD DEFINITIONS

a = Group number.
b = Member number.
c = Destination point code (DPC) in the received SLTM or SLTA.
d = Origination point code (OPC) in the received SLTM or SLTA.
e = Signaling link code (SLC) in the received SLTM or SLTA.
= Expected DPC for the received SLTM or SLTA.
g = Expected OPC for the received SLTM or SLTA.
h = Expected $SLC®$ for the received SLTM or SLTA.
i = Length indicator (LI) in the received SLTA.
j = Expected LI for the received SLTA.

4. ACTION TO BE TAKEN

For Format 1, refer this problem to the office data administration personnel. This problem can be with either the data at the local office, or data at the far end.

For Format 2, same action taken for Format 1. In addition, if the problem is in the length indicator (LI), refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. The LI is software generated.

For Format 3, the test pattern is software generated. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Either the local end is interpreting the received test pattern incorrectly, or the far end is sending an incorrect test pattern.

For Format 4, if the intent for this link is to carry traffic, recent change the major state to available (AVL), otherwise ignore this report.

For Format 5, this warning message indicates that SLTM/SLTA exchange is successfully done under the self-loop condition. The self-loop intention is indicated by sltchk-off command, and the link is self-looped. If self-looping is desired, ignore this report. If self-looping is not desired, execute the sltchk-on command, and clear the self-loop on the facility.

For Format 6, this warning message indicates that SLTM/SLTA exchange is successfully done under the end-to-end condition. Although a self-loop intention is indicated by sltchk-off, the link is NOT self-looped. If self-looping is not desired, execute sltchk-on. If self-looping is desired, establish a loop on the link.

5. ALARMS

None.

**REPT:SM-CALL**

- **Software Release:** 5E14 and later
- **Message Class:** SED_MON
- **Application:** 5
- **Type:** Output

1. **FORMAT**

   REPT SM=a CALL PROCESSING DOWNTIME=bb:bb:bb EVENT=c  
   [ POWER UP – TIME MAY BE INVALID ]

2. **REASON FOR OUTPUT**

   To report outage time in the switching module (SM). (Minor outages- currently less than 30 seconds- will not be reported by this output message but will be included in the plant measurement 24 hour report.)

3. **VARIABLE FIELD DEFINITIONS**

   - **a** = SM number reporting outage time.
   - **b** = Outage time, in the form hours:minutes:seconds.
   - **c** = Event number.

   If this outage is caused by a power up or immediately follows a power up, the time reported may be invalid.

4. **ACTION TO BE TAKEN**

   None.

5. **ALARMS**

   None.
REPT:SM-CCF

Software Release: 5E14 and later
Message Class: RCVY
Application: 5
Type: Output

1. FORMAT

REPT SM a b COMM CHK FAILURE
   LOG LINK:  c d
   PHY LINK:  e f
   SM MODE:  g ESCALATION:  h

2. REASON FOR OUTPUT

To report the loss of end-to-end communication between the administrative module (AM) and the specified switching module (SM).

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Type of failure encountered. Valid value(s):
   DUPLEX = Both links have failed.
   SIMPLEX = Single link failure.
c, d = Logical link numbers over which communication failed.
e, f = Physical link numbers that correspond to the logical links (variables 'c' and 'd') the last time any communication was received from this switching module.
g = Mode of the switching module the last time communication was received. Valid value(s):
   GRWTH = Growth.
   MIN = Min mode.
   NORM = Normal operation.
   PRCVY = Post recovery.
h = Value of the link recovery escalation counter at the time the failure occurred.

4. ACTION TO BE TAKEN

Check the status of all attempted software recovery actions. Check the hardware associated with the current active links.

5. ALARMS

If the type of failure (variable 'b') is duplex, a critical alarm occurs. If the type of failure is simplex, a major alarm occurs.

6. REFERENCES
None.
REPT:SM-CF
Software Release: 5E14 and later
Message Class: SED_MON
Application: 5
Type: Output

1. FORMAT

REPT SM a CONTINUITY FAILURES
    INTERVAL bb:bb:bb
    ORIGINATING CALLS = c  FAILURES = d
    TERMINATING CALLS = e  FAILURES = f

2. REASON FOR OUTPUT

To report excessive continuity failures and the number of calls lost due to these failures.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Span of time over which failures were counted, in the form hours:minutes:seconds.
c = Number of originating calls attempted.
d = Number of originating calls that failed.
e = Number of terminating calls attempted.
f = Number of terminating calls that failed.

4. ACTION TO BE TAKEN

Network control and timing (NCT) link hardware for the specified SM is suspected to be faulty. Check the log files and receive-only printer (ROP) output for indications of hardware failures in the operation of the NCT links and associated hardware. This message provides the results of continuity failures, the number of calls attempted and the number of calls lost, it cannot provide the source of the failures.

REPT SM=a,b,c DPLI HW REGS EVENT=d
  DPLI-ERRORS:ef gh
  DPLI i-j TSI BOARD k PORT l m
  DI n-o
  IFEMR=p PLEM=p DPLPEMR=r
  IFESR=s PLESR=t DPLPESR=u
  IFCTL=v PLLCR=w DPLPCTL=x
  IFDGCTL=y PLBST=z

2. REASON FOR OUTPUT

To report the contents of a specific time slot interchange (TSI) and peripheral interface data bus-peripheral link interface (DPLI) hardware registers as information for trouble analysis. This message may contain a maximum of five DPLI error reports and a minimum of one. This message is automatically generated by the system when a DPLI fault is detected.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number where the report originated.
b = SM side on which the interrupt occurred.
c = SM processor status of side reporting the error (ACT or MATE).
d = Event number, time sequence indicator.
e = Bit map of the DPLIs (that is, TSI links 39-32) that reported errors for MCTSI side 0.
   0 = No error reported.
   1 = An error is reported.
f = Bit map of DPLIs (that is, TSI links 31-0) that reported errors for MCTSI side 0. Valid values are:
   0 = No error reported.
   1 = An error is reported.
g = Bit map of the DPLIs (that is, TSI links 39-32) that reported errors for MCTSI side 1. Valid values are:
   0 = No error reported.
   1 = An error is reported.
h = Bit map of the DPLIs (that is, TSI links 31-0) that reported errors for the MCTSI side 1. Valid values are:
   0 = No error reported.
   1 = An error is reported.
\( i \) = physical TSI link (0-39)

\( j \) = OXU side.

\( k \) = TSI board number.

\( l \) = Relative TSI port associated with the specified TSI board.

\( m \) = Source of the error that caused the interrupt. Valid values are:

- **DPLI-DETECTED-BAD-FRAME-BYTE** = The DPLI's paddle board detected a bad frame word byte received from the DPLI's PCTSI.
- **DPLI-DETECTED-BAD-SUPERFRAME-BYTE** = The DPLI's paddle board detected a bad superframe byte received from the DPLI's PCTSI.
- **DPLI-DETECTED-BUFFER-CHECK-ERROR** = The DPLI's PCTSI detected a parity error on a read operation of the internal elastic store buffer.
- **DPLI-DETECTED-LOOP-BACK-WORD-ERROR** = The DPLI's PCTSI detected an inconsistency in the loop back data that is stored in the DPLI loop data word source and sink registers.
- **DPLI-DETECTED-OUT-OF-FRAME** = The DPLI detected a framing error on the PCT link framing bytes coming from the TSI (such as, the DPLI's PLI paddle board) for four consecutive frames.
- **DPLI-DETECTED-RECEIVE-CRC-ERROR** = The DPLI's PCTSI detected a CRC error on the PCT link data coming from the TSI (such as, the DPLI's PLI paddle board).
- **DPLI-DETECTED-RECEIVE-PARITY-ERROR** = The DPLI's PCTSI detected a receive parity error on the data being internally received on the PCT link from the TSI (such as, the DPLI's PLI paddle board).
- **DPLI-DETECTED-TRANSMIT-CRC-ERROR** = The DPLI's PCTSI detected a CRC error on the data being internally transmitted on the PCT link toward the TSI (such as, the DPLI's PLI paddle board).
- **DPLI-DETECTED-TRANSMIT-PARITY-ERROR** = The DPLI's PCTSI detected a transmit parity error on the data being internally transmitted on the PCT link toward the TSI (such as, the DPLI's PLI paddle board).
- **DPLI-DETECTED-WRITE-ERROR** = The DPLI's PCTSI detected a write error on the PCT link coming from the TSI (such as, the DPLI's PLI paddle board). The write error could be the result of independent stimuli including:
  - The write protect password key was not properly set prior to a write operation.
  - A CRC error occurred during a write operation.
  - A parity error occurred during a write operation.

- **DPLI-LINK-REPORTED-A-TRANSIENT-ERROR** = The DPLI's PCTSI link detected a transient error from the TSI.
- **DPLI-LINK-REPORTED-AN-INTERRUPT-THRU-MASK-ERROR** = The DPLI was declaring an interrupt through mask error.
- **DPLI-LINK-REPORTED-AN-UNEXPECTED-INTERRUPT** = The DPLI detected an unexpected interrupt.
- **IF-DETECTED-CRC-ERROR-ON-DATA-RCV-FROM-DPLI** = The TSI detected CRC errors on data received from DPLI.
- **IF-DETECTED-HARDWARE-MASKING-PROBLEM** = The DPLI was declaring an error that should have been masked by hardware.
- **IF-DETECTED-LOSS-OF-CLOCK-FROM-THE-DPLI** = The TSI detected a loss of clock signal from the DPLI.
IF-DETECTED-LOSS-OF-CLOCK-REFERENCE = The TSI detected a loss of clock from the DPLI.
IF-DETECTED-PARITY-ERROR-ON-RCV-OVERHEAD-BYTES = The TSI detected a parity error on the overhead bytes from the DPLI's paddle board.
IF-DETECTED-SOFTWARE-MASKING-PROBLEM = The DPLI was declaring an error that should have been masked by software.
IF-DETECTED-SYNCHRONIZATION-ERROR-WITH-DPLI = The TSI detected synchronization error from the DPLI.
MULTIPLE-DPLI-LINKS-ARE-REPORTING-INTERRUPT = Multiple DPLI links are reporting interrupt errors.
PLI-DETECTED-BAD-FRAME-WORD-ON-RCV-LINK = The PLI paddle board detected a bad frame word received from the DPLI's PCTSI.
PLI-DETECTED-BAD-SUPERFRAME-BYTE-ON-RCV-LNK = The PLI paddle board detected a bad superframe byte received from the DPLI's PCTSI.
PLI-DETECTED-CRC-ERROR-ON-DATA-FROM-TSI = The PLI paddle board detected a CRC error on data received from the active TSI.
PLI-DETECTED-INTERNAL-DATA-PARITY-ERROR = The PLI paddle board detected an internal parity error.
PLI-DETECTED-LINK-TO-BE-OUT-OF-FRAME = The PLI detected the link to be out of frame from the DPLIs PCTSI.
PLI-DETECTED-OUT-GOING-BUFFER-CHECK-ERROR = The PLI paddle board detected a buffer check error from the DPLI's PCTSI.
PLI-DETECTED-PARITY-ERROR-ON-RCV-OVERHEAD-BYTES = The PLI paddle board detected a parity error on the overhead bytes from the DPLI's PCTSI.
PLI-DETECTED-PARITY-ERRORS-ON-DATA-FROM-DPLI = The PLI paddle board detected a a parity error on data from the DPLI's PCTSI.
PLI-DETECTED-THAT-IT-IS-SOURCING-BAD-CRC = The PLI paddle board detected that it is sourcing a bad CRC.

n = OXU number (1 - 8).
o = Relative DPLI link number (0 - 5).
p = Contents of the TSI interface (IF) error mask register (TSIFEMR) of the identified TSI board and port.
q = Contents of the PLI error mask register (PLEMR) of the identified PLI.
r = Contents of the DPLI peripheral error mask register (DPLPEMR) of the identified DPLI.
s = Original contents of the TSI IF error source register (TSIFESR) of the identified TSI board and port.
t = Contents of the PLI error source register (PLESR) of the identified PLI.
u = Contents of the DPLI peripheral error source register (DPLPESR) of the identified DPLI.
v = Original contents of the TSI IF control register (TSIFCTL) of the identified TSI board and port.
w = Contents of the PLI link control register (PLLCR) of the identified PLI.
x = Contents of the DPLI peripheral control register (DPLPCTL) of the identified DPLI.
y = Original contents of the TSI IF diagnostic control register (IFDGCTL) of the identified TSI board and port.
Contents of the DPLI built in self test register (PLBST) of the identified DPLI.

REPT:SM-DUMP

Software Release: 5E14 and later
Message Class: RCVY
Application: 5
Type: Output

1. FORMAT

REPT SM (a,b) c d e f g EVENT No.=h

2. REASON FOR OUTPUT

To report a system-generated dump of switching module (SM) data associated with an audit or a defensive check failure. On systems with a 1A switching module, this message is also used by MICO to report hash sum check failures and log the past 240 events.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Active processor side at the time of the dump request.
c = Name of the data block being dumped (refer to audit input message format for a list of data block mnemonics). If the data block being dumped is client data as a result of an assert, the field will read DATA.
d = Environment in which the request was stimulated. Valid value(s):
   AIM = Application integrity monitor.
   CMKP = Communication package kernel process.
   IODRV = Input/output driver kernel process.
   HMALM = Human/machine alarm process.
   HMIRA = Human/machine input request administrator.
   HMMCC = Human/machine master control center control process.
   HMSIP = Human/machine spooler input process.
   HMTIME = Human/machine timing process.
   OSDS-C = Operating System for Distributed Switching - administrative module.
   OSDS-M = Operating System for Distributed Switching - switching module.
   PUCR = Pump control kernel process.
   SMKP = Switch maintenance kernel process.
e = Source of the dump request. Valid value(s):
   AUD = Audit of the associated data structure.
   DCF = Defensive check failure request.
f = Block number.
g = Physical block address.
h = Event number, which is used to correlate messages to a single event.
i = Raw dump in groups of 32 bits of associated data.

   k [k...]

2. REASON FOR OUTPUT

To report the data in the process message data block (PMDB). A terminal process has been purged. That process
has a PMDB associated with it. The PMDB will contain an incoming and/or outgoing message. These messages will
be dumped in this message.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Source of the message. Valid value(s):
   PMDB-IN = This message was received by the terminal process.
   PMDB-OUT = A message to be sent from this terminal process.
c = Source of the dump request. Valid value(s):
   AUDR = Audit of the associated data structure.
   DCF = Defensive check failure request.
   DCFSPP = DCF deferred single process purge.
   FR = Fault recovery.
   SI = System integrity data.
   SPP = Single process purge.
d = Event number.
e = Message type in the PMDB (in decimal).
f = The length of the message in the PMDB.
g = The priority of the message in the PMDB.
h = The process that formatted this message.
i = Processor identification.
j = Processor uniqueness.
k = Data (in hexadecimal) from the message saved in the PMDB.
4. **ACTION TO BE TAKEN**

This information should be sent along with any trouble report concerning the SM initialization to an appropriate technical support organization.

5. **ALARMS**

REPT:SM-EPLLR

Software Release: 5E14 and later
Message Class: CP
Application: 5
Type: Output

1. FORMAT

REPT SM=a EXCESSIVE PP LOW LEVEL RECOVERIES SUMMARY
UNIT COUNT
-------------------------------------------------

2. REASON FOR OUTPUT

To report any PI(packet interface) or PSUPH(packet switch unit protocol handler) units which have experienced an excessive number of low level recoveries in the past 24 hours. Low level recoveries include audit errors, RPI(return to point of interrupt) errors, and SPP(single process purge) events.

A maximum of 10 PIs/PSUPHs will be reported in this report. PIs will always be reported if they have more than 10 low level recovery errors. If more than 10 units have experienced an excessive number of low-level recoveries, only those PSUPHs with the highest error counts will be reported.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Unit name, MCTSI or PSUPH
c = Count of the number of low-level errors reported by this unit.

4. ACTIONS TO BE TAKEN

Detail on the type of errors that have been occurring on this unit may be obtained by entering OP:HISTORY command for this unit. To collect data concerning future events, printmode may be turned on by entering CHG:PRNTMODE command for this unit.

5. ALARMS

None.

6. REFERENCES

None.
REPT:SM-FAST

**Software Release:** 5E14 and later
**Message Class:** INT
**Application:** 5
**Type:** Output

1. **FORMAT**

REPT SM=a FAST PUMP FAILURE: b

2. **REASON FOR OUTPUT**

To sound a major alarm and notify the user that a normal pump has reverted to a backup pump.

3. **VARIABLE FIELD DEFINITIONS**

   a  = Switching module (SM) number.

   b  = Reason for reverting. Valid value(s):
   AM/MSGS PROBLEM = A fast pump cannot be continued because centralized resources are not available, such as, no pump peripheral controllers (PPCs) are in service.
   BTSR/PUMP HW BAD OR UNAVAILABLE = The pump hardware in the SM was found to be bad or not operational. In a module control and time slot interchange unit, version 2 (MCTU2), this pump hardware is duplicated in each module controller and time slot interchanger (MCTSI). In earlier versions, the SM pump hardware is the simplex bootstrapper (BTSR) circuit.
   HSM PATH SETUP FAILURE = The host switching module (HSM) was unable to allocate [sufficient] timeslots for this remote switching module (RSM) to pump.
   ODD FAILED TO PUMP = The SM initialization determined that the ODD was to be pumped but after the pump completed, the ODD was not pumped.
   NO PROGRESS = Progress is no longer being made pumping in this initialization.
   NO PROGRESS EXCESSIVE PUMP RESETS = The SM initialization has continually restarted because of problems with pump.

4. **ACTION TO BE TAKEN**

Follow the procedures outlined in the System Recovery Manual.

5. **ALARMS**

Major.

Output Message(s):

REPT:SM-HASHSUM
REPT:SM-HASHSUM

Software Release: 5E14 and later
Message Class: INT,SM
Application: 5
Type: Output

1. FORMAT

REPT SM=a HASHSUM FAILURE b SIDE c [EVENT=f]
   FAILING ADDRESS RANGES:
   d   e
   .   .
   .   .
   .   .

2. REASON FOR OUTPUT

To notify the user that hashsum checks of the switching module (SM) memory failed on the ACTIVE or MATE module controller/time-slot interchange (MCTSI) side. Hashsum checks are made during switching module pump (automatic or manual), MATE MCTSI restorations (automatic or manual), and routinely. The message class is SINIT for SM pump and SMSTAT otherwise.

Failure of hashsum checks may indicate that the hashsum tables are in error, or it may be that the memory is bad. The address ranges for the blocks that had bad hashsums are provided.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Side of the SM. Valid value(s): ACTIVE MATE
c = Side number.
d = The starting address of the failing address range.
e = The ending address of the failing address range.
f = Event number.

4. ACTION TO BE TAKEN

Investigate the cause of the failure; it may be the result of a bad memory or a bad hashsum table. Make any necessary repairs. This condition may prevent the SM from going duplex.

If hashsum failure is reported for the MATE and the MCTSI diagnostic passes, there are two possibilities:
1 = There is a memory fault in the MATE memory that is not caught by the diagnostic; or
2 = There is a difference between the ACTIVE memory and the hashsum table.

If an offline pump was in progress, the message will be accompanied by a REPT:SM-OFFLINE output message with the reason for the hashsum failure.

If a MATE memory fault is suspected, execute MCTSI diagnostic phase 7 on the suspect side of the SM. If phase 7 passes, all tests passed (ATP), there may be an intermittent memory fault that is not detectable by the diagnostics.
Replace the suspect memory boards. To determine the board numbers, use the failing addresses in this message (variables 'd' and 'e') within the procedure described in the Corrective Maintenance Manual (235-105-220). Note: Values below 0x24000 do not map to dynamic RAM.

If replacing the boards does not clear up the problem, there might be a difference between the ACTIVE memory and the hashsum table. If the SM mode indicator says HASH ERR, it is very likely that the ACTIVE memory hashsums do not agree with the hashsum table. The MATE MCTSI should not be restored until this difference is resolved. Resolve any differences between the ACTIVE memory and the hashsum table. This problem can occur when certain utility commands are used that change the contents of memory, but not the hashsum table. Refer to the LOAD:UT-SM and WHEN:UT-SM input messages for additional information.

It is possible for a MCTSI restoration to succeed even when the SM is reporting hashsum failures on the active side when the failures are in certain ranges. That is, a MCTSI restoration does not check all memory; so if the active MCTSI has ranges failing which are not in the set of memory checked, a restoration may succeed. Only portions of the various hashsum-protected ranges are checked during the MCTSI restoration.

5. ALARMS

Major alarm only when the hashsum check fails on the ACTIVE MCTSI side.

                     IRR: g     g     g     [i]
                     IMR: g     g     g     [i]
                     ISR: g     g     g     [i]

2. REASON FOR OUTPUT

To report the contents of the module processor (MP) registers at the time of an interrupt.

The contents of selected quad integrated communications controller (QUICC) interrupt registers are provided for the MCTU3 which supports this device. Variable ‘h’ will indicate whether QUICC registers are included in the printed report.

The contents of the message handler interrupt controller registers are printed if the message handler is the interrupt source and unable to print a message. Printing message handler interrupt control registers applies only for the SM-2000 configuration, refer to variable ‘b’ for configuration.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number. This field may not appear in initial reports from SM power-up initializations.

b = The SM software configuration, reflecting the types of service this SM could potentially support (visible through the switching module equipment view of recent change). This field will not appear in initial reports from high-level SM initializations. Valid value(s):

   BASIC
   STANDARD
   LOADED
   SM2000

c = The SM type, or hardware configuration, reflecting the type of connections between this SM and the central office. This field may not appear in initial reports from SM power-up initializations. Valid value(s):

   LSM = Local switching module.
   HSM = Host switching module.
   RSM = Remote switching module.
   ORM = Optically integrated remote switching module.
   TRM = Two-mile optically remote switching module.
d = Event number; related messages from this SM will also be printed with this event number.

e = Microprocessor type (UNK, 68012, 68020, 68040, 68060).

f = Register contents (in hexadecimal) of the microprocessor. Valid value(s):

680XX register definitions:
A0–A5 = Address registers.
D0–D7 = Data registers.
FP = Stack frame pointer (base of current stack).
PC = Program counter.
SR = Status register.

680XX status register:
BIT15 = Trace mode status.
BIT13 = Supervisor state.
BIT10–8 = Interrupt mask status.
BIT4 = Extend status.
BIT3 = Negative status.
BIT2 = Zero status.
BIT1 = Overflow status.
BIT0 = Carry status.
SSP = Supervisor stack pointer.
USP = User stack pointer.

g = Register contents in hexadecimal of the low, medium and high priority interrupt controllers that represent. Valid value(s):
IMR = Interrupt mask register.
IRR = Interrupt request register.
ISR = Interrupt service register (interrupt being processed).

h = The message handler reporting the interrupt or a QUICC device. Valid value(s):
MH–0 = Message handler 0.
MH–1 = Message handler 1.
MH–2 = Message handler 2.
QUICC = QUICC device. The QUICC is supported on the processor board, so the QUICC interrupt controller registers are printed.

The message handler and its associated interrupt fields are only printed in the SM-2000 configuration when the message handler does not provide post-mortem data.

i = The message handler or QUICC event source bit, interrupt mask bit, and interrupt source request registers. Valid value(s):
IRR = Event source bit register.
IMR = Interrupt mask bit register.
ISR = Interrupt source request register.

If variable 'h' is not empty, then an empty variable 'i' means that the value of that register is all 1's.
4. ACTION TO BE TAKEN
None.

5. ALARMS
None.

   SHADOW TYPE/COUNT: g1 h1
   AUX DATA:     i1 j1 k1 l1
   ESCALATION-COUNTS: m1 n1 o1 p1

2. REASON FOR OUTPUT

To provide information about the type and source of an interrupt that occurred in the switching module (SM) controller and the resulting level of initialization.

The ORIG-HW-STATUS fields contain the status of both elements of the affected duplex hardware prior to the event. The FINAL-HW-STATUS fields contain the status of the hardware after automatic fault recovery has occurred. Format 1 is printed and Format 2 is logged unless the message class specifies otherwise (INT and INT_MON respectively). To verify the log/print status, use the OP:LPS input message. To change the log/print status, use the CHG:LPS-MSGCLS input message.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
   Note: When variable 'k' equals IN PROGRESS, the SM number may be 0 or blank. The true number will appear when variable 'k' equals COMPLETED.

b = SM side on which the interrupt occurred.

c = SM processor status active (ACT) or MATE on the side where the interrupt occurred.

d = Level of hardware recovery initiated by fault recovery. Refer to Exhibit A for associated actions and minimum software recovery levels.

e = Level of software initialization performed. Valid value(s):
   DA = Directed audit.
   FGI = Foreground initialization (all foreground jobs cleared).
f = Reporting hardware subunit that triggered the interrupt, or software stimulus that caused the recovery. Valid value(s):

- **CI0** = Control interface (CI) 0.
- **CI1** = Control interface 1.
- **CI2** = Control interface 2.
- **CI3** = Control interface 3.
- **CIK** = Craft intervention key.
- **DLI0** = Dual link interface (DLI) side 0.
- **DLI0_MP** = Dual link interface side 0 and module processor.
- **DLI1** = Dual link interface side 1.
- **DLI1_MP** = Dual link interface side 1 and module processor.
- **LK0A** = DLI0 isolated to network control/timing link A.
- **LK0A_MP** = DLI0 network control/timing link A and module processor.
- **LK0B** = DLI0 isolated to network control/timing link B.
- **LK0B_MP** = DLI0 network control/timing link B and module processor.
- **LK1A** = DLI1 isolated to network control/timing link A.
- **LK1A_MP** = DLI1 network control/timing link A and module processor.
- **LK1B** = DLI1 isolated to network control/timing link B.
- **LK1B_MP** = DLI1 network control/timing link B and module processor.
- **MP** = Module processor/module controller.
- **ONTCO** = Office network timing complex side 0.
- **ONTCl** = Office network timing complex side 1.
- **ONTCB** = Office network timing complex, both sides.
- **PI** = Packet interface.
- **RL_RCLK** = Remote clock interface.
- **RL_RDFI** = Remote link interface (RLI).
- **RLA_RDFI** = Remote link interface multiplexor A and remote digital facility interface.
- **RLB_RDFI** = Remote link interface multiplexor B and remote digital facility interface.
- **RLI0** = Remote link interface side 0. The RLI consists of a DLI and a facility interface (FI).
- **RLI1** = Remote link interface side 1. The RLI consists of a DLI and a FI.
- **SP** = Signal processor.
- **TSI** = Time slot interchange.
- **UNK** = Unknown. Normally this indicates that recovery was aborted (check variable 'k'), and the subunit was not reported by the time of the failure.

\( g \) = Subunit component reporting the interrupt. The reporting component is the network link interface (NLI) when the subunit is ONTC (0,1) and the SMREF when the subunit is TSI. Valid value(s):

- **MULT-NLI** = Multiple NLIs are reporting errors.
- **MULT-SMREF** = Multiple external timing references are associated with the error.
- **NLI-x** = NLI link number reporting an error, where the link number 'x' is 0-23.
SMREF-0 = Error on external timing reference 0.
SMREF-1 = Error on external timing reference 1.

h = Source of the error that caused the interrupt. Valid value(s):
A-ALTERNATE-DATA = The TSI detected an error in the A alternate data.
A-FLIP-FLOP-CLEAR = The A flip flop has been cleared in a running processor.
A-MEM-HI-BYTE = The TSI A random access memory (RAM) memory had bad parity in the high byte.
A-MEM-LO-BYTE = The TSI A RAM had bad parity in the low byte.
A-MEM-MAINT = The TSI A RAM memory maintenance bit was set.
A-MEM-PARITY = The TSI A RAM memory had bad parity.
ACT-CLOCK = The active clock synchronous circuit (CSC) lost either the clock or synchronization signal or both.
ACT-CSC-REFERENCE = The active CSC detected loss of the clock reference used as the source of timing.
ADDR-BUS-PAR-ERR = A parity error was detected by the time slot interchange (TSI) on the address bus from the MP.
ADDR-PARITY-ERR = The address presented to the control interface (CI) by the microprocessor had bad parity.
ADDRESS-PARITY = Bad parity was detected on the address bus.
ADDRESSING-ERR = Word access was attempted on an odd-byte boundary.
ADR-LODSU-PARITY = Bad parity was detected by the TSI on local digital service unit data read from the alternate data RAM.
ASW-FAILURE = A multiple PICB operation failed to return "All Seems Well" for at least one PICB.
ATTENUATOR-ERR = The TSI detected an error in the TSI attenuator.
B-ALTERNATE-DATA = The TSI detected an error in the B alternate data.
B-MEM-HI-BYTE = The TSI B RAM memory had bad parity in the high byte.
B-MEM-LO-BYTE = The TSI B RAM memory had bad parity in the low byte.
B-MEM-MAINT = The TSI B RAM maintenance bit was set.
B-MEM-PARITY = The TSI B RAM memory had bad parity.
BOARD-CLOCK = A TSI board detected a bad clock signal coming from the TSICOM.
BOARD-DATA-PARITY = A TSI board detected a data parity or cyclic redundancy check (CRC) error. The stimulus is bad data, address, or control to or from a CRAM, SRAM or ARAM circuit. The error is either from a switch module processor (SMP) access or internal to the time slot interchange unit (TSIU).
BOARD-HARDWARE-MASK = A TSIU mask register was found to contain an invalid value. The mask register could not be successfully written, so the condition still exists.
BOARD-INTERFACE = A TSI board detected bad data or addresses during an SMP read or write operation.
BOARD-INVALID-DATA = The TSIU detected invalid data in either a control time slot (CTS) register or a CRAM. If a CTS register, then the probable cause is that the CTS dip switches are improperly set. If a CRAM error, the probable stimulus is an invalid SMP access (read or write).
BOARD-SOFTWARE-MASK = A TSIU mask register was found to contain an invalid value. The register has been written with the proper value.
BUFFER-CHECK = The NLI detected a buffer check error.
BUS-ERR = A 680XX bus error exception occurred without resetting. This indicates a failure in the reset source circuitry.
BUS-LOCK-PROT-VIOL-ER = The microprocessor bus is locked. This usually indicates a software problem.
C-MEM-ADR-READ = The alternate data RAM read address of TSI C RAM had bad parity.
C-MEM-ADR-WRITE = The alternate data RAM write address of TSI C RAM had bad parity.
C-MEM-HI-BYTE = The TSI detected bad parity in the high byte of the CRAM memory.
C-MEM-LO-BYTE = The TSI detected bad parity in the high byte of the CRAM memory.
C-MEM-MAINT = The TSI C RAM maintenance bit is set.
CACHE-ERR = An error involving the cache has occurred. The cache can detect parity errors and multiple bank match errors.
CIn-READY-TO = A time-out was encountered while accessing CIn, where n is 0-3.
CMD3-REG-ENABLE = The TSI detected an error in enabling the command register 3 (TSCMD3).
COMMON-CLOCK = The TSICOM detected a bad clock signal from its oscillator. The problem is internal to the TSICOM.
COMMON-DATA-PARITY = The TSIU detected a data parity error during an SMP read operation.
COMMON-INTERFACE = The TSICOM detected bad data or addresses during an SMP read or write operation.
CONTIN-x-OOF-ERROR = Continuous out-of-frame (OOF) errors occurred on link A or B (where 'x' is A or B).
CONTROL-ADDR = Error in the control address.
CORE-ADDR-PRESENTED-ER = A memory controller could not find an address in its memory.
CORR-BIT-ERR = Number of single bit errors detected in memory and corrected by the Hamming code exceeded threshold (pre-SM-2000 threshold is one).
CPI-ERROR = An illegal or garbled message was received from the administrative module (AM).
CRC = CRC error associated with the NLI.
CRC-FROM-ACTIVE-TSI = The NLI detected a CRC error on data received from the active TSI.
CRC-FROM-MATE-TSI = The NLI detected a CRC error on data received from the mate TSI.
CSC-PARITY = The CSC detected a parity error on the subunit interface bus.
D-MEM-EVEN = The TSI detected bad parity in one of the even time slots in the DRAM.
D-MEM-ODD = The TSI detected bad parity in one of the odd time slots in the DRAM.
DATA-PARITY-ERR = The data presented to the CI by the microprocessor had bad parity.
DATA-SELECT-ERR = The TSI detected an error during the data selection.
DBL-BUS-ERR = A 680XX reset (exception 0) has occurred, probably due to a double bus error or a double address error.
DECODE-ERROR = An address on the bus was not successfully decoded.
DI-A-OUTPUT = The TSI detected bad parity being sent on the A output to the data interface (DI).
DI-B-OUTPUT = The TSI detected bad parity being sent on the B output to the DI.
DI-DATA-PARITY = The DI detected a data parity error during a read of DI RAM. The stimulus is either an SMP access or an internal access with the DI.
DI-INTERFACE = The DI detected bad data or addresses during an SMP read or write operation.
DI-PIDB-PARITY = The TSI detected bad parity on the data being received from peripheral time slots. The implicated time slots are stored in the DI buffer. If this error occurred on the active module processor time slot interchanger (MCTSI), look for ‘PIDB PARITY’ error reports with the same event number.
DLI-A-INPUT = The TSI detected bad parity from the DLI A input.
DLI-A-OUTPUT = Bad parity was detected by the TSI on the data sent to DLI A output.
DLI-B-INPUT = The TSI detected bad parity from the DLI B input.
DLI-B-OUTPUT = Bad parity was detected by the TSI on the data sent to the DLI B output.
DLI-INPUT-CLOCK-ERROR = Both DLLs are reporting bad clock input signals from the active MCTSI.
DLI-INTERFACE-ERR = The module processor (MP) detected bad parity on the control time slot data or on a read of DLI registers.
DLI-READY-TIMEOUT = A time-out was encountered while accessing a DLI.
DSU-A-PAR-ERR = A parity error was detected by the TSI from the digital service circuit unit A [local digital service unit (LDSU) service group 0].
DSU-B-PAR-ERR = A parity error was detected by the TSI from the digital service circuit unit B.
(LDSU service group 1).

DSU-C-PAR-ERR = A parity error was detected by the TSI from the digital service circuit C.

DSU-D-PAR-ERR = A parity error was detected by the TSI from the digital service circuit D.

E-BIT-PARITY = The TSI detected bad parity in the E-bit receive circuit.

E-MEM-EVEN = The TSI detected bad parity in one of the even time slots in the ERAM.

E-MEM-ODD = The TSI detected bad parity in one of the odd time slots in the ERAM.

EQUIPAGE = The TSIU detected that an operational TSIU board has been physically removed from the shelf.

EXCESSIVE-JITTER = The amount of jitter on an external timing reference signal has exceeded its threshold.

EXCPTN-STK-FRM-ER = The microprocessor detected an invalid stack frame format while attempting to return from an exception.

FI-A/B-SLIP = The RLI detected slips between the FI active (A) and back-up (B) references.

FI-ACT-T1-REF = The RLI detected the FI active T1 reference failing.

FI-BACKUP-T1-REF = The RLI detected the back-up T1 reference failing in the FI.

FI-FIDB-A/B-PAR = RLI to DLI facility interface data bus parity error.

FI-FIDx-PARITY = The RLI x multiplexer in the facility interface (FI) detected parity errors on an FI data bus (FIDB) (where 'x' is A or B).

FI-INTERNAL-INTERFACE = The RLI detected parity errors on the FI internal interface.

FI-INTERNAL-REF = The RLI is using the internal oscillator in the FI as the reference.

FI-LINK-x-BUF-ERR = The RLI detected FI buffer errors on link 'x' (where 'x' is A or B).

FI-LINK-x-CLK = The RLI detected that the FI link 'x' clock was stopped (where 'x' is A or B).

FI-LINK-x-LP = The RLI detected that the FI link 'x' was looped (where 'x' is A or B).

FI-LINK-x-OOF = The RLI lost synchronization with the framing bits for link 'x' in the FI (where 'x' is A or B).

FI-LINK-x-RCV-PARITY = The RLI detected FI receive parity errors on link 'x' (where 'x' is A or B).

FI-LINK-x-XMIT-PARITY = The RLI detected FI transmit parity errors on link 'x' (where 'x' is A or B).

FI-LOSS-OF-OSC = The RLI lost the signal from the oscillator in the FI.

FI-MASTER-SLAVE-SLIP = The RLI detected slips between the master and slave RLIs.

FI-MUXx-EQ-RDFI-ACCESS = The RLI 'x' multiplexer in the FI cannot access all the equipped remote digital facilities interface (DFI) circuits (where 'x' is A or B).

FI-MUX-x-FIDB-LP = The RLI detected a FIDB looped in the 'x' multiplexer of the FI (where 'x' is A or B).

FI-MUXx-LI-PARITY = The RLI 'x' multiplexer in the FI received bad parity from the FI link interface (where 'x' is A or B).

FI-MUX-x-LNK-INTERFACE-LP = The RLI 'x' multiplexer interface to the link is looped in the FI (where 'x' is A or B).

FI-PLL-SLIP = The RLI detected slips in the FI phase lock loop (PLL) clock.

FI-x-MUX-RCV-ROM = The RLI detected a read-only memory (ROM) or address circuitry failure in the 'x' multiplexer of the FI (where 'x' is A or B).

FI-x-MUX-XMIT-ROM = The RLI detected a transmit ROM circuitry failure in the 'x' multiplexer of the FI (where 'x' is A or B).

FIFO-FULL = The signal processor (SP) buffer that records state changes is full.

FORCED-RESET = A manually generated reset was forced on the central processor intervention (CPI) channel.

FROM-MATE = The reset was generated by the mate controller.

GENERATED-INTERRUPT = The TSI detected an error in the peripheral link interface (PLI).

HARDWARE-RESET = General category for hardware resets as indicated by the reset source register.

HI-MP-DATA-BUS-PAR = A parity error was detected by the TSI on the high data byte. Parity on
the MP high data bus did not match the parity received by the TSI subunit bus.

HI-TSI-DATA-BUS-PAR = A parity error was detected by the TSI on the high data byte. Bad parity on the high byte of the internal TSI data bus was detected.

HI-TSI-MP-READ-PAR = A read parity error was detected on the low byte by the TSI. Parity on the MP data bus did not match parity taken out of the TSI RAM.

HI-TSI-MP-WRITE-PAR = A parity error was detected by the TSI on a write in the high byte.

HIT-TIMING-ERR = The SP detected an error in the hit timing circuit.

IGNORE-RAM-PARITY = A parity error was detected in the SP ignore RAM.

ILLEGAL-AUTOVECTOR = One of the unused interrupt counters was incremented at the 680X0 processor.

ILLEGAL-INSTR = The processor detected an illegal opcode.

IMPROPER-ADDR-SEL = The register address presented to the CI by the microprocessor specified a nonexistent register; this includes any attempt to read the ‘reset.’

INTERNAL-DATA-BUS = The SP detected bad parity on its internal data bus.

INTERNAL-PARITY = The NLI detected an internal parity error.

INTERRUPTS = A combination of different types of errors occurred simultaneously.

INVALID-OPERATION = An invalid operation was attempted, which usually indicates a software problem. An invalid operation is an access of the wrong type to an address, such as byte access of a word register, write to a read only register, access to unequipped I/O or dynamic RAM.

IO-LOCK = The input/output (I/O) timer was stopped while the timer was not running, which usually indicates a software problem.

IO-PARITY = Bad parity was detected on the I/O bus.

IO-TIMEOUT = The I/O timer was expired before being locked. This usually indicates a software problem.

IO-UNLOCK = The I/O timer was started while it was already on, which usually indicates a software problem.

LATCHED-TS-CNTR = An error was detected in the latched time slot counter.

LINK-A-BUF-ERR = A fault was detected on the network control and timing (NCT) link A buffer circuitry.

LINK-A-CLOCK = The clock on link A stopped.

LINK-A-OUTOF-FRAME = The DLI lost synchronization with the framing bits for link A.

LINK-A-RCV-PARITY = The DLI received bad parity from NCT link A.

LINK-A-XMIT-PARITY = The DLI received bad parity from the TSI to be transmitted on the A NCT link.

LINK-ADDR-ERR = The peripheral interface control bus (PICB) address (bits LA0 through LA4 of the address register), which was presented to the CI by the microprocessor, specified a nonexistent PICB. The CI PERAD register is NOT valid.

LINK-B-BUF-ERR = NCT link B buffer circuitry fault detected.

LINK-B-CLOCK = The clock on link B stopped.

LINK-B-OUTOF-FRAME = The DLI lost synchronization with the framing bits for link B.

LINK-B-RCV-PARITY = The DLI received bad parity from NCT link B.

LINK-B-XMIT-PARITY = The DLI received bad parity from the TSI to be transmitted on the B NCT link.

LO-MP-DATA-BUS-PAR = A parity error was detected on the low byte by the TSI. Parity on the MP low data bus did not match the parity received by the TSI subunit bus.

LO-TSI-DATA-BUS-PAR = A parity error was detected on the low byte of the internal TSI data bus.

LO-TSI-MP-READ-PAR = A read parity error was detected on the high byte by the TSI. Parity on the MP data bus did not match parity taken out of the TSI RAM.

LO-TSI-MP-WRITE-PAR = A parity error was detected by the TSI on a write in the low byte.

LOSS-OF-SIGNAL = The TSICOM has detected a bad signal on an external timing reference.

M-RAM-ERR = The SP detected a parity error in its internal M-RAM.
MATE-COMMON-CLOCK = The TSICOM detected a bad clock signal from the mate TSICOM. The clock signal is either the 30 msec synchronization signaler the oscillator signal. The problem is internal to the mate TSICOM.

MATE-READ-WHILE-RUNNING = The active MP side attempted a mate MP read access when the mate MP was running.

MATE-READY-TO = A time-out was encountered while accessing the mate’s memory either as a mate only operation or while the mate was in a standby (STBY) state.

MCP-LINK-PARITY-ERR = Bad parity was received by the module processor from the TSI over the MCP link.

MEM-REFRESH-FAIL = A failure occurred while a memory board was being refreshed.

MEM-SYSTEM = An error was detected in the memory complex.

MH0-ERROR = An error was detected on message handler 0.

MH0-INTERRUPT = The module processor received an interrupt from message handler 0.

MH1-ERROR = An error was detected on message handler 1.

MH1-INTERRUPT = The module processor received an interrupt from message handler 1.

MH2-ERROR = An error was detected on message handler 2.

MH2-INTERRUPT = The module processor received an interrupt from message handler 2.

MH-READY-TIMEOUT = A time-out was encountered while accessing a message handler.

MP-ADDR-BUS = The SP received bad parity from the MP address bus.

MP-BAD-PARITY = The DLI received bad parity on the address and data.

MP-DATA-BUS = Data bus error.

MP-READY-TO = A time-out occurred while accessing module processor hardware.

MP-SYNC-ERROR = The module processor scan points have lost synchronization and contain invalid data.

MP-TSI-CLOCK-ERR = The module processor lost either or both the clock and synchronization signal from the TSI.

MULT-RESPONSE = Multiple hardware units responded to the same address.

MULTI-RDY-TO = More than one source indicates a ready time-out (TO) because the operations took too long.

MUX-SELECT-ERR = The 'one-of-n' checkers monitoring the output clock and output data multiplexers have detected an error.

NET-SSP-INPUT = Bad parity was detected by the TSI at the input port on the network side for the smart SP.

NO-CI-ERR-FOUND = The CI interrupted but no error was found in the error source register.

NO-COM-DLI0 = The MCTSI cannot communicate with DLI 0.

NO-COM-DLI1 = The MCTSI cannot communicate with DLI 1.

NO-COM-FI0 = The MCTSI cannot communicate with FI 0.

NO-COM-FI1 = The MCTSI cannot communicate with FI 1.

NO-DLI-ERR-FOUND = The DLI interrupted but no error was found in the error source register.

NO-ERR-SOURCE-FND = No error source register indication.

NO-ERROR = There were no errors found on the reporting NLI(s).

NO-ERROR-FOUND = No error indication.

NO-RESET-FOUND = The MP was interrupted but no error source bit in the error source register was set.

NO-SP-ERR-FOUND = The SP generated an interrupt but no error was found in the error source register.

NO-TSI-ERR-FOUND = The TSI interrupted but no error was indicated in the TSI error source register.

NON-COR-BIT-ERR = A non-correctable bit error occurred during a memory board access.

NOT-IN-ERROR = There was no NLI error found, although the TSI reported that the NLI declared an error.

OUT-OF-FRAME = The NLI detected out of frame errors on data from the ONTC.
OUTPUT-ENERGY-DETECTION = The TSICOM detected the loss of its output energy signal.
OVERHEAD-BYTE-PARITY = The NLI detected a parity error on the overhead bytes from the TSI.
PARITY = The NLI detected a parity error on data from the ONTC.
PARITY-ERROR = Bad parity was detected by the hardware on a read or write of memory.
PER-BAD-PARITY = A peripheral reply message had bad parity.
PER-BAD-START-CODE = A peripheral reply message had a bad start code.
PER-DET-BAD-ADDR = A peripheral detected an addressing error while attempting to do a scan or
distribute operation requested by the CI.
PER-DET-BAD-PARITY = A peripheral received bad parity in a message from the CI.
PER-DET-BAD-START = A peripheral received a bad start code on a message from the CI.
PER-SSP-INPUT = The TSI detected bad parity at the input port on the peripheral side for the
smart SP.
PI-DARAM-OUT-OF-RANGE-ERR = An error asserted when an attempt was made to access the PI
dual access random access memory (DARAM) outside of the valid address
spectrum.
PI-ERR-LEAD-SET = The PI has set its error lead, which indicates that some error threshold has
been reached.
PI-ERR-NOT-FOUND = The PI generated an interrupt, but no error was found in the PI subunit
error source register.
PI-NON-COR-BIT-ERR = A noncorrectable memory error was detected during an SMP read of PI
DARAM.
PI-READY-TO = A time-out occurred while accessing the PI.
PI-SIB-PARITY-ERR = Bad parity was detected by the PI hardware during an SMP write to the PI
using the subunit interface bus circuitry.
PI-WRITE-PROT-ERR = The SMP has attempted to write to an address in PI DARAM that is
write-protected at the subunit interface.
PLL-SLIP = The PLL clock in the DLI slipped more than 256 time slots.
PRIVILEGE-VIOL = A privileged instruction was attempted while not in the supervisor mode.
READ-MODIFY-WRITE-HI = The TSI detected an error on the high byte of a read-modify-write
operation.
READ-MODIFY-WRITE-LO = The TSI detected an error on the low byte of a read-modify-write
operation.
SANITY-TIMER = A program sanity timer expired before the program was able to reset the timer.
SDLC-A-RCV-PARITY = The DLI received bad parity from synchronous data link controller (SDLC) A.
SDLC-A-XMIT-PARITY = The DLI detected bad parity on the data to be sent to SDLC A.
SDLC-B-RCV-PARITY = The DLI received bad parity from SDLC B.
SDLC-B-XMIT-PARITY = The DLI detected bad parity on the data to be sent to SDLC B.
SOFTWARE-BUS-ERROR = The switching module software caused a bus error implicating the
module controller.
SOFTWARE-MASK-PROBLEM = The NLI was declaring an error that should have been masked.
SOFTWARE-RESET = The switching module software caused an entry to the reset handler.
SP-FIFO-FULL = One of the SP buffers that records state changes is full.
SP-INPUT = Bad parity was detected from the SP by the TSI.
SP-READY-TO = A time-out was encountered while accessing the SP.
STACK-PROT-ERR = A process attempted to reference stack space belonging to a different
process. May be a stack overflow or a wild write.
STANDBY-CLOCK = The standby CSC lost either or both the clock and synchronization signal.
STANDBY-CSC-REFERENCE = The Standby CSC detected loss of the clock reference used as the
source of timing.
SUBUNIT-MISMATCH = The address decoding of subunits in the module controller enabled more
than one of eight subunits.
TIME-OUT-ERROR = A peripheral failed to reply to a message from the CI.
TIME-SLOT-COUNTER = An error was detected in the TSI time slot counter.
TRAP = A single byte interrupt, a division by zero, a single step, or an unimplemented software interrupt was executed. Usually indicates a software problem.
TSI-ADDR-BUS = A parity error was detected by the TSI on the internal TSI address bus.
TSI-CRC = The TSI detected CRC errors on data received from the NLI.
TSI-DATA-ERR = The SP detected bad parity on data from the TSI.
TSI-LOSS-OF-CLOCK = The TSI detected a loss of the clock signal from the NLI.
TSI-LOSS-OF-CLOCK-REFERENCE = The TSICOM detected loss of the clock reference from the NLI being used as the source of timing.
TSI-OVERHEAD-PARITY = The TSI detected a parity error on the overhead bytes from the NLI.
TSI-READY-TO = A time-out was encountered while accessing the TSI.
TSI-SYNCHRONIZATION = The TSI detected a synchronization error with the NLI.
UNEXPECTED-INTERRUPT = An interrupt that should not occur was detected.
UNEXPECTED-QUICC-INTERRUPT = The active MP received an unexpected interrupt from the quad integrated communications controller (QUICC).
UNK-SRC = Error source unknown.
UNRECOG-UT-TRAP = One of the exceptions assigned to generic utilities was raised, but the utilities subsystem (UT) did not accept the exception.
UNUSED-EXCEPTION = A processor exception that is not used by the software release occurred.
UNUSED-SW-TRAP = A TRAP instruction that is not used by the current software release was executed.
UNUSED-TEXT-EXEC = A bad transfer vector (TV) slot was used or a wild transfer occurred, causing memory not used by the current software release code to be executed.
UPDATE-BUS-ACCESS-ER = The module processor detected an access error on the update bus.
WRITE-PROT-ERR = A write was attempted to a write-protected address, which usually indicates a software problem.
XMT-TSI-DATA = A parity error was detected by the TSI on data from the transmit TSI RAM.
ZERO-DIVIDE = An attempt to divide by zero was detected.

= Supplementary information on software error sources relating to the preceding hardware source of the error (variable 'h'). Valid value(s):
AUTO-PUMP-REQUEST = Recovery has reached a level that requires a pump.
CI-AUDIT-FAIL = A count of control interface (CI) errors has exceeded the threshold.
DLI-CLOCK-FAILURE = A software sanity timer interrupt occurred due to a DLI clock or power failure. The purpose of this is to switch MCTSIs immediately.
EXCESSIVE-AUDIT-SPP = A count of audit-caused single process purge (SPP) initializations has exceeded the threshold.
EXCESSIVE-DCF = A count of asserts (defensive check failures) has exceeded the threshold.
EXCESSIVE-DEFERRED-SPP = A count of assert-caused deferred single process purge (SPP) initializations has exceeded the threshold.
EXCESSIVE-DEMAND-AUD = Non-segmented demand audits have been taking too much time away from call processing.
EXCESSIVE-ERRORS-INIT = SI's count of escalating events in the last 30 seconds has exceeded the SM initialization threshold. This results in an SM initialization.
EXCESSIVE-ERRORS-SPP = SI's count of escalating events in the last 30 seconds has exceeded the SPP threshold. This results in an MP reset and single process purge (SPP).
EXCESSIVE-ERRORS-SW = SI's count of escalating events in the last 30 seconds has exceeded the MP switch threshold. This results in an MP switch and a single process purge (SPP).
EXCESSIVE-FAULT-SPP = A count of fault-caused single process purge (SPP) initializations has exceeded the threshold.
EXCESSIVE-INTRPTS = A count of interrupts has exceeded the threshold.
EXCESSIVE-RESETS = A count of non-maskable interrupts has exceeded the threshold.
EXCESSIVE-RPI = A count of errors with recovery action of return to point of interrupt (RPI) has exceeded the threshold.
GENERIC-RETROFIT = This event occurred during a software release retrofit, software release update, large terminal growth, or after a retrofit SM switch.
INTERJECT-FAILURE = Call processing interject failed.
INVALID = Initial value for this field. Should not be seen unless recovery was aborted.
INVALID-STACK = High-level initialization was attempted on a stack other than the recovery stack, so initialization was restarted. Important post-mortem information will be associated with previous event number.
LVL-3-FAILURE = Lack of level 3 protocol messages exchanged between the SM and the AM.
MANUAL-REQUEST = This is a user-initiated initialization.
MCB-EXHAUST = The message control block resource was found to be exhausted.
MH0-EXCESSIVE-CERS = Excessive communication errors have been detected from message handler 0 on the active MCTSI.
MH1-EXCESSIVE-CERS = Excessive communication errors have been detected from message handler 1 on the active MCTSI.
MH2-EXCESSIVE-CERS = Excessive communication errors have been detected from message handler 2 on the active MCTSI.
MH0-EXCESSIVE-OSRS = Excessive operational software restart (OSR) errors have been detected from message handler 0 on the active MCTSI.
MH1-EXCESSIVE-OSRS = Excessive operational software restart (OSR) errors have been detected from message handler 1 on the active MCTSI.
MH2-EXCESSIVE-OSRS = Excessive operational software restart (OSR) errors have been detected from message handler 2 on the active MCTSI.
MH0-INIT-FAILED = Message handler 0 on the active MCTSI failed initialization.
MH1-INIT-FAILED = Message handler 1 on the active MCTSI failed initialization.
MH2-INIT-FAILED = Message handler 2 on the active MCTSI failed initialization.
MH0-IST-FAIL = Message handler 0 on the active MCTSI failed the interprocessor sanity timer (IST).
MH1-IST-FAIL = Message handler 1 on the active MCTSI failed the interprocessor sanity timer (IST).
MH2-IST-FAIL = Message handler 2 on the active MCTSI failed the interprocessor sanity timer (IST).
MH-PLINK-ERROR = Message handler on the active MCTSI failed during PCT hardware initialization.
NESTED-RCVY = An assert occurred during recovery from a hardware fault, which cannot be handled. Recovery was restarted with an MP reset.
NO-RCVY-PROGRESS = There is a lack of positive progress in an already active recovery. Twenty-four seconds have elapsed without any progress.
PCB-EXHAUST = The process control block resource was found to be exhausted.
PERPH-DUPLEX-FAIL = SI's limit of one peripheral unit duplex failing was exceeded during the initialization. Peripheral units included are: access interface unit (AIU), digital network unit (DNU), integrated digital carrier unit (IDCU), (remote) integrated services line unit (ISLU), pumpable local digital services unit (LDSU), and packet switch unit (PSU).
PI-RECOVERY = Excessive errors have been detected on the packet interface (PI) subunit of the active MCTSI. During SM initializations, this means that the subunit is failing to initialize. During normal operation, this error indicates that background recovery
software has exceeded an error threshold.

PKB-EXHAUST = The packet buffer data block resource was found to be exhausted.

POWERUP = The SM memory on this side is in a state that makes it unreliable, such as after power cycling or diagnostics.

PROGRAM-LOOP = A program loop is not allowing the integrity monitor to run its background process.

PSU-RECOVERY = Excessive errors have been detected on the packet switching unit (PSU) peripheral of the SM. During SM initializations, this means that the peripheral (or all the PHs within it) is failing to initialize. During normal operation, this error indicates that background recovery software has exceeded an error threshold.

PUMP-COMMUNICATION = Pump in the SM failed to communicate with pump in the AM.

PUMP-FAILURE = A timeout occurred while the pump program was waiting for messages from the AM.

PUMP-PREEMPTED = Pump in the SM was preempted by pump in the AM.

PUMP-SYNC = Pump in the SM lost synchronization with pump in the AM.

RCVY-RESOURCE-SHORT = There is a lack of OSDS (SM operating system) resources, usually timers.

REAL-TIME-CNTR-FAIL = A hardware timer (driven off the DLI timing) is slipping substantially when compared to the 10-millisecond software timing. Hardware fault recovery is being invoked to reinitialize the timer hardware and possibly reconfigure the SM.

SCB-EXHAUST = The stack control block resource was found to be exhausted.

SW-RCVY-ERROR = Recovery software detected insanity or an assert was processed before completion of recovery.

TCB-EXHAUST = The timer control block resource was found to be exhausted.

j = Event number.

k = Termination report. Valid value(s):
ABORTED = The current job did not complete before being interrupted by another stimulus.
COMPLETED = The indicated or requested action has completed.
IN PROGRESS = The data dump is preliminary information on the job currently executing in read-only memory code. As a consequence, the SM number may be zero or blank. This output message will be followed by a short version of the format when the job has completed.

l = Type of error (probable cause, internal counters affected). Valid value(s):
HW-ERR = Hardware error.
SW-ERR = Software error.
UNK-ERR = Unknown - recovery probably aborted, refer to variable ‘k’ and look for succeeding reports.

m = Address on the address bus at the time of the interrupt (hexadecimal).

n = Type of memory referenced by failing address (only when variable ‘t’ indicates MP errors). Valid value(s):
DATA = Address that contains data accessed by the program.
DRAM = Read/write memory using dynamic RAM devices.
IO = Address range for accessing hardware.
MH0RAM = Message handler 0 random access memory.
MH1RAM = Message handler 1 random access memory.
MH2RAM = Message handler 2 random access memory.
OOR = Address is out of a valid range.
ROM = Read-only memory.
SRAM = Read/write memory using static RAM devices.
TEXT = Address that contains program text (instructions).

o = Type of access being performed at failing address. Valid value(s):
READ = The specified address was being read when the error occurred.
UNK = Access type not determined for this message type (variable 't' does not indicate an MP error), or the type has not yet been determined (variable 'k' is IN PROGRESS) or the event was aborted before the access type could be determined (variable 'k' is ABORTED).
WRITE = The specified address was being written when the error was recognized.

p = Raw data on the data bus at the time of the interrupt, in hexadecimal (MP errors only).
q = Time when the interrupt occurred, in the form minute:seconds:tenths of second.
r = Process ID of the running background (BG) process in OSDS.
s = Uniqueness field of the running BG process in OSDS.
t = Recovery action for OSDS process. Valid value(s):
(blank) = No recovery action because the target was not active.
PURGE = Single process was purged.
RPI = Return to point of interrupt.

u = State of the communication software. Valid value(s):
A-CR = The SDLC combined receive interrupt handler was active on SDLC A.
A-RECV = The SDLC A receive interrupt handler was active.
A-TRANS = The SDLC A transmit interrupt handler was active.
ACR-ARECV = The SDLC A receive interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
ACR-ATRANS = The SDLC A transmit interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
ACR-BRECV = The SDLC B receive interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
ACR-BTRANS = The SDLC B transmit interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
ACTIVE = The CM is active but which action on which link can not be determined.
B-CR = The SDLC combined receive handler was active on the SDLC B.
B-RECV = The SDLC B was receiving.
B-TRANS = The SDLC B was transmitting.
BASE = CM was called from the base level environment.
BCR-ARECV = The SDLC A receive interrupt handler was interrupted by the SDLC B combined receive handler, and the SDLC B combined receive handler was active at the time of the error.

</table>

**Recovery action for CM software. Valid value(s):**

- (blank) = No recovery action taken because the target was not active.
- CLEAR = Aborted all scheduled jobs in CM foreground.
- PURGE = The single target job or process was purged.
- RPI = Return to the point of interrupt.

**State of foreground activity. Valid value(s):**

- CM = The communication package was executing.
- INTMON = The system integrity monitor was executing.
- NONE = Foreground (10-millisecond interrupt) was not being served.
- NONPC = Foreground was being served for an indeterminable job other than PC.
- OSDS = OSDS work for 10-millisecond interrupt was executing.
- PC = Peripheral control foreground was executing. Refer to variable ‘x’ for further information.

**The type of PC foreground activity that was being performed. Valid value(s):**

- (blank) = No PC foreground jobs were active.
- CCB10T = Channel control block (CCB) 10-millisecond timer (1-second clock).
- CCB50T = CCB 50-millisecond timer (6-second clock).
- CHDB10T = Channel data block (CHDB) 10-millisecond timer (1-second clock).
- CHDB50T = CHBD 50-millisecond timer (6-second clock).
- CISCAN = CI scanning.
- DPOUT = Dial pulse outpulsing.
- EBTSCAN = E-bit scanning.
- ETONE-NET = Enhanced tone cadencing in the network direction.
- ETONE-PER = Enhanced tone cadencing in the peripheral direction.
- FGCADETL1 = Foreground (FG) tone cadencing, list 1.
- FGCADETL2 = FG cadencing, timing list 2.
- IQUNLD = Immediate sequence queue unloader.
ISLURING = Integrated services line unit-Z (ISLU-Z) ring cadencing.
LCNSCAN = Line concentrator summary scanning.
LUSEQJB = Line unit (LU) sequenced job.
MFTTOUT = Multi-frequency (MF) and touch tone (TT) outpulsing.
PISCAN = Packet interface (PI) first-in-first-out (FIFO) pointer scanning.
RINGC = Ringing cycles.
ROHCAD = Receiver off hook (ROH) cadencing.
SD-PULSING = MSU signal-distribute pulsing job.
SPFUNLD = SP transition queue FIFO unloading.
SQUNLD = Sequence queue unloader.
TONECAD = Tone cadencing.

y = Recovery action for PC foreground. Valid value(s):
   (blank) = No recovery action taken because the target was not active.
   CLEAR = Abort all scheduled jobs in PC foreground.
   PURGE = The single target job or process was purged.
   RPI = Return to the point of interrupt.

z = Mode of SM operation at the time. Valid value(s):
   CONSISTENT = Hardware consistent with software.
   ESSENTIAL = Essential jobs operational.
   MIN-MODE = Switching module is in a "minimum" mode where normal automatic actions are
               inhibited.
   NORMAL = Module is in normal full-operation mode.
   OFFULL = All jobs are operational.
   RAMDYN = Dynamic memory consistent.
   RAMTXT = RAM text and data consistent.
   RAMWP = Write-protect placed over appropriate parts of RAM.
   SW-RCVY = Software recovery phase of initialization.
   SYSPROC = All system processes initialized.
   UNKNOWN = Unknown.

a1 = Unit whose status is being reported. Valid value(s):
   MC0
   MC1
   DLI0
   DLI1
   LINK-0A
   LINK-0B
   LINK-1A
   LINK-1B
   NLI-x-0 = Where 'x' is 0-23
   NLI-x-1 = Where 'x' is 0-23
   ONTC0
   ONTC1
   SMREF-0-0 = External timing reference 0 on MCTSI side 0.
   SMREF-0-1 = External timing reference 1 on MCTSI side 0.
   SMREF-1-0 = External timing reference 0 on MCTSI side 1.
   SMREF-1-1 = External timing reference 1 on MCTSI side 1.
UNK = Unknown.

\( b^1 \)

- **Primary status of unit. Valid value(s):**
  - ACT = Active
  - ACT-TIMING = Active, source of system timing for SM.
  - OOS = Out-of-service.
  - STBY = Standby.
  - UNAV = Unavailable to the system.

\( c^1 \)

- **Qualifier status indicating the origin of the request for the change in state. Valid value(s):**
  - AUTO = Unit was put into current state by system.
  - FRCD = CPI force selected configuration.
  - GROWTH = Growth.
  - MAN = Unit was put into current state manually.
  - RTNEX = Unit is being diagnosed by the routine exerciser.
  - SPGRWTH = Special growth.

\( d^1 \)

- **Qualifier of the primary status. Valid value(s):**
  - AUOOS = Unit was taken out-of-service due to audits.
  - DGNS = Unit is being diagnosed.
  - EX = Unit is being interactively exercised.
  - FE = Unit is in current state due to family-of-equipment considerations (for example, the parent is OOS).
  - FLT = Unit contains a fault.
  - PROOS = Unit is pre-out-of-service, waiting for a decision from the AM.
  - PWRALM = Unit has lost power due to a fault condition.
  - PWROFF = Power not being supplied to unit.
  - REX = is being routinely exercised.
  - RMVD = Unit was removed from service by the system.
  - TBLA = Unit passes diagnostics but the system has taken it out-of-service.
  - TMP = Unit is currently a helper for some other unit diagnostic.
  - UPDT = Unit memory was being updated.

**Note:** The following fields are for post mortem evaluation.

\( e^1 \)

- **Recovery progress type when the stimuli occurred, in decimal.**

\( f^1 \)

- **Recovery progress counter within the recovery progress type when the stimuli occurred, in decimal.**

\( g^1 \)

- **Snapshot of the recovery progress type at the last recovery progress check, in decimal. (The recovery progress check is done in four-second intervals during an initialization.)**

\( h^1 \)

- **Snapshot of the recovery progress counter at the last recovery progress check, in decimal. (The recovery progress check is done in four-second intervals during an initialization.)**

\( i^1 \)

- **SI recovery variables, in hexadecimal, packed into 32 bits: INallcntr - count of all stimuli (upper 16 bits), INrpcntr - count of RPI stimuli (lower 16 bits).**
SI recovery variables, in hexadecimal, packed into 32 bits:

\begin{itemize}
\item INsppcntr - count of interrupt requested SPP stimuli (upper 16 bits),
\item INdefcntr - count of ASSERT requested SPP stimuli (lower 16 bits).
\end{itemize}

SI recovery variables, in hexadecimal, packed into 32 bits:

\begin{itemize}
\item INausppcntr - count of AUDIT requested SPP stimuli (upper 16 bits),
\item INdausppcntr - count of deferred SPP stimuli (lower 16 bits).
\end{itemize}

SI recovery variables, in hexadecimal, packed into 32 bits:

\begin{itemize}
\item automatic initialization escalation reason (upper 16 bits), measure of time call processing was turned off due to SPPs and directed audits (1 count equals 30 milliseconds) (lower 16 bits).
\end{itemize}

Unused, in hexadecimal.

Reset counter shadow (lower four bits), in hexadecimal, requested TTY level (middle four bits), and number of links up (upper four bits).

Pump return code from the previous initialization, in hexadecimal.

SMrcvy_level - highest recent hardware recovery level (least significant 8 bits), SMoldrcvy_level - shadow hardware recovery level (next most significant 8 bits), in hexadecimal.

4. ACTIONS TO BE TAKEN

Monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected.

If the error is related to the memory system (variable 'h' is CORR-BIT-ERR or MEM-SYSTEM) and the type of memory referenced is not OOR (variable 'n'), there may be something wrong with the memory system hardware. A certain number of CORR-BIT-ERR is normal. A CORR-BIT-ERR indicates that one bit within a word of memory was changed, detected and corrected. It may be considered normal if:
- The errors are scattered randomly among SMs throughout the office.
- An MCTSI is not removed due to CORR-BIT-ERR.

For a 30-SM office, if approximately one or fewer CORR-BIT-ERR occurs per day and occurrences meets the above criteria, the CORR-BIT-ERR can be ignored. MEM-SYSTEM should never be considered normal. If the errors recur but without sufficient frequency to invoke the MCTSI diagnostic, manually invoke the MCTSI diagnostic. If it passes, execute MCTSI diagnostic phase 7 on the suspect side of the SM. If phase 7 passes ATP, there may be an intermittent memory fault that is not detectable by the diagnostics. Replace the suspect memory board(s). To determine the board number, use the failing address in this message (variable 'm') within the procedure described in the Corrective Maintenance manual.

If the error type is related to an SM peripheral (for example, CI PER-DET-BAD-ADDR or TSI DI-PIDB-PARITY), then another output message may appear with the same event number indicating the faulty peripheral (for example, a REPT:LUCHAN and a REPT:MSUCOM). If peripheral REPT output messages do not appear, the errors may be occurring too slowly for the peripheral circuit to be removed, causing the messages to be throttled at the SM. Setting the SM in VERBOSE mode will route the peripheral messages to the daylog file, and changing the message class action can cause these messages to print. Refer to the OP:PERPH-SM-SUM and SET:PERPH-SM input messages for further explanation.

5. ALARMS

None.

2. REASON FOR OUTPUT

To provide information about the type and source of an interrupt that occurred in the switching module (SM) controller and the resulting level of initialization.

The ORIG-HW-STATUS fields contain the status of both elements of the affected duplex hardware prior to the event. The FINAL-HW-STATUS fields contain the status of the hardware after automatic fault recovery has occurred. Format 1 is printed and Format 2 is logged unless the message class specifies otherwise (INT and INT_MON respectively). To verify the log/print status, use the OP:LPS input message. To change the log/print status, use the CHG:LPS-MSGCLS input message.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
Note: When variable 'k' equals IN PROGRESS, the SM number may be 0 or blank. The true number will appear when variable 'k' equals COMPLETED.

b = SM side on which the interrupt occurred.

c = SM processor status active (ACT) or MATE on the side where the interrupt occurred.

d = Level of hardware recovery initiated by fault recovery. Refer to Exhibit A for associated actions and minimum software recovery levels.

e = Level of software initialization performed. Valid value(s):
DA = Directed audit.
FGI = Foreground initialization (all foreground jobs cleared).
FI = Module full initialization.
FI,PUMP = Module full initialization with full memory pump.
RPI = Return to point of interrupt.
SA = Stitched audit (multiple directed audits).
SI = Module selective initialization.
SI,PUMP = Module selective initialization with memory pump.
SPP = Single process purge.
UNK = Unknown.

f

Reporting hardware subunit that triggered the interrupt, or software stimulus that caused the
recovery. Valid value(s):
CIa-b = Where a is the switch module processor (SMP) when 0 and the Optical
Extended Control and Data Unit (OXU) when 1-8 and b is the control interface (CI)
number.
CIK = Craft intervention key.
DLI0 = Dual link interface (DLI) side 0.
DLI0_MP = Dual link interface side 0 and module processor.
DLI1 = Dual link interface side 1.
DLI1_MP = Dual link interface side 1 and module processor.
LK0A = DLI0 isolated to network control/timing link A.
LK0A_MP = DLI0 network control/timing link A and module processor.
LK0B = DLI0 isolated to network control/timing link B.
LK0B_MP = DLI0 network control/timing link B and module processor.
LK1A = DLI1 isolated to network control/timing link A.
LK1A_MP = DLI1 network control/timing link A and module processor.
LK1B = DLI1 isolated to network control/timing link B.
LK1B_MP = DLI1 network control/timing link B and module processor.
MP = Module processor/module controller.
ONTC0 = Office network timing complex side 0.
ONTC1 = Office network timing complex side 1.
ONTCB = Office network timing complex, both sides.
OXUx = Optical Extended Control and Data Unit, where x is 1-8
PI = Packet interface.
RL_RCLK = Remote clock interface.
RL_RDFI = Remote link interface (RLI).
RLA_RDFI = Remote link interface multiplexor A and remote digital facility interface.
RLB_RDFI = Remote link interface multiplexor B and remote digital facility interface.
RLI0 = Remote link interface side 0. The RLI consists of a DLI and a facility interface
(FL).
RLI1 = Remote link interface side 1. The RLI consists of a DLI and a FL.
SP = Signal processor.
TSI = Time slot interchange.
UNK = Unknown. Normally this indicates that recovery was aborted (check variable ‘k’),
and the subunit was not reported by the time of the failure.

Copyright ©2003 Lucent Technologies
= Source of the error that caused the interrupt. Valid value(s):
A-ALTERNATE-DATA = The TSI detected an error in the A alternate data.
A-FLIP-FLOP-CLEAR = The A flip flop has been cleared in a running processor.
A-MEM-HI-BYTE = The TSI A random access memory (RAM) memory had bad parity in the high byte.
A-MEM-LO-BYTE = The TSI A RAM had bad parity in the low byte.
A-MEM-MAINT = The TSI A RAM memory maintenance bit was set.
A-MEM-PARITY = The TSI A RAM memory had bad parity.
ACT-CLOCK = The active clock synchronous circuit (CSC) lost either the clock or synchronization signal or both.
ACT-CSC-REFERENCE = The active CSC detected loss of the clock reference used as the source of timing.
ADDR-BUS-PAR-ERR = A parity error was detected by the time slot interchange (TSI) on the address bus from the MP.
ADDR-PARITY-ERR = The address presented to the control interface (CI) by the microprocessor had bad parity.
ADDRESS-PARITY = Bad parity was detected on the address bus.
ADDRESSING-ERR = Word access was attempted on an odd-byte boundary.
ADR-LSU-PARITY = Bad parity was detected by the TSI on local digital service unit data read from the alternate data RAM.
ASW-FAILURE = A multiple PICB operation failed to return "All Seems Well" for at least one PICB.
ATTENUATOR-ERR = The TSI detected an error in the TSI attenuator.
B-ALTERNATE-DATA = The TSI detected an error in the B alternate data.
B-MEM-HI-BYTE = The TSI B RAM memory had bad parity in the high byte.
B-MEM-LO-BYTE = The TSI B RAM memory had bad parity in the low byte.
B-MEM-MAINT = The TSI B RAM maintenance bit was set.
B-MEM-PARITY = The TSI B RAM memory had bad parity.
BOARD-CLOCK = A TSI board detected a bad clock signal coming from the TSICOM.
BOARD-DATA-PARITY = A TSI board detected a data parity or cyclic redundancy check (CRC) error. The stimulus is bad data, address, or control to or from a CRAM, SRAM or ARAM circuit. The error is either from a switch module processor (SMP) access or internal to the time slot interchange unit (TSIU).
BOARD-HARDWARE-MASK = A TSIU mask register was found to contain an invalid value. The mask register could not be successfully written, so the condition still exists.
BOARD-INTERFACE = A TSI board detected bad data or addresses during an SMP read or write operation.
BOARD-INVALID-DATA = The TSIU detected invalid data in either a control time slot (CTS) register or a CRAM. If a CTS register, then the probable cause is that the CTS dip switches are improperly set. If a CRAM error, the probable stimulus is an invalid SMP access (read or write).
BOARD-SOFTWARE-MASK = A TSIU mask register was found to contain an invalid value. The register has been written with the proper value.
BUFFER-CHECK = The NLI detected a buffer check error.
BUS-ERR = A 680XX bus error exception occurred without resetting. This indicates a failure in the reset source circuitry.
BUS-LOCK-PROT-VIOL-ER = The microprocessor bus is locked. This usually indicates a software problem.
C-MEM-ADR-READ = The alternate data RAM read address of TSI C RAM had bad parity.
C-MEM-ADR-WRITE = The alternate data RAM write address of TSI C RAM had bad parity.
C-MEM-HI-BYTE = The TSI detected bad parity in the high byte of the CRAM memory.
C-MEM-LO-BYTE = The TSI detected bad parity in the high byte of the CRAM memory.
C-MEM-MAINT = The TSI C RAM maintenance bit is set.
CACHE-ERR = An error involving the cache has occurred. The cache can detect parity errors and multiple bank match errors.
CI-EQUIPAGE = The reporting XCDU/OXU detected that an operational remote CI board has been physically removed from the shelf.
CIa-b-READY-TO = A time-out was encountered while accessing Cia-b, where a is the unit number (0 for SMP, 1-8 for XCDU/OXU) and b is the relative CI number (0-3)
CMD3-REG-ENABLE = The TSI detected an error in enabling the command register 3 (TSCMD3).
COMMON-CLOCK = The TSICOM detected a bad clock signal from its oscillator. The problem is internal to the TSICOM.
COMMON-DATA-PARITY = The TSIU detected a data parity error during an SMP read operation.
COM-HARDWARE-MASK = The reporting XCDU common board (XCDCOM) or OXU common board (OCDCOM) error mask register was found to contain an invalid value. The mask register could not be successfully written, so the condition still exists.
COM-INTERFACE = The reporting XCDU/OXU detected bad data or addresses during an SMP read or write operation.
COM-SOFTWARE-MASK = The reporting XCDCOM/OCDCOM error mask register was found to contain an invalid value. The register has been written with the proper value.
CONTIN-x-OOF-ERROR = Continuous out-of-frame (OOF) errors occurred on link A or B (where 'x' is A or B).
CONTROL-ADD = Error in the control address.
CORE-ADDR-PRESENTED-ER = A memory controller could not find an address in its memory.
CORR-BIT-ERR = Number of single bit errors detected in memory and corrected by the Hamming code exceeded threshold (pre-SM-2000 threshold is one).
CPI-ERROR = An illegal or garbled message was received from the administrative module (AM).
CRC = CRC error associated with the NLI.
CRC-FROM-ACTIVE-TSI = The NLI detected a CRC error on data received from the active TSI.
CRC-FROM-MATE-TSI = The NLI detected a CRC error on data received from the mate TSI.
CSC-PARITY = The CSC detected a parity error on the subunit interface bus.
D-MEM-EVEN = The TSI detected bad parity in one of the even time slots in the DRAM.
D-MEM-ODD = The TSI detected bad parity in one of the odd time slots in the DRAM.
DATA-PARITY-ERR = The data presented to the CI by the microprocessor had bad parity.
DATA-SELECT-ERR = The TSI detected an error during the data selection.
DBL-BUS-ERR = A 680XX reset (exception 0) has occurred, probably due to a double bus error or a double address error.
DECODE-ERROR = An address on the bus was not successfully decoded.
DI-A-OUTPUT = The TSI detected bad parity being sent on the A output to the data interface (DI).
DI-B-OUTPUT = The TSI detected bad parity being sent on the B output to the DI.
DI-DATA-PARITY = The DI detected a data parity error during a read of DI RAM. The stimulus is either an SMP access or an internal access with the DI.
DI-EQUIPAGE = The reporting XCDU/OXU detected an operational remote DI board has been physically removed from the shelf.
DI-INTERFACE = The DI detected bad data or addresses during an SMP read or write operation.
DI-PIDB-PARITY = The TSI detected bad parity on the data being received from peripheral time slots. The implicated time slots are stored in the DI buffer. If this error occurred on the active module processor time slot interchanger (MCTSI), look for 'PIDB PARITY' error reports with the same event number.
DLI-A-INPUT = The TSI detected bad parity from the DLI A input.
DLI-A-OUTPUT = Bad parity was detected by the TSI on the data sent to DLI A output.
DLI-B-INPUT = The TSI detected bad parity from the DLI B input.
DLI-B-OUTPUT = Bad parity was detected by the TSI on the data sent to the DLI B output.
DLI-INPUT-CLOCK-ERROR = Both DLIs are reporting bad clock input signals from the active MCTSI.
DLI-INTERFACE-ERR = The module processor (MP) detected bad parity on the control time slot data or on a read of DLI registers.
DLI-READY-TIMEOUT = A time-out was encountered while accessing a DLI.
DPLI-GENERATED-INTERRUPT = The TSI detected an error in the DPLI link (dx-peripheral link interface).
DSU-A-PAR-ERR = A parity error was detected by the TSI from the digital service circuit unit A (LDSU service group 0).
DSU-B-PAR-ERR = A parity error was detected by the TSI from the digital service circuit unit B (LDSU service group 1).
DSU-C-PAR-ERR = A parity error was detected by the TSI from the digital service circuit C.
DSU-D-PAR-ERR = A parity error was detected by the TSI from the digital service circuit D.
E-BIT-PARITY = The TSI detected bad parity in the E-bit receive circuit.
E-MEM-EVEN = The TSI detected bad parity in one of the even time slots in the ERAM.
E-MEM-ODD = The TSI detected bad parity in one of the odd time slots in the ERAM.
EQUIPAGE = The TSIU detected that an operational TSIU board has been physically removed from the shelf.
EXCESSIVE-JITTER = The amount of jitter on an external timing reference signal has exceeded its threshold.
EXCPTN-STK-FRM-ER = The microprocessor detected an invalid stack frame format while attempting to return from an exception.
FI-A/B-SLIP = The RLI detected slips between the FI active (A) and back-up (B) references.
FI-ACT-T1-REF = The RLI detected the FI active T1 reference failing.
FI-BACKUP-T1-REF = The RLI detected the back-up T1 reference failing in the FI.
FI-FIDB-A/B-PAR = RLI to DLI facility interface data bus parity error.
FI-FIDx-PARITY = The RLI x multiplexer in the facility interface (FI) detected parity errors on an FI data bus (FIDB) (where 'x' is A or B).
FI-INTERNAL-INTERFACE = The RLI detected parity errors on the FI internal interface.
FI-INTERNAL-REF = The RLI is using the internal oscillator in the FI as the reference.
FI-LINK-x-BUF-ERR = The RLI detected FI buffer errors on link 'x' (where 'x' is A or B).
FI-LINK-x-CLK = The RLI detected that the FI link 'x' clock was stopped (where 'x' is A or B).
FI-LINK-x-LP = The RLI detected that the FI link 'x' was looped (where 'x' is A or B).
FI-LINK-x-OOF = The RLI lost synchronization with the framing bits for link 'x' in the FI (where 'x' is A or B).
FI-LINK-x-RCV-PARITY = The RLI detected FI receive parity errors on link 'x' (where 'x' is A or B).
FI-LINK-x-XMIT-PARITY = The RLI detected FI transmit parity errors on link 'x' (where 'x' is A or B).
FI-LOSS-OF-OSC = The RLI lost the signal from the oscillator in the FI.
FI-MASTER-SLAVE-SLIP = The RLI detected slips between the master and slave RLIs.
FI-MUXx-EQ-RDFI-ACCESS = The RLI 'x' multiplexer in the FI cannot access all the equipped remote digital facilities interface (DFI) circuits (where 'x' is A or B).
FI-MUX-x-FIDB-LP = The RLI detected a FIDB looped in the 'x' multiplexer of the FI (where 'x' is A or B).
FI-MUXx-LI-PARITY = The RLI 'x' multiplexer in the FI received bad parity from the FI link interface (where 'x' is A or B).
FI-MUXx-LNK-INTERFACE-LP = The RLI 'x' multiplexer interface to the link is looped in the FI (where 'x' is A or B).
FI-PLL-SLIP = The RLI detected slips in the FI phase lock loop (PLL) clock.
FI-x-MUX-RCV-ROM = The RLI detected a read-only memory (ROM) or address circuitry failure in
the 'x' multiplexer of the FI (where 'x' is A or B).

FI-x-MUX-XMIT-ROM = The RLI detected a transmit ROM circuitry failure in the 'x' multiplexer of the FI (where 'x' is A or B).

FIFO-FULL = The signal processor (SP) buffer that records state changes is full.

FORCED-RESET = A manually generated reset was forced on the central processor intervention (CPI) channel.

FROM-MATE = The reset was generated by the mate controller.

GENERATED-INTERRUPT = The TSI detected an error in the peripheral link interface (PLI).

HARDWARE-RESET = General category for hardware resets as indicated by the reset source register.

HI-MP-DATA-BUS-PAR = A parity error was detected by the TSI on the high data byte. Parity on the MP high data bus did not match the parity received by the TSI subunit bus.

HI-TSI-DATA-BUS-PAR = A parity error was detected by the TSI on the high data byte. Bad parity on the high byte of the internal TSI data bus was detected.

HI-TSI-MP-READ-PAR = A read parity error was detected on the low byte by the TSI. Parity on the MP data bus did not match parity taken out of the TSI RAM.

HI-TSI-MP-WRITE-PAR = A parity error was detected by the TSI on a write in the high byte.

HIT-TIMING-ERR = The SP detected an error in the hit timing circuit.

IGNORE-RAM-PARITY = A parity error was detected in the SP ignore RAM.

ILLEGAL-AUTOVECTOR = One of the unused interrupt counters was incremented at the 680X0 processor.

ILLEGAL-INSTR = The processor detected an illegal opcode.

IMPROPER-ADDR-SEL = The register address presented to the CI by the microprocessor specified a nonexistent register; this includes any attempt to read the 'reset.'

INTERNAL-DATA-BUS = The SP detected bad parity on its internal data bus.

INTERNAL-PARITY = The NLI detected an internal parity error.

INTERRUPTS = A combination of different types of errors occurred simultaneously.

INVALID-OPERATION = An invalid operation was attempted, which usually indicates a software problem. An invalid operation is an access of the wrong type to an address, such as byte access of a word register, write to a read only register, access to unequipped I/O or dynamic RAM.

IO-LOCK = The input/output (I/O) timer was stopped while the timer was not running, which usually indicates a software problem.

IO-PARITY = Bad parity was detected on the I/O bus.

IO-TIMEOUT = The I/O timer was expired before being locked. This usually indicates a software problem.

IO-UNLOCK = The I/O timer was started while it was already on, which usually indicates a software problem.

LATCHED-TS-CNTR = An error was detected in the latched time slot counter.

LINK-A-BUF-ERR = A fault was detected on the network control and timing (NCT) link A buffer circuitry.

LINK-A-CLOCK = The clock on link A stopped.

LINK-A-OUTOF-FRAME = The DLI lost synchronization with the framing bits for link A.

LINK-A-RCV-PARITY = The DLI received bad parity from NCT link A.

LINK-A-XMIT-PARITY = The DLI received bad parity from the TSI to be transmitted on the A NCT link.

LINK-ADDR-ERR = The peripheral interface control bus (PICB) address (bits LA0 through LA4 of the address register), which was presented to the CI by the microprocessor, specified a nonexistent PICB. The CI PERAD register is NOT valid.

LINK-B-BUF-ERR = NCT link B buffer circuitry fault detected.

LINK-B-CLOCK = The clock on link B stopped.

LINK-B-OUTOF-FRAME = The DLI lost synchronization with the framing bits for link B.
LINK-B-RCV-PARITY = The DLI received bad parity from NCT link B.
LINK-B-XMIT-PARITY = The DLI received bad parity from the TSI to be transmitted on the B NCT link.
LO-MP-DATA-BUS-PAR = A parity error was detected on the low byte by the TSI. Parity on the MP low data bus did not match the parity received by the TSI subunit bus.
LO-TSI-DATA-BUS-PAR = A parity error was detected on the low byte of the internal TSI data bus.
LO-TSI-MP-READ-PAR = A read parity error was detected on the high byte by the TSI. Parity on the MP data bus did not match parity taken out of the TSI RAM.
LO-TSI-MP-WRITE-PAR = A parity error was detected by the TSI on a write in the low byte.
LOSS-OF-CLK-FROM-MATE = XCDU/OXU detected a bad clock signal coming from its mate XCDCOM/OCDCOM.
LOSS-OF-CLK-TO-MATE = The reporting XCDU/OXU detected a bad clock signal to its mate XCDCOM/OCDCOM.
LOSS-OF-SIGNAL = The TSICOM has detected a bad signal on an external timing reference.
M-RAM-ERR = The SP detected a parity error in its internal M-RAM.
MATE-COMMON-CLOCK = The TSICOM detected a bad clock signal from the mate TSICOM. The clock signal is either the 30 msec synchronization signaler or the oscillator signal. The problem is internal to the mate TSICOM.
MATE-READ-WHILE-RUNNING = The active MP side attempted a mate MP read access when the mate MP was running.
MATE-READY-TO = A time-out was encountered while accessing the mate's memory either as a mate only operation or while the mate was in a standby (STBY) state.
MCP-LINK-PARITY-ERR = Bad parity was received by the module processor from the TSI over the MCP link.
MEM-REFRESH-FAIL = A failure occurred while a memory board was being refreshed.
MEM-SYSTEM = An error was detected in the memory complex.
MH0-ERROR = An error was detected on message handler 0.
MH0-INTERRUPT = The module processor received an interrupt from message handler 0.
MH1-ERROR = An error was detected on message handler 1.
MH1-INTERRUPT = The module processor received an interrupt from message handler 1.
MH2-ERROR = An error was detected on message handler 2.
MH2-INTERRUPT = The module processor received an interrupt from message handler 2.
MH-READY-TIMEOUT = A time-out was encountered while accessing a message handler.
MP-ADDR-BUS = The SP received bad parity from the MP address bus.
MP-BAD-PARITY = The DLI received bad parity on the address and data.
MP-DATA-BUS = Data bus error.
MP-READY-TO = A time-out occurred while accessing module processor hardware.
MP-SYNC-ERROR = The module processor scan points have lost synchronization and contain invalid data.
MP-TSI-CLOCK-ERR = The module processor lost either or both the clock and synchronization signal from the TSI.
MULT-RESPONSE = Multiple hardware units responded to the same address.
MULTI-RDY-TO = More than one source indicates a ready time-out (TO) because the operations took too long.
MUX-SELECT-ERR = The 'one-of-n' checkers monitoring the output clock and output data multiplexers have detected an error.
NET-SSP-INPUT = Bad parity was detected by the TSI at the input port on the network side for the smart SP.
NO-CI-ERR-FOUND = The CI interrupted but no error was found in the error source register.
NO-COM-DLI0 = The MCTSI cannot communicate with DLI 0.
NO-COM-DLI1 = The MCTSI cannot communicate with DLI 1.
NO-COM-FI0 = The MCTSI cannot communicate with FI 0.
NO-COM-FI1 = The MCTSI cannot communicate with FI 1.
NO-DLI-ERR-FOUND = The DLI interrupted but no error was found in the error source register.
NO-ERR-SOURCE-FND = No error source register indication.
NO-ERROR = There were no errors found on the reporting NLI(s).
NO-ERROR-FOUND = No error indication.
NO-RESET-FOUND = The MP was interrupted but no error source bit in the error source register was set.
NO-SP-ERR-FOUND = The SP generated an interrupt but no error was found in the error source register.
NO-TSI-ERR-FOUND = The TSI interrupted but no error was indicated in the TSI error source register.
NON-COR-BIT-ERR = A non-correctable bit error occurred during a memory board access.
NOT-IN-ERROR = There was no NLI error found, although the TSI reported that the NLI declared an error.
OUT-OF-FRAME = The NLI detected out of frame errors on data from the ONTC.
OUTPUT-ENERGY-DETECTION = The TSICOM detected the loss of its output energy signal.
OVERHEAD-BYTE-PARITY = The NLI detected a parity error on the overhead bytes from the TSI.
PARITY = The NLI detected a parity error on data from the ONTC.
PARITY-ERROR = Bad parity was detected by the hardware on a read or write of memory.
PER-BAD-PARITY = A peripheral reply message had bad parity.
PER-BAD-START-CODE = A peripheral reply message had a bad start code.
PER-DET-BAD-ADDR = A peripheral detected an addressing error while attempting to do a scan or distribute operation requested by the CI.
PER-DET-BAD-PARITY = A peripheral received bad parity in a message from the CI.
PER-DET-BAD-START = A peripheral received a bad start code on a message from the CI.
PER-SSP-INPUT = The TSI detected bad parity at the input port on the peripheral side for the smart SP.
PI-DARAM-OUT-OF-RANGE-ERR = An error asserted when an attempt was made to access the PI dual access random access memory (DARAM) outside of the valid address spectrum.
PI-ERR-LEAD-SET = The PI has set its error lead, which indicates that some error threshold has been reached.
PI-ERR-NOT-FOUND = The PI generated an interrupt, but no error was found in the PI subunit error source register.
PI-NON-COR-BIT-ERR = A noncorrectable memory error was detected during an SMP read of PI DARAM.
PI-READY-TO = A time-out occurred while accessing the PI.
PI-SIB-PARITY-ERR = Bad parity was detected by the PI hardware during an SMP write to the PI using the subunit interface bus circuitry.
PI-WRITE-PROT-ERR = The SMP has attempted to write to an address in PI DARAM that is write-protected at the subunit interface.
PLL-SLIP = The PLL clock in the DLI slipped more than 256 time slots.
POWER-LOSS = The reporting XCDU/OXU was found to have lost power.
PRIVILEGE-VIOL = A privileged instruction was attempted while not in the supervisor mode.
READ-MODIFY-WRITE-HI = The TSI detected an error on the high byte of a read-modify-write operation.
READ-MODIFY-WRITE-LO = The TSI detected an error on the low byte of a read-modify-write operation.
SANITY-TIMER = A program sanity timer expired before the program was able to reset the timer.
SDLC-A-RCV-PARITY = The DLI received bad parity from synchronous data link controller (SDLC) A.
SDLC-A-XMIT-PARITY = The DLI detected bad parity on the data to be sent to SDLC A.
SDLC-B-RCV-PARITY = The DLI received bad parity from SDLC B.
SDLC-B-XMIT-PARITY = The DLI detected bad parity on the data to be sent to SDLC B.
SOFTWARE-BUS-ERROR = The switching module software caused a bus error implicating the module controller.
SOFTWARE-MASK-PROBLEM = The NLI was declaring an error that should have been masked.
SOFTWARE-RESET = The switching module software caused an entry to the reset handler.
SP-FIFO-FULL = One of the SP buffers that records state changes is full.
SP-INPUT = Bad parity was detected from the SP by the TSI.
SP-READY-TO = A time-out was encountered while accessing the SP.
STACK-PROT-ERR = A process attempted to reference stack space belonging to a different process. May be a stack overflow or a wild write.
STANDBY-CLOCK = The standby CSC lost either or both the clock and synchronization signal.
STANDBY-CSC-REFERENCE = The Standby CSC detected loss of the clock reference used as the source of timing.
SUBUNIT-MISMATCH = The address decoding of subunits in the module controller enabled more than one of eight subunits.
TIME-OUT-ERROR = A peripheral failed to reply to a message from the CI.
TIME-SLOT-COUNTER = An error was detected in the TSI time slot counter.
TRAP = A single byte interrupt, a division by zero, a single step, or an unimplemented software interrupt was executed. Usually indicates a software problem.
TSI-ADDR-BUS = A parity error was detected by the TSI on the internal TSI address bus.
TSI-CRC = The TSI detected CRC errors on data received from the NLI.
TSI-DATA-ERR = The SP detected bad parity on data from the TSI.
TSI-LOSS-OF-CLOCK = The TSI detected a loss of the clock signal from the NLI.
TSI-LOSS-OF-CLOCK-REFERENCE = The TSI detected loss of the clock reference from the NLI being used as the source of timing.
TSI-OVERHEAD-PARITY = The TSI detected a parity error on the overhead bytes from the NLI.
TSI-READY-TO = A time-out was encountered while accessing the TSI.
TSI-SYNCHRONIZATION = The TSI detected a synchronization error with the NLI.
UNEXPECTED-INTERRUPT = An interrupt that should not occur was detected.
UNEXPECTED-QUICC-INTERRUPT = The active MP received an unexpected interrupt from the quad integrated communications controller (QUICC).
UNK-SRC = Error source unknown.
UNRECOG-UT-TRAP = One of the exceptions assigned to generic utilities was raised, but the utilities subsystem (UT) did not accept the exception.
UNUSED-EXCEPTION = A processor exception that is not used by the software release occurred.
UNUSED-SW-TRAP = A TRAP instruction that is not used by the current software release was executed.
UNUSED-TEXT-EXEC = A bad transfer vector (TV) slot was used or a wild transfer occurred, causing memory not used by the current software release code to be executed.
UPDATE-BUS-ACCESS-ER = The module processor detected an access error on the update bus. The mate MCTSI may be unavailable.
WRITE-PROT-ERR = A write was attempted to a write-protected address, which usually indicates a software problem.
XMT-TSI-DATA = A parity error was detected by the TSI on data from the transmit TSI RAM.
XU-EQUIPAGE = An operational in-service OCDCOM board has been physically removed from the shelf.
XU-HW-MASK = An OXU mask register was found to contain an invalid value. The mask register could not be successfully written, so the condition still exists.
XU-PARITY = The reporting OXU detected bad parity.
XU-SW-MASK = The mask register was found to contain an invalid state. The register has be written with the proper value.
XUx-CELL-PARITY = The MP (module processor) detected a parity error in at least one status cell for OCDCL (optical extended control and data control link) where x is the OXU number (1-8).

XUx-LINK-DATA = The MP (module processor) detected a problem on OCDCL (optical extended control and data control link) where x is the OXU number (1-8).

XUx-LOSS-CLK = The MP detected a loss of clock on a OCDCL (optical extended control and data control link). This can also indicate that OCDCOM lost power. (Power detection can be performed only if both MCTSIs are in-service.)

XUx-LOSS-OF-POWER = An OXU (optical extended control and data unit) loss of clock was detected and attributed to the loss of power in that OXU.

XUx-RCV-LINK-LOSS = The MP (module processor) reported a problem on OCDCL (optical extended control and data control link) where x is the OXU number (1-8) that is detected by the OXU Common pack when there are insufficient transitions on the link.

XUx-READY-TO = A time-out was encountered while accessing OXU where x is the OXU number (1-8).

ZERO-DIVIDE = An attempt to divide by zero was detected.

Supplementary information on software error sources relating to the preceding hardware source of the error (variable 'h'). Valid value(s):

AUTO-PUMP-REQUEST = Recovery has reached a level that requires a pump.

CI-AUDIT-FAIL = A count of control interface (CI) errors has exceeded the threshold.

DLI-CLOCK-FAILURE = A software sanity timer interrupt occurred due to a DLI clock or power failure. The purpose of this is to switch MCTSIs immediately.

EXCESSIVE-AUDIT-SPP = A count of audit-caused single process purge (SPP) initializations has exceeded the threshold.

EXCESSIVE-DCF = A count of asserts (defensive check failures) has exceeded the threshold.

EXCESSIVE-DEFERRED-SPP = A count of assert-caused deferred single process purge (SPP) initializations has exceeded the threshold.

EXCESSIVE-DEMAND-AUD = Non-segmented demand audits have been taking too much time away from call processing.

EXCESSIVE-ERRORS-INIT = SI's count of escalating events in the last 30 seconds has exceeded the SM initialization threshold. This results in an SM initialization.

EXCESSIVE-ERRORS-SPP = SI's count of escalating events in the last 30 seconds has exceeded the SPP threshold. This results in an MP reset and single process purge (SPP).

EXCESSIVE-ERRORS-SW = SI's count of escalating events in the last 30 seconds has exceeded the MP switch threshold. This results in an MP switch and a single process purge (SPP).

EXCESSIVE-FAULT-SPP = A count of fault-caused single process purge (SPP) initializations has exceeded the threshold.

EXCESSIVE-INTRPTS = A count of interrupts has exceeded the threshold.

EXCESSIVE-RESETS = A count of non-maskable interrupts has exceeded the threshold.

EXCESSIVE-RPI = A count of errors with recovery action of return to point of interrupt (RPI) has exceeded the threshold.

GENERIC-RETROFIT = This event occurred during a software release retrofit, software release update, large terminal growth, or after a retrofit SM switch.

INTERJECT-FAILURE = Call processing interject failed.

INVALID = Initial value for this field. Should not be seen unless recovery was aborted.

INVALID-STACK = High-level initialization was attempted on a stack other than the recovery stack, so initialization was restarted. Important post-mortem information will be associated with previous event number.

LVL-3-FAILURE = Lack of level 3 protocol messages exchanged between the SM and the AM.
MANUAL-REQUEST = This is a user-initiated initialization.
MCB-EXHAUST = The message control block resource was found to be exhausted.
MH0-EXCESSIVE-CERS = Excessive communication errors have been detected from message handler 0 on the active MCTSI.
MH1-EXCESSIVE-CERS = Excessive communication errors have been detected from message handler 1 on the active MCTSI.
MH2-EXCESSIVE-CERS = Excessive communication errors have been detected from message handler 2 on the active MCTSI.
MH0-EXCESSIVE-OSRS = Excessive operational software restart (OSR) errors have been detected from message handler 0 on the active MCTSI.
MH1-EXCESSIVE-OSRS = Excessive operational software restart (OSR) errors have been detected from message handler 1 on the active MCTSI.
MH2-EXCESSIVE-OSRS = Excessive operational software restart (OSR) errors have been detected from message handler 2 on the active MCTSI.
MH0-INIT-FAILED = Message handler 0 on the active MCTSI failed initialization.
MH1-INIT-FAILED = Message handler 1 on the active MCTSI failed initialization.
MH2-INIT-FAILED = Message handler 2 on the active MCTSI failed initialization.
MH0-IST-FAIL = Message handler 0 on the active MCTSI failed the interprocessor sanity timer (IST).
MH1-IST-FAIL = Message handler 1 on the active MCTSI failed the interprocessor sanity timer (IST).
MH2-IST-FAIL = Message handler 2 on the active MCTSI failed the interprocessor sanity timer (IST).
MH-PLINK-ERROR = Message handler on the active MCTSI failed during PCT hardware initialization.
NESTED-RCVY = An assert occurred during recovery from a hardware fault, which cannot be handled. Recovery was restarted with an MP reset.
NO-RCVY-PROGRESS = There is a lack of positive progress in an already active recovery. Twenty-four seconds have elapsed without any progress.
PCB-EXHAUST = The process control block resource was found to be exhausted.
PERPH-DUPLEX-FAIL = SI's limit of one peripheral unit duplex failing was exceeded during the initialization. Peripheral units included are: access interface unit (AIU), digital network unit (DNU), integrated digital carrier unit (IDCU), (remote) integrated services line unit (ISLU), pumpable local digital services unit (LDSU), and packet switch unit (PSU).
PI-RECOVERY = Excessive errors have been detected on the packet interface (PI) subunit of the active MCTSI. During SM initializations, this means that the subunit is failing to initialize. During normal operation, this error indicates that background recovery software has exceeded an error threshold.
PKB-EXHAUST = The packet buffer data block resource was found to be exhausted.
POWERUP = The SM memory on this side is in a state that makes it unreliable, such as after power cycling or diagnostics.
PROGRAM-LOOP = A program loop is not allowing the integrity monitor to run its background process.
PSU-RECOVERY = Excessive errors have been detected on the packet switching unit (PSU) peripheral of the SM. During SM initializations, this means that the peripheral (or all the PHs within it) is failing to initialize. During normal operation, this error indicates that background recovery software has exceeded an error threshold.
PUMP-COMMUNICATION = Pump in the SM failed to communicate with pump in the AM.
PUMP-FAILURE = A timeout occurred while the pump program was waiting for messages from the AM.
PUMP-PREEMPTED = Pump in the SM was preempted by pump in the AM.
PUMP-SYNC = Pump in the SM lost synchronization with pump in the AM.
RCVY-RESOURCE-SHORT = There is a lack of OSDS (SM operating system) resources, usually timers.
REAL-TIME-CNTR-FAIL = A hardware timer (driven off the DLI timing) is slipping substantially when compared to the 10-millisecond software timing. Hardware fault recovery is being invoked to reinitialize the timer hardware and possibly reconfigure the SM.
SCB-EXHAUST = The stack control block resource was found to be exhausted.
SW-RCVY-ERROR = Recovery software detected insanity or an assert was processed before completion of recovery.
TCB-EXHAUST = The timer control block resource was found to be exhausted.

j = Event number.
k = Termination report. Valid value(s):
ABORTED = The current job did not complete before being interrupted by another stimulus.
COMPLETED = The indicated or requested action has completed.
IN PROGRESS = The data dump is preliminary information on the job currently executing in read-only memory code. As a consequence, the SM number may be zero or blank. This output message will be followed by a short version of the format when the job has completed.

l = Type of error (probable cause, internal counters affected). Valid value(s):
HW-ERR = Hardware error.
SW-ERR = Software error.
UNK-ERR = Unknown - recovery probably aborted, refer to variable ‘k’ and look for succeeding reports.

m = Address on the address bus at the time of the interrupt (hexadecimal).
n = Type of memory referenced by failing address (only when variable ‘t’ indicates MP errors). Valid value(s):
DATA = Address that contains data accessed by the program.
DRAM = Read/write memory using dynamic RAM devices.
IO = Address range for accessing hardware.
MH0RAM = Message handler 0 random access memory.
MH1RAM = Message handler 1 random access memory.
MH2RAM = Message handler 2 random access memory.
OOR = Address is out of a valid range.
ROM = Read-only memory.
SRAM = Read/write memory using static RAM devices.
TEXT = Address that contains program text (instructions).

o = Type of access being performed at failing address. Valid value(s):
READ = The specified address was being read when the error occurred.
UNK = Access type not determined for this message type (variable ‘t’ does not indicate an MP error), or the type has not yet been determined (variable ‘k’ is IN PROGRESS) or the event was aborted before the access type could be determined (variable ‘k’ is ABORTED).
WRITE = The specified address was being written when the error was recognized.
p = Raw data on the data bus at the time of the interrupt, in hexadecimal (MP errors only).
q = Time when the interrupt occurred, in the form minute:seconds:tenths of second.
r = Process ID of the running background (BG) process in OSDS.
s = Uniqueness field of the running BG process in OSDS.
t = Recovery action for OSDS process. Valid value(s):
   (blank) = No recovery action because the target was not active.
   CLEAR = Abort all scheduled jobs in foreground.
   PURGE = Single process was purged.
   RPI = Return to point of interrupt.

u = State of the communication software. Valid value(s):
   A-CR = The SDLC combined receive interrupt handler was active on SDLC A.
   A-RECV = The SDLC A receive interrupt handler was active.
   A-TRANS = The SDLC A transmit interrupt handler was active.
   ACR-ARECV = The SDLC A receive interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
   ACR-ATRANS = The SDLC A transmit interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
   ACR-BRECV = The SDLC B receive interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
   ACR-BTRANS = The SDLC B transmit interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
   ACTIVE = The CM is active but which action on which link can not be determined.
   B-CR = The SDLC combined receive handler was active on the SDLC B.
   B-RECV = The SDLC B was receiving.
   B-TRANS = The SDLC B was transmitting.
   BASE = CM was called from the base level environment.
   BCR-ARECV = The SDLC A receive interrupt handler was interrupted by the SDLC B combined receive handler, and the SDLC B combined receive handler was active at the time of the error.
   BCR-ATRANS = The SDLC A transmit interrupt handler was interrupted by the SDLC B combined receive handler, and the SDLC B combined receive handler was active at the time of the error.
   BCR-BRECV = The SDLC B receive interrupt handler was interrupted by the SDLC B combined receive handler, and the SDLC B combined receive handler was active at the time of the error.
   BCR-BTRANS = The SDLC B transmit interrupt handler was interrupted by the SDLC B combined receive handler, and the SDLC B combined receive handler was active at the time of the error.
   HP-RECV = CM was unloading messages from the high priority peripheral MH FIFO.
   HP-TRANS = CM was sending messages to the high priority peripheral MH FIFO.
   LP-RECV = CM was unloading messages from the low priority peripheral MH FIFO.
   LP-TRANS = CM was sending messages to the low priority peripheral MH FIFO.
MTCE-RECV = The CM was unloading messages from the MTCE MH FIFO.
MTCE-TRANS = The CM was sending messages to the MTCE MH FIFO.
NONE = CM was not active.
NOT-APPL = Not applicable. The SM-2000 does not have SDLCs, therefore field ‘u’ does not apply. Also, field ‘v’ will be blank for SM-2000.
OSDS-RECV = The CM was unloading messages from the OSDS MH FIFO.
OSDS-TRANS = The CM was sending messages to the OSDS MH FIFO.

v = Recovery action for CM software. Valid value(s):
(Blank) = No recovery action taken because the target was not active.
CLEAR = Aborted all scheduled jobs in CM foreground.
PURGE = The single target job or process was purged.
RPI = Return to the point of interrupt.

w = State of foreground activity. Valid value(s):
CM = The communication package was executing.
INTMON = The system integrity monitor was executing.
NONE = Foreground (10-millisecond interrupt) was not being served.
NONPC = Foreground was being served for an indeterminable job other than PC.
OSDS = OSDS work for 10-millisecond interrupt was executing.
PC = Peripheral control foreground was executing. Refer to variable ‘x’ for further information.

x = The type of PC foreground activity that was being performed. Valid value(s):
(Blank) = No PC foreground jobs were active.
CCB10T = Channel control block (CCB) 10-millisecond timer (1-second clock).
CCB50T = CCB 50-millisecond timer (6-second clock).
CHDB10T = Channel data block (CHDB) 10-millisecond timer (1-second clock).
CHDB50T = CHBD 50-millisecond timer (6-second clock).
CISCAN = CI scanning.
DPOUT = Dial pulse outpulsing.
EBTSCAN = E-bit scanning.
ETONE-NET = Enhanced tone cadencing in the network direction.
ETONE-PER = Enhanced tone cadencing in the peripheral direction.
FGCADTL1 = Foreground (FG) tone cadencing, list 1.
FGCADTL2 = FG cadencing, timing list 2.
IQUNLD = Immediate sequence queue unloader.
ISLRING = Integrated services line unit-Z (ISLU-Z) ring cadencing.
LCNSCAN = Line concentrator summary scanning.
LUSEQJB = Line unit (LU) sequenced job.
MFTTOUT = Multi-frequency (MF) and touch tone (TT) outpulsing.
PISCAN = Packet interface (PI) first-in-first-out (FIFO) pointer scanning.
RINGC = Ringing cycles.
ROHCAD = Receiver off hook (ROH) cadencing.
SD-PULSING = MSU signal-distribute pulsing job.
SPFUNLD = SP transition queue FIFO unloading.
SQUNLD = Sequence queue unloader.
TONECAD = Tone cadencing.
y = Recovery action for PC foreground. Valid value(s):
   (blank) = No recovery action taken because the target was not active.
   CLEAR = Abort all scheduled jobs in PC foreground.
   PURGE = The single target job or process was purged.
   RPI = Return to the point of interrupt.

z = Mode of SM operation at the time. Valid value(s):
   CONSISTENT = Hardware consistent with software.
   ESSENTIAL = Essential jobs operational.
   MIN-MODE = Switching module is in a "minimum" mode where normal automatic actions are
               inhibited.
   NORMAL = Module is in normal full-operation mode.
   OPFULL = All jobs are operational.
   RAMDYN = Dynamic memory consistent.
   RAMTXT = RAM text and data consistent.
   RAMWP = Write-protect placed over appropriate parts of RAM.
   SW-RCVY = Software recovery phase of initialization.
   SYSPROC = All system processes initialized.
   UNKNOWN = Unknown.

a¹ = Unit whose status is being reported. Valid value(s):
   MC0
   MC1
   DLI0
   DLI1
   LINK-0A
   LINK-0B
   LINK-1A
   LINK-1B
   NLI-x-0 = Where 'x' is 0-23
   NLI-x-1 = Where 'x' is 0-23
   ONTC0
   ONTC1
   SMREF-0-0 = External timing reference 0 on MCTSI side 0.
   SMREF-0-1 = External timing reference 1 on MCTSI side 0.
   SMREF-1-0 = External timing reference 0 on MCTSI side 1.
   SMREF-1-1 = External timing reference 1 on MCTSI side 1.
   UNK = Unknown.

b¹ = Primary status of unit. Valid value(s):
   ACT = Active
   ACT-TIMING = Active, source of system timing for SM.
   OOS = Out-of-service.
   STBY = Standby.
   UNAV = Unavailable to the system.

c¹ = Qualifier status indicating the origin of the request for the change in state. Valid value(s):
   AUTO = Unit was put into current state by system.
   FRCD = CPI force selected configuration.
GROWTH = Growth.
MAN = Unit was put into current state manually.
RTNEX = Unit is being diagnosed by the routine exerciser.
SPGRWTH = Special growth.

d = Qualifier of the primary status. Valid value(s):
AUOOS = Unit was taken out-of-service due to audits.
DGNS = Unit is being diagnosed.
EX = Unit is being interactively exercised.
FE = Unit is in current state due to family-of-equipment considerations (for example, the parent is OOS).
FLT = Unit contains a fault.
PROOS = Unit is pre-out-of-service, waiting for a decision from the AM.
PWRALM = Unit has lost power due to a fault condition.
PWRFF = Power not being supplied to unit.
REX = is being routinely exercised.
RMVD = Unit was removed from service by the system.
TBLA = Unit passes diagnostics but the system has taken it out-of-service.
TMP = Unit is currently a helper for some other unit diagnostic.
UPDT = Unit memory was being updated.

Note: The following fields are for post mortem evaluation.

e = Recovery progress type when the stimuli occurred, in decimal.
f = Recovery progress counter within the recovery progress type when the stimuli occurred, in decimal.
g = Snapshot of the recovery progress type at the last recovery progress check, in decimal. (The recovery progress check is done in four-second intervals during an initialization.)
h = Snapshot of the recovery progress counter at the last recovery progress check, in decimal. (The recovery progress check is done in four-second intervals during an initialization.)
i = SI recovery variables, in hexadecimal, packed into 32 bits: INallcntr - count of all stimuli (upper 16 bits), INnrpicntr - count of RPI stimuli (lower 16 bits).
j = SI recovery variables, in hexadecimal, packed into 32 bits: INsppcntr - count of interrupt requested SPP stimuli (upper 16 bits), INdefcntr - count of ASSERT requested SPP stimuli (lower 16 bits).
k = SI recovery variables, in hexadecimal, packed into 32 bits: INausppcntr - count of AUDIT requested SPP stimuli (upper 16 bits), INdausppcntr - count of deferred SPP stimuli (lower 16 bits).
l = SI recovery variables, in hexadecimal, packed into 32 bits: automatic initialization escalation reason (upper 16 bits), measure of time call processing was turned off due to SPPs and directed audits (1 count equals 30 milliseconds) (lower 16 bits).
m = Unused, in hexadecimal.

n = Reset counter shadow (lower four bits), in hexadecimal, requested TTY level (middle four bits), and number of links up (upper four bits).
= Pump return code from the previous initialization, in hexadecimal.

= SMrcvy_level - highest recent hardware recovery level (least significant 8 bits), SMoldrcvy_level - shadow hardware recovery level (next most significant 8 bits), in hexadecimal.

4. ACTIONS TO BE TAKEN

Monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected.

If the error is related to the memory system (variable 'h' is CORR-BIT-ERR or MEM-SYSTEM) and the type of memory referenced is not OOR (variable 'n'), there may be something wrong with the memory system hardware. A certain number of CORR-BIT-ERR is normal. A CORR-BIT-ERR indicates that one bit within a word of memory was changed, detected and corrected. It may be considered normal if:

- The errors are scattered randomly among SMs throughout the office.
- An MCTSI is not removed due to CORR-BIT-ERR.
For a 30-SM office, if approximately one or fewer CORR-BIT-ERR occurs per day and occurrences meets the above criteria, the CORR-BIT-ERR can be ignored. MEM-SYSTEM should never be considered normal. If the errors recur but without sufficient frequency to invoke the MCTSI diagnostic, manually invoke the MCTSI diagnostic. If it passes, execute MCTSI diagnostic phase 7 on the suspect side of the SM. If phase 7 passes ATP, there may be an intermittent memory fault that is not detectable by the diagnostics. Replace the suspect memory board(s). To determine the board number, use the failing address in this message (variable ‘m’) within the procedure described in the Corrective Maintenance manual.

If the error type is related to an SM peripheral (for example, CI PER-DET-BAD-ADDR or TSI DI-PIDB-PARITY), then another output message may appear with the same event number indicating the faulty peripheral (for example, a REPT:LUCHAN and a REPT:MSUCOM). If peripheral REPT output messages do not appear, the errors may be occurring too slowly for the peripheral circuit to be removed, causing the messages to be throttled at the SM. Setting the SM in VERBOSE mode will route the peripheral messages to the daylog file, and changing the message class action can cause these messages to print. Refer to the OP:PERPH-SM-SUM and SET:PERPH-SM input messages for further explanation.

2. REASON FOR OUTPUT

To provide information about the type and source of an interrupt that occurred in the switching module (SM) controller and the resulting level of initialization.

The ORIG-HW-STATUS fields contain the status of both elements of the affected duplex hardware prior to the event. The FINAL-HW-STATUS fields contain the status of the hardware after automatic fault recovery has occurred.

Format 1 is printed and Format 2 is logged unless the message class specifies otherwise (INT and INT_MON respectively). To verify the log/print status, use the OP:LPS input message. To change the log/print status, use the CHG:LPS-MSGCLS input message.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

NOTE: When variable 'k' equals IN PROGRESS, the SM number may be 0 or blank. The true number will appear when variable 'k' equals COMPLETED.

b = SM side on which the interrupt occurred.

c = SM processor status active (ACT) or MATE on the side where the interrupt occurred.

d = Level of hardware recovery initiated by fault recovery. Refer to Exhibit A for associated actions and minimum software recovery levels.

e = Level of software initialization performed. Valid value(s):
   DA = Directed audit.

**Source of the error that caused the interrupt.** Valid value(s):

- **A-ALTERNATE-DATA** = The TSI detected an error in the A alternate data.
- **A-FLIP-FLOP-CLEAR** = The A flip flop has been cleared in a running processor.
- **A-MEM-HI-BYTE** = The TSI A random access memory (RAM) memory had bad parity in the high byte.
- **A-MEM-LO-BYTE** = The TSI A RAM had bad parity in the low byte.
- **A-MEM-MAINT** = The TSI A RAM memory maintenance bit was set.
- **A-MEM-PARITY** = The TSI A RAM memory had bad parity.
- **ACT-CLOCK** = The active clock synchronous circuit (CSC) lost either the clock or synchronization signal or both.
- **ACT-CSC-REFERENCE** = The active CSC detected loss of the clock reference used as the source of timing.
- **ADDR-BUS-PAR-ERR** = A parity error was detected by the time slot interchange (TSI) on the address bus from the MP.
- **ADDR-PARITY-ERR** = The address presented to the control interface (CI) by the microprocessor had bad parity.
- **ADDRESS-PARITY** = Bad parity was detected on the address bus.
- **ADDRESSING-ERR** = Word access was attempted on an odd-byte boundary.
- **ADR-LSU-PARITY** = Bad parity was detected by the TSI on local digital service unit data read from the alternate data RAM.
- **ASW-FAILED** = A multiple PICB operation failed to return "All Seems Well" for at least one PICB.
- **ATTENUATOR-ERR** = The TSI detected an error in the TSI attenuator.
- **B-ALTERNATE-DATA** = The TSI detected an error in the B alternate data.
- **B-MEM-HI-BYTE** = The TSI B RAM memory had bad parity in the high byte.
- **B-MEM-LO-BYTE** = The TSI B RAM memory had bad parity in the low byte.
- **B-MEM-MAINT** = The TSI B RAM maintenance bit was set.
- **B-MEM-PARITY** = The TSI B RAM memory had bad parity.
- **BOARD-CLOCK** = A TSI board detected a bad clock signal coming from the TSICOM.
- **BOARD-DATA-PARITY** = A TSI board detected a data parity or cyclic redundancy check (CRC) error. The stimulus is bad data, address, or control to or from a CRAM, SRAM or ARAM circuit. The error is either from a switch module processor (SMP) access or internal to the time slot interchange unit (TSIU).
- **BOARD-HARDWARE-MASK** = A TSIU mask register was found to contain an invalid value. The mask register could not be successfully written, so the condition still exists.
- **BOARD-INTERFACE** = A TSI board detected bad data or addresses during an SMP read or write operation.
- **BOARD-INVALID-DATA** = The TSIU detected invalid data in either a control time slot (CTS) register or a CRAM. If a CTS register, then the probable cause is that the CTS dip switches are improperly set. If a CRAM error, the probable stimulus is an invalid SMP access (read or write).
- **BOARD-SOFTWARE-MASK** = A TSIU mask register was found to contain an invalid value. The register has been written with the proper value.
- **BUFFER-CHECK** = The NLI detected a buffer check error.
- **BUS-ERR** = A 680XX bus error exception occurred without resetting. This indicates a failure in the reset source circuitry.
- **BUS-LOCK-PROT-VIOL-ER** = The microprocessor bus is locked. This usually indicates a software problem.
- **C-MEM-ADR-READ** = The alternate data RAM read address of TSI C RAM had bad parity.
C-MEM-ADR-WRITE = The alternate data RAM write address of TSI C RAM had bad parity.
C-MEM-HI-BYTE = The TSI detected bad parity in the high byte of the CRAM memory.
C-MEM-LO-BYTE = The TSI detected bad parity in the high byte of the CRAM memory.
C-MEM-MAINT = The TSI C RAM maintenance bit is set.
CACHE-ERR = An error involving the cache has occurred. The cache can detect parity errors and multiple bank match errors.
CI-EQUIPAGE = The reporting XCDU/OXU detected that an operational remote CI board has been physically removed from the shelf.
CIa-b-READY-TO = A time-out was encountered while accessing Cla-b, where a is the unit number (0 for SMP, 1-8 for XCDU/OXU) and b is the relative CI number (0-3).
CMD3-REG-ENABLE = The TSI detected an error in enabling the command register 3 (TSCMD3).
COMMON-CLOCK = The TSICOM detected a bad clock signal from its oscillator. The problem is internal to the TSICOM.
COMMON-DATA-PARITY = The TSIU detected a data parity error during an SMP read operation.
COM-HARDWARE-MASK = The reporting XCDCOM/OCDCOM error mask register was found to contain an invalid value. The mask register could not be successfully written, so the condition still exists.
COM-INTERFACE = The reporting XCDU/OXU detected bad data or addresses during an SMP read or write operation.
COM-SOFTWARE-MASK = The reporting XCDCOM/OCDCOM error mask register was found to contain an invalid value. The register has been written with the proper value.
CONTIN-x-OOF-ERROR = Continuous out-of-frame (OOF) errors occurred on link A or B (where ‘x’ is A or B).
CONTROL-ADD = Error in the control address.
CORE-ADDR-PRESENTED-ER = A memory controller could not find an address in its memory.
CORR-BIT-ERR = Number of single bit errors detected in memory and corrected by the Hamming code exceeded threshold (pre-SM-2000 threshold is one).
CPI-ERROR = An illegal or garbled message was received from the administrative module (AM).
CRC = CRC error associated with the NLI.
CRC-FROM-ACTIVE-TSI = The NLI detected a CRC error on data received from the active TSI.
CRC-FROM-MATE-TSI = The NLI detected a CRC error on data received from the mate TSI.
CSC-PARITY = The CSC detected a parity error on the subunit interface bus.
D-MEM-EVEN = The TSI detected bad parity in one of the even time slots in the DRAM.
D-MEM-ODD = The TSI detected bad parity in one of the odd time slots in the DRAM.
DATA-PARITY-ERR = The data presented to the CI by the microprocessor had bad parity.
DATA-SELECT-ERR = The TSI detected an error during the data selection.
DBL-BUS-ERR = A 680XX reset (exception 0) has occurred, probably due to a double bus error or a double address error.
DECODE-ERROR = An address on the bus was not successfully decoded.
DI-A-OUTPUT = The TSI detected bad parity being sent on the A output to the data interface (DI).
DI-B-OUTPUT = The TSI detected bad parity being sent on the B output to the DI.
DI-DATA-PARITY = The DI detected a data parity error during a read of DI RAM. The stimulus is either an SMP access or an internal access with the DI.
DI-EQUIPAGE = The reporting XCDU/OXU detected an operational remote DI board has been physically removed from the shelf.
DI-INTERFACE = The DI detected bad data or addresses during an SMP read or write operation.
DI-PIDB-PARITY = The TSI detected bad parity on the data being received from peripheral time slots. The implicated time slots are stored in the DI buffer. If this error occurred on the active module processor time slot interchanger (MCTSI), look for ‘PIDB PARITY’ error reports with the same event number.
DLI-A-INPUT = The TSI detected bad parity from the DLI A input.

DLI-A-OUTPUT = Bad parity was detected by the TSI on the data sent to DLI A output.

DLI-B-INPUT = The TSI detected bad parity from the DLI B input.

DLI-B-OUTPUT = Bad parity was detected by the TSI on the data sent to the DLI B output.

DLI-INPUT-CLOCK-ERROR = Both DLIs are reporting bad clock input signals from the active MCTSI.

DLI-INTERFACE-ERR = The module processor (MP) detected bad parity on the control time slot data or on a read of DLI registers.

DLI-READY-TIMEOUT = A time-out was encountered while accessing a DLI.

DPLI-GENERATED-INTERRUPT = The TSI detected an error in the DPLI link (dx-peripheral link interface).

DSU-A-PAR-ERR = A parity error was detected by the TSI from the digital service circuit unit A (LDSU service group 0).

DSU-B-PAR-ERR = A parity error was detected by the TSI from the digital service circuit unit B (LDSU service group 1).

DSU-C-PAR-ERR = A parity error was detected by the TSI from the digital service circuit C.

DSU-D-PAR-ERR = A parity error was detected by the TSI from the digital service circuit D.

E-BIT-PARITY = The TSI detected bad parity in the E-bit receive circuit.

E-MEM-EVEN = The TSI detected bad parity in one of the even time slots in the ERAM.

E-MEM-ODD = The TSI detected bad parity in one of the odd time slots in the ERAM.

EQUIPAGE = The TSIU detected that an operational TSIU board has been physically removed from the shelf.

EXCESSIVE-JITTER = The amount of jitter on an external timing reference signal has exceeded its threshold.

EXCPTN-STK-FRM-ER = The microprocessor detected an invalid stack frame format while attempting to return from an exception.

FI-A/B-SLIP = The RLI detected slips between the FI active (A) and back-up (B) references.

FI-ACT-T1-REF = The RLI detected the FI active T1 reference failing.

FI-BACKUP-T1-REF = The RLI detected the back-up T1 reference failing in the FI.

FI-FIDB-A/B-PAR = RLI to DLI facility interface data bus parity error.

FI-FIDx-PARITY = The RLI x multiplexer in the facility interface (FI) detected parity errors on an FI data bus (FIDB) (where 'x' is A or B).

FI-INTERNAL-INTERFACE = The RLI detected parity errors on the FI internal interface.

FI-INTERNAL-REF = The RLI is using the internal oscillator in the FI as the reference.

FI-LINK-x-BUF-ERR = The RLI detected FI buffer errors on link 'x' (where 'x' is A or B).

FI-LINK-x-CLK = The RLI detected that the FI link 'x' clock was stopped (where 'x' is A or B).

FI-LINK-x-LP = The RLI detected that the FI link 'x' was looped (where 'x' is A or B).

FI-LINK-x-OOF = The RLI lost synchronization with the framing bits for link 'x' in the FI (where 'x' is A or B).

FI-LINK-x-RCV-PARITY = The RLI detected FI receive parity errors on link 'x' (where 'x' is A or B).

FI-LINK-x-XMIT-PARITY = The RLI detected FI transmit parity errors on link 'x' (where 'x' is A or B).

FI-LOSS-OF-OSC = The RLI lost the signal from the oscillator in the FI.

FI-MASTER-SLAVE-SLIP = The RLI detected slips between the master and slave RLIs.

FI-MUXx-EQ-RDFI-ACCESS = The RLI 'x' multiplexer in the FI cannot access all the equipped remote digital facilities interface (DFI) circuits (where 'x' is A or B).

FI-MUX-x-FIDB-LP = The RLI detected a FIDB looped in the 'x' multiplexer of the FI (where 'x' is A or B).

FI-MUXx-LI-PARITY = The RLI 'x' multiplexer in the FI received bad parity from the FI link interface (where 'x' is A or B).

FI-MUXx-LNK-INTERFACE-LP = The RLI 'x' multiplexer interface to the link is looped in the FI.
FI-PLL-SLIP = The RLI detected slips in the FI phase lock loop (PLL) clock.
FI-x-MUX-RCV-ROM = The RLI detected a read-only memory (ROM) or address circuitry failure in the 'x' multiplexer of the FI (where 'x' is A or B).
FI-x-MUX-XMIT-ROM = The RLI detected a transmit ROM circuitry failure in the 'x' multiplexer of the FI (where 'x' is A or B).
FIFO-FULL = The signal processor (SP) buffer that records state changes is full.
FORCED-RESET = A manually generated reset was forced on the central processor intervention (CPI) channel.
FROM-MATE = The reset was generated by the mate controller.
GENERATED-INTERRUPT = The TSI detected an error in the peripheral link interface (PLI).
HARDWARE-RESET = General category for hardware resets as indicated by the reset source register.
HI-MP-DATA-BUS-PAR = A parity error was detected by the TSI on the high data byte. Parity on the MP high data bus did not match the parity received by the TSI subunit bus.
HI-TSI-DATA-BUS-PAR = A parity error was detected by the TSI on the high data byte. Bad parity on the high byte of the internal TSI data bus was detected.
HI-TSI-MP-READ-PAR = A read parity error was detected on the low byte by the TSI. Parity on the MP data bus did not match parity taken out of the TSI RAM.
HI-TSI-MP-WRITE-PAR = A parity error was detected by the TSI on a write in the high byte.
HIT-TIMING-ERR = The SP detected an error in the hit timing circuit.
IGNORE-RAM-PARITY = A parity error was detected in the SP ignore RAM.
ILLEGAL-AUTOVECTOR = One of the unused interrupt counters was incremented at the 680X0 processor.
ILLEGAL-INSTR = The processor detected an illegal opcode.
IMPROPER-ADDR-SEL = The register address presented to the CI by the microprocessor specified a nonexistent register; this includes any attempt to read the 'reset.'
INTERNAL-DATA-BUS = The SP detected bad parity on its internal data bus.
INTERNAL-PARITY = The NLI detected an internal parity error.
INTERRUPTS = A combination of different types of errors occurred simultaneously.
INVALID-OPERATION = An invalid operation was attempted, which usually indicates a software problem. An invalid operation is an access of the wrong type to an address, such as byte access of a word register, write to a read only register, access to unequipped I/O or dynamic RAM.
IO-LOCK = The input/output (I/O) timer was stopped while the timer was not running, which usually indicates a software problem.
IO-PARITY = Bad parity was detected on the I/O bus.
IO-TIMEOUT = The I/O timer was expired before being locked. This usually indicates a software problem.
IO-UNLOCK = The I/O timer was started while it was already on, which usually indicates a software problem.
LATCHED-TS-CNTR = An error was detected in the latched time slot counter.
LINK-A-BUF-ERR = A fault was detected on the network control and timing (NCT) link A buffer circuitry.
LINK-A-CLOCK = The clock on link A stopped.
LINK-A-OUTOF-FRAME = The DLI lost synchronization with the framing bits for link A.
LINK-A-RCV-PARITY = The DLI received bad parity from NCT link A.
LINK-A-XMIT-PARITY = The DLI received bad parity from the TSI to be transmitted on the A NCT link.
LINK-ADDR-ERR = The peripheral interface control bus (PICB) address (bits LA0 through LA4 of the address register), which was presented to the CI by the microprocessor, specified a nonexistent PICB. The CI PERAD register is NOT valid.
LINK-B-BUF-ERR = NCT link B buffer circuitry fault detected.
LINK-B-CLOCK = The clock on link B stopped.
LINK-B-OUTOF-FRAME = The DLI lost synchronization with the framing bits for link B.
LINK-B-RCV-PARITY = The DLI received bad parity from NCT link B.
LINK-B-XMIT-PARITY = The DLI received bad parity from the TSI to be transmitted on the B NCT link.
LO-MP-DATA-BUS-PAR = A parity error was detected on the low byte by the TSI. Parity on the MP low data bus did not match the parity received by the TSI subunit bus.
LO-TSI-DATA-BUS-PAR = A parity error was detected on the low byte of the internal TSI data bus.
LO-TSI-MP-READ-PAR = A read parity error was detected on the high byte by the TSI. Parity on the MP data bus did not match parity taken out of the TSI RAM.
LO-TSI-MP-WRITE-PAR = A parity error was detected by the TSI on a write in the low byte.
LOSS-OF-CLK-FROM-MATE = XCDU/OXU detected a bad clock signal coming from its mate XCDCOM/OCDCOM.
LOSS-OF-CLK-TO-MATE = The reporting XCDU/OXU detected a bad clock signal to its mate XCDCOM/OCDCOM.
LOSS-OF-SIGNAL = The TSICOM has detected a bad signal on an external timing reference.
M-RAM-ERR = The SP detected a parity error in its internal M-RAM.
MATE-COMMON-CLOCK = The TSICOM detected a bad clock signal from the mate TSICOM. The clock signal is either the 30 msec synchronization signaler or the oscillator signal. The problem is internal to the mate TSICOM.
MATE-READ-WHILE-RUNNING = The active MP side attempted a mate MP read access when the mate MP was running.
MATE-READY-TO = A time-out was encountered while accessing the mate's memory either as a mate only operation or while the mate was in a standby (STBY) state.
MCP-LINK-PARITY-ERR = Bad parity was received by the module processor from the TSI over the MCP link.
MEM-REFRESH-FAIL = A failure occurred while a memory board was being refreshed.
MEM-SYSTEM = An error was detected in the memory complex.
MH0-ERROR = An error was detected on message handler 0.
MH0-INTERRUPT = The module processor received an interrupt from message handler 0.
MH1-ERROR = An error was detected on message handler 1.
MH1-INTERRUPT = The module processor received an interrupt from message handler 1.
MH2-ERROR = An error was detected on message handler 2.
MH2-INTERRUPT = The module processor received an interrupt from message handler 2.
MH-READY-TIMEOUT = A time-out was encountered while accessing a message handler.
MP-ADDR-BUS = The SP received bad parity from the MP address bus.
MP-BAD-PARITY = The DLI received bad parity on the address and data.
MP-DATA-BUS = Data bus error.
MP-READY-TO = A time-out occurred while accessing module processor hardware.
MP-SYNC-ERROR = The module processor scan points have lost synchronization and contain invalid data.
MP-TSI-CLOCK-ERR = The module processor lost either or both the clock and synchronization signal from the TSI.
MULT-RESPONSE = Multiple hardware units responded to the same address.
MULTI-RDY-TO = More than one source indicates a ready time-out (TO) because the operations took too long.
MUX-SELECT-ERR = The 'one-of-n' checkers monitoring the output clock and output data multiplexers have detected an error.
NET-SSP-INPUT = Bad parity was detected by the TSI at the input port on the network side for the smart SP.
NO-CI-ERR-FOUND = The CI interrupted but no error was found in the error source register.
NO-COM-DLI0 = The MCTSI cannot communicate with DLI 0.
NO-COM-DLI1 = The MCTSI cannot communicate with DLI 1.
NO-COM-FI0 = The MCTSI cannot communicate with FI 0.
NO-COM-FI1 = The MCTSI cannot communicate with FI 1.
NO-DLI-ERR-FOUND = The DLI interrupted but no error was found in the error source register.
NO-ERR-SOURCE-FND = No error source register indication.
NO-ERROR = There were no errors found on the reporting NLI(s).
NO-ERROR-FOUND = No error indication.
NO-RESET-FOUND = The MP was interrupted but no error source bit in the error source register was set.
NO-SP-ERR-FOUND = The SP generated an interrupt but no error was found in the error source register.
NO-TSI-ERR-FOUND = The TSI interrupted but no error was indicated in the TSI error source register.
NON-COR-BIT-ERR = A non-correctable bit error occurred during a memory board access.
NOT-IN-ERROR = There was no NLI error found, although the TSI reported that the NLI declared an error.
OUT-OF-FRAME = The NLI detected out of frame errors on data from the ONTC.
OUTPUT-ENERGY-DETECTION = The TSICOM detected the loss of its output energy signal.
OVERHEAD-BYTE-PARITY = The NLI detected a parity error on the overhead bytes from the TSI.
PARITY = The NLI detected a parity error on data from the ONTC.
PARITY-ERROR = Bad parity was detected by the hardware on a read or write of memory.
PER-BAD-PARITY = A peripheral reply message had bad parity.
PER-BAD-START-CODE = A peripheral reply message had a bad start code.
PER-DET-BAD-ADDR = A peripheral detected an addressing error while attempting to do a scan or distribute operation requested by the CI.
PER-DET-BAD-PARITY = A peripheral received bad parity in a message from the CI.
PER-DET-BAD-START = A peripheral received a bad start code on a message from the CI.
PER-SSP-INPUT = The TSI detected bad parity at the input port on the peripheral side for the smart SP.
PI-DARAM-OUT-OF-RANGE-ERR = An error asserted when an attempt was made to access the PI dual access random access memory (DARAM) outside of the valid address spectrum.
PI-ERR-LEAD-SET = The PI has set its error lead, which indicates that some error threshold has been reached.
PI-ERR-NOT-FOUND = The PI generated an interrupt, but no error was found in the PI subunit error source register.
PI-NON-COR-BIT-ERR = A noncorrectable memory error was detected during an SMP read of PI DARAM.
PI-READY-TO = A time-out occurred while accessing the PI.
PI-SIB-PARITY-ERR = Bad parity was detected by the PI hardware during an SMP write to the PI using the subunit interface bus circuitry.
PI-WRITE-PROT-ERR = The SMP has attempted to write to an address in PI DARAM that is write-protected at the subunit interface.
PLL-SLIP = The PLL clock in the DLI slipped more than 256 time slots.
POWER-LOSS = The reporting XCDU/OXU was found to have lost power.
PRIVILEGE-VIOL = A privileged instruction was attempted while not in the supervisor mode.
READ-MODIFY-WRITE-HI = The TSI detected an error on the high byte of a read-modify-write operation.
READ-MODIFY-WRITE-LO = The TSI detected an error on the low byte of a read-modify-write operation.
SANITY-TIMER = A program sanity timer expired before the program was able to reset the timer.
SDLC-A-RCV-PARITY = The DLI received bad parity from synchronous data link controller (SDLC) A.
SDLC-A-XMIT-PARITY = The DLI detected bad parity on the data to be sent to SDLC A.
SDLC-B-RCV-PARITY = The DLI received bad parity from SDLC B.
SDLC-B-XMIT-PARITY = The DLI detected bad parity on the data to be sent to SDLC B.
SOFTWARE-BUS-ERROR = The switching module software caused a bus error implicating the module controller.
SOFTWARE-MASK-PROBLEM = The NLI was declaring an error that should have been masked.
SOFTWARE-RESET = The switching module software caused an entry to the reset handler.
SP-FIFO-FULL = One of the SP buffers that records state changes is full.
SP-INPUT = Bad parity was detected from the SP by the TSI.
SP-READY-TO = A time-out was encountered while accessing the SP.
STACK-PROT-ERR = A process attempted to reference stack space belonging to a different process. May be a stack overflow or a wild write.
STANDBY-CLOCK = The standby CSC lost either or both the clock and synchronization signal.
STANDBY-CSC-REFERENCE = The Standby CSC detected loss of the clock reference used as the source of timing.
SUBUNIT-MISMATCH = The address decoding of subunits in the module controller enabled more than one of eight subunits.
TIME-OUT-ERROR = A peripheral failed to reply to a message from the CI.
TIME-SLOT-COUNTER = An error was detected in the TSI time slot counter.
TRAP = A single byte interrupt, a division by zero, a single step, or an unimplemented software interrupt was executed. Usually indicates a software problem.
TSI-ADDR-BUS = A parity error was detected by the TSI on the internal TSI address bus.
TSI-CRC = The TSI detected CRC errors on data received from the NLI.
TSI-DATA-ERR = The SP detected bad parity on data from the TSI.
TSI-LOSS-OF-CLOCK = The TSI detected a loss of the clock signal from the NLI.
TSI-LOSS-OF-CLOCK-REFERENCE = The TSICOM detected loss of the clock reference from the NLI being used as the source of timing.
TSI-OVERHEAD-PARITY = The TSI detected a parity error on the overhead bytes from the NLI.
TSI-READY-TO = A time-out was encountered while accessing the TSI.
TSI-SYNCHRONIZATION = The TSI detected a synchronization error with the NLI.
UNEXPECTED-INTERUPT = An interrupt that should not occur was detected.
UNEXPECTED-QUICC-INTERUPT = The active MP received an unexpected interrupt from the quad integrated communications controller (QUICC).
UNK-SRC = Error source unknown.
UNRECOG-UT-TRAP = One of the exceptions assigned to generic utilities was raised, but the utilities subsystem (UT) did not accept the exception.
UNUSED-EXCEPTION = A processor exception that is not used by the software release occurred.
UNUSED-SW-TRAP = A TRAP instruction that is not used by the current software release was executed.
UNUSED-TEXT-EXEC = A bad transfer vector (TV) slot was used or a wild transfer occurred, causing memory not used by the current software release code to be executed.
UPDATE-BUS-ACCESS-ER = The module processor detected an access error on the update bus. The mate MCTSI may be unavailable.
WRITE-PROT-ERR = A write was attempted to a write-protected address, which usually indicates a software problem.
XMT-TSI-DATA = A parity error was detected by the TSI on data from the transmit TSI RAM.
XU-EQUIPAGE = An operational in-service OCDCOM board has been physically removed from the shelf.
XU-HW-MASK = An OXU mask register was found to contain an invalid value. The mask register could not be successfully written, so the condition still exists.
XU-PARITY = The reporting OXU detected bad parity.

XU-SW-MASK = The mask register was found to contain an invalid state. The register has be
written with the proper value.

XUx-CELL-PARITY = The MP (module processor) detected a parity error in at least one status cell
for optical extended control and data control link (OCDCL) where x is the OXU
number (1 -8).

XUx-LINK-DATA = The MP (module processor) detected a problem on OCDCL where x is the
OXU number (1 -8).

XUx-LOSS-CLK = The MP detected a loss of clock on a OCDCL. This can also indicate that
OCDCOM lost power. (Power detection can be performed only if both MCTSI are
in-service.)

XUx-LOSS-OF-POWER = An OXU (optical extended control and data unit) loss of clock was
detected and attributed to the loss of power in that OXU.

XUx-RCV-LINK-LOSS = The MP (module processor) reported a problem on OCDCL where x is the
OXU number (1 -8) that is detected by the OXU Common pack when there are
insufficient transitions on the link.

XUx-READY-TO = A time-out was encountered while accessing OXU where x is the OXU number
(1 - 8).

ZERO-DIVIDE = An attempt to divide by zero was detected.

= Supplementary information on software error sources relating to the preceding hardware source
of the error (variable ‘h’). Valid value(s):

AUTO-PUMP-REQUEST = Recovery has reached a level that requires a pump.

CI-AUDIT-FAIL = A count of control interface (CI) errors has exceeded the threshold.

DLI-CLOCK-FAILURE = A software sanity timer interrupt occurred due to a DLI clock or power
failure. The purpose of this is to switch MCTSIs immediately.

EXCESSIVE-AUDIT-SPP = A count of audit-caused single process purge (SPP) initializations has
exceeded the threshold.

EXCESSIVE-DCF = A count of asserts (defensive check failures) has exceeded the threshold.

EXCESSIVE-DEFERRED-SPP = A count of assert-caused deferred single process purge (SPP)
initializations has exceeded the threshold.

EXCESSIVE-DEMAND-AUD = Non-segmented demand audits have been taking too much time
away from call processing.

EXCESSIVE-ERRORS-INIT = SI's count of escalating events in the last 30 seconds has exceeded
the SM initialization threshold. This results in an SM initialization.

EXCESSIVE-ERRORS-SPP = SI's count of escalating events in the last 30 seconds has exceeded
the SPP threshold. This results in an MP reset and single process purge (SPP).

EXCESSIVE-ERRORS-SW = SI's count of escalating events in the last 30 seconds has exceeded the
MP switch threshold. This results in an MP switch and a single process purge
(SPP).

EXCESSIVE-FAULT-SPP = A count of fault-caused single process purge (SPP) initializations has
exceeded the threshold.

EXCESSIVE-INTRPTS = A count of interrupts has exceeded the threshold.

EXCESSIVE-RESETS = A count of non-maskable interrupts has exceeded the threshold.

EXCESSIVE-RPI = A count of errors with recovery action of return to point of interrupt (RPI) has
exceeded the threshold.

GENERIC-RETROFIT = This event occurred during a software release retrofit, software release
update, large terminal growth, or after a retrofit SM switch.

GSM-ESCALATION = This event occurred because the minimally acceptable CCS functionality on a
GSM became unavailable.

INTERJECT-FAILURE = Call processing interject failed.
INVALID = Initial value for this field. Should not be seen unless recovery was aborted.
INVALID-STACK = High-level initialization was attempted on a stack other than the recovery stack, so initialization was restarted. Important post-mortem information will be associated with previous event number.
LVL-3-FAILURE = Lack of level 3 protocol messages exchanged between the SM and the AM.
MANUAL-REQUEST = This is a user-initiated initialization.
MCB-EXHAUST = The message control block resource was found to be exhausted.
MH0-EXCESSIVE-CERS = Excessive communication errors have been detected from message handler 0 on the active MCTSI.
MH1-EXCESSIVE-CERS = Excessive communication errors have been detected from message handler 1 on the active MCTSI.
MH2-EXCESSIVE-CERS = Excessive communication errors have been detected from message handler 2 on the active MCTSI.
MH0-EXCESSIVE-OSRS = Excessive operational software restart (OSR) errors have been detected from message handler 0 on the active MCTSI.
MH1-EXCESSIVE-OSRS = Excessive operational software restart (OSR) errors have been detected from message handler 1 on the active MCTSI.
MH2-EXCESSIVE-OSRS = Excessive operational software restart (OSR) errors have been detected from message handler 2 on the active MCTSI.
MH0-INIT-FAILED = Message handler 0 on the active MCTSI failed initialization.
MH1-INIT-FAILED = Message handler 1 on the active MCTSI failed initialization.
MH2-INIT-FAILED = Message handler 2 on the active MCTSI failed initialization.
MH0-IST-FAIL = Message handler 0 on the active MCTSI failed the interprocessor sanity timer (IST).
MH1-IST-FAIL = Message handler 1 on the active MCTSI failed the interprocessor sanity timer (IST).
MH2-IST-FAIL = Message handler 2 on the active MCTSI failed the interprocessor sanity timer (IST).
MH-PLINK-ERROR = Message handler on the active MCTSI failed during PCT hardware initialization.
NESTED-RCVY = An assert occurred during recovery from a hardware fault, which cannot be handled. Recovery was restarted with an MP reset.
NO-RCVY-PROGRESS = There is a lack of positive progress in an already active recovery. Twenty-four seconds have elapsed without any progress.
PCB-EXHAUST = The process control block resource was found to be exhausted.
PERPH-DUPLEX-FAIL = SI's limit of one peripheral unit duplex failing was exceeded during the initialization. Peripheral units included are: access interface unit (AIU), digital network unit (DNU), integrated digital carrier unit (IDCU), (remote) integrated services line unit (ISLU), pumpable local digital services unit (LDSU), and packet switch unit (PSU).
PI-RECOVERY = Excessive errors have been detected on the packet interface (PI) subunit of the active MCTSI. During SM initializations, this means that the subunit is failing to initialize. During normal operation, this error indicates that background recovery software has exceeded an error threshold.
PKB-EXHAUST = The packet buffer data block resource was found to be exhausted.
POWERUP = The SM memory on this side is in a state that makes it unreliable, such as after power cycling or diagnostics.
PROGRAM-LOOP = A program loop is not allowing the integrity monitor to run its background process.
PSU0-RECOVERY = Excessive errors have been detected on the packet switching unit (PSU) 0 peripheral of the SM. During SM initializations, this means that the peripheral (or all the PHs within it) is failing to initialize. During normal operation, this error indicates
that background recovery software has exceeded an error threshold.

**PSU1-RECOVERY** = Excessive errors have been detected on the packet switching unit (PSU) 1 peripheral of the SM. During SM initializations, this means that the peripheral (or all the PHs within it) is failing to initialize. During normal operation, this error indicates that background recovery software has exceeded an error threshold.

**PUMP-COMMUNICATION** = Pump in the SM failed to communicate with pump in the AM.

**PUMP-FAILURE** = A timeout occurred while the pump program was waiting for messages from the AM.

**PUMP-PREEMPTED** = Pump in the SM was preempted by pump in the AM.

**PUMP-SYNC** = Pump in the SM lost synchronization with pump in the AM.

**RCVY-RESOURCE-SHORT** = There is a lack of OSDS (SM operating system) resources, usually timers.

**REAL-TIME-CNTR-FAIL** = A hardware timer (driven off the DLI timing) is slipping substantially when compared to the 10-millisecond software timing. Hardware fault recovery is being invoked to reinitialize the timer hardware and possibly reconfigure the SM.

**SCB-EXHAUST** = The stack control block resource was found to be exhausted.

**SW-RCVY-ERROR** = Recovery software detected insanity or an assert was processed before completion of recovery.

**TCB-EXHAUST** = The timer control block resource was found to be exhausted.

---

**j** = Event number.

**k** = Termination report. Valid value(s):

- **ABORTED** = The current job did not complete before being interrupted by another stimulus.
- **COMPLETED** = The indicated or requested action has completed.
- **IN PROGRESS** = The data dump is preliminary information on the job currently executing in read-only memory code. As a consequence, the SM number may be zero or blank. This output message will be followed by a short version of the format when the job has completed.

**l** = Type of error (probable cause, internal counters affected). Valid value(s):

- **HW-ERR** = Hardware error.
- **SW-ERR** = Software error.
- **UNK-ERR** = Unknown - recovery probably aborted, refer to variable ‘k’ and look for succeeding reports.

**m** = Address on the address bus at the time of the interrupt (hexadecimal).

**n** = Type of memory referenced by failing address (only when variable ‘t’ indicates MP errors). Valid value(s):

- **DATA** = Address that contains data accessed by the program.
- **DRAM** = Read/write memory using dynamic RAM devices.
- **IO** = Address range for accessing hardware.
- **MH0RAM** = Message handler 0 random access memory.
- **MH1RAM** = Message handler 1 random access memory.
- **MH2RAM** = Message handler 2 random access memory.
- **OOR** = Address is out of a valid range.
- **ROM** = Read-only memory.
- **SRAM** = Read/write memory using static RAM devices.
- **TEXT** = Address that contains program text (instructions).
Type of access being performed at failing address. Valid value(s):

READ = The specified address was being read when the error occurred.
UNK = Access type not determined for this message type (variable 't' does not indicate an MP error), or the type has not yet been determined (variable 'k' is IN PROGRESS) or the event was aborted before the access type could be determined (variable 'k' is ABORTED).
WRITE = The specified address was being written when the error was recognized.

Raw data on the data bus at the time of the interrupt, in hexadecimal (MP errors only).

Time when the interrupt occurred, in the form minute:seconds:tenths of second.

Process ID of the running background (BG) process in OSDS.

Uniqueness field of the running BG process in OSDS.

Recovery action for OSDS process. Valid value(s):
(Blank) = No recovery action because the target was not active.
CLEAR = Abort all scheduled jobs in foreground.
PURGE = Single process was purged.
RPI = Return to point of interrupt.

State of the communication software. Valid value(s):
A-CR = The SDLC combined receive interrupt handler was active on SDLC A.
A-RECV = The SDLC A receive interrupt handler was active.
A-TRANS = The SDLC A transmit interrupt handler was active.
ACR-ARECV = The SDLC A receive interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
ACR-ATRANS = The SDLC A transmit interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
ACR-BRECV = The SDLC B receive interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
ACR-BTRANS = The SDLC B transmit interrupt handler was interrupted by the SDLC A combined receive handler, and the SDLC A combined receive handler was active at the time of the error.
ACTIVE = The CM is active but which action on which link can not be determined.
B-CR = The SDLC combined receive interrupt handler was active on the SDLC B.
B-RECV = The SDLC B was receiving.
B-TRANS = The SDLC B was transmitting.
BASE = CM was called from the base level environment.
BCR-ARECV = The SDLC A receive interrupt handler was interrupted by the SDLC B combined receive handler, and the SDLC B combined receive handler was active at the time of the error.
BCR-ATRANS = The SDLC A transmit interrupt handler was interrupted by the SDLC B combined receive handler, and the SDLC B combined receive handler was active at the time of the error.
BCR-BRECV = The SDLC B receive interrupt handler was interrupted by the SDLC B combined
receive handler, and the SDLC B combined receive handler was active at the time of the error.

**BCR-BTRANS** = The SDLC B transmit interrupt handler was interrupted by the SDLC B combined receive handler, and the SDLC B combined receive handler was active at the time of the error.

**HP-RECV** = CM was unloading messages from the high priority peripheral MH FIFO.

**HP-TRANS** = CM was sending messages to the high priority peripheral MH FIFO.

**LP-RECV** = CM was unloading messages from the low priority peripheral MH FIFO.

**LP-TRANS** = CM was sending messages to the low priority peripheral MH FIFO.

**MTCE-RECV** = The CM was unloading messages from the MTCE MH FIFO.

**MTCE-TRANS** = The CM was sending messages to the MTCE MH FIFO.

**NONE** = CM was not active.

**NOT-APPL** = Not applicable. The SM-2000 does not have SDLCs, therefore field ‘\( v \)’ does not apply. Also, field ‘\( v \)’ will be blank for SM-2000.

**OSDS-RECV** = The CM was unloading messages from the OSDS MH FIFO.

**OSDS-TRANS** = The CM was sending messages to the OSDS MH FIFO.

\( v \) = Recovery action for CM software. Valid value(s):

- (blank) = No recovery action taken because the target was not active.
- CLEAR = Aborted all scheduled jobs in CM foreground.
- PURGE = The single target job or process was purged.
- RPI = Return to the point of interrupt.

\( w \) = State of foreground activity. Valid value(s):

- CM = The communication package was executing.
- INTMON = The system integrity monitor was executing.
- NONE = Foreground (10-millisecond interrupt) was not being served.
- NONPC = Foreground was being served for an indeterminable job other than PC.
- OSDS = OSDS work for 10-millisecond interrupt was executing.
- PC = Peripheral control foreground was executing. Refer to variable ‘\( x \)’ for further information.

\( x \) = The type of PC foreground activity that was being performed. Valid value(s):

- (blank) = No PC foreground jobs were active.
- APSSCN = Automatic protection switch scanning.
- CCB10T = Channel control block (CCB) 10-millisecond timer (1-second clock).
- CCB50T = CCB 50-millisecond timer (6-second clock).
- CHDB10T = Channel data block (CHDB) 10-millisecond timer (1-second clock).
- CHDB50T = CHDB 50-millisecond timer (6-second clock).
- CISCAN = CI scanning.
- DPOUT = Dial pulse outpulsing.
- EBTSCAN = E-bit scanning.
- ESRSCN = Error source register scanning.
- ETONE-NET = Enhanced tone cadencing in the network direction.
- ETONE-PER = Enhanced tone cadencing in the peripheral direction.
- FGCADETL1 = Foreground (FG) tone cadencing, list 1.
- FGCADETL2 = FG cadencing, timing list 2.
- IQUNLD = Immediate sequence queue unloader.
- ISLURING = Integrated services line unit-Z (ISLU-Z) ring cadencing.
LCNSCAN  = Line concentrator summary scanning.
LUSEQJB  = Line unit (LU) sequenced job.
MFTTOUT  = Multi-frequency (MF) and touch tone (TT) outpulsing.
PISCAN   = Packet interface (PI) first-in-first-out (FIFO) pointer scanning.
RINGC    = Ringing cycles.
ROHCAD   = Receiver off hook (ROH) cadencing.
SD-PULSING = MSU signal-distribute pulsing job.
SPFUNLD  = SP transition queue FIFO unloading.
SQUNLD   = Sequence queue unloader.
TONECAD  = Tone cadencing.

y = Recovery action for PC foreground. Valid value(s):
   (blank) = No recovery action taken because the target was not active.
   CLEAR   = Abort all scheduled jobs in PC foreground.
   PURGE   = The single target job or process was purged.
   RPI     = Return to the point of interrupt.

z = Mode of SM operation at the time. Valid value(s):
   CONSISTENT = Hardware consistent with software.
   ESSENTIAL  = Essential jobs operational.
   MIN-MODE   = Switching module is in a "minimum" mode where normal automatic actions are
                 inhibited.
   NORMAL     = Module is in normal full-operation mode.
   OFFULL     = All jobs are operational.
   RAMDYN     = Dynamic memory consistent.
   RAMTXT     = RAM text and data consistent.
   RAMWP      = Write-protect placed over appropriate parts of RAM.
   SW-RCVY    = Software recovery phase of initialization.
   SYSPROC    = All system processes initialized.
   UNKNOWN    = Unknown.

a
   = Unit whose status is being reported. Valid value(s):
     DLI0
     DLI1
     LINK-0A
     LINK-0B
     LINK-1A
     LINK-1B
     MC0
     MC1
     NLI-x-0 = Where 'x' is 0-23
     NLI-x-1 = Where 'x' is 0-23
     ONTC0
     ONTC1
     SMREF-0-0 = External timing reference 0 on MCTSI side 0.
     SMREF-0-1 = External timing reference 1 on MCTSI side 0.
     SMREF-1-0 = External timing reference 0 on MCTSI side 1.
     SMREF-1-1 = External timing reference 1 on MCTSI side 1.
     UNK = Unknown.
= Primary status of unit. Valid value(s):
ACT = Active
ACT-TIMING = Active, source of system timing for SM.
OOS = Out-of-service.
STBY = Standby.
UNAV = Unavailable to the system.

= Qualifier status indicating the origin of the request for the change in state. Valid value(s):
AUTO = Unit was put into current state by system.
FRCD = CPI force selected configuration.
GROWTH = Growth.
MAN = Unit was put into current state manually.
RTNEX = Unit is being diagnosed by the routine exerciser.
SPGRWTH = Special growth.

= Qualifier of the primary status. Valid value(s):
AUOOS = Unit was taken out-of-service due to audits.
DGNOS = Unit is being diagnosed.
EX = Unit is being interactively exercised.
FE = Unit is in current state due to family-of-equipment considerations (for example, the parent is OOS).
FLT = Unit contains a fault.
PROOS = Unit is pre-out-of-service, waiting for a decision from the AM.
PWRALRM = Unit has lost power due to a fault condition.
PWROFF = Power not being supplied to unit.
REX = is being routinely exercised.
RMVD = Unit was removed from service by the system.
TBLA = Unit passes diagnostics but the system has taken it out-of-service.
TMP = Unit is currently a helper for some other unit diagnostic.
UPDT = Unit memory was being updated.

NOTE: The following fields are for post mortem evaluation.

= Recovery progress type when the stimuli occurred, in decimal.
= Recovery progress counter within the recovery progress type when the stimuli occurred, in decimal.
= Snapshot of the recovery progress type at the last recovery progress check, in decimal. (The recovery progress check is done in four-second intervals during an initialization.)
= Snapshot of the recovery progress counter at the last recovery progress check, in decimal. (The recovery progress check is done in four-second intervals during an initialization.)

= SI recovery variables, in hexadecimal, packed into 32 bits. Valid value(s):
INallcntr = Count of all stimuli (upper 16 bits),
INrpicntr = Count of RPI stimuli (lower 16 bits).

= SI recovery variables, in hexadecimal, packed into 32 bits: Valid value(s):
\(\text{INsppcntr} = \text{Count of interrupt requested SPP stimuli (upper 16 bits)},\)
\(\text{INdefcntr} = \text{Count of ASSERT requested SPP stimuli (lower 16 bits)}.\)

\(k^1 = \text{SI recovery variables, in hexadecimal, packed into 32 bits: Valid value(s):}\)
\(\text{INausppcntr} = \text{Count of AUDIT requested SPP stimuli (upper 16 bits)},\)
\(\text{INdausppcntr} = \text{Count of deferred SPP stimuli (lower 16 bits)}.\)

\(l^1 = \text{SI recovery variables, in hexadecimal, packed into 32 bits: Valid value(s):}\)
— Automatic initialization escalation reason (upper 16 bits).
— Measure of time call processing was turned off due to SPPs and directed audits (1 count equals 30 milliseconds) (lower 16 bits).

\(m^1 = \text{Unused, in hexadecimal.}\)

\(n^1 = \text{Reset counter shadow (lower four bits), in hexadecimal, requested TTY level (middle four bits),}\)
and number of links up (upper four bits).

\(o^1 = \text{Pump return code from the previous initialization, in hexadecimal.}\)

\(p^1 = \text{Hardware recover levels, in hexadecimal. Valid value(s):}\)
\(\text{SMrcvy\_level} = \text{Highest recent hardware recovery level (least significant 8 bits)},\)
\(\text{SMoldrcvy\_level} = \text{Shadow hardware recovery level (next most significant 8 bits)}.\)

4. ACTIONS TO BE TAKEN

Monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected.

If the error is related to the memory system (variable 'h' is CORR-BIT-ERR or MEM-SYSTEM) and the type of memory referenced is not OOR (variable 'n'), there may be something wrong with the memory system hardware. A certain number of CORR-BIT-ERR is normal. A CORR-BIT-ERR indicates that one bit within a word of memory was changed, detected and corrected. It may be considered normal if:

— The errors are scattered randomly among SMs throughout the office.
— An MCTSI is not removed due to CORR-BIT-ERR.

For a 30-SM office, if approximately one or fewer CORR-BIT-ERR occurs per day and occurrences meets the above criteria, the CORR-BIT-ERR can be ignored. MEM-SYSTEM should never be considered normal. If the errors recur but without sufficient frequency to invoke the MCTSI diagnostic, manually invoke the MCTSI diagnostic. If it passes, execute MCTSI diagnostic phase 7 on the suspect side of the SM. If phase 7 passes ATP, there may be an intermittent memory fault that is not detectable by the diagnostics. Replace the suspect memory board(s). To determine the board number, use the failing address in this message (variable 'm') within the procedure described in the Corrective Maintenance manual.

If the error type is related to an SM peripheral (for example, CI PER-DET-BAD-ADDR or TSI DI-PIDB-PARITY), then another output message may appear with the same event number indicating the faulty peripheral (for example, a REPT:LUCHAN and a REPT:MSUCOM). If peripheral REPT output messages do not appear, the errors may be occurring too slowly for the peripheral circuit to be removed, causing the messages to be throttled at the SM. Setting the SM in VERBOSE mode will route the peripheral messages to the daylog file, and changing the message class action can cause these messages to print. Refer to the OP:PERPH-SM-SUM and SET:PERPH-SM input messages for further explanation.

Message Class: INT
Application: 5
Type: Output

1. FORMAT

REPT SM=a  INITIALIZATION  TRIGGER=b  EVENT=c

2. REASON FOR OUTPUT

To report that a switching module (SM) is beginning a high-level initialization and to report the cause of that initialization. This is the first report on the initialization and immediate attention is required.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = Phase trigger for the initialization. Valid value(s):
CIAUD FAIL = A count of excessive control interface (CI) errors has exceeded the threshold.
DLI CLK = A software sanity timer interrupt occurred due to a DLI clock or power failure.
DPLX FAIL = Multiple peripheral units duplex failed.
EX AUD SPP = A count of audit-caused single process purge (SPP) initializations has exceeded the threshold.
EX DCF = A count of asserts (defensive check failures) has exceeded the threshold.
EX DEF SPP = A count of assert-caused deferred single process purge (SPP) initializations has exceeded the threshold.
EX DMD AUD = Non-segmented demand audits have taken too much time away from call processing.
EXERR INIT = A count of escalating events in the last 30 seconds has exceeded the SM initialization threshold. This results in an SM initialization.
EX ERR SPP = A count of escalating events in the last 30 seconds has exceeded the SPP threshold. This results in an MP reset and a single process purge (SPP).
EX ERR SW = A count of escalating events in the last 30 seconds has exceeded the MP switch threshold. This results in an MP switch and a single process purge (SPP).
EX FLT SPP = A count of single process purge (SPP) initializations has exceeded the threshold.
EX INTRPTS = A count of returning interrupts has exceeded the threshold.
EX RESETS = A count of non-maskable interrupts has exceeded the threshold.
EX RPI = A count of errors with recovery action of return-to-the-point-of-interrupt (RPI) has exceeded the threshold.
HDW STIM = An unknown hardware stimulus triggered the initialization.
INTJ FAIL = Call processing interject failed.
INVALID = Initial value for this field. Should not be seen unless recovery was aborted.
INVLD STK = High-level initialization was attempted on a stack other than the recovery stack, so the initialization restarted.
LVL3 FAIL = Lack of level 3 protocol messages exchanged between the SM and the AM.
MANUAL REQ = A user-initiated manual initialization has occurred.
MCB EXHST = Recovery due to operating system for distributed switching (OSDS) message control block exhaustion.
MHOCER = Excessive communication errors have been detected from message handler 0 on the active MCTSI.
MH1CER  = Excessive communication errors have been detected from message handler 1 on the active MCTSI.
MH2CER  = Excessive communication errors have been detected from message handler 2 on the active MCTSI.
MH0INT  = Message handler 0 on the active MCTSI failed initialization.
MH1INT  = Message handler 1 on the active MCTSI failed initialization.
MH2INT  = Message handler 2 on the active MCTSI failed initialization.
MH0IST  = Message handler 0 on the active MCTSI failed the interprocessor sanity timer (IST).
MH1IST  = Message handler 1 on the active MCTSI failed the interprocessor sanity timer (IST).
MH2IST  = Message handler 2 on the active MCTSI failed the interprocessor sanity timer (IST).
MH0OSR  = Excessive operational software restart (OSR) errors have been detected from message handler 0 on the active MCTSI.
MH1OSR  = Excessive operational software restart (OSR) errors have been detected from message handler 1 on the active MCTSI.
MH2OSR  = Excessive operational software restart (OSR) errors have been detected from message handler 2 on the active MCTSI.
MH PLNKR  = Message handler on the active MCTSI failed during PCT hardware initialization.
NESTD RCVY = A purging assert was processed before the completion of a previous recovery action.
NO PROGRES = At least twenty-four seconds have elapsed without any progress in an already active recovery.
PCB EXHST  = Recovery due to OSDS process control block exhaustion.
PI RCVY  = Excessive errors have been detected on the packet interface (PI) subunit of the active MCTSI.
PKB EXHST  = Recovery due to packet buffer data block exhaustion.
POWER UP  = The switching module has been power-cycled, or the memory in the switching module is in an unreliable state.
PREEMPTION = Pump in the SM was preempted by the AM.
PROG LOOP  = A program loop is not allowing the integrity monitor to run its background process.
PSU RCVY  = Excessive errors have been detected on the packet switching unit (PSU) peripheral of the SM.
PUMP COMM  = Pump communication failure.
PUMP FAIL  = A timeout occurred while the pump program was waiting for messages from the AM.
PUMP REQ  = Recovery has reached a level that requires a pump.
PUMP SYNC  = Pump in the SM lost synchronization with the AM.
RCVY RSRC  = A lack of OSDS resources, usually timers.
RETROFIT = Software release retrofit has taken place.
RTCN FAIL  = Real time counter hardware failure.
SCB EXHST  = Recovery due to OSDS stack control block exhaustion.
SW RCVY ER = Recovery software detected insanity or an assert was processed before completion of recovery.
TCB EXHST  = Recovery due to OSDS timer control block exhaustion.

c = Event number.

4. ACTIONS TO BE TAKEN
Immediately analyze the cause of the initialization and verify that the system recovers properly. Use output messages INIT:LVL-SM and REPT:SM-HWLVL or access MCC display pages 1800 and 11XX to verify the system recovery.

MCC Display Page(s):
11XX SM Equipment Pages
1800 SM INH & RCVY CNTL
REPT:SM-ISOL

Software Release: 5E14 and later
Message Class: SED_MON
Application: 5
Type: Output

1. FORMAT

REPT SM a [b] ISOLATED FROM c [d]

2. REASON FOR OUTPUT

To report that the integrity monitor detected a lack of communication to a switching module (SM) and subsequent recovery actions failed to restore communication.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = Isolation type. Valid value(s):
   (blank) = The SM is automatically totally isolated.
   MANUALLY = The SM is manually totally isolated.
   ISMQLNKs = The ISMQLNKs are automatically isolated.
   ISMQLNKs MANUALLY = The inter-switching module communication link (ISMQLNKs) are manually isolated.
   QLNKS = The QLNks are automatically isolated.
   QLNKS MANUALLY = The quad link packet switch (QLPS) communication links (QLNKs) are manually isolated.

(c = Other processor involved. Valid value(s):
   AM = SM isolated from the administrative module (AM).
   AM - CLNKS OPERATIONAL = QLNks isolated from the AM, but the communication links (CLNKs) are still operational.
   OTHER SMS = SM isolated from other SMs.

(d = Failure type. Valid value(s):
   AUTO LINK RCVY FAILURE = Failure of the automatic link recovery.
   COMMUNICATION LOST = Prolonged loss of AM-SM communication.

4. ACTION TO BE TAKEN

If the SM isolation is due to a manual request, no action needs to be taken.

If a non-remote SM becomes totally isolated due to automatic recovery (REPT Sma ISOLATED FROM AM message), refer to the System Recovery Procedures manual for step-by-step repair procedures in the section titled "ESTABLISH COMMUNICATION WITH ISOLATED SM/SM-2000".

If an RSM becomes totally isolated due to automatic recovery (REPT Sma ISOLATED FROM AM message), refer to
the System Recovery Procedures manual for step-by-step repair procedures in the section titled "ESTABLISH COMMUNICATION WITH ISOLATED RSM".

If an SM-2000 becomes isolated from the QLPS network only due to automatic recovery (REPT SMa ISMQLNKS ISOLATED FROM OTHER SMs or REPT SMa QLNKS ISOLATED FROM AM message), refer to the System Recovery Procedures manual for step-by-step repair procedures in the section titled "ESTABLISH QLPS COMMUNICATION WITH SM-2000".

5. ALARMS

If the SM is not manually isolated, then a critical alarm is generated. If the SM is manually isolated, then an automatic alarm is generated.

REPT:SM-LINK-MAP

Software Release: 5E14 and later
Message Class: SED_MON
Application: 5
Type: Output

1. FORMAT

[1] REPT SM a LINK MAP INCONSISTENCY

CTS

AM:   b   c
SM:   d   e

[2] REPT SM a LINK MAP INCONSISTENCY

QLPS

AM:   f   g   h   i
SM:   j   k   l   m

[3] REPT SM a LINK MAP INCONSISTENCY

CTS

QLPS

AM:   b   c   f   g   h   i
SM:   d   e   j   k   l   m

2. REASON FOR OUTPUT

To report the detection of a logical-to-physical link map inconsistency between the specified switching module (SM) and the administrative module (AM).

Format 1 prints a control timeslot (CTS) link map inconsistency.

Format 2 prints a quad-link packet switch (QLPS) link map inconsistency.

Format 3 prints a CTS and a QLPS link map inconsistency.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.

b,c = The physical CLNKs that are mapped to the AM logical links with an inconsistency. Valid value(s):

0A = Time-multiplexed switch (TMS) 0 even time slot.
1A = TMS 1, even time slot.
0B = TMS 0, odd time slot.
1B = TMS 1, odd time slot.

d,e = The physical CLNKs that are mapped to the SM logical links with an inconsistency. Valid value(s):

0A = TMS 0 even time slot.
1A = TMS 1, even time slot.
0B = TMS0, odd time slot.
1B = TMS 1, odd time slot.

\[ f, g, h, i \] = The physical QLNKs that are mapped to the AM logical links with an inconsistency. Valid value(s):
0000 = Network 0, TMS 0, QGP 0, MSCU 0
0001 = Network 0, TMS 0, QGP 0, MSCU 1
0010 = Network 0, TMS 0, QGP 1, MSCU 0
0011 = Network 0, TMS 0, QGP 1, MSCU 1
0100 = Network 0, TMS 1, QGP 0, MSCU 0
0101 = Network 0, TMS 1, QGP 0, MSCU 1
0110 = Network 0, TMS 1, QGP 1, MSCU 0
0111 = Network 0, TMS 1, QGP 1, MSCU 1
1000 = Network 1, TMS 0, QGP 0, MSCU 0
1001 = Network 1, TMS 0, QGP 0, MSCU 1
1010 = Network 1, TMS 0, QGP 1, MSCU 0
1011 = Network 1, TMS 0, QGP 1, MSCU 1
1100 = Network 1, TMS 1, QGP 0, MSCU 0
1101 = Network 1, TMS 1, QGP 0, MSCU 1
1110 = Network 1, TMS 1, QGP 1, MSCU 0
1111 = Network 1, TMS 1, QGP 1, MSCU 1

\[ j, k, l, m \] = The physical QLNKs that are mapped to the SM logical links with an inconsistency. Valid value(s):
0000 = Network 0, TMS 0, QGP 0, MSCU 0
0001 = Network 0, TMS 0, QGP 0, MSCU 1
0010 = Network 0, TMS 0, QGP 1, MSCU 0
0011 = Network 0, TMS 0, QGP 1, MSCU 1
0100 = Network 0, TMS 1, QGP 0, MSCU 0
0101 = Network 0, TMS 1, QGP 0, MSCU 1
0110 = Network 0, TMS 1, QGP 1, MSCU 0
0111 = Network 0, TMS 1, QGP 1, MSCU 1
1000 = Network 1, TMS 0, QGP 0, MSCU 0
1001 = Network 1, TMS 0, QGP 0, MSCU 1
1010 = Network 1, TMS 0, QGP 1, MSCU 0
1011 = Network 1, TMS 0, QGP 1, MSCU 1
1100 = Network 1, TMS 1, QGP 0, MSCU 0
1101 = Network 1, TMS 1, QGP 0, MSCU 1
1110 = Network 1, TMS 1, QGP 1, MSCU 0
1111 = Network 1, TMS 1, QGP 1, MSCU 1

4. ACTION TO BE TAKEN

Study the link-related activities that occurred before the inconsistency to determine its cause.

5. ALARMS

Minor.

2. REASON FOR OUTPUT

To provide information about specific module processor (MP) hardware registers for trouble analysis. This message is automatically generated by the system when a fault is detected. A REPT:SM-HWLVL output message and others should appear with the same event number to report other details of the error.

Format 1 prints when equipped with module controller and time slot interchanger unit 2 (MCTU2) and earlier switching modules (SMs).

Format 2 prints when equipped with an module controller and time slot interchanger unit 3 (MCTU3) SM.

Format 3 prints when equipped with SM-2000.

The registers referred to in this message description are located in the header files of the software listings.

3. VARIABLE FIELD DEFINITIONS

a = SM number where the report originated.

b = Event number.

c = Contents of the active circuit status register (ACTSR) in hexadecimal notation.

d = Contents of the bus control register (BUSCR) in hexadecimal notation.

e = Contents of the cache control register (CACTL) in hexadecimal notation.

f = Contents of the central processor intervention (CPI) diagnostic status register (CPDSR) in hexadecimal notation.

g = Contents of the CPI status register (CPISR) in hexadecimal notation.

h = Contents of the dual link interface-module processor/module controller (DLI-MP) interface error mask register (DLEMR) in hexadecimal notation.

i = Contents of the DLI-MP interface error source register (DLESR) in hexadecimal notation.

j = Contents of the dual link interface (DLI) switch control register (DLSCR) in hexadecimal notation.

k = Contents of the direct memory access (DMA) command register (DMACS) in hexadecimal notation.

l = Contents of the channel 0 DMA controller (address register) in hexadecimal notation.

m = Contents of the channel 1 DMA controller (address register) in hexadecimal notation.

n = Contents of the channel 2 DMA controller (address register) in hexadecimal notation.

o = Contents of the channel 3 DMA controller (address register) in hexadecimal notation.
p = Contents of the DMA 0 map register in hexadecimal notation.
q = Contents of the DMA 1 map register in hexadecimal notation.
r = Contents of the DMA 2 map register in hexadecimal notation.
s = Contents of the DMA 3 map register in hexadecimal notation.
t = Contents of the channel 0 DMA controller (current word count register) in hexadecimal notation.
u = Contents of the channel 1 DMA controller (current word count register) in hexadecimal notation.
v = Contents of the channel 2 DMA controller (current word count register) in hexadecimal notation.
w = Contents of the channel 3 DMA controller (current word count register) in hexadecimal notation.
x = Exception (EXCEP) number of this error, in decimal.
y = Contents of the function code latch (FUNCL) register in hexadecimal notation.
z = Contents of the hardware reset source mask register (HRSMR) in hexadecimal notation.
a = Contents of the hardware reset source (HRSRC) register in hexadecimal notation.
b = Contents of the memory auxiliary control (MACTL) register in hexadecimal notation.
c = Contents of the memory control (MCTRL) register in hexadecimal notation.
d = Contents of the memory error source (MEMES) register in hexadecimal notation.
e = Contents of the memory error source mask register (MESMR) in hexadecimal notation.
f = Contents of the pre-active flip-flop register (PAFFR) in hexadecimal notation.
g = Contents of the scan port A in hexadecimal notation.
h = Contents of the scan port B in hexadecimal notation.
i = Contents of the scan port C in hexadecimal notation.
j = Contents of the processor status 1 register (PROC1) in hexadecimal notation.
k = Contents of the processor status 2 register (PROC2) in hexadecimal notation.
l = Contents of the reset mask (RSMSK) register in hexadecimal notation.
m = Contents of the reset error source register (RSTSR) in hexadecimal notation.
n = Contents of the synchronous data link controller (SDLC) A command/status register in hexadecimal notation.
o = Contents of the SDLC B command/status register in hexadecimal notation.
p = Contents of the shadow address register (SHADDR) in hexadecimal notation.
q = Contents of the shadowed bus control register (SHBCR) in hexadecimal notation.
r\(^1\) = Contents of the shadowed operations register (SHOPR) in hexadecimal notation.

s\(^1\) = Contents of the software reset source mask register (SRSMR) in hexadecimal notation.

t\(^1\) = Contents of the software reset source register (SRSRC) in hexadecimal notation.

u\(^1\) = Contents of the stack window (STKWD) register (index of the current user stack) in hexadecimal notation.

v\(^1\) = Contents of the subunit ready register (SUBRR) in hexadecimal notation.

w\(^1\) = Contents of the scan port B (PRTBN) in hexadecimal notation.

x\(^1\) = Contents of the processor status 3 register (PROC3) in hexadecimal notation.

y\(^1\) = Contents of the summary error source register (SESR).

z\(^1\) = Contents of the bus service node error source register (BSNES).

a\(^2\) = Contents of the application processor control error source register (APESR).

b\(^2\) = Contents of the summary error source mask register (SESMR).

c\(^2\) = Contents of the bus service node error source mask register (BSNEM).

d\(^2\) = Contents of the application processor control error source mask register (APESM).

e\(^2\) = Contents of the subunit ready register (SUBRR).

f\(^2\) = Memory board (MEMBD) is a decimal number used to present location information on faults concerning memory system access or controls.

   0 to 15 Identifies which memory board was associated with the REPT SM HWLVL failing address when a form of memory system fault has occurred.
   -1 Indicates no memory board was associated with this exception.
   -2 Indicates the failing address from the REPT SM HWLVL message is in read only memory.
   -3 Indicates core board memory was associated with the REPT SM HWLVL failing address when a form of memory system fault has occurred.
   -4 Indicates the failing address from the REPT SM HWLVL failing address is in I/O space.

g\(^2\) = Contents of the memory board status register 1-0.

h\(^2\) = Contents of the memory board status register 1-1.

i\(^2\) = Contents of the memory board status register 1-2.

j\(^2\) = Contents of the memory board status register 1-3.

k\(^2\) = Contents of the memory board 0 error source register.

l\(^2\) = Contents of the memory board 1 error source register.

m\(^2\) = Contents of the memory board 2 error source register.
Contents of the memory board 3 error source register.
Contents of the memory board 0 error source mask register.
Contents of the memory board 1 error source mask register.
Contents of the memory board 2 error source mask register.
Contents of the memory board 3 error source mask register.
Contents of the core error source register.
Contents of the core auxiliary error source register.

2. REASON FOR OUTPUT

To provide information about specific module processor (MP) hardware registers for trouble analysis. This message is automatically generated by the system when a fault is detected. A REPT:SM-HWLVL output message and others should appear with the same event number to report other details of the error.

Format 1 prints when equipped with MCTU2 and earlier SMs. Format 2 prints when equipped with an MCTU3 SM. Format 3 prints when equipped with SM-2000. The registers referred to in this message description are located in the header files of the software listings.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number where the report originated.
b = Event number.
c = Contents of the active circuit status register (ACTSR) in hexadecimal notation.
d = Contents of the bus control register (BUSCR) in hexadecimal notation.
e = Contents of the cache control register (CACTL) in hexadecimal notation.
f = Contents of the central processor intervention (CPI) diagnostic status register (CPDSR) in hexadecimal notation.
g = Contents of the CPI status register (CPISR) in hexadecimal notation.
h = Contents of the dual link interface-module processor/module controller (DLI-MP) interface error mask register (DLEMR) in hexadecimal notation.
i = Contents of the DLI-MP interface error source register (DLESR) in hexadecimal notation.
j = Contents of the dual link interface (DLI) switch control register (DLSCR) in hexadecimal notation.
k = Contents of the direct memory access (DMA) command register (DMACS) in hexadecimal notation.
l = Contents of the channel 0 DMA controller (address register) in hexadecimal notation.
m = Contents of the channel 1 DMA controller (address register) in hexadecimal notation.
n = Contents of the channel 2 DMA controller (address register) in hexadecimal notation.
o = Contents of the channel 3 DMA controller (address register) in hexadecimal notation.
p = Contents of the DMA 0 map register in hexadecimal notation.
q = Contents of the DMA 1 map register in hexadecimal notation.

r = Contents of the DMA 2 map register in hexadecimal notation.

s = Contents of the DMA 3 map register in hexadecimal notation.

t = Contents of the channel 0 DMA controller (current word count register) in hexadecimal notation.

u = Contents of the channel 1 DMA controller (current word count register) in hexadecimal notation.

v = Contents of the channel 2 DMA controller (current word count register) in hexadecimal notation.

w = Contents of the channel 3 DMA controller (current word count register) in hexadecimal notation.

x = Exception (EXCEP) number of this error, in decimal.

y = Contents of the function code latch (FUNCL) register in hexadecimal notation.

z = Contents of the hardware reset source mask register (HRSMR) in hexadecimal notation.

a1 = Contents of the hardware reset source (HRSRC) register in hexadecimal notation.

b1 = Contents of the memory auxiliary control (MACTL) register in hexadecimal notation.

c1 = Contents of the memory control (MCTRL) register in hexadecimal notation.

d1 = Contents of the memory error source (MEMES) register in hexadecimal notation.

e1 = Contents of the memory error source mask register (MESMR) in hexadecimal notation.

f1 = Contents of the pre-active flip-flop register (PAFFR) in hexadecimal notation.

g1 = Contents of the scan port A in hexadecimal notation.

h1 = Contents of the scan port B in hexadecimal notation.

i1 = Contents of the scan port C in hexadecimal notation.

j1 = Contents of the processor status 1 register (PROC1) in hexadecimal notation.

k1 = Contents of the processor status 2 register (PROC2) in hexadecimal notation.

l1 = Contents of the reset mask (RSMSK) register in hexadecimal notation.

m1 = Contents of the reset error source register (RSTSR) in hexadecimal notation.

n1 = Contents of the synchronous data link controller (SDLC) A command/status register in hexadecimal notation.

o1 = Contents of the SDLC B command/status register in hexadecimal notation.

p1 = Contents of the shadow address register (SHADDR) in hexadecimal notation.

q1 = Contents of the shadowed bus control register (SHBCR) in hexadecimal notation.

r1 = Contents of the shadowed operations register (SHOPR) in hexadecimal notation.
s¹ = Contents of the software reset source mask register (SRSMR) in hexadecimal notation.

t¹ = Contents of the software reset source register (SRSRC) in hexadecimal notation.

u¹ = Contents of the stack window (STKWD) register (index of the current user stack) in hexadecimal notation.

v¹ = Contents of the subunit ready register (SUBRR) in hexadecimal notation.

w¹ = Contents of the scan port B (PRTBN) in hexadecimal notation.

x¹ = Contents of the processor status 3 register (PROC3) in hexadecimal notation.

y¹ = Contents of the summary error source register (SESR).

z¹ = Contents of the bus service node error source register (BSNES).

a² = Contents of the application processor control error source register (APESR).

b² = Contents of the summary error source mask register (SESMR).

c² = Contents of the bus service node error source mask register (BSNEM).

d² = Contents of the application processor control error source mask register (APESM).

e² = Contents of the subunit ready register (SUBRR).

f² = Memory board (MEMBD) is a decimal number used to present location information on faults concerning memory system access or controls.

  0 to 15 Identifies which memory board was associated with the REPT SM HWLVL failing address when a form of memory system fault has occurred.

-1 Indicates no memory board was associated with this exception.

-2 Indicates the failing address from the REPT SM HWLVL message is in read only memory.

-3 Indicates core board memory was associated with the REPT SM HWLVL failing address when a form of memory system fault has occurred.

-4 Indicates the failing address from the REPT SM HWLVL failing address is in I/O space.

g² = Contents of the memory board status register 1-0.

h² = Contents of the memory board status register 1-1.

i² = Contents of the memory board status register 1-2.

j² = Contents of the memory board status register 1-3.

k² = Contents of the memory board 0 error source register.

l² = Contents of the memory board 1 error source register.

m² = Contents of the memory board 2 error source register.

n² = Contents of the memory board 3 error source register.
\( a^2 \) = Contents of the memory board 0 error source mask register.

\( p^2 \) = Contents of the memory board 1 error source mask register.

\( q^2 \) = Contents of the memory board 2 error source mask register.

2. REASON FOR OUTPUT

To report the contents of specific time slot interchange (TSI) and network link interface (NLI) hardware registers as information for trouble analysis. This message may contain a maximum of four NLI error reports and a minimum of one. This message is automatically generated by the system when a NLI fault is detected.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number where the report originated.
b = SM side on which the interrupt occurred.
c = SM processor status of side reporting the error (ACT or MATE).
d = Event number, time sequence indicator.
e = The office network and timing complex (ONTC) status. Valid value(s):
MAJ = The major ONTC side.
MIN = The minor ONTC side.
OOS = The ONTC side is out of service (OOS).
f = Bit map of the original NLI statuses for the ONTC side specified. Valid value(s):
0 = OOS.
1 = In service.
g = Bit map of the NLIs that reported errors for the ONTC side specified. Valid value(s):
  0 = No error reported.
  1 = An error is reported.

h = Bit map of the final NLI statuses for the ONTC side specified. Valid value(s):
  0 = OOS.
  1 = In service.

i = The MCTSI state. This field prints unless the MCTSI was reconfigured as part of the interrupt
    recovery actions. Valid value(s):
    ACT = The MCTSI is active.
    OOS = The MCTSI is OOS.
    STBY = The MCTSI is on standby.
    UNAV = The MCTSI is unavailable.

j = Original contents of the TSI clock control register (TSCMCCR) for the module controller/time slot
    interchange (MCTSI) specified. This value is blank if the MCTSI is OOS.

k = Final contents of the TSCMCCR for the MCTSI specified. This value is blank if the MCTSI is OOS.

l = Contents of the TSI common board (TSICOM) error mask register (TSCMEMR) for the MCTSI
    specified. This value is blank if the MCTSI is OOS.

m = Contents of the TSICOM error source register (TSCMESR) for the MCTSI specified. This value is
    blank if the MCTSI is OOS.

Note: The remaining fields identify a set of NLI data for a specific NLI error. The number of sets depends
on the number of NLIs that are reporting faults.

n = NLI number.

o = ONTC side.

p = TSI board number.

q = Relative TSI port associated with the specified TSI board.

r = Source of the error that caused the interrupt. Valid value(s):
    BUFFER-CHECK = The network link interface (NLI) detected a buffer check error.
    CRC-FROM-ACTIVE-TSI = The NLI detected a CRC error on data received from the active TSI.
    CRC-FROM-MATE-TSI = The NLI detected a CRC error on data received from the mate TSI.
    INTERNAL-PARITY = The NLI detected an internal parity error.
    NO-ERROR = There were no errors found on the reporting NLI(s).
    NOT-IN-ERROR = There was no NLI error found, although the TSI reported that the NLI declared
                   an error.
    OUT-OF-FRAME = The NLI detected out of frame errors on data from the ONTC.
    OVERHEAD-BYTE-PARITY = The NLI detected a parity error on the overhead bytes from the TSI.
    PARITY = The NLI detected a parity error on data from the ONTC.
    SOFTWARE-MASK-PROBLEM = The NLI was declaring an error that should have been masked.
TSI-CRC = The TSI detected CRC errors on data received from the NLI.
TSI-LOSS-OF-CLOCK = The TSI detected a loss of the clock signal from the NLI.
TSI-LOSS-OF-CLOCK-REFERENCE = The TSICOM detected loss of the clock reference from the NLI being used as the source of timing.
TSI-OVERHEAD-PARITY = The TSI detected a parity error on the overhead bytes from the NLI.
TSI-SYNCHRONIZATION = The TSI detected a synchronization error with the NLI.

s = Contents of the TSI interface (IF) error mask register (TSIFEMR) of the identified TSI board and port.
t = Contents of the NLI error mask register (NLEMR) of the identified NLI.
u = Contents of the NLI link control register (NLLCR) of the identified NLI.
v = Original contents of the TSI IF error source register (TSIFESR) of the identified TSI board and port.
w = Original contents of the active MCTSI IF control register (TSIFCTL) of the identified TSI board and port.
x = Contents of the NLI error source register (NLESR) of the identified NLI.
y = Contents of the NLI built in self test register (NLBIST) of the identified NLI.
z = Additional TSIFESR data that was analyzed for this NLI fault. This field only prints if this register is used to help determine the error. Valid value(s):
ACT = The data is from the active MCTSI TSIFESR of the identified TSI board and port.
MOD = The data is from the reporting side (either active or mate) TSIFESR of the identified TSI board and port.
a¹ = Final contents of the register identified in parameter ‘z’. This field only prints if parameter ‘z’ prints.
b¹ = Final contents of the active side TSI IFCTL register. This field only prints if this register was modified as part of the NLI error analysis/recovery procedures.

4. ACTION TO BE TAKEN

Software Release: 5E14 and later
Message Class: GENR
Application: 5
Type: Output

1. FORMAT

REPT SM=a b [DATA=c|d]

2. REASON FOR OUTPUT

To report progress or reason for termination for certain types of action on a switching module (SM). These types of action include an SM off-line pump with or without peripheral offline pump.

3. VARIABLE FIELD DEFINITIONS

- a = SM number.
- b = Outcome of the request. Valid value(s):
  - OFFLINE PUMP ALREADY IN PROGRESS = An offline pump was requested but there was one already in progress.
  - OFFLINE PUMP COMPLETED = The offline pump has been completed successfully.
  - OFFLINE PUMP REQUEST IGNORED: NIPMP IN PUMP PROGRESS = Offline pump request was not executed because a Non-Interfering Pump request is currently running.
  - OFFLINE PUMP STOPPED: PROCESS PURGED = The Offline Pump System Process in the SM was purged during the offline pump, mate hashsum checks, offline verify, or peripheral offline pump. The offline pump request has been aborted and must be retried.
  - OFFLINE PUMP STOPPED: ASSERT LOGGED = A problem occurred over which the offline pump has no control. Offline pump has stopped and the reason can be found in the assert log file.
  - OFFLINE PUMP STOPPED: BTSR/PUMP HW BAD OR UNAVAILABLE = The pump hardware in the SM was found to be bad or not operational. In a module control and time slot interchange unit, version 2 (MCTU2), this pump hardware is duplicated in each module controller and time slot interchanger (MCTSI). In earlier versions, the SM pump hardware is the simplex bootstrapper (BTSR) circuit.
  - OFFLINE PUMP STOPPED: CANNOT CONNECT PATH = Fewer than ten free timeslots were found for the offline pump (chosen from a fixed set of 32).
  - OFFLINE PUMP STOPPED: CANNOT OPEN DISK FILE = The administrative module (AM) pump process could not open the image files for this SM.
  - OFFLINE PUMP STOPPED: CRITICAL MATE MP ERRORS = Processor errors occurred on the offline side during the verify (the initialization of the offline side following the memory pump).
  - OFFLINE PUMP STOPPED: INCONSISTENT SM NUMBERS DATA = c = Indicates that the SM number recorded in the offline side differs from the SM number in the active memory.
  - OFFLINE PUMP STOPPED: LACK OF PROGRESS = The SM timed out waiting for a response from the AM.
  - OFFLINE PUMP STOPPED: MATE ACT AT END OF VRFY DATA = d = The offline processor was still running at the end of the period allowed for offline initialization/verification.
  - OFFLINE PUMP STOPPED: MATE HASHSUM ERRORS = Hashsum checks failed four times.
  - OFFLINE PUMP STOPPED: MATE NOT READY = Offline pump has stopped. The mate is not
ready to be offline pumped. Some of the common reasons for this are that the active side of the SM was not forced with the mate side out of service, or that the mate was powered down.

**OFFLINE PUMP STOPPED: OFFLINE VERIFY FAILED**
DATA = d = The offline side was pumped and passed hashsum checks, but the offline initialization (the verify stage of offline pump) failed.

**OFFLINE PUMP STOPPED: PPC/TMS PROBLEM** = An error occurred on the pump peripheral controller (PPC) or time multiplexed switch (TMS).

**OFFLINE PUMP STOPPED: OFFLINE RELOCATION FAILED** = The offline relocation of peripheral images failed during broadcast offline pump of the SM.

**OFFLINE PUMP STOPPED: REQUESTED** = The stop was requested either manually or from another process.

**OFFLINE PUMP STOPPED: VERIFY OR PUMP NOT RUN SUCCESSFULLY** = A peripheral offline pump has been requested and either the pump or the verify has not run successfully on the mate side. Refer to the ST:OPUMP-SM input message for further information.

**OFFLINE PERIPHERAL PUMP FAILED** = One or more peripherals failed the offline pump. The failing peripherals can be retrieved by entering the OP:OPUMP message for this SM.

**OFFLINE PERIPHERAL PUMP STOPPED: REVERSE VERIFY IN PROGRESS** = After the SM switched and initialized, an offline peripheral pump request was denied since reverse verification was in progress.

\[c\] = A hexadecimal number indicating the SM number recorded in the offline side.

\[d\] = A hexadecimal number indicating the progress mark.

### 4. ACTION TO BE TAKEN

In the case of offline pump failures, check the indicated error source. For example, if there was a failure to open a disk file, check to make certain that all appropriate disk files exist on mounted partitions. Also, check compliance with retrofit/update procedures. If errors continue after retrying the command, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

235-105-110 System Maintenance Requirements and Tools
1. FORMAT

REPT SM=a,b PIDB PARITY FAILURE EVENT=c
   REASON FOR OUTPUT d
   TOTAL UNLINKED TIME SLOTS=e [f g]
   [PICB=h TYPE=i UNIT=j SG=k]
   PIDB ERRS TIMESLOTS
   l m [n...]

2. REASON FOR OUTPUT

To report that a peripheral interface data bus (PIDB) parity error occurred, either on unlinked or linked time slots. A time slot is unlinked if software is not able to find out what peripheral circuit was using the time slot interchange (TSI) time slot. This message is generated only when a PIDB parity error occurs and one of these three things is true:

- The time slot taking the PIDB parity error was not linked to a switching module (SM) peripheral circuit or a database read failure occurred and the peripheral circuit could not be found.
- The flag SMTSDMP is equal to 44 (set by using generic utilities).
- The time slot taking the PIDB parity error was not connected to a PIDB in the hardware. In this case, the reason for output will be 'DISCONNECTED TIME SLOTS,' the fields 'h' through 'k' will not be printed, and field 'l' will be hexadecimal 7F.

The event number of this message is the same as the corresponding PIDB parity interrupt report.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Module controller and time slot interchange (MCTSI) side number.
c = Event number.
d = The reason this message was printed. Valid value(s):

 MANUAL REQUEST = The SMTSDMP flag has been set equal to 44 using generic utilities. This causes this message to be printed whenever a PIDB parity error occurs, whether or not the time slots are linked by data structures to a peripheral circuit.

 UNLINKED TIME SLOTS = The only PIDB time slots that had bad parity were not linked by data structures to a peripheral circuit.

 DISCONNECTED TIME SLOTS = The time slots in the message had bad parity and were not connected to a PIDB in the hardware.
The number of unlinked time slots found for the PIDB(s) listed in field '1'.

= TSI BOARD number.

= Data interface (DI) number.

= Hexadecimal number of the peripheral interface control bus (PICB) associated with the unit with the most PIDB parity errors. This number is the key to the PICB relation.

= The type of unit associated with PICB 'h'. This is a decimal number representing the 'unittype' attribute in the PICB relation.

= The decimal unit number associated with PICB 'h'.

= The service group number associated with PICB 'h'.

= Hexadecimal number of the PIDB that had parity errors. This number is the key to the PIDB relation. If this number is equal to 7F, then the time slot was not linked to a PIDB.

= The decimal number of PIDB parity errors that occurred on PIDB '1'.

= TSI time slot number in decimal that had a PIDB parity error on PIDB '1'.

4. ACTIONS TO BE TAKEN

If this message was not requested manually by setting SMTSDMP to 44, monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected. If SMTSDMP has been set to 44, it remains set until it is explicitly set to zero.

Check the ODD for multiple definitions of some circuits; one possible failure cause is multiple ports with the same offset (such as, channel 4), different circuit names (different PICBs), and the same base address (in the CKTDATA relation). If this report indicates software problems, the information in the other messages associated with this event number (field 'c') should be examined.

SMts[] is an array containing the information dumped by this message, as an array of shorts (two bytes each) with the first entry being the number of the PIDB parity entries in SMts[].

For SM-2000, succeeding shorts contain the channel number in the upper byte and the PIDB number in the lower byte. For other SMs, the succeeding shorts contain the channel number in the upper 3 digits and PIDB number in the lower digit. If some data are not printed due to message size limitations or brevity control, the array SMts[] may be dumped manually to get the data from the last occurrence of this message.

5. ALARMS

2. **REASON FOR OUTPUT**

To report that a peripheral interface data bus (PIDB) parity error occurred, either on unlinked or linked time slots. A time slot is unlinked if software is not able to find out what peripheral circuit was using the time slot interchange (TSI) time slot. This message is generated only when a PIDB parity error occurs and one of these three things is true:

- The time slot taking the PIDB parity error was not linked to a switching module (SM) peripheral circuit or a database read failure occurred and the peripheral circuit could not be found.
- The flag SMTSDMP is equal to 44 (set by using generic utilities).
- The time slot taking the PIDB parity error was not connected to a PIDB in the hardware. In this case, the reason for output will be 'DISCONNECTED TIME SLOTS,' the fields 'h' through 'k' will not be printed, and field 'l' will be hexadecimal 7F.

The event number of this message is the same as the corresponding PIDB parity interrupt report.

3. **VARIABLE FIELD DEFINITIONS**

- **a** = SM number.
- **b** = Module controller and time slot interchange (MCTSI) side number.
- **c** = Event number.
- **d** = The reason this message was printed. Valid value(s):

  - MANUAL REQUEST = The SMTSDMP flag has been set equal to 44 using generic utilities. This causes this message to be printed whenever a PIDB parity error occurs, whether or not the time slots are linked by data structures to a peripheral circuit.
  - UNLINKED TIME SLOTS = The only PIDB time slots that had bad parity were not linked by data structures to a peripheral circuit.
  - DISCONNECTED TIME SLOTS = The time slots in the message had bad parity and were not connected to a PIDB in the hardware.

- **e** = The number of unlinked time slots found for the PIDB(s) listed in field 'l'.
- **f** = TSI BOARD number.
- **g** = Data interface (DI) number.
h = Hexadecimal number of the peripheral interface control bus (PICB) associated with the unit with the most PIDB parity errors. This number is the key to the PICB relation.

i = The type of peripheral unit associated with PICB 'h'. This is a decimal number representing the 'unittype' attribute in the PICB relation.

j = The decimal peripheral unit number associated with PICB 'h'.

k = The service group number associated with PICB 'h'.

l = Hexadecimal number of the PIDB that had parity errors. This number is the key to the PIDB relation. If this number is equal to 7F, then the time slot was not linked to a PIDB.

m = The decimal number of PIDB parity errors that occurred on PIDB 'l'.

n = TSI time slot number in decimal that had a PIDB parity error on PIDB 'l'.

o = Unit number where the DI resides: 0 for time slot interchange unit (TSIU) and 1-8 for optical extended control and data unit (OXU)

### 4. ACTIONS TO BE TAKEN

If this message was not requested manually by setting SMTSDMP to 44, monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected. If SMTSDMP has been set to 44, it remains set until it is explicitly set to zero.

Check the ODD for multiple definitions of some circuits; one possible failure cause is multiple ports with the same offset (such as, channel 4), different circuit names (different PICBs), and the same base address (in the CKTDATA relation). If this report indicates software problems, the information in the other messages associated with this event number (field 'c') should be examined.

SMts[] is an array containing the information dumped by this message. For SM-2000, SMts[] is an array of longs (four bytes each). For other SMs it is an array of shorts (two bytes each). In both SM types, the first entry is the event number of the PIDB parity error and the second entry is the number of succeeding entries in SMts[]. For SM-2000, succeeding entries contain the channel number in the upper two bytes and the PIDB number in the lower two bytes. For other SMs, the succeeding entries contain the channel number in the upper three digits and the PIDB number in the lower digit. If some data are not printed due to message size limitations or brevity control, the array SMts[] may be dumped manually to get the data from the last occurrence of this message.

.
.
.

2. REASON FOR OUTPUT

To report the contents of specific time slot interchange (TSI) and peripheral link interface (PLI) hardware registers as information for trouble analysis. This message may contain a maximum of five PLI error reports and a minimum of one. This message is automatically generated by the system when a PLI fault is detected.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number where the report originated.

b = SM side on which the interrupt occurred.

c = SM processor status of side reporting the error (ACT or MATE).

d = Event number, time sequence indicator.

e = Bit map of the PLIs (that is, TSI links 32-40) that reported errors for peripheral side 0. Valid value(s):
   0 = No error reported.
   1 = An error is reported.

f = Bit map of PLIs (that is, TSI links 0-31) that reported errors for peripheral side 0. Valid value(s):
   0 = No error reported.
   1 = An error is reported.
g  = Bit map of the PLIs (that is, TSI links 32-40) that reported errors for peripheral side 1. Valid value(s):
   0 = No error reported.
   1 = An error is reported.

h  = Bit map of the PLIs (that is, TSI links 0-31) that reported errors for the peripheral side 1. Valid value(s):
   0 = No error reported.
   1 = An error is reported.

i  = The MCTSI state. This field prints unless the MCTSI was reconfigured as part of the interrupt recovery actions. Valid value(s):
   ACT = The MCTSI is active.
   OOS = The MCTSI is OOS.
   STBY = The MCTSI is on standby.
   UNAV = The MCTSI is unavailable.

j  = Original contents of the TSI clock control register (TSCMCCR) for the module controller/time slot interchange (MCTSI) specified. This value is blank if the MCTSI is OOS.

k  = Final contents of the TSCMCCR for the MCTSI specified. This value is blank if the MCTSI is OOS.

l  = Contents of the TSI common board (TSICOM) error mask register (TSCMEMR) for the MCTSI specified. This value is blank if the MCTSI is OOS.

m  = Contents of the TSICOM error source register (TSCMESR) for the MCTSI specified. This value is blank if the MCTSI is OOS.

Note: The remaining fields identify a set of PLI data for a specific PLI error. The number of sets depends on the number of PLIs that are reporting faults.

n  = PLI number.

o  = Peripheral side.

p  = TSI board number.

q  = Relative TSI port associated with the specified TSI board.

r  = Source of the error that caused the interrupt. Valid value(s):
   PLI-DETECTED-BUFFER-CHECK-ERROR = The PLI detected a buffer check error.
   PLI-DETECTED-BAD-CRC = The PLI detected a CRC error on data received from the peripheral.
   PLI-DETECTED-ACTIVE-MCTSI-CRC-ERROR = The PLI detected a CRC error on data received from the active TSI.
   PLI-DETECTED-MATE-MCTSI-CRC-ERROR = The PLI detected a CRC error on data received from the mate TSI.
   PLI-DETECTED-BAD-SUPERFRAME-BYTE = The PLI detected a bad superframe byte received from the peripheral.
   PLI-DETECTED-BAD-FRAME-WORD = The PLI detected a bad frame word received from the peripheral.
PLI-DETECTED-INTERNAL-DATA-PARITY = The PLI detected an internal parity error.
PLI-TRANSIENT-ERROR = There were no errors found on any PLI(s).
PLI-ERRONEOUS-ERROR-REPORT = There was no PLI error found, although the TSI reported that the PLI declared an error.
PLI-DETECTED-OUT-OF-FRAME = The PLI detected out of frame errors on data from the peripheral.
PLI-DETECTED-OVERHEAD-PARITY = The PLI detected a parity error on the overhead bytes from the TSI.
PLI-DETECTED-PERIPHERAL-PARITY-ERROR = The PLI detected a parity error on data from the peripheral.
PLI-MASK-ERROR = The PLI was declaring an error that should have been masked.
IF-DETECTED-CRC-ERROR-ON-PLI = The TSI detected CRC errors on data received from the PLI.
IF-DETECTED-LOSS-OF-CLOCK-ON-PLI = The TSI detected a loss of the clock signal from the PLI.
IF-DETECTED-LOSS-OF-REFERENCE-ON-PLI = The TSICOM detected loss of the clock reference from the PLI being used as the source of timing.
IF-DETECTED-OVERHEAD-PARITY-ON-PLI = The TSI detected a parity error on the overhead bytes from the PLI.
IF-DETECTED-SYNC-ERROR-ON-PLI = The TSI detected a synchronization error with the PLI.

s = Contents of the TSI interface (IF) error mask register (TSIFEMR) of the identified TSI board and port.
t = Contents of the PLI error mask register (PLEMR) of the identified PLI.
u = Contents of the PLI link control register (PLLCR) of the identified PLI.
v = Original contents of the TSI IF error source register (TSIFESR) of the identified TSI board and port.
w = Original contents of the active MCTSI IF control register (TSIFCTL) of the identified TSI board and port.
x = Contents of the PLI error source register (PLESR) of the identified PLI.
y = Contents of the PLI built in self test register (PLBIST) of the identified PLI.
z = Additional TSIFESR data that was analyzed for this PLI fault. This field only prints if this register is used to help determine the error. Valid value(s):
ACT = The data is from the active MCTSI TSIFESR of the identified TSI board and port.
MOD = The data is from the reporting side (either active or mate) TSIFESR of the identified TSI board and port.

a = Final contents of the register identified in parameter ‘z’. This field only prints if parameter ‘z’ prints.
b = Final contents of the active side TSI IFCTL register. This field only prints if this register was modified as part of the PLI error analysis/recovery procedures.
c = Contents of the peripheral auxiliary control register 1.
d = Contents of the peripheral auxiliary control register 2.
c³ = Contents of the peripheral auxiliary control register 3.

REPT: SM-PSLNK-A

Software Release: 5E14 - 5E15
Message Class: VAR
Application: 5
Type: Output

1. FORMAT

[1] REPT SM=a PSLNK=b-c d CH=e f MATE-CH g

[2] REPT SM=a PSLNK=b-c d CH=e f

2. REASON FOR OUTPUT

To report a change in state of a packet switch unit (PSU) link (PSLNK). A link consists of one or two channels which can transition from in-service (IS) to out-of-service (OOS) or vice versa.

Format 1 reports a change in one channel of a duplex link (a link consisting of two channels) and also reports the state of the mate channel.

Format 2 reports a change in the state of a simplex link.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Near-end PSU community address (CA). This is the CA where the state change was detected.
c = Far-end PSU community address. This is the far-end of the link being reported.
d = Link summary status. Indicates the overall status of the link. A link may be simplex or duplex. A duplex link consists of two channels and a simplex link has one channel. The link is in service if at least one channel is active. Valid value(s):
  ACT = If this is a simplex link, the channel is active. For a duplex link, one channel is active and the other is standby. All traffic between two end points of a PSLNK is carried on the active channel, with the standby ready to take over if needed.
  OFFNORM = This only applies to duplex links and indicates that one channel is active and the other is one of the following states: OOSF-FE, OOS-LCL, OOS-AIS, ACT-RMT, or STBY-RMT. Communication between the two end points of the PSLNK will be lost if the active channel should go OOS.
  OOS = There is no active channel and therefore no communication over the link.
e = Channel (0 or 1).
f = Channel status. Valid value(s):
  ACT = The channel is carrying traffic between two end points of a PSLNK.
  ACTF = The channel is forced to carry traffic between two end points of a PSLNK because its mate has been manually made unavailable by the SET:PSLNK input message.
  ACT-RMT = The channel is still capable of carrying traffic but it is receiving a SONET/SDH indication from the far end that it cannot receive data from the near end. This does
not necessarily mean that the problem is in the local electrical hardware. It could be a problem in the near-end optical transmitter or the fiber link.

OOS-AIS = The channel is OOS because the far end is OOS.
OOS-LCL = The channel is OOS because it cannot receive data from the far end. This does not necessarily mean that the problem is in the local electrical hardware. It could be a problem with the fiber link or the far-end optical transmitter.
OOS-FE = The channel is OOS because its parent PHA is OOS.
STBY = The channel is in service and available to carry traffic if necessary.
STBY-RMT = The channel is in service and available to carry traffic if necessary, but it is receiving an SONET/SDH indication from the far end that it cannot receive data from the near end. This does not necessarily mean that the problem is in the local electrical hardware. It could be a problem in the near-end optical transmitter or the fiber link.
UNAV = The channel has been manually lock out of protection switch (channel 0 only) or forced switch away from it.
UNEQUIP = The channel does not exist because its parent PHA is unequipped.

4. ACTION TO BE TAKEN

No action is required if a channel has transitioned from OOS to IS or if a switch is reported.

If a channel has gone OOS, monitor the progress of software recovery, and initiate manual actions if the recovery does not proceed as expected.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

5. ALARMS

Major, minor, or none. A channel is not in normal operation when it is not ACT, ACTF, or STBY (refer to variable 'f'). A major alarm occurs if all channels of a PSU link are not in normal operation (and the condition is not due to manually requested action.) A minor alarm occurs if a single channel of a duplex PSU link is not in normal operation (and the condition is not due to manually requested action.) No alarm occurs when both channels of the link are restored to normal operation.

```
[1] REPT SM=a PSLNK=b-c d CH=e f MATE-CH g

[2] REPT SM=a PSLNK=b-c d CH=e f
```

2. **REASON FOR OUTPUT**

To report a change in state of a packet switch unit (PSU) link (PSLNK). A link consists of one or two channels which can transition from in-service (IS) to out-of-service (OOS) or vice versa.

Format 1 reports a change in one channel of a duplex link (a link consisting of two channels) and also reports the state of the mate channel. Format 2 reports a change in the state of a simplex link.

3. **VARIABLE FIELD DEFINITIONS**

- **a** = Switching module (SM) number.
- **b** = Near-end PSU community address (CA). This is the CA where the state change was detected.
- **c** = Far-end PSU community address. This is the far-end of the link being reported.
- **d** = Link summary status. Indicates the overall status of the link. A link may be simplex or duplex. A duplex link consists of two channels and a simplex link has one channel. The link is in service if at least one channel is active. Valid value(s):
  - **ACT** = If this is a simplex link, the channel is active. For a duplex link, one channel is active and the other is standby. All traffic between two end points of a PSLNK is carried on the active channel, with the standby ready to take over if needed.
  - **OFFNORM** = This only applies to duplex links and indicates that one channel is active and the other is one of the following states: OOSF-FE, OOS-LCL, OOS-AIS, ACT-RMT, or STBY-RMT. Communication between the two end points of the PSLNK will be lost if the active channel should go OOS.
  - **OOS** = There is no active channel and therefore no communication over the link.
- **e** = Channel (0 or 1).
- **f** = Channel status. Valid value(s):
  - **ACT** = The channel is carrying traffic between two end points of a PSLNK.
  - **ACTF** = The channel is forced to carry traffic between two end points of a PSLNK because its mate has been manually made unavailable by the SET:PSLNK input message.
  - **ACT-RMT** = The channel is still capable of carrying traffic but it is receiving a SONET/SDH indication from the far end that it cannot receive data from the near end. This does not necessarily mean that the problem is in the local electrical hardware. It could be a problem in the near-end optical transmitter or the fiber link.
OOS-AIS = The channel is OOS because the far end is OOS.
OOS-LCL = The channel is OOS because it cannot receive data from the far end. This does
not necessarily mean that the problem is in the local electrical hardware. It could be
a problem with the fiber link or the far-end optical transmitter.
OOS-FE = The channel is OOS because its parent PHA is OOS.
STBY = The channel is in service and available to carry traffic if necessary.
STBY-RMT = The channel is in service and available to carry traffic if necessary, but it is
receiving an SONET/SDH indication from the far end that it cannot receive data
from the near end. This does not necessarily mean that the problem is in the local
electrical hardware. It could be a problem in the near-end optical transmitter or the
fiber link.
UNAV = The channel has been manually lock out of protection switch (channel 0 only) or
forced switch away from it.
UNEQUIP = The channel does not exist because its parent PHA is unequipped.

\( g \) = Mate channel status. Values are the same as for the channel status (refer to variable \( f \).)

4. ACTIONS TO BE TAKEN

No action is required if a channel has transitioned from OOS to IS or if a switch is reported.

If a channel has gone OOS, monitor the progress of software recovery, and initiate manual actions if the recovery
does not proceed as expected.

<table>
<thead>
<tr>
<th>If ( f' )=</th>
<th>Action:</th>
</tr>
</thead>
</table>
| ACT-RMT | Verify that the near-end packet handler for ATM (PHA) passes diagnostics and that the paddleboard and
optical fiber associated with the near-end PHA are intact and properly connected. |
| ACTF-RMT | |
| OOS-LCL | Check the status of the far-end PHA. If the far-end is OOS, then the far-end must first be restored.
Otherwise, verify that the near-end PHA passes diagnostics and that all hardware is intact and properly
connected. |
| OOS-AIS | There is a hardware or software problem with the far-end PHA. The far-end PHA should be diagnosed and
repaired as necessary. |
| OOS-FE | The parent PHA is OOS. It must be restored to service before the channel can be restored to service. |
| STBY-RMT | Verify that the near-end PHA passes diagnostics and that the paddleboard and optical fiber associated with
the near-end PHA are intact and properly connected. |
| UNAV | The channel is manually made unavailable for protection switch by the near end or by the far end using the
SET:PSLNK input message. It must be cleared using the CLR:PSLNK input message before the channel
will become available. |

5. ALARMS

Major, minor, or none. A channel is not in normal operation when it is not ACT, ACTF, or STBY (refer to variable \( f \).) A
major alarm occurs if all channels of a PSU link are not in normal operation (and the condition is not due to manually
requested action.) A minor alarm occurs if a single channel of a duplex PSU link is not in normal operation (and the
condition is not due to manually requested action.) No alarm occurs when both channels of the link are restored to
normal operation.

REPT:SM-PUMP

Software Release: 5E14 and later
Message Class: INT
Application: 5
Type: Output

1. FORMAT

REPT SM=a FAST PUMP FAILURE:b

2. REASON FOR OUTPUT

To report that the normal pump of an switching module (SM) has failed and that the backup pump is in use.

3. VARIABLE FIELD DEFINITIONS

a = SM number.

b = Reason for failure. Valid value(s):

   AM/MSGS PROBLEM
   BOOTSTRAPPER BAD OR UNAVAILABLE
   NO PROGRESS

4. ACTION TO BE TAKEN

Investigate the cause of the failure. If the problem is not fixed, future initializations with pump will revert to the backup pump and drastically increase call processing downtime.

5. ALARMS

Major.

6. REFERENCES

None.
REPT:SM-REVERSE
Software Release: 5E14 and later
Message Class: GENR
Application: 5
Type: Output

1. FORMAT

REPT SM=a b

2. REASON FOR OUTPUT

To report the reason for termination of the reverse offline verify operation on a switching module (SM). Reverse off-line verification is automatically run after an SM is switched during retrofit.

3. VARIABLE FIELD DEFINITIONS

  a = SM number.

  b = Outcome of the request. Valid value(s):
     REVERSE VERIFY COMPLETED = After the SM switched and initialized, it successfully completed reverse offline verification.
     REVERSE VERIFY FAILED DATA = c = The SM switched and initialized, but reverse offline verification failed.
     REVERSE VERIFY STOPPED: INCONSISTENT SM NUMBERS DATA = d = Indicates that the SM number recorded in the offline side differs from the SM number in the active memory.
     REVERSE VERIFY STOPPED: MATE ACT AT END OF VRFY DATA = c = After the SM switched and initialized, the offline processor was still running at the end of the period allowed for reverse offline verification.
     REVERSE VERIFY STOPPED: PROCESS PURGED = The offline pump system process in the SM was purged during the reverse offline verify. The verify was stopped before completing.

  c = Hexadecimal number indicating progress mark.

  d = Hexadecimal number indicating the SM in the offline side.

4. ACTION TO BE TAKEN

In the case of reverse offline verify failures, request an offline pump (with peripherals when appropriate) before switching the SM back.

5. ALARMS

None.

Other Manual(s):
235-105-220  Corrective Maintenance
235-105-110  System Maintenance Requirements and Tools
REPT:SM-SP-FIFO-A

Software Release: 5E14 only
Message Class: PFR_MON,HW,SM
Application: 5
Type: Output

1. FORMAT

REPT SM=a,b SP FIFO-FULL EVENT=c
d[e f] [LINK=g] [[h] PIDB=i PICB=j|MCP|UNEQ|PLI}]
[NLI=a-k-l ...]

[mmmnnnn oooopppp qqqqrrrr ssss]
[ttttuuuu vvvvwwww]

2. REASON FOR OUTPUT

To report that a signal processor (SP) FIFO-FULL error occurred. An SP's first-in first-out (FIFO) queue contains 256 entries, so this message indicates that the FIFO needed more than 256 entries to contain all of the signaling transitions that recently occurred. There are three situations that can cause this output:

- The SP FIFO was filled with entries from peripheral circuits that use peripheral interface data buses (PIDBs), but the specific circuit could not be determined. Fields 'h' through 'j' and fields 'm' through 's' will only appear in this case.

- The SP FIFO was filled with entries from peripheral circuits that use peripheral link interfaces (PLIs), but the specific circuit could not be determined. Fields 't' through 'w' will only appear in this case.

- The SP FIFO was filled with entries that are associated with non-peripheral circuits (NLI, MCP, UNEQ). If the unit associated with the SP is an NLI then fields 'k' and 'l' will appear up to four times, once for each in-service NLI associated with the SP.

This report can be associated with either the active or the mate module controller and time slot interchange (MCTSI). Fields 'h' through 'w' will not print for the mate MCTSI.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM)/SM-2000 number.
b = MCTSI side number.
c = Event number.
d = Indicates that MCTSI 'b' is the active or mate MCTSI.
e = Time slot interchange (TSI) BOARD number. Valid for SM-2000 only.
f = The SP number (SP0 or SP1). Valid for SM-2000 only.
g = The link number of the associated SP (0 or 1). Valid for SM-2000 only.
h = Data interface (DI) number. Valid for SM-2000 only.
i = Hexadecimal number of the PIDB that had the most entries in the SP FIFO. This number is the key to the PIDB relation. If this number is equal to 7F, then the time slots were not linked to any PIDB and the time slot was idle.

j = Hexadecimal number of the peripheral interface control bus (PICB) associated with PIDB 'i'. This number is the key to the PICB relation. If this number is equal to D7, then the time slots were not linked to any PIDB and the time slot was idle.

k = Network link interface (NLI) number.

l = Office network timing complex (ONTC) side number.

Note: Fields 'm' through 'w' will be reported as hexadecimal data, where each field is a short (4 digits). Fields 'n' through 's' will only be filled in if there was a DI on this SP. Fields 'q' through 's' will not be reported if field 'i' is equal to 7F and field 'j' is equal to D7.

m = Number of SP FIFO-FULL errors counted on this SM/SM-2000.

n = Number of entries in the SP FIFO associated with PIDB 'i'.

o = Number of time slots on PIDB 'i' that had entries in the FIFO.

p = Number of PIDBs on DI 'i' that had entries in the FIFO.

q = Unit type associated with PICB 'j'.

r = Unit number of unit type associated with PICB 'j'.

s = Service group number (from PICB relation) associated with PICB 'j'.

t = Number of SP FIFO-FULL errors counted on this SM.

u = Number of time slots on the PLI link that had entries in the FIFO.

v = Unit type associated with the PLI link.

w = Unit number of unit type associated with PLI link.

4. ACTION TO BE TAKEN

Monitor the progress of software recovery. Initiate manual actions if the recovery does not proceed as expected.

5. ALARMS

None.

__________________________________________________________________

2. REASON FOR OUTPUT

To report the contents of specific hardware registers as information for trouble analysis.

Format 2 represents the message expected for the time slot interchange (TSI) on an SM-2000 configuration. Format 1 represents the message expected for the TSI on all other SM configurations.

For SM-2000s (Format 2), it's possible that some of the register data will not be collected and will output as all "0"s. The reasons for this are as follows:
- If TSI board 0 is pulled, it will not be possible to read any TSI 0 board registers. If any other TSI board is pulled, this report will contain TSI board 0 registers.
- If data exchanger (DI) board 0 is pulled, it will not be possible to read that DI's board registers. If any other DI board is pulled, this report will contain DI board 0 registers.
- If a TSI board error occurs and there is no DI associated with that TSI board, then the DI register fields will be zero. The "DI" field (field 'q') will have '-1' as its value in this case.

3. VARIABLE FIELD DEFINITIONS
a = Switching module (SM) number.

b = Event number.

c = Contents of the time slot command register 1 (TSCMD1) (smim/SMts_cmd1.h).

d = Contents of the time slot command register 2 (TSCMD2) (smim/SMts_cmd2.h).

e = Contents of the time slot command register 3 (TSCMD3) (smim/SMts_cmd3.h).

f = Contents of the time slot error source register 1 (TSESR1) (smim/SMts_esr1.h).

g = Contents of the time slot error source register 2 (TSESR2) (smim/SMts_esr2.h).

h = Contents of the time slot error source register 3 (TSESR3) (smim/SMts_esr3.h).

i = Contents of the TSI interrupt summary error mask register (TSUIIMR) (smim/SMts_iuimr.h).

j = Contents of the TSICOM error mask register (TSCMEMR) (smim/SMts_cmemr.h).

k = Original contents of the TSI clock control register (TSCMCCR) (smim/SMts_cmccr.h).

l = Contents of the TSI interrupt summary error source register (TSUISR) (smim/SMts_iuisr.h).

m = Contents of the TSICOM error source register (TSCMESR) (smim/SMts_cmesr.h).

n = Final contents of the TSI clock control register (TSCMCCR) (smim/SMts_cmccr.h). This value and identifier will not print if the TSCMCCR was not altered.

o = Contents of the TSI equipage register (TSIUEQP) (smim/SMts_iueqp.h).

p = Contents of the TSICOM diagnostic control register (TSCMDNR) (smim/SMts_cmdnr.h).

q = Contents of the non-reporting TSICOM error source register (TSCMESR) (smim/SMts_cmesr.h). This value and identifier will not print if the TSCMESR was not used as part of the error analysis.

r = This field identifies a TSI board. The TSI identified here has different meanings, depending on the circumstances:
- If the TSI board was the source of the error, then this field identifies that TSI board.
- If a DI was the source of the error, then this field identifies the TSI board the DI is connected to.
- If the TSICOM was the source of the error, then this field will be set to "0" (identifies TSI board 0).

s = This field identifies a DI board. The DI identified here has different meanings, depending on the circumstances:
- If the DI was the source of the error, then this field identifies that DI.
- If a TSI board was the source of the error, then this field identifies the first DI on that TSI board.
- If the TSICOM was the source of the error, then this field identifies the first DI on TSI board 0.
- If there is not a DI on the TSI board in error or not a DI on TSI board 0 (TSICOM error case), then a "-1" outputs in this field. "-1" is not a valid DI number. The DI register fields ("h1", "j1") will contain all "0"s in this instance.
Contents of the TSI board error mask register (TSBEMR) of the identified TSI board (smim/SMts_bemr0.h and smim/SMts_bemr1.h). There are two of these registers per TSI board (TSBEMR0 and TSBEMR1).

Contents of the signal processor (SP) error mask register of the identified TSI board (smim/SMsp_emr.h). There are two of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of the SP error source register of the identified TSI board (smim/SMts_besr0.h and smim/SMts_besr1.h). There are two of these registers per TSI board (TSBESR0 and TSBESR1).

Contents of SP error source register (SPESR) of the identified TSI board (smim/SMsp_esr.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of SP control register (SPCTL) of the identified TSI board (smim/SMsp_ctl.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of SP diagnostic control register (TSBSTCR) of the identified TSI board (smim/SMsp_ctl.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of control random access memory (CRAM) error mask register (TSCREMR) of the identified TSI board (smim/SMts_cremr.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of CRAM device diagnostic register (TSCRMDG) of the identified TSI board (smim/SMts_crmdg.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of CRAM error source register (TSCRESR) of the identified TSI board (smim/SMts_cresr.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of the TSI interface circuit (IF) error mask register (TSIFEMR), of the identified TSI board (smim/SMts_ifemr.h). There are 4 of these registers per TSI board (one for each port).

Contents of the TSI IF Control register (TSIFCTL) of the identified TSI board (smim/SMts_ifctl.h). There are 4 of these registers per TSI board (one for each port).

Contents of the TSI IF error source register (TSIFESR) of the identified TSI board (smim/SMts_ifesr.h). There are 4 of these registers per TSI board (one for each port).

Contents of the TSI IF diagnostic control register (TSIFDGC) of the identified TSI board (smim/SMts_ifdgc.h). There are 4 of these registers per TSI board (one for each port).

Contents of the TSI IF device control time slot (CTS) number register (TSICTSN), of the identified TSI board (smim/SMts_ictsn.h). There are 4 of these registers per TSI board, but only ports 2 and 3 of TSI board 0 contain valid information.

Contents of the DI diagnostic control register (DIDNC) (smim/SMts_dxndnc.h).

Contents of the DI error mask register (DIEMR) (smim/SMts_dxemr.h).

Contents of the DI error source register (DIESR) (smim/SMts_dxesr.h).
4. ACTION TO BE TAKEN

Monitor the progress of the recovery action. Use the information presented in the report for analysis.

2. REASON FOR OUTPUT

To report the contents of specific hardware registers as information for trouble analysis.

Format 2 represents the message expected for the time slot interchange (TSI) on an SM-2000 configuration. Format 1 represents the message expected for the TSI on all other SM configurations.

For SM-2000s (Format 2), it's possible that some of the register data will not be collected and will output as all "0"s. The reasons for this are as follows:
- If TSI board 0 is pulled, it will not be possible to read any TSI 0 board registers. If any other TSI board is pulled, this report will contain TSI board 0 registers.
- If data exchanger (DI) board 0 is pulled, it will not be possible to read that DI's board registers. If any other DI board is pulled, this report will contain DI board 0 registers.
- If a TSI board error occurs and there is no DI associated with that TSI board, then the DI register fields will be zero. The "DI" field (field 'q') will have '-1' as its value in this case.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b  = Event number.
c  = Contents of the time slot command register 1 (TSCMD1) (smim/SMts_cmd1.h).
d  = Contents of the time slot command register 2 (TSCMD2) (smim/SMts_cmd2.h).
e  = Contents of the time slot command register 3 (TSCMD3) (smim/SMts_cmd3.h).
f  = Contents of the time slot error source register 1 (TSESR1) (smim/SMts_esr1.h).
g  = Contents of the time slot error source register 2 (TSESR2) (smim/SMts_esr2.h).
h  = Contents of the time slot error source register 3 (TSESR3) (smim/SMts_esr3.h).
i  = Contents of the TSI interrupt summary error mask register (TSIUIMR) (smim/SMts_iuimr.h).
j  = Contents of the TSICOM error mask register (TSCMEMR) (smim/SMts_cmosmr.h).
k  = Original contents of the TSI clock control register (TSCMCCR) (smim/SMts_cmccr.h).
l  = Contents of the TSI interrupt summary error source register (TSIUISR) (smim/SMts_iuisr.h).
m  = Contents of the TSICOM error source register (TSCMESR) (smim/SMts_cmesr.h).
n  = Final contents of the TSI clock control register (TSCMCCR) (smim/SMts_cmccr.h). This value
    and identifier will not print if the TSCMCCR was not altered.
o  = Contents of the TSI equipage register (TSIUEQP) (smim/SMts_iueqp.h).
p  = Contents of the TSICOM diagnostic control register (TSCMDNR) (smim/SMts_cmdnr.h).
q  = Contents of the non-reporting TSICOM error source register (TSCMESR) (smim/SMts_cmesr.h).
    This value and identifier will not print if the TSCMESR was not used as part of the error
    analysis.
r  = This field identifies a TSI board. The TSI identified here has different meanings, depending on
    the circumstances:
    - If the TSI board was the source of the error, then this field identifies that TSI board.
    - If a DI was the source of the error, then this field identifies the TSI board the DI
      is connected to.
    - If the TSICOM was the source of the error, then this field will be set to "0" (identifies
      TSI board 0).
s  = This field identifies a (DI) board relative to the unit (switching module processor (SMP) if "0" or
    optical extended control and data unit (OXU) if the range is "1" thru "8") where the DI is
    located, and the relative DI number. The DI identified here has different meanings, depending on
    the circumstances:
    - If the DI was the source of the error, then this field identifies that DI.
    - If a TSI board was the source of the error, then this field identifies the first DI on
      that TSI board.
    - If the TSICOM was the source of the error, then this field identifies the first DI on
      TSI board 0.
    - If there is not a DI on the TSI board in error or not a DI on TSI board 0 (TSICOM
      error case), then a "-1" outputs in this field. "-1" is not a valid DI number. The DI
      register fields ('h1' - 'j1') will contain all "0"s in this instance.
Contents of the TSI board error mask register (TSBEMR) of the identified TSI board (smim/SMts_bemr0.h and smim/SMts_bemr1.h). There are two of these registers per TSI board (TSBEMR0 and TSBEMR1).

Contents of the signal processor (SPEMR) error mask register of the identified TSI board (smim/SMsp_emr.h). There are two of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3). (SPEMR0 and SPEMR1)

Contents of the SP error source register of the identified TSI board (smim/SMts_besr0.h and smim/SMts_besr1.h). There are two of these registers per TSI board (TSBESR0 and TSBESR1).

Contents of SP error source register (SPESR) of the identified TSI board (smim/SMsp_esr.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of SP control register (SPCTL) of the identified TSI board (smim/SMsp_ctl.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of SP diagnostic control register (TSBSTCR) of the identified TSI board (smim/SMsp_ctl.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of control random access memory (CRAM) error mask register (TSCREMR) of the identified TSI board (smim/SMts_cremr.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of CRAM device diagnostic register (TSCRMDG) of the identified TSI board (smim/SMts_crmdg.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of CRAM error source register (TSCRESR) of the identified TSI board (smim/SMts_cresr.h). There are 2 of these registers per TSI board (one for ports 0 and 1, and a second for ports 2 and 3).

Contents of the TSI interface circuit (IF) error mask register (TSIFEMR), of the identified TSI board (smim/SMts_ifemr.h). There are 4 of these registers per TSI board (one for each port).

Contents of the TSI IF Control register (TSIFCTL) of the identified TSI board (smim/SMts_ifctl.h). There are 4 of these registers per TSI board (one for each port).

Contents of the TSI IF error source register (TSIFESR) of the identified TSI board (smim/SMts_ifesr.h). There are 4 of these registers per TSI board (one for each port).

Contents of the TSI IF diagnostic control register (TSIFDGC) of the identified TSI board (smim/SMts_ifdgc.h). There are 4 of these registers per TSI board (one for each port).

Contents of the TSI IF device control time slot (CTS) number register (TSICTSN), of the identified TSI board (smim/SMts_ictsn.h). There are 4 of these registers per TSI board, but only ports 2 and 3 of TSI board 0 contain valid information.

Contents of the DI diagnostic control register (DIDNC) (smim/SMts_dxndnc.h).

Contents of the DI error mask register (DIEMR) (smim/SMts_dxemr.h).

Contents of the DI error source register (DIESR) (smim/SMts_dxesr.h).
4. ACTIONS TO BE TAKEN

Monitor the progress of the recovery action. Use the information presented in the report for analysis.

2. REASON FOR OUTPUT

To report the contents of specific optical extended control and data unit (OXU) hardware registers as information for trouble analysis. This report is automatically generated by the system when a fault is detected.

It is possible that some of the register data will not be collected and parameters will output as all "0"s or "-1"s. Possible reasons for this and the expected parameter values are as follows:

a  Certain optical extended control and data control links (OCDCL) errors and OXU errors will not allow any OXU's registers to be read. In these cases, the contents of the OXU and data interface (DI) register parameters ('f'-'g', 'j'-'p', 't'-'x') will be output as all "0"s and the data interface (DI) board parameters ('q'-'s') will be output as "-1".

b  A DI board 0 pull will cause the DI register parameters ('u'-'x') to be 0. If any other DI board is pulled, this report will contain DI board 0 registers.

c  In the event that an OXU error occurs and there is no DI equipped on the reporting OXU, then the DI register parameters ('u'-'x') will be 0 and the "DI" board parameters ('q'-'s') will be output as "-1".

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number where the report originated.

b  = This parameter identifies the OXU number.

c  = Event number, which is the time sequence indicator, that is used to correlate all reports related to a particular event such as reset, interrupt, assert, and so forth.

Note  The registers referred to in this report are located in the global header files of the listings. All parameters are applicable only to SM-2000s.

d  = Contents of OCDCL maintenance interrupt mask register (AXIMR) in the APCO.

e  = Contents of APCO BIST/ID register (AXID).

f  = Contents of OXU interrupt summary error mask register (CDIMR).

g  = Contents of optical extended control and data common circuit pack (OCDCOM) error mask register (CMEM).
Contents of OCDCL maintenance interrupt source register (AXISR), indicating in which OCDCL an interrupt occurred.

Contents of OCDCL loss of clock register (AXCR).

Contents of OXU interrupt summary error source register (CDISR).

Contents of OCDCOM error source register (CMESR).

Contents of OXU equipage register (CDEQP).

Contents of OXU control and display scan register (CDSCN).

Contents of OXU control and display distribute register (CDDST).

Contents of OCDCOM diagnostic control register (CMDNR).

Contents of OCDCOM version source register (CMVER).

This parameter identifies a DI board. The DI board identified here may not be the source of the error. If an OCDCOM board was the source of the error, then this parameter identifies the first DI board of that OXU. If there is no DI equipped on the OXU in error, then the value printed is -1. The DI register parameters ('u'-'x') will contain 0 in this instance.

This parameter identifies the time slot interchange (TSI) board connected to the DI reported in parameter 'q'.

This parameter identifies a TSI port of the TSI board connected to the DI reported in parameter 'q'.

Contents of TSI IF Control register (IFCTL) of the identified TSI port (parameters 'u'-'x').

Contents of the DI diagnostic control register (DIDNC).

Contents of the DI error mask register (DIEMR) in DI board.

Contents of the DI error source register (DIESR) in DI board.

Contents of the DI PIDB loop control register (DILCR) in DI board.

Contents of the OXU clock and control register (CMCCR)

4. ACTIONS TO BE TAKEN

Monitor the progress of the software recovery. Initiate manual actions if the recovery does not proceed as expected.

5. ALARMS

None.

REPT:SMDIMP-A

Software Release: 5E14 - 5E16(1)
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT SMDIMP a b

2. REASON FOR OUTPUT

To report when an error occurs in the communication module (CM) input message process SMdimp. SMdimp controls all deferrable reconfiguration requests (for example, remove, restore, allow) on CM units. An unexpected event has occurred.

3. VARIABLE FIELD DEFINITIONS

a  = Text phrase. Valid value(s):
   INVALID ACKNOWLEDGMENT RECEIVED FOR b = SMdimp received an acknowledgment message for the given unit (refer to variable 'b'), but the acknowledgment did not match anything that was presently active on the deferred maintenance queue (DMQ).
   INVALID MESSAGE RECEIVED FROM MRA FOR b = SMdimp received an acknowledgment message for the given dual link interface (DLI) (refer to variable 'b') from the maintenance request administrator (MRA), but the message did not match the DLI that was currently active on the DMQ.
   REQUEST TIMED OUT FOR b = SMdimp timed out waiting for an acknowledgment for the currently active request (refer to variable 'b'). This may also be accompanied by one of the above messages, if the acknowledgment gets to SMdimp late.
   SCAN POINT CHECK FAILED, UNIT'S STATE MAY BE INVALID b = After a diagnostic or conditional restore is run on a unit, the scan points are checked to see if a power transition has occurred after the diagnostic completed. If this message prints, an error occurred while attempting to read the scan points, and the unit that was being diagnosed could be in an invalid state. An example of this would be if the unit was powered off and the scan point check failed, the unit would not go into the UNAV MAN POWEROFF state. Refer to the 4Action To Be Taken section of this manual page.
   UNEXPECTED MESSAGE RECEIVED FROM MRA FOR b = SMdimp received an acknowledgment message for the given DLI (refer to variable 'b') from the maintenance request administrator (MRA), but the message did not match anything that was currently active on the DMQ.

b  = Unit (for example, MSCU, MMP, CMP) that was running when the invalid event was received by SMdimp.

4. ACTION TO BE TAKEN

The only one of the above responses that requires immediate action is SCAN POINT CHECK FAILED, UNIT'S STATE MAY BE INVALID. Check the control and display (C/D) pack for the unit, and if the maintenance state on the MCC page (or from OP:CFGSTAT output message) for that unit matches what the C/D pack says, nothing
further needs to be done. If the information does not match, run another diagnostic or conditional restore on the unit. If no error is reported, continue with the current troubleshooting procedure. If the error is reported again, refer to the Corrective Maintenance manual for information on how to report the problem.

The rest of the above errors can be ignored if they are occurring in an isolated case (for example, a timeout occurring for a DLI diagnostic while the DLI was being switched due to a hardware fault). If a report is printed repeatedly, however, it probably indicates a more serious problem. Refer to the Corrective Maintenance manual for information on how to report the problem.

5. ALARMS

None.

REPT SMDIMP a b

2. REASON FOR OUTPUT

To report when an error occurs in the communication module (CM) input message process SMdimp. SMdimp controls all deferrable reconfiguration requests (for example, remove, restore, allow) on CM units. An unexpected event has occurred.

3. VARIABLE FIELD DEFINITIONS

a

= Text phrase. Valid value(s):
INVALID ACKNOWLEDGMENT RECEIVED FOR b = SMdimp received an acknowledgment message for the given unit (refer to variable 'b'), but the acknowledgment did not match anything that was presently active on the deferred maintenance queue (DMQ).
INVALID MESSAGE RECEIVED FROM MRA FOR b = SMdimp received an acknowledgment message for the given dual link interface (DLI) (refer to variable 'b') from the maintenance request administrator (MRA), but the message did not match the DLI that was currently active on the DMQ.
REQUEST TIMED OUT FOR b = SMdimp timed out waiting for an acknowledgment for the currently active request (refer to variable 'b'). This may also be accompanied by one of the above messages, if the acknowledgment gets to SMdimp late.
SCAN POINT CHECK FAILED, UNIT'S STATE MAY BE INVALID b = After a diagnostic or conditional restore is run on a unit, the scan points are checked to see if a power transition has occurred after the diagnostic completed. If this message prints, an error occurred while attempting to read the scan points, and the unit that was being diagnosed could be in an invalid state. An example of this would be if the unit was powered off and the scan point check failed, the unit would not go into the UNAV MAN POWEROFF state. Refer to the Action To Be Taken section of this manual page.
UNEXPECTED MESSAGE RECEIVED FROM MRA FOR b = SMdimp received an acknowledgment message for the given DLI (refer to variable 'b') from the maintenance request administrator (MRA), but the message did not match anything that was currently active on the DMQ.

b

= Unit (for example, MSCU, MMP, CMP, ONTC) that was running when the invalid event was received by SMdimp.

4. ACTIONS TO BE TAKEN

The only one of the above responses that requires immediate action is SCAN POINT CHECK FAILED, UNIT'S STATE MAY BE INVALID. Check the control and display (C/D) pack for the unit, and if the maintenance state on the MCC page (or from OP:CFGSTAT output message) for that unit matches what the C/D pack says, nothing
further needs to be done. If the information does not match, run another diagnostic or conditional restore on the unit. If no error is reported, continue with the current troubleshooting procedure. If the error is reported again, refer to the Corrective Maintenance manual for information on how to report the problem.

The rest of the above errors can be ignored if they are occurring in an isolated case (for example, a timeout occurring for a DLI diagnostic while the DLI was being switched due to a hardware fault). If a report is printed repeatedly, however, it probably indicates a more serious problem. Refer to the Corrective Maintenance manual for information on how to report the problem.

2. REASON FOR OUTPUT

To print the signaling link 15-minute marginal performance report after the scheduled (automatic) REPT:SMR-A15MPR15 report. Refer to the input message of OP:SMR for the demand report.

3. VARIABLE FIELD DEFINITIONS

a = Reporting office CLLI code.
b = Current software release identification.
c = Local date, in the form year-month-day.
d = Local time, in the form hour:minute:second.
e = User defined string [by way of the equipment configuration database (ECD)]. This is the time zone indicator and has a default of "NWT".
f = Network date of beginning of accumulation period, in the form year-month-day.
g = Network time of beginning of accumulation period, in the form hour:minute:second.
h = Network date of ending of accumulation period, in the form year-month-day.
i = Network time of ending of accumulation period, in the form hour:minute:second.
j = The number of 5-minute accumulation periods out of the maximum number of coverage periods for this report. The format is 'rrr/sss'.

rrr = The number of periods of accumulated data for this report.
s

- The maximum number of periods that can be covered where:
  
  \[
  001 \leq r \leq 288 \text{ (288 periods equal one day - 24 hours)}
  \]
  \[
  001 \leq s \leq 288
  \]
  \[
  r \leq s
  \]

\[k\] = Group number of link.

\[l\] = Member number of link.

\[m\] = Number of incoming bytes (to a 5ESS® switch).

\[n\] = Number of outgoing bytes (to network).

\[o\] = Number of message signal units in to a 5ESS® switch.

\[p\] = Number of message signal units out to network.

\[q\] = Declared link failure count.

2. REASON FOR OUTPUT

To print the signaling link 30-minute marginal performance report after the scheduled (automatic) REPT:SMR-A30MPR30 report. The output may be interrupted by other output messages. Refer to the input message of OP:SMR for the demand report.

3. VARIABLE FIELD DEFINITIONS

a = Reporting office CLLI code.

b = Current software release identification.

c = Local date, in the form year-month-day.

d = Local time, in the form hour:minute:second.
= User defined string [by way of the equipment configuration database (ECD)]. This is the time zone indicator and has a default of "NWT".

f = Network date of beginning of accumulation period, in the form year-month-day.

g = Network time of beginning of accumulation period, in the form hour:minute:second.

h = Network date of ending of accumulation period, in the form year-month-day.

i = Network time of ending of accumulation period, in the form hour:minute:second.

j = The number of 5-minute accumulation periods out of the maximum number of coverage periods for this report. Format is $h_1^i h_1^i h_1^i / i_1^i i_1^i i_1^i$.

text for this report

\( h_1^i h_1^i \) = The number of periods of accumulated data for this report

\( i_1^i i_1^i i_1^i \) = The maximum number of periods that can be covered where:

\[ 001 \leq h_1^i h_1^i \leq 288 \text{ (288 periods equal one day - 24 hours)} \]

\[ 001 \leq i_1^i i_1^i i_1^i \leq 288 \]

\[ h_1^i h_1^i \leq i_1^i i_1^i i_1^i \]

k = CLLI code plus set member number.

l = Link layer number.

m = Link type. Valid value(s):

A = Signaling link between an end office (EO) and a signaling transfer point (STP) in the same (home) region.

B = Signaling link between a home STP and an STP in a different region.

C = Signaling link between two home STPs.

D = Signaling link between a regional STP and an area STP.

E = Signaling link between an EO and an STP in a different region.

F = Signaling link between EOs.

n = Group number of link in frame.

o = Member number of link in frame.

p = Voice frequency link (VFL) type. Valid value(s):

A = Secondary.

B = Primary.

Only A and E links types have a secondary (A) VFL.

q = Out-of-service time, in the form minutes:seconds.

r = Cluster number.

s = Cluster type. Valid value(s):

NO_RTE = No route.

POP = Populated.

UNPOP = Unpopulated.
Note: Any of the following measurements may appear on the report followed by an asterisk (*) indicating that the threshold for that measurement has been exceeded. Only links that have at least one measurement whose threshold is exceeded are printed; therefore if no data appears on this report, then no thresholds were exceeded for the report period.

\[ \begin{align*}
  t &= \text{Number of signaling units in error.} \\
  u &= \text{Number of byte retransmission requests.} \\
  v &= \text{Number of repeated or skipped acknowledgement signal units.} \\
  w &= \text{Number of automatically initiated changeovers.} \\
  x &= \text{Number of changeover/changebacks to the same VFL.} \\
  y &= \text{Number of cyclic redundancy check errors.} \\
  z &= \text{Number of bytes retransmitted.} \\
  a_1 &= \text{Number of automatically initiated changeovers.} \\
  b_1 &= \text{The number of seconds in error.} \\
  c_1 &= \text{The proportion of time the link was out of service (count is in 100ths of a percent).} \\
  d_1 &= \text{Number of times a route set was unavailable.} \\
  e_1 &= \text{Duration of route set unavailable, in seconds.} \\
  f_1 &= \text{Current page number.} \\
  g_1 &= \text{Total number of pages in report.}
\end{align*} \]

2. REASON FOR OUTPUT
To automatically report the switch machine performance report (MPR) equipment performance measurements for both the common and the non-common portions of the switch. Refer to the OP:SMR input message for the demand report.

3. VARIABLE FIELD DEFINITIONS

a  = Report period. Valid value(s):
   15  = 15 minutes
   30  = 30 minutes
   HR  = 1 hour
   CDAY = Current day
   LDAY = Last (previous) day

b  = Status of the input message. Valid value(s):
   ABT  = Aborted.
   COMPL = Completed.
   IN PROG = In progress.
   STARTED  = Started.
   STOPPED  = Stopped.

c  = Local CLLI code of the office.

d  = The accumulation period. Valid value(s):
   DAILY
   FIFTEEN MINUTES
   HALF HOURLY
   HOURLY

e  = Current software release identification.

f  = Local date, in the form year-month-day.

g  = Local time, in the form hour:minute:second.

h  = Network date at beginning of accumulation period, in the form year-month-day.

i  = Network date at beginning of accumulation period, in the form hour:minute:second.

j  = Network date at end of accumulation period, in the form year-month-day.

k  = Network date at end of accumulation period, in the form hour:minute:second.

l  = The number of accumulation periods (one period is 5 minutes) out of the maximum number of coverage periods for this report; format is 'l²l²l²/m²m²m²'.
   l²l²l²  = the number of periods of accumulated data for this report
   m²m²m²  = the maximum number of periods than can be covered where:
001 \leq l^2 l^2 l^2 \leq 288 \text{ (288 periods equals one day - 24 hours)}
001 \leq m^2 m^2 m^2 \leq 288
l^2 l^2 l^2 \leq m^2 m^2 m^2

m = \text{The number of common network interface (CNI) level 0 initializations.}
n = \text{The time (in seconds) of variable 'm'.}
o = \text{The number of CNI level 1 initializations.}
p = \text{The time (in seconds) of variable 'o'.}
q = \text{The number of interprocess message switch (IMS) level 0 initializations.}
r = \text{The time (in seconds) of variable 'q'.}
s = \text{The number of IMS level 1A initializations.}
t = \text{The time (in seconds) of variable 's'.}
u = \text{The number of IMS level 1B initializations.}
v = \text{The time (in seconds) of variable 'u'.}
w = \text{The number of CNI level 3 initializations.}
x = \text{The time (in seconds) of variable 'w'.}
y = \text{The number of CNI level 4 initializations.}
z = \text{The time (in seconds) of variable 'y'.}
a^1 = \text{The number of IMS level 3 initializations.}
b^1 = \text{The time (in seconds) of variable 'a^1'.}
c^1 = \text{The number of IMS level 4 initializations.}
d^1 = \text{The time (in seconds) of variable 'c^1'.}
e^1 = \text{The number of times no signal unit processing was occurring.}
f^1 = \text{The interval (in seconds) that no signal unit processing was occurring.}
g^1 = \text{The number of ring peripheral controller (RPC) node errors.}
h^1 = \text{The number of RPC out-of-service auto for RPC node.}
i^1 = \text{The time (in seconds) of variable 'h^1'.}
j^1 = \text{The number of RPC out-of-service manual for RPC node.}
k^1 = \text{The time (in seconds) of variable 'j^1'.}
l^1 = \text{The number of RPC out-of-service configuration for RPC node.}
4. ACTION TO BE TAKEN

If the aborted (ABT) status message is printed, the user may wish to try the input message again. Otherwise, this message requires no action.

2. REASON FOR OUTPUT
To print part one of the signaling network performance report.

3. VARIABLE FIELD DEFINITIONS

a = Report period. Valid value(s):
  15 = 15 minutes.
  30 = 30 minutes.
  HR = 1 hour.
  CDAY = Current day.
  LDAY = Last (previous) day.

b = Reporting office CLLI code.

c = Accumulation period. Valid value(s):
  DAILY
  FIFTEEN MINUTES
  HALF HOURLY
  HOURLY

d = Current software release identification.

e = Local time-zone in the form year-month-date.

f = Local time-zone time in the form hour:minute:second.

g = User defined string (by the way of the equipment configuration database (ECD)). This is the time
zone indicator and has a default of "NWT" within the Continental US.

h = Network time of beginning of accumulation period in the form hour:minute:second.

i = Network date of ending of accumulation period in the form hour:minute:second.

j = Network time of ending of accumulation period in the form year-month-date.

k = Network time of ending of accumulation period in the form hour:minute:second.
l = The number of accumulation periods (one period is 5 minutes) out of the maximum number of coverage periods for this report; format is \( i_1^2 i_2^2 i_3^2 / j_1^2 j_2^2 j_3^2 \)

\( i_2^2 i_3^2 = \) The number of periods of accumulated data for this report

\( j_1^2 j_2^2 j_3^2 = \) The maximum number of periods that can be covered where:

\[
001 \leq i_1^2 i_2^2 i_3^2 \leq 288 \text{ (288 periods equal one 24-hour day)}
\]

\[
001 \leq j_1^2 j_2^2 j_3^2 \leq 288 \text{ } i_2^2 i_3^2 \leq j_1^2 j_2^2 j_3^2 .
\]

m = Common channel signaling 7 (CCS7) bytes received.

n = CCS7 bytes transmitted.

o = CCS7 routed messages received.

p = CCS7 routed messages transmitted.

q = Embedded CCIS (ECIS) messages received.

r = ECIS messages transmitted.

s = Total number of global title routing messages received.

t = SP node isolations.

u = Duration of SP node isolations (in seconds).

v = SP link set failures.

w = Duration of SP link set failures (in seconds).

x = Level 1 transmit buffer congestion onset.

y = Duration of level 1 transmit buffer congestion (in seconds).

z = Declared failures.

a^1 = Duration of declared link failures.

b^1 = Automatic changeovers.

c^1 = Receive buffer overflow.

d^1 = Receive buffer overload.

e^1 = Duration of receive buffer overload (in seconds).

f^1 = Transmit buffer discard level 1.

g^1 = Number of alternate link set routing transitions to a lower priority link set.

h^1 = Duration, in seconds, of alternate link set transitions.

i^1 = Routing audit failures.

j^1 = Half-hours with errored second threshold exceeded.
k$^1$ = Half-hours with detected error threshold exceeded.
l$^1$ = Bytes retransmitted.
m$^1$ = Half-hours with automatic changeover threshold exceeded.
n$^1$ = ECIS messages refused, congestion.
o$^1$ = ECIS messages refused, no translation.
p$^1$ = Destination CCIS6 (DCIS) messages refused - congestion.
q$^1$ = DCIS messages refused - no translation.
r$^1$ = Number of priority level 1/2/3 ECIS6 messages dropped due to ring peripheral controller (RPC) congestion.
s$^1$ = Message Signaling service units (MSUs) discarded due to routing data error count.
t$^1$ = Looping CCS7 messages.
u$^1$ = Global title translation refused - blocked.
v$^1$ = Global title translation refused - no translation.
w$^1$ = Messages removed/discarded due to link congestion.
x$^1$ = Number of priority level 1/2/3 messages dropped due to RPC congestion.
y$^1$ = Number of signaling connection control part (SCCP) messages destined for an unknown address (or global title) (link node LN7).
z$^1$ = Number of SCCP messages destined for an unknown address (or global title) type (LN7).
a$^2$ = Number of SCCP messages destined for an unequipped subsystem (LN7).
b$^2$ = Number of SCCP messages destined for a prohibited subsystem (LN7).
c$^2$ = Number of SCCP messages destined for an unknown address (or global title) [office (OFC)].
d$^2$ = Number of SCCP messages destined for an unknown address (or global title) type (OFC).
e$^2$ = Number of SCCP messages destined for an unequipped subsystem (OFC).
f$^2$ = Number of SCCP messages destined for an prohibited subsystem (OFC).
g$^2$ = Current page number.
h$^2$ = Total number of pages of report.
i$^2$ = The number of periods of accumulated data for this report.
j$^2$ = The maximum number of periods that can be covered.

[7] REPT SMR ASNPR2a        COMPL

2. REASON FOR OUTPUT
To print part two of the signaling network performance report.

3. VARIABLE FIELD DEFINITIONS

a  = Report period. Valid value(s):
   15  = 15 minutes.
   30  = 30 minutes.
   HR  = 1 hour.
   CDAY = Current day.
   LDAY = Last (previous) day.

b  = Reporting office CLLI code.
c = Accumulation period. Valid value(s):
   DAILY
   FIFTEEN MINUTES
   HALF HOURLY
   HOURLY

d = Current software release identification.

e = Local time-zone in the form year-month-date.

f = Local time-zone in the form hour:minute:second.

g = User defined string [the equipment configuration database (ECD)]. This is the time zone indicator and has a default of "NWT" within the Continental US.

h = Network date of beginning of accumulation period in the form year-month-date.

i = Network time of beginning of accumulation period in the form hour:minute:second.

j = Network date of ending of accumulation period in the form year-month-date.

k = Network time of ending of accumulation period in the form hour:minute:second.

l = The number of accumulation periods (one period is 5 minutes) out of the maximum number of coverage periods for this report; format is 'c^2c^2c^2/d^2d^2d^2'.
   c^2c^2c^2 = The number of periods of accumulated data for this report
   d^2d^2d^2 = The maximum number of periods than can be covered where:

   001 <= c^2c^2c^2 <= 288 (288 periods equals one day - 24 hours)
   001 <= d^2d^2d^2 <= 288 c^2c^2c^2 <= d^2d^2d^2

m = The number of CCS7 equipped links; this number is not necessarily equal to the number of CCS7 links whose data is printed on this report since links with data measurements of zero are not printed.

n = The total OOS time in seconds of all CCS7 links, including those not printed since measurement data was zero

o = Duration of CCS7 far end processor outage events observed.

p = Total number of link sets.

q = Emergency restart peg count.

r = Duration in seconds of emergency restart.

s = Node isolation peg count.

r = Duration in seconds of node isolation.

u = Combined link-set failure peg count.

v = Duration in seconds of link-set failure.
w = Far-end CLLI code.
x = Link-layer.
y = Link type. Valid value(s):
   A
   E
   F

z = Group number of link in frame.
a = Member member of link in frame.
b = Peg count for automatic changeover.
c = Number of times threshold exceeded for automatic change-over.
d = Out-of-service time (in hours:minutes:seconds).
e = Peg count for declared link failures.
f = Duration in seconds of declared link failures.
g = Emergency restart due to far end processor outage.
h = Duration of emergency restart due to far end processor outage.
i = Link interface in processor send mode.
j = Duration of processor outage.
k = Far end processor outage occurred.
l = Duration of far end processor outage.
m = Peg count for data link in error time.
n = Number of times threshold exceeded for data link in error time.
o = Peg count for cyclic redundancy check errors.
p = Number of times threshold exceeded for CRC check errors.
q = Peg count for bytes retransmitted.
r = Number of times threshold exceeded for byte retransmissions.
s = MSUs removed due to link congestions.
t = Peg count for transmit buffer overload - level 1.
u = Duration in seconds of transmit buffer overload - level 1.
v = Adjacent signaling point isolation due to far end processor outage.
w = Duration of adjacent signaling point isolation due to far end processor outage.
4. ACTIONS TO BE TAKEN

2. REASON FOR OUTPUT

To automatically report the number 2 signal transfer point (STP) machine performance report (STP MPR) equipment performance measurements for both the common and the non-common portions of the number 2 STP. This report can be generated manually using the OP:SMR input message.

3. VARIABLE FIELD DEFINITIONS

a  = Termination status of the input message. Valid value(s):
   ABT    = Aborted.
   COMPL  = Completed.
   IN PROG = In progress.
   STARTED = Started.
   STOPPED = Stopped.

b  = Local CLLI code of the office.

c  = The accumulation period. Valid value(s):
DAILY
DAY TO HOUR
HOURLY

d = Current office type and software release.

e = Date when the report was printed.

f = Time when the report was printed.

g = The date of the beginning of the accumulation interval.

h = The time of the beginning of the accumulation interval.
i = The date of the end of the accumulation interval.
j = The time of the end of the accumulation interval.
k = The data validity flag. Valid value(s):
   NO        = Invalid.
   YES       = Valid.

l = The peg count showing the number of occurrences when no signal unit processing was occurring.

m = The interval (in seconds) of the peg counts referenced in variable 'l'.

n = The number of interprocess message switch (IMS) level 0 initializations.
o = The number of IMS level 1A initializations.
p = The number of IMS level 1B initializations.
q = The number of IMS level 3 initializations.
r = The number of IMS level 4 initializations.
s = The number of common network interface (CNI) level 0 initializations.
t = The number of CNI level 1 initializations.
u = The number of CNI level 3 initializations.
v = The number of CNI level 4 initializations.
w = The number of STP level 0 initializations.
x = The number of STP level 1 initializations.
y = The number of STP level 3 initializations.
z = The number of STP level 4 initializations.
a^1 = The peg count of ring peripheral controller (RPC) node errors.
b^1 = The peg count of RPC out of service auto for RPC node.
4. ACTION TO BE TAKEN

If the aborted (ABT) status message is printed, the user may try the OP:SMR message again.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print part one of the signaling network performance report autonomously as a result of the scheduled (automatic) OP:SMR-SNPRI report.

3. VARIABLE FIELD DEFINITIONS

\(a\) = Termination status. Valid value(s):
- ABT = Aborted
- COMPL = Completed
- IN PROG = In progress
- STARTED = Started
- STOPPED = Stopped

\(b\) = Local CLLI code of the office.

\(c\) = Accumulation period. Valid value(s):
- DAILY = Data represents an accumulation period of 24 hours (this is the longest interval).
- DAY TO HOUR = Data represents an accumulation period of more than one hour but fewer than 24 hours.
- HOURLY = Data represents an accumulation period of one hour (this is the shortest interval).

\(d\) = Current software release.

\(e\) = Local time-zone date in the form month/day/year.

\(f\) = Local time-zone time in the form hour:minute:second.

\(g\) = Network date of beginning of accumulation period in the form month/day/year.

\(h\) = Network time of beginning of accumulation period in the form hour:minute:second.

\(i\) = Network date of end of accumulation period in the form month/day/year.

\(j\) = Network time of end of accumulation period in the form hour:minute:second.

\(k\) = Data validity flag. Valid value(s):
- NO = Data for one or more links is questionable.
- YES = Data for all links is legitimate.

\(l\) = Common channel interoffice signaling system 6 (CCIS6) signal units received.
m = CCIS6 signal units transmitted.
n = Common channel signaling system 7 (CCS7) bytes received.
o = CCS7 bytes transmitted.
p = Duration of near-end processor outage (in seconds).
q = Near-end processor congestion: level 1.
r = Duration of level 1 near-end processor congestion (in seconds).
s = Near-end processor congestion: level 2.
t = Duration of level 2 near-end processor congestion (in seconds).
u = Near-end processor congestion: level 3.
v = Duration of level 3 near-end processor congestion (in seconds).
w = SP emergency restarts.
x = Duration of SP emergency restarts (in seconds).
y = Transmit buffer overflows.
z = Transmit buffer overloads.
a¹ = Duration of transmit buffer overloads (in seconds).
b¹ = Declared link failures.
c¹ = Duration of declared link failures (in seconds).
d¹ = Automatic changeovers.
e¹ = Duration of all link failures (in seconds).
f¹ = Half-hours with signal unit error threshold exceeded.
g¹ = Half-hours with retransmission threshold exceeded.
h¹ = Half-hours with acknowledgment unit repeat or skip threshold exceeded.
i¹ = Half-hours with automatic changeover threshold exceeded.
j¹ = Plain old telephone service (POTS) messages refused: congestion.
k¹ = POTS messages refused: no translation.
l¹ = Direct signaling messages refused: congestion.
m¹ = Direct signaling messages refused: no translation.
n¹ = SP node isolations.
\( a^n \) = Duration of SP node isolations (in seconds).
\( p^n \) = SP combined link set failures.
\( q^n \) = Duration of SP combined link set failures (in seconds).
\( r^n \) = Transmit buffer overflows: level 3.
\( s^n \) = Transmit buffer overloads: level 1.
\( t^n \) = Duration of level 1 transmit buffer overloads (in seconds).
\( u^n \) = Transmit buffer overloads: level 2.
\( v^n \) = Duration of level 2 transmit buffer overloads (in seconds).
\( w^n \) = Transmit buffer overloads: level 3.
\( x^n \) = Duration of level 3 transmit buffer overloads (in seconds).
\( y^n \) = Declared failures.
\( z^n \) = Duration of declared link failures.
\( a^2 \) = Automatic changeovers.
\( b^2 \) = Duration of all link failures.
\( c^2 \) = Half-hours with errored second threshold exceeded.
\( d^2 \) = Half-hours with detected error threshold exceeded.
\( e^2 \) = Messages retransmitted.
\( f^2 \) = Half-hours with automatic changeover threshold exceeded.
\( g^2 \) = Embedded CCIS6 (ECIS) messages refused: congestion.
\( h^2 \) = ECIS messages refused: no translation.
\( i^2 \) = Non-ECIS messages refused: congestion.
\( j^2 \) = Non-ECIS messages refused: no translation.
\( k^2 \) = Time of day stamp.

2. REASON FOR OUTPUT

To print part two of the signaling network performance report autonomously as a result of the scheduled (automatic) OP:SMR-SNPR2 report.

3. VARIABLE FIELD DEFINITIONS

- **b** = Reporting office CLLI code.
- **c** = Accumulation period. Valid value(s):
  - **DAILY** = Data represents an accumulation period of 24 hours (this is the longest interval).
  - **DAY TO HOUR** = Data represents an accumulation period of more than one hour but fewer than 24 hours.
  - **HOURLY** = Data represents an accumulation period of one hour (this is the shortest interval).
- **d** = Current software release.
- **e** = Local time-zone date in the form month/day/year.
- **f** = Local time-zone time in the form hour:minute:second.
- **g** = Network date of beginning of accumulation period in the form month/day/year.
- **h** = Network time of beginning of accumulation period in the form hour:minute:second.
- **i** = Network date of ending of accumulation period in the form month/day/year.
- **j** = Network time of ending of accumulation period in the form hour:minute:second.
- **k** = Data validity flag. Valid value(s):
  - **NO** = Data for one or more links is questionable.
  - **YES** = Data for all links is legitimate.
- **l** = Emergency restart peg count.
- **m** = Duration in seconds of emergency restart.
- **n** = Node isolation peg count.
- **o** = Duration in seconds of node isolation.
- **p** = Combined link-set failure peg count.
- **q** = Duration in seconds of combined link-set failure.
- **r** = Current page number.
s = Number of logical pages to report.

t = Far-end CLLI code.

u = Link-layer.

v = Link type (A-E).

w = Group number of link in frame.

x = Member number of link in frame.

z = VFL type. Valid value(s):
   A = Secondary. Only A and E links have a secondary VFL.
   B = Primary.

z = Amount of time link is active.

a = Number of times threshold exceeded for signaling units in error.

b = Number of times threshold exceeded for signaling units retransmitted.

c = Peg count for automatic changeover.

d = Number of times threshold exceeded for automatic changeover.

e = Number of times threshold exceeded for repeated and skipped acknowledgment signaling units.

f = Peg count for declared link failures.

g = Duration of declared link failures (in seconds).

h = Peg count for transmit buffer overload.

i = Duration of transmit buffer overload (in seconds).

j = Peg count for transmit buffer overflow.

k = Number of times threshold exceeded for data link in error time.

l = Number of times threshold exceeded for cyclic redundancy check (CRC) errors.

m = Number of times threshold exceeded for byte retransmissions.

4. ACTION TO BE TAKEN

If the ABORTED status message is printed, the user may ignore it.

5. ALARMS

None.

6. REFERENCES
Output Message(s):

OP : SMR-SNPR2
REPT:SMR

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT SMR a b

2. REASON FOR OUTPUT

To print an autonomously scheduled output report. The body of the report is enclosed by two messages specified in each group of which the second is called the termination message. Depending on the nature of the report, a report can either be paginated or not paginated. At the beginning of each page of a multipage report, the first message in each group is repeated.

3. VARIABLE FIELD DEFINITIONS

a = Report name.

b = Message termination code. Valid value(s):
   ABT = Aborted.
   COMPL = Completed.
   IN PROG = In progress.
   STARTED = Started.
   STOPPED = Stopped.

4. ACTION TO BE TAKEN

None.

5. ALARMS

REPT:SNAT

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT SNAT a
    NWT b c d e:f:g:h i

2. REASON FOR OUTPUT

To report the current signaling network administration time (SNAT) from the slave node when it receives a synchronization message from the network master clock node.

3. VARIABLE FIELD DEFINITIONS

a = Message termination code.
b = Day of the week.
c = Month.
d = Day of the month.
e = Hour.
f = Minute.
g = Seconds.
h = Milliseconds.
i = Year.

4. ACTION TO BE TAKEN

None.

5. ALARMS

Input Message(s):

OP:SNAT

Output Message(s):

OP:SNAT
REPT:SNM

Software Release: 5E14 and later
Message Class: SWM01
Application: 5,CNI
Type: Output

1. FORMAT

[1] REPT SNM
   WARNING: a NM/SCMG MSGS DROPPED IN LAST b MIN -- NL MEM TBL OVRFL

__________________________________________________________________

[2] REPT SNM
   WARNING: a NM/SCMG MSGS DROPPED IN LAST b MIN -- NL PA TBL OVRFL

__________________________________________________________________

[3] REPT SNM
   WARNING: a SCMG MSGS DROPPED IN LAST b MIN -- NL SSNBITS TBL OVRFL

__________________________________________________________________

2. REASON FOR OUTPUT

This message originates in the signal link maintenance kernel (SLMK) process. It warns that message transfer point (MTP) signaling network management (SNM) or signaling connection control part (SCCP) management (SCMG) messages have been discarded due to lack of space in the nonlocal network routing tables in the last time interval. The three tables that are monitored are: 1) the nonlocal network member table (cNnl_mem), 2) the nonlocal network page access table (cNpage_access), and 3) the SCCP subsystem bits table (cSssnbits).

Format 1 warns that network management (NM)/SCMG messages have been dropped due to lack of space in the nonlocal network member table in the last minutes of variable 'b.'

Format 2 warns that NM/SCMG messages have been dropped due to lack of space in the nonlocal network page access table in the last minutes of variable 'b.'

Format 3 warns that SCMG messages have been dropped due to lack of space in the nonlocal network ssnbits table in the last minutes of variable 'b.'

3. VARIABLE FIELD DEFINITIONS

a = Number of messages dropped.
b = Interval over which NM/SCMG messages were dropped (in minutes).

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, run the NM audit. If there is an error in the tables which is causing the problem, the audit should be able to detect the error and to recover more space in the tables which will eliminate the problem. However, if the situation persists after the audit is run, the size of the tables are inadequate for the number of network events that are occurring at the present time. There is no further immediate action that can be taken. Receive-only printer (ROP) and REPTLOG output should be collected and common network interface (CNI) customer support should be notified of the problem.

5. ALARMS
None.

6. REFERENCES
REPT:SOP

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] REPT SOP a OUTPUT MESSAGES DISCARDED FOR b

[2] REPT SOP DELETING OLDER HALF OF c

[3] REPT SOP INVALID OUTPUT REQUEST d e
   Uid: f          Logfile: c
   Logflimit: g     Request size: h

2. REASON FOR OUTPUT

To report a spooler output process (SOP) related error or warning.

Format 1 indicates message loss because of spooler queue overflow for a particular device.

Format 2 indicates the log file became full and the older half of the log file has been deleted to allow for the storage of newly generated messages.

Format 3 indicates that an output report to be written to the named log file is larger than the maximum size of the log file.

Format 4 indicates a failure to open the output device that is associated with the Switching Control Center (SCC).

3. VARIABLE FIELD DEFINITIONS

a = Number of output messages discarded due to spooler queue overflow.
b = Name of device.
c = Name of log file.
d = Character string 'OMDB KEY' or null.
e = OMDB key number of the output report or null.
f = User identification (UID) of the process requesting the output report.
h = Maximum size of the log file.
i = Size of the requested output report.

4. ACTION TO BE TAKEN
For Format 1, if spooler queue overflow occurs repeatedly for the same device during normal operations, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Otherwise, it may be necessary to increase the queue size for that device. Use the recent change and verify (RC/V) system to modify the "maxq" field of the "device" record for the device.

For Format 2, no action is taken.

For Format 3, use RC/V to increase the logflimit field in the device form for the named log file.

For Format 4, use RC/V to examine the equipment configuration database (ECD) logdev record for the device and verify that the channel ID is specified correctly.

5. ALARMS

None.

Refer the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

REPT SPL SYNTAX ERROR a b

2. REASON FOR OUTPUT

To report that an incorrectly formatted message was passed to the spoolf() function in the craft library.

3. VARIABLE FIELD DEFINITIONS

a = Error code specifying the error condition detected. Valid value(s):
   0 = First $ in user control string missing.
   -1 = Teletypewriter (TTY) field too big (greater than 8 characters).
   -2 = TTY size is maximum and first byte is not '-' (minus) or contents of the string is a minus sign only.
   -3 = NULL TTY is specified with no spooler options.
   -4 = Class not decimal.
   -6 = Class field too big (greater than 255).
   -7 = Missing both TTY field and class field.
   -8 = Paction field was not 0 or 2 characters long.
   -9 = Timestamp type field too big (greater than 1 character).
  -10 = Timestamp type field invalid. Must be full time stamp, basic time stamp, or no time stamp.
  -11 = Priority field not decimal.
  -12 = Priority field too big (greater than 1 character).
  -13 = Priority value greater than 7 (highest priority).
  -14 = Ident field too big (greater than 4 characters).
  -15 = Ident field not decimal.
  -16 = Type field too big (greater than 4 characters).
  -17 = Type field not decimal.
  -19 = User file does not exist or cannot be read.
  -20 = User process ID (PID) too big (greater than 8 characters).
  -21 = User PID not decimal.
  -22 = Last $ in user control string missing.
  -23 = Invalid paction.
  -24 = Process number does not correspond to existing process.
  -25 = Send message to csop failed.
  -26 = Message is truncated by sendpw.
  -27 = User file does not have full pathname.

b = Control string and text of message containing error.

REPT:STACK-FRAME-A

Software Release: 5E14 only
Message Class: INT_MON, ASRTMON, TRCEMON
Application: 5
Type: Output

1. FORMAT

REPT {l} STACK FRAME ENV=f SRC=g EVENT=h
   FUNC ADDR: iiiiiiiii
   PARAMETERS: jjj jjj jjj jjj jjj
   LOCAL DATA: kkk kkk kkk kkk kkk

2. REASON FOR OUTPUT

To report the contents of a stack frame associated with a previous REPT:STACK-TRACE output message.

This message is normally logged, but will also print in response to input message OP:POSTMORT.

The TRCEMON message class is used when this message is output for peripheral control (PC) debugging purposes.

The ASRTMON message class is used for defensive check failure errors, otherwise the INT_MON message class is used.

3. VARIABLE FIELD DEFINITIONS

AM = Administrative module.
CMP = Communication module processor.
MCTSI = Module controller/time slot interchange unit.
QGP = Quad-link gateway processor.
SM = Switching module.
a = SM number.
b = Message switch side (MSGS) or MCTSI side.
c = Physical CMP number.
d = Processor being reported upon. Valid value(s):
   MATE = Mate CMP.
   MH0 = Message handler 0.
   MH1 = Message handler 1.
   MH2 = Message handler 2.
   PRIM = Primary CMP.
e = QGP number.

f = Environment in which this request was stimulated. Refer to the APP:ENVIR appendix in the Appendixes section of this manual for a list of environments and definitions.

g = Source of the stack trace request. Valid value(s):
   DCF = Defensive check failure.
   DCF\'SPP = Assert-C deferred single process purge (SPP).
   FR = Fault recovery.
   KLL = Kernel level lockout.
   PC\-DEBUG = PC debugging of call failures.
   SI = System integrity.

h = Event number.

i = Address of the function to which this stack frame belongs and whose data follows.

j = Hexadecimal dump in groups of 32 bits of functions parameters. This data is arranged in order of the parameter list of the function with the first parameter first. A single parameter is listed with the most significant eight bits followed by the next significant eight bits, etc.

k = Hexadecimal dump in groups of 32 bits of functions local data. This data is arranged in order of the local variable list of the function with the first local variable first. If the reporting processor is the AM, a single local variable is listed with its most significant eight bits first, followed by the next eight significant bits, etc. If the reporting processor is an SM, CMP, or QGP, a single local variable is listed with its least significant eight bits first, followed by the next eight bits, etc.

2. REASON FOR OUTPUT

To report a trace of the recovery, system, and user stacks as a result of system recovery. For the CM3 message switch (MSGS), this message will also provide a trace of the CM foreground stack, if necessary. This message is used for fault locating.

Format 1 is used for all stack trace messages except for the CM3 (CMP, MSGS, and ONTC) stack trace messages.

Format 2 is used for CM3 stack trace messages.

This message is normally logged, but will also print in response to input message OP:POSTMORT.

The TRCE message class is used when this message is output for peripheral control (PC) debugging purposes.

The ASRTMON message class is used for defensive check failure errors, otherwise the INT_MON message class is used.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Message switch (MSGS), office network and timing complex (ONTC), or MCTSI side.
c = Physical CMP number.
d = Processor being reported upon. Valid value(s):
   
   MATE = Mate CMP.
   MH0 = Message handler 0.
   MH1 = Message handler 1.
   MH2 = Message handler 2.
   PRIM = Primary CMP.

  e = QGP number.
  f = PSU unit number.
  g = PSU shelf number.
  h = PSUPH unit number.

  i = Environment in which this request was stimulated. Refer to the APP:ENVIR appendix in the Appendixes section of the Output Messages manual for a list of environments and their definitions.

  j = Source of the stack trace request. Valid value(s):
     DCF = Defensive check failure processing.
     DCFSPP = Assert-C deferred SPP.
     FR = Fault recovery actions.
     KLL = Kernel level lockout.
     PC-DEBUG = PC debugging of call failures.
     SI = System integrity recovery actions.
     UT = Generic utilities.

  k = Event number.

  l = Type of event identifier. Valid value(s):
     EVENT = Event number identifier.
     WHEN_ID = Generic utility when clause identifier.

  m = Event number which is used to correlate messages with a single event or generic utility when clause ID number.

  n = List of applicable addresses stored in the user stack with up to 6 groups of four bytes per line; otherwise all these fields are absent.

  o = List of applicable addresses stored in the operating system for distributed switching (OSDS)
recovery stack with up to 6 groups of four bytes per line; otherwise all these fields are absent.

\( p \) = List of applicable addresses stored in the OSDS system stack with up to 6 groups of four bytes per line; otherwise all these fields are absent.

\( q \) = Stack type for the interrupt context traced on that line. Valid value(s):

BAD: \( =\) Invalid stack address was encountered while switching from one context to the next.

CMFG: \( =\) CM foreground stack.

RCVY: \( =\) Recovery stack.

SYS: \( =\) System stack.

USER: \( =\) User stack.

blank \( =\) If a label does not appear before a row of addresses, then the stack trace is continued from the previous line and the stack type is the same as the previous line.

\( r \) = List of addresses for the stack trace of an interrupt context. The addresses are stored on the stack indicated by the label to the left of the row of addresses. If an interrupt context does not contain enough addresses to fill an entire row in the message, then the empty fields will be absent. 0xffffffff indicates an invalid stack address was encountered while tracing the stack frames in the current context.

\( s \) = Unit. Valid value(s):

AM
CMP=b-c d
MCTSI=a-b d
MSGS=b
ONTC=b
PSUPH=a-f-g-h
QGP=b-e
SM=a

g RECOVERY ACTION h
[iijjkkkk l1mmnnnn nnnnnnnn nnnnnnnn nnnnnnnn nnnnnnnn nnnnnnnn nnnnnnnn
[EC1STE=a-b-c-d o p]

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a SONET terminating equipment (STE) facility (FAC) circuit in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and reported by the DNU-S resident software.

The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to variable ‘h’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Digital Networking Unit - SONET (DNU-S) number.
c = Data Group (DG) number.
d = SONET Termination Equipment (STE) facility number.
e = STE equipment status. Valid value(s):
   ACTIVE = The STE is in service and a fault has been detected.
   OOS = The STE is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this STE from service. However, fault stimuli are still being detected from the circuit indicating that the STE has not been completely removed from service.
f = Event number.
g = Error type. Valid value(s):
   SLI BOARD FAILURE/PULLED
h = Recovery action. Valid value(s):
   ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
   HARD RESET = The circuit has been hard reset without scheduling diagnostics.
   INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
   INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.
   NO RECOVERY ACTION TAKEN = This event needed no recovery action.
PRE-OOS THRESHOLD EXCEEDED = The STE was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The STE has been preempted and is still detecting errors,
inhibit has been re-applied on the STE.
RE-INHIBIT ERROR = The STE has been inhibited and error are still detected. Inhibit has been
re-applied on the STE.
RST PREEMPT = The failing circuit was preempted.

i  = DNU-S message type.
j  = Message handler (MH) number and MH channel number, in a bit-packed representation. The first
   three bits indicate the MH number, and the next five bits indicate the MH channel number.
k  = Internal circuit name.
l  = Unit type.
m  = Number of information words sent from DNU-S fault recovery.
n  = Information sent from DNU-S fault recovery. The data sent is dependent on the type of error (the
   value of variable 'g').
o  = Number of recent failures of this error type (variable 'g') on this STE circuit (in decimal).
p  = Error count threshold above which the recovery action will become stronger.

4. ACTIONS TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the STE from service during a period of low
usage and perform trouble locating procedures.

5. ALARMS

None.

REPT SUBJECT SERVICE CHANGE
VIEW: a
STATUS: b

<table>
<thead>
<tr>
<th>CASENAMID</th>
<th>SUBJECT TN/MLHG MEMB</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>d</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To report that provisioning activity has occurred on a subject's line. This includes adding/changing/deleting a subject's telephone number (TN), multi-line hunt group (MLHG) and/or member (MEMB) a change to the office equipment number (OE), or any changes to the business and residential custom services (BRCS) feature(s).

3. VARIABLE FIELD DEFINITIONS

a = Recent change and verify (RC/V) view name where change occurred.
b = Status of case. Valid value(s):
   LOCKED
   UNLOCKED
c = Key to RC/V View C.4.
d = States whether the subject's TN, MLHG/MEMB changed. Valid value(s):
   Y = yes.
   N = no.

4. ACTIONS TO BE TAKEN

If the status of the case is locked, determine what change to the RC/V view caused this. If it is determined that the change is within the limits of the court order, set the field ADMIN STATE on RC/V View C.4 to ‘ACT’ and surveillance will continue.

2. REASON FOR OUTPUT

Report the failure of an internal operating system call.

3. VARIABLE FIELD DEFINITIONS

- **a**: Error code which indicates why the system call failed (refer to Exhibit A).
- **b**: Name of the process which experienced the failure.
- **c**: Name of source code file where failure occurred.
- **d**: Source code line number where failure occurred.
- **e**: Action attempted by system call and system call arguments (if any).
- **f**: Short statement describing the failure or conditions existing when the failure occurred.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>Typically this error indicates an attempt to modify a file in some way forbidden except to its owner or super-user. It is also returned for attempts by ordinary users to do things allowed only to the super-user.</td>
</tr>
<tr>
<td>02</td>
<td>A file name is specified and the file should exist but does not, or one of the directories in a path name does not exist.</td>
</tr>
<tr>
<td>03</td>
<td>The process corresponding to that specified by pid in a system call does not exist or is already dead.</td>
</tr>
<tr>
<td>04</td>
<td>An asynchronous signal (such as interrupt or quit), which the user has elected to catch, occurred during a system call. If execution is resumed after processing the signal, it will appear as if the interrupted system call returned this error condition.</td>
</tr>
<tr>
<td>05</td>
<td>A physical input/output (I/O) error occurred during read or write.</td>
</tr>
<tr>
<td>06</td>
<td>I/O on a special file refers to a subdevice which does not exist, or is beyond the limits of the device. It may also occur when, for example, a tape drive is not on-line or no disk pack is loaded on a drive.</td>
</tr>
<tr>
<td>07</td>
<td>An argument list longer than 5120 bytes was used in a call trying to exec a process.</td>
</tr>
<tr>
<td>08</td>
<td>A request was made to execute a file which, although it has the appropriate permissions, does not start with a valid magic number. This could be as a result of a faulty field update attempt. A roll back might clear the problem.</td>
</tr>
<tr>
<td>09</td>
<td>Either a file descriptor refers to no open file, or a read (or write) request is made to a file which is open only for writing (or reading).</td>
</tr>
<tr>
<td>10</td>
<td>A wait was executed by a process that had no existing or unwaited-for child processes.</td>
</tr>
<tr>
<td>11</td>
<td>A fork failed because the system's process table is full or the user is not allowed to create any more processes. This may occur under system overload.</td>
</tr>
<tr>
<td>12</td>
<td>During an exec or break, a program asks for more space than the system is able to supply. This is not a temporary condition, the maximum space size is a system parameter. The error may also occur if the arrangement of text, data, and stack segments requires too many segments, or if there is not enough swap space for a fork.</td>
</tr>
<tr>
<td>13</td>
<td>An attempt was made to access a file in a way forbidden by the protection system.</td>
</tr>
<tr>
<td>14</td>
<td>The system encountered a hardware fault in attempting to use an argument of a system call.</td>
</tr>
<tr>
<td>15</td>
<td>A non-block file was mentioned where a block device was required, for example, in mount.</td>
</tr>
</tbody>
</table>
| 16         | An attempt was made to mount a device that was already mounted or to dismount a device on which there is an
4. ACTION TO BE TAKEN

If action to take is not obvious from description of trouble cause, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Specific actions to be taken are not given for each code. It is expected that the trouble will be internal to the programs and that technical assistance will be required. However, there are some instances where the trouble can be corrected by manual action, for example, putting a tape unit on-line, installing a write ring on a tape, or powering up a disk unit.

5. ALARMS

None.

6. REFERENCES

None.
1. FORMAT

REPT SYSTEM IS IN MINIMUM CONFIGURATION MODE

2. REASON FOR OUTPUT

To remind the operator that the system is running in the minimum configuration mode.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

Minimum configuration mode should only be used in extreme cases where the system will not stay up with the application running. It should only be used to diagnose or troubleshoot a system which will not recover by any other means, such as forcing configuration, inhibit options, or bootstrap options. Application software will not be started in the minimum configuration mode.

To return to full configuration mode, clear the MIN-CONFIG request on the emergency action page of the maintenance terminal with an EAI command 33, then bootstrap the system with an EAI command 54.

Input/Output Messages:

None.
REPT:TAC-TTSRF

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT TAC=a-b-c TRBL TU SERV REQ FAILURE d
    GBIT OR START CODE FAILURE RECOVERY ACTION e
    g h

2. REASON FOR OUTPUT

This message is part of the recovery action for the maintenance service requests of the control and data interface circuit (CDI).

3. VARIABLE FIELD DEFINITIONS

   a = Switching module (SM) number.
   b = Trunk unit number.
   c = Service group number.
   d = Event number.
   e = Recovery action. Valid value(s):
       RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit (refer to the ACTION TO BE TAKEN section of this manual page). A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
       g = Contents of the trunk unit CDI error source register.
       h = Software image of the trunk unit CDI mask data.

4. ACTION TO BE TAKEN

Interrupts are inhibited on the CDI specified by variables ‘a’, ‘b’, and ‘c’ and the test and access circuit (TAC) also specified by variables ‘a’, ‘b’, and ‘c’ is removed from service. A request to restore the TAC will be denied until interrupts are allowed on the CDI.

If this message occurs again, then the CDI should be removed and diagnosed to locate the failure (refer to the RMV:CDI and DGN:CDI input messages). Since the failure of the CDI is not service-affecting, it should be removed when traffic is low.

When the failure is located and corrected, enter the RST:CDI message to restore the CDI. Once this is done the TAC should be restored by entering the RST:TAC input message.

APP: IOP-E
APP: IOP-F
REPT:TEN-TPCF

Software Release: 5E14 and later
Message Class: PFR_MON
Application: 5
Type: Output

1. FORMAT

REPT TEN=a-b-c-d-e TRBL PICB CONTROL FAILURE EVENT=f
  g  RECOVERY ACTION h
  i  j  k  l  m  n  o  p

2. REASON FOR OUTPUT

To respond to a peripheral interface control bus (PICB) control failure interrupt in the trunk unit trunk circuits.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Trunk unit number.
c = Service group number.
d = Trunk board number.
e = Trunk number.
f = Event number.
g = Error type. Valid value(s):
    CI RECEIVED BAD PARITY
    CI RECEIVED BAD START CODE
    CI TIME OUT
    PER DETECTED BAD ADDRESS
    PER DETECTED BAD PARITY
    PER DETECTED BAD START CODE
    SOFTWARE BAD ADDRESS ERROR

h = Recovery action. Valid value(s):
    ANALYSIS ONLY = A post mortem report is provided.
    ASSERT TO SYSTEM INTEGRITY = A software failure has been detected and system integrity has been notified.
    RMV = The failing circuit will be removed from service. Intervention is required to change the state of the circuit. A message from the maintenance request administrator (MRA) will be printed after the circuit is removed.
    RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the results of the diagnostic.

i = Indication of whether the fault was transient or hard, as determined by the module controller fault recovery.
j = System PICB number in hexadecimal that was being written when the failure occurred.
k = Read/write (uppermost) bit and address in hexadecimal to which the control interface (CI) was writing when the failure occurred.
l = Data being written to the periphery by the CI.
m = Contents of the CI error source register.

Note: Up to two logical circuit names, error counts, and error threshold (variables 'n' - 'p') may be printed.

n = External logical circuit name.
o = Current decimal number of recent failures of this type recorded.
p = Error count threshold, a fix value above which the intensity of the fault recovery action will increase.

2. REASON FOR OUTPUT

To respond to a time-slot interchange (TSI) interrupt caused by peripheral interface data bus (PIDB) parity errors in the trunk circuit (CDI).

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Trunk unit number.
c = Switch group number.
d = Channel board number.
e = Channel number.
f = Event number.
g = Error type, which indicates PIDB trouble.
h = Recovery action. Valid value(s):
   ANALYSIS ONLY = A post mortem report is generated.
   RST AUTO CAMPON = The failing circuit will be diagnosed when it is available. A message will be printed with the results of the diagnostic.
   RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A message will be printed with the result of the diagnostic.
i = Common board error count.
j = Common board threshold, above which the recovery action will be escalated.
k = Channel board error count. Left most 'k' refers to board 0.
Channel board threshold, above which the recovery action will be escalated.

= Number of parity errors in frame.

= Channel error count.

= Channel threshold, above which the recovery action will be escalated.

i = Digital facility interface channel number. If this is a DFI-1, there is only one facility with channels 1-24. If this is a DFI-2, then channels 1-24 are associated with facility T1 A (FAC 0) and channels 25-48 are associated with facility T1 B (FAC 1).
j = Digital carrier line unit number.
k = Remote terminal (RT) number.
l = RT line number.
m = Trunk group number.
n = Trunk member number.
o = Analysis type. Valid value(s):
PEER-GROUP ANALYSIS
QUICK-CHECK ANALYSIS
SYSTEM ERROR

\[ p \]
= Local digital service unit number.

\[ q \]
= Service group number.

\[ r \]
= Digital service unit board position number.

\[ s \]
= IDCU number.

\[ t \]
= RT number.

\[ u \]
= RT line number.

\[ v \]
= One of the following. Valid value(s):

- \[ \text{DEN}=f-g-h-i \]
- \[ \text{ILEN}=f-s-t-u \]
- \[ \text{INEN}=f-w-t-u \]
- \[ \text{NEN}=f-w-x-b^1-y-z-c^1-a^1 \]
- \[ \text{OIUEN}=f-h^1-i^1-j^1-y-z-c^1-a^1 \]

- \[ \text{SLEN}=f-j-k-l \]
- \[ \text{TEN}=f-b-c-d-e \]

\[ w \]
= Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

\[ x \]
= Data group (DG).

\[ y \]
= Synchronous transport signal (STS).

\[ z \]
= Virtual tributary group (VTG) number.

\[ a^1 \]
= Digital signal level 0 (DS0) number.

\[ b^1 \]
= SONET termination equipment (STE) facility number.

\[ c^1 \]
= Virtual tributary member (VTM)

\[ d^1 \]
= Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

\[ e^1 \]
= PCT facility interface (PCTFI) number.

\[ f^1 \]
= Tributary number (T1FAC).

\[ g^1 \]
= Channel (CHAN) number.

\[ h^1 \]
= Optical interface unit (OIU) number.

\[ i^1 \]
= Protection group (PG) number.

\[ j^1 \]
= OIU SONET termination equipment (STE) number.

REPT: TMS-AER

Software Release: 5E14 and later
Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

REPT TMS=a ASYNCHRONOUS ERROR REPORT EVENT=b
c d e f g

2. REASON FOR OUTPUT

To print to the daylog file each occurrence of a time multiplexed switch (TMS) fault asynchronous error report.

3. VARIABLE FIELD DEFINITIONS

a = TMS side.
b = Event number.
c = Critical error status. Valid value(s):
2F  d e f g = don’t care (non-readable error).
3F  d e f g = don’t care.
DB = TMS critical or non critical error (depends on d e f g).

**NOTE:** Variables ‘d’ and ‘e’ are for summary error source registers (ESRs); variables ‘f’ and ‘g’ are for controller ESRs.

d = Summary ESR - low byte.

For CM1 equipped offices, valid values are:

```
<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>MLIBE</td>
<td>TSTBE</td>
<td>CLBOE</td>
<td>CLBIE</td>
<td>______</td>
<td>______</td>
<td>CER27</td>
<td>CER01</td>
</tr>
</tbody>
</table>
MLIBE  = MLI board, readable error.
TSTBE  = Test board, readable error.
CLBOE  = Clock board output, readable error.
CLBIE  = Clock board input from NCLK, readable error.
CER27  = Controller ESR bits 2-7, non-readable error.
CER01  = Controller ESR bits 0-1, non-readable error.
```

For CM2 equipped offices, valid values are:

```
<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVN__MLI</td>
<td>ODD__MLI</td>
<td>CLKOE</td>
<td>CLKIE</td>
<td>XCLKOE</td>
<td>XCLKIE</td>
<td>NRCRTE</td>
<td>BE/SANTOE</td>
</tr>
</tbody>
</table>
EVNMLI  = Even switch unit MLI board error.
ODDMLI  = Odd switch unit MLI board error.
CLKOE  = Clock output (slip detect) error (network clock reference).
CLKIE  = Clock input (energy detect) error (network clock reference).```
XCLKOE  = Cross couple clock output (slip detect) error.
XCLKIE  = Cross couple clock input (energy detect) error.
NRCRTE  = Nonreadable controller error.
BE/SANTOE  = Nonreadable microprocessor bus parity error or sanity timeout error.

e  = Summary ESR - high byte:

For CM1 equipped offices, valid values are:

```
| 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |
|_____|INMRQ|WRFER|SH3ER|SH2ER|SH1ER|SH0ER|CERDE|
```

INMRQ  = Invalid maintenance request, maintenance flip-flop set required, readable error.
WRFER  = Write fabric error, readable error.
SH3ER  = Shelf 3, readable error.
SH2ER  = Shelf 2, readable error.
SH1ER  = Shelf 1, readable error.
SH0ER  = Shelf 0, readable error.
CERDE  = Controller ESR, readable error - high byte.

For CM2 equipped offices, valid values are:

```
| 15  | 14  | 13  | 12  | 11  | 10    |  9    |  8     |
|_____|INMRQ|WRFER|UNUSED|ERPROP|ODD__SU|EVN__SU|CON__CRIT|
```

INVLRQ  = Invalid request error.
WRFER  = Write fabric error.
ERPROP  = TMSLNKs reported due to fabric parity error propagation.
ODDSU  = Odd switch unit summary error.
EVNSU  = Even switch unit summary error.
CONCRIT  = Readable controller critical error.

f  = Controller ESR - low byte:

For CM1 equipped offices, valid values are:

```
|  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0  |
|BPINT|IVOPC|BPMNT|DPCON|BPCON|SEQBL|MPRTO|SANER|
```

BPINT  = Bus parity error over address and data - TMS interface board.
IVOPC  = Invalid opcode received by TMS interface from FPC.
BPMNT  = Bus parity error over address and data maintenance board.
DPCON  = Data parity error- controller-interrupt chip only.
BPCON  = Bus parity error over address and data controller board.
SEQBL  = Sequencer busy too long during microprocessor access.
MPRTO  = Microprocessor readable timeout error.
SANER  = Sanity error, firmware failed to reset the sanity timer.

For CM2 equipped offices, valid values are:
CICBER = Controller CIC bus error indicating serial parity or CIC time out error.
CICPER = Controller CIC parity error on parallel data from CIC.
INVLOP = Invalid opcode received from the FPC.
TMIBPER = TMS interface board bus parity error.
MBUSTO = Microprocessor busy time out error.
SANTER = Sanity timer error.
MBPER = Microprocessor bus parity error.

= Controller ESR - high byte:

For CM1 equipped offices, valid values are:

INVRQ = Invalid request - software controlled bit. The high byte of the controller ESR contains bits for errors that are classified as "readable errors". The low byte of the controller ESR contains bits for errors that are classified as "non-readable errors". The invalid request error indicates that an action was requested that could not be completed by the TMS firmware. Invalid requests include trying to connect calls to NCT links that are not equipped, accessing RAM that is protected, clearing the ESR without the maintenance flip-flop being set, etc. Non-readable errors prevent the FPC from being able to read the TMS ESRs, where as readable errors do not interfere with the mechanism of reading the TMS ESRs, although bad data may be returned as a result of a parity error.

FPCPE = FPC message parity error.
SHTOE = Shelf message timed out at TMS interface.
WSIDR = Wrong shelf ID returned to the TMS interface.
SHDPE = Shelf data parity error on message returned to TMS interface.

For CM2 equipped offices, valid values are:

XSLIP = Slip error of clock output frequency with regards to cross couple reference input.
XEDER = Energy detector error on cross couple reference input.
SLIP = Slip error of clock output frequency with regards to the network clock reference input.
EDER = Energy detector error on network clock reference input.
CMUXER = Error detected on clock interface input reference multiplexer.
CDALPER = Parity error detected on control and diagnostic access link message from the FPC.
WRFAB = Write fabric error during call processing routine.
INVRQ = Invalid request received from the FPC.

For CM1 equipped offices:
For CM2 equipped offices:

<table>
<thead>
<tr>
<th>d</th>
<th>e</th>
<th>f</th>
<th>g</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

h = For CM1 equipped offices, shelf 3. For CM2 equipped offices, odd switch unit.
i = For CM1 equipped offices, shelf 2. For CM2 equipped offices, even switch unit.
j = Shelf 1.
k = Shelf 0.

2. REASON FOR OUTPUT

To indicate that an office network and timing complex (ONTC) has gone from duplex to simplex configuration due to the time multiplexed switch (TMS).

All TMS error source registers (ESR) are read, if possible, and their contents are printed. This message is in response to some TMS fault recovery action, and is intended to assist in analyzing unusual TMS errors.

Page 1 shows the ERROR SUMMARIES (message count and up to 5 messages), TMSLNKS AFFECTED, and the SHELF SUMMARIES (always 16 0xE9 messages).

Page 2 shows the ERROR SUMMARIES (message count and up to 5 messages), QLI, FAB, OR FAB CONTROLLER ESR (up to 20 0x11 messages, may be none), and QLPS BOARDS AND QTMSLNKS (up to 12 messages, may be none).

3. VARIABLE FIELD DEFINITIONS

a = Event number.
b = Number of messages in error report, in hexadecimal.

c = Opcode. Valid value(s):
- db = TMS2 summary error report.
- df = Control error source register.
- 06 = Write fabric error.
- fb = Read the switch unit error source register. This opcode might be 0x0e instead of 0x06.
- ed = CIC error message.
- 5b = Equipage configuration table information.
- e9 = SUB board error summary message.
- 11 = NCT link error source register.
- 49 = QLPS global summary ESR report.
- 4d = QLPS Rx Pfc/L2&m gateway ESR error report.
- 51 = QLPS receiver/transmitter link error ESR error report.

d = Low byte (bits 0-7) TMS model 2 (TMS2) summary error report.

|  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----------------|
| bit 0 = Microprocessor bus parity or sanity timeout error. |
| bit 1 = Nonreadable controller error. |
| bit 2 = Cross couple clock input (energy detect) error. |
| bit 3 = Cross couple clock output (slip detect) error. |
| bit 4 = Clock input (energy detect) error (network clock reference). |
| bit 5 = Clock output (slip detect) error (network clock reference). |
| bit 6 = Odd switch unit message link interface (MLI) circuit error. |
| bit 7 = Even switch unit MLI circuit error. |

e = High byte (bits 8-15) TMS2 summary error report.

| 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |
|----------------|
| bit 8 = Readable controller critical error. |
| bit 9 = Even switch unit summary ESR error. |
| bit 10 = Odd switch unit summary ESR error. |

| bit 12 = Quad-link packet switch (QLPS) critical error. |
| bit 13 = Write fabric error. |
| bit 14 = Invalid request error. |
| bit 15 = Not used. |

f = Low byte (bits 0-7) of the control error source register.

|  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----------------|
| bit 0 = Micro bus parity error. |
bit 1 = Sanity timer error.
bite 2 = Micro busy time out error.
bite 3 = TMS2 interface board bus parity error.
bite 4 = Not used.
bite 5 = Invalid opcode received from foundation peripheral controller (FPC).
bite 6 = Controller CIC parity error on parallel data from CIC.
bite 7 = Controller CIC buss error (BERR) error indicating serial parity or CIC time out error.

g = High byte (bits 8-15) of the control error source register.

| 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |

bit 8 = Invalid request received from the FPC.
bit 9 = Write fabric error during call processing routine.
bit 10 = Parity error detected on control and diagnostic access link (CDAL) message from FPC.
bit 11 = Error detected on clock interface input reference multiplexer.
bit 12 = Energy detector error on network clock (NCLK) reference input.
bit 13 = Slip error of clock output frequency with regards to NCLK reference input.
bit 14 = Energy error detector error on cross couple reference input.
bit 15 = Slip error of clock output frequency with regards to cross couple reference input.

h = Data that was attempted to be written.

i = Least significant byte of the fabric random access memory (RAM) address.

j = Next significant byte of the fabric RAM address.

k = Most significant byte of the fabric RAM address.

l = Low byte (bits 0-7) of the switch unit error source register. This byte represents the even switch unit.

|  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

bit 0 = Shelf 0 summary error bit.
bit 1 = Shelf 2 summary error bit.
bit 2 = Shelf 4 summary error bit.
bit 3 = Shelf 6 summary error bit.
bit 4 = Shelf 8 summary error bit.
bit 5 = Shelf 10 summary error bit.
bit 6 = Shelf 12 summary error bit.
bit 7 = Shelf 14 summary error bit.

m = High byte (bits 8-15) of the switch unit error source register. This byte represents the odd switch unit.

</table>

**bit 0** = Test access monitor (TAM) equipage status bit.

**bit 1** = Fabric configuration status bit.

**bit 2** = Not used.

**bit 3** = Not used.

**bit 4** = Controller CIC parity error on parallel data from CIC.

**bit 5** = Controller CIC BER error - serial parity of time out.

**bit 6** = Not used.

**bit 7** = Not used.

**o** = These fields indicate the TMS switch links (TMSLNKs) affected by the reported errors. There are 2 rows of TMSLNK data. The first 4 words of the first row of ‘o’s correspond to TMSLNKs 127 - 0, the second 4 words of the first row of ‘o’s correspond to TMSLNKs 255 - 128. For the second row, the first 4 words of ‘o’s correspond to TMSLNKs 383 - 256, and the second 4 words of ‘o’s correspond to TMSLNKs 511 - 384.

There are 16 4-byte TMSLNK messages. Each message contains 32 TMSLNKs and the TMSLNK numbers increase sequentially. For example, the first 4 byte message (4th word in 1st row) contains TMSLNKs 0-31, the next word (3rd word in 1st row) contains TMSLNKs 32-63, and so on. Each byte is 8 bits for eight TMSLNKs and 4 bytes equals 32 TMSLNKs. Each byte is read in reverse. For example, the first byte of a TMSLNK message contains bits for TMSLNKs 7-0, the next byte contains bits for TMSLNKs 15-8, the next byte contains bits for TMSLNKs 23-16, and the last byte contains bits for TMSLNKs 31-24.

2. REASON FOR OUTPUT
To indicate that an office network and timing complex (ONTC) reported errors related to the time multiplexed switch (TMS). This message is printed by the administrative module (AM) in response to a TMS fault recovery event, and is intended to aid in the analysis of the TMS-related errors.

For a communication module model 2 (CM2) office, all of the TMS error source registers (ESRs) are read, if possible, and their contents are printed.

Format 1 shows the ERROR SUMMARIES (a count and up to five blocks of data), the TMSLNKS AFFECTED, and the SHELF SUMMARIES (always 16 blocks of data each beginning with 0xe9).

Format 2 shows the ERROR SUMMARIES (a count and up to five blocks of data), the QLI, FAB, OR FAB CONTROLLER ESR (0 to 20 blocks of data beginning with 0x11), and QLPS BOARDS AND QTMSLNKS (0 to 12 blocks of data).

Format 3, for a communication module model 3 (CM3) office, identifies all TMSLNKs for which errors were reported to the AM and includes the associated fault type. The contents of the relevant TMS registers are reported in REPT:ONTC-FD-TMS and/or REPT:ONTC-FD-TMSL output messages.

3. VARIABLE FIELD DEFINITIONS

- a = ONTC side reporting the error.
- b = AM event number.
- c = Number of this page.
- d = Total number of pages in the report.
- e = Number of blocks of data in the error report, in hexadecimal.
- f = TMS opcode. Valid value(s):
  - db = TMS model 2 (TMS2) summary error report. Use "ERROR SUMMARIES" bit pattern "ffgghh0000".
  - df = Control ESR. Use "ERROR SUMMARIES" bit pattern "ffiijj0000".
  - 06 or 0e = Fabric write error. Use "ERROR SUMMARIES" bit pattern "ffkkllmmnn".
  - fb = Switch unit ESR. Use "ERROR SUMMARIES" bit pattern "ffooopp0000".
  - ed = CIC error data. Use "ERROR SUMMARIES" bit pattern "ffqq000000".
  - 5b = Equipage configuration table information.
  - e9 = SUB board error summary data.
  - 11 = NCT link error source register.
  - 49 = Quad-link packet switch (QLPS) global summary ESR report.
  - 4d = QLPS Rx Pfc/L2&ov/gateway ESR error report.
  - 51 = QLPS receiver/transmitter link error ESR error report.

- g = Low byte (bits 0-7) of the TMS2 summary error report.

k = Data that was supposed to be written.

l = Least significant byte of the fabric random access memory (RAM) address.

m = Next least significant byte of the fabric RAM address.

n = Most significant byte of the fabric RAM address.

o = Low byte (bits 0-7) of the switch unit error source register. This byte represents the even switch unit.
bit 0 = Shelf 0 summary error bit.
bit 1 = Shelf 2 summary error bit.
bit 2 = Shelf 4 summary error bit.
bit 3 = Shelf 6 summary error bit.
bit 4 = Shelf 8 summary error bit.
bit 5 = Shelf 10 summary error bit.
bit 6 = Shelf 12 summary error bit.
bit 7 = Shelf 14 summary error bit.

p = High byte (bits 8-15) of the switch unit error source register. This byte represents the odd switch unit.

bit 0 = Shelf 0 summary error bit.
bit 1 = Shelf 2 summary error bit.
bit 2 = Shelf 4 summary error bit.
bit 3 = Shelf 6 summary error bit.
bit 4 = Shelf 8 summary error bit.
bit 5 = Shelf 10 summary error bit.
bit 6 = Shelf 12 summary error bit.
bit 7 = Shelf 14 summary error bit.

q = Control status register.

bit 0 = Test access monitor (TAM) equipage status bit.
bit 1 = Fabric configuration status bit.
bit 2 = Not used.
bit 3 = Not used.
bit 4 = Controller CIC parity error on parallel data from CIC.
bit 5 = Controller CIC BERR error - serial parity of time out.
bit 6 = Not used.
bit 7 = Not used.

r = These fields indicate the CM2 TMSLNK(s) affected by the reported errors. There are 2 rows of TMSLNK data. The first 4 words of the first row correspond to TMSLNKs 127 - 0, the second 4 words of the first row correspond to TMSLNKs 255 - 128. For the second row, the first 4 words correspond to TMSLNKs 383 - 256, and the second 4 words correspond to TMSLNKs 511 - 384.

There are 16 4-byte TMSLNK data blocks. Each block contains 32 TMSLNKs and the TMSLNK numbers increase sequentially. For example, the first 4 byte block (4th word in 1st row) contains TMSLNKs 0-31, the next word (3rd word in 1st row) contains TMSLNKs 32-63, and so on. Each byte is 8 bits for eight TMSLNKs and 4 bytes equals 32 TMSLNKs. Each byte is read in reverse. For example, the first byte of a TMSLNK block contains bits for TMSLNKs 7-0, the next byte contains bits for TMSLNKs 15-8, the next byte contains bits for TMSLNKs 23-16, and the last byte contains bits for TMSLNKs 31-24.

Normally the "TMSLNKS AFFECTED" field will contain the TMSLNK(s) that are detecting the errors but, if the "ERROR SUMMARIES" indicate a TMS2 summary error report with high bit 11 set indicating error propagation was found, then the "TMSLNKS AFFECTED" field will contain the TMSLNK(s) that are sourcing the error(s).
s = Shelf utility board (SUB) summary ESR (ESR1).

<tr>
<td>6</td>
<td>LIR 2 summary bit error.</td>
</tr>
<tr>
<td>7</td>
<td>LIR 3 summary bit error.</td>
</tr>
</tbody>
</table>

y = QLT summary error source register.
bit 0 = Link 0 fabric data parity error.
bit 1 = Link 1 fabric data parity error.
bit 2 = Link 2 fabric data parity error.
bit 3 = Link 3 fabric data parity error.
bit 4 = Time slot parity error.
bit 5 = Not used.
bit 6 = If set then variable ‘z’ indicates source TMSLNK (divided by 2) that caused a parity error. Variable ‘z’ will have a value of H'ff if the faulty TMSLNK can't be identified. Bit 6 is not used for non-QLPS offices.
    - To calculate the sourcing TMSLNK, convert variable ‘z’ from a hexadecimal value to decimal, multiply by 2 and then add 1 if bit 7 is set.
bit 7 = Is used in conjunction with Bit 6 to identify the TMS Fabric half of the TMSLNK captured by fault recovery software (along with bit 6). The value will be set if the TMSLNK is associated with the ODD TMS fabric. Otherwise, it will not be set. Bit 7 is not used for non-QLPS offices.

\[
z = \text{QLI LIR error source register.}
\]

bit 0 = Out of frame error.
bit 1 = Parity threshold error.
bit 2 = Buffer error (F of G bit error).
bit 3 = Automatic time slot switching (AUTISS) bit detected.
bit 4 = F bit error detected.
bit 5 = G bit error detected.
bits 6 and 7 = LIR ID (0 to 3).

Note: As described above, if bit 6 of variable ‘y’ is set, variable ‘z’ does not contain the LIR ESR but is instead the TMSLNK number (divided by 2) of a TMSLNK sourcing data toward the QLT when a fabric parity error occurred. This will have a value of H'ff if the source TMSLNK couldn't be determined.

2. REASON FOR OUTPUT

To report to the daylog file each occurrence of a bad completion code returned by the foundation peripheral controller (FPC) to the time multiplexed switch configuration (TMSCON) process.

3. VARIABLE FIELD DEFINITIONS

   a = Time multiplexed switch (TMS) side.
   b = Event number.
   c = Completion code. Valid value(s):
       32 = Subdevice parity error.
       33 = Subdevice all seems well (ASW) error.
       34 = Bad subdevice specified.
       35 = Bad unit side specified.
       36 = TMS busy time out.
       39 = FPC detected unknown TMS opcode.
       42 = Bad byte count.

4. ACTION TO BE TAKEN

None.

5. ALARMS

REPT:TMS-TACFM

Software Release: 5E14 and later
Message Class: ONTCMON
Application: 5
Type: Output

1. FORMAT

REPT TMS=a TO AM COMMUNICATION FAULT MESSAGE TIME OUT EVENT=b
   COMPLETION CODE=c

2. REASON FOR OUTPUT

To report to the daylog each occurrence of a time multiplexed switch (TMS) message time out before being received from the foundation peripheral controller (FPC) handler to the time multiplexed switch configuration (TMSCON) process.

3. VARIABLE FIELD DEFINITIONS

a = TMS side.

b = Event number.

c = Completion code. Valid value(s):
   0  = Successful completion.
   32 = Subdevice parity error.
   33 = Subdevice all seems well (ASW) error.
   34 = Bad subdevice specified.
   35 = Bad unit side specified.
   36 = TMS busy time out.
   39 = FPC detected unknown TMS opcode.
   42 = Bad byte count.

Input/Output Messages:

None.
REPT:TMUX-HF

Software Release: 5E14 and later
Message Class: INT
Application: 5
Type: Output

1. FORMAT

REPT TMUX=a-b-c-d HASHSUM FAILURE e EVENT=f
   FAILING ADDRESS RANGES:
       g   h

2. REASON FOR OUTPUT

To notify the user that hashsum checks of the digital networking unit - synchronous optical network (SONET) (DNU-S) memory failed on a transmission multiplexer (TMUX) circuit. Hashsum checks are made during TMUX pump (automatic or manual), TMUX restorations (automatic or manual), and routinely.

Failure of hashsum checks may indicate that the hashsum tables are in error, or that the memory is bad. The address range for the block that had a bad hashsum is provided.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S unit number.
c = Data group number.
d = TMUX number.
e = State of the TMUX circuit. Valid value(s):
   ACTIVE
   MATE
f = Event number.
g = The starting address of the failing address range.
h = The ending address of the failing address range.

4. ACTION TO BE TAKEN

Investigate the cause of the failure by running diagnostics on the TMUX that took the fault.

5. ALARMS

Major alarm only when the TMUX fails diagnostics.

6. REFERENCES

REPT TMUX=a-b-c-d [e] TRBL BACKGROUND TEST FAILURE EVENT=f
  g RECOVERY ACTION h
  iijkkkk llllmmmm nnnnoooo oooooooo
  TMUX=a-b-c-d p q

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a transmission multiplexer (TMUX) circuit in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and reported by the routine background test process. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to field ‘h’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = DNU-S unit number.
c = DNU-S data group number. section of the Output Messages manual.
d = DNU-S TMUX circuit number.
e = TMUX equipment status. Valid value(s):
   ACTIVE = The TMUX is in service and a fault has been detected
   OOS = The TMUX is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this TMUX from service. However, fault stimuli are still being detected from the circuit indicating that the TMUX has not been completely removed from service.
   STANDBY = The TMUX is in standby and a fault has been detected.
f = Event number.
g = Error type. Valid value(s):
   HEART BEAT ERROR = A routine check found that the TMUX failed to respond to a functional check.
h = Recovery action. Valid value(s):
   ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or circuits are failing, but the error counts have not reached a threshold for action.
   HARD RESET = The circuit has been hard reset without scheduling diagnostics.
   INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
   INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling diagnostics.
NO RECOVERY ACTION TAKEN = This event needed no recovery action.
PRE-00S THRESHOLD EXCEEDED = The TMUX was preempted and is still detecting errors.
PRE-00S, RE-INHIBIT HDWCHKS = The TMUX has been preempted and is still detecting errors, inhibit has been re-applied on the TMUX.
RE-INHIBIT ERROR = The TMUX has been inhibited and error are still detected. Inhibit has been re-applied on the TMUX.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:TMUX output message will be printed with the results of the diagnostic.

i = DNU-S message type.
j = Message handler (MH) number and MH channel number, in a bit-packed representation. The first three bits indicate the MH number, and the next five bits indicate the MH channel number.
k = Internal circuit name of TMUX.
l = Fault type.
m = Internal circuit index of TMUX.
n = Internal DNU-S message return code.
o = Currently unused.
p = Number of recent failures of this error type (variable 'g') on this TMUX circuit (in decimal).
q = Error count threshold above which the recovery action will become stronger.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the TMUX from service during a period of low usage and perform trouble locating procedures.

5. ALARMS

None.

2. REASON FOR OUTPUT

To indicate fault recovery activity within the switching module (SM) caused by failure of a transmission multiplexer (TMUX) circuit in the digital networking unit - synchronous optical network (SONET) (DNU-S). The fault was detected and reported by the DNU-S resident software. The message indicates what recovery action was taken and gives the current fault counts against the circuit specified in the message. Refer to field ‘i’ to determine the effect the fault recovery activity had on the system.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = DNU-S unit number.
c = DNU-S data group number.
d = DNU-S TMUX circuit number.
e = TMUX equipment status. Valid value(s):
   ACTIVE = The TMUX is in service and a fault has been detected
   DEGRADED = The TMUX is still providing minimal service, and a fault has been detected.
   OOS = The TMUX is marked as out-of-service, but fault stimuli are still being detected.
   PRE-OOS = Fault recovery has notified the maintenance request administrator (MRA) to remove this TMUX from service. However, fault stimuli are still being detected from the circuit indicating that the TMUX has not been completely removed from service.
   STANDBY = The TMUX is in standby and a fault has been detected.

f = High level error types. Valid value(s):
   RESIDENT AUTO SPARED = An error was detected and recovered by DNU-S resident fault recovery software.
   FAULT MESSAGE = Error was detected and reported by DNU-S resident software.

h = Error type. Valid value(s):

i = Recovery action. Valid value(s):
ANALYSIS ONLY = This recovery action applies to all circuits and all errors. A particular circuit or
circuits are failing, but the error counts have not reached a threshold for action.
HARD RESET = The circuit has been hard reset without scheduling diagnostics.
INHIBIT HDWCHKS = The circuit has been inhibited because of excessive errors.
INITIALIZE = This recovery action is used to re-initialize a circuit without scheduling
diagnostics.
NO RECOVERY ACTION TAKEN = No automatic recovery was performed.
PRE-OOS THRESHOLD EXCEEDED = The TMUX was preempted and is still detecting errors.
PRE-OOS, RE-INHIBIT HDWCHKS = The TMUX has been preempted and is still detecting errors,
inhibit has been re-applied on the TMUX.
RE-INHIBIT ERROR = The TMUX has been inhibited and error are still detected. Inhibit has been
re-applied on the TMUX.
RST PREEMPT = The failing circuit was preempted and a diagnostic was scheduled. A DGN:TMUX
output message will be printed with the results of the diagnostic.

j = DNU-S message type.
k = Currently unused.
l = Internal TMUX circuit name.
m = Unit type.
n = Number of information words sent from DNU-S fault recovery.
o = Information sent from DNU-S fault recovery. The data sent is dependent on the type of error (that
is, the value of field 'h').
p = Number of recent failures of this error type (variable 'h') on this TMUX circuit (in decimal).
q = Error count threshold.

4. ACTION TO BE TAKEN

If the problem persists and no automatic recovery is attempted, remove the TMUX from service during a period of
low usage and perform trouble locating procedures.

5. ALARMS

None.

REPT:TOD-FAIL

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

REPT TOD FAIL MEM a SM b CODE c API d TYPE e POS f

2. REASON FOR OUTPUT

To indicate that a second attempt by TIME OF DAY (TOD) to update a database relation has failed.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Module number.
c = Customer dialed code.
d = Action point identifier (API).
e = Type of code: zero parameter or one parameter code.
f = Position of code (POS) in the code list.

4. ACTION TO BE TAKEN

Update the database using Recent Change.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

ALW:TOD
INH:TOD
REPT:TOKEN-TRACK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] REPT TOKEN TRACK
   TOKEN WAS LOST BETWEEN a AND a b
   c c c c

   [2] REPT TOKEN TRACK
      SEARCH FOR TOKEN WAS UNSUCCESSFUL b: REASON d
      c c c c c

2. REASON FOR OUTPUT

Format 1 prints a message indicating the vicinity of where the interprocess message switch (IMS) token was lost.

Format 2 prints a message indicating the IMS token track software could not perform the analysis necessary to find the position of the loss of token.

3. VARIABLE FIELD DEFINITIONS

a = Nodes where token was last detected.
b = Ring ID. Valid value(s):
   ON Ring 0
   ON Ring 1
   RING NOT DETERMINED
c = A 32 bit word of internal information, passed by the token track software.
d = Reason code for unsuccessful token track search (1-7). Valid value(s):

<table>
<thead>
<tr>
<th>Reason</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The message used to send token track equipped information from the administrative module (AM) to all ring peripheral controls (RPCs) was unsuccessful.</td>
</tr>
<tr>
<td>2</td>
<td>The attempt to select a control RPC to collect token track information from the IMS ring was unsuccessful.</td>
</tr>
<tr>
<td>3</td>
<td>Forced read operation to remove messages from one of the IMS rings was unsuccessful.</td>
</tr>
<tr>
<td>4</td>
<td>Operation to place IMS ring nodes in the user silence state was unsuccessful.</td>
</tr>
<tr>
<td>5</td>
<td>IMS ring fault exists on the IMS ring (that is, a fault that prevents any data from propagating on the IMS ring).</td>
</tr>
<tr>
<td>6</td>
<td>The IMS ring nodes reported unreliable information to the token track software.</td>
</tr>
<tr>
<td>7</td>
<td>The IMS ring contains less than the minimum number of token track equipped nodes.</td>
</tr>
</tbody>
</table>

4. ACTION TO BE TAKEN

None. However, the information contained in these messages is useful in identifying faults on the IMS ring. Of
particular interest is Format 1, which pinpoints the area of the IMS ring where the token disappeared. In the event of Format 2, the token track software was not able to perform its task of finding the lost token because of one of the reasons stated above. After this message, the IMS ring error analysis and recovery software will automatically restore IMS ring operation.

HARDWARE CALL TRACE i
```

2. REASON FOR OUTPUT

To report specific information related to a transient call lost when allowed. This information can be analyzed as to the source of the problem. The number of transient calls lost which occur is printed on the plant measurements reports.

3. VARIABLE FIELD DEFINITIONS

- **a** = Event number.
- **b** = The directory number (DN) of the call's originator (supplied only for line originations).
- **c** = The dialed DN.
- **d** = The number of the switching module (SM) where the call originated.
- **e** = The number of the SM where the call terminated.
- **f** = The number of the originating port in hexadecimal.
- **g** = The number of the terminating port in hexadecimal.
- **h** = List of addresses of the functions called which resulted in the transient call lost. These function addresses are in hexadecimal.
- **i** = Hardware call trace status. Valid value(s):
  - **IN PROGRESS** = An ALW:TCLRPT,TRC input message was entered.
  - **NOT REQUESTED** = An ALW:TCLRPT input message was entered, or an ALW:TCLRPT,TRC input message was entered and the calling process was a system process.

1. FORMAT

REPT TRBL, [a][ b][ c], [NEXT RECORD,] EVENT=d
ERROR=e TIME=ff:ff:ff.f
RECOVERY ACTIONS:
   [g | h]
   .
   .

2. REASON FOR OUTPUT

To report that an error has been detected in the communication module (CM) and to summarize the actions already taken to recover. This message is related to one of three message classes, depending upon the unit identified by variable 'b'. If the unit is associated with the office network and timing complex (ONTC), the message class will be ONTC. If the unit is a communication link (CLNK), quad link packet switch PIPE (QPIPE), QLPS communication link (QLNK), or inter-switching module QLPS communication link (ISMQLNK), the message class will be CLNK. If the unit is associated with a message switch (communication module processor (CMP), foundation peripheral controller (FPC), module message processor (MMP), QLPS gateway processor (QGP), message switch control unit (MSCU), or pump peripheral controller (PPC)), the message class will be MSGS.

3. VARIABLE FIELD DEFINITIONS

NEXT RECORD = This message is a subsequent report. If blank, this message is a new report.

a = The most important action taken on a unit during the recovery sequence. Valid value(s):
   (blank) = This is a subsequent report.
   ABORT DIAGNOSTIC = Any running or waiting diagnostics were terminated.
   ABORT DLI DIAGNOSTICS = Any running or waiting diagnostics for one or more dual link interfaces (DLIs) on the specified ONTC side were terminated.
   ABORT NLI DIAGNOSTICS = Any running or waiting diagnostics for one or more network link interfaces (NLIs) on the specified ONTC side were terminated.
   ABORT QLPS DIAGNOSTICS = Terminated any running or waiting diagnostics of quad-link packet switch (QLPS) unit specified.
   ABORT RECOVERY = All remaining recovery actions were aborted. Usually caused by an error on the same unit.
   ALLOW HDWCHKS = Hardware checks for this unit were turned on.
   AUDIT = CLNK or QLNK audit in directed mode for data of requested switching module (SM) was run.
   CDAL ERROR FLAG RESET = Reset "error reported" flag of the control and diagnostic access link (CDAL) and reconnected CDAL to in-service ONTCs.
   CHANGE STATUS MAJOR = This was a single recovery sequence in which the major unit was immediately taken out of service, while at the same time the minor unit was quickly changed to become the new major unit.
   CONDITIONAL DLI RESTORE = One or more DLIs were scheduled to be diagnosed on the specified side and then restored if the diagnostic results were "all tests passed (ATP)."
CONDITIONAL NLI RESTORE = One or more NLIs were scheduled to be diagnosed on the specified side and then restored if the diagnostic results were all tests passed (ATP).

CONDITIONAL QLPS RESTORE = Scheduled out-of-service (OOS) QLPS unit for diagnostics and then restored if diagnostics were ATP.

CONDITIONAL RESTORE = The OOS unit was scheduled to be diagnosed and restored if the diagnostic results were ATP.

CONFIG CLOCK AND SYNC TO SIDE 0 = Timing to ONTC side 0 was configured.
CONFIG CLOCK AND SYNC TO SIDE 1 = Timing to ONTC side 1 was configured.
CONTINUE = Continuation of a report trouble message.

CRITICAL RESTORE = The specific unit was restored without harming any stable phone calls. For ONTC recovery, the critical restoration was done when the ONTCs were secondarily implicated or when the ONTCs were simplex and a critical fault occurred.

DE-ELEVATE UNIT = The active unit was put into the standby state.

DEFERRED CONDITIONAL RESTORE = An automatic request to conditionally restore the unit to active or standby was placed on the deferred maintenance queue.

DEFERRED UNCONDITIONAL RESTORE = An automatic request to unconditionally restore the unit to active or standby was placed on the deferred maintenance queue.

DEGRADE = One or more time multiplexed switch (TMS) links on the specified ONTC side were removed from service. Refer to the Master Control Center (MCC) TMS 0 & 1 SUMMARY page.

DEGRADE 100 PERCENT = All TMS links, DLIs, and NLIs on the specified ONTC side were removed.

DELAY FOR KERNAL LEVEL LOCKOUT = A real time delay in fault recovery is taken to avoid escalation due to a kernel level lockout.

DIAGNOSE = Proper circuit operation was verified and tested.

DMA REQUEST = Direct memory access was requested.

DUPLEX FAIL = Both sets of duplicated hardware became inoperable.

ELEVATE = The standby unit was put into the active state.

ERROR REPORT = An error was received on a unit.

ERROR TYPE RECLASSIFIED CRITICAL = A non-critical error was reclassified to critical because of a failure that was encountered during the non-critical error recovery sequence. The critical error recovery sequence has been entered.

HARD SWITCH = Fault recovery switched the units with possible loss of transient calls.

HASH CHECK, FI TO ACTIVE = Full initialization of the unit to active occurred with a pump of phase 2 and phase 3 hash-sums.

HASH CHECK, FI TO STANDBY = Full initialization of the unit to standby occurred with a pump of phase 2 and phase 3 hash-sums.

IMPLICATE = Indicated unit is being implicated for removal.

INHIBIT HDWCHKS = Hardware checks for this unit were turned off.

INITIALIZE = Circuitry was programmed to initial known state.

LEVEL 2 RESTART = The administrative module (AM) is requesting a restart of level 2 communication protocol on the indicated QLNK.

LEVEL 3 RESTART = The AM is requesting a restart of level 3 link establishment protocol for the indicated QLNK.

MMP TIMING REMOVAL = ONTC was removed due to MMP synchronization difficulty. Requires manual diagnostics of the ONTC to be executed with the message interface bus (MIB) demand phase of the diagnostics.

NC OSCILLATOR RECOVERY = ONTC network clock (NC) oscillator fault recovery occurred. Refer to MCC NETWORK CLOCK page (CM 2 only) and REPT:ONTC-NC output messages with the same event number as the REPT:TRBL output message.
NC REFERENCE CONFIGURE = ONTC NC reference fault recovery occurred. Refer to either MCC MI/NC 0 & 1 page (CM 1 only) or to MCC NETWORK CLOCK page (CM 2 only) and REPT:ONTC-NC messages with the same event number as the REPT:TRBL output message.

NO ACTION = Autonomous recovery was performed in CM only with no additional action in AM.

NO FAIL RESTORE = The specific unit was restored unconditionally and completed the restoration sequence even if all units could not be completely restored.

NO PUMP, FI TO ACTIVE = Full initialization of the unit to active occurred without a pump.

NO PUMP, FI TO STANDBY = Full initialization of the unit to standby occurred without a pump.

NO PUMP, PGI TO ACTIVE = Purging initialization of the unit to active occurred without a pump.

NO PUMP, PGI TO STANDBY = Purging initialization of the unit to standby occurred without a pump.

NON CRITICAL ERROR CLEANUP = Hardware checks were allowed on the unit after a non-critical error caused the hardware checks to be inhibited.

NORMALIZE = Communication link normalization was requested to optimally arrange CLNK configurations.

ODD PUMP, FI TO ACTIVE = Full initialization of the unit to active occurred with a pump of phase 2, phase 3 and office-dependent data hash-sums, and office-dependent data.

ODD PUMP, FI TO STANDBY = Full initialization of the unit to standby occurred with a pump of phase 2, phase 3 and office-dependent data hash-sums, and office-dependent data.

OUT-OF-SERVICE UNIT CLEANUP = An error on an OOS unit was received.

POST-MORTEM = A post-mortem dump was requested because the specified unit reported a critical error. This is only a request, it does not mean that the post-mortem can be or will be dumped.

POWER PUMP, FI TO ACTIVE = Full initialization of the unit to active occurred with a pump of phase 2, phase 3 and office dependent data hash-sums, office dependent data, phase 2 text and data, phase 3 text and data, and a memory clear of the unit.

POWER PUMP, FI TO STANDBY = Full initialization of the unit to standby occurred with a pump of phase 2, phase 3 and office dependent data hash-sums, office dependent data, phase 2 text and data, phase 3 text and data, and a memory clear of the unit.

QGP ERROR REPORT = The QGP has detected errors on the indicated QLNK and is initiating autonomous recovery actions.

QGP RECEIVED DISCONNECT = The QGP has detected a disconnect request from the far end on the indicated QLNK.

QLPS QUAD FAIL = All units on QLPS networks 0 and 1 have failed. No QLPS connectivity to any endpoint.

QUADRUPLEX FAIL = The unit specified quadruplex failed.

RECOUPLE = Fault recovery of the MSCU without initializing it or its children.

REFRESH = Circuitry was reprogrammed to reflect current software states.

REMOVE = Unit was isolated from rest of system. If the unit is a QLNK, the AM has removed the link from service and temporarily disabled autonomous recovery action.

REMOVE DLI = One or more DLIs were removed from the specified ONTC side. Begin scanning DLIs that were removed by referring to MCC TMS 0 & 1 SUMMARY page.

REMOVE NLI = One or more NLIs were removed from the specified ONTC side. Begin scanning NLIs that were removed by referring to MCC TMS 0 & 1 SUMMARY page.

REMOVE QGL = Removed from service a QLPS gateway link (QGL) on the specified MSGS side. Refer to MCC QLPS network 0 & 1 SUMMARY page.

REMOVE QLPS = Removed from service a QLPS on the specified ONTC side. Refer to MCC QLPS network 0 & 1 SUMMARY page.

REMOVE QTMSLNK = Removed from service one or more QLPS time multiplex switch links (QTMSLNK) on the specified ONTC side. Refer to MCC QLPS network 0 & 1 SUMMARY page.
SUMMARY page.

REPORT NETWORK CLOCK = Reported reference integrity from NC. Refer to REPT:NC output message with the same event number as the REPT:TRBL output message.

RESCHEDULE = Continuation of a report trouble message resulting from RESCHEDULE RECOVERY action.

RESCHEDULE RECOVERY = All remaining recovery actions are rescheduled. Usually caused by an error on a parent unit.

RESTART = Fault recovery initialized the unit.

RESTART = An OOS unit was unconditionally restored to active or standby state.

RESTORE DLI = One or more OOS DLIs was unconditionally restored. Recovery done when both DLIs to one or more SMs are faulty. Begin scanning which DLIs were restored by referring to MCC TMS 0 & 1 SUMMARY page.

RESTORE NLI = One or more OOS NLIs was unconditionally restored. Recovery done when NLIs to one or more SMs are faulty. Begin scanning which NLIs were restored by referring to MCC TMS 0 & 1 SUMMARY page.

RESTORE TO ACTIVE = An OOS unit was restored to the active state.

RESTORE TO STANDBY = An OOS unit was restored to the standby state.

SET NETWORK CLOCK MODE = Set NC mode to NORM mode, FAST mode, or HOLD mode.

SM ERROR REPORT = The SM/message handler (MH) has detected errors on the indicated QLNK link and is initiating autonomous recovery actions.

SM INITIATED LEVEL 2 RESTART = The SM has initiated a restart of level 2 communication protocol on the indicated QLNK/ISMQLNK.

SM INITIATED LEVEL 3 RESTART = The SM has initiated a restart of level 3 link establishment protocol for the indicated QLNK/ISMQLNK.

SM INITIATED REMOVE = The SM has removed the QLNK/ISMQLNK from service, and has temporarily disabled autonomous recovery actions.

SM RECEIVED DISCONNECT = The SM/MH has detected a disconnect request from the far end on the indicated QLNK/ISMQLNK.

SOFT SWITCH = Fault recovery of switched units without losing transient calls.

START = Start of a report trouble message.

STOP RECOVERY = All remaining recovery actions were stopped. Usually caused by a manual request to force a parent unit.

SWITCH = Switched active/standby relationship of duplicated units, or, for CLNK, switched logical link assignment.

SWITCH THEN REMOVE = The units were switched and then the standby (formerly active) unit was removed.

TMS CALL PROCESSING AUDIT = Check of PCD and AM verses time multiplexed switch (TMS) firmware. It runs every hour or on demand based on e-bit continuity errors.

TMS FABRIC UPDATE = The TMS fabric random access memory was configured for stable calls after a restoration of the ONTC, DLI, NLI or TMS link.

TMS FABRIC UPDATE CLEANUP = A continuation of ONTC recovery after the TMS completed the fabric update. The recovery sequence was completed with a common office network timing complex (ONTCCOM) removal and an ONTCCOM conditional restoration.
