c = Current state of the ESA. Valid value(s):
   ACTIVE = The ESA is active and receiving queries.
   FORCED = The ESA is in the forced active state and is receiving queries and cannot be switched to inactive until the force has been removed.
   INACTIVE = The ESA is not active and is not currently receiving queries.

d = Current health value of the ESA. Valid value(s):
   COMM LOST = The switch is not currently able to send queries to the ESA.
   CRITICAL = The ESA has a critical alarm.
   MAJOR = The ESA has a major alarm.
   MINOR = The ESA has a minor alarm.
   NORMAL = The ESA is functioning normally with no alarms.
   UNKNOWN = The health status of the ESA is unknown.
4. ACTION TO BE TAKEN

This message is printed in response to a CLR:ESA input message. If the message indicates that REQUEST HAS TIMED OUT, retry the CLR:ESA input message. If the message has NO INFORMATION TEXT, this should be reported as a problem.

5. ALARMS

None.

6. REFERENCES

8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]
24.7 [DSL APPLICATIONS PROCESSOR COMMUNICATION DATA]
CLR:FANALM-3B
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] CLR FANALM UNIT a PT b{bbb} f

[2] CLR FANALM GRPN c DUPID d DATA PT e{eee}f

[3] CLR FANALM NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS

2. REASON FOR OUTPUT

To indicate the result of a fan alarm reset operation requested by a CLR:FANALM input message.

Format 1 reports a distribute point by physical location.

Format reports a distribute point by a logical address.

Format 2 reports the SCSD administration process is not active. No communication with SDSD points is possible.

Format 3 reports the SCSD administration process is not active. No communication with SDSD points is possible.

3. VARIABLE FIELD DEFINITIONS

a = Member number of scanner and signal distributor (SCSD) unit.
b = Physical scan point number on an SCSD.
c = Logical group name.
d = Duplex group ID.
e = Number of a point within a logical group.
f = Termination status. Valid value(s):
   FAILED = Action could not be completed by SCSD administrator. Possible reasons for failure are:
                - SCSD unit number is invalid.
                - Point number is invalid for the logical group.
                - Logical group name is invalid and either the SCSD unit is out-of-service (OOS) or is in an inactive state to the SCSD administrator.
   COMPLETED = Action completed.
4. ACTION TO BE TAKEN

Issue the OP:OOS input message to determine if the SC/SD unit is listed as out-of-service. Otherwise, enter recent change and verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists, and/or that the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the above results are negative, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Message Class: BPSC
Application: 5
Type: Output

1. FORMAT

CLR FANALM a b c [d]

2. REASON FOR OUTPUT

To acknowledge a user request to clear a fan alarm.

3. VARIABLE FIELD DEFINITIONS

a = Alarm type. Valid value(s):
   CNI = Common network interface.
   MFFAN = Miscellaneous frame.
   MSGS = Message switch.
   ONTC = Office network and timing complex.
   SM = Switching module.
   TMS = Time-multiplexed switch.

b = Unit number. Valid value(s):
   If 'a' = 'b' = TMS, ONTC, or MSDGS: 0 or 1
   SM SM number
   CNI or MFFAN: null

c = Termination report. Valid value(s):
   ABORTED
   COMPLETED

d = Explanation of termination report. Valid value(s):
   SCSSC UNAVAIL (scanner and signal distributor controller)
   SEND FAILURE
   VALID WITH CM1 ONLY
   VALID WITH CM2 ONLY
   FAILED SD OPERATION = Failed to set and/or clear one or more signal distributor points
   associated with the fan unit(s) (SM case only). If the SM has peripheral control and
   timing (PCT)-based peripheral units [such as, a digital network unit-synchronous
   optical network (SONET) (DNU-S)], each of these units must have at least one
   common control (CC) active in order to write to the unit's signal distributor points for
   clearing fan alarms.

4. ACTION TO BE TAKEN

If the operation fails, a manual reset of the fan unit(s) may be necessary.

[3] CLR HPRI - TERMINAL NOT AUTHORIZED FOR DEACTIVATING HIGH PRIORITY TERMINAL FEATURE

[4] CLR HPRI - HIGH PRIORITY TERMINAL FEATURE DEACTIVATION FAILED WITH a

2. REASON FOR OUTPUT

To respond to CLR:HPRI input command.

Format 1 is printed when the feature is successfully deactivated.

Format 2 is printed when the feature is currently not active.

Format 3 is printed when the feature could not be deactivated because the terminal is not authorized to deactivate. The feature can only be deactivated from the high priority terminal itself or the maintenance class terminal(s).

Format 4 is printed when the feature could not be deactivated because of an internal error code. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

3. VARIABLE FIELD DEFINITIONS

a = Internal error code. Possible values are:
   3 = An invalid terminal name was received.
   4 = Unable to successfully deactivate feature. Message failed.

4. ACTION TO BE TAKEN

For Format 3 try deactivating from the high priority terminal or a maintenance class terminal. The high priority terminal can be found with the OP:HPRI input command.

For Format 4, if the input command has failed, try it again later.

5. ALARMS

None.

Application: 5
Type: Output

1. FORMAT
CLR M5 PKG=a b

2. REASON FOR OUTPUT
To report the clearing of a package from the five-minute surveillance data set of packages for the on-site network management channel.

Refer to the APP:MEASUREMENTS appendix in the Appendixes section of the Output Messages manual for additional information.

3. VARIABLE FIELD DEFINITIONS

a
= Package. Valid value(s):
  ASPF  = Advanced services platform toll free counts.
  BICCMEAS  = Bearer independent call control measurements.
  BNP  = Basic number portability measurements.
  CCS  = Common channel signaling general service measurements.
  CCSP  = Common channel signaling special service measurements.
  CGAP  = Code control.
  CLCT  = Network management control counts.
  CLDIR = Call direction.
  DLYR = Delayed readiness.
  EON5 = End office nodal phase 5.
  GETSHPC = Government emergency telecommunications service high probability of call completion.
  HPCBICC = High probability of call completion BICC group.
  HPCTG = High probability of call completion trunk group.
  IECSSST = Inter-exchange carrier start signal timeout counts.
  IECSTG = Inter-exchange carrier shared trunk group counts.
  IMA = Additional ineffective machine attempts.
  LN = Leased network action point.
  LNCU = Leased network office-wide measurements for critical users.
  LNNODE = Leased network node-to-node measurements.
  MLNC = Failure to match and no circuit.
  NS = Number services.
  OVRLD = Overload or congestion.
  RRC = Manual reroute trunk group controls.
  SDN = Action control point for software defined networks.
  SVC = Critical service circuits.
  TGFLAG = Trunk group flags.
  TGMEAS = Basic trunk group.
  WBTGMEAS = Wideband trunk group.

b
= Termination status. Valid value(s):

Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

CLR MCTSI=a b

2. REASON FOR OUTPUT

To provide the result of the CLR:MCTSI input message.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Results of the input message. Valid value(s):
  COMPLETED = Force was removed or no force was in effect.
  STOPPED STATUS UNKNOWN = The message was sent to the SM and no response was received.
  STOPPED FAULT-STATUS UNKNOWN = Error detected during central processor intervention (CPI) transmission.
  STOPPED TIMEOUT = The message interface (MI) was unable to process the request.
  STOPPED MATE IS POWERED OFF = Not all forces cleared. The power force is still in effect.

4. ACTION TO BE TAKEN

<table>

(INHIBIT AND RECOVERY CONTROL)
CLR:MHD-MAEC

Software Release: 5E14 and later
Message Class:
Application: 5,3B
Type: Output

1. FORMAT

[1] CLR MHD a MAEC STARTED
__________________________________________________________________

[2] CLR MHD a MAEC IN PROGRESS
__________________________________________________________________

[3] CLR MHD a MAEC NOT STARTED b c
__________________________________________________________________

[4] CLR MHD a MAEC STOPPED b c
__________________________________________________________________

[5] CLR MHD a MAEC ERROR b c
__________________________________________________________________

[6] CLR MHD a MAEC ABORTED b
__________________________________________________________________

[7] CLR MHD a MAEC COMPLETED
__________________________________________________________________

2. REASON FOR OUTPUT

To report the result of executing a CLR:MHD-MAEC input message.

Format 1 indicates the message was started successfully.
Format 2 indicates message execution is in progress.
Format 3 indicates a system resource was not available and message execution was discontinued.
Format 4, 5, and 6 indicate the message encountered an error condition of some type and message execution was halted.
Format 7 indicates the message completed successfully.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Process step or reason code. Valid value(s):
f03 = Cannot open equipment configuration database (ECD).
f06 = Cannot get unit control block (UCB) of unit by name.
f09 = Cannot reserve UCB.
f0c = Cannot assign special device file name.
f0f = Cannot open special device file.
f12 = Cannot set input/output (I/O) mode of special device file.
f15  = Cannot enable message reception.
f18  = Refer to the disk driver (DKDRV) error report on the receive-only printer (ROP).
f1b  = Message to port failure.
f1e  = Message reception failure.
f21  = Process timed out.
f24  = Failed to close special device file.
f27  = Failed to release special device file.
f2a  = Failed to unreserve UCB of unit.
f2d  = Failed to close ECD.
f30  = Terminated externally with signal.

c  = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

A termination report specifying noncompletion with an error code, usually indicates a system resource was not available, or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

Format 6 indicates that the message was aborted either because the process timed out or because the disk driver could not clear the media access error counter (MAEC) for the specified moving head disk (MHD). In either case, the input request should be retried. If the error condition continues, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   None.
CLR:MWI

Software Release: 5E14 and later
Message Class: CP_RSP
Application: 5
Type: Output

1. FORMAT

CLR MWI DN=a FNAME=b c

2. REASON FOR OUTPUT

To report the result of a message waiting indicator (MWI) deactivation request in response to a CLR:MWI input message. If the request could not be processed, the message should be tried again later.

3. VARIABLE FIELD DEFINITIONS

a = Seven-digit directory number.
b = Message Service System (MSS) feature name.
c = Result of the MWI deactivation request. Valid value(s):
   MWI DEACTIVATED = The MWI has been successfully deactivated.
   INVALID DN = The directory number (DN) entered was not found in the office dialing plan.
   INVALID FEATURE = The feature name entered or defaulted is one of the following error cases:
   - No MSS feature on DN entered.
   - MSS feature not active.
   - MSS feature does not have MWI option.
   - Feature name entered is not an MSS feature.
   UNASSIGNED VISUAL MWI = A visual MWI indicator was not assigned for the DN that is requesting MWI activation or deactivation.
   RETRY LATER: ODD BACKUP IN PROGRESS = Office-dependent data (ODD) backup is in progress. No MWI activations or deactivations are allowed during an ODD backup.
   RETRY LATER: RESOURCES UNAVAILABLE = Switch resources were not available to allow processing of the request.

<td>CLLI</td>
<td>V/D</td>
</tr>
<tr>
<td>[b</td>
<td>c</td>
</tr>
<tr>
<td>.</td>
<td>.</td>
</tr>
</tbody>
</table>

2. **REASON FOR OUTPUT**

To report the deletion of node(s) from the five-minute network management node schedule (NMNODES). A node is identified by a CLLI code and the voice/data indicator. This is a response to a CLR:NMNODES input message.

3. **VARIABLE FIELD DEFINITIONS**

a = Termination status. Valid value(s):
- COMPLETED = Nodes specified in the CLR:NMNODES input message have been successfully cleared from the node schedule.
- FAILED-PARAMETER = Message failed due to bad input. The node identifiers specified are invalid.

b = Common language location ID (CLLI) code.

c = Voice/data indicator. Valid value(s):
- D = Data indicator.
- V = Voice indicator.

Note: Variables 'b' and 'c' will be displayed only when the node has been successfully removed from the node schedule. If a CLR:NMNODES input message requests to delete all nodes on the node schedule, the nodes being deleted will not be displayed.

4. **ACTION TO BE TAKEN**

<table>

   PSU NETWORK
CLR:PTN

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] CLR PTN CLEARING a ON MHD b

[2] CLR PTN ON MHD b COMPLETED

[3] CLR PTN STOPPED WITH ERROR CODE c ERRNO d[, (e)]

2. REASON FOR OUTPUT

To report the result of executing a CLR:PTN input message, and to provide status information.

3. VARIABLE FIELD DEFINITIONS

a = Path name of partition being initialized with zeroes.

b = Specifies disk unit containing backup disk copy with application partitions cleared.

c = Error code indicating error that caused process to terminate. The first three digits indicate the nature of the error. The last two digits (represented as \textit{xx}) indicate which module the error occurred in. Valid value(s):

\begin{itemize}
  \item 01xx = Missing arguments.
  \item 02xx = Destination disk does not exist.
  \item 03xx = Destination disk is not active.
  \item 04xx = Mate of destination disk does not exist.
  \item 05xx = Mate of destination disk is not active.
  \item 06xx = Specification file (variable ‘e’) does not exist.
  \item 07xx = Duplicate partitions in specification file.
  \item 08xx = File name (variable ‘e’) in specification file is not a partition.
  \item 09xx = File name (variable ‘e’) in specification file does not exist.
  \item 10xx = Partition specified (variable ‘e’) does not exist in destination disk.
  \item 11xx = File name (variable ‘e’) in specification file does not have any entry in the volume table of contents (VTOC) (it may be a block device but not a partition).
  \item 12xx = Specification file (variable ‘e’) is empty.
  \item 13xx = Process was stopped by a termination (SIGTERM) signal.
  \item 14xx = Partition (variable ‘e’) is not an application partition. This partition needs to be set with correct flag in the VTOC.
\end{itemize}

Errors associated with system calls. Valid value(s):

\begin{itemize}
  \item 201xx = The "open()" failed to open ‘e’.
  \item 202xx = "mknod()” failed to create special device file ‘e’ (temporary file to read VTOC from disk).
  \item 203xx = "read()” failed to read file ‘e’.
\end{itemize}
204xx = "mkseg()" failed to allocate one segment of memory.
205xx = "lseek()" failed to change offset (variable 'e') in out of service disk.
206xx = "setio()" failed to set physical IO for 'e'.
207xx = "write()" failed on segment 'e' (on partition being cleared).
208xx = "ugucbn()" failed to get unit control block (UCB) information for moving head disk (MHD) 'e'.
209xx = "ugucb()" failed to get UCB information for MHD 'e'.
210xx = "unlink()" failed to unlink file 'e'.
211xx = "ursvucb()" failed to reserve MHD 'e'.
212xx = "ugsdf()" failed to access out of service (OOS) disk MHD 'e'.
213xx = "sendpw()" failed to send message to 'e'.
214xx = "recvw()" failed to receive message from 'e'.
215xx = "msgenab()" failed.
216xx = Bad message received from maintenance input request administrator (MIRA).
217xx = After MIRA removed disk from service, data base does not have disk as OOS.
218xx = "ugmamirids()" failed to get UCB record.
219xx = "close()" failed to close file 'e'.
220xx = "stat()" failed on 'e'.

d = Indicates system error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
e = Supplementary data.

4. ACTION TO BE TAKEN
Correct user execution errors by examining the procedures used for execution of the message. If any other errors occur, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS
None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

**Message Class:** SMCONFG  
**Application:** 5  
**Type:** Output

1. **FORMAT**

CLR RT FAC=a-b {PROT|FELP} c [d]

2. **REASON FOR OUTPUT**

To respond to the CLR:RT-FAC input message that requested either a switch to the protection (PROT) line or a far end loop (FELP) around be cleared for a particular remote terminal (RT) digital signal level one (DS1) facility (FAC).

3. **VARIABLE FIELD DEFINITIONS**

   - **a** = Site identification (SID) number.
   - **b** = RT DS1 FAC number [A, B, C, D, or P for TR008 or 1-28 for TR303].
   - **c** = Termination status. Valid value(s):
     - **COMPLETED** = The requested action has completed successfully.
     - **IN PROGRESS** = The message is in progress.
     - **STOPPED** = The action terminated before a normal completion but the termination was graceful.
   - **d** = Additional information qualifying the termination report. This information can be found in the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

Response to a CLR:RUTILFLAG input message.

3. VARIABLE FIELD DEFINITIONS

a = The group number of the concerned node.
b = The member number of the concerned node.
c = The specified break point number.
d = The value of the global variable ‘errno’.
e = Illegal break point status value.
f = Memory protection error return.
g = Completion information. Valid value(s):
   BP = c = Successful completion of the CLR:RUTILFLAG input message.
   BP = c ILLEGAL = The break point has an illegal status.
   BP = c NOT SETUP COMPL = The specified break point is not setup.
   BP = c MEMORY PROTECTION = A memory protection error has occurred.
   INVALID BP = c = The break point specified is invalid.
   VECTOR MEMORY PROTECTION ERROR = f = A memory protection error has occurred.

h = Abort information. Valid value(s):
   KERNEL RESPONSE TIMEOUT d = The kernel has not responded to the process.
   SEND2KERN KERNEL RETURNED ERROR d = The kernel has returned a failing return code.
   SEND2KERN MKNODE() FAILED d = The creating of the special file for the kernel has failed.
   SEND2KERN OPEN() FAILED d = Attempting to open the file for kernel processing has failed.

4. ACTIONS TO BE TAKEN
For Formats 2 and 3, check the specified break point number. Otherwise, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual for Formats 4 through 10.

CLR SCMG:
   GSM = a    DPC = b    c
   SCMG STATUS = d
   SSN STATUS
   ---    -------
   e     f

2. REASON FOR OUTPUT

To report the result of a CLR:SCMG input message.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Destination point code (DPC).
c = Report error conditions. Valid value(s):
   NO DATA AVAILABLE = The DPC is not available.
   DPC IS INACCESSIBLE = The DPC is inaccessible.
   NO SSNs DEFINED AT THIS DPC = There are no signaling connection control part subsystem
      (SSN)s defined at this DPC.
   INTERNAL DATABASE ERROR = Internal database error.
   DPC NOT DEFINED = The DPC is not defined.
   COULD NOT GET SCMG STATUS = The signaling connection control part (SCCP) network
      management (SCMG) status could not be gotten.
   NO SCMG INDEX AVAILABLE = The SCMG index is not available.
   INVALID SSN ENTERED = The entered SSN is invalid.
   COULD NOT CHANGE STATUS OF SSN - SCMG PROHIBITED = The status of SSN could not be
      changed due to the SCMG status is prohibited.

d = SCMG status. Valid value(s):
   ALLOWED = The SCMG status is allowed.
   PROHIBITED = The SCMG status is prohibited.
   NONE = The SCMG status is none.

e = SSN number.
f = SSN status. Valid value(s):
   ALLOWED = The SSN status is allowed.
   PROHIBITED = The SSN status is prohibited.
   NONE = The SSN status is none.
4. ACTIONS TO BE TAKEN

Try again later if no response.

CLR:SILC

Software Release: 5E14 and later
Message Class: ADMN
Application: 5
Type: Output

1. FORMAT

[1] CLR SILC TG=a b

[2] CLR SILC b

2. REASON FOR OUTPUT

To report the clearing of a specified trunk group or all trunk groups from the SILC list.

Format 1 is for removal of one trunk group from the selective incoming load control (SILC) list.

Format 2 is for removal of all trunk groups from the SILC list.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number.

b = Termination status. Valid value(s):
   ABORTED = Command aborted. System error encountered.
   COMPLETED = Command successfully completed.
   FAILED-PARAMETER = Command failed. Input parameter error.

4. ACTION TO BE TAKEN

No action is needed for an automatically generated request from the engineering and administrative data acquisition system/network management (EADAS/NM). These messages are to be treated as information-only messages. For manually generated requests, the following actions will apply.

<table>
<thead>
<tr>
<th>'b'</th>
<th>Action</th>

2. REASON FOR OUTPUT

To report the disposition of a CLR:UMEM input message or to report that the process identification (PID) listed on the INIT:UMEM message aborted.

3. VARIABLE FIELD DEFINITIONS

UCL = Unconditional execution.

a = Status of the operation. Valid value(s):
COMPLETED = The trace definition has been cleared.
NOT STARTED = The operation was ignored because data loss might have resulted.
STOPPED UCERR = The utility circuit either does not respond or does not match the circuit present when the trace was defined.

b = State of the trace before the operation was attempted. Valid value(s):
DUMPED = The trace was not running and its data had already been dumped.
NEW = The trace was not running and did not have data.
RUNNING = The trace was collecting data.
STOPPED = The trace was not running and did have data.

C = State of the trace after the operation was attempted. Valid value(s):
RUNNING = The trace is collecting data.
STOPPED = The trace is stopped and does contain data.
UNDEF = No trace is defined.

D = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT STARTED</td>
<td>The trace must be in the NEW or DUMPED state in order to be cleared. Use the INH:UMEM and or the OP:UMEM input messages before reissuing the CLR:UMEM input message.</td>
</tr>
<tr>
<td>STOPPED UCERR</td>
<td>Check the utility circuit hardware. After it is fixed, use the INIT:UC input message to reinitialize the circuit.</td>
</tr>
</tbody>
</table>
5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report results of the CLR:UPART input message

3. VARIABLE FIELD DEFINITIONS

a = OPC (Originating Point Code) number.
b = DPC (Destination Point Code) number.
c = Signaling type. Valid value(s):
BICC

d = Completion report. Valid value(s):
CCS NOT AVAILABLE IN OFFICE = The request cannot be processed because the office is not equipped with CCS capability.
COMPLETED = The request was executed successfully.
DPC INVALID = The entered DPC is not valid. The DPC may be out of the valid range, or it may not be provisioned in the office.
GSM UNAVAILABLE = The GSM is busy at this moment. Retry this command later.
OPC INVALID = The entered OPC is not valid. The OPC may be out of the valid range, or it may not be provisioned in the office.
OPC DPC NOT PROVISIONED = The OPC DPC specified in the input message are not provisioned in the office.
REMOTE USER PART ALREADY AVAILABLE = The remote user part is already in available status. There is no need to reset its status to available.
SIGTYPE NOT PROVISIONED = The entered signalling type is not provisioned in this office.
SYSTEM ERROR = A system error has occurred making it impossible to continue processing the request.

e = Supplementary information. Valid value(s):
CNI TO PSU CONVERSION IN PROGRESS = The output value may be inaccurate due to the processing of CNI to PSU conversion.
OPC DPC NOT BICC PROVISIONED = The OPC DPC specified in the input message are not provisioned for BICC protocol in the office.

\( e \) = Error code. Valid value(s):

2 = Unable to 'lock out' field update.
3 = Process failed to end.
4 = Unable to read disk copy.
5 = File failed to open.
6 = File requested is killable.
7 = Specified file is too large.
8 = Cannot locate core image of the process.
10 = No segments available in user address space.
11 = Unable to share an in core segment.
12 = Failure to change to read only permissions.
13 = Could not lock disk copy in core.
14 = Read error on disk copy.
15 = File not swabbed.
16 = Unable to allocate a segment.
17 = Failure freeing a shared segment.
18 = Library specified is invalid.
19 = Pfile specified has an invalid magic number.
20 = Unable to create compare process.
= Start message failed to be sent.
= Compare process still alive. Refer to manual 235-105-210, Routine Operations and Maintenance.
= Disk and core mismatch.
= File manager open request failed.
= File manager segcode I/O message failed.
= Call to gettype() failed.
= Bad core size in the segment map.
= KPUPDATE process died before or during segment attach.
= KPUPDATE process died after segment attach.

f
  = MISMATCH AT q IN SECTION r
  CORE CONTENTS s
  DISK CONTENTS t

g  = Number of the breakpoint.

h  = Address where breakpoint was found.

i  = Pathname of file compared.

j  = Number of errno.

k  = Name of the offline partition.

l  = Signal number.

m  = Return code of locklib call.

n  = Return code of sendw call.

o  = Return code of recvw call.

p  = Return code of freelib call.

q  = Address where the mismatch between disk and core was found.

r  = Name of section where mismatch is found.

s  = Sixteen bytes of the contents of core, taken from the address of the mismatch.

t  = Sixteen bytes of the contents of disk, taken from the address of the mismatch.

4. ACTION TO BE TAKEN

None if normal termination occurs. Otherwise, determine the type of CMPR:ERR or the reason for the disk and core mismatch.

5. ALARMS

None. This alarm is either a manually-requested report, or an automatically-generated report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

PARTITION SIZES NOT EQUAL
STIME r ETIME s

[13] CMPR MHD {a|q} (RO) PARTITION ACCESS FAILURE
MHD {a|q} (READ) FAILED
PARTITION e OFFSET f BLOCK p

2. REASON FOR OUTPUT

To report the result of executing an CMPR:MHD input message. The [RO] is output to indicate that the READ ONLY option was used. STIME is the time the message was started. ETIME is used to indicate the elapsed time for a particular partition. The ETIME for the FINAL message is the total elapsed time.

3. VARIABLE FIELD DEFINITIONS

RO  = Indicates that the READ ONLY option was selected.

a  = Member number of the first unit of the moving head disk (MHD) drive.

b  = Process step or reason code. Valid value(s):
  bxx = Where ‘xx’ are hexadecimal digits. Refer to the APP:DFC-A appendix in the Appendixes section of the Output Messages manual.
  f03 = Cannot open equipment configuration database (ECD).
  f06 = Cannot get unit control block (UCB) of first unit by name.
  f09 = Cannot get UCB of second unit by name.
  f12 = Cannot get UCB of first unit's mate.
  f15 = Cannot get UCB of first unit's mate.
  f18 = Cannot reserve UCB of second unit.
  f21 = Cannot assign special device file name of second unit.
  f24 = Cannot open special device file of second unit.
  f27 = Cannot enable message reception.
  f30 = Refer to the accompanying DKDRV error report on the ROP.
  f36 = Failed to close special device file of second unit.
  f39 = Failed to release special device file of second unit.
  f42 = Message to port failure.
  f45 = Message reception failure.
  f48 = Message to port failure.
  f51 = Message reception failure.
  f54 = Process timed out.
  f57 = Failed to close special device file of second unit.
  f60 = Failed to release special device file of second unit.
  f63 = Failed to unreserve UCB of second unit.
  f66 = Failed to close ECD.

c  = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
e = Partition number in use when a mismatch was encountered.
f = Offset within partition when mismatch was detected.
g = First disk block number (of a range) that mismatched or retried while being compared.
h = Last disk block number (of a range) that mismatched, failed or successfully retried while being compared.
i = Number of mismatches that were detected.
j = Number of Input/Output jobs done.
k = Number of errors detected doing I/O.
l = Size of the partition given in disk blocks.
m = Disk block number that failed to read or write.
n = Member number of the second unit of the moving head disk (MHD) drive.
o = Elapsed time for a partition to compare. For the FINAL SUMMARY report, the ETIME is the total elapsed time of all the partitions.
p = The time the compare of the partition was started. For the FINAL SUMMARY report, STIME indicates the start time of the input message.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

Appropriate mismatch messages will be generated indicating the range of disk blocks where the mismatch occurred. A maximum of eight mismatch error messages will be output per partition. More than eight mismatch messages will result in an early termination.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

CNVT:AMA-CONFIG

**Software Release:** 5E14 and later  
**Message Class:** AMA  
**Application:** 5  
**Type:** Output

1. **FORMAT**

```bash
CNVT AMA CONFIG
```

2. **REASON FOR OUTPUT**

To report on the status of the processing of the CNVT:AMA-CONFIG input message.

3. **VARIABLE FIELD DEFINITIONS**

   a. `= Text phrase indicating the outcome of the operation requested by the CNVT:AMA-CONFIG input message. Valid value(s):`

   - `CONFIGURATION FILE FOR STREAM x FOR MHD y HAS BEEN CONVERTED = Where 'x' is the data stream number and 'y' is the MHD number. This simply indicates that the configuration file for the specified data stream was successfully converted.`
   - `CONVERSION OF AMA CONFIGURATION FILES HAS COMPLETED = The CNVT:AMA:CONFIG input message has processed all MHD's and is now complete.`
   - `COULD NOT ASSIGN SPECIAL DIAGNOSTIC FILE NAME FOR MHD x = Where 'x' is the MHD number. /etc/dgnnm failed.`
   - `COULD NOT CREATE CONVERTED CONFIGURATION FILE FOR STREAM x = Where 'x' is the data stream number. The new, converted configuration file for this stream could not be created.`
   - `COULD NOT CLOSE CONFIGURATION FILE FOR STREAM x = Where 'x' is the data stream number. The online configuration file for this stream could not be closed.`
   - `COULD NOT CLOSE CONVERTED CONFIGURATION FILE FOR STREAM x = Where 'x' is the data stream number. The new, converted configuration file for this stream could not be closed.`
   - `COULD NOT CLOSE OFFLINE MHD x = Where 'x' is the MHD number.`
   - `COULD NOT CONVERT CONFIGURATION FILE FOR PARTITION x ON MHD y = Where 'x' is the AMA disk partition number and 'y' is the MHD number. The AMA disk partition's entry in the configuration file could not be converted.`
   - `COULD NOT INITIATE PIPE TO DGNNM FOR MHD x ERROR NUMBER = y = Where 'x' is the MHD number and 'y' is the UNIX® process error number. /etc/dgnnm failed for this MHD because a pipe to the process could not be initiated.`
   - `COULD NOT INITIATE PIPE TO UDGNNM FOR MHD x ERROR NUMBER = y = Where 'x' is the MHD number and 'y' is the UNIX® process error number. /etc/udgnnm failed for this MHD because a pipe to the process could not be initiated.`
   - `COULD NOT LSEEK TO VTOC ON MHD x = Where 'x' is the MHD number. The lseek() to the volume table of contents (VTOC) for this MHD failed.`
   - `COULD NOT OPEN CONFIGURATION FILE FOR STREAM x = Where 'x' is the data stream number. The online configuration file for this stream could not be opened.`
   - `COULD NOT OPEN OFFLINE MHD x = Where 'x' is the MHD number.`
   - `COULD NOT OPEN VTOC FILE ON MHD x = Where 'x' is the MHD number.`
   - `COULD NOT READ CONFIGURATION FILE FOR STREAM x = Where 'x' is the data stream number. The online configuration file for this stream could not be read.`
COULD NOT READ FROM THE PIPE FOR DGNNM FOR MHD x ERROR NUMBER = y

= Where ‘x’ is the MHD number and ‘y’ is the UNIX® process error number.

/etc/dgnnm failed for this MHD because the pipe for the process could not be read from.

COULD NOT READ VTOC FILE ON MHD x = Where ‘x’ is the MHD number.

COULD NOT RELEASE SPECIAL DIAGNOSTIC FILE FOR MHD x = Where ‘x’ is the MHD number. /etc/udgnnm failed.

COULD NOT WRITE CONVERTED CONFIGURATION FILE FOR STREAM x = Where ‘x’ is the data stream number. The new, converted configuration file for this stream could not be written.

MHD x IS NOT OFFLINE CANNOT CONVERT CONFIGURATION FILE = Where ‘x’ is the moving head disk (MHD) number.

PCLOSE OF DGNNM FILE FAILED FOR MHD x ERROR NUMBER = y = Where ‘x’ is the MHD number and ‘y’ is the UNIX® process error number. /etc/dgnnm failed for this MHD because the pipe to the process could not be closed.

PCLOSE OF UDGNNM FILE FAILED FOR MHD x ERROR NUMBER = y = Where ‘x’ is the MHD number and ‘y’ is the UNIX® process error number. /etc/udgnnm failed for this MHD because the pipe to the process could not be closed.

VTOC ENTRY FOR PARTITION x ON MHD y IS CORRUPT = Where ‘x’ is the automatic message accounting (AMA) disk partition number and ‘y’ is the MHD number.

4. ACTION TO BE TAKEN

If the AMA configuration files have been successfully converted, no action is necessary; otherwise, consult the Generic Retrofit Procedures manual or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Note: If the CNVT:AMA-CONFIG input message is entered at any time other than during a retrofit, disk growth, or update, it will fail and several output messages will be printed.

Type: Output

1. FORMAT

CNVT RCLOG [EVOL | LOAD] a

2. REASON FOR OUTPUT

To report the status of the recent change (RC) log evolution.

3. VARIABLE FIELD DEFINITIONS

EVOL = Evolves the RC ASCII logfiles from the format of the current software release to the format of the target software release.

LOAD = Converts the RC ASCII logfiles to binary format.

a = Termination report. Valid value(s):
COMPLETE = The requested action was terminated after completion.
STOPPED = The requested action was terminated before a normal completion.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

Where 'x' is the release-specific version of the document.
235-105-24x Generic Retrofit Procedures
CNVT:RT-SID-LRT

Software Release: 5E14 and later
Message Class: PFR
Application: 5
Type: Output

1. FORMAT

CNVT RT SID=a {IDCURT=b-c-e|DCLURT=b-d-e|DNUSRT=b-j-e} {IFAC=b-c-f RTFAC=g|SDFI-h=i|DS1SFAC=b-j-k-l-m-n-o RTFAC=g}

2. REASON FOR OUTPUT

To respond to the CNVT:RT input message that reports the remote terminal (RT) site identification number (SID) and the corresponding local remote terminal (LRT) number associated with an integrated digital carrier unit (IDCU) or a digital carrier line unit (DCLU) or a digital networking unit - synchronous optical network (SONET) (DNU-S). Also listed are the equipped RT digital signal level one (DS1) facility (IFAC) circuits for the IDCU or the SLC® 96 digital facility interface (SDFI) circuits for the DCLU or the digital signal level 1 facility (DS1SFAC) circuits for the DNU-S.

3. VARIABLE FIELD DEFINITIONS

a = Site identification number.
b = Switching module (SM) number.
c = IDCU number.
d = DCLU number.
e = Local RT number.
f = IFAC number.
g = RT DS1 FAC number.
h = SLC®96 T1 facility ID.
i = SDFI number.
j = DNU-S number.
k = Data group (DG) number.
l = SONET termination equipment (STE) facility number.
m = Synchronous transport signal (STS) facility number.
n = Virtual tributary group (VTG) number.
o = Virtual tributary member (VTM) number.
4. ACTIONS TO BE TAKEN

Message Class: ODD
Application: 5
Type: Output

1. FORMAT

    CNVT STANDALONE SM=a b
    [c]
    [ADDITIONAL SPACE REQUIRED IS 'd' BLOCKS]

2. REASON FOR OUTPUT

To indicate the result of a CNVT:STANDALONE input message request to update the office dependent data (ODD) of a specified switching module (SM) to support stand-alone operation. This activity is related to the SM stand-alone installation procedure, which is a function of SM growth.

3. VARIABLE FIELD DEFINITIONS

    a = SM number of the module to be converted to stand-alone.
    
    b = Operation completion status. Valid value(s):
    ABORTED = Operation terminated. Data was changed.
    COMPLETED = Operation completed successfully. Data is updated.
    IN-PROG = Operation is not yet completed. This is the five-minute-interval status report.
    NOT STARTED = Operation never started.
    STOPPED = Operation terminated. No data was changed.

    c = If the operation status is not COMPLETED this field will supply supplemental information. Valid value(s):
    CANNOT SETUP COMMUNICATION PORT WITH OKP
    CANNOT READ RELATION MODATT IN AM
    INVALID MODULE NUMBER
    INVALID PASSWORD FOR GIVEN MODULE NUMBER
    MODULE ALREADY CONVERTED TO STAND ALONE
    INSUFFICIENT OS RESOURCES IN OKP FOR CONVERSION
    CANNOT READ RELATION DB_AMGPD
    CANNOT READ OFFICE SERIAL NUMBER-GLOSNS FROM THE AM
    INSUFFICIENT ODD SPACE FOR CONVERSION
    CANNOT BEGIN UPDATE TRANSACTION

2. REASON FOR OUTPUT

To indicate that the port over which an incoming 101 test call arrived has been seized (connected to) by a TLWS test position (TP) in preparation for testing.

3. VARIABLE FIELD DEFINITIONS

E   = Error.

a   = Test position number.

b   = Telephone number entered.

c   = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

d   = Line equipment number. Valid value(s):

AP=l1-m
ILEN=n-j-k-l
INEN=n-m1-k-l
LCEN=n-o-p-q
LCKEN=n-o-p-v1-w1
LEN=n-o-r-s-t-u
SLEN=n-v-w-x
AIUEN=n-x1-y1-z1
e = Multi-line hunt group number.

f = Hunt group member number.

g = Valid value(s): AC1 JACK = Connection to the AC jack number 1.
AC2 JACK = Connection to the AC jack number 2.
CAMPED ON = Line or trunk is camped on.
CPE TESTS = Test customer premises equipment.
DC1 JACK = Connection to the DC jack number 1.
DC2 JACK = Connection to the DC jack number 2.
DIG TRANS = Connection to digital transmission equipment.
IN PROGRESS = Test or test setup is in progress.
METALLIC = Connection to metallic measurement equipment.
MONITOR B&I = Monitor a busy or idle line/trunk.
MONITOR BUSY = Monitor a busy line/trunk.
SEIZED = Line or trunk is seized.
SUPERVISION = Supervisory test running.
TRANSMISSION = Connection to transmission equipment.

h = TLWSR tuple identification.

i = The mode of the talk and monitor (T&M) phone in the test connection. Valid value(s):
H = The T&M phone is ON-HOLD (metallic connections).
M = The T&M phone is in the MONITOR mode (listen-only).
N = No T&M phone in the connection.
T = The T&M phone is in the TALK mode (listen and talk).

j = IDCU number.

k = Remote terminal (RT) number, or IDCU digital signal level 1 (DS1) serving PUB43801 number.

l = RT line number, or PUB43801 channel.

m = Relative link (member) number of the AP.

n = Switching module (SM) number.

o = Line unit number.

p = Line group number.

q = Line card number.

r = Grid number.

s = Switch board number (LU1, LU2, or LU3).

t = Switch number.

u = Level number.

v = Digital carrier line unit number.
w = Remote terminal (RT) number.
x = RT line number.
y = Digital line and trunk unit (DLTU) number.
z = Digital facility interface (DFI) number.
a = Channel number.
b = RAF unit number.
c = RAF channel number. of the Output Messages manual.
d = Trunk unit number.
e = Service group number.
f = Channel board number.
g = Circuit number.
h = Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.
i = Trunk group number.
j = Trunk member number.
k = Trunk equipment number. Valid value(s):

DEN=n-y-z-a

CONN:WSTRK-C
Software Release: 5E16(1) and later
Message Class: TLWSRSP
Application: 5
Type: Output

1. FORMAT

CONN WSTRK TEST POSITION a-b
   ACCESS=c                           T&M=g
   TKGMN=d-e  f                     [E=h]

2. REASON FOR OUTPUT

To indicate that the port has been seized (connected to) by a trunk and line work station (TLWS) test position (TP) in preparation for testing.

3. VARIABLE FIELD DEFINITIONS

E = Error.
a = TP number.
b = TLWSR tuple identification.
c = Access type. Valid value(s):
   AC1 JACK = Connection to the AC jack number 1.
   AC2 JACK = Connection to the AC jack number 2.
   CAMPED ON = Line or trunk is camped on.
   CPE TESTS = Test customer premises equipment.
   DC1 JACK = Connection to the DC jack number 1.
   DC2 JACK = Connection to the DC jack number 2.
   DIG TRANS = Connection to digital transmission equipment.
   IN PROGRESS = Test or test setup is in progress.
   METALLIC = Connection to metallic measurement equipment.
   MONITOR B&I = Monitor a busy or idle line/trunk.
   MONITOR BUSY = Monitor a busy line/trunk.
   SEIZED = Line or trunk is seized.
   SUPERVISION = Supervisory test running.
   TRANSMISSION = Connection to transmission equipment.

d = Trunk group number.

e = Trunk member number.

f = Trunk equipment number. Valid value(s):
   DEN=h-i-j-k
   INEN=h-r-c^1-d^1
   NEN=h-r-s-u-t-a^1-b^1-v
   PLTEN=h-e^1-f^1-g^1-h^1
   PSUEN=h-w-x-y-z
RAF PORT h-l-m
TEN=h-n-o-p-q
VTRK=h-i^1-j^1
OIUENC-k^1-l^1-m^1-n^1-o^1-k

g = The mode of the talk and monitor (T&M) phone in the test connection. Valid value(s):
H = The T&M phone is ON-HOLD (metallic connections).
M = The T&M phone is in the MONITOR mode (listen-only).
N = No T&M phone in the connection.
T = The T&M phone is in the TALK mode (listen and talk).

h = Switching module (SM) number.
i = Digital line and trunk unit (DLTU) number.
j = Digital facility interface (DFI) number.
k = Channel number.
l = RAF unit number.
m = RAF channel number.
n = Trunk unit number.
o = Service group number.
p = Channel board number.
q = Circuit number.
r = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
s = Data group (DG) number.
t = Synchronous transport signal (STS) facility number.
u = SONET termination equipment (STE) facility number.
v = Digital signal level 0 (DS0) number.
w = PSU unit number.
x = PSU shelf number.
y = PSU channel group number.
z = PSU channel group member number.
a^1 = Virtual tributary group (VTG) number.
b^1 = Virtual tributary member (VTM) number.
c^1 = Remote terminal (RT) number.
d^1 = RT line number.
e^1 = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.
f^1 = PCT facility interface (PCTFI) number.
g^1 = Tributary number.
h^1 = Channel number.
i^1 = Virtual Trunk Facility number.
j^1 = Virtual trunk channel number.
k^1 = Optical interface unit (OIU) number.
l^1 = Protection group (PG) number.
m^1 = STS level 1 (STS-1) number.
n^1 = Virtual tributary 1.5 group (VTGRP) number.
o^1 = Virtual tributary 1.5 member (VTMEM) number.
p^1 = OC-3 STE number.

4. ACTIONS TO BE TAKEN

COPY:ACTDISK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] COPY ACTDISK ON MHD a COMPLETED

[2] COPY ACTDISK STOPPED WITH ERROR CODE b ERRNO c[, (d)]

2. REASON FOR OUTPUT

To report the result of executing a COPY:ACTDISK input message.

3. VARIABLE FIELD DEFINITIONS

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Disk unit where file was copied to.</td>
</tr>
<tr>
<td>b</td>
<td>Error code indicating error that caused process to terminate. The first three digits indicate the nature of the error; the last two (represented as xx) indicate which module the error occurred in (the information is not provided here).</td>
</tr>
<tr>
<td>01xx</td>
<td>Missing arguments. This error is related with the usage of the /prc/mntfs process. The arguments expected by this process are: /prc/mntfs -d a -p b -c -x d. Where 'a' specifies the non-active disk, 'b' the target file system, 'c' the directory to mount the file system, 'd' the name of the process, plus arguments, to be executed. The arguments should consist of files or directory path names, including the mount directory specified in 'c'.</td>
</tr>
<tr>
<td>02xx</td>
<td>The partition number that corresponds to the mount point of the destination file, is not the same as the destination partition number. To by pass this check, don't include the mount point in destination file name. For example, to copy &quot;/etc/ularp&quot; to the root file system on the non-active disk, don't specify &quot;/etc/ularp&quot; as the destination file; instead the name &quot;ularp&quot; or &quot;/ularp&quot; should be specified.</td>
</tr>
<tr>
<td>03xx</td>
<td>The source specified is not a regular file, a contiguous file (type &quot;C&quot; or 'x'), or a block device (type 'b', a partition or file system).</td>
</tr>
<tr>
<td>04xx</td>
<td>Cannot find mount point for destination file. To avoid the error, exclude the mount point from the destination file path name.</td>
</tr>
<tr>
<td>05xx</td>
<td>The destination disk specified is not in the out-of-service (OOS) or offline (OFL) state.</td>
</tr>
<tr>
<td>06xx</td>
<td>Cannot find an entry for the destination partition, in the destination disk volume table of contents (VTOC). Make sure that the partition number specified exists in the destination disk.</td>
</tr>
<tr>
<td>07xx</td>
<td>Bad mount directory specified. This error results from the execution of the /prc/mntfs process.</td>
</tr>
<tr>
<td>08xx</td>
<td>The VTOC in the destination disk is bad or does not exist.</td>
</tr>
<tr>
<td>09xx</td>
<td>Bad destination file specified.</td>
</tr>
<tr>
<td>10xx</td>
<td>Process stopped due to SIGTERM signal.</td>
</tr>
<tr>
<td>11xx</td>
<td>The source file specified does not exist.</td>
</tr>
<tr>
<td>12xx</td>
<td>Cannot find entry for the source partition on the active disk VTOC.</td>
</tr>
<tr>
<td>13xx</td>
<td>The destination partition is smaller than the source partition.</td>
</tr>
</tbody>
</table>
14xx  = The partition number specified is greater than the maximum number of partitions on disk.
15xx  = The destination partition does not exist in the destination disk.

ERRORS ASSOCIATED WITH SYSTEM CALLS

201xx  = The "open()" failed to open 'd'.
202xx  = "mknod()" failed to create 'd'.
203xx  = "read()" failed to read file 'd'.
204xx  = "mkseg()" failed to allocate one segment of memory.
205xx  = "lseek()" failed to change offset (variable 'd') in out of service disk.
206xx  = "setio()" failed to set physical IO for 'd'.
207xx  = "write()" failed on segment 'd'.
208xx  = "ugucbn()" failed to get unit control block (UCB) information for moving head disk (MHD) 'd'. This error occurs when disk unit specified does not exist.
209xx  = "mount()" failed to mount partition 'd'. This error occurs when partition is not a file system, or mount directory is busy.
201xx  = "unlink()" failed to unlink file 'd'.
211xx  = "ursvucb()" failed to reserve MHD 'd'. This error occurs when the disk is reserved by other process (for example, diagnostics).
212xx  = "udsdfl()" failed to get special device file to access MHD 'd'. This error occurs when another process failed to release the special device file.
213xx  = "msgport()" failed to send message to the disk driver.
214xx  = "recvw()" failed to receive message from the disk driver.
215xx  = "msgenab()" failed.
216xx  = Bad message received from the disk driver.
217xx  = Bad return code received from the disk driver. This error occurs when the entry in destination disk VTOC does not have all the fields properly set (such as, the address for the partition may be bad).
218xx  = "chown()" failed to change "owner" for destination file.
219xx  = "close()" failed to close 'd'.
220xx  = "stat()" failed on 'd'.
221xx  = "plock()" failed to lock "/prc/mntfs" process in core.
222xx  = "chmod()" failed to change mode of destination file.
223xx  = "system()" call returned with an error code 'd'.
224xx  = "create()" failed to create the destination file, on file system in the destination disk. This error occurs when there is no more space in the file system.
225xx  = "falloc()" failed to allocate contiguous space for a contiguous file, on the file system in the destination disk. This error occurs when the file system does not have enough contiguous space for the file to be created.
226xx  = "ugetrec()" failed to get UCB record for destination disk MHD 'a' in the ECD database.

c  = Indicates system error code (refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

d  = Supplementary data.

4. ACTION TO BE TAKEN

User execution errors can be corrected by examining the procedures used for execution of the message. If any other errors occur, refer to the TECHNICAL ASSISTANCE refer to the TECHNICAL ASSISTANCE portion of the
INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Input Message(s):

COPY:ACTDISK

Output Appendix(es):

APP:OMDB-X-REF
APP:SYSERR
COPY:ADDR

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

COPY ADDR a b #c

2. REASON FOR OUTPUT

To report the completion of a COPY:ADDR input message.

3. VARIABLE FIELD DEFINITIONS

a = Virtual address.

b = Termination status of the operation. Valid value(s):
COMPLETED = Request successfully completed.
NOT STARTED NGPID = The COPY was stopped because the process does not exist.
NOT STARTED NGUID = The COPY was stopped because no copies of the process exist.
STOPPED NGADDR = The COPY was stopped because the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were specified.
STOPPED NGPROT = The COPY was stopped because the destination address does not have write permission granted.
STOPPED NGCOPY = The COPY was stopped because some other error occurred in moving the data.

c = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'b' =</th>
<th>Action: =</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT STARTED NGPID</td>
<td>The process did not exist at the time the COPY was attempted. Consider using the process UID instead of the PID.</td>
</tr>
<tr>
<td>NOT STARTED NGUID</td>
<td>The process did not exist at the time the COPY was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.</td>
</tr>
<tr>
<td>STOPPED NGADDR</td>
<td>Recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the COPY message in the action list. This will help control the exact circumstances under which the operation is performed.</td>
</tr>
<tr>
<td>STOPPED NGPROT</td>
<td>Recheck the destination to verify that it indicates a writable area.</td>
</tr>
</tbody>
</table>

5. ALARMS

None. This is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[4] COPY BKDISK STOPPED
CANNOT EXECUTE CHILD PROCESS

2. REASON FOR OUTPUT

To report the progress of the COPY:BKDISK input message or to indicate a problem.

3. VARIABLE FIELD DEFINITIONS

a = Status message. Valid value(s):
CANNOT LOCK PROCESS IN CORE = Cannot lock physical disk-to-tape (PDT) writer process 
program in core. This may slow down the system processing.
COM OPTION MISUSED. ISSUE COMMAND AGAIN. = The COM option was used on UNIX® 
RTR boot disks that do not have a common volume table of contents (VTOC). A 
common UNIX® RTR VTOC includes both the 3B20D very large main memory 
(VLMM) and the 3B21D lboot partitions. Issue the input message again without the 
COM option.
COM OPTION NEEDED. ISSUE COMMAND AGAIN. = The COM option is needed, since the 
UNIX® RTR boot disk disk image being created has a VTOC including both the 
3B20D VLMM and the 3B21D lboot partitions. Issue the input message again with 
the COM option.
COMPLETED. DISMOUNT DATABASE TAPE AND LABEL = Dismount the tape and label it as required by local procedures.
COMPLETED. DISMOUNT GENERIC TAPE AND LABEL = Dismount the tape and label it as required by local procedures.
COMPLETED. DISMOUNT TAPE AND LABEL = Dismount the tape and label it as required by local procedures.

DISMOUNT DATABASE TAPE LABEL AND MOUNT NEXT TAPE = End of tape has been reached. There are 10 minutes in which to dismount the tape, label it, and mount a new tape. COPY: BKDISK input message must be entered with the ACK option to continue the process (refer to COPY: BKDISK, Format 2).

DISMOUNT DATABASE TAPE LABEL AND MOUNT NEXT TAPE LAST CHANCE = If the previous message was not executed within the prescribed time limit, a new limit of 20 minutes is set.

DISMOUNT TAPE LABEL AND MOUNT NEXT TAPE = End of tape has been reached. There are 10 minutes in which to dismount the tape, label it, and mount a new tape. COPY: BKDISK input message must be entered with the ACK option to continue the process (refer to COPY: BKDISK, Format 2).

DISMOUNT GENERIC TAPE LABEL AND MOUNT NEXT TAPE LAST CHANCE = If the previous message was not executed within the prescribed time limit, a new limit of 20 minutes is set.

DISMOUNT GENERIC TAPE, LABEL AND MOUNT NEXT TAPE = End of tape has been reached. There are 10 minutes in which to dismount the tape, label it, and mount a new tape. COPY: BKDISK input message must be entered with the ACK option to continue the process (refer to COPY: BKDISK, Format 2).

IN PROGRESS = Procedure is proceeding normally.
STOPPED = Physical disk-to-tape writer has been stopped.
COMMON TAPE - BOTH LBOOTS WILL BE WRITTEN = For administrative modules (AMs) with a common VTOC, if one lboot partition is specified in the specfile, both lboot partitions will be written to tape.

b

= Error message. Valid value(s):
CAN'T OPEN DISK. CHECK DATA FIELD AND TRY AGAIN = The disk name given could not be opened. There may be an error in the arguments to the DISK keyword.

CAN'T OPEN TAPE. CHECK DATA FIELD AND TRY AGAIN = The tape name given could not be opened. There may be an error in the arguments to the TAPE keyword, or possibly the tape drive is not on-line.

CAN'T OPEN TAPE. NEED TO RE-WRITE ENTIRE SEQUENCE = The tape name given could not be opened. There may be an error in the arguments to the TAPE keyword, or possibly the tape drive is not on-line.

CANNOT OPEN TAPE DATA = This message indicates that the "open" to the tape device failed. This may be due to the tape drive being "off-line" or the tape being write protected. A message will follow indicating to mount tape and acknowledge. There will be four chances given to mount a tape.

CANNOT RUN WITH SYSTEM OR FIELD UPDATE, OR ANOTHER COPY BKDISK = The COPY: BKDISK message cannot run simultaneously with a field update or system update message (any UPD input message), and cannot run while another COPY: BKDISK message is in progress.

COPY: BKDISK; START WAS NOT ISSUED = A COPY: BKDISK input message with the ACK option was issued before a COPY: BKDISK message with the START option.
ERROR CODE xx = The procedure has been terminated for one of the reasons listed. Valid value(s):
1 = A read of the VTOC indicated zero bytes read.
Error on read of VTOC.
Second VTOC entry is not for 'VTOC' itself (the VTOC partitions may not be valid).
Failed on "setio" system call for tape.
Unable to open device directory "/dev".
The "stat()" UNIX® function failed to get device information for
the diskname specified.
The "stat()" UNIX® function failed to get device information for a
partition name in the "/dev" directory.
Two partition names specified in the specification file are
duplicate (map into the same partition on disk). Remove one
partition name and try again.
Error in reading /dev device directory entries.
Did not find "stat()" function information for all partition names
specified in specification file. One or more partition names
specified may reside in a different disk. Remove these partition
names and try again.
Failed on open of partition.
Failed on 'setio' system call for disk.
Error on read of partition.
Unable to add data segment to address space.
Can't open specification file. This file may not exist, or may be
zero length. Add required partition names and try again.
The COPY:BKDISK input message with the ACK option can not
open /tmp/pdt to get the process ID of the COPY:BKDISK
message with the START option.
Too many partitions specified in the specification file.
The "stat()" function failed to get device information for a partition
name in the "/etc/pdtspec" file (this partition may not exist); or the
"stat()" function could not find the name of the disk device or tape
entered on the message line. The name entered is not a special
device name. Replace the name and try again.
Name specified in the specification file is not a partition (file is not
a block device). Replace with proper partition name and try again.
The "lla_dbatt" function failed to attach to the system generation
database (SG) (to get the SG time stamp that is included in the
first header of a tape sequence).
The "lla_rgget" function failed to get the "sghdr_rec" record from
the SG.
Failed on "lla_dbrel" call.
The "getdbseg()" function failed to attach to the equipment
configuration database (ECD) (to get the generic version to be
included in the first header of a tape sequence).
The "lla_iatt()" function failed trying to attach to the incore
database.
A tape sequence was not effective for a generic or database
(internal error in the COPY:BKDISK message with the START
option). Try the entire procedure again.
The system call "close()" failed when trying to close the partition
that was opened to read the data.
The system call "unlink()" failed when trying to unlink the partition
already written to tape.
= The system call "mknod()" failed when trying to create a special device file or a partition.

= The system call "lseek()" failed when trying to find the disk offset to rewrite the tape.

= The "lla_rdget" function failed to get the ecdorg, ucb, or mdct records from the ECD.

= The "lla_get" function failed to get the logdev record from the ECD.

= The tape device being used is not compatible with the EXT option. The EXT option is always compatible with a 3B20D or an administrative work station (AWS) tape device, since data to be written is broken up into 6K-size records by default. On the 3B21D, data is not broken up into 6K-size records by default. This error occurs if you are on the 3B21D and the logdev record for the tape device specified:
  - is of type IOP
  - has a fixed blocking factor
  - has a blocking factor not equal to 6K

If necessary, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INVALID SPECFILE = Make sure that partition names were specified in the specification file.

MOUNT TAPE AND ACKNOWLEDGE = This message is printed after a previous request to mount a tape failed (for example, the "open()" of the tape failed), or if the COPY:BKDISK input message with the ACK option was not entered to continue the process. There are seven chances to mount a tape successfully, before the COPY:BKDISK input message with the START option aborts.

MOUNT TAPE AGAIN AND ACKNOWLEDGE LAST CHANCE = This message will be output as the last warning for mounting a tape successfully. The COPY:BKDISK message will abort after 20 minutes.

MRG OPTION INCORRECTLY USED = Specification file does not have database and generic partitions. This option should be used when there is a need to create one sequence for generic and database partitions.

RE-INITIALIZE ENTIRE SEQUENCE = This message indicates that the entire tape writing procedure must be re-initiated using the COPY:BKDISK input message with the START option.

TAPE CHANGE ACTION INCORRECT = The action taken to change the tape was incorrect. This can occur if the time limits were exceeded, an invalid tape size was entered, or no tape size was entered. This message is immediately followed by RE-INITIATE ENTIRE SEQUENCE.

TAPE SIZE OUT OF RANGE RE-ENTER MESSAGE = An incorrect tape size was entered for the tape device specified. The acceptable range for a 9-track tape is 600 to 2400 feet and the acceptable range for a digital audio tape (DAT) is 30-90 meters.

TAPE WRITE ERROR MOUNT NEW TAPE AND TRY AGAIN = A physical write error was encountered while writing to the tape. It may be necessary to mount a new tape, since write errors occur due to "bad spots" on tape. COPY:BKDISK input message must be entered with the ACK option to rewrite the tape.

TAPE WRITE ERROR. NEED TO RE-RIGHT ENTIRE SEQUENCE = A physical error was encountered while writing to the tape. This error may also appear if an incorrect device name was specified for 'EXT' (extended) format. Mount tape on proper device if necessary and enter COPY:BKDISK input message with the START
c = Tape library error code number. Refer to the APP:TAPE-LIB appendix in the Appendixes section of the Output Messages manual.

d = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

Format 1 execution errors (error codes 8, 10, 15, and 17 - 19) can be corrected by examining the procedures used for execution of the message.

Format 3 errors pertain to multi-volume digital audio tapes and will be accompanied by explanatory text. If the message indicates that there is a problem with the tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing the tape drive, verify that the tape is loaded and that the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Format 4 indicates that there is a problem invoking the /prc/3btpwrt process. Verify that the process exists and is executable. If these checks fail to uncover the problem, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the status of a request to copy the contents of a multi-volume digital audio tape (DAT) to a destination DAT.

3. VARIABLE FIELD DEFINITIONS

a = Request status. Valid value(s):
ABORTED = The copy failed and was aborted.
COMPLETED = The copy completed with no errors.
IN PROGRESS = The copy is in progress.
STARTED = The copy started.
STOPPED = The copy failed and was stopped.

b = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

c = Internal error code for failure of an equipment configuration database (ECD) access function.
Valid value(s):

1  = getdbseg failed, could not attach to the ECD.
2  = lla_iatt failed, could not attach to the incore database.
3  = lla_rdget failed, could not get the ecdorg record from the ECD.
4  = lla_get failed, could not get the logdev record for the source tape device from the ECD.
5  = lla_rdget failed, could not get the mdct record for the source tape device from the ECD.
6  = lla_rdget failed, could not get the ucb record for the source tape device from the ECD.
7  = lla_get failed, could not get the logdev record for the destination tape device from the ECD.
8  = lla_rdget failed, could not get the mdct record for the destination tape device from the ECD.
9  = lla_rdget failed, could not get the ucb record for the destination tape device from the ECD.
10 = rmovdbseg failed, could not remove incore database segments.

d  = Tape library error code number. Refer to the APP:TAPE-LIB appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

Errors will be accompanied by explanatory text. Verify that the message that was input is consistent with the COPY-BKTAPE input message manual page. If the message indicates that there is a problem with a tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing a tape drive, verify that a tape is loaded and that the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report.

MHD p PARTITION f SIZE m
PARTITION SIZES NOT EQUAL
STIME n ETIME o

2. REASON FOR OUTPUT
To report the result of executing a COPY:DIFF-SRC-MHD input message. STIME is the time the message was started. ETIME is used to indicate the elapsed time for a particular partition. The ETIME for the FINAL message is the total elapsed time.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the source disk of the moving head disk (MHD) drive.
b = Process step or reason code. Valid value(s):
f03 = Can't open equipment configuration database (ECD).
f06 = Can't get unit control block (UCB) of first unit by name.
f09 = Can't get UCB of second unit by name.
f12 = Can't get UCB of first unit's mate.
f15 = Can't get UCB of first unit's mate.
f18 = Can't reserve UCB of second unit.
f21 = Can't assign special device file name of second unit.
f24 = Can't open special device file of second unit.
f27 = Can't enable message reception.
f30 = Refer to the accompanying DKDRV error report on the receive-only printer.
f36 = Failed to close special device file of second unit.
f39 = Failed to release special device file of second unit.
f42 = Message to port failure.
f45 = Message reception failure.
f48 = Message to port failure.
f51 = Message reception failure.
f54 = Process timed out.
f57 = Failed to close special device file of second unit.
f60 = Failed to release special device file of second unit.
f63 = Failed to unreserve UCB of second unit.
f66 = Failed to close ECD.
c = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of this manual.
d = First disk block number (of a range) that mismatched while being compared.
e = Last disk block number (of a range) that mismatched while being compared.
f = Partition number in use when a mismatch was encountered.
g = Offset within partition when mismatch was detected.
h = Number of mismatches that were detected.
i = Number of corrections that were made.
j = Number of Input/Output jobs done.
k = Number of errors detected doing I/O.
l = Disk block number that failed to read or write.
m = Size of the partition given in disk blocks.
n = The time the compare of the partition was started. For the FINAL SUMMARY report, STIME indicates the start time of the input message.
o = Elapsed time for a partition to compare. For the FINAL SUMMARY report, the ETIME is the total elapsed time of all the partitions.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

Appropriate mismatch messages is generated indicating the range of disk blocks where the mismatch occurred. A maximum of eight mismatch error messages is output per partition. More than eight mismatch messages results in an early termination.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

COPY:ECD-TAPE

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] COPY ECD TAPE BEGINNING: PROCESS PID = a

[2] COPY ECD TAPE b CONTINUING [WITH ERROR CODE c] AT STEP d

[4] COPY ECD TAPE LABEL

[5] COPY ECD TAPE b STOPPED e

2. REASON FOR OUTPUT

To report progress of a request to copy the equipment configuration database (ECD) and system generation (SG) databases to tape. These messages are printed only in response to COPY:ECD-TAPE input message.

Format 1 reports that the input was accepted and the process has started.

Format 2 reports that the program is still in progress. If ERROR CODE is present, the program encountered a non-fatal error.

Format 3 reports that a certain step has been completed or the process has completed.

Format 4 is the header for the label which is to be cut out and attached to the tape just completed.

Format 5 reports that the program was stopped before completion due to a fatal error.

3. VARIABLE FIELD DEFINITIONS

a = Process identification number (PID). PID is used to stop the process if needed (use input message STOP:EXC-USER).

b = Tape sequence number. Since the process only produces one tape, ignore the tape number. Tape number is 0 during the most of the processing but will be 1 in the label.

c = Numeric code for errors that cause the program to stop (Format 5) or print a warning (Format 2). Valid value(s):
   104 = Unknown step code (program error).
   109 = Cannot generate checksum file for the data.
   110 = Cannot write to magnetic tape.
   111 = Cannot dump data base in ASCII format.
   127 = Cannot read results of "pwd" (present working directory) message.
   129 = Initial tape verification failed.
= Cannot initialize work area on disk.
144 = Cannot create file for site identification (nonfatal).
164 = Cannot create ("fork/exec") child process.
166 = Cannot generate Lsfile (nonfatal).
167 = Cannot create sumfile or Lsfile. Both are internal files used for verification of the contents when the tape is processed.
190 = Cannot execute "ls" (list) message.
191 = Lsfile is not consistent.
1099 = Ran out of buffer area for strings (program error).

c = Alphabetic code indicating a certain step in the process.
A = Initialization of temporary work area on disk.
B = Dumping ECD/SG data bases in ASCII format.
C = Writing ECD/SG data base files to tape.
Z = Initialization of the process such as decoding the input.

e = Reason for stopping. It is either a short self-explanatory phrase or a numeric error code (in the form of WITH ERROR CODEc). Refer to variable ‘c’ for the explanation of error codes.

4. ACTION TO BE TAKEN

When tape copy completes successfully, unmount the tape, cut out the label, attach the label to the tape and send it to the designated central location for processing.

Error codes 104 and 1099 indicate programming error or corruption of the program. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

When a tape write or read error is indicated, take one or more of the following corrective steps and re-enter the input message.
- Verify that the tape has a write ring.
- Retry with a clean fresh tape.
- Try the other tape unit if available.
- If the error persists, diagnose the magnetic tape (MT) and magnetic tape controller (MTC).
- Reset the tape drive and try in low density mode using the input option of TU=L0 or L1.

The remaining error codes indicate that the "/updtmp" file system is full or one of the ECD evolution programs is not executable. The following is an ordered list of possible corrections:
- Verify that "/updtmp" is empty and has write permission.
- Verify that any program update software update processing is not running.
- Verify that the retrofit software update is installed and that the program update processing has been completed.

5. ALARMS

None.

COPY:FSYS-CFILE

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] COPY FILESYS CFILE COMPLETED

[2] COPY FILESYS CFILE STOPPED
   a

2. REASON FOR OUTPUT

To report the result of executing a COPY:FSYS-CFILE input message to move a file to a contiguous area.

3. VARIABLE FIELD DEFINITIONS

   a = The description of the error encountered.

4. ACTION TO BE TAKEN

Format 1 indicates success, and no action is necessary.

If Format 2 is printed, the explanatory text will indicate the error encountered. Verify that the message that was input is consistent with the COPY:FSYS-CFILE input message manual page. Use the OP:ST-LISTDIR input message to verify that the file exists with the appropriate permissions. If the message indicates that there is not enough space on the file system, use the CLR:FSYS-FILE input message to remove some files to create the file space.

If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Type: Output

1. FORMAT

[1] COPY FILESYS FILE COMPLETED

[2] COPY FILESYS FILE STOPPED
   (Cannot access a |
    a and b are identical)

2. REASON FOR OUTPUT

To report the result of executing a COPY:FSYS-FILE input message to copy a file to another place.

3. VARIABLE FIELD DEFINITIONS

a = Pathname specified in the input message as the source file.
b = Pathname specified in the input message as the destination file.

4. ACTION TO BE TAKEN

Refer to the Input Messages manual for the correct format and reenter the message or check the status of the file using the OP:ST-LISTDIR input message if a Format 2 message is printed.

If any other error message is printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

APP:OMDB-X-REF
COPY:LOG-TAPE
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] COPY LOG TAPE SUCCESSFULLY COMPLETED FOR a

[2] COPY LOG TAPE STOPPED, NONEXISTENT OR EMPTY FILE a

[3] COPY LOG TAPE STOPPED, COULD NOT CREATE TEMPORARY FILE

[4] COPY LOG TAPE STOPPED, COULD NOT CREATE SITE FILE

[5] COPY LOG TAPE STOPPED, COULD NOT CREATE SUM FILE

[6] COPY LOG TAPE STOPPED, TAPE WRITE FAILED ON a

[7] COPY LOG TAPE STOPPED, COULD NOT CHANGE ROOT DIRECTORY

2. REASON FOR OUTPUT

To report the completion of a request to copy the named file from disk to magnetic tape, or to indicate problems that were encountered.

Format 1 indicates successful completion of the copying.

Format 2 indicates that the requested file does not exist or is empty.

Format 3 indicates that the temporary status indicator file "/tmp/copylog" could not be created.

Format 4 indicates that the file identifying the site could not be created.

Format 5 indicates that the file containing the hash sum of the requested file could not be created.

Format 6 indicates that a problem was encountered while trying to write the requested file to tape.

Format 7 indicates that the root directory of the process could not be changed.

3. VARIABLE FIELD DEFINITIONS

a  = Name of the requested file as entered in the input message.

4. ACTION TO BE TAKEN

For Format 1, unmount the tape and label it as the recent change log file tape. Send the tape to the designated
central location for office dependent data processing.

For Format 2, re-enter the filename correctly, or insure that the named file is non-zero in length. Refer to the associated input manual page for more information.

For Format 3, insure that the /tmp file system is mounted and is not full. If necessary, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 4, insure that the /tmp file system is mounted and is not full, and that the file /no5text/rcv/oddinfo exists and is executable. If necessary, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 5, insure that the /tmp file system is mounted and is not full, and that the file /bin/sum exists and is executable. If necessary, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 6, insure that the tape is mounted with a write ring, and that the tape drive is on-line. Use a new tape, and/or clean the tape drive head unit if necessary.

Format 7 indicates an unstable operating environment; retry the input message again later refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Where 'x' is the release-specific version of the specified manual.
235-105-24x Generic Retrofit Procedures
COPY:ODD-TAPE

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

2. REASON FOR OUTPUT

To report progress of a request to copy the office-dependent data (ODD) to tape. These messages are printed only in response to COPY:ODD-TAPE input message.

Format 1 reports that the input was accepted and the process has started.

Format 2 reports that the program is still in progress. If ERROR CODE is present, the program encountered a non-fatal error.

Format 3 reports that a certain step has been completed or the process has completed.

Format 4 is the header for the label which is to be cut out and attached to the tape just completed.

Format 5 reports that the program was stopped before completion due to a fatal error.

Format 6 reports completion of one tape and instructs the user to mount the next tape.

3. VARIABLE FIELD DEFINITIONS

ALL = The input message was entered with “ALL” keyword (for example, COPY:ODD:TAPE:ALL).

a = Process identification number (PID). PID is used to stop the process if needed (use input message STOP:EXC-USER).

b = Sequence number of the tape.

c = Numeric code for errors that cause the program to stop (Format 5) or print a warning (Format 2).
   Valid value(s):
   104 = Unknown step code (program error).
109 = Cannot generate checksum file for the data.
110 = Cannot write to magnetic tape.
111 = Cannot dump data base in ASCII format.
127 = Cannot read results of "pwd" (present working directory) message.
129 = Initial tape verification failed.
142 = Cannot initialize work area on disk.
144 = Cannot create file for site identification (nonfatal).
164 = Cannot create ("fork/exec") child process.
166 = Cannot generate lsfile (nonfatal).
167 = Cannot create sumfile or lsfile. Both are internal files used for verification of the contents when the tape is processed.
190 = Cannot execute "ls" (list) message.
191 = Lsfile is not consistent.
194 = DBRETROCHK function failed.
1099 = Ran out of buffer area for strings (program error).

d = Alphabetic code indicating a certain step in the process. Valid value(s):
A = Initialization of temporary work area on disk.
P = Writing ODD files to magnetic tape.
W = Waiting for a new tape to be mounted.
Z = Initialization of the process.

e = Reason for stopping. It is either a short self-explanatory phrase or a numeric error code (in the form of WITH ERROR CODEc). Refer to variable ‘c’ for the explanation of error codes.

4. ACTION TO BE TAKEN

When copy of a tape completes successfully, unmount the tape, cut out the label printed on the receive-only printer (ROP) and attach the label to the tape. When the output message indicates a need for another tape (Format 6), mount a new tape and enter input message COPY:ODD-TAPE using the CONTINUE option. Make sure the new tape is mounted on the same tape unit as the previous one. After the process is complete, send all the tapes to the designated central location for processing.

Error codes 104 and 1099 indicate programming error or corruption of the program. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

When a tape write or read error is indicated, take one or more of the following corrective steps and re-enter the input message.
- Verify that the tape has a write ring.
- Retry with a clean fresh tape.
- Try the other tape unit if available.
- If the error persists, diagnose the magnetic tape (MT) and magnetic tape controller (MTC).
- Reset the tape drive and try in low density mode using the input option of TU=L0 or L1.

The remaining error codes indicate that the "/updtmp" file system is full or one of the internal messages is not executable. The following is an ordered list of possible corrections:
- Verify that "/updtmp" is empty and has write permission.
- Verify that any program update software update processing is not running.
- Verify that the retrofit software update is installed and that the program update processing has been completed.
5. ALARMS

None.

Type: Output

1. FORMAT

[1] COPY OOSDISK STOPPED WITH ERROR CODE a

__________________________________________________________________

[2] COPY OOSDISK COMPLETED

__________________________________________________________________

2. REASON FOR OUTPUT

To report the result of executing a COPY:OOSDISK input message.

3. VARIABLE FIELD DEFINITIONS

a = Numeric code for the error that caused the process to terminate. The least significant digit (represented as ‘x’) indicates the module in which the error occurred. ‘x’ is not provided.

Errors associated with UNIX® system calls. Valid value(s):
01x = mkseg error.
02x = Open error.
03x = Read error.
04x = Stat error.
05x = Write error.
06x = Close error.
07x = Unlink error.
08x = setio error.
09x = mknod error.
0x = msgenab error.
1x = Send error.
2x = msgport error.
3x = Mount error.
4x = umount error.
5x = cp error.

Errors associated with input message format. Valid value(s):
20x = Invalid arguments. The source or destination filename may not exist.
22x = Process stopped by an interrupt or termination signal.
25x = Bad pathname specified for source file.
26x = Disk containing source file is active.

Errors associated with the system integrity monitor (SIM), the maintenance input request administrator (MIRA), and the disk driver. Valid value(s):
30x = Message not what was expected.
31x = Tried to reserve two disks.
32x = Tried to release unreserved disk.

Errors associated with equipment configuration data base manager (ECDMAN) user functions.

50x = ugetucb error.
51x = ugmamirids error.
52x = ursvucb error.
53x = ugsdf error.
54x = urelucb error.
55x = ursdf error.
56x = usettnum error.
57x = usetucb error.

4. ACTION TO BE TAKEN

User execution errors can be corrected by examining the procedures used for execution of the message. If any other errors occur, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

COPY:PTN-ALL

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] COPY PTN ALL COMPLETED
   a  BLOCKS COPIED
   .
   .

[2] COPY PTN ALL STOPPED
   {INVALID SOURCE/DESTINATION SPECIFIED b  |
   PROCESS STOPPED b  |
   DISK ACCESS PROCEDURE ABORTED b  |
   CANNOT COPY PARTITION b  |
   DISK RESTORAL PROCEDURE ABORTED b  |
   CANNOT CONNECT TO SYSTEM UPDATE PORT}

2. REASON FOR OUTPUT

Format 1 indicates the input message completed and successfully invoked the process that copies partitions. For each partition, the number of blocks copied is output.

Format 2 indicates the process that copies partitions did not complete successfully. The reason for stopping is indicated.

3. VARIABLE FIELD DEFINITIONS

a  = Number of blocks copied (for each partition copied).

b  = Numeric code for the error that caused the process to terminate. The least significant digit (represented as 'x') indicates the module in which the error occurred. 'x' is not provided.

Errors associated with UNIX® operating system calls. Valid value(s):

01x  = mkseg error.
02x  = Open error.
03x  = Read error.
04x  = Stat error.
05x  = Write error.
06x  = Close error.
07x  = unlink error.
08x  = setio error.
09x  = mknod error.
0x   = msgenab error.
1x   = Send error.
2x   = msgport error.
Errors associated with execution. Valid value(s):

20x  = Invalid arguments. The source or destination filename may not exist, or does not contain a valid list of partition names. The source/destination partition names specified may not be special devices, or they do not exist in the disk. Make sure that valid source/destination partition names are used.

21x  = Destination is small. Cannot copy to a partition that is smaller than the source partition. Make sure that the destination partition specified is not smaller than the source partition.

22x  = Process stopped by an interrupt or termination signal.

23x  = Cannot overwrite destination partition. The destination specified may be an active partition or currently in use. For example, if the system is running on primary, /dev/root is an active partition. A partition with no backup is considered an active partition. Make sure that the destination partition specified is not an active partition.

24x  = Disk is not duplexed. Need both disks active before attempting to do a partition copy.

Errors associated with the system integrity monitor (SIM), the maintenance input request administrator (MIRA), and the disk driver. Valid value(s):

30x  = Message not what was expected.

31x  = Tried to reserve two disks.

32x  = Tried to release unreserved disk.

33x  = New disk state bad.

36x  = Timeout for MIRA message.

37x  = Timeout for disk driver message.

38x  = Bad MIRA return on message.

39x  = Bad disk driver return on message.

40x  = State result bad.

41x  = Timeout for SIM message.

Errors associated with the equipment configuration database manager (ECDMAN) user functions. Valid value(s):

50x  = ugetucb error.

51x  = ugmamirids error.

52x  = ursvucb error.

53x  = ugsdf error.

54x  = urelucb error.

55x  = ursdf error.

56x  = usettnum error.

57x  = usetucb error.

58x  = ugetrec error.

4. ACTION TO BE TAKEN

For codes 20x–24x, correct the problem and re-enter the input message. If any other error message is printed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

Manual alarm. This alarm is a manually-requested report.
None. This is an automatically-generated report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

235-105-210  Routine Operations and Maintenance
COPY:REG

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT
COPY REG a b #c

2. REASON FOR OUTPUT
To report the completion of a COPY:REG input message.

3. VARIABLE FIELD DEFINITIONS
   a = Valid register name (valid register names are listed in the COPY:REG input manual page).
   b = Termination status of the operation. Valid value(s):
       COMPLETED = Request successfully completed.
       NOT STARTED NGPID = The COPY was stopped because the process does not exist.
       NOT STARTED NGUID = The COPY was stopped because no copies of the process exist.
       STOPPED NGADDR = The COPY was stopped because the address specified is not valid for the
           process, or invalid address values were encountered in the address chain if offsets were
           specified.
       STOPPED NGCOPY = The COPY was stopped because some other error occurred in moving the
           data.
       STOPPED NGPROT = The COPY was stopped because the destination address does not have write
           permission granted.
   c = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'b' =</th>
<th>Action:</th>
</tr>
</thead>
</table>
| NOT STARTED NGPID               | The process did not exist at the time the COPY was attempted. Consider using the process
|                                 | UID instead of the PID.                                                                      |
| NOT STARTED NGUID               | The process did not exist at the time the COPY was attempted. If this happens repeatedly, a
|                                 | breakpoint could be defined and enabled for the process while no copies of the process exist. |
|                                 | At the time a copy is created, the breakpoint would be planted in the enabled state.         |
| STOPPED NGADDR                  | Recheck the program listings. If offsets were specified, try breaking the chain into several |
|                                 | parts and printing the intermediate addresses. Another possibility is to define a breakpoint for |
|                                 | that process and use the COPY message in the action list. This will help control the exact    |
|                                 | circumstances under which the operation is performed.                                       |
| STOPPED NGPROT                  | Recheck the destination to verify that it indicates a writable area.                         |

5. ALARMS
None. This is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

COPY:SPDISK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] COPY SPDISK COPIED a BLOCKS

[2] COPY SPDISK COMPLETED

[3] COPY SPDISK STOPPED WITH ERROR CODE b

2. REASON FOR OUTPUT
To report the result of executing a COPY:SPDISK input message, and to provide status information.

3. VARIABLE FIELD DEFINITIONS

a = Number of blocks written for each partition copied.

b = Numeric code for the error that caused the process to terminate. The least significant digit (represented as 'x') indicates the module in which the error occurred. 'x' is not provided.

Errors associated with UNIX® system calls. Valid value(s):

01x = mkseg error.
02x = Open error.
03x = Read error.
04x = Stat error.
05x = Write error.
06x = Close error.
07x = unlink error.
08x = setio error.
09x = mknod error.
10x = msgenab error.
11x = send error.
12x = msgport error.

Errors associated with input message format.

20x = Invalid arguments. The source or destination filename may not exist, or does not contain a valid list of partition names. The source/destination partition names specified may not be special devices, or they do not exist in the disk. Make sure that valid source/destination partition names are used.

21x = Destination is small. Cannot copy to a partition that is smaller than the source partition. Make sure that the destination partition specified is not smaller than the source partition.

22x = Process stopped by an interrupt or termination signal.

24x = Disk is not duplexed. Need both disks active before attempting to do a cpspdisk.
Errors associated with the system integrity monitor (SIM), the maintenance input request administrator (MIRA), and the disk driver. Valid value(s):

30x = Message not what was expected.
31x = Tried to reserve two disks.
32x = Tried to release unreserved disk.
33x = New disk state bad.
36x = Timeout for MIRA message.
37x = Timeout for disk driver message.
38x = Bad MIRA return on message.
39x = Bad disk driver return on message.
40x = State result bad.
41x = Timeout for SIM message.

Errors associated with equipment configuration data base manager (ECDMAN) user functions. Valid value(s):

50x = ugetucb error.
51x = ugmamirids error.
52x = ursvucb error.
53x = ugsdf error.
54x = urelucb error.
55x = ursdf error.
56x = usettnum error.
57x = usetucb error.

4. ACTION TO BE TAKEN

User execution errors can be corrected by examining the procedures used for execution of the message. If any other errors occur, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

1. FORMAT

[1] COPY TAPE EMERDMP COMPLETED
   a

[2] COPY TAPE EMERDMP STOPPED
   b

2. REASON FOR OUTPUT

To report the result of executing a COPY:TAPE-EMERDMP input message to copy emergency dump data from a
disk partition to a magnetic tape with a header block.

Format 1 is printed when the input message executes successfully. Format 2 is printed when errors are
encountered.

3. VARIABLE FIELD DEFINITIONS

a  = Record counts.
b  = Text explaining why the message was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates success and requires no action.

For Format 2, refer to the Input Messages manual and correct any message line errors. If the text is not
self-explanatory,

5. ALARMS

refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Output Appendix(es):
COPY:TAPE-TOP

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] COPY TAPE TOP COMPLETED
   a + a records in
   a + a records out
   [a + a records in]
   [a + a records out]

__________________________________________________________________

[2] COPY TAPE TOP STOPPED
   b

__________________________________________________________________

2. REASON FOR OUTPUT

To report the result of executing a COPY:TAPE-TOP input message to copy a tape-only program (TOP) file from disk to tape.

Format 1 prints when the input message executes successfully, and the COM option is not used. This output prints when copying the standard main memory (SMM) or extended main memory (EMM) TOP file, the very large main memory (VLMM) TOP file, or the 3B21D TOP file, based on the hardware-platform type.

The optional lines print when copying both the VLMM TOP file and the 3B21D TOP file and are displayed in that order.

Format 2 prints when errors are encountered.

3. VARIABLE FIELD DEFINITIONS

a = Record counts.
b = The pathname of a TOP file.
c = The pathname of the specified tape drive.
d = Error message. Valid value(s):
   NO TOPFILE EXISTS
   UNKNOWN HARDWARE PLATFORM
   dd: cannot open b
   dd: cannot create c
   dd: not enough memory
   dd read error
   dd write error

4. ACTIONS TO BE TAKEN
If 'd' =

<table>
<thead>
<tr>
<th>Condition</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO TOPFILE EXISTS</td>
<td>Verify the correct topfile is present in the /etc directory.</td>

Input Message(s):

COPY:TAPE-TOP
COPY:UID

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] COPY UID a ADDR b c #d

[2] COPY UID NOT STARTED
   CONFLICT WITH CURRENT SYSTEM STATUS BAD PID

[3] COPY UID NOT STARTED
   INVALID ID FIELD e

[4] COPY UID NOT STARTED
   RETRY LATER f

2. REASON FOR OUTPUT

To report the completion of a COPY:UID input message.

3. VARIABLE FIELD DEFINITIONS

a = Utility ID of process.
b = Virtual address.
c = Termination status of the operation. Valid value(s):
   COMPLETED = Request successfully completed.
   NOT STARTED NGPID = The COPY was stopped because the process does not exist.
   NOT STARTED NGUID = The COPY was stopped because no copies of the process exist.
   STOPPED NGADDR = The COPY was stopped because the address specified is not valid for the
                     process, or invalid address values were encountered in the address chain if offsets
                     were specified.
   STOPPED NGCOPY = The COPY was stopped because some other error occurred in moving the
                    data.
   STOPPED NGPROT = The COPY was stopped because the destination address does not have write
                    permission granted.

d = Generic access package (GRASP) execution sequence number.
e = Test phrase. Valid value(s):
   EXTRA KEYWORD (PID).
   INCONSISTENT KEYWORDS (NL-OFF).
   INPUT ERROR (OFF COUNT).
   INVALID KEYWORD.
   RANGE ERROR (L or NL).
RANGE ERROR (PID).
RANGE ERROR (UVAR).

f = The system is in an overload condition.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'c' =</th>
<th>Action:</th>
</tr>

COPY:UT-CMP

Software Release: 5E14 and later
Message Class: UT
Application: 5
Type: Output

1. FORMAT

[1] COPY UT CMP=a-b {MATE|PRIM} {ADDR c|REG d|UVAR e |VAL f} i

[2] COPY UT CMP=a-b {MATE|PRIM} i
               SYMIDX g GVAR h

2. REASON FOR OUTPUT

To report the status of the response to the COPY:UT-CMP input message. This output uses the information from field one of the input message for COMPLETED message responses. When an error occurs the information will be from the field of the input message found to be in error.

Format 1 reports the status of a COPY:UT-CMP input message defined by a physical address, microprocessor register, utility variable, or a constant value.

Format 2 reports the status of a COPY:UT-CMP input message defined by a symbolic reference.

3. VARIABLE FIELD DEFINITIONS

MATE = Message was executed in the standby communications module processor (CMP).
PRIM = Message was executed on the active CMP.
a = Message switch side.
b = CMP number.
c = Absolute physical address. This can be the destination address, the source address, or the offset of an address to be added to or subtracted from the source. This varies with where in the message the error was found.
d = Register name used in the section of the input message where the error was found.
e = Utility variable used in the section of the input message where the error was found.
f = Value used in the section of the input message where the error was found.
g = Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name 'h'. If an invalid input message is entered, the symbol index number will be "-1".
h = Symbolic name specified in the input message or determined by the UT code based on the symbol index number 'g'. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
i = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

If appropriate, correct the specified input message and repeat.

5. ALARMS

g = Utility variable (UVAR) used in the section of the input message where the error was found.
h = Input value (VAL) used in the section of the input message where the error was found.
i = Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name 'j'. If an invalid input message is entered, the symbol index number will be "-1".
j = Symbolic name specified in the input message or determined by the UT code based on the symbol index number 'i'. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
k = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendices section of the Output Messages manual.
4. ACTION TO BE TAKEN

If appropriate, correct the specified input message and repeat.

5. ALARMS

None.

6. REFERENCES

Application: 5
Type: Output

1. FORMAT

[1] COPY UT SM=a [MATE] {ADDR b|REG c|UVAR d|VAL e} h

__________________________________________________________________

SYMIDX f GVAR g

__________________________________________________________________

2. REASON FOR OUTPUT

To report the status of the response to the COPY:UT-SM input message. This output uses the information from field one of the input message for COMPLETED message responses. When an error occurs the information will be from the field of the input message found to be in error.

Format 1 reports the status of a COPY:UT-SM input message defined by a physical address, microprocessor register, utility variable, or a constant value.

Format 2 reports the status of a COPY:UT-SM input message defined by a symbolic reference.

3. VARIABLE FIELD DEFINITIONS

MATE = Operation was performed on the mate side of the processor.
a = Switching module number.
b = Absolute physical address. This can be the destination address, the source address, or the offset of an address to be added to or subtracted from the source. This varies with where in the message the error was found.
c = Register name used in the section of the input message where the error was found.
d = Utility variable used in the section of the input message where the error was found.
e = Value used in the section of the input message where the error was found.
f = Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name ‘g’. If an invalid input message is entered, the symbol index number will be "-1".
g = Symbolic name specified in the input message or determined by the UT code based on the symbol index number ‘f’. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a ‘*’ to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
h = Termination report. Refer to the APP:UT-OM-REASONS appendix in the Appendixes section of the Output Messages manual.
4. ACTION TO BE TAKEN

If appropriate, correct the specified input message and repeat.

5. ALARMS

None.

COPY:UVAR

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

COPY UVAR a b #c

2. REASON FOR OUTPUT

To report the completion of a COPY:UVAR input message.

3. VARIABLE FIELD DEFINITIONS

a = Source of the data copied. Utility variable number.

b = Termination status of the operation. Valid values are:
   COMPLETED = Request successfully completed.
   NOT_STARTED NGPID = The COPY was stopped because the process does not exist.
   NOT_STARTED NGUID = The COPY was stopped because no copies of the process exist.
   STOPPED NGADDR = The COPY was stopped because the address specified is not valid for the
   process, or invalid address values were encountered in the address chain if offsets were specified.
   STOPPED NGPROT = The COPY was stopped because the destination address does not have write
   permission granted.
   STOPPED NGCOPY = The COPY was stopped because some other error occurred in moving the
   data.

c = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If ‘b’ =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT_STARTED NGPID</td>
<td>The process did not exist at the time the COPY was attempted. Consider using the process UID instead of the PID.</td>
</tr>
<tr>
<td>NOT_STARTED NGUID</td>
<td>The process did not exist at the time the COPY was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.</td>
</tr>
<tr>
<td>STOPPED NGADDR</td>
<td>Recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the COPY message in the action list. This will help control the exact circumstances under which the operation is performed.</td>
</tr>
<tr>
<td>STOPPED NGPROT</td>
<td>Recheck the destination to verify that it indicates a writable area.</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To report that a customer-originated trace has been sent to an authorized agency. If the data link between the
authorized agency and the switch is inoperable, the customer-originated trace will be sent to the authorized agency
when the link is restored.

3. VARIABLE FIELD DEFINITIONS

a  = Time of the customer-originated trace (COT) request, in the form hour:minute:second.
b  = Directory number (DN) of calling line.
c  = Time of the call, in the form hour:minute.
d  = Date of the call, in the form month/day.
e  = Calling line uniqueness indicator. Valid value(s):
    N  = The calling DN is nonunique. This indicates the sharing of an address between
two or more terminals.
    U  = The calling DN is unique. This indicates that the calling address identifies a
specific station.
    ?  = Unknown.

f  = Multiple call indicator. Valid value(s):
    M  = A call was already active when this call updated the incoming line history block
(ILHB).
    S  = No call was active when this call updated the ILHB.

g  = DN of the customer who originated the trace.
h  = Line equipment number (LEN) of the customer who originated the trace.
i  = Screening indicator. Valid value(s):
    F  = User provided, screened and failed.
    N  = Network-provided DN.
    P  = User provided, screened and passed.
    U  = User-provided, not screened.
    ?  = Unknown provider.

j  = Type of address. Valid value(s):
I = International.
L = Local.
N = National.
? = Unknown.

k = Numbering plan. Valid value(s):
I = Integrated services digital network (ISDN).
P = Private.
T = Telephony.
? = Unknown.

4. ACTION TO BE TAKEN
None.

23. CUTCORC
**CUTCORC:0**

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5  
**Type:** Output

### 1. FORMAT

1. **CUTCORC NOT STARTED**
   - NO ARGUMENTS SHOULD BE PROVIDED  
   - COULD NOT CHANGE TO DIRECTORY a  
   - COULD NOT OPEN FILE b FOR WRITING  
   - COULD NOT OPEN FILE b FOR READING  
   - COULD NOT COMMUNICATE WITH OSDS  
   - COULD NOT BEGIN TRANSACTION  
   - COULD NOT OPEN RELATION c

2. **CUTCORC STOPPED**
   - COULD NOT CREATE FILE b  
   - COULD NOT SEEK TO END OF FILE b  
   - COULD NOT WRITE TO FILE b  
   - COULD NOT BEGIN TRANSACTION  
   - COULD NOT OPEN RELATION c  
   - COULD NOT COMMIT TRANSACTION

3. **CUTCORC ABORTED**
   - INTERRUPTED BY SIGNAL

4. **CUTCORC IN PROGRESS**
   - d INPUT LINES PROCESSED  
   - e ERRORS

5. **CUTCORC COMPLETED**
   - d TOTAL INPUT LINES PROCESSED  
   - e TOTAL ERRORS

### 2. REASON FOR OUTPUT

To report the status of executing the "/no5text/rcv/cutcorc" program with the EXC:ENVIR-UPROC input message. The cutcorc program is used to apply customer originated recent changes (CORCs) into the data base of a new switch during switch cutover.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Pathname of the work directory.  
- **b** = Pathname of a file.  
- **c** = Relation name.
\( d \) = Number of input lines for which processing was attempted.
\( e \) = Number of input lines that could not be processed.

4. **ACTION TO BE TAKEN**

If a message with Format 1, 2, or 3 is received, correct the cause of the failure, remove the output files, and issue the EXC:E-UPROC input message to restart the "/no5text/rcv/cutcorc" program.

Format 4 indicates that the program is still running and requires no action.

Format 5 indicates that the program has completed. The file "/rclog/cutcorc.ok" contains the data that was successfully processed and loaded into the data base. If any errors occurred in the CUTCORC processing, the file "/rclog/cutcorc.bad" will contain the data that could not be processed, and the file "/rclog/cutcorc.err" will describe the reasons why any input lines could not be processed. The user may issue the DUMP:F-ALL input message to list any of these files.

After correcting the cause of the failures, copy the file "/rclog/cutcorc.bad" to "/rclog/cutcorc.in" using the COPY:FSYS-FILE input message. Then issue the EXC:ENVIR-UPROC input message to restart the "/no5text/rcv/cutcorc" program to process the lines that encountered errors.

5. **ALARMS**

None.

[7] DEL ACSR DN_LOCDN FAILED, INVALID TN

[8] DEL ACSR DN_LOCDN FAILED, BAD DIGIT COUNT

[9] DEL ACSR DN_LOCDN FAILED, DB FAILED

2. REASON FOR OUTPUT

To report completion status of the DEL:ACSR input message.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

If Format 1 is printed, user action is not required.

If Format 2 is printed, an audit is scheduled to correct data inconsistency. User action is not required.

If Format 3, repeat the DEL:ACSR input message.

If Format 4 is printed, the request for a given primary directory number (PDN) was not found in the automatic customer station rearrangement (ACSR) queue. Use the OP:ACSR input message to determine whether any ACSR requests are present in the ACSR queue.

If Format 5 is printed, the data base manager was unable to close a data base transaction. Re-enter the DEL:ACSR
input message.

If Format 6, re-enter the DEL:ACSR input message using a 10 digit Directory Number/TN.

If Format 7, re-enter the DEL:ACSR input message using a valid Directory Number/TN.

If Format 8, re-enter the DEL:ACSR input message using a valid 7 or 10 digit Directory Number/TN.

If Format 9, re-enter the DEL:ACSR input message.

5. ALARMS

   [3] DGN AIUCOM=a-b-c w [x]

   [4] DGN AIUCOM=a-b-c COMPLETED y [PH z]

2. **REASON FOR OUTPUT**

   To report the results of executing a DGN:AIUCOM input message to diagnose an access interface unit common
data and control controller (COMDAC).

   Format 1 is printed when a test has failed.

   Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input
   message. An ordered list of suspected faulty equipment is provided.

   Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not
   continue.

   Format 4 prints when the specified phase(s) has completed.

3. **VARIABLE FIELD DEFINITIONS**

   a  = Switching module (SM) number.
   b  = AIU number.
   c  = COMDAC number.
   d  = Number of the phase in which the failure occurred.
   e  = Number of the segment in which the failure occurred.
   f  = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.

h = Actual result in hexadecimal for the specified test.

i = Mask in hexadecimal used to determine test failure.

j = Expected result in hexadecimal for the specified test.

k = Floor and aisle number.

l = Module type.

m = Module number.

n = Cabinet type.

o = Cabinet number.

p = Replacement equipment code(s).

q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]</td>
<td>[:C] [-] D[:E]...[:F]</td>
</tr>
</tbody>
</table>

: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

t = Depth location in the cabinet.

u = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
_____ = Equipment is part of the circuit under test.
= Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

**w**

= Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Requested action was completed successfully.
NOT STARTED = Requested action was not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

**x**

= Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

**y**

= Phase result.

**z**

= Phase number completed.

**a**

= Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

---

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of executing a DGN:AIULC input message to diagnose an access interface unit (AIU) line circuit (LC).

Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = AIU number.
c = Line pack (LP) number.
d = LC number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Actual result in hexadecimal for the specified test.

j = Mask in hexadecimal used to determine test failure.

k = Expected result in hexadecimal for the specified test.

l = Floor and aisle number.

m = Module type.

n = Module number.

o = Cabinet type.

p = Cabinet number.

q = Replacement equipment code(s).

r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE   FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-] D[:E]...[:F]</td>
<td>:</td>

   __________________________________________________________

   **[4]**  
   
   DGN AIULP=a-b-c COMPLETED y [PH z]

   __________________________________________________________

2. **REASON FOR OUTPUT**

   To report the results of executing a DGN:AIULP input message to diagnose an access interface unit (AIU) line pack (LP).

   Format 1 is printed when a test has failed.

   Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

   Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

   Format 4 prints when the specified phase(s) has completed.

3. **VARIABLE FIELD DEFINITIONS**

   a = SM number.  
   b = AIU number.  
   c = LP number.  
   d = Number of the phase in which the failure occurred.  
   e = Number of the segment in which the failure occurred.  
   f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.

h = Actual result in hexadecimal for the specified test.

i = Mask in hexadecimal used to determine test failure.

j = Expected result in hexadecimal for the specified test.

k = Floor and aisle number.

l = Module type.

m = Module number.

n = Cabinet type.

o = Cabinet number.

p = Replacement equipment code(s).

q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-] D[:E]...[:F]</td>
<td></td>
</tr>
<tr>
<td>:</td>
<td>= Intra-field delimiter.</td>
</tr>
<tr>
<td>-</td>
<td>= Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>A</td>
<td>= Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>= Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>= Additional compatible equipment code(s) (added as space permits).</td>
</tr>
<tr>
<td>D</td>
<td>= Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>= Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>= Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

t = Depth location in tenths of an inch in the cabinet.

u = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

___ = Equipment is part of the circuit under test.

v = Refer to the APP:TLP-NOTE appendix in the Appendices section of the Output Messages manual.
for definition of TLP note.

\[ w \]
\[ = \] Action status report. Valid value(s):
\[ \text{ABORTED} = \] Requested action was terminated before completion, and the termination was not graceful.
\[ \text{COMPLETED} = \] Requested action was completed successfully.
\[ \text{IN PROGRESS} = \] Requested action is in progress.
\[ \text{NOT STARTED} = \] Requested action was not begun.
\[ \text{STOPPED} = \] Requested action was terminated before a normal completion. Termination was graceful.

\[ x \]
\[ = \] Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

Note: The AIULP diagnostic runs AIULP and access interface unit line circuit (AIULC) phases. If all of the AIULP phases pass, but one or more of the AIULC phases fail, the AIULP diagnostic will still output an ATP result. In this case, failing the entire AIULP diagnostic would leave too much circuitry out-of-service (OOS). Instead, only the AIULC will be left OOS.

\[ y \]
\[ = \] Phase result.

\[ z \]
\[ = \] Phase number completed.

\[ a^1 \]
\[ = \] Text identifier showing order of record. Valid value(s):
\[ \text{FIRST} = \] First record of continuing list.
\[ \text{LAST} = \] Last record of list.
\[ \text{NEXT} = \] Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

### 4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action required.

### 5. ALARMS

None.

__________________________________________________________________

[4] DGN AIURG=a-b-c COMPLETED y [PH z]
__________________________________________________________________

2. REASON FOR OUTPUT

To describe the result of the DGN:AIURG input message that is issued to diagnose an access interface unit (AIU) ringing generator (RG) circuit.

Both Formats 1 and 2 print when one or more tests have failed. Format 2 provides an ordered list of suspected faulty circuit packs.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue. If the termination report is 'NOT STARTED', an incorrect phase number was specified in the input message.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue if some test has failed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = AIU number.
c = RG number.
d = Number of the phase in which the error occurred.
e = Number of the segment in which the error occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test.

h = Expected result for the specified test (in hexadecimal).

i = Mask used to determine the test failure (in hexadecimal).

j = Actual result of the specified test (in hexadecimal).

k = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

l = Floor and aisle number.

m = Switching module type.

n = Switching module number.

o = Cabinet type.

p = Cabinet number.

q = Circuit pack code number.

r = Equipment form. The equipment form represents the minimal operating level of replacement equipment.

s = Vertical location in the cabinet.

t = Horizontal location in the cabinet.

u = Circuit type.

v = Note number. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

w = Type of termination. Valid value(s):
   ABORTED = Immediate termination.
   NOT STARTED = Action has not begun.
   STopped = Terminated before normal completion.

x = Information the qualifies the previous termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

y = Phase result. Valid value(s):
   ATP = All tests were performed and all passed.
   CATP = Some tests were skipped because supporting hardware was not available, but all tests that were run passed.
   NTR = No tests were run.
   STF = Some tests failed.

z = Number of the phase that has completed.
4. ACTION TO BE TAKEN

For Format 1, analyze the failure data to determine the reason for failure.

For Format 2, replace the suspect packs one at a time in the order specified. Rerun the diagnostic after each replacement until the fault is repaired or the diagnostic result changes.

For Format 3, if the termination report is 'NOT STARTED', an incorrect phase number was specified in the input message. Determine the correct phase number and reissue the exercise message.

If unexpected results occur, refer to the Corrective Maintenance manual.

For Format 4, if the phase result is STF, take action indicated by Formats 1 and 2.

5. ALARMS

Alarms may be triggered because:

- The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.
- A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.
- A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.
- The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

2. REASON FOR OUTPUT

To report the result of executing a DGN:ALIT input message to diagnose the automatic line insulation test (ALIT).

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = MSU board number.
Phase number.

Segment number.

Test number.

Mismatch results for the specified test in hexadecimal.

Expected result in hexadecimal.

Mask used to determine test failure in hexadecimal.

Actual result in hexadecimal.

Identification number of floor and aisle.

Module type.

Module number.

Cabinet type.

Cabinet number.

Replacement equipment code(s).

Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to subsequent example.

Example of Code

FORM content: CODE
FORM A[:B]...[:C] [-]
D[:E]...[:F]

: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

___ = Equipment is part of the circuit under test.

w = Type of termination. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

x = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

y = Phase result.

z = Phase number completed.

a¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b¹ = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

c¹ = Statement number.

d¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

2. REASON FOR OUTPUT

To report the result of executing Master Control Center (MCC) diagnostic/restore request or DGN:BTSR input message to diagnose the bootstrapper board (BTSR).

Format 1 is printed when the specified phase(s) have been completely executed and all tests passed. Execution of the diagnostic will continue for any remaining iterations.

Format 2 is printed when the specified phase(s) have been completed but some tests were not run because the mate MCTSI is not available. All tests that ran were ATP so the final result is ‘conditionally’ ATP. Execution of the diagnostic will continue for any remaining iterations.

Format 3 is printed when the specified phase(s) have been completed but no tests were run. Execution of the diagnostic will continue for any remaining iterations. An NTR results from Phase 2 when the mate MCTSI is not available.

Format 4 is printed when a test has failed.

Format 5 is printed when the trouble location procedure (TLP) was specified in the input message and a test has failed. An ordered list of equipment where a fault might be located is provided. Refer to the APP:STD-REPAIR appendix in the Appendices section of the Output Messages manual.
Format 6 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

- a = Switching module (SM) number.
- b = Number of the phase in which the failure occurred.
- c = Number of the segment in which the failure occurs.
- d = Number of the test that failed.
- e = Mismatch results for the specified test in hexadecimal.
- f = Expected results for the specified test in hexadecimal.
- g = Mask used before determining test failure in hexadecimal.
- h = Actual result for the specified test in hexadecimal before mask and compare operations.
- i = Identification number of floor and aisle.
- j = Module type.
- k = Module number.
- l = Cabinet type.
- m = Cabinet number.
- n = Replacement equipment code(s).
- o = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of Code FORM content:

```
CODE                      FORM A[:B]...[:C] [-]
D [:E]...[:F]             
:                        = Intra-field delimiter.
=                        = Inter-field delimiter if necessary.
A                        = Current minimal accepted equipment code.
B                        = Current production equipment code (substitutable equipment for code 'A').
C                        = Additional compatible equipment code(s) (added as space permits).
D                        = Current minimal approved operating level for equipment code 'A'.
E                        = Current minimal approved operating level for equipment code 'B'.
F                        = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

- p = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
q = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

r = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

s = Circuit type. Valid value(s):
  HELPER = Suspect pack is in another unit/circuit which is probably not removed from service.
  HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
  ON-LINE = Suspect pack is in another unit/circuit which is probably not removed from service.
  ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
  ___ = Equipment is part of the circuit under test.

z = Text identifier showing order of record. Valid value(s):
  FIRST = First record of continuing list.
  NEXT = Next record of continuing list.
  LAST = Last record of list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b¹ = Statement number.

c¹ = Reason why some tests were not performed. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

For Format 1, bootstrapper circuit apparently working and should be restored to service.

For Format 2, request BTSR diagnosis again after the mate MCTSI is restored to service.

For Format 3, request the BTSR diagnosis again after the mate MCTSI is restored to service.

For Format 4 or 5, refer to the APP:STD-REPAIR appendix in the Appendixes section of the Output Messages manual.

For Format 6, none.

5. ALARMS

2. REASON FOR OUTPUT

To report the result of executing a DGN:CDFI input message to diagnose an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.

Format 1 is printed when a test has failed.

Format 2 is printed when a test fails and the trouble locating procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 is printed when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 is printed when the specified phase(s) completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Digital line and trunk unit (DLTU) number.

c = CDFI number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the tests that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Floor and aisle number.
l = Module type.
m = Module number.
n = Cabinet type.
o = Cabinet number.
p = Replacement equipment code(s).
q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content: CODE FORM A [:B]...[:C]
[-] D[:E]...[:F]
: = Intra-field delimiter.
− = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.
r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
t = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

_____ = Equipment is part of the circuit under test.

u = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

v = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Request has successfully completed.
NOT STARTED = Requested action had not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

w = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

x = Phase result.

y = Phase number completed.

z = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a\(^1\) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b\(^1\) = Statement number.

c\(^1\) = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty circuit.

For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

None.

__________________________________________________________________

2. REASON FOR OUTPUT

To report the results of executing a DGN:CMP input message to diagnose a communication module processor.

Format 1 is printed when a test has failed.

Format 2 is printed when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 is printed when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 is printed when the specified phase(s) has completed. Execution of the diagnostic will continue until all requested phases are completed.

Formats 3 and 4 (without phase number) belong to the MSGS message class.

3. VARIABLE FIELD DEFINITIONS

a = Message switch side number.
b = Communication module processor (CMP) number.
c = Number of the phase in which the failure occurred.
d = Number of the segment in which the failure occurred.
e = Number of the test that failed.
f = Mismatch results for the specified test in hexadecimal.
g = Expected result for the specified test in hexadecimal.

h = Mask used to determine test failure in hexadecimal.

i = Actual result for the specified test in hexadecimal.

j = Text identifier showing order of trouble location procedure (TLP) record. Valid value(s):
   FIRST  = First record of continuing list.
   LAST   = Last record of list.
   NEXT   = Next record of continuing list.

A maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of one to four entries. Each record will have a new header.

k = Identification number of floor and aisle.

l = Module type. Valid value(s):
   CM    = Communication module.
   HSM   = Host switching module.
   RSM   = Remote switching module.
   SM    = Switching module.

m = Module number.

n = Cabinet type. Valid value(s):
   CM2   = Communication module 2 cabinet.
   M     = Miscellaneous cabinet.
   MSG   = Message switch cabinet.
   SMC   = Switching module controller cabinet.
   TMS   = Time multiplexed switch cabinet.

o = Cabinet number.

p = Replacement equipment code(s). Refer to subsequent example.

q = Equipment form(s). Equipment form represents the minimal operating level of replacement equipment.

Example of CODE FORM content: CODE FORM A [:B]...[:C]
[-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code ‘A’).
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code ‘A’.
E = Current minimal approved operating level for equipment code ‘B’.
F = Current minimal approved operating level(s) for equipment code(s) ‘C’.

Codes ‘A’, ‘B’, and ‘C’ may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.
Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

\[ \text{r} \] = Vertical location in the cabinet, in inches above the floor to the center of the implicated shelf.

\[ \text{s} \] = Horizontal location in the cabinet, in eighths of an inch from the left corner of the implicated shelf.

\[ \text{u} \] = Circuit type. Valid value(s):

- HPR: Equipment is part of a helper circuit. The helper must be removed from service before replacement is attempted.
- ONL: Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.
- ___: Equipment is part of the circuit under test.

\[ \text{v} \] = Number of the TLP note containing supplementary information related to the specified suspected faulty equipment. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

\[ \text{y} \] = Termination status. Valid value(s):

- ABORTED: Requested action was terminated before completion, and the termination was not graceful.
- NOT STARTED: Requested action was not begun.
- STOPPED: Requested action was terminated before a normal completion. Termination was graceful.

\[ \text{z} \] = Reason for the termination.

\[ \text{a} \] = Phase or diagnostic result. Valid value(s):

- ATP: All tests were performed and passed.
- CATP: Some tests were not performed, but all tests that were performed passed.
- NTR: No tests were performed.
- STF: Some test(s) failed.

\[ \text{b} \] = Number of the phase completed.

4. ACTION TO BE TAKEN

For Format 1, none. It indicates that one or more faults exist in the system and provides data for manual analysis if necessary. Normally, a message of Format 2 should be obtained by rerunning the diagnostic with the TLP option if necessary, to begin to locate and repair the fault.

For Format 2, replace the indicated circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, none.

5. ALARMS

None.

2. REASON FOR OUTPUT

To provide failure information when memory failures are detected by the main store controller (MASC) diagnostic. The output contains detailed data on the first memory fault detected and histogram style summary data on all the faults in the sample, which is typically the first 100 faults detected. This information can be used to determine the faulty circuit pack and the faulty device on that circuit pack.
3. VARIABLE FIELD DEFINITIONS

a = Control unit.
b = Main store controller.
c = Phase number, in decimal notation.
d = Type of failing memory array.
e = Equipment location (EQL) of the failing memory array, in decimal notation. EQL equals distance from floor - distance from frame left.
f = Address of the first memory location to fail as a result of a mismatch between the expected memory contents and the actual memory contents or memory location under test when a mystore error became active (refer to the address trapped indicator in \( n \), in hexadecimal notation.
g = Data bit mismatch (bits 0-31) first failing memory location, in hexadecimal notation.
h = Actual data in memory, in hexadecimal notation.
i = Expected data (data that was written), in hexadecimal notation.
j = Parity bit mismatches in bits 31-24, and 2 error indicators in bits 23-22.

Bit 31 = H0.
Bit 30 = H1.
Bit 29 = H2.
Bit 28 = H3.
Bit 27 = PX.
Bit 26 = PY.
Bit 25 = PZ.
Bit 24 = PA.
Bit 23 = Multi-bit error is set when an error:
- Causes an address trap (TRAPPED ADDRESS REG bit 27 set) and an error C or D (bits 28 or 29 set) but the correctable parity failure (bit 0) is not set and the noncorrectable parity failure (bit 1) is set.
- Causes an address trap (bit 27 set) and error C or D active (bits 28 or 29 set) and the correctable parity failure (bit 0) is set, but more than one data and parity bits are mismatching.

Bit 22 = Logic error is set when an error:
- Does not cause an address trap (TRAPPED ADDRESS REG bit 27 not set) but there are data or parity mismatches.
- Causes an address trap (bit 27 set) but error C or D not active (bits 28 or 29 set).
- Causes an address trap (bit 27 set) and error C or D active (bit 28 or 29 not set) and correctable (single) bit error indicated (bit 0 set) but group failure bits (MAS ERROR REG2 bits 6-0) contain a code not recognized as a single bit error.

k = Actual parity in memory, bits 31-24, same format as 'j'.

l = Parity expected for the data written to memory in bits 31-24, same format as 'j'.

m = Main store error register 2 after a read of the first failing memory location, in hexadecimal notation.

Bit 28 = HA parity group failure - (not available on UN39 type MASC).
Bit 23 = Trapped address bit 25 (UN618 type MASC). Refer to the main store trapped address error register.
Bit 21 = Trapped address parity byte 0 (UN59C and UN618 type MASC). Refer to the main store trapped address error register.
Bit 6 = PX parity group failure.
Bit 5 = PY parity group failure.
Bit 4 = PZ parity group failure.
Bit 3 = H0 parity group failure.
Bit 2 = H1 parity group failure.
Bit 1 = H2 parity group failure.
Bit 0 = H3 parity group failure.

n = Main store trapped address error register after a read of the first failing memory location, in hexadecimal notation. Trapped address parity for byte 0 (UN59C and UN618 type MASC) and trapped address bit 25 (UN618 type MASC) appear in main store error register 2.

Bit 31 = Trapped address bit 24 (UN59C type and UN618 type MASC).
Bit 30 = Trapped address bit 23 (not available on UN39 type MASC).
Bit 29 = Error C.
Bit 28 = Error D.
Bit 27 = Address trapped indicator.
Bit 23 = Read-write (1) or refresh (0) data parity error.
Bit 1 = Noncorrectable parity failure.
Bit 0 = Correctable (single-bit) parity failure.

o = Main store error register after a read of the first failing memory location in hexadecimal notation.

Bit 22 = Block store go error A.
Bit 11 = No row select on refresh error A.
Bit 10 = Row or column selects on maint op error A.
Bit 9 = Double half plane select row error A.
Bit 8 = Double half plane select column error A.
Bit 7 = Select row and column error A.
Bit 6 = Array address parity error A.
Bit 5 = Command bit parity error A.
Bit 4 = Busy clear F/F state error A.
Bit 3 = Latched normal address parity error A.
Bit 2 = Refresh address counter mismatch error A.
Bit 1 = Write data parity error A.
Bit 0 = Address loop - around F/F error A.

Usually the under test CU CC ER with byte parities in bits 31-28 from the failing address.

For MASC phases 39, 41, and 96, the ACTIVE CU CC ER with byte parities in bits 31-28 from a read of the under test CU MASC at the failing address.

p = Number of failing locations for which histogram information was collected, in decimal notation. The upper limit is usually 100.
q = Number of addresses listed in 'r', in decimal notation.

r = List of the first 'q' failing addresses, in hexadecimal notation.

s = Number of times the specified data bit (0-31) or parity bit (H0, H1, H2, H3, PX, PY, PZ, PA) was read as 0 when it was expected to be 1, in decimal notation.

t = Number of times the specified data or parity bit was read as 1 when it was expected to be 0, in decimal notation.

u = Number of times the address bit was 0 when a memory failure was detected, in decimal notation.

v = Number of times the address bit was 1 when a memory failure was detected, in decimal notation.

w = Number of times a multi-bit error occurred, in decimal notation (variable 'j', bit 23).

x = Number of times a logic error occurred, in decimal notation (variable 'j', bit 22).

y = Central control error register (CC ER) after a read of the first failing memory location or after a store error is detected, in hexadecimal notation.

4. ACTION TO BE TAKEN

Replace the memory array identified by the failing array information in the first fault data.

5. ALARMS

[5] DGN CU a [b] TERMINATED AT PH c STMNT k AFTER TEST l

[6] DGN CU a [b] TASK n {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To report the result of executing a DGN:CU input message to diagnose the control unit or one of its subunits.

Format 1 specifies the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Unit type and member number of the subunit under the CU (for example: CC 0, MASC 0, MASC
1, SAT 0, and so forth).

c = Phase number.

d = The result of the diagnostic. Valid value(s):
    ATP = All tests pass.
    CATP = All tests were ATP; some were not executed due to the unavailability of a system
           resource needed to perform the test.
    NTR = No tests were run.
    STF = Some tests failed.

e = Valid value(s):

<table>
<thead>
<tr>
<th>If 'd' =</th>
<th>'e' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATP or NTR</td>
<td>Indicates the reasons tests were skipped by their bit position in a 16-digit hexadecimal number. For example, if 'e' = (0000000000000018), tests were skipped for reasons 3 and 4.</td>
</tr>
<tr>
<td>STF</td>
<td>Identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'e' = (7 0000000000000018), seven tests failed, plus tests were skipped for reasons 3 and 4. The reasons are:</td>
</tr>
<tr>
<td>Bit 0 = Unused.</td>
<td></td>
</tr>
<tr>
<td>Bit 1 = Unit under test is forced on-line.</td>
<td></td>
</tr>
<tr>
<td>Bit 2 = Sanity timers are disabled.</td>
<td></td>
</tr>
<tr>
<td>Bit 3 = EAI forces on CU, disk, sanity timer are active.</td>
<td></td>
</tr>
<tr>
<td>Bit 4 = Peripheral unit controller is out of service.</td>
<td></td>
</tr>
<tr>
<td>Bit 5 = Helper unit not specified or invalid.</td>
<td></td>
</tr>
<tr>
<td>Bit 6 = Helper unit unavailable.</td>
<td></td>
</tr>
<tr>
<td>Bit 7 = Unit under test is forced off-line.</td>
<td></td>
</tr>
<tr>
<td>Bit 8 = EAI initialization parameter buffer data pending; EAI must be cleared.</td>
<td></td>
</tr>
<tr>
<td>Bit 9 = Helper unit not connected to sub-unit under test.</td>
<td></td>
</tr>
<tr>
<td>Bits 10-63 = Unused.</td>
<td></td>
</tr>
</tbody>
</table>

m = Status of the request. Valid value(s):
    COMPLETE = The request has completed.
    IN PROGRESS = The request is in progress.

f = Test number of the failing test.

g = The bits that were in error. A '1' in a bit position indicates the response from the unit did not match the expected response in that bit.

Note: For Format 3, the values for 'h', 'i' and 'j' may be set to N/A. This means that this data is not available for the specified device.

h = The bits which were actually received from the hardware device.

i = Determines which bits in variable 'h' are included in this test.

j = The value which the test expected.

k = Last statement successfully executed before the diagnostic terminated.

l = Current test number when diagnostic terminated.
n = Task number assigned to the request.

4. ACTION TO BE TAKEN

<table>

2. REASON FOR OUTPUT

To print results of a diagnostic run on the dual serial channel/computer interconnect (DCI).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = The result of the diagnostic. Valid value(s):
ATP = All tests passed.
CATP = All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
NTR = No tests were run.
STF = Some tests failed.

c = Valid value(s):

<table>
<thead>

### 2. REASON FOR OUTPUT

To report the results of the SLC®96 digital carrier line unit (DCLU) diagnostics.

Format 1 prints when some test failed (STF).

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) have been completed. Execution of the diagnostic will not continue until all phases are completed.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = Digital carrier line unit (DCLU) number.
- **c** = Service group number.
d = Number of the phase in which the failure occurred.

e = Number of the segment in which the failure occurred.

f = Number of the test that failed.

g = Mismatch results for the specified test in hexadecimal.

h = Expected result for the specified test in hexadecimal.

i = Mask used to determine test failure in hexadecimal.

j = Actual result for the specified test in hexadecimal.

k = Identification number of floor and aisle.

l = Module type.

m = Module number.

n = Cabinet type.

o = Cabinet number.

p = Replacement equipment code(s).

q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM content:

```
CODE FORM A[:B]...[:C] [-] D[:E]...[:F]
```

A = Current minimal accepted equipment code.

: = Intra-field delimiter.

B = Current production equipment code (substitutable equipment for code A).

C = Additional compatible equipment code(s) (added as space permits)

- = Inter-field delimiter if necessary.

D = Current minimal approved operating level for equipment code A.

E = Current minimal approved operating level for equipment code B.

F = Current minimal approved operating level(s) for equipment code(s) C.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

t = Circuit type. Valid value(s):

_____ = Equipment is part of the circuit under test.

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

u = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

v = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

x = Phase result.

y = Phase number completed.

z = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b¹ = Statement number.

c¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the 'TLP' option to generate a suspected faulty circuit pack list.

For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes. If, after replacing each circuit pack listed, the problem still is not resolved, rerun the diagnostic with the 'RAW' and 'UCL' options. If this does not assist in solving the problem, then contact the appropriate organization for technical assistance.

For Formats 3, 4, and 5, none.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing a DGN:DCTUCOM input message to diagnose the directly connected test unit common board (DCTUCOM). Phase 90 is a demand-only phase; it is run only when specifically requested.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Directly connected test unit (DCTU) number.
c = Number of the phase in which the failure occurred.
d = Number of the segment in which the failure occurred.
e = Number of the test that failed.
f = Mismatch results for the specified test in hexadecimal.
g = Expected result for the specified test in hexadecimal.
h = Mask used to determine test failure in hexadecimal.
i = Actual result for the specified test in hexadecimal.
j = Identification number of floor and aisle.
k = Module type.
l = Module number.
m = Cabinet type.
n = Cabinet number.
o = Replacement equipment code(s).
p = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to subsequent example.

Example of CODE FORM content:

```
CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

q = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

r = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

s = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before
replacement is attempted.

**ONL** = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

= Equipment is part of the circuit under test.

**t** = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

**u** = Termination status. Valid value(s):

- **ABORTED** = The process was terminated (process not gracefully terminated).
- **NOT_STARTED** = Action was not begun.
- **STOPPED** = Terminated before normal completion (process gracefully terminated).

**v** = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

**w** = Phase result.

**x** = Phase number completed.

**y** = Text identifier showing order of record. Valid value(s):

- **FIRST** = First record of continuing list.
- **LAST** = Last record of list.
- **NEXT** = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

**z** = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

**a¹** = Statement number.

**b¹** = Reason why some tests were not performed.

### 4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

   (MESSAGE|MSG) {IN PROGRESS|COMPLETE}

[2] DGN DFC a PH d b [(c)] {MESSAGE IN PROGRESS|MSG IP}

[3] DGN DFC a PH d STF (c)
   TEST e MISMATCH f ACTUAL g MASK h EXPECTED i

[4] DGN DFC a ABORTED AT PH d STMNT j b [(c)] MSG IP

[5] DGN DFC a TERMINATED AT PH d STMNT j AFTER TEST k

[6] DGN DFC a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

[7] DFN DFC a -FLASH MEMORY UPDATE PROCESS IN PROGRESS
   DO NOT STOP THIS DIAGNOSTIC DURING FLASH MEMORY UPDATE
   THIS PROCESS SHOULD RUN NO LONGER THAN 15 MINUTES
   AND MAY RUN ONLY A FEW SECONDS IF NO UPDATE IS REQUIRED

[8] DGN DFC a -FLASH MEMORY UPDATE PROCESS COMPLETE

2. REASON FOR OUTPUT

To print results of a diagnostic run on the disk file controller (DFC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status. Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request. Format 3 indicates failing diagnostic results for an individual phase. Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request. Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution. Format 6 indicates that the request was started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted. Format 7 indicates that the flash update process has started, warning the user against stopping the diagnostic until the flash update process has completed.

3. VARIABLE FIELD DEFINITIONS
**a**

= Member number.

**b**

= The result of the diagnostic. Valid value(s):

- **ATP** = All tests passed.
- **CATP** = All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
- **NTR** = No tests were executed.
- **STF** = Some tests failed.

**c**

= Valid value(s):

<table>
<thead>
<tr>
<th>'b' =</th>
<th>'c' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATP or NTR</td>
<td>Identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if 'c' = (0000000000000018), tests were skipped for reasons 3 and 4.</td>
</tr>
</tbody>
</table>
| STF | Identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (70000000000000006), seven tests failed, plus tests were skipped for reasons 1 and 2. The reason codes are as follows:
  - Bit 0 = Helper unit invalid or not specified.
  - Bit 1 = Helper unit cannot be reserved.
  - Bit 2 = Helper unit is not out-of-service.
  - Bit 3 = Helper control unit (CU) is not ATP.
  - Bit 4 = Helper unit not connected to controller being diagnosed.
  - Bits 5-63 = Unused.
  Note: To interpret CATP bits 32-46, the structure of the system must be understood. All device references are relative to the DFC under test, and may not correspond to "real" unit numbers. The down pointer of the DFC will point to the first SBUS. The side pointer of the first SBUS points to the second SBUS. Similarly, the down pointer of an SBUS points to the first MHD beneath it. The side pointer of an MHD points to the next MHD in the chain. These concepts are displayed graphically on display pages 120 and 122. The leftmost SBUS under a DFC is considered first SBUS, with the rightmost SBUS being second. MHD relative numbering for each SBUS is top-down, with the top MHD being first and the bottom being last. Currently only four MHDs per SBUS are supported.
  - Bit 32 = First MHD on first SBUS of DFC did not respond correctly.
  - Bit 33 = Second MHD on first SBUS of DFC did not respond correctly.
  - Bit 34 = Third MHD on first SBUS of DFC did not respond correctly.
  - Bit 35 = Fourth MHD on first SBUS of DFC did not respond correctly.
  - Bit 36 = Reserved for fifth MHD on first SBUS of DFC.
  - Bit 37 = Reserved for sixth MHD on first SBUS of DFC.
  - Bit 38 = Reserved for seventh MHD on first SBUS of DFC.
  - Bit 40 = First MHD on second SBUS of DFC did not respond correctly.
  - Bit 41 = Second MHD on second SBUS of DFC did not respond correctly.
  - Bit 42 = Third MHD on second SBUS of DFC did not respond correctly.
  - Bit 43 = Fourth MHD on second SBUS of DFC did not respond correctly.
  - Bit 44 = Reserved for fifth MHD on second SBUS of DFC.
  - Bit 45 = Reserved for sixth MHD on second SBUS of DFC.
  - Bit 46 = Reserved for seventh MHD on second SBUS of DFC. |

**d**

= Phase number.

**e**

= Test number of the failing test.

**f**

= The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.
**4. ACTIONS TO BE TAKEN**

<table>
<thead>
<tr>
<th>If 'b' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATP</td>
<td>The needed system resource should be made available if possible, so that all tests may be executed.</td>
</tr>
<tr>
<td>STF</td>
<td>The unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.</td>
</tr>
</tbody>
</table>

**5. ALARMS**

This alarm is automatically generated. Action may or may not be required.

2. REASON FOR OUTPUT

To report the result of executing a DGN:DFI input message to diagnose the digital facility interface (DFI).

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line/trunk unit number.
c = DFI number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Identification number of floor and aisle.
l = Module type.
m = Module number.
n = Cabinet type.
o = Cabinet number.
p = Replacement equipment code(s).
q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content: CODE FORM A[:B]...[:C] [-]
D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

= Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

___ = Equipment is part of the circuit under test.

u = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

v = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

x = Phase result.

y = Phase number completed.

z = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b = Statement number.

c = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of a DGN:DFIH input message to diagnose a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH). This message also reports the results of automatic diagnostics run by the system in response to DFIH faults. Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = RISLU digital line and trunk unit (DLTU) number.

c = DFIH number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Floor and aisle number.
l = Module type.
m = Module number.
n = Cabinet type.
o = Cabinet number.
p = Replacement equipment code(s).
q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to subsequent example.

Example of CODE FORM content: CODE FORM A[:B]...[:C] [-] D[:E]...[:F]

: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

t = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member
must be removed, and the mate made on-line, before replacement is attempted.

___ = Equipment is part of the circuit under test.

\[u\] = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

\[v\] = Termination report. Valid value(s):
- ABORTED = Requested action was terminated before completion, and the termination was not graceful.
- COMPLETED = Request has successfully completed.
- NOT_STARTED = Requested action has not begun.
- STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

\[w\] = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

\[x\] = Phase result.

\[y\] = Phase number completed.

\[z\] = Text identifier showing order of record:
- FIRST = First record of continuing list.
- LAST = Last record of list.
- NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\[a\] = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\[b\] = Statement number.

\[c\] = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the 'TLP' option to generate a suspected faulty circuit pack list.

For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes. If, after replacing each circuit pack listed, the problem still is not resolved, rerun the diagnostic with the 'RAW' and 'UCL' options. If this does not assist in solving the problem, then refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 3, 4, and 5, none.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing DGN:DFTAC input message to diagnose the distributing frame test access circuit (DFTAC), to report the diagnostic outcome as the result of a RST:DFTAC input message, or to report the diagnostic outcome as the result of a recovery action that removed the circuit from service.

Format 1 is printed when a specified phase(s) has been completed and either a phase range or RAW was specified on a manual request. Execution of the diagnostic will continue for any remaining phases.

Format 2 is printed to report the final results when diagnostic execution has been completed.

Format 3 is printed when a test has failed.

Format 4 is printed when the trouble location procedure (TLP) was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = MSU number.
= Service group.
d = Circuit number.
e = Completion status. Valid value(s):
   ABORTED = The diagnostic phase was unable to clean up or remove hardware or software
             resources. Further output showing data or hardware recovery by audits may follow.
             A message of Format 2 will follow giving the reason for the abort.
   COMPLETED = Successful completion.
   STOPPED = The diagnostic phase terminated prematurely but cleanly. A message in Format 2
              will follow giving the reason for termination.

f = Diagnostic phase result. Valid value(s):
   ATP
   CATP
   NTR
   STR

h = Termination status. Valid value(s):
   ABORTED = The diagnostic process was purged or terminated without cleaning up. Further
             output showing data or hardware recovery by audits may follow.
   COMPLETED = Successful completion.
   NOT STARTED = The diagnostic was not started.
   STOPPED = Terminated before normal completion.

i = Reason for termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of
    the Output Messages manual.

j = Number of the phase in which the failure occurred.

k = Number of the segment in which the failure occurred.

l = Number of the test that failed.

m = Mismatched results for the specified test in hexadecimal.

n = Expected results for the specified test in hexadecimal.

o = Mask used to determine test failure in hexadecimal.

p = Actual result for the specified test in hexadecimal.

q = Aisle.

r = Module type, CM or SM.

s = Switching module number.

t = Cabinet type.

u = Cabinet number.
= Replacement equipment code(s).

w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content: CODE FORM A[:B]...[:C] [-]
D[:E]...[:F]

: = Intra-field delimeter.
- = Inter-field delimeter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eights of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

a = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b = Text identifier showing order of record:
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

c = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

d = Statement number.

e = Reason why some tests were not performed.
4. ACTION TO BE TAKEN

For Formats 1 and 2,

<table>
<thead>
<tr>
<th>If 'F' =</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATP</td>
<td>No action is required. The circuit is not automatically restored.</td>
</tr>
<tr>
<td>CATP</td>
<td>Find the suspected resource by checking diagnostic listing.</td>
</tr>
<tr>
<td>NTR</td>
<td>Find the suspected resource by checking diagnostic listing.</td>
</tr>
<tr>
<td>STF</td>
<td>Repair the faulty circuit and rerun the diagnostic.</td>
</tr>
</tbody>
</table>

For Format 3, replace the faulty unit.

For Format 4, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Format 5, none.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing the corresponding input message to diagnose the distribute point board (DIST).

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = DIST number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.
h = Mismatch results for the specified test in hexadecimal.
i = Expected result for the specified test in hexadecimal.
j = Mask used to determine test failure in hexadecimal.
k = Actual result for the specified test in hexadecimal.
l = Identification number of floor and aisle.
m = Module type.
n = Module number.
o = Cabinet type.
p = Cabinet number.
q = Replacement equipment code(s).
r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to subsequent example.

Example of CODE FORM content: CODE FORM A [:B]...[:C]
[-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.
Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

= Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
u = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

v = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

w = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

x = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

y = Phase result.

z = Phase number completed.

a\(^1\) = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b\(^1\) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

c\(^1\) = Statement number.

d\(^1\) = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

None.

2. REASON FOR OUTPUT

To acknowledge a manual or automatic request to remove and diagnose a specific dual link interface (DLI) or range of DLIs. This message is also printed when DLI diagnostics are run as part of a DGN:ONTC request.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase has completed. Execution of the diagnostic will continue until all phases are complete.

Format 4 prints when the specified phase(s) have been terminated before completion and the execution of the diagnostic will not continue; or to acknowledge that the diagnostic request that was input from the master control center (MCC) has completed.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number that the DLI(s) has (have) been diagnosed in. This can also be the lower limit for a range of DLIs that were diagnosed. (The DLI number and the SM number are the same).
b = Upper limit of a range of DLIs that were diagnosed.
c = ONTC side the DLI is on.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used before determining test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal before mask and compare operation.
k = Aisle.
l = Module type.
y = Communication or switching module (CM or SM) number.
m = Cabinet in which the pack is located.
z = Cabinet number.
n = Replacement equipment code(s).
o = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Example of CODE

FORM content: CODE

 FORM A [:B]...[:C] [-] D[:E]...[:F]

: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code ‘A’).
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code ‘A’.
E = Current minimal approved operating level for equipment code ‘B’.
F = Current minimal approved operating level(s) for equipment code(s) ‘C’.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'B', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

p = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
q = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
r = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

s = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

t = Phase result.

u = Phase number completed.

v = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
COMPLETED = Request completed successfully.
NOT_STARTED = Requested action could not begin.
STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

w = Additional data qualifying the termination report (variable 'v') field.

x = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b = Statement number.

c = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1 and 2, refer to the APP:STD-REPAIR appendix in the Appendixes section of the Output Messages manual.

For Format 3, if 't' = CATP or NTR, re-enter the diagnostic request (DLI) after the mate MCTSI is restored (phase 3 CATP) or the TMS is powered up and verified ATP (phase 4 CATP). If 't' = STF, refer to the APP:STD-REPAIR appendix in the Appendixes section of the Output Messages manual.

For Format 4, if 'v' = ABORTED or NOT_STARTED, check the validity of the original request (assuming the request was not manually aborted). Look at field 'w' for information as to why the request was not started. Then clear the condition preventing the request from running. If the DGN request continues to give abnormal responses, request
assistance.
For Format 5, none.

5. ALARMS
None.

[4] DGN DNUSCC=a-b-c COMPLETED y [PH z]

2. REASON FOR OUTPUT

To report the results of diagnosing a digital networking unit - synchronous optical network (DNU-S) common
controller (DNUSCC).

Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified for the request. An
ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not
continue.

Format 4 prints when the specified phase(s) has completed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Common controller number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g  = Mismatch results for the specified test in hexadecimal.

h  = Actual result in hexadecimal for the specified test.

i  = Mask in hexadecimal used to determine test failure.

j  = Expected result in hexadecimal for the specified test.

k  = Floor and aisle number.

l  = Module type.

m  = Module number.

n  = Cabinet type.

o  = Cabinet number.

p  = Replacement equipment code(s).

q  = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-] D[:E]...[:F]</td>
<td></td>
</tr>
<tr>
<td>-</td>
<td>= Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>:</td>
<td>= Intra-field delimiter.</td>
</tr>
<tr>
<td>A</td>
<td>= Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>= Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>= Additional compatible equipment code(s) (added as space permits)</td>
</tr>
<tr>
<td>D</td>
<td>= Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>= Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>= Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r  = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

s  = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

t  = Depth location in the cabinet.

u  = Circuit type. Valid value(s):

- HPR  = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
- ONL  = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.
- ___  = Equipment is part of the circuit under test.
v = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

w = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was completed successfully.
   IN PROGRESS = Requested action is in progress.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

x = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

y = Phase result.

z = Phase number completed.

a¹ Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

   Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTIONS TO BE TAKEN

   For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

   For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

   For Formats 3 and 4, no action is required.

5. ALARMS

   None.

[3] DGN DNUSCD=a-b-c-d x [y]

[4] DGN DNUSCD=a-b-c-d COMPLETED z [PH b[l]]

2. REASON FOR OUTPUT

To report the results of diagnosing a digital networking unit - synchronous optical network (DNU-S) common data (DNUSCD).

Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified for the request. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Data group number.
d = Common data number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Actual result in hexadecimal for the specified test.

j = Mask in hexadecimal used to determine test failure.

k = Expected result in hexadecimal for the specified test.

l = Floor and aisle number.

m = Module type.

n = Module number.

o = Cabinet type.

p = Cabinet number.

q = Replacement equipment code(s).

r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [?] D[:E]...[:F]</td>
<td>- = Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>:</td>
<td>= Intra-field delimiter.</td>
</tr>
<tr>
<td>A</td>
<td>= Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>= Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>= Additional compatible equipment code(s) (added as space permits)</td>
</tr>
<tr>
<td>D</td>
<td>= Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>= Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>= Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

r = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Depth location in the cabinet.

v = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the online member of a duplex pair. The online member
must be removed, and the mate made online, before replacement is attempted.

___

= Equipment is part of the circuit under test.

w = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

x = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was completed successfully.
   IN PROGRESS = Requested action is in progress.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

y = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

z = Phase result.

a¹ = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b¹ = Phase number completed.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action is required.

5. ALARMS

None.

MCC Display Page(s):
1510      DNUS STATUS
DGN:DUIC

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] DGN DUIC a [COMPLETED] b [(c)]
   (MESSAGE|MSG) {IN PROGRESS|COMPLETE}

[2] DGN DUIC A PH d b [(c)] {MESSAGE IN PROGRESS|MSG IP}

[3] DGN DUIC a PH d STF (c) MSG IP
   TEST  MISMATCH  ACTUAL   MASK    EXPECTED

[4] DGN DUIC a ABORTED AT PH d STMNT j b [(c)] MSG IP

[5] DGN DUIC a TERMINATED AT PH d STMNT j AFTER TEST k

[6] DGN DUIC a TASK l (MESSAGE STARTED|QUEUED|ABORTED)

2. REASON FOR OUTPUT

To print results of a diagnostic run on the direct user interface controller (DUIC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination) since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic.
ATP = All tests passed.
NTR = No tests were run.
STF = Some tests failed.

c = Identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits that were actually received from the hardware device.

h = Determines what bits in 'g' are of interest to this test.

i = The value that the test expected.

j = Last statement successfully executed before the diagnostic terminated.
k = Current test number when diagnostic terminated.
l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the result of executing a DGN:EAN input message to diagnose the equipment access network (EAN). Phase 90 is a demand-only phase; it is run only when specifically requested.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Directly connected test unit (DCTU) number.
c = Number of the phase in which the failure occurred.
d = Number of the segment in which the failure occurred.
e = Number of the test that failed.
f = Mismatch results for the specified test in hexadecimal.
g = Expected result for the specified test in hexadecimal.
h = Mask used to determine test failure in hexadecimal.
i = Actual result for the specified test in hexadecimal.
j = Identification number of floor and aisle.
k = Module type.
l = Module number.
m = Cabinet type.
n = Cabinet number.
o = Replacement equipment code(s).
p = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content: CODE FORM A [:B]...[:C]
[~] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

q = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
r = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
s = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member
must be removed, and the mate made on-line, before replacement is attempted.

Equipment is part of the circuit under test.

t = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

u = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT_STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

v = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

w = Phase result.

x = Phase number completed.

y = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

   Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

z = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

a = Statement number.

b = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

None.

DGN:FPC

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

DGN FPC=a b [c]

2. REASON FOR OUTPUT

To respond to a manual or automatic request to diagnose a specific foundation peripheral controller (FPC).

3. VARIABLE FIELD DEFINITIONS

a = FPC side.
b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before a normal completion and the consistency of hardware states is questionable.
   COMPLETED = Requested action was completed successfully.
   NOT_STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion, but consistency of hardware states and data is reliable.

c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual or automatic request. No further action is necessary if the requested action completed successfully. If the termination report is not COMPLETED, the variable 'c' field should give some indication as to why the request failed. The table below explains the cause of a conditional all tests passed (CATP) termination code. Check the appropriate Master Control Center (MCC) pages or OP:CFGSTAT output messages to verify that the associated units were in a valid state to perform the request.

### 2. REASON FOR OUTPUT

To report the result of executing a DGN:GDSF input message to diagnose the global digital services function (GDSF) circuit.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = GDSF number.
c = Number of the phase in which the failure occurred.
d = Number of the segment in which the failure occurred.
e = Number of the test that failed.
f = Mismatch results for the specified test.
g = Expected result for the specified test in hexadecimal.
h = Mask used to determine test failure in hexadecimal.
i = Actual result for the specified test in hexadecimal.
j = Identification number of floor and aisle.
k = Module type.
l = Module number.
m = Cabinet type.
n = Cabinet number.
o = Replacement equipment code(s).
p = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-] D[:E]...[:F]</td>
<td></td>
</tr>
</tbody>
</table>

Valid value(s):
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

q = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
r = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
s = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

t = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ___ = Equipment is part of the circuit under test.

u = Refer to output appendix APP:TLP-NOTE in the Appendixes section of the Output Messages manual.

v = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   NOT_STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the output Messages manual.

x = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

   Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

y = Phase result.

z = Phase number completed.

a¹ = Statement number.

b¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Format 3, 4, and 5, none.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing a DGN:GDSUCOM input message to diagnose the global digital service unit (DSU) common (GDSUCOM) board.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Global digital service unit (GDSU) number.
c = Service group number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.

   [EXP h MASK i ACTL j]

2. REASON FOR OUTPUT

To report the result of executing a DGN:GDXACC input message to diagnose the gated diode crosspoint access (GDXACC).

Format 1 prints when a test has failed.

Format 2 prints when the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue until all phases are complete.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Service group number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Identification number of floor and aisle.
l = Module type.
m = Module number.
n = Cabinet type.
o = Cabinet number.
p = Replacement equipment code(s).
q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
CODE FORM
A [:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
t = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ___ = Equipment is part of the circuit under test.

u = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

v = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT_STARTED = Action was not begun.
   STOPPED = Terminated before normal completion The process gracefully terminated.

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

x = Phase result.

y = Phase number completed.

z = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b¹ = Statement number.

c¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

Alarms may be triggered because:

(1) The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED.
This is the only time that these three parameters are equal to the stated values.

(2) A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

(3) A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

(4) The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

2. REASON FOR OUTPUT

To report the result of a DGN:HDFI input message to diagnose a host switching module (HSM) digital facilities interface (HDFI) circuit.

Format 1 prints when a test has failed.

Format 2 is printed when a test fails and the trouble locating procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 is printed when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 is printed when the specified phase(s) completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Digital line and trunk unit (DLTU) number.
c = HDFI number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Identification number of floor and aisle.
l = Module type.
y = Module number.
m = Cabinet type.
z = Cabinet number.
n = Replacement equipment code(s).
o = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
CODE FORM
A[:B]...[C] [-] D[:E]...[F]
  : = Intra-field delimiter.
  - = Inter-field delimiter if necessary.
  A = Current minimal accepted equipment code.
  B = Current production equipment code (substitutable equipment for code 'A').
  C = Additional compatible equipment code(s) (added as space permits).
  D = Current minimal approved operating level for equipment code 'A'.
  E = Current minimal approved operating level for equipment code 'B'.
  F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

p = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
q = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
r = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

s = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

 t = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was complete.
COMPLETED = Request has successfully completed.
NOT_STARTED = Requested action had not begun.
STOPPED = Requested action was terminated before a normal completion.

u = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

v = Phase result.

w = Phase number completed.

x = Text identifier showing order of record:
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a^1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b^1 = Statement number.

c^1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

None.

[5] DGN HSDC a TERMINATED AT PH d STMNT j AFTER TEST k

[6] DGN HSDC a TASK l {MESSAGE STARTED|QUEUED|ABORTE D}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the high speed data-link controller (HSDC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = The result of the diagnostic. Valid value(s):
   ATP = All tests passed.
   NTR = No tests were run.
   STF = Some tests failed.

c = If 'b'=STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'd' = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in 'g' are of interest to this test.

i = The value that the test expected.

Note: For Format 3, the values for 'g', 'h', and 'i' may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   [EXPR h MASK i ACTL j]

2. REASON FOR OUTPUT

To report the results of a DGN:IDCU input message to diagnose an integrated digital carrier unit (IDCU) service group circuit.

Format 1 is printed when a test has failed.

Format 2 is printed when a test fails and the trouble locating procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 is printed when the specified phase(s) terminated before completion. Execution of the diagnostic request will not continue.

Format 4 is printed when the specified phase(s) has completed.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = IDCU number.
c = IDCU service group number.
d = Number of the phase that failed.
e = Number of the segment that failed.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Text identifier. Valid value(s):
   FIRST = The first record of continuing list.
   LAST = The last record of list.
   NEXT = The next record of continuing list.

Up to 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

l = Floor an aisle number.
m = Module type.
n = Module number.
o = Cabinet type.
p = Cabinet number.
q = Replacement equipment code(s).
r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```plaintext
CODE FORM
A[:B] ... [:C] [-] D[:E] ... [:F]
:  = Intra-field delimiter.
-  = Inter-field delimiter, if necessary.
A  = Current minimal accepted equipment code.
B  = Current production equipment code (replaceable equipment for code 'A').
C  = Additional compatible equipment code(s) (added as space permits).
D  = Current minimal approved operating level for equipment code 'A'.
E  = Current minimal approved operating level for equipment code 'B'.
F  = Current minimal approved operating level(s) for equipment code(s) 'C'.

Forms 'p', 'e', and 'f' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier, or text identifier(s) as applicable.
```
Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s), or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Depth location in the bay computed in tenths of an inch, measured left to right in the drawer on the implicated shelf.

v = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ____ = Equipment is part of the circuit under test.

w = Note number and refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

x = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request action has successfully completed.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

y = Additional information qualifying the termination report. This information can be found in the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

z = Phase result.

a¹ = Phase number completed.

b¹ = Statement number.

c¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty circuit pack list.

For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes. If, after replacing each circuit pack listed, the problem still is not resolved, rerun the diagnostic with the RAW and UCL options. If this does not assist in solving the problem, then refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 3, 4, and 5, no action required.
5. ALARMS
None.

[6] DGN IOP A TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the input/output processor (IOP).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = The result of the diagnostic.
  ATP = All tests passed.
  CATP = All tests that were executed were ATP; some were not executed due to the
        unavailability of a system resource that was needed to perform the test.
  NTR = No tests were run.
  STF = Some tests failed.

c = Valid value(s):

<table>
<thead>
<tr>
<th>'b'</th>
<th>'c'</th>
</tr>
</thead>
</table>
| CATP or NTR | The reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if 'd' = (00000000 00000006), tests were skipped for reasons 1 and 2. The reason codes are as follows:
  Bit 0 = Helper unit not specified or invalid.
  Bit 1 = Helper unit cannot be reserved.
  Bit 2 = Helper unit not out-of-service.
  Bit 3 = Helper control unit (CU) is not ATP.
  Bit 4 = Helper unit not connected to controller being diagnosed.
  Bit 5 to 63 = Unused. |

  STF | The reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if 'd' = (00000000 00000018), tests were skipped for reasons 3 and 4. |

  d = Phase number.
  e = Test number of the failing test.
  f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not
      match the expected response in that bit.
  g = The bits which were actually received from the hardware device.
  h = Determines what bits in 'g' are of interest to this test.
  i = The value that the test expected.

Note: For Format 3, the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not
available for the specified device.

  j = Last statement successfully executed before the diagnostic terminated.
  k = Current test number when diagnostic terminated.
  l = Task number assigned to the request.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>'b'</th>
<th>Action:</th>
</tr>
</thead>
</table>
| CATP | The needed system resource should be made available if possible, so that all tests
      may be executed. |
| STF  | The unit should be repaired as quickly as possible. Refer to the Corrective
      Maintenance manual for the repair procedures. |

5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix
in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the results of executing a DGN:ISLUCC input message to diagnose an integrated services line unit common controller (ISLUCC).

Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Integrated services line unit (ISLU) number.

c = Common controller number.

d = Number of the phase in which the failure occurred.

e = Number of the segment in which the failure occurred.

f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.

h = Actual result in hexadecimal for the specified test.

i = Mask in hexadecimal used to determine test failure.

j = Expected result in hexadecimal for the specified test.

k = Floor and aisle number.

l = Module type.

m = Module number.

n = Cabinet type.

o = Cabinet number.

p = Replacement equipment code(s).

q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
CODE           FORM
A[:B]...[:C]  [-] D[:E]...[:F]
```

: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

t = Depth location in the cabinet.

u = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.
= Equipment is part of the circuit under test.

v = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

w = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was completed successfully.
   NOT_STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

x = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

y = Phase result.

z = Phase number completed.

a₁ = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

2. REASON FOR OUTPUT

To report the results of executing a DGN:ISLUCD input message to diagnose an integrated services line unit common data (ISLUCD).

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Integrated services line unit (ISLU) number.
c = Common data number (0 or 1).
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.

h = Actual result in hexadecimal for the specified test.

i = Mask in hexadecimal used to determine test failure.

j = Expected result in hexadecimal for the specified test.

k = Floor and aisle number.

l = Module type.

m = Module number.

n = Cabinet type.

o = Cabinet number.

p = Replacement equipment code(s).

q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>:</td>
<td>= Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>A</td>
<td>= Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>= Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>= Additional compatible equipment code(s) (added as space permits).</td>
</tr>
<tr>
<td>D</td>
<td>= Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>= Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>= Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

t = Depth location in the cabinet.

u = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.

___ = Equipment is part of the circuit under test.
Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

Termination report. Valid value(s):
- **ABORTED** = Requested action was terminated before completion, and the termination was not graceful.
- **COMPLETED** = Requested action was completed successfully.
- **NOT_STARTED** = Requested action was not begun.
- **STOPPED** = Requested action was terminated before a normal completion. Termination was graceful.

Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

Phase result.

Phase number completed.

Test identifier showing order of record. Valid value(s):
- **FIRST** = First record of continuing list.
- **LAST** = Last record of list.
- **NEXT** = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

### 4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action required.

### 5. ALARMS

None.

__________________________________________________________________

2. REASON FOR OUTPUT

To describe the result of the DGN:ISLUHLSC input message that is issued to diagnose an integrated services line
unit (ISLU) high level service circuit.

Both Formats 1 and 2 print when one or more tests have failed.

Format 2 provides an ordered list of suspected faulty circuit packs.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic
will not continue. If the termination report is NOT STARTED, an incorrect phase number was specified in the input
message.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue if some test
has failed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = ISLU number.
c = ISLU service group number.
d = High level service circuit number.
e = Number of the phase in which the error occurred.
f = Number of the segment in which the error occurred.
g = Number of the test that failed.

h = Mismatch results for the specified test.

i = Expected result for the specified test (in hexadecimal).

j = Mask used to determine the test failure (in hexadecimal).

k = Actual result of the specified test (in hexadecimal).

l = Text identifier showing order of record. Valid value(s):
    FIRST = First record of continuing list.
    LAST  = Last record of list.
    NEXT  = Next record of continuing list.

m = Floor and aisle number.

n = Module type.

o = Module number.

p = Cabinet type.

q = Cabinet number.

r = Circuit pack code number.

s = Equipment form. The equipment form represents the minimal operating level of replacement equipment.

t = Vertical location in the cabinet.

u = Horizontal location in the cabinet.

v = Circuit type.

w = Note number. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

x = Type of termination. Valid value(s):
    ABORTED = Immediate termination.
    NOT_STARTED = Action has not begun.
    STOPPED = Terminated before normal completion.

y = Information that qualifies the previous termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

z = Phase result. Valid value(s):
    ATP = All tests were performed and all passed.
    CATP = Some tests were skipped because supporting hardware was not available, but all tests that were run passed.
    NTR = No tests were run.
    STF = Some tests failed.
4. ACTION TO BE TAKEN

For Format 1, analyze the failure data to determine the reason for failure.

For Format 2, replace the suspected packs one at a time in the order specified. Rerun the diagnostic after each replacement until the fault is repaired or the diagnostic result changes.

For Format 3, if the termination report is NOT STARTED, an incorrect phase number was specified in the input message. Determine the correct phase number and reissue the exercise message.

If unexpected results occur, refer to the manual Corrective Maintenance manual.

For Format 4, if the phase result is STF, take action indicated by Formats 1 and 2.

5. ALARMS

None.

[3] DGN ISLULBD=a-b-c-d x [y]

[4] DGN ISLULBD=a-b-c-d COMPLETED z [PH a1]

2. REASON FOR OUTPUT

To report the results of executing a DGN:ISLULBD input message to diagnose an integrated services line unit line board (ISLULBD).

Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Integrated services line unit (ISLU) number.
c = Line group number.
d = Line board number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Actual result in hexadecimal for the specified test.

j = Mask in hexadecimal used to determine test failure.

k = Expected result in hexadecimal for the specified test.

l = Floor and aisle number.

m = Module type.

n = Module number.

o = Cabinet type.

p = Cabinet number.

q = Replacement equipment code(s).

r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...</td>
<td>[:C] [-]</td>
</tr>
<tr>
<td>D[:E]...</td>
<td>[:F]</td>
</tr>
</tbody>
</table>

: = Intra-field delimiter.
-
= Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Depth location in tenths of an inch in the cabinet.

v = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the online member of a duplex pair. The online member
must be removed, and the mate made online, before replacement is attempted.

= Equipment is part of the circuit under test.

w = Refer to the APP:TLP-NOTE appendix in the Appendices section of the Output Messages manual for definition of TLP note.

x = Action status report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Requested action was completed successfully.
IN PROGRESS = Requested action is in progress.
NOT STARTED = Requested action was not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

y = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

Note: The ISLUBD diagnostic runs ISLULBD and integrated services line unit line circuit (ISLULCKT) phases. If all of the SISLULBD phases pass, but one or more of the ISLULCKT phases fail, the ISLULBD diagnostic will still output an ATP result. In this case, failing the entire ISLULBD diagnostic would leave too much circuitry out-of-service (OOS). Instead, only the ISLULCKT will be left OOS.

z = Phase result.

a¹ = Phase number completed.

b¹ = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action required.

5. ALARMS

None.

[4] DGN ISLULC=a-b-c-d COMPLETED z [PH a1]

2. REASON FOR OUTPUT

To report the results of executing a DGN:ISLULC input message to diagnose an integrated services line unit line card (ISLULC).

Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

3. VARIABLE FIELD DEFINITIONS

a  = SM number.
b  = Integrated services line unit (ISLU) number.
c  = Line group controller number.
d  = Line card number.
e  = Number of the phase in which the failure occurred.
f  = Number of the segment in which the failure occurred.
g = Number of the test that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Actual result in hexadecimal for the specified test.

j = Mask in hexadecimal used to determine test failure.

k = Expected result in hexadecimal for the specified test.

l = Floor and aisle number.

m = Module type.

n = Module number.

o = Cabinet type.

p = Cabinet number.

q = Replacement equipment code(s).

r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C]</td>
<td>[-]</td>
</tr>
<tr>
<td>D[:E]...[:F]</td>
<td></td>
</tr>
</tbody>
</table>

= Inter-field delimiter if necessary.

= Intra-field delimiter.

A = Current minimal accepted equipment code.

B = Current production equipment code (substitutable equipment for code ‘A’).

C = Additional compatible equipment code(s) (added as space permits)

D = Current minimal approved operating level for equipment code ‘A’.

E = Current minimal approved operating level for equipment code ‘B’.

F = Current minimal approved operating level(s) for equipment code(s) ‘C’.

Codes ‘A’, ‘B’, and ‘C’ may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms ‘D’, ‘E’, and ‘F’ may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Depth location in tenths of an inch in the cabinet.

v = Circuit type. Valid value(s):

___ = Equipment is part of the circuit under test.

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.

w = Refer to output appendix APP:TLP-NOTE for definition of TLP note.

x = Action status report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Requested action was completed successfully.
IN PROGRESS = Requested action is in progress.
NOT_STARTED = Requested action was not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

y = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

Note: Diagnostics may not be started due to a line card sparing conflict. This condition exists when trying to gain metallic access to a line card that is in the same half of a line group drawer as an actively spared faulty card. “Same half of a line group drawer” refers to those line groups that are vertically adjacent (such as, LG0 and LG1 or LG2 and LG3).

z = Phase result.

a = Phase number completed.

b = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action required.

5. ALARMS

Alarms may be triggered because:

- The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.
- A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

- A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

- The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

3. VARIABLE FIELD DEFINITIONS

a = SM number.
b = Integrated services line unit (ISLU) number.
c = Line group controller number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.

\[\text{g} = \text{Mismatch results for the specified test in hexadecimal.}\]

\[\text{h} = \text{Actual result in hexadecimal for the specified test.}\]

\[\text{i} = \text{Mask in hexadecimal used to determine test failure.}\]

\[\text{j} = \text{Expected result in hexadecimal for the specified test.}\]

\[\text{k} = \text{Floor and aisle number.}\]

\[\text{l} = \text{Module type.}\]

\[\text{m} = \text{Module number.}\]

\[\text{n} = \text{Cabinet type.}\]

\[\text{o} = \text{Cabinet number.}\]

\[\text{p} = \text{Replacement equipment code(s).}\]

\[\text{q} = \text{Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.}\]

### Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
</table>
| A[:B]...[:C] [-] D[:E]...[:F] | \[
| : | = Intra-field delimiter.  
| - | = Inter-field delimiter if necessary.  
| A | = Current minimal accepted equipment code.  
| B | = Current production equipment code (substitutable equipment for code 'A').  
| C | = Additional compatible equipment code(s) (added as space permits).  
| D | = Current minimal approved operating level for equipment code 'A'.  
| E | = Current minimal approved operating level for equipment code 'B'.  
| F | = Current minimal approved operating level(s) for equipment code(s) 'C'.  

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

\[\text{r} = \text{Vertical location in the bay computed in inches from the floor to center of the implicated shelf.}\]

\[\text{s} = \text{Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.}\]

\[\text{t} = \text{Depth location in tenths of an inch in the cabinet.}\]

\[\text{u} = \text{Circuit type. Valid value(s):}\]

- **HPR** = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
- **ONL** = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.
- **---** = Equipment is part of the circuit under test.
v = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

w = Action status report. Valid value(s):
- ABORTED = Requested action was terminated before completion, and the termination was not graceful.
- COMPLETED = Requested action was completed successfully.
- IN PROGRESS = Requested action is in progress.
- NOT STARTED = Requested action was not begun.
- STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

x = Additional information qualifying the termination report.

Note: Diagnostics will not be started if there is a line card sparing conflict. This condition occurs if either a spared faulty card or designated spare card is involved in an active spare connection in the LGC to be diagnosed.

Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

y = Phase result.

z = Phase number completed.

a¹ = Text identifier showing order of record. Valid value(s):
- FIRST = First record of continuing list.
- LAST = Last record of list.
- NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action required.

5. ALARMS

None.

[4] DGN ISLUMAN=a-b-c-d COMPLETED z [PH a1]

__________________________________________________________________

2. REASON FOR OUTPUT

To describe the result of the DGN:ISLUMAN input message that is issued to diagnose an integrated services line unit (ISLU) metallic access network pack.

Both Formats 1 and 2 print when one or more tests have failed.

Format 2 provides an ordered list of suspected faulty circuit packs.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue. If the termination report is 'NOT STARTED', an incorrect phase number was specified in the input message.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue if some test has failed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = ISLU number.
c = ISLU service group number.
d = Metallic access network pack number.
e = Number of the phase in which the error occurred.
f = Number of the segment in which the error occurred.
g  = Number of the test that failed.

h  = Mismatch results for the specified test.

i  = Expected result for the specified test (in hexadecimal).

j  = Mask used to determine the test failure (in hexadecimal).

k  = Actual result of the specified test (in hexadecimal).

l  = Text identifier showing order of record. Valid value(s):
    FIRST  = First record of continuing list.
    LAST   = Last record of list.
    NEXT   = Next record of continuing list.

m  = Floor and aisle number.

n  = Module type.

o  = Module number.

p  = Cabinet type.

q  = Cabinet number.

r  = Circuit pack code number.

s  = Equipment form. The equipment form represents the minimal operating level of replacement equipment.

t  = Vertical location in the cabinet.

u  = Horizontal location in the cabinet.

v  = Circuit type.

w  = Note number. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

x  = Type of termination. Valid value(s):
    ABORTED  = Immediate termination.
    NOT_STARTED  = Action has not begun.
    STOPPED  = Terminated before normal completion.

y  = Information the qualifies the previous termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

z  = Phase result. Valid value(s):
    ATP     = All tests were performed and all passed.
    CATP    = Some tests were skipped because supporting hardware was not available, but all tests that were run passed.
    NTR     = No tests were run.
    STF     = Some tests failed.
1 = Number of the phase that has completed.

4. ACTION TO BE TAKEN

For Format 1, analyze the failure data to determine the reason for failure.

For Format 2, replace the suspected packs one at a time in the order specified. Rerun the diagnostic after each replacement until the fault is repaired or the diagnostic result changes.

For Format 3, if the termination report is ‘NOT STARTED’, an incorrect phase number was specified in the input message. Determine the correct phase number and reissue the exercise message.

Note: Diagnostics will not start if there is a line card sparing conflict. This condition occurs when an attempt is made to diagnose an ISLU metallic access network pack that is servicing an ISLU line group controller that contains either a spared faulty card or a designated spare card involved in an active spare connection. ISLU metallic access network 0 serves line group controllers 0 through 7, and metallic access network 1 serves line group controllers 8 through 15.

If unexpected results occur, refer to the Corrective Maintenance manual.

For Format 4, if the phase result is STF, take action indicated by Formats 1 and 2.

5. ALARMS

Alarms may be triggered because:
- The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.
- A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.
- A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.
- The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

2. REASON FOR OUTPUT

To report the result of executing a DGN:ISTF input message to diagnose the integrated services test function (ISTF) unit.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = ISTF unit number.
c = Number of the phase in which the failure occurred. Valid value(s):
   STF = Some tests failed.

d = Number of the segment in which the failure occurred.

e = Number of the test that failed.

f = Mismatch results for the specified test in hexadecimal.

g = Expected results for the specified test, in hexadecimal.

h = Mask used to determine test failure, in hexadecimal.

i = Actual result for the specified test in hexadecimal.

j = Identification number of floor and aisle.

k = Module type.

l = Module number.

m = Cabinet type.

n = Cabinet number.

o = Replacement equipment code(s).

p = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
```

: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

q = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

r = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
s = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

t = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

u = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

v = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

x = Phase result.

y = Phase number completed. Format 5 - circuit unavailable.

z = Statement number.

a^1 = Reason why some tests were not performed.

b^1 = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTION TO BE TAKEN

For Format 1, if fields 'g' and 'i' of Format 1 do not match, refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual. If this does not assist in solving the problem, rerun the diagnostic with the 'RAW' and 'UCL' options. Give the resulting output to a diagnostician for interpretation.

For Format 2, replace the suspected packs, one at a time, in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Format 3, 4, and 5, none.

5. ALARMS

None.

</tr>
</tbody>
</table>

codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

q = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

r = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

s = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

t = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

___ = Equipment is part of the circuit under test.

u = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

v = Termination status. Valid value(s):
   ABORTED = Immediate termination.
   COMPLETED = Successful completion.
   NOT_STARTED = Action has not begun.
   STOPPED = Terminated before normal completion.

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the output Messages manual.

x = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   NEXT = Next record of continuing list.
   LAST = Last record of list.

   Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

y = Phase result.

z = Phase number completed.

a\(^1\) = Statement number.

b\(^1\) = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Format 3, 4, and 5, none.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing a DGN:LDSU input message to diagnose the local digital service unit - model 2 (LDSU2) board. Format 1 prints when a test has failed. Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided. Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue. Format 4 prints when the specified phase(s) has completed. Execution of the diagnostic will not continue until all phases are complete. Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Local digital service unit (LDSU) number.
c = Service group number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Identification number of floor and aisle.
l = Module type.
m = Cabinet type.
n = Replacement equipment code(s).
o = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-] D[:E]...[:F]</td>
<td>Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>A</td>
<td>Intra-field delimiter.</td>
</tr>
<tr>
<td>A</td>
<td>Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>Additional compatible equipment code(s) (added as space permits).</td>
</tr>
<tr>
<td>D</td>
<td>Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

p = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

q = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

r = Circuit type. Valid value(s):
   ______ = Equipment is part of the circuit under test.
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

s = Refer to output appendix APP:TLP-NOTE in the Appendixes section of the Output Messages manual.

t = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

u = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section
of the output Messages manual.

v = Phase result.
w = Phase number completed.
x = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST  = Last record of list.
   NEXT  = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

y = Module number.
z = Cabinet number.
a¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
b¹ = Statement number.
c¹ = Reason why some tests were not performed.

4. ACTIONS TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

Alarms may be triggered because:

1 The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.

2 A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

3 A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

4 The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an “alarm” was requested on failures. These callers have the option of not alarming failures.

2. REASON FOR OUTPUT

To report the result of executing a DGN:LDSUCOM input message to diagnose the local digital service unit common (LDSUCOM) board.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Local digital service unit (LDSU) number.
= Service group number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Identification number of floor and aisle.
l = Module type.
m = Module number.
n = Cabinet type.
o = Cabinet number.
p = Replacement equipment code(s).
q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
**Circuit type. Valid value(s):**

- **HPR** = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
- **ONL** = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
- **___** = Equipment is part of the circuit under test.

**Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.**

**Termination status. Valid value(s):**

- **ABORTED** = The process was terminated (process not gracefully terminated).
- **NOT_STARTED** = Action was not begun.
- **STOPPED** = Terminated before normal completion (process gracefully terminated).

**Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the output Messages manual.**

**Phase result.**

**Phase number completed.**

**Text identifier showing order of record. Valid value(s):**

- **FIRST** = First record of continuing list.
- **LAST** = Last record of list.
- **NEXT** = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

**Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.**

**Statement number.**

**Reason why some tests were not performed.**

---

**4. ACTION TO BE TAKEN**

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

**5. ALARMS**

None.

DGN:LI

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

DGN LI=a b [c]

2. REASON FOR OUTPUT

To acknowledge a manual or automatic request to remove and diagnose a specific link interface (LI).

3. VARIABLE FIELD DEFINITIONS

a  = The office network and timing complex (ONTC) side the LI is on.

b  = Termination report. Valid value(s):
   ABORTED    = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED  = Request completed successfully.
   NOT STARTED= Requested action could not begin.
   STOPPED   = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

c  = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual or automatic request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the variable 'c' field should give some indication as to why the request failed. Check the ONTC MCC pages or the OP:CFGSTAT output message to verify that the LI was in a valid state to perform the request.

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,CNI
Type: Output

1. FORMAT

[1] DGN LNa b c d [e]

[2] DGN LNa b PH f g [h]
   TEST    MISMATCH
   i          j

2. REASON FOR OUTPUT

To print the results of a diagnostic run on a link node (LN).

Format 1 prints at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode. Format 2 prints whenever the diagnostic results are printed for an individual phase. This occurs in the case of partial diagnosis, a test failure, or whenever RAW was specified in the input message.

3. VARIABLE FIELD DEFINITIONS

a = Ring node (RN) group number.
b = Ring node member number.
c = Termination mode of diagnostic. Valid value(s):
   ABORTED = Diagnostic was abnormally stopped due to an external or internal error in execution, or a STOP:DMQ input request.
   COMPLETED = Diagnostic completed normally.
   TERMINATED = Diagnostic terminated under program control (early termination), since further testing would not improve diagnostic resolution.
d = Result of the diagnostic. Valid value(s):
   ATP = All tests passed.
   CATP = All tests that were executed were ATP. Some tests were not executed due to the inability to isolate, or to singly isolate, the node under test.
   NTR = No tests run.
   STF = Some tests failed.
e = Valid value(s):

<table>
<thead>
<tr>
<th>If 'd' =</th>
<th>'e' =</th>
</tr>
</thead>
</table>
| CATP    | Identifies the reason that tests were skipped in this phase by their bit position in a 16-character hexadecimal number. For example, if 'e' = 0000000000000000, tests were skipped for reason 31. Valid value(s):
| Bits 0 to 24 = Not used.
| Bit 25 = The phase was not run because the unit control block (UCB) indicates that the node is not equipped with an enhanced message sampling board (EMSB).
| Bit 26 = Could not get the 'RPCD' UCB for the 'RPCD' - 'DLN' UCB pair at a DLN.
Bit 27 = Smart node memory board is not equipped.
Bit 28 = Attached processor state variable indicates that this phase need not be run.
Bit 29 = Node under test is neither isolated nor in the ring interface usable (RIUSBL) minor state.
Bit 30 = Node under test was not the only isolated node.
Bit 31 = Node under test was not isolated.
Bits 32 to 63 = Not used.

STF = Number of test failures in addition to the reasons that tests were skipped. For example, if \( e = 000000000000000000000001 \), one test failed, plus tests were skipped for reason 31.

\[ f \] = Phase number.

\[ g \] = Result of the phase. Valid value(s):
- ATP = All tests passed.
- CATP = All tests that were executed were ATP. Some tests were not executed due to the inability to isolate, or to singly isolate, the node under test.
- NTR = No tests run.
- STF = Some tests failed.

\[ h \] = Identifies the reason that some tests were skipped. This field is the same as the 'e' field in Format 1 except that the result of only one phase is reflected.

\[ i \] = Test number of the failing test.

\[ j \] = An 8-digit hexadecimal number that indicates the bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

### 4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'g' or 'g'</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATP</td>
<td>The needed system resource should be made available if possible, so that all tests may be executed.</td>
</tr>
<tr>
<td>STF</td>
<td>The unit should be repaired as quickly as possible.</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To report the result of executing a DGN:LUOMC input message to diagnose the line unit common control (LUOMC).

Format 1 prints when a test has failed.

Format 2 prints when the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Service group number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Identification number of floor and aisle.
l = Module type.
m = Module number.
n = Cabinet type.
o = Cabinet number.
p = Replacement equipment code(s).
q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
t = Circuit type. Valid value(s):
  HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
  ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
  ___ = Equipment is part of the circuit under test.

u = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

v = Termination status. Valid value(s):
  ABORTED = The process was terminated (process not gracefully terminated).
  NOT STARTED = Action was not begun.
  STOPPED = Terminated before normal completion (process gracefully terminated).

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the output Messages manual.

x = Phase result.

y = Phase number completed.

z = Text identifier showing order of record. Valid value(s):
  FIRST = First record of continuing list.
  LAST = Last record of list.
  NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

c = Statement number.

d = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

2. REASON FOR OUTPUT

To report the result of executing a DGN:LUHLSC input message to diagnose the high level service circuit
(LUHLSC). Phases 3, 4, and 5 are demand-only phases; they are run only when specifically requested.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input
message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic
will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all
phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests
passed.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Line unit number.
= Service group number.

d = High level service circuit.

e = Number of the phase in which the failure occurred.

f = Number of the segment in which the failure occurred.

g = Number of the test that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Expected result for the specified test in hexadecimal.

j = Mask used to determine test failure in hexadecimal.

k = Actual result for the specified test in hexadecimal.

l = Identification number of floor and aisle.

m = Module type.

n = Module number.

o = Cabinet type.

p = Cabinet number.

q = Replacement equipment code(s).

r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-] D[:E]...[:F]</td>
<td>= Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>:</td>
<td>= Intra-field delimiter.</td>
</tr>
<tr>
<td>A</td>
<td>= Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>= Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>= Additional compatible equipment code(s) (added as space permits)</td>
</tr>
<tr>
<td>D</td>
<td>= Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>= Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>= Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Circuit type. Valid value(s):
   _____ = Equipment is part of the circuit under test.
   HPR   = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL   = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

v = Refer to the APP:TLP-NOTE appendix in the Appendices section of the Output Messages manual.

w = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

x = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

y = Phase result.

z = Phase number completed.

a = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST  = Last record of list.
   NEXT  = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

c = Statement number.

d = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

Alarms may be triggered because:
(1) The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.

(2) A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

(3) A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

(4) The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

2. REASON FOR OUTPUT

To report the result of executing the corresponding input message to diagnose the metallic access (MA) board.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Metallic service unit (MSU) number.

c = Service group number.
d = MSU board number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.
h = Mismatch results for the specified test in hexadecimal.
i = Expected result for the specified test in hexadecimal.
j = Mask used to determine test failure in hexadecimal.
k = Actual result for the specified test in hexadecimal.
l = Identification number of floor and aisle.
m = Module type.
n = Module number.
o = Cabinet type.
p = Cabinet number.
q = Replacement equipment code(s).
r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-]</td>
<td>D[:E]...[:F]</td>

   [EXP g MASK h ACTL i]

2. REASON FOR OUTPUT

To report the result of executing a DGN:MCTSI input message to diagnose the module control/time slot interchange unit (MCTSI).

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Module control unit (MCU) number.
c = Number of the phase in which the failure occurred.
g = Expected result for the specified test in hexadecimal.

h = Mask used to determine test failure in hexadecimal.
i = Actual result for the specified test in hexadecimal.
j = Identification number of floor and aisle.
k = Module type.
l = Module number.
m = Cabinet type.
n = Cabinet number.
o = Replacement equipment code(s).
p = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
CODE FORM
A[[:B]...[:C] [-] D[[:E]...[:F]]
: = inter-field delimiter if necessary.
= intra-field delimiter.
A = current minimal accepted equipment code.
B = current production equipment code (substitutable equipment for code 'A').
C = additional compatible equipment code(s) (added as space permits)
D = current minimal approved operating level for equipment code 'A'.
E = current minimal approved operating level for equipment code 'B'.
F = current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

q = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

r = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

s = Circuit type. Valid value(s):
   _____ = Equipment is part of the circuit under test.
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

t = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

u = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

v = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the output Messages manual.

w = Phase result.

x = Phase number completed.

y = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

z = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

a¹ = Statement number.

b¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

Alarms may be triggered because:

(1) The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.
(2) A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

(3) A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

(4) The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

APP:TLF-NOTE

Other Manual(s):
235-105-110 System Maintenance Requirements and Tools
235-105-220 Corrective Maintenance
DGN:MHD

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] DGN MHD a [COMPLETED] b [(c)]
   (MESSAGE|MSG) {IN PROGRESS|COMPLETE}

[2] DGN MHD a PH d b [(c)]
   (MESSAGE IN PROGRESS|MSG IP)

[3] DGN MHD a PH d STF (c)
   TEST e MISMATCH f ACTUAL g MASK h EXPECTED i

[4] DGN MHD a ABORTED AT PH d STMNT j b [(c)]
   MSG IP

[5] DGN MHD a TERMINATED AT PH d STMNT j AFTER TEST k

[6] DGN MHD A PH 6 DISK READ/WRITE FAILURES
   ERROR CODE l JOB TYPE m SECTOR n HEAD o

[7] DGN MHD a TASK p {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the moving head disk (MHD).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input message.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6, a histogram-type printout of disk read/write test failures, is printed if MHD phase 6 fails the read/write tests.
Format 7 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a  = Member number.

b  = The result of the diagnostic. Valid value(s):
   ATP     = All tests passed.
   NTR     = No tests were executed.
   STF     = Some tests failed.

c  = Identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d  = Phase number.

e  = Test number of the failing test.

f  = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

g  = The bits which were actually received from the hardware device.

h  = Determines what bits in the actual value are of interest to this test.

i  = The value which the test expected.
   Note: For Format 3 the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.

j  = Last statement successfully executed before the diagnostic terminated.

k  = Current test number when diagnostic terminated.

l  = Error code, in hexadecimal notation. Valid value(s):
   02     = Disk read data all zeros.
   04     = Disk read data mismatch.
   08     = Disk read parity mismatch.

For other error codes, Refer to the APP:DFC-B appendix in the Appendixes section of the Output Messages manual.

m  = Numeric code for the job in progress at the time of the error. Valid value(s):
   1     = Maintenance sector write worst case data.
   2     = Maintenance sector read worst case data.
   3     = Maintenance sector write inverted worst case data.
   4     = Maintenance sector read inverted worst case data.
   5     = Maintenance sector ECC test write.
   6     = Maintenance sector ECC test read.
   41    = Head selection error for maintenance sector write worst case data.
n = Sector number where the error occurred.
 o = Head number where the error occurred.
p = Task number assigned to the request.

4. ACTION TO BE TAKEN

For Formats 1, 5, and 7, take no action.

For Formats 2 - 4, if 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for repair procedures.

For Format 6, repair the unit as quickly as possible. Refer to the Routine Operations and Maintenance manual for repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

235-105-210 Routine Operations and Maintenance
235-105-220 Corrective Maintenance
**DGN:MI**

**Software Release:** 5E14 and later  
**Message Class:** ONTC  
**Application:** 5  
**Type:** Output

1. **FORMAT**

DGN MI=a b [c]

2. **REASON FOR OUTPUT**

To respond to a manual or automatic request to diagnose a specific message interface unit (MI).

3. **VARIABLE FIELD DEFINITIONS**

   a  = Office network and timing complex (ONTC) identification.  
   b  = Termination report. Valid value(s):
   
   ABORTED  = Requested action was terminated before a normal completion and the consistency of hardware states is questionable.  
   COMPLETED = Requested action was completed successfully.  
   NOT_STARTED = Requested action was not begun.  
   STOPPED = Requested action was terminated before a normal completion, but consistency of hardware states and data is reliable.  
   c  = Additional data qualifying the termination field.

4. **ACTION TO BE TAKEN**

This message is printed out in response to a manual or automatic request. No further action is necessary if the requested action completed successfully. If the termination report is not COMPLETED, the variable 'c' field should give some indication as to why the request failed. The table below explains the cause of a conditional all tests passed (CATP) termination code. Check the appropriate MCC pages or OP:CFGSTAT output messages to verify that the associated units were in a valid state to perform the request.

**Causes of CATP**

**Message Class:** MTCE  
**Application:** 5  
**Type:** Output

1. **FORMAT**

DGN MMP=a-b c [d]

2. **REASON FOR OUTPUT**

To respond to a manual or automatic request to diagnose a specific module message processor (MMP).

3. **VARIABLE FIELD DEFINITIONS**

   a = Message switch identification.  
   b = MMP unit number.  
   c = Termination report. Valid value(s):  
      ABORTED = Requested action was terminated before a normal completion and the  
                 consistency of hardware states is questionable.  
      COMPLETED = Requested action was completed successfully.  
      NOT STARTED = Requested action was not begun.  
      STOPPED = Requested action was terminated before a normal completion, but consistency of  
                 hardware states and data is reliable.  
   d = Additional data qualifying the termination field.

4. **ACTION TO BE TAKEN**

This message is printed out in response to a manual or automatic request. No further action is necessary if the requested action completed successfully. If the termination report is not **COMPLETED**, the variable ‘d’ field should give some indication as to why the request failed. The table below explains the cause of a conditional all tests passed (CATP) termination code. Check the appropriate MCC pages or OP:CFGSTAT output messages to verify that the associated units were in a valid state to perform the request.

**Causes of CATP**

<table>
<thead>

[4] DGN MSUCOM=a-b-c COMPLETED x [PH y]

[5] DGN MSUCOM=a-b-c PH d SEG e STMT c¹ d¹ [EXP h MASK i ACTL j]

2. REASON FOR OUTPUT

To report the result of executing the corresponding input message to diagnose the metallic service unit common (MSUCOM) board.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Identification number of floor and aisle.
l = Module type.
m = Module number.
n = Cabinet type.
o = Cabinet number.
p = Replacement equipment code(s).
q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

CODE FORM
A[:B]...[[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimeter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
t = Circuit type. Valid value(s):
    HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
    ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
    ____ = Equipment is part of the circuit under test.

u = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

v = Termination status. Valid value(s):
    ABORTED = The process was terminated (process not gracefully terminated).
    NOT STARTED = Action was not begun.
    STOPPED = Terminated before normal completion (process gracefully terminated).

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

x = Phase result.

y = Phase number completed.

z = Text identifier showing order of record. Valid value(s):
    FIRST = First record of continuing list.
    NEXT = Next record of continuing list.
    LAST = Last record of list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

c1 = Statement number.

d1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, no action is required.

5. ALARMS

None.

[4] DGN MT a ABORTED AT PH d STMNT j b [(c)] MSG IP

[5] DGN MT a TERMINATED AT PH d STMNT j AFTER TEST k

[6] DGN MT a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the magnetic tape (MT).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates that non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates that failing diagnostic results for an individual phase.

Format 4 indicates that the diagnostic was stopped due to an external or internal error in execution, or an input message.

Format 5 indicates that the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

   a = Member number.
b = The result of the diagnostic. Valid value(s):
   ATP = All tests passed.
   NTR = No tests were executed.
   STF = Some tests failed.

c = Identifies the number of test failures in addition to the number of tests that were skipped. For example, if ‘c’ = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A ‘1’ in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits that were received from the hardware device.

h = Determines what bits in the actual value are of interest to this test.

i = The value that the test expected.
   Note: For Format 3 the values for ‘g’, ‘h’ and ‘i’ may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when the diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

For Formats 1 and 5, no action is needed.

For Formats 2, 3, and 4, if b = STF, the unit should be repaired as quickly as possible; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 6, repair the unit as quickly as possible; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the result of executing the corresponding input message to diagnose the metallic access test bus (MTB).

Format 1 prints when a test has failed. Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided. Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue. Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete. Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = MSU board number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Expected result for the specified test in hexadecimal.

j = Mask used to determine test failure in hexadecimal.

k = Actual result for the specified test in hexadecimal.

l = Identification number of floor and aisle.

m = Module type.

n = Module number.

o = Cabinet type.

p = Cabinet number.

q = Replacement equipment code(s).

r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

CODE FORM A[:B]...[:C] [-] D[:E]...[:F]
-
= Inter-field delimiter if necessary.
:
= Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Circuit type. Valid value(s):

_____ = Equipment is part of the circuit under test.
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
v

= Refer to output appendix APP:TLP-NOTE in the Appendixes section of the Output Messages manual.

w

= Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

x

= Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

y

= Phase result.

z

= Phase number completed.

a

= Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b

= Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

c

= Statement number.

d

= Reason why some tests were not performed.

e

= MTB number.

4. ACTIONS TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

Alarms may be triggered because:

1

The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.

2

A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.
A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the magnetic tape controller (MTC). Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode. Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request. Format 3 indicates failing diagnostic results for an individual phase. Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request. Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution. Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic. Valid value(s):
   ATP = All tests passed.
   CATP = All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
   NTR = No tests were run.
   STF = Some tests failed.

c = Valid value(s):
<table>
<thead>
<tr>
<th>'b' = CATP or NTR</th>
<th>'c' = CATP or NTR</th>
</tr>
</thead>
<tbody>
<tr>
<td>The reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if 'c'=(0000000000000018), tests were skipped for reasons 3 and 4.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>STF</th>
<th>The number of test failures in addition to the reasons that tests were skipped. For example, if 'c'=(70000000000000006), seven tests failed, plus tests were skipped for reasons 1 and 2. The reason codes are as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 0 = Helper unit not specified or invalid.</td>
<td></td>
</tr>
<tr>
<td>Bit 1 = Helper unit cannot be reserved.</td>
<td></td>
</tr>
<tr>
<td>Bit 2 = Helper unit not out-of-service.</td>
<td></td>
</tr>
<tr>
<td>Bit 3 = Helper unit is not ATP.</td>
<td></td>
</tr>
<tr>
<td>Bit 4 = Helper unit not connected to controller being under test.</td>
<td></td>
</tr>
<tr>
<td>Bit 17 = Helper MT tape not mounted and/or transport door open.</td>
<td></td>
</tr>
<tr>
<td>Bit 18 = Helper MT transport not in &quot;on-line&quot; mode.</td>
<td></td>
</tr>
<tr>
<td>Bit 19 = Helper MT tape reel has no write enable ring (WER).</td>
<td></td>
</tr>
<tr>
<td>Bit 20 = Helper MT tape too long for diagnostic test tape.</td>
<td></td>
</tr>
<tr>
<td>Bit 21 = Helper MT tape has no header block at BOT or header block indicates not diagnostic test tape.</td>
<td></td>
</tr>
</tbody>
</table>

**d** = Phase number.

**e** = Test number of the failing test.

**f** = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

**g** = The bits which were actually received from the hardware device.

**h** = Determines what bits in the actual value are of interest to this test.

**i** = The value which the test expected.

Note: For Format 3 the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.

**j** = Last statement successfully executed before the diagnostic terminated.

**k** = Current test number when diagnostic terminated.

**l** = Task number assigned to the request.

### 4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>'b' = CATP or NTR</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATP</td>
<td>The needed system resource should be made available if possible, so that all tests may be executed.</td>
</tr>
<tr>
<td>STF</td>
<td>The unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.</td>
</tr>
</tbody>
</table>

### 5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[5] DGN MTIB=a PH b SEG c STMT z a l
    [EXP f MASK g ACTL h]

2. REASON FOR OUTPUT

To report the result of executing the DGN:MTIB input message to diagnose the metallic test interconnect bus (MTIB), to report the diagnostic outcome as the result of a RST:MTIB input message, or to report the diagnostic outcome as the result of a recovery action that removed the MTIB from service.

Format 1 is printed when a test has failed.

Format 2 is printed when the trouble location procedure (TLP) was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = MTIB number.
b = Number of the phase in which the failure occurred.
c = Number of the segment in which the failure occurred.

d = Number of the test that failed.

e = Mismatch results for the specified test in hexadecimal.

f = Expected result for the specified test in hexadecimal.

g = Mask used to determine test failure in hexadecimal.

h = Actual result for the specified test in hexadecimal.

i = Identification number of floor and aisle.

j = Module type.

k = Module number.

l = Cabinet type.

m = Cabinet number.

n = Replacement equipment code(s).

o = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

p = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

q = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

r = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before
replacement is attempted.

ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

___ = Equipment is part of the circuit under test.

s = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

t = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

u = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

v = Phase result.

w = Phase number completed.

x = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
NEXT = Next record of continuing list.
LAST = Last record of list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

y = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

z = Statement number.

a1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, replace the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing the DGN:MTIBAX input message to diagnose the metallic test interconnect bus access (MTIBAX), to report the diagnostic outcome as the result of a RST:MTIBAX input message, or to report the diagnostic outcome as the result of a recovery action that removed the MTIBAX from service.

Format 1 is printed when a test has failed.

Format 2 is printed when the trouble locating procedure (TLP) was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a \hspace{1cm} = Switching module (SM) number.
b \hspace{1cm} = Unit number.
c = Service group number.
d = Board number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.
h = Mismatch results for the specified test in hexadecimal.
i = Expected result for the specified test in hexadecimal.
j = Mask used to determine test failure in hexadecimal.
k = Actual result for the specified test in hexadecimal.
l = Identification number of floor and aisle.
m = Module type.
n = Module number.
o = Cabinet type.
p = Cabinet number.
q = Replacement equipment code(s).
r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
</table>

- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Circuit type. Valid value(s):
   --- = Equipment is part of the circuit under test.
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

v = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

w = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

x = Reason for termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of this manual.

y = Phase result.

z = Phase number completed.

a^1 = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

   Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b^1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

c^1 = Statement number.

d^1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

   For Format 1, replace the faulty unit.

   For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

   For Formats 3, 4, and 5, no action is required.

5. ALARMS

   Alarms may be triggered because:
The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.

A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an “alarm” was requested on failures. These callers have the option of not alarming failures.

6. REFERENCES

Input Message(s):

DGN: MTIBAX

   (MESSAGE|MSG) {IN PROGRESS|COMPLETE}

[2] DGN MTTYC a PH d b [(c)] {MESSAGE IN PROGRESS|MSG IP}

[3] DGN MTTYC a PH d STF (c)          MSG IP
    TEST MISMATCH ACTUAL MASK EXPECTED
    e    f    g    h    i

[4] DGN MTTYC a ABORTED AT PH d STMNT j b [(c)]        MSG IP

[5] DGN MTTYC a TERMINATED AT PH d STMNT j AFTER TEST k

[6] DGN MTTYC a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

[7] DGN MTTYC a - FLASH MEMORY UPDATE PROCESS IN PROGRESS
    DO NOT STOP THIS DIAGNOSTIC DURING FLASH MEMORY UPDATE
    THIS PROCESS SHOULD RUN NO LONGER THAN 15 MINUTES
    AND MAY RUN ONLY A FEW SECONDS IF NO UPDATE IS REQUIRED

[8] DGN MTTYC a - FLASH MEMORY UPDATE PROCESS COMPLETE

2. REASON FOR OUTPUT

To print results of a diagnostic run on the maintenance teletypewriter controller (MTTYC). Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode. Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request. Format 3 indicates failing diagnostic results for an individual phase. Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request. Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution. Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted. Format 7 indicates that the flash update process has started, warning the user against stopping the diagnostic until the flash update process has completed. Format 8 indicates that the flash update process has completed.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b  = The result of the diagnostic. Valid value(s):
  ATP  = All tests passed.
  NTR  = No tests were run.
  STF  = Some tests failed.

c  = Identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d  = Phase number.

e  = Test number of the failing test.

f  = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

g  = The bits which were actually received from the hardware device.

h  = Determines what bits in the actual value are of interest to this test.

i  = The value which the test expected.
Note: For Format 3 the values for 'g', 'h', and 'i' may be set to N/A. This means that this data is not available for the specified device.

j  = Last statement successfully executed before the diagnostic terminated.

k  = Current test number when diagnostic terminated.

l  = Task number assigned to the request.

4. ACTIONS TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2 - 4, if 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Application: 5
Type: Output

1. FORMAT

DGN NC=a b [c]

2. REASON FOR OUTPUT

To respond to a manual or automatic request to diagnose a specific network clock (NC).

3. VARIABLE FIELD DEFINITIONS

a = The office network timing complex (ONTC) side the NC is on.

b = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before a normal completion and the
             consistency of hardware states is questionable.
   COMPLETED = Requested action was completed successfully.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion, but consistency of
              hardware states and data is reliable.

c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual or automatic request. No further action is necessary if the
requested action was completed successfully.

If the termination report is not COMPLETED, the variable ‘c’ field should give some indication as to why the request
failed. The table below explains the cause of a conditional all tests passed (CATP) termination code. Check the
appropriate MCC Display pages or OP:CFGSTAT output messages to verify that the associated units were in a valid
state to perform the request.

[4] DGN NLI=a-b-c COMPLETED y [PH z]

2. REASON FOR OUTPUT

To report the executing of DGN:NLI input message to diagnose a network link interface (NLI).

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic does not continue.

Format 4 prints when the specified phase(s) has completed. Execution of the diagnostic continues until all phases are complete.

Formats 1, 2, and 4 (with phase number) belong to the SM message class, while formats 3 and 4 (without phase number) belong to the ONTC message class.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = NLI number.
c = Office network and timing complex (ONTC) side the NLI is on.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Text identifier showing TLP record. Valid value(s):
    FIRST = First record of continuing list.
    LAST = Last record of list.
    NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of one to four entries. Each record has a new header.
l = Identification number of floor and aisle.
m = Module type. Valid value(s):
    CM = Communication module.
    HSM = Host switching module.
    RSM = Remote switching module.
    SM = Switching module.
n = Module number.
o = Cabinet type. Valid value(s):
    CM2 = Communication module 2 cabinet.
    M = Miscellaneous cabinet.
    MSG = Message switch cabinet.
    SMC = Switching module controller cabinet.
    TMS = Time multiplexed switch cabinet.
p = Cabinet number.
q = Replacement equipment code(s). Refer to the following example.
r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

<table>
<thead>

</tr>
</tbody>
</table>

Copyright ©2003 Lucent Technologies
Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

\( s \) = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

\( t \) = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

\( u \) = Circuit type. Valid value(s):
- HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
- ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
- ___ = Equipment is part of the circuit under test.

\( v \) = Number of the TLP note containing supplementary information related to the specified suspected faulty equipment. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

\( w \) = Termination report. Valid value(s):
- ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
- COMPLETED = Request completed successfully.
- NOT_STARTED = Requested action could not begin.
- STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a correct state.

\( x \) = Reason for the termination.

\( y \) = Phase or diagnostic result. Valid value(s):
- ATP = All tests were performed and passed.
- CATP = Some tests were not performed, but all tests that were performed passed.
- NTR = No tests were performed.
- STF = Some test(s) failed.

\( z \) = Phase number completed.

### 4. ACTION TO BE TAKEN

For Format 1, no action is required. It indicates that one or more faults exist in the system and provides data for manual analysis if necessary. Normally, a message of Format 2 should be obtained by rerunning the diagnostic with the TLP option if necessary, to begin to locate and repair the fault.

For Format 2, replace the indicated circuit packs, one at a time in the order specified. Rerun the diagnostic after
each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action is required.

5. ALARMS

None.

</tr>
</tbody>
</table>

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Depth location in the cabinet. Valid value(s):
    F = Front.
    R = Rear.

v = Circuit type. Valid value(s):
    HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.

___ = Equipment is part of the circuit under test.

w = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

x = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was completed successfully.
   IN PROGRESS = Requested action is in progress.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

y = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

z = Phase result.

a1 = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

   Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b1 = Phase number completed.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action required.

5. ALARMS

None.

**Type:** Output

1. **FORMAT**

DGN ONTCCOM=a b [c]

2. **REASON FOR OUTPUT**

To respond to a manual or automatic request to diagnose a specific office network and timing complex common unit (ONTCCOM).

3. **VARIABLE FIELD DEFINITIONS**

   a  
   = The ONTCCOM side.

   b  
   = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   NOT_STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

   c  
   = Additional data qualifying the termination field.

4. **ACTION TO BE TAKEN**

This message is printed out in response to a manual or automatic request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, variable 'c' should give some indication as to why the request failed. Check the ONTC MCC pages or the OP:CFGSTAT output message to verify that the ONTCCOM unit was in a valid state to perform the request.

5. **ALARMS**

__________________________________________________________________

2. REASON FOR OUTPUT

To report the results of executing a DGN:PCTDX input message to diagnose a peripheral control and timing data exchanger (PCTDX)

Format 1 prints printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Message manual.

b = peripheral control and timing data exchanger unit (PDXU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Message manual.

c = peripheral control and timing data exchanger (PCTDX) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Message manual.

d = Number of the phase in which the failure occurred.

e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Actual result in hexadecimal for the specified test.
i = Mask in hexadecimal used to determine test failure.
j = Actual result in hexadecimal for the specified test.
k = Floor and aisle number.
l = Module type.
m = Module number.
n = Cabinet type.
o = Cabinet number.
p = Replacement equipment code(s).
q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-] D[:E]...[:F]</td>
<td></td>
</tr>
</tbody>
</table>

: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code)
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
t = Number depth location in the cabinet.
F = Front cabinet reference
R = Rear cabinet reference
E = External to cabinet
= Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

= Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

= Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Requested action was completed successfully.
NOT STARTED = Requested action was not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

= Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

= Phase result.

= Phase number completed.

= Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action required.

DGN:PH-HELPER

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

DGN a=b-c-d-e-f PH g HELPER h=[b-c-d-e-f | i] UNAVAILABLE

2. REASON FOR OUTPUT

To print only in response to manually requested diagnostic action where raw data or a phase range has been specified. This message occurs when a helper circuit requested by the diagnostic program was unavailable and the attempt to seize control of this circuit has failed. This message accompanies and precedes the COMPLETED CATP message.

3. VARIABLE FIELD DEFINITIONS

- **a** = Global name of the circuit under diagnosis.
- **b** = Switching module (SM) number.
- **c** = Unit number.
- **d** = Service group number.
- **e** = Board number.
- **f** = Circuit number.
- **g** = Phase number.
- **h** = Global name of the unavailable helper circuit.
- **i** = Appears in place of above five variable 'b' through 'f' if no circuit of this type was available and no specific member was requested. Valid value(s):
  - ANY_MEMBER = Any circuit of this type in the office.
  - ANY_IN_SG = Any in the service group under test.
  - ANY_IN_UNIT = Any in the unit under test.
  - ANY_IN_CIRCUIT = Any in the circuit under test.
  - ACT_IN_UNIT = The active member of a duplex unit.
  - MATE_IN_UNIT = The standby member of a duplex unit.
  - ANY_IN_MATE = Any circuit in the standby member of a duplex unit.

4. ACTION TO BE TAKEN

Restore to service the helper circuit named by this message or make the helper circuit available for the diagnostic to complete normally. Re-enter the original diagnostic message.

5. ALARMS

None.

   [3] DGN PLTLK=a-b-c-d x [y]

   [4] DGN PLTLK=a-b-c-d COMPLETED z [PH b^1]

2. **REASON FOR OUTPUT**

To report the results of executing a DGN:PLTLK command to diagnose a PCT (Peripheral COntrol and Timing) Link.

Format 1 is printed when a test has failed. Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified for the request. An ordered list of suspected faulty equipment is provided. Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue. Format 4 prints when the specified phase(s) has completed.

3. **VARIABLE FIELD DEFINITIONS**

   a
   b = PLTU (PCT Line and Trunk Unit) number.
   c = PCT Facility Interface number.
   d = PCT Facility Interface side number.
   e = Number of the phase in which the failure occurred.
   f = Number of the segment in which the failure occurred.
   g = Number of the test that failed.
   h = Mismatch results for the specified test in hexadecimal.
   i = Actual result in hexadecimal for the specified test.
j = Mask in hexadecimal used to determine test failure.
k = Actual result in hexadecimal for the specified test.
l = Floor and aisle number.
m = Module type.
n = Module number.
o = Cabinet type.
p = Cabinet number.
q = Replacement equipment code(s).
r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

CODE FORM A[:B]...[:C] [-] D[:E]...[:F]
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code ‘A’).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code ‘A’.
E = Current minimal approved operating level for equipment code ‘B’.
F = Current minimal approved operating level(s) for equipment code(s) ‘C’.

Codes ‘A’, ‘B’ and ‘C’ may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms ‘D’, ‘E’ and ‘F’ may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Depth location in the cabinet.

v = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.
___ = Equipment is part of the circuit under test.

w = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.
x  = Termination report. Valid value(s):
    ABORTED    = Requested action was terminated before completion, and the termination was not graceful.
    COMPLETED  = Requested action was completed successfully.
    IN PROGRESS= Requested action is in progress.
    NOT STARTED= Requested action was not begun.
    STOPPED    = Requested action was terminated before a normal completion. Termination was graceful.

y  = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

z  = Phase result.

a  = Text identifier showing order of record. Valid value(s):
    FIRST      = First record of continuing list.
    LAST       = Last record of list.
    NEXT       = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b  = Phase number completed.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

2. REASON FOR OUTPUT

To report the result of executing a DGN:PMU input message to diagnose the precision measurement unit (PMU).

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Directly connected test unit (DCTU) number.
c = Circuit number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Identification number of floor and aisle.
l = Module type.
m = Module number.
n = Cabinet type.
o = Cabinet number.
p = Replacement equipment code(s).
q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

CODE FORM
A[:B]...[[:C] [:-] D[:E]...[[:F]]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.
Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
t = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

u = TLPNOTE number. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Message manual.

v = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

x = Phase result.

y = Phase number completed.

z = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b1 = Statement number.

c1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, no action is required.

5. ALARMS

None.

Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

DGN PPC=a b [c]

2. REASON FOR OUTPUT

To respond to a manual or automatic request to diagnose a specific pump peripheral controller (PPC).

3. VARIABLE FIELD DEFINITIONS

a = PPC side.

b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before a normal completion and the consistency of hardware states is questionable.
   COMPLETED = Requested action was completed successfully.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion, but consistency of hardware states and data is reliable.

c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual or automatic request. No further action is necessary if the requested action completed successfully. If the termination report is not COMPLETED, the variable 'c' field should give some indication as to why the request failed. The following exhibit explains the cause of a conditional all tests passed (CATP) termination code. Check the appropriate MCC pages or OP:CFGSTAT output messages to verify that the associated units were in a valid state to perform the request.

Causes of CATP

CODE         FORM
A[:B]...[:C] [-] D[:E]...[:F]

: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the
implicated shelf.

\[ t \] = Circuit type. Valid value(s):
\[ \text{HPR} \] = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
\[ \text{ONL} \] = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
\[ ___ \] = Equipment is part of the circuit under test.

\[ u \] = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Message manual.

\[ v \] = Termination status. Valid value(s):
\[ \text{ABORTED} \] = The process was terminated (process not gracefully terminated).
\[ \text{NOT\ \STARTED} \] = Action was not begun.
\[ \text{STOPPED} \] = Terminated before normal completion (process gracefully terminated).

\[ w \] = Reason for termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

\[ x \] = Phase result.

\[ y \] = Phase number completed.

\[ z \] = Text identifier showing order of record. Valid value(s):
\[ \text{FIRST} \] = First record of continuing list.
\[ \text{LAST} \] = Last record of list.
\[ \text{NEXT} \] = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\[ a^1 \] = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\[ b^1 \] = Statement number.

\[ c^1 \] = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, replace the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of executing a DGN:PSU input message to diagnose a packet switch unit (PSU) common controller (COM).

Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

b = Switching module (SM) number.
c = PSU number.
d = Service group number.
f = Number of the phase in which the failure occurred.
g = Number of the segment in which the failure occurred.
h = Number of the test that failed.
i = Mismatch results for the specified test in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Mask used to determine test failure in hexadecimal.
l = Expected result for the specified test in hexadecimal.
m = Floor and aisle number.
n = Module type.
o = Module number.
p = Cabinet type.
q = Cabinet number.
r = Replacement equipment code(s).
s = Equipment form(s). Refer to the APP:EQUIP-FORM appendix in the Appendixes section of the Output Messages manual.
t = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
u = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
v = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
w = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ = Equipment is part of the circuit under test.
x = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.
y = Termination report. Valid value(s):

ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Request has successfully completed.
NOT_STARTED = Requested action has not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.
z = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

a
 = Phase result.

b
 = Phase number completed.

c
 = Text identifier showing order of record. Valid value(s):
  FIRST = First record of continuing list.
  LAST = Last record of list.
  NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d
 = Statement number.

e
 = Reason why some tests were not performed.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty circuit pack list.

For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes. If, after replacing each circuit pack listed, the problem still is not resolved, rerun the diagnostic with the RAW and UCL options. If this does not assist in solving the problem, then contact the appropriate organization for technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 3, 4, and 5, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of executing a DGN:PSU input message to diagnose a packet switch unit (PSU) common controller (COM).

Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.
Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

Formats 6 and 7 are used for PSUCOM non-volatile memory (NVMEM) modification report.

Format 6 reports a list of version identifiers associated with the firmware and hardware images of the control fanout (CF) and packet fanout (PF) of the PSUCOM.

3. VARIABLE FIELD DEFINITIONS

\(b\) = Switching module (SM) number.
\(c\) = PSU number.
\(d\) = Service group number.
\(f\) = Number of the phase in which the failure occurred.
\(g\) = Number of the segment in which the failure occurred.
\(h\) = Number of the test that failed.
\(i\) = Mismatch results for the specified test in hexadecimal.
\(j\) = Actual result for the specified test in hexadecimal.
\(k\) = Mask used to determine test failure in hexadecimal.
\(l\) = Expected result for the specified test in hexadecimal.
\(m\) = Floor and aisle number.
\(n\) = Module type.
\(o\) = Module number.
\(p\) = Cabinet type.
\(q\) = Cabinet number.
\(r\) = Replacement equipment code(s).
\(s\) = Equipment form(s). Refer to the APP:EQUIP-FORM appendix in the Appendixes section of the Output Messages manual.
\(t\) = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
\(u\) = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
\(v\) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
w  = Circuit type. Valid value(s):
   HPR  = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL  = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ___ = Equipment is part of the circuit under test.

x  = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

y  = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   IN PROGRESS = Diagnostics request is in progress.
   NOT STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

z  = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual. If format 3 is associated with an NVMEM request, please refer to the APP:NVMEM-REAS appendix.

a  = Phase result.

b  = Phase number completed.

c  = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.
   NO RECORD AVAILABLE FOR THIS REQUEST = Used by NVMEM requests. Indicates that no offnormal records were found.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d  = Statement number.

e  = Reason why some tests were not performed.

f  = NVMEM version query status. Refer to the APP:NVMEM-REAS appendix in the Appendixes section of the Output Messages manual.

g  = PSU image type. Valid value(s):
   CF3 FW = Control fanout model 3 (CF3) firmware (FW) image.
   CF3 HW = CF3 hardware (HW) image.
   PF3 FW = Packet fanout model 3 (PF3) FW image.
   PF3 HW = PF3 HW image.
h\(^1\) = PSUCOM shelf number.

i\(^1\) = Version identifier associated with the factory-programmed FW/HW image.

j\(^1\) = Version identifier associated with the writable FW/HW image.

k\(^1\) = Version identifier associated with the last booted, currently running FW/HW image. This is the image selected from the last reset.

l\(^1\) = Version identifier associated with the optional data region (ODR) image resident on SMP.

m\(^1\) = Header for NVMEM supplementary data. Valid value(s):
   ATTRIBUTE = Attribute of the image header information.
   STIMULUS = Stimulus for NVMEM errors encountered.

n\(^1\) = NVMEM supplementary information reason. Refer to the Supplementary Data table in the APP:NVMEM-REAS appendix in the Appendixes section of the Output Messages manual.

o\(^1\) = Data supplementing reason. The first hexadecimal number represents the specific circuit packs that are failing. A definition of the bitmap is in the APP-NVMEM-REAS appendix. If more hexadecimal dumps are displayed please, contact technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty circuit pack list.

For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes. If, after replacing each circuit pack listed, the problem still is not resolved, rerun the diagnostic with the RAW and UCL options. If this does not assist in solving the problem, then contact the appropriate organization for technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 3, 4, and 5, no action is required.

For Formats 6, 7 and Format 3 (if related to an NVMEM request), please refer to the APP:NVMEM-REAS appendix for more details.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of executing a DGN:PSU input message to diagnose a packet switch unit (PSU) protocol handler (PH). Format 1 is printed when a test has failed. Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided. Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue. Format 4 prints when the specified phase(s) has completed. Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

b = Switching module (SM) number.
c = PSU number.
d = Shelf number.
e = Protocol handler number.
f = Number of the phase in which the failure occurred.
g = Number of the segment in which the failure occurred.
h = Number of the test that failed.
i = Mismatch results for the specified test in hexadecimal.

j = Actual result for the specified test in hexadecimal.

k = Mask used to determine test failure in hexadecimal.

l = Expected result for the specified test in hexadecimal.

m = Floor and aisle number.

n = Module type.

o = Module number.

p = Cabinet type.

q = Cabinet number.

r = Replacement equipment code(s).

s = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM content:

CODE FORM A[:B]...[:C] [-] D[:E]...[:F]

- = Inter-field delimiter if necessary.

- = Intra-field delimiter.

A = Current minimal accepted equipment code.

B = Current production equipment code (substitutable equipment for code 'A').

C = Additional compatible equipment code(s) (added as space permits).

D = Current minimal approved operating level for equipment code 'A'.

E = Current minimal approved operating level for equipment code 'B'.

F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

t = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

u = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

v = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

w = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

___ = Equipment is part of the circuit under test.
x = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

y = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action has not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

z = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

a¹ = Phase result.

b¹ = Phase number completed.

c¹ = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d¹ = Statement number.

e¹ = Reason why some tests were not performed.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty circuit pack list.

For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes. If, after replacing each circuit pack listed, the problem still is not resolved, rerun the diagnostic with the RAW and UCL options. If this does not assist in solving the problem, then contact the appropriate organization for technical assistance.

For Formats 3, 4, and 5, no action is required.

C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.
t = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
u = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
v = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
w = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.
x = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.
y = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Request has successfully completed.
NOT_STARTED = Requested action has not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

z = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

a^1 = Phase result.
b^1 = Phase number completed.
c^1 = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST  = Last record of list.
   NEXT  = Next record of continuing list.

   Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d^1 = Statement number.
e^1 = Reason why some tests were not performed.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty circuit pack list.

For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes. If, after replacing each circuit pack listed, the problem still is not resolved, rerun the diagnostic with the RAW and UCL options. If this does not assist in solving the problem, then contact the appropriate organization for technical assistance.

For Formats 3, 4, and 5, no action is required.

5. ALARMS

None.

__________________________________________________________________

2. REASON FOR OUTPUT

To report the results of executing a DGN:QGP input message to diagnose a quad-link gateway processor (QGP). The report may also be produced from DGN:MSGS, RST:QLPS, or RST:MSGS input messages.

Format 1 is printed when a test has failed. The text in the square bracket will be printed if the RAW option is used with the diagnostic request.

Format 2 is printed when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 is printed when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 is printed when the specified phase(s) has completed. Execution of the diagnostic will continue until all requested phases are completed.

Formats 1, 2, and 4 (with phase number) belong to the SMCONFG message class, while Formats 3 and 4 (without phase number) belong to the MSGS message class.

3. VARIABLE FIELD DEFINITIONS

a = Message switch (MSGS) number.

b = QGP number.

c = Number of the phase in which the failure occurred.
d = Number of the segment in which the failure occurred.
e = Number of the test that failed.
f = Mismatch results for the specified test in hexadecimal.
g = Expected result for the specified test in hexadecimal.
h = Mask used to determine test failure in hexadecimal.
i = Actual result for the specified test in hexadecimal.
j = Text identifier showing order of TLP record. Valid value(s):
   FIRST  = First record of continuing list.
   LAST   = Last record of list.
   NEXT   = Next record of continuing list.

A maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of one to four entries. Each record will have a new header.

k = Identification number of floor and aisle.

l = Cabinet type. Valid value(s):
   CM2    = Communication module 2 cabinet.
   M      = Miscellaneous cabinet.
   MSG    = Message switch cabinet.
   SMC    = Switching module controller cabinet.
   TMS    = Time multiplexed switch cabinet.

m = Cabinet number.

n = Replacement equipment code(s). Refer to the following example.

o = Equipment form(s). Equipment form represents the minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
- = Inter-field delimiter.
: = Intra-field delimited.

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifiers(s) as applicable.
Forms 'p', 'q', and 'r' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

- **p** = Vertical location in the cabinet, in inches above the floor to the center of the implicated shelf.
- **q** = Horizontal location in the cabinet, in eighths of an inch from the left corner of the implicated shelf.
- **r** = Circuit type. Valid value(s):
  - **HPR** = Equipment is part of a helper circuit. The helper must be removed from service before replacement is attempted.
  - **ONL** = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
  - **---** = Equipment is part of the circuit under test.

Note: The equipment may be in a unit (such as QLPS) which shares a power service group with a related unit (such as ONTCCOM). The related unit must also be removed from service, and the related unit's mate made on-line before replacement is attempted.

- **s** = Number of the TLP note containing supplementary information related to the specified suspected faulty equipment. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

- **t** = Termination status. Valid value(s):
  - **ABORTED** = Requested action was terminated before completion, and the termination was not graceful.
  - **NOT STARTED** = Requested action was not begun.
  - **STOPPED** = Requested action was terminated before a normal completion.

- **u** = Reason for the termination.

- **v** = Phase or diagnostic result. Valid value(s):
  - **ATP** = All tests were performed and passed.
  - **CATP** = Some tests were not performed, but all tests that were performed passed.
  - **NTR** = No tests were performed.
  - **STF** = Some test(s) failed.

- **w** = Number of the phase completed.

## 4. ACTION TO BE TAKEN

For Format 1, no action is required. It indicates that one or more faults exist in the system and provides data for manual analysis if necessary. Normally, a message of Format 2 should be obtained by rerunning the diagnostic with the TLP option if necessary, to begin to locate and repair the fault.

For Format 2, replace the indicated circuit packs, refer to the Corrective Maintenance Manual for specific instructions. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action is required.

## 5. ALARMS
None.

__________________________________________________________________

2. REASON FOR OUTPUT

To report the results of executing a DGN:QLPS input message to diagnose a quad-link packet switch (QLPS) processor. The report may also be produced from the DGN:ONTC, RST:QLPS, or RST:ONTC input messages.

Format 1 is printed when a test has failed. The text in the square bracket will be printed if the RAW option is used with the diagnostic request.

Format 2 is printed when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 is printed when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 is printed when the specified phase(s) has completed. Execution of the diagnostic will continue until all requested phases are completed.

Formats 1, 2, and 4 (with phase number) belong to the SMCONFG message class, while Formats 3 and 4 (without phase number) belong to the MSGS message class.

3. VARIABLE FIELD DEFINITIONS

a
  = Office network timing and control (ONTC) side number.

b
  = Quad-link packet switch (QLPS) network number.

c
  = Number of the phase in which the failure occurred.

d
  = Number of the segment in which the failure occurred.
e = Number of the test that failed.

f = Mismatch results for the specified test in hexadecimal.

g = Expected result for the specified test in hexadecimal.

h = Mask used to determine test failure in hexadecimal.

i = Actual result for the specified test in hexadecimal.

j = Text identifier showing order of TLP record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

A maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of one to four entries. Each record will have a new header.

k = Identification number of floor and aisle.

l = Cabinet type. Valid value(s):
CM2 = Communication module 2 cabinet.
M = Miscellaneous cabinet.
MSG = Message switch cabinet.
SMC = Switching module controller cabinet.
TMS = Time multiplexed switch cabinet.

m = Cabinet number.

n = Replacement equipment code(s). Refer to the following example.

o = Equipment form(s). Equipment form represents the minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
: = Intra-field delimited.
- = Inter-field delimiter.

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.
p = Vertical location in the cabinet, in inches above the floor to the center of the implicated shelf.

q = Horizontal location in the cabinet, in eighths of an inch from the left corner of the implicated shelf.

r = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed from service before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   --- = Equipment is part of the circuit under test.

Note: The equipment may be in a unit (such as QLPS 0-0) which shares a power service group with a related unit (such as QLPS 0-1). The related unit must also be removed from service, and the related unit's mate made on-line before replacement is attempted.

s = Number of the TLP note containing supplementary information related to the specified suspected faulty equipment. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

t = Termination status. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion.

u = Reason for the termination.

v = Phase or diagnostic result. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Some tests were not performed, but all tests that were performed passed.
   NTR = No tests were performed.
   STF = Some test(s) failed.

w = Number of the phase completed.

4. ACTION TO BE TAKEN

For Format 1, no action is required. It indicates that one or more faults exist in the system and provides data for manual analysis if necessary. Normally, a message of Format 2 should be obtained by rerunning the diagnostic with the TLP option if necessary, to begin to locate and repair the fault.

For Format 2, replace the indicated circuit packs, refer to the Corrective Maintenance Manual for specific instructions. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing a DGN:RAF input message to diagnose the recorded announcement function (RAF) unit.

Format 1 prints when a test fails.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) has been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RAF unit number.
c  = Number of the phase in which the failure occurred.
d  = Number of the segment in which the failure occurred.
e  = Number of the test that failed.
f  = Mismatch results for the specified test.
g  = Expected result for the specified test, in hexadecimal.
h  = Mask used to determine test failure in hexadecimal.
i  = Actual result for the specified test in hexadecimal.
j  = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
k  = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
l  = Circuit type. Valid value(s):
    HPR  = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
    ONL  = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
    ___  = Equipment is part of the circuit under test.
m  = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.
n  = Text identifier showing order of record. Valid value(s):
    FIRST  = First record of continuing list.
    NEXT   = Next record of continuing list.
    LAST   = Last record of list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

o  = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

p  = Termination status. Valid value(s):
    ABORTED  = The process was terminated (process not gracefully terminated).
    NOT_STARTED  = Action was not begun.
    STOPPED  = Terminated before normal completion (process gracefully terminated).

q  = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

r  = Phase result.
s  = Phase number completed.
t  = Statement number.
u = Reason why some tests were not performed.
v = ID number for floor and aisle.
w = Module type.
x = Module number.
y = Cabinet type.
z = Cabinet number.
a¹ = Replacement equipment code(s).
b¹ = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example. Example of CODE FORM content: CODE FORM A[:B]...[:C] [-] D[:E]...[:F]
    = Intra-field delimiter.
    = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'A', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

4. ACTIONS TO BE TAKEN

For Format 1, if variables 'g' and 'i' do not match, refer to TLP. If this does not assist in solving the problem, rerun the diagnostic with the ‘RAW’ and ‘UCL’ options. Give the resulting output to a diagnostician for interpretation.

For Format 2, replace the suspected packs, one at a time, in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Format 3, 4, and 5, none.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of a DGN:RAU input message to diagnose a remote switching module (RSM) alarm (RAU) circuit.

Format 1 is printed when a test has failed.

Format 2 is printed when a test fails and the trouble locating procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 is printed when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 is printed when the specified phase(s) completed. Execution of the diagnostic will continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Number of the phase in which the failure occurred.
c = Number of the segment in which the failure occurred.
d = Number of the test that failed.
e = Mismatch results for the specified test.
f = Expected result for the specified test in hexadecimal.
g = Mask used to determine test failure in hexadecimal.
h = Actual result for the specified test in hexadecimal.
i = Aisle.
j = Module type.
k = Cabinet type.
l = Replacement equipment code(s).
m = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
</table>
| A[:B]...[:C] [-] D[:E]...[:F] | - = Inter-field delimiter if necessary. :
|          | = Intra-field delimiter. |
| A        | = Current minimal accepted equipment code. |
| B        | = Current production equipment code (substitutable equipment for code 'A'). |
| C        | = Additional compatible equipment code(s) (added as space permits) |
| D        | = Current minimal approved operating level for equipment code 'A'. |
| E        | = Current minimal approved operating level for equipment code 'B'. |
| F        | = Current minimal approved operating level(s) for equipment code(s) 'C'. |

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

n = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

o = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

p = Circuit type. Valid value(s):
   ___ = Equipment is part of the circuit under test.
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
q = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

r = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was complete.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before a normal completion.

s = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

t = Phase result.

u = Phase number completed.

v = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   NEXT = Next record of continuing list.
   LAST = Last record of list.

   Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

w = Module number.

x = Cabinet number.

y = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

z = Statement number.

a1 = Reason why some tests were not performed.

4. ACTIONS TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

Alarms may be triggered because:

- The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.
- A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

- A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

- The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

To report the result of executing a DGN:RCLK input message to diagnose a remote clock (RCLK) circuit.

Format 1 is printed when a test has failed.

Format 2 is printed when a test fails and the trouble locating procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 is printed when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 is printed when the specified phase(s) completed. Execution of the diagnostic will continue until all the requested phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RCLK side.
c = Number of the phase in which the failure occurred.
d = Number of the segment in which the failure occurred.
e = Number of the test that failed.
f = Mismatch results for the specified test in hexadecimal.
g = Expected result for the specified test in hexadecimal.
h = Mask used to determine test failure in hexadecimal.
i = Actual result for the specified test in hexadecimal.
j = Aisle.
k = Module type.
x = Module number.
l = Cabinet type.
y = Cabinet number.
m = Replacement equipment code(s).
n = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-] D[:E]...[:F]</td>
<td></td>
</tr>
</tbody>
</table>
```

: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

o = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
f = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
q = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

r = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.
s = Termination report. Valid value(s):
  ABORTED = Requested action was terminated before completion, and the termination is immediate. Consistency of hardware and data is questionable.
  COMPLETED = Request has successfully completed.
  NOT_STARTED = Requested action had not begun.
  STOPPED = Requested action was terminated before a normal completion.

t = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

u = Phase result.
v = Phase number completed.
w = Text identifier showing order of record. Valid value(s):
  FIRST = First record of continuing list.
  NEXT = Next record of continuing list.
  LAST = Last record of list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

z = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

a^1 = Statement number.
b^1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty circuit.

For Format 2, replace the suspected circuit packs, one at a time, in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3, 4, and 5, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of a DGN:RDFI input message to diagnose a remote switching module (RSM) digital facilities interface (RDFI) circuit.

Format 1 is printed when a test has failed.

Format 2 is printed when a test fails and the trouble locating procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 is printed when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 is printed when the specified phase(s) completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.

b  = Digital line and trunk unit (DLTU) number.
c = RDFI number.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Aisle.
l = Module type.
y = Module number.
m = Cabinet type.
z = Cabinet number.
n = Replacement equipment code(s).
o = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]

: = Intra-field delimiter.
A = Current minimal accepted equipment code.
- = Inter-field delimiter if necessary.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

p = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
q = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
r = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

s = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

= Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was complete.
COMPLETED = Request has successfully completed.
NOT_STARTED = Requested action had not begun.
STOPPED = Requested action was terminated before a normal completion.

u = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

v = Phase result.

w = Phase number completed.

x = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
NEXT = Next record of continuing list.
LAST = Last record of list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b¹ = Statement number.

c¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3, 4, and 5, none.

2. REASON FOR OUTPUT

To report the result of a DGN:RLI input message to diagnose a remote switching module (RSM) remote link interface (RLI) circuit.

Format 1 is printed when a test has failed.

Format 2 is printed when a test fails and the trouble locating procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 is printed when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 is printed when the specified phase(s) completed. Execution of the diagnostic will continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = RLI number.
c = Number of the phase in which the failure occurred.
d = Number of the segment in which the failure occurred.
e = Number of the test that failed.
f = Mismatch results for the specified test.
g = Expected result for the specified test in hexadecimal.
h = Mask used to determine test failure in hexadecimal.
i = Actual result for the specified test in hexadecimal.
j = Aisle.
k = Module type.
x = Module number.
l = Cabinet type.
y = Cabinet number.
m = Replacement equipment code(s).
n = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-] D[:E]...[:F]</td>
<td>= Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>:</td>
<td>= Intra-field delimiter.</td>
</tr>
<tr>
<td>A</td>
<td>= Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>= Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>= Additional compatible equipment code(s) (added as space permits)</td>
</tr>
<tr>
<td>D</td>
<td>= Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>= Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>= Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

o = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

p = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

q = Circuit type. Valid value(s):
= Equipment is part of the circuit under test.

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

r = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

s = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was complete.
COMPLETED = Request has successfully completed.
NOT_STARTED = Requested action had not begun.
STOPPED = Requested action was terminated before a normal completion.

t = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

u = Phase result.

v = Phase number completed.

w = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

z = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

a¹ = Statement number

b¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit. For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

Alarms may be triggered because:

(1) The switch is sending a response message that is reporting that a fault recovery (FR) restore request was
purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.

(2) A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

(3) A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

(4) The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

Application: 5,CNI
Type: Output

1. FORMAT

[1] DGN RPCNa 0 b c [d]

__________________________________________________________________

[2] DGN RPCNa 0 PH e f [g]

TEST      MISMATCH
h          i

__________________________________________________________________

2. REASON FOR OUTPUT

To print the results of a diagnostic run on a ring peripheral controller node (RPCN). Format 1 prints at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode. Format 2 prints whenever the diagnostic results are printed for an individual phase. This occurs in the case of partial diagnosis, a test failure, or whenever RAW was specified in the input message.

3. VARIABLE FIELD DEFINITIONS

a = Ring node (RN) group number.

b = Termination mode of diagnostic. Valid value(s):
   ABORTED = Diagnostic was abnormally stopped due to an external or internal error in execution, or a STOP:DMQ input request.
   COMPLETED = Diagnostic completed normally.
   TERMINATED = Diagnostic terminated under program control (early termination), since further testing would not improve diagnostic resolution.

c = Result of the diagnostic. Valid value(s):
   ATP = All tests passed.
   CATP = All tests that were executed were ATP. Some tests were not executed due to the unavailability of a system resource that was needed to perform the test, or due to the inability to isolate, or to singly isolate, the node under test.
   NTR = No tests run.
   STF = Some tests failed.

d = Valid value(s):

<table>
<thead>
<tr>
<th>'a' =</th>
<th>'b' =</th>
</tr>
</thead>
</table>
| CATP or NTR | Identifies the reason that tests were skipped in this phase by their bit position in a 16-character hexadecimal number. For example, if 'd' = 00000000 00000006, tests were skipped for reasons 1 and 2. The reason codes are as follows:
|       | Bit 0 = Helper unit invalid or not specified.
|       | Bit 1 = Helper unit cannot be reserved.
|       | Bit 2 = Helper unit not out-of-service.
|       | Bit 3 = Helper control unit (CU) is not ATP. |
Bits 4 to 29 = Unused.
Bit 30 = Node under test was not the only isolated node.
Bit 31 = Node under test was not isolated.
Bits 32 to 63 = Unused.

| STF | Number of test failures in addition to the reasons that tests were skipped. For example, if 'd' = 7
|     | 00000000 00000006, seven tests failed, plus tests were skipped for reasons 1 and 2. |

e = Phase number.

f = Result of the phase. Valid value(s):

- ATP = All tests passed.
- CATP = All tests that were executed were ATP. Some tests were not executed due to the unavailability of a system resource that was needed to perform the test, or due to the inability to isolate, or to singly isolate, the node under test.
- NTR = No tests run.
- STF = Some tests failed.

Identifies the reason that some tests were skipped. This field is the same as the 'd' field in Format 1 except that the result of only one phase is reflected.

h = Test number of the failing test.

i = An 8-digit hexadecimal number that indicates the bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'c' or 'r' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATP</td>
<td>The needed system resource should be made available if possible, so that all tests may be executed.</td>
</tr>
<tr>
<td>STF</td>
<td>The unit should be repaired as quickly as possible.</td>
</tr>
</tbody>
</table>

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of a DGN:RRCLK input message to diagnose a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK). This message also reports the results of automatic diagnostics run by the system in response to RRCLK faults.

Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = RISLU number.
c = RRCLK side.
d = Number of the phase in which the failure occurred.
e = Number of the segment in which the failure occurred.
f = Number of the test that failed.
g = Mismatch results for the specified test in hexadecimal.
h = Expected result for the specified test in hexadecimal.
i = Mask used to determine test failure in hexadecimal.
j = Actual result for the specified test in hexadecimal.
k = Floor and aisle number.
l = Module type.
m = Module number.
n = Cabinet type.
o = Cabinet number.
p = Replacement equipment code(s).
q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>:</td>
<td>- Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>A</td>
<td>= Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>= Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>= Additional compatible equipment code(s) (added as space permits)</td>
</tr>
<tr>
<td>D</td>
<td>= Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>= Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>= Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'B', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
= Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

___ = Equipment is part of the circuit under test.

u = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

v = Termination report. Valid value(s):

ABORTED = Requested action was terminated before completion, and the termination was not graceful.

COMPLETED = Request has successfully completed.

NOT_STARTED = Requested action has not begun.

STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

w = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

x = Phase result.

y = Phase number completed.

z = Text identifier showing order of record:

FIRST = First record of continuing list.

LAST = Last record of list.

NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b = Statement number.

c = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the 'TLP' option to generate a suspected faulty circuit pack list.

For Format 2, replace the suspected circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes. If, after replacing each circuit pack listed, the problem still is not resolved, rerun the diagnostic with the 'RAW' and 'UCL' options. If this does not assist in solving the problem, then contact the appropriate organization for technical assistance.

For Format 3, 4, and 5, none.
5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing DGN:RVPT input message to diagnose the revertive pulsing transceiver (RVPT), to report the diagnostic outcome as the result of a RST:RVPT input message, or to report the diagnostic outcome as the result of a recovery action that removed the circuit from service.

Format 1 is printed when a specified phase(s) has been completed and either a phase range or RAW was specified on a manual request. Execution of the diagnostic will continue for any remaining phases.

Format 2 is printed to report the final results when diagnostic execution has been completed.

Format 3 is printed when a test has failed.

Format 4 is printed when the trouble location procedure (TLP) was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Unit number.
c = Service group.

d = Circuit number.

e = Completion status. Valid value(s):
ABORTED = The diagnostic phase was unable to clean up or remove hardware or software resources. Further output showing data or hardware recovery by audits may follow. A message of Format 2 will follow giving the reason for the abort.
COMPLETED = Successful completion.
STOPPED = The diagnostic phase terminated prematurely but cleanly. A message of Format 2 will follow giving the reason for termination.

f = Diagnostic phase result. Valid value(s):
ATP = All tests were performed and passed.
CATP = Some tests were not performed, but all tests that were performed passed.
NTR = No tests were performed.
STF = Some test(s) failed.

h = Termination status. Valid value(s):
ABORTED = The diagnostic process was purged or terminated without cleaning up. Further output showing data or hardware recovery by audits may follow.
COMPLETED = Successful completion.
NOT STARTED = The diagnostic was not started.
STOPPED = Terminated before normal completion.

i = Reason for termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

j = Number of the phase in which the failure occurred.

k = Number of the segment in which the failure occurred.

l = Number of the test that failed.

m = Mismatched results for the specified test in hexadecimal.

n = Expected results for the specified test in hexadecimal.

o = Mask used to determine test failure in hexadecimal.

p = Actual result for the specified test in hexadecimal.

q = Aisle.

r = Module type.

s = Switching module number.

t = Cabinet type.

u = Cabinet number.

v = Replacement equipment code(s).
= Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
= Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

a¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b¹ = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

c¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

d¹ = Statement number.

e¹ = Reason why some tests were not performed.
4. ACTION TO BE TAKEN

For Formats 1 and 2,

<table>
<thead>
<tr>
<th>'r' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATP</td>
<td>No action is required. The circuit is not automatically restored.</td>
</tr>
<tr>
<td>CATP</td>
<td>Find the suspected resource by checking diagnostic listing.</td>
</tr>
<tr>
<td>NTR</td>
<td>Find the suspected resource by checking diagnostic listing.</td>
</tr>
<tr>
<td>STF</td>
<td>Repair the faulty circuit and rerun the diagnostic.</td>
</tr>
</tbody>
</table>

For Format 3, replace the faulty unit.

For Format 4, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Format 5, none.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing a DGN:SAS input message to diagnose the service announcement system (SAS) unit.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = SAS unit number.
c = Number of the phase in which the failure occurred.
d = Number of the segment in which the failure occurred.
e = Number of the test that failed.
f = Mismatch results for the specified test.
g = Expected result for the specified test in hexadecimal.
h = Mask used to determine test failure in hexadecimal.
i = Actual result for the specified test in hexadecimal.
j = Identification number of floor and aisle.
k = Module type.
l = Module number.
m = Cabinet type.
n = Cabinet number.
o = Replacement equipment code(s).
p = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

q = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
r = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
s = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the
implicated shelf.

t = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
___ = Equipment is part of the circuit under test.

u = Refer to output appendix APP:TLP-NOTE in the Appendixes section of the Output Messages manual.

v = Termination status. Valid value(s):
ABORTED = Immediate termination.
COMPLETED = Successful completion.
NOT STARTED = Action has not begun.
STOPPED = Terminated before normal completion.

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

x = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

y = Phase result.

z = Phase number completed.

a = Statement number.

b = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4 and 5, no action is required.

5. ALARMS

None.

### 2. REASON FOR OUTPUT

To report the result of executing the corresponding input message to diagnose the scan point board (SCAN).

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble locating procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.  
- **b** = Metallic service unit (MSU) number.  
- **c** = Service group number.
d = SCAN number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.
h = Mismatch results for the specified test in hexadecimal.
i = Expected result for the specified test in hexadecimal.
j = Mask used to determine test failure in hexadecimal.
k = Actual result for the specified test in hexadecimal.
l = Identification number of floor and aisle.
m = Module type.
n = Module number.
o = Cabinet type.
p = Cabinet number.
q = Replacement equipment code(s).
r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[::C] [-] D[:E]...[::F]</td>
<td></td>
</tr>
<tr>
<td>-</td>
<td>= Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>:</td>
<td>= Intra-field delimiter.</td>
</tr>
<tr>
<td>A</td>
<td>= Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>= Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>= Additional compatible equipment code(s) (added as space permits).</td>
</tr>
<tr>
<td>D</td>
<td>= Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>= Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>= Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

= Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the
implicated shelf.

\[ u \]  Circuit type. Valid value(s):
- _____  Equipment is part of the circuit under test.
- HPR  Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
- ONL  Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

\[ v \]  Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

\[ w \]  Termination status. Valid value(s):
- ABORTED  The process was terminated (process not gracefully terminated).
- NOT STARTED  Action was not begun.
- STOPPED  Terminated before normal completion (process gracefully terminated).

\[ x \]  Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

\[ y \]  Phase result.

\[ z \]  Phase number completed.

\[ a^1 \]  Text identifier showing order of record. Valid value(s):
- FIRST  First record of continuing list.
- LAST  Last record of list.
- NEXT  Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\[ b^1 \]  Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\[ c^1 \]  Statement number.

\[ d^1 \]  Reason why some tests were not performed.

### 4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

### 5. ALARMS

Alarms may be triggered because:
(1) The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.

(2) A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

(3) A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

(4) The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an “alarm” was requested on failures. These callers have the option of not alarming failures.

[6] DGN SCSDC a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the scanner and signal distributor controller (SCSDC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic. Valid value(s):
ATP = All tests passed.
NTR = No tests were run.
STF = Some tests failed.

c = If 'b' = STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (70000000000000000), seven tests failed, and no tests were skipped.
d = Phase number.
e = Test number of the failing test.
f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.
g = The bits which were actually received from the hardware device.
h = Determines what bits in the actual value are of interest to this test.
i = The value which the test expected.
Note: For Format 3 the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.
j = Last statement successfully executed before the diagnostic terminated.
k = Current test number when diagnostic terminated.
l = Task number assigned to the request.

4. ACTION TO BE TAKEN
If 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for repair procedures.

5. ALARMS
This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the results of the SLC® 96 digital facility interface (SDFI) diagnostics.

Format 1 prints when a test have been failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) have been completed. Execution of the diagnostic will not continue until all phases are completed.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

| a  | Switching module (SM) number. |
| b  | Digital carrier line unit (DCLU) number. |
| c  | SDFI number. |
= Number of the phase in which the failure occurred.

e = Number of the segment in which the failure occurred.

f = Number of the test that failed.

g = Mismatch results for the specified test in hexadecimal.

h = Expected result for the specified test in hexadecimal.

i = Mask used to determine test failure in hexadecimal.

j = Actual result for the specified test in hexadecimal.

k = Identification number of floor and aisle.

l = Module type.

m = Module number.

n = Cabinet type.

o = Cabinet number.

p = Replacement equipment code(s).

q = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

```
CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
– = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

r = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

s = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
t = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ___ = Equipment is part of the circuit under test.

u = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

v = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT_STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

w = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

x = Phase result.

y = Phase number completed.

z = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

a = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b = Statement number.

c = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the synchronous data link controller (SDLC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
The result of the diagnostic. Valid value(s):
- ATP = All tests passed.
- NTR = No tests were run.
- STF = Some tests failed.

Identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (70000000000000000), seven tests failed, and no tests were skipped.

Phase number.

Test number of the failing test.

The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

The bits which were actually received from the hardware device.

Determines what bits in the actual value are of interest to this test.

The value which the test expected.

Note: For Format 3 the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.

Last statement successfully executed before the diagnostic terminated.

Current test number when diagnostic terminated.

Task number assigned to the request.

4. ACTION TO BE TAKEN

If 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required

2. **REASON FOR OUTPUT**

   To report the results of diagnosing a digital networking unit - synchronous optical network (SONET) (DNU-S) synchronous transport signal electrical interface (STSX-1) facility interface (SFI).

   Format 1 is printed when a test has failed.

   Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified for the request. An ordered list of suspected faulty equipment is provided.

   Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

   Format 4 prints when the specified phase(s) has completed.

3. **VARIABLE FIELD DEFINITIONS**

   a = Switching module (SM) number.
   b = DNU-S number.
   c = Data group number.
   d = STSX-1 facility interface number.
   e = Number of the phase in which the failure occurred.
   f = Number of the segment in which the failure occurred.
g = Number of the test that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Actual result in hexadecimal for the specified test.

j = Mask in hexadecimal used to determine test failure.

k = Expected result in hexadecimal for the specified test.

l = Floor and aisle number.

m = Module type.

n = Module number.

o = Cabinet type.

p = Cabinet number.

q = Replacement equipment code(s).

r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]..[:C] [-] D[:E]...[:F]</td>
<td>Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>:</td>
<td>Intra-field delimiter.</td>
</tr>
<tr>
<td>A</td>
<td>Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>Additional compatible equipment code(s) (added as space permits).</td>
</tr>
<tr>
<td>D</td>
<td>Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Depth location in the cabinet.

v = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the online member of a duplex pair. The online member
must be removed, and the mate made online, before replacement is attempted.

___

= Equipment is part of the circuit under test.

w = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

x = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was completed successfully.
   IN PROGRESS = Requested action is in progress.
   NOT_STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

y = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

z = Phase result.

Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b = Phase number completed.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing the corresponding input message to diagnose the subscriber line instrument measurement (SLIM) board.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble locating procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phases is terminated before completion. Execution of any later diagnostic phases(s) will not continue.

Format 4 prints when each phase of a diagnostic has completed, and when the full diagnostic has completed. Completion is denoted by no phase number specified after the result.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = SLIM number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.
h = Mismatch results for the specified test in hexadecimal.
i = Expected result for the specified test in hexadecimal.
j = Mask used to determine test failure in hexadecimal.
k = Actual result for the specified test in hexadecimal.
l = Identification number of floor and aisle.
m = Module type.
n = Module number.
o = Cabinet type.
p = Cabinet number.
q = Replacement equipment code(s).
r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C]</td>
<td>D[:E]...[:F]</td>
</tr>
<tr>
<td>-</td>
<td>= Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>:</td>
<td>= Intra-field delimiter.</td>
</tr>
<tr>
<td>A</td>
<td>= Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>= Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>= Additional compatible equipment code(s) (added as space permits).</td>
</tr>
<tr>
<td>D</td>
<td>= Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>= Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>= Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ = Equipment is part of the circuit under test.

v = Number of the TLP note containing supplementary information related to the suspected faulty equipment. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

w = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

x = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

y = Phase result.

z = Phase number completed.

a1 = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

c1 = Statement number.

d1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS
Alarms may be triggered because:

(1) The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.

(2) A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

(3) A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

(4) The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

2. REASON FOR OUTPUT

To report the result of executing a DGN:TEN input message to diagnose the trunk equipment number (TEN).

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 is printed when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 is printed when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specific circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = TEN unit number.
c = Service group number.
= TEN board number.

e = TEN circuit number.

f = Phase number.

g = Segment number.

h = Test number.

i = Mismatch results for the specified test in hexadecimal.

j = Expected result in hexadecimal.

k = Mask used to determine test failure in hexadecimal.

l = Actual result in hexadecimal.

m = Identification number of floor and aisle.

n = Module type.

o = Module number.

p = Cabinet type.

q = Cabinet number.

r = Replacement equipment code(s).

s = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [-] D[:E]...[:F]</td>
<td></td>
</tr>
<tr>
<td>-</td>
<td>Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>:</td>
<td>Intra-field delimiter.</td>
</tr>
<tr>
<td>A</td>
<td>Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>Additional compatible equipment code(s) (added as space permits)</td>
</tr>
<tr>
<td>D</td>
<td>Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

t = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
u = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

v = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ___ = Equipment is part of the circuit under test.

w = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

x = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT_STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

y = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

z = Phase result.

a1 = Phase number completed.

b1 = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

c1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

d1 = Statement number.

e1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4 and 5, none.

5. ALARMS
Alarms may be triggered because:

(1) The switch is sending a response message that is reporting that a fault recovery (FR) restore request was purged by system integrity. The verb is DGN, the source is AUTO, and the return response is ABORTED. This is the only time that these three parameters are equal to the stated values.

(2) A routine exercise requested diagnostic fails and, if requested, an alarm is sounded. The verb is RTN exercise, the source is AUTO, and the return response is STF.

(3) A routine exercise was requested and it failed. It failed because the diagnostic was ATP but the circuit failed hardware initialization.

(4) The request originated from a program update or retrofit and the request was not successfully completed. The alarm is sounded only if an "alarm" was requested on failures. These callers have the option of not alarming failures.

Application: 5
Type: Output

1. FORMAT

DGN TMS=a b c

2. REASON FOR OUTPUT

To respond to a manual or automatic request to diagnose a specific time multiplexed switch (TMS).

3. VARIABLE FIELD DEFINITIONS

a = Office network and timing complex (ONTC) identification.

b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before a normal completion and the consistency of hardware states is questionable.
   COMPLETED = Requested action was completed successfully.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion, but consistency of hardware states and data is reliable.

C = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual or automatic request. No further action is necessary if the requested action completed successfully. If the termination report is not COMPLETED, the variable 'C' field should give some indication as to why the request failed. The table below explains the cause of a conditional all tests passed (CATP) termination code. Check the appropriate MCC pages or OP:CFGSTAT output messages to verify that the associated units were in a valid state to perform the request.

Causes of CATP

<table>

2. REASON FOR OUTPUT

To report the results of diagnosing a digital networking unit - synchronous optical network (SONET) (DNU-S) transmission multiplexer (TMUX).

Format 1 is printed when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified for the request. An ordered list of suspected faulty equipment is provided.

Format 3 prints when the specified phase(s) terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) has completed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Data group number.
d = TMUX number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Actual result in hexadecimal for the specified test.

j = Mask in hexadecimal used to determine test failure.

k = Expected result in hexadecimal for the specified test.

l = Floor and aisle number.

m = Module type.

n = Module number.

o = Cabinet type.

p = Cabinet number.

q = Replacement equipment code(s).

r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>A[:B]...[:C] [ - ] D[:E]...[:F]</td>
<td>= Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>:</td>
<td>= Intra-field delimiter.</td>
</tr>
<tr>
<td>A</td>
<td>= Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>= Current production equipment code (substitutable equipment for code ‘A’).</td>
</tr>
<tr>
<td>C</td>
<td>= Additional compatible equipment code(s) (added as space permits)</td>

<tr>
<td>E</td>
<td>= Current minimal approved operating level for equipment code ‘B’.</td>
</tr>
<tr>
<td>F</td>
<td>= Current minimal approved operating level(s) for equipment code(s) ‘C’.</td>
</tr>
</tbody>
</table>

Codes ‘A’, ‘B’ and ‘C’ may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms ‘D’, ‘E’ and ‘F’ may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

u = Depth location in the cabinet.

v = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the online member of a duplex pair. The online member
must be removed, and the mate made online, before replacement is attempted.

Equipment is part of the circuit under test.

w = Refer to output appendix APP:TLP-NOTE in the Appendixes volume of the Output Messages manual.

x = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Requested action was completed successfully.
   IN PROGRESS = Requested action is in progress.
   NOT STARTED = Requested action was not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

y = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

z = Phase result.

a¹ = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

   Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b¹ = Phase number completed.

4. ACTIONS TO BE TAKEN

For Format 1, analyze failure data to determine reason for failure or run the diagnostic using the TLP option to generate a suspected faulty equipment list.

For Format 2, replace the suspected equipment, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

For Formats 3 and 4, no action is required.

5. ALARMS

None.

[5] DGN TTFCOM=a-b-c-d PH e SEG f STMT c\(^1\) d\(^1\)
   [EXP i MASK j ACTL k]

2. REASON FOR OUTPUT

To report the result of executing a DGN:TTFCOM input message to diagnose the transmission test facility common (TTFCOM) circuit.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Global digital service unit (GDSU) number.
\[c\] = Service group number.
\[d\] = Board number.
\[e\] = Number of the phase in which the failure occurred.
\[f\] = Number of the segment in which the failure occurred.
\[g\] = Number of the test that failed.
\[h\] = Mismatch results for the specified test in hexadecimal.
\[i\] = Expected result for the specified test in hexadecimal.
\[j\] = Mask used to determine test failure in hexadecimal.
\[k\] = Actual result for the specified test in hexadecimal.
\[l\] = Identification number of floor and aisle.
\[m\] = Module type.
\[n\] = Module number.
\[o\] = Cabinet type.
\[p\] = Cabinet number.
\[q\] = Replacement equipment code(s).
\[r\] = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Example of CODE FORM content:

```
CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
: = Intra-field delimiter.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
- = Inter-field delimiter if necessary.
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
```

Codes A, B and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

\[s\] = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
\[t\] = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
u  = Circuit type:
   ___ = Equipment is part of the circuit under test.
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

v  = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

w  = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT_STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

x  = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

y  = Phase result.

z  = Phase number completed.

a¹  = Text identifier showing order of record:
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b¹  = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

c¹  = Statement number.

d¹  = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, none.

5. ALARMS

None.

6. REFERENCES
DGN: TTYC

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] DGN TTYC a [COMPLETED] b [(c)] (MESSAGE|MSG) {IN PROGRESS|COMPLETE}

[2] DGN TTYC a PH d b [(c)] {MESSAGE IN PROGRESS|MSG IP}

[3] DGN TTYC a PH d STF (c) MSG IP
   TEST      MISMATCH   ACTUAL   MASK   EXPECTED
   e          f          g       h       i

[4] DGN TTYC a ABORTED AT PH d STMNT j b [(c)] MSG IP

[5] DGN TTYC a TERMINATED AT PH d STMNT j AFTER TEST k

[6] DGN TTYC a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the teletypewriter controller (TTYC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = The result of the diagnostic. Valid value(s):
   ATP = All tests passed.
   NTR = No tests were executed.
   STF = Some tests failed.

c = If 'b' = STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines what bits in the actual value are of interest to this test.

i = The value which the test expected.
   Note: For Format 3 the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the report.

4. ACTION TO BE TAKEN
   If 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for repair procedures.

5. ALARMS
   This alarm is automatically generated. Action may or may not be required.

2. REASON FOR OUTPUT

To report the result of executing a DGN:TUCHBD input message to diagnose the trunk unit channel board (TUCHBD).

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase(s) have been abnormally terminated. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Trunk unit number.
c = Service group number.
d = Channel board number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.
h = Mismatch results for the specified test in hexadecimal.
i = Expected result for the specified test in hexadecimal.
j = Mask used to determine test failure in hexadecimal.
k = Actual result for the specified test in hexadecimal.
l = Identification number of floor and aisle.
m = Module type.
n = Module number.
o = Cabinet type.
p = Cabinet number.
q = Replacement equipment code(s).
r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

<table>

2. REASON FOR OUTPUT

To report the result of executing a DGN:UTD input message to diagnose the universal tone decoder (UTD) board.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

\begin{itemize}
    \item \(a\) = Switching module (SM) number.
    \item \(b\) = Local digital service unit (LDSU) number.
    \item \(c\) = Service group number.
\end{itemize}
d = DSU board position number.
e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.
h = Mismatch results for the specified test in hexadecimal.
i = Expected result for the specified test in hexadecimal.
j = Mask used to determine test failure in hexadecimal.
k = Actual result for the specified test in hexadecimal.
l = Identification number of floor and aisle.
m = Module type.
n = Module number.
o = Cabinet type.
p = Cabinet number.
q = Replacement equipment code(s).
r = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM content:

CODE       FORM
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').

[5] DGN UTG=a-b-c-d PH e SEF f STMT c\(^1\) d\(^1\)
   [EXP i MASK j ACTL k]

2. REASON FOR OUTPUT

To report the result of executing a DGN:UTG input message to diagnose the universal tone generator (UTG) board.

Format 1 prints when a test has failed.

Format 2 prints when a test fails and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 3 prints when the specified phase(s) have been terminated before completion. Execution of the diagnostic will not continue.

Format 4 prints when the specified phase has completed. Execution of the diagnostic will not continue until all phases are complete.

Format 5 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Local digital service unit (LDSU) number.
c = Service group number.
d  = Digital service unit (DSU) board position number.
e  = Number of the phase in which the failure occurred.
f  = Number of the segment in which the failure occurred.
g  = Number of the test that failed.
h  = Mismatch results for the specified test in hexadecimal.
i  = Expected result for the specified test in hexadecimal.
j  = Mask used to determine test failure in hexadecimal.
k  = Actual result for the specified test in hexadecimal.
l  = Identification number of floor and aisle.
m  = Module type.
n  = Module number.
o  = Cabinet type.
p  = Cabinet number.
q  = Replacement equipment code(s).
r  = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to subsequent example.

Example of CODE    FORM content:

```
CODE FORM
A[:B]...[:C] [-] D[:E]...[:F]
- = Inter-field delimiter if necessary.
  = Intra-field delimiter.
A  = Current minimal accepted equipment code.
B  = Current production equipment code (substitutable equipment for code 'A').
C  = Additional compatible equipment code(s) (added as space permits).
D  = Current minimal approved operating level for equipment code 'A'.
E  = Current minimal approved operating level for equipment code 'B'.
F  = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s  = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
t  = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the
implicated shelf.

**u**
- Circuit type. Valid value(s):
  - HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
  - ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
  - ____ = Equipment is part of the circuit under test.

**v**
- Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

**w**
- Termination status. Valid value(s):
  - ABORTED = The process was terminated (process not gracefully terminated).
  - NOT STARTED = Action was not begun.
  - STOPPED = Terminated before normal completion (process gracefully terminated).

**x**
- Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

**y**
- Phase result.

**z**
- Phase number completed.

**a**
- Text identifier showing order of record. Valid value(s):
  - FIRST = First record of continuing list.
  - NEXT = Next record of continuing list.
  - LAST = Last record of list.

**b**
- Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

**c**
- Statement number.

**d**
- Reason why some tests were not performed.

### 4. ACTION TO BE TAKEN

For Format 1, repair the faulty unit.

For Format 2, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 3, 4, and 5, no action is required.

### 5. ALARMS

None.

    DN=e[-f] f2
    j[=k] [E=1]

2. REASON FOR OUTPUT

To indicate that the talk and monitor (T&M) phone has been released from the current testing configuration at the trunk and line work station (TLWS) test position (TP).

3. VARIABLE FIELD DEFINITIONS

E = Error.

a = TP number.

b = TLWSR tuple identification.

c = Valid value(s):
    AC1 JACK = Connection to the AC jack number 1.
    AC2 JACK = Connection to the AC jack number 2.
    CAMPED ON = Line or trunk is camped on.
    CPE TESTS = Test customer premises equipment.
    DC1 JACK = Connection to the DC jack number 1.
    DC2 JACK = Connection to the DC jack number 2.
    DIG TRANS = Connection to digital transmission equipment.
    IN PROGRESS = Test or test setup is in progress.
    METALLIC = Connection to metallic measurement equipment.
    MONITOR B&I = Monitor a busy or idle line/trunk.
MONITOR BUSY = Monitor a busy line/trunk.
SEIZED = Line or trunk is seized.
SUPERVISION = Supervisory test running.
TRANSMISSION = Connection to transmission equipment.

d = The mode of the T&M phone in the test connection. Valid value(s):
   H = The T&M phone is ON-HOLD (metallic connections).
   N = No T&M phone in the connection.
   M = The T&M phone is in the MONITOR mode (listen-only).
   T = The T&M phone is in the TALK mode (listen and talk).

e = Telephone number entered.

f = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

g = Valid value(s):
   AIUEN=r-a^2-b^2-c^2
   AP=p-q
   ILEN=r-y-z-a^1
   LCEN=r-s-b^1-c^1
   LCKEN=r-s-b^1-y^1-z^1
   LEN=r-s-t-u-v-w
   SLEN=r-d^1-e^1-f^1

h = Multi-line hunt group number.
i = Hunt group member number.

j = Type of T&M phone. Valid value(s):
   LOCAL T&M PHONE = The T&M phone populated for this ID in the database is local.
   NO T&M PHONE = There is no T&M phone populated for this ID in the database (TLWSR tuple).
   REMOTE T&M PHONE = The T&M phone populated for this ID in the database is remote.

k = Phone number of the T&M phone when the phone is remote.
l = Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.
m = Trunk group number.
n = Trunk member number.
o = Valid value(s):
   DEN=r-g^1-h^1-i^1
   NEN=r-p^1-q^1-s^1-r^1-d^2-e^2-t^1

2. REASON FOR OUTPUT
To print the contents of one or all automatic customer station rearrangement (ACSR) recent change log files or error data files.

3. VARIABLE FIELD DEFINITIONS

a = File that was dumped. Valid value(s):
   1 = Today's log file.
   2 = Yesterday's log file.
   3 = Log file from two days ago.

b = Primary directory number of ACSR request.

c = Line equipment number (where equipment type is assumed to be 'I').

d = Date ACSR request was made.

e = Time ACSR request was made, in the form hours:minutes.

f = Date ACSR request was completed.

g = Time ACSR request was completed, in the form hours:minutes.

h = Number of records printed.

i = File that was dumped. Valid value(s):
   1 = Today's error data file.
   2 = Yesterday's error data file.
   3 = Error data file from 2 days ago.

j = Primary directory number of failed ACSR request.

k = Date that ACSR request failed.

l = Time that ACSR request failed.
4. ACTION TO BE TAKEN

For Formats 1, 2, 8, or 9, no action is required.

For Format 3, check the syntax of the input message and re-enter input message.

For Format 4, check the syntax of the input message and re-enter input message.

For Format 5, check the syntax of the input message and re-enter input message.

For Format 6, verify whether the file exists or not. Also, verify if there are sufficient inodes or blocks in the directory.

For Format 7, using ECD recent change and form classdef, verify the output message class 172 exists.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

```

Output Message(s):

```
OP:ACSR
```
DUMP:ADDR
Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

DUMP ADDR a [OFF b] c
    [d: e]
    #f

2. REASON FOR OUTPUT

To report the result of executing the DUMP:ADDR input message to dump out the contents of an address or address range in main memory.

3. VARIABLE FIELD DEFINITIONS

a = Virtual address specified in input message.
b = Offset(s) used on input message line.
c = Termination status. Valid value(s):
    COMPLETED = Output follows this message.
    STOPPED NGADDR = The DUMP was stopped because the address specified is not valid for the
                      process; or if offsets were specified, invalid address values were encountered in
                      the address chain.

d = Address label for line of data.
e = Data as dumped from memory.
f = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If 'b' = STOPPED NGADDR, recheck the program listings. If an indirection chain was specified, try breaking the chain into several parts and printing the intermediate addresses.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the manually requested dump of test session entries in the automatic trunk test scheduler (ATTS) schedule database.

3. VARIABLE FIELD DEFINITIONS

a = The number of the ATTS test schedule whose test session entries were requested to be dumped.

b = Label for the output report block being dumped. Valid value(s):
   FIRST RECORD = Additional output report blocks will follow.
   LAST RECORD = This is the last output report block to be dumped.
   NEXT RECORD = Additional output report blocks will follow.
   ONLY RECORD = This is the only output report block to be dumped.

c = The type of test performed during the schedule’s sessions.

d = The ATTS test schedule number.

e = The ATTS test schedule week.

f = The day in the ATTS test schedule week.

g = The session’s scheduled starting time.

h = The session’s scheduled stopping time.

i = Flag indicating whether or not the test session is to be started early if the previous test session finishes ahead of schedule (Y/N).

j = Flag indicating whether or not the test session is to be skipped when its scheduled starting time arrives (Y/N).

m = Identity of the trunk group member(s) to be tested.

n = Flag indicating the order in which the range of members are to be tested. Valid value(s):
   A = Ascending (low-to-high order).
   D = Descending (high-to-low order).
= Identity of the trunk group whose members are to be tested.

2. REASON FOR OUTPUT

Displays, in tabular form, logged operational test data from scheduled operational trunk tests executed by automatic trunk test scheduler (ATTS) retrieved with the execution of the input message DUMP:ATLOG.

3. VARIABLE FIELD DEFINITIONS

a = Schedule number.
b = Schedule week number.
c = Schedule day number.
d = Trunk group number.
e = Status type. Valid value(s):
   A = Print ABORTED trunk test results only.
   F = Print FAILED trunk test results only. This is the default value.
   FA = Print FAILED or ABORTED (that is, non-passing) trunk test results only.
   FU = Print FAILED and/or UNAVAILABLE trunk test results only.
   P = Print PASSED trunk test results only.
   PFA = Print all trunk test results.

f = Type of operational test executed.
g = Schedule number of logged test result.
h = Schedule week number of logged test result.
i = Schedule day number of logged test result.
j = Time of test, hours.
k = Time of test, minutes.
1 = Time of test, seconds.

m = Date of test, year.

n = Date of test, month.

o = Date of test, day of month.

p = Trunk group number of logged test result.

q = Trunk member number of logged test result.

r = Data equipment number (DEN) of logged test result.

s = Status information.

t = Overall test status. Valid value(s):
ABT = The attempted operations were aborted because of a busy resource or error detected during the setup or execution of the operational test sequence, not related to the operational test result analysis of the trunk under test.
ATP = All tests passed. The requested operational test completed and all expected signals were received.
FAIL = The test completed, resulting in a failure detected in one or more parts or the requested operational test sequence. Failures include, one or more of the requested test signals not received.

u = The total number of completed tests performed during the session (passed and/or failed).

v = The number of tests performed during the session which passed.

w = The number of tests performed during the session which failed.

x = The number of tests performed during the session which aborted.

y = The number of tests which were aborted during the session because the trunk under test was busy.

z = The number of tests which were aborted during the session because the responder at the far end of the trunk under test was busy.

4. ACTION TO BE TAKEN

None.

5. ALARMS

SUMMARY: TEST=u PASS=v FAIL=w ABT=x TRKBSY=y RSPBSY=z

2. REASON FOR OUTPUT

Displays, in tabular form, logged operational test data from scheduled operational trunk tests executed by automatic trunk test scheduler (ATTS) retrieved with the execution of the input message DUMP:ATLOG.

3. VARIABLE FIELD DEFINITIONS

- a = Schedule number.
- b = Schedule week number.
- c = Schedule day number.
- d = Trunk group number.
- e = Status type. Valid value(s):
  - A = Print ABORTED trunk test results only.
  - F = Print FAILED trunk test results only. This is the default value.
  - FA = Print FAILED or ABORTED (that is, non-passing) trunk test results only.
  - FU = Print FAILED and/or UNAVAILABLE trunk test results only.
  - P = Print PASSED trunk tests results only.
  - PFA = Print all trunk test results.
- f = Type of operational test executed. The invalid types are: 102LB, 105, CONT, NINV, NSYS, PB, PVELBK, SHCT, or SYS.
- g = Schedule number of logged test result.
- h = Schedule week number of logged test result.
i = Schedule day number of logged test result.

j = Time of test, hours.

k = Time of test, minutes.

l = Time of test, seconds.

m = Date of test, year.

n = Date of test, month.

o = Date of test, day of month.

p = Trunk group number of logged test result.

q = Trunk member number of logged test result.

r = Valid value(s):

s

| DEN=a^1-b^1-c^1-d^1 |
| RAF=a^1-e^1-f^1 |
| TEN=a^1-g^1-h^1-i^1-j^1 |

= Status information.

t = Overall test status. Valid value(s):

ABT = The attempted operations were aborted because of a busy resource or error detected during the setup or execution of the operational test sequence, not related to the operational test result analysis of the trunk under test.

ATP = All tests passed. The requested operational test completed and all expected signals were received.

FAIL = The test completed, resulting in a failure detected in one or more parts or the requested operational test sequence. Failures include, one or more of the requested test signals not received.

u = The total number of completed tests performed during the session (passed and/or failed).

v = The number of tests performed during the session which passed.

w = The number of tests performed during the session which failed.

x = The number of tests performed during the session which aborted.

y = The number of tests which were aborted during the session because the trunk under test was busy.
= The number of tests which were aborted during the session because the responder at the far end of the trunk under test was busy.

= Switching module (SM) number.

= Digital line and trunk unit (DLTU) number.

= Digital facility interface number.

= Channel number.

= Recorded announcement facility (RAF) or service announcement system (SAS) unit number.

= RAF or SAS announcement channel number.

= Trunk unit number.

= Service group number.

= Channel board number.

= Circuit number.

= Virtual Trunk Channel number.

= Digital carrier line unit number.

= Remote terminal number.

= Remote terminal line number.

= Integrated digital carrier unit number.

= Digital network unit - SONET (DNU-S) number.

= Data group (DG) number.

= SONET terminal equipment (STE) facility number.

= Synchronous transport signal (STS) facility number.

= Virtual tributary group (VTG) number.

= Virtual tributary member (VTM) number.

= Digital signal level 0 (DS0) number.

= PSU unit number.

= PSU shelf number.

= PSU channel group number.

= PSU channel group member number.

= Peripheral Control and Timing (PCT) Line and Trunk Unit (PLTU) number.
b² = PCT Facility Interface (PCTFI) number.
c² = Tributary number.
d² = Channel number.
e² = Virtual Trunk Facility number.

```

2. **REASON FOR OUTPUT**

Reports the manually requested dumping of the automatic trunk test scheduler (ATTS) parameters database for a specified ATTS test schedule.

3. **VARIABLE FIELD DEFINITIONS**

- `a` = The number of the ATTS test schedule whose parameters were requested to be dumped.
- `b` = The type of test to be performed by the specified ATTS test schedule’s sessions.
- `c` = The maximum number of successive test calls per test session which abort.
- `d` = The maximum number of successive test calls per test session which abort due to congestion.
- `e` = The maximum number of successive test calls per test session in which the director times out waiting for an answer signal.
- `f` = The maximum number of successive test calls per test session in which the director times out waiting for an event other than answer.
- `g` = The maximum number of loops allowed to be made per test session through a list of trunks associated with aborted tests.
- `h` = Flag indicating whether or not an immediate attempt to repeat an aborted test should be made (Y/N).
- `i` = Flag indicating whether or not an immediate attempt to repeat a failed test should be made (Y/N).
- `j` = Flag indicating whether or not to count busy-trunk aborted tests with miscellaneous aborts (Y/N).
- `k` = Flag to control real-time printing of test results. Valid value(s):
  - `A` = Print aborting test results only.
  - `F` = Print failing test results only.
  - `FA` = Print failing or aborting (that is, non-passing) test results only.
NONE = Do not print test results in real-time.
P = Print passing test results only.
PFA = Print passing, failing, or aborting (that is, all) test results.

__________________________________________________________________

2. REASON FOR OUTPUT

To display logical volume information for the multi-volume digital audio tape (DAT) loaded in the user-specified tape drive. The logical volume information consists of the backup session number, logical volume number, logical volume name, size, source disk, and date written. The logical volume information will be displayed as a result of executing either the DUMP:BKTAPE input message or the DUMP BKTAPE command poke on the DFC Status Page. If the command was invoked using a command poke, a REPT:DKDIP message will precede the output message.
3. VARIABLE FIELD DEFINITIONS

a = Pathname of the tape special device file.

b = Request status. Valid value(s):
- ABORTED = The dump failed and aborted.
- COMPLETED = The dump completed with no errors.
- IN PROGRESS = The dump is processing logical volume headers.
- STARTED = The dump started processing logical volume headers.
- STOPPED = The dump failed and stopped.

c = Error code output by the DUMP BKTAPE command poke on the DFC Status Page. Valid value(s):

<table>

d = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

e = Internal error code for failure of an equipment configuration database (ECD) access function. Valid value(s):
- 1 = getdbseg() failed, could not attach to the ECD.
- 2 = lla_iatt() failed, could not attach to the incore database.
- 3 = lla_rdget() failed, could not get the ecording record from the ECD.
- 4 = lla_get() failed, could not get the logdev record from the ECD.
- 5 = lla_rdget() failed, could not get the mdct record from the ECD.
- 6 = lla_rdget() failed, could not get the ucb record from the ECD.
- 10 = rmovdbseg() failed, could not remove incore database segments.
Error code returned by a failed tape library function. Refer to the APP:TAPE-LIB appendix in the Appendixes section of the Output Messages manual.

Session number (1-9).

Logical volume number (0-9).

Logical volume name. Valid value(s):
- AMODD
- AMTEXT
- SMODD1
- SMODD2
- SMODD3
- SMODD4
- SMODD5
- SMODD6
- SMTEXT
- TOP

Size, in 512 byte blocks, of the logical volume. NAV (not available) is output if the logical volume is a TOP volume.

Name of the source disk(s). NAV (not available) is output if the logical volume is a TOP volume.

Date (mm/dd/yy) on which the logical volume was written. NAV (not available) is output if the logical volume is a TOP volume.

Total size, in 512 byte blocks, of the data on the DAT. The total size does not include the TOP volume.

Length, in meters, of the DAT.

Estimated percentage of the DAT that is being used.

4. ACTION TO BE TAKEN

Errors will be accompanied by explanatory text or an error code. Verify that the command that was input is consistent with the DUMP:BKTAPE input message manual page. If the message indicates that there is a problem with the tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing the tape drive, verify that the tape is loaded and the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. This alarm is either a manually-requested report or an automatically-generated report.

1. FORMAT

[1] DUMP CACHE a b

[2] DUMP CACHE NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS c

2. REASON FOR OUTPUT

To report the status of a request to dump the contents of cache in the offline processor.

3. VARIABLE FIELD DEFINITIONS

a = Request status. Valid value(s):
  COMPLETED = The offline cache was dumped successfully.
  STOPPED = The cache dump could not be completed because of an error.

b = Reason the cache dump was stopped. Valid value(s):
  1 = Process maintenance driver (PCPMD) could not open physical memory (/dev/pmem).
  2 = PCPMD could not set the position of the input stream after opening physical memory.
  3 = PCPMD reached an end-of-file (EOF) when it tried to search for information located in physical memory.
  4 = PCPMD encountered an error in reading the contents of physical memory.
  5 = PCPMD could not set the contents of a register in the offline processor.
  6 = PCPMD failed when it tried to copy data to the memory of the offline processor.
  7 = PCMPD could not execute a program in the offline processor.
  8 = The DUMP:CACHE message could not reserve the unit control block (UCB) of the offline processor.

c = Could not access or reserve the UCB record of the mate CU, or the mate CU was not out-of-service.

DUMP:F-ALL

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] DUMP FILE ALL {STARTED | IN PROGRESS | COMPLETED}
   a

[2] DUMP FILE ALL STOPPED
   b

2. REASON FOR OUTPUT

To report the result of executing a DUMP:F-ALL input message to dump the contents of an ASCII file.

Format 1 indicates successful execution of the input message.

Format 2 indicates failure.

Note: STARTED, IN PROGRESS, and COMPLETED messages appear when three or more output segments are printed. STARTED and COMPLETED messages appear when two output segments are printed. A COMPLETED message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Contents of the file.
b = Text explaining why the input message was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates success. No action is required.

If Format 2 is printed, refer to the input message manual for the correct input message format, and correct any input message line errors. If the explanatory text indicates that the file cannot be accessed, verify the file's existence using the OP:ST-LISTDIR input message. If the text is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] DUMP FILE FORMAT {STARTED | IN PROGRESS | COMPLETED}

[2] DUMP FILE FORMAT STOPPED

2. REASON FOR OUTPUT

To report the execution of a DUMP:F-FORMAT input message to dump the contents of a file. Format 1 indicates successful execution of the command. Format 2 indicates failure.

Note: STARTED, IN PROGRESS, and COMPLETED messages appear when three or more output segments are printed. STARTED and COMPLETED messages appear when two output segments are printed. A COMPLETED message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Contents of the file in ASCII, decimal, octal, or hexadecimal notation. Default is octal notation. If the dump is in ASCII notation, the following special symbols are used to express non-graphic characters:

[0] = Null.
[b] = Backspace.
[f] = Form-feed.
[n] = New-line.
[r] = Return.
[t] = Tab.

Other non-graphic characters appear as three-digit octal numbers.

b = Pathname specified in the input message.

4. ACTION TO BE TAKEN

Format 1 indicates success. Take no action.

For Format 2, refer to the input message manual for the correct command format, and correct any command line errors. If the explanatory text indicates that the file cannot be accessed, verify the file's existence using the OP:ST-LISTDIR input message. If the text is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Application: 5,3B
Type: Output

1. FORMAT

[1] DUMP FILE PARTL {STARTED | IN PROGRESS | COMPLETED}

[2] DUMP FILE PARTL STOPPED

2. REASON FOR OUTPUT

To print one or more lines of an ASCII file as the result of executing a DUMP:F-PARTL input message.

Note: STARTED, IN PROGRESS and COMPLETED messages appear when three or more output segments are printed. STARTED and COMPLETED messages appear when two output segments are printed. A COMPLETED message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Content of specified line(s).
b = Text explaining why the command was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates that the command executed successfully.

Format 2 can be printed due to several errors which the system may encounter. If the explanatory text indicates that the file cannot be accessed, use the OP:ST-LISTDIR input message to verify the existence of the file. If the explanatory text indicates that there is insufficient disk space to execute the command, use the OP:ST-FREEDISK input message to verify that there is free space in the file system under which the file being edited resides.

If the message is not self-explanatory, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

DUMP:KERN

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] DUMP KERN a [OFF b] #e
   ADDRESS (HEX): CONTENTS OF MEMORY (HEX):
   c d

[2] DUMP KERN a [OFF b] STOPPED NGADDR #e

2. REASON FOR OUTPUT

To report the result of executing a DUMP:KERN input message to dump out the contents of an address or address range in the kernel.

Format 2 indicates the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were used.

3. VARIABLE FIELD DEFINITIONS

a = Virtual address specified in input message.
b = Offset(s) used on input message line.
c = Address label for line of data.
d = Data as dumped from memory.
e = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If Format 2 is printed, recheck the program listings. If an indirection chain was specified, try breaking the chain into several parts and printing the intermediate addresses.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

6. REFERENCES

DUMP : KERN
Output Appendix(es):

APP: OMDB-X-REF
DUMP:MHD-BLOCK

Software Release: 5E14 and later
Message Class: DSKUTL
Application: 5,3B
Type: Output

1. FORMAT

[1] DUMP MHD a BLOCK { STARTED | IN PROGRESS }
    [DATA FOR DISK BLOCK d e]

[2] DUMP MHD a BLOCK COMPLETED

[3] DUMP MHD a BLOCK NOT STARTED b c

[4] DUMP MHD a BLOCK STOPPED b c

[5] DUMP MHD a BLOCK ERROR b c

[6] DUMP MHD a BLOCK ABORTED b

[7] DUMP MHD a BLOCK ABORTED b
    ERROR DATA f g h i j

2. REASON FOR OUTPUT

To report the current status or result of executing a DUMP:MHD input message, which requests that the contents of
the disk block be displayed.

Format 7 provides additional error information when an explicit small computer system interface (SCSI) command
fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the moving head disk (MHD).

b = Process step or reason code. Valid value(s):

</tbody>
</table>

c = System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

d = Identifies the disk block which is being dumped.

e = Data contained in the specified disk block. Printed in row major order, hexadecimal notation.

f = Command completion word. The command completion word is eight hexadecimal digits in the form AAAABBCC.

AAAA = SCSI job block (SJB) completion code. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.

BB = Status byte. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.

CC = Fill. Not used.

g = First word of extended sense data (ESD). Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. This word is eight hexadecimal digits in the form AABBCCDD.

AA = Byte 0 of ESD.

BB = Byte 1 of ESD.

CC = Byte 2 of ESD.

DD = Byte 3 of ESD.

h = Second word of ESD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. This word is eight hexadecimal digits in the form AABBCCDD.

AA = Byte 4 of ESD.

BB = Byte 5 of ESD.

CC = Byte 6 of ESD.

DD = Byte 7 of ESD.

i = Third word of ESD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. This word is eight hexadecimal digits in the form AABBCCDD.

AA = Byte 8 of ESD.

BB = Byte 9 of ESD.

CC = Byte 10 of ESD.

DD = Byte 11 of ESD.
j = Fourth word of ESD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. This word is eight hexadecimal digits in the form AABBCCDD.

AA = Byte 12 of ESD.
BB = Byte 13 of ESD.
CC = Byte 14 of ESD.
DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports which provide an error code usually indicate that a system resource was not available or became unavailable to perform the task. Clear the problem causing the resource limitation and retry the input request.

In some instances, other error messages may be printed which may provide information pertaining to the failure encountered.

If Format 7 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

__________________________________________________________________

2. REASON FOR OUTPUT
To report the execution of a DUMP:MHD-DEFECT input message, from either the DUMP:MHD-DEFECT command or from the DUMP DEFECT poke on the DFSA display page. If the input message was invoked using the poke, a REPT:DKDIP message will precede the output message.

The output data represents defect management information pertaining to the specified moving head disk (MHD). For a small computer system interface (SCSI) drive type, the GROWN defect list is output as the COMBINED defect table, and similarly, the PRIMARY defect list is the MANUFACTURER's defect table.

Formats 4 and 5 provide additional error information when an explicit SCSI command fails. The additional error data is necessary to determine the exact cause of the error condition.

</table>

- **d**: System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
- **e**: Number of defects on disk drive up to the recommended limit. For a SCSI disk drive, the total number of defects in the table could exceed the recommended limit. However, no more than the recommended limit of defects will be displayed.
- **f**: Total number of defects in "combined" defect table.
- **g**: Maximum number of defects allowed. This variable field only applies for storage module driver (SMD) disk drives.
- **h**: Cylinder number of defect.
- **i**: Head number of defect.
- **j**: Type of defect. Valid value(s):
  - **M**: Manufacturer specified.
  - **N**: New; found by DFC.
- **k**: For new defects, the number of tests failed.
- **l**: For new defects, the number of tests run.
- **m**: Sector number of defect.
- **o**: Command completion word. Eight hexadecimal digits, in the form AAAABBC. Valid value(s):
  - **AAAA**: SCSI job block(SJB) completion code. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.
  - **BB**: Status byte. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.
CC = Not used.

p = First word of extended sense data (ESD), eight hexadecimal digits in the form AABBCCDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. Valid value(s):
\[ AA = \text{Byte 0 of ESD.} \]
\[ BB = \text{Byte 1 of ESD.} \]
\[ CC = \text{Byte 2 of ESD.} \]
\[ DD = \text{Byte 3 of ESD.} \]

q = Second word of ESD, eight hexadecimal digits in the form AABBCCDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. Valid value(s):
\[ AA = \text{Byte 4 of ESD.} \]
\[ BB = \text{Byte 5 of ESD.} \]
\[ CC = \text{Byte 6 of ESD.} \]
\[ DD = \text{Byte 7 of ESD.} \]

r = Third word of ESD, eight hexadecimal digits in the form AABBCCDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. Valid value(s):
\[ AA = \text{Byte 8 of ESD.} \]
\[ BB = \text{Byte 9 of ESD.} \]
\[ CC = \text{Byte 10 of ESD.} \]
\[ DD = \text{Byte 11 of ESD.} \]

s = Fourth word of ESD, eight hexadecimal digits in the form AABBCCDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual. Valid value(s):
\[ AA = \text{Byte 12 of ESD.} \]
\[ BB = \text{Byte 13 of ESD.} \]
\[ CC = \text{Byte 14 of ESD.} \]
\[ DD = \text{Byte 15 of ESD.} \]

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports that provide an error code usually indicate a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and input the request again.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk against the following:
- The number of GROWN defects should be no more than a recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.
- The total number of defects (PRIMARY and GROWN) on a disk drive should not exceed the recommended limit. If the disk has more than the number of defects allowed, the disk drive could become unreliable.
- The total number of defects (PRIMARY and GROWN) on a cylinder should not exceed the
recommended limit. If the number of defects on a cylinder is larger than the limit, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the administrative module (AM).

It is recommended that the SCSI disk drive should be replaced if there is any warning output related to the above recommendations.

If Formats 4 and 5 print, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data and contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

None. This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the result of executing a DUMP:MHD-VTOC input message. The output data represents information contained in the volume table of contents (VTOC) of the specified moving head disk (MHD).

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = Process step or reason code. Valid value(s):
   f03 = Failed to open ECD.
   f06 = Failed to get unit UCB by name.
   f07 = Failed to get UCP of controlling unit.
   f08 = Controlling unit is not active.
   f09 = Failed to reserve UCB.
   f12 = Failed to assign special device file name.
   f15 = Failed to open special device file.
   f18 = Failed to set I/O mode of the device.
   f24 = Disk read failed.
   f28 = Too many partitions in VTOC.
f29 = No VTOC partition found; VTOC invalid.
f30 = Process time out.
f31 = Failed to close special device file.
f33 = Failed to release special device file.
f36 = Failed to unreserve UCB.
f39 = Failed to close ECD.
f42 = Terminated externally with signal.

c = System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

d = Segment number (32 partitions per segment).

e = Total number of segments.

f = Disk logical partition number.

g = Starting disk block number of the indicated partition.

h = Ending (inclusive) disk block number of the indicated partition.

i = Size, in 512-byte blocks, of the indicated partition.

j = Describes the partition. Unresolved values are printed in hexadecimal and indicate whether the partition is a UNIX®RTR-defined value or an application-defined value.

k = Indicates the modifier(s) applied to the specific partition definition.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports that provide an error code usually indicate that a system resource was not available or became unavailable to perform the task. Clear the problem causing the resource limitation and retry the input message.

In some instances, other UNIX®RTR error messages may be printed which may provide information pertaining to the failure encountered.

5. ALARMS

This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To dump the specified network clock 2 (NC2) communication control buffer and communication link receiver/transmitter (CCB/CLRT) registers and status data in response to a manual (DUMP:NC) or automatic request. This message will appear with many types of REPT:NC error reports on the receive-only printer (ROP). It can be used to help identify the exact problem according to the bits that are set as shown in the format description.

The various fields within the dump format give the configuration and status of the network clock hardware and its subunits (NC references and NC oscillators). In the format, there are '0's present to hold places and make the format a little more readable. The first 5 fields in the dump message deal with the CLRT subaddresses and status.

The rest of the dump message concerns the contents of the CCB. The CCB stores both input and output data. The input buffer contains messages to the NC. The output buffer contains responses to the input messages (as well as the messages themselves). Both the input and output CCB buffers are dumped by this message. Fields 't' through 'x2' are the inputs to the CCB. Fields 'y2' through 'b5' are the outputs from the CCB.

The data in the fields contain information about location and cause of errors, as well as data on the configuration of the network clock. Fields 'i' and 'l' through 's' will indicate if there are errors reported by the NC to the foundation peripheral controller (FPC). Field 'i' contains a summary of the flag vectors (fields 'l' through 's'). If the value in 'i' is '00', then there are no errors reported from the NC hardware to the FPC. If the field is non-zero, then there are errors and further investigation is required. The flag vectors, 'l' through 's', tell which location of the CCB is reporting the error. The bits set in 'i' point to a specific flag vector:

<table>
<thead>
<tr>

</tbody>
</table>

By examining the flag fields specified by the summary vector, 'i', you may determine the exact location of the error. The combination of the location and the hexadecimal value in the flag vector will point to the field which contains the error report. The bits set serve as flags to the locations; therefore, there may be more than one bit set in any flag field. The values shown below assume only one bit is set at a time in the flag vector. If more than one bit is set,
investigate the field pointed to by each flag. The report location is found by intersecting the row corresponding to the flag vector location (‘l’ through ‘s’) with the value or bit set in that field.

</table>

Example: Assume field ‘i’ contains the value ‘02’, and field ‘m’ contains the value ‘08’. Field ‘i’ has bit 2 set, which points to flag vector ‘m’. By intersecting row ‘m’ of the above table with the value of field ‘m’ (‘08’), you will find report location ‘b1’. Variable ‘b1’ contains reference summary ESR (refer to description for field ‘b1’). Note that this field points to other fields, which contain detailed reference data. Therefore, depending on the bit(s) set in field ‘b1’, one would examine other fields (that is, ‘n1’, ‘r1’, ‘v1’, etc.) to get the detailed information.

The values in the information bytes of the dump are keyed off of bit position in the data. A byte has its most significant bit (left-most position) as b7, and least significant (right-most position) as b0. In order to decipher the dumped data, the hexadecimal values must be investigated on a bit-by-bit basis.

Note: Not every bit in each defined field is significant. If one or more bits are not defined within a field, those bits should be ignored. They may have a value of 0 or 1 (not guaranteed).

3. VARIABLE FIELD DEFINITIONS

a = Network clock side.

b = Fault type identifier printed as a result of NC unit error report or manual DUMP command. Valid value(s):
   IN PROGRESS = DUMP:NC command.
   OSCILLATOR FAULT = NC oscillator unit fault.
   PROCESSOR FAULT = Sanity timeout on the NC microprocessor.
   REFERENCE FAULT = NC reference error report.
   UNIT FAULT = Other NC hardware error.

c = Additional data qualifying the termination field.

d = CLRT subaddress 0.

e = CLRT subaddress 1.

f = CLRT subaddress 2.

g = CLRT status upper byte.

h = CLRT status lower byte.

j = Event number.
\( t \) = Network clock configuration. Valid value(s):
\( b0 \)
= Valid value(s):
0 = Active major clock side.
1 = Active minor clock side.
\( b1 \)
= Valid value(s):
0 = Cross couple out of service.
1 = Cross couple in service.
\( b3, b4 \)
= Valid value(s):
0 = Using MMRSM local return.
1 = Using MMRSM remote return.
2 = Using TMS return (set in AM application).
\( b5-b7 \)
= Valid value(s):
0 = 24 channel (T1 trunk) synchronization.
1 = 30 channel synchronization.
2 = Stand alone clock.

\( u \) = Clock mode and stratum (oscillator type and stability). Valid value(s):
\( b0-b2 \)
= Valid value(s):
1 = Side locked in normal mode.
3 = Side locked in fast mode.
5 = Side in holdover mode.
7 = Side in free run mode.
\( b3-b4 \)
= Valid value(s):
0 = Foreign high stability oscillator.
1 = Foreign low stability oscillator.
2 = Stratum 2 (U.S. high stability).
3 = Stratum 3 (U.S. medium stability).
\( b5 \)
= Valid value(s):
0 = Single-ended mutual synchronization.
1 = Master/slave synchronization.

\( v \) = Local and remote oscillator status. Valid value(s):
\( b0, b1 \)
= Give status of local (same side) oscillator.
\( b4, b5 \)
= Give status of remote (other side) oscillator.
\( b0 \)
= Out of service.
1 = In warmup state.
2 = Active.
3 = Standby.
\( w \)
= Inverted talkback location. The value in this location should have the logically inverted value from field.
\( a^5 \)
This indicates that the communications to and from the clock are operating properly.
\( x \)
= Active reference byte. The active reference(s) for the clock side are indicated by a set bit in this field. b0 set means REF1 is active, b1 set means REF2 is active, etc. for all eight references.
y = Hardware error source register (ESR). A set bit means an error of the noted type has occurred. These errors are detected from the network clock controller (CNTL) or synchronization (SYNC) circuit pack. Valid value(s):
\[ b0 = \text{Digital/analog converter (DAC) or voltage-controlled oscillator (VCO) register error (CNTL).} \]
\[ b1 = \text{Memory error/firmware fault (CNTL).} \]
\[ b2 = \text{Local oscillator energy detector error (SYNC0).} \]
\[ b3 = \text{Remote oscillator energy detector error (SYNC0).} \]
\[ b4 = \text{Local oscillator energy detector error (SYNC1).} \]
\[ b5 = \text{Remote oscillator energy detector error (SYNC1).} \]
\[ b6 = \text{Local oscillator phase register error (CNTL).} \]
\[ b7 = \text{Remote oscillator phase register error (CNTL).} \]

z = Oscillator ESR. A set bit means that an error of the noted type has occurred. These errors are detected on the network clock oscillator circuit pack. Valid value(s):
\[ b0 = \text{Local oscillator energy detector.} \]
\[ b1 = \text{Local oscillator frequency.} \]
\[ b2 = \text{Local oscillator inner oven bit (loss of temperature stability on high stability oscillator).} \]
\[ b3 = \text{Local oscillator outer oven bit (loss of temperature stability on high stability oscillator).} \]
\[ b4 = \text{Remote oscillator energy detector.} \]
\[ b5 = \text{Remote oscillator frequency.} \]

a\textsuperscript{1} = Source ESR. A set bit means that an error of the noted type has occurred. These errors are detected on the network clock controller circuit pack. Valid value(s):
\[ b0 = \text{8 Khz return signal frequency difference.} \]
\[ b1 = \text{8 Khz return signal jitter.} \]
\[ b2 = \text{8 Khz return signal energy detector.} \]
\[ b3 = \text{Cross couple energy detector.} \]
\[ b4 = \text{Cross couple frequency difference.} \]

b\textsuperscript{1} = Reference summary ESR. A set bit means that there is an error on the corresponding reference. For more information refer to the following reference. Valid value(s):
\[ b0 = \text{REF1 (refer to 'n\textsuperscript{1}').} \]
\[ b1 = \text{REF2 (refer to 'p\textsuperscript{1}').} \]
\[ b2 = \text{REF3 (refer to 'v\textsuperscript{1}').} \]
\[ b3 = \text{REF4 (refer to 'z\textsuperscript{1}').} \]
\[ b4 = \text{REF5 (refer to 'd\textsuperscript{2}').} \]
\[ b5 = \text{REF6 (refer to 'h\textsuperscript{2}').} \]
\[ b6 = \text{REF7 (refer to 'i\textsuperscript{2}').} \]
\[ b7 = \text{REF8 (refer to 'p\textsuperscript{2}').} \]

c\textsuperscript{1} = Invalid message address. Indicates that an internal error has occurred and the firmware has received an invalid request. The location is an internal CCB address (refer to \( c1 \)).

d\textsuperscript{1} = Invalid message data. This is the data that was passed to the firmware in the invalid address (c\textsuperscript{1}).
\( e^1 \) = Time base offset calculation status. This byte indicates what action is taken on the time base offset for the local and remote side. Valid value(s):
\( b1, b2 \) = Local side.
\( b5, b6 \) = Remote side. Valid value(s):
0 = No action taken.
1 = Calculate.
2 = Load existing value from memory.
3 = No calculation.

\( f^1-i^1 \) = Value of the time base offset. This value is loaded into system memory to be used in the event that an initialization must be done without external references.

\( j^1-k^1 \) = (Upper byte and lower byte) counts taken of reference errors.

\( l^1 \) = Diagnostic result return value.

\( m^1 \) = Reference 1 configuration.

\( n^1 \) = Reference 1 ESR.

\( o^1 \) = Reference 1 parameter.

\( p^1 \) = Reference 1 data.

\( q^1 \) = Reference 2 configuration.

\( r^1 \) = Reference 2 ESR.

\( s^1 \) = Reference 2 parameter.

\( t^1 \) = Reference 2 data.

\( u^1 \) = Reference 3 configuration.

\( v^1 \) = Reference 3 ESR.

\( w^1 \) = Reference 3 parameter.

\( x^1 \) = Reference 3 data.

\( y^1 \) = Reference 4 configuration.

\( z^1 \) = Reference 4 ESR.

\( a^2 \) = Reference 4 parameter.

\( b^2 \) = Reference 4 data.

\( c^2 \) = Reference 5 configuration.

\( d^2 \) = Reference 5 ESR.

\( e^2 \) = Reference 5 parameter.
= Reference 5 data.

\( g^2 \) = Reference 6 configuration.

\( h^2 \) = Reference 6 ESR.

\( i^2 \) = Reference 6 parameter.

\( j^2 \) = Reference 6 data.

\( k^2 \) = Reference 7 configuration.

\( l^2 \) = Reference 7 ESR.

\( m^2 \) = Reference 7 parameter.

\( n^2 \) = Reference 7 data.

\( o^2 \) = Reference 8 configuration. Gives configuration data for each reference. Valid value(s):

- **b0** = Equipage state. Valid value(s):
  - 0 = Digital reference.
  - 1 = Equipped reference.

- **b1** = Reference type. Valid value(s):
  - 0 = Digital reference.
  - 1 = Analog reference.

- **b2-b5** = Reference format. Valid value(s):
  - 0 = Foreign AMI/U.S. D4 no zero code suppression (ZCS).
  - 2 = Foreign HDB3/U.S. D$ with B8ZC format.
  - 4 = U.S. D4 with ZCS.
  - 8 = U.S. FE no ZCS.
  - a = U.S. FE B8ZS.
  - c = U.S. FE with ZCS.

- **b6** = Service status. Valid value(s):
  - 0 = Out of service.
  - 1 = In service.

\( p^2 \) = Reference 8 ESR. Individual reference error source registers (ESRs). A set bit in the field means that an error of this type was reported on this reference. Valid value(s):

- **b0** = Out of range of allowed frequency.
- **b1** = Phase step.
- **b2** = Excess jitter on the reference.
- **b3** = Local alarm (loss of reference).
- **b4** = Low error rate threshold exceeded.
- **b5** = High error rate threshold exceeded.
- **b6** = Low out of frame threshold exceeded.
- **b7** = High out of frame threshold exceeded.

\( q^2 \) = Reference 8 parameter.
Variables \( o_1 - q_2 \). You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

\[ r^2 \]

= Reference 8 data.

Used in double-ended mutual synchronization only. No meaning for master/slave or single-ended mutual synchronization schemes.

\[ s^2, t^2 \]

= Phase buildout value (upper and lower bytes, respectively). Used to quickly lock the active major side to the external reference. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

\[ u^2, v^2 \]

= Digital/analog converter (DAC) value (upper and lower bytes, respectively). Used to give an analog value to run the voltage-controlled oscillator. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

\[ w^2, x^2 \]

= Phase detector output. Detects phase difference between the reference signal and the clock output signal. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

The following locations are information passed to the network clock hardware from the maintenance software through the foundation peripheral controller (FPC) to tell it configuration and pass messages. There is no flag vector manipulation as for the previous information.

\[ y^2 \]

= Network clock configuration. Valid value(s):

\[ b0 \]

= Valid value(s):

0 = Active major clock side.
1 = Active minor clock side.

\[ b1 \]

= Valid value(s):

0 = Cross couple out of service.
1 = Cross couple in service.

\[ b3, b4 \]

= Valid value(s):

0 = Using MMRSM local return.
1 = Using MMRSM remote return.
2 = Using TMS return (set in AM application).

\[ b5-b7 \]

= Valid value(s):

0 = 24 channel (T1 trunk) synchronization.
1 = 30 channel synchronization.
2 = Stand alone clock.

\[ z^2 \]

= Clock mode and stratum (oscillator type and stability). Valid value(s):

\[ b0-b2 \]

= Valid value(s):

1 = Lock side in normal mode.
3 = Lock side in fast mode.
5 = Put side in holdover mode.
7 = Put side in free run mode.

\[ b3-b4 \]

= Valid value(s):

0 = Foreign high stability oscillator.
1 = Foreign low stability oscillator.
2 = Stratum 2 (U.S. high stability).
3 = Stratum 3 (U.S. medium stability).

b5 = Valid value(s):
0 = Synchronize in master/slave synchronization.
1 = Synchronize in single-ended mutual synchronization.

a3 = Local and remote oscillator status. Valid value(s):
b0, b1, b2 = Give status of local (same side) oscillator.
b4, b5, b6 = Give status of remote (other side) oscillator. Valid value(s):
0 = Out of service.
1 = In warmup state.
2 = Active.
3 = Standby.
4 = Active forced.

b3 = Active reference byte. The active reference(s) for the clock side are indicated by a set bit in this field. b0 set means REF1 is active, b1 set means REF2 is active, and so on for all eight references.

c3 = Hardware error source register (ESR) pests. A set bit means an error of the noted type is pested. These errors are detected from the network clock controller (CNTL) or synchronization (SYNC) circuit pack. Valid value(s):
b0 = Digital/analog converter (DAC) or voltage-controlled oscillator (VCO) register error (CNTL).
b1 = Memory error/firmware fault (CNTL).
b2 = Local oscillator energy detector error (SYNC0).
b3 = Remote oscillator energy detector error (SYNC0).
b4 = Local oscillator energy detector error (SYNC1).
b5 = Remote oscillator energy detector error (SYNC1).
b6 = Local oscillator phase register error (CNTL).
b7 = Remote oscillator phase register error (CNTL).

d3 = Oscillator ESR pests. A set bit means that an error of the noted type is pested. These errors are detected on the network clock oscillator circuit pack. Valid value(s):
b0 = Local oscillator energy detector.
b1 = Local oscillator frequency.
b2 = Local oscillator inner oven bit (loss of temperature stability on high stability oscillator).
b3 = Local oscillator outer oven bit (loss of temperature stability on high stability oscillator).
b4 = Remote oscillator energy detector.
b5 = Remote oscillator frequency.

e3 = Source ESR pests. A set bit means that an error of the noted type is pested. These errors are detected on the network clock controller circuit pack. Valid value(s):
b0 = 8 Khz return signal frequency difference.
b1 = 8 Khz return signal jitter.
b2 = 8 Khz return signal energy detector.
b3 = Cross couple energy detector.
b4 = Cross couple frequency difference.

f³ = Reference summary ESR pests. A set bit means that all errors on the corresponding reference are pested. For more information refer to the following fields. Valid value(s):
b0 = REF1 (refer to 'r³').
b1 = REF2 (refer to 'v³').
b2 = REF3 (refer to 'z³').
b3 = REF4 (refer to 'd4').
b4 = REF5 (refer to 'h4').
b5 = REF6 (refer to 'l4').
b6 = REF7 (refer to 'p4').
b7 = REF8 (refer to 'c4').

g³ = Pest invalid command. Refer to 'c¹'.
00 = Unpested.
FF = Pested.

h³ = Pest trace. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

i³ = Time base offset calculation status. This byte indicates what action is taken on the time base offset for the local and remote side. Valid value(s):
b1, b2 = Local side.
b5, b6 = Remote side. Valid value(s):
0 = No action taken.
1 = Calculate.
2 = Load existing value from memory.

j³–m³ = Value of the time base offset. This value is loaded into system memory to be used in the event that an initialization must be done without external references.

n³ = Requests that internal reference counts be taken on a reference for specific errors.

o³ = Specifies the type of reference count to be taken. Valid value(s):
b0 = Out of frame count.
b1 = CRC-6 count (U.S. Fe format only).
b6 = Clear OOF count for all references.
b7 = Clear OOF count for a specific reference.

p³ = Order to run hardware diagnostics phases. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

q³ = Reference 1 configuration.

r³ = Reference 1 ESR pests.
s^3 = Reference 1 coefficient.

t^3 = Reference 1 data.

u^3 = Reference 2 configuration.

v^3 = Reference 2 ESR pests.

w^3 = Reference 2 coefficient.

x^3 = Reference 2 data.

y^3 = Reference 3 configuration.

z^3 = Reference 3 ESR pests.

a^4 = Reference 3 coefficient.

b^4 = Reference 3 data.

c^4 = Reference 4 configuration.

d^4 = Reference 4 ESR pests.

e^4 = Reference 4 coefficient.

f^4 = Reference 4 data.

g^4 = Reference 5 configuration.

h^4 = Reference 5 ESR pests.

i^4 = Reference 5 coefficient.

j^4 = Reference 5 data.

k^4 = Reference 6 configuration.

l^4 = Reference 6 ESR pests.

m^4 = Reference 6 coefficient.

n^4 = Reference 6 data.

o^4 = Reference 7 configuration.

p^4 = Reference 7 ESR pests.

q^4 = Reference 7 coefficient.

r^4 = Reference 7 data.

s^4 = Reference 8 configuration. Gives configuration data for each reference.

b0 = Equipage state. Valid value(s):

0 = Unequipped reference.

1 = Equipped reference.
### Reference Type (b1)
- **0**: Digital reference.
- **1**: Analog reference.

### Reference Format (b2-b5)
- **0**: Foreign AMI/U.S. D4 no zero code suppression (ZCS).
- **2**: Foreign HDB3/U.S. D$ with B8ZC format.
- **4**: U.S. D4 with ZCS.
- **8**: U.S. FE no ZCS.
- **a**: U.S. FE B8ZS.
- **c**: U.S. FE with ZCS.

### Service Status (b6)
- **0**: Out of service.
- **1**: In service.

### Reference 8 ESR Pests (t)
- **0**: Out of range of allowed frequency.
- **1**: Phase step.
- **2**: Excess jitter on the reference.
- **3**: Local alarm (loss of reference).
- **4**: Low error rate threshold.
- **5**: High error rate threshold.
- **6**: Low out of frame threshold.
- **7**: High out of frame threshold.

### Reference 8 Coefficient (u)
- Used to provide the "reference priority". In master/slave synchronization this means that the order of preference from 1 to 'n' (with 'n' the number of equipped references) should be in the appropriate reference coefficient. The most preferred reference should be '1' and the least preferred should be 'n'. Automatic actions will switch from reference '1' to reference '2' on detection of errors, and so on through all equipped references.

In mutual synchronization this value is a weighting parameter, where the larger the value, the more a reference is taken into consideration when calculating a phase to lock to.

### Reference 8 Data (v)
- Used in double-ended mutual synchronization only. No meaning for master/slave or single-ended mutual synchronization schemes.

### Phase Buildout Value (w, x)
- Phase buildout value (upper and lower bytes, respectively). Used to quickly lock the active major side to the external reference. Can be loaded as a desired value for testing. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

### Digital/Analog Converter (DAC) Value (y, z)
- Digital/analog converter (DAC) value (upper and lower bytes, respectively). Used to give an analog value to run the voltage-controlled oscillator. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
a = Data written to test communications from FPC to NC. Should have the inverted value from field 'w'.

b = Phase detector stage. You may not have the resources to interpret the data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

c = Not used.

d = Local time base offset (TBO) bits 24 through 31.

e = Local TBO, bits 16 through 23.

f = Local TBO, bits 8 through 15.

g = Local TBO, bits 0 through 7.

h = Remote TBO, bits 24 through 31.

i = Remote TBO, bits 16 through 23.

j = Remote TBO, bits 8 through 15.

k = Remote TBO, bits 0 through 7.

l = Oscillator year value.

m = Oscillator day value, bits 8 through 15.

n = Oscillator day value, bits 0 through 7.

o = Oscillator hour value.

p = Oscillator minute value.

q = Network clock type. Valid value(s):
   0 = 24-channel (T1 trunk) synchronization
   1 = 30-channel synchronization
   2 = Stand alone clock

r = Oscillator type. Valid value(s):
   0 = Foreign high stability oscillator.
   1 = Foreign low stability oscillator.
   2 = Stratum 2 (U.S. high stability).
   3 = Stratum 3 (U.S. medium stability).

4. ACTION TO BE TAKEN

When an error condition triggers this message, a REPT:NC output message related to the error type specified by the variable 'c' prints to the receive-only printer (ROP). Consult the appropriate REPT:NC error message and the explanation for the dumped registers for additional information. The dump can be used along with the information gained from diagnostics (DGN:NC) to analyze the problems in the network clock hardware.

5. ALARMS
None.

2. REASON FOR OUTPUT

To dump the specified network clock (NC) communication control buffer and communication link receiver/transmitter (CCB/CLRT) registers and status data in response to a manual or automatic request.

When this message is automatically generated, the values of the specific CCB and CLRT registers depend on the values of the summary flags (variables 'g' through 'h') and the flag vectors (variables 'j' through 'x'). In the following matrix, identify the variable field ('y' through 'n') at the intersection of the row of the summary flag value printed in the dump (01,02,...,80) and the flag vector. Then look up the variable field definition in the following Exhibit.

For example, the following message prints:

DUMP ONTC 1 NC COMPLETED REFERENCE FAULT
NETWORK CLOCK 0 CCB/CLRT REGISTERS X'
  00003F01 01020000 00020000 . . .
Field ‘d’ is 3F, field ‘e’ is 01, and field ‘f’ is 01. Field ‘g’, the NC to FPC summary flag byte, is 02. Field ‘j’, the NC to FPC flag vector 1 byte, is also 02. The intersection of flag vector column 02 and summary flag row 02 is variable field ‘d1’. Field ‘d1’ indicates a frequency difference in the TMS/LI return signal. If an error caused this message to print, more information about the error is found in the REPT:ONTC output message printed after the dump. If the dump message is requested manually, no report message prints.

Note that the variable fields are documented as hexadecimal bytes. In some fields, specific masks and alarms are indicated at the bit level. In these cases, transform the hexadecimal value printed into binary and interpret the bits appropriately. For example, field ‘d’, the PSR mask set during an initialization, is 3F. Expanded into binary, this byte is 0011 1111. Bits are interpreted from right to left. Therefore, the initialization enables the CCB activity flag (bit 0), the VCXO energy detector alarm (bit 1), etc.

Note also that some fields in this message print zeros. These fields are currently not used.

3. VARIABLE FIELD DEFINITIONS

a = Side (0 or 1) of the office network and timing complex (ONTC).

b = Termination report. Valid value(s):
   ABORTED
   COMPLETED
   STOPPED

c = Additional failure information. A character string in this field indicates the type of REPT:ONTC message that will print after the dump is completed.
   CONFIGURATION/MODE FAULT
   INTERRUPT DATA
   PHASE LOCK LOOP FAULT
   PROCESSOR FAULT
   REFERENCE FAULT
   THRESHOLD EXCEEDED
   UNIT FAULT

d = Peripheral service request (PSR) mask, indicating which NC scan points are enabled (0 = disabled; 1 = enabled) by the last initialization. Valid value(s):
   2F = DS1 NC simplex.
   3F = DS1 NC duplex.
   6F = Stand-alone NC simplex.
   7F = Stand-alone NC duplex.

   The bit fields indicate the following scan points. Valid value(s):
   7 = Configuration of the NC (0 = active major; 1 = active minor).
   6 = Reference configuration if the PSR mask is for a DS1 NC (0 = primary; 1 = secondary).

   Stand-alone oscillator energy detector alarm if the PSR mask is for a stand-alone NC.
   5 = TMS/LI energy detector alarm.
   4 = Cross-couple energy detector alarm.
   3 = 2 KHz reference energy detector alarm.
2 = Microprocessor sanity timer alarm.
1 = Voltage controlled oscillator (VCXO) energy detector alarm.
0 = CCB activity flag indicating an error in the CCB registers. Check the summary and vector flags for the error location.

e = First reading of the NC scan points. (Refer to variable 'd'.) Valid value(s):
0 = No alarm.
1 = Alarm.

f = Second reading of the NC scan points. (Refer to variable 'd'.) Valid value(s):
0 = No alarm.
1 = Alarm.

g = NC to FPC summary flags.

h = FPC to NC summary flags.
i = NC to FPC flag vector 0.
j = NC to FPC flag vector 1.
k = NC to FPC flag vector 2.
l = NC to FPC flag vector 3.
m = NC to FPC flag vector 4.
n = NC to FPC flag vector 5.
o = NC to FPC flag vector 6.
p = NC to FPC flag vector 7.
q = FPC to NC flag vector 0.
r = FPC to NC flag vector 1.
s = FPC to NC flag vector 2.
t = FPC to NC flag vector 3.
u = FPC to NC flag vector 4.
v = FPC to NC flag vector 5.
w = FPC to NC flag vector 6.
x = FPC to NC flag vector 7.
y–t¹ = CCB locations X'80 through X'BF. This data is written by the NC microprocessor.
y = Configuration bits. Valid value(s):

- **z** = Mode. Valid value(s):
  - 00 = Fast mode.
  - FF = Normal.

- **a** = Digital phase lock loop (DPLL) status. Valid value(s):
  - 00 = Locked.
  - FF = Holdover.

- **b** = Inverted talkback (AA should always be present).

- **c** = Phase jitter of reference NC is locked to. Valid value(s):
  - 00 = No calculation.
  - 55 = Less than threshold.
  - AA = Exceeds threshold. Summary and vector flags are set.

- **d** = Frequency difference TMS/LI return signal. (Refer to variable 'c'.)

- **e** = Frequency difference default active/standby reference. (Refer to variable 'c'.)

- **f** = Frequency difference of alternate DS1. (Refer to variable 'c'.)

- **g** = Phase build-out register, upper byte. Ignore.

- **h** = Phase build-out register, lower byte. Ignore.

- **i** = NC error source register (ESR) bit field (0 = no alarm; 1 = alarm). Valid value(s):
n\(^1\) = Primary reference error rate. Valid value(s):
00 = No calculation.
55 = Rate < 106.
AA = Rate > 106.
FF = Rate > 103.

o\(^1\) = Secondary reference error rate. (Refer to variable \('n\(^2\)'\).)

p\(^1\) = NC diagnostic results.

q\(^1\) = Upper byte of phase detector output.

r\(^1\) = Lower byte of phase detector output.

s\(^1\) = Input value to the digital-to-analog converter (DAC).

t\(^1\) = Ignore.

u\(^1\)--n\(^2\) = CCB locations 0xC0 through 0xFF. This data is written by the CP or AM.

u\(^1\) = Configuration bits (same as variable \('y\)'). Valid value(s):

v\(^1\) = Mode (same as variable \('z\)'). Valid value(s):
00 = Fast.
FF = Normal.

w\(^1\) = DPLL status. (Same as variable \('a\(^1\)'\)). Valid value(s):
00 = Locked.
FF = Holdover.

x\(^1\) = Pest of the phase jitter of the reference NCLK is locked to. A pest means the error register is prevented (inhibited) from interrupting. Valid value(s):
0 = Not pested.
FF = Pested.

y\(^1\) = Pest of the frequency difference TMS/LI return signal. (Refer to variable \('x\(^1\)'\).)

z\(^1\) = Pest of the frequency difference default active/stanby call reference. (Refer to variable \('x\(^1\)'\).)

a\(^2\) = Pest of the frequency difference of the alternate DS1 line. (Refer to variable \('x\(^1\)'\).)

\[ a^3 = \text{Event number for the requested action.} \]

4. ACTION TO BE TAKEN

When an error triggers this message, a REPT:ONTC output message related to the error type specified by variable 'c' prints. Consult the appropriate REPT:ONTC message for additional information about the error.

5. ALARMS
None.

2. REASON FOR OUTPUT

To dump the specified network clock 3 (NC3) registers and status data in response to a manual DUMP:NC input command. It can be used to help identify a problem according to the bits that are set as shown in the format description.

3. VARIABLE FIELD DEFINITIONS

a = Network clock side.

b = Number of parts in the message. Normally 3, but can be 1 if the data cannot be retrieved from the NC hardware. Part 1 is AM resident data, part 2 is NC resident data and registers, part 3 is data from the NC resident syncmon process.

c = Event number.

d = NC status. Valid value(s):
MAJOR = This Network Clock side is supplying the clock signal.
MINOR = This Network Clock side is receiving the clock signal from the other side via the cross-couple.

= The "active" external NCRE, from the perspective of this network clock side. The active reference is the one to which the major (master) network clock is synchronized. Therefore, if the network clock on this side is not major, the concept of an active reference is not applicable. Valid value(s):
REF1,DGTL = Digital reference 1.
REF2,DGTL = Digital reference 2.
REF3,DGTL = Digital reference 3.
REF5,DGTL = Digital reference 5.
REF6,DGTL = Digital reference 6.
REF7,DGTL = Digital reference 7.
REF8,DGTL = Digital reference 8.
REF1,10M = 10 MHz analog reference 1.
REF2,10M = 10 MHz analog reference 2.
REF1,2M = 2.048 MHz analog reference 1.
REF2,2M = 2.048 MHz analog reference 2.
REF1,CC = 64K composite clock reference 1.
REF2,CC = 64K composite clock reference 2.
NONE = There is currently no active reference. This occurs when in HOLDOVER or FREE RUN modes.
N/A = This is a minor network clock side and is synchronized to the timing signal from the major (master) network clock via the network clock cross couple (XC), therefore the active reference specification is not applicable.

f = Network Clock mode. Valid value(s):
NORMAL = After synchronization with a reference has been achieved, the network clock will be in the normal mode.
FAST = While in the process of achieving synchronization with a reference, the network clock will be in the fast mode.
HOLDOVER = After synchronization with a reference has been lost, the network clock will be in holdover mode.
FREE RUN = If the network clock has never been synchronized to a reference, it will be in free run mode.
DISABLED = If a fatal error occurs, the network clock synchronization monitoring software may be disabled. This is a transient condition that can only occur while recovering from a fault.

g = Number of 5 minute intervals each of the possible 14 reference units has been in service. See field "e" for the reference order.
h = Number of 5 minute intervals the near side oscillator has left to complete the warmup period.
i = Time base offset for oscillator 0.
j = Time base offset for oscillator 1.
k = Hex dump of all the clock status data stored in the AM.
l = ONTC fault classification.
m = Contents of the ONTC-AP's interrupt request register (IRR).
n = Contents of the ONTC-AP's application control register (APCTL)
o = Contents of the ONTC-AP's external interrupt mask register (EIMR).
p = Contents of the ONTC-AP's application status register (APSTAT).
q = Contents of the ONTC-AP's system management interrupt mask register (SMIMR).
r = Contents of the ONTC-AP's bus control register (BCR).
s = Contents of the system timing and reference synchronization (STARS) device voltage-controlled crystal oscillator (VCXO) frequency control register (FRQCTL).
t = Contents of the STARS device direct memory access (DMA) start register (DMAST).
u = Contents of the STARS device line interface configuration register (LITERM).
v = Contents of the STARS device phase locked loop (PLL) control register (PLLCTL).
w = Contents of the STARS device DMA end register (DMAEND).
x = Contents of the STARS device diagnostic control register (DCR).
y = Contents of the STARS device test signal control register (TSTCTL).
z = Contents of the STARS device phase counter input multiplexer control register (INCTL).
a = Contents of the STARS device version number register (SVERS).
= Line framer (LFRMR) device number (0-3). The line framer devices terminate digital external network clock references (NCREFs).

c1
= Contents of general register 0 (GREG0) on LFRMR device "b1". This is the primary block interrupt status register.

d1
= Contents of general register 1 (GREG1) on LFRMR device "b1". This is the primary block interrupt enable register.

e1
= Contents of the framer mode option register for the first digital reference interface on LFRMR device "b1" (FMODEA).

f1
= Contents of line interface unit (LIU) register 0 for the first digital reference interface on LFRMR device "b1" (LIU0A). This is the alarm status register for this NCREF.

g1
= Contents of LIU register 1 for the first digital reference interface on LFRMR device "b1" (LIU1A). This is the alarm interrupt enable register for this NCREF.

h1
= Contents of the framer mode option register for the second digital reference interface on LFRMR device "b1" (FMODEB).

i1
= Contents of LIU register 0 for the second digital reference interface on LFRMR device "b1" (LIU0B). This is the alarm status register for this NCREF.

j1
= Contents of LIU register 1 for the second digital reference interface on LFRMR device "b1" (LIU1B). This is the alarm interrupt enable register for this NCREF.

k1
= A bitmap indicating which NCREFs and network clock oscillators (NCOSCs) are equipped. Each set bit corresponds to an equipped NCREF or NCOSC. Viewing the bits as "15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0", bits 0 thru 7 are associated with digital references 1 thru 8. Bits 8 and 9 are associated with 10 MHz analog references 1 and 2. Bits 10 and 11 are associated with 2.048 MHz analog references 1 and 2. Bits 12 and 13 are associated with 64K composite clock references 1 and 2. Finally, bits 14 and 15 are associated with NCOSC 0 and 1 (which are always equipped).

l1
= A bitmap (in the same format as field "k1") indicating which NCREFs and NCOSCs are in-service.

m1
= A bitmap (in the same format as field "k1") indicating which NCREFs and NCOSCs have taken errors.

n1
= The network clock mode from the last configuration request from the AM. Refer to field "e" for a description of the possible values.

o1
= The network clock mode, from the ONTC's perspective. Refer to field "e" for a description of the possible values.

p1
= The NCOSC being utilized by this ONTC side, from the AM's perspective.

q1
= The NCOSC being utilized by this ONTC side, from the ONTC's perspective. This field reflects any autonomous change in NCOSC utilization performed within the ONTC in order to maintain stable timing during the interval before a re-configuration action can be initiated by fault recovery software in the AM.

r1
= Unit for which a fault was detected.

s1
= ONTC fault type.
\( t^1 \) = The "error source byte" (a bitmap indicating all existing error conditions) associated with the unit specified in field "r^1".

\( u^1 \) = Sync-mon foreground state. Valid value(s):

- NULL
- DISABLED
- INVALID SWITCH
- FG COLLISION
- NO OSC IS ERROR FREE
- POSITION DAC
- NETROM-FREE RUN
- NETROM-HOLOVER
- NETROM-FAST
- NETROM-NORMAL
- START STATE
- TO FREE RUN
- TO HOLOVER
- TO PHASELOCK
- TO MINOR
- FIRST SYNC
- FAST MODE
- LOCKED
- NORMAL MODE
- MINOR
- FREE RUN MODE
- HOLOVER MODE
- SWITCH

\( v^1 \) = Hex dump of the configuration data in sync-mon, CDcurrcfg.

\( w \) = Hex dump of the fault recovery data in sync-mon, CDcurrfrd.

\( x \) = Hex dump of the CDrefs[] array containing data pertaining to the reference being processed by foreground sync-mon.

4. ACTIONS TO BE TAKEN

The dump can be used along with the information gained from diagnostics (DGN:ONTCCOM) to analyze the problems in the network clock hardware. This report can be cross checked against the OP:CFGSTAT information and the MCC pages.

5. ALARMS

None.

6. REFERENCES

APP: OMDB-X-REF
APP: TLP-NOTE

Other Manual(s):
235-105-250  System Recovery Procedures
DUMP:PID

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] DUMP PID a ADDR b [OFF c] COMPLETED #g
ADDRESS (HEX): CONTENTS OF MEMORY (HEX):

d                   e

__________________________________________________________________

[2] DUMP PID a ADDR b [OFF c] f #g

2. REASON FOR OUTPUT

To report the result of executing the DUMP:PID input message to dump out the contents of an address or address range in main memory.

3. VARIABLE FIELD DEFINITIONS

a = Process ID of the target process.
b = Virtual address specified in input message.
c = Offset(s) used on input message line.
d = Address label for line of data.
e = Data as dumped from memory.
f = Termination status. Valid value(s):
NOT STARTED NGPID = The DUMP was stopped because the specified process does not exist.
STOPPED NGADDR = The DUMP was stopped because the address specified is not valid for the process; or invalid address values were encountered in the address chain, if offsets were specified.
g = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If 'f' is NOT STARTED NGPID, the process did not exist at the time the DUMP was attempted. If this happens repeatedly with the process IDs used because the process has a short lifetime, consider using the process utility identification (UID) instead of process identification (PID).

If 'f' is STOPPED NGADDR, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the DUMP message in the action list.

5. ALARMS
None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Software Release: 5E14 and later  
Message Class: MTCE  
Application: 5,3B  
Type: Output

1. FORMAT

[1] DUMP PMEM a COMPLETED #d  
   ADDRESS (HEX): CONTENTS OF MEMORY (HEX):  
   "b                              c"

[2] DUMP PMEM a STOPPED NGADDR #d

2. REASON FOR OUTPUT

To report the result of executing the DUMP:PMEM input message to dump out the contents of a physical address or address range in main memory.

3. VARIABLE FIELD DEFINITIONS

a  = Physical address specified in input message.  
b  = Address label for line of data.  
c  = Data as dumped from memory.  
d  = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If Format 2 is printed, verify that the desired address is correct.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

DUMP : PMEM

Output Appendix(es):

APP : OMDB-X-REF
DUMP:REG

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] DUMP REG a COMPLETED #g
    REGISTER: CONTENTS>
       b     c

[2] DUMP REG a OFF d COMPLETED #g
    ADDRESS (HEX): CONTENTS OF MEMORY (HEX):
       e     f

[3] DUMP REG a OFF d STOPPED NGADDR #g

[4] DUMP REG a
     DUMP INV REG/UVAR VALUE

2. REASON FOR OUTPUT

To report the result of executing a DUMP:REG input message to dump the contents of a register or area of main memory.

Format 3 indicates an error was encountered in the indirection addressing chain.

Format 4 indicates that this action-list has been aborted. The register or UVAR name is invalid. Refer to the WHEN:RUTIL input message for valid register or UVAR names.

3. VARIABLE FIELD DEFINITIONS

a = Name of register to be dumped.
b = Name of register for line of data.
c = Data dumped from register.
d = Offset(s) used in input message line.
e = Address label for line of data.
f = Data dumped from memory.
g = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If Format 3 is printed, recheck the program listings. Try printing the register contents and break the indirection chain...
into several parts, printing the intermediate results.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   .

[6] DUMP SMEAS COMPL
2. REASON FOR OUTPUT

To print the values of the specified measurements from a history file in response to the input message DUMP:SMEAS. The first six formats correspond to no option, the signaling link (SLK) option, the NODE option, the channel (CHN) option, the linkset (LS) option, and the CLUSTER option respectively. Non-zero measurement data is not output. Any option having zero measurement counts are not output.

Format 7 is output if no non-zero measurements are encountered.

Format 8 prints in response to invalid input.

Format 9 prints when the dump is requested when the LPM data is being updated. Retry the input message later.

3. VARIABLE FIELD DEFINITIONS

a = Name of measurement specified.
b = Measurement value.
c = Ring node (RN) group number.
d = Member number.
e = Channel number.
f = Type of node 6 (CCS6) or 7 (CCS7).
g = Link set number.
h = Cluster number.
i = Valid value(s):
   Measurement ID j is duplicated in the view.
   Cannot specify IDS j and j in the same view.
   Must provide SLK number.
   Must provide cluster number.
Must provide LS number.
Must provide CHN number.
Must provide node number.

\( j \) = Measurement ID. For a complete listing can be found in the Recent Change Attribute Definitions manual.

4. ACTION TO BE TAKEN

2. REASON FOR OUTPUT

To output the status and the start and end addresses of Office-Dependent Data (ODD) sections, Real Time Billing Memory (RTBM), Stand Alone Billing Memory (SABM), and peripheral images in a Switching Module’s (SM’s) memory.

3. VARIABLE FIELD DEFINITIONS

a = Switching module number.
b = Message number sequence for this message.
c = Total number of messages to be outputted.
d = Image name, if memory section is a peripheral image, blank otherwise.
e = Type of image indicating the contents of the memory section.
f = Start address of memory section in hexadecimal.
g = End address of memory section in hexadecimal.
h = The status of the memory section for the image. Valid value(s):
   EMPTY = The peripheral image has been allocated but not yet pumped.
   LOCKED = The peripheral image is locked for use by a process.
   NORMAL = The peripheral image is pumped and not locked.
   PUMPING = The peripheral image is currently being pumped from administrative module (AM) disk.

2. REASON FOR OUTPUT

To read the contents of time multiplexed switch (TMS) error source registers (ESR) in response to a DUMP-TMS input message.

Format 1 dumps the CONTROLLER SHELF BOARDS (always 5 messages), and the ACTIVE AND SPECIAL GROW TMSLNK BOARDS (up to 40 messages per page). There may be several pages with this format depending on the number of SMs in the office.
Format 2 dumps the CONTROLLER SHELF BOARDS (always 5 messages), and the ACTIVE QLPS, QTMSLNK, AND COUNTERS (always 30 messages). This is always the last page in the dump.

3. VARIABLE FIELD DEFINITIONS

a = Unit side.

b = Event number.

c = Page number.

d = Total number of pages in report.

e = Opcode. Valid value(s):
   db = Read the TMS2 summary error report.
   df = Read the control error source register.
   fb = Read the switch unit error source register.
   11 = Read the NCT link error source register.
   49 = QLPS global summary ESR report. The first 3 lines of this part of the dump deals with QLPS network 0, the last three lines are for QLPS network 1.
   4d = QLPS Rx Pfc/L2&ov/gateway ESR error report.
   51 = QLPS receiver/transmitter link error report.
   83 = Read the level 2 error counters for QLPS.

f = Low byte (bits 0-7) TMS2 summary error report.
   bit 0 = Microprocessor bus parity or sanity timeout error.
   bit 1 = Nonreadable controller error.
   bit 2 = Cross couple clock input (energy detect) error.
   bit 3 = Cross couple clock output (slip detect) error.
   bit 4 = Clock input (energy detect) error (network clock reference).
   bit 5 = Clock output (slip detect) error (network clock reference).
   bit 6 = Odd switch unit MLI (message link interface) circuit error.
   bit 7 = Even switch unit MLI circuit error.

g = High byte (bits 8-15) TMS2 summary error report.
   bit 8 = Readable controller critical error.
   bit 9 = Even switch unit summary ESR error.
   bit 10 = Odd switch unit summary ESR error.
   bit 11 = One or more links reported as affected because fabric parity error propagation was found.
   bit 12 = QLPS critical error.
   bit 13 = Write fabric error.
   bit 14 = Invalid request error.
   bit 15 = Not used.

h = Low byte (bits 0-7) of the control error source register.
   bit 0 = Micro bus parity error.
   bit 1 = Sanity timer error.
   bit 2 = Micro busy time out error.
   bit 3 = TMS2 interface board bus parity error.
   bit 4 = Not used.
bit 5 = Invalid opcode received from FPC.
bit 6 = Controller CIC parity error on parallel data from CIC.
bit 7 = Controller CIC BERR error indicating serial parity or CIC timeout error.

i

bit 8 = Invalid request received from the FPC.
bit 9 = Write fabric error during call processing routine.
bit 10 = Parity error detected on CDAL message from FPC.
bit 11 = Error detected on clock interface input reference multiplexer.
bit 12 = Energy detector error on NCLK reference input.
bit 13 = Slip error of clock output frequency with regards to NCLK reference input.
bit 14 = Energy error detector error on cross couple reference input.
bit 15 = Slip error of clock output frequency with regards to cross couple reference input.

j

bit 0 = Shelf 0 summary error bit.
bit 1 = Shelf 2 summary error bit.
bit 2 = Shelf 4 summary error bit.
bit 3 = Shelf 6 summary error bit.
bit 4 = Shelf 8 summary error bit.
bit 5 = Shelf 10 summary error bit.
bit 6 = Shelf 12 summary error bit.
bit 7 = Shelf 14 summary error bit error.

k

bit 8 = Shelf 1 summary error bit.
bit 9 = Shelf 3 summary error bit.
bit 10 = Shelf 5 summary error bit.
bit 11 = Shelf 7 summary error bit.
bit 12 = Shelf 9 summary error bit.
bit 13 = Shelf 11 summary error bit.
bit 14 = Shelf 13 summary error bit.
bit 15 = Shelf 15 summary error bit.

l

bit 0 = QLI summary error source register.
bit 1 = QLT summary bit error.
bit 2 = QLT summary bit error.
bit 3 = Fabric control data parity error.
bit 4 = LIR 0 summary bit error.
bit 5 = LIR 1 summary bit error.
bit 6 = LIR 2 summary bit error.
bit 7 = LIR 3 summary bit error.

m

bit 0 = Link 0 fabric data parity error.
bit 1 = Link 1 fabric data parity error.
bit 2 = Link 2 fabric data parity error.

2. REASON FOR OUTPUT

To read the contents of time multiplexed switch (TMS) error source registers (ESR) in response to a DUMP:TMS input message.

Format 1 dumps the CONTROLLER SHELF BOARDS (always 5 messages), and the ACTIVE AND SPECIAL GROW TMSLNK BOARDS (up to 40 messages per page). There may be several pages with this format depending on the number of SMs in the office. This format is not used in CM3 office.

Format 2 dumps the CONTROLLER SHELF BOARDS (always 5 messages), and the ACTIVE QLPS, QTMSLNK, AND COUNTERS (always 30 messages). This is always the last page in the dump. This format is not used in the CM3 office.

Format 3 dumps the TMS FABRIC STATUS and the contents of MCA740 and NCC-CSI registers. This format is used for the CM3 office.

Format 4 dumps TMS STATUS and the contents of CSIX, FMI and TMSF LIT48 registers. This format is used for the CM3 office.

Format 5 dumps the contents of TMSX LIT48 registers. This format is used for the CM3 office.

3. VARIABLE FIELD DEFINITIONS

a = Unit side.
b = Event number.
c = Page number.
d = Total number of pages in report.
e = Opcode. Valid value(s):
  db = Read the TMS2 summary error report.
  df = Read the control error source register.
  fb = Read the switch unit error source register.
  11 = Read the NCT link error source register.
  49 = QLPS global summary ESR report. The first 3 lines of this part of the dump deals with QLPS network 0, the last three lines are for QLPS network 1.
  4d = QLPS Rx Pfc/L2&ov/gateway ESR error report.
  51 = QLPS receiver/transmitter link error report.
  83 = Read the level 2 error counters for QLPS.

f = Low byte (bits 0-7) TMS2 summary error report.
  bit 0 = Microprocessor bus parity or sanity timeout error.
  bit 1 = Nonreadable controller error.
  bit 2 = Cross couple clock input (energy detect) error.
  bit 3 = Cross couple clock output (slip detect) error.
  bit 4 = Clock input (energy detect) error (network clock reference).
  bit 5 = Clock output (slip detect) error (network clock reference).
bit 6 = Odd switch unit MLI (message link interface) circuit error.
bit 7 = Even switch unit MLI circuit error.

g = High byte (bits 8-15) TMS2 summary error report.
bit 8 = Readable controller critical error.
bit 9 = Even switch unit summary ESR error.
bit 10 = Odd switch unit summary ESR error.
bit 11 = One or more links reported as affected because fabric parity error propagation
        was found.
bit 12 = QLPS critical error.
bit 13 = Write fabric error.
bit 14 = Invalid request error.
bit 15 = Not used.

h = Low byte (bits 0-7) of the control error source register.
bit 0 = Micro bus parity error.
bit 1 = Sanity timer error.
bit 2 = Micro busy time out error.
bit 3 = TMS2 interface board bus parity error.
bit 4 = Not used.
bit 5 = Invalid opcode received from FPC.
bit 6 = Controller CIC parity error on parallel data from CIC.
bit 7 = Controller CIC BERR error indicating serial parity or CIC time out error.

i = High byte (bits 8-15) of the control error source register.
bit 8 = Invalid request received from the FPC.
bit 9 = Write fabric error during call processing routine.
bit 10 = Parity error detected on CDAL message from FPC.
bit 11 = Error detected on clock interface input reference multiplexer.
bit 12 = Energy detector error on NCLK reference input.
bit 13 = Slip error of clock output frequency with regards to NCLK reference input.
bit 14 = Energy error detector error on cross couple reference input.
bit 15 = Slip error of clock output frequency with regards to cross couple reference input.

j = Low byte (bits 0-7) of the switch unit error source register. This byte represents the even switch
    unit.
bit 0 = Shelf 0 summary error bit.
bit 1 = Shelf 2 summary error bit.
bit 2 = Shelf 4 summary error bit.
bit 3 = Shelf 6 summary error bit.
bit 4 = Shelf 8 summary error bit.
bit 5 = Shelf 10 summary error bit.
bit 6 = Shelf 12 summary error bit.
bit 7 = Shelf 14 summary error bit error.

k = High byte (bits 8-15) of the switch unit error source register. This byte represents the odd switch
    unit.
bit 8 = Shelf 1 summary error bit.
bit 9 = Shelf 3 summary error bit.
bit 10 = Shelf 5 summary error bit.
bit 11 = Shelf 7 summary error bit.
bit 12 = Shelf 9 summary error bit.
bit 13 = Shelf 11 summary error bit.
bit 14 = Shelf 13 summary error bit.
bit 15 = Shelf 15 summary error bit.

l = QLI summary error source register.
  bit 0 = Bus error form CIC (timeout or serial data parity).
  bit 1 = Bus parity error on parallel data from CIC.
  bit 2 = QLT summary bit error.
  bit 3 = Fabric control data parity error.
  bit 4 = LIR 0 summary bit error.
  bit 5 = LIR 1 summary bit error.
  bit 6 = LIR 2 summary bit error.
  bit 7 = LIR 3 summary bit error.

m = QLT summary error source register.
  bit 0 = Link 0 fabric data parity error.
  bit 1 = Link 1 fabric data parity error.
  bit 2 = Link 2 fabric data parity error.
  bit 3 = Link 3 fabric data parity error.
  bit 4 = Time slot parity error.
  bit 5 = Not used.
  bit 6 = Not used.
  bit 7 = Not used.

n = QLI LIR error source register.
  bit 0 = Out of frame error.
  bit 1 = Parity threshold error.
  bit 2 = Buffer error (F of G bit error).
  bit 3 = AUTISS bit detected.
  bit 4 = F bit error detected.
  bit 5 = G bit error detected.
  bits 6 and 7 = LIR ID (0 to 3).

o = Shelf ID (0 to 15).

p = Board ID (0 to 7). On shelf 0 and 1, board 0 is the MLI.

q = QLPS summary ESR.
  bit 0 = Bus error form CIC (timeout or serial data parity).
  bit 1 = Bus parity error on parallel data from CIC.
  bit 2 = Global ESR summary bit.
  bit 3 = Circuit ESR summary bit.
  bit 4 = Rx_0 gate array ESR summary bit.
  bit 5 = Tx_0 gate array ESR summary bit.
  bit 6 = Rx_1 gate array ESR summary bit.
  bit 7 = Tx_1 gate array ESR summary bit.

r = QLPS global ESR.
bit 0 = Tx FIFO controller detected bus parity error.
b bit 1 = FIFO status RAM parity error detected by the TX FIFO pointer circuit.
b bit 2 = Parity error detected on the routing RAM data read by the routing RAM controller.
b bit 3 = Time slot channel map parity error.
b bit 4 = QGP ESR summary error bit.
b bit 5 = Rx pointer FIFO ESR 1 summary error bit.
b bit 6 = Rx pointer FIFO ESR 2 summary error bit.
b bit 7 = Level 2 and overload summary error bit.

s = QLPS circuit ESR.
b bit 0 = Time slot parity error.
b bit 1 = Fabric control parity error.
b bit 2 = Link 0 fabric data parity error.
b bit 3 = Link 1 fabric data parity error.
b bit 4 = Link 2 fabric data parity error.
b bit 5 = Link 3 fabric data parity error.
b bit 6 = Not used.
b bit 7 = Not used.

t = Shelf ID (0 to 15).

u = Board ID (0 to 7).

v = Rx pointer FIFO controller ESR1.
b bit 0 = Lost Rx FIFO pointer.
b bit 1 = Duplicated Rx FIFO pointer.
b bit 2 = Rx pointer FIFO overrun.
b bit 3 = Rx pointer FIFO underrun.
b bit 4 = Shunt pointer parity.
b bit 5 = Shunt pointer out-of-range.
b bit 6 = Invalid load/init request.
b bit 7 = FIFO full (not an error).

w = Rx pointer FIFO controller ESR2.
b bit 0 = RX_0 pointer parity.
b bit 1 = TX_0 return pointer parity.
b bit 2 = RX_1 pointer parity.
b bit 3 = TX_1 return pointer parity.
b bit 4 = TX_0 return pointer out-of-range.
b bit 5 = TX_1 return pointer out-of-range.
b bit 6 = Not used.
b bit 7 = Not used.

x = QGP ESR bits and L2&Ovl bits.
b bit 0 = QGP link 0 parity error.
b bit 1 = QGP link 1 parity error.
b bit 2 = QGP link 2 parity error.
b bit 3 = QGP link 3 parity error.
b bit 4 = Unroutable packet.
b bit 5 = Tx pointer FIFO overflow.
b bit 6 = Not used.
bit 7 = Not used.

y = Shelf ID (0 to 15).

z = Board ID (0 to 7).

\[ a^1 \] = Tx ESR.
- bit 0 = Transmit channel status RAM parity error.
- bit 1 = Transmitter long frame detected.
- bit 2 = Transmit packet data RAM parity error.
- bit 3 = Transmit pointer FIFO RAM parity error.
- bit 4 = Transmit pointer out-of-range.
- bit 5 = Transmit detected channel bus parity error.
- bit 6 = RAM BIST flag.
- bit 7 = Not used.

\[ b^1 \] = Rx ESR1.
- bit 0 = Rx pointer parity error.
- bit 1 = Rx pointer out-of-range.
- bit 2 = Channel status ERAM parity error.
- bit 3 = Channel bus parity error.
- bit 4 = Channel status LRAM parity error.
- bit 5 = Early RAM BIST test failed.
- bit 6 = Late RAM BIST test failed.
- bit 7 = Parity RAM BIST test failed.

\[ c^1 \] = Rx ESR2 and Rx L2 error.
- bit 0 = CRC error.
- bit 1 = Abort sequence detected.
- bit 2 = Bad bit count.
- bit 3 = Long receive frame.
- bit 4 = Short receive frame.
- bit 5 = Rx L2 error.
- bit 6 and 7 = Link number (0 to 3).

\[ d^1 \] = Shelf ID (0 to 15).

\[ e^1 \] = Board ID (0 to 7).

\[ f^1 \] = Rx link 0 level 2 error counter.

\[ g^1 \] = Rx link 1 level 2 error counter.

\[ h^1 \] = Rx link 2 level 2 error counter.

\[ i^1 \] = Rx link 3 level 2 error counter.

\[ j^1 \] = Unroutable packet error counter.

\[ k^1 \] = Tx pointer FIFO overrun error counter.

\[ l^1 \] = Rx pointer FIFO underrun error counter.
m¹ = TMS fabric status bitmap.
n¹ = Interrupt request register.
o¹ = TMSF loss of clock error register.
p¹ = TMSF general error register.
q¹ = External interrupt mask register.
r¹ = TMSF loss of clock error mask.
s¹ = TMSF general error mask.
t¹ = NCC-CSI error source register.
u¹ = TMSF loss of sync error register.
v¹ = TMSF parity error register.
w¹ = NCC-CSI error mask register.
x¹ = TMSF loss of sync error mask.
y¹ = TMSF parity error mask.
z¹ = CSI address register.
a² = CSI address register.
b² = CSI timer/status register.
c² = TMSX status bitmap.

2. REASON FOR OUTPUT

To report the contents of time multiplexed switch (TMS) error source registers (ESRs) (and related information) in response to a DUMP:TMS input message.
In CM3 offices, the TMS fabric pair (TMSFP) for which information is to be dumped may be specified in the DUMP:TMS input message. If no TMSFP is specified, the data associated with TMSFP 0 will be dumped.

Format 1 (used in CM2 offices only) dumps the CONTROLLER SHELF BOARDS (always 5 messages), and the ACTIVE AND SPECIAL GROW TMSLNK BOARDS (up to 40 messages per page). There may be several pages with this format depending on the number of SMs in the office.

Format 2 (used in CM2 offices only) dumps the CONTROLLER SHELF BOARDS (always 5 messages), and the ACTIVE QLPS, QTMSLNK, AND COUNTERS (always 30 messages). This is always the last page in the dump for a CM2 office.

Format 3 (used in CM3 offices only) dumps the status of all TMS fabrics on the specified office network and timing complex (ONTC) side, along with the contents of the MCA740 and NCC-CSI registers. These registers contain information that is applicable to all TMS fabrics.

Format 4 (used in CM3 offices only) dumps the status of all TMS foundation (TMSF) and TMS expansion (TMSX) boards associated with a single TMS fabric, along with the contents of the CSIX, FMI, and TMSF LIT48 registers for that fabric. In a CM3 office, each TMSFP contains an even fabric and an odd fabric, so two pages will always be printed with this format.

Format 5 (used in CM3 offices only) dumps the contents of the TMSX LIT48 registers associated with a single TMSX board. In a CM3 office, each TMS fabric can contain up to 3 TMSX boards, and there are two fabrics per TMSFP, so as many as six pages will be printed with this format.

3. VARIABLE FIELD DEFINITIONS

a = ONTC side.
b = Event number.
c = Page number.
d = Total number of pages in report.
e = Opcode. Valid value(s):
db = Read the TMS2 summary error report.
df = Read the control error source register.
fb = Read the switch unit error source register.
11 = Read the NCT link error source register.
49 = QLPS global summary ESR report. The first 3 lines of this part of the dump deals with QLPS network 0, the last three lines are for QLPS network 1.
4d = QLPS Rx Pfc/L2&ov/gateway ESR error report.
51 = QLPS receiver/transmitter link error report.
83 = Read the level 2 error counters for QLPS.

f = Low byte (bits 0-7) TMS2 summary error report. Valid value(s):
bit 0 = Microprocessor bus parity or sanity timeout error.
bit 1 = Nonreadable controller error.
bit 2 = Cross couple clock input (energy detect) error.
bit 3 = Cross couple clock output (slip detect) error.
bit 4 = Clock input (energy detect) error (network clock reference).
bit 5 = Clock output (slip detect) error (network clock reference).
bit 6 = Odd switch unit message link interface (MLI) circuit error.
bit 7 = Even switch unit MLI circuit error.
g  = High byte (bits 8-15) TMS2 summary error report. Valid value(s):
    bit 8  = Readable controller critical error.
    bit 9  = Even switch unit summary ESR error.
    bit 10 = Odd switch unit summary ESR error.
    bit 11 = One or more links reported as affected because fabric parity error propagation
             was found.
    bit 12 = QLPS critical error.
    bit 13 = Write fabric error.
    bit 14 = Invalid request error.
    bit 15 = Not used.

h  = Low byte (bits 0-7) of the control error source register. Valid value(s):
    bit 0  = Micro bus parity error.
    bit 1  = Sanity timer error.
    bit 2  = Micro busy time out error.
    bit 3  = TMS2 interface board bus parity error.
    bit 4  = Not used.
    bit 5  = Invalid opcode received from FPC.
    bit 6  = Controller CIC parity error on parallel data from CIC.
    bit 7  = Controller CIC BERR error indicating serial parity or CIC time out error.

i  = High byte (bits 8-15) of the control error source register. Valid value(s):
    bit 8  = Invalid request received from the FPC.
    bit 9  = Write fabric error during call processing routine.
    bit 10 = Parity error detected on CDAL message from FPC.
    bit 11 = Error detected on clock interface input reference multiplexer.
    bit 12 = Energy detector error on NCLK reference input.
    bit 13 = Slip error of clock output frequency with regards to NCLK reference input.
    bit 14 = Energy error detector error on cross couple reference input.
    bit 15 = Slip error of clock output frequency with regards to cross couple reference input.

j  = Low byte (bits 0-7) of the switch unit error source register. This byte represents the even switch
    unit. Valid value(s):
    bit 0  = Shelf 0 summary error bit.
    bit 1  = Shelf 2 summary error bit.
    bit 2  = Shelf 4 summary error bit.
    bit 3  = Shelf 6 summary error bit.
    bit 4  = Shelf 8 summary error bit.
    bit 5  = Shelf 10 summary error bit.
    bit 6  = Shelf 12 summary error bit.
    bit 7  = Shelf 14 summary error bit error.

k  = High byte (bits 8-15) of the switch unit error source register. This byte represents the odd switch
    unit. Valid value(s):
    bit 8  = Shelf 1 summary error bit.
    bit 9  = Shelf 3 summary error bit.
    bit 10 = Shelf 5 summary error bit.
    bit 11 = Shelf 7 summary error bit.
    bit 12 = Shelf 9 summary error bit.
bit 13 = Shelf 11 summary error bit.
bit 14 = Shelf 13 summary error bit.
bit 15 = Shelf 15 summary error bit.

l = QLI summary error source register. Valid value(s):
bit 0 = Bus error form CIC (timeout or serial data parity).
bit 1 = Bus parity error on parallel data from CIC.
bit 2 = QLT summary bit error.
bit 3 = Fabric control data parity error.
bit 4 = LIR 0 summary bit error.
bit 5 = LIR 1 summary bit error.
bit 6 = LIR 2 summary bit error.
bit 7 = LIR 3 summary bit error.

m = QLT summary error source register. Valid value(s):
bit 0 = Link 0 fabric data parity error.
bit 1 = Link 1 fabric data parity error.
bit 2 = Link 2 fabric data parity error.
bit 3 = Link 3 fabric data parity error.
bit 4 = Time slot parity error.
bit 5 = Not used.
bit 6 = Not used.
bit 7 = Not used.

n = QLI LIR error source register. Valid value(s):
bit 0 = Out of frame error.
bit 1 = Parity threshold error.
bit 2 = Buffer error (F of G bit error).
bit 3 = AUTISS bit detected.
bit 4 = F bit error detected.
bit 5 = G bit error detected.
bits 6 and 7 = LIR ID (0 to 3).

o = Shelf ID (0 to 15).

p = Board ID (0 to 7). On shelf 0 and 1, board 0 is the MLI.

q = QLPS summary ESR. Valid value(s):
bit 0 = Bus error form CIC (timeout or serial data parity).
bit 1 = Bus parity error on parallel data from CIC.
bit 2 = Global ESR summary bit.
bit 3 = Circuit ESR summary bit.
bit 4 = Rx_0 gate array ESR summary bit.
bit 5 = Tx_0 gate array ESR summary bit.
bit 6 = Rx_1 gate array ESR summary bit.
bit 7 = Tx_1 gate array ESR summary bit.

r = QLPS global ESR. Valid value(s):
bit 0 = Tx FIFO controller detected bus parity error.
bit 1 = FIFO status RAM parity error detected by the TX FIFO pointer circuit.
bit 2 = Parity error detected on the routing RAM data read by the routing RAM controller.
bite 3 = Time slot channel map parity error.
bite 4 = QGP ESR summary error bit.
bite 5 = Rx pointer FIFO ESR 1 summary error bit.
bite 6 = Rx pointer FIFO ESR 2 summary error bit.
bite 7 = Level 2 and overload summary error bit.

s = QLPS circuit ESR. Valid value(s):
bite 0 = Time slot parity error.
bite 1 = Fabric control parity error.
bite 2 = Link 0 fabric data parity error.
bite 3 = Link 1 fabric data parity error.
bite 4 = Link 2 fabric data parity error.
bite 5 = Link 3 fabric data parity error.
bite 6 = Not used.
bite 7 = Not used.

t = Shelf ID (0 to 15).

u = Board ID (0 to 7).

v = Rx pointer FIFO controller ESR1. Valid value(s):
bite 0 = Lost Rx FIFO pointer.
bite 1 = Duplicated Rx FIFO pointer.
bite 2 = Rx pointer FIFO overrun.
bite 3 = Rx pointer FIFO underrun.
bite 4 = Shunt pointer parity.
bite 5 = Shunt pointer out-of-range.
bite 6 = Invalid load/init request.
bite 7 = FIFO full (not an error).

w = Rx pointer FIFO controller ESR2. Valid value(s):
bite 0 = RX_0 pointer parity.
bite 1 = TX_0 return pointer parity.
bite 2 = RX_1 pointer parity.
bite 3 = TX_1 return pointer parity.
bite 4 = TX_0 return pointer out-of-range.
bite 5 = TX_1 return pointer out-of-range.
bite 6 = Not used.
bite 7 = Not used.

x = QGP ESR bits and L2&Ovl bits. Valid value(s):
bite 0 = QGP link 0 parity error.
bite 1 = QGP link 1 parity error.
bite 2 = QGP link 2 parity error.
bite 3 = QGP link 3 parity error.
bite 4 = Unroutable packet.
bite 5 = Tx pointer FIFO overflow.
bite 6 = Not used.
bite 7 = Not used.
**y**

= Tx ESR. Valid value(s):

- bit 0 = Transmit channel status RAM parity error.
- bit 1 = Transmitter long frame detected.
- bit 2 = Transmit packet data RAM parity error.
- bit 3 = Transmit pointer FIFO RAM parity error.
- bit 4 = Transmit pointer out-of-range.
- bit 5 = Transmit detected channel bus parity error.
- bit 6 = RAM BIST flag.
- bit 7 = Not used.

**z**

= Rx ESR1. Valid value(s):

- bit 0 = Rx pointer parity error.
- bit 1 = Rx pointer out-of-range.
- bit 2 = Channel status ERAM parity error.
- bit 3 = Channel bus parity error.
- bit 4 = Channel status LRAM parity error.
- bit 5 = Early RAM BIST test failed.
- bit 6 = Late RAM BIST test failed.
- bit 7 = Parity RAM BIST test failed.

**a**

= Rx ESR2 and Rx L2 error. Valid value(s):

- bit 0 = CRC error.
- bit 1 = Abort sequence detected.
- bit 2 = Bad bit count.
- bit 3 = Long receive frame.
- bit 4 = Short receive frame.
- bit 5 = Rx L2 error.
- bit 6 and 7 = Link number (0 to 3).

**b**

= Rx link 0 level 2 error counter.

**c**

= Rx link 1 level 2 error counter.

**d**

= Rx link 2 level 2 error counter.

**e**

= Rx link 3 level 2 error counter.

**f**

= Unroutable packet error counter.

**g**

= Tx pointer FIFO overrun error counter.

**h**

= Rx pointer FIFO underrun error counter.

**i**

= TMSFP number.

**j**

= TMS fabric status bitmap. The least significant bit is associated with the even fabric of TMSFP 0, the next with the odd fabric of TMSFP 0, the next with the even fabric of TMSFP 1, etc. A set bit indicates that the fabric is in-service (i.e. is supporting an in-service TMSLNK).

**k**

= Interrupt request register.

**l**

= TMSF loss of clock error register.
m¹ = TMSF general error register.

n¹ = External interrupt mask register.

o¹ = TMSF loss of clock error mask register.

p¹ = TMSF general error mask register.

q¹ = NCC-CSI error source register.

r¹ = TMSF loss of sync error register.

s¹ = TMSF parity error register.

t¹ = NCC-CSI error mask register.

u¹ = TMSF loss of sync error mask register.

v¹ = TMSF parity error mask register.

w¹ = CSI address register.

x¹ = CSI data register.

y¹ = CSI timer/status register.

z¹ = TMS fabric (0 for even fabric or 1 for odd fabric).

a² = TMSF/X status bitmap. The least significant bit is associated with the TMSF, the next with TMSX 1, etc. A set bit indicates that the TMSF/X is in-service (i.e. is supporting an in-service TMSLNK).

b² = Primary spoke’s summary error source register.

c² = FMI error summary register.

d² = CSIX secondary bus ESR for the TMSX1 LIT48 device.

e² = Primary spoke’s summary error mask register.

f² = CSIX secondary bus ESR for the TMSF LIT48 device.

g² = CSIX secondary bus ESR for the TMSX2 LIT48 device.

h² = Secondary CSI bus enable register.

i² = Diagnostic control register.

j² = CSIX secondary bus ESR for the TMSX3 LIT48 device.

k² = Secondary CSI bus reset register.

l² = Miscellaneous control register.

m² = CSIX secondary bus ESR for the PRISM device.

n² = FMI error summary register.
\( a^2 \) = MLI error source register.

\( p^2 \) = FMI device control register.

\( q^2 \) = FMI error summary mask register.

\( r^2 \) = MLI error source mask register.

\( s^2 \) = FMI diagnostic register.

\( t^2 \) = Fabric output parity summary ESR 0.

\( u^2 \) = Fabric output parity summary ESR 1.

\( v^2 \) = Fabric output parity summary ESR 2.

\( w^2 \) = Fabric output parity summary EMR 0.

\( x^2 \) = Fabric output parity summary EMR 1.

\( g^3 \) = Fabric output parity summary ESR 7.

\( h^3 \) = Fabric output parity summary EMR 6.

\( i^3 \) = Fabric output parity summary EMR 7.

\( j^3 \) = Receive FDI link ESR for the TMSF.

\( k^3 \) = Receive FDI link ESR for TMSX1.

\( l^3 \) = Receive FDI link EMR for the TMSF.

\( m^3 \) = Receive FDI link EMR for TMSX1.

\( n^3 \) = Receive FDI link ESR for TMSX2.

\( o^3 \) = Receive FDI link ESR for TMSX3.

\( p^3 \) = Receive FDI link EMR for TMSX2.

\( q^3 \) = Receive FDI link EMR for TMSX3.
r³  = LIT48 summary error source register.
s³  = LIT48 diagnostic control register.
t³  = LIT48 FDI error source register.
u³  = LIT48 summary error mask register.
v³  = LIT48 miscellaneous control register.
w³  = LIT48 FDI error mask register.
x³  = LIT48 high internal receive parity error source register.
y³  = LIT48 low internal receive parity error source register.
z³  = LIT48 high internal receive parity error mask register.
a⁴  = LIT48 low internal receive parity error mask register.
b⁴  = LIT48 high network control and timing (NCT) link error source register.
c⁴  = LIT48 low NCT link error source register.
d⁴  = LIT48 high NCT link error mask register.
e⁴  = LIT48 low NCT link error mask register.
f⁴  = The TMSX number (with 0 indicating the TMSF board).

4. ACTIONS TO BE TAKEN

None. Output is in response to the TMS dump input message.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

DUMP : TMS

MCC Display Page(s):
1212 (CM3 only)
1220
1221 - 1228 for ONTC/TMS side 0
1231 - 1238 for ONTC/TMS side 1
DUMP:TTY-ERROR
Software Release: 5E14 and later
Message Class: IOC
Application: 5
Type: Output

1. FORMAT

DUMP TTY ERROR: [NUMBER=a] [SUBSYSTEM=h]
TYPE=b MSGID=c PARAM=d LENGTH=e PID=f
'H' g

2. REASON FOR OUTPUT

To report an error in the output message or that an attempt to translate data for output was unsuccessful.

3. VARIABLE FIELD DEFINITIONS

\(a\)

= Error number. Valid value(s):

612 = Alarm level used is illegal.
618 = The message identified by the MSGID is not in the output message database and therefore cannot be translated.
621 = Valid value(s):

\(if \ 'd' =\)

621 = A string is non-NULL terminated. A "NULL" is inserted in the last byte of the corrupt field to complete the translation. The string of the printed message may be truncated.
622 = Valid value(s):

\(if \ 'd' =\)

622 = An enumeration value in the output message is undefined. The message causing the error contains "'H'(xx)?' in the place where the undefined enumeration value is used, where (xx) is the undefined enumeration value.
625 = A field of type str4bit could not be translated.
625 = An invalid 4 bit combination was found and that set of bits is translated into a '$' in the output message.
625 = The size of the field is too large and the field is not translated.

631 = The message class used is illegal. The number indicated for variable 'd' is the illegal message class.
641 = The translated message length exceeds the maximum size (992 characters) allowed. On Switching Control Center (SCC) terminals, the message causing the error is truncated. On other terminals, the message causing the error is unaffected. The number indicated for variable 'd' is the length in bytes of the translated message.

Variable 'a' is not printed if an internal error (such as, buffer allocation or file opening) or an output message database error occurs.

\(b\)

= Type of the message causing the error. Valid value(s):

5 = Operating system for distributed switching (OSDS) type message of high priority.
(IOCMDHP; alarmed or manual).
6 = OSDS type message of base priority (IOCMDBP).
119 = UNIX® type message of high priority (HMHITTY).
120 = UNIX® type message of base priority (HMTTYMSG).

c = ID number of the message causing the error.
d = Parameter value. Valid value(s):

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>622</td>
<td>If PARAM=1, d is an undefined enumeration value; otherwise message exceeds buffer size.</td>
</tr>
<tr>
<td>625</td>
<td>Valid value(s):</td>
</tr>
</tbody>
</table>
|       | 1 = A str4bit field had an invalid combination of 4 bits and this set of bits is translated to a $.
|       | 2 = A str4bit field is too large and is not translated. |
| 641   | The length in bytes of the translated message. |
| 631   | The illegal message class being used. |

e = Size in bytes of the inter-process message structure.
f = ID number of the process sending the message.
g = The content of the inter-process message in hex.
h = The abbreviation of a subsystem that owns the dumped message.

The SUBSYSTEM=h string is not printed if an internal error (such as, buffer allocation or file opening) or output message database error occurs.

4. ACTION TO BE TAKEN

This indicates a software problem. Retain the ROP output of this message and at least one preceding page to assist in resolving the problem. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

6. REFERENCES

None.
DUMP:UID

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] DUMP UID a ADDR b [OFF c] COMPLETED #g
ADDRESS (HEX):      CONTENTS OF MEMORY (HEX):
 d                       e
__________________________________________________________________

[2] DUMP UID a ADDR b [OFF c] f #g
__________________________________________________________________

2. REASON FOR OUTPUT

To report the result of executing the DUMP:UID input message to dump out the contents of an address or address range in main memory.

3. VARIABLE FIELD DEFINITIONS

a = Utility ID of the target process.
b = Virtual address specified in input message.
c = Offset(s) used on input message line.
d = Address label for line of data.
e = Data as dumped from memory.
f = Termination status. Valid value(s):
   NOT STARTED NGUID = The DUMP was stopped because no copies of the specified process exist.
   STOPPED NGADDR = The DUMP was stopped because the address specified is not valid for the process, or invalid address values were encountered in address chain, if offsets were specified.
g = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'f' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT STARTED NGUID</td>
<td>The process did not exist at the time the DUMP was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.</td>
</tr>
<tr>
<td>STOPPED NGADDR</td>
<td>Recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the DUMP message in the action list.</td>
</tr>
</tbody>
</table>

APP:OMDB-X-REF
DUMP:UT-CMP-A

**Software Release:** 5E14 only  
**Message Class:** UT  
**Application:** 5  
**Type:** Output

1. **FORMAT**

```
[1] DUMP UT CMP=a-b {MATE|PRIM} {ADDR c|REG e|UVAR f} [EA g] [h] i

[2] DUMP UT CMP=a-b {MATE|PRIM} i
    SYMIDX k GVAR d [h]
```

2. **REASON FOR OUTPUT**

To report the status of the DUMP:UT-CMP input message which dumps the memory of a specified communication module processor (CMP).

Format 1 reports the status of the DUMP:UT-CMP input message which has been defined with an address, a register or utility variable.

Format 2 reports the status of the DUMP:UT-CMP input message which has been defined with a symbolic access.

3. **VARIABLE FIELD DEFINITIONS**

- **MATE** = Message was executed on the standby CMP.
- **PRIM** = Message was executed on the active CMP.
- **a** = Message switch side.
- **b** = CMP number.
- **c** = Absolute physical address, as specified in the input message. Actual address may differ if indirection was specified.
- **d** = Symbolic name specified in the input message or determined by the UT code based on the symbol index number 'k'. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
- **e** = Register name that was requested in the input message.
- **f** = Utility variable that was requested in the input message.
- **g** = Effective starting address of dump.
- **h** = Output data in long word form when the length is defined to be less than four bytes, or the default length was indicated.
= Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

= Multiple lines of output data when the length was defined to be greater than four bytes. This data will be in a disassembled format if the disassembly (DIS) flag was set or defaulted to hexadecimal output.

= Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name 'd'. If an invalid input message is entered, the symbol index number will be "-1".

4. ACTION TO BE TAKEN

If appropriate, correct the specified input message and repeat.

5. ALARMS

None.

   [k]

2. REASON FOR OUTPUT

To report the status of the DUMP:UT-IDCULSI input message to dump the memory of the integrated digital carrier
unit (IDCU) loop side interface (LSI).

Format 1 reports the status of the DUMP:UT-IDCULSI input message which has been defined with an address or
utility variable.

Format 2 reports the status of the DUMP:UT-IDCULSI input message which has been defined with a symbolic
access.

3. VARIABLE FIELD DEFINITIONS

MATE = Mate memory was dumped.

a = Switching module (SM) number.

b = IDCU number.

c = LSI number.

d = Absolute physical address, as specified in the input message, with all specified offsets applied.

e = Symbolic name specified in the input message or determined by the UT code based on the
   symbol index number 'j'. The symbol name is limited to 15 characters in length. If the symbol is
   longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th
   character will be replaced with a '*' to indicate this. The full name of these symbols can be
determined by using the DUMP:UT-SYMID input message.

f = Utility variable name.

g = Effective starting address.

h = Output data of up to 4 bytes, in hexadecimal.

Note: If output data is longer than 4 bytes, it will print at variable 'k' instead of at variable
'h'.

= Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name ‘e’. If an invalid input message is entered, the symbol index number will be "-1".

= Data that was requested. The data is multiple lines when the length was defined to be greater than four bytes. This data is in a disassembled format if the disassembly (DIS) flag was set on the input message, otherwise the output is hexadecimal.

4. ACTION TO BE TAKEN

If appropriate, correct the DUMP:UT-IDCULSI message and repeat.

5. ALARMS

None.

   [i]

__________________________________________________________________

2. REASON FOR OUTPUT

To report the status of the DUMP:UT-ISLUCC input message to dump the memory of the integrated service line unit common controller (ISLUCC).

Format 1 reports the status of the DUMP:UT-ISLUCC input message which has been defined with an address or utility variable.

Format 2 reports the status of the DUMP:UT-ISLUCC input message which has been defined with a symbolic access.

3. VARIABLE FIELD DEFINITIONS

MATE = Memory dumped in MATE memory.

a = Switching module (SM) number.

b = Line unit number.

c = Absolute physical address, as specified in the input message, with all specified offsets applied.

d = Symbolic name specified in the input message or determined by the UT code based on the symbol index number ‘j’. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a ‘*’ to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.

e = Utility variable name.

f = Effective starting address of dump.

g = Output data of up to 4 bytes, in hexadecimal.

Note: If output data is longer than 4 bytes, it will print at variable ‘i’ instead of at variable ‘g’.

h = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.
i = Data that was requested. The data is multiple lines when the length was defined to be greater than four bytes. This data is in a disassembled format if the disassembly (DIS) flag was set on the input message, otherwise the output is hexadecimal.

j = Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name ‘{d}’. If an invalid input message is entered, the symbol index number will be “-1”.

4. ACTION TO BE TAKEN
If appropriate, correct the specified input message and repeat.

AP = Message was executed in the QGP's application processor.

MSGH = Message was executed in the QGP's message handler processor.

a = Message switch (MSGS) side number.

b = QGP number.

c = Absolute physical address.

d = Symbolic name specified in the input message or determined by the UT code based on the symbol index number 'i'. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.

e = Effective starting address of dump.

f = Output data of up to 4 bytes, in hexadecimal.
   Note: If output data is longer than 4 bytes, it will print at variable 'h' instead of at variable 'f'.

g = Termination status. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

h = Data that was requested. The data is multiple lines when the length was defined to be greater
than four bytes. This data is in a disassembled format if the disassembly (DIS) flag was set on the input message, otherwise the output is hexadecimal.

\[ i \]

\[ \] = Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name ‘i’. If an invalid input message is entered, the symbol index number will be "-1".

4. ACTION TO BE TAKEN

If appropriate, correct the specified message and repeat.

5. ALARMS

None.

Type: Output

1. FORMAT

[1] DUMP UT SM a [MATE] {ADDR b|REG d|UVAR e} [EA f] [g] h
   [i]

   SYMIDX j GVAR c [g]
   [i]

2. REASON FOR OUTPUT

To report the status of the DUMP:UT-SM input message to dump the memory of a specified switching module (SM).

Format 1 Reports the status of the DUMP:UT-SM input message which has been defined with an address, a register or utility variable.

Format 2 Reports the status of the DUMP:UT-SM input message which has been defined with a symbolic access.

3. VARIABLE FIELD DEFINITIONS

MATE = Mate memory was dumped.
a = Switching module number.
b = Absolute physical address, as specified in the input message, with all specified offset applied.
c = Symbolic name specified in the input message or determined by the UT code based on the symbol index number ‘j’. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a ‘*’ to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
d = Register name.
e = Utility variable name.
f = Effective starting address of dump.
g = Output data of up to 4 bytes, in hexadecimal.
Note: If output data is longer than 4 bytes, it will print at variable ‘i’ instead of at variable ‘g’.
h = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.
i = Data that was requested. The data is multiple lines when the length was defined to be greater
than four bytes. This data is in a disassembled format if the disassembly (DIS) flag was set on the input message, otherwise the output is hexadecimal.

\[ j \]

= Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name ‘c’. If an invalid input message is entered, the symbol index number will be "-1".

4. ACTION TO BE TAKEN

If appropriate, correct the specified input message and repeat.

2. REASON FOR OUTPUT

   To report the status of the DUMP:UT-SM input message to dump the memory or microprocessor registers of a specified switching module (SM).

   Format 1 Reports the status of the DUMP:UT-SM input message which has been defined with an address, a register or utility variable.

   Format 2 Reports the status of the DUMP:UT-SM input message which has been defined with a symbolic access.

   Format 3 reports the status of the DUMP:UT-SM input message which has been defined with all registers for a SM which has a software configuration which is non-CNFG2KPPC.

   Format 4 reports the status of the DUMP:UT-SM input message which has been defined with all registers for a SM of software configuration type of CNFG2KPPC.

3. VARIABLE FIELD DEFINITIONS

   a      = Switching module number.
b  = Absolute physical address, as specified in the input message, with all specified offset applied.

c  = Symbolic name specified in the input message or determined by the UT code based on the symbol index number 'j'. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.

d  = Register name.

e  = Utility variable name.

f  = Effective starting address of dump.

g  = Output data of up to 4 bytes, in hexadecimal.

NOTE: If output data is longer than 4 bytes, it will print at variable 'i' instead of at variable 'g'.

h  = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendices section of the Output Messages manual.

i  = Data that was requested. The data is multiple lines when the length was defined to be greater than four bytes. This data is in a disassembled format if the disassembly (DIS) flag was set on the input message, otherwise the output is hexadecimal.

j  = Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name 'c'. If an invalid input message is entered, the symbol index number will be "-1".

k  = The contents of the SM's microprocessor registers when the SM supports a 680x0 based microprocessor.

l  = The contents of the SM's microprocessor registers when the SM supports a PowerPC® based microprocessor.

4. ACTIONS TO BE TAKEN

If appropriate, correct the specified input message and repeat.

5. ALARMS

None.

Message Class: UT
Application: 5
Type: Output

1. FORMAT

DUMP UT SYMINFO [a] [b] c
   PATH d
   SYMINFO GVAR
   [e]     [f]
   .       .
   .       .

2. REASON FOR OUTPUT

To report the status of the DUMP:UT-SYMID input message which is used to dump symbol table information from a common object file format (COFF) file.

3. VARIABLE FIELD DEFINITIONS

a = Processor name and numbers. If no processor was provided on the input message line this field will print NOUNIT.
b = Processor qualifier information (that is, for a quad-link packet switch gateway processor this field maybe AP or MSGH). If the provided processor does not need a qualifier this field will be blank.
c = Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.
d = Path from "root" on the AM disk to the COFF file being accessed by this input message. If no path was provided on the input message line and an error occurred prior to path determination the field will be blank.
e = Symbol index value(s) for its corresponding global variable name 'f'. This can be a list of up to 40 symbol indices.
f = Global variable name(s) for its corresponding symbol index value 'e'. This can be a list of up to 40 symbol names.

4. ACTION TO BE TAKEN

If appropriate, correct the specified input message and repeat.

Application: 5
Type: Output

1. FORMAT

[1] DUMP UT TMUX=a-b-c-d (ADDR e|UVAR g) [EA h] [i] j [k]

[2] DUMP UT TMUX=a-b-c-d j
   SYMIDX l GVAR f [i]
   [k]

2. REASON FOR OUTPUT

To report the status of the DUMP:UT-TMUX input message to dump the memory of the digital networking unit - synchronous optical network (SONET) (DNU-S) transmission multiplexer (TMUX).

Format 1 reports the status of the DUMP:UT-TMUX input message which has been defined with an address or utility variable.

Format 2 reports the status of the DUMP:UT-TMUX input message which has been defined with a symbolic access.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = DNU-S number.
c = Data group number.
d = TMUX number.
e = Absolute physical address, as specified in the input message with all specified indirections and offsets applied.
f = Symbolic name specified in the input message or determined by the UT code based on the symbol index number 'l'. The symbol name is limited to 15 characters in length. If the symbol is longer than 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a '*' to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.
g = Utility variable name.
h = Effective starting address of dump.
i = Output data of up to 4 bytes in hexadecimal.

Note: If output data is longer than 4 bytes, it will print at variable 'k' instead of at variable 'i'.

Copyright ©2003 Lucent Technologies
Termination report. Refer to the APP:UT-OM-REASON appendix in the Appendixes section of the Output Messages manual.

Data that was requested. The data is multiple lines when the length was defined to be greater than four bytes. This data is in a disassembled format if the disassembly (DIS) flag was set on the input message, otherwise the output is hexadecimal.

Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name 'f'. If an invalid input message is entered, the symbol index number will be "-1".

4. ACTION TO BE TAKEN

If appropriate, correct the DUMP:UT-TMUX message and repeat.

1. FORMAT

[1] DUMP UVAR a COMPLETED #g
   UVAR: CONTENTS:
   b c

[2] DUMP UVAR a OFF d COMPLETED #g
   ADDRESS (HEX): CONTENTS OF MEMORY (HEX):
   e f

[3] DUMP UVAR a STOPPED NGADDR #g

2. REASON FOR OUTPUT

To report the disposition of a DUMP:UVAR input message.

Format 3 indicates an error was encountered in the indirection addressing chain.

3. VARIABLE FIELD DEFINITIONS

a = Utility variable to be dumped.
b = Name of utility variable for line of data.
c = Data as dumped from utility variable.
d = Offset(s) used on input message line.
e = Address label for line of data.
f = Data dumped from memory.
g = Generic access package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If Format 3 is printed, recheck the program listings. Try printing the utility variable contents and breaking the addressing chain into several parts, printing the intermediate results.

2. REASON FOR OUTPUT

To report the result of executing an EX:ALIT input message to diagnose the automatic line insulation test (ALIT).

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous input message may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble locating procedure (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = MSU board number.
e = Loop result. Valid value(s):
   ATP = All test were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   STF = Some tests failed.
   NTR = No tests run.
f = Reason the input message was rejected. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.
g = Phase in which the failure occurred.
h = Segment in which the failure occurred.
i = Test number that failed.
j = Mismatch results for the specified test in hexadecimal.
k = Raw data expected result for the specified test in hexadecimal.
l = Raw data mask used to determine the test failure in hexadecimal.
m = Raw data actual result for the specified test in hexadecimal.
n = Result of previous input message. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.
o = Phase number in which execution is suspended.
p = Segment number in which execution is suspended.
q = Identification number of floor and aisle.
r = Module type, communication module (CM), SM, host switching module (HSM), remote switching module (RSM).
s = Module number.
t = Cabinet type.

u = Cabinet number.

v = Replacement equipment code(s).

w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents.

CODE A[:B]...[:C] [-] D[:E]...[:F]
  A = Current minimal accepted equipment code.
  B = Current production equipment code (substitutable equipment for code A).
  C = Additional compatible equipment code(s) (added as space permits)
  D = Current minimal approved operating level for equipment code A.
  E = Current minimal approved operating level for equipment code B.
  F = Current minimal approved operating level(s) for equipment code(s) C.
  : = Intra-field delimiter.
  - = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
  ---- = Equipment is part of the circuit under test.
  HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
  ONL = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.

a\^1 = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b\^1 = Termination status. Valid value(s):
  ABORTED = The process was terminated (process not gracefully terminated).
  NOT_STARTED = Action was not begun.
  STOPPED = Terminated before normal completion (process gracefully terminated).

c\^1 = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

d\^1 = Text identifier showing order of record. Valid value(s):
  FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\( e^1 \) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\( f^1 \) = Statement number.

\( g^1 \) = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1 no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4, reenter the diagnostic exercise request.

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED ATP PH o SEG p</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>

2. REASON FOR OUTPUT

To report the result of executing an EX:ASC input message to exercise a remote switching module (RSM), optical remote switching module (ORM), or two-mile switching module (TRM) alarm and status circuit (ASC).

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input message. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous input message may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message.

Format 6 indicates execution of the exercise is terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Loop result. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Some tests were skipped because supporting hardware was not available, but all tests which were run passed.
   STF = Some tests failed.
   NTP = No tests performed.

c = Reason the input message was rejected.

d = Phase in which the failure occurred.

e = Segment in which the failure occurred.

f = Test that failed.

g = Mismatch results for the specified test in hexadecimal.

h = Expected result for the specified test in hexadecimal.

i = Mask used to determine test failure in hexadecimal.

j = Actual result for the specified test in hexadecimal.

k = Type of suspension. Valid value(s):
   ATP = The specified segment(s) were completed and all tests were performed and passed.
   CATP = Some tests in the specified segment were skipped because supporting hardware was not available, but all tests which were run passed.
   STF = Some tests in the segment failed.
   NTP = No tests performed.

l = Phase where execution is suspended.

m = Segment where execution is suspended.

n = Aisle.

o = Module type.

p = Module number.

q = Cabinet type.

r = Cabinet number.

s = Replacement equipment code(s).
t = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

CODE A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = current minimal approved operating level(s) for equipment code(s) C.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

u = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

v = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

w = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

x = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages.

y = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

z = Depth location in the bay in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

a¹ = Termination status. Valid value(s):
ABORTED = The process was terminated (process not terminated gracefully).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process terminated gracefully).
b\(^1\) = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages.

c\(^1\) = Statement number.

d\(^1\) = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct phase numbers and reenter the exercise request.

For Format 3, repair the faulty alarm status circuit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>

2. **REASON FOR OUTPUT**

To provide information about a recent exercise on the bootstrapper board (BTSR), as requested by input message EX:BTSR.

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates a conditional all tests passed (CATP): the specified segments have been completed but some portion was skipped. It applies only when the RPT option was specified in the input message. All tests that were performed passed. Execution of the diagnostic will continue for the remaining iterations.

Format 3 indicates that the specified options in the input message referred to an invalid diagnostic phase.
Format 4 indicates that the specified segments have been completed but no tests were performed. It applies only when the RPT option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 5 indicates that a test has failed and specifies which test.

Format 6 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and other diagnostic information, may also be specified.

Format 7 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

Format 8 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Illegal synch phase number.
c = Synch segment number.
d = Synch statement number.
e = Illegal pause phase number.
f = Pause segment number.
g = Illegal phase to execute.
h = First segment to execute.
i = Last segment to execute.
j = Phase in which the failure occurred.
k = Segment in which the failure occurred.
l = Test number that failed.
m = Mismatch results for the specified test in hexadecimal.
n = Raw data expected result for the specified test in hexadecimal.
o = Raw data mask used to determine the test failure in hexadecimal.
p = Raw data actual result for the specified test in hexadecimal.
q = Result of previous input message. Valid value(s):
   CATP = Conditional all test passed. The specified phases were completed but some portion was skipped.
   NTR = No tests run since the last completion message.
   STF = The specified segment(s) has completed and some tests failed.
   (blank) = The system is suspended and is waiting for an input message. No phase ans segment (variables ‘c’ and ‘d’) are specified.
r = Phase number in which execution is suspended.

s = Segment number in which execution is suspended.

t = Identification number of floor and aisle.

u = Module type.

v = Module number.

w = Cabinet type.

x = Cabinet number.

y = Replacement equipment code(s).

z = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Example of CODE FORM contents:

CODE
A[:B]...[:C][-]D[:E]...[:F]
A = Current minimal accepted equipment code.
: = Intra-field delimiter.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
- = Inter-field delimiter if necessary.
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

a1 = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

b1 = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

c1 = Circuit type. Valid value(s):
    _____ = Equipment is part of the circuit under test.
    HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
    ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

d1 = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

e1 = Text identifier showing order of record. Valid value(s):
    FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

f

= Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

g

= Statement number.

h

= Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1 (ATP), no action is required.

For Format 2, the execution of the diagnostic for the specified phases was inhibited by a lack of resources. Idle the suspected resources and reenter the diagnostic exercise request.

For Format 3, determine the correct input message and reenter the diagnostic exercise request.

For Format 4, the execution of the diagnostic for the specified segments was inhibited by a lack of resources. Idle the suspected resources and reenter the diagnostic exercise request.

For Format 5, repair the faulty unit.

For Format 6:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTR</td>
<td>Enter the first exercise input message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH r SEG s</td>
<td>This message indicates that a lack of resources for the previously specified phase inhibited the execution of some segments. Idle the suspected resources and reenter the previous input message.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH r SEG s and the RPT option was specified</td>
<td>This message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no test were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH r SEG s</td>
<td>analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>the specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 7, replace the suspected circuit packs one at a time. Return the diagnostic exercise for each replaced pack until the fault is repaired or the diagnostic results change.

For Format 8, no action is required.

5. ALARMS

None.

2. **REASON FOR OUTPUT**

   To report the result of executing an EX:CDFI input message to exercise an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit.

   Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input message. Execution of the exercise will continue for the remaining iterations.

   Format 2 indicates that an option specified in the input message was invalid.

   Format 3 indicates which test failed.

   Format 4 indicates execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous message may also be printed.

   Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message.

   Format 6 indicates execution of the exercise is terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line and trunk unit.
c = CDFI number.
d = Loop result. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Some tests were skipped because supporting hardware was not available, but all tests which were run passed.
   STF = Some tests failed.
   NTP = No tests performed.
e = Reason the message was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test that failed.
i = Mismatch results for the specified test in hexadecimal.
j = Expected result for the specified test in hexadecimal.
k = Mask used to determine test failure in hexadecimal.
l = Actual result for the specified test in hexadecimal.
m = Type of suspension. Valid value(s):
   ATP = The specified segment(s) were completed and all tests were performed and passed.
   CATP = Some tests in the specified segment were skipped because supporting hardware was not available, but all tests which were run passed.
   NTP = No tests performed since the last completion message.
   STF = Some tests in the segment failed.

n = Phase where execution is suspended.
o = Segment where execution is suspended.
p = Floor and aisle number.
q = Module type.
r = Module number.
s = Cabinet type.
\( t \) = Cabinet number.

\( u \) = Replacement equipment code(s).

\( v \) = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Example of CODE FORM contents:

\[
\text{CODE A[:B]...[:C] [-] D[:E]...[:F]}
\]

\( A \) = Current minimal accepted equipment code.

\( B \) = Current production equipment code (substitutable equipment for code A).

\( C \) = Additional compatible equipment code(s) (added as space permits).

\( - \) = Inter-field delimiter if necessary.

\( D \) = Current minimal approved operating level for equipment code A.

\( E \) = Current minimal approved operating level for equipment code B.

\( F \) = Current minimal approved operating level(s) for equipment code(s) C.

Codes \( A \), \( B \), and \( C \) may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms \( D \), \( E \), and \( F \) may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

\( w \) = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

\( x \) = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

\( y \) = Circuit type. Valid value(s):

\[ \_\_\_\_ \] = Equipment is part of the circuit under test.

\( HPR \) = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

\( ONL \) = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

\( z \) = Refer to the APP:TLP-NOTE appendix in the Appendices section of the Output Messages.

\( a^1 \) = Termination report. Valid value(s):

\begin{align*}
\text{ABORTED} & \quad = \text{Requested action was terminated before completion, and the termination was not graceful.} \\
\text{COMPLETED} & \quad = \text{Request has successfully completed.} \\
\text{NOT STARTED} & \quad = \text{Requested action had not begun.} \\
\text{STOPPED} & \quad = \text{Requested action was terminated before a normal completion. Termination was graceful.}
\end{align*}

\( b^1 \) = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendices section of the Output Messages.

\( c^1 \) = Text identifier showing order of record:

\begin{align*}
\text{FIRST} & \quad = \text{First record of continuing list.} \\
\text{LAST} & \quad = \text{Last record of list.} \\
\text{NEXT} & \quad = \text{Next record of continuing list.}
\end{align*}
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\(d^1\) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\(e^1\) = Statement number.

\(f^1\) = Reason why some tests were not performed.

**4. ACTION TO BE TAKEN**

For Format 1, no action is required.

For Format 2, determine the correct phase numbers and reenter the exercise request.

For Format 3, repair the fault circuit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>

   [6]  EX CDI=a-b-c a 1 [b 1]

   [7]  EX CDI=a-b-c PH f SEG g STMT e 1 f 1 
       [EXP j MASK k ACTL l]

2. **REASON FOR OUTPUT**

   To report the result of executing an EX:CDI input command to diagnose the control data interface (CDI).

   Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

   Format 2 indicates that the specified input message was invalid.

   Format 3 indicates that a test has failed and specifies which test.

   Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command may also be specified.

   Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

   Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = Trunk unit number.
- **c** = Service group number.
- **d** = Loop result. Valid value(s):
  - ATP = All test were performed and all passed.
  - CATP = Some tests were not performed, but all that were passed.
  - NTR = No tests run.
  - STF = Some tests failed.
- **e** = Reason the command was rejected.
- **f** = Phase in which the failure occurred.
- **g** = Segment in which the failure occurred.
- **h** = Test number that failed.
- **i** = Mismatch results for the specified test in hexadecimal.
- **j** = Raw data expected result for the specified test in hexadecimal.
- **k** = Raw data mask used to determine the test failure in hexadecimal.
- **l** = Raw data actual result for the specified test in hexadecimal.
- **m** = Result of previous command. Valid value(s):
  - ATP = The specified segment(s) were completed and all tests passed.
  - CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
  - NTR = No tests were run since the last completion message.
  - STF = The diagnostic has completed and some tests failed.
- **n** = Phase number in which execution is suspended.
- **o** = Segment number in which execution is suspended.
- **p** = Identification number of floor and aisle.
- **q** = Module type.
- **r** = Module number.
- **s** = Cabinet type.
- **t** = Cabinet number.
u = Replacement equipment code(s).

v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Example of CODE FORM contents: CODE A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
: = Intra-field delimiter.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
- = Inter-field delimiter if necessary.
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Circuit type. Valid value(s):
   _____ = Equipment is part of the circuit under test.
   HPR   = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL   = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a¹ = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT_STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

b¹ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c¹ = Text identifier showing order of record:
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the
implicated shelf.

e¹ = Statement number.

f¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous command.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH n SEG o</td>
<td>Printed and the RPT option was specified, this message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

For Formats 6 and 7, no action is required.

5. ALARMS

__________________________________________________________________

2. REASON FOR OUTPUT

To report the results of executing an EX:CMP input message to diagnose a communication module processor (CMP).

Format 1 indicates the completed segments and reports the overall result. It applies only when the repeat (RPT) option is specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the input message was invalid.

Format 3 indicates and specifies that a test failed.

Format 4 indicates that diagnostic execution is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous message, may also be specified.

Format 5 is printed when a test failed and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 6 indicates that the diagnostic execution has terminated.

Formats 1, 3, 4 and 5 belong to the SM message class, while Formats 2 and 6 belong to the MSGS message class.

3. VARIABLE FIELD DEFINITIONS
a = Message switch side number.
b = CMP number.
c = Loop result. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Some tests were not performed, but all tests that were performed passed.
   NTR = No tests were performed.
   STF = Some test(s) failed.
d = Reason the message was rejected. Valid value(s):
   EXECUTE PHASE NOT DEFINED = The phase number containing the segments to be executed was invalid.
   PAUSE PHASE NOT DEFINED = The phase number at which suspension was desired was invalid.
   PREVIOUS EX IN PROGRESS = An earlier exercise message was still in progress; the rejected message is valid only if the diagnostic is suspended.

e = Number of the phase in which the failure occurred.
f = Number of the segment in which the failure occurred.
g = Number of the test that failed.
h = Mismatch results for the specified test, in hexadecimal.
i = Expected result for the specified test, in hexadecimal.
j = Mask used to determine test failure, in hexadecimal.
k = Actual result for the specified test, in hexadecimal.
l = Result of previous message. Valid value(s):
   ATP = The specified segment(s) were completed and all tests were performed and passed.
   CATP = Some tests in the specified segment(s) were not performed, but all tests that were performed passed.
   NTR = No tests were performed since the last completion message.
   REQUEST NOT ALLOWED = The invert or transfer input message was invalid.
   STF = The specified segment(s) were completed, and some test(s) failed.
m = Phase number where execution was suspended.
n = Segment number where execution was suspended.
o = Text identifier showing order of TLP record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

A maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of one to four entries. Each record will have a new header.
\( p \) = Identification number of floor and aisle.

\( q \) = Module type. Valid value(s):
- CM = Communication module.
- HSM = Host switching module.
- RSM = Remote switching module.
- SM = Switching module.

\( r \) = Module number.

\( s \) = Cabinet type. Valid value(s):
- CM2 = Communication module 2 cabinet.
- M = Miscellaneous cabinet.
- MSG = Message switch cabinet.
- SMC = Switching module controller cabinet.
- TMS = Time multiplexed switch cabinet.

\( t \) = Cabinet number.

\( u \) = Replacement equipment code(s).

\( v \) = Equipment form(s). Equipment form represents the minimal operating level of replacement equipment. Example of CODE FORM content: CODE FORM A[:B]...[:C] [-] D[:E]...[:F]
- A = Current minimal accepted equipment code.
- : = Intra-field delimiter.
- B = Current production equipment code (substitutable equipment for code A).
- C = Additional compatible equipment code(s) (added as space permits)
- - = Inter-field delimiter.
- D = Current minimal approved operating level for equipment code A.
- E = Current minimal approved operating level for equipment code B.
- F = Current minimal approved operating level(s) for equipment code(s) C.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s), as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s), as applicable.

\( w \) = Vertical location in the cabinet, in inches above the floor to the center of the implicated shelf.

\( x \) = Horizontal location in the cabinet, in eighths of an inch from the left corner of the implicated shelf.

\( z \) = Circuit type. Valid value(s):
- ---- = Equipment is part of the circuit under test.
- HPR = Equipment is part of a helper circuit. The helper must be removed from service before replacement is attempted.
- ONL = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.
a¹ = Number of the TLP note containing supplementary information related to the specified-suspected faulty equipment. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages.

b¹ = Termination status. Valid value(s):

ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Request was successfully completed.
NOT_STARTED = Requested action was not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

c¹ = Reason for the termination, or status of the completed request.

4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, determine the correct input message and reenter the exercise request.

For Format 3, no action is required.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>only SUSPENDED 1 PH m</td>
<td>The specified phase was terminated. Complete phase and segment specification must be provided on the next exercise request.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH m SEG n</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH m SEG n</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous message.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH m SEG n and the repeat (RPT) option was specified</td>
<td>This message indicates completion of the exercise. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH m SEG n</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
</tbody>
</table>

For Format 5, replace the indicated circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

For Format 6, no action is required.

5. ALARMS

None.

[5] EX CU a [b] TERMINATED AT PH c STMNT k
   AFTER TEST l

[6] EX CU a [b] TASK n (MESSAGE STARTED|QUEUED|ABORTED)

2. REASON FOR OUTPUT

To report the result of executing an EX:CU input message to diagnose the control unit (CU) or one of its subunits in the interactive mode.

Format 1 specifies the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = Unit type and member number of the subunit under the CU which has been diagnosed; for example: CC 0, MASC 0, MASC 1, SAT 0, etc.

c = Phase number.

d = The result of the diagnostic. Valid value(s):
   ATP = All tests pass.
   CATP = All tests run were ATP; some were not executed due to the unavailability of a system resource needed to perform the test.
   NTR = No tests were run.
   STF = Some tests fail.

e = Identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if 'e' = (00000000 00000018), tests were skipped for reasons 3 and 4.

<table>
<thead>
<tr>
<th>Bits</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Unused</td>
</tr>
<tr>
<td>1</td>
<td>Unit under test is forced on-line.</td>
</tr>
<tr>
<td>2</td>
<td>Sanity timers are disabled.</td>
</tr>
<tr>
<td>3</td>
<td>Emergency action interface (EAI) forces on CU, disk, sanity timer are active.</td>
</tr>
<tr>
<td>4</td>
<td>Peripheral unit controller is out of service.</td>
</tr>
<tr>
<td>5</td>
<td>Helper unit not specified or invalid.</td>
</tr>
<tr>
<td>6</td>
<td>Helper unit unavailable.</td>
</tr>
<tr>
<td>7</td>
<td>Unit under test is forced off-line.</td>
</tr>
<tr>
<td>8</td>
<td>EAI initialization parameter buffer data pending; EAI must be cleared.</td>
</tr>
<tr>
<td>9</td>
<td>Helper unit not connected to sub-unit under test.</td>
</tr>
<tr>
<td>10</td>
<td>Unused.</td>
</tr>
</tbody>
</table>

f = Test number of the failing test.

g = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

h = The bits which were actually received from the hardware device.

i = Determines which bits in 'h' are included in this test.

j = The value which the test expected.

Note: For Format 3 the values for 'h', 'i' and 'j' may be set to N/A. This means that this data is not available for the specified device.

k = Last statement successfully executed before the diagnostic terminated.

l = Current test number when diagnostic terminated.

m = Status of the report. Valid value(s):
   COMPLETE = The request has been completed.
   IN PROGRESS = The request is in progress.

n = Task number assigned to the request.

4. ACTION TO BE TAKEN

If 'd' = Action:
The needed system resource should be made available if possible, so that all tests may be executed.

The unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.

### 5. ALARMS

None.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the dual serial channel/computer interconnect (DCI) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a  = Member number.
The result of the diagnostic. Valid value(s):

- ATP: All tests passed.
- CATP: All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
- NTR: No tests were executed.
- STF: Some tests failed.

Valid value(s):

<table>

2. REASON FOR OUTPUT

To report the results of executing the EX:DCLU input message to diagnose the SLC® 96 digital carrier line unit (DCLU).

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic continues for the remaining iterations.

Format 2 indicates that the specified options in the input message was invalid.

Format 3 indicates that a test has failed and specifies that test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital carrier line unit (DCLU) number.
c = SLC®96 DCLU number.
d = Loop result. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Some tests were not performed, but all performed tests passed.
   NTR = No tests run.
   STF = Some tests failed.

e = Reason the command was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test number that failed.
i = Results for the specified test were mismatched in hexadecimal.
j = Raw data expected result for the specified test in hexadecimal.
k = Raw data mask used to determine the test failure in hexadecimal.
l = Raw data actual result for the specified test in hexadecimal.
m = Result of previous command. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

n = Phase number in which execution is suspended.
o = Segment number in which execution is suspended.
p = Identification number of floor and aisle.
q = Module type.
r = Module number.
s = Cabinet type.
t = Cabinet number.

u = Replacement equipment code(s).

v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ____ = Equipment is part of the circuit under test.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a1 = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT_STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

b1 = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c1 = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
e¹ = Statement number.
f¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, 6, and 7, no action is required.

For Format 2, determine the correct phase number and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>

2. REASON FOR OUTPUT

To report the result of executing an EX:DCTUCOM input message to diagnose the directly connected test unit common board (DCTUCOM).

Format 1 indicates that the specified segments have been completed, and reports the overall result. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble locating procedure (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution has terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.

b  = Directly connected test unit (DCTU) number.

c  = Loop result. Valid value(s):
    ATP   = All test were performed and all passed.
    CATP  = Some tests were not performed, but all that were passed.
    NTR   = No tests run.
    STF   = Some tests failed.

d  = Reason the command was rejected.

e  = Phase in which the failure occurred.

f  = Segment in which the failure occurred.

g  = Test number that failed.

h  = Mismatch results for the specified test in hexadecimal.

i  = Raw data expected result for the specified test in hexadecimal.

j  = Raw data mask used to determine the test failure in hexadecimal.

k  = Raw data actual result for the specified test in hexadecimal.

l  = Result of previous command. Valid value(s):
    ATP   = The specified segment(s) were completed and all tests passed.
    CATP  = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
    NTR   = No tests were run since the last completion message.
    STF   = The diagnostic has completed and some tests failed.

m  = Phase number in which execution is suspended.

n  = Segment number in which execution is suspended.

o  = Identification number of floor and aisle.

p  = Module type.

q  = Module number.

r  = Cabinet type.

s  = Cabinet number.
t = Replacement equipment code(s).

u = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]

A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

v = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

w = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

x = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ = Equipment is part of the circuit under test.

y = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

z = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

\(a^1\) = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

\(b^1\) = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

c = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

d = Statement number.

e = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>

APP:MAINT-RESP
EX:DFC

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] EX DFC a [COMPLETED] b [(c)]
   (MESSAGE|MSG) {IN PROGRESS|COMPLETE}

[2] EX DFC a PH d b [(c)] (MESSAGE IN PROGRESS|MSG IP)

[3] EX DFC a PH d STF (c)          MSG IP
   TEST MISMATCH ACTUAL MASK EXPECTED
   e     f     g     h     i

[4] EX DFC a ABORTED AT PH d STMNT j b [(c)]       MSG IP

[5] EX DFC a TERMINATED AT PH d STMNT j AFTER TEST k

[6] EX DFC a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the disk file controller (DFC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
= The result of the diagnostic. Valid value(s):
  ATP = All tests passed.
  CATP = All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
  NTR = No tests were executed.
  STF = Some tests failed.

= If 'b' = CATP or NTR, 'c' identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if 'c' = (00000000 00000018), tests were skipped for reasons 3 and 4.

If 'b' = STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2. The reason codes are as follows:

<table>
<thead>
<tr>
<th>Bit:</th>
<th>Reason:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Helper unit not specified or invalid.</td>
</tr>
<tr>
<td>1</td>
<td>Helper unit cannot be reserved.</td>
</tr>
<tr>
<td>2</td>
<td>Helper unit is not out-of-service.</td>
</tr>
<tr>
<td>3</td>
<td>Helper unit is not ATP.</td>
</tr>
<tr>
<td>4</td>
<td>Helper unit not connected to controller being diagnosed.</td>
</tr>
</tbody>
</table>

**NOTE:** To interpret CATP bits 32-46, the structure of the system must be understood. All device references are relative to the DFC under test, and may not correspond to "real" unit numbers. The down pointer of the DFC will point to the first SBUS. The side pointer of the first SBUS points to the second SBUS. Similarly, the down pointer of an SBUS points to the first MHD beneath it. The side pointer of an MHD points to the next MHD in the chain. These concepts are displayed graphically on display pages 120 and 122. The leftmost SBUS under a DFC is considered first SBUS, with the rightmost SBUS being second. MHD relative numbering for each SBUS is top-down, with the top MHD being first and the bottom being last. Currently only four MHDs per SBUS are supported.

<table>
<thead>
<tr>
<th>Bit:</th>
<th>Reason:</th>
</tr>
</thead>
<tbody>
<tr>
<td>32</td>
<td>First MHD on first SBUS of DFC did not respond correctly.</td>
</tr>
<tr>
<td>33</td>
<td>Second MHD on first SBUS of DFC did not respond correctly.</td>
</tr>
<tr>
<td>34</td>
<td>Third MHD on first SBUS of DFC did not respond correctly.</td>
</tr>
<tr>
<td>35</td>
<td>Fourth MHD on first SBUS of DFC did not respond correctly.</td>
</tr>
<tr>
<td>36</td>
<td>Reserved for fifth MHD on first SBUS of DFC.</td>
</tr>
<tr>
<td>37</td>
<td>Reserved for sixth MHD on first SBUS of DFC.</td>
</tr>
<tr>
<td>38</td>
<td>Reserved for seventh MHD on first SBUS of DFC.</td>
</tr>
<tr>
<td>40</td>
<td>First MHD on second SBUS of DFC did not respond correctly.</td>
</tr>
<tr>
<td>41</td>
<td>Second MHD on second SBUS of DFC did not respond correctly.</td>
</tr>
<tr>

<td>Third MHD on second SBUS of DFC did not respond correctly.</td>
</tr>
<tr>
<td>43</td>
<td>Fourth MHD on second SBUS of DFC did not respond correctly.</td>
</tr>
<tr>
<td>44</td>
<td>Reserved for fifth MHD on second SBUS of DFC.</td>
</tr>
<tr>
<td>45</td>
<td>Reserved for sixth MHD on second SBUS of DFC.</td>
</tr>
<tr>
<td>46</td>
<td>Reserved for seventh MHD on second SBUS of DFC.</td>
</tr>
</tbody>
</table>

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits that were received from the device.

h = The mask that determines which bits in 'g' are of interest to this test.
= The value that the test expected.

Note: For Format 3, the values for 'g', 'h', and 'i' may be set to N/A. This means that this data is not available for the specified device.

= Last statement successfully executed before the diagnostic terminated.

= Current test number when diagnostic terminated.

= Task number assigned to the request.

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2 - 4, if 'b' = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the result of executing an EX:DFI input message to diagnose the digital facilities interface (DFI).

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous input message may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble locating procedure (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line/trunk unit.
c = Service group number.
d = Loop result. Valid value(s):
   ATP = All tests were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.

e = Reason the input message was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test number that failed.
i = Mismatch results for the specified test in hexadecimal.
j = Raw data expected result for the specified test in hexadecimal.
k = Raw data mask used to determine the test failure in hexadecimal.
l = Raw data actual result for the specified test in hexadecimal.
m = Result of previous input message. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

n = Phase number in which execution is suspended.
o = Segment number in which execution is suspended.
p = Identification number of floor and aisle.
q = Module type.
r = Module number.
s = Cabinet type.
t = Cabinet number.
u = Replacement equipment code(s).

v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

```
CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Circuit type. Valid value(s):

- **HPR** = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
- **ONL** = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
- **____** = Equipment is part of the circuit under test.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a¹ = Termination status. Valid value(s):

- **ABORTED** = The process was terminated (process not gracefully terminated).
- **NOT STARTED** = Action was not begun.
- **STOPPED** = Terminated before normal completion (process gracefully terminated).

b¹ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c¹ = Text identifier showing order of record. Valid value(s):

- **FIRST** = First record of continuing list.
- **LAST** = Last record of list.
- **NEXT** = Next record of continuing list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\[ d^1 \] = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\[ e^1 \] = Statement number.

\[ f^1 \] = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>

2. REASON FOR OUTPUT

To report the results of an EX:DFIH input message to exercise a remote integrated services line unit (RISLU)
host/remote digital facility interface circuit pair (DFIH).

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option
is specified in the input messages. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates that execution of the exercise is suspended. The phase and segment in which the suspension
occurs, and a summary of the results of the previous message may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in
the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = RISLU digital line trunk unit number.
c  = DFIH number.
d  = Loop result. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Some tests were skipped because supporting hardware was not available, but all tests which were run passed.
   NTP = No tests performed.
   STF = Some tests failed.
e  = Reason the message was rejected.
f  = Phase in which the failure occurred.
g  = Segment in which the failure occurred.
h  = Test that failed.
i  = Mismatch results for the specified test in hexadecimal.
j  = Expected result for the specified test in hexadecimal.
k  = Mask used to determine test failure in hexadecimal.
l  = Actual result for the specified test in hexadecimal.
m  = Type of suspension. Valid value(s):
   ATP = The specified segment(s) were completed and all tests were performed and passed.
   CATP = Some tests in the specified segment were skipped because supporting hardware was not available, but all tests which were run passed.
   NTP = No tests performed since the last completion message.
   STF = Some tests in the segment failed.

n  = Phase where execution is suspended.
o  = Segment where execution is suspended.
p  = Floor and aisle number.
q  = Module type.
r  = Module number.
s  = Cabinet type.
t = Cabinet number.

u = Replacement equipment code(s).

v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ = Equipment is part of the circuit under test.

z = Refer to the APP:TLP-NOTE appendix in the Appendix section of the Output Messages.

a\textsuperscript{1} = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Request has successfully completed.
NOT STARTED = Requested action has not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

b\textsuperscript{1} = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages.
c^1 = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d^1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

e^1 = Statement number.

f^1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct phase number and reenter the exercise request.

For Format 3, analyze failure data to determine reason for failure or run the exercise using the 'TLP' option to generate a suspected faulty circuit pack list.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTP</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Run the entire diagnostic by using the DGN:DFIH input message.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED NTP PH n SEG o and the RPT option was specified</td>
<td>Normal completion of the exercise is indicated. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the diagnostic exercise for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing EX:DFTAC input message to exercise the distributing frame test access circuit (DFTAC).

Format 1 is printed when the specified segment(s) have been completely executed. Execution of the diagnostic will continue for any remaining iterations.

Format 2 indicates that the previous EX:DFTAC input message was invalid.

Format 3 is printed when a test has failed.

Format 4 is printed when the execution of the diagnostic is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous message, may also be specified.

Format 5 is printed when the trouble locating procedure (TLP) was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Unit number.

c = Service group number.

d = Board number.

e = Loop result. Valid value(s):
ATP = All tests were performed and all passed.
CATP = Some tests were not performed, but all that were passed.
NTR = No tests were run.
STF = Some tests failed.

f = Reason the message was rejected.

g = Number of the phase in which the failure occurred.

h = Number of the segment in which the failure occurred.

i = Number of the test that failed.

j = Mismatch results for the specified test in hexadecimal.

k = Expected result for the specified test in hexadecimal.

l = Mask used to determine test failure in hexadecimal.

m = Actual result for the specified test in hexadecimal.

n = Type of suspension. Valid value(s):
ATP = All tests were performed and all passed.
CATP = Some tests were not performed, but all that were passed.
NTR = No tests were run.
STF = Some tests failed.

o = Phase number in which execution suspended.

p = Segment number in which execution suspended.

q = Aisle.

r = Module type, communication module (CM) or SM.

s = Switching module number.

t = Cabinet type.
u = Cabinet number.

v = Replacement equipment code(s).

w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

```
CODE A[:B]...[:C] [-] D[:E]...[:F]
```

- = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):

- **HPR** = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
- **ONL** = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.
- ______ = Equipment is part of the circuit under test.

a¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b¹ = Termination status. Valid value(s):

- **ABORTED** = The process was terminated (process not gracefully terminated).
- **NOT_STARTED** = Action was not begun.
- **STOPPED** = Terminated before normal completion (process gracefully terminated).

c¹ = Text identifier showing order of record. Valid value(s):

- **FIRST** = First record of continuing list.
- **LAST** = Last record of list.
- **NEXT** = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4
entries. Each record will have a new header.

d$^1$ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

e$^1$ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

f$^1$ = Statement number.

g$^1$ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, 6, and 7, no action is required.

For Format 2, determine the correct phase number and reenter the diagnostic exercise request, or wait until the previous message is completed.

For Format 3, replace the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTR</td>
<td>Enter the first exercise message for the purpose of manual trouble shooting.</td>

2. REASON FOR OUTPUT

To report the result of executing an EX:DIST input message to diagnose the distribute point board.

Format 1 indicates that the specified segments have been completed, and reports the overall result. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = Board number.
e = Loop result. Valid value(s):
   ATP = All tests were performed and all passed.
   CATP = Some tests were not performed, but all that were performed have passed.
   NTR = No tests were run.
   STF = Some tests failed.

f = Reason the command was rejected.
g = Phase in which the failure occurred.
h = Segment in which the failure occurred.
i = Test number that failed.
j = Mismatch results for the specified test in hexadecimal.
k = Raw data expected result for the specified test in hexadecimal.
l = Raw data mask used to determine the test failure in hexadecimal.
m = Raw data actual result for the specified test in hexadecimal.
n = Result of previous command. Valid value(s):
   ATP = The specified segment(s) completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The specified segment(s) completed and some tests failed.

o = Phase number in which execution is suspended.
p = Segment number in which execution is suspended.
q = Identification number of floor and aisle.
r = Module type.
s = Module number.
t = Cabinet type.
u = Cabinet number.

v = Replacement equipment code(s).

w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

a¹ = Refer to APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b¹ = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

c¹ = Termination reason. Refer to APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

d¹ = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\[ e^1 \] = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\[ f^1 \] = Statement number.

\[ g^1 \] = Reason why some tests were not performed.

### 4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>

6. REFERENCES

Input Message(s):

EX:DISTPT
EX:DLI

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

EX DLI=a-b c [d]

2. REASON FOR OUTPUT

To acknowledge that a manual request to exercise a dual link interface (DLI) is complete.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number that the DLI that was exercised was in.
b = Side of the office network and timing complex (ONTC) that the DLI is on.
c = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   NOT_STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.
d = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, variable 'd' should give some indication as to why the request failed. Check the SM/DLI MCC pages or the OP:CFGSTAT output message to verify that the DLI was in a valid state to perform the request.

5. ALARMS

None.

Output Message(s):

   OP:CFGSTAT
EX:DUIC

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] EX DUIC a [COMPLETED] b [(c)]
   (MESSAGE|MSG) {IN PROGRESS|COMPLETE}

[2] EX DUIC a PH d b [(c)] {MESSAGE IN PROGRESS|MSG IP}

[3] EX DUIC a PH d STF (c)          MSG IP
   TEST  MISMATCH  ACTUAL  MASK  EXPECTED
   e      f        g      h      i

[4] EX DUIC a ABORTED AT PH d STMNT j b [(c)]       MSG IP

[5] EX DUIC a TERMINATED AT PH d STMNT j AFTER TEST k

[6] EX DUIC a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the direct user interface controller (DUIC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
The result of the diagnostic. Valid value(s):

- **ATP** = All tests passed.
- **NTR** = No tests were executed.
- **STF** = Some tests failed.

If 'b' = **STF**, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.

h = Determines which bits in 'g' are included in this test.

i = The value which the test expected.

Note: For Format 3, the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

### 4. ACTION TO BE TAKEN

If 'b' = **STF**, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.

### 5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix.

2. REASON FOR OUTPUT

To report the result of executing an EX:EAN input message to diagnose the equipment access network (EAN).

Format 1 indicates that the specified segments have been completed, and reports the overall result. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Directly connected test unit (DCTU) number.

c = Loop result. Valid value(s):
   ATP = All test were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.

d = Reason the command was rejected.

e = Phase in which the failure occurred.

f = Segment in which the failure occurred.

g = Test number that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Raw data expected result for the specified test in hexadecimal.

j = Raw data mask used to determine the test failure in hexadecimal.

k = Raw data actual result for the specified test in hexadecimal.

l = Result of previous command. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

m = Phase number in which execution is suspended.

n = Segment number in which execution is suspended.

o = Identification number of floor and aisle.

p = Module type.

q = Module number.

r = Cabinet type.

s = Cabinet number.

t = Replacement equipment code(s).
Example of CODE FORM contents:

```
CODE
A[:B]...[:C] [-] D[:E]...[:F]
```

- `:` = Intra-field delimiter.
- `=` = Inter-field delimiter if necessary.
- `A` = Current minimal accepted equipment code.
- `B` = Current production equipment code (substitutable equipment for code 'A').
- `C` = Additional compatible equipment code(s) (added as space permits).
- `D` = Current minimal approved operating level for equipment code 'A'.
- `E` = Current minimal approved operating level for equipment code 'B'.
- `F` = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

- `v` = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
- `w` = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
- `x` = Circuit type. Valid value(s):
  - `HPR` = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
  - `ONL` = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
  - `___` = Equipment is part of the circuit under test.

- `y` = Refer to APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

- `z` = Termination status. Valid value(s):
  - `ABORTED` = The process was terminated (process not gracefully terminated).
  - `NOT_STARTED` = Action was not begun.
  - `STOPPED` = Terminated before normal completion (process gracefully terminated).

- `a` = Termination reason. Refer to APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

- `b` = Text identifier showing order of record. Valid value(s):
  - `FIRST` = First record of continuing list.
  - `LAST` = Last record of list.
  - `NEXT` = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4
entries. Each record will have a new header.

\[ c^1 \] = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\[ d^1 \] = Statement number.

\[ e^1 \] = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH m SEG n</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH m SEG n</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous command.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH m SEG n</td>
<td>This message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH m SEG n</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

EX:EAN

Output Appendix(es):

APP:MAINT-RESP
APP:TLP-NOTE
EX:FPC

Software Release: 5E14 and later
Message Class: MSGS
Application: 5
Type: Output

1. FORMAT

EX FPC=a b [c]

2. REASON FOR OUTPUT

To acknowledge that a manual request to exercise a foundation peripheral controller (FPC) is complete.

3. VARIABLE FIELD DEFINITIONS

a = FPC side.
b = Termination report. Valid value(s):
  ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
  COMPLETED = Request completed successfully.
  NOT_STARTED = Requested action could not begin.
  STOPPED = Requested action was terminated before a normal completion. Attempts were made to leave everything in a sane state.
c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, variable ‘c’ should give some indication as to why the request failed. Check MSGS MCC pages or OP:CFGSTAT output message to verify that the FPC was in a valid state to perform the request.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing a EX:GDSF input message to diagnose the global digital services function (GDSF) circuit.

Format 1 indicates that the specified segments have been completed. It applies only when the RPT option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified options in the input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous message, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedures (TLPs) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = GDSF number.

c = Loop result. Valid value(s):
ATP = All tests were performed and all passed.
CATP = Some tests were not performed, but all that were passed.
NTR = No tests run.
STF = Some tests failed.

d = Reason the message was rejected.

e = Phase in which the failure occurred.

f = Segment in which the failure occurred.

g = Test number that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Raw data expected result for the specified test in hexadecimal.

j = Raw data mask used to determine the test failure in hexadecimal.

k = Raw data actual result for the specified test in hexadecimal.

l = Type of suspension. Valid value(s):
ATP = The specified segment(s) were completed and all tests passed.
CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
NTR = No tests were run since the last completion message.
STF = The diagnostic has completed and some tests failed.

m = Phase number in which execution is suspended.

n = Segment number in which execution is suspended.

o = Identification number of floor and aisle.

p = Module type.

q = Module number.

r = Cabinet type.

s = Cabinet number.

t = Replacement equipment code(s).
Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

```
CODE
A[:B]...[:C] [-] D[:E]...[:F]
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

- Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
- Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
- Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
- Circuit type. Valid value(s):
  HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
  ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
  ____ = Equipment is part of the circuit under test.

- Refer to the APP: TLP-NOTE appendix in the Appendixes section of the Output Messages manual.
- Termination status. Valid value(s):
  ABORTED = Immediate termination.
  COMPLETED = Successful completion.
  NOT_STARTED = Action has not begun.
  STOPPED = Terminated before normal completion.

- Termination reason. Refer to the APP: MAINT-RESP appendix in the Appendixes section of this section.
- Text identifier showing order of record. Valid value(s):
  FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d1 = Statement number.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, none.

For Format 2, determine the correct phase numbers and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>

2. REASON FOR OUTPUT

To report the result of executing an EX:GDSUCOM input message to diagnose the global digital service unit common (GDSUCOM) board.

Format 1 indicates that the specified segments have been completed, and reports the overall result. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous message, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution has terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = GDSU number.
- **c** = Service group number. Valid value(s):
- **d** = Loop result. Valid value(s):
  - ATP = All tests were performed and all passed.
  - CATP = Some tests were not performed, but all that were passed.
  - NTR = No tests run.
  - STF = Some tests failed.
- **e** = Reason the message was rejected.
- **f** = Phase in which the failure occurred.
- **g** = Segment in which the failure occurred.
- **h** = Test number that failed.
- **i** = Mismatch results for the specified test in hexadecimal.
- **j** = Raw data expected result for the specified test in hexadecimal.
- **k** = Raw data mask used to determine the test failure in hexadecimal.
- **l** = Raw data actual result for the specified test in hexadecimal.
- **m** = Result of previous message. Valid value(s):
  - ATP = The specified segment(s) were completed and all tests passed.
  - CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
  - NTR = No tests were run since the last completion message.
  - STF = The diagnostic has completed and some tests failed.
- **n** = Phase number in which execution is suspended.
- **o** = Segment number in which execution is suspended.
- **p** = Identification number of floor and aisle.
- **q** = Module type.
- **r** = Module number.
- **s** = Cabinet type.
t = Cabinet number.
u = Replacement equipment code(s).
v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

```plaintext
CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Circuit type. Valid value(s):
   
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ____ = Equipment is part of the circuit under test.

z = Refer to APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a = Termination code.

b = Termination reason. Refer to APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c = Text identifier showing order of record. Valid value(s):
   
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4
entries. Each record will have a new header.

d\textsuperscript{1} = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

e\textsuperscript{1} = Statement number.

f\textsuperscript{1} = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>

y = Circuit type. Valid value(s):

- **HPR** = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
- **ONL** = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
- ____ = Equipment is part of the circuit under test.

z = Refer to APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a¹ = Termination status. Valid value(s):

- **ABORTED** = The process was terminated (process not gracefully terminated).
- **NOT_STARTED** = Action was not begun.
- **STOPPED** = Terminated before normal completion (process gracefully terminated).

b¹ = Termination reason. Refer to APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c¹ = Text identifier showing order of record. Valid value(s):

- **FIRST** = First record of continuing list.
- **LAST** = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d^1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

e^1 = Statement number.

f^1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous command.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH n SEG o</td>
<td>This message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

For Formats 6 and 7, no action is required.

2. REASON FOR OUTPUT

To report the result of executing an EX:GDXC input message to diagnose the gated diode cross point compensator (GDXC).

Format 1 indicates that the specified segments have been completed, and reports the overall result. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution has terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = Metallic service unit (MSU) number.

c = Service group number.

d = MSU board position number.

e = Loop result. Valid value(s):
ATP = All tests were performed and all passed.
CATP = Some tests were not performed, but all that were passed.
NTR = No tests were run.
STF = Some tests failed.

f = Reason the command was not started.

g = Phase in which the failure occurred.

h = Segment in which the failure occurred.

i = Test number that failed.

j = Mismatch results for the specified test in hexadecimal.

k = Raw data expected result for the specified test in hexadecimal.

l = Raw data mask used to determine the test failure in hexadecimal.

m = Raw data actual result for the specified test in hexadecimal.

n = Result of previous command. Valid value(s):
ATP = The specified segment(s) completed and all tests passed.
CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
NTR = No tests were run since the last completion message.
STF = The specified segment(s) completed and some tests failed.

o = Phase number in which execution is suspended.

p = Segment number in which execution is suspended.

q = Identification number of floor and aisle.

r = Module type.

s = Module number.
t = Cabinet type.
u = Cabinet number.
v = Replacement equipment code(s).
w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

a1 = Refer to APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b1 = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

c1 = Termination reason. Refer to APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

d1 = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
NEXT = Next record of continuing list.
LAST = Last record of list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

e = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

f = Statement number.

g = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6 and 7, no action is required.

2. REASON FOR OUTPUT

To report the result of executing an EX:GDXCON input message to diagnose the gated diode crosspoint control (GDXCON).

Format 1 indicates that the specified segments have been completed, and reports the overall result. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution has terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Service group number.
d = Loop result. Valid value(s):
   ATP = All test were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.
e = Reason the command was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test number that failed.
i = Mismatch results for the specified test in hexadecimal.
j = Raw data expected result for the specified test in hexadecimal.
k = Raw data mask used to determine the test failure in hexadecimal.
l = Raw data actual result for the specified test in hexadecimal.
m = Result of previous command. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

n = Phase number in which execution is suspended.
o = Segment number in which execution is suspended.
p = Identification number of floor and aisle.
q = Module type.
r = Module number.
s = Cabinet type.
= Cabinet number.
u = Replacement equipment code(s).
v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.
w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

a1 = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b1 = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

c1 = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

e1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

f1 = Statement number.

g1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTR</td>
<td>Enter the first input exercise input message for the purpose of manual troubleshooting.</td>
<td></td>
</tr>
<tr>
<td>SUSPENDED ATP PH o SEG p</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
<td></td>
</tr>
<tr>
<td>SUSPENDED CATP PH o SEG p</td>
<td>This message indicates that a lack of resources for the previously specified segments(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous input message.</td>
<td></td>
</tr>
<tr>
<td>SUSPENDED NTR PH o SEG p and the RPT option was specified</td>
<td>This message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
<td></td>
</tr>
<tr>
<td>SUSPENDED STF PH o SEG p</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
<td></td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
<td></td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected packs one at a time in the order specified. Rerun the entire diagnostic after each substitution until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing an EX:HDFI input message to exercise a host switching module (HSM) digital facilities interface (HDFI) circuit.

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the repeat (RPT) option is specified in the input message. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates execution of the exercise is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous input message may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the trouble locating procedure (TLP) option is specified in the input message.

Format 6 indicates execution of the exercise is terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = Digital line and trunk unit (DLTU) number.
- **c** = HDFI number.
- **d** = Loop result. Valid value(s):
  - ATP = All tests performed and passed.
  - CATP = Some tests were skipped because supporting hardware was not available, but all tests which were run passed.
  - NTP = No tests performed.
  - STF = Some tests failed.
- **e** = Reason the input message was rejected.
- **f** = Phase in which the failure occurred.
- **g** = Segment in which the failure occurred.
- **h** = Test that failed.
- **i** = Mismatch results for the specified test in hexadecimal.
- **j** = Expected result for the specified test in hexadecimal.
- **k** = Mask used to determine test failure in hexadecimal.
- **l** = Actual result for the specified test in hexadecimal.
- **m** = Result of previous input message. Valid value(s):
  - ATP = The specified segment(s) were completed and all tests were performed and passed.
  - CATP = Some tests in the specified segment were skipped because supporting hardware was not available, but all tests which were run passed.
  - NTP = No tests performed.
  - STF = Some tests in the segment failed.
- **n** = Phase where execution is suspended.
- **o** = Segment where execution is suspended.
- **p** = Floor and aisle.
- **q** = Module type.
- **r** = Cabinet type.
- **s** = Replacement equipment code(s).
= Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]

A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating Level for equipment code A.
E = Current minimal approved operating Level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

u = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

v = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

w = Circuit type. Valid value(s):
   _____ = Equipment is part of the circuit under test.
   HPR   = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL   = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

x = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

y = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was complete.
   COMPLETED = Request has successfully completed, and reports the overall result.
   NOT STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before a normal completion.

z = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

a1 = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\( b^1 \) = Module number.

\( c^1 \) = Cabinet number.

\( d^1 \) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\( e^1 \) = Statement number.

\( f^1 \) = Reason why some tests were not performed.

### 4. ACTION TO BE TAKEN

For Format 2, determine the correct phase numbers and reenter the exercise request.

For Format 3, repair the faulty circuit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTP</td>
<td>Enter the first exercise input message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This indicates a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH n SEG o and the RPT option was specified</td>
<td>Normal completion of the exercise is indicated. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected faulty circuit packs one at a time. Rerun the exercise for each replaced circuit pack until the fault is repaired or the diagnostic results change.

For Formats 1, 6 and 7, no action is required.

### 5. ALARMS

None.

   - `EX HSDC a TERMINATED AT PH d STMNT j AFTER TEST k

6. **Format 6:**
   - `EX HSDC a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

### 2. REASON FOR OUTPUT

To print results of a diagnostic run on the high speed data-link controller (HSDC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Member number.
b = The result of the diagnostic. Valid value(s):  
   ATP = All tests passed.  
   NTR = No tests were executed.  
   STF = Some tests failed.

c = If 'b' = STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.
Note: For Format 3 the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.

\begin{itemize}
   \item [g] The bits which were actually received from the hardware device.
\item [h] Determines which bits in 'g' are included in this test.
\item [i] The value which the test expected.
\item [j] Last statement successfully executed before the diagnostic terminated.
\item [k] Current test number when diagnostic terminated.
\item [l] Task number assigned to the request.
\end{itemize}

4. ACTION TO BE TAKEN

If 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the results of executing the EX:IDCU input message that diagnoses an integrated digital carrier unit (IDCU) service group circuit.

Format 1 indicates that the specified segments have been completed and all tests have passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic continues for the remaining iterations.

Format 2 indicates that the specified options in the input message was invalid.

Format 3 indicates that a specific test has failed.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble locating procedure (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution terminated.

3. VARIABLE FIELD DEFINITIONS
a = Switching module number.
b = IDCU number.
c = IDCU service group number.
d = Loop results. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Some tests were not performed, but all performed tests passed.
   NTR = No tests run.
   STF = Some tests failed.
e = Reason the command was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test number that failed.
i = Mismatched results for the specified test in hexadecimal.
j = Expected result for the specified test in hexadecimal.
k = Mask used to determine the test failure in hexadecimal.
l = Actual result for the specified test in hexadecimal.
m = Result of previous command. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

n = Phase number in which execution is suspended.
o = Segment number in which execution is suspended.
p = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Up to 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.
q = Identification number of floor and aisle.
r = Module type.
s = Module number.

Copyright ©2003 Lucent Technologies
t = Cabinet type.

u = Cabinet number.

v = Replacement equipment code(s).

w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM content:

```
CODE
A[:B] ... [:C] [-] D[:E] ... [:F]
```

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s), or text identifier(s) as applicable.

- = Intra-field delimiter.
- = Inter-field delimiter, if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (replaceable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s), or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier, or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

a = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
= Equipment is part of the circuit under test.

b = Note number refers to the APP:TLP-NOTE appendix.

c = Termination report. Valid value(s):

ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Request action has successfully completed.
NOT STARTED = Requested action has not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

d1 = Additional information qualifying the termination report. This information can be found in the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

For Format 1 no action is required.

For Format 2 determine the correct phase number and reenter the exercise request.

For Format 3 analyze failure data to determine reason for failure or run the exercise using the TLP option to generate a suspected faulty circuit pack list.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only EX:IDCU=a-b-c</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED NTR</td>
<td>The fault may have been repaired. Rerun the entire diagnostic.</td>
</tr>
<tr>
<td>ATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the exercise request.</td>
</tr>
<tr>
<td>EX:IDCU=a-b-c SUSPENDED</td>
<td></td>
</tr>
<tr>
<td>CATP PH n SEG o</td>
<td></td>
</tr>
<tr>
<td>EX:IDCU=a-b-c SUSPENDED</td>
<td>Normal completion of the exercise is indicated. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>NTR PH n SEG o printed and the RPT option was specified</td>
<td></td>
</tr>
<tr>
<td>EX:IDCU=a-b-c SUSPENDED</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>STF PH n SEG o</td>
<td></td>
</tr>
<tr>
<td>EX:IDCU=a-b-c SUSPENDED</td>
<td>The specific phase was terminated. Complete PH and SEG specification must be provided on the next EX request.</td>
</tr>
<tr>
<td>PH o</td>
<td></td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the diagnostic exercise for each replaced pack until the fault is repaired or the diagnostic results change.

For Format 6, no action is required.

5. ALARMS

None.

[5] EX IOP a TERMINATED AT PH d STMNT j AFTER TEST k

[6] EX IOP a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the input/output processor (IOP) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = The result of the diagnostic. Valid value(s):
ATP = All tests passed.
CATP = All tests that were executed were ATP; some were not executed due to the
       unavailability of a system resource that was needed to perform the test.
NTR = No tests were executed.
STF = Some tests failed.

c = If 'b' = CATP or NTR, 'c' identifies the reasons tests were skipped in this phase by their bit
     position in a 16-digit hexadecimal number. For example, if 'c' = (00000000 00000018), tests were
     skipped for reasons 3 and 4.

     If 'b' = STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped.
     For example, if 'c' = (7 00000000 00000006), seven tests failed, plus tests were skipped for
     reasons 1 and 2. The reason codes are as follows:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Helper unit not specified or invalid.</td>
</tr>
<tr>
<td>1</td>
<td>Helper unit cannot be reserved.</td>
</tr>
<tr>
<td>2</td>
<td>Helper unit not out-of-service.</td>
</tr>
<tr>
<td>3</td>
<td>Helper unit is not ATP.</td>
</tr>
<tr>
<td>4</td>
<td>Helper unit not connected to controller being diagnosed.</td>
</tr>
</tbody>
</table>

d = Phase number.
e = Test number of the failing test.
f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not
   match the expected response in that bit.
g = The bits which were actually received from the hardware device.
h = Determines which bits in 'g' are included in this test.
i = The value which the test expected.
   Note: For Format 3 the values for 'g', 'h,' and 'l' may be set to N/A. This means that this
   data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.
k = Current test number when diagnostic terminated.
l = Task number assigned to the request.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'b' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>

2. REASON FOR OUTPUT

To report the results of executing an EX:ISLUCC input message to exercise an integrated services line unit common controller (ISLUCC).

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input messages. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates that execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous command may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Integrated services line unit (ISLU) number.

c = Common controller number.

d = Loop result. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Conditionally ATP. Some tests were skipped because supporting hardware was not available, but all tests passed which were run.
   NTR = No tests run.
   STF = Some tests failed.

e = Reason the command was rejected.

f = Phase in which the failure occurred.

g = Segment in which the failure occurred.

h = Test that failed.

i = Mismatch results for the specified test in hexadecimal.

j = Actual result in hexadecimal for the specified test in hexadecimal.

k = Mask in hexadecimal used to determine test failure in hexadecimal.

l = Expected result in hexadecimal for the specified test in hexadecimal.

m = Type of suspension. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Conditionally ATP. Some test were skipped because supporting hardware was not available, but all tests passed which were run.
   NTR = No tests run.
   STF = Some tests failed.

n = Phase where execution is suspended.

o = Segment where execution is suspended.

p = Floor and aisle number.

q = Module type.

r = Module number.

s = Cabinet type.

t = Cabinet number.

u = Replacement equipment code(s).

v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Example of CODE FORM content:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>235</td>
<td></td>
</tr>
<tr>
<td>600</td>
<td></td>
</tr>
<tr>
<td>750</td>
<td></td>
</tr>
<tr>
<td>December 2003</td>
<td></td>
</tr>
</tbody>
</table>
A[:B]...[:C] [-] D[:E]...[:F]

A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Depth location in the cabinet.

z = Circuit type. Valid value(s):
  ____ = Equipment is part of the circuit under test.
  HPR  = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
  ONL  = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.

\text{a}^{1} = \text{Refer to appendix APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.}

\text{b}^{1} = \text{Termination status. Valid value(s):}
  \text{ABORTED} = \text{Requested action was terminated before completion, and the termination was not graceful.}
  \text{COMPLETED} = \text{Requested action has successfully completed.}
  \text{NOT STARTED} = \text{Requested action has not begun.}
  \text{STOPPED} = \text{Requested action was terminated before a normal completion. Termination was graceful.}

\text{c}^{1} = \text{Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.}

\text{d}^{1} = \text{Text identifier showing order of record. Valid value(s):}
  \text{FIRST} = \text{First record of continuing list.}
  \text{LAST} = \text{Last record of list.}
  \text{NEXT} = \text{Next record of continuing list.}

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.
4. ACTIONS TO BE TAKEN

For Format 1, none.

For Format 2, determine the correct phase number and reenter the exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only EX ISLUCC (a,b,c) SUSPENDED NTR</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>EX ISLUCC (a,b,c) SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic.</td>
</tr>
<tr>
<td>EX ISLUCC (a,b,c) SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the exercise request.</td>
</tr>
<tr>
<td>EX ISLUCC (a,b,c) SUSPENDED NTR PH n SEG o and the RPT option was specified</td>
<td>Normal completion of the exercise is indicated. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>EX ISLUCC (a,b,c) SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>EX ISLUCC (a,b,c) SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected equipment one at a time. Rerun the diagnostic exercise for each replacement until the fault is repaired or the diagnostic results change.

For Format 6, none.

5. ALARMS

2. **REASON FOR OUTPUT**

   To report the results of executing an EX:ISLUCD input message to exercise an integrated services line unit common data (ISLUCD).

   Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input messages. Execution of the exercise will continue for the remaining iterations.

   Format 2 indicates that an option specified in the input message was invalid.

   Format 3 indicates that an option specified in the input message was invalid.

   Format 4 indicates that execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous command may also be printed.

   Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message.

   Format 6 indicates that the diagnostic execution has terminated.

3. **VARIABLE FIELD DEFINITIONS**

   \( a \) = Switching module (SM) number.
b = Integrated services line unit (ISLU) number.

c = Common data number.

d = Loop result. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Conditionally ATP. Some tests were skipped because supporting hardware was
           not available, but all tests passed which were run.
   NTR = No tests run.
   STF = Some tests failed.

  e = Reason the command was rejected.

  f = Phase in which the failure occurred.

  g = Segment in which the failure occurred.

  h = Test that failed.

  i = Mismatch results for the specified test in hexadecimal.

  j = Expected result in hexadecimal for the specified test in hexadecimal.

  k = Mask in hexadecimal used to determine test failure in hexadecimal.

  l = Actual result in hexadecimal for the specified test in hexadecimal.

  m = Type of suspension. Valid value(s):
     ATP = All tests were performed and passed.
     CATP = Conditionally ATP. Some tests were skipped because supporting hardware was
             not available, but all tests passed which were run.
     NTR = No tests run.
     STF = Some tests failed.

  n = Phase where execution is suspended.

  o = Segment where execution is suspended.

  p = Floor and aisle number.

  q = Module type.

  r = Module number.

  s = Cabinet type.

  t = Cabinet number.

  u = Replacement equipment code(s).

  v = Equipment form(s). Equipment form represents minimal operating level of replacement
      equipment.

Example of CODE FORM content:
CODE
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Depth location in the cabinet.

z = Circuit type. Valid value(s):
   = Equipment is part of the circuit under test.
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.

a^1 = Refer to APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b^1 = Termination status. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Requested action has successfully completed.
NOT_STARTED = Requested action has not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

c^1 = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

d^1 = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTION TO BE TAKEN

For Format 1, none.

For Format 2, determine the correct phase number and reenter the exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>

   .  .  .  .  .  .  .  .  .  .

2. REASON FOR OUTPUT

To describe the result of the EX:ISLUHLSC input message that is issued to interactively diagnose an integrated
services line unit (ISLU) high level service circuit. Format 1 prints when the specified segments have completed and
all tests passed. This applies only when the RPT option was specified in the input message. Execution of the
diagnostic will continue for the remaining iterations. Format 2 prints when the diagnostic execution has completed,
stopped, not started, or aborted. If the termination report is NOT STARTED, an incorrect phase number was
specified in the input message. Format 3 indicates that execution of the diagnostic has been suspended. Both
Formats 4 and 5 print when one or more tests have failed. Format 5 provides an ordered list of suspected faulty
circuit packs.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = ISLU number.
c = ISLU service group number.
d = High level service circuit number.
e = Phase result. Valid value(s):
   ATP            = All tests were performed and all passed.
   CATP           = Some tests were skipped because supporting hardware was not available, but all
tests that were run passed.
NTR = No tests were run.
STF = Some tests failed.

f = Termination report. Valid value(s):
ABORTED = Immediate termination
COMPLETED = Successful completion
NOT STARTED = Action has not begun
STOPPED = Terminated before normal completion

= Information that qualifies the above termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

h = Phase result. Valid value(s):
ATP = All tests were performed and all passed.
CATP = Some tests were skipped because supporting hardware was not available, but all tests that were run passed.
NTR = No tests were run.
STF = Some tests failed.

i = Number of the phase in which execution was suspended.
j = Number of the segment in which execution was suspended.
k = Number of the phase in which the error occurred.
l = Number of the segment in which the error occurred.
m = Number of the test that failed.
n = Mismatch results for the specified test.
o = Expected result for the specified test (in hexadecimal).
p = Mask used to determine the test failure (in hexadecimal).
q = Actual result of the specified test (in hexadecimal).
r = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list
LAST = Last record of list
NEXT = Next record of continuing list

s = Floor and aisle number.
t = Module type.
u = Module number.
v = Cabinet type.
w = Cabinet number.
4. ACTION TO BE TAKEN

For Format 1, none.

For Format 2, if the termination report is NOT STARTED, an incorrect phase number was specified in the input message. Determine the correct phase number and reissue the exercise input message.

If unexpected results occur, refer to the Corrective Maintenance manual.

For Format 3:

<table>
<thead>
<tr>
<th>If the phase result is:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>NTR and no phase number or segment number is given</td>
<td>Reissue the EX:ISLUHLSC input message for the purpose of troubleshooting.</td>
</tr>
<tr>
<td>NTR and phase and segment numbers are given, and the RPT option was specified in the input message</td>
<td>The exercise has completed normally. If the RPT option was not specified in the input message, determine the reason that no tests were run and reissue the exercise input message.</td>
</tr>
<tr>
<td>ATP</td>
<td>A lack of resources for the previously specified segments inhibited some of the tests. Idle the suspected resources and reissue the input message.</td>
</tr>
<tr>
<td>STF</td>
<td>Analyze the test failure data. Repair the faulty unit and issue another exercise input message to continue troubleshooting.</td>
</tr>
</tbody>
</table>

For Format 4, analyze the failure data to determine the reason for failure.

For Format 5, replace the suspected circuit packs one at a time in the order specified. Rerun the diagnostic exercise after each replacement until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of executing an EX:ISLULBD input message to exercise an integrated services line unit line board (ISLULBD).

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input messages. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates that execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous command may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Integrated services line unit (ISLU) number.
c = Line group number.
d = Line board number.
e = Loop result. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Conditionally ATP. Some tests were skipped because supporting hardware was not available, but all tests passed which were run.
   NTR = No tests run.
   STF = Some tests failed.

f = Reason the command was rejected.
g = Phase in which the failure occurred.
h = Segment in which the failure occurred.
i = Test that failed.
j = Mismatch results for the specified test in hexadecimal.
k = Expected result in hexadecimal for the specified test in hexadecimal.
l = Mask in hexadecimal used to determine test failure in hexadecimal.
m = Actual result in hexadecimal for the specified test in hexadecimal.
n = Type of suspension. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Conditionally ATP. Some tests were skipped because supporting hardware was not available, but all tests passed which were run.
   NTR = No tests run.
   STF = Some tests failed.

o = Phase where execution is suspended.
p = Segment where execution is suspended.
q = Floor and aisle number.
r = Module type.
s = Module number.
t = Cabinet type.
u = Cabinet number.
v = Replacement equipment code(s).
w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.
Example of CODE FORM content:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
A  = Current minimal accepted equipment code.
B  = Current production equipment code (substitutable equipment for code A).
C  = Additional compatible equipment code(s) (added as space permits).
D  = Current minimal approved operating level for equipment code A.
E  = Current minimal approved operating level for equipment code B.
F  = Current minimal approved operating level(s) for equipment code(s) C.
:  = Intra-field delimiter.
-  = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x  = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
y  = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
z  = Depth location in the cabinet.

a1  = Circuit type. Valid value(s):
HPR  = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL  = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.
___  = Equipment is part of the circuit under test.

b1  = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

c1  = Termination status. Valid value(s):
ABORTED  = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Requested action has successfully completed.
NOT STARTED = Requested action has not begun.
STOPPED  = Requested action was terminated before a normal completion. Termination was graceful.

d1  = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

e1  = Text identifier showing order of record. Valid value(s):
FIRST   = First record of continuing list.
LAST    = Last record of list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTION TO BE TAKEN

For Format 1, none.

For Format 2, determine the correct phase number and reenter the exercise request.

For Format 3, repair the faulty unit.

For Format 4:

2. REASON FOR OUTPUT

To report the results of executing an EX:ISLULC input message to exercise an integrated services line unit line card (ISLULC).

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input messages. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates that execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous command may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Integrated services line unit (ISLU) number.
c = Line group controller number.
d = Line card number.
e = Loop result. Valid value(s):
  ATP = All tests performed and passed.
  CATP = Conditionally ATP. Some tests were skipped because supporting hardware was
          not available, but all tests passed which were run.
  NTR = No tests run.
  STF = Some tests failed.
f = Reason the command was rejected.
g = Phase in which the failure occurred.
h = Segment in which the failure occurred.
i = Test that failed.
j = Mismatch results for the specified test in hexadecimal.
k = Expected result in hexadecimal for the specified test in hexadecimal.
l = Mask in hexadecimal used to determine test failure in hexadecimal.
m = Actual result in hexadecimal for the specified test in hexadecimal.
n = Type of suspension. Valid value(s):
  ATP = All tests were performed and passed.
  CATP = Conditionally ATP. Some tests were skipped because supporting hardware was
          not available, but all tests passed which were run.
  NTR = No tests run.
  STF = Some tests failed.
o = Phase where execution is suspended.
p = Segment where execution is suspended.
q = Floor and aisle number.
r = Module type.
s = Module number.
t = Cabinet type.
u = Cabinet number.
v = Replacement equipment code(s).
w = Equipment form(s). Equipment form represents minimal operating level of replacement
   equipment.
Example of CODE FORM content:

```
CODE
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
```

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Depth location in the cabinet.

a¹ = Circuit type. Valid value(s):
  HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
  ONL = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.
    ___ = Equipment is part of the circuit under test.

b¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

c¹ = Termination status. Valid value(s):
  ABORTED = Requested action was terminated before completion, and the termination was not graceful.
  COMPLETED = Requested action has successfully completed.
  NOT STARTED = Requested action has not begun.
  STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

d¹ = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

e¹ = Text identifier showing order of record. Valid value(s):
  FIRST = First record of continuing list.
  LAST = Last record of list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTION TO BE TAKEN

For Format 1, none.

For Format 2, determine the correct phase number and reenter the exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only EX ISLULC (a,b,c,d) SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>

2. REASON FOR OUTPUT

To report the results of executing an EX:ISLULCKT input message to exercise an integrated services line unit line circuit (ISLULCKT).

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input messages. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates that execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous command may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Integrated services line unit (ISLU) number.

c = Line group number.

d = Line board number.

e = Line circuit number.

f = Loop result. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Conditionally ATP. Some tests were skipped because supporting hardware was not available, but all tests passed which were run.
   NTR = No tests run.
   STF = Some tests failed.

g = Reason the command was rejected.

h = Phase in which the failure occurred.

i = Segment in which the failure occurred.

j = Test that failed.

k = Mismatch results for the specified test in hexadecimal.

l = Expected result in hexadecimal for the specified test in hexadecimal.

m = Mask in hexadecimal used to determine test failure in hexadecimal.

n = Actual result in hexadecimal for the specified test in hexadecimal.

o = Type of suspension. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Conditionally ATP. Some tests were skipped because supporting hardware was not available, but all tests passed which were run.
   NTR = No tests run.
   STF = Some tests failed.

p = Phase where execution is suspended.

q = Segment where execution is suspended.

r = Floor and aisle number.

s = Module type.

t = Module number.

u = Cabinet type.

v = Cabinet number.

w = Replacement equipment code(s).
x = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM content:

```
CODE

2. REASON FOR OUTPUT

To report the results of executing an EX:ISLULGC input message to exercise an integrated services line unit line group controller (ISLULGC).

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input messages. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates that execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous command may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Integrated services line unit (ISLU) number.
c = Line group controller number.
d = Loop result. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Conditionally ATP. Some tests were skipped because supporting hardware was not available, but all tests passed which were run.
   NTR = No tests run.
   STF = Some tests failed.
e = Reason the command was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test that failed.
i = Mismatch results for the specified test in hexadecimal.
j = Expected result in hexadecimal for the specified test in hexadecimal.
k = Mask in hexadecimal used to determine test failure in hexadecimal.
l = Actual result in hexadecimal for the specified test in hexadecimal.
m = Type of suspension. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Conditionally ATP. Some tests in the specified segment were skipped because supporting hardware was not available, but all tests passed which were run.
   NTR = No tests run.
   STF = Some tests failed.
n = Phase where execution is suspended.
o = Segment where execution is suspended.
p = Floor and aisle number.
q = Module type.
r = Module number.
s = Cabinet type.
t = Cabinet number.
u = Replacement equipment code(s).
v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM content:
CODE
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
: = Intra-field delimiter.
_ = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Depth location in the cabinet.

z = Circuit type. Valid value(s):
    ___ = Equipment is part of the circuit under test.
    HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
    ONL = Equipment is part of the online member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.

a¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b¹ = Termination status. Valid value(s):
    ABORTED = Requested action was terminated before completion, and the termination was not graceful.
    COMPLETED = Requested action has successfully completed.
    NOT STARTED = Requested action has not begun.
    STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

c¹ = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

d¹ = Text identifier showing order of record. Valid value(s):
    FIRST = First record of continuing list.
    NEXT = Next record of continuing list.
    LAST = Last record of list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

4. ACTION TO BE TAKEN

For Format 1, none.

For Format 2, determine the correct phase number and reenter the exercise request.

For Format 3, repair faulty unit.

For Format 4:

<table>

4. ACTION TO BE TAKEN

For Format 1, none.

For Format 2, if the termination report is NOT STARTED, an incorrect phase number was specified in the input message. Determine the correct phase number and reissue the exercise message. If unexpected results occur, refer to the Corrective Maintenance manual.

For Format 3, if the phase result is NTR and no phase number or segment number is given, reissue the EX:ISLUMAN message for the purpose of troubleshooting.

If the phase result is NTR and phase and segment numbers are given, and the RPT option was specified in the input message, then the exercise has completed normally. If the RPT option was not specified in the input message, determine the reason that no tests were run and reissue the exercise message.

If the phase result is ATP, then a lack of resources for the previously specified segments inhibited some of the tests. Idle the suspected resources and reissue the message.

If the phase result is STF, analyze the test failure data. Repair the faulty unit and issue another exercise message to continue troubleshooting.

For Format 4, analyze the failure data to determine the reason for failure.

For Format 5, replace the suspected circuit packs one at a time in the order specified. Rerun the diagnostic exercise after each replacement until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

Both Formats 4 and 5 print when one or more tests have failed.

Format 5 provides an ordered list of suspected faulty circuit packs.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = ISLU number.

c = ISLU service group number.

d = Phase result. Valid value(s):
ATP = All tests were performed and all passed.
CATP = Some tests were skipped because supporting hardware was not available, but all tests that were run passed.
NTR = No tests were run.
STF = Some tests failed.

e = Termination report. Valid value(s):
ABORTED = Immediate termination
COMPLETED = Successful completion
NOT_STARTED = Action has not begun
STOPPED = Terminated before normal completion

f = Information that qualifies the above termination report. Refer to the APP-MAINT-RESP appendix in the Appendixes section of the Output Message manual.

G = Phase result. Valid value(s):
ATP = All tests were performed and all passed.
CATP = Some tests were skipped because supporting hardware was not available, but all tests that were run passed.
NTR = No tests were run.
STF = Some tests failed.

h = Number of the phase in which execution was suspended.
i = Number of the segment in which execution was suspended.
j = Number of the phase in which the error occurred.
k = Number of the segment in which the error occurred.
l = Number of the test that failed.
m = Mismatch results for the specified test.
n = Expected result for the specified test (in hexadecimal).
o = Mask used to determine the test failure (in hexadecimal).
p = Actual result of the specified test (in hexadecimal).
q = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.
r = Floor and aisle number.
s = Module type.
t = Module number.
u = Cabinet type.
\[ v \] = Cabinet number.

\[ w \] = Circuit pack code number.

\[ x \] = Equipment form. The equipment form represents the minimal operating level of replacement equipment.

\[ y \] = Vertical location in the cabinet.

\[ z \] = Horizontal location in the cabinet.

\[ a^1 \] = Circuit type.

\[ b^1 \] = Note number. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

### 4. ACTION TO BE TAKEN

For Format 1, none.

For Format 2, if the termination report is NOT STARTED, an incorrect phase number was specified in the input message. Determine the correct phase number and reissue the exercise message.

If unexpected results occur, refer to Corrective Maintenance manual.

For Format 3:

<table>
<thead>
<tr>
<th>'g'</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>NTR</td>
<td>No phase number or segment number is given, reissue the EX:ISLURG message for the purpose of troubleshooting.</td>
</tr>
<tr>
<td></td>
<td>Phase and segment numbers are given, and the RPT option was specified in the input message, then the exercise has completed normally. If the RPT option was not specified in the input message, determine the reason that no tests were run and reissue the exercise message.</td>
</tr>
<tr>
<td>ATP</td>
<td>A lack of resources for the previously specified segments inhibited some of the tests. Idle the suspected resources and reissue the message.</td>
</tr>
<tr>
<td>STF</td>
<td>Analyze the test failure data. Repair the faulty unit and issue another exercise message to continue troubleshooting.</td>
</tr>
</tbody>
</table>

For Format 4, analyze the failure data to determine the reason for failure.

For Format 5, replace the suspected circuit packs one at a time in the order specified. Rerun the diagnostic exercise after each replacement until the fault is repaired or the diagnostic results change.

### 5. ALARMS

None.

### 2. REASON FOR OUTPUT

To report the result of executing an EX:ISTF input message to diagnose the integrated services test function (ISTF) unit.

Format 1 indicates that the specified segments have been completed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified options in the input message were invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedures (TLPs) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = ISTF unit number.
c  = Loop result. Valid value(s):
   ATP  = All tests pass. All tests were performed and passed.
   CATP = Conditional all tests pass. Some tests were not performed, but all that were passed.
   NTR  = No tests run.
   STF  = Some tests failed.
d  = Reason the command was rejected.
e  = Phase in which the failure occurred.
f  = Segment in which the failure occurred.
g  = Test number that failed.
h  = Mismatch results for the specified test in hexadecimal.
i  = Raw data expected result for the specified test in hexadecimal.
j  = Raw data mask used to determine the test failure in hexadecimal.
k  = Raw data actual result for the specified test in hexadecimal.
l  = Type of suspension. Valid value(s):
   ATP  = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment completed but some portion was skipped.
   NTR  = No tests were run since the last completion message.
   STF  = The diagnostic has completed and some tests failed.
m  = Phase number in which execution is suspended.
n  = Segment number in which execution is suspended.
o  = Identification number of floor and aisle.
p  = Module type.
q  = Module number.
r  = Cabinet type.
s  = Cabinet number.
= Replacement equipment code(s).

u = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]

A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

v = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

w = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

x = Circuit type. Valid value(s):
    ____ = Equipment is part of the circuit under test.
    HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
    ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

y = Board note. Refer to the APP:TLP-NOTE appendix is the appendixes section of the Output Message manual.

z = Termination status. Valid value(s):
    ABORTED = The process was terminated (process not gracefully terminated).
    NOT STARTED = Action was not begun.
    STOPPED = Terminated before normal completion (process gracefully terminated).

a = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Message manual.

b = Text identifier showing order of record. Valid value(s):
    FIRST = First record of continuing list.
    LAST = Last record of list.
    NEXT = Next record of continuing list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

c₁ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

d₁ = Statement number.

e₁ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, none.

For Format 2, determine the correct phase numbers and reenter the diagnostic exercise request.

For Format 3, if fields ‘i’ and ‘k’ of Format 1 do not match, refer to the APP:TLP-NOTE appendix in the Appendixes section in the Output Message manual. If this does not assist in solving the problem, rerun the diagnostic with the ‘RAW’ and ‘UCL’ options. Give the resulting output to a diagnostician for interpretation.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only EX ISTF(a,b) SUSPENDED NTR</td>
<td>enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>EX ISTF(a,b) SUSPENDED ATP PH m SEG</td>
<td>The fault may have been repaired. Rerun the entire exercise to determine the condition of the circuit.</td>
</tr>
<tr>
<td>EX ISTF(a,b) SUSPENDED CATP PH m SEG</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous command.</td>
</tr>
<tr>
<td>EX ISTF(a,b) SUSPENDED NTR PH m SEG and the RPT option was specified</td>
<td>This message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>EX ISTF(a,b) SUSPENDED STF PH m SEG</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the diagnostic exercise for each replaced pack until the fault is repaired or the diagnostic results change.

For Formats 6 and 7, none.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

EX:ISTF

Output Appendix(es):
EX:LDPARM

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] EX LDPARM MASC MEM TEST INPUT VALUES
   START ADDRESS = a
   [ERROR: b]
   END ADDRESS = c
   [ERROR: b]
   REFRESH RATE = d MS
   [ERROR: b]
   NUMBER OF FAILURES = e
   [DATA PATTERN = f]
   [ERROR: b]

[2] EX LDPARM MASC UPD TEST INPUT VALUES
   START ADDRESS = a
   [ERROR: b]
   END ADDRESS = c
   [ERROR: b]
   REFRESH RATE = d MS
   [ERROR: b]
   NUMBER OF FAILURES = e
   WORDS PER ARRAY TO COPY = g
   [ERROR: b]
   REFRESH DATA PARITY CHECK TIME = h SEC

2. REASON FOR OUTPUT

To echo the memory test parameters input manually as part of the control unit (CU) interactive diagnostic mode using the EX:CU input message in conjunction with EX:LDPARM input message. This output comes from main store diagnostic phases 95 or 96.

Format 1 is printed when mainstore controller (MASC) phase 95 is executed. Format 2 is printed when MASC phase 96 is executed.

3. VARIABLE FIELD DEFINITIONS

a = First or lowest address in the address range of memory to be tested, in hexadecimal notation.

b = Error message explaining why previous line was not accepted. Valid value(s):
   ADDRESS MUST BE GREATER THAN 0
   ADDRESS MUST BE ON FULLWORD BOUNDARY
   START ADDRESS GREATER THAN END ADDRESS
   END ADDRESS TOO LARGE
   NOT POSSIBLE REFRESH RATE
   ERROR VALID REFRESH RATES ARE 2, 4, 6, 8, 10, 12, 14, 16, 32, 36, 40, 44, 48, 52, 56, 60 (3B20D)
ERROR VALID REFRESH RATES ARE 16, 18, 20, 22, 24, 26, 28, 30 (3B21D

\[ c \] = Last or highest address in the address range of memory to be tested, in hexadecimal notation.

\[ d \] = Rate at which the memory is refreshed by the main store controller, in decimal notation. The possible refresh rate values are:

\[ e \] = Number of addresses for which failing information is to be collected, in decimal notation.

\[ f \] = Data to be written into each memory location in the address range under test, in hexadecimal notation. (MASC phase 95.)

\[ g \] = Words per memory array to copy from the online to the off-line memory, in hexadecimal notation. (MASC phase 96.)

\[ h \] = Valid value(s):

<table>
<thead>
<tr>
<th>Unit:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>3B20D</td>
<td>Duration of time, in seconds, for which refresh data parity checks are allowed as a mechanism to scan for errors, in decimal notation. (MASC phase 96.)</td>
</tr>
<tr>
<td>3B21D</td>
<td>This field is always 0.</td>
</tr>
</tbody>
</table>

4. ACTION TO BE TAKEN

Reenter the memory test parameters using the EX:CU and then the EX:LDPARM input message if the values are not as desired.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the result of executing a EX:LDSF input message to diagnose the local digital service function (LDSF) circuit.

Format 1 indicates that the specified segments have been completed. It applies only when the RPT option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified options in the input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous message, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedures (TLPs) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = LDSF number.

c = Loop result. Valid value(s):
   ATP = All test were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.

d = Reason the message was rejected.

e = Phase in which the failure occurred.

f = Segment in which the failure occurred.

g = Test number that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Raw data expected result for the specified test in hexadecimal.

j = Raw data mask used to determine the test failure in hexadecimal.

k = Raw data actual result for the specified test in hexadecimal.

l = Type of suspension. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

m = Phase number in which execution is suspended.

n = Segment number in which execution is suspended.

o = Identification number of floor and aisle.

p = Module type.

q = Module number.

r = Cabinet type.

s = Cabinet number.

t = Replacement equipment code(s).
= Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

v = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

w = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

x = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

y = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ = Equipment is part of the circuit under test.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a1 = Termination status. Valid value(s):
ABORTED = Immediate termination.
COMPLETED = Successful completion.
NOT STARTED = Action has not begun.
STOPPED = Terminated before normal completion.

b1 = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of this section.

c1 = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d1 = Statement number.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, none.

For Format 2, determine the correct phase numbers and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>

2. REASON FOR OUTPUT

To report the result of executing a EX:LDSU input message to diagnose the local digital service unit - model 2
(LDSU2) board.

Format 1 indicates that the specified segments have been completed. It applies only when the RPT option was
specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified options in the input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension
occurs, and a summary of the results of the previous message, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It
applies only when the trouble location procedures (TLPs) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Local digital service unit (LDSU) number.
c = Service group number.
d = Loop result. Valid value(s):
   ATP = All test were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.
e = Reason the message was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test number that failed.
i = Mismatch results for the specified test in hexadecimal.
j = Raw data expected result for the specified test in hexadecimal.
k = Raw data mask used to determine the test failure in hexadecimal.
l = Raw data actual result for the specified test in hexadecimal.
m = Type of suspension. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

n = Phase number in which execution is suspended.
o = Segment number in which execution is suspended.
p = Identification number of floor and aisle.
q = Module type.
r = Module number.
s = Cabinet type.
t = Cabinet number.
u = Replacement equipment code(s).

v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to subsequent example. Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Circuit type. Valid value(s):
_____ = Equipment is part of the circuit under test.
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a¹ = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

b¹ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of this section.

c¹ = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.
\( d^1 \) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\( e^1 \) = Statement number.

\( f^1 \) = Reason why some tests were not performed.

4. ACTIONS TO BE TAKEN

For Format 1, none.

For Format 2, determine the correct phase numbers and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>

2. REASON FOR OUTPUT

To report the result of executing an EX:LDSUCOM input message to diagnose the local digital service circuit unit common (LDSCUCOM) board.

Format 1 indicates that the specified segments have been completed, and reports the overall result. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous input messages, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedures (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution has terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Local digital service unit (LDSU) number.
c = Service group number.
d = Loop result. Valid value(s):
   ATP = All test were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.
e = Reason the input messages was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test number that failed.
i = Mismatch results for the specified test in hexadecimal.
j = Raw data expected result for the specified test in hexadecimal.
k = Raw data mask used to determine the test failure in hexadecimal.
l = Raw data actual result for the specified test in hexadecimal.
m = Result of previous input messages. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

n = Phase number in which execution is suspended.
o = Segment number in which execution is suspended.
p = Identification number of floor and aisle.
q = Module type.
r = Module number.
s = Cabinet type.
t = Cabinet number.

u = Replacement equipment code(s).

v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]

- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code ‘A’).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code ‘A’.
E = Current minimal approved operating level for equipment code ‘B’.
F = Current minimal approved operating level(s) for equipment code(s) ‘C’.

Codes ‘A’, ‘B’, and ‘C’ may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms ‘D’, ‘E’, and ‘F’ may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a1 = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

b1 = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c1 = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d\(^1\) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

e\(^1\) = Statement number.

f\(^1\) = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2 determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTR</td>
<td>Enter the first exercise input messages for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous input messages.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH n SEG o and the RPT option was specified</td>
<td>This message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

Output Appendix(es):

   APP: MAINT-RESP
   APP: TLP-NOTE
EX:LI

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

EX LI=a b [c]

2. REASON FOR OUTPUT

To acknowledge that a manual request to exercise a link interface (LI) is complete.

3. VARIABLE FIELD DEFINITIONS

a = The office network and timing complex (ONTC) side the LI is on.
b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   NOT_STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.
c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the variable ‘c’ field should give some indication as to why the request failed.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   EX:LI
   OP:CFGSTAT

Output Message(s):

   OP:CFGSTAT
EX:LN

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] EX LNa b c d [e]

[2] EX LNa b PH f g [h]
   TEST    MISMATCH
   i         j

2. REASON FOR OUTPUT

To print the results of a diagnostic run on a link node (LN) in the interactive mode.

Format 1 prints at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 prints whenever the diagnostic results are printed for an individual phase.

3. VARIABLE FIELD DEFINITIONS

a = Ring node (RN) group number.
b = Ring node member number.
c = Termination mode of diagnostic. Valid value(s):
   ABORTED = Diagnostic was abnormally stopped due to an external or internal error in execution.
   COMPLETED = Diagnostic passed normally.
   TERMINATED = Diagnostic terminated under program control (early termination).
d = Result of the diagnostic. Valid value(s):
   ATP = All tests passed.
   CATP = All tests that were executed were ATP. Some tests were not executed due to the inability to isolate, or to singly isolate, the node under test.
   NTR = No tests run.
   STF = Some tests failed.

e = Valid value(s):

| CATP or NTR | Identifies the reason that tests were skipped in this phase by their bit position in a 16-character hexadecimal number. For example, if 'e' = 00000000 80000000, tests were skipped for reason 31. The reason codes are as follows:  
|--------------|---------------------------------------------------------------|
| 0 to 29 = Not used.  
| 30 = Node under test was not the only isolated node.  
| 31 = Node under test was not isolated.  
| 32 to 63 = Not used.  |
STF

<table>
<thead>
<tr>
<th>STF</th>
<th>Number of test failures in addition to the reasons that tests were skipped. For example, if 'e' = 7 00000000 80000000, seven tests failed, plus tests were skipped for reason 31.</th>
</tr>
</thead>
</table>

f = Phase number.

g = Result of the phase. Valid value(s):

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATP</td>
<td>All tests passed.</td>
</tr>
<tr>
<td>CATP</td>
<td>All tests that were executed were ATP. Some tests were not executed due to the inability to isolate, or to singly isolate, the node under test.</td>
</tr>
<tr>
<td>NTR</td>
<td>No tests run.</td>
</tr>
<tr>
<td>STF</td>
<td>Some tests failed.</td>
</tr>
</tbody>
</table>

h = If 'g' = STF, identifies the reason that some tests were skipped. This field is the same as the 'e' field in Format 1 except that the result of only one phase is reflected.

i = Test number of the failing test.

j = An 8-digit hexadecimal number that indicates the bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

4. ACTION TO BE TAKEN

5. ALARMS

None.

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] EX LOOP a [b] INVALID BEGIN

[2] EX LOOP a [b] INVALID END d

[3] EX LOOP a [b] BETWEEN ST c-d

[4] EX LOOP REQUEST NOT YET ACTIVE

[5] EX LOOP REQUEST NOT IN INTERACTIVE MODE

[6] EX LOOP ILLEGAL REQUEST TYPE

2. REASON FOR OUTPUT

To report the result of executing an EX:LOOP interactive diagnostic input message as part of an EX:LN or
EX:RPCN input message.

Format 1 prints if the specified loop start data table statement number cannot be found.

Format 2 prints if the specified loop end data table statement number cannot be found by searching forward in the
data table from the loop start statement.

Format 3 prints if a diagnostic program loop has been established as specified in the input message.

Format 4 prints if the unit (and subunit) specified by the interactive diagnostic input message is not in the active
queue.

Format 5 prints if the unit (and subunit) specified by the interactive diagnostic input message is in the active queue
but not an active request.

Format 6 prints if the unit (and subunit) specified by the interactive diagnostic input message could not be found in
either the waiting or active queues.

3. VARIABLE FIELD DEFINITIONS

a = Unit type and member number of unit under test.

b = Unit type and member number of the subunit under the unit under test.

c = Starting data table statement number.
d = Ending data table statement number.

4. ACTION TO BE TAKEN

For Formats 1 and 2, reenter the input message using a valid start or end statement number.

For Format 3, no action is needed.

For Formats 4, 5, and 6, reenter the input message after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input message. Use the OP:DMQ input message to display the requests in the queue. Enter the desired interactive diagnostic request if it is not in the queue. Wait until the desired interactive diagnostic request becomes active, or use the STOP:DMQ or STP:DMQ input message to remove other request(s) from the queue until the desired interactive diagnostic request becomes active.

5. ALARMS

None. This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Input Messages manual.

2. REASON FOR OUTPUT

To report the result of executing an EX:LUCHAN input message to diagnose the line unit channel (LUCHAN).

Format 1; indicates that the specified segments have been completed, and reports the overall result. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2; indicates that the specified input message was invalid.

Format 3; indicates that a test has failed and specifies which test.

Format 4; indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5; provides an ordered list of equipment packs on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

Format 6; indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Line unit number.
c = Service group number.
d = Channel board number.
e = Channel number.
f = Loop result. Valid value(s):
   ATP = All test were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.

g = Reason the input message was rejected.
h = Phase in which the failure occurred.
i = Segment in which the failure occurred.
j = Test number that failed.
k = Mismatch results for the specified test in hexadecimal.
l = Raw data expected result for the specified test in hexadecimal.
m = Raw data mask used to determine the test failure in hexadecimal.
n = Raw data actual result for the specified test in hexadecimal.
o = Result of previous command. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

p = Phase number in which execution is suspended.
q = Segment number in which execution is suspended.
r = Identification number of floor and aisle.
s = Module type.
t = Module number.
u = Cabinet type.

v = Cabinet number.

w = Replacement equipment code(s).

x = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE
A[:B][C] ... D[:E][F]
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

y = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

z = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

a¹ = Circuit type. Valid value(s):
_____ = Equipment is part of the circuit under test.
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

b¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

c¹ = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

d¹ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.
4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTR</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH p SEG q</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH p SEG q</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous message.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH p SEG q and the RPT option was specified</td>
<td>This message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH p SEG q</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

For Formats 6 and 7, no action is required.

5. ALARMS

None.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ = Equipment is part of the circuit under test.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

b = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
e¹ = Statement number.
f¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTR</td>
<td>Enter the first exercise input message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous input message.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH n SEG o and the RPT option was specified</td>
<td>This message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

For Formats 6 and 7, no action is required.

5. ALARMS

### 2. REASON FOR OUTPUT

To report the result of executing an EX:LUHLSC input message to diagnose the line unit high level service circuit (LUHLSC).

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous input message, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution has terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

- a = Switching module (SM) number.
- b = Line unit number.
- c = Service group number.
- d = High level service circuit number.
- e = Loop result. Valid value(s):
  - ATP = All test were performed and all passed.
  - CATP = Some tests were not performed, but all that were passed.
  - NTR = No tests run.
  - STF = Some tests failed.
- f = Reason the input message was rejected.
- g = Phase in which the failure occurred.
- h = Segment in which the failure occurred.
- i = Test number that failed.
- j = Mismatch results for the specified test in hexadecimal.
- k = Raw data expected result for the specified test in hexadecimal.
- l = Raw data mask used to determine the test failure in hexadecimal.
- m = Raw data actual result for the specified test in hexadecimal.
- n = Result of previous input message. Valid value(s):
  - ATP = The specified segment(s) were completed and all tests passed.
  - CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
  - NTR = No tests were run since the last completion message.
  - STF = The diagnostic has completed and some tests failed.
- o = Phase number in which execution is suspended.
- p = Segment number in which execution is suspended.
- q = Identification number of floor and aisle.
- r = Module type.
- s = Module number.
= Cabinet type.

u = Cabinet number.

v = Replacement equipment code(s).

w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type.
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

a¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b¹ = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

c¹ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.
d\(^1\) = Text identifier showing order of record.
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

e\(^1\) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

f\(^1\) = Statement number.

g\(^1\) = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTR</td>
<td>Enter the first exercise input message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH o SEG p</td>
<td>the fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH o SEG p</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous input message.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH o SEG p and the RPT option was specified</td>
<td>This message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH o SEG p</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

For Formats 6 and 7, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing an EX:MA input message to diagnose the metallic access (MA) board.

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous input message, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = MSU board number.
e = Loop result. Valid value(s):
   ATP = All tests were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.
f = Reason the input message was rejected.
g = Phase in which the failure occurred.
h = Segment in which the failure occurred.
i = Test number that failed.
j = Mismatch results for the specified test in hexadecimal.
k = Raw data expected result for the specified test in hexadecimal.
l = Raw data mask used to determine the test failure in hexadecimal.
m = Raw data actual result for the specified test in hexadecimal.
n = Result of previous input message. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.
o = Phase number in which execution is suspended.
p = Segment number in which execution is suspended.
q = Identification number of floor and aisle.
r = Module type.
s = Module number.
t = Cabinet type.
u  = Cabinet number.
v  = Replacement equipment code(s).
w  = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

```plaintext
CODE
A[:B]...[:C] [-] D[:E]...[:F]
:  = Intra-field delimiter.
-  = Inter-field delimiter if necessary.
A  = Current minimal accepted equipment code.
B  = Current production equipment code (substitutable equipment for code 'A').
C  = Additional compatible equipment code(s) (added as space permits)
D  = Current minimal approved operating level for equipment code 'A'.
E  = Current minimal approved operating level for equipment code 'B'.
F  = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x  = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y  = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z  = Circuit type. Valid value(s):
HPR  = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL  = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

___  = Equipment is part of the circuit under test.

a^  = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b^  = Termination status. Valid value(s):
ABORTED  = The process was terminated (process not gracefully terminated).
NOT_STARTED  = Action was not begun.
STOPPED  = Terminated before normal completion (process gracefully terminated).

c^  = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendix section of the Output Messages manual.

d^  = Text identifier showing order of record:
FIRST = First record of continuing list.
NEXT = Next record of continuing list.
LAST = Last record of list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

e¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
f¹ = Statement number.
g¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>

u = Cabinet number.
v = Replacement equipment code(s).
w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to subsequent example.
Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
z = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ____ = Equipment is part of the circuit under test.

a¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b¹ = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT_STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

c¹ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

d¹ = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.
\[ e^1 \] = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\[ f^1 \] = Statement number.

\[ g^1 \] = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, none.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, replace the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>only SUSPENDED NTR</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH o SEG p</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH o SEG p</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and re-enter the previous message.</td>
</tr>
<tr>
<td>SUSPECTED STF PH o SEG p</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected packs, one at a time in the order specified. Rerun the entire diagnostic after each substitution until the fault is repaired or the diagnostic result changes.

For Formats 6 and 7, none.

5. ALARMS

None.

[6] EX MHD a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the moving head disk (MHD) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = The result of the diagnostic. Valid value(s):
ATP = All tests passed.
NTR = No tests were executed.
STF = Some tests failed.

c = If 'b' = STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (70000000000000000), seven tests failed and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.
Note: For Format 3 the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.

g = The bits which were actually received from the hardware device.

h = Determines which bits in 'g' are included in this test.

i = The value which the test expected.

j = Last statement successfully executed before the diagnostic terminated.
k = Current test number when diagnostic terminated.
l = Task number assigned to the request.

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2 - 4, if 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required.

EX:MI

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

EX MI=a b [c]

2. REASON FOR OUTPUT

To acknowledge that a manual request to exercise a message interface (MI) is complete.

3. VARIABLE FIELD DEFINITIONS

a = The office network and timing complex (ONTC) side the MI is on.

b = Termination report. Valid value(s):
   ABORTED Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED Requested action completed successfully.
   NOT STARTED Requested action could not begin.
   STOPPED Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the variable 'c' field should give some indication as to why the request failed.

5. ALARMS

None.

2. REASON FOR OUTPUT

To acknowledge that a manual request, from EX:MMP, to exercise a module message processor (MMP) is complete.

3. VARIABLE FIELD DEFINITIONS

a = Message switch control unit (MSCU) side.
b = MMP number.
c = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
COMPLETED = Request completed successfully.
NOT_STARTED = Requested action could not begin.
STOPPED = Request was terminated before a normal completion.
d = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the ‘d’ field should give some indication as to why the request failed. Check MMP MCC pages or OP:CFGSTAT output message to verify that the MMP was in a valid state to perform the request.

2. REASON FOR OUTPUT

To report the result of executing an EX:MSUCOM input message to diagnose the metallic service unit common (MSUCOM) board.

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution has terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

\begin{itemize}
  \item \textbf{a} = Switching module (SM) number.
  \item \textbf{b} = Metallic service unit (MSU) number.
  \item \textbf{c} = Service group number.
  \item \textbf{d} = Loop result. Valid value(s):
    \begin{itemize}
      \item \textbf{ATP} = All test were performed and all passed.
      \item \textbf{CATP} = Some tests were not performed, but all that were passed.
      \item \textbf{NTR} = No tests run.
      \item \textbf{STF} = Some tests failed.
    \end{itemize}
  \item \textbf{e} = Reason the command was rejected.
  \item \textbf{f} = Phase in which the failure occurred.
  \item \textbf{g} = Segment in which the failure occurred.
  \item \textbf{h} = Test number that failed.
  \item \textbf{i} = Mismatch results for the specified test in hexadecimal.
  \item \textbf{j} = Raw data expected result for the specified test in hexadecimal.
  \item \textbf{k} = Raw data mask used to determine the test failure in hexadecimal.
  \item \textbf{l} = Raw data actual result for the specified test in hexadecimal.
  \item \textbf{m} = Result of previous command. Valid value(s):
    \begin{itemize}
      \item \textbf{ATP} = The specified segment(s) were completed and all tests passed.
      \item \textbf{CATP} = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
      \item \textbf{NTR} = No tests were run since the last completion message.
      \item \textbf{STF} = The diagnostic has completed and some tests failed.
    \end{itemize}
  \item \textbf{n} = Phase number in which execution is suspended.
  \item \textbf{o} = Segment number in which execution is suspended.
  \item \textbf{p} = Identification number of floor and aisle.
  \item \textbf{q} = Module type.
  \item \textbf{r} = Module number.
  \item \textbf{s} = Cabinet type.
\end{itemize}
t = Cabinet number.

u = Replacement equipment code(s).

v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a¹ = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

b¹ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c¹ = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d\(^1\) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
e\(^1\) = Statement number.
f\(^1\) = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6 and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous command.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH n SEG o</td>
<td>If the RPT option was specified, this message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

2. **REASON FOR OUTPUT**

Prints the results of the diagnostic executed on the magnetic tape (MT) in interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates that non-failing diagnostic results for an individual phase. This occurs if a partial diagnostic or RAW data was specified on the diagnostic request.

Format 3 indicates that the diagnostic results for an individual failing phase.

Format 4 indicates that the diagnostic was stopped due to an external or internal error in execution, or an input request.

Format 5 indicates that the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or the request has aborted.

3. **VARIABLE FIELD DEFINITIONS**

a = Member number.
b = The result of the diagnostic. Valid value(s):
ATP = All tests passed.
NTR = No tests were executed.
STF = Some tests failed.

c = If 'b' = STF, 'c' identifies the number of test failures in addition to the number of tests that were skipped. For example, if 'c' = (70000000000000000), seven tests failed and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.
Note: For Format 3, the values for 'g', 'h', and 'i' may be set to N/A. This means that this data is not available for the specified device.

= The bits that were actually received from the hardware device.

h = Determines bits in 'g' that are included in this test.

i = The value that the test expected.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when the diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2, 3, and 4, if 'b' = STF, the unit should be repaired as quickly as possible; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the result of executing an EX:MTB input message to diagnose the metallic access test bus (MTB). Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations. Format 2 indicates that the specified input message was invalid. Format 3 indicates that a test has failed and specifies which test. Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous input message, may also be specified. Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message. Format 6 indicates that the diagnostic execution has terminated. Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Metallic service unit (MSU) number.
c = Service group number.
d = MSU board number.
e = Loop result. Valid value(s):
   ATP = All test were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.
f = Reason the input message was rejected.
g = Phase in which the failure occurred.
h = Segment in which the failure occurred.
i = Test number that failed.
j = Mismatch results for the specified test in hexadecimal.
k = Raw data expected result for the specified test in hexadecimal.
l = Raw data mask used to determine the test failure in hexadecimal.
m = Raw data actual result for the specified test in hexadecimal.
n = Result of previous input message. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.
o = Phase number in which execution is suspended.
p = Segment number in which execution is suspended.
q = Identification number of floor and aisle.
r = Module type.
s = Module number.
t = Cabinet type.
u = Cabinet number.
v = Replacement equipment code(s).
w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:
CODE A[:B]...[:C] [-] D[:E]...[:F]
  : = Intra-field delimiter.
  - = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A')
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
  HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
  ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
  ____ = Equipment is part of the circuit under test.

a¹ = Refer to the APP:TLP-NOTE appendix in the Appendices section of the Output Messages manual.

b¹ = Termination status. Valid value(s):
  ABORTED = The process was terminated (process not gracefully terminated).
  NOT STARTED = Action was not begun.
  STOPPED = Terminated before normal completion (process gracefully terminated).

c¹ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendix section of the Output Messages manual.

d¹ = Text identifier showing order of record:
  FIRST = First record of continuing list.
  NEXT = Next record of continuing list.
  LAST = Last record of list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

e¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
4. ACTIONS TO BE TAKEN

For Format 1, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>

[6] EX MTC a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the magnetic tape controller (MTC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
The result of the diagnostic. Valid value(s):

- ATP = All tests passed.
- CATP = All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
- NTR = No tests were run.
- STF = Some tests failed.

If 'b' = 'c' = CATP or NTR
Identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, if 'c' = (00000000 0000018), tests were skipped for reasons 3 and 4.

STF
Identifies the number of test failures in addition to the reasons tests were skipped. For example, if 'c' = (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2.

The reason codes are:

<table>
<thead>
<tr>
<th>Bit #</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Helper unit cannot be reserved.</td>
</tr>
<tr>
<td>2</td>
<td>Helper unit not out-of-service.</td>

2. REASON FOR OUTPUT

To report the result of executing the EX:MTIB input message to exercise the metallic test interconnect bus (MTIB).

Format 1 is printed when the specified phase(s) have been completely executed, and reports the overall result. Execution of the diagnostic will continue for any remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 is printed when a test has failed.

Format 4 is printed when the execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous message may also be specified.

Format 5 is printed when the trouble location procedure (TLP) was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 6 indicates that the diagnostic execution has terminated.

3. VARIABLE FIELD DEFINITIONS

a = MTIB number.
b  = Loop result. Valid value(s):
  ATP    = All tests were performed and all passed.
  CATP   = Some tests were not performed, but all that were performed have passed.
  NTR    = No tests were run.
  STF    = Some tests failed.

c  = Reason the command was rejected.

d  = Number of the phase in which the failure occurred.

e  = Number of the segment in which the failure occurred.

f  = Number of the test that failed.

g  = Mismatch results for the specified test in hexadecimal.

h  = Expected result for the specified test in hexadecimal.

i  = Mask used to determine test failure in hexadecimal.

j  = Actual result for the specified test in hexadecimal.

k  = Result of previous command (variable 'b' for expected responses).

l  = Phase number in which execution suspended.

m  = Segment number in which execution suspended.

n  = Identification number of floor and aisle.

o  = Module type.

p  = Module number.

q  = Cabinet type.

r  = Cabinet number.

s  = Replacement equipment code(s).

t  = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
  :       = Intra-field delimiter.
  -      = Inter-field delimiter if necessary.
  A      = Current minimal accepted equipment code.
  B      = Current production equipment code (substitutable equipment for code 'A').
  C      = Additional compatible equipment code(s) (added as space permits)
  D      = Current minimal approved operating level for equipment code 'A'.
  E      = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'c'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

u = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

v = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

w = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ____ = Equipment is part of the circuit under test.

x = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

y = Termination status. Valid value(s):
   ABORTED = The process was terminated (process not gracefully terminated).
   NOT_STARTED = Action was not begun.
   STOPPED = Terminated before normal completion (process gracefully terminated).

z = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

a¹ = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

b¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

4. ACTION TO BE TAKEN

For Formats 1 and 6, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, replace the faulty unit.

For Format 4:
<table>
<thead>
<tr>
<th>Output Code</th>
<th>Description</th>

2. REASON FOR OUTPUT

To report the result of executing the EX:MTIBAX input message to exercise the metallic test interconnect bus access (MTIBAX).

Format 1 is printed when the specified phase(s) have been completely executed, and reports the overall result. Execution of the diagnostic will continue for any remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 is printed when a test has failed.

Format 4 is printed when the execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous message may also be specified.

Format 5 is printed when the trouble location procedure (TLP) was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = Unit number.
- **c** = Service group number.
- **d** = Shelf number.
- **e** = Loop result. Valid value(s):
  - ATP = All tests were performed and all passed.
  - CATP = Some tests were not performed, but all that were performed have passed.
  - NTR = No tests were run.
  - STF = Some tests failed.
- **f** = Reason the command was rejected.
- **g** = Number of the phase in which the failure occurred.
- **h** = Number of the segment in which the failure occurred.
- **i** = Number of the test that failed.
- **j** = Mismatch results for the specified test in hexadecimal.
- **k** = Expected result for the specified test in hexadecimal.
- **l** = Mask used to determine test failure in hexadecimal.
- **m** = Actual result for the specified test in hexadecimal.
- **n** = Result of previous command (variable 'e' for expected responses).
- **o** = Phase number in which execution suspended.
- **p** = Segment number in which execution suspended.
- **q** = Identification number of floor and aisle.
- **r** = Module type.
- **s** = Module number.
- **t** = Cabinet type.
- **u** = Cabinet number.
- **v** = Replacement equipment code(s).
- **w** = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.
Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ = Equipment is part of the circuit under test.

a^1 = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b^1 = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

c^1 = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

d^1 = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.
e<sup>1</sup> = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

f<sup>1</sup> = Statement number.

g<sup>1</sup> = Reason why some tests were not performed.

**4. ACTION TO BE TAKEN**

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, replace the faulty unit.

For Format 4:

<table>
<thead>
<tr>

2. REASON FOR OUTPUT

To print results of a diagnostic run on the maintenance teletypewriter controller (MTTYC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a            = Member number.
b = The result of the diagnostic. Valid value(s):
ATP    = All tests passed.
NTR    = No tests were executed.
STF    = Some tests failed.

c = If 'b' = STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (7 00000000 00000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.
Note: For Format 3, the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.

g = The bits which were actually received from the hardware device.

h = Determines which bits in 'g' are included in this test.

i = The value which the test expected.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN
If 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.

5. ALARMS
This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the executing of EX:NLI input message to diagnose a network link interface (NLI).

Format 1 indicates the completed segments and reports the overall result. It applies only when the repeat (RPT) option is specified in the input message. Execution of the diagnostic continues for the remaining iterations.

Format 2 indicates that the input message was invalid.

Format 3 indicates and specifies that a test failed.

Format 4 indicates that diagnostic execution is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous message, may also be specified.

Format 5 is printed when a test failed and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 6 indicates that the diagnostic execution has terminated.

Formats 1, 3, 4 and 5 belong to the switching module (SM) message class, while Formats 2 and 6 belong to the office network and timing complex (ONTC) message class.

3. VARIABLE FIELD DEFINITIONS
Switching module (SM) number.

NLI number.

ONTC side the NLI is on.

Loop result. Valid value(s):
- **ATP**: All tests were performed and passed.
- **CATP**: Some tests were not performed, but all tests that were performed passed.
- **NTR**: No tests were performed.
- **STF**: Some test(s) failed.

Error messages. Valid value(s):
- **EXECUTE PHASE NOT DEFINED**: The phase number containing the segments to be executed was invalid.
- **PAUSE PHASE NOT DEFINED**: The phase number at which suspension was desired was invalid.
- **PREVIOUS EX IN PROGRESS**: An earlier exercise message was still in progress; the rejected message is valid only if the diagnostic is suspended.

Number of the phase in which the failure occurred.

Number of the segment in which the failure occurred.

Number of the test that failed.

Mismatch results for the specified test in hexadecimal.

Expected result for the specified test in hexadecimal.

Mask used to determine test failure in hexadecimal.

Actual result for the specified test in hexadecimal.

Result of previous message. Valid value(s):
- **ATP**: The specified segment(s) were completed and all tests were performed and passed.
- **CATP**: Some tests in the specified segment(s) were not performed, but all tests that were performed passed.
- **NTR**: No tests were performed since the last completion message.
- **REQUEST NOT ALLOWED**: The invert or transfer input message was invalid.
- **STF**: The specified segment(s) were completed, and some test(s) failed.

Phase number were execution was suspended.

Segment number where execution was suspended.

Text identifier showing trouble location procedure (TLP) record. Valid value(s):
- **FIRST**: First record of continuing list.
- **LAST**: Last record of list.
- **NEXT**: Next record of continuing list.
A maximum of 12 list entries may be reported on a TLP list. They print in groups (records) of one to four entries. Each record has a new header.

\[ \text{q} \] = Identification number of floor and aisle.
\[ \text{r} \] = Module type. Valid value(s):
CM = Communication module.
HSM = Host switching module.
RSM = Remote switching module.
SM = Switching module.

\[ \text{s} \] = Module number.
\[ \text{t} \] = Cabinet type. Valid value(s):
CM2 = Communication module 2 cabinet.
M = Miscellaneous cabinet.
MSG = Message switch cabinet.
SMC = Switching module controller cabinet.
TMS = Time multiplexed switch cabinet.

\[ \text{u} \] = Cabinet number.
\[ \text{v} \] = Replacement equipment code(s). Refer to the following example.
\[ \text{w} \] = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

\[ \text{CODE} \]
\[ A[:B]\ldots[:C] [-] D[:E]\ldots[:F] \]
\[ A \] = Current minimal accepted equipment code.
\[ B \] = Current production equipment code (substitutable equipment for code \( A \)).
\[ C \] = Additional compatible equipment code(s) (added as space permits)
\[ D \] = Current minimal approved operating level for equipment code \( A \).
\[ E \] = Current minimal approved operating level for equipment code \( B \).
\[ F \] = Current minimal approved operating level(s) for equipment code(s) \( C \).
\[ : \] = Intra-field delimiter.
\[ - \] = Inter-field delimiter if necessary.

Codes \( A \), \( B \) and \( C \) may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms \( D \), \( E \) and \( F \) may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

\[ \text{x} \] = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
\[ \text{y} \] = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
z = Circuit type. Valid value(s):
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
   ___ = Equipment is part of the circuit under test.

a\textsuperscript{1} = Number of the TLP note containing supplementary information related to the specified suspected faulty equipment. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b\textsuperscript{1} = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   NOT STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

c\textsuperscript{1} = Reason for the termination, or status of the completed request.

4. ACTION TO BE TAKEN

For Formats 1, 3, and 6, no action is needed.

For Format 2, determine the correct input message and reenter the exercise request.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED m PH n</td>
<td>The specified phase was terminated. Complete phase and segment specification must be provided on the next exercise request.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspended resources and reenter the previous message.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH n SEG o</td>
<td>If the repeat (RPT) option was specified, this message indicates completion of the exercise. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
</tbody>
</table>

For Format 5, replace the indicated circuit packs, one at a time in the order specified. Rerun the diagnostic after each substitution until the fault is repaired or until the diagnostic result changes.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of an office-to-office (OTO) task initiated by an EX:OTO input message.

Format 1 reflects the output for an individual line.

Format 2 reflects the summary output which is printed at 15-minute intervals during active testing, and upon completion or termination of the task.

3. VARIABLE FIELD DEFINITIONS

Note:

a = Status of the test. Valid value(s):
ABORT = OTO task was aborted prior to completion.
ERROR = An error was detected.
REPORT = Report of test result.

b = Explanation of status.

<table>
<thead>
<tr>
<th>'a'</th>
<th>'b'</th>
</tr>
</thead>
</table>
| ABORT | Reason for abort. Refer to variable 'j^2'.
| NOTE: Additional data on reason for ABORT may be obtained by enabling the PTC message class and examining REPT:PTTRACE output messages. |

| ERROR | Type of error. Refer to variable 'j^2'. |
| REPORT | Result of line test. Refer to variable 'j^2'. |

c = Directory number.
d = Equipment number. Valid value(s):

<table>
<thead>
<tr>
<th>Valid Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AIUEN=a¹-v¹-x¹</td>

</tr>
</tbody>
</table>

e = Request number associated with the task.
f = The starting directory number of the task being summarized.
g = The ending directory number of the task being summarized.
h = The starting SLEN of the task being summarized.
i = The ending RT line number of the task being summarized.
j = The starting ILEN of the task being summarized.
k = The ending RT line number of the task being summarized.
m = The request number associated with the task.
n = The current summary page number.
o = The total number of pages in this summary.
p = Status of the office to office task. Valid value(s):
   ABORT:MANUAL = User-requested abort of an office-to-office task prior to completion with the ABT:OTO input message.
   ABORT:SOFTWARE-BLOCKAGE = Abort of an office-to-office task due to a software resource blockage.
   COMPLETED = Completion of an office-to-office task.
   PERIODIC-REPORT = Progress report given at approximately 15-minute intervals.
   QUERY JOB STATUS = Response to OP:JOBSTATUS input message which prints the status of the current OTO task.

q = The DN of the line currently under test (not printed for completion summaries).
r = The equipment number (ILEN, LCEN, LCKEN, LEN, SLEN or AIUEN) of the line currently under test (refer to variable ‘d’) (not printed for completion summaries).
s = The DN in the retest queue at the time of the periodic summary or abort (not printed for completion summaries).
t = The equipment number (ILEN, LCEN, LCKEN, LEN, SLEN or AIUEN) of lines in the retest queue at the time of the periodic summary or abort (refer to variable ‘d’) (not printed for completion summaries).
u = Total number of lines passed.
v = Total number of lines with error.
Note: The sum of the values for 'w', 'x', 'y', and 'z' should equal the total number of lines specified in the EX:OTO input message.

- \( w \) = Total number of lines tested. (Does not include busy, unassigned, or untestable lines.)
- \( x \) = Total number of lines busy.
- \( y \) = Total number of lines unassigned.
- \( z \) = Total number of lines untestable.

- \( a^1 \) = SM number.
- \( b^1 \) = IDCU number.
- \( c^1 \) = Remote terminal (RT) number.
- \( d^1 \) = RT line number.
- \( f^1 \) = ISLU number.
- \( g^1 \) = Line group number.
- \( h^1 \) = Line card number.
- \( j^1 \) = Line unit number.
- \( k^1 \) = Grid number.
- \( l^1 \) = Grid board number (LU1, LU2, or LU3).
- \( m^1 \) = Switch number.
- \( n^1 \) = Level number.
- \( p^1 \) = Digital carrier line unit (DCLU) number.
- \( q^1 \) = Trunk group number.
- \( r^1 \) = Trunk member number.
- \( s^1 \) = ISLU2 number.
- \( t^1 \) = Line board number.
- \( u^1 \) = Line circuit number.
- \( v^1 \) = Access interface unit equipment number.
- \( w^1 \) = AIU pack number.
- \( x^1 \) = AIU circuit number.
- \( y^1 \) = Remote terminal (RT) number.
- \( z^1 \) = RT line number.
a\textsuperscript{2} = Digital network unit (DNU) number.

b\textsuperscript{2} = The starting INEN of the task being summarized.

c\textsuperscript{2} = The ending RT line number of the task being summarized.

d\textsuperscript{2} = DNU number.

e\textsuperscript{2} = Remote terminal (RT) number.

f\textsuperscript{2} = RT line number.

g\textsuperscript{2} = Valid value(s):

- DN=f\&g
- ILEN=j\&k
- INEN=b\textsuperscript{2}\&c\textsuperscript{2}
- SLEN=h\&i

h\textsuperscript{2} = Numbering Plan Area or Area Code of the DN.

i\textsuperscript{2} = Explanation of variable b.

COMPLETED = The ABT:OTO request completed successfully.

DISTRIBUTE-POINTS = All necessary distribute points are not assigned to this trunk or unable to initialize distribute points. Check switching module (SM) relation BTBPG.

INVALID-INPUT = Invalid directory number (DN), SLC\textsuperscript{\textregistered} line equipment number (SLEN), or integrated digital carrier unit line equipment number (ILEN) specified, or office code (OC) option incorrectly used with DN; possible data or procedure error.

INVALID-TRUNK = Incorrect far end office type parameter specified or trunk data assignment error, or route index (RTI) not for OTO trunk.

MANUAL = The EX:OTO request was aborted by manual request.

NO-TRUNK = Route index not specified, or no idle in-service trunk available. Refer to output message REPT:RTA-DCF-RE.

NOT-PRECUT = Office not in precut state. (Refer to the recent change and verify (RC/V) office parameters view - field= CUTTRANS)

PAGING-MEMORY = Insufficient paging memory in the switching module for the trunk process. This may require temporary termination of other paged programs (such as DGN).

ROUTE-FAILURE = Unassigned RTI specified, or routing failure in creation of trunk process to switching module with OTO trunk.

SOFTWARE-BLOCKAGE = The most likely case is a timeout within the controlling process, but it could be due to any software resource blockage such as messages or stacks.

TASKLIMIT = Attempt to exceed the maximum number of OTO tasks allowed.

j\textsuperscript{2} = Explanation of variable b.

FALSE-CROSS-GROUND = False cross and ground failure.

GRID-SCAN-HDW-FAIL = Test of tip/ring crosspoints and scan detector circuitry failed.

GROUND-LOOP = Far end office line is ground start; Translations show loop start.

LOOP-GROUND = Far end office line is loop start; Translations show ground start.

NO-CONTINUITY = Verification of wiring continuity failed. Verify cross-connect to old line using trunk and line work station (TLWS) to measure battery from old switch on the line.

OUTPULSE = Outpulsing failure or failure to receive acknowledgment from existing office.

POLARITY = Incorrect party affiliation or reversal.

POWER-CROSS = Power cross failure.
SHORT = Presence of wiring short- one of the following cases:
- Ring to battery short.
- Ring to ground short.
- Tip to battery short.
- Tip to ground short.
- Tip to ring short.

It could also indicate:
- Incorrect outpulsing of DN.
- Reversed scan-distribute point.

TIP–RING–REVERSAL = Tip and ring reversal.

= Explanation of variable b.

ATP = Line passed all tests.

BLKD–ACT–SPARE = The line could not be tested because a line card was being spared in its ISLU.

BLKD–IN–LINE–UNIT = The line could not be tested because of a metallic blockage between the high-level service circuit (HLSC) and the line.

BUSY–OFFHOOK = This result is valid only for testing of SLC® or IDCU lines. The switch port state indicated line to be offhook. If line is served by line unit in existing office, consistent result of BUSY–OFFHOOK indicates a short circuit, foreign EMF, or abnormal resistance condition on the customer loop beyond the remote terminal. If intermittent, or if line is served by Universal carrier system in existing office, indicates that the line has gone offhook subsequent to the initial verification that the line was idle. No automatic retesting is performed.

BUSY–VOICE/TONE = Line found to be traffic busy during two successive test attempts- no tests were performed. Detection of traffic busy condition based on voice or tone (for step-by-step offices, based on battery reversal) returned from existing office.

CHANNEL–UNIT–UNEQ = SLC® or IDCU line channel unit unequipped. Possible office data or procedure error.

CUT–THRU–FAILURE = Unable to operate distribute points to cut through the connection to existing office line.

DIR–SCAN–FAILURE = Directed scan of the SLC® or IDCU line port state failed. Possible data error.

HARDWARE–BLOCKAGE = Hardware blockage in the existing office.

HLSC–FAILURE = High-level service circuit failure.

NOT–PRECUR = Line not designated inactive. Possible data or procedure error.

NO–TRUNK–ACT = Failure to activate the far end office test trunk or failure to receive start signal for outpulsing.

OC–NOT–IN–RANGE = The office code of the current SLC® or IDCU line is different from that specified in the OC parameter; or if OC parameter omitted, this line has a different office code from that of the first assigned line in the SLEN or ILEN range.

PAGING–MEMORY = Insufficient paging memory in the switching module for the line process. May require temporary termination of other paged programs (such as DGN).

ROUTE–FAILURE = Routing failure in the creation of the line process or TTF process. Verify RC/V fixed routing view and trunk group and member views for the TTF logical test ports used by OTO.

SOFTWARE–BLOCKAGE = Software blockage.

TONE–DETECTOR = Transmission test facility (TTF) tone detector unavailable for busy detection.

UNASSIGNED–LINE = Unassigned line. Possible data or procedure error.

UNTESTABLE–LINE = Untestable line. For analog tasks this includes SLC® lines, IDCU lines aging
lines, PBXID, TDSL, UDSL, series completion lines, and lines designated as test ports. For SLC® and IDCU tasks this includes D4 channels, analog lines, TR303 RT lines, PUB43801 channels, and lines designated as test ports.

117-VOLT-SIGNATURE = Unable to apply 117 volt signature toward existing office SLC® system.

4. ACTION TO BE TAKEN

Correct any wiring or database errors detected and re-run the office-to-office test.

5. ALARMS

If the printing priority option on the EX:OTO input message was changed from the default, the corresponding alarm of that printing priority will fire.

6. REFERENCES

Input Message(s):

ABT:OTO
EX:OTO
OP:JOBSTATUS

Output Message(s):

REPT:PTRACE
REPT:RTA-DCF-RE

Other Manual(s):
235-105-200 Precutover and Cutover Procedures
EX:PAUSE

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] EX PAUSE a [b] SUSPENDED AT ST c

[2] EX PAUSE REQUEST NOT YET ACTIVE

[3] EX PAUSE REQUEST NOT IN INTERACTIVE MODE

[4] EX PAUSE ILLEGAL REQUEST TYPE

2. REASON FOR OUTPUT

To report the result of executing an EX:PAUSE interactive diagnostic input message as part of an interactive diagnostic procedure.

Format 1 prints when the interactive diagnostic is suspended.

Format 2 prints if the unit (and subunit) specified by the interactive diagnostic input message is not in the active queue.

Format 3 prints if the unit (and subunit) specified by the interactive diagnostic input message is in the active queue but not an interactive request.

Format 4 prints if the unit (and subunit) specified by the interactive diagnostic input message could not be found in either the waiting or active queues.

3. VARIABLE FIELD DEFINITIONS

a = Unit type and member number of unit under test.

b = Unit type and member number of the subunit under the unit under test.

c = Data table statement number.

4. ACTION TO BE TAKEN

For Format 1, after the possible hardware troubleshooting, advance through the data table by issuing the EX:PAUSE input message again or by issuing the EX:STEP input message.

For Formats 2, 3, and 4, reenter the input message after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input message. Use the OP:DMQ input message to display the requests in the queue. Enter the desired interactive diagnostic request if it is not in the queue. Wait until the desired interactive diagnostic request becomes active, or use the STOP:DMQ or STP:DMQ input message to remove other request(s) from the queue until the desired interactive diagnostic request
becomes active.

5. ALARMS

None. This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the result of executing an EX:PMU input message to diagnose the precision measurement unit (PMU).

Format 1 indicates that the specified segments have been completed, and reports the overall result. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Directly connected test unit (DCTU) number.
c = Circuit number.
d = Loop result. Valid value(s):
  ATP = All test were performed and all passed.
  CATP = Some tests were not performed, but all that were passed.
  NTR = No tests run.
  STF = Some tests failed.
e = Reason the command was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test number that failed.
i = Mismatch results for the specified test in hexadecimal.
j = Raw data expected result for the specified test in hexadecimal.
k = Raw data mask used to determine the test failure in hexadecimal.
l = Raw data actual result for the specified test in hexadecimal.
m = Result of previous command. Valid value(s):
  ATP = The specified segment(s) were completed and all tests passed.
  CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
  NTR = No tests were run since the last completion message.
  STF = The diagnostic has completed and some tests failed.
n = Phase number in which execution is suspended.
o = Segment number in which execution is suspended.
p = Identification number of floor and aisle.
q = Module type.
r = Module number.
s = Cabinet type.
t = Cabinet number.
u = Replacement equipment code(s).

v = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE A[:B]...[:C] [-] D[:E]...[:F]

- Inter-field delimiter if necessary.
: Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

y = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted. _____ = Equipment is part of the circuit under test.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a1 = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

b1 = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c1 = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\[d\] = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\[e\] = Statement number.

\[f\] = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing the EX:PROTO input message to exercise the protocol circuit (PROTO).

Format 1 is printed when the specified phase(s) have been completely executed, and reports the overall result. Execution of the diagnostic will continue for any remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 is printed when a test has failed.

Format 4 is printed when the execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous message may also be specified.

Format 5 is printed when the trouble location procedure (TLP) was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = Unit number.
- **c** = Service group number.
- **d** = Loop result. Valid value(s):
  - ATP = All tests were performed and all passed.
  - CATP = Some tests were not performed, but all that were performed have passed.
  - NTR = No tests were run.
  - STF = Some tests failed.
- **e** = Reason the command was rejected.
- **f** = Number of the phase in which the failure occurred.
- **g** = Number of the segment in which the failure occurred.
- **h** = Number of the test that failed.
- **i** = Mismatch results for the specified test in hexadecimal.
- **j** = Expected result for the specified test in hexadecimal.
- **k** = Mask used to determine test failure in hexadecimal.
- **l** = Actual result for the specified test in hexadecimal.
- **m** = Result of previous command (variable ‘d’ for expected responses).
- **n** = Phase number in which execution suspended.
- **o** = Segment number in which execution suspended.
- **p** = Identification number of floor and aisle.
- **q** = Module type.
- **r** = Module number.
- **s** = Cabinet type.
- **t** = Cabinet number.
- **u** = Replacement equipment code(s).
- **v** = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:
CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
x = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
y = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a1 = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

b1 = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c1 = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
\(e^1\) = Statement number.

\(f^1\) = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, replace the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and re-enter the previous message.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected packs, one at a time in the order specified. Rerun the entire diagnostic after each substitution until the fault is repaired or the diagnostic result changes.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of executing an EX:PSU input message to exercise a packet switch unit (PSU) common controller (COM). Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input messages. Execution of the exercise will continue for the remaining iterations. Format 2 indicates that an option specified in the input message was invalid. Format 3 indicates which test failed. Format 4 indicates that execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous command may also be printed. Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message. Format 6 indicates that the diagnostic execution has terminated. Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

\texttt{b} = Switching module (SM) number.

\texttt{c} = PSU number.
d = Service group number.

f = Loop result. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Conditionally ATP. Some tests were skipped because supporting hardware was not available, but all tests which were run passed.
   NTR = No tests run.
   STF = Some tests failed.

g = Reason the command was rejected.

h = Number of the phase in which the failure occurred.

i = Number of the segment in which the failure occurred.

j = Number of the test that failed.

k = Mismatch results for the specified test.

l = Actual result for the specified test in hexadecimal.

m = Mask used to determine test failure in hexadecimal.

n = Expected result for the specified test in hexadecimal.

o = Type of suspension. Valid value(s):
   ATP = The specified segment(s) were completed and all tests were performed and passed.
   CATP = Some tests in the specified segment were skipped because supporting hardware was not available, but all tests which were run passed.
   NTR = No tests performed since the last completion message.
   STF = Some tests in the segment failed.

p = Phase number where execution is suspended.

q = Segment number where execution is suspended.

r = Floor and aisle number.

s = Module type.

t = Module number.

u = Cabinet type.

v = Cabinet number.

w = Replacement equipment code(s).

x = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example. Example of CODE FORM contents: CODE A[:B]...[:C] [-] D[:E]...[:F]
   = Intra-field delimiter.
   - = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

y = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
z = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
a = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b = Circuit type. Valid value(s):
  HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
  ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
  _____ = Equipment is part of the circuit under test.

c = Refer to in the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

d = Termination report. Valid value(s):
  ABORTED = Requested action was terminated before completion, and the termination was not graceful.
  COMPLETED = Request has successfully completed.
  NOT STARTED = Requested action has not begun.
  STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

e = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

f = Text identifier showing order of record. Valid value(s):
  FIRST = First record of continuing list.
  LAST = Last record of list.
  NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

g = Statement number.
4. ACTIONS TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct phase number and reenter the exercise request.

For Format 3, analyze failure data to determine reason for failure or run the exercise using the TLP option to generate a suspected faulty circuit pack list.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH p SEG q</td>
<td>The fault may have been repaired. Rerun the entire diagnostic.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH p SEG q</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH p SEG q</td>
<td>If the RPT option was specified, normal completion of the exercise is indicated. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH p SEG q</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the diagnostic exercise for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

A = Current minimal accepted equipment code.

B = Current production equipment code (substitutable equipment for code 'A').

C = Additional compatible equipment code(s) (added as space permits)

D = Current minimal approved operating level for equipment code 'A'.

E = Current minimal approved operating level for equipment code 'B'.

F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

y = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

z = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

a¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

b¹ = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.

ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
= Equipment is part of the circuit under test.

= Refer to in the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

= Termination report. Valid value(s):

ABORTED = Requested action was terminated before completion, and the termination was not graceful.

COMPLETED = Request has successfully completed.

NOT STARTED = Requested action has not begun.

STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

= Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

= Text identifier showing order of record. Valid value(s):

FIRST = First record of continuing list.

LAST = Last record of list.

NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

= Statement number.

= Reason why some tests were not performed.

### 4. ACTIONS TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct phase number and reenter the exercise request.

For Format 3, analyze failure data to determine reason for failure or run the exercise using the TLP option to generate a suspected faulty circuit pack list.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH p SEG q</td>
<td>The fault may have been repaired. Rerun the entire diagnostic.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH p SEG q</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH p SEG q</td>
<td>If the RPT option was specified, normal completion of the exercise is indicated. Proceed to troubleshoot the circuit. If this message occurs when the RPT option</td>
</tr>
</tbody>
</table>
was not specified, no tests were run. Determine the reason and reenter the exercise request.

<table>
<thead>
<tr>
<th>SUSPENDED STF PH p SEG q</th>
<th>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the diagnostic exercise for each replaced pack until the fault is repaired or the diagnostic results change.

[6] EX QGP=a-b y [z]

2. REASON FOR OUTPUT

To report the results of executing an EX:QGP input message to diagnose a quad-link gateway processor (QGP).

Format 1 indicates the completed segments and reports the overall result. It applies only when the repeat (RPT) option is specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the input message was invalid.

Format 3 indicates and specifies that a test failed. The text in the square bracket will be printed if the RAW option is used with the input request.

Format 4 indicates that diagnostic execution is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous message, may also be specified.

Format 5 is printed when a test failed and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 6 indicates that the diagnostic execution has terminated.

Formats 1, 3, 4 and 5 belong to the SM message class, while formats 2 and 6 belong to the MSGS message class.

3. VARIABLE FIELD DEFINITIONS
a  = Message switch (MSGS) number.
b  = QGP number.
c  = Loop result. Valid value(s):
   ATP  = All tests were performed and passed.
   CATP = Some tests were not performed, but all tests that were performed passed.
   NTR  = No tests were performed.
   STF  = Some test(s) failed.
d  = Reason the message was rejected. Valid value(s):
   EXECUTE PHASE NOT DEFINED = The phase number containing the segments to be executed
                                 was invalid.
   PAUSE PHASE NOT DEFINED = The phase number at which suspension was desired was invalid.
   PREVIOUS EX IN PROGRESS = An earlier exercise message was still in progress; the rejected
                            message is valid only if the diagnostic is suspended.
e  = Number of the phase in which the failure occurred.
f  = Number of segment in which the failure occurred.
g  = Number of the test that failed.
h  = Mismatch results for the specified test in hexadecimal.
i  = Expected result for the specified test in hexadecimal.
j  = Mask used to determine test failure in hexadecimal.
k  = Actual result for the specified test in hexadecimal.
l  = Result of previous message. Valid value(s):
   ATP  = The specified segment(s) were completed and all tests were performed and
          passed.
   CATP = Some tests in the specified segment(s) were not performed, but all tests that
          were performed passed.
   NTR  = No tests were performed.
   STF  = The specified segment(s) were completed, and some test(s) failed.
   REQUEST NOT ALLOWED = The invert or transfer input message was invalid.
m  = Phase number where execution was suspended.
n  = Segment number where execution was suspended.
o  = Text identifier showing order of TLP record. Valid value(s):
   FIRST = First record of continuing list.
   LAST  = Last record of list.
   NEXT  = Next record of continuing list.

A maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of
one to four entries. Each record will have a new header.
Identification number of floor and aisle.

Cabinet type. Valid value(s):
CM2 = Communication module 2 cabinet.
M = Miscellaneous cabinet.
MSG = Message switch cabinet.
SMC = Switching module controller cabinet.
TMS = Time multiplexed switch cabinet.

Cabinet number.

Replacement equipment code(s). Refer to the following example.

Equipment form(s). Equipment form represents the minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimited.
- = Inter-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifiers(s) as applicable.

Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

Vertical location in the cabinet, in inches above the floor to the center of the implicated shelf.

Horizontal location in the cabinet, in eighths of an inch from the left corner of the implicated shelf.

Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed from service before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
--- = Equipment is part of the circuit under test.

Number of the TLP note containing supplementary information related to the specified suspected faulty equipment. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

Termination status. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Request was successfully completed.
NOT STARTED = Requested action was not begun.
STOPPED = Requested action was terminated before a normal completion.

z = Reason for the termination.

4. ACTION TO BE TAKEN

For Formats 1, 3 and 6, no action is required.

For Format 2, determine the correct input message and reenter the exercise request.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED 1 PH m</td>
<td>The specified phase was terminated. Complete phase and segment specification must be provided on the next exercise request.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH m SEG n</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH m SEG n</td>
<td>This message indicates that one of two conditions occurred which inhibited the execution of some tests. If the message is printed for phase 1, an anomaly with the scan and distribute points caused the CATP condition. If the message is printed for phase 4, the QGP was unable to communicate with any one of the QLPS's physically connected (using the QGLs) to it.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH m SEG n</td>
<td>This message indicates completion of the exercise. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH m SEG n</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
</tbody>
</table>

For Format 5, replace the indicated circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

[6] EX QLPS=a-b y [z]

2. REASON FOR OUTPUT

To report the results of executing an EX:QLPS input message to diagnose a quad-link packet switch (QLPS).

Format 1 indicates the completed segments and reports the overall result. It applies only when the repeat (RPT) option is specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the input message was invalid.

Format 3 indicates and specifies that a test failed. The text in the square bracket will be printed if the RAW option is used with the input request.

Format 4 indicates that diagnostic execution is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous message, may also be specified.

Format 5 is printed when a test failed and the trouble location procedure (TLP) option was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 6 indicates that the diagnostic execution has terminated.

Formats 1, 3, 4 and 5 belong to the SM message class, while formats 2 and 6 belong to the MSGS message class.

3. VARIABLE FIELD DEFINITIONS
a = Office network timing and control (ONTC) side number.
b = QLPS network number.
c = Loop result. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Some tests were not performed, but all tests that were performed passed.
   NTR = No tests were performed.
   STF = Some test(s) failed.
d = Reason the message was rejected. Valid value(s):
   EXECUTE PHASE NOT DEFINED = The phase number containing the segments to be executed was invalid.
   PAUSE PHASE NOT DEFINED = The phase number at which suspension was desired was invalid.
   PREVIOUS EX IN PROGRESS = An earlier exercise message was still in progress; the rejected message is valid only if the diagnostic is suspended.
e = Number of the phase in which the failure occurred.
f = Number of segment in which the failure occurred.
g = Number of the test that failed.
h = Mismatch results for the specified test in hexadecimal.
i = Expected result for the specified test in hexadecimal.
j = Mask used to determine test failure in hexadecimal.
k = Actual result for the specified test in hexadecimal.
l = Result of previous message. Valid value(s):
   ATP = The specified segment(s) were completed and all tests were performed and passed.
   CATP = Some tests in the specified segment(s) were not performed, but all tests that were performed passed.
   NTR = Not tests were performed.
   REQUEST NOT ALLOWED = The invert or transfer input message was invalid.
   STF = The specified segment(s) were completed, and some test(s) failed.
m = Phase number where execution was suspended.
n = Segment number where execution was suspended.
o = Text identifier showing order of TLP record. Valid value(s):
   FIRST = First record of continuing list.
   LAST = Last record of list.
   NEXT = Next record of continuing list.

A maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of one to four entries. Each record will have a new header.
Identification number of floor and aisle.

= Cabinet type. Valid value(s):
CM2 = Communication module 2 cabinet.
M = Miscellaneous cabinet.
MSG = Message switch cabinet.
SMC = Switching module controller cabinet.
TMS = Time multiplexed switch cabinet.

= Cabinet number.

= Replacement equipment code(s). Refer to the following example.

= Equipment form(s). Equipment form represents the minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM content:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimited.
- = Inter-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifiers(s) as applicable.

Forms 'D', 'E' and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

= Vertical location in the cabinet, in inches above the floor to the center of the implicated shelf.

= Horizontal location in the cabinet, in eighths of an inch from the left corner of the implicated shelf.

= Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed from service before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
--- = Equipment is part of the circuit under test.

= Number of the TLP note containing supplementary information related to the specified suspected faulty equipment. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

= Termination status. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Request was successfully completed.
NOT_STARTED = Requested action was not begun.
STOPPED = Requested action was terminated before a normal completion.

z = Reason for the termination.

4. ACTION TO BE TAKEN

For Formats 1, 3 and 6, no action is required.

For Format 2, determine the correct input message and reenter the exercise request.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED PH m</td>
<td>The specified phase was terminated. Complete phase and segment specification must be provided on the next exercise request.</td>
</tr>
<tr>
<td>SUSPENDED PH m SEG n</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATPH m SEG n</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous message. If the message is printed for phase 3, the QLPS was unable to communicate with any one of the QGPs physically connected (using the QBLs) to it.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH m SEG n and the repeat (RPT) option was specified.</td>
<td>This message indicates completion of the exercise. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED PH m SEG n</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
</tbody>
</table>

For Format 5, replace the indicated circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing an EX:RAF input message to diagnose the recorded announcement function (RAF) unit.

Format 1 indicates that the specified segments have been completed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified options in the input message were invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedures (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RAF unit number.
c = Loop result. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Some tests were not performed, but all performed tests passed.
   NTR = No tests run.
   STF = Some tests failed.
d = Reason the command was rejected.
e = Phase in which the failure occurred.
f = Segment in which the failure occurred.
g = Test number that failed.
h = Mismatch results for the specified test in hexadecimal.
i = Raw data expected result for the specified test in hexadecimal.
j = Raw data mask used to determine the test failure in hexadecimal.
k = Raw data actual result for the specified test in hexadecimal.
l = Type of suspension. Valid value(s):
   ATP = The specified segment(s) was completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.
m = Phase number in which execution is suspended.
n = Segment number in which execution is suspended.
o = Identification number of floor and aisle.
p = Module type.
q = Module number.
r = Cabinet type.
s = Cabinet number.
t = Replacement equipment code(s).
= Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example. Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
   := Intra-field delimiter.
- := Inter-field delimiter if necessary.
A := Current minimal accepted equipment code.
B := Current production equipment code (substitutable equipment for code 'A').
C := Additional compatible equipment code(s) (added as space permits)
D := Current minimal approved operating level for equipment code 'A'.
E := Current minimal approved operating level for equipment code 'B'.
F := Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

v = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

w = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

x = Circuit type. Valid value(s):
HPR := Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL := Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ := Equipment is part of the circuit under test.

y = Board. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

z = Termination status. Valid value(s):
ABORTED := The process was terminated (process not gracefully terminated).
NOT STARTED := Action was not begun.
STOPPED := Terminated before normal completion (process gracefully terminated).

a1 = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

b1 = Text identifier showing order of record. Valid value(s):
FIRST := First record of continuing list.
LAST := Last record of list.
NEXT := Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

c1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the
implicated shelf.

\[ e^1 \] = Statement number.

\[ f^1 \] = Reason why some tests were not performed.

4. ACTIONS TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct phase numbers and reenter the diagnostic exercise request.

For Format 3, if fields 'g' and 'i' do not match, refer to TLP. If this does not assist in solving the problem, rerun the diagnostic with the 'RAW' and 'UCL' options. Give the resulting output to a diagnostician for interpretation.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise command and proceed with manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH m SEG</td>
<td>The fault may have been repaired. Rerun the entire exercise to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH m SEG</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous command.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH m SEG</td>
<td>If the RPT option was specified, this message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH m SEG</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the diagnostic exercise for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

2. REASON FOR OUTPUT

To report the result of executing an EX:RAU input message to exercise a remote switching module (RSM) alarm (RAU) circuit.

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the repeat (RPT) option is specified in the input message. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates execution of the exercise is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous input message may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the trouble locating procedure (TLP) option is specified in the input message.

Format 6 indicates execution of the exercise is terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = Loop result. Valid value(s):
  - ATP = All tests performed and passed.
  - CATP = Some tests were skipped because supporting hardware was not available, but all tests which were run passed.
  - NTP = No tests performed.
  - STF = Some tests failed.
- **c** = Reason the input message was rejected.
- **d** = Phase in which the failure occurred.
- **e** = Segment in which the failure occurred.
- **f** = Test that failed.
- **g** = Mismatch results for the specified test in hexadecimal.
- **h** = Expected result for the specified test in hexadecimal.
- **i** = Mask used to determine test failure in hexadecimal.
- **j** = Actual result for the specified test in hexadecimal.
- **k** = Result of previous input message. Valid value(s):
  - ATP = The specified segment(s) were completed and all tests were performed and passed.
  - CATP = Some tests in the specified segment were skipped because supporting hardware was not available, but all tests which were run passed.
  - NTP = No tests performed.
  - STF = Some tests in the segment failed.
- **l** = Phase where execution is suspended.
- **m** = Segment where execution is suspended.
- **n** = Floor and aisle.
- **o** = Module type.
- **p** = Cabinet type.
- **q** = Replacement equipment code(s).
- **r** = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Example of CODE FORM contents:
CODE
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
: = Intra-field delimiter.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
- = Inter-field delimiter if necessary.
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable. Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

s = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
t = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
u = Circuit type. Valid value(s):
_____ = Equipment is part of the circuit under test.
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

v = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.
w = Termination report. Valid value(s):
ABORTED = Requested action was terminated before completion, and the termination was complete.
COMPLETED = Request has successfully completed, and reports the overall result.
NOT STARTED = Requested action had not begun.
STOPPED = Requested action was terminated before a normal completion.

x = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.
y = Module number.
z = Cabinet number.
a¹ = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4
entries. Each record will have a new header.

\[ b^1 \] = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\[ c^1 \] = Statement number.

\[ d^1 \] = Reason why some tests were not performed.

## 4. ACTIONS TO BE TAKEN

For Formats 1, 6 and 7, no action is required.

For Format 2, determine the correct phase numbers and reenter the exercise request.

For Format 3, repair the faulty circuit.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTP</td>
<td>Enter the first exercise input message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH 1 SEG m</td>
<td>The fault may have been repaired. Rerun the entire diagnostic.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH 1 SEG m</td>
<td>This indicates a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH 1 SEG m</td>
<td>If the RPT option was specified, normal completion of the exercise is indicated. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH 1 SEG m</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected faulty circuit packs one at a time. Rerun the exercise for each replaced circuit pack until the fault is repaired or the exercise results change.

## 5. ALARMS

1. FORMAT

EX RCDDP=a-b-c d e

2. REASON FOR OUTPUT

To report information about a specified operation on a signal distribute point.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Remote access interface unit (RAIU) number.
c = Distribute point number.
d = Status of the request. Valid value(s):
   REQUEST COMPLETED = Indicates that the request has been completed and the requested operation has been performed.
   REQUEST INVALID = Indicates an invalid request. The input parameters do not fall within the range for a remote COMDAC in the RAIU.
   REQUEST REJECTED = Indicates that the request has been rejected. The possible reasons for this are the remote common data and control (COMDAC) is not in service or the input parameters may not correspond to a remote COMDAC in the RAIU.
e = Distribute point status.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'd' =</th>
<th>Action:</th>

2. REASON FOR OUTPUT

To report the result of executing an EX:RCLK input message to exercise a remote clock (RCLK) circuit.

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input message. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous message may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message.

Format 6 indicates execution of the exercise is terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = RCLK side.
c = Loop result. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Some tests were skipped because supporting hardware was not available, but all tests which were run passed.
   NTP = No tests performed.
   STF = Some tests failed.
d = Reason the message was rejected.
e = Phase in which the failure occurred.
f = Segment in which the failure occurred.
g = Test that failed.
h = Mismatch results for the specified test in hexadecimal.
i = Expected result for the specified test in hexadecimal.
j = Mask used to determine test failure in hexadecimal.
k = Actual result for the specified test in hexadecimal.
l = Type of suspension. Valid value(s):
   ATP = The specified segment(s) were completed and all tests were performed and passed.
   CATP = Some tests in the specified segment were skipped because supporting hardware was not available, but all tests which were run passed.
   NTP = No tests performed.
   STF = Some tests in the segment failed.
m = Phase where execution is suspended.
n = Segment where execution is suspended.
o = Floor and aisle.
p = Module type.
a = Module number.
q = Cabinet Type.
b = Cabinet number.
r = Replacement equipment code(s).

s = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
: = Intra-field delimiter.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits)
- = Inter-field delimiter if necessary.
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

t = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

u = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

v = Circuit type. Valid value(s):
   _____ = Equipment is part of the circuit under test.
   HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
   ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

w = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

x = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination is immediate. Consistency of hardware and data is questionable.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before a normal completion.

y = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

z = Text identifier showing order of record. Valid value(s):
   FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

c1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
d1 = Statement number.
e1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action required.

For Format 2, determine the correct phase numbers and reenter the exercise request.

For Format 3, repair the faulty circuit.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED ATP PH m SEG n</td>
<td>The fault may have been repaired. Rerun the entire diagnostic.</td>
</tr>
<tr>
<td>SUSPENDED CAT PH m SEG n</td>
<td>This indicates a lack of resources for the previously specified segment(s) inhibited execution of some tests. Idle the suspected resources and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED NTP</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH m SEG n</td>
<td>If the RPT option was specified, normal completion of the exercise is indicated. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH m SEG n</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected faulty circuit packs one at a time. Rerun the exercise for each replaced circuit pack until the fault is repaired or the exercise results change.

2. REASON FOR OUTPUT

To report the result of executing an EX:RDFI input message to exercise a remote switching module (RSM) digital facilities interface (RDFI) circuit.

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the repeat (RPT) option is specified in the input message. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates execution of the exercise is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the trouble locating procedure (TLP) option is specified in the input message.

Format 6 indicates execution of the exercise is terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital line and trunk unit (DLTU) number.
c = RDFI number.
d = Loop result. Valid value(s):
   ATP = All tests performed and passed.
   CATP = Some tests were skipped because supporting hardware was not available, but all tests which were run passed.
   NTP = No tests performed.
   STF = Some tests failed.

e = Reason the command was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test that failed.
i = Mismatch results for the specified test.
j = Expected result for the specified test in hexadecimal.
k = Mask used to determine test failure in hexadecimal.
l = Actual result for the specified test in hexadecimal.
m = Result of previous command. Valid value(s):
   ATP = The specified segment(s) were completed and all tests were performed and passed.
   CATP = Some tests in the specified segment were skipped because supporting hardware was not available, but all tests which were run passed. failed.
   NTP = No tests performed.
   STF = Some tests in the segment

n = Phase where execution is suspended.
o = Segment where execution is suspended.
p = Floor and aisle.
q = Module type.
r = Cabinet type.
s = Replacement equipment code(s).
t = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the subsequent example.

Example of CODE FORM contents:

```
CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

u = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

v = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

w = Circuit type. Valid value(s):

HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The online member must be removed, and the mate made online, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

x = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

y = Termination report. Valid value(s):

ABORTED = Requested action was terminated before completion, and the termination was complete.
COMPLETED = Request has successfully completed, and reports the overall result
NOT STARTED = Requested action had not begun.
STOPPED = Requested action was terminated before a normal completion.

z = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix of the Appendixes section of the Output Messages manual.

a = Text identifier showing order of record. Valid value(s):

FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

- \( b \) = Module number.
- \( c \) = Cabinet number.
- \( d \) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
- \( e \) = Statement number.
- \( f \) = Reason why some tests were not performed.

### 4. ACTION TO BE TAKEN

For Formats 1, 6 and 7, no action is required.

For Format 2, determine the correct phase numbers and reenter the exercise request.

  \item APP:TLP-NOTE
\end{itemize}
EX:RPCN

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] EX RPCNa 0 b c [d]

[2] EX RPCNa 0 PH e f [g]
   TEST MISMATCH
   h i

2. REASON FOR OUTPUT

To print the results of a diagnostic run on a ring peripheral controller node (RPCN) in the interactive mode.

Format 1 prints at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 prints whenever the diagnostic results are printed for an individual phase.

3. VARIABLE FIELD DEFINITIONS

a  = Ring node (RN) group number.

b  = Termination mode of diagnostic. Valid value(s):
   ABORTED = Diagnostic was abnormally stopped due to an external or internal error in execution.
   COMPLETED = Diagnostic completed normally.
   TERMINATED = Diagnostic terminated under program control (early termination), since further testing would not improve diagnostic resolution.

c  = Result of the diagnostic. Valid value(s):
   ATP = All tests passed.
   CATP = All tests that were executed were ATP. Some tests were not executed due to the unavailability of a system resource that was needed to perform the test, or due to the inability to isolate, or to singly isolate, the node under test.
   NTR = No tests run.
   STF = Some tests failed.

d  = Valid value(s):

<table>
<thead>
<tr>
<th>'c'</th>
<th>'d'</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATP or NTR</td>
<td>Identifies the reason that tests were skipped in this phase by their bit position in a 16-character hexadecimal number. For example, if 'd'=00000000 00000006, tests were skipped for reasons 1 and 2.</td>
</tr>
<tr>
<td>STF</td>
<td>Number of test failures in addition to the reasons that tests were skipped. For example, if 'd'=7 00000000 00000006, seven tests failed, plus tests were skipped for reasons 1 and 2.</td>
</tr>
</tbody>
</table>
The reason codes are as follows:

<table>
<thead>
<tr>
<th>Bit #</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Helper unit invalid or not specified.</td>
</tr>
<tr>
<td>1</td>
<td>Helper unit cannot be reserved.</td>
</tr>
<tr>
<td>2</td>
<td>Helper unit not out-of-service.</td>
</tr>
<tr>
<td>3</td>
<td>Helper control unit (CU) is not ATP.</td>
</tr>
<tr>
<td>4 to 29</td>
<td>Unused.</td>
</tr>
<tr>
<td>30</td>
<td>Node under test was the only isolated node.</td>
</tr>
<tr>
<td>31</td>
<td>Node under test was not isolated.</td>
</tr>
<tr>
<td>32 to 63</td>
<td>Unused.</td>
</tr>
</tbody>
</table>

e = Phase number.

f = Result of the phase. Valid value(s):
- ATP = All tests passed.
- CATP = All tests that were executed were ATP. Some tests were not executed due to the unavailability of a system resource that was needed to perform the test, or due to the inability to isolate, or to singly isolate, the node under test.
- NTR = No tests run.
- STF = Some tests failed.

g = If ’f’ = STF, identifies the reason that some tests were skipped. This field is the same as the ’d’ field in Format 1 except that the result of only one phase is reflected.

h = Test number of the failing test.

i = An 8-digit hexadecimal number that indicates the bits that were in error. A ‘1’ in a bit position indicates that the response from the unit did not match the expected response in that bit.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If ’e’ or ’f’ =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATP</td>
<td>The needed system resource should be made available if possible, so that all tests may be executed.</td>
</tr>
<tr>
<td>STF</td>
<td>The unit should be repaired as quickly as possible.</td>
</tr>
</tbody>
</table>

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of executing an EX:RRCLK input message to exercise a remote integrated services line unit (RISLU) remote circuit pack (RRCLK).

Format 1 indicates that the specified segments completed and all tests passed. It applies only when the RPT option is specified in the input messages. Execution of the exercise will continue for the remaining iterations.

Format 2 indicates that an option specified in the input message was invalid.

Format 3 indicates which test failed.

Format 4 indicates that execution of the exercise is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous message may also be printed.

Format 5 provides an ordered list of suspected faulty equipment. It applies only when the TLP option is specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = RISLU number.

c = RRCLK side.

d = Loop result. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Some tests were skipped because supporting hardware was not available, but all tests which were run passed.
   NTP = No tests performed.
   STF = Some tests failed.

e = Reason the message was rejected.

f = Phase in which the failure occurred.

g = Segment in which the failure occurred.

h = Test that failed.

i = Mismatch results for the specified test in hexadecimal.

j = Expected result for the specified test in hexadecimal.

k = Mask used to determine test failure in hexadecimal.

l = Actual result for the specified test in hexadecimal.

m = Type of suspension. Valid value(s):
   ATP = The specified segment(s) were completed and all tests were performed and passed.
   CATP = Some tests in the specified segment were skipped because supporting hardware was not available, but all tests which were run passed.
   NTP = No tests performed since the last completion message.
   STF = Some tests in the segment failed.

n = Phase where execution is suspended.

o = Segment where execution is suspended.

p = Floor and aisle number.

q = Module type.

r = Module number.

s = Cabinet type.
= Cabinet number.

= Replacement equipment code(s).

= Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
: = Intra-field delimiter.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
- = Inter-field delimiter if necessary.
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

= Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

= Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

= Circuit type. Valid value(s):

_____ = Equipment is part of the circuit under test.
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

= Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

= Termination report. Valid value(s):

ABORTED = Requested action was terminated before completion, and the termination was not graceful.
COMPLETED = Request has successfully completed.
NOT STARTED = Requested action has not begun.
STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

= Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

= Text identifier showing order of record. Valid value(s):

FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.
e¹ = Statement number.
f¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct phase number and reenter the exercise request.

For Format 3, analyze failure data to determine reason for failure or run the exercise using the 'TLP' option to generate a suspected faulty circuit pack list.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTP</td>
<td>Enter the first exercise message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Run the entire diagnostic by using the DGN:RRCLK input message.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED NTP PH n SEG o</td>
<td>If the RPT option was specified, normal completion of the exercise is indicated. Proceed to troubleshoot the circuit. If this message occurs when the RPT option was not specified, no tests were run. Determine the reason and reenter the exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty circuit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the diagnostic exercise for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing EX:RVPT input message to exercise the revertive pulsing transceiver (RVPT).

Format 1 is printed when the specified segment(s) have been completely executed. Execution of the diagnostic will continue for any remaining iterations.

Format 2 indicates that the previous EX:RVPT input message was invalid.

Format 3 is printed when a test has failed.

Format 4 is printed when the execution of the diagnostic is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous input message, may also be specified.

Format 5 is printed when the trouble location procedure (TLP) was specified in the input message. An ordered list of equipment where a fault might be located is provided.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a  = Switching module (SM) number.
b  = Unit number.
c  = Service group number.
d  = Board number.
e  = Loop result. Valid value(s):
   ATP  = All tests were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR  = No tests were run.
   STF  = Some tests failed.

f  = Reason the input message was rejected.
g  = Number of the phase in which the failure occurred.
h  = Number of the segment in which the failure occurred.
i  = Number of the test that failed.
j  = Mismatch results for the specified test in hexadecimal.
k  = Expected result for the specified test in hexadecimal.
l  = Mask used to determine test failure in hexadecimal.
m  = Actual result for the specified test in hexadecimal.
n  = Type of suspension. Valid value(s):
   ATP  = All tests were performed and all passed.
   CATP = Some tests were not performed, but all that were passed. Refer to the
           APP:MAINT-RESP appendix in the Appendixes section of the Output Messages
           manual.
   NTR  = No tests were run.
   STF  = Some tests failed.

o  = Phase number in which execution suspended.
p  = Segment number in which execution suspended.
q  = Aisle.
r  = Module type, communication module (CM) or SM.
s  = Switching module number.
t  = Cabinet type.
u = Cabinet number.

v = Replacement equipment code(s).

w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
A = Current minimal accepted equipment code.
: = Intra-field delimiter.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
- = Inter-field delimiter if necessary.
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
    _____ = Equipment is part of the circuit under test.
    HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
    ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

a1 = Refer to the APP:TLP-NOTE appendix in the Appendix section of the Output Messages manual.

b1 = Termination status. Valid value(s):
    ABORTED = The process was terminated (process not gracefully terminated).
    NOT STARTED = Action was not begun.
    STOPPED = Terminated before normal completion (process gracefully terminated).

c1 = Termination reason.

d1 = Text identifier showing order of record. Valid value(s):
    FIRST = First record of continuing list.
    LAST = Last record of list.
    NEXT = Next record of continuing list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\[ e^1 \]

- Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\[ f^1 \]

- Statement number.

\[ g^1 \]

- Reason why some tests were not performed.

### 4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct phase number and reenter the diagnostic exercise request, or wait until the previous input message is completed.

For Format 3, replace the faulty unit.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise input message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH f SEG g</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH f SEG g</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous input message.</td>
</tr>
<tr>
<td>SUSPENDED STF PH f SEG g</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected packs, one at a time in the order specified. Rerun the diagnostic program after each substitution until the fault is repaired or the diagnostic result changes.

2. REASON FOR OUTPUT

To report the result of executing a EX:SAS input message to diagnose the service announcement system (SAS) unit.

Format 1 indicates that the specified segments have been completed. It applies only when the RPT option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified options in the input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurs, and a summary of the results of the previous message, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedures (TLPs) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.

b = SAS unit number.

c = Loop result. Valid value(s):
ATP = All test were performed and all passed.
CATP = Some tests were not performed, but all that were passed.
NTR = No tests run.
STF = Some tests failed.

d = Reason the message was rejected.

e = Phase in which the failure occurred.

f = Segment in which the failure occurred.

g = Test number that failed.

h = Mismatch results for the specified test in hexadecimal.

i = Raw data expected result for the specified test in hexadecimal.

j = Raw data mask used to determine the test failure in hexadecimal.

k = Raw data actual result for the specified test in hexadecimal.

l = Type of suspension. Valid value(s):
ATP = The specified segment(s) were completed and all tests passed.
CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
NTR = No tests were run since the last completion message.
STF = The diagnostic has completed and some tests failed.

m = Phase number in which execution is suspended.

n = Segment number in which execution is suspended.

o = Identification number of floor and aisle.

p = Module type.

q = Module number.

r = Cabinet type.

s = Cabinet number.

t = Replacement equipment code(s).
Equipment form(s). Equipment form represents minimal operating level of replacement equipment. Refer to the following example.

Example of CODE FORM contents:

CODE A[:B]...[:C] [:-] D[:E]...[:F]
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits)
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.

Codes 'A', 'B' and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

v = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
w = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
x = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

y = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ = Equipment is part of the circuit under test.

z = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

a = Termination status. Valid value(s):
ABORTED = Immediate termination.
COMPLETED = Successful completion.
NOT_STARTED = Action has not begun.
STOPPED = Terminated before normal completion.

b = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

c = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d¹ = Statement number.
e¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6 and y, no action is required.

For Format 2, determine the correct phase numbers and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4,

<table>

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]

A = Current minimal accepted equipment code.
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'B', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

a1 = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b1 = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

c1 = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.
d

= Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

e

= Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

f

= Statement number.

g

= Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH o SEG p</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH o SEG p</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous command.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH o SEG p</td>
<td>If the RPT option was specified, this message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH o SEG p</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

   e f g h i

[4] EX SCSDC a ABORTED AT PH d STMNT j b [(c)] MSG IP

[5] EX SCSDC a TERMINATED AT PH d STMNT j AFTER TEST k

[6] EX SCSDC a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To report the results of an interactive mode diagnostic run on the scanner and signal distributor controller (SCSDC).

Format 1 specifies the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = The result of the diagnostic. Valid value(s):
ATP = All tests pass.
NTR = No tests were run.
STF = Some tests failed.

c = If 'b' = STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (700000000 00000000), seven tests failed and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates the response from the unit did not match the expected response in that bit.

g = The bits which were actually received from the hardware device.
h = Determines which bits in 'g' are included in this test.
i = The value which the test expected.

Note: For Format 3 the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.

j = Last statement successfully executed before the diagnostic terminated.
k = Current test number when diagnostic terminated.
l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the results of executing the EX:SDFI input message to diagnose the SLC® 96 digital facility interface (SDFI).

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified options in the input message was invalid.

Format 3 indicates that a test failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Digital carrier line unit (DCLU) number.
c = SLC®96 digital facility interface number (SDFI).
d = Loop result. Valid value(s):
   ATP = All tests were performed and passed.
   CATP = Some tests were not performed, but all performed tests passed.
   NTR = No tests were run.
   STF = Some tests failed.

e = Reason the command was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test number that failed.
i = Results for the specified test were mismatched in hexadecimal.
j = Raw data expected result for the specified test in hexadecimal.
k = Raw data mask used to determine the test failure in hexadecimal.
l = Raw data actual result for the specified test in hexadecimal.
m = Result of previous command. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

n = Phase number in which execution is suspended.
o = Segment number in which execution is suspended.
p = Identification number of floor and aisle.
q = Module type.
r = Module number.
s = Cabinet type.
t    = Cabinet number.

u    = Replacement equipment code(s).

v    = Equipment form(s). Equipment form represents minimal operating level of replacement
      equipment. Refer to the following example.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
:   = Intra-field delimiter.
-   = Inter-field delimiter if necessary.
A   = Current minimal accepted equipment code.
B   = Current production equipment code (substitutable equipment for code 'A').
C   = Additional compatible equipment code(s) (added as space permits).
D   = Current minimal approved operating level for equipment code 'A'.
E   = Current minimal approved operating level for equipment code 'B'.
F   = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text
identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the
issue level for a corresponding microcode identifier or text identifier(s) as applicable.

w    = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

x    = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the
      implicated shelf.

y    = Circuit type. Valid value(s):
      HPR    = Equipment is part of a helper circuit. The helper must be removed before
              replacement is attempted.
      ONL    = Equipment is part of the on-line member of a duplex pair. The on-line member
              must be removed, and the mate made on-line, before replacement is attempted.
      _____  = Equipment is part of the circuit under test.

z    = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages
      manual.

a1   = Termination status. Valid value(s):
      ABORTED    = The process was terminated (process not gracefully terminated).
      NOT_STARTED = Action was not begun.
      STOPPED    = Terminated before normal completion (process gracefully terminated).

b1   = Reason for the termination. Refer to the APP:MAINT-RESP appendix in the Appendixes section
      of the Output Messages manual.

c1   = Text identifier showing order of record. Valid value(s):
      FIRST      = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

d^1 = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

e^1 = Statement number.

f^1 = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Format 1, 6, and 7, no action is required.

For Format 2, determine the correct phase number and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4,

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTP</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous command.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH n SEG o</td>
<td>If the RPT option was specified, this message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of an interactive mode diagnostic run on the synchronous data link controller (SDLC).

Format 1 specifies the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention [no openings in the active deferred maintenance queue (DMQ) and the request is in the waiting DMQ], or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.

b = The result of the diagnostic. Valid value(s):
ATP = ALL tests pass.
NTR = No tests were run.
STF = Some tests failed.

c = If '0' = STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (7 00000000 00000000), seven tests failed and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.

Note: For Format 3, the values for 'g', 'h', and 'i' may be set to N/A. This means that this data is not available for the specified device.

g = The bits which were actually received from the hardware device.

h = Determines which bits in 'g' are included in this test.

i = The value which the test expected.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.

l = Task number assigned to the request.

4. ACTION TO BE TAKEN

If 'c' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.

5. ALARMS

This alarm is automatically generated. Action may or may not be required. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

1.  FORMAT

1.  FORMAT

1.  FORMAT

1.  FORMAT

2. REASON FOR OUTPUT

To report the result of executing an EX:SLIM input message to diagnose the subscriber line instrument measurement (SLIM) board.

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution has terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

### 3. VARIABLE FIELD DEFINITIONS

- **a**: Switching module (SM) number.
- **b**: Metallic service unit (MSU) number.
- **c**: Service group number.
- **d**: SLIM Board number.
- **e**: Loop result. Valid value(s):
  - ATP = All test were performed and all passed.
  - CATP = Some tests were not performed, but all that were passed.
  - NTR = No tests run.
  - STF = Some tests failed.
- **f**: Reason the command was rejected.
- **g**: Phase in which the failure occurred.
- **h**: Segment in which the failure occurred.
- **i**: Test number that failed.
- **j**: Mismatch results for the specified test in hexadecimal.
- **k**: Raw data expected result for the specified test in hexadecimal.
- **l**: Raw data mask used to determine the test failure in hexadecimal.
- **m**: Raw data actual result for the specified test in hexadecimal.
- **n**: Result of previous command. Valid value(s):
  - ATP = The specified segment(s) were completed and all tests passed.
  - CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
  - NTR = No tests were run since the last completion message.
  - STF = The diagnostic has completed and some tests failed.
- **o**: Phase number in which execution is suspended.
- **p**: Segment number in which execution is suspended.
- **q**: Identification number of floor and aisle.
- **r**: Module type.
- **s**: Module number.
t  = Cabinet type.

u  = Cabinet number.

v  = Replacement equipment code(s).

w  = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

```
CODE
A[:B]...[:C] [-] D[:E]...[:F]
: = Intra-field delimiter.
- = Inter-field delimiter if necessary.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code 'A').
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code 'A'.
E = Current minimal approved operating level for equipment code 'B'.
F = Current minimal approved operating level(s) for equipment code(s) 'C'.
```

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x  = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y  = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z  = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

a\textsuperscript{1} = Number of the TLP note containing supplementary information related to the suspected faulty equipment. Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b\textsuperscript{1} = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT_STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

c\textsuperscript{1} = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.
4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4,

<table>
<thead>

**Software Release:** 5E14 and later  
**Message Class:** MAINT  
**Application:** 5,3B  
**Type:** Output

1. **FORMAT**

   [1] EX STEP a [b] SUSPENDED AT ST c
   
   [2] EX STEP REQUEST NOT YET ACTIVE
   
   [3] EX STEP REQUEST NOT IN INTERACTIVE MODE
   
   [4] EX STEP ILLEGAL REQUEST TYPE

2. **REASON FOR OUTPUT**

   To report the result of executing an EX:STEP interactive diagnostic input message as part of an interactive diagnostic procedure.

   Format 1 prints when the interactive diagnostic is suspended.

   Format 2 prints if the unit (and subunit) specified by the interactive diagnostic input message is not in the active queue.

   Format 3 prints if the unit (and subunit) specified by the interactive diagnostic input message in the active queue but not an interactive request.

   Format 4 prints if the unit (and subunit) specified by the interactive diagnostic input message could not be found in either the waiting or active queues.

3. **VARIABLE FIELD DEFINITIONS**

   a  = Unit type and member number of unit under test.
   b  = Unit type and member number of the subunit under the unit under test.
   c  = Data table statement number.

4. **ACTION TO BE TAKEN**

   For Format 1, after the possible hardware troubleshooting, advance through the data table by issuing the EX:STEP input message again or by issuing the EX:PAUSE input message.

   For Formats 2, 3, and 4, reenter the input message after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input message. Use the OP:DMQ input message to display requests in the queue. Enter the desired interactive request if it is not in the queue. Wait until the desired interactive diagnostic request becomes active, or use the STOP:DMQ or STP:DMQ input message to remove other request(s) from the queue until the desired interactive diagnostic request becomes active.
active.

5. ALARMS

None. This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Type: Output

1. FORMAT

[1] EX STOP REQUEST NOT YET ACTIVE NO ACTION TAKEN

[2] EX STOP REQUEST NOT IN INTERACTIVE MODE NO ACTION TAKEN

[3] EX STOP ILLEGAL REQUEST TYPE NO ACTION TAKEN

2. REASON FOR OUTPUT

To report the result of executing an EX:STOP interactive diagnostic input message but the appropriate interactive request could not be found.

Format 1 prints if the unit (and subunit) specified by the interactive diagnostic command is not in the active queue.

Format 2 prints if the unit (and subunit) specified by the interactive diagnostic command is in the active queue but not an interactive request.

Format 3 prints if the unit (and subunit) specified by the interactive diagnostic command could not be found in either the waiting or active queues.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

For Formats 1, 2, and 3, reenter the input message after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input message. Use the OP:DMQ input message to display the requests in the queue. Enter the desired interactive diagnostic request if it is not in the queue. Wait until the desired interactive diagnostic request becomes active, or use the STOP:DMQ or STP:DMQ input message to remove other request(s) from the queue until the desired interactive diagnostic request becomes active.

5. ALARMS

None. This alarm is a manually-requested report. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

   [EXP j MASK k ACTL l]

2. REASON FOR OUTPUT

To report the result of executing an EX:TAC input message to diagnose the test and access circuit (TAC).

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous input message, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Trunk unit number.
c = Service group number.
d = Loop result. Valid value(s):
   ATP = All test were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.
e = Reason the input message was rejected.
f = Phase in which the failure occurred.
g = Segment in which the failure occurred.
h = Test number that failed.
i = Mismatch results for the specified test in hexadecimal.
j = Raw data expected result for the specified test in hexadecimal.
k = Raw data mask used to determine the test failure in hexadecimal.
l = Raw data actual result for the specified test in hexadecimal.
m = Result of previous input message. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

n = Phase number in which execution is suspended.
o = Segment number in which execution is suspended.
p = Identification number of floor and aisle.
q = Module type.
r = Module number.
s = Cabinet type.
t = Cabinet number.
Replacement equipment code(s).

Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
  = Inter-field delimiter if necessary.
:  = Intra-field delimiter.
A  = Current minimal accepted equipment code.
B  = Current production equipment code (substitutable equipment for code 'A').
C  = Additional compatible equipment code(s) (added as space permits).
D  = Current minimal approved operating level for equipment code 'A'.
E  = Current minimal approved operating level for equipment code 'B'.
F  = Current minimal approved operating level(s) for equipment code(s) 'C'.

Codes 'A', 'B', and 'C' may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms 'D', 'E', and 'F' may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

Circuit type. Valid value(s):
HPR  = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL  = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
_____ = Equipment is part of the circuit under test.

Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

Termination status. Valid value(s):
ABORTED  = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED  = Terminated before normal completion (process gracefully terminated).

Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

Text identifier showing order of record. Valid value(s):
FIRST  = First record of continuing list.
LAST   = Last record of list.
NEXT   = Next record of continuing list.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

\( d^1 \) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

\( e^1 \) = Statement number.

\( f^1 \) = Reason why some tests were not performed.

4. **ACTION TO BE TAKEN**

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP PH n SEG o</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH n SEG o</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous command.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH n SEG o</td>
<td>If the RPT option was specified, this message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH n SEG o</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

5. **ALARMS**

None.

2. REASON FOR OUTPUT

To report the result of executing an EX:TEN input message to diagnose the trunk equipment network (TEN).

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid to an invalid diagnostic phase.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = TEN unit number.
c = Service group number.
d = TEN board number.
e = TEN circuit number.
f = Loop result. Valid value(s):
   ATP = All tests were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.

g = Reason the command was rejected.
h = Phase in which the failure occurred.
i = Segment in which the failure occurred.
j = Test number that failed.
k = Mismatch results for the specified test in hexadecimal.
l = Raw data expected result for the specified test in hexadecimal.
m = Raw data mask used to determine the test failure in hexadecimal.
n = Raw data actual result for the specified test in hexadecimal.
o = Result of previous command. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

p = Phase number in which execution is suspended.
q = Segment number in which execution is suspended.
r = Identification number of floor and aisle.
s = Module type.
t = Module number.

v = Cabinet number.

w = Replacement equipment code(s).

x = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code ‘A’).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code ‘A’.
E = Current minimal approved operating level for equipment code ‘B’.
F = Current minimal approved operating level(s) for equipment code(s) ‘C’.

Codes ‘A’, ‘B’, and ‘C’ may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms ‘D’, ‘E’, and ‘F’ may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

y = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

z = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

a¹ = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ = Equipment is part of the circuit under test.

b¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

c¹ = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

d¹ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.
e¹ = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLF list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

f¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

g¹ = Statement number.

h¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>

Output Appendix(es):
EX:TMS

Software Release: 5E14 and later
Message Class: ONTC
Application: 5
Type: Output

1. FORMAT

EX TMS=a b [c]

2. REASON FOR OUTPUT

To acknowledge that a manual request to exercise a time multiplexed switch (TMS) is complete.

3. VARIABLE FIELD DEFINITIONS

a = The office network and timing complex (ONTC) side the TMS is on.

b = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate (no cleanup was done).
   COMPLETED = Request completed successfully.
   NOT STARTED = Requested action could not begin.
   STOPPED = Request was terminated before a normal completion. Attempts were made to leave everything in a sane state.

c = Additional data qualifying the termination field.

4. ACTION TO BE TAKEN

This message is printed out in response to a manual request. No further action is necessary if the request completed successfully. If the termination report is not COMPLETED, the variable 'c' field should give some indication as to why the request failed.

5. ALARMS

None.

__________________________________________________________________

2. REASON FOR OUTPUT

To report the result of executing an EX:TTFCOM input message to diagnose transmission test facility common (TTFCOM) unit.

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.
Format 6 indicates that the diagnostic execution has terminated.

Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Global digital service unit (GDSU) number.
c = Service group number.
d = Board number.
e = Loop result. Valid value(s):
   ATP = All tests were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.
f = Reason the command was rejected.
g = Phase in which the failure occurred.
h = Segment in which the failure occurred.
i = Test number that failed.
j = Mismatch results for the specified test in hexadecimal.
k = Raw data expected result for the specified test in hexadecimal.
l = Raw data mask used to determine the test failure in hexadecimal.
m = Raw data actual result for the specified test in hexadecimal.
n = Result of previous command. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.
o = Phase number in which execution is suspended.
p = Segment number in which execution is suspended.
q = Identification number of floor and aisle.
r = Module type.
s = Module number.
t = Cabinet type.

u = Cabinet number.

v = Replacement equipment code(s).

w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

```plaintext
CODE
A[:B]...[:C] [-] D[:E]...[:F]
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
```

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):

- HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
- ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
- ____ = Equipment is part of the circuit under test.

a1 = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b1 = Termination status. Valid value(s):

- ABORTED = The process was terminated (process not gracefully terminated).
- NOT_STARTED = Action was not begun.
- STOPPED = Terminated before normal completion (process gracefully terminated).

1 = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.
Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

e¹ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

f¹ = Statement number.

g¹ = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise command for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED ATP, PH o SEG p</td>
<td>The fault may have been repaired. Rerun the entire diagnostic to determine the condition of the circuit.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH o SEG p</td>
<td>This message indicates that a lack of resources for the previously specified segment(s) inhibited the execution of some tests. Idle the suspected resources and reenter the previous command.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH o SEG p</td>
<td>If the RPT option was specified, this message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH o SEG p</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 5, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

EX: TTFCOM

Output Appendix(es):
EX:TTYC

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

   TEST e MISMATCH f ACTUAL g MASK h EXPECTED i

[4] EX TTYC a ABORTED AT PH d STMNT j b [(c)] MSG IP

[5] EX TTYC a TERMINATED AT PH d STMNT j AFTER TEST k

[6] EX TTYC a TASK l {MESSAGE STARTED | QUEUED | ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the teletypewriter controller (TTYC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active deferred maintenance queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a = Member number.
b = The result of the diagnostic. Valid value(s):
   ATP = All tests passed.
   NTR = No tests were executed.
   STF = Some tests failed.

c = If 'b' = STF, 'c' identifies the number of test failures in addition to the reasons that tests were skipped. For example, if 'c' = (70000000000000000), seven tests failed, and no tests were skipped.

d = Phase number.

e = Test number of the failing test.

f = The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.
Note: For Format 3, the values for 'g', 'h' and 'i' may be set to N/A. This means that this data is not available for the specified device.

g = The bits which were actually received from the hardware device.

h = Determines which bits in 'g' are included in this test.

i = The value which the test expected.

j = Last statement successfully executed before the diagnostic terminated.

k = Current test number when diagnostic terminated.
l = Task number assigned to the request.

4. ACTION TO BE TAKEN
If 'b' = STF, the unit should be repaired as quickly as possible. Refer to the Corrective Maintenance manual for the repair procedures.

5. ALARMS
This alarm is automatically generated. Action may or may not be required.

2. REASON FOR OUTPUT

To provide information about a recent exercise on the universal conference (UCONF) circuit board, as requested by input message EX:UCONF.

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates a conditional all tests passed (CATP): the specified segments have been completed but some portion was skipped. It applies only when the RPT option was specified in the input message. All tests that were performed passed. Execution of the diagnostic will continue for the remaining iterations.

Format 3 indicates that the specified input message referred to an invalid diagnostic phase.
Format 4 indicates that the specified segments have been completed but no tests were performed. It applies only when the RPT option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 5 indicates that a test has failed and specifies which test.

Format 6 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and other diagnostic information, may also be specified.

Format 7 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

Format 8 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = Global digital service unit (DSU) number.
- **c** = Service group number.
- **d** = DSU board number.
- **e** = Illegal synch phase number (SM units only).
- **f** = Synch segment number (SM units only).
- **g** = Synch statement number (SM units only).
- **h** = Illegal pause phase number.
- **i** = Pause segment number.
- **j** = Illegal phase to execute.
- **k** = First segment to execute.
- **l** = Last segment to execute.
- **m** = Phase in which the failure occurred.
- **n** = Segment in which the failure occurred.
- **o** = Test number that failed.
- **p** = Mismatch results for the specified test in hexadecimal.
- **q** = Raw data expected result for the specified test in hexadecimal.
- **r** = Raw data mask used to determine the test failure in hexadecimal.
- **s** = Raw data actual result for the specified test in hexadecimal.
- **t** = Result of previous input message. Valid value(s):
  - **CATP** = Conditional all tests passed. The specified phases were completed but some
portion was skipped.

**NTR** = No tests were run since the last completion message.

**STF** = The diagnostic has completed and some tests failed.

(Blank) = The system is suspended and is waiting for an input message. No phase and segment (variables 'u' and 'v') are specified.

- **u** = Phase number in which execution is suspended.
- **v** = Segment number in which execution is suspended.
- **w** = Identification number of floor and aisle.
- **x** = Module type.
- **y** = Module number.
- **z** = Cabinet type.
- **a** = Cabinet number.
- **b** = Replacement equipment code(s).
- **c** = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

```
CODE
A[:B]...[:C] [-] D[:E]...[:F]
- = Inter-field delimiter if necessary.
: = Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code A.
E = current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.
```

Codes **A**, **B**, and **C** may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms **D**, **E**, and **F** may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable of CLEI.

- **d** = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.
- **e** = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.
- **f** = Circuit type. Valid value(s):
  - **HPR** = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.

___ = Equipment is part of the circuit under test.

$g^1$ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

$h^1$ = Text identifier showing order of record. Valid value(s):
  FIRST = First record of continuing list.
  LAST = Last record of list.
  NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

$i^1$ = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

$j^1$ = Statement number.

$k^1$ = Reason why some tests were not performed. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTION TO BE TAKEN

For Formats 1 and 8, no action is required.

For Format 2, the execution of the diagnostic for the specified phases was inhibited by a lack of resources. Idle the suspected resources and reenter the diagnostic exercise request.

For Format 3, determine the correct input message and reenter the diagnostic exercise request.

For Format 4, the execution of the diagnostic for the specified segments was inhibited by a lack of resources. Idle the suspected resources and reenter the diagnostic exercise request.

For Format 5, repair the faulty unit.

For Format 6:

<table>
<thead>
<tr>
<th>If output includes:</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUSPENDED NTR</td>
<td>Enter the first exercise input message for the purpose of manual troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED CATP PH u SEG v</td>
<td>This message indicates that a lack of resources for the previously specified phase inhibited the execution of some segments. Idle the suspected resources and reenter the previous input message.</td>
</tr>
<tr>
<td>SUSPENDED NTR PH u SEG v</td>
<td>If the RPT option was specified, this message indicates the normal completion of the exercise. Proceed to troubleshoot the unit. If this message occurs when the RPT option was not specified, it indicates that no tests were run. Determine the reason and reenter the diagnostic exercise request.</td>
</tr>
<tr>
<td>SUSPENDED STF PH u SEG v</td>
<td>Analyze the test failure data. Repair the faulty unit or enter another exercise request to continue troubleshooting.</td>
</tr>
<tr>
<td>SUSPENDED x PH o</td>
<td>The specific phase was terminated. Complete PH and SEG specifications must be provided on next EX request.</td>
</tr>
</tbody>
</table>

For Format 7, replace the suspected circuit packs one at a time. Rerun the entire diagnostic for each replaced pack.
until the fault is repaired or the diagnostic results change.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing an EX:UTD input message to diagnose the universal tone decoder (UTD) board.

Format 1 indicates that the specified segments have been completed and all tests passed. It applies only when the repeat (RPT) option was specified in the input message. Execution of the diagnostic will continue for the remaining iterations.

Format 2 indicates that the specified input message was invalid.

Format 3 indicates that a test has failed and specifies which test.

Format 4 indicates that execution of the diagnostic is suspended. The phase and segment in which the suspension occurred, and a summary of the results of the previous command, may also be specified.

Format 5 provides an ordered list of equipment on which a fault that could cause a test failure may be located. It applies only when the trouble location procedure (TLP) option was specified in the input message.

Format 6 indicates that the diagnostic execution has terminated.
Format 7 prints when the specified circuit is unavailable. Some tests were not performed, but all performed tests passed.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = Local digital service unit (DSU).
c = Service group number.
d = DSU board position number.
e = Loop result. Valid value(s):
   ATP = All tests were performed and all passed.
   CATP = Some tests were not performed, but all that were passed.
   NTR = No tests run.
   STF = Some tests failed.

f = Reason the command was rejected.
g = Phase in which the failure occurred.
h = Segment in which the failure occurred.
i = Test number that failed.
j = Mismatch results for the specified test in hexadecimal.
k = Raw data expected result for the specified test in hexadecimal.
l = Raw data mask used to determine the test failure in hexadecimal.
m = Raw data actual result for the specified test in hexadecimal.
n = Result of previous command. Valid value(s):
   ATP = The specified segment(s) were completed and all tests passed.
   CATP = Conditional all tests passed. The specified segment(s) completed but some portion was skipped.
   NTR = No tests were run since the last completion message.
   STF = The diagnostic has completed and some tests failed.

o = Phase number in which execution is suspended.
p = Segment number in which execution is suspended.
q = Identification number of floor and aisle.
r = Module type.
s = Module number.
t = Cabinet type.
u = Cabinet number.

v = Replacement equipment code(s).

w = Equipment form(s). Equipment form represents minimal operating level of replacement equipment.

Example of CODE FORM contents:

CODE
A[:B]...[:C] [-] D[:E]...[:F]
= Inter-field delimiter if necessary.
= Intra-field delimiter.
A = Current minimal accepted equipment code.
B = Current production equipment code (substitutable equipment for code A).
C = Additional compatible equipment code(s) (added as space permits).
D = Current minimal approved operating level for equipment code A.
E = Current minimal approved operating level for equipment code B.
F = Current minimal approved operating level(s) for equipment code(s) C.

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.

x = Vertical location in the bay computed in inches from the floor to center of the implicated shelf.

y = Horizontal location in the bay computed in eighths of an inch from the left-hand corner of the implicated shelf.

z = Circuit type. Valid value(s):
HPR = Equipment is part of a helper circuit. The helper must be removed before replacement is attempted.
ONL = Equipment is part of the on-line member of a duplex pair. The on-line member must be removed, and the mate made on-line, before replacement is attempted.
____ = Equipment is part of the circuit under test.

a¹ = Refer to the APP:TLP-NOTE appendix in the Appendixes section of the Output Messages manual.

b¹ = Termination status. Valid value(s):
ABORTED = The process was terminated (process not gracefully terminated).
NOT STARTED = Action was not begun.
STOPPED = Terminated before normal completion (process gracefully terminated).

c¹ = Termination reason. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

d¹ = Text identifier showing order of record. Valid value(s):
FIRST = First record of continuing list.
LAST = Last record of list.
NEXT = Next record of continuing list.

Maximum of 12 list entries may be reported on a TLP list. They will print in groups (records) of 1-4 entries. Each record will have a new header.

e\(^1\) = Depth location in the bay computed in tenths of an inch. Measured left to right in the drawer on the implicated shelf.

f\(^1\) = Statement number.

g\(^1\) = Reason why some tests were not performed.

4. ACTION TO BE TAKEN

For Formats 1, 6, and 7, no action is required.

For Format 2, determine the correct input message and reenter the diagnostic exercise request.

For Format 3, repair the faulty unit.

For Format 4:

<table>
<thead>
<tr>
<th>If output includes:</th>

APP:MAINT-RESP
31. EXC
EXC:ALE-A  

**Software Release:** 5E14 - 5E15  
**Message Class:** TLWS,RSB  
**Application:** 5  
**Type:** Output  

1. **FORMAT**

   [1]  
   EXC ALE a  

   [2]  
   EXC ALE - THE FOLLOWING SM’S DATA MAY BE INCOMPLETE OR UNAVAILABLE  
   b [b . . . b]  
   . . .  
   . . .  
   . . .  

2. **REASON FOR OUTPUT**

   To respond to the EXC:ALE input message or to output results of the automatic line evaluation (ALE) session. Automatic line insulation testing requests the ALE session.

   ALE reports data stored in line cards, protocol handlers (PHs), and switching modules (SMs) that record error events detected for digital subscriber lines (DSLs), extended digital subscriber lines (EDSLs), X.75'/X.75 packet gateway trunks, and internal protocol (IP) packet gateway trunks. ALE data is reported using three session types: level 1, level 2 and protocol error records (PER).

   Level 1 sessions report the errored-frame seconds detected within the U-interface line cards. This session only generates reports for U-interface DSLs (U-DSL); all other line or trunk types are ignored. For more information, refer to the EXC:ALE-LVL1 output message.

   Level 2 sessions report the quality of the transmission of layer 2 frames between the switch and the customer premises equipment (CPE). The quality measure is the ratio of the errored packets to the total number of packets received. For more information, refer to the EXC:ALE-LVL2 output message.

   PER sessions report the protocol errors recorded for an integrated services digital network (ISDN) line or trunk. PERs provide detailed information regarding a detected failure in the layer 2 and layer 3 peer-to-peer protocols. For more information, refer to the EXC:ALE-PER output message.

Format 1 indicates the start and completion status of the ALE session.

Format 2 is used to indicate that some SMs did not execute the ALE session successfully. This message will be output to the same destination message class that the Format 1 message is sent to.

3. **VARIABLE FIELD DEFINITIONS**

   \[a\]  
   = ALE session start and finish messages. Valid value(s):  
   ABORTED - COMMUNICATION FAILURE = The current ALE session is stopped because of failures in inter-process message transmission.  
   ABORTED - DATA BASE ERROR = The current ALE session is stopped due to a data base access failure in the administrative module (AM).  
   ABORTED - LOADABLE PACKAGE DOES NOT EXIST = The request cannot link to the ISDN base package.
4. ACTION TO BE TAKEN

If the problem indicates that an SM's ALE data is incomplete or unavailable, then determine if the SM is isolated from the AM. If the SM is not isolated from the AM, then attempt the request after several minutes.

If the problem is that ALE is not started, use the STP:ALE to terminate the current request, or wait for the session to complete.

Other ALE abort reasons indicate system resource shortages. Attempt the request after several minutes.

5. ALARMS

None.

2. REASON FOR OUTPUT

To respond to the EXC:ALE input message or to output results of the automatic line evaluation (ALE) session. Automatic line insulation testing requests the ALE session.

ALE reports data stored in line cards, protocol handlers (PHs), and switching modules (SMs) that record error events detected for digital subscriber lines (DSLs), extended digital subscriber lines (EDSLs), X.75'/X.75 packet gateway trunks, internal protocol (IP) packet gateway trunks, virtual basic rate interface (VBRI) and virtual trunk (VTRK). ALE data is reported using three session types: level 1, level 2 and protocol error records (PER).

Please note that for VBRI and VTRK only the PER session is available.

Level 1 sessions report the errored-frame seconds detected within the U-interface line cards. This session only generates reports for U-interface DSLs (U-DSL); all other line or trunk types are ignored. For more information, refer to the EXC:ALE-LVL1 output message.

Level 2 sessions report the quality of the transmission of layer 2 frames between the switch and the customer premises equipment (CPE). The quality measure is the ratio of the errored packets to the total number of packets received. For more information, refer to the EXC:ALE-LVL2 output message.

PER sessions report the protocol errors recorded for an integrated services digital network (ISDN) line or trunk. PERs provide detailed information regarding a detected failure in the layer 2 and layer 3 peer-to-peer protocols. For more information, refer to the EXC:ALE-PER output message.

Format 1 indicates the start and completion status of the ALE session.

Format 2 is used to indicate that some SMs did not execute the ALE session successfully. This message will be output to the same destination message class that the Format 1 message is sent to.

3. VARIABLE FIELD DEFINITIONS

a = ALE session start and finish messages. Valid value(s):
ABORTED - COMMUNICATION FAILURE = The current ALE session is stopped because of failures in inter-process message transmission.
ABORTED - DATA BASE ERROR = The current ALE session is stopped due to a data base access failure in the administrative module (AM).
ABORTED - LOADABLE PACKAGE DOES NOT EXIST = The request cannot link to the ISDN base package.
ABORTED - UNABLE TO CREATE PROCESS = The current ALE request cannot start an AM
terminal process to execute the session.

**COMPLETED** = Either an automatic ALE session or a manual request using the SRESET option has completed.

**COMPLETED - NO DSLS EQUIPPED/ASSIGNED** = Either an automatic ALE session or a manual request has completed without any output as no DSLs were found in the requested range. DSL logical groups must be assigned to a physical PH for ALE information to be collected.

**COMPLETED - NO DSL ERRORS** = Either an automatic ALE session or a manual request has completed without any output as no errors have been found.

**INHIBITED** = Neither level 1 nor level 2 is allowed for automatic ALE.

**NOT STARTED - ALE ACTIVE** = Automatic ALE is blocked by another ALE session in progress.

**NOT STARTED - CMP UNAVAILABLE** = The input request could not be completed because a needed communication module (CM) was unable to respond. Retry the request later.

**NOT STARTED - INVALID PORT** = A single DSL request has been made for a non-existent line, a non-existent trunk, or a DSL channel that does not support any protocols.

**NOT STARTED - INVALID REQUEST** = A single DSL request has been made with an invalid channel option. The channel option may only be used when the line identifier is the line card equipment number (LCEN) or the line circuit equipment number (LCKEN). Moreover, the channel option may not be used when only level 1 has been requested. Or ATMPP has been made with PER option.

**NOT STARTED - NON-PRIMARY DN SPECIFIED** = A single DSL request has been made for a DN that is not a primary DN.

**NOT STARTED - NON-UNIQUE NXX DN** = A non-unique NXX DN was entered. The NXX is in multiple NPA's. Reenter DN with NPA.

**NOT STARTED - NOT A U-DSL PORT** = A single DSL request that is only valid for U-DSLs, has been made with an equipment number (EN) or DSL group and member (DSLGM) identifier that does not identify a U-DSL port.

**NOT STARTED - SM UNAVAILABLE** = A single DSL request has been made where the DSL is on an SM that is not fully operational.

**STARTED** = An ALE session has begun.

**STOPPED** = An ALE session was stopped manually or due to an inability to report data.

b = Number of the SM that did not properly execute the ALE session.

## 4. ACTIONS TO BE TAKEN

If the problem indicates that an SM's ALE data is incomplete or unavailable, then determine if the SM is isolated from the AM. If the SM is not isolated from the AM, then attempt the request after several minutes.

If the problem is that ALE is not started, use the STP:ALE to terminate the current request, or wait for the session to complete.

Other ALE abort reasons indicate system resource shortages. Attempt the request after several minutes.

## 5. ALARMS

           f n [*] o p q [r] [s] [t] [u] [v] [w]
           . . . . . . . . . . . .
           . . . . . . . . . . . .
           . . . . . . . . . . . .

[3] EXC ALE LEVEL 1 x: TOTAL OF y SEGMENTS PRINTED

2. REASON FOR OUTPUT

To respond to the EXC:ALE input message with the level 1 (LEVEL1) option specified or to output results of the automatic line evaluation (ALE) session if the LEVEL1 option was set using the ALW:ALE input message.

If the output is a response to a manual request, the scope of the report is those U-interface digital subscriber loops (DSLs) specified in the input message. If the request was automatic, the scope of the report is the entire office.

A response to a manual request uses the PRFMRSP message class except when the PRINT option is used to force it to the PRFM message class. Automatic sessions will output to the PRFM or RSB message classes depending on the option set using the INH:ALE input message or the ALW:ALE input message respectively.

Level 1 responses that immediately follow the inhibiting (INH:ALE) of ISDN protocol channels may give an erroneous indication that the level 1 error counts are increasing. The actual counting of level 1 errored seconds (ES), severely errored seconds (SES), and cyclic redundancy check (CRC) block errors (BEs), may not be inhibited for a period of up to 5 minutes. Level 1 responses that immediately follow the allowing (ALW:ALE) of integrated services digital network (ISDN) protocol channels may give an erroneous indication that the level 1 error counts are not incrementing. The actual counting of level 1 ES, SES, and CRC BEs, may not resume for a period of up to 5 minutes.

Counts for integrated digital carrier unit (IDCU) U-DSL line terminations may not be completely reported due to the need to support multiple vendor's remote terminals (RT) that may not be able to report the counts requested.

Format 1 indicates that the ALE level 1 session has begun.

Format 2 reports the level 1 ES, SES, and CRC BEs for the indicated DSLs. Each line of the output corresponds to a particular count set. A single DSL may report from 1 to 25 count sets. Up to 11 count sets may be reported in a single message.

Format 3 outputs the completion status of the ALE level 1 session indicating the number of ALE level 1 message
3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

* = Corruption indication flag. When set, the counts may not be complete since this indicates that the counters have stopped because the line card was removed from service, a CRC test has been run, or layer 1 was not operational. This flag is not valid for basic rate interface transmission extension (BRITE) channel units (CU).

a = Type of level 1 report. Valid value(s):
DAILY SUMMARY = Message contains level 1 information for the current day event.
DISK SUMMARY = Message contains level 1 information obtained from a disk file demand query.
SUMMARY = Message contains level 1 information obtained from a DSL demand query.

b = Segment number of the message. Segments are numbered sequentially starting from 1.

c = Current (recorded) interval duration in hours.

d = Hour in which current (recorded) interval started.

e = Hour in which current (recorded) interval will be completed.

f = Equipment number. Valid value(s):
ILEN g-k-l-m
INEN g-d1-l-m
LCEN g-h-i-j
LCKEN g-z-a1-b1-c1

g = Switching module number.

h = Integrated services line unit number.

i = Line group controller number.

j = Line card number.

k = Integrated digital carrier unit number.

l = Remote terminal (RT) number.

m = RT line number.

n = The DSL interface type. Valid value(s):
A = ANSI® standard U-interface.
U = Alternate mark inversion (AMI) U-interface.

o = The count set being reported. Valid value(s):
1C = BRITE CU 1 current interval.
1P = BRITE CU 1 previous interval.
2C = BRITE CU 2 current interval.
2P = BRITE CU 2 previous interval.
3C = BRITE CU 3 current interval.
3P = BRITE CU 3 previous interval.
4C = BRITE CU 4 current interval.
4P = BRITE CU 4 previous interval.
5C = BRITE CU 5 current interval.
5P = BRITE CU 5 previous interval.
6C = BRITE CU 6 current interval.
6P = BRITE CU 6 previous interval.
CD = Current day.
CH = Current hour.
CI = Current interval.
CU1 NOT EQUIPPED = Channel unit 1 is not equipped.
CU1 NOT RESPONDING = Channel unit 1 is not responding.
CU1 RESOURCE BUSY = Channel unit 1 resources are busy.
CU2 NOT EQUIPPED = Channel unit 2 is not equipped.
CU2 NOT RESPONDING = Channel unit 2 is not responding.
CU2 RESOURCE BUSY = Channel unit 2 resources are busy.
CU3 NOT EQUIPPED = Channel unit 3 is not equipped.
CU3 NOT RESPONDING = Channel unit 3 is not responding.
CU3 RESOURCE BUSY = Channel unit 3 resources are busy.
CU4 NOT EQUIPPED = Channel unit 4 is not equipped.
CU4 NOT RESPONDING = Channel unit 4 is not responding.
CU4 RESOURCE BUSY = Channel unit 4 resources are busy.
CU5 NOT EQUIPPED = Channel unit 5 is not equipped.
CU5 NOT RESPONDING = Channel unit 5 is not responding.
CU5 RESOURCE BUSY = Channel unit 5 resources are busy.
CU6 NOT EQUIPPED = Channel unit 6 is not equipped.
CU6 NOT RESPONDING = Channel unit 6 is not responding.
CU6 RESOURCE BUSY = Channel unit 6 resources are busy.
DSL RESOURCE BUSY = DSL resources are busy.
H2 = Second history interval.
H3 = Third history interval.
H4 = Fourth history interval.
H5 = Fifth history interval.
H6 = Sixth history interval.
H7 = Seventh history interval.
H8 = Eighth history interval.
LCEN NOT FOUND IN DATABASE = Invalid line card equipment number.
LINE CARD OUT-OF-SERVICE = Line card is out of service.
NOT A U-DSL PORT- = Port is not a U-DSL port.
PD = Previous day.
PH = Previous hour.
PI = Previous interval.
PM DATA READ TIMEOUT = Performance monitoring data read has timed out.
PM DATA UNSUPPORTED = Performance monitoring data requested is unsupported by this type of U-DSL. AMI U-DSL ports do not support reports for HIST, HOUR, INT, or PREV counts.
P = Number of upstream network termination equipment (NTE) to line card (LC) or line termination
(LT)] errored seconds. An errored second occurs when at least one CRC block error occurs in a second. The AMI U-interface only keeps the count of errored seconds for the current day (CD).

\( q \) = Number of downstream (LC or LT to NTE) errored seconds.

\( r \) = Number of errored seconds reporting threshold. This value is only reported for the current hour (CH), current interval (CI), and CD count sets.

\( s \) = Number of upstream severely errored seconds. A severely errored second occurs when a fixed number of CRC block errors is exceeded in one second. The parameter defining a severely errored second is specified on RC/V View 8.1. This value is not reported for history interval (H2 - H8) count sets.

\( t \) = Number of downstream severely errored seconds.

\( u \) = Severely errored seconds reporting threshold. This value is only reported for the CH, CI, and CD count sets.

\( v \) = Number of upstream CRC block errors. This value is not reported for history interval (H2 - H8), CD, or previous day (PD) count sets.

\( w \) = Number of downstream CRC block errors.

\( x \) = Session completion status. Valid value(s):

- **COMPLETED** = Session completed normally.
- **STOPPED** = Session stopped due to abnormal condition or manual request.

\( y \) = Total number of segments printed.

\( z \) = Integrated service line unit 2 (ISLU2).

\( a^1 \) = Line group number.

\( b^1 \) = Line board number.

\( c^1 \) = Line circuit number.

\( d^1 \) = Digital network unit - synchronous optical network (SONET) (DNU-S) number.

1. FORMAT

[1] EXC ALE LEVEL 2 STARTED

[2] EXC ALE LEVEL 2 SUMMARY - SEGMENT a:
   [r₁] [e] [g] [f] [r]
   [t] [c₁] [d₁] [e₁]
   . . . . . . . . . . . . .
   . . . . . . . . . . . . .
   . . . . . . . . . . . . .

[3] EXC ALE LEVEL 2 f₁: TOTAL OF g₁ SEGMENTS PRINTED

2. REASON FOR OUTPUT

To respond to the EXC:ALE input message with the level 2 (LEVEL2) option specified or to output results of the automatic line evaluation (ALE) session if the LEVEL2 option was set using the ALW:ALE input message.

If the output is a response to a manual request, the scope of the report is those integrated services digital network (ISDN) channels specified in the input message. If the request was automatic, the scope of the report is the entire office.

A response to a manual request will use the PRFMRSP message class except when the PRINT option is used to force it to the PRFM message class. Automatic sessions will output to the RSB or PRFM message classes when the PRINT option has been selected using the INH:ALE input message or the ALW:ALE input message, respectively.

Format 1 indicates that the ALE level 2 session has begun.

Format 2 reports the level 2 error indications for the indicated digital subscriber lines (DSLs). Up to six ISDN channels can be output in a single message.

Format 3 outputs the completion status of the ALE level 2 session indicating the number of level 2 message segments printed.

3. VARIABLE FIELD DEFINITIONS

+ = Assigned to a multipoint interface.

a = Segment number of the message. Segments are numbered sequentially starting from 1.

b = Switching module (SM) number.

c = Protocol handler (PH) channel group number.

d = PH channel member number.

e = Channel type. Valid value(s):
   B1 = Channel B1.
D = D-channel.

f = Physical PH number.

g = Equipment number. Valid value(s):

   SET=z2]...
   ...LINK=a3 [DLCI=b3] [CEDLCI=z3] KEY=w2
   [CDADDR=t2] [CGADDR=u2]

[3]  EXC ALE PER REPORTING f2: TOTAL OF g2 SEGMENTS PRINTED

2. REASON FOR OUTPUT

To respond to the EXC:ALE input message with the protocol error record (PER) option specified or to output results of
the automatic line evaluation (ALE) session if the PER option was set using the ALW:ALE input message.
Automatic line insulation testing requests the ALE session. Refer to the Protocol Error Record Descriptions manual
for specific information about an individual PER.

If the output is a response to a manual request, the scope of the report is the integrated services digital network
(ISDN) channels specified in the input message. If the request was automatic, the scope of the report is the entire
office. A response to a manual request will use the PRFRMRSP message class except when the PRINT option is
used to force it to the PRFM message class. Automatic sessions will output to the PRFM or RSB message classes
depending on the option set using the INH:ALE input message or the ALW:ALE input message respectively. Format
1 indicates the ALE PER reporting session has begun. Format 2 reports the PERs recorded for the indicated ISDN
channels. Up to four PERs can be output in a single message. Each of the reported PERs will be for the same ISDN
channel. A single ISDN channel may report up to fifteen PERs. In this case, the line identification information is
repeated for each successive output message until a different ISDN channel is reported. The PER count, however,
will only be printed for the first instance of the line identification information. Format 3 reports the completion status
of the ALE PER reporting session indicating the number of EXC:ALE-PER message segments printed.

3. VARIABLE FIELD DEFINITIONS

t = Data link relative group number.

u = Data link relative member number.

v = Operator service center number.
w = Relative position number.
x = Multi-line hunt group number.
y = Multi-line hunt group member number.
z = Trunk group number.
a1 = Trunk group member number.
b1 = Interface type. Valid value(s):
  ADT = Autoplex data trunk.
  AIU-U = Access interface unit U-interface.
  AMI-U = Alternate mark inversion (AMI) U-interface.
  DNUS-TRK = DNU-S Trunk.
  DNUS-X25-T1 = DNU-S X.25 T1.
  FD = EOC or TMC facility data link.
  FRBC = Frame Relay Bearer Channel.
  ISM = Inter-module trunk.
  ISW = Inter-switch trunk.
  PP-TRK = Packet pipe trunk.
  RAIU-U = Remote access interface unit U-interface.
  SH-TRK = Speech handler trunk.
  T = T-interface.
  X25-T1 = X.25 link over T1 trunk.

c1 = Packet service capability. Valid value(s):
  ODP = On-demand packet service.
  PPB = Permanent packet B-channel service.
  PPD = Permanent packet D-channel service.

d1 = PER count since last reset. This count may not be consistent with the number of PERs retrieved from the SM history tables since some PERs may have been removed from the history tables due to storage limitations.

e1 = Timestamp month.
f1 = Timestamp day.
g1 = Timestamp hour in 24-hour format.
h1 = Timestamp minute.
i1 = Timestamp seconds.
j1 = Protocol detecting the error. Valid value(s):
  CEP = Common element protocol.
  CESHL2 = Channel element speech handler level 2 protocol.
  CESHL3 = Channel element speech handler level 3 protocol.
  IDLC = Integrated digital line carrier (IDLC) public data network gateway protocol.
  ISLP = Inter-System link protocol.
LAPB/SLP = Link access protocol type B.
LAPD = Link access protocol type D.
Q.931 = Q.931 ISDN call control protocol.
RLP = Radio link protocol.
TMC = TMC public data network gateway protocol.
UNKNOWN = Unknown protocol being used.
V.120 = V.120 public data network gateway protocol.
X.25 = X.25 public data network access protocol.
X.75 = X.75 public data network gateway protocol.
X.75P = X.75' public data network gateway protocol.

k^1 = Protocol state for network side of the interface when error was detected. For the IDLC and CEP protocols, the state represents the common management information service element (CMISE) operation or error.

l^1 = Protocol state for the network side of the interface for the X.25 or X.75' or X.75 permanent virtual circuit or virtual circuit associated with the detected error.

m^1 = The frame/packet/message/segment/module type that was received or transmitted when the error was detected. For the IDLC and CEP protocols, the field represents the module type.

n^1 = The direction of the frame/packet/message when the error was detected. Valid value(s):
   RCV = Frame/packet/message was transmitted from the customer premises equipment (CPE) to the switch.
   XMT = Frame/packet/message was transmitted from the network to the CPE.

o^1 = Protocol error code (PEC) for the error detected. Refer to the 235-600-755 for details.

p^1 = Terminal endpoint identifier (TEI) (in decimal) of the CPE where the error was detected.

q^1 = Protocol address information (in decimal) for the protocol entity detecting the error. Valid value(s):
   ADDR=r^1
   CRV=s^1
   LCN=t^1
   SAPI=u^1

r^1 = Link address (in decimal). Valid for LAPB protocol.

s^1 = Call reference value (in decimal). Valid for Q.931, timeslot management channel (TMC), and CEP protocols.

t^1 = Logical channel number (in decimal). Valid for X.25, X.75' and X.75 protocols.

u^1 = Service access point identifier (SAPI) (in decimal). Valid for LAPD and V.120 protocols.

v^1 = Call reference flag. Valid for Q.931 and TMC protocols. Supplemental protocol address information for the protocol entity detecting the error.

w^1 = Cause code (in decimal) associated with the protocol error. Valid for X.25, X.75' and X.75 protocols. The cause code for the IDLC protocol represents application protocol data unit (APDU) status. The value of 0 represents unlinked APDU status and 1 represents linked APDU status.
x\textsuperscript{1} = Diagnostic code (in decimal) associated with the protocol error. Valid for X.25, X.75' and X.75 protocols.

y\textsuperscript{1} = Logical channel type information. Valid value(s):
PVC = Permanent virtual channel.
SVC = Switched virtual channel.

z\textsuperscript{1} = Clearing network identification code.

a\textsuperscript{2} = Clearing sub-network identification code.

b\textsuperscript{2} = Object class identifier for the IDLC and CEP protocols.

c\textsuperscript{2} = The IDLC protocol transaction ID, or the CEP protocol invoke ID (in hexadecimal) associated with the APDU.

d\textsuperscript{2} = APDU type for the IDLC and CEP protocols.

e\textsuperscript{2} = Linked ID (in hexadecimal) for the CEP protocol.

f\textsuperscript{2} = Session completion status. Valid value(s):
COMPLETED = Session completed normally.
STOPPED = Session stopped due to abnormal condition or manual request.

g\textsuperscript{2} = Total number of segments printed.

h\textsuperscript{2} = Primary/protection identifier.

i\textsuperscript{2} = Integrated service line unit 2 (ISLU2) number.

j\textsuperscript{2} = Line board number.

k\textsuperscript{2} = Line circuit number.

l\textsuperscript{2} = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

m\textsuperscript{2} = Data group (DG) number.

n\textsuperscript{2} = Synchronous transport signal (STS) facility number.

o\textsuperscript{2} = Virtual tributary group (VTG) number.

p\textsuperscript{2} = Digital signal level 0 (DS0) number.

q\textsuperscript{2} = Packet switching unit (PSU) number.

r\textsuperscript{2} = PSU shelf number.

s\textsuperscript{2} = PSU channel group number.

t\textsuperscript{2} = Called address. Valid for X.25, X.75' and X.75 protocols.

u\textsuperscript{2} = Calling address. Valid for X.25, X.75' and X.75 protocols.

v\textsuperscript{2} = Line group number.
z\textsuperscript{3} = Channel Element Data Link Connection Identifier.

w\textsuperscript{2} = PER key value. The PER KEY value is a tracing mechanism used to UNIQUELY identify a location in the switch software where a PER is logged. The KEY values are defined in the Protocol Error Record Descriptions documentation. The KEY value is printed on the ROP is used as an index into documentation.

x\textsuperscript{2} = Access interface unit (AIU) number.

y\textsuperscript{2} = AIU pack number.

z\textsuperscript{2} = AIU circuit number.

a\textsuperscript{3} = SONET termination equipment (STE) facility number.

b\textsuperscript{3} = Virtual tributary member (VTM) number.

c\textsuperscript{3} = Peripheral Control and Timing (PCT) Line and Trunk Unit number (PLTU).

d\textsuperscript{3} = PCT Facility Interface (PCTFI) number.

e\textsuperscript{3} = Tributary number (T1FAC).

f\textsuperscript{3} = Channel number (CHAN).

4. ACTIONS TO BE TAKEN

Inspect the EXC:ALE-PER output message for ALE information indicating DSL line problems.

________________________________________________________

[3] EXC ALE PER REPORTING f^2: TOTAL OF g^2 SEGMENTS PRINTED

________________________________________________________

2. REASON FOR OUTPUT

To respond to the EXC:ALE input message with the protocol error record (PER) option specified or to output results of the automatic line evaluation (ALE) session if the PER option was set using the ALW:ALE input message. Automatic line insulation testing requests the ALE session. Refer to the Protocol Error Record Descriptions manual for specific information about an individual PER.

If the output is a response to a manual request, the scope of the report is the integrated services digital network (ISDN) channels specified in the input message. If the request was automatic, the scope of the report is the entire office. A response to a manual request will use the PRFM-RSP message class except when the PRINT option is used to force it to the PRFM message class. Automatic sessions will output to the PRFM or RSB message classes depending on the option set using the INH:ALE input message or the ALW:ALE input message respectively.

Format 1 indicates the ALE PER reporting session has begun.

Format 2 reports the PERs recorded for the indicated ISDN channels. Up to four PERs can be output in a single message. Each of the reported PERs will be for the same ISDN channel. A single ISDN channel may report up to fifteen PERs. In this case, the line identification information is repeated for each successive output message until a different ISDN channel is reported. The PER count, however, will only be printed for the first instance of the line identification information.

Format 3 reports the completion status of the ALE PER reporting session indicating the number of EXC:ALE-PER message segments printed.

3. VARIABLE FIELD DEFINITIONS
+ = Assigned to a multipoint interface.
a = Segment number of the message. Segments are numbered sequentially starting from 1.

4. EXC ALE PER REPORTING f^2: TOTAL OF g^2 SEGMENTS PRINTED

2. REASON FOR OUTPUT

To respond to the EXC:ALE input message with the protocol error record (PER) option specified or to output results of the automatic line evaluation (ALE) session if the PER option was set using the ALW:ALE input message. Automatic line insulation testing requests the ALE session. Refer to the Protocol Error Record Descriptions manual for specific information about an individual PER.

PER was originally introduced for ISDN protocols, however, after the introduction of PCF on PHE2 feature, PER is to provide the protocol error histories on A10/A11/ETHERNET protocols on PCF trunks. There are two kind of PERs: level 2 and level 7. Level 2 PER retrieves the ethernet protocol error histories stored in the PH. Level 7 retrieves A10/A11 error histories stored in PH. If the output is a response to a manual request, the scope of the report is the integrated services digital network (ISDN) channels or the PCF PH specified in the input message. If the request was automatic, the scope of the report is the entire office, including both ISDN channels and the PCF PH in the office.

A response to a manual request will use the PRFMRSP message class except when the PRINT option is used to...
force it to the PRFM message class. Automatic sessions will output to the PRFM or RSB message classes depending on the option set using the INH:ALE input message or the ALW:ALE input message respectively.

Format 1 indicates the ALE PER reporting session has begun.

Format 2 reports the PERs recorded for the indicated ISDN channels. Up to four PERs can be output in a single message. Each of the reported PERs will be for the same ISDN channel. A single ISDN channel may report up to fifteen PERs. In this case, the line identification information is repeated for each successive output message until a different ISDN channel is reported. The PER count, however, will only be printed for the first instance of the line identification information.

Format 3 reports the PERs recorded for the indicated PCF PH. Up to four PERs can be output in a single message. Each of the reported PERs will be for the same PCF trunk. A single PCF PH may report up to fifteen PERs. In this case, the PCF IP address information is repeated for each successive output message until a different PCF PH is reported. The PER count, however, will only be printed for the first instance of the PCF IP address information.

Format 4 reports the completion status of the ALE PER reporting session indicating the number of EXC:ALE-PER message segments printed.

3. VARIABLE FIELD DEFINITIONS

+ = Assigned to a multipoint interface.

a = Segment number of the message. Segments are numbered sequentially starting from 1.

b = Switching module (SM) number.

= Interface type. Valid value(s):
3G1XPD = 3G-1X High speed packet data trunk.
ADT = AUTOPLEX® data trunk.
AIU-U = Access interface unit U-interface.
AMI-U = Alternate mark inversion (AMI) U-interface.
DNUS-TRK = DNU-S Trunk.
DNUS-X25-T1 = DNU-S X.25 T1.
DTE-XAT-PSU = Emulated DTE on a PSU without a T1.
FD = EOC or TMC facility data link.
FRBC = Frame relay bearer channel.
ISM = Inter-module trunk.
ISW = Inter-switch trunk.
OIU-TRK = OIU trunk.
PP-TRK = Packet pipe trunk.
RAIU-U = Remote access interface unit U-interface.
SH-TRK = Speech handler trunk.
T = T-interface.
X25-T1 = X.25 link over T1 trunk.

= Packet service capability. Valid value(s):
ODP = On-demand packet service.
PPB = Permanent packet B-channel service.
PPD = Permanent packet D-channel service.

= PER count since last reset. This count may not be consistent with the number of PERs retrieved from the SM history tables since some PERs may have been removed from the history tables due to storage limitations.

= Timestamp month.

= Timestamp day.

= Timestamp hour in 24-hour format.

= Timestamp minute.

= Timestamp seconds.

= Protocol detecting the error. Valid value(s):
CEP = Common element protocol.
CESHL2 = Channel element speech handler level 2 protocol.
CESHL3 = Channel element speech handler level 3 protocol.
IDLC = Integrated digital line carrier (IDLC) public data network gateway protocol.
ISLP = Inter-System link protocol.
LAPB/SLP = Link access protocol type B.
LAPD = Link access protocol type D.
Q.931 = Q.931 ISDN call control protocol.
RLP = Radio link protocol.
TMC = TMC public data network gateway protocol.
UNKNOWN = Unknown protocol being used.
V.120 = V.120 public data network gateway protocol.
X.25 = X.25 public data network access protocol.
X.75 = X.75 public data network gateway protocol.
X.75P = X.75’ public data network gateway protocol.

k = Protocol state for network side of the interface when error was detected. For the IDLC and CEP protocols, the state represents the common management information service element (CMISE) operation or error.

l = Protocol state for the network side of the interface for the X.25 or X.75’ or X.75 permanent virtual circuit or virtual circuit associated with the detected error.

m = The frame/packet/message/segment/module type that was received or transmitted when the error was detected. For the IDLC and CEP protocols, the field represents the module type.

n = The direction of the frame/packet/message when the error was detected. Valid value(s):
RCV = Frame/packet/message was transmitted from the customer premises equipment (CPE) to the switch.
XMT = Frame/packet/message was transmitted from the network to the CPE.

o = Protocol error code (PEC) for the error detected. Refer to the Protocol Error Record manual (235-600-755) for details.

p = Terminal endpoint identifier (TEI) (in decimal) of the CPE where the error was detected.

q = Protocol address information (in decimal) for the protocol entity detecting the error. Valid value(s):
ADDR=r
CRV=s
LCN=t
SAPI=u

r = Link address (in decimal). Valid for LAPB protocol.

s = Call reference value (in decimal). Valid for Q.931, timeslot management channel (TMC), and CEP protocols.

t = Logical channel number (in decimal). Valid for X.25, X.75’ and X.75 protocols.

u = Service access point identifier (SAPI) (in decimal). Valid for LAPD and V.120 protocols.

v = Call reference flag. Valid for Q.931 and TMC protocols. Supplemental protocol address information for the protocol entity detecting the error.

w = Cause code (in decimal) associated with the protocol error. Valid for X.25, X.75’ and X.75 protocols. The cause code for the IDLC protocol represents application protocol data unit (APDU) status. The value of 0 represents unlinked APDU status and 1 represents linked APDU status.

x = Diagnostic code (in decimal) associated with the protocol error. Valid for X.25, X.75’ and X.75 protocols.
y\textsuperscript{1} = Logical channel type information. Valid value(s):
  PVC  = Permanent virtual channel.
  SVC  = Switched virtual channel.

z\textsuperscript{1} = Clearing network identification code.
a\textsuperscript{2} = Clearing sub-network identification code.
b\textsuperscript{2} = Object class identifier for the IDLC and CEP protocols.
c\textsuperscript{2} = The IDLC protocol transaction ID, or the CEP protocol invoke ID (in hexadecimal) associated with the APDU.
d\textsuperscript{2} = APDU type for the IDLC and CEP protocols.
e\textsuperscript{2} = Linked ID (in hexadecimal) for the CEP protocol.
f\textsuperscript{2} = Session completion status. Valid value(s):
  COMPLETED  = Session completed normally.
  STOPPED    = Session stopped due to abnormal condition or manual request.

g\textsuperscript{2} = Total number of segments printed.
h\textsuperscript{2} = Primary/protection identifier.
i\textsuperscript{2} = Integrated service line unit 2 (ISLU2) number.
j\textsuperscript{2} = Line board number.
k\textsuperscript{2} = Line circuit number.
l\textsuperscript{2} = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
m\textsuperscript{2} = Data group (DG) number.
n\textsuperscript{2} = Synchronous transport signal (STS) facility number.
o\textsuperscript{2} = Virtual tributary group (VTG) number.
p\textsuperscript{2} = Digital signal level 0 (DS0) number.
q\textsuperscript{2} = Packet switching unit (PSU) number.
r\textsuperscript{2} = PSU shelf number.
s\textsuperscript{2} = PSU channel group number.
t\textsuperscript{2} = Called address. Valid for X.25, X.75' and X.75 protocols.
u\textsuperscript{2} = Calling address. Valid for X.25, X.75' and X.75 protocols.
v\textsuperscript{2} = Line group number.
w\textsuperscript{2} = PER key value. The PER KEY value is a tracing mechanism used to UNIQUELY identify a location in the switch software where a PER is logged. The KEY values are defined in the Protocol
Error Record Descriptions documentation. The KEY value is printed on the ROP is used as an index into documentation.

\[ x^2 \] = Access interface unit (AIU) number.

\[ y^2 \] = AIU pack number.

\[ z^2 \] = AIU circuit number.

\[ a^3 \] = SONET termination equipment (STE) facility number.

\[ b^3 \] = Virtual tributary member (VTM) number.

\[ c^3 \] = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

\[ d^3 \] = PCT facility interface (PCTFI) number.

\[ e^3 \] = Tributary number (T1FAC).

\[ f^3 \] = Channel (CHAN) number.

\[ g^3 \] = Virtual BRI line number.

\[ h^3 \] = Virtual trunk facility (FAC) number.

\[ i^3 \] = Virtual trunk CHAN number.

\[ j^3 \] = IP address field. Valid value is 0-255.

\[ k^3 \] = The layer information for the protocol detecting the error. Valid value(s):

- **LEVEL2** = Layer 2 protocol. Valid for the ETHERNET protocol.
- **LEVEL7** = Layer 7 protocol. Valid for the A10 and A11 protocol.

\[ l^3 \] = PCF link state. Not for Ethernet. Valid value(s):

- **CLOSEPENDING** = Close pending.
- **IDLE** = Connection idle.
- **OAPENDING** = Open active pending.
- **OAUMOBINFO** = Open active wait mobility information.
- **OAUPENDING** = Open active wait pending.
- **OPENACTIVE** = Open active.
- **OPENDORMANT** = Open dormant PDSN reactivation.
- **PREACTIVATION** = Dormant close pending reactivation.
- **UNKNOWN** = Unknown PCF link state.

\[ m^3 \] = A11 protocol message type. Valid value(s):

- **A11-REGREQ** = A11 registration request message.
- **A11-REGRPL** = A11 registration reply message.
- **A11-REGUPD** = A11 registration update message.
- **A11_REGACK** = A11 registration acknowledge message.
- **UNKNOWN** = Message unknown.

\[ n^3 \] = Protocol frame type. Valid value(s):
ARP = Address resolution protocol.
GRE = Generic routing encapsulation.
IPDGRAM = IP datagram.
RARP = Reverse address resolution protocol.
UDP = User datagram protocol.
UNKNOWN = Unknown frame type.

o^3 = PCF session identity number. Not for Ethernet. Valid value is 0x00000000-0xffffffff.
p^3 = International mobile station identifier (IMSI). Valid value is 0-99999999.
q^3 = Electronic serial number (ESN). Valid value is 0x00000000-0xffffffff.
r^3 = PCF connection type. Not for Ethernet. Valid value(s):
  MSINIT = MS initialization.
  MSREACT = MS reactivation.
  PCFREACT = PCF reactivation.
  CONNUNKNOWN = Connection unknown.

s^3 = Protocol detecting the error for PCF. Valid value(s):
  A10 = A10 open interface defined in IS-634.
  A11 = A11 open interface defined in IS-634.
  ETHERNET = The LAN ethernet protocol.

t^3 = Optical interface unit (OIU) number.

u^3 = Protection group (PG) number.

v^3 = OC3 STE number.

w^3 = Packet pipe manager states.
x^3 = Speech handler data link connection identifier.
y^3 = Channel element data link connection identifier.

4. ACTIONS TO BE TAKEN

Inspect the EXC:ALE-PER output message for ALE information indicating DSL line problems.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   .
   .

[4] EXC ALE PER REPORTING f²: TOTAL OF g² SEGMENTS PRINTED

2. REASON FOR OUTPUT

To respond to the EXC:ALE input message with the protocol error record (PER) option specified or to output results of the automatic line evaluation (ALE) session if the PER option was set using the ALW:ALE input message. Automatic line insulation testing requests the ALE session. Refer to the Protocol Error Record Descriptions manual for specific information about an individual PER.

PER was originally introduced for ISDN protocols, however, after the introduction of PCF on PHE2 feature, PER is to provide the protocol error histories on A10/A11/ETHERNET protocols on PCF trunks. There are two kind of PERs: level 2 and level 7. Level 2 PER retrieves the ethernet protocol error histories stored in the PH. Level 7 retrieves A10/A11 error histories stored in PH. If the output is a response to a manual request, the scope of the report is the integrated services digital network (ISDN) channels or the PCF PH specified in the input message. If the request was automatic, the scope of the report is the entire office, including both ISDN channels and the PCF PH in the office.

A response to a manual request will use the PRFMRSP message class except when the PRINT option is used to
force it to the PRFM message class. Automatic sessions will output to the PRFM or RSB message classes depending on the option set using the INH:ALE input message or the ALW:ALE input message respectively.

Format 1 indicates the ALE PER reporting session has begun.

Format 2 reports the PERs recorded for the indicated ISDN channels. Up to four PERs can be output in a single message. Each of the reported PERs will be for the same ISDN channel. A single ISDN channel may report up to fifteen PERs. In this case, the line identification information is repeated for each successive output message until a different ISDN channel is reported. The PER count, however, will only be printed for the first instance of the line identification information.

Format 3 reports the PERs recorded for the indicated PCF PH. Up to four PERs can be output in a single message. Each of the reported PERs will be for the same PCF trunk. A single PCF PH may report up to fifteen PERs. In this case, the PCF IP address information is repeated for each successive output message until a different PCF PH is reported. The PER count, however, will only be printed for the first instance of the PCF IP address information.

Format 4 reports the completion status of the ALE PER reporting session indicating the number of EXC:ALE-PER message segments printed.

3. VARIABLE FIELD DEFINITIONS

+ = Assigned to a multipoint interface.

a = Segment number of the message. Segments are numbered sequentially starting from 1.

b = Switching module (SM) number.

c = Protocol handler (PH) channel group number.

d = PH channel group member number.

e = Channel type. Valid value(s):
   B1 = Channel B1.
   D = D-channel.

f = Physical PH number.

g = Equipment number. Valid value(s):

   AIUEN=b-x^2-y^2-z^2
   DEN=b-h-i-j
   DNUSEOC=b-l^2-o-h^2
   DNUSTMC=b-l^2-o-h^2
   IDCUEOC=b-n-o-h^2
   IDCUTMC=b-n-o-h^2
   ILEN=b-n-o-p
   INEN=b-l^2-o-p
   LCEN=b-k-l-m
   LCKEN=b-i^2-v^1-j^2-k^2
   NEN=b-l^2-m^2-a^3-n^2-o^2-b^3-p^2
   OIUEN=b-t^3-u^3-v^3-n^2-o^2-b^3-p^2
   PLTEN=b-c^3-d^3-e^3-f^3
PSUEN=b-q^2-r^2-s^2-d
VBRI=b-g^3
VTRK=b-h^3-i^3

h = Digital line and trunk unit (DLTU) number.
i = Digital facility interface number.
j = Digital channel.
k = Integrated services line unit number.
l = Line group controller number.
m = Line card number.
n = Integrated digital carrier unit number.
o = Remote terminal (RT) number.
p = RT line number.
q = Directory number. Valid value(s):
    DN=r[+]
    PKTDN=r[+]

r = Directory number.
s = Service group and member numbers. Valid value(s):
    AP=t-u
    BST=v-w
    MLHG=x-y
    OAPO=v
    OPT=v-w
    RTRS=t-u
    TKGMN=z-a^1

t = Data link relative group number.
u = Data link relative member number.
v = Operator service center number.
w = Relative position number.
x = Multi-line hunt group number.
y = Multi-line hunt group member number.
z = Trunk group number.
a^1 = Trunk group member number.
b\(^1\) = Interface type. Valid value(s):
3G1XPD  = 3G-1X High speed packet data trunk.
ADT     = AUTOPLEX\(^\circledR\) data trunk.
AIU-U   = Access interface unit U-interface.
AMI-U   = Alternate mark inversion (AMI) U-interface.
DNUS-TRK = DNUS Trunk.
DNUS-X25-T1 = DNUS X.25 T1.
DTE-XAT-PSU = Emulated DTE on a PSU without a T1.
FD      = EOC or TMC facility data link.
FRBC    = Frame relay bearer channel.
ISM     = Inter-module trunk.
ISW     = Inter-switch trunk.
OIU-TRK = OIU trunk.
PP-TRK  = Packet pipe trunk.
RAIU-U  = Remote access interface unit U-interface.
SH-TRK  = Speech handler trunk.
T       = T-interface.
X25-T1  = X.25 link over T1 trunk.

c\(^1\) = Packet service capability. Valid value(s):
ODP     = On-demand packet service.
PPB     = Permanent packet B-channel service.
PPD     = Permanent packet D-channel service.

d\(^1\) = PER count since last reset. This count may not be consistent with the number of PERs retrieved from the SM history tables since some PERs may have been removed from the history tables due to storage limitations.

e\(^1\) = Timestamp month.

f\(^1\) = Timestamp day.

g\(^1\) = Timestamp hour in 24-hour format.

h\(^1\) = Timestamp minute.

i\(^1\) = Timestamp seconds.

j\(^1\) = Protocol detecting the error. Valid value(s):
CEP     = Common element protocol.
CESHL2  = Channel element speech handler level 2 protocol.
CESHL3  = Channel element speech handler level 3 protocol.
CESHL4  = Channel element speech handler level 4 protocol.
IDLC    = Integrated digital line carrier (IDLC) public data network gateway protocol.
ISLP    = Inter-System link protocol.
LAPB/SLP = Link access protocol type B.
LAPD    = Link access protocol type D.
Q.931   = Q.931 ISDN call control protocol.
RLP     = Radio link protocol.
TMC = TMC public data network gateway protocol.
UNKNOWN = Unknown protocol being used.
V.120 = V.120 public data network gateway protocol.
X.25 = X.25 public data network access protocol.
X.75 = X.75 public data network gateway protocol.
X.75P = X.75' public data network gateway protocol.

k = Protocol state for network side of the interface when error was detected. For the IDLC and CEP protocols, the state represents the common management information service element (CMISE) operation or error.

l = Protocol state for the network side of the interface for the X.25 or X.75 or X.75 permanent virtual circuit or virtual circuit associated with the detected error.

m = The frame/packet/message/segment/module type that was received or transmitted when the error was detected. For the IDLC and CEP protocols, the field represents the module type.

n = The direction of the frame/packet/message when the error was detected. Valid value(s):
RCV = Frame/packet/message was transmitted from the customer premises equipment (CPE) to the switch.
XMT = Frame/packet/message was transmitted from the network to the CPE.

o = Protocol error code (PEC) for the error detected. Refer to the Protocol Error Record manual (235-600-755) for details.

This message may print the following PECs:
UXP-SMVCNTL = For protocol CESHL3, an unexpected FS_SMVCNTL message was received from the cell.
INV-APPL-SAPI = For protocol CESHL4, an FS_TRANSPORT message was received by the 5ESS® DCS with an unknown service application point identifier (SAPI) value.
INV-PV-L4 = For protocol CESHL4, an FS_TRANSPORT message was received by the 5ESS® DCS with an L4_pv_in_use value that is not equal to the value that was sent back to the cell using FS_ACK in response to a FS_CONNECT for the setup of a specific leg of the call.

p = Terminal endpoint identifier (TEI) (in decimal) of the CPE where the error was detected.

q = Protocol address information (in decimal) for the protocol entity detecting the error. Valid value(s):
ADDR=r
CRV=s
LCN=t
SAPI=u

r = Link address (in decimal). Valid for LAPB protocol.

s = Call reference value (in decimal). Valid for Q.931, timeslot management channel (TMC), and CEP protocols.

t = Logical channel number (in decimal). Valid for X.25, X.75 and X.75 protocols.
= Service access point identifier (SAPI) (in decimal). Valid for LAPD and V.120 protocols.

= Call reference flag. Valid for Q.931 and TMC protocols. Supplemental protocol address information for the protocol entity detecting the error.

= Cause code (in decimal) associated with the protocol error. Valid for X.25, X.75' and X.75 protocols. The cause code for the IDLC protocol represents application protocol data unit (APDU) status. The value of 0 represents unlinked APDU status and 1 represents linked APDU status.

= Diagnostic code (in decimal) associated with the protocol error. Valid for X.25, X.75' and X.75 protocols.

= Logical channel type information. Valid value(s):
PVC = Permanent virtual channel.
SVC = Switched virtual channel.

= Clearing network identification code.

= Clearing sub-network identification code.

= Object class identifier for the IDLC and CEP protocols.

= The IDLC protocol transaction ID, or the CEP protocol invoke ID (in hexadecimal) associated with the APDU.

= APDU type for the IDLC and CEP protocols.

= Linked ID (in hexadecimal) for the CEP protocol.

= Session completion status. Valid value(s):
COMPLETED = Session completed normally.
STOPPED = Session stopped due to abnormal condition or manual request.

= Total number of segments printed.

= Primary/protection identifier.

= Integrated service line unit 2 (ISLU2) number.

= Line board number.

= Line circuit number.

= Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

= Data group (DG) number.

= Synchronous transport signal (STS) facility number.

= Virtual tributary group (VTG) number.

= Digital signal level 0 (DS0) number.

= Packet switching unit (PSU) number.
\( r^2 \) = PSU shelf number.

\( s^2 \) = PSU channel group number.

\( t^2 \) = Called address. Valid for X.25, X.75' and X.75 protocols.

\( u^2 \) = Calling address. Valid for X.25, X.75' and X.75 protocols.

\( v^2 \) = Line group number.

\( w^2 \) = PER key value. The PER KEY value is a tracing mechanism used to UNIQUELY identify a location in the switch software where a PER is logged. The KEY values are defined in the Protocol Error Record Descriptions documentation. The KEY value is printed on the ROP is used as an index into documentation.

\( x^2 \) = Access interface unit (AIU) number.

\( y^2 \) = AIU pack number.

\( z^2 \) = AIU circuit number.

\( a^3 \) = SONET termination equipment (STE) facility number.

\( b^3 \) = Virtual tributary member (VTM) number.

\( c^3 \) = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

\( d^3 \) = PCT facility interface (PCTFI) number.

\( e^3 \) = Tributary number (T1FAC).

\( f^3 \) = Channel (CHAN) number.

\( g^3 \) = Virtual BRI line number.

\( h^3 \) = Virtual trunk facility (FAC) number.

\( i^3 \) = Virtual trunk CHAN number.

\( j^3 \) = IP address field. Valid value is 0-255.

\( k^3 \) = The layer information for the protocol detecting the error. Valid value(s):

```
LEVEL2 = Layer 2 protocol. Valid for the ETHERNET protocol.
LEVEL7 = Layer 7 protocol. Valid for the A10 and A11 protocol.
```

\( l^3 \) = PCF link state. Not for Ethernet. Valid value(s):

```
CLOSEPENDING = Close pending.
IDLE = Connection idle.
OAPENDING = Open active pending.
OAWMOBINFO = Open active wait mobility information.
OAWPENDING = Open active wait pending.
OPENACTIVE = Open active.
OPENDORMANT = Open dormant PDSN reactivation.
PREACTIVATION = Dormant close pending reactivation.
```
UNKNOWN = Unknown PCF link state.

m = A11 protocol message type. Valid value(s):
A11-REGREQ = A11 registration request message.
A11-REGRPL = A11 registration reply message.
A11-REGUPD = A11 registration update message.
A11 REGACK = A11 registration acknowledge message.
MUNKNOWN = Message unknown.

n = Protocol frame type. Valid value(s):
ARP = Address resolution protocol.
GRE = Generic routing encapsulation.
IPDGRAM = IP datagram.
RARP = Reverse address resolution protocol.
UDP = User datagram protocol.
UNKNOWN = Unknown frame type.

o = PCF session identity number. Not for Ethernet. Valid value is 0x00000000-0xffffffff.
p = International mobile station identifier (IMSI). Valid value is 0-99999999.
q = Electronic serial number (ESN). Valid value is 0x00000000-0xffffffff.
r = PCF connection type. Not for Ethernet. Valid value(s):
MSINIT = MS initialization.
MSREACT = MS reactivation.
PCFREACT = PCF reactivation.
CONNUNKNOWN = Connection unknown.

s = Protocol detecting the error for PCF. Valid value(s):
A10 = A10 open interface defined in IS-634.
A11 = A11 open interface defined in IS-634.
ETHERNET = The LAN ethernet protocol.

t = Optical interface unit (OIU) number.
u = Protection group (PG) number.
v = OC3 STE number.
w = Packet pipe manager states.
x = Speech handler data link connection identifier.
y = Channel element data link connection identifier.

4. ACTIONS TO BE TAKEN

Inspect the EXC:ALE-PER output message for ALE information indicating DSL line problems.

To print the results from the EXC:BICCBMOVE input message.

3. VARIABLE FIELD DEFINITIONS

a = Status. Valid value(s):
    COMPLETE = Request has completed.
    ABORTED-COMPLETE = Request has been aborted and has completed all in progress BICC CIC blocks.
    ABORTED-OFFICE IN RETROFIT = Request has been aborted due to retrofit.
    ABORTED-SM UNAVAILABLE = Request has been aborted due to a switching module (SM) becoming unavailable.
    RL - CNI TO PSU CONVERSION IN PROGRESS = The system is not available due to the processing of CNI to PSU conversion.

b = Number of BICC CIC blocks to be moved.
c = Number of BICC CIC blocks successfully moved.
d = Number of BICC CIC blocks unsuccessfully moved.
e = Total number of calls killed.
f = Total number of BICC modules.
g = SM number.
h = Total number of BICC CIC blocks on SM.

[10] EXC BICCCQ OFFICE NOT STARTED q
2. REASON FOR OUTPUT

To report the results from either an automatic bearer independent call control (BICC) call instance code (CIC) query (BQ) or a manual BQ request originating in this office. Format 1 reports that the identified BICC CIC query has been STARTED. Format 2 reports the results of a BICC interoffice BICC CIC query on all BICC CICs provisioned for query. The office-wide BICC CIC query runs periodically or can be requested manually. This format includes a summary for each originating point code (OPC)-destination point code (DPC) pair, containing the count of the number of BICC CICs in which the near and far end statuses either matched, mismatched, or could not be determined. This report is only valid for an office-wide BQ request. OPC-DPC pairs are printed in groups. Format 3 reports the accumulated results of a BICC CIC query request. It is the last output message printed regardless of report option specified, and the only output when FORM=SHORT was selected in the EXC:BICCCQ input message. The format includes the accumulated numbers of matched, mismatched and undetermined statuses for the corresponding query. Format 4 reports the results of an OPC-DPC, BICC group (BG) or BICC group member number (BGMN) BQ. If the FORM=LONG or FORM=EXPANDED report option was selected, this format lists per BICC CIC information about the BICC CIC(s) queried. This format lists BICC CICs in groups, all provisioned on the same switching module (SM) and OPC-DPC. If FORM=EXPANDED was specified, then this format displays near-end and far-end BICC CIC statuses regardless of whether there was a match or mismatch. If the FORM=LONG option was specified, then this format will display the near-end and far-end BICC CIC statuses only if there was a mismatch. FORM=LONG or FORM=EXPANDED output is printed only for CICs where a far-end CIC status has been received from the far-end. If the CORRECT=INH option was specified, then this format displays the action INHIBITED, if mismatches were detected. Format 5 reports results only when an SM has incomplete data due to the SM being inaccessible or in min-mode, or failing to respond in time. It will display the SM numbers that have incomplete data if the number of SMs with incomplete data is less than 10. If more than 10 SMs are unresponsive, the report will print the first 10 SM numbers and then a message will print stating that there is incomplete data from more than 10 SMs. Format 6 reports a problem accessing a common network interface (CNI) or global SM (GSM) common channel signaling (CCS) signaling platform. The affected GSM and SM or the CNI are listed. Format 7 reports a problem accessing a DPC due to congestion or inaccessibility. The affected OPC and DPC are listed. Format 8 reports the number of trunks that were not queried because trunk groups were not provisioned for circuit query (CQ) (on recent change and verify (RC/V) view 5.1). Format 9 reports that a BICC CIC query has been aborted for the reason given. Format 10 reports that an automatic office-wide BICC CIC query has not been started for the reason given.

3. VARIABLE FIELD DEFINITIONS

- **a** = Originating point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.
- **b** = Destination Point Code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.
- **c** = BICC Group number.
- **d** = BICC group member number or the lower limit of a range of BICC group member numbers. Refer to the APP:RANGES appendix.
- **e** = The upper limit of a range of BICC group member numbers. Refer to the APP:RANGES appendix.
- **f** = Number of BICC CICs whose near-end and far-end statuses matched.

The near-end and far-end statuses match (that is, the statuses are consistent) if any of these combinations occur.
ICB-ACT to OGB-ACT
IDL-ACT to IDL-ACT
OGB-ACT to ICB-ACT

Refer to variable \( k \) for a description of these statuses.

\( g \) = Number of BICC CICs whose near-end and far-end statuses did not match. Any near-end and far-end status combination that was not listed above is considered a mismatch, unless either end has a status of TRN (transient), as defined in variable \( k \).

\( h \) = Number of BICC CICs for which near-end and/or far-end status match could not be determined. In these cases, the status of one/both ends is TRN (transient), as defined in variable \( k \).

\( i \) = The reason for terminating a BQ request. Valid value(s):
- COMPLETED = Normal termination.
- STOPPED = Stopped by a STP:BICCQ input message.

\( j \) = Call instance code (CIC).

\( k \) = Near-end BICC CIC status prior to any action. Valid value(s):
- ICB-ACT = Incoming circuit busy, active (that is, in service).
- ICB-LBO = Incoming circuit busy, local maintenance blocked.
- ICB-LRB = Incoming circuit busy, local/remote maintenance blocked.
- ICB-RBO = Incoming circuit busy, remote maintenance blocked.
- IDL-ACT = Idle, active (that is, in service).
- IDL-LBO = Idle, local maintenance blocked.
- IDL-LRB = Idle, local/remote maintenance blocked.
- IDL-RBO = Idle, remote maintenance blocked.
- OGB-ACT = Outgoing busy, active (that is, in service).
- OGB-LBO = Outgoing busy, local maintenance blocked.
- OGB-LRB = Outgoing busy, local/remote maintenance blocked.
- OGB-RBO = Outgoing busy, remote maintenance blocked.
- TRN = Transient.
- UNQ = Unequipped.

Near-end BICC CICs are considered transient if they are:
- BICC CICs involved in growth/degrowth procedures with an out of service (OOS), circuit administration (CADN) or disabled (DSBLD) CIC status.
- BICC CICs involved in audit type recovery, where the CIC status is in service (IS), AUDIT or AUTO.
- BICC CICs pending reset, with an OOS, maintenance (MTCE) or CCS initialization (CCSINIT) CIC status.
- BICC CICs involved in transient CCS outgoing calls before address complete message (ACM) is received.
- BICC CICs involved in transient CCS incoming calls before ACM sent.
- BICC CICs involved in transient CCS calls before release complete (RLC) is received, after sending reset circuit (RSC) or release (REL) message.
- BICC CICs involved in incoming blocking (BLO), unblocking (UBL), circuit group blocking (CGB) or circuit group unblocking (CGU) message processing before blocking message acknowledgement (BLA), unblocking message acknowledgement (UBA), circuit group blocking acknowledgement (CGBA) or...
circuit group unblocking acknowledgement (CGUA) has been returned. These BICC CICs are transitioning between IDL-ACT and IDL-RBO statuses in the near-end office.

- BICC CICs involved in outgoing BLO, UBL, CGB, CGU sending before BLA, UBA, CGBA, CGUA has been received. These CICs are transitioning between IDL-ACT and IDL-RBO statuses in the far-end office.
- BICC CICs whose SM is unreliable or unavailable.

l = Far-end BICC CIC status prior to any action. Valid values are the same as those listed for variable k.

m = Action taken to correct a mismatch. Valid value(s):
CLRRB = Cleared remote blocked status. Deleted the OOS, blocked (BLKD), AUTO status.
IDLE = Idled the BICC CIC. Preempted the current process associated with the BICC CIC.
INHIBITED = Corrective action was required but it was inhibited by the CORRECT=INH option.
NONE = No corrective action was needed.
SETCADN = Set circuit administration status. Added OOS, CADN, DSBLD status.
SETRB = Set remote blocked status. Added OOS, BLKD, AUTO status.
SNDBLO = Sent maintenance blocked message.
SNDUBL = Sent maintenance unblocked message.
SNDREL = Sent release message.

n = Switching module number.

o = Number of BICC CICs in the specified CQ that were not processed, as they were not provisioned as query candidates.

p = Reason for an aborted BICC CIC query. Valid value(s):
DATABASE ERROR = Required information could not be obtained from the database.
AM OVERLOAD = The administrative module (AM) overloaded during processing of the BQ request.

q = Reason for not starting a scheduled automatic office-wide BICC CIC query. Valid value(s):
AUTOMATIC BQ INHIBITED = It was time to start automatic office-wide BQ according to the provisioned schedule (RC/V view 8.15), but automatic queries are manually inhibited.
SYSTEM RESOURCE = System Resources are not available to start the automatic office BQ. The switch will attempt to start it again at the beginning of the next hour.
CONFLICTING BQ REQUEST RUNNING = An office-wide request can only be executed if no other BQ requests are running.

r = Reason the GSM CCS signaling platform or CNI cannot be accessed. Valid value(s):
CMT INACCESSIBLE = CCS Message Transport (CMT) is inaccessible.
CMT OVERLOAD = CMT is in the overload state.
CNI INACCESSIBLE = CNI is inaccessible.
CNI OVERLOAD = CNI is in the overload state.

s = Global switching module number.

t = Reason the DPC cannot be accessed. Valid value(s):
DPC INACCESSIBLE = The DPC is completely blocked from use by any feature.
DPC CONGESTION = The DPC is accessible, but is partially congested and can only accept certain CCS messages. CCS circuit query messages (CQM) and circuit query response (CQR) messages are not allowed access.

4. ACTIONS TO BE TAKEN

If the result of the BICC CIC query was COMPLETED, no action is required. If CORRECT=INH was specified in the EXC:BICCCQ input message and a MISMATCHED value greater than zero was reported, the EXC:BICCCQ input message should be repeated without CORRECT=INH (CORRECT=ALW may be specified; it is the default).

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results from either an automatic bearer independent call control (BICC) call instance code (CIC) query (BQ) or a manual BQ request originating in this office.

Format 1 reports that the identified BICC CIC query has been STARTED.

Format 2 reports the results of a BICC interoffice BICC CIC query on all BICC CICs provisioned for query. The
office-wide BICC CIC query runs periodically or can be requested manually.

This format includes a summary for each originating point code (OPC)-destination point code (DPC) pair, containing the count of the number of BICC CICs in which the near and far end statuses either matched, mismatched, or could not be determined. This report is only valid for an office-wide BQ request. OPC-DPC pairs are printed in groups.

Format 3 reports the accumulated results of a BICC CIC query request. It is the last output message printed regardless of report option specified, and the only output when FORM=SHORT was selected in the EXC:BICCCQ input message. The format includes the accumulated numbers of matched, mismatched and undetermined statuses for the corresponding query.

Format 4 reports the results of an OPC-DPC, BICC group (BG) or BICC group member number (BGMN) BQ. If the FORM=LONG or FORM=EXPANDED report option was selected, this format lists per BICC CIC information about the BICC CIC(s) queried. This format lists BICC CICs in groups, all provisioned on the same switching module (SM) and OPC-DPC. If FORM=EXPANDED was specified, then this format displays near-end and far-end BICC CIC statuses regardless of whether there was a match or mismatch. If the FORM=LONG option was specified, then this format will display the near-end and far-end BICC CIC statuses only if there was a mismatch. FORM=LONG or FORM=EXPANDED output is printed only for CICs where a far-end CIC status has been received from the far-end. If the CORRECT=INH option was specified, then this format displays the action INHIBITED, if mismatches were detected.

Format 5 reports results only when an SM has incomplete data due to the SM being inaccessible or in min-mode, or failing to respond in time. It will display the SM numbers that have incomplete data if the number of SMs with incomplete data is less than 10. If more than 10 SMs are unresponsive, the report will print the first 10 SM numbers and then a message will print stating that there is incomplete data from more than 10 SMs.

Format 6 reports a problem accessing a common network interface (CNI) or global SM (GSM) common channel signaling (CCS) signaling platform. The affected GSM and SM or the CNI are listed.

Format 7 reports a problem accessing a DPC due to congestion or inaccessibility. The affected OPC and DPC are listed.

Format 8 reports the number of trunks that were not queried because trunk groups were not provisioned for circuit query (CQ) (on recent change and verify (RC/V) view 5.1).

Format 9 reports that a BICC CIC query has been aborted for the reason given. Format 10 reports that an automatic office-wide BICC CIC query has not been started for the reason given.

3. VARIABLE FIELD DEFINITIONS

a = Originating point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

b = Destination Point Code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

c = BICC Group number.

d = BICC group member number or the lower limit of a range of BICC group member numbers. Refer to the APP:RANGES appendix.

e = The upper limit of a range of BICC group member numbers. Refer to the APP:RANGES appendix.

f = Number of BICC CICs whose near-end and far-end statuses matched.
The near-end and far-end statuses match (that is, the statuses are consistent) if any of these combinations occur:

- ICB-ACT to OGB-ACT
- IDL-ACT to IDL-ACT
- OGB-ACT to ICB-ACT

Refer to variable \( k \) for a description of these statuses.

\[ g \] = Number of BICC CICs whose near-end and far-end statuses did not match.

Any near-end and far-end status combination that was not listed above is considered a mismatch, unless either end has a status of TRN (transient), as defined in variable \( k \).

\[ h \] = Number of BICC CICs for which near-end and/or far-end status match could not be determined.

In these cases, the status of one/both ends is TRN (transient), as defined in variable \( k \).

\[ i \] = The reason for terminating a BQ request. Valid value(s):
- COMPLETED = Normal termination.
- STOPPED = Stopped by a STP:BICCCQ input message.

\[ j \] = Call instance code (CIC).

\[ k \] = Near-end BICC CIC status prior to any action. Valid value(s):
- ICB-ACT = Incoming circuit busy, active (that is, in service).
- ICB-LBO = Incoming circuit busy, local maintenance blocked.
- ICB-LRB = Incoming circuit busy, local/remote maintenance blocked.
- ICB-RBO = Incoming circuit busy, remote maintenance blocked.
- IDL-ACT = Idle, active (that is, in service).
- IDL-LBO = Idle, local maintenance blocked.
- IDL-LRB = Idle, local/remote maintenance blocked.
- IDL-RBO = Idle, remote maintenance blocked.
- OGB-ACT = Outgoing busy, active (that is, in service).
- OGB-LBO = Outgoing busy, local maintenance blocked.
- OGB-LRB = Outgoing busy, local/remote maintenance blocked.
- OGB-RBO = Outgoing busy, remote maintenance blocked.
- TRN = Transient.
- UNQ = Unequipped.

Near-end BICC CICs are considered transient if they are:
- BICC CICs involved in growth/degrowth procedures with an out of service (OOS), circuit administration (CADN) or disabled (DSBLD) CIC status.
- BICC CICs involved in audit type recovery, where the CIC status is in service (IS), AUDIT or AUTO.
- BICC CICs pending reset, with an OOS, maintenance (MTCE) or CCS initialization (CCSINIT) CIC status.
- BICC CICs involved in transient CCS outgoing calls before address complete message (ACM) is received.
- BICC CICs involved in transient CCS incoming calls before ACM sent.
- BICC CICs involved in transient CCS calls before release complete (RLC) is received, after sending reset circuit (RSC) or release (REL) message.
BICC CICs involved in incoming blocking (BLO), unblocking (UBL), circuit group blocking (CGB) or circuit group unblocking (CGU) message processing before blocking message acknowledgement (BLA), unblocking message acknowledgement (UBA), circuit group blocking acknowledgement (CGBA) or circuit group unblocking acknowledgement (CGUA) has been returned. These BICC CICs are transitioning between IDL-ACT and IDL-RBO statuses in the near-end office.

BICC CICs involved in outgoing BLO, UBL, CGB, CGU sending before BLA, UBA, CGBA, CGUA has been received. These CICs are transitioning between IDL-ACT and IDL-RBO statuses in the far-end office.

BICC CICs whose SM is unreliable or unavailable.

1 = Far-end BICC CIC status prior to any action. Valid values are the same as those listed for variable k.

m = Action taken to correct a mismatch. Valid value(s):
   CLRRB = Cleared remote blocked status. Deleted the OOS, blocked (BLKD), AUTO status.
   IDLE = Idled the BICC CIC. Preempted the current process associated with the BICC CIC.
   INHIBITED = Corrective action was required but it was inhibited by the CORRECT=INH option.
   NONE = No corrective action was needed.
   SETCADN = Set circuit administration status. Added OOS, CADN, DSBLD status.
   SETRB = Set remote blocked status. Added OOS, BLKD, AUTO status.
   SND BLO = Sent maintenance blocked message.
   SND UBL = Sent maintenance unblocked message.
   SND REL = Sent release message.

n = Switching module number.

o = Number of BICC CICs in the specified CQ that were not processed, as they were not provisioned as query candidates.

p = Reason for an aborted BICC CIC query. Valid value(s):
   DATABASE ERROR = Required information could not be obtained from the database.
   AM OVERLOAD = The administrative module (AM) overloaded during processing of the BQ request.
   CNI TO PSU CONVERSION IN PROGRESS = The system is not available due to the processing of CNI to PSU conversion.

q = Reason for not starting a scheduled automatic office-wide BICC CIC query. Valid value(s):
   AUTOMATIC BQ INHIBITED = It was time to start automatic office-wide BQ according to the provisioned schedule (RC/V view 8.15), but automatic queries are manually inhibited.
   SYSTEM RESOURCE = System Resources are not available to start the automatic office BQ. The switch will attempt to start it again at the beginning of the next hour.
   CONFLICTING BQ REQUEST RUNNING = An office-wide request can only be executed if no other BQ requests are running.
   CNI TO PSU CONVERSION IN PROGRESS = The system is not available due to the processing of CNI to PSU conversion.

r = Reason the GSM CCS signaling platform or CNI cannot be accessed. Valid value(s):
   CMT INACCESSIBLE = CCS Message Transport (CMT) is inaccessible.
CMT OVERLOAD = CMT is in the overload state.
CNI INACCESSIBLE = CNI is inaccessible.
CNI OVERLOAD = CNI is in the overload state.

s = Global switching module number.
t = Reason the DPC cannot be accessed. Valid value(s):
DPC INACCESSIBLE = The DPC is completely blocked from use by any feature.
DPC CONGESTION = The DPC is accessible, but is partially congested and can only accept certain CCS messages. CCS circuit query messages (CQM) and circuit query response (CQR) messages are not allowed access.
USER PART UNAVAILABLE = The far end user part is unavailable. It may either be inaccessible, unequipped or unknown at present time.

4. ACTIONS TO BE TAKEN

If the result of the BICC CIC query was COMPLETED, no action is required. If CORRECT=INH was specified in the EXC:BICCCQ input message and a MISMATCHED value greater than zero was reported, the EXC:BICCCQ input message should be repeated without CORRECT=INH (CORRECT=ALW may be specified; it is the default).

2. REASON FOR OUTPUT

Format 2 reports the information contained in MRVA message(s). This report is returned in response to each MRVT message sent to an adjacent point code.

Format 3 reports information contained in trace MRVR message(s).

Format 4 reports the test results for an initiated MRVT, when an MRVT message could not be sent or no MRVA was received.

Format 5 reports the test results for an initiated MRVT, when an MRVR error message has been received.

Formats 1, 6, and 7 report the MRVT status for TEST STARTED, TEST ENDED, and TEST NOT STARTED.

3. VARIABLE FIELD DEFINITIONS

NO TRACE REQUESTED = The user did not request a trace of all the STPs crossed.

TRACE REQUESTED = The user requested a trace of all the STPs crossed.

a = Destination point code (DPC). See APP:POINT-CODE for formats.
b = Origination point code (OPC). See APP:POINT-CODE for formats.
c = Maximum number of point codes to cross.
d = Result of whole test. Valid value(s):
   FAILURE = If all expected MRVA messages are returned with a failure result.
   PARTIAL SUCCESS = If some expected MRVA messages are returned with a failure result and other expected MRVA messages return with a success result.
   SUCCESS = If all expected MRVA messages are returned with a success result.

e = Point code that sent the MRVA. See APP:POINT-CODE for formats.
f = Test result reported by MRVA message (FAILURE, PARTIAL SUCCESS, or SUCCESS).
g = Reason for failure. Valid value(s):
   EXCESSIVE LENGTH ROUTE
   INACCESSIBLE ROUTE
   LOCAL CONDITIONS
   LOOP
   TIMER EXPIRED
   UNKNOWN DESTINATION
   UNKNOWN ERROR CODE
<table>
<thead>
<tr>
<th>ERROR</th>
<th>DEFINITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOOP</td>
<td>The point code of the intermediate signaling point (STP) to which an MRVT would be sent is already present in the STPs crossed list in the received MRVT message.</td>
</tr>
<tr>
<td>EXCESSIVE LENGTH ROUTE</td>
<td>The maximum number of STPs crossed has been reached and the signaling point is not the tested destination.</td>
</tr>
<tr>
<td>UNKNOWN DESTINATION</td>
<td>The signaling point does not have a signaling route defined to the MRVT test destination.</td>
</tr>
<tr>
<td>INACCESSIBLE ROUTE</td>
<td>The MRVT could not be sent due to network blockage or network congestion.</td>
</tr>
<tr>
<td>LOCAL CONDITIONS</td>
<td>The MRVT test cannot proceed due to local conditions (e.g., processor outage or overload) at the receiving signaling point.</td>
</tr>
<tr>
<td>UNKNOWN INITIATING POINT CODE</td>
<td>The signaling point cannot route an MRVR message back to the test initiator.</td>
</tr>
<tr>
<td>TIMER EXPIRED</td>
<td>Expected MRVAs were not received within the Failed Link Craft Referral Timer Expired (T1.116/T1).</td>
</tr>
<tr>
<td>WRONG SP</td>
<td>The MRVT message has arrived at a signaling point that does not have STP functionality and is not the tested destination.</td>
</tr>
<tr>
<td>UNKNOWN ERROR CODE</td>
<td>Failure codes above value 8 and higher are considered unknown by the switch.</td>
</tr>
</tbody>
</table>

Note: If multiple errors were detected, item 'g' will be printed for each error received.

- **h**: The value "h" identifies the unknown failure code returned in item "g".
- **i**: The number of STPs that were crossed.
- **j**: List of point codes. See APP:POINT-CODE for formats.
- **k**: MRVT/MRVA status. Valid value(s):
  - MRVT NOT SENT
  - MRVA NOT RECEIVED
- **l**: Failure reasons if variable 'j' equals Any Of The Above. Valid value(s):
  - INACCESSIBLE APC = All links unavailable.
  - TIMER EXPIRED = When the Failed Link Craft Referral Timer Expired (T1.116/T1) expires for an initiated MRVT.
  - NETWORK ERROR = An SCCP error or TCAP error/reject/abort from the SS7 network.
- **m**: Point code that sent the MRVR message. See APP:POINT-CODE for formats.
- **n**: List of point codes in the MRVR message. See APP:POINT-CODE for formats.

- **o**: Failure reasons if TEST NOT STARTED. Valid value(s):
DPC IS ALREADY UNDER TEST = Test destination is already under test.
INACCESSIBLE DPC = No paths to DPC are accessible.
INTERNAL DB ERROR = Internal database error.
INVALID DPC = A member route set to the test destination (DPC) is not provisioned.
LOCAL CONDITIONS—MESSAGE PATH INACCESSIBLE = Intra-SM MD path is inaccessible.
MAXIMUM TESTS ALREADY IN PROGRESS = The maximum number of MRVT tests for the GSM are already in progress. (Provisioned by Recent Change.)

4. ACTIONS TO BE TAKEN

For Format 2, investigate the MTP routing data based on the errors given in the received MRVA message.

For Format 3, verify the route of this MRVT test in a responding MRVR success message after all expected MRVA messages have been received.

For Format 4, investigate the MTP routing data based on the error and point codes associated with the error, when an MRVT message could not be sent or no MRVA was received.

For Format 5, investigate the MTP routing data based on the error and point codes associated with the error.

For Formats 1, 6, and 7 verify the test has started, ended, and not started, respectively.

5. ALARMS

None.

2. REASON FOR OUTPUT

Format 2 reports the test result when an SRVA message has been received in response to an SRVT request sent to a translation point code.

Format 3 reports information contained in a responding SRVR message from an initiated SRVT request. Note: If received SRVR messages contain more than eight PCs, duplicate messages may be output to complete point code lists (unless max GTTs in range [1-4]).

Format 4 reports the test result for an initiated SRVT, when an SRVT message can not be sent or no SRVA was received.

Format 5 reports the test result for an initiated SRVT, when an SRVR error message has been received. Note: If received SRVR messages contain more than eight PCs, duplicate messages may be output to complete point code lists (unless max GTTs in range [1-4]).

Formats 1, 6, and 7 report the SRVT status for TEST STARTED, TEST ENDED, and TEST NOT STARTED.

3. VARIABLE FIELD DEFINITIONS

NO TRACE REQUESTED = The user did not request a trace of all the STPs crossed.

TRACE REQUESTED = The user requested a trace of all the STPs crossed.

a = Translation type.

b = Global title digits.

c = Originating point code (OPC). See APP:POINT-CODE for formats.

d = Point codes to send SRVT (as specified by craft, or TPCs found in SCCP GTT data). See APP:POINT-CODE for formats.

e = Maximum number of global title translations allowed.

Note: Both members of mated STP pairs are included in the trace list.

f = Result of the test. Valid value(s):

FAILURE = If all expected SRVA messages are returned with a failure result.

PARTIAL SUCCESS = If some expected SRVA messages are returned with a failure result and other expected SRVA messages return with a success result.

SUCCESS = If all expected SRVA messages are returned with a success result.

g = Point code that sent the SRVA message.
Test result contained in the SRVA message (FAILURE, PARTIAL SUCCESS, SUCCESS).

Reason for failure. Valid value(s):

- LOOP
- EXCESSIVE LENGTH ROUTE
- NO TRANSLATION FOR GLOBAL TITLE
- INACCESSIBLE ROUTE
- LOCAL CONDITIONS
- UNKNOWN INITIATING POINT CODE
- TIMER EXPIRED
- WRONG SP
- INCORRECT TRANSLATION FOR PRIMARY DEST
- INCORRECT TRANSLATION FOR SECONDARY DEST
- INCORRECT TRANSLATION FOR INTERMEDIATE TSP
- NOT PRIMARY DESTINATION
- NOT SECONDARY DESTINATION
- PRIMARY DESTINATION NOT RECOGNIZED
- SECONDARY DESTINATION NOT RECOGNIZED
- ROUTING PROBLEM
- SUCCESS TO GATEWAY

</table>
4. ACTIONS TO BE TAKEN

For Format 2, investigate the SCCP routing data based on the error(s) given in the received SRVA message. Error detected message report may be generated which gives the point codes associated with the error.

For Format 3, verify the route of this SRVT test by checking the translation signaling point codes in the trace list.

For Format 4, investigate the SCCP routing data based on the error and point codes associated with the error, when an SRVT message cannot be sent or no SRVA was received.

For Format 5, investigate the SCCP routing data based on the error and point codes associated with the error.

For Formats 1, 6, and 7 verify the test has started, ended, and not started, respectively.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results from either an automatic circuit query (CQ) or a manual circuit query CQ request originating in this office.

Format 1 reports that the identified circuit query has been STARTED. Format 2 reports the results of a common channel signaling (CCS) interoffice circuit query on all CCS7 trunks provisioned for query. The office-wide circuit query runs routinely or can be requested manually. This format includes a summary for each OPC/DPC pair, containing the count of the number of circuits in which the near and far end statuses either matched, mismatched, or could not be determined. This report is only valid for an office-wide CQ request. OPC/DPC pairs are printed in groups of 6. Format 3 reports the accumulated results of a circuit query request. It is the last output report printed regardless of report option specified, and the only output when FORM=SHORT is selected. The format includes the accumulated number of matched, mismatched, and undetermined statuses for the corresponding query. Format 4 optionally reports the results of OPC/DPC, TG, or TRKMN CQ. If selected, this format lists per circuit information as the trunk queried. This format lists circuits in groups of 6, all provisioned on the same SM and OPC-DPC, but possibly belonging to different trunk groups. If FORM=EXPANDED, then this format displays near-end and far-end circuit status no matter if there is a match or mismatch. If the FORM=LONG option was specified, then it this format will display the near-end and far-end circuit states only if there was a mismatch. If the FORM=EXPANDED option was specified, then this format will display the near-end and far-end circuit states regardless of their values. If the CORRECT=INH option is specified, then this format displays the action INHIBITED, if mismatches are detected. Format 5 reports results only when a SM has incomplete data due to the SM being inaccessible, Min-Mode, or failing to respond in time. It will display the SM numbers that are failing if the number of SMs with incomplete data is less than 10. If more than 10 SMs are unresponsive the report will print the first 10 SMs and then a message will print stating there is incomplete data from more than 10 SMs. Format 6 reports a problem accessing a CNI or GSM CCS signaling platform. The affected GSM and SM are listed or the CNI. Format 7 reports a problem accessing a DPC due to congestion or inaccessibility. The affected OPC and DPC are listed. Format 8 reports how many trunks were not queried because trunk groups were not provisioned for CQ (5.1 RC/V view). Format 9 reports a circuit query has been aborted for the reason cited. Format 10 reports an automatic office-wide circuit query has not been started for the reason cited. These formats replace AUD:CCSTQ output in pre-5E12 releases.

3. VARIABLE FIELD DEFINITIONS

a = Origination point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

b = Destination Point Code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

c = Trunk group number.

d = Trunk member number.

e = Number of circuits where near-end and far-end statuses matched.

Near-end and far-end status match (that is, the statuses are consistent) if any of the following combinations occur.

ICB-ACT -> OGB-ACT
ICB-LBO -> OGB-RBO
ICB-LRB -> OGB-LRB
Refer to variable 
\[ j \]
for a description of these acronyms.

\[
f = \text{Number of circuits where near-end and far-end statuses did not match.}
\]

Any near-end and far-end status combination that was not listed above is considered a mismatch, unless either end has a status of TRN (transient), as defined in variable \( j \).

\[
g = \text{Number of circuits where near-end and/or far-end statuses match could not be determined.}
\]

In these cases, status of one/both ends is TRN (transient), as defined in variable \( j \).

\[
h = \text{The reason for terminating a CQ request. Valid value(s) are:}
\]

- COMPLETED - normal termination.
- STOPPED - stopped by STP:CCSCQ request.

\[
i = \text{Circuit identification code (CIC).}
\]

\[
j = \text{Near-end circuit state prior to any action. Valid value(s):}
\]

- ICB-ACT = Incoming busy, active (that is, in service).
- IDL-ACT = Idle, active (that is, in service).
- IDL-LBO = Idle, local maintenance blocked.
- IDL-LRB = Idle, local/remote maintenance blocked.
- IDL-RBO = Idle, remote maintenance blocked.
- OGB-ACT = Outgoing busy, active (that is, in service).
- TRN = Transient.
- UNQ = Unequipped.

The following circuit statuses are not possible in the switch:

- ICB-LBO = Incoming circuit busy, local maintenance blocked.
- ICB-LRB = Incoming circuit busy, local/remote maintenance blocked.
- ICB-RBO = Incoming circuit busy, remote maintenance blocked.
- OGB-LBO = Outgoing circuit busy, local maintenance blocked.
- OGB-LRB = Outgoing circuit busy, local/remote maintenance blocked.
- OGB-RBO = Outgoing circuit busy, remote maintenance blocked.

Near-end trunks are considered transient if they are:

- Trunks involved in growth/degrowth procedures with an OOS, CADN, DSBLD port status.
- Trunks involved in audit type recovery, where the port status is IS, AUDIT, AUTO.
- Trunks pending reset, with an OOS, MTCE, CCSINIT port status.
- Trunks involved in continuity re-check, with an OOS, MTCE, COT port status.
- Trunks involved in non-CCS call related activities, such as TLWS scenarios or test calls.
- Trunks involved in transient CCS outgoing calls before ACM received.
- Trunks involved in transient CCS incoming calls before ACM sent.
- Trunks involved in transient CCS calls before RLC received after sending RSC or REL.
- Trunks involved in incoming BLO, UBL, CGB, CGU processing before BLA, UBA, CGBA, CGUA has been returned. These trunks are transitioning between IDL-LRB, IDL-ACT, and IDL-RBO states in the near-end office.
- Trunks involved in outgoing BLO, UBL, CGB, CGU sending before BLA, UBA, CGBA, CGUA has been received. These trunks are transitioning between IDL-LRB, IDL-ACT, and IDL-LBO states in the far-end office.
- Trunk's SM is unreliable or unavailable.

**k**
= Far-end circuit state prior to any action. Valid value(s):

- **ICB-ACT** = Incoming circuit busy, active (that is, in service).
- **ICB-LBO** = Incoming circuit busy, local maintenance blocked.
- **ICB-LRB** = Incoming circuit busy, local/remote maintenance blocked.
- **ICB-RBO** = Incoming circuit busy, remote maintenance blocked.
- **IDL-ACT** = Idle, active (that is, in service).
- **IDL-LBO** = Idle, local maintenance blocked.
- **IDL-RBO** = Idle, remote maintenance blocked.
- **IDL-LRB** = Idle, local/remote maintenance blocked.
- **OGB-ACT** = Out going circuit busy, active (that is, in service).
- **OGB-LBO** = Out going circuit busy, local maintenance blocked.
- **OGB-LRB** = Out going circuit busy, local/remote maintenance blocked.
- **OGB-RBO** = Out going circuit busy, remote maintenance blocked.
- **TRN** = Transient.
- **UNQ** = Unequipped.

**l**
= Action taken to correct a mismatch. Valid value(s):

- **CLRRB** = Clear remote blocked status. Delete the OOS, BLKD, AUTO status.
- **IDLE** = Idle trunk. Preempt current process associated with trunk.
- **NONE** = No corrective action needed.
- **SETCADN** = Set circuit administration status. Add OOS, CADN, DSBLD status.
- **SETRB** = Set remote blocked status. Add OOS, BLKD, AUTO status.
- **SNDLBO** = Send maintenance blocked message.
- **SNDUBL** = Send maintenance unblocked message.
- **SNDREL** = Send release message.
- **INHIBITED** = Corrective action is required but it is inhibited by the CORRECT=INH option.

**m**
= Switching module number (1-192)

**n**
= Number of trunks in the specified CQ that were not processed, as they are not provisioned as query candidates.

**o**
= Reason for an aborted circuit query. Valid value(s) are:
- **DATABASE ERROR** = Required information could not be obtained from the database.
- **AM OVERLOAD** = AM overloaded during processing of CQ request.
Reason for not starting a scheduled automatic office-wide circuit query. Valid value(s) are:
- **AUTOMATIC CQ INHIBITED** = It is time to start automatic office-wide CQ according to the provisioned schedule (RC/V view 8.15), but automatic queries are manually inhibited.
- **OFFICE REQUEST ALREADY RUNNING** = Only one office-wide CQ request can be executed at any time.
- **SYSTEM RESOURCE** = System Resources are not available to start the automatic office CQ. The switch will attempt to start it again at the beginning of the next hour.
- **OPC/DPC or TG REQUEST ALREADY RUNNING** = An office-wide request can only be executed if no other CQ requests are running.

Reason the DPC cannot be accessed:
- **CMT OVERLOAD** = CCS Message Transport is in overload state.
- **DPC INACCESSIBLE** = The DPC is completely blocked from use by any feature.
- **DPC CONGESTION** = The DPC is accessible, but is partially congested and can only accept certain CCS messages. CCS circuit query messages (CQM,CQR) are not allowed access.

Global switching module number

4. ACTIONS TO BE TAKEN

If the result of the circuit query is **COMPLETED**, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results from either an automatic circuit query (CQ) or a manual circuit query CQ request originating in this office. Format 1 reports that the identified circuit query has been STARTED. Format 2 reports the results of a common channel signaling (CCS) interoffice circuit query on all CCS7 trunks provisioned for query. The office-wide circuit query runs routinely or can be requested manually. This format includes a summary for each OPC/DPC pair, containing the count of the number of circuits in which the near and far end statuses either matched, mismatched, or could not be determined. This report is only valid for an office-wide CQ request. OPC/DPC pairs are printed in groups of 6. Format 3 reports the accumulated results of a circuit query request. It is the last output report printed regardless of report option specified, and the only output when FORM=SHORT is selected. The format includes the accumulated number of matched, mismatched, and undetermined statuses for the corresponding query. Format 4 optionally reports the results of OPC/DPC, TG, or TRKMN CQ. If selected, this format lists per circuit information as the trunk queried. This format lists circuits in groups of 6, all provisioned on the same SM and OPC-DPC, but possibly belonging to different trunk groups. If FORM=EXPANDED, then this format displays near-end and far-end circuit status no matter if there is a match or mismatch. If the FORM=LONG option was specified, then it this format will display the near-end and far-end circuit states only if there was a mismatch. If the FORM=EXPANDED option was specified, then this format will display the near-end and far-end circuit states regardless of their values. If the CORRECT=INH option is specified, then this format displays the action INHIBITED, if mismatches are detected. Format 5 reports results only when a SM has incomplete data due to the SM being inaccessible, Min-Mode, or failing to respond in time. It will display the SM numbers that are failing if the number of SMs with incomplete data is less than 10. If more than 10 SMs are unresponsive the report will print the first 10 SMs and then a message will print stating there is incomplete data from more than 10 SMs. Format 6 reports a problem accessing a CNI or GSM CCS signaling platform. The affected GSM and SM are listed or the CNI. Format 7 reports a problem accessing a DPC due to congestion or inaccessibility. The affected OPC and DPC are listed. Format 8 reports how many trunks were not queried because trunk groups were not provisioned for CQ (5.1 RC/V view). Format 9 reports a circuit query has been aborted for the reason cited. Format 10 reports an automatic office-wide circuit query has not been started for the reason cited. These formats replace AUD:CCSTQ output in pre-5E12 releases.

3. VARIABLE FIELD DEFINITIONS

a = Origination point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

b = Destination Point Code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

c = Trunk group number.

d = Trunk member number.

e = Number of circuits where near-end and far-end statuses matched.

Near-end and far-end status match (that is, the statuses are consistent) if any of the following combinations occur.

- ICB-ACT to OGB-ACT
- ICB-LBO to OGB-RBO
- ICB-LRB to OGB-LRB
- ICB-RBO to OGB-LBO
- IDL-ACT to IDL-ACT
- IDL-LBO to IDL-RBO
- IDL-RBO to IDL-BLO
- IDL-LRB to IDL-LRB
- OGB-ACT to ICB-ACT
- OGB-LBO to ICB-RBO
OGB-LRB to ICB-LRB
OGB-RBO to ICB-LBO

Refer to variable 'j' for a description of these acronyms.

\( f \) = Number of circuits where near-end and far-end statuses did not match. Any near-end and far-end status combination that was not listed above is considered a mismatch, unless either end has a status of TRN (transient), as defined in variable 'j'.

\( g \) = Number of circuits where near-end and/or far-end statuses match could not be determined. In these cases, status of one/both ends is TRN (transient), as defined in variable 'j'.

\( h \) = The reason for terminating a CQ request. Valid value(s):
- COMPLETED  = Normal termination.
- STOPPED    = Stopped by STP:CCSCQ request.

\( i \) = Circuit identification code (CIC).

\( j \) = Near-end circuit state prior to any action. Valid value(s):
- ICB-ACT    = Incoming busy, active (that is, in service).
- IDL-ACT    = Idle, active (that is, in service).
- IDL-LBO    = Idle, local maintenance blocked.
- IDL-LRB    = Idle, local/remote maintenance blocked.
- IDL-RBO    = Idle, remote maintenance blocked.
- OGB-ACT    = Outgoing busy, active (that is, in service).
- TRN        = Transient.
- UNQ        = Unequipped.

Near-end trunks are considered transient if they are:
- Trunks involved in growth/degrowth procedures with an OOS, CADN, DSBLD port status.
- Trunks involved in audit type recovery, where the port status is IS, AUDIT, AUTO.
- Trunks pending reset, with an OOS, MTCE, CCSINIT port status.
- Trunks involved in continuity re-check, with an OOS, MTCE, COT port status.
- Trunks involved in non-CCS call related activities, such as TLWS scenarios or test calls.
- Trunks involved in transient CCS outgoing calls before ACM received.
- Trunks involved in transient CCS incoming calls before ACM sent.
- Trunks involved in transient CCS calls before RLC received after sending RSC or REL.
- Trunks involved in incoming BLO, UBL, CGB, CGU processing before BLA, UBA, CGBA, CGUA has been returned. These trunks are transitioning between IDL-LRB, IDL-ACT, and IDL-RBO states in the near-end office.
- Trunks involved in outgoing BLO, UBL, CGB, CGU sending before BLA, UBA, CGBA, CGUA has been received. These trunks are transitioning between IDL-LRB, IDL-ACT, and IDL-LBO states in the far-end office.
- Trunk's SM is unreliable or unavailable.

\( k \) = Far-end circuit state prior to any action. Valid value(s):
- ICB-ACT    = Incoming circuit busy, active (that is, in service).
- ICB-LBO    = Incoming circuit busy, local maintenance blocked.
ICB-LRB  = Incoming circuit busy, local/remote maintenance blocked.
ICB-RBO  = Incoming circuit busy, remote maintenance blocked.
IDL-ACT  = Idle, active (that is, in service).
IDL-LBO  = Idle, local maintenance blocked.
IDL-RBO  = Idle, remote maintenance blocked.
IDL-LRB  = Idle, local/remote maintenance blocked.
OGB-ACT  = Out going circuit busy, active (that is, in service).
OGB-LBO  = Out going circuit busy, local maintenance blocked.
OGB-LRB  = Out going circuit busy, local/remote maintenance blocked.
OGB-RBO  = Out going circuit busy, remote maintenance blocked.
TRN      = Transient.
UNQ      = Unequipped.

1    = Action taken to correct a mismatch. Valid value(s):
CLRRB = Clear remote blocked status. Delete the OOS, BLKD, AUTO status.
IDLE  = Idle trunk. Preempt current process associated with trunk.
INHIBITED  = Corrective action is required but it was inhibited by the CORRECT=INH option.
NONE   = No corrective action needed.
SETCADN  = Set circuit administration status. Add OOS,CADN, DSBLD status.
SETRB  = Set remote blocked status. Add OOS, BLKD, AUTO status.
SNDBLO  = Send maintenance blocked message.
SNDUBL  = Send maintenance unblocked message.
SNDREL  = Send release message.

m    = Switching module number.

n    = Number of trunks in the specified CQ that were not processed, as they are not provisioned as query candidates.

o    = Reason for an aborted circuit query. Valid value(s):
DATABASE ERROR = Required information could not be obtained from the database.
AM OVERLOAD  = AM overloaded during processing of CQ request.
CNI TO PSU CONVERSION IN PROGRESS = The system is not available due to the processing of CNI to PSU conversion.

p    = Reason for not starting a scheduled automatic office-wide circuit query. Valid value(s):
AUTOMATIC CQ INHIBITED = It is time to start automatic office-wide CQ according to the provisioned schedule (RC/V view 8.15), but automatic queries are manually inhibited.
OFFICE REQUEST ALREADY RUNNING = Only one office-wide CQ request can be executed at any time.
SYSTEM RESOURCE = System Resources are not available to start the automatic office CQ. The switch will attempt to start it again at the beginning of the next hour.
OPC/DPC or TG REQUEST ALREADY RUNNING = An office-wide request can only be executed if no other CQ requests are running.
CNI TO PSU CONVERSION IN PROGRESS = The system is not available due to the processing of CNI to PSU conversion.

q    = Reason the GSM CCS signaling platform or CNI cannot be accessed. Valid value(s):
CMT INACCESSIBLE = CCS Message Transport (CMT) is inaccessible.
CMT OVERLOAD = CCS Message Transport (CMT) is in overload state.
CNI INACCESSIBLE = CNI is inaccessible.
CNI OVERLOAD = CNI is in overload state.

\[ r \] = Global switching module number.
\[ s \] = Reason the DPC cannot be accessed. Valid value(s):
DPC INACCESSIBLE = The DPC is completely blocked from use by any feature.
DPC CONGESTION = The DPC is accessible, but is partially congested and can only accept certain CCS messages. CCS circuit query messages (CQM,CQR) are not allowed access.

4. ACTIONS TO BE TAKEN

If the result of the circuit query is COMPLETED, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results from either an automatic circuit query (CQ) or a manual circuit query CQ request originating in this office.

Format 1 reports that the identified circuit query has been STARTED.

Format 2 reports the results of a common channel signaling (CCS) interoffice circuit query on all CCS7 trunks provisioned for query. The office-wide circuit query runs routinely or can be requested manually.

This format includes a summary for each OPC/DPC pair, containing the count of the number of circuits in which the near and far end statuses either matched, mismatched, or could not be determined. This report is only valid for an office-wide CQ request. OPC/DPC pairs are printed in groups of 6.

Format 3 reports the accumulated results of a circuit query request. It is the last output report printed regardless of report option specified, and the only output when FORM=SHORT is selected. The format includes the accumulated number of matched, mismatched, and undetermined statuses for the corresponding query.

Format 4 optionally reports the results of OPC/DPC, TG, or TRKMN CQ. If selected, this format lists per circuit information as the trunk queried. This format lists circuits in groups of 6, all provisioned on the same SM and OPC-DPC, but possibly belonging to different trunk groups. If the FORM=LONG option was specified, then it this format will display the near-end and far-end circuit states only if there was a mismatch. If the FORM=EXPANDED option was specified, then this format will display the near-end and far-end circuit states regardless of their values. If the CORRECT=INH option is specified, then this format displays the action INHIBITED, if mismatches are detected.

Format 5 reports results only when a SM has incomplete data due to the SM being inaccessible, Min-Mode, or failing to respond in time. It will display the SM numbers that are failing if the number of SMs with incomplete data is less than 10. If more than 10 SMs are unresponsive the report will print the first 10 SMs and then a message will print stating there is incomplete data from more than 10 SMs.

Format 6 reports a problem accessing a CNI or GSM CCS signaling platform. The affected GSM and SM are listed or the CNI.

Format 7 reports a problem accessing a DPC due to congestion or inaccessibility. The affected OPC and DPC are listed.

Format 8 reports how many trunks were not queried because trunk groups were not provisioned for CQ (5.1 RC/V view).

Format 9 reports a circuit query has been aborted for the reason cited.

Format 10 reports an automatic office-wide circuit query has not been started for the reason cited.

These formats replace AUD:CCSTQ output in pre-5E12 releases.

3. VARIABLE FIELD DEFINITIONS

- **a** = Origination point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.

- **b** = Destination Point Code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual.
c = Trunk group number.

d = Trunk member number.

e = Number of circuits where near-end and far-end statuses matched.

Near-end and far-end status match (that is, the statuses are consistent) if any of the following combinations occur.

- ICB-ACT to OGB-ACT
- ICB-LBO to OGB-RBO
- ICB-LRB to OGB-LRB
- ICB-RBO to OGB-LBO
- IDL-ACT to IDL-ACT
- IDL-LBO to IDL-RBO
- IDL-RBO to IDL-LBO
- IDL-LRB to IDL-LRB
- OGB-ACT to ICB-ACT
- OGB-LBO to ICB-RBO
- OGB-LRB to ICB-LRB
- OGB-RBO to ICB-LBO

Refer to variable 'j' for a description of these acronyms.

f = Number of circuits where near-end and far-end statuses did not match. Any near-end and far-end status combination that was not listed above is considered a mismatch, unless either end has a status of TRN (transient), as defined in variable 'j'.

g = Number of circuits where near-end and/or far-end statuses match could not be determined. In these cases, status of one/both ends is TRN (transient), as defined in variable 'j'.

h = The reason for terminating a CQ request. Valid value(s):
  - COMPLETED = Normal termination.
  - STOPPED = Stopped by STP:CCSCQ request.

i = Circuit identification code (CIC).

j = Near-end circuit state prior to any action. Valid value(s):
  - ICB-ACT = Incoming busy, active (that is, in service).
  - IDL-ACT = Idle, active (that is, in service).
  - IDL-LBO = Idle, local maintenance blocked, or call processing inhibited locally.
  - IDL-LRB = Idle, local/remote maintenance blocked, or call processing inhibited locally/remotely.
  - IDL-RBO = Idle, remote maintenance blocked, or call processing inhibited remotely.
  - OGB-ACT = Outgoing busy, active (that is, in service).
  - TRN = Transient.
  - UNQ = Unequipped.

Near-end trunks are considered transient if they are:
- Trunks involved in growth/degrowth procedures with an OOS, CADN, DSBLD port status.
- Trunks involved in audit type recovery, where the port status is IS, AUDIT, AUTO.
- Trunks pending reset, with an OOS, MTCE, CCSINIT port status.
- Trunks involved in continuity re-check, with an OOS, MTCE, COT port status.
- Trunks involved in non-CCS call related activities, such as TLWS scenarios or test calls.
- Trunks involved in transient CCS outgoing calls before ACM received.
- Trunks involved in transient CCS incoming calls before ACM sent.
- Trunks involved in transient CCS calls before RLC received after sending RSC or REL.
- Trunks involved in incoming BLO, UBL, CGB, CGU processing before BLA, UBA, CGBA, CGUA has been returned. These trunks are transitioning between IDL-LRB, IDL-ACT, and IDL-RBO states in the near-end office.
- Trunks involved in outgoing BLO, UBL, CGB, CGU sending before BLA, UBA, CGBA, CGUA has been received. These trunks are transitioning between IDL-LRB, IDL-ACT, and IDL-LBO states in the far-end office.
- Trunk's SM is unreliable or unavailable.

\[ k \]

= Far-end circuit state prior to any action. Valid value(s):

- **ICB-ACT** = Incoming circuit busy, active (that is, in service).
- **ICB-LBO** = Incoming circuit busy, local maintenance blocked, or call processing inhibited locally.
- **ICB-LRB** = Incoming circuit busy, local/remote maintenance blocked, or call processing inhibited locally/remote.
- **ICB-RBO** = Incoming circuit busy, remote maintenance blocked, or call processing inhibited remotely.
- **IDL-ACT** = Idle, active (that is, in service).
- **IDL-LBO** = Idle, local maintenance blocked, or call processing inhibited locally.
- **IDL-RBO** = Idle, remote maintenance blocked, or call processing inhibited remotely.
- **IDL-LRB** = Idle, local/remote maintenance blocked, or call processing inhibited locally/remote.
- **OGB-ACT** = Outgoing circuit busy, active (that is, in service).
- **OGB-LBO** = Outgoing circuit busy, local maintenance blocked, or call processing inhibited locally.
- **OGB-LRB** = Outgoing circuit busy, local/remote maintenance blocked, or call processing inhibited locally/remote.
- **OGB-RBO** = Outgoing circuit busy, remote maintenance blocked, or call processing inhibited remotely.
- TRN = Transient.
- UNQ = Unequipped.

\[ l \]

= Action taken to correct a mismatch. Valid value(s):

- **CLRRB** = Clear remote blocked status. Delete the OOS, BLKD, AUTO status.
- **IDLE** = Idle trunk. Preempt current process associated with trunk.
- **INHIBITED** = Corrective action is required but it was inhibited by the CORRECT=INH option.
- **NONE** = No corrective action needed.
- **SETCADN** = Set circuit administration status. Add OOS,CADN, DSBLD status.
- **SETRB** = Set remote blocked status. Add OOS, BLKD, AUTO status.
- **SNDHLO** = Send maintenance blocked message.
- **SNDUBL** = Send maintenance unblocked message.
- **SNDREL** = Send release message.
m = Switching module number.

n = Number of trunks in the specified CQ that were not processed, as they are not provisioned as query candidates.

o = Reason for an aborted circuit query. Valid value(s):
DATABASE ERROR = Required information could not be obtained from the database.
AM OVERLOAD = AM overloaded during processing of CQ request.
CNI TO PSU CONVERSION IN PROGRESS = The system is not available due to the processing of CNI to PSU conversion.

p = Reason for not starting a scheduled automatic office-wide circuit query. Valid value(s):
AUTOMATIC CQ INHIBITED = It is time to start automatic office-wide CQ according to the provisioned schedule (RC/V view 8.15), but automatic queries are manually inhibited.
OFFICE REQUEST ALREADY RUNNING = Only one office-wide CQ request can be executed at any time.
SYSTEM RESOURCE = System Resources are not available to start the automatic office CQ. The switch will attempt to start it again at the beginning of the next hour.
OPC/DPC or TG REQUEST ALREADY RUNNING = An office-wide request can only be executed if no other CQ requests are running.
CNI TO PSU CONVERSION IN PROGRESS = The system is not available due to the processing of CNI to PSU conversion.

q = Reason the GSM CCS signaling platform or CNI cannot be accessed. Valid value(s):
CMT INACCESSIBLE = CCS Message Transport (CMT) is inaccessible.
CMT OVERLOAD = CCS Message Transport (CMT) is in overload state.
CNI INACCESSIBLE = CNI is inaccessible.
CNI OVERLOAD = CNI is in overload state.

r = Global switching module number.

s = Reason the DPC cannot be accessed. Valid value(s):
DPC INACCESSIBLE = The DPC is completely blocked from use by any feature.
DPC CONGESTION = The DPC is accessible, but is partially congested and can only accept certain CCS messages. CCS circuit query messages (CQM, CQR) are not allowed access.

4. ACTIONS TO BE TAKEN

If the result of the circuit query is COMPLETED, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of a manual request for a common channel signaling (CCS) translation test for a specific trunk (EXC:CCSXLATE input message).

Format 1 reports all verified fields are consistent between offices, and near-end ODD is correct.

Format 2 reports near-end office translation test failure. This format specifies the first inconsistent ODD relation encountered. Each format 2 message is accompanied by a manual action assert directing the user to the ODD relation tuple in error.

Format 3 reports near-end data, when no response is received from far-end.

Format 4 reports when verified near-end data is not consistent with the far-end data.

3. VARIABLE FIELD DEFINITIONS
a = Trunk group number.
b = Trunk member number.
c = The problem encountered during a CCS translation test. Valid value(s):
CVR TRANSLATION FAILURE = CVR message received from far-end office could not be
translated per protocol.
DATABASE ERROR = Required information could not be obtained from the database.
DPC CONGESTION = Destination point code is accessible but is experiencing congestion that
prohibit CCS translation test execution at this time.
DPC INACCESSIBLE = Destination point code is inaccessible and cannot be used at the present
time.
FE Xlate FAILURE = The far-end office responded to the circuit validation test (CVT) message
with a circuit validation response (CVR) message indicating a failure occurred in
the far-end office.
MTP INACCESSIBLE = The CCS message transfer part (MTP) transport on the CNI or PSU
platform is inaccessible.
MTP OVERLOAD = Some portion of the CCS message transfer part (MTP) transport on the CNI or
PSU platform is experiencing an overload situation.
FE RESPONSE TIMEOUT = The far-end office did not respond to the CVT message with a CVR
message.
SM INACCESSIBLE = The target trunk's SM is inaccessible because it is in MIN-MODE, it has lost
communication with the AM, or the SM is not operational.
SM OVERLOAD = The target trunk's SM is experiencing an overload situation on a CNI or PSU
platform
SM RESPONSE TIMEOUT = AM process timed-out waiting for SM processing to complete.
SYSTEM ERROR = An unexpected error has occurred during processing.

e = Destination point code (DPC). Refer to the APP:POINT-CODE appendix.
f = Circuit identification code (CIC).
g = Origination point code (OPC). Refer to the APP:POINT-CODE appendix.
h = Circuit group carrier (CGC) indicator. Valid value(s):
UNK = Unknown.
ANG = Analog.
DIG = Digital.
ANDI = Analog and digital.

The CGC indicator must match for the trunk translation to pass. Since CGC indicator setting is not
uniform between vendors, CGC indicator mismatches will not result in trunk translation failures.
However, CGC indicator mismatches between offices, using the interpretation, could result in call
handling failures. The CGC values between offices are:
UNK -> UNK, ANG, DIG, or ANDI
ANG -> ANG
DIG -> DIG
ANDI -> ANDI

j = Double seizing control (DSC) indicator (glare control). Valid value(s):
ALL = The office has all CIC control and will assume control of any call if placed over the trunk group.

EVEN = This office assumes control of calls placed over even CICs within the trunk group. If the CIC of the specific trunk is EVEN then it will assume control during double seizure situations. If the CIC is ODD then the trunk will back down in double seizure scenarios.

NONE = The office has no control and will always back down during dual seizure scenarios in the trunk group.

ODD = This office assumes control of calls placed over ODD CICs within the trunk group. If the CIC of the specific trunk is ODD then the trunk will assume control during double seizure situations. If the CIC is EVEN then the trunk will back down in double seizure scenarios.

The DSC indicator must be complementary for the trunk translation to pass for two-way trunks. DSC inconsistencies between offices can result in call handling failures. DSC mismatches will result in translation test failure. Valid value(s):

ALL -> NONE
NONE -> ALL
ODD -> EVEN
EVEN -> ODD

One-way trunks are not required to be complementary for the trunk translation to pass.

1 = Alarm carrier indicator (ACI). Valid value(s):

HCG = Hardware carrier handling.
SCG = Software carrier handling.
SPR = Spare.
UNK = Unknown.

ACI information is displayed only, and need not match for calls to complete. ACI mismatches will not result in translation test failures.

n = Continuity check indicator (CCI). Valid value(s):

NO COT = Continuity test (COT) is not run on per-call basis for trunks in the trunk group.
PER CALL = Continuity test (COT) per-call test is run on all outgoing calls placed using the trunk group.
STATISTICAL = Continuity test (COT) is run on a percentage of all outgoing calls placed using the trunk group.
UNK = Unknown.

CCI information is displayed only and need not match for calls to complete. CCI mismatches will not result in translation test failures.

p = Circuit identification name (CIN). The CIN is constructed using the CIC, NE-CLLI, and FE-CLLI.
The first portion is the CIC. The second and third portions are the CLLIs from both offices. For
one-way trunks, the first CLLI given is the CLLI of the office that offers traffic to the trunk. For
two-way trunks, CLLIs are given in alphanumeric order.

CINs are always constructed and displayed for the near-end trunk.

CIN is an optional field in the CVR message returned from the far-end office. If CIN is included, it is
checked to ensure it matches. If the CIN is not returned from the far-end office then the string
"**NOT RETURNED**" is displayed.

CIN mismatches will result in trunk translation failures. CIN inconsistencies between offices can
result in call handling failures. Failures include:
- The CICs are not consistent between the offices. CIC inconsistency will cause call
  handling failures.
- Trunk groups routing types (incoming, outgoing or two-way) are inconsistent
  between the offices. Routing types are used to determine the order in which the
  CLLI fields are displayed in the CIN. Routing type inconsistencies can be inferred if
  the CLLIs are listed in different orders, in the FECIN and the NECIN.
- The CLLIs mismatch. If the CLLIs are inconsistent, then the CIN will also be
  inconsistent.

CIN fields are required by the ISUP protocol to be exactly 26 characters with the end-of-string
character. If the far-end office returns a CIN with less than 26 characters, then '*' is used as
padding.

CINs that contain the "**UNKNOWN**" string will not cause a mismatch since the string is used to
indicate that the CLLI is not provisioned. The only exception is if the first 4 characters (CIC) do not
match. If the CICs do not match, the mismatch is reported regardless of the CLLI values.

---

r = CLLI identifier. The EXC CCSXLATE output messages can print up to 3 CLLIs:
- Near end CLLI. This field is always given.
- Far-end CLLI received in the CVR from the far-end office. The FE CLLI is optional
  and may not be sent. If it is not received, then "**UNKNOWN**" is displayed.
- Near-end copy of the FE CLLI. NE COPY OF FE CLLI is also optional. If the
  near-end copy of the FE CLLI is not provisioned, then "**UNKNOWN**" is displayed.

CLLI mismatch occurs when the near-end office's copy of the far-end office's CLLI does not match
the CLLI returned from the far-end office in the CVR message.

If the far-end office has not returned a CLLI, then the CLLIs are not checked. CLLI mismatches will
cause a translation test failure. However, CLLI mismatches can not result in call handling failures.

CLLI fields are required by the ISUP protocol to be exactly 11 characters with an end-of-string
character. If any CLLI is detected to be less than 11 characters, then '*' is used as padding.

Near-end CLLI and Near-end copy of FE CLLI that are less than 11 characters will result in a
manual action assert.

CLLIs that contain the "**UNKNOWN**" string will not cause a mismatch.

---

t = Mismatched near-end versus far-end characteristics. Valid value(s):
CIN = Circuit identification name
CLLI = Common language location identifier.
4. ACTIONS TO BE TAKEN

To correct near-end ODD problems and inconsistencies between offices, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

EXC CO=a STATUS=b TTYNAME=c

2. REASON FOR OUTPUT

To report the system completion status of a particular cutover (CO) migration after all equipped switching module (SM) processing is complete, or after a timeout event occurs. Types of cutover migrations include cutover, cutback, and abort.

3. VARIABLE FIELD DEFINITIONS

a = Type of migrations completed. Valid value(s):
   ABORT = Abort sequence.
   CUT BACK = Cutback sequence.
   CUT OVER = Cutover sequence.

b = Migration completion code. Valid value(s):
   ABORT = Migration aborted.
   FATAL ERROR = Cutover program stopped. Cutover program unable to retrieve office cutover state.
   SUCCESS = Successful migration.
   SYSERR = System error encountered. Migration stopped.
   TIMEOUT = Not all SMs have reported SM complete message to the administrative module (AM).

c = TTY identifier for the origin of the cutover commands.

4. ACTION TO BE TAKEN

As appropriate for the procedure being followed in section 7 of the Precutover and Cutover Procedure manual.

5. ALARMS

None.

EXC:DSTT

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

EXC DSTT {INWATS=a|NCD=b|FUNC=c|BNS=d|CCRD=b|CAS=b} DURATION=e

2. REASON FOR OUTPUT

To report the result of the manual request, EXC:DSTT, for a direct signaling translation test (DSTT).

3. VARIABLE FIELD DEFINITIONS

a = Inward wide area telecommunications service (INWATS) number that was tested, in the form 800NXX.
b = Network call denial (NCD) number, customer account services (CAS) number or calling card (CCRD) number that was tested, in the form NPANXX or RAO[0/1]XX. For CAS, this is the first six digits of the individual account number.
c = Function number that was tested.
d = Billed number screening (BNS) in the form NPANXX.
e = Duration of the test, in milliseconds. Timing starts when the 5ESS® switch sends a test message and ends when the 5ESS® switch receives a reply from the common channel signaling (CCS) network.
f = Results of the DSTT. Valid value(s):
   DESTINATION UNEQUIPPED = Destination is unequipped.
   INCORRECT DESTINATION = Test message was sent to an incorrect destination.
   INCORRECT ROUTING DATA = Incorrect routing data.
   INVALID DSTT RESPONSE MESSAGE = A response message received contained a field with invalid data.
   NETWORK BLOCKED = Network blocked.
   NETWORK OVERLOAD = Network overload.
   NO ROUTING DATA = No routing data for the destination address.
   STP MISMATCH = There was a mismatch in routing data at mate signaling transfer points.
   STP MISROUTED = Test message was misrouted at a signaling transfer point.
   STP NON C-LINK = An STP received a test message on other than a C-link.
   SUCCESS = Translation test was a success.
   TIMEOUT WAITING FOR RESPONSE = A timeout occurred waiting for a response (neither an RTT1 nor an RTT2 message was received).
   TIMEOUT WAITING FOR RTT1 = A timeout occurred waiting for first reply to translation test (RTT) message after second received.
   TIMEOUT WAITING FOR RTT2 = A timeout occurred waiting for second RTT message after first received.
g = CLLI code. CLLI code is a string of eleven characters that identifies the node that replied to the 5ESS® switch test message. A reply was received when field 'f' does not indicate a TIMEOUT. For SUCCESS, the CLLI code indicates the intended destination as given by the address in fields 'a', 'b', and 'd'. For all other reply cases, the CLLI code indicates where the reported error occurred in the CCS network.

h = Function number (FUNC) of the node that replied as described in 'f'. The FUNC is a value from 1 to 32767 and will be reported for all cases in which fields 'f' is output. For SUCCESS, the FUNC is the correct destination's function number. For all other reply cases, it is the function number of the point where the error occurred.

4. ACTION TO BE TAKEN

Wait ten minutes before requesting another test for cases of timeout or overload. Other non-success results suggest some routing problem within the network.

5. ALARMS

None.

[3] EXC ECDAUD COMPLETED b ERRORS, OUTPUT FILE c

__________________________________________________________________

[4] EXC ECDAUD NOT STARTED - AUDIT INHIBITED

__________________________________________________________________

[5] EXC ECDAUD ABORTED - SYSTEM ERROR d

__________________________________________________________________

2. REASON FOR OUTPUT

To respond to an EXC:ECDAUD input message and notify the user that the on-switch ECD audit has begun.

Format 1 reports the start of the ECD audit and progress messages. This request can come from either from an immediate or scheduled input message.

Format 2 reports that the ECD audit completed with no errors. No further action is required.

Format 3 reports that the ECD audit completed with errors. The output file specified should be analyzed and the ECD database corrected based on the errors specified in the file.

Format 4 specifies that the ECD audit was not started because it is currently inhibited.

Format 5 indicates that an internal error has occurred. Refer to variable 'd' for more information.

3. VARIABLE FIELD DEFINITIONS

a = Progress message. Valid value(s):
BEGINNING PROCESSING
IN PROGRESS 250 CHECKS COMPLETED
COMPLETED

b = Number of errors encountered during the audit execution.

c = Path to output file that contains ECD error descriptions.

d = System error number. Valid value(s):
1 = Cannot open audit rule file - /lla/ECDAUD/ecdaud.rules.
2 = Cannot attach to ECD database.
3 = Unable to kill running audit, check PID in /lla/ECDAUD/.ecdaud.pid.
4. ACTION TO BE TAKEN

This message is printed out in response to a request of the EXC:ECDAUD input message. No further action is necessary if the request completed successfully. If errors were found in the ECD, the error file should be analyzed and the errors corrected.

5. ALARMS

Minor if errors were detected or on a system error.

Application: 5,3B
Type: Output

1. FORMAT

[1] EXC ENVIR PROC a (STARTED | INPROGRESS | COMPLETED)
   b

[2] EXC ENVIR PROC a STOPPED
c

2. REASON FOR OUTPUT

To report the result of executing a kernel or supervisor process.

Note: STARTED, IN PROGRESS and COMPLETED messages appear when three or more output segments are printed.

STARTED and COMPLETED messages appear when two output segments are printed.

A COMPLETED message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

a = Pathname specified in the input message.
b = Result of the process executed.
c = Text explaining why the command was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates success. Take no action.

If Format 2 is printed, refer to the input message manual for the correct command format, and correct any command line errors. If the explanatory text indicates that the process could not be executed, use the OP:ST-LISTDIR command to verify the existence of the process being run. If the text is not self-explanatory, seek technical assistance.

5. ALARMS

None.

[2] EXC ENVIR UPROC a STOPPED [{b} | CANNOT EXEC c, ERRNO d | CANNOT CREATE A NEW PROCESS]

[3] EXC ENVIR UPROC - PID = e

2. REASON FOR OUTPUT

Format 1 is printed to report the execution of a user process.
Format 2 is printed to report the reason the process was stopped.
Format 3 is printed to give the process identification (PID) if the process was executed in the background.

Note: started, in progress, and completed messages appear when three or more output segments are printed.
started and completed messages appear when two output segments are printed.
A completed message appears when only one output segment is printed.
The stopped message appears when an error occurs in the executed pathname.
The segment information appears with in progress and optionally with completed messages for segments 2 or greater.

3. VARIABLE FIELD DEFINITIONS

a = The number of segments output.
b = Result of the process executed. (Output will be zero, one, or multiple lines depending on the process executed.)
c = Pathname specified in the input message.
d = System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
e = User process ID.
4. ACTION TO BE TAKEN

Refer to the Input Messages manual for the correct format, and reenter the input message or check the status of the file using the OP:ST-LISTDIR input message if the 'CANNOT EXEC' message is printed.

Use the ALW:FSYS-ACCESS input message to make the file executable, if necessary.

If 'CANNOT CREATE' or any other error message appears, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

    TOTAL TRUNKS PROCESSED e
    TOTAL ERRORS f

    NSEP VALUE ENTERED

[12] EXC FACR NOT STARTED
    DETAIL REPORT ON LASS NSEP VALUE
    g NOT PERMITTED.
2. REASON FOR OUTPUT

To report the feature activation counting and reconciliation (FACR) audit has started or been scheduled to start.

Format 1 reports the start of the FACR audit to begin processing. This request can come from either from an immediate or scheduled input message.

Format 2 is the result of the FACR audit trying to be executed outside the permitted execution times. FACR will be scheduled for execution at 6 p.m.

Format 5 indicates that the FACR audit was outside the permitted execution window while beginning to process the next SM in the office. FACR will be scheduled to begin processing with the next SM at the specified time.

Formats 8 and 9 report that FACR has completed processing all lines and trunks and will now be processing features that are associated with an entire office.

Format 10 reports the total number of lines and trunks processed for the entire office along with the number of errors encountered. For information on how to handle errors refer to the Routine Operations and Maintenance Procedures manual.

Format 11 and 12 indicate that the national security emergency preparedness (NSEP) value entered is not supported by FACR. Refer to the Routine Operations and Maintenance Procedures manual further details.

3. VARIABLE FIELD DEFINITIONS

| a  | = Hour of the current day FACR has been scheduled to continue. |
| b  | = Minute of the hour for the current day FACR has been scheduled to continue. |
| c  | = Switching module number being processed. |
| d  | = Total number of lines queried for features. |
| e  | = Total number of trunks queried for features. |
| f  | = Total number of errors encountered for a line or trunk while querying for features. |
| g  | = NSEP value entered on input message. |

4. ACTIONS TO BE TAKEN

This message is printed out in response to a manual request of the EXC:FACR input message. No further action is necessary if the request completed successfully.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

EXC:FACR
OP:FACR
STP:FACR
EXC:GKCCR

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

EXC GKCCR \(\text{SM}=a, \text{CMP}=b-c, \text{PRIM|MATE}\) AM d

2. REASON FOR OUTPUT

To report the status of a generated key collection and compression routine (GKCCR) request, which was requested using the EXC:GKCCR input message. The message is repeated for each processor that was requested in the EXC:GKCCR input message.

3. VARIABLE FIELD DEFINITIONS

- **AM**: The GKCCR executed in the administrative module.
- **MATE**: The GKCCR was requested on the mate CMP.
- **PRIM**: The GKCCR was requested on the primary CMP.
- **a**: Number of the switching module for which a GKCCR was requested.
- **b**: Message switch side for the desired communication module processor (CMP).
- **c**: CMP for which a GKCCR was requested.
- **d**: Output message termination report. Valid value(s):
  - **COMPLETED**: The GKCCR completed successfully.
  - **IN PROGRESS**: A previously requested EXC:GKCCR is currently being executed. A EXC:GKCCR output message with IN PROGRESS status will appear every three minutes until the GKCCR is completed.
  - **QUEUED**: The EXC:GKCCR request is queued behind another currently executing GKCCR. Only one GKCCR is queued at a time: multiple GKCCR requests while another is running result in a single GKCCR being executed after the currently running GKCCR completes.
  - **STOPPED**: The GKCCR was unable to complete successfully.

4. ACTION TO BE TAKEN

None. If the 'STOPPED' output terminations occur, all processes terminate gracefully. If during the execution of the GKCCR, data or system errors were discovered in generated key relations, REPT:GKCCR output messages are produced. Appropriate action to be taken for these messages is explained in the REPT:GKCCR output message description.

5. ALARMS

None.

EXC LIT ABORTED a b [c] [d] [e] [f] [g]

2. REASON FOR OUTPUT

To report that an automatic line insulation testing (ALIT) session or manually requested (demand) line insulation testing (DLIT) session was forced to terminate abnormally.

3. VARIABLE FIELD DEFINITIONS

a  = Type of testing that was aborted. Valid value(s):
    Q  = ALIT.
    S  = DLIT.

b  = Reasons for the abort. Valid value(s):
    DATA BASE PROBLEM = An internal database relation read error has occurred which prevents further processing of the request.
    DUE TO MIN MODE = The administrative module (AM) or the switching module (SM) containing the line being demand-tested is in minimum (min) mode.
    DUE TO OVERLOAD = The AM or SM involved in the DLIT is in overload.
    HARDWARE PROBLEM = Hardware failures have occurred. Probable failures are:
      - LIT is not able to acquire control of the ALIT circuit,
      - The ALIT circuit is not responding to control commands, or
      - Problems exist in the modular metallic service unit (MMSU) hardware used in the metallic connection.
    NO METALLIC PATH = No metallic connections could be established between any ALIT circuits and LIT testable lines.
    NO TEST CKT = The needed test circuits are inaccessible or out-of-service (OOS).
    NO UNITS APPEAR TESTABLE = No units were found to be in a testable state and/or no units could be tested because of hardware problems in the MSU metallic access network.
    SOFTWARE PROBLEM = Aborted due to unresolvable software problems such as an inability to read the database, send messages, or create processes.

c  = Processor name where LIT aborted (AM or SM).

d  = SM number.

e  = Total number of lines attempted to be tested.

f  = Number of lines actually tested.

g  = Number of lines that failed.
4. ACTIONS TO BE TAKEN

Determine the cause for the abort and the need for further testing.

Type: Output

1. FORMAT

EXC LIT COMPLETED a b c d

2. REASON FOR OUTPUT

To report the termination of a manually requested (demand) line insulation testing (DLIT) session or an automatic
line insulation testing (ALIT) session and to report that testing of all available testable lines in the office has been
completed.

3. VARIABLE FIELD DEFINITIONS

a  = Type of session. Valid value(s):
    Q = ALIT.
    S = DLIT.

b  = Total number of lines attempted to be tested.

c  = Number of lines actually tested.

d  = Number of lines that failed.

4. ACTION TO BE TAKEN

This message could be in response to the action requested by the corresponding manually executed input
message. No specific action is indicated.

5. ALARMS

None.

Output Message(s):

   OP:LIT
EXC:LIT-NOT

Software Release: 5E14 and later
Message Class: ALIT
Application: 5
Type: Output

1. FORMAT

EXC LIT NOT STARTED Q a

2. REASON FOR OUTPUT

To report that automatic line insulation testing (ALIT) has not started executing for the given reason. Q is the defined symbol for ALIT.

3. VARIABLE FIELD DEFINITIONS

a = Reason for not starting. Valid value(s):
   COMMUNICATION FAILURE = The LIT system process could not communicate with the newly created ALIT terminal process. Cause is unknown. An assert might accompany this reason.
   DURATION = 0 The duration for the ALIT session has been set to 0 hours. ALIT will only execute if the duration is set from 1 to 8 hours. This value can be changed in RC/V View 8.1.
   GENERIC RETROFIT IN PROGRESS = ALIT can not execute when software release retrofit is in progress.
   INSUFFICIENT RESOURCES = A system resource shortage prevented creation of the ALIT terminal process or prevented communication with the newly created ALIT terminal process.
   PREVIOUS SESSION EXECUTING = An ALIT session is already executing. Can not start a second ALIT process.
   UNABLE TO CREATE PROCESS = The LIT system process could not create the ALIT terminal process. Cause is unknown. An assert might accompany this reason.

4. ACTION TO BE TAKEN

No specific action is required. ALIT will attempt to start at the next scheduled start time. If the duration is incorrectly set, it can be changed with RC/V View 8.1. If ALIT fails to start after several scheduled sessions, the LIT system process should be purged with the input message INIT:AM-SPP.

EXC LIT SINGLE CIRCUIT ABORT - MMSU PROBLEM
CIRCUITS INVOLVED: ALIT=a-b-c-d MTB=a-b-c-d-e
LAST LINE TESTED: DN=f[-g][+] h [MLHG=i-j]

2. REASON FOR OUTPUT

To report that a single automatic line insulation testing (ALIT) circuit aborted abnormally because of a modular metallic service unit (MMSU) hardware problem or improper wiring to the line.

For ALIT, testing will be suspended for the unit of the aborted line for the current session only. Routine office ALIT will continue and if possible will use the aborted ALIT circuit. In the next session ALIT will try to test the unit of the aborted line.

For demand line insulation testing (DLIT), testing will be suspended for the unit of the aborted line for that specific request only. DLIT testing will continue and if possible will use the aborted ALIT circuit.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

+  = Indicates the line is a party line.

a  = Switching module number.

b  = MMSU number.

c  = MMSU service group number.

d  = MMSU board position number.

e  = Metallic test bus number.

f  = Directory number of the line being tested.

g  = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

h  = Equipment type and number. Valid value(s):

<table>
<thead>
<tr>
<th>AIUEN=a-a^1-b^1-c^1</th>
</tr>
</thead>
<tbody>
<tr>
<td>ILEN=a-k-l-m</td>
</tr>
<tr>
<td>INEN=a-d^1-e^1-r^1</td>
</tr>
<tr>
<td>LCEN=a-n-o-p</td>
</tr>
<tr>
<td>LCKEN=a-w-x-y-z</td>
</tr>
<tr>
<td>LEN=a-q-r-s-t-u</td>
</tr>
<tr>
<td>SLEN=a-v-l-m</td>
</tr>
</tbody>
</table>

i  = Multi-line hunt group (MLHG).
4. ACTION TO BE TAKEN

Determine if the cause of the abort is hardware related and correct the hardware problem. If the abort is not hardware related, and it re-occurs, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report that line insulation testing (LIT) on a line or group of lines could not be done and those lines were skipped by LIT. The LIT session is continuing.

3. VARIABLE FIELD DEFINITIONS

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

+ = Indicates the line is a party line if the feature is assigned.
a = Type of test session. Valid value(s):
  Q = A sequential automatic LIT (ALIT) session.
  S = A single manually requested (demand) LIT (DLIT) session.
b = Type of test. Valid value(s):
  F = Foreign potential (FEMF) test only.
  G = General. Performs tip and ring-to-ground (TRG), short circuit and ring-to-ground (SRG), and FEMF tests.
  S = SRG test only.
  T = TRG test only.
c = Reason line was skipped. Valid value(s):
  ALIT CKT TIMEOUT = The ALIT circuit failed to yield test results for this line before a software timeout occurred. If this occurs repeatedly, the ALIT circuit in use should be diagnosed and replaced if necessary.
  ALIT CKT UNAVAILABLE = The ALIT circuit in use has gone out of service (OOS); it will be tried again.
  BLKD-SPARED LINE CARD = The metallic connection from the ALIT circuit in the modular metallic service unit (MMSU) to the line was blocked in the integrated services line unit (ISLU) metallic access network because a line card (LC) was spared. This condition exists when trying to gain metallic access to a LC that is in the same half of a line group drawer as an actively spared faulty card. "Same half of a line group drawer" refers to those line groups that are vertically adjacent (such as, LG0 and LG1 or LG2 and LG3). The remaining lines in the affected ISLU line groups will also
be skipped.

BUSY LINE = The line is in use and cannot be tested.

COMMUNICATION FAILURE = Results for this line test are unavailable due to a damaged message or inability to receive a message.

DATA BASE PROBLEM = The unit type obtained from reading relation RL_PICB with the peripheral interface control bus (PICB) of the in-use ALIT circuit in MMSU was not an MMSU type.

EQUIP TP INTERRUPTED = The ALIT equipment test process has been interrupted by system integrity (SI) and can not complete this line test.

EXEMPT LINE = The line is marked exempt for LIT testing.

FAILED TO CREATE TP = System routing was unable to create the needed MMSU test process or the line test process. The affected SMs may be in overload or temporarily isolated.

FAMILY OF EQUIP LINE = The line terminates on a component of line unit (LU) hardware that is OOS.

FAULTY ALIT CKT = The ALIT circuit in use failed its sanity or calibration self-test, or repeatedly failed to complete a line test before software timeout occurs.

GDXC CKT UNAVAILABLE = To test this line type, the metallic path must include a GDXC compensator circuit. This resource was not available.

INVALID LINE = The line is invalid. It is probably unequipped or unassigned.

INVALID RT CHAN TYPE = ALIT is attempting to test an integrated subscriber loop carrier (ISLC) remote terminal (RT) channel unit (CU) that does not support metallic connections.

LINE TEST INTERRUPTED = This line test was interrupted by system software.

LINE TP INTERRUPTED = The line test process has been interrupted by SI and can not complete this line test.

MET NETWORK FAILURE = A failure has been encountered while setting up the metallic path between the ALIT circuit and the line. Most probable cause is a resource not available such as the line’s MTB, junctors, MTIB, or a mate GDXC for the ALIT circuit. The most likely cause for this resource shortage is if other metallic test activity is in progress or there is REX activity on the required MMSU hardware.

MMSU DATA BASE PROB = A problem was found reading the RLCKTDATA relation.

MMSU SG UNAVAILABLE = The metallic service unit service group in use has gone OOS; a LIT test will be tried again.

MMSU TP INTERRUPTED = The MMSU test process has been interrupted by SI and can not complete this line test.

NO EQUIP TP = The logical test port for the ALIT equipment test process could not be activated or access was denied by switch software.

NO LINE TP = The port for the line test process could not be activated or access was denied by switch software.

NO METALLIC AT LINE = The final metallic connection of the line's tip-and-ring (T/R) to the metallic path failed.

NO METALLIC PATH = The metallic connection from the ALIT circuit in the MMSU to the line could not be set up.

NO MMSU TP = The logical test port for the MMSU test process could not be activated or access was denied by switch software.

POWER CROSS LINE = An external power source exists on the tip and ring.

PRECUT LINE = This line is in a pre-cutover state and cannot be tested by LIT since to do so could interfere with the old office.

PROBLEM TESTING LINE = A hardware or software problem occurred when the line was tested.

RT METALLIC BUS BUSY = The MTB out to an ISLC RT is busy.

SOFTWARE-TIMEOUT PROB = Results for this line test are unavailable because of a damaged or missing message between the ALIT equipment test process, the MMSU test process, or a line test process.
TBCU SETUP FAILURE = A problem was encountered with the test bus control unit (TBCU) when attempting to setup a metallic connection to an ISLC RT.

TP KEEP ALIVE BROKEN = The software keep alive mechanism between the ALIT equipment test process, MMSU test process, and line test process has detected a broken linkage.

UNEQUIPPED DCLU = This line belongs to an unequipped digital carrier line unit (DCLU). Therefore, the LIT software will silently skip over the rest of this unit.

UNEQUIPPED GRID = This line belongs to an unequipped LU grid; therefore, the LIT software will silently skip over the rest of this grid.

UNEQUIPPED IDCU = This line belongs to an unequipped integrated digital carrier unit (IDCU). Therefore, the LIT software will silently skip over the rest of this unit.

UNEQUIPPED ISLU = This line belongs to an unequipped ISLU. Therefore, the LIT software will silently skip over the rest of this unit.

UNEQUIPPED LB = This line belongs to an unequipped line board (LB) in an ISLU2. Therefore, the LIT software will silently skip over the rest of this LB.

UNEQUIPPED LGC = This line belongs to an unequipped line group controller (LGC) in an ISLU. Therefore, the LIT software will silently skip over the rest of this LGC.

UNEQUIPPED LU = This line belongs to an unequipped LU. Therefore, the LIT software will silently skip over the rest of this unit.

UNEQUIPPED SLC RT = This line belongs to an unequipped SLC® remote terminal (RT). Therefore, the LIT software will silently skip over the rest of this line group controller.

d = Directory number of the line being skipped, if a number is assigned.

e = Member number of the line time slot bridging (LTSB) line if the feature is assigned. For an LTSB line, a member number of 1 represents the lead line and a member number of 2 represents the associate line.

f = MLHG member of the line, if the line is member of a multi-line hunt group.

g = Type of equipment that determines the equipment number (EN) field. Valid value(s):

<table>

</table>

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

+ Indicates the line is a party line if the feature is assigned.
\( P \) = Test passed.
\( Q \) = Test failed at quarter-resistance range.

\( e \) = TRG result from the general test (otherwise N). Valid value(s):
\( F \) = Test passed at half-resistance range but failed at full-resistance range.
\( H \) = Test passed at quarter-resistance range but failed at half-resistance range.
\( N \) = No test performed.
\( P \) = Test passed.
\( Q \) = Test failed at quarter-resistance range.

\( f \) = Directory number of the line, if a number is assigned.

\( g \) = Member number of the line time slot bridging (LTSB) line if the feature is assigned. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

\( h \) = MLHG member of the line if the line is a member of a multi-line hunt group.

\( i \) = Type of equipment which determines the equipment number (EN) field. Valid value(s):
\( \text{AIUEN} \) = Access interface unit equipment number.
\( \text{ILEN} \) = Integrated digital carrier unit equipment number.
\( \text{INEN} \) = Digital network equipment number.
\( \text{LCEN} \) = Line card equipment number.
\( \text{LCKEN} \) = Line circuit equipment number.
\( \text{LEN} \) = Line equipment number.
\( \text{SLEN} \) = SLC\textsuperscript{\textregistered} line equipment number.

\( j \) = Equipment number. Valid value(s):

<table>
<thead>
<tr>
<th>if 'i' =</th>
<th>'j' =</th>

</tr>
<tr>
<td>\text{SLEN}</td>
<td>k-t\ldots u\ldots v</td>
</tr>
</tbody>
</table>

\( k \) = SM (switching module) number.
\( l \) = Line unit number.
\( m \) = Grid number.
\( n \) = Board number (LU1, LU2, or LU3).
\( o \) = Switch number.
\( p \) = Level number.
\( q \) = Integrated services line unit (ISLU) number.
\( r \) = Line group controller number.
4. ACTION TO BE TAKEN

If the line passed the LIT test, no action is required.

If the line failed the half-resistance range, or the full-resistance range, it should be monitored to verify that service quality is not impaired.

If the line failed the quarter-resistance range, the service quality of the line is in serious question. The distance to the short should be determined [using the trunk and line work station (TLWS)] and the outside plant associated with the line should be investigated and repaired if necessary.

2. REASON FOR OUTPUT

To respond to a message transfer part (MTP) route verification test (MRVT) input message that verifies the network communication end to end. The output will be directed to the standard output associated with the initiator of the test, and also to the destination(s) specified for the MTCE message class. If they are the same device, only one printout will occur.

3. VARIABLE FIELD DEFINITIONS

FAILURE = Depending upon the responses received.
NO TRACE = The user did not request a trace of all the STPs crossed.
PARTIAL SUCCESS = Depending upon the responses received.
TRACE = The user requested a trace of all the STPs crossed.
**a** = The point code of the terminating node for the test. Valid value(s):

- `kkklllmmm` = ANSI® standard format.
- `kkknnlmmm` = AT&T format.

Note: Non-local network point codes always use ANSI® standard format.

**b** = The maximum number of signaling transfer points (STPs) the MRVT is allowed to cross.

**c** = The list of STP point codes in the trace of a received MTP routing verification result (MRVR) message indicating success. If multiple success-indicating MRVR messages are received, this line will be printed for each such message (three success-indicating MRVR messages result in three lists of point codes).

Note: In Format 3, if **FAILURE** is printed, variable ‘c’ will not be present in the output.

**d** = Text phrase describing the problem found. Valid value(s):

- **EXCESSIVE LENGTH ROUTE**
- **INACCESSIBLE SIGNALING POINT**
- **LOOP**
- **TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS**
- **TIMER EXPIRED**
- **UNKNOWN ERROR CODE**
- **UNKNOWN INITIATOR POINT CODE**
- **UNKNOWN TERMINATOR POINT CODE**

**e** = Error number associated with error described in ‘d’. Valid value(s):

- 1 = Detected loop.
- 2 = Excessive length route.
- 3 = Unknown resource instance.
- 4 = Route inaccessible.
- 5 = Processing failure.
- 6 = Unknown initiating SP.
- 7 = Timer expired.

**f** = Point code(s) associated with the failure being reported a nine digit number (such as, 254162371).

<table>

<tr>
<td>TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS</td>
<td>Point code of the SP that cannot run the test.</td>
</tr>
<tr>
<td>UNKNOWN ERROR CODE</td>
<td>The error number received that is not on the above list.</td>
</tr>
</tbody>
</table>
Note: If multiple errors were detected, items 'd', 'e', and 'i' will be printed for each error received.

g = Point code of the SP from which the MRVA message was received.

h = MRVT resolution. Valid value(s):
   FAILURE = No network paths from origin to destination verified.
   PARTIAL SUCCESS = One or more (but not all) network paths from origin to destination verified.
   SUCCESS = All network paths from origin to destination verified.

i = The failure type in hexadecimal notation. At an intermediate SP, the failure types from the MRVAs received are logically OR'ed together. The initiating SP then prints the aggregate of failure types received in its MRVAs. Below are the MRVA failure types and the bits that represent them. Valid value(s):
   10000000 = Detected loop
   01000000 = Excessive length route
   00100000 = Unknown resource instance
   00010000 = Route inaccessible
   00001000 = Processing failure
   00000100 = Unknown initiating SP
   00000010 = Timer expired
   00000000 = Success

MRVA MESSAGES RECEIVED
   254999000 FAILURE 0x82 The above MRVA had two errors.

   0x80 = detected loop
   0x02 = timer expired

j = The problem found. Valid value(s):
   MAXIMUM MRVTS ALREADY IN PROGRESS
   MRVT ALREADY IN PROGRESS WITH TERMINATOR
   NO NEW TRANSACTIONS ALLOWED
   STPS NOT IN 0 - 15 RANGE
   TERMINATOR IS ALIAS FOR LOCAL PC
   TERMINATOR IS DCIS6 POINT CODE
   TERMINATOR IS UNKNOWN
   TERMINATOR SAME AS ORIGINATOR

k = The network identifier.

l = The cluster identifier.

m = The member identifier.

n = The region identifier.

4. ACTION TO BE TAKEN

Format 1 is used when the MRVT is successful and the MRVT user did not request a trace.
Format 2 is used when the MRVT is successful and the user requested a trace.

Format 3 is used when either a partial success or failure occurs.

Format 4 is used by the initiating SP if the MRVT message cannot be sent due to local conditions.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

Output Message(s):

CHG: MRVT
REPT: MRVR

Other Manual(s):
235-190-120  Common Channel Signaling Services
EXC:ODDRCVY
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

EXC ODDRCVY {CORC|ALL|SKIPLOG} {SM=a | CMP=b-c | AM | SM=a, CMP=b-c, AM}
[NON-FATAL ERRORS=d] e

2. REASON FOR OUTPUT

To report the status of the reapplication of customer-originated and/or regular recent changes (RCs) to the office-dependent data (ODD).

3. VARIABLE FIELD DEFINITIONS

ALL = All RCs, including CORCs were reapplied.
AM = The customer-originated and/or regular recent changes were reapplied to the ODD in the administrative module.
CORC = Only customer-originated recent changes were reapplied to the ODD.
SKIPLOG = Clear RC backout status.
a = Number of the switching module for which customer-originated and/or regular recent changes were reapplied.
b = Message switch side for the desired communication module processor (CMP) (0, 1).
c = CMP for which customer-originated and/or regular recent changes were reapplied.
d = Number of nonfatal errors that occurred and were corrected by the database manager during the ODD recovery. If they are not correctable, the ODD recovery will be aborted and the input message EXC:ODDRCVY must be reissued with the SKIPRC option to skip over the failing database transaction. Under normal operation the number of nonfatal errors should equal zero.
e = Termination report. Valid value(s):
   ABORTED = The requested action was terminated before a normal completion and the consistency of hardware states or data is questionable.
   COMPLETED = The requested action was terminated after completion.
   NOT STARTED = The requested action could not begin. Probable causes: a previously requested reapplication was still in progress or the disk log file had already been reapplied.
   STOPPED = The requested action was terminated before a normal completion but consistency of hardware states and data is reliable.

4. ACTION TO BE TAKEN

If the ODD recovery aborted, the failing transaction must be skipped by using the SKIPRC option in the input message EXC:ODDRCVY.
If the ODD recovery stopped, then reissue the input message EXC:ODDRCVY.

All other cases mean that the ODD is up to date and no further action need be performed.

5. ALARMS

None.

### 2. REASON FOR OUTPUT

These messages are output to report information regarding the execution of the offline boot feature.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Message type. Valid value(s):
  - **ABORTED** = Application request to stop the oflboot procedure; devices moved to the offline side will be restored.
  - **COMPLETED** = Indicates offline side boot has completed.
  - **INFO** = Informational output.
  - **STOPPED** = Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the offline side will be restored.
  - **TERMINATED** = Administrative module (AM) software-initiated termination of the oflboot procedure; devices moved to the offline side will not be restored.

- **b** = Text line. Valid value(s):
  1. **A CU IS FORCED** = Printed by EXC:OFLBOOT if either CU 0 or CU 1 is forced on-line.
  2. **AIM REPORTED CHECKS FAILURE** = Application integrity monitor (AIM)
pre-oflboot checks have failed.

3 AND NEITHER OOS NOR UCL WAS SPECIFIED = The specified unit is out-of-service (OOS). For units in this state, either the OOS or UCL options must be specified on the command line.

4 BOOT IN PROGRESS = Indicates the offline side is booting.

5 BOTH IOP 0 AND IOP 1 CANNOT BE MOVED TO OFFLINE SIDE = Printed if both IOP 0 and IOP 1 were selected to move to the offline side.

6 CANNOT ACCESS ECD = EXC:OFLBOOT encountered problems accessing equipment configuration database (ECD) device information.

7 CANNOT BOOT FROM THIS DEVICE = It is not possible to boot from a device that is offline for initialization level 2.

8 CANNOT SEND OLBPRECHK MESSAGE TO AIM ERROR i = A message requesting AIM to perform offline boot prechecks cannot be sent to the AIM process. Reason for failure is given in variable ‘i’.

9 CANNOT UPDATE ECD = The RC/V ECD cannot be updated. The reason is dependent on the function ‘e’ printed. Valid value(s):

   DFS = Count not reserve a unit’s UCB record as part of EXC:OFLBOOT pre-checks.
   UNRESERVE = Could not unreserve a UCB record while stopping offline boot. Some units’ UCB records may remain reserved.

10 CANNOT VERIFY IF RC/V ECD SESSION IS IN PROGRESS = The timer for verifying if a disk RC/V ECD session is in progress has expired before the process that checks this responds.

11 CORRUPT ECD UCB RECORD FOR g h = EXC:OFLBOOT encountered inconsistent information about a device from RC/V ECD. For example, EXC:OFLBOOT accessed the RC/V ECD unit control block (UCB) record for a DFC and the device type in the UCB record is not disk file controller (DFC).

12 COULD NOT BUILD TABLE FOR UNKNOWN DEVICE = Indicates an illegal instruction inside EIH. Offline boot will be terminated.

13 DFC 2 OOS DFC 3 ACT AND UCL WAS NOT SPECIFIED = When more than 2 disk file controllers (DFCs) are present, offline boot attempts to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If DFC 2 is in the out-of-service (OOS) state and DFC 3 is in the ACT state, the UCL option is required. Offline boot is terminated.

14 DFC 2 OOS DFC 3 OOS AND UCL WAS NOT SPECIFIED = When more than 2 DFCs are present, offline boot attempts to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If both DFC 2 and DFC 3 are in the OOS state, the UCL option is required. Offline boot is terminated.

15 DFC 3 OOS DFC 2 ACT AND UCL WAS NOT SPECIFIED = When more than 2 DFCs are present, offline boot attempts to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If DFC 3 is in the OOS state and DFC 2 is in the ACT state, the UCL option is required. Offline boot is terminated.

16 DIAGNOSTICS IN PROGRESS = Indicates the specified device's RC/V ECD UCB record is marked “reserved.” Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.

17 EXCEEDED STORAGE CAPACITY FOR STORING DEVICE INFORMATION = Indicates overflow in internal tables holding device information for offline boot.

18 HAS CORRUPT UNIT NUMBER = The unit number for the maintenance teletypewriter controller (MTTYC) is greater than or equal to 2 and this is invalid.

19 HAS DEVICE TYPE ROP = A UCB record with device type receive-only printer (ROP) was found whose parent controller was not MTTYC or teletypewriter controller (TTYC).
20 IN DISK INDEPENDENT OPERATION MODE = Printed if the system is in disk independent operation mode.

21 INITLVL 2 INCOMPATIBLE WITH ANY MHD IN OFL STATE = Invoking offline boot with initialization level 2 is rejected if any MHD is in the OFL state. Offline boot is terminated.

22 MODE MUST BE OLBDLIE TO BOOT OFFLINE = This message indicates that either offline boot is already in progress or offline boot is not supported.

23 MUST BE ACT OR OOS FOR SPLITTING = When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 will remain in the on-line side. The offline boot will continue without splitting DFC 2 and DFC 3.

24 MUST BE ACT FOR INITLEVEL 2 = The TTY device selected to be the offline pseudo-ROP is OOS. Also selected was an initialization level 2. Because devices are not automatically restored during this level of initialization, the TTY would have remained OOS in the offline side after the initialization, that is, there would not have been a pseudo-ROP in the offline side. This condition cannot be overridden with the OOS or UCL options.

25 MUST BE STBY FOR INITLEVEL 2 = Boot level 2 was selected on the offline control unit (CU) is not in the STBY state. The incorrect state is given by 'j'.

26 NO DISK FORCED = Indicates a DFC is not forced.

27 NO EXC OFLBOOT IN PROGRESS MESSAGE WILL PRINT = Printed when all internal timer slots have been used and a new timer cannot be obtained to print the EXC OFLBOOT IN PROGRESS messages.

28 NO TIMER SLOTS AVAILABLE = Printed when all internal timer slots have been used. Timer slots are freed at this point.

29 NOT ACTIVE = Printed if the specified device is not in the ACT state. The incorrect state is given by 'j'.

30 NOT SPLITTING - DFC 2 UNEQUIP = When more than 2 DFCs are present, offline boot attempts to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 remain in the on-line side. The offline boot continues without splitting.

31 NOT SPLITTING - DFC 3 UNEQUIP = When more than 2 DFCs are present, offline boot attempts to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 remain in the on-line side. The offline boot continues without splitting.

32 OFFLINE SIDE BOOT COMPLETE = If function 'e' is TIM_EXCCHK, the on-line side did not receive the results from the post-boot checks in time.

If the function is TIM_PRINT, AIM did not reply to the message to print post-boot or switch checks.

If the function is OLBMSGHDLR, the offline boot sequence completed all its steps.

33 OLBSTATE < NOT EXC_LCKECD = Printed if offline boot is not in the EXC_LCKECD state when EXC:OFLBOOT expects it to be. OLBSTATE is corrupt or an internal timer was not cleared correctly.

34 OLBSTATE < NOT EXC_PRCK = Printed if offline boot is not in the EXC_PRCK state when EXC:OFLBOOT expects it to be. OLBSTATE is corrupt or an internal timer was not cleared correctly.

35 OLBSTATE MUST BE OLBDLIE TO BOOT OFFLINE = This message indicates that either an offline boot is already in progress or the value stored in OLBSTATE is
corrupted.

36 ONLY ONE BOOT DEVICE = Only one boot device is installed. Minimally, both MHD 0 and MHD 1 need to be installed for a system to be considered fully duplex.

37 SPECIFIED TTY DOES NOT EXIST = The TTY device specified in the command line is invalid.

38 STATE UNACCEPTABLE FOR OFFLINE BOOT = The major state of a device is not in the state needed while attempting to boot offline. The incorrect state is given by 'j'.

39 SYSTEM STATUS INCONSISTENT WITH COMMAND LINE OPTIONS = Printed if command line options do not match system status. This message will be output if any of the following conditions are true:
- Required unit is OOS and neither OOS nor UCL was specified.
- Specified teletypewriter (TTY) does not exist.
- Specified input/output processor (IOP) does not exist.
- Both IOP0 and IOP1 are selected for moving.
- A primary disk was not forced.
- A CU is forced.
- Only one bootable disk is available or one of the bootable disks is not equipped.
- Mate CU state is not STBY or OOS.
- If any RC/V ECD UCB record is reserved.

This list is not exhaustive. Additional information is provided in a previous output message. Refer to it for a description of the problem.

40 TIME OUT -- AIM OFLBOOT PRECHECKS = Printed when the timer for AIM offline boot prechecks expires.

41 TIME OUT -- CANNOT SPAWN USER PROCESS = Printed when a timer expires for creating a process to verify if a disk RC/V ECD session is in progress.

42 UCL PASSWD FILE CANNOT BE OPENED FOR WRITING = Refer to the 4ACTION TO BE TAKEN section.

43 UCL PASSWD FILE DOES NOT EXIST, SET TO k = The password file does not exist when the UCL option is used for the first time. A new encrypted password 'k' is generated automatically.

44 UCL PASSWD FILE HAD BAD FORMAT, RESET TO k = Either the file was empty or its contents was damaged. A new encrypted password 'k' is generated automatically.

45 UCL PASSWD IS INVALID, RESET TO k = The password supplied by the user is incorrect. A new encrypted password 'k' is generated automatically.

46 UNEXPECTED MESSAGE FROM AIM = Indicates a message was received unexpectedly from AIM.

47 UP POINTER IS INVALID = Printed when the RC/V ECD UCB record for a device (containing the up pointer) has been corrupted.

48 WILL BE MOVED TO OFFLINE SIDE = Printed when an IOP has not been selected to be moved to the offline side, but offline boot selected it to be moved. It was selected because one of its TTYs was listed on the command line.

c = Current offline boot state.

d = Previous offline boot state.

e = Name of the function from which the output message originated. This field is used by the AM in diagnosing offline boot problems.
f = Line number in the function ‘e’ which the output message originated. This field is used by the AM, in conjunction with field ‘e’, to diagnose offline boot problems.

g = String giving device type information; CU, DFC, IOP, moving head disk (MHD), TTY, TTYC, and dual serial channel (DSCH), for example. Refer to the APP:MEM-NUM-UNIT Appendix in the Appendixes section of the Output Messages manual for unit names.

h = Device number. A value of zero, when used with ‘g’, could form DFC 0, for example.

i = Reason message could not be sent.
0 = Process is not attached to its port or port is invalid.
8192 = Process cannot queue more messages.
-1 = Cannot allocate system message buffer.

j = Device state.

k = To obtain a legal password for using the UCL option, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual and provide the encrypted password ‘k’. The value of variable ‘k’ will change every time the UCL option is entered. Using the UCL option always requires assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

4. ACTION TO BE TAKEN

For Format 1, no action needs to be taken.

For Formats 2, 3, 4, and 5, the action to be taken depends on text line ‘b’.

<table>
<thead>
<tr>
<th>Textline</th>
<th>Action to be Taken</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Clear the forced on-line CU and try offline boot again.</td>
</tr>
<tr>
<td>2</td>
<td>Clear problem with application; try offline boot again.</td>
</tr>
<tr>
<td>3</td>
<td>Either restore the device or add OOS or UCL to the EXC:OFIBOOT command line.</td>
</tr>
<tr>
<td>4</td>
<td>No action is needed.</td>
</tr>
<tr>
<td>5</td>
<td>Specify only one primary IOP (IOP 0 or IOP 1) in addition to any other IOPs (IOP 2, IOP 3, and so forth). Try offline boot again.</td>
</tr>
<tr>
<td>6</td>
<td>Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.</td>
</tr>
<tr>
<td>7</td>
<td>Restore boot device and try offline boot again. If device cannot be restored, then retry offline boot with initialization level 3 or 4.</td>
</tr>
<tr>
<td>8</td>
<td>Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>9</td>
<td>The action to be taken depends on the function ‘e’ output with the message.</td>
</tr>
<tr>
<td>DFS</td>
<td>Run RC/V ECD audits. If the audits pass, try offline boot again.</td>
</tr>
<tr>
<td>UNRESERVE</td>
<td>If diagnostics are not running, then the RC/V ECD UCB record is corrupted; in this case, the UCB record needs to be unreserved manually or through the ECDOWN audit.</td>
</tr>
<tr>
<td>10</td>
<td>Try offline boot again.</td>
</tr>
<tr>
<td>11</td>
<td>Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.</td>
</tr>
<tr>
<td>12</td>
<td>Save the ROP output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>13</td>
<td>Try offline boot again, specifying the UCL option.</td>
</tr>
<tr>
<td>Note:</td>
<td>The UCL option inhibits application initiated aborts during offline boot. Refer to the</td>
</tr>
</tbody>
</table>
EXC:OFLBOOT input message for more information on UCL.

14 Try offline boot again, specifying the UCL option.
Note: The UCL option inhibits application initiated aborts during offline boot. Refer to the EXC:OFLBOOT input message for more information on UCL.

15 Try offline boot again, specifying the UCL option.
Note: The UCL option inhibits application initiated aborts during offline boot. Refer to the EXC:OFLBOOT input message for more information on UCL.

16 Wait for diagnostics to complete, fix any problems, and then try offline boot again. If diagnostics are not running, the RC/V ECD UCB record is corrupt. In this case, the UCB needs to be unreserved manually or through the ECDOWN audit.
17 Save the ROP output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
18 Run audits ECD 1 and ECD 3. If the audits pass, verify RC/V ECD UCB record for this MTTYC; the unit value should be 0 or 1. Try offline boot again.
19 Run audits ECD 1 and ECD 3. If the audits pass, verify RC/V ECD UCB record for this unit. The device type of the ROP controller must be MTTYC or TTYC. Try offline boot again.

20 No action is needed.
21 Either change the state of affected devices from OFL or specify INITLVL 3 or 4. Then try offline boot again.
22 Allow the existing offline boot process to complete or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

23 No action is necessary.
24 Restore the specified TTY, or select another TTY that is ACT, or do not specify the TTY option, or use initialization level 3 or 4.
25 Change the state of this device to the state needed by EXC:OFLBOOT; try offline boot again.
26 Force a DFC; try offline boot again. No action is needed.
27 No action is needed.
28 No action is needed.
29 Change the state of this device to the state needed by EXC:OFLBOOT; try offline boot again.
30 No action is needed.
31 No action is needed.
32 The action to be taken is dependent on the function ‘e’ output with the message:

OLBMSGHDLR  = No action is needed.
TIM_EXCCHK   = Check OLBLOG files on the offline side to determine if AIM has a problem. Do not start a side switch if it does. Also, recover OLBLOG files and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. If the message was part of a retrofit side switch, look for and verify correct operation on the new side since AIM was having problems and may not support call origination.
TIM_PRINT    = Check AIM’s operational status on the on-line side.

33 Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
34 Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
35 Allow the existing offline boot process to complete or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
36 Add another boot disk; try offline boot again.
37 Choose a valid TTY and try the offline boot again.
38 Change the state of this device to the state needed by EXC:OFLBOOT; try offline boot again.
39 No action is needed.
40 Try offline boot again.
41 Try offline boot again.
42 The use of the UCL option is not recommended; try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual to manually construct a valid password
file.
43 The use of the UCL option is not recommended; try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, refer to the TECHNICAL ASSISTANCE portion of the
INTRODUCTION section of the Output Messages manual, provide the encrypted password 'k:' to
obtain a legal password and try offline boot again.
44 The use of the UCL option is not recommended; try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual, provide the encrypted password 'k:' to
obtain a legal password and try offline boot again.
45 The use of the UCL option is not recommended; try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual, provide the encrypted password 'k:' to
obtain a legal password and try offline boot again.
46 Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
47 Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.
48 No action is needed.

5. ALARMS

There is no fixed priority of action. The software process that generates the message can determine the alarm level.

For a minor alarm, take action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

**NOTE:** Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

- \(a\) = SM number.
- \(b\) = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
- \(c\) = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
- \(d\) = Channel group (CHNG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
- \(e\) = The image type of the PH. If not a PH this field will read NULL IMAGE.
- \(f\) = The source IP address. If zero is displayed the default source address is used.
- \(g\) = The destination IP address.
- \(h\) = The bytes sent.
- \(i\) = The timeout value, in seconds.
- \(j\) = The PING sent count.
- \(k\) = The time it takes to receive the PING, in milliseconds.
- \(l\) = The status of the PING request. Valid value(s):
  - **FAIL** = PING attempt failed.
  - **PING BAD DATA** = A response was received, but the data returned did not match the data sent.
  - **PING NOT RUN** = No test run. This could mean that the PPP link is down.
  - **PING NOT SENT** = PING could not be sent to the router.
  - **PING SUCCESS** = Successful PING attempt.
  - **PING TIMEOUT** = PING attempt timed out due to no response from far end.
- \(m\) = OIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
- \(n\) = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
- \(o\) = Side number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
- \(p\) = Number of successful ping attempts.
- \(q\) = Number of failed ping attempts.
- \(r\) = Error report. Valid value(s):
NOT VALID – NON-SELECTED SIDE CHOSEN = The non-selected side of the OFI was chosen.
PING is only run on the selected side.
NOT VALID FOR OFI = The IP address or OFI that was specified is not valid.
OFI IS OOS = The OFI is out-of-service.
PPP LINK IS OOS = The point-to-point protocol (PPP) link is out-of-service.
UNIT DOES NOT EXIST = The OFI entered does not exist.

4. ACTIONS TO BE TAKEN
None.

5. ALARMS

2. REASON FOR OUTPUT

To report the information collected during a protocol monitoring (PM) session.

Format 1 provides an indication that a PM session has either successfully started, aborted, stopped, or failed to
start. In addition, all pertinent information relating to the PM session is displayed. This format is also used as a
prelude to the hexadecimal output or as notification that translation of the hexadecimal output into the American
standard code for information interchange (ASCII) has begun.

Format 2 contains the raw data collected during the monitoring session. Additional information regarding the frame
is also provided. The raw data is printed in a hexadecimal format. This message type is only used when
hexadecimal data is being dumped to the read-only printer (ROP).

Translated sessions will not use this output format. The maximum amount of recorded data that can be output in
one segment is 132 bytes. If the length of the recorded frame or packet or messages is larger than 132 bytes, then
the frame or packet or message will require more than one segment to output. Incomplete frames will be noted with
the CONT indicator.
Format 3 provides the status for the conclusion of a session (that is, successfully completed, stopped due to a manual request, or terminated abnormally).

3. VARIABLE FIELD DEFINITIONS

**CONT** = The recorded frame is continued in the next output segment.

**NO Xlate** = The hexadecimal output for this session will not be translated through the protocol monitoring translator.

**PER** = Trigger value that terminated the recording session was a protocol error record (PER) occurring on the channel being recorded. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

**PKTDN** = Directory number with packet-switched service.

**PORT** = Global port.

**TEI_CHANGED** = The TEI has changed since the protocol monitoring session began. Note that when the TEI change occurs, the trigger may not yet have been found. The TEI_CHANGED indicator will appear only for multipoint lines and only when user triggering.

Note: When triggering on a single user of a multipoint line, the TEI for that user is stored at the beginning of the monitoring session and its value is used to determine the triggering frame or message. If the TEI stored and used by the monitoring session changes before the session is triggered, then the TEI_CHANGED indicator will appear for each frame of that session. It is possible, when the offset value is set to be less than 10 and the trigger event occurs around the same time as the change in TEIs, that some EXC:PM DATA messages will display the new TEI number, but the TEI_CHANGED indicator will not appear.

**TRIG** = The recorded frame is associated with the triggering event.

**Xlate** = The protocol monitoring translator has been invoked for this session. The output will be translated into an ASCII file.

**a** = Status. Valid value(s):

**ABORTED - ATF CLOSE FAILURE** = The PM session was aborted because the ASCII translation file (ATF) could not be closed.

**ABORTED - ATF OPEN FAILURE** = The PM session was aborted because the ATF could not be opened.

**ABORTED - ATF WRITE FAILURE** = The PM session was aborted because the ATF could not be written to.

**ABORTED - COMMUNICATION FAILURE** = An unspecified communication error occurred between the administrative module (AM) and switching module (SM), between the SM and the protocol handler (PH), or between the AM and UNIX® operating system.

**ABORTED - DATABASE PROBLEM** = The request to start a PM session failed because an error occurred while reading the database.

**ABORTED - INVALID PMCFF FILE** = The PM session was aborted because the protocol monitoring common format file (PMCFF) contents were corrupted, or were missing.

**ABORTED - INVALID SESSION ID** = The PM session was aborted because the session identifier did not correspond to a valid session.

**ABORTED - PMCFF CLOSE FAILURE** = The PM session was aborted because the PMCFF could
not be closed.

**ABORTED - PMCFF OPEN FAILURE** = The PM session was aborted because the PMCFF could not be opened.

**ABORTED - PMCFF READ FAILURE** = The PM session was aborted because the PMCFF could not be read.

**ABORTED - PMCFF WRITE FAILURE** = The PM session was aborted because the PMCFF could not be written to.

**ABORTED - TEMPORARY FILE CLOSE FAILURE** = The PM session was aborted because the temporary file created for this session could not be closed.

**ABORTED - TEMPORARY FILE OPEN FAILURE** = The PM session was aborted because the temporary file created for this session could not be read.

**ABORTED - TEMPORARY FILE WRITE FAILURE** = The PM session was aborted because the temporary file created for this session could not be written to.

**ABORTED - TRANSLATION FAILURE** = The PM session was aborted because the protocol translator was not able to translate this session.

**ABORTED - INTERNAL FAILURE** = The request to start a PM session failed because an internal failure was encountered.

**ABORTED - RECORDER FAILURE** = The request to start a PM session failed because a recorder failure was encountered.

**ABORTED - UNABLE TO CREATE PROCESS** = The request to start a PM session failed because of the inability to create the internal processes necessary for controlling the session.

**COMPLETED** = The protocol monitoring session has completed.

**CONTINUING - TRANSLATION NOT AVAILABLE** = The protocol monitoring session is continuing, but translation of the output into ASCII is not available.

**NOT STARTED - CHANNEL MISMATCH** = The channel (CH) specified on the input line is not valid for the protocol (PROT) specified on the input line. The CH specified on the input line is not a valid channel.

**NOT STARTED - CHANNEL REQUIRED** = CH option must be specified on the input line, since the directory number or multi-line hunt group (MLHG) is assigned to more than one channel.

**NOT STARTED - CMP UNAVAILABLE** = The request to start a PM session failed because the communication module (CM) is isolated from the AM.

**NOT STARTED - INVALID PORT** = The port identifier entered could not be translated and was considered to be invalid.

**NOT STARTED - INVALID PROTOCOL** = The protocol specified on the input message is not valid.

**NOT STARTED - INVALID PROTOCOL ERROR CODE** = The protocol error code specified on the input message is not valid. (Refer to the 235-600-755 for details.)

**NOT STARTED - MAX JOBS RUNNING** = A new PM session could not be started because the maximum number of PM sessions are currently active. The maximum number of sessions is 8 per office.

**NOT STARTED - MESSAGE MISMATCH** = The trigger value (TRIGVAL) specified on the input line is not valid for the PROT specified on the input line.

**NOT STARTED - MLHG DN SPECIFIED** = The request to verify a PM session failed because a directory number (DN) for a MLHG or uniform call distribution (UCD) group was specified. Repeat request using MLHG port services identifier option.

**NOT STARTED - NON-PRIMARY DN SPECIFIED** = The request to verify a PM session failed because the primary DN is required. Repeat request specifying the primary DN.

**NOT STARTED - NON-UNIQUE NXX DN** = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.
NOT STARTED - PH UNAVAILABLE = The request to start a PM session failed because the PH is isolated from the SM.

NOT STARTED - PORT CONFLICT = A PM session could not be started because a session is currently active on the port specified on the input line.

NOT STARTED - PORT HAS NO PM CAPABILITY = A PM session could not be started because the port specified is either not an integrated services digital network (ISDN) line or does not support ISDN capabilities.

NOT STARTED - PROCESSOR CONFLICT = A PM session could not be started because the maximum number of sessions recording on a processor are currently active. The relationship between protocol and processor type is given in the list of protocols contained in this manual page. The maximum number of sessions recorded on a processor are:
- 8 per office.
- 2 per SM and 4 per SM 2000.
- 2 per PH and PH2.
- 3 per PH3 and PH4.
- 2 per PHV1, PHV2, and PHV3.
- 1 per PH4 connected to Frame Relay Bearer Channels (FRBCs).

NOT STARTED - PROTOCOL MISMATCH = The PROT specified on the input line does not match the line identifier specified on the input line.

NOT STARTED - PROTOCOL ERROR CODE MISMATCH = The protocol error code (PER) specified on the input line is not a valid protocol error code for the PROT specified on the input line. (Refer to the 235-600-755 for details.)

NOT STARTED - SM UNAVAILABLE = The request to start a PM session failed because the SM is isolated from the AM.

NOT STARTED - TRIGGER MISMATCH = The TRIGLVL specified on the input line is not valid for the PROT specified on the input line.

REPORTING - BEGINNING TRANSLATION = The collection of data in this protocol monitoring session has completed and translation of that data into ASCII (the ATF file) is beginning.

REPORTING - OUTPUT FOLLOWS = The collection of data in this protocol monitoring session has completed and the hexadecimal data that was collected will now be output.

STARTED = A PM session was successfully started.

STOPPED = The PM session was stopped due to a manual request.

STOPPED - DURATION TIMEOUT = The PM session was stopped when the duration timer expired.

b = SM number.

c = PH channel group number.

d = PH channel member number.

e = Logical port number.

f = The equipment number identifier.

Note: If the port is associated with an X.75 trunk or an X.75 trunk or an extended digital subscriber line (EDSL), then the digital equipment number (DEN) is used. If the port is associated with a digital networking unit - synchronous optical network (SONET) (DNU-S) then the DNU-S networking equipment number (NEN) is used or peripheral control and timing line and trunk equipment number (PLTEN). If the port is associated with an embedded operation channel (EOC) or timeslot management
channel (TMC), then the EOC or TMC equipment number is used. Otherwise, the line card equipment number (LCEN), line circuit equipment number (LCKEN), access interface unit number (AIUEN), packet switching unit equipment number (PSUEN), integrated digital carrier unit line equipment number (ILEN) or IDLC network equipment number (INEN) is used.

Valid value(s):

AIUEN=b-m^2-n^2-o^2
DEN=b-g-h-i
DNUSEOCl=b-h^2-n-o
DNUSTMC=b-h^2-n-o
IDCUEOC=b-m-n-o
IDCUTMC=b-m-n-o
ILEN=b-m-n-p
INEN=b-h^2-n-p
LCEN=b-j-k-l
LCKEN=b-e^2-m^1-f^2-g^2
NEN=b-h^2-i^2-v^2-j^2-k^2-w^2-l^2
PLTEN=b-x^2-y^2-z^2-a^3
PSUEN=b-r^2-t^2-u^2-d
VBRI=b-b^3
VTRK=b-c^3-d^3

| g | Digital line and trunk unit (DLTU) number. |
| h | Digital facility interface number.         |
| i | Digital channel number.                   |
| j | Integrated services line unit number.     |
| k | Line group controller number.             |
| l | Line card number.                         |
| m | Integrated digital carrier unit number.   |
| n | Remote terminal (RT) number.              |
| o | Primary/protection identifier.            |
| p | RT line number.                           |
| q | Channel being monitored. Valid value(s):   |
| B1 | Channel B1.                              |
| D  | D-channel.                               |
| r | Port services identifier. Note: This field will be blank if the port does not have a unique port services identifier. Valid value(s): |
DN=s
MLHG=t\-u
PKTDN=v
TKGMN=w\-x

s = The primary DN associated with the digital subscriber line (DSL) channel. This DN may be either
a circuit-switched or a packet-switched service DN.
t = Multi-line hunt group number.
u = Multi-line hunt group member number.
v = The DN associated with a packet-switched channel of a DSL.
w = Trunk group number.
x = Trunk group member number.
y = Service characteristic identifier of DSL channel. Valid value(s):
  ODP = On-demand packet.
  PPB = Permanent packet B.
  PPD = Permanent packet D.
z = The value of the session identifier (SES) for this monitoring session.
a\textsuperscript{1} = The date-stamp of the beginning of the monitoring session, in the form month/day.
b\textsuperscript{1} = The time-stamp of the beginning of the monitoring session, in the form hours:minutes:seconds.
c\textsuperscript{1} = The current date-stamp for the monitoring session, in the form month/day.
d\textsuperscript{1} = The current time-stamp for the monitoring session, in the form hours:minutes:seconds.
e\textsuperscript{1} = The offset (OFFSET) for the number of frames that was recorded after detection of the trigger
  event.
f\textsuperscript{1} = The duration (DUR) of the recording session in seconds.
g\textsuperscript{1} = Protocol (PROT) being monitored. Valid value(s):
  LAPB = The LAPB protocol (recorded on the PH).
  LAPD = The LAPD protocol (recorded on the PH).
  LAPF = The LAPF protocol (recorded on the PH).
  Q931 = The Q.931 protocol (recorded on the SM).
  TMC = The TMC protocol (recorded on the SM).
  V120 = The V.120 protocol (recorded on the SM).
  X25 = The X.25 protocol (B-channel packet recorded on the PH, D-channel packet
  recorded on the SM).
  X75 = The X.75 protocol (recorded on the PH).
  X75P = The X.75' protocol (recorded on the PH).
  RLP = The RLP protocol (recorded on the PHV).
  CESHL2 = The CESHL2 protocol (recorded on the PHV).
  CESHL3 = The CESHL3 protocol (recorded on the PHV).
  ISLP = The ISLP protocol (recorded on the PHV).
h\(^1\) = Protocol's trigger level (TRIGLVL). Note: Trigger protocol level must be terminated on the same processor as the recording protocol. Valid value(s):

- **ATS** = The trigger level is the ATS protocol.
- **IDLC** = The trigger level is the IDLC protocol.
- **LAPB** = The trigger level is the LAPB protocol.
- **LAPD** = The trigger level is the LAPD protocol.
- **LAPF** = The trigger level is the LAPF protocol.
- **Q931** = The trigger level is the Q.931 protocol.
- **TMC** = The trigger level is the TMC protocol.
- **V120** = The trigger level is the V.120 protocol.
- **X25** = The trigger level is the X.25 protocol.
- **X75** = The trigger level is the X.75 protocol.
- **X75P** = The trigger level is the X.75' protocol.
- **RLP** = The trigger level is the RLP protocol.
- **CESHL2** = The trigger level is the CESHL2 protocol.
- **CESHL3** = The trigger level is the CESHL3 protocol.
- **ISLP** = The trigger level is the ISLP protocol.

i\(^1\) = TRIGVAL that terminates the recording session. Refer to the EXC:PM input manual page for a complete list of trigger values.

j\(^1\) = Specific PER that terminated the recording session.

k\(^1\) = Direction (DIR) of frame or packet or message triggered on. Valid value(s):

- **EITHER** = Triggered on a frame or packet or message transmitted from the switch to the customer premises equipment (CPE) or received by the switch from the CPE.
- **RCV** = Triggered on a frame or packet or message received by the switch from the CPE.
- **XMT** = Triggered on a frame or packet or message transmitted from the switch to the CPE.

l\(^1\) = The protocol level recorded (RECLVL). Valid value(s):

- **LEVEL2** = Recorded all layer 2 frames.
- **LEVEL3** = Recorded only the layer 3 packets or messages.
- **LEVEL7** = Recorded only the layer 7 packets or messages.

m\(^1\) = The number of events recorded.

n\(^1\) = State of the protocol monitoring session. Valid value(s):

- **ABORTED** = The session has aborted.
- **DATA RETRIEVAL** = The recording of data has completed and is being processed for output.
- **DURATION TIMEOUT** = The duration timer has fired. Waiting for session output.
- **RECORD COMPLETED** = The session has completed normally.
- **RECORDING** = The session is recording data and the trigger has not yet fired.
- **STOP NO DUMP** = The session has been manually terminated with neither translation nor dump of the output data.
- **STOP WITH DUMP** = The session has been manually terminated with either translation or dump of the output data.
- **TRANSLATING** = The hexadecimal data collected during the session is being translated into an ASCII format.
TRIGGER FIRED = The trigger of the session has fired.
WAIT DUMP ACK = A manual request has been made to terminate the session with translation or dump. Awaiting response from the switch.
WAIT STOP ACK = A manual request has been made to terminate the session without translation or dump. Awaiting response from the switch.

o\(^1\) = The ATF file name. Contains the ASCII translation of the hexadecimal data output from the protocol monitoring session.
p\(^1\) = The PMCFF file name. The intermediate binary file created during the translation of the hexadecimal output of the session into ASCII output. This file is used internally and is not generally available for inspection.
q\(^1\) = The segment number (SEG) of the output data. The segments are in ascending order beginning at 1 for each session output. Note: The segment number is not necessarily the same as the frame number since frames may be continued over more than one segment.
r\(^1\) = The date-stamp of the recorded frame, in the form month/day.
s\(^1\) = The time-stamp of the recorded frame, in the form hours:minutes:seconds.
t\(^1\) = Terminal endpoint identifier (TEI).
u\(^1\) = Total bytes.
v\(^1\) = The frame number relative to the first frame in the recording window.
w\(^1\) = The length of the recorded frame in bytes.
x\(^1\) = DIR of recorded frame. Valid value(s):
    - RCV = Frame or packet or message received by the switch from the CPE.
    - XMT = Frame or packet or message transmitted from the switch to the CPE.
y\(^1\) = The protocol error code (PEC) associated with the recorded frame. Refer to the 235-600-755 for details. In the event that two PER’s are reported against the same frame, the PEC of the second PER will overwrite the first. This situation could cause the output message to indicate a triggering event that shows a different PEC than the value that actually triggered the session.
z\(^1\) = The four-byte hexadecimal representation from the recorded frame or packet or message.
a\(^2\) = The date-stamp of the end of the monitoring session, in the form month/day.
b\(^2\) = The time-stamp of the end of the monitoring session, in the form hours:minutes:seconds.
c\(^2\) = The PEC which acted as the trigger. This is displayed only on the \texttt{EXC PM COMPLETED} message and only if PER triggering was chosen for the protocol monitoring session and only if the number of data segments was zero. Refer to the 235-600-755 for details.
d\(^2\) = Internal error code to assist in locating reason for abort.
e\(^2\) = Integrated service line unit 2 (ISLU2) number.
f\(^2\) = Line board number.
g² = Line circuit number.

h² = DNU-S number.

i² = Data group (DG) number.

j² = Synchronous transport signal (STS) facility number.

k² = Virtual tributary group (VTG) number.

l² = DS0 number.

m² = Access interface unit (AIU) number.

n² = AIU pack number.

o² = AIU circuit number.

p² = Type of messages recorded when monitoring LAP D protocol on a Frame Relay Bearer Channel. User can request specifically to monitor either control messages or user data. However, if user data recording is requested, only a summary of the user data frame will be recorded, due to the sheer volume of the user data. The summary of the user data frame will contain the address information and the length of the actual user data frame transmitted or received.

Valid values are as follows:
CTRL = recorded only control messages. CTRL is the default value.
DATA = recorded only a summary of the transmitted or received user data frame.
ALL = recorded both control messages and a summary of the transmitted or received user data frame.

q² = Type of messages or frames recorded when protocol monitoring is on a Speech Handler or an Autoplex Data Trunk. This option can be used with CESHL2 or CESHL3 or RLP protocol.

Valid values are as follows:
CTRL = recorded control frames (S and I) for CESHL2 protocol. Default value for CESHL2 protocol at level 2 recording.
TRAF = recorded UI traffic messages for CESHL3 protocol.
IP = recorded Inter-Processor messages for CESHL3 protocol. Default value for CESHL3 protocol at level 3 recording.
RLP = recorded non-idle RLP frames for RLP protocol. Default value for RLP protocol at level 7 recording.
ALL = recorded all messages for CESHL2 or CESHL3 or RLP protocol. This will result in recording S, I, XID, and, UI frames for CESHL2 protocol, or UI plus IP frames for CESHL3 protocol, or RLP plus idle frames for RLP protocol.

r² = Packet Switching Unit (PSU) number.

t² = PSU shelf number

u² = PSU channel group number.

v² = SONET termination equipment (STE) facility number.

w² = Virtual tributary member (VTM) number
= Peripheral Control and Timing (PCT) Line and Trunk Unit number (PLTU).

y² = PCT Facility Interface (PCTFI) number.

z² = Tributary number (T1FAC).

a³ = Channel number (CHAN).

b³ = Virtual BRI line number.

c³ = Virtual trunk facility number.

d³ = Virtual trunk channel number.

4. ACTIONS TO BE TAKEN

Inspect the EXC:PM output messages for the results of the monitoring session and analyze for protocol violations or other errors. If translation of the hexadecimal output into ASCII has been requested, examine the ATF. If variable ‘d²’ is output, save the ROP printout and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

2. REASON FOR OUTPUT

To report the information collected during a protocol monitoring (PM) session.

Format 1 provides an indication that a ISDN or CCS PM session has either successfully started, aborted, stopped, or failed to start.
Format 2 provides an indication that a PCF PM session has either successfully started, aborted, stopped, or failed to start.

For Format 1 and Format 2, in addition, all pertinent information relating to the PM session is displayed. The formats are also used as the prelude to the hexadecimal output or as notification that translation of the hexadecimal output into the American standard code for information interchange (ASCII) has begun.

Format 3 contains the raw data collected during the ISDN or CCS monitoring session.

Format 4 contains the raw data collected during the PCF monitoring session.

For Format 3 and Format 4, additional information regarding the frame is also provided. The raw data is printed in a hexadecimal format. This message type is only used when hexadecimal data is being dumped to the read-only printer (ROP). Translated sessions will not use this output format.

NOTE: The maximum amount of recorded data that can be output in one segment is 132 bytes. If the length of the recorded frame or packet or messages is larger than 132 bytes, then the frame or packet or message will require more than one segment to output. Incomplete frames will be noted with the CONT indicator.

Format 5 provides the status for the conclusion of a session (that is, successfully completed, stopped due to a manual request, or terminated abnormally).

3. VARIABLE FIELD DEFINITIONS

CONT = The recorded frame is continued in the next output segment.

NO XLATE = The hexadecimal output for this session will not be translated through the protocol monitoring translator.

PER = Trigger value that terminated the recording session was a protocol error record (PER) occurring on the channel being recorded. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

PKTDN = Directory number with packet-switched service.

PORT = Global port.

TEI_CHANGED = The TEI has changed since the protocol monitoring session began. Note that when the TEI change occurs, the trigger may not yet have been found. The TEI_CHANGED indicator will appear only for multipoint lines and only when user triggering.

NOTE: When triggering on a single user of a multipoint line, the TEI for that user is stored at the beginning of the monitoring session and its value is used to determine the triggering frame or message. If the TEI stored and used by the monitoring session changes before the session is triggered, then the TEI_CHANGED indicator will appear for each frame of that session. It is possible, when the offset value is set to be less than 10 and the trigger event occurs around the same time as the change in TEIs, that some EXC:PM DATA messages will display the new TEI number, but the TEI_CHANGED indicator will not appear.

TRIG = The recorded frame is associated with the triggering event.

XLATE = The protocol monitoring translator has been invoked for this session. The output will be translated into an ASCII file.

a = Status. Valid value(s): ABORTED – ATF CLOSE FAILURE = The PM session was aborted because the ASCII translation
file (ATF) could not be closed.

ABORTED - ATF OPEN FAILURE = The PM session was aborted because the ATF could not be opened.

ABORTED - ATF WRITE FAILURE = The PM session was aborted because the ATF could not be written to.

ABORTED - COMMUNICATION FAILURE = An unspecified communication error occurred between the administrative module (AM) and switching module (SM), between the SM and the protocol handler (PH), or between the AM and UNIX® operating system.

ABORTED - DATABASE PROBLEM = The request to start a PM session failed because an error occurred while reading the database.

ABORTED - INVALID PMCFF FILE = The PM session was aborted because the protocol monitoring common format file (PMCFF) contents were corrupted, or were missing.

ABORTED - INVALID SESSION ID = The PM session was aborted because the session identifier did not correspond to a valid session.

ABORTED - PMCFF CLOSE FAILURE = The PM session was aborted because the PMCFF could not be closed.

ABORTED - PMCFF OPEN FAILURE = The PM session was aborted because the PMCFF could not be opened.

ABORTED - PMCFF READ FAILURE = The PM session was aborted because the PMCFF could not be read.

ABORTED - PMCFF WRITE FAILURE = The PM session was aborted because the PMCFF could not be written to.

ABORTED - TEMPORARY FILE CLOSE FAILURE = The PM session was aborted because the temporary file created for this session could not be closed.

ABORTED - TEMPORARY FILE OPEN FAILURE = The PM session was aborted because the temporary file created for this session could not be opened.

ABORTED - TEMPORARY FILE READ FAILURE = The PM session was aborted because the temporary file created for this session could not be read.

ABORTED - TEMPORARY FILE WRITE FAILURE = The PM session was aborted because the temporary file created for this session could not be written to.

ABORTED - TRANSLATION FAILURE = The PM session was aborted because the protocol translator was not able to translate this session.

ABORTED - INTERNAL FAILURE = The request to start a PM session failed because an internal failure was encountered.

ABORTED - RECORDER FAILURE = The request to start a PM session failed because a recorder failure was encountered.

ABORTED - UNABLE TO CREATE PROCESS = The request to start a PM session failed because of the inability to create the internal processes necessary for controlling the session.

COMPLETED = The protocol monitoring session has completed.

CONTINUING - TRANSLATION NOT AVAILABLE = The protocol monitoring session is continuing, but translation of the output into ASCII is not available.

NOT STARTED - CHANNEL MISMATCH = The channel (CH) specified on the input line is not valid for the protocol (PROT) specified on the input line. The CH specified on the input line is not a valid channel.

NOT STARTED - CHANNEL REQUIRED = CH option must be specified on the input line, since the directory number or multi-line hunt group (MLHG) is assigned to more than one channel.

NOT STARTED - CMP UNAVAILABLE = The request to start a PM session failed because the communication module (CM) is isolated from the AM.

NOT STARTED - INVALID PCF IP ADDRESS = The PCF IP address entered was verified to be invalid.
NOT STARTED - INVALID PDSN IP ADDRESS = The PDSN IP address entered was verified to be invalid.

NOT STARTED - PCF AND PDSN IP ADDRESS MISMATCH = The PCF IP address and the PDSN IP address are not connected.

NOT STARTED - PM FOR ENTIRE PCF IS RUNNING = Since PM is running on the entire PCF, no more PCF PM session can be started.

NOT STARTED - INVALID PCF EQUIPMENT IDENTIFIER INPUT = The request to start a PM session failed because the PCF equipment entered identifier is not IP address.

MAXIMUM JOBS RUNNING ON PCF AND PDSN IP = The request to start a PM session failed because the number of PCF PM sessions on the specified PCF and PDSN IP address reaches its maximum limit.

NOT STARTED - MAXIMUM JOBS RUNNING ON PCF = The request to start a PM session failed because the number of PCF PM sessions on the entire PCF reaches its maximum limit.

NOT STARTED - INVALID PORT = The port identifier entered could not be translated and was considered to be invalid.

NOT STARTED - INVALID PROTOCOL = The protocol specified on the input message is not valid.

NOT STARTED - INVALID PROTOCOL ERROR CODE = The protocol error code specified on the input message is not valid. (Refer to the 235-600-755 for details.)

NOT STARTED - MAX JOBS RUNNING = A new PM session could not be started because the maximum number of PM sessions are currently active. The maximum number of sessions is 8 per office.

NOT STARTED - MESSAGE MISMATCH = The trigger value (TRIGVAL) specified on the input line is not valid for the PROT specified on the input line.

NOT STARTED - MLHG DN SPECIFIED = The request to verify a PM session failed because a directory number (DN) for a MLHG or uniform call distribution (UCD) group was specified. Repeat request using MLHG port services identifier option.

NOT STARTED - NON-PRIMARY DN SPECIFIED = The request to verify a PM session failed because the primary DN is required. Repeat request specifying the primary DN.

NOT STARTED - NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

NOT STARTED - NOT PM TESTABLE = The request to verify a PM session failed because the port cannot be tested.

NOT STARTED - PH UNAVAILABLE = The request to start a PM session failed because the PH is isolated from the SM.

NOT STARTED - PORT CONFLICT = A PM session could not be started because a session is currently active on the port specified on the input line.

NOT STARTED - PORT HAS NO PM CAPABILITY = A PM session could not be started because the port specified is either not an integrated services digital network (ISDN) line or does not support ISDN capabilities.

NOT STARTED - PROCESSOR CONFLICT = A PM session could not be started because the maximum number of sessions recording on a processor are currently active. The relationship between protocol and processor type is given in the list of protocols contained in this manual page. The maximum number of sessions recorded on a processor are:

- 8 per office.
- 2 per SM and 4 per SM 2000.
- 2 per PH and PH2.
- 3 per PH3 and PH4.
- 2 per PHV1, PHV2, and PHV3.
- 1 per PH4 connected to frame relay bearer channels (FRBCs).

**NOT STARTED** - PROTOCOL MISMATCH = The PROT specified on the input line does not match the line identifier specified on the input line.

**NOT STARTED** - PROTOCOL ERROR CODE MISMATCH = The protocol error code (PER) specified on the input line is not a valid protocol error code for the PROT specified on the input line. (Refer to the 235-600-755 for details.)

**NOT STARTED** - SM UNAVAILABLE = The request to start a PM session failed because the SM is isolated from the AM.

**NOT STARTED** - TRIGGER MISMATCH = The TRIGLVL specified on the input line is not valid for the PROT specified on the input line.

**REPORTING** - BEGINNING TRANSLATION = The collection of data in this protocol monitoring session has completed and translation of that data into ASCII (the ATF file) is beginning.

**REPORTING** - OUTPUT FOLLOWS = The collection of data in this protocol monitoring session has completed and the hexadecimal data that was collected will now be output.

**STARTED** = A PM session was successfully started.

**STOPPED** = The PM session was stopped due to a manual request.

**STOPPED** - DURATION TIMEOUT = The PM session was stopped when the duration timer expired.

b = SM number.
c = PH channel group number.
d = PH channel member number.
e = Logical port number.
f = The equipment number identifier.

**NOTE:** If the port is associated with an X.75 trunk or an X.75 trunk or an extended digital subscriber line (EDSL), then the digital equipment number (DEN) is used. If the port is associated with a digital networking unit - synchronous optical network (SONET) (DNU-S) then the DNU-S networking equipment number (NEN) is used or peripheral control and timing line and trunk equipment number (PLTEN). If the port is associated with an embedded operation channel (EOC) or timeslot management channel (TMC), then the EOC or TMC equipment number is used. Otherwise, the line card equipment number (LCN), line circuit equipment number (LCKEN), access interface unit number (AIUEN), packet switching unit equipment number (PSUEN), integrated digital carrier unit line equipment number (ILEN) or IDLC network equipment number (INEN) is used.

Valid value(s):

- AIUEN=b-m^2-n^2-o^2
- DEN=b-g-h-i
- DNUSEOC=b-h^2-n-o
- DNUSTMC=b-h^2-n-o
- IDCUEOC=b-m-n-o
- IDCUTMC=b-m-n-o
- ILEN=b-m-n-p

Copyright ©2003 Lucent Technologies
INEN=b-h-n-p
LCEN=b-j-k-l
LCKEN=b-e-m-f-g
NEN=b-h-l-v-j-k-w-l
OIUEN=b-j-k-l
PLTEN=b-x-y-z-a
PSUEN=b-r-t-u-d
VBRI=b-b
VTRK=b-c-d

\( g \) = Digital line and trunk unit (DLTU) number.
\( h \) = Digital facility interface number.
\( i \) = Digital channel number.
\( j \) = Integrated services line unit number.
\( k \) = Line group controller number.
\( l \) = Line card number.
\( m \) = Integrated digital carrier unit number.
\( n \) = Remote terminal (RT) number.
\( o \) = Primary/protection identifier.
\( p \) = RT line number.
\( q \) = Channel being monitored. Valid value(s):
    B1 = Channel B1.
    D  = D-channel.
\( r \) = Port services identifier.

**NOTE:** This field will be blank if the port does not have a unique port services identifier.

Valid value(s):

\( s \) = The primary DN associated with the digital subscriber line (DSL) channel. This DN may be either a circuit-switched or a packet-switched service DN.
\( t \) = Multi-line hunt group number.
\( u \) = Multi-line hunt group member number.
\( v \) = The DN associated with a packet-switched channel of a DSL.
w = Trunk group number.
x = Trunk group member number.
y = Service characteristic identifier of DSL channel. Valid value(s):
  ODP = On-demand packet.
  PPB = Permanent packet B.
  PPD = Permanent packet D.

z = The value of the session (SES) identifier for this monitoring session.
a = The date-stamp of the beginning of the monitoring session, in the form month/day.
b = The time-stamp of the beginning of the monitoring session, in the form hours:minutes:seconds.
c = The current date-stamp for the monitoring session, in the form month/day.
d = The current time-stamp for the monitoring session, in the form hours:minutes:seconds.
e = The offset (OFFSET) for the number of frames that was recorded after detection of the trigger event.
f = The duration (DUR) of the recording session in seconds.
g = Protocol (PROT) being monitored. Valid value(s):
  LAPB = The LAPB protocol (recorded on the PH).
  LAPD = The LAPD protocol (recorded on the PH).
  LAPF = The LAPF protocol (recorded on the PH).
  Q931 = The Q.931 protocol (recorded on the SM).
  TMC = The TMC protocol (recorded on the SM).
  V120 = The V.120 protocol (recorded on the SM).
  X25 = The X.25 protocol (B-channel packet recorded on the PH, D-channel packet recorded on the SM).
  X75 = The X.75 protocol (recorded on the PH).
  X75P = The X.75’ protocol (recorded on the PH).
  RLP = The RLP protocol (recorded on the PHV).
  CESHL2 = The CESHL2 protocol (recorded on the PHV).
  CESHL3 = The CESHL3 protocol (recorded on the PHV).
  ISLP = The ISLP protocol (recorded on the PHV).

h = Protocol’s trigger level (TRIGLVL).

**NOTE:** Trigger protocol level must be terminated on the same processor as the recording protocol.

Valid value(s):
  ATS = The trigger level is the ATS protocol.
  IDLC = The trigger level is the IDLC protocol.
  LAPB = The trigger level is the LAPB protocol.
  LAPD = The trigger level is the LAPD protocol.
  LAPF = The trigger level is the LAPF protocol.
  Q931 = The trigger level is the Q.931 protocol.
  TMC = The trigger level is the TMC protocol.
The trigger level is the V.120 protocol.
The trigger level is the X.25 protocol.
The trigger level is the X.75 protocol.
The trigger level is the X.75' protocol.
The trigger level is the RLP protocol.
The trigger level is the CESHL2 protocol.
The trigger level is the CESHL3 protocol.
The trigger level is the ISLP protocol.

TRIGVAL that terminates the recording session. Refer to the EXC:PM input manual page for a complete list of trigger values.

Specific PER that terminated the recording session.

Direction (DIR) of frame or packet or message triggered on. Valid value(s):
- **EITHER** = Triggered on a frame or packet or message transmitted from the switch to the customer premises equipment (CPE) or the packet data switch network (PDSN) or received by the switch from the CPE or PDSN.
- **RCV** = Triggered on a frame or packet or message received by the switch from the CPE or PDSN.
- **XMT** = Triggered on a frame or packet or message transmitted from the switch to the CPE or PDSN.

The protocol level recorded (RECLVL). Valid value(s):
- **LEVEL2** = Recorded all layer 2 frames.
- **LEVEL3** = Recorded only the layer 3 packets or messages.

The number of events recorded.

State of the protocol monitoring session. Valid value(s):
- **ABORTED** = The session has aborted.
- **DATA RETRIEVAL** = The recording of data has completed and is being processed for output.
- **DURATION TIMEOUT** = The duration timer has fired. Waiting for session output.
- **RECORD COMPLETED** = The session has completed normally.
- **RECORDING** = The session is recording data and the trigger has not yet fired.
- **STOP NO DUMP** = The session has been manually terminated with neither translation nor dump of the output data.
- **STOP WITH DUMP** = The session has been manually terminated with either translation or dump of the output data.
- **TRANSLATING** = The hexadecimal data collected during the session is being translated into an ASCII format.
- **TRIGGER FIRED** = The trigger of the session has fired.
- **WAIT DUMP ACK** = A manual request has been made to terminate the session with translation or dump. Awaiting response from the switch.
- **WAIT STOP ACK** = A manual request has been made to terminate the session without translation or dump. Awaiting response from the switch.

The ATF file name. Contains the ASCII translation of the hexadecimal data output from the protocol monitoring session.
p\(^1\) = The PMCFF file name. The intermediate binary file created during the translation of the hexadecimal output of the session into ASCII output. This file is used internally and is not generally available for inspection.

q\(^1\) = The segment (SEG) number of the output data. The segments are in ascending order beginning at 1 for each session output.

**NOTE:** The segment number is not necessarily the same as the frame number since frames may be continued over more than one segment.

r\(^1\) = The date-stamp of the recorded frame, in the form month/day.

s\(^1\) = The time-stamp of the recorded frame, in the form hours:minutes:seconds.

t\(^1\) = Terminal endpoint identifier (TEI).

u\(^1\) = Total bytes.

v\(^1\) = The frame number relative to the first frame in the recording window.

w\(^1\) = The length of the recorded frame in bytes.

x\(^1\) = DIR of recorded frame. Valid value(s):

- RCV = Frame or packet or message received by the switch from the CPE or PDSN.
- XMT = Frame or packet or message transmitted from the switch to the CPE or PDSN.

y\(^1\) = The protocol error code (PEC) associated with the recorded frame. Refer to the 235-600-755 for details. In the event that two PER's are reported against the same frame, the PEC of the second PER will overwrite the first. This situation could cause the output message to indicate a triggering event that shows a different PEC than the value that actually triggered the session.

z\(^1\) = The four-byte hexadecimal representation from the recorded frame or packet or message.

a\(^2\) = The date-stamp of the end of the monitoring session, in the form month/day.

b\(^2\) = The time-stamp of the end of the monitoring session, in the form hours:minutes:seconds.

c\(^2\) = The PEC which acted as the trigger. This is displayed only on the **EXC PM COMPLETED** message and only if PER triggering was chosen for the protocol monitoring session and only if the number of data segments was zero. Refer to the 235-600-755 for details.

d\(^2\) = Internal error code to assist in locating reason for abort.

e\(^2\) = Integrated service line unit 2 (ISLU2) number.

f\(^2\) = Line board number.

g\(^2\) = Line circuit number.

h\(^2\) = DNU-S number.

i\(^2\) = Data group (DG) number.

j\(^2\) = Synchronous transport signal (STS) facility number.
Virtual tributary group (VTG) number.

DS0 number.

Access interface unit (AIU) number.

AIU pack number.

AIU circuit number.

Type of messages recorded when monitoring LAP D protocol on a frame relay bearer channel. User can request specifically to monitor either control messages or user data. However, if user data recording is requested, only a summary of the user data frame will be recorded, due to the sheer volume of the user data. The summary of the user data frame will contain the address information and the length of the actual user data frame transmitted or received. Valid value(s):

CTRL = Recorded only control messages. CTRL is the default value.
DATA = Recorded only a summary of the transmitted or received user data frame.
ALL = Recorded both control messages and a summary of the transmitted or received user data frame.

Type of messages or frames recorded when protocol monitoring is on a speech handler or an AUTOLEX® data trunk. This option can be used with CESHL2 or CESHL3 or RLP protocol. Valid value(s):

CTRL = Recorded control frames (S and I) for CESHL2 protocol. Default value for CESHL2 protocol at level 2 recording.
TRAF = Recorded UI traffic messages for CESHL3 protocol.
IP = Recorded inter-processor messages for CESHL3 protocol. Default value for CESHL3 protocol at level 3 recording.
RLP = Recorded non-idle RLP frames for RLP protocol. Default value for RLP protocol at level 7 recording.
ALL = Recorded all messages for CESHL2 or CESHL3 or RLP protocol. This will result in recording S, I, XID, and UI frames for CESHL2 protocol, or UI plus IP frames for CESHL3 protocol, or RLP plus idle frames for RLP protocol.

Packet switching unit (PSU) number.

PSU shelf number.

PSU channel group number.

SONET termination equipment (STE) facility number.

Virtual tributary member (VTM) number.

Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

PCT facility interface (PCTFI) number.

Tributary number (T1FAC).

Channel (CHAN) number.

Virtual BRI line number.
c³  = Virtual trunk facility number.
d³  = Virtual trunk channel number.
e³  = IP address field. Valid value is number between 0-255.
f³  = The GRE frame length.
g³  = The protocol being monitoring in PCF PM session. Valid value(s):
   A10  = The A10 protocol specified in IS-634.
   A11  = The A11 protocol specified in IS-634.
h³  = Protocol's trigger level (TRIGLVL) for PCF PM session.

   **NOTE:** Trigger protocol level must be terminated on the same processor as the recording protocol.

   Valid value(s):
   A10  = The trigger level is the A10 protocol.
   A11  = The trigger level is the A11 protocol.

i³  = The protocol level recorded (RECLVL) for PCF PM session. Valid value(s):
   LEVEL7 = Recorded only the layer 7 packets or messages.

j³  = Optical interface unit (OIU) number.
k³  = Protection group (PG) number.
l³  = OC3 STE number.

4. **ACTIONS TO BE TAKEN**
