   DISALLOWED CARD ISSUER [g 1]
   ACCT-OWNER=[h 1]   BILL-SVC-PROVIDER=[i 1]

2. **REASON FOR OUTPUT**

To report the results of the manual request from the TST:OLNS input message that a originating line number screening (OLNS) query test be performed using the line information database (LIDB). It is used as a high-level check on connections to a LIDB destination (a database external to the switch), to check out data in the database, or to check out a repeatedly failing query.

3. **VARIABLE FIELD DEFINITIONS**

   a = Ten-digit calling number that was queried.
   b = Duration of the test in milliseconds. Timing starts when the switch receives the input request and ends when the switch receives the result from the network or a timeout occurs.
   c = Results of a failed test. This field prints out only when the test query was not successful. Valid value(s):
      GARbled MESSAGE = A response was received but the data in the message was mutilated.
      IMS OR CNI RETURNED MSG = The inter-process message switch (IMS) or the common network interface (CNI) returned the message.
      NETWORK CONGESTION = Could not complete the test due to network congestion.
      NETWORK FAILURE = Could not complete the test due to failure in the network.
      NO TRANSLATION ADDRESS NATURE = No entries exist in the database for addresses of this nature.
      NO TRANSLATION SPECIFIC ADDRESS = No entries exist in the database for this specific address.
      SUBSYSTEM CONGESTION = Could not complete the test due to subsystem congestion.
      SUBSYSTEM FAILURE = Could not complete the test due to subsystem failure.
      TIMEOUT = A response to the test query was not received within the eight-second time limit.
      UNEQUIPPed USER = Could not complete the test due to unequipped user.
**d**

= LIDB OLNS response. Valid value(s):

MISRUTE = Misroute.
MISSING CUST REC = Missing customer record.
MISSING GROUP = Missing group.
NONPARTICIPATE GRP = Nonparticipating group.
RECEIVE REJECT = Received reject message for LIDB BNS query.
RECORD FOUND = LIDB BNS record found.
UNAV NET RESOURCE = Unavailable network resource.
UNXP DATA VALUE = Unexpected data value.
VACANT GROUP = Vacant group.

**f**

= Originating Collect billing indicator. Valid value(s):

ALW COL = Allowed from this line.
ALWC DOM = Allowed from this line for domestic calls only.
NOCOL = Not allowed from this line.

**g**

= Originating Third Number billing indicator. Valid value(s):

ALW 3RD = Allowed from this line.
ALW3 DOM = Allowed from this line for domestic calls only.
NO 3RD = Not allowed from this line.
OFPVFY 3RD = Allowed from this line with operator verification.
VFY 3RD = Allowed from this line with operator or automated verification.

**h**

= Originating Local, Non-Toll indicator. Valid value(s):

ALW LOC = Allowed from this line.
NO LOC = Not allowed from this line.

**i**

= Originating Credit Card indicator. Valid value(s):

ALW CRD = Allowed from this line.
ALWCRD DOM = Allowed from this line for domestic calls only.
NO CRD = Not allowed from this line.
CRDRES LOC = Card Issuer restrictions associated with this line for local calls only.
CRDRES INTRA = Card Issuer restrictions associated with this line for intraLATA, non-local calls only.
CRDRES = Card Issuer restrictions associated with this line.
NO INTL RES LOC = Non-domestic calls not allowed from this line and Card Issuer restrictions associated with this line for local calls only.
NO INTL RES INTRA = Non-domestic calls not allowed from this line and Card Issuer restrictions associated with this line for intraLATA, non-local calls only.
NO INTL RES = Non-domestic calls not allowed from this line and Card Issuer restrictions associated with this line.

**j**

= Originating Free Directory Assistance (DA) indicator. Valid value(s):

ALW FREEDA = Allowed from this line.
NO FREEDA = Not allowed from this line.
k = Originating Special Billing Number Services (BNS) indicator. Valid value(s):
ALW SPECBNS = Allowed from this line.
NO SPECBNS = Not allowed from this line.

l = Originating Special Sent Paid (SP) indicator. Valid value(s):
ALW SP = Allowed from this line.
ALW DOM SP = Allowed from this line for domestic calls only.
INTRA SP NONPAY = Allowed from this line for intraLATA calls only, due to nonpayment.
INTRA SP CUSTREQ = Allowed from this line for intraLATA calls only, due to customer request.
NO SP = Not allowed from this line.

m = Originating DA Call Completion (DACC) indicator. Valid value(s):
ALW DACC = Allowed from this line (for toll and non-toll calls).
NO DACC = Not allowed from this line (for toll and non-toll calls).
ALWDACC RES = Allowed from this line with billing restrictions (for toll and non-toll calls).
ALWDACC LOC = Allowed from this line for local, non-toll calls.
ALWDACC ALT = Allowed from this line with alternate billing restrictions/no sent-paid allowed.

n = Additional Originating Third billing indicator. Valid value(s):
ALW A3RD = Allowed from this line.
NO A3RD = Not allowed from this line.
OPVFY A3RD = Allowed with operator verification.
VFY A3RD = Allowed with operator or automated verification.

o = Additional Originating Credit Card indicator. Valid value(s):
ALW ACRD = Allowed from this line.
NO ACRD = Not allowed from this line.
ACRDRES = Card Issuer restrictions associated with this line.

p = Additional Originating Special BNS indicator. Valid value(s):
ALW ASP = Allowed from this line.
NO ASP = Not allowed from this line.

q = Additional Originating SP indicator. Valid value(s):
ALW ASP = Allowed from this line.
NO ASP = Not allowed from this line.

r = Treatment indicator. Valid value(s):
AUTO-T = Automated treatment - provide alerting tone only.
AUTO-TP = Automated treatment - provide alerting tone and prompting announcement.
OP-STN = Operator treatment - operator handling because of station limitations.
ST-CUST = Special treatment - operator handling at customer request.
ST-HC1 = Special treatment - handicapped 1.
ST-HC2 = Special treatment - handicapped 2.
AUTO_TP2 = Automated treatment - provide alerting tone and prompting announcement 2.
AUTO_TP3 = Automated treatment - provide alerting tone and prompting announcement 3.
OP_FRAUD = Operator treatment - high fraud.
AUTO_T_NOOP = Automated treatment - provide alerting tone only - no operator access.
AUTO_TP4_NOOP = Automated treatment - provide alerting tone and prompting announcement 4 - no operator access.
AUTO_TP5_NOOP = Automated treatment - provide alerting tone and prompting announcement 5 - no operator access.
AUTO_TP6_NOOP = Automated treatment - provide alerting tone and prompting announcement 6 - no operator access.
AUTO_TP7 = Automated treatment - provide alerting tone and prompting announcement 7.
AUTO_TP8 = Automated treatment - provide alerting tone and prompting announcement 8.
AUTO_TP9 = Automated treatment - provide alerting tone and prompting announcement 9.
AUTO_TP10_NOOP = Automated treatment - provide alerting tone and prompting announcement 10 - no operator access.
AUTO_TP11_NOOP = Automated treatment - provide alerting tone and prompting announcement 11 - no operator access.
AUTO_TP12_NOOP = Automated treatment - provide alerting tone and prompting announcement 12 - no operator access.
AUTO_SH1 = Automated treatment - special handling 1.
AUTO_SH2 = Automated treatment - special handling 2.
AUTO_SH3 = Automated treatment - special handling 3.
AUTO_SH4 = Automated treatment - special handling 4.
AUTO_SH5 = Automated treatment - special handling 5.
AUTO_TP13 = Automated treatment - provide alerting tone and prompting announcement 13.
AUTO_TP14_NOOP = Automated treatment - provide alerting tone and prompting announcement 14 - no operator access.

s = Service or equipment indicator. Valid value(s):
SRV1 = (1) POTS Line.
SRV2 = (2) LEC Public - Standard Interface - Postpay Overtime.
SRV3 = (3) POTS Line - Residential - Message Rate 1.
SRV4 = (4) POTS Line - Residential - Message Rate 2.
SRV5 = (5) LEC Semi-Public.
SRV6 = (6) POTS Line - Business - Flat Rate.
SRV7 = (7) POTS Line - Business - Message Rate 1.
SRV8 = (8) Coinless (non-IPP).
SRV9 = (9) Coinless (IPP).
SRV10 = (10) LEC Prepaid Telecommunications Card Station.
SRV12 = (12) LEC Public - Standard Interface - Prepay Overtime.
SRV13 = (13) LEC Public - Alternate Interface.
SRV14 = (14) IC Public - Standard Interface.
SRV15 = (15) IC Public - Alternate Interface.
SRV16 = (16) POTS Line - Residential - Flat Rate.
SRV17 = (17) Voice Quote - without tax.
SRV18 = (18) Voice Quote - with tax.
SRV19 = (19) IPP - Standard Interface.
SRV20 = (20) IPP - Alternate Interface.
SRV21 = (21) Hospital
SRV22 = (22) Prison (non-IPP).
SRV23 = (23) Auto Quote - without tax.
SRV24 = (24) Auto Quote - with tax.
SRV26 = (26) Centrex Line.
SRV27 = (27) PBX Line.
SRV28 = (28) Prison (IPP).
SRV29 = (29) WATS Line.
SRV30 = (30) Cellular.
SRV31 = (31) Pager.
SRV32 = (32) Personal Communication Service (PCS).
SRV33 = (33) Feature Group A (FGA).
SRV34 = (34) Mobile.
SRV35 = (35) LEC Public - Special Billing - Postpay Overtime.
SRV36 = (36) LEC Public - Special Billing - Prepay Overtime.
SRV37 = (37) Public - Incompatible Network Interface.
SRV38 = (38) Cellular - Rate 1.
SRV39 = (39) Cellular - Rate 2.
SRV40 = (40) POTS Line - Business - Single Line
SRV41 = (41) POTS Line - Business - Multi-Line
SRV42 = (42) Public - Postpay

t = First interLATA carrier (IC) indicator.

u = Second IC indicator.

v = Originating point code of the LIDB.

w = Call gap present indicator. Valid value(s):
   ACG NOT PRESENT = Automatic call gap component not present.
   ACG PRESENT, CORRECT = Automatic call gap component present, has no errors.
   ACG PRESENT, INERROR = Automatic call gap component present, has errors.

z = Call gap control digits - digits to which controls are to be applied.

y = The call gap duration - used to determine the length of time for which controls are to be in effect.
   The following table lists the call gap duration index number received from the database and the corresponding time (in seconds) that the index represents:

<table>
<thead>
<tr>
<th>index</th>
<th>gap duration in seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

e^1 = Generic Name received. Valid value(s):
    NONE = Generic Name Identifier was not received in reply.
    RECEIVED = Generic Name Identifier was received in reply.

f^1 = Alphanumeric String indicator.

g^1 = Card Issuer Restrictions received. Valid value(s):
    NONE = A Disallowed Card Issuer Code was not received in reply.
    RECEIVED = A Disallowed Card Issuer Code was received in reply.

h^1 = Account Owner indicator.

i^1 = Billing Service Provider indicator.

4. ACTIONS TO BE TAKEN

This message is the response to a manual request. If variable ‘c’ prints out, then there is a problem with the connection to the database. Otherwise, the response is from the database. In this case, the response should be examined to see if it indicates proper data in the database. Contact the LIDB administrator for assistance.

5. ALARMS

None.

</tr>
</tbody>
</table>
   | k      | Completion report. Valid value(s):
   | COMPLETED      | The text string has been printed on the HOBIS/HOBIC TTY. |
   | DATABASE ERROR | The test could not be completed because of data base errors. |
   | FAILURE        | The text string could not be printed because the HOBIS/HOBIC service process does not exist. |
   | INVALID PORT   | The test could not be completed because the specified port is invalid. |
LINKBUSY = The text string could not be printed because the HOBIS/HOBIC TTY link is busy. Retry later.

UNASSIGNED PORT = The test was not completed because the port is not assigned.

l = AQEST directory (telephone) number.
m = AQ group ID.
n = AQ relative DSL number.
o = Test type. Valid value(s):

   CARRIER  ENQACK  PRINT

p = Completion report. Valid value(s):
COMPLETED = The test was successfully completed.
DSLBUSY = The test could not be completed because all the AQ-DSLs are busy, or the requested AQ-DSL is busy doing another craft requested TST:OSPS job.
DSLOOS = The test failed because the requested AQ-DSL was out-of-service.
HANDSHAKE PROBLEM = The test failed because the local and remote modem could not handshake.
ROUTING FAILURE = The test failed because the test call could not be routed to the AQEST.

q = Interleaved time sequence of “ENQ” characters sent from the switch and characters received from the AQEST printer. The characters received from the printer will be represented as ACK (for “ACK” character), and INV (invalid) for other characters received.

2. REASON FOR OUTPUT

To report the results of a digital loop-back (LPBK) test on inter-working gateway (IWG) or end to end test over the
ATM packet network connections. These messages are in response to TST:PATH and STP:TST-PATH input
messages.

Formats 1 and 2 are typical for all tests.

Format 1 prints the header and trailer message for test repeat more than 1.

Format 2 prints the testing output of a completed, failed, aborted, invalid or error test, with applicable test results and
information.

Formats 3 and 4 are unique to explicit requests to prematurely terminate a TST:PATH procedure (refer to the
For Format 3, if an active test procedure is found, that procedure will acknowledge the stop request. This allows test specific information to be displayed on output (such as the request number of the terminated procedure).

For Format 4, if no active test procedure is found or invalid request, the STP:TST-PATH procedure will generate the resultant output message; therefore, no test specific information will be seen.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Switching module (SM) number.
- **b** = IWG unit number.
- **c** = Relative link number.
- **d** = Relative tributary number.
- **e** = DS0 value.
- **f** = BICC group number.
- **g** = BICC group member, normalized CIC.
- **h** = Digits outpulsed for the test call.
- **i** = Optical carrier 3 (OC3) link.
- **j** = Duration of a test in seconds.
- **k** = The bit rate of the digital test run. This value is not necessarily the data rate of the circuit. In some cases, the incompatibility of the circuit data rate and the testing equipment will be detected and the test will be run at the appropriate rate. Valid value(s):
  - **56KPS** = A 56K test was run.
  - **64CLR** = A 64K clear test was run.
  - **64RES** = A 64K restricted test was run.
- **m** = Number of test bytes sent per block.
- **o** = Termination. Valid value(s):
  - **IWG** = A loopback was setup at the IWG.
  - **TL** = A loopback was setup at the test line.
- **p** = Test type. Valid value(s):
  - **BER** = A non-inverted loopback was setup.
  - **BERINV** = An inverted loopback was setup.
- **q** = The test request number (REQNO). A unique REQNO is assigned to a test procedure when it is first established. This number is useful for associating test result messages that may be distributed widely over time.
- **r** = Operational condition of testing. The testing status consists of test condition and test status.
The test condition, which is delineated from the status string with a colon, indicates the operational condition of the test procedure.

Valid value(s):
- **ABORTED**: Test could not proceed because the indicated resources could not be obtained. The test procedure has been terminated. Refer to variable 's'.
- **COMPLETED**: Request completed. The test status follows the test condition indicates the measurement status of the test. Refer to variable 's'.
- **ERROR**: An unexpected error condition was detected. The test procedure has been prematurely terminated. Refer to variable 's'.
- **INVALID**: The test request as specified, was invalid for the path to be tested. Refer to variable 's'.
- **FAILED**: An internal failure has prevented the test procedure from establishing or clearing condition(s) necessary for testing. The test procedure has been terminated. Refer to variable 's'.
- **STATUS**: The present operational status of the test is presented. The test procedure continues as indicated. Refer to variable 's'.
- **STOPPED**: The test procedure has been terminated in response to a manual request (refer to the STP:TST:PATH input message).

s = Status of testing. The test status indicates the disposition of testing request. Refer to the TST:TRK output message.

x = Number of tests started, completed or aborted for repeat testing.

a
  = Test equipment unit number.

This is the ISTF or GDSF unit used to evaluate the path under test.

b
  = Test equipment data interface (DI) number.

c
  = Test equipment peripheral interface data buss (PIDB) number.

d
  = Test equipment PIDB channel.

e
  = logical PH channel.

f
  = Bit error rate (BER). The bit error rate is presented in decimal scientific notation with exponent preceded by "E" (for example, 1.234E-8). The BER represents the total number of errored bits detected divided by the total number of bits sent.

The failing BER of 1 or more bits in error, for every 1,000,000 bits transmitted, is compared to the failure threshold (default ABER of 6) to determine when a LPBK test is passes unconditionally (ATP), passes with degradation (DGR), or fails (FAILED). Refer to variable 's'.

g
  = Errored blocks (ERBLK). The ERBLK is the number of blocks returned from the LPBK termination during testing, with one or more bit errors. The ERBLK is expressed in decimal scientific notation with the exponent preceded by "E" (for example, 5.600E1 = 5.600 x 10 = 56).

2. **REASON FOR OUTPUT**

To report the results of a digital loop-back (LPBK) test on inter-working gateway (IWG) or end to end (BICC) test over the ATM packet network connections. These messages are in response to TST:PATH and STP:TST-PATH input messages.

Formats 1 and 2 are typical for all tests. Format 1 prints the header and trailer message for test repeat more than 1. Format 2 prints the testing output of a completed, failed, aborted, invalid or error test, with applicable test results and information.

Format 3 is used to prematurely terminate a TST:PATH procedure (refer to the STP:TST-PATH input message). If an active test procedure is found, Format 3 will acknowledge the stop request. This allows test specific information to be displayed on output (such as the request number of the terminated procedure).

3. **VARIABLE FIELD DEFINITIONS**

   a  
   = Switching module (SM) number.

   b  
   = IWG unit number.

   c  
   = Relative link number.

   d  
   = Relative tributary number.
e = DS0 value.
f = BICC group number.
g = BICC group member, normalized CIC.
h = Digits outpulsed for the test call.
i = Optical carrier 3 (OC3) link.
j = Duration of a test in seconds.
k = The bit rate of the digital test run. This value is not necessarily the data rate of the circuit. In some cases, the incompatibility of the circuit data rate and the testing equipment will be detected and the test will be run at the appropriate rate. Valid value(s):
   56KPS = A 56K test was run.
   64CLR = A 64K clear test was run.
   64RES = A 64K restricted test was run.
m = Number of test bytes sent per block.
o = Termination. Valid value(s):
   IWG = A loopback was setup at the IWG.
   TL = A loopback was setup at the test line.
p = Test type. Valid value(s):
   BER = A non-inverted loopback was setup.
   BERINV = An inverted loopback was setup.
q = The test request number (REQNO). A unique REQNO is assigned to a test procedure when it is first established. This number is useful for associating test result messages that may be distributed widely over time.
r = Operational condition of testing. The testing status consists of test condition and test status.

The test condition, which is delineated from the status string with a colon, indicates the operational condition of the test procedure.

Valid value(s):
   ABORTED = Test could not proceed because the indicated resources could not be obtained. The test procedure has been terminated. Refer to variable 's'.
   COMPLETED = Request completed. The test status follows the test condition indicates the measurement status of the test. Refer to variable 's'.
   ERROR = An unexpected error condition was detected. The test procedure has been prematurely terminated. Refer to variable 's'.
   INVALID = The test request as specified, was invalid for the path to be tested. Refer to variable 's'.
   FAILED = An internal failure has prevented the test procedure from establishing or clearing condition(s) necessary for testing. The test procedure has been terminated. Refer to variable 's'.
   STATUS = The present operational status of the test is presented. The test procedure
continues as indicated. Refer to variable 's'.

STOPPED = The test procedure has been terminated in response to a manual request (refer to the STP:TST:PATH input message).

s = Status of testing. The test status indicates the disposition of testing request. Refer to the TST:TRK output message.

x = Number of tests started, completed or aborted for repeat testing.

a = Test equipment unit number
This is the ISTF or GDSF unit used to evaluate the path under test.

b = Test equipment data interface (DI) number.

c = Test equipment peripheral interface data buss (PIDB) number.

d = Test equipment PIDB channel.

e = logical PH channel.

f = Bit error rate (BER). The bit error rate is presented in decimal scientific notation with exponent preceded by "E" (for example, 1.234E-8). The BER represents the total number of errored bits detected divided by the total number of bits sent.

The failing BER of 1 or more bits in error, for every 1,000,000 bits transmitted, is compared to the failure threshold (default ABER of 6) to determine when a LPBK test is passes unconditionally (ATP), passes with degradation (DGR), or fails (FAILED). Refer to variable 's'.

g = Errored blocks (ERBLK). The ERBLK is the number of blocks returned from the LPBK termination during testing, with one or more bit errors. The ERBLK is expressed in decimal scientific notation with the exponent preceded by "E" (for example, 5.600E1 = 5.600 x 10 = 56).

2. REASON FOR OUTPUT

To report the results of a loop-back (LPBK) test and 105 Transmission test over the ATM and OIU-IP packet network connections. These messages are in response to TST:PATH input messages.

Format 1 reports the test for ATM packet pipe trunk test (either a standard ATM loop-back test or an enhanced ATM loop-back test). The result for the enhanced loop back test contains more information than the standard test, which includes trunk group and trunk member information for both the 5ESS® switch and the cell site.

**NOTE:** When the ATM packet pipe trunk test is run with the DUR option, only a test result that is different from the previous test result will be printed. Refer to the ALW:DEBUG input message for more information on allowing all test results. Refer to the INH:DEBUG input message for more information on inhibiting the ATM packet pipe trunk test.

Format 2 prints the ATM loop-back test output of a complete, fail, abort, invalid or error test, with corresponding test results and information.

Format 3 reports the tests for signaling ATM adaptation layer - high speed link (SAAL HSL) with a standard ATM loop-back test. Each test could request to send up to 3 cells over SAAL high speed link. If the first cell doesn't return during of limited timer, the second cell is sent. The third cell will be sent again if the second one is still not looped back. The "SEND 3 CELLS RECEIVED 0 CELL" will be printed out if all three cells are not looped back by far end CCS node.

Format 4 prints the summary information for the test on ATMPP trunk.

Format 5 prints the summary information for the test on SAAL HSL PSU pipe.

Format 6 is used to report requests to prematurely terminate a TST:PATH procedure (refer to the STP:TST-PATH input message). The STP:TST-PATH input message operates on all TST-PATH input messages. This allows test specific information to be displayed on output (such as the request number of the terminated procedure).

Format 6 prints as the result of a TST:PATH input message request to prematurely terminate a ATM packet pipe trunk test or ATM loop-back test on SAAL HSL. If a matched active test procedure is found, it will be stopped and "STOPPED:STOPPED BY REQUEST" will be displayed along with the test specific information.

Format 7 prints the results of the TST:PATH DELAY input message supporting round trip transmission characteristics and delay functionality for OIU-IP paths.

Format 8 prints the results of the TST:PATH input message Outgoing 105 transmission test for OIU-IP paths established between the near and far end offices.

Format 9 prints the results of the TST:PATH input message SCTP heart beat transmission test for OIU SIPT test path. The format prints the OIP and DIP associated with the test path, along with the ASSOC and TEST STATUS of the path.

Format 10 prints the overall summary of the TST:PATH input message SCTP heart beat transmission test. Format 9 and 10 are printed as sequential report.

3. VARIABLE FIELD DEFINITIONS

**CHANNEL 1** = Protocol handle for ATM version 2 (PHA2) ATM link channel 1. In the simplex configuration, only channel 1 is provisioned.

**CHANNEL 0** = PHA2 ATM link channel 0. In the duplex configuration, both channel 1 and 0 are provisioned. Each channel has a dynamic status that indicates an active/standby status marked with ‘’*(u)’’.
EXPT RSP = Expected response from ATM cell site presented by trunk group number and member number. This is used for enhanced loop back test.

RECV RSP = Received response from ATM cell site presented by trunk group number and member number. This is used for enhanced loop back test.

a = Switching module (SM) number.

b = DS0 value.

c = Digits outpulsed for the test call.

i = Optical carrier 3 (OC3) link.

j = Duration of a test in seconds.

o = Termination. Valid value(s):
   TL = A loop-back was setup at the test line.
   CELL = A loop-back was setup at the cell site.

p = Test type. Valid value(s):
   ATMLBK = Standard ATMPP loop-back test.
   ATMENH = Enhanced ATMPP loop-back test. For ATMPP trunk test only.

q = The test request number (REQNO). A unique REQNO is assigned to a test procedure when it is first established. This number is useful for associating test result messages that may be distributed widely over time.

r = Operational condition of testing. The testing status consists of test condition and test status.

The test condition, which is delineated from the status string with a colon, indicates the operational condition of the test procedure.

Valid value(s):
   ABORTED = Test could not proceed because the indicated resources could not be obtained. The test procedure has been terminated. Refer to variable 's'.
   COMPLETED = Request completed. The test status follows the test condition indicates the measurement status of the test. Refer to variable 's'.
   ERROR = An unexpected error condition was detected. The test procedure has been prematurely terminated. Refer to variable 's'.
   INVALID = The test request as specified, was invalid for the path to be tested. Refer to variable 's'.
   FAILED = An internal failure has prevented the test procedure from establishing or clearing condition(s) necessary for testing. The test procedure has been terminated. Refer to variable 's'.
   STATUS = The present operational status of the test is presented. The test procedure continues as indicated. Refer to variable 's'.
   STOPPED = The test procedure has been terminated in response to a manual request (refer to the STP:TST-PATH input message).
   SUMMARY = The summary line indicates the number of test that completed or aborted.

s = Status of testing. The test status indicates the disposition of testing request. Refer to the
TST:TRK output message in the Output Messages manual.

\( t \) = Camp-on (CAMP) time (10-3600). Refer to the TST:PATH input message in the Input Messages manual for explanation.

\( u \) = Status of channel. Its valid value is "*" which means this channel is STBY.

\( x \) = Number of tests started, completed or aborted for repeat testing.

\( z \) = Test result from ATM network for each channel. Valid value(s):
- ATM LOOPBACK SUCCESS = Loopback test succeeded.
- ATM LOOPBACK FAIL = Loopback test failed.
- ATM NETWORK NO RESPONSE = No response from the link/PHA2 on duplex mode.
- LOOPBACK TIMEOUT = Loopback test timeout--used for simplex. Request has been sent out but without receiving the test OA&M cell back from the cell site.
- CELL DATA MISMATCH = The received trunk group and member from cell site don't match expected trunk group and member.
- NO RESPONSE FROM PH = 5ESS\textsuperscript{®} switch can not transfer the OA&M cell successfully to ATM since no response from PH.
- MATE UNEQUIPPED = Mate in unequipped state (on duplex request).
- MATE OOS = Duplex mode, the status of channel is OOS.

\( a \) = Test equipment unit number.

This is the ISTF or GDSF unit used to evaluate the path under test.

\( b \) = Test equipment data interface (DI) number.

\( c \) = Test equipment peripheral interface data bus (PIDB) number.

\( d \) = Test equipment PIDB channel.

\( e \) = logical PH channel.

\( h \) = Packet switch unit (PSU).

\( i \) = ATM link unit number.

\( j \) = Virtual connection identifier (VCID).

\( k \) = The only valid variable for this field is "ALL".

\( l \) = Trunk group number (TG).

\( m \) = Trunk group member number (TKGMN) or lower limit of range of trunk group member numbers.

\( n \) = Upper limit of range of trunk group member numbers.

\( o \) = Virtual connection ID (VCI). For ATMLBK test on SAAL HSL, VCI is fixed to 5

\( p \) = Virtual path ID (VPI). For ATMLBK test on SAAL HSL, VPI is fixed to 0.

\( q \) = The repeat time specified in the TST:PATH input message (for the status report).

\( r \) = cell sent times.
s\(^1\) = Current repeating time (for the test report).

t\(^1\) = The passed test number in the tests on channel 1.

u\(^1\) = The failed test number in the tests on channel 1.

v\(^1\) = The passed test number in the tests on channel 0.

w\(^1\) = The failed test number in the tests on channel 0.

x\(^1\) = Actual repeating times for the duration.

y\(^1\) = PSU shelf number.

z\(^1\) = PSU channel group number.

a\(^2\) = PSU channel member number.

b\(^2\) = Test result for OA&M stand loop back test on signaling ATM adaptation layer high speed link.

Valid value(s):

SEND 1 CELL RECEIVED 1 CELL = Loopback test succeeded on the first cell transmission.
SEND 2 CELLS RECEIVED 1 CELL = Loopback test succeeded on the second cell transmission.
SEND 3 CELLS RECEIVED 1 CELL = Loopback test succeeded on the third cell transmission.
SEND 3 CELLS RECEIVED 0 CELL = Loopback test failed after sending OA&M cell three times.
NO RESPONSE FROM PH = Loopback test failed because there is no response from PH to TM.

c\(^2\) = Optical interface unit (OIU) number.

d\(^2\) = Optical interface unit protection group (OIUPG) number.

e\(^2\) = Peripheral control and timing (PCT) link number, relative to the OIU.

f\(^2\) = PCT time slot (PCTTS) number.

g\(^2\) = Packet group number over which to set the test call.

h\(^2\) = Packet group member number. Only valid for BICC packet groups, and is the normalized call identification code (CIC) to use for the test call (0-65535).

i\(^2\) = Digits to be outpulsed for the specified test. The digits outpulsed should be the digits necessary to connect to the appropriate incoming test line in the far-end office for the outgoing test type specified.

j\(^2\) = The DELAY test timeout threshold in milliseconds. The DELAY test will compare the round-trip transmission delays against this value to determine the results of the test. If the round-trip delay is equal or less than the specified delay timeout, the result will indicate the delay threshold was not exceeded.

k\(^2\) = SM number.

l\(^2\) = Unit number.

m\(^2\) = Channel.
n² = Circuit number.

o² = Grid number.

p² = Test results consisting of a character string of 32 bytes that describes measured results. If the test are completed, the measurements are described in the APP:TRANS-MEAS appendix. If the test failed or aborted, refer to the APP:TEST-ERROR appendix in the Appendixes section of the Output Messages manual.

r² = Association set.

s² = Number of SCTP HB repeat tests defined.

t² = Destination internet protocol (IP) address, in the form xxx.xxx.xxx.xxx.

u² = Indicates the results.

v² = Near end point.

a³ = PCR group.

b³ = PSU number.

c³ = PSU shelf number.

d³ = Relational PH.

e³ = Initial retransmission timeout value.

f³ = The minimum bound for the retransmission timeout.

g³ = The maximum bound for the retransmission timeout.

h³ = Table number.

i³ = Originating IP address, in the form xxx.xxx.xxx.xxx.

j³ = Destination IP address, in the form xxx.xxx.xxx.xxx.

k³ = Association number.

l³ = Table number.

m³ = Initial retransmission timeout value.

n³ = Retransmission retry. Zero indicates that the retry mechanism is disabled.

2. REASON FOR OUTPUT

To report the result of an intra-network or inter-network virtual path (VPATH) loop back test.

For PSUs in the same subnetwork there are two virtual paths, one high priority and one low priority, that connect two PSU CAs. Each virtual path is identified with a unique virtual path identifier (VPI) number or virtual channel identifier (VCI). For PSUs that are located in different subnetworks, there is only one virtual path and it is high priority. The report lists the result of the loop back test of both channels of both VPIs individually.

Virtual path connectivity is lost only when the active channel fails the loop back test.

If the "ENH" option was used, the values of the "EXPECTED" and "RECEIVED" are compared to see if they are the same. If the values do not match, then there is a situation where the VPATH is connected to a PSU CA but not to the intended PSU CA.

If the "DELAY" option was used, then the enhanced checks will be done as well as the round trip time for the test will be displayed.

If the "TRACE" option was used, then the enhanced checks will be done as well as the far PSUCA endpoint will use its routing data and determine whether to respond using the virtual path or virtual channel connection. The
provisioned near and far connection types will be output.

If the "VP" option was used, then the originating PSU will test the virtual path connection between the two endpoints.

If the "VC" option was used, then the originating PSU will test the virtual channel connection between the two endpoints.

3. VARIABLE FIELD DEFINITIONS

a = Switching module (SM) number.
b = PSU number. Far end community address of the PSU link.
c = ATM link number.
d = Near end community address of the virtual path.
e = Far end community address of the virtual path.
f = Termination status. Valid value(s):
   ABORTED = Requested action has aborted.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action was not started.
   STOPPED = Requested action has stopped.
g = Additional information qualifying the termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.
h = High priority VPI number to the far end of the virtual path.
i = Low priority VPI number to the far end of the virtual path.
j = Loop back test result. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.
k = High priority VPI number to the near end of the virtual path.
l = Far end community address that has responded to this loop back test.
m = Destination VPI number of the loop back response. This is the virtual path taken by the returned loop back cell.
n = Round trip loopback time including the ATM delay.
o = Virtual path connection type used by the source CA to reach the destination CA during loop back test.
p = Virtual path connection type used by the destination CA to reach the source CA during loop back test.
q = Low priority VPI number to the near end of the virtual path.
r = High/Low priority VCI number to the near end of the virtual path.
s = Destination VCI number of the loop back response. This is the virtual path taken by the returned
loop back cell.

t = Far subnetwork number.

u = Far subnetwork number that responded to this loop back test.

v = Gateway community address used by the source CA to reach the destination CA during loop back test.

w = Gateway community address used by the destination CA to reach the source CA during loop back test.

4. ACTIONS TO BE TAKEN

If a virtual path connectivity is lost, identification of the source of the problem and resolution of the problem requires the cooperation of the intermediate office(s), if any, and the far end office.

If any form of the "ENH" option was used for this test and if the "EXPECTED" and "RECEIVED" values are not the same, then there is a possibility that the VPATH is connected to a PSU CA but not to the intended PSU CA. If this is the case, the virtual path provisioning in the ATM center-stage switch must be corrected. This has to be performed by the ATM center-stage switch owner.

5. ALARMS

2. REASON FOR OUTPUT

To report the result of a packet switch unit (PSU) link (PSLNK) loop back test and intra-network virtual path (VPATH) loop back test as in Format 1 or 2 or inter-network VPATH loop back test as in Format 3.

For PSUs in the same subnetwork there are two virtual paths, one high priority and one low priority, that connect two

Copyright ©2003 Lucent Technologies
PSU CAs. Each virtual path is identified with an unique virtual path identifier (VPI) number. For PSUs that are located different different subnetworks there is only one virtual path that is high priority. The report lists the result of the loop back test of both channels of both VPIs individually.

A virtual path connectivity is lost only when both of its channels fail the loop back test.

If the “ENH” option was used, the values of the “EXPECTED” and “RECEIVED” must be compared to see if they are the same. If the values do not match, then there is a situation where the VPATH is connected to a PSU CA but not to the intended PSU CA.

3. VARIABLE FIELD DEFINITIONS

a = Near end community address of the PSU link or virtual path.

2. REASON FOR OUTPUT

To report the result of a packet switch unit (PSU) link (PSLNK) loop back test and intra-network or inter-network virtual path (VPATH) loop back test. The PSLNK test is shown in Format 1. The VPATH originated intra and inter network loopback tests are shown in Formats 2, 3, 4, 5, 6 and 7. Formats 1-3 are for PHA1s and Formats 4-7 are for PHA2s.

For PSUs in the same subnetwork there are two virtual paths, one high priority and one low priority, that connect two PSU CAs. Each virtual path is identified with an unique virtual path identifier (VPI) number. For PSUs that are located in different subnetworks there is only one virtual path that is high priority. The report lists the result of the loop back test of both channels of both VPIs individually.

Virtual path connectivity is lost only when the active channel fails the loop back test.

If the "ENH" option was used, the values of the "EXPECTED" and "RECEIVED" must be compared to see if they are the same. If the values do not match, then there is a situation where the VPATH is connected to a PSU CA but not to the intended PSU CA.

If the "DELAY" option was used, then the enhanced checks will be done as well as the round trip time for the test will be displayed.

If the "TRACE" option was used, then the enhanced checks will be done as well as the far PSUCA endpoint will use its routing data and determine whether to respond using the virtual path or virtual channel connection. The provisioned near and far connection types will be output.

If the "VP" option was used, then the originating PSU will test the virtual path connection between the two endpoints.

If the "VC" option was used, then the originating PSU will test the virtual channel connection between the two endpoints.

3. VARIABLE FIELD DEFINITIONS
a = Near end community address of the PSU link or virtual path.

b = Far end community address of the PSU link.

c = Termination status. Valid value(s):
   ABORTED  = Requested action has aborted.
   COMPLETED = Request has successfully completed.
   NOT_STARTED = Requested action was not started.
   STOPPED  = Requested action has stopped.

d = Additional information qualifying the termination status. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.

e = Far subnetwork number.

f = Loop back test result. Refer to the APP:PSU-RESP appendix in the Appendixes section of this Output Messages manual.

  g = High priority VPI number to the far end of the PSU link or virtual path.

  h = Low priority VPI number to the far end of the PSU link or virtual path.

  i = High priority VPI number to the near end of the PSU link or virtual path.

  j = Far end community address that has responded to this loop back test.

  k = Destination VPI number of the loop back response. This is the virtual path taken by the returned loop back cell.

  l = Low priority VPI number to the near end of the PSU link or virtual path.

  m = Far subnetwork number that responded to this loop back test.

  n = Gateway community address used by the source CA to reach the destination CA during loop back test.

  o = Gateway community address used by the destination CA to reach the source CA during loop back test.

  p = Virtual path connection type used by the source CA to reach the destination CA during loop back test.

  q = Virtual path connection type used by the destination CA to reach the source CA during loop back test.

  r = High priority VCI number to the near end of the virtual path.

  s = Destination VCI number of the loop back response. This is the virtual path taken by the returned loop back cell.

  t = Round trip loopback time including the ATM delay.

4. ACTIONS TO BE TAKEN
If a virtual path connectivity is lost, identification of the source of the problem and resolution of the problem requires the cooperation of the intermediate office(s), if any, and the far end office.

If any form of the "ENH" option was used for this test and if the "EXPECTED" and "RECEIVED" values are not the same, then there is a possibility that the VPATH is connected to a PSU CA but not to the intended PSU CA. If this is the case, the virtual path provisioning in the ATM center-stage switch must be corrected. This has to be performed by the ATM center-stage switch owner.

   CHARGES FOR DA SEARCH TYPE 2=[h₁]

2. **REASON FOR OUTPUT**

   To report the results of the manual request (TST:RATE) that a rate query test be performed.

3. **VARIABLE FIELD DEFINITIONS**

   a = The originating ten-digit directory number.  
   b = The terminating ten-digit directory number.  
   c = Duration of the test in milliseconds. Timing starts when the switch receives the input request and ends when the switch receives the result from the network or a timeout.  
   d = Results of the test. Valid value(s):

   **CHARGE OVERFLOW** = Database unable to process due to charge overflow.  
   **DENY** = Deny this call due to class of service (coin only) or because:
   - The call is a busy line verify (BLV)/emergency interrupt (EI) and the rate table in Real Time Rating System (RTRS) indicates that BLV/EI calls are not allowed for this call.
   - The call is for a certain combination of billing type and automation degree that the rate table in RTRS indicates it is not allowed.
   - The call could be a local person coin call. RTRS has the ability to deny or not allow local person coin calls from selected NPA-NXXes.
   **FLAT CHARGE** = Call has a flat charge independent of duration.  
   **FLAT RATED COMPARISON CARD** = The RTRS database has returned a flat rated reply for the comparison calling card, but no data was returned for the customer calling card.
   **FLAT RATED-INSUFFICIENT BALANCE** = The RTRS database has returned a flat rated reply for a purchase limits initial query, but the balance in the query was insufficient to cover...
the charges for the call.

FLAT RATED REQUESTED CARD = The RTRS database has returned a flat rated reply for the customer calling card, but no data was returned for the comparison calling card.

INVALID RATE MESSAGE RECEIVED = A response was received from the database but the data in the response was mutilated.

NO RATING DATA = Database unable to process due to no rating data available.

RATED = Database has rated the call.

RATED COMPARISON CARD = The RTRS database has returned a rated reply for a comparison calling card, but no data was returned for the customer calling card.

RATED REQUESTED CARD = The RTRS database has returned a rated reply for a customer calling card, but no data was returned for the comparison calling card.

RATED-INSUFFICIENT BALANCE = The RTRS database has returned a rated reply for a purchase limits initial query, but the balance in the query was insufficient to cover the charges for the call.

RTRS FAILURE-HARDWARE PROBLEM = The RTRS database was unable to return a valid query response due to hardware problems.

RTRS FAILURE-TOO MANY QUERIES = The RTRS database was unable to return a valid query response because no query ID’s were available.

SHORT TERM OVERLOAD = Database unable to process due to short term overload.

TIMEOUT = A response to the test query was not received within the eight second time limit.

TRANSIENT ERROR = Database unable to process due to transient error.

UNRECOGNIZED MESSAGE = Database unable to process due to unrecognized message.

f = Initial period charge or flat charge or verification charge or total charge. If initial period charge or flat charge or verification charge or total charge is not returned in the reply, NONE is printed.

g = Tax exempt indicator. Valid value(s):

NO = Rate does include tax. If tax exempt indicator is not returned in the reply, NONE is printed.

YES = Rate does not include tax.

h = Initial period duration - the amount of time (in seconds) for the initial period. If initial period duration is not returned in the reply, NONE is printed.

i = Notification post pay. Valid value(s):

NONE = Notification post pay indicator is not returned in the reply.

YES = Notification post pay is present.

j = Notification coin call. Valid value(s):

NONE = Notification coin call is not returned in the reply.

YES = Notification coin call is present.

k = Collect coin interval - the time interval (in seconds) in which the database must be queried again for new charges. If coin collect interval is not returned in the reply, NONE is printed.

l = Interrupt charge or overtime period charge. If interrupt charge or overtime period charge is not returned in the reply, NONE is printed.

m = Overtime period duration - the amount of time (in seconds) for one overtime period. If overtime period duration is not returned in the reply, NONE is printed.
n = Chargeable duration - the chargeable duration (in seconds) that should be quoted. If chargeable
duration is not returned in the reply, \texttt{NONE} is printed.

o = Purchase limits allowable time in tenths of seconds or allowable indicator for BLV calls. If this field
is not returned in the reply, \texttt{NONE} is printed.

p = Comparison card initial period charge or flat charge or verification charge or total charge. If
comparison card initial period charge or flat charge or verification charge or total charge is not
returned in the reply, \texttt{NONE} is printed.

q = Comparison card initial period duration - the amount of time (in seconds) for the initial period for
the comparison card. If comparison card initial period duration is not returned in the reply, \texttt{NONE} is
printed.

r = Comparison card interrupt charge or overtime period charge. If comparison card interrupt charge
or overtime period charge is not returned in the reply, \texttt{NONE} is printed.

s = Comparison card overtime period duration - the amount of time (in seconds) for one overtime
period. If comparison card overtime period duration is not returned in the reply, \texttt{NONE} is printed.

t = Control level value received. This field is output only if a control level is received in the reply.
Possible values are 0 - 7 and refer to the number of queries out of eight that are being cut back.

u = Automation offering (AO). This is an optional field used to identify the level of automation (type of
treatment) associated with a given OSPS 0/-00- originated call. Valid value(s):
\texttt{AUTOMATED POSITION} = Call handled by the automated position system.
\texttt{NOT APPLICABLE} = Not applicable (not used by call processing at this time).
\texttt{OPERATOR} = Call handled by the operator.
\texttt{SWITCH} = Not applicable (not used by call processing at this time).

v = Forward number entry (FNE). This is an optional field used to identify who entered the forward
number associated with a given OSPS 0/-00- originated call. Valid value(s):
\texttt{CUSTOMER ENTERED} = Customer entered the forward number at the APS.
\texttt{NOT APPLICABLE} = Not applicable (not used by call processing at this time).
\texttt{OPERATOR ENTERED} = Operator entered the forward number.
\texttt{SWITCH} = Not applicable (not used by call processing at this time).

w = Results of test. Valid value(s):
\texttt{(blank)} = The pre-paid overtime for coin calls feature has not been purchase (secure
feature ID is not on).
\texttt{POSTPAY EACH OVERTIME} = Charges for each overtime interval will be requested at the end of
each overtime period.
\texttt{PREPAY EACH OVERTIME} = Charges for each overtime interval will be requested at the start of
each overtime period.

x = Special access service identifier that was entered in the query. A number from 1 to 10 or \texttt{NONE} if
the field was not entered.

y = Prior call completion status that was entered in the query. Valid value(s):
\texttt{NEG} = Negative prior call completion status.
\texttt{NONE} = Field not entered.
= Positive prior call completion status.

z = Directory Assistance Type value. If there is no Directory Assistance Type value specified in the query, then NONE is printed.

a\(^1\) = Measured service initial period charge, rated or flat. If rated or flat charge is not returned in the reply, NONE is printed.

b\(^1\) = Measured service initial duration. If measured service initial duration is not returned in the reply, NONE is printed.

c\(^1\) = Measured service overtime period charge, rated or flat. If overtime period charge is not returned in the reply, NONE is printed.

d\(^1\) = Measured service overtime duration. If overtime duration is not returned in the reply, NONE is printed.

e\(^1\) = Flat reply code for flat and measured services request. If the flat reply code is not returned in the reply, NONE is printed.

f\(^1\) = Measured reply code for flat and measured services request. If the measured reply code is not returned in the reply, NONE is printed.

g\(^1\) = Charges for Directory Assistance Search Type 1. If no charges are returned in the reply, 'NONE' is printed.

h\(^1\) = Charges for Directory Assistance Search Type 2. If no charges are returned in the reply, 'NONE' is printed.

4. ACTION TO BE TAKEN

Follow the local practice for handling RATE query tests.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the results of a manually requested automatic trunk test. This message is in response to a TST:TRK input message.

Formats 1 and 2 are used when an error condition has been detected early (while processing the request). Refer to variables 'k1' and 'j1' for additional information. Format 1 reports failures for analog, digital, and packet handler voice (PHV) speech handler trunks, and Format 2 reports failures for X.25 access on T1 (XAT) ports.

Formats 3 and 4 are used to report the results of a test. Format 3 reports the test results on an analog or digital trunk. This includes speech handler trunks. Format 4 reports the test results on a trunk that has a directory number (DN) or multi-line hunt group (MLHG) associated with it. This includes XAT ports.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number.
b = Member number.
c = Switching module (SM) number.
d = Digital line and trunk unit (DLTU) number.
e = Digital facility interface number.
f = Channel number.
g = Directory number (DN).
h = MLHG number.

i = MLHG member number.

j = Digits outpulsed for the test call. Note that this field is not applicable for packet switching trunks, and will be omitted.

k = Valid value(s):

</tbody>
</table>

Note: The standard 105 test includes: 105L, 105RN, 105N, and 105NT.
Note: The 105RL (return loss) test includes: 105ERL, 105SRL, and 105SHI.
Note: The 105GS (gain slope) test includes: 105L4, 105L10, and 105L28.
Note: The 105ALL test includes the following 105 tests: 105L, 105RN, 105N, 105L4, 105L10, 105L28, and 105NT.

Note: 102LB (Only valid for APX BSSAPS2 and IVT trunks) test executes 1004Hz at 0dB transmission and C-message noise filter used in measurement for noise.
Note: Continuity (CONT) is used for common channel signaling (CCS) trunks.
Note: The 104 transmission measuring and noise checking feature provides a test termination for two-way loss and one-way far to near (FTON) noise. In addition this test provides a pass/fail signal from the far end that indicates the results of a noise measurement. The output ">=41" is pass and ">41" indicates failure. The actual value of the measurement is not provided.

Digital tests. Valid value(s):

- **LBK** = Loopback test line.
- **LBKINV** = Inverting loopback test line.
- **LBKOCU** = Automatic loopback test to office channel unit (OCU). Valid for packet switching trunks and XAT ports only.
- **LBKCSU** = Automatic loopback test to channel service unit (CSU). Valid for packet switching trunks and XAT ports only.
- **MANSINK** = Number 1 Packet Switching System (1PSS) originated to the switch terminated manual loopback test. Valid for packet switching trunks only.
- **MANSRCE** = The switch originated to 1PSS or AMPS packet pipe member (PPM) terminated manual loopback test. Valid for packet switching trunks only.
- **SHCT** = Automatic loopback test to PHV speech handler trunk. Valid for AMPS speech handler trunks only.

Operational tests. Valid value(s):

- **103** = 103 type test line.
- **NSYNC** = Non-synchronous test line.
- **PERM** = Permanent busy test line.
- **SYNC** = Synchronous test line.

- **g** = Duration of a test in seconds.
- **h** = Number of test bytes sent per block.
- **i** = The bit rate of the digital test run. This value is not necessarily the data rate of the trunk. In some cases, the incompatibility of the trunk data rate and the testing equipment will be detected and the test will be run at the appropriate rate. Valid value(s):
  - **56KPS** = A 56K test was run.
  - **64CLR** = A 64K clear test was run.
64RES  = A 64K restricted test was run.
VOICE  = A voice grade test was run.

\( j^1 \) = Status of the test. Valid value(s):

- **ABT** = The attempted operations were aborted because of a failure not related to the trunk itself. Refer to variable ‘\( k \)’.
- **ATP** = Request completed. The test call passed.
- **COMPL** = Request completed. Refer to variable ‘\( k \)’.
- **COMPLETED** = Request completed. This status message is returned at the completion of a test on an entire trunk group.
- **FAIL** = Request completed. The test call failed. Refer to variable ‘\( k \)’.
- **STARTED** = Request started. This status message is returned at the beginning of a test on an entire trunk group.

The following are results indicating that no test was attempted:

- **CMP UNAVAILABLE** = The input request could not be completed because a needed communication module (CM) is unable to respond. Retry the request later.
- **INPUT ERROR** = The input message was in error in some way, most likely invalid data.
- **INV PORT** = The trunk specified in the input message was not a valid trunk identifier.
- **INV PORT STATUS FOR TEST** = Port status for an Operator Services Position System (OSPS) extended digital subscriber line (EDSL) B-channel, or a PPM trunk is inappropriate for test.
- **INV PORT TYPE** = The port type specified is invalid for that particular test.
- **INV TEST FOR ANALOG TRUNKS** = Digital LBK and LBKINV tests are invalid for all analog trunks (TENs, SLENs, and ILENs).
- **MLHG ACCESS DN** = The DN entered is a multi-line hunt group channel and as such cannot be tested by specifying its DN. An equipment number (that is, DEN) or MLHG and member number must be specified. To obtain the channel equipment number and/or multi-line hunt group and member number, use recent change/verify (RC/V) for the DN or refer to office records.
- **MLHG INVALID** = The multi-line hunt group specified is not a valid one.
- **NO TEST** = This output can be caused by multiple reasons: 1. a TEST TYPE must be specified. No default test exists for the indicated trunk. 2. An INVALID TEST TYPE was specified. 3. An INVALID TEST is attempted. No OPDN exists for this test.
- **PACKAGE NOT LOADED** = The software optioned package needed to run the test has not been loaded.
- **SM UNAVAILABLE** = The input request could not be completed because a needed SM is unable to respond. Retry the request later.
- **SYSTEM BUSY** = A system resource failure occurred. The system was too busy to perform the request or a system resource failure occurred which prevented the request from being processed.
- **SYSTEM ERROR** = An unspecified error condition occurred while processing the test request.
- **TERMINATING OSPS NOT TESTABLE** = Terminating office in an OSPS interflow configuration is not testable.
- **TG INVALID** = The trunk group specified in the input request was invalid. Verify that the correct group number was specified.
- **TRUNK BUSY** = The trunk was busy and could not be tested. If the trunk was an OSPS interflow trunk or other nailed-up trunk configuration, the trunk was traffic busy and could not be made maintenance busy and could not be tested. If the trunk is a CCS trunk and is in the OOS MTCE CCSINIT state, the trunk is in the process of being reset and cannot be tested.
Test results consisting of a character string of 32 bytes that describes measured results. If the tests are completed, the measurement results are described in the APP:TRANS-MEAS appendix in the Appendixes section of the Output Messages manual. If the test failed or aborted, refer to the APP:TEST-ERROR appendix in the Appendixes section of the Output Messages manual.

<table>
<thead>
<tr>
<th>Test Group Results:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>STARTING $^1$ TEST CALLS</td>

**Note:** The standard 105 test includes: 105L, 105RN, 105N, and 105NT.

**Note:** The 105RL (return loss) test includes: 105ERL, 105SRL, and 105SHI.

**Note:** The 105GS (gain slope) test includes: 105L4, 105L10, and 105L28.

**Note:** The 105ALL test includes the following 105 tests: 105L, 105RN, 105N, 105L4, 105L10, 105L28, and 105NT.

**Note:** 102LB (Only valid for APX BSSAPS2 and IVT trunks) test executes 1004Hz at 0dB transmission and C-message noise filter used in measurement for noise.

**Note:** Continuity (CONT) is used for common channel signaling (CCS) trunks.

**Note:** Protocol handler voice encoding loopback (PVELBK) is only used on speech handler trunks.

**Note:** The 104 transmission measuring and noise checking feature provides a test termination for two-way loss and one-way far to near (FTON) noise. In addition this test provides a pass/fail signal from the far end that indicates the results of a noise measurement. The output "<=41" is pass and ">41" indicates failure. The actual value of the measurement is not provided.

**Digital tests. Valid value(s):**

- **LBK** = Loopback test line.
- **LBKINV** = Inverting loopback test line.
- **LBKOCU** = Automatic loopback test to office channel unit (OCU). Valid for packet switching trunks and XAT ports only.
- **LBKCSU** = Automatic loopback test to channel service unit (CSU). Valid for packet switching trunks and XAT ports only.
- **MANSINK** = Number 1 Packet Switching System (1PSS) originated to 5ESS®-2000 switch terminated manual loopback test. Valid for packet switching trunks only.
- **MANSRCE** = 5ESS®-2000 switch originated to 1PSS or AMPS packet pipe member (PPM) terminated manual loopback test. Valid for packet switching trunks only.
- **SHCT** = Automatic loopback test to PHV speech handler trunk. Valid for AMPS speech
handler trunks only.

Operational tests. Valid value(s):
103 = 103 type test line.
NSYNC = Non-synchronous test line.
PERM = Permanent busy test line.
SYNC = Synchronous test line.

\[ k^1 \]
= Duration of a test in seconds.

\[ l^1 \]
= Number of test bytes sent per block.

\[ m^1 \]
The bit rate of the digital test run. This value is not necessarily the data rate of the trunk. In some cases, the incompatibility of the trunk data rate and the testing equipment will be detected and the test will be run at the appropriate rate. Valid value(s):
56KPS = A 56K test was run.
64CLR = A 64K clear test was run.
64RES = A 64K restricted test was run.
VOICE = A voice grade test was run.

\[ n^1 \]
= Status of the test. Valid value(s):
ABT = The attempted operations were aborted because of a failure not related to the trunk itself. Refer to variable 'o'.
ATP = Request completed. The test call passed.
COMPL = Request completed. Refer to variable 'o'.
COMPLETED = Request completed. This status message is returned at the completion of a test on an entire trunk group.
FAIL = Request completed. The test call failed. Refer to variable 'o'.
STARTED = Request started. This status message is returned at the beginning of a test on an entire trunk group.

The following are results indicating that no test was attempted:

CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) is unable to respond. Retry the request later.
INPUT ERROR = The input message was in error in some way, most likely invalid data.
INV PORT = The trunk specified in the input message was not a valid trunk identifier.
INV PORT STATUS FOR TEST = Port status for an Operator Services Position System (OSPS) extended digital subscriber line (EDSL) B-channel, or a PPM trunk is inappropriate for test.
INV PORT TYPE = The port type specified is invalid for that particular test.
INV TEST FOR ANALOG TRUNKS = Digital LBK and LBKINV tests are invalid for all analog trunks (TENs, SLENs, and ILENs).
MLHG ACCESS DN = The DN entered is a multi-line hunt group channel and as such cannot be tested by specifying its DN. An equipment number (that is, DEN) or MLHG and member number must be specified. To obtain the channel equipment number and/or multi-line hunt group and member number, use recent change/verify (RC/V) for the DN or refer to office records.
MLHG INVALID = The multi-line hunt group specified is not a valid one.
NO TEST = This output can be caused by multiple reasons: 1. a TEST TYPE must be specified. No default test exists for the indicated trunk. 2. An INVALID TEST TYPE
was specified. 3. An INVALID TEST is attempted. No OPDN exists for this test.

**PACKAGE NOT LOADED** = The software optioned package needed to run the test has not been loaded.

**SM UNAVAILABLE** = The input request could not be completed because a needed SM is unable to respond. Retry the request later.

**SYSTEM BUSY** = A system resource failure occurred. The system was too busy to perform the request or a system resource failure occurred which prevented the request from being processed.

**SYSTEM ERROR** = An unspecified error condition occurred while processing the test request.

**TERMINATING OSPS NOT TESTABLE** = Terminating office in an OSPS interflow configuration is not testable.

**TG INVALID** = The trunk group specified in the input request was invalid. Verify that the correct group number was specified.

**TRUNK BUSY** = The trunk was busy and could not be tested. If the trunk was an OSPS interflow trunk or other nailed-up trunk configuration, the trunk was traffic busy and could not be made maintenance busy and could not be tested. If the trunk is a CCS trunk and is in the OOS MTCE CCSINIT state, the trunk is in the process of being reset and cannot be tested.

**Test Results**

- **o**: Test results consisting of a character string of 32 bytes that describes measured results. If the tests are completed, the measurement results are described in APP:TRANS-MEAS. If the test failed or aborted, refer to APP:TEST-ERROR.

- **p**: Number of tests started, passed, failed or aborted.

- **q**: Data interface number.

- **r**: Data fanout type.
  - **DF2**: Data fanout version 2.
  - **FLEX**: Data fanout with flex firmware.
  - **MPFLEX**: Data fanout with multiple PIDBs with flex firmware.

- **s**: Peripheral interface data bus number.

- **t**: Time slot number.

- **u**: Peripheral control link time slot number.

- **v**: Path data block time slot number.

If an internal software error occurs repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

4. **ACTIONS TO BE TAKEN**

Take the trunk OOS or write a trouble report against a trunk if it is faulty. If an internal software error occurs repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. **ALARMS**

None.

2. REASON FOR OUTPUT

To report the results of a manually requested automatic trunk test. This message is in response to a TST:TRK input message.

Formats 1 and 2 are used to display the test status or when an error condition has been detected early (while processing the request). Refer to variables 'p1' and 'o1' for additional information. Format 1 reports failures for analog, digital, and packet handler voice (PHV) speech handler trunks, and Format 2 reports failures for X.25 access on T1 (XAT) ports.

Formats 3 and 4 are used to report the results of a test. Format 3 reports the test results on an analog or digital trunk. This includes speech handler trunks. Format 4 reports the test results on a trunk that has a directory number (DN) or multi-line hunt group (MLHG) associated with it. This includes XAT ports.

3. VARIABLE FIELD DEFINITIONS

a = Trunk group number.
b = Member number.
c = Switching module (SM) number.
d = Digital line and trunk unit (DLTU) number.
e = Digital facility interface number.
f = Channel number.
g = Directory number (DN).

h = MLHG number.

i = MLHG member number.

j = Digits outpulsed for the test call. Note that this field is not applicable for packet switching trunks, and will be omitted.

k = Valid value(s):

</tbody>
</table>

**NOTE 1:** The standard 105 test includes: 105L, 105RN, 105N, and 105NT.

**NOTE 2:** The 105RL (return loss) test includes: 105ERL, 105SRL, and 105SHI.

**NOTE 3:** The 105GS (gain slope) test includes: 105L4, 105L10, and 105L28.

**NOTE 4:** The 105ALL test includes the following 105 tests: 105L, 105RN, 105N, 105L4, 105L10, 105L28, and 105NT.

**NOTE 5:** 102LB (Only valid for APX BSSAPS2 and IVT trunks) test executes 1004Hz at 0dB transmission and C-message noise filter used in measurement for noise.

**NOTE 6:** Continuity (CONT) is used for common channel signaling (CCS) trunks.

**NOTE 7:** Protocol handler voice encoding loopback (PVELBK) is only used on speech handler trunks.

**NOTE 8:** The 104 transmission measuring and noise checking feature provides a test termination for two-way loss and one-way far to near (FTON) noise. In addition this test provides a pass/fail signal from the far end that indicates the results of a noise measurement. The output ”<=41” is pass and ”>41” indicates failure. The actual value of the measurement is not provided.

Digital tests. Valid value(s):
- LBK = Loopback test line.
- LBKINV = Inverting loopback test line.
LBKOCU = Automatic loopback test to office channel unit (OCU). Valid for packet switching trunks and XAT ports only.

LBKCSU = Automatic loopback test to channel service unit (CSU). Valid for packet switching trunks and XAT ports only.

MANSINK = Number 1 Packet Switching System (1PSS) originated to the switch terminated manual loopback test. Valid for packet switching trunks only.

MANSRCE = The switch originated to 1PSS or AMPS packet pipe member (PPM) terminated manual loopback test. Valid for packet switching trunks only.

SHCT = Automatic loopback test to PHV speech handler trunk. Valid for AMPS speech handler trunks only.

Operational tests. Valid value(s):

103 = 103 type test line.

NSYNC = Non-synchronous test line.

PERM = Permanent busy test line.

SYNC = Synchronous test line.

l = Duration of a test in seconds.

m = Number of test bytes sent per block.

n = The bit rate of the digital test run. This value is not necessarily the data rate of the trunk. In some cases, the incompatibility of the trunk data rate and the testing equipment will be detected and the test will be run at the appropriate rate. Valid value(s):

56KPS = A 56K test was run.

64CLR = A 64K clear test was run.

64RES = A 64K restricted test was run.

VOICE = A voice grade test was run.

o = Status of the test. Valid value(s):

ABT = The attempted operations were aborted because of a failure not related to the trunk itself. Refer to variable 'o'.

ATP = Request completed. The test call passed.

COMPL = Request completed. Refer to variable ‘o’.

COMPLETED = Request completed. This status message is returned at the completion of a test on an entire trunk group.

FAIL = Request completed. The test call failed. Refer to variable ‘o’.

STARTED = Request started. This status message is returned at the beginning of a test on an entire trunk group.

CAMPON STARTED = The required test trunk resource for testing is currently busy. If the camp-on option is specified, the test procedure will wait for control of the resource for the specified camp-on time, and display this message.

TESTING BEGINS = This message indicates that the test procedure has successfully obtained ownership of all required test trunk resources. The test procedure now proceeds to obtain control of any required test equipment and to establish all conditions necessary to start testing.

The following are results indicating that no test was attempted:

CMP UNAVAILABLE = The input request could not be completed because a needed communication module (CM) is unable to respond. Retry the request later.
INPUT ERROR = The input message was in error in some way, most likely invalid data.
INV PORT = The trunk specified in the input message was not a valid trunk identifier.
INV PORT STATUS FOR TEST = Port status for an Operator Services Position System (OSPS) extended digital subscriber line (EDSL) B-channel, or a PPM trunk is inappropriate for test.
INV PORT TYPE = The port type specified is invalid for that particular test.
INV TEST FOR ANALOG TRUNKS = Digital LBK and LBKINV tests are invalid for all analog trunks (TENs, SLENs, and ILENs).
MLHG ACCESS DN = The DN entered is a multi-line hunt group channel and as such cannot be tested by specifying its DN. An equipment number (that is, DEN) or MLHG and member number must be specified. To obtain the channel equipment number and/or multi-line hunt group and member number, use recent change/verify (RC/V) for the DN or refer to office records.
MLHG INVALID = The multi-line hunt group specified is not a valid one.
NO TEST = This output can be caused by multiple reasons: 1. a TEST TYPE must be specified. No default test exists for the indicated trunk. 2. An INVALID TEST TYPE was specified. 3. An INVALID TEST is attempted. No OPDN exists for this test.
PACKAGE NOT LOADED = The software optioned package needed to run the test has not been loaded.
SM UNAVAILABLE = The input request could not be completed because a needed SM is unable to respond. Retry the request later.
SYSTEM BUSY = A system resource failure occurred. The system was too busy to perform the request or a system resource failure occurred which prevented the request from being processed.
SYSTEM ERROR = An unspecified error condition occurred while processing the test request.
TERMINATING OSPS NOT TESTABLE = Terminating office in an OSPS interflow configuration is not testable.
TG INVALID = The trunk group specified in the input request was invalid. Verify that the correct group number was specified.
TRUNK BUSY = The trunk was busy and could not be tested. If the trunk was an OSPS interflow trunk or other nailed-up trunk configuration, the trunk was traffic busy and could not be made maintenance busy and could not be tested. If the trunk is a CCS trunk and is in the OOS MTCE CCSINIT state, the trunk is in the process of being reset and cannot be tested.
INVALID TEST FOR TRUNK = The test specified in the input request was invalid for the trunk.
INVALID TEST FOR PACKET TRUNK = The test specified in the input request was invalid for the packet trunk.

Test Group Results:

<table>
<thead>
<tr>
<th>Test Group Results</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>STARTING p^1 TEST CALLS</td>
<td>Starting results given when starting a test with the repeat option. Individual tests will be reported as if individually entered.</td>

<td>Final result given when completing a test with the repeat option. Individual test have been reported as if individually entered.</td>
</tr>
</tbody>
</table>

q^1 = Number of tests started, passed, failed or aborted.

r^1 = Data interface number.
4. ACTIONS TO BE TAKEN

Take the trunk OOS or write a trouble report against a trunk if it is faulty. If an internal software error occurs repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TST:UMBIL

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

TST UMBIL=a-b-c d [e]

2. REASON FOR OUTPUT

To report the result of a test of the connection of a host switching module (HSM) umbilical (UMBIL).

A UMBIL is a host umbilical between a HSM and a remote switching module (RSM). This message is the result of a user TST:UMBIL input message or system action.

3. VARIABLE FIELD DEFINITIONS

a = Host switching module (HSM) number.
b = Remote switching module (RSM) number.
c = Host umbilical (UMBIL) number.
d = Termination report. Valid value(s):
   ABORTED = Requested action was terminated before completion, and the termination was not graceful.
   COMPLETED = Request has successfully completed.
   NOT STARTED = Requested action had not begun.
   STOPPED = Requested action was terminated before a normal completion. Termination was graceful.

e = Additional information qualifying the termination report. Refer to the APP:MAINT-RESP appendix in the Appendixes section of the Output Messages manual.

4. ACTIONS TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

- 1741,xxx,yyy (HOST UMBILICALS (11 - 20))
TST:VFL

Software Release: 5E14 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

TST VFL SOURCE = a STATUS = b [c]
GROUP = d MEMBER = e VFLID = f

2. REASON FOR OUTPUT

To respond to a voice frequency link (VFL) test requested by the craft. A VFL test can be requested from either the 5ESS® switch or from a neighboring 2STP (number 2 signal transfer point). Each 2.4 or 4.8 kbps common channel signaling (CCS) link between the 5ESS® switch and a 2STP consists of a pair of VFLs, one active and the other standby. Each VFL in a pair is distinguished by an identifier (A or B). When a VFL test is requested for a specified CCS link, the test is always run for the standby VFL. This message will indicate which VFL is being tested by listing the group and member numbers for the CCS link and the VFL identifier. Also, the status of the test will be given as either passed, failed, or denied. If a test is denied, the reason for denial will be listed.

3. VARIABLE FIELD DEFINITIONS

a = Source of the test request. Valid value(s):
   5ESS = 5ESS® switch.
   2STP = Number 2 signal transfer point.

b = Status of the test. Valid value(s):
   DENIED
   FAILED
   PASSED

c = If 'b' = DENIED, reason for test denial. Valid value(s):
   1 = VFL test has been preempted.
   2 = Signaling link minor state is not in-service (IS) or TEST.
   3 = Unable to test VFL, resubmit request.

d = Group number.

e = Member number.

f = VFL identifier.

4. ACTION TO BE TAKEN

If a test has PASSED, no action is necessary.

If a test has FAILED, the faulty VFLs should be repaired.

If the test has been DENIED, the action to be taken depends on the reason for test denial (variable 'c'). If variable 'c'
is 1 or 3, the test may be resubmitted. If variable ’c’ is 2, check the signaling link minor state on the CNI display page and resubmit the test once the minor state is IS or TEST.

5. ALARMS

Minor.

TST:WLINE

Software Release: 5E14 and later
Message Class: LINE
Application: AEWNC
Type: Output

1. FORMAT

TST WLINE a b

2. REASON FOR OUTPUT

To report the result of the TST:WLINE.

3. VARIABLE FIELD DEFINITIONS

a = 10 digits of user's analog DN under testing.
b = Status. Valid value(s):
   TST:WLINE ATP = All the line(s) passed the test.
   SYSTEM BUSY -RL = Testing did not started. Retry later.
   SYSTEM ERROR = System error occurred during testing.
   INVALID PORT TYPE = The port is not W-card port.
   TST:WLINE STF = Test for all the W lines completed but some tests failed.
   TST:WLINE TEST FAILED = A single W line test failed.
   TST:WLINE,ALL STARTED = Test for all the W-lines started.
   TST:WLINE,ALL IN PROGRESS = Test for all the W-lines is still in progress.
   TST:WLINE,ALL IN PROGRESS, STF = Test for all the W-lines is still in progress and some tests failed.
   INVALID LINE = The port being tested in not valid.
   SM UNAVAILABLE = The SM is not available.
   PROCESS TIMEOUT = The process time out.
   TST:WLINE HARDWARE PROBLEM = The hardware is out of service.
   TST:WLINE LINE IS BUSY = The W-line under test is busy.

2. REASON FOR OUTPUT

To indicate that the port has been released for automatic testing. Output is produced by the testing processes that actually perform the requested test.

For DGN, a printout of the supported DGN output message follows. For TSTTRK, a printout of the TST:TRK output message follows. For LIT, a printout of the EXC:LIT output message follows. For ALE, a printout of the EXC:ALE output message follows. For RST, a printout of the RST:LINE or RST:TRK output message follows.

3. VARIABLE FIELD DEFINITIONS

a = Test position (TP) number.
b = TLWSR tuple identification.
c = Access type. Valid value(s):
   AC1 JACK = Connection to the AC jack number 1.
   AC2 JACK = Connection to the AC jack number 2.
   CAMPED ON = Line or trunk is camped on.
   CPE TESTS = Test customer premises equipment.
   DC1 JACK = Connection to the DC jack number 1.
   DC2 JACK = Connection to the DC jack number 2.
   DEN = Digital equipment number of the digital trunk or line.
   DIG TRANS = Connection to digital transmission equipment.
IN PROGRESS = Test or test setup is in progress.
METALLIC = Connection to metallic measurement equipment.
MONITOR B&I = Monitor a busy or idle line/trunk.
MONITOR BUSY = Monitor a busy line/trunk.
SEIZED = Line or trunk is seized.
SUPERVISION = Supervisory test running.
TRANSMISSION = Connection to transmission equipment.

d = The mode of the talk and monitor (T&M) phone in the test connection. Valid value(s):
  H = The T&M phone is ON-HOLD (metallic connections).
  M = The T&M phone is in the MONITOR mode (listen-only).
  N = No T&M phone in the connection.
  T = The T&M phone is in the TALK mode (listen and talk).

e = Telephone number entered.

f = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

g = Line equipment number. Valid value(s):

m = Test type requested. Valid value(s):
  DIAGNOSTIC = The circuit will be diagnosed (if supported).
  EXC:ALE = Automatic line evaluation.
EXC:LIT = Line insulation test.
RST:PORT = The port will be restored to service.
TST:DSL = Digital subscriber line testing.
TST:TRK = Automatic test call on the trunk.

n = IDCU number.
o = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Application processor data link. of the Output Messages manual.
p = Data link group number.
q = Relative link member number.
r = Switching module (SM) number.
s = Line unit number.
t = Line group number.
u = Line card number.
v = Grid number.
w = Switch board number (LU1, LU2, or LU3).
x = Switch number.

      PORT HAS BEEN RELEASED  
      m TEST HAS BEEN SCHEDULED

2. **REASON FOR OUTPUT**

   To indicate that the port has been released for automatic testing. Output is produced by the testing processes that actually perform the requested test.

   For DGN, a printout of the supported DGN output message follows.

   For TSTTRK, a printout of the TST:TRK output message follows.

   For LIT, a printout of the EXC:LIT output message follows.

   For ALE, a printout of the EXC:ALE output message follows.

   For RST, a printout of the RST:LINE or RST:TRK output message follows.

3. **VARIABLE FIELD DEFINITIONS**

   Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

   a = Test position (TP) number.  
   b = TLWSR tuple identification.  
   c = Access type. Valid value(s):
   
<table>
<thead>
<tr>
<th>Acronym</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AC1 JACK</td>
<td>Connection to the AC jack number 1.</td>

</tbody>
</table>
DC1 JACK = Connection to the DC jack number 1.
DC2 JACK = Connection to the DC jack number 2.
DEN = Digital equipment number of the digital trunk or line.
DIG TRANS = Connection to digital transmission equipment.
IN PROGRESS = Test or test setup is in progress.
METALLIC = Connection to metallic measurement equipment.
MONITOR B&I = Monitor a busy or idle line/trunk.
MONITOR BUSY = Monitor a busy line/trunk.
SEIZED = Line or trunk is seized.
SUPERVISION = Supervisory test running.
TRANSMISSION = Connection to transmission equipment.

d = The mode of the talk and monitor (T&M) phone in the test connection. Valid value(s):
H = The T&M phone is ON-HOLD (metallic connections).
M = The T&M phone is in the MONITOR mode (listen-only).
N = No T&M phone in the connection.
T = The T&M phone is in the TALK mode (listen and talk).

e = Telephone number entered.

f = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

g = Line equipment number. Valid value(s):
AIUEN=r-u₁-v₁-w₁
AF=p-q
ILEN=r-n-o-n₁
INEN=r-i₁-o-n₁
LCEN=r-s-t-u

VTRK=r-e^2-f^2
OIUEN=r-g^2-h^2-l^2-i^2-j^2-k^2-e^1

m = Test type requested. Valid value(s):
DIAGNOSTIC = The circuit will be diagnosed (if supported).
EXC:ALE = Automatic line evaluation.
EXC:LIT = Line insulation test.
RST:PORT = The port will be restored to service.
TST:DSL = Digital subscriber line testing.
TST:TRK = Automatic test call on the trunk.

n = IDCU number.
o = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.
Application processor data link of the Output Messages manual.
p = Data link group number.
q = Relative link member number.
r = Switching module (SM) number.
s = Line unit number.
t = Line group number.
u = Line card number.
v = Grid number.
w = Switch board number (LU1, LU2, or LU3).
x = Switch number.
y = Level number.
z = Digital carrier line unit number.
a^1 = Remote terminal (RT) number.
b^1 = RT line number.
c^1 = Unit number.
d^1 = Digital facility interface (DFI) number.
e^1 = Channel number.
f^1 = Service group number.
g^1 = Channel board number.
h^1 = Circuit number.
i = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

j = Data group (DG) number.

k = Synchronous transport signal (STS) facility number.

l = SONET termination equipment (STE) facility number.

m = DS0 number.

n = RT line number or PUB43801 channel.

o = PSU unit number.

p = PSU shelf number.

q = PSU channel group number.

r = PSU channel group member number.

s = Line board number.

t = Line circuit number.

u = Access interface unit (AIU) number.

v = AIU line pack number.

w = AIU line circuit number.

x = Virtual tributary group (VTG) number.

y = Virtual tributary member (VTM) number.

z = Line equipment number. Valid value(s):

\[ \text{NEN} = r^1 - j^1 - l^1 - k^1 - x^1 - y^1 - m^1 \]

a = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

b = PCT Facility Interface (PCTFI) number.

c = Tributary number.

d = Channel number.

e = Virtual trunk facility number.

f = Virtual trunk channel number.

g = Optical interface unit (OIU) number.

h = Protection group (PG) number.

i = STS level 1 (STS-1) number.

2. **REASON FOR OUTPUT**

   To display the results of a transmission measurement of the port seized at the trunk and line work station (TLWS) test position (TP).

3. **VARIABLE FIELD DEFINITIONS**

   \( E \) = Error.  

   \( a \) = TP number.  

   \( b \) = TLWSR tuple identification.  

   \( c \) = Valid value(s):  
      AC1 JACK = Connection to the AC jack number 1.  
      AC2 JACK = Connection to the AC jack number 2.  
      CAMPED ON = Line or trunk is camped on.  
      CPE TESTS = Test customer premises equipment.  
      DC1 JACK = Connection to the DC jack number 1.  
      DC2 JACK = Connection to the DC jack number 2.  
      DIG TRANS = Connection to digital transmission equipment.  
      IN PROGRESS = Test or test setup is in progress.
METALLIC = Connection to metallic measurement equipment.
MONITOR B&I = Monitor a busy or idle line/trunk.
MONITOR BUSY = Monitor a busy line/trunk.
SEIZED = Line or trunk is seized.
SUPERVISION = Supervisory test running.
TRANSMISSION = Connection to transmission equipment.

d = Valid value(s):
LOOP BACK PATTERN = A digital loopback test is in progress.
MEASURE = A measure test is being performed on the port.
MONITOR BUSY = The port is busy and currently being monitored with the T&M phone.
MONITOR BUSY/IDLE = The port is busy or idle and currently being monitored with the T&M phone.
OPEN TERMINATION = An open termination is being applied to the port.
PREEMPT TONE = A precedent and preemption tone is being applied to the port.
PLAY ANNOUNCEMENT = An announcement is being played at the RAF or SAS port.
PLAY PHRASE = Phrases are being played at the RAF or SAS port.
QUEUEING HARDWARE = The requested test has not begun, waiting for testing hardware to become available.
QUIET TERMINATION = A quiet termination is being applied to the port.
RING = The line is ringing.
ROH TONE = Receiver off-hook tone being applied to the port.
SENDING = Tone is being sent over the port.
STOPPED = Send activity has been stopped.

e = Telephone number entered.
f = Member number of the line time slot bridging (LT SB) line. For LT SB a member number of 1 represents the lead line and a member number of 2 represents the associate line.
g = Line equipment number. Valid value(s):

\[
\begin{align*}
AIUE = u - x^1 - y^1 - z^1 \\
AP = a - t \\
ILEN = u - v - w - x \\
INEN = u - m^1 - w - x \\
LCEN = u - y - z - a^1 \\
LCKEN = u - y - z - v^1 - w^1 \\
LEN = u - y - b^1 - c^1 - d^1 - e^1 \\
SLEN = u - f^1 - v - w - x
\end{align*}
\]
h = Multi-line hunt group number.
i = Hunt group member number.
j = Trunk group number.
k = Trunk member number.
l = Trunk equipment number. Valid value(s):
m = The mode of the T&M phone in the test connection. Valid value(s):
H = The T&M phone is ON-HOLD (metallic connections).
M = The T&M phone is in the MONITOR mode (listen-only).
N = No T&M phone in the connection.
T = The T&M phone is in the TALK mode (listen and talk).

n = Frequency of tone being sent simultaneous to measurement being performed.

o = Level of tone being sent simultaneous to measurement being performed.

p = Measured frequency in hertz. Valid value(s):
BBAND = Broad-band-level test.
ERL = Echo-return-loss test.
L404 = Frequency test at 404 Hz.
L1004 = Frequency test at 1004 Hz.
L2804 = Frequency test at 2804 Hz.
N = Noise test.
NWT = Noise with tone test.
SRL = Singing-return-loss test.
SRLHI = Singing-return-loss-high test.

q = Measured level in decibels. Valid value(s):
NOTST = No test run.
OORHI = Out-of-range high.
OORLO = Out-of-range low.

r = Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

s = Data link (group) number.

t = Relative link (member) number.

u = Switching module (SM) number.

v = IDCU number.

w = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.

x = RT line number or PUB43801 channel.

y = Line unit number.
z = Line group number.
a = Line card number.
b = Grid number.
c = Switch board number (LU1, LU2, or LU3).
d = Switch number.
e = Level number.
f = Digital carrier line unit number.
g = Digital line and trunk unit (DLTU) number.
h = Digital facility interface (DFI) number.
i = Channel number.
j = Service group number.
k = Channel board number.
l = Circuit number.
m = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
n = Data group (DG) number.
o = Synchronous transport signal (STS) facility number.
p = SONET termination equipment (STE) facility number.
q = Digital signal level 0 (DS0) number.
r = PSU unit number.
s = PSU shelf number.
t = PSU channel group number.
u = PSU channel group member number.
v = Line board number.
w = Line circuit number.
x = Access interface unit (AIU) number.
y = AIU line pack number.
z = AIU line circuit number.
a = Virtual tributary group (VTG) number.
b = Virtual tributary member (VTM) number.
$c^2$ = Line equipment number. Valid value(s):

\[NEN=u-m^1-n^1-p^1-c^1-a^2-b^2-q^1\]

4. ACTIONS TO BE TAKEN

None. No action is required.

2. REASON FOR OUTPUT

To display the results of a transmission measurement of the port seized at the trunk and line work station (TLWS) test position (TP).

3. VARIABLE FIELD DEFINITIONS

   NOTE: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

   E   = Error.
   a   = TP number.
   b   = TLWSR tuple identification.
   c   = Valid value(s):
   AC1 JACK = Connection to the AC jack number 1.
   AC2 JACK = Connection to the AC jack number 2.
   CAMPED ON = Line or trunk is camped on.
   CPE TESTS = Test customer premises equipment.
   DC1 JACK = Connection to the DC jack number 1.
   DC2 JACK = Connection to the DC jack number 2.
   DIG TRANS = Connection to digital transmission equipment.
   IN PROGRESS = Test or test setup is in progress.
METALLIC = Connection to metallic measurement equipment.
MONITOR B&I = Monitor a busy or idle line/trunk.
MONITOR BUSY = Monitor a busy line/trunk.
SEIZED = Line or trunk is seized.
SUPERVISION = Supervisory test running.
TRANSMISSION = Connection to transmission equipment.

\[d\] = Valid value(s):
LOOP BACK PATTERN = A digital loopback test is in progress.
MEASURE = A measure test is being performed on the port.
MONITOR BUSY = The port is busy and currently being monitored with the T&M phone.
MONITOR BUSY/IDLE = The port is busy or idle and currently being monitored with the T&M phone.
OPEN TERMINATION = An open termination is being applied to the port.
PREEMPTTONE = A precedent and preemption tone is being applied to the port.
PLAY ANNOUNCEMENT = An announcement is being played at the RAF or SAS port.
PLAY PHRASE = Phrases are being played at the RAF or SAS port.
QUEUEING HARDWARE = The requested test has not begun, waiting for testing hardware to become available.
QUIET TERMINATION = A quiet termination is being applied to the port.
RING = The line is ringing.
ROH TONE = Receiver off-hook tone being applied to the port.
SENDING = Tone is being sent over the port.
STOPPED = Send activity has been stopped.

\[e\] = Telephone number entered.

\[f\] = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

\[g\] = Line equipment number. Valid value(s):
AIUN=x+y+z
\[AP=s-t\]
ILEN=u-v-w-x
\[INEN=u+m-w-x\]
LCEN=u-y-z-a
\[LCKEN=u-y-z-v-w\]
\[LEN=u-y-b-c-d-e\]
SLEN=u-f-v-w-x

\[h\] = Multi-line hunt group number.

\[i\] = Hunt group member number.

\[j\] = Trunk group number.

\[k\] = Trunk member number.

\[l\] = Trunk equipment number. Valid value(s):
DEN = u-g\(^1\)-h\(^1\)-i\(^1\)
INEN = u-m\(^1\)-w-x
NEN = u-m\(^1\)-n\(^1\)-p\(^1\)-o\(^1\)-a\(^2\)-b\(^2\)-q\(^1\)
PLTEN = u-d\(^2\)-e\(^2\)-f\(^2\)-g\(^2\)
OIUEN = u-h\(^2\)-i\(^2\)-m\(^2\)-j\(^2\)-k\(^2\)-l\(^2\)-l\(^1\)
PSUEN = u-r\(^1\)-s\(^1\)-t\(^1\)-u\(^1\)
RAF PORT = u-g\(^1\)-i\(^1\)
SAS PORT = u-g\(^1\)-i\(^1\)
TEN = u-g\(^1\)-j\(^1\)-k\(^1\)-l\(^1\)

m = The mode of the T&M phone in the test connection. Valid value(s):
   H = The T&M phone is ON-HOLD (metallic connections).
   M = The T&M phone is in the MONITOR mode (listen-only).
   N = No T&M phone in the connection.
   T = The T&M phone is in the TALK mode (listen and talk).

n = Frequency of tone being sent simultaneous to measurement being performed.

o = Level of tone being sent simultaneous to measurement being performed.

p = Measured frequency in hertz. Valid value(s):
   BBAND = Broad-band-level test.
   ERL = Echo-return-loss test.
   L404 = Frequency test at 404 Hz.
   L1004 = Frequency test at 1004 Hz.
   L2804 = Frequency test at 2804 Hz.
   N = Noise test.
   NWT = Noise with tone test.
   SRL = Singing-return-loss test.
   SRLHI = Singing-return-loss-high test.

q = Measured level in decibels. Valid value(s):
   NOTST = No test run.
   OORHI = Out-of-range high.
   OORLO = Out-of-range low.

r = Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

s = Data link (group) number.

t = Relative link (member) number.

u = Switching module (SM) number.

v = IDCU number.

w = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.

x = RT line number or PUB43801 channel.
= Line unit number.

z = Line group number.
a = Line card number.
b = Grid number.
c = Switch board number (LU1, LU2, or LU3).
d = Switch number.
e = Level number.
f = Digital carrier line unit number.
g = Digital line and trunk unit (DLTU) number.
h = Digital facility interface (DFI) number.
i = Channel number.
j = Service group number.
k = Channel board number.
l = Circuit number.
m = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.
n = Data group (DG) number.
o = Synchronous transport signal (STS) facility number.
p = SONET termination equipment (STE) facility number.
q = Digital signal level 0 (DS0) number.
r = PSU unit number.
s = PSU shelf number.
t = PSU channel group number.
u = PSU channel group member number.
v = Line board number.
w = Line circuit number.
x = Access interface unit (AIU) number.
y = AIU line pack number.
z = AIU line circuit number.
a = Virtual tributary group (VTG) number.
b² = Virtual tributary member (VTM) number.
c² = Line equipment number. Valid value(s):
    NEN=u-m¹-n¹-p¹-o¹-a²-b²-q¹
d² = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.
e² = PCT facility interface (PCTFI) number.
f² = Tributary number.
g² = Channel number.
h² = Optical interface unit (OIU) number.
i² = Protection group (PG) number.
j² = STS-1 number.
k² = Virtual tributary 1.5 group (VTGRP) number.
l² = Virtual tributary 1.5 member (VTMEM) number.
m² = OC-3 STE number.

4. ACTIONS TO BE TAKEN

None. No action is required.

5. ALARMS

None.

   [E=n]

2. REASON FOR OUTPUT

To display the results of a metallic test at the trunk and line work station (TLWS) test position (TP).

Format 1 is for the output of line testing. Format 2 is for the output of trunk testing.

3. VARIABLE FIELD DEFINITIONS

E = Error.
a = TP number.
b = TLWSR tuple identification.
c = Access type. Valid value(s):
   METALLIC = Connection to metallic measurement equipment.

e = The mode of the T&M phone in the test connection. Valid value(s):
   H = The T&M phone is ON-HOLD (metallic connections).
   M = The T&M phone is in the MONITOR mode (listen-only).
   N = No T&M phone in the connection.
   T = The T&M phone is in the TALK mode (listen and talk).

f = Telephone number entered.
g = Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.
h = Line equipment number. Valid value(s):
   AIUEN=r-n^1-o^1-p^1
   AP=p-q
   ILEN=r-s-t-u
   INEN=r-q^1-t-u
   LCEN=r-v-w-x
   LCEN=r-v-w-l^1-m^1
   LEN=r-v-y-z-a^1-b^1
   SLEN=r-c^1-t-u

i = Multi-line hunt group number.

j = Hunt group member number.

k = Trunk group number.

l = Trunk member number.

m = Trunk equipment number. Valid value(s):
   DEN=r-d^1-e^1-f^1
   INEN=r-q^1-t-u
   RAF PORT=r-g^1-f^1
   SAS PORT=r-g^1-f^1
   TEN=r-g^1-h^1-i^1-j^1

n = Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

o = The test results. Refer to the OP:WSDATA output message for detailed result formats.

p = Data link (group) number.

q = Relative link (member) number.

r = Switching module (SM) number.

s = IDCU number.

t = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.

u = RT line number or PUB43801 channel.

v = Line unit number.

w = Line group number.

x = Line card number.

y = Grid number.

z = Switch board number (LU1, LU2, or LU3).
a\textsuperscript{1} = Switch number.

b\textsuperscript{1} = Level number.

c\textsuperscript{1} = Digital carrier line unit number.

d\textsuperscript{1} = Digital line and trunk unit (DLTU) number.

e\textsuperscript{1} = Digital facility interface (DFI) number.

f\textsuperscript{1} = Channel number.

g\textsuperscript{1} = Unit number.

h\textsuperscript{1} = Service group number.

i\textsuperscript{1} = Channel board number.

j\textsuperscript{1} = Circuit number.

k\textsuperscript{1} = Type of metallic test equipment. Valid type are:

\begin{itemize}
  \item DCTU = Directly connected test unit.
  \item SLIM = Subscriber line and instrument measurement.
\end{itemize}

l\textsuperscript{1} = Line board number.

m\textsuperscript{1} = Line circuit number.

n\textsuperscript{1} = Access interface unit (AIU) number.

o\textsuperscript{1} = AIU line pack number.

p\textsuperscript{1} = AIU line circuit number.

q\textsuperscript{1} = DNU number.

2. REASON FOR OUTPUT

To display the results of a monitor busy or monitor idle test at the trunk and line work station (TLWS) test position (TP).

3. VARIABLE FIELD DEFINITIONS

E = Error.
a = TP number.
b = TLWSR tuple identification.
c = Access. Valid value(s):
AC1 JACK = Connection to the AC jack number 1.
AC2 JACK = Connection to the AC jack number 2.
CAMPED ON = Line or trunk is camped on.
CPE TESTS = Test customer premises equipment.
DC1 JACK = Connection to the DC jack number 1.
DC2 JACK = Connection to the DC jack number 2.
DIG TRANS = Connection to digital transmission equipment.
IN PROGRESS = Test or test setup is in progress.
METALLIC = Connection to metallic measurement equipment.
MONITOR B&I = Monitor a busy or idle line/trunk.
MONITOR BUSY = Monitor a busy line/trunk.
SEIZED = Line or trunk is seized.
SUPERVISION = Supervisory test running.
TRANSMISSION = Connection to transmission equipment.

D = Action. Valid value(s):
LOOPBACK PATTERN = A digital loopback test is in progress.
MEASURE = A measure test is being performed on the port.
MONITOR BUSY = The port is busy and currently being monitored with the talk and monitor (T&M) phone.
MONITOR BUSY/IDLE = The port is busy or idle and currently being monitored with the T&M phone.
OPEN TERMINATION = An open termination is being applied to the port.
PREEMPT TONE = A precedent and preemption tone is being applied to the port.
PLAY ANNOUNCEMENT = An announcement is being played at the RAF or SAS port.
PLAY PHRASE = Phrases are being played at the RAF or SAS port.
QUEUEING HARDWARE = The requested test has not begun, waiting for testing hardware to become available.
QUIET TERMINATION = A quiet termination is being applied to the port.
RING = The line is ringing.
ROH TONE = Receiver off-hook tone being applied to the port.
SENDING = Tone is being sent over the port.
STOPPED = Send activity has been stopped.
ADD PGTC = Add pair gain test controller to the port.

E = The mode of the T&M phone in the test connection. Valid value(s):
H = The T&M phone is ON-HOLD (metallic connections).
N = No T&M phone in the connection.
M = The T&M phone is in the MONITOR mode (listen-only).
T = The T&M phone is in the TALK mode (listen and talk).

F = Error Type. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

G = Telephone number entered.

H = Member number of the line time slot bridging (LT SB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

I = Line equipment number. Valid value(s):
AIUEN=q-v₁-w₁-x₁
AP=o-p
ILEN=q-r-s-t
INEN=q-k₁-s-t
LCEN=q-u-v-w

p = Relative link (member) number of the AP.
q = Switching module (SM) number.
r = IDCU number.
s = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.
t = RT line number or PUB43801 channel.
u = Line unit number.
v = Line group number.
w = Line card number.
x = Grid number.
y = Switch board number (LU1, LU2, or LU3).
z = Switch number.
a\textsuperscript{1} = Level number.
b\textsuperscript{1} = Digital carrier line unit number.
c\textsuperscript{1} = Digital line and trunk unit (DLTU) number.
d\textsuperscript{1} = Digital facility interface (DFI) number.
e\textsuperscript{1} = Channel number.
f\textsuperscript{1} = Unit number.
g\textsuperscript{1} = Service group number.

h\textsuperscript{1} = Channel board number.

i\textsuperscript{1} = Circuit number.

j\textsuperscript{1} = The type of the T&M phone in the test connection. Valid value(s):
- LOCAL T&M PHONE = The T&M phone type is a local talk and monitor phone.
- NO T&M PHONE = No T&M phone in the connection.
- REMOTE T&M PHONE = The T&M phone type is a remote talk and monitor phone.

k\textsuperscript{1} = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

l\textsuperscript{1} = Data group (DG) number.

m\textsuperscript{1} = Synchronous transport signal (STS) facility number.

n\textsuperscript{1} = SONET termination equipment (STE) facility number.

o\textsuperscript{1} = Digital signal level 0 (DS0) number.

p\textsuperscript{1} = PSU unit number.

q\textsuperscript{1} = PSU shelf number.

r\textsuperscript{1} = PSU channel group number.

s\textsuperscript{1} = PSU channel group member number.

t\textsuperscript{1} = Line board number.

u\textsuperscript{1} = Line circuit number.

v\textsuperscript{1} = Access interface unit (AIU) number.

w\textsuperscript{1} = AIU line pack number.

x\textsuperscript{1} = AIU line circuit number.

y\textsuperscript{1} = Virtual tributary group (VTG) number.

z\textsuperscript{1} = Virtual tributary member (VTM) number.

a\textsuperscript{2} = Line equipment number. Valid value(s):

\[ q-k\textsuperscript{1}l\textsuperscript{1}n\textsuperscript{1}m\textsuperscript{1}y\textsuperscript{1}z\textsuperscript{1}o\textsuperscript{1} \]

4. ACTIONS TO BE TAKEN

None. No action is required.

   [E=f]

2. REASON FOR OUTPUT

To display the results of a monitor busy or monitor idle test at the trunk and line work station (TLWS) test position (TP).

3. VARIABLE FIELD DEFINITIONS

E = Error.
a = TP number.
b = TLWSR tuple identification.
c = Access. Valid value(s):
   AC1 JACK = Connection to the AC jack number 1.
   AC2 JACK = Connection to the AC jack number 2.
   CAMPED ON = Line or trunk is camped on.
   CPE TESTS = Test customer premises equipment.
   DC1 JACK = Connection to the DC jack number 1.
   DC2 JACK = Connection to the DC jack number 2.
   DIG TRANS = Connection to digital transmission equipment.
   IN PROGRESS = Test or test setup is in progress.
   METALLIC = Connection to metallic measurement equipment.
   MONITOR B&I = Monitor a busy or idle line/trunk.
   MONITOR BUSY = Monitor a busy line/trunk.
   SEIZED = Line or trunk is seized.
   SUPERVISION = Supervisory test running.
**TRANSMISSION =** Connection to transmission equipment.

**d**  
LOOPBACK PATTERN = A digital loopback test is in progress.  
MEASURE = A measure test is being performed on the port.  
MONITOR BUSY = The port is busy and currently being monitored with the talk and monitor (T&M) phone.  
MONITOR BUSY/IDLE = The port is busy or idle and currently being monitored with the T&M phone.  
OPEN TERMINATION = An open termination is being applied to the port.  
PREEMPT TONE = A precedent and preemption tone is being applied to the port.  
PLAY ANNOUNCEMENT = An announcement is being played at the RAF or SAS port.  
PLAY PHRASE = Phrases are being played at the RAF or SAS port.  
QUEUEING HARDWARE = The requested test has not begun, waiting for testing hardware to become available.  
QUIET TERMINATION = A quiet termination is being applied to the port.  
RING = The line is ringing.  
ROH TONE = Receiver off-hook tone being applied to the port.  
SENDING = Tone is being sent over the port.  
STOPPED = Send activity has been stopped.  
ADD PGTC = Add pair gain test controller to the port.

**e**  
= The mode of the T&M phone in the test connection. Valid value(s):  
H = The T&M phone is ON-HOLD (metallic connections).  
N = No T&M phone in the connection.  
M = The T&M phone is in the MONITOR mode (listen-only).  
T = The T&M phone is in the TALK mode (listen and talk).

**f**  
= Error Type. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

**g**  
= Telephone number entered.

**h**  
= Member number of the line time slot bridging (LTSB) line. For LTSB a member number of 1 represents the lead line and a member number of 2 represents the associate line.

**i**  
= Line equipment number. Valid value(s):

- AIUEN=q-v^1-w^1-x^1  
- AP=o-p  
- ILEN=q-r-s-t  
- INEN=q-k^1-s-t  
- LCEN=q-u-v-w  
- LCKEN=q-u-v-t^1-u^1  
- LEN=q-u-x-y-z-a^1  
- SLEN=q-b^1-s-t

**j**  
= Multi-line hunt group number.

**k**  
= Hunt group member number.
l = Trunk group number.
m = Trunk member number.
n = Trunk equipment number. Valid value(s):
   DEN=q-c^1-d^1-e^1
   INEN=q-k^1-s-t
   NEN=q-k^1-l^1-m^1-n^1-y^1-z^1-o^1
   PLTEN=q-b^2-c^2-d^2-e^2
   OIUEN=q-f^2-g^2-k^2-h^2-i^2-j^2-e^1
   PSUEN=q-p^1-q^1-r^1-s^1
   RAF PORT=q-f^1-e^1
   SAS PORT=q-f^1-e^1
   TEN=q-f^1-g^1-h^1-i^1

o = Data link (group) number of the AP.
p = Relative link (member) number of the AP.
q = Switching module (SM) number.
r = IDCU number.
s = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number.
t = RT line number or PUB43801 channel.
u = Line unit number.
v = Line group number.
w = Line card number.
x = Grid number.
y = Switch board number (LU1, LU2, or LU3).
z = Switch number.
a^1 = Level number.
b^1 = Digital carrier line unit number.
c^1 = Digital line and trunk unit (DLTU) number.
d^1 = Digital facility interface (DFI) number.
e^1 = Channel number.
f^1 = Unit number.
g^1 = Service group number.
h₁ = Channel board number.

i₁ = Circuit number.

j₁ = The type of the T&M phone in the test connection. Valid value(s):
   LOCAL T&M PHONE = The T&M phone type is a local talk and monitor phone.
   NO T&M PHONE = No T&M phone in the connection.
   REMOTE T&M PHONE = The T&M phone type is a remote talk and monitor phone.

k₁ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

l₁ = Data group (DG) number.

m₁ = Synchronous transport signal (STS) facility number.

n₁ = SONET termination equipment (STE) facility number.

o₁ = Digital signal level 0 (DS0) number.

p₁ = PSU unit number.

q₁ = PSU shelf number.

r₁ = PSU channel group number.

s₁ = PSU channel group member number.

τ₁ = Line board number.

u₁ = Line circuit number.

v₁ = Access interface unit (AIU) number.

w₁ = AIU line pack number.

x₁ = AIU line circuit number.

y₁ = Virtual tributary group (VTG) number.

z₁ = Virtual tributary member (VTM) number.

a² = Line equipment number. Valid value(s):
   NEN=q₁-k₁-l₁-n₁-m₁-y₁-z₁-o₁

b² = Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

c² = PCT facility interface (PCTFI) number.

d² = Tributary number.

e² = Channel number.

f² = Optical interface unit (OIU) number.
g^2 = Protection group (PG) number.
h^2 = STS level 1 (STS-1) number.
i^2 = Virtual tributary 1.5 group (VTGRP) number.
j^2 = Virtual tributary 1.5 member (VTMEM) number.
k^2 = OC-3 STE number.

4. ACTIONS TO BE TAKEN

None. No action is required.

5. ALARMS

None.

q

2. REASON FOR OUTPUT

To display the results of a supervision test request at the trunk and line work station (TLWS) test position (TP).

3. VARIABLE FIELD DEFINITIONS

a = TP number.

b = rTLWSR tuple identification.

c = Access type. Valid value(s):
SEIZED = Line or trunk is seized.
SUPERVISION = Supervisory test running.
TRANSMISSION = Connection to transmission equipment.

d = The mode of the T&M phone in the test connection. Valid value(s):
H = The T&M phone is ON-HOLD (metallic connections).
M = The T&M phone is in the MONITOR mode (listen-only).
N = No T&M phone in the connection.
T = The T&M phone is in the TALK mode (listen and talk).

e = Telephone number entered.
f = Member number of the line time slot bridging (LTSB) line. For LTSB member number. Valid value(s):
   1 = The lead line.
   2 = The associate line.

g = Line equipment number. Valid value(s):
   AIUEN=t-e^2-f^2-g^2
   AP=r-s
   ILEN=t-u-v-w
   INEN=t-t^1-v-w
   LCEN=t-x-y-z
   LCKEN=t-x-y-c^2-d^2
   LEN=t-x-a^1-b^1-c^1-d^1
   SLEN=t-e^1-v-w

h = Multi-line hunt group number.
i = Hunt group member number.
j = Trunk group number.
k = Trunk member number.
l = Trunk equipment number. Valid value(s):
   DEN=t-f-g-h^1
   INEN=t-t^1-v-w
   NEN=t-t^1-u^1-w^1-v^1-h^2-i^2-x^1
   PSUEN=t-y^1-z^1-a^2-b^2
   RAF t-i^1-h^1
   SAS t-i^1-h^1
   TEN=t-t^1-j^1-k^1-l^1

m = Error messages. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.
n = Far-end supervision. Valid value(s):
   FAR=ON-HOOK = The far-end of the trunk is on hook.
   FAR=OFF-HOOK = The far-end of the trunk is off hook.

o = Near-end supervision. Valid value(s):
   NEAR=OFF-HOOK = The near-end of the trunk is off hook.
   NEAR=ON-HOOK = The near-end of the trunk is on hook.
p = Supervision test type. Valid value(s):
COIN COLLECT = An operator coin collect was performed on the port.
COIN COLLECT/OPERATOR RELEASE = An operator coin collect and operator release was performed on the port.
COIN DETECTION = An operator coin detected was performed on the port.
COIN RETURN = An operator coin return was performed on the port.
DISABLE ECHO CANCELER = A request to disable the echo canceler was performed.
ENABLE ECHO CANCELER = A request to enable the echo canceler was performed.
HOME TOTALIZER = An operator home totalizer was performed on the port.
MISMATCH TEST = The results of a line-card mismatch test are provided.
OPERATOR ATTACH = Operator attach was performed on the port.
OPERATOR RELEASE = Operator release was performed on the port.
PLAY DIAL-THROUGH ANNOUNCEMENT = A DTA recorded announcement is being played. The DTA digits may also be provided if present.
PLAY RECORDED ANNOUNCEMENT = A recorded announcement is being played.
PLAY RECORDED PHRASE = A recorded announcement phrase is being played.
QUICK WINK RESULTS = The results of a quick wink are provided. Only one set of results are given for quick winks.
RINGBACK TONE = Ringback tone being applied.
RING LINE = The port is ringing.
SEND PREEMPT TONE = Precedence and preemption tone being sent.
SEND ROH TONE = Receiver off-hook tone being sent.
SHT LOOPBACK COMPLETED = A request to loopback the speech handler trunk was completed.
SHT UNLOOPBACK COMPLETED = A request to un-loopback the speech handler trunk was completed.
SUPERVISION TRANSITION = Near-end and far-end supervision status changes.
WINK RESULTS = Provides a set of wink results. Up to ten sets will be provided.

q

2. REASON FOR OUTPUT

To display the results of a supervision test request at the trunk and line work station (TLWS) test position (TP).

3. VARIABLE FIELD DEFINITIONS

E = Error.

a = TP number.

b = TLWSR tuple identification.

c = Access type. Valid value(s):
   SEIZED = Line or trunk is seized.
   SUPERVISION = Supervisory test running.
   TRANSMISSION = Connection to transmission equipment.

d = The mode of the T&M phone in the test connection. Valid value(s):
   H = The T&M phone is ON-HOLD (metallic connections).
   M = The T&M phone is in the MONITOR mode (listen-only).
   N = No T&M phone in the connection.
T  = The T&M phone is in the TALK mode (listen and talk).

e  = Telephone number entered.

f  = Member number of the line time slot bridging (LTSB) line. For LTSB member number. Valid value(s):
   1  = The lead line.
   2  = The associate line.

g  = Line equipment number. Valid value(s):
      AIUEN=t-e^2-f^2-g^2
      AP=r-s
      ILEN=t-u-v-w
      INEN=t-t^1-v-w

2. REASON FOR OUTPUT

To report progression of action requested by the UPD:APPLY input message.

Format 1 indicates the APPLY has already completed for the software update indicated in 'a' for the file name indicated in 'b' and the dependent file name indicated in 'c'.

Format 2 indicates the APPLY has already completed for software update indicated in 'a' for the file name indicated in 'b'.

Format 3 indicates the new file name created during the APPLY.

Format 4 indicates that the APPLY section is in progress.

Format 5 indicates that the entire APPLY section has completed for the software update indicated in 'a'.

Format 6 indicates the completion of APPLY for software update indicated in 'a' for file name indicated in 'b' with
dependent file indicated in ‘c’.

Format 7 indicates the completion of APPLY for software update indicated in ‘a’ for file name indicated in ‘b’.

Format 8 indicates that the stubs function indicated in ‘d’ has been applied to the new address indicated in ‘e’.

Format 9 indicates that the function indicated in ‘d’ has been applied to the new address indicated in ‘e’.

Format 10 indicates the status of the target communication module processor (CMP) indicated in ‘g’.

Format 11 indicates the status of the target switching module (SM) indicated in ‘g’.

Format 12 indicates the list of affected peripherals of the type indicated in ‘i’. If an affected SM contains no affected peripherals, then this fact is printed.

Format 13 indicates that a remove/restore will be necessary to complete the update. One or more UPD:PMPPERF input messages should appear in the software update messages file to do this automatically.

Format 14 indicates that some of the affected SMs or CMPs are not updated.

Format 15 indicates that an apply has either aborted, partially completed, completed or stopped.

3. VARIABLE FIELD DEFINITIONS

a = Software update name.

b = File path.

c = Dependent file path.

d = Function name.

e = New address.

f = Processor type. Valid value(s):
   AP = Application processor.
   CMP = Communication module processor.
   MSGH = Message handler.

g = Processor number.

h = Processor status. Valid value(s):
   APPL = Applied and operational.
   BKT = Backed out and operational.
   ISOL = Isolated.
   NAPP = Not applied, but operational.
   NOP = Not operational.
   UPNBKT = Not backed out, but operational.

i = Affected processor type. Valid value(s):
   DNUSCC:SM[l] = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control (CC) when the indicated inconsistency applies to a specific SM's DNU-S CC(s).
   DSC3-GDSF:SM[l] = Digital service circuit - model 3 (DSC3) global digital services function
GDSF) when the indicated inconsistency applies to a specific SM’s GDSF.

DSC3-LDSF:SM[l] = DSC3 local digital services function (LDSF) when the indicated inconsistency applies to a specific SM’s LDSF.

DSU2-ISTF:SM[l] = DSU2 - integrated services test function (ISTF) when the indicated inconsistency applies to a specific SM’s ISTF(s).

DSU2-LDSU:SM[l] = DSU2 - local digital service unit (LDSU) function when the indicated inconsistency applies to a specific SM’s LDSU(s).

DSU2-RAF:SM[l] = DSU2 - recorded announcement function (RAF) when the indicated inconsistency applies to a specific SM’s RAF(s).

DSU2-SAS:SM[l] = DSU2 - service announcement system (SAS) when the indicated inconsistency applies to a specific SM’s SAS(s).

ISLU-CC:SM[l] = Integrated services line unit (ISLU) CC when the indicated inconsistency applies to a specific SM’s ISLUCC(s).

ISLU2-CC:SM[l] = Integrated services line unit 2 (ISLU2) common controller (CC) when the indicated inconsistency applies to a specific SM’s ISLU2CC(s).

IDCU-CCP:SM[l] = Integrated digital carrier unit (IDCU) common control processor (CCP) when the indicated inconsistency applies to a specific SM’s IDCU CCP(s).

IDCU-DLP:SM[l] = IDCU data link processor (DLP) when the indicated inconsistency applies to a specific SM’s IDCU DLP(s).

PSU-IP4I:SM[l] = The operational image for the input/output processor on the PSU PH4 integrated services digital network (ISDN) when the indicated inconsistency applies to a specific SM’s PH4(s).

PSU-OIOP:SM[l] = The operational image for the input/output processor on the PSU PH3 when the indicated inconsistency applies to a specific SM’s PH3(s).

PSU-ODMA:SM[l] = The operational image for the direct-memory-access processor on the PSU PH2 when the indicated inconsistency applies to a specific SM’s PH2(s).

PSU-PH2A:SM[l] = PSU PH2 loaded with the ACCESS image when the indicated inconsistency applies to a specific SM’s PH2(s).

PSU-PH2G:SM[l] = PSU PH2 loaded with the GATEWAY image when the indicated inconsistency applies to a specific SM’s PH2G(s).

PSU-PH3C:SM[l] = Packet switching unit (PSU) protocol handler 3 (PH3) loaded with the COMMON image when the indicated inconsistency applies to a specific SM’s PH3(s).

PSU-PH3S:SM[l] = Packet switching unit (PSU) protocol handler 4 (PH4) loaded with the integrated services digital network (ISDN) image when the indicated inconsistency applies to a specific SM’s PH4(s).

TMUX:SM[l] = Transmission multiplexer when the indicated inconsistency applies to a specific SM’s TMUX(s).

PSU-IP4F:SM[l] = Operational image for the input/output processor on the PSU PH4 frame relay protocol handler. When the indicated inconsistency applies to a specific SM’s IP4F(s).

PSU-PHV1C:SM[l] = Protocol handler for voice when the indicated inconsistency applies to a specific SM’s PHV1C(s).

PSU-PHA1A:SM[l] = Protocol handler for ATM when the indicated inconsistency applies to a specific SM’s PHA1A(s).

ISLU-CC2:SM[l] = Integrated services line unit (ISLU) common controller (CC) when the indicated inconsistency applies to a specific SM’s ISLUCC2(s).

PSU-IP4IF:SM[l] = The operational image for the input/output processor on the PSU PH4 integrated services digital network specific SM’s PH4(s).

PSU-PH3S:SM[l] = Packet switching unit (PSU) protocol handler 3 (PH3) when the indicated
inconsistency applies to a specific SM's PH3(s)

PSU-IP3S:SM[1] = The operational image for the input/output processor on the PSU PH3 integrated services digital network (ISDN) for common channel signaling when the indicated inconsistency applies to a specific SM's IP3(s).

PSU-DSP8K:SM[1] = 8k digital signal processor (DSP) on PHV3 when the indicated inconsistency applies to a specific SM's PHV3(s).

PSU-DSP13K:SM[1] = 13K digital signal processor (DSP) on PHV3 when the indicated inconsistency applies to a specific SM's PHV3(s).

PSU-PHV3C:SM[1] = Packet switching unit (PSU) protocol handler for voice 3 (PHV3) loaded with the COMMON image when the indicated inconsistency applies to a specific SM's PHV3C(s).

PSU-PHV4C:SM[1] = Packet switching unit (PSU) protocol handler for voice 4 (PHV) loaded with the COMMON image when the indicated inconsistency applies to a specific SM's PHV4C(s).

PSU-V4D8K:SM[1] = 8K digital signal processor (DSP) on PHV4C when the indicated inconsistency applies to a specific SM's V4D(s).

PSU-V4D13K:SM[1] = 13K digital signal processor (DSP) on PHV4C when the indicated inconsistency applies to a specific SM's V4D(s).

PSU-DDMA:SM[1] = Diagnostic image for the direct-memory-access processor on the PSU PH2 when the indicated inconsistency applies to a specific SM's PH2(s).

PSU-DSP3EVRC:SM[1] = EVRC digital signal processor for CDMA protocol handler for voice when the inconsistency applies to a specific DSPEVRC(s).

PSU-V3DACP:SM[1] = ACELP digital signal processor, for TDMA protocol handler for voice. When the indicated inconsistency applies to a specific SM's V3DACP(s).

PSU-V3DVSP:SM[1] = VSELP digital signal processor, for TDMA protocol handler for voice. When the indicated inconsistency applies to specific SM's V3DVSP(s).

PSU-D4VDVERC:SM[1] = EVRC DSP, for CDMA protocol handler for voice version 4. When the indicated inconsistency applies to specific SM's D4VDVERC(s).

PSU-V4DACP:SM[1] = ACELP DSP, for TDMA protocol handler for voice version 4. When the indicated inconsistency applies to specific SM's V4DACP.

PSU-V4DVSP:SM[1] = VSELP, DSP, for TDMA protocol handler for voice version 4. When the indicated inconsistency applies to a specific SM's V4DVSP.

DSU2-HSAS:SM[1] = DSU2 service announcement system (SAS) When the indicated inconsistency applies to a specific SM's HSAS(s).

DSC4-LDSF:SM[1] = DSC4 local digital service function (LDSF). When the indicated inconsistency applies to a specific SM's LDSF.

DSU2-DGN:SM[1] = DSU2 Diagnostic Image. When the indicated inconsistency applies to a specific SM's DGN.

\[ j \] = The unit names of the affected peripherals.

\[ k \] = The pumpable peripheral type which requires a remove/restore to activate the update. Valid value(s):

ALL PH2 = All PH2 circuits, no matter which application processor image.

ALL PH3 = All PH3 circuits.

ALL PH4 = All PH4 circuits.

DNUSCC = DNU-S common control.

IDCU = Integrated digital carrier unit.

ISLU = Integrated services line unit.

ISLU2 = Integrated services line unit #2.

ISTF = Integrated services test function.

GDSF = Global digital services function - model 3.

**l** = SM number.

**m** = Messages from the field update processes. These messages may contain information about the progress of an update or report an error encountered while processing the update. Error messages fall into six categories. Valid value(s):

- **COFF ERROR** = An error occurred in the internal format of a file.
- **DATABASE ERROR** = An error occurred in the data base.
- **FILESYS ERROR** = An error occurred in the file system.
- **INTERNAL ERROR** = An error was found by the field update code.
- **SYSTEM ERROR** = A system error occurred.
- **USAGE ERROR** = An error occurred using field update.

**n** = *UNIX®* system error call number.

**o** = Termination mode of the input message. Valid value(s):
ABORTED = The request terminated with errors.
COMPLETED = The request was fulfilled successfully.

4. ACTIONS TO BE TAKEN

If a message aborts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Otherwise, no action is required.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report progression of action requested by the UPD:APPLY input message.

Format 1 indicates the APPLY has already completed for the software update indicated in 'a' for the file name indicated in 'b' and the dependent file name indicated in 'c'.

Format 2 indicates the APPLY has already completed for software update indicated in 'a' for the file name indicated in 'b'.

Format 3 indicates the new file name created during the APPLY.

Format 4 indicates that the APPLY section is in progress.

Format 5 indicates that the entire APPLY section has completed for the software update indicated in 'a'.

Format 6 indicates the completion of APPLY for software update indicated in 'a' for file name indicated in 'b' with
dependent file indicated in 'c'.

Format 7 indicates the completion of APPLY for software update indicated in 'a' for file name indicated in 'b'.

Format 8 indicates that the stubs function indicated in 'd' has been applied to the new address indicated in 'e'.

Format 9 indicates that the function indicated in 'd' has been applied to the new address indicated in 'e'.

Format 10 indicates the status of the target communication module processor (CMP) indicated in 'g'.

Format 11 indicates the status of the target switching module (SM) indicated in 'g'.

Format 12 indicates the list of affected peripherals of the type indicated in 'i'. If an affected SM contains no affected peripherals, then this fact is printed.

Format 13 indicates that a remove/restore will be necessary to complete the update. One or more UPD:PMPPERF input messages should appear in the software update messages file to do this automatically.

Format 14 indicates that some of the affected SMs or CMPs are not updated.

Format 15 indicates that an apply has either aborted, partially completed, completed or stopped.

3. VARIABLE FIELD DEFINITIONS

a  = Software update name.

b  = File path.

c  = Dependent file path.

d  = Function name.

e  = New address.

f  = Processor type. Valid value(s):
    AP       = Application processor.
    CMP      = Communication module processor.
    MSGH     = Message handler.

 g  = Processor number.

h  = Processor status. Valid value(s):
    APPL     = Applied and operational.
    BKT      = Backed out and operational.
    ISOL     = Isolated.
    NAPP     = Not applied, but operational.
    NOP      = Not operational.
    UPNBKT   = Not backed out, but operational.

i  = Affected processor type. Valid value(s):
    DNUSSCC:SM[1] = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control (CC) when the indicated inconsistency applies to a specific SM's DNU-S CC(s).
    DSU2-HSAS:SM[1] = DSU2 service announcement system (SAS) When the indicated
DSU2-DGN:SM[1] = DSU2 diagnostic image. When the indicated inconsistency applies to a specific SM's DGN.
DSU2-ISTF:SM[1] = DSU2 - integrated services test function (ISTF) when the indicated inconsistency applies to a specific SM's ISTF(s).
DSU2-LDSU:SM[1] = DSU2 - local digital service unit (LDSU) function when the indicated inconsistency applies to a specific SM's LDSU(s).
DSU2-RAF:SM[1] = DSU2 - recorded announcement function (RAF) when the indicated inconsistency applies to a specific SM's RAF(s).
DSU2-SAS:SM[1] = DSU2 - service announcement system (SAS) when the indicated inconsistency applies to a specific SM's SAS(s).
DSC3-GDSF:SM[1] = Digital service circuit - model 3 (DSC3) global digital services function (GDSF) when the indicated inconsistency applies to a specific SM's GDSF.
DSC3-LDSF:SM[1] = DSC3 local digital services function (LDSF) when the indicated inconsistency applies to a specific SM's LDSF.
DSC4-LDSF:SM[1] = DSC4 LDSF. When the indicated inconsistency applies to a specific SM's LDSF.
ISLU-CC:SM[1] = Integrated services line unit (ISLU) CC when the indicated inconsistency applies to a specific SM's ISLUCC(s).
ISLU2-CC:SM[1] = Integrated services line unit 2 (ISLU2) common controller (CC) when the indicated inconsistency applies to a specific SM's ISLU2CC(s).
IDCU-CCP:SM[1] = Integrated digital carrier unit (IDCU) common control processor (CCP) when the indicated inconsistency applies to a specific SM's IDCU CCP(s).
IDCU-DLP:SM[1] = IDCU data link processor (DLP) when the indicated inconsistency applies to a specific SM's IDCU DLP(s).
IDCU-LSI:SM[1] = IDCU loop side interface (LSI) when the indicated inconsistency applies to a specific SM's IDCU LSI(s).
OIU24:SM[1] = Optical interface unit (24 channels) when the indicated inconsistency applies to a specific SM's OIU.
PSU-DDMA:SM[1] = Diagnostic image for the direct-memory-access processor on the PSU PH2 when the indicated inconsistency applies to a specific SM's PH2(s).
PSU-DSPEVRC:SM[1] = EVRC digital signal processor for code division multiple access (CDMA) protocol handler for voice when the inconsistency applies to a specific DSPEVRC(s).
PSU-DSP8K:SM[1] = 8k digital signal processor (DSP) on protocol handler for voice 3 (PHV3) when the indicated inconsistency applies to a specific SM's PHV3(s).
PSU-DSP13K:SM[1] = 13K DSP on PHV3 when the indicated inconsistency applies to a specific SM's PHV3(s).
PSU-IP22:SM[1] = The operational image for the input/output processor on the PSU PH22 when the indicated inconsistency applies to a specific SM's PH22(s).
PSU-IP3S:SM[1] = The operational image for the input/output processor on the PSU PH3 integrated services digital network (ISDN) for common channel signaling when the indicated
PSU-IP4I:SM[1] = The operational image for the input/output processor on the PSU PH4 ISDN when the indicated inconsistency applies to a specific SM's PH4(s).
PSU-IP4F:SM[1] = Operational image for the input/output processor on the PSU PH4 frame relay protocol handler. When the indicated inconsistency applies to a specific SM's IP4F(s).
PSU-OIOP:SM[1] = The operational image for the input/output processor on the PSU PH3 when the indicated inconsistency applies to a specific SM's PH3(s).
PSU-ODMA:SM[1] = The operational image for the direct-memory-access processor on the PSU PH2 when the indicated inconsistency applies to a specific SM's PH2(s).

PSU-PH2A:SM[1] = PSU PH2 loaded with the ACCESS image when the indicated inconsistency applies to a specific SM's PH2(s).

PSU-PH2G:SM[1] = PSU PH2 loaded with the GATEWAY image when the indicated inconsistency applies to a specific SM's PH2G(s).

PSU-PH22I:SM[1] = Packet switching unit (PSU) PH22 loaded with the wireless ISDN image when the indicated inconsistency applies to a specific SM's PH22(s).

PSU-PH22S:SM[1] = Packet switching unit (PSU) PH22 loaded with common channel signaling image when the indicated inconsistency applies to a specific SM's PH22S(s).

PSU-PH3C:SM[1] = Packet switching unit (PSU) protocol handler 3 (PH3) loaded with the COMMON image when the indicated inconsistency applies to a specific SM's PH3(s).

PSU-PH3S:SM[1] = Packet switching unit (PSU) protocol handler 3 (PH3) when the indicated inconsistency applies to a specific SM's PH3(s).

PSU-PH4I:SM[1] = Packet switching unit (PSU) protocol handler 4 (PH4) loaded with the ISDN image when the indicated inconsistency applies to a specific SM's PH4(s).

PSU-PHA1A:SM[1] = Protocol handler for asynchronous transfer mode (ATM) when the indicated inconsistency applies to a specific SM's PHA1A(s).

PSU-PHA2A:SM[1] = Protocol handler for ATM model 2 when the indicated inconsistency applies to a specific SM's PHA2A(s).

PSU-PHE2E:SM[1] = Protocol handler for ethernet when the indicated inconsistency applies to a specific SM's PHE2E(s).

PSU-PHV1C:SM[1] = Protocol handler for voice 1 (PHV4) when the indicated inconsistency applies to a specific SM's PHV1C(s).

PSU-PHV3C:SM[1] = Protocol handler for voice 3 (PHV3) loaded with the COMMON image when the indicated inconsistency applies to a specific SM's PHV3C(s).

PSU-PHV4C:SM[1] = PSU PHV4 loaded with the COMMON image when the indicated inconsistency applies to a specific SM's PHV4C(s).

PSU-PHV5C:SM[1] = PSU protocol handler for voice 5 (PHV) loaded with the COMMON image when the indicated inconsistency applies to a specific SM's PHV5C(s).

PSU-V4D8K:SM[1] = 8K DSP on PHV4C when the indicated inconsistency applies to a specific SM's V4D8K.

PSU-V4D13K:SM[1] = 13K DSP on PHV4C when the indicated inconsistency applies to a specific SM's V4D13K.

PSU-V3DACP:SM[1] = ACELP digital Signal processor, for TDMA protocol handler for voice when the indicated inconsistency applies to a specific SM's V3DACP.

PSU-V3DVSP:SM[1] = VSELP digital signal processor, for TDMA protocol handler for voice when the indicated inconsistency applies to a specific SM's V3DVSP.

PSU-D4VDVERC:SM[1] = EVRC DSP, for CDMA protocol handler for voice version 4. When the indicated inconsistency applies to specific SM's D4VDVERC(s).

PSU-V4DACP:SM[1] = ACELP DSP, for TDMA protocol handler for voice version 4. When the indicated inconsistency applies to specific SM's V4DACP.

PSU-V4DVSP:SM[1] = VSELP, DSP, for TDMA protocol handler for voice version 4. When the indicated inconsistency applies to a specific SM's V4DVSP.

PSU-V5D13K:SM[1] = 13K DSP, for CDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's V5D13K.

PSU-V5D8K:SM[1] = 8K DSP, for CDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's V5D8K.

PSU-V5DACP:SM[1] = ACELP DSP, for TDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's V5DACP.
indicated inconsistency applies to a specific SM's V5DACP.

PSU-V5DEVR1:SM[1] = EVRC1 DSP, for CDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's V5DEVR1.

PSU-V5DEVR2:SM[1] = EVRC2 DSP, for CDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's V5DEVR2.

PSU-V5DEVR3:SM[1] = EVRC3 DSP, for CDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's V5DEVR3.

PSU-V5DVSp:sm[1] = VSELP DSP, for TDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's VSELP.

PSU-V5DISL:sm[1] = ISLP DSP, for IS41 TDMA protocol handler for data circuit. When the indicated inconsistency applies to a specific SM's VISLP.

TMUX:SM[l] = Transmission multiplexer when the indicated inconsistency applies to a specific SM's TMUX(s).

j = The unit names of the affected peripherals.

k = The pumpable peripheral type which requires a remove/restore to activate the update. Valid value(s):

ALL PH2 = All PH2 circuits, no matter which application processor image.
ALL PH3 = All PH3 circuits.
ALL PH4 = All PH4 circuits.
CC2 = Common controller.
CCP = Common control processor.
DDMA = Diagnostic image for the direct-memory-access.
DGN = Diagnostic image.
DLP = Data link processor.
DSP8K = 8K digital signal processor for CDMA protocol handler for voice.
DSP13K = 1313K digital signal processor for CDMA protocol handler for voice.
DNUSCC = DNU-S common control.
DSPEVRC = EVRC digital signal processor for CDMA.
IDCU = Integrated digital carrier unit.
IP22 = Common PH22 input output processor (IOP) processor image.
IP3S = Operational image for PH3 IOP processor.
IP4F = Frame relay protocol handler version 4 IOP image.
IP4IF = ISDN frame relay protocol handler version 4 IOP image.
ISLU = Integrated services line unit.
ISLU2 = Integrated services line unit 2.
ISTF = Integrated services test function.
GDSF = Global digital services function - model 3.
LDSF = Local digital services function - model 3.
LDSU = Local digital service unit.
LSI = Loop Side Interface.
ODMA = Operational image for the direct-memory-access.
OIU24 = Optical interface unit - 24 channels.
PH2A = Protocol handler 2 (PH2) with ACCESS application processor image.
PH2G = PH2 with GATEWAY application processor image.
PH22I = PH22 with wireless ISDN application processor image.
PH22S = PH22 with common channel signaling application processor image.
PH3C = PH3 with COMMON application processor image.
PH3S = Protocol handler version 3.
PH4I = PH4 with ISDN application processor image.
1 = SM number.

m = Messages from the field update processes. These messages may contain information about the progress of an update or report an error encountered while processing the update. Error messages fall into six categories. Valid value(s):

- **COFF ERROR** = An error occurred in the internal format of a file.
- **DATABASE ERROR** = An error occurred in the data base.
- **FILESYS ERROR** = An error occurred in the file system.
- **INTERNAL ERROR** = An error was found by the field update code.
- **SYSTEM ERROR** = A system error occurred.
- **USAGE ERROR** = An error occurred using field update.

n = **UNIX®** system error call number.

o = Termination mode of the input message. Valid value(s):

- **ABORTED** = The request terminated with errors.
- **COMPLETED** = The request was fulfilled successfully.

4. ACTIONS TO BE TAKEN
If a message aborts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Otherwise, no action is required.

5. ALARMS

None.

    UPD APPLY n

2. REASON FOR OUTPUT

To report progression of action requested by the UPD:APPLY input message.

Format 1 indicates the APPLY has already completed for the software update indicated in 'a' for the file name indicated in 'b' and the dependent file name indicated in 'c'.

Format 2 indicates the APPLY has already completed for software update indicated in 'a' for the file name indicated in 'b'.

Format 3 indicates the new file name created during the APPLY.

Format 4 indicates that the APPLY section is in progress.

Format 5 indicates that the entire APPLY section has completed for the software update indicated in 'a'.

Format 6 indicates the completion of APPLY for software update indicated in 'a' for file name indicated in 'b' with
dependent file indicated in 'c'.

Format 7 indicates the completion of APPLY for software update indicated in 'a' for file name indicated in 'b'.

Format 8 indicates that the stubs function indicated in 'd' has been applied to the new address indicated in 'e'.

Format 9 indicates that the function indicated in 'd' has been applied to the new address indicated in 'e'.

Format 10 indicates the status of the target communication module processor (CMP) indicated in 'g'.

Format 11 indicates the status of the target switching module (SM) indicated in 'g'.

Format 12 indicates the list of affected peripherals of the type indicated in 'i'. If an affected SM contains no affected peripherals, then this fact is printed.

Format 13 indicates that a remove/restore will be necessary to complete the update. One or more UPD:PMPPERF input messages should appear in the software update messages file to do this automatically.

Format 14 indicates that some of the affected SMs or CMPs are not updated.

Format 15 indicates that an apply has either aborted, partially completed, completed or stopped.

3. VARIABLE FIELD DEFINITIONS

\[ \begin{align*}
\text{a} & \quad \text{= Software update name.} \\
\text{b} & \quad \text{= File path.} \\
\text{c} & \quad \text{= Dependent file path.} \\
\text{d} & \quad \text{= Function name.} \\
\text{e} & \quad \text{= New address.} \\
\text{f} & \quad \text{= Processor type. Valid value(s):} \\
& \quad \text{AP} \quad \text{= Application processor.} \\
& \quad \text{CMP} \quad \text{= Communication module processor.} \\
& \quad \text{MSGH} \quad \text{= Message handler.} \\
\text{g} & \quad \text{= Processor number.} \\
\text{h} & \quad \text{= Processor status. Valid value(s):} \\
& \quad \text{APPL} \quad \text{= Applied and operational.} \\
& \quad \text{BKT} \quad \text{= Backed out and operational.} \\
& \quad \text{ISOL} \quad \text{= Isolated.} \\
& \quad \text{NAPP} \quad \text{= Not applied, but operational.} \\
& \quad \text{NOP} \quad \text{= Not operational.} \\
& \quad \text{UPN} \quad \text{= Not backed out, but operational.} \\
\text{i} & \quad \text{= Affected processor type. Valid value(s):} \\
& \quad \text{DNUSCC:SM[1]} \quad \text{= Digital networking unit - synchronous optical network (SONET) (DNU-S) common control (CC) when the indicated inconsistency applies to a specific SM's DNU-S CC(s).} \\
& \quad \text{DSU2-HSAS:SM[1]} \quad \text{= DSU2 service announcement system (SAS) When the indicated}
\end{align*} \]
inconsistency applies to a specific SM's HSAS(s).

DSU2-DGN:SM[l] = DSU2 diagnostic image. When the indicated inconsistency applies to a specific SM's DGN.

DSU2-ISTF:SM[l] = DSU2 - integrated services test function (ISTF) when the indicated inconsistency applies to a specific SM's ISTF(s).

DSU2-LDSU:SM[l] = DSU2 - local digital service unit (LDSU) function when the indicated inconsistency applies to a specific SM's LDSU(s).

DSU2-RAF:SM[l] = DSU2 - recorded announcement function (RAF) when the indicated inconsistency applies to a specific SM's RAF(s).

DSU2-SAS:SM[l] = DSU2 - service announcement system (SAS) when the indicated inconsistency applies to a specific SM's SAS(s).

DSC3-GDSF:SM[l] = Digital service circuit - model 3 (DSC3) global digital services function (GDSF) when the indicated inconsistency applies to a specific SM's GDSF.

DSC3-LDSF:SM[l] = DSC3 local digital services function (LDSF) when the indicated inconsistency applies to a specific SM's LDSF.

DSC4-LDSF:SM[l] = DSC4 LDSF. When the indicated inconsistency applies to a specific SM's LDSF.

ISLU-CC:SM[l] = Integrated services line unit (ISLU) CC when the indicated inconsistency applies to a specific SM's ISLUCC(s).

ISLU2-CC:SM[l] = Integrated services line unit 2 (ISLU2) common controller (CC) when the indicated inconsistency applies to a specific SM's ISLU2CC(s).

IDCU-CCP:SM[l] = Integrated digital carrier unit (IDCU) common control processor (CCP) when the indicated inconsistency applies to a specific SM's IDCU CCP(s).

IDCU-DLP:SM[l] = IDCU data link processor (DLP) when the indicated inconsistency applies to a specific SM's IDCU DLP(s).

IDCU-LSI:SM[l] = IDCU loop side interface (LSI) when the indicated inconsistency applies to a specific SM's IDCU LSI(s).

OIU24:SM[l] = Optical interface unit (24 channels) when the indicated inconsistency applies to a specific SM's OIU.

OUIIP:SM[l] = Optical interface unit (IP - internet protocol) when the indicated inconsistency applies to a specific SM's OIU.

PSU-DDMA:SM[l] = Diagnostic image for the direct-memory-access processor on the PSU PH2 when the indicated inconsistency applies to a specific SM's PH2(s).

PSU-DSPEVRC:SM[l] = EVRC digital signal processor for code division multiple access (CDMA) protocol handler for voice when the inconsistency applies to a specific DSPEVRC(s).

PSU-DSP8K:SM[l] = 8k digital signal processor (DSP) on protocol handler for voice 3 (PHV3) when the indicated inconsistency applies to a specific SM's PHV3(s).

PSU-DSP13K:SM[l] = 13K DSP on PHV3 when the indicated inconsistency applies to a specific SM's PHV3(s).

PSU-IP22:SM[l] = The operational image for the input/output processor on the PSU PH22 when the indicated inconsistency applies to a specific SM's PH22(s).

PSU-IP3S:SM[l] = The operational image for the input/output processor on the PSU PH3 integrated services digital network (ISDN) for common channel signaling when the indicated inconsistency applies to a specific SM's ISDN.

PSU-IP4I:SM[l] = The operational image for the input/output processor on the PSU PH4 ISDN when the indicated inconsistency applies to a specific SM's PH4(s).

PSU-IP4F:SM[l] = Operational image for the input/output processor on the PSU PH4 frame relay protocol handler. When the indicated inconsistency applies to a specific SM's IP4F(s).

PSU-IP4IF:SM[l] = The operational image for the input/output processor on the PSU PH4 integrated services digital network specific SM's PH4(s).

</tbody>
</table>

ACELP DSP, VSELP DSP, and EVRC DSP are digital signal processors used in various telecommunications protocols.
inconsistency applies to a specific SM's V5D8K.

PSU-V5DACP:SM[1] = ACELP DSP, for TDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's V5DACP.

PSU-V5DEVR1:SM[1] = EVRC1 DSP, for CDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's V5DEVR1.

PSU-V5DEVR2:SM[1] = EVRC2 DSP, for CDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's V5DEVR2.

PSU-V5DEVR3:SM[1] = EVRC3 DSP, for CDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's V5DEVR3.

PSU-V5DVSp:sm[1] = VSELP DSP, for TDMA protocol handler for voice version 5. When the indicated inconsistency applies to a specific SM's VSELP.

PSU-V5DISL:sm[1] = ISLP DSP, for IS41 TDMA protocol handler for data circuit. When the indicated inconsistency applies to a specific SM's VISLP.

TMUX:SM[l] = Transmission multiplexer when the indicated inconsistency applies to a specific SM's TMUX(s).

j = The unit names of the affected peripherals.

k = The pumpable peripheral type which requires a remove/restore to activate the update. Valid value(s):

ALL PH2 = All PH2 circuits, no matter which application processor image.
ALL PH3 = All PH3 circuits.
ALL PH4 = All PH4 circuits.
CC2 = Common controller.
CCP = Common control processor.
DDMA = Diagnostic image for the direct-memory-access.
DGN = Diagnostic image.
DLP = Data link processor.
DSP8K = 8K digital signal processor for CDMA protocol handler for voice.
DSP13K = 1313K digital signal processor for CDMA protocol handler for voice.
DNUSCC = DNU-S common control.
DSPEVRC = EVRC digital signal processor for CDMA.
IDCU = Integrated digital carrier unit.
IP22 = Common PH22 input output processor (IOP) processor image.
IP3S = Operational image for PH3 IOP processor.
IP4F = Frame relay protocol handler version 4 IOP image.
IP4IF = ISDN frame relay protocol handler version 4 IOP image.
ISLU = Integrated services line unit.
ISLU2 = Integrated services line unit 2.
ISTF = Integrated services test function.
GDSF = Global digital services function - model 3.
LDSF = Local digital services function - model 3.
LDSU = Local digital service unit.
LSI = Loop Side Interface.
ODMA = Operational image for the direct-memory-access.
OU24 = Optical interface unit - 24 channels.
OUIP = Optical interface unit (OU) - IP (internet protocol).
PH2A = Protocol handler 2 (PH2) with ACCESS application processor image.
PH2G = PH2 with GATEWAY application processor image.
PH22I = PH22 with wireless ISDN application processor image.
PH22S = PH22 with common channel signaling application processor image.
PH3C = PH3 with COMMON application processor image.
PH3S = Protocol handler version 3.
PH4I = PH4 with ISDN application processor image.
PHA1A = Protocol handler for ATM.
PHA2A = Protocol handler for ATM model 2 AP image.
PH2E = Protocol handler for ethernet.
PHV1C = Protocol handler for voice version 1 for CDMA.
PHV3C = Protocol handler for voice version 3 for CDMA application.
PHV5C = Protocol handler for voice version 5 for CDMA application.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
TMUX = Transmission multiplexer.
V3DACP = ACELP digital signal processor, for TDMA protocol handler for voice.
V3DVSP = VSELP digital signal processor, for TDMA protocol handler for voice.
V4D13K = 13K DSP, for CDMA protocol handler for voice version 4.
V4D8K = 8K DSP, for CDMA protocol handler for voice version 4.
V4DACP = ACELP DSP, for TDMA protocol handler for voice version 4.
V4DEVR1 = EVRC1 DSP, for CDMA protocol handler for voice version 4.
V4DEVR2 = EVRC2 DSP, for CDMA protocol handler for voice version 4.
V4DEVR3 = EVRC3 DSP, for CDMA protocol handler for voice version 4.
V4DVSP = VSELP, DSP, for TDMA protocol handler for voice version 4.
V4DISL = ISLP DSP, for IS41 TDMA protocol handler for data circuit.
V5D13K = 13K DSP, for CDMA protocol handler for voice version 5.
V5D8K = 8K DSP, for CDMA protocol handler for voice version 5.
V5DACP = ACELP DSP, for TDMA protocol handler for voice version 5.
V5DEVR1 = EVRC1 DSP, for CDMA protocol handler for voice version 5.
V5DEVR2 = EVRC2 DSP, for CDMA protocol handler for voice version 5.
V5DEVR3 = EVRC3 DSP, for CDMA protocol handler for voice version 5.
V5DVSP = VSELP DSP, for TDMA protocol handler for voice version 5.
V5DISL = ISLP DSP, for IS41 TDMA protocol handler for data circuit.

l = SM number.

m = Messages from the field update processes. These messages may contain information about the progress of an update or report an error encountered while processing the update. Error messages fall into six categories. Valid value(s):
    COFF ERROR = An error occurred in the internal format of a file.
    DATABASE ERROR = An error occurred in the database.
    FILESYS ERROR = An error occurred in the file system.
    INTERNAL ERROR = An error was found by the field update code.
    SYSTEM ERROR = A system error occurred.
    USAGE ERROR = An error occurred using field update.

n = UNIX® system error call number.

o = Termination mode of the input message. Valid value(s):
    ABORTED = The request terminated with errors.
    COMPLETED = The request was fulfilled successfully.
4. ACTIONS TO BE TAKEN

If a message aborts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Otherwise, no action is required.

5. ALARMS

None.

[2] UPD AUDITS SM a COMPLETED
   TABLE OF UNITS SCHEDULED FOR CORRECTIVE ACTION:
   b NOT SCHEDULED FOR NON-CRITICAL ERROR H'd
   .
   .

2. REASON FOR OUTPUT

   To report corrective actions scheduled as the result of a software update consistency audit. The audit is scheduled routinely for software images of digital networking unit - synchronous optical network (SONET) (DNU-S) units. This includes image residing in common control (CC) and transmission multiplexer (TMUX). The goal of the corrective action is to ensure that the active (ACT) side of a DNU-S CC is always at the same software update level as the TMUX(s).

When the CC image in DNU-S CC is found inconsistent with the image in the switching module processor (SMP), a flag is set in SMP internally and no corrective action is scheduled. A subsequent UPD:PMPPERF input message or manual remove and restore of a DNU-S CC from MCC 1510 page will correct the inconsistency.

When the TMUX image in DNU-S CC or TMUX is found inconsistent with the image in SMP, corrective action(s) would be scheduled through the maintenance request administrator (MRA) maintenance queue. The corrective action can be either CC soft switch or remove and restore of in-service TMUX(s), depending on the software update levels of both sides of a DNU-S CC and all the in-service TMUX(s).

Occasionally, TMUX may not respond to the consistency query issued by DNU-S CC. If the lack of resources is the cause, the TMUXs that do not respond will not be treated as inconsistent. As a result, they will be exempted from any corrective actions. This is because this audit is routinely performed. Most likely the TMUXs failed to respond would succeed in the next cycle. If TMUXs are being reported as lack of resources for consecutive consistency audits, a technical support should be contacted for further investigation.

The following exhibit lists the cases that trigger the corrective action, and their corrective actions. A "Y" denotes that the TMUX image is at the same update level as SMP. A "N" denotes that the TMUX image is at a different update level than SMP.

<table>
<thead>
<tr>
<th>Case Number</th>
<th>ACT CC</th>
<th>STBY CC</th>
<th>TMUX units</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>N</td>
<td>Y</td>
<td>all are Y</td>
<td>CC soft switch</td>
</tr>
<tr>
<td>2</td>
<td>Y</td>
<td>N</td>
<td>all are N</td>
<td>CC soft switch</td>
</tr>
<tr>
<td>3</td>
<td>All the other</td>
<td>All the other</td>
<td>All the other</td>
<td>MUX remove/restore</td>
</tr>
</tbody>
</table>
Format 1 is printed to report the corrective action scheduled.

Format 2 is printed to report the exemption of corrective action because consistency audit could not be performed due to the lack of resources.

3. VARIABLE FIELD DEFINITIONS

a  = SM number.

b  = The unit name of the peripheral. Valid value(s):

DNUSCC=SM-UNIT-CC
TMUX=SM-UNIT-DG-TMUX

c  = The corrective action scheduled. Valid value(s):

SWITCH = Soft switch DNU-S CC.
REMOVE AND RESTORE = Remove then restore a DNU-S TMUX unit.

d  = The resource-related error. Valid value(s):

2 = There was no free task data block (TDB).
4 = At least one TMUX responded with null, probably caused by heavy workload.

4. ACTION TO BE TAKEN

For Format 1, verify that a subsequent output message reports successful completion for each of the actions scheduled. For all possible outcomes, refer to the output message page of SW:DNUSCC when a DNU-S CC soft switch is scheduled. Refer to output message pages of RMV:TMUX and RST:TMUX when in-service TMUX(s) are scheduled for remove and restore.

If the scheduled corrective action completes successfully, no further action is needed.

If the scheduled corrective action fails, refer to the pages mentioned above for additional recovery procedures. After the recovery procedures are performed, it is recommended that the inconsistency be corrected by executing the UPD:PMPPERF input message on demand, before the next routine audit starts again.

A report of the current update level inconsistency can also be obtained by executing the UPD:VFYCON input message.

For Format 2, verify that only one of the valid values is printed. If this is being reported persistently, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual for further investigation.

[6] UPD AUTO STATUS INHIBITED c

[7] UPD AUTO WARNING STATUS FILE REINITIALIZED

[8] UPD AUTO BWM AUTOMATION RESCHEDULING FOR 30 MINS

[9] UPD AUTO IN PROGRESS

[10] UPD AUTO BWM AUTOMATION INITIATING BWM INSTALLATION

[12] UPD AUTO BWM AUTOMATION STOPPED BY USER REQUEST

[13] UPD AUTO EXECUTE ANY MANUAL COMMANDS NEEDED

2. REASON FOR OUTPUT

To report the progress of the UPD: AUTO input message.

Format 1 indicates when the UPD: AUTO has completed or aborted.

Format 2 indicates the reason that the UPD: AUTO aborted.

Format 3 indicates that the automatic BWM installation to the official stage has completed.
Format 4 indicates that the automatic BWM installation to the requested stage has completed.

Format 5 indicates that BWM automation is currently allowed (ON).

Format 6 indicates that BWM automation is currently inhibited (OFF).

Format 7 indicates that the BWM automation status file has been reinitialized due to the file being missing or unreadable.

Format 8 indicates that the BWM automated installation process is rescheduling the currently scheduled BWM to be automatically installed 30 minutes from the current time. This occurs when the BWM automation office health check for a previously scheduled automated BWM installation fails.

Format 9 indicates that the BWM automation command requested is in progress.

Format 10 indicates that the automatic BWM installation process has begun.

Format 11 indicates that the BWM scheduled for automatic installation has been cancelled. When the "FOR d" portion is included in the message, it indicates that a specific BWM (d) was cancelled, due to a request to schedule another BWM.

Format 12 indicates that BWM automation has been stopped.

Format 13 indicates that any manual commands necessary to continue with the BWM installation should be executed now, before resuming BWM automation.

3. VARIABLE FIELD DEFINITIONS

a = The cause of failure. Valid value(s):

BWM AUTOMATION FEATURE NOT AVAILABLE
BWM AUTOMATION NOT IN PROGRESS
BWM AUTOMATION NOT PREVIOUSLY STOPPED
BWM NOT CURRENTLY SCHEDULED
CALL TO RECVW RETURNED AN ERROR
CANNOT CHANGE DIRECTORIES DURING EXEC

2. REASON FOR OUTPUT

To report errors that occur following the UPD:AUTOCHK input message. Format 1 is printed when all equipped switching modules (SMs) are off_normal. This is printed during the check for breakpoints in the SMs.

Format 2 is printed when the call to ugucbm fails during the check for the administrative module (AM) in simplex mode.

Format 3 and 4 are printed when off_normal conditions exist in the communication module processor (CMP) during the check for breakpoints in the CMP.

Format 5 is printed when the file that contains the health check structure does not exist.

Format 6 is printed when the central update database (CUD) file exists without entries.

Format 7 is printed when there is a failure in accessing the unit control block (UCB) record during either a check for the AM in simplex mode or a check for the Switching Control Center (SCC) link.

Format 8 is printed when a open fails on the file indicated in 'b'.

Format 9 is printed when the read of the office profile file fails.

Format 10 is printed when the system health check is invoked with an invalid option.

Format 11 is printed when there is a failure during the attempt to communicate with one or more SMs.

Format 12 is printed when there is a failure during the attempt to connect to the message port. The error code is indicated in 'c'.

Format 13 is printed when a system health check is requested while a previous request (for a system health check is still in progress).

Format 14 is printed when a failure to read a file occurs.

Format 15 is printed when an unexpected message is received by the UPautomgr process.

Format 16 is printed if a system health check is requested when the feature is not available (was not purchased).

3. VARIABLE FIELD DEFINITIONS

a = Processor number.

b = Path name.

c = Return code.

4. ACTION TO BE TAKEN

For errors that indicate off-normal situations, request a copy of the off-normal report through the use of the OP:SYSSTAT input message. Refer to the OP:SYSSTAT input message in the Input Messages manual for the correct format and take the appropriate action to correct the situation. Failure to access the system health check file is an indication that there was a request to print the results of the last system health check, when the results file either was not saved, or has never been generated.

For all other messages, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the
Output Messages manual.

5. ALARMS
None.

FAILING SYSTEM HEALTH CHECK ITEMS - ADDITIONAL INFORMATION

Last AM Initialization on Day Month Date hh:mm:ss Year

SM a is in Overload

SM a is in Hash Sum Error

SM a has Breakpoints

SM a is in Isolation

...

SM a Last Initialization on Day Month Date hh:mm:ss Year

CMP a is in Overload
2. REASON FOR OUTPUT

Format 1 is in response to the UPD:AUTOCHK input message requesting a report on the status of the "health" of the switch. A short summary is printed indicating the items checked and their status at the time the report was run (that is, PASSED, FAILED, NOT CHECKED or UNABLE TO CHECK). If any of the system health check items indicate failure or unable to check, the overall status of the UPD AUTOCHK REPORT is FAILED. In addition, if an SM or CMP item indicates failure, inconsistencies are detected, or the time since the last initialization of any processor indicates failure, additional information is provided. The allowable time following an initialization is specified in the office profile.

Format 2 is in response to the UPD:AUTOCHK input message. It indicates that the request is in progress.

Format 3 is in response to the UPD:AUTOCHK input message. It indicates that the requested system health check passed.

Format 4 is in response to the UPD:AUTOCHK input message. It indicates that the requested system health check failed.

Format 5 is in response to the UPD:AUTOCHK input message. It indicates that the request has completed.

Format 6 is in response to the UPD:AUTOCHK input message. It indicates that the request has aborted.

Format 7 is in response to the UPD:AUTOCHK input message. It indicates that the requested report was not available since the system health check has not been run yet.

3. VARIABLE FIELD DEFINITIONS
a = Processor number.

b = Type of inconsistency. Valid value(s):
1 = The indicated processor does not contain the indicated temporary update even though it is shown in the update records as having been applied.
3 = A temporary switching module (SM) update has been installed but at least one of the associated temporary files in /updtmp is missing.
4 = An entry in the update records has been garbled or is missing history file entries.
5 = The resident switching module processor (SMP) image associated with the indicated pumpable peripheral type does not contain the indicated update, even though it is shown in the update records as having been applied.
6 = The resident SMP image and the pumpable peripheral(s) associated with the indicated processor type do not contain the indicated update, even though it is shown in the update records as having been applied.
7 = The pumpable peripheral(s) associated with the indicated processor type do not contain the indicated update, even though it is shown in the update records as having been applied, and the peripheral's SMP resident image contains the update.
8 = The update file or product file needed to back out an official software update is missing. It is not possible to recover from this type of inconsistency and the official software update cannot be backed out using the 9900 poke on the Master Control Center (MCC) 1950 menu page. This inconsistency type does not prevent recovery from other types of inconsistencies and does not prevent subsequent software updates from being made official. Once a subsequent software update is made official and all the files needed to back out that software update are available, the inconsistency is removed by default.

4. ACTION TO BE TAKEN

This report lists any activities or situations that may interfere with the automatic application of a software update (SU). If the report shows that the overall status is failed, corrective action may be necessary. However, some instances of this report require that no action be taken. These instances are:
- Conflicting switch activity.
- Other processes are in progress.
- The time interval since the last processor initialization.

Wait until the process in question completes or until the proper amount of time, according to the information set in the office profile, has passed.

If the UPD AUTOCHK report lists failures that indicate off-normal situations, request a copy of the off-normal report through the use of the OP:SYSSTAT input message. Refer to the OP:SYSSTAT input message in the Input Messages manual for the correct format and take the appropriate action to correct the situation. Also, any SUs in the temporary state on the switch, must be either made official (9330 poke on the 1960 page) or backed out (9340 poke on the 1960 page). Any breakpoints that exist must be cleared. If no spare units or OOS peripheral units exist, refer to the UPD:PMPPERF output message in the Output Messages manual. If the consistency check fails, refer to the UPD:VFYCON output message in the Output Messages manual for the action to be taken according to the type of inconsistency detected.

5. ALARMS

None.

Application: 5
Type: Output

1. FORMAT

[1] UPD AUTOPROFILE {COMPLETED|ABORTED}
__________________________________________________________________

[2] UPD AUTOPROFILE ERROR a
__________________________________________________________________

[3] UPD AUTOPROFILE HEALTH CHECK INFORMATION
   c
__________________________________________________________________

[4] UPD AUTOPROFILE IN PROGRESS
__________________________________________________________________

[5] UPD AUTOPROFILE STATUS IS ALLOWED
__________________________________________________________________

[6] UPD AUTOPROFILE STATUS IS INHIBITED b
__________________________________________________________________

[7] UPD AUTOPROFILE WARNING INITIALIZING OFFICE PROFILE
__________________________________________________________________

2. REASON FOR OUTPUT

To report the progress of the UPD:AUTOPROFILE input message.
Format 1 indicates when the UPD:AUTOPROFILE has completed or aborted.
Format 2 indicates the reason that the UPD:AUTOPROFILE aborted.
Format 3 describes the information that is checked for the given office health check condition.
Format 4 indicates that the BWM automation command requested is in progress.
Format 5 indicates that BWM automation is currently allowed (ON).
Format 6 indicates that BWM automation is currently inhibited (OFF).
Format 7 indicates that the BWM automation office profile file has been reinitialized due to the file being missing or unreadable.

3. VARIABLE FIELD DEFINITIONS

a = The cause of failure. Valid value(s):
   BWM AUTOMATION FEATURE NOT AVAILABLE
   CANNOT SEND MESSAGE TO UPAUTOMGR
   FILE WRITE
IN UPDATING OFFICE PROFILE
INVALID ARGUMENT
INVALID INSTALL STATE
INVALID INSTALL TIME
INVALID MESSAGE TYPE RECEIVED
INVALID OPTION
PREVIOUS OFFICE PROFILE UPDATE IS STILL IN PROGRESS
UFAUTOMGR RECEIVED UNEXPECTED MESSAGE

b = The reason BWM automation was inhibited.
c = Information describing the health check condition
d = The invalid message type received.

4. ACTION TO BE TAKEN

If Format 1 prints ABORTED, refer to variable 'a' to determine the cause of the failure. To continue the procedure, enter the UPD:AUTOPROFILE input message.

5. ALARMS

None.

[6] UPD AUTOSCHED BWM AUTOMATION EXECUTING HEALTHCHECK

[7] UPD AUTOSCHED BWM AUTOMATION WILL BEGIN IN [f HOURS] g MINUTES

2. REASON FOR OUTPUT

To report the progress of the UPD:AUTOSCHED input message.
Format 1 indicates when the UPD:AUTOSCHED has completed or aborted.
Format 2 indicates the reason that the UPD:AUTOSCHED aborted.
Format 3 indicates the BWM 'b' has been scheduled for automatic installation.
Format 4 indicates that BWM automation is currently allowed (ON).
Format 5 indicates that BWM automation is currently inhibited (OFF).
Format 6 indicates that the BWM automation office health check was just initiated.
Format 7 indicates when BWM Automation will begin in hours and minutes from the current time.

3. VARIABLE FIELD DEFINITIONS

a = The cause of failure. Valid value(s):

ALL TIMES ARE OFF IN OFFICE PROFILE
BWM AUTOMATION ALREADY IN PROGRESS
BWM AUTOMATION FEATURE IS INHIBITED
BWM AUTOMATION FEATURE NOT AVAILABLE
BWM AUTOMATION NOT ALLOWED FOR BWM b
EXCEEDED HEALTH CHECK RETRIES - BWM AUTOMATION CANCELLED
FILE READ
INVALID ARGUMENT h
INVALID INSTALL STATE
INVALID INSTALL TIME
INVALID MESSAGE TYPE RECEIVED i
MISSING REQUIRED BWMNAME ARGUMENT

b = The BWM name.
c = The BWM install stage to which the BWM will be automatically installed. Valid value(s):
   OFC = Official.
   SOAK = Soak.
   VFY = Verify.

d = The date and time at which automatic BWM installation will begin (mm/dd/yyyy hh:mm).
e = The reason BWM automation was inhibited.
f = The number of hours before BWM automation will begin.
g = The number of minutes before BWM automation will begin.
h = The input value that was out of range.
i = The message type received.

4. ACTION TO BE TAKEN
If Format 1 prints ABORTED, refer to variable 'a' to determine the cause of the failure. To continue the procedure, enter the UPD:AUTOSCHED input message.

5. ALARMS
None.

```

2. REASON FOR OUTPUT

To report the result of executing a UPD:BKOUT or other input message to back out a specified update from a file.

If three UPD:BKOUT input messages with the same UPNM name are issued to three different processes, then three UPD:BKOUT output messages will be issued, one for each process.

Format 1 indicates that BKOUT has terminated for the software update indicated in 'a' with a path indicated in 'b' and a dependent file path, if one exists, as indicated in 'c' with a termination mode as indicated in 'd'.

Format 2 indicates that the backout either is in progress, has partially completed, completed or aborted.

Format 3 indicates that the entire BKOUT section has completed for the software update indicated in 'a'.

Format 4 indicates that a remove/restore will be necessary to complete the update. One or more UPD:PMPPERF input messages should appear in the software update messages file to do this automatically.

Format 5 indicates that the file indicated in 'b' was not backed out of some communication module processors (CMPs) or switching module (SMs).

3. VARIABLE FIELD DEFINITIONS

a = Software update name.
b. File path.

c. Dependent file path.

d. Termination mode. Valid value(s):
- **ABORTED**: The backout was abnormally terminated because of a system error or an error in execution. This message is preceded by a UPD:SYSERR output message that identifies the specific system error.
- **COMPLETED**: The backout completed normally.
- **FINISHED**: The backout completed normally.
- **STOPPED**: The backout was halted because of a user error. This message is preceded by a UPD:USRERR output message that identifies the specific user error.

e. The pumpable peripheral type which requires a remove/restore in order to back out the update. Valid value(s):
- **ALLPH2**: All PH2 units.
- **ALLPH3**: All PH3 units.
- **ALLPH4**: All PH4 units.
- **DNUSCC**: Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
- **GDSF**: Global digital services function - model 3.
- **IDCU**: Integrated digital carrier unit.
- **ISLU**: Integrated services line unit.
- **ISLU2**: Integrated services line unit 2.
- **ISTF**: Integrated services test function.
- **LDSF**: Local digital services function - model 3.
- **LDSU**: Local digital service unit.
- **PH2A**: Protocol handler 2 (PH2) with ACCESS application processor image.
- **PH2G**: PH2 with GATEWAY application processor image.
- **PH3C**: PH3 with COMMON application processor image.
- **PH4I**: PH4 with integrated services digital network (ISDN) application processor image.
- **RAF**: Recorded announcement function.
- **SAS**: Service announcement system operational image.
- **TMUX**: Transmission multiplexer.

f. Messages from the field update processes. These messages may contain information about the progress of an update or report an error encountered while processing the update. Error messages fall into six categories. Valid value(s):
- **COFF ERROR**: An error occurred in the internal format of a file.
- **DATABASE ERROR**: An error occurred in the database.
- **FILESYS ERROR**: An error occurred in the file system.
- **INTERNAL ERROR**: An error was found by the field update code.
- **SYSTEM ERROR**: A system error occurred.
- **USAGE ERROR**: An error occurred using field update.

g. UNIX® system error call number.

h. Termination mode of the input message. Valid value(s):
- **ABORTED**: The request terminated with errors.
- **COMPLETED**: The request was fulfilled successfully.
4. ACTIONS TO BE TAKEN

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STOPPED</td>
<td>The UPD:BKOUT input message is invalid and should not be retried.</td>
</tr>
<tr>
<td>ABORTED</td>
<td>For Formats 1-5, follow instruction of additional output messages. For Format 6, if the message aborts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Otherwise, no action is required.</td>
</tr>
</tbody>
</table>

5. ALARMS

None.

6. REFERENCES

Input Message(s):

**Application:** 5,3B  
**Type:** Output

1. **FORMAT**

[1] UPD BLDBOOT REPT  
 a  
 [b]

[2] UPD BLDBOOT c

2. **REASON FOR OUTPUT**

To report the result of executing a UPD:BLDBOOT input message.

Format 1 reports the progress of the bldboot process or reports an error encountered while executing the process.  
Format 2 reports that the bldboot process has terminated.

3. **VARIABLE FIELD DEFINITIONS**

a = Information about the progress of an update, or report of an error encountered while processing the update. Valid value(s):
   - COFF = Reports an error in the internal format of the file.
   - database = Reports an error in the database.
   - filesys = Reports an error in the file system.
   - internal = Reports an error found by the bldboot code.
   - system = Reports a system error that occurred.
   - usage = Reports an error using bldboot.

A number may follow the error category as in, for example, 'DATABASE ERROR -1'.

This error value is simply the value passed to exit() upon termination. It will always be non-zero to show the process’s parent that an error has occurred.

Refer to the APP:ERRCODE-FU appendix in the Appendixes section of the Output Messages manual for explanations of error codes which may appear in error messages.

b = More information about the error. A field update error code may also be printed. Refer to the APP:ERRCODE-FU appendix in the Appendixes section of the Output Messages manual for explanations of error codes which may appear in these error messages.

c = Termination mode of the input message UPD:BLDBOOT. Valid value(s):
   - ABORTED = Termination with errors.
   - COMPLETED = Successful completion.

4. **ACTION TO BE TAKEN**
If a message aborts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Otherwise, no action is required.

5. ALARMS

   b
   UPD USE 9900,UCL TO CONTINUE WITH BACKOUT
   UPD BACK OUT OF LAST OFFICIAL BWM STOPPED

2. REASON FOR OUTPUT

To report progression of action requested by the UPD:BOLO input message.

Format 1 displays the back-out section of the software update that indicates any manual commands that may need to be executed.

Format 2 notifies the user of a text/office-dependent data (ODD) associated software update. When a "backout last official" (BOLO) is done on a text/ODD associated software update, the ODD changes should be removed before the software update is backed out.

3. VARIABLE FIELD DEFINITIONS

a = Software update name.
b = Contents of the back-out section of the software update.
c = Status of software update. Valid value(s):
   ABORTED
   COMPLETED
   STOPPED

4. ACTION TO BE TAKEN

Follow any instructions listed in the back-out section (variable ‘b’) of the software update.

   [5] UPD CCS CUTOVER [BKOUT] GSM=a OPC=b c
   FAILED TO UPDATE j TO VALUE k
   __________________________________________________________
   ```

2. **REASON FOR OUTPUT**

To respond and provide status for the UPD:CCS-CUTOVER input message, that requested that the integrated services user part (ISUP) trunk data currently defined to use the CNI platform be copied to the host global switching module (GSM). This command is valid only during the conversion of a CNI platform to a host GSM platform.

Format 1 displays the start and complete indication of the input message.

Format 2 displays an autonomous periodic status report.

Format 3 displays an autonomous periodic status report and failure indications on the host GSM incoming routing table operations and any loss of communication to the conversion terminal process on the CMP processor.

Format 4 displays the error report for the failure of a static relation operation.

Format 5 displays the error report for the failure of a global parameter operation.

### 3. VARIABLE FIELD DEFINITIONS

- **a** = Host global switching module number.
- **b** = Primary originating point code (9-digit OPC associated with the CNI and the host GSM platform). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual, for a description of the ANSI and AT&T/UNITEL formats.
- **c** = Current status of the job. Valid value(s):
COMMAND MAY BE UNEXPECTEDLY TERMINATED
COMPLETED, NO ISUP TRUNKS DEFINED IN THE OFFICE
FAILED TO COMMIT TRANSACTION
FAILED TO OPEN RELATION
FAILED TO OPEN TRANSACTION
FAILED TO START TIMER IN TERMINAL PROCESS
MESSAGE NOT RECEIVED BY TP IN CMP
ODR TASK FAILED
ODR TASK IN PROGRESS
ODR TASK STARTED
ODR TASK SUCCESSFULLY COMPLETED
TRK TASK FAILED
TRK TASK IN PROGRESS
TRK TASK STARTED
TRK TASK SUCCESSFULLY COMPLETED

d = Number of tuples that have been inserted into the static database for the specified relation.
e = Operation performed on the relation. Valid value(s):
   
   *DELETED FROM*
   *INSERTED INTO*

f = The relation name. Valid value(s):
   
   *CMTPATH*
   *GMPCI7GR*
   *IPCS_PCI*
   *LAB7_SM*

g = The failure reason. Valid value(s):
   
   *FAILED TO DELETE TUPLE*
   *FAILED TO INSERT TUPLE*
   *FAILED TO UPDATE TUPLE*
   *MISSING TUPLE*

h = The key attribute of the relation that experienced a failed operation. Valid value(s):
   
   *CIC*
   *CIC_OFFSET*
   *GSM*
   *MODULE*
   *NGSM*
   *PCI*

i = The value of the key for a failing relation.
j = The global parameter name. Valid value(s):
   
   *GLCNITRKCNT*
   *GLISUPEQUP*
k  = The expected integer value for the stated global parameter.

l  = Status of the building of the host GSM incoming routing data table and the copying of it to the
   CCS PH processors. Valid value(s):

   COMPLETED BUILDING ICR ON GSM
   COPYING ICR TABLE TO PSU
   COULD NOT COMMUNICATE WITH GSM
   ICR MEMORY NOT ALLOCATED
   INITIALIZING ICR ON GSM
   OGR MEMORY NOT ALLOCATED
   PHDA IN GSM FAILED TO BUILD THE ODR
   TIMED OUT WAITING FOR A RESPONSE FROM GSM
   TRK TASK FAILED
   TRK TASK SUCCESSFULLY COMPLETED
   UNABLE TO CREATE CLIENT PROCESS IN SM
   UNABLE TO LOCK ICR HASHSUM REGION
   UNABLE TO LOCK ICR REGION
   UNABLE TO LOCK OGR HASHSUM REGION
   UNABLE TO LOCK OGR REGION

4. ACTIONS TO BE TAKEN

For Formats 1, 2, and 3, no action is required.

For Formats 4, and 5, determine the reason for the failure. This may require RCV operation(s) to insert missing
components, the use of ODBE to correct the error in the database, or simply running the input request at a later
time. Re-execute the input request once the correction is made.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

   UPD:CCS-CUTOVER

Other Manual(s):

   235-200-115  CNI Common Channel Signaling
   235-200-116  Signaling Gateway Common Channel Signaling
UPD:CCS-PSUMOD
Software Release: 5E15 and later
Message Class: CCS
Application: 5
Type: Output

1. FORMAT

[1] UPD CCS PSUMOD OPC=a OLD=b NEW=c d
   [e] [TUPLES UPDATED IN RELATION=] [f]

[2] UPD CCS PSUMOD OPC=a OLD=b NEW=c d
   FAILED TO UPDATE RELATION=f
   KEY g=h [g=] [h] [g=] [h]

[3] UPD CCS PSUMOD OPC=a OLD=b NEW=c d

2. REASON FOR OUTPUT

To respond and to provide status for the UPD:CCS-PSUMOD input message. This procedure is used only during
the conversion of a CNI platform to the host GSM platform.

Format 1 displays the start and complete indication and the autonomous periodic status report of the command.

Format 2 displays the error report for the failure of a static relation operation.

Format 3 displays the error report when communication to the conversion terminal process is lost.

3. VARIABLE FIELD DEFINITIONS

a = Primary originating point code (9-digit OPC associated with the CNI and the host GSM platform).
Refer to the APP:POINT-CODE appendix in the Appendices section of the Output Messages
manual, for a description of ANSI and AT&T/UNITEL formats.

b = The platform number that is being switched from.

c = The platform number that is being switched to.

d = Current status of the job. Valid value(s):

   COMPLETED
   FAILED
   IN PROGRESS
   STARTED

e = Number of tuples that have been updated into the static database for the specified relation.

f = The relation name. Valid value(s):

   APPL_PLAT
   LAB7_PCI
   PCI7_LAB
RT_TRKG

g = The key attribute of the relation that experienced a failed operation. Valid value(s):

- APPL
- DPC
- GRPNUM
- NETWORK
- OPC
- PCI
- SM

h = The value of the specified key of the failing relation.

4. ACTIONS TO BE TAKEN

For Formats 1, no action is required.

For Formats 2 and 3, action is required. Determine the reason for the failure. This may require RCV operation(s) to insert missing components, the use of ODBE to correct the error in the database, or simply running the input request at a later time. Retry the input request once the correction is made.

5. ALARMS

None.

   [5] UPD CLR REPT
      c
      [d]
      e
      UPD CLR d

2. REASON FOR OUTPUT

To report the progress of the UPD:CLR input message.

Format 1 is printed to indicate the removal is in progress for the software update indicated in 'a'.

Format 2 is printed to indicate the completion of the input message.

Format 3 is printed to indicate an input/output (I/O) error with the error code number indicated in 'b'.

Format 4 is printed to indicate that there were more than ten software update names included in the UPD:CLR input message.

3. VARIABLE FIELD DEFINITIONS

   a = Software update name.

   b = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual for definitions.

   c = Messages from the field update processes. These messages may contain information about the progress of an update or report an error encountered while processing the update. Error messages fall into six categories. Valid value(s):

      COFF ERROR = An error occurred in the internal format of a file.
DATABASE ERROR = An error occurred in the data base.
FILESYS ERROR = An error occurred in the file system.
INTERNAL ERROR = An error was found by the field update code.
SYSTEM ERROR = A system error occurred.
USAGE ERROR = An error occurred using field update.

d = UNIX® system error call number.
e = Termination mode of the input message. Valid value(s):
ABORTED = The request terminated with errors.
COMPLETED = The request was fulfilled successfully.

4. ACTIONS TO BE TAKEN

If there is an I/O error or a message aborts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. All other messages require no action.

__________________________________________________________________

[2] UPD CSCANS ERROR:
   Can not allocate space for password, key or attempt
   CSCANS STOPPED
__________________________________________________________________

[3] UPD CSCANS ERROR: -r & -w OPTIONS MUST BE SPECIFIED
__________________________________________________________________

__________________________________________________________________

[5] UPD CSCANS ERROR, FAILED TO CONNECT TO PORT 21
__________________________________________________________________

2. REASON FOR OUTPUT

Format 1 is used to report the termination of the UPfilerecv process due to an error unrelated to the actual transmission of files. This message may occur either before, during or after the transmission of files.

Format 2 reports that the UPfilerecv process failed to allocate working space for the password file contents.

Format 3 reports that the upgetty process did not execute UPfilerecv process with correct parameters. UPfilerecv aborted after this message printed on the receive-only printer (ROP).

Format 4 reports that the upgetty process did not execute UPfilerecv process with password as a parameter. UPfilerecv aborted after this message printed on the ROP.

Format 5 reports that the UPfilerecv failed to connect to system port.

3. VARIABLE FIELD DEFINITIONS

21 = Numeric port number reporting that the system port desired is a Software Change Administration and Notification System (SCANS-2) interface port.

a = Reason for termination. Valid value(s):
   1 = A bad argument was passed to the file receive process.
   2 = Failed stat call on base directory.
   3 = Failed usstat call on base directory.
   4 = Could not enable reception of messages.
   5 = Failed to read connect message or received invalid connect message from the remote sending system.
   6 = A UPD:CSCANS request failed because of invalid request message.
= The system error number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual. The system error number will be printed if ‘a’=2, 3 or 4.

4. ACTION TO BE TAKEN

Inform CSCANS office of the error message. If required, try to download software update later.

*Type:* Output

### 1. FORMAT

**UPD CSCANS REPORT:**

- a FILE RECEIVED UNDER b:

- c

- .

- .

  FILE CURRENTLY DOWNLOADING: c

  ELAPSED TIME dd:dd SPACE REMAINING e

  [f ERROR g]

### 2. REASON FOR OUTPUT

To report the current status of a software update download session through Customer Service Computer Access Network System (CSCANS). This report displays the number of files received, and the name of the file currently downloading. It also displays the total time used for receiving software update files and disk space available for receiving more software update files.

### 3. VARIABLE FIELD DEFINITIONS

- a = The number of files received.

- b = Complete path name of the software update files received.

- c = The name of the files received.

**NOTE:** The file names displayed in 'c' may not be consistent with the actual file names seen under the software update directory. This is the result of the software update expansion mechanism which changes the file name from the compressed file name to the original file name.

- d = The total number of hours and minutes used for receiving files, in the form of hours:minutes.

- e = Amount of space remaining under /etc/bwm that can be used to receive more software update files.

- f = Pathname of a file issued by the sending end which was not received by the CSCANS file receive process.

- g = Error code specifying the reason why the file was not received by the CSCANS file receive process. Valid value(s):

  - 01 = Insufficient space on disk to store the file.
  - 02 = File length exceeds the maximum length permitted.
  - 03 = The pathname being processed matches that of a file already on disk.
  - 04 = Could not create incoming file on disk.
  - 05 = File transmission was interrupted.
4. ACTION TO BE TAKEN

Verify that all files have been received. If the software update expansion mechanism is not turned on, the file names in the software update directory should be consistent with those from CSCANS. If the software update expansion mechanism is turned on, the files in the software update directory should be the expanded version of the files sent through the CSCANS machine.

5. ALARMS

None.

2. **REASON FOR OUTPUT**

   To report the progress of the UPD:CSCANS-STOP input message.

3. **VARIABLE FIELD DEFINITIONS**

   a

   - Code indicating reason for termination. Valid value(s):
     - 0 = Successful completion of the file transfer session.
     - 1 = Time limit to receive messages from the remote system has expired.
     - 2 = Unable to resynchronize messages with the remote sender.
     - 3 = Unable to resynchronize files with the remote sender.
     - 4 = Bad file sequence number.
     - 5 = Insufficient disk space to store incoming files.
     - 6 = Too many files interrupted.
     - 7 = An internal error occurred in the process.
     - 8 = The file receive process was terminated in response to the UPD:CSCANS-STOP input message.
     - 9 = An I/O error occurred in writing a file to disk.
     - 10 = The remote sender aborted transmission.
     - 11 = A bad disconnect message was received from the sender.
     - 12 = CSCANS password file does not exist.
     - 13 = Security violation, too many unauthorized connection attempts.

4. **ACTION TO BE TAKEN**

   Verify that all files have been received. If required, try to download software update later.

5. **ALARMS**

   None.

[10] UPD CSCANS :
    SECURITY VIOLATION -- PASSWORD MISMATCH
2. REASON FOR OUTPUT

Format 1 reports that a remote system tried to connect to the switch using CSCANS interface, and reports the time for this attempt.

Format 2 reports that the UPfilerecv process could not send an upload query return message to the remote system. The return message contains the last official broadcast warning message (BWM) number from the switch. UPfilerecv process aborted after this message printed on the receive-only printer (ROP).

Format 3 reports that the UPfilerecv process sent a message with an invalid pathname to the UPexpand process.

Format 4 is a warning message indicating that the UPfilerecv process failed to send a message to UPexpand. No BWM files will be expanded.

Format 5 reports that a remote system connected to the switch successfully using CSCANS interface.

Format 6 reports that a scan data link was disconnected.

Format 7 reports that a BWM download using the CSCANS interface was completed successfully. Files downloaded elapsed time, and the remaining file space were also output.

Format 8 reports that no BWM files were received on the switch.

Format 9 reports that the hidden password file was missing or in an invalid format state. No BWM files will be downloaded.

Format 10 reports that a security violation occurred because the password from the CSCANS system and the switch did not match. UPfilerecv aborted after this message printed.

Format 11 reports that UPfilerecv detected that a data link was disconnected for an unknown reason.

Format 12 reports that UPfilerecv can not read the equipment configuration database (ECD) to get the software release information.

Format 13 reports that the ECD contains invalid software release or issue format.

Format 14 reports that the ECD contains invalid software release or point load format.
Format 15 reports that there is no CSCANS download currently in progress.

3. VARIABLE FIELD DEFINITIONS

a = The pathname that UPfilerecv sent to the UPexpand process.
b = The pathname where the BWM files were stored in the switch.
c = File space, expressed as the number of blocks before BWM download session start.
d = Number of files received in current download session.
e = Complete pathname for the BWM files received.
f = List of files received in current download session.
g = File space, in blocks, left after the current download session.
h = Hour.
i = Minute.
j = Pathname of a file issued by the sending end which was not received by the CSCANS file receive process.
k = Error code specifying the reason why the file was not received by the CSCANS file receive process. Valid value(s):
   01 = Insufficient space on disk to store the file.
   02 = File length exceeds the maximum length permitted.
   03 = The pathname being processed matches that of a file already on disk.
   04 = Could not create incoming file on disk.
   05 = File transmission was interrupted.

4. ACTION TO BE TAKEN

Verify that all files have been received. If required, try to download software update again later.

5. ALARMS

None.

6. REFERENCES

APP: SYSERR
**UPD:DATABASE**

**Software Release:** 5E14 and later  
**Message Class:** MTCE  
**Application:** 5  
**Type:** Output

1. **FORMAT**

   UPD DATABASE ERROR a

2. **REASON FOR OUTPUT**

   To report database errors that occurred as a result of performing a field update activity that accessed the equipment configuration database (ECD). This happens when a file system compaction (FSCMPT) or file system link (FSLINK) audit has been attempted unsuccessfully.

3. **VARIABLE FIELD DEFINITIONS**

   a = Text string describing outcome. Valid value(s):
   
   CANNOT READ GLOBAL PARAMETER GLAWS  
   FAILED TO FIND AN ECD AUDINST RECORD FOR THE FSLINK AUDIT FOR b. UPDATE CONTINUES...  
   FAILED TO FIND AN ECD AUDINST RECORD FOR THE FSCMPT AUDIT FOR b. NO AUDIT SCHEDULED  
   UNABLE TO ATTACH TO THE ECD  
   UNABLE TO CLOSE ECD SEQUENCE  
   UNABLE TO GET NEXT ECD RECORD  
   UNABLE TO LOAD INCORE ECD SEGMENTS  
   UNABLE TO OPEN ECD SEQUENCE  
   UNABLE TO READ ECD RECORD  
   UNABLE TO READ NEXT ECD RECORD

   b = File system device name.

4. **ACTION TO BE TAKEN**

   If the phrase FAILED TO FIND AN ECD AUDINST RECORD FOR THE FSCMPT AUDIT FOR 'b'. NO AUDIT SCHEDULED is output, this will not cause the process to abort. However, the benefit of compacting the file system will not be attained. Any other instance of this output message requires technical assistance.

2. REASON FOR OUTPUT

Formats 1 and 5 report the result of executing the UPD:DISPLAY input message.

Format 2 is printed when there is a backlog.

Format 3 is printed when the SUM option is chosen.

Format 4 is printed when the V (verbose) option is chosen.

3. VARIABLE FIELD DEFINITIONS

a = Unique internally assigned update number. It distinguishes this update item from every other update item in this software release. Used internally for update synchronization primitives, where they apply.

b = Time and date of creation of this update item, in the form weekday month day hour:minute:second year.

c = Update name, specified as BWMyy-qqqq, CFTyy-qqqq or TMPyy-qqqq. Valid value(s):
   BWM = Indicates an off-site originated update.
   CFT = Indicates an on-site originated update.
   TMP = Indicates an off-site originated update.
   qqqq = Unique number identifying the update.
   yy = Last two digits of the year in which the update is applied.

d = Name of the process to which this update item applies.

e = OSsyspatch address in hexadecimal notation.

f = Software update sequence number identifying which update is being reported. The last software update applied is reported first and continues until the first software update applied is reported.

g = Package sequence numbers.

h = Switching module (SM) configuration indicates the type of SM that the update is being applied.

i = List of affected SMs or communication module processors (CMPS).

j = Transaction flag printed in hexadecimal notation with a keyword that indicates what type of update is made.

k = File update type.

l = Status flag (in hexadecimal notation) and one or more keywords which identify the particular flags that are set. Valid value(s):
   AUDT = Update has been audited to reclaim patch space.
BOLO = Update has backed out last official change.
CORE = Update has been applied to core.
INSTALLED = Update has been installed as a file replacement.
OFC = Update has been made permanent or official.
OGEN = Update has been run through the overwrite generator (OGEN) to convert the
relocatable .m file(s) into an absolute .u file.
OILD = Update has been run through the overwrite incremental loader (OILD).
SGEN = Update has been run through system generation (SGEN) to recreate the boot
image to include this update.

m = Pathname of the specific file.
n = Updated function name that has been updated.
o = Address of the newly updated function, in hexadecimal notation.
p = Termination mode. Valid value(s):
   ABORTED = The display was abnormally terminated due to a system error or an error in
              execution. This output message is preceded by a UPD:SYSERR output message
              identifying the system error that caused the problem.
   COMPLETED = The display completed normally.
   STOPPED = The display was halted by a user error. This output message is preceded by a
              UPD:USRERR output message identifying the user error that caused the problem.
              When the display fails in this manner, it is usually because no update items exist
              that match the specific request.

q = The generic identifier in the form generic (release) version.pointload for the office being displayed.
r = The update transaction type. Valid value(s):
   AMBTER = AM word overwrite(s).
   AMFILER = Administration module (AM) file replacement.
   AMFUNCR = AM function replacement.
   AMNREL = AM newly released file.
   AMUNIX = A UNIXCMD entry in the APPLY section.
   CMPBYTE = CMP word overwrite(s).
   CFILER = CMP file replacement.
   CMPFUNCR = CMP function replacement.
   CMNREL = CMP newly released file.
   MSGBYTE = CMP message handler word overwrite(s).
   MSGFILER = CMP message handler file replacement.
   MSGFUNCR = CMP message handler function replacement.
   MSGNREL = CMP message handler newly released file.
   PERBYTE = SM peripheral word overwrite(s).
   PERFILER = SM peripheral file replacement.
   PERFUNCR = SM peripheral function replacement.
   PERNREL = SM peripheral newly released file.
   SMBYTE = SM word overwrite(s).
   SMFILER = SM file replacement.
   SMFUNCR = SM function replacement.
   SMNREL = SM newly released file.
Messages from the field update processes. These messages may contain information about the progress of an update or report an error encountered while processing the update. Error messages fall into six categories. Valid value(s):

- COFF ERROR = An error occurred in the internal format of a file.
- DATABASE ERROR = An error occurred in the database.
- FILESYS ERROR = An error occurred in the file system.
- INTERNAL ERROR = An error was found by the field update code.
- SYSTEM ERROR = A system error occurred.
- USAGE ERROR = An error occurred using field update.

\( t \) = UNIX® system error call number.

\( u \) = Termination mode of the input message. Valid value(s):

- ABORTED = The request terminated with errors.
- COMPLETED = The request was fulfilled successfully.

235-105-210 Routine Operations and Maintenance
**UPD:DUMPCORE**

*Software Release*: 5E14 and later  
*Message Class*: MTCE  
*Application*: 5  
*Type*: Output

1. **FORMAT**

   [1] UPD DUMPCORE  STARTED: \( (SM|CMP) = a \)

   \[
   \text{OUTPUT FILE} = b, \quad \text{ADDRESS} = c, \quad \text{LENGTH} = d, \quad [\text{TARGET} = g]
   \]

   [2] UPD DUMPCORE  FINISHED: \( (SM|CMP) = a \)

   \[
   \text{OUTPUT FILE} = b, \quad \text{ADDRESS} = c, \quad \text{LENGTH} = d, \quad [\text{TARGET} = g]
   \]

   [3] UPD DUMPCORE  FAILED: \( (SM|CMP) = a \)

   \[
   \text{INSUFFICIENT DISK SPACE} \text{ for } e. \quad \text{AVAILABLE } f \text{ BYTES, REQUIRE } d \text{ BYTES}
   \]

   [4] UPD DUMPCORE  \( j \)

2. **REASON FOR OUTPUT**

   To report the status of the request to dump core memory.

   Format 1 is printed to indicate that the data dump is beginning.

   Format 2 is printed to report the completion of the data dump.

   Format 3 is printed if there is not enough disk space to store the number of bytes that have been requested in the specified output file. Before the dump of core memory begins, the free space in the file system where the output file is to be created is checked. If the free space is less than the number of bytes that is requested to dump, an error message is generated.

   Format 4 is prints a text string that provides information about the data dump.

3. **VARIABLE FIELD DEFINITIONS**

   \( a \)  = The SM or CMP number that core memory is being dumped from.

   \( b \)  = The full path name of the output file.

   \( c \)  = The starting address of the data dump.

   \( d \)  = The number of bytes to dump from core memory.

   \( e \)  = The name of the output file is to be created.
f = The number of bytes of free space in the file system where the output file is to be created.

g = The name of the target to dump memory from.

h = Failure error code.

i = The configuration of the target.

j = A text string describing the error. Valid value(s):

ADDRESS c IS NOT DEFINED FOR g
DUMP ADDRESS MUST BE SPECIFIED
DUMP LENGTH MUST BE SPECIFIED
FAILED TO DUMP CORE MEMORY BECAUSE g IS NOT AVAILABLE
FAILED TO DUMP CORE MEMORY BECAUSE g IS NOT EQUIPPED
FAILED TO DUMP CORE MEMORY FOR g. CMP IS IN AN OFFNORMAL STATE - h
FAILED TO OPEN OSDS MESSAGE PORT - h
FAILED TO READ CMP SOFT SWITCH DD KEY
FAILED TO SEND DATA TO TARGET - g
FAILED TO TRANSMIT DATA TO i g. ERROR CODE - h
FAILED TO WRITE TO e WITH ERRNO = k
FULL PATHNAME TO OUTPUT FILE MUST BE SPECIFIED
INTERNAL ERROR. INVALID OUTPUT TYPE - h
INVALID ADDRESS = c FOR g
INVALID TARGET SPECIFIED
MAXIMUM DUMP LENGTH FOR TARGET g IS l, REQUESTED d
MESSAGE SEQUENCE ERROR WHILE WRITING FILE
OUTPUT FILE MUST BE SPECIFIED
SM/CMP = a NOT FOUND IN THE OFFICE
SM/CMP NUMBER MUST BE SPECIFIED
TARGET MUST BE CMP OR MSGH
TERMINATED FOR i g DUE TO A CMP SOFT SWITCH
UNKNOWN ACTION = h
VIRTUAL TO PHYSICAL ADDRESS CONVERSION FAILED FOR g, ADDR = c
WARNING: FIELD UPDATE IS IN PROGRESS AND MAY ALTER CORE MEMORY

k = The failure error number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual for an explanation of the error codes.

l = The maximum size of a target file.

4. ACTION TO BE TAKEN

Once the dump of core memory has completed the output file can be examined. This is a data file and cannot be examined with tools or editors that expect ASCII text input.

If the dump from core memory failed because another dump was in progress, wait until the previous dump's completion message is displayed and enter the UPD:DUMPCORE input message.

If the dump from core memory failed because of lack of disk space, either reduce the number of bytes that were requested to dump or change the output file so that it is created in a file system with more space.

5. ALARMS
None.

UPD:EXPAND

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] UPD EXPAND BWM a (COMPLETED|ABORTED)

[2] UPD EXPAND ERROR b

[3] UPD EXPAND STOPPED - MANUAL REQUEST

[4] UPD EXPAND STOP ERROR - NO BWM DOWNLOAD IN PROGRESS

2. REASON FOR OUTPUT

To report the progress of the software update expansion process. This may be in response to a UPD:EXPAND input message or it may occur normally as part of the software update download process.

Format 1 reports that the update expansion has completed for the current software update download process, or that the expansion was aborted. If software update expansion was aborted, Format 2 will precede this message.

Format 2 reports that an error has occurred in the software update expansion and gives the reason for the failure as indicated in 'b'.

Format 3 reports that the expansion process was manually stopped in response to a UPD:EXPAND:STOP input message.

Format 4 reports that the automatic expansion of a software update was not stopped because there was no BWM download in progress. This message is in response to a UPD:EXPAND input message.

3. VARIABLE FIELD DEFINITIONS

ABORTED = Requested action was terminated before completion and the termination was immediate.

COMPLETED = Request has successfully completed.

a = The name of the software update that was being expanded.

b = The cause of the expansion failure. Valid value(s):

BWM a DOES NOT EXIST
CANNOT CONNECT TO PORT c d
CANNOT ENABLE MESSAGE RECEPTION
CREATE FILE e FAILED
FAILED ON FILE e
INVALID CALLING PROCESS d
ON FILENO e
OPEN FILE e FAILED
RECEIVED AN INVALID MESSAGE
SEND MESSAGE TO UPVERIFY FAILED d
WAIT FOR UNCOMPRESS ON FILE e FAILED d
WRITE FILE e FAILED

= The message port number.

= The return code of the failed library function call.

= The name of the file that was being expanded when the failure occurred.

4. ACTION TO BE TAKEN

If Format 1 prints ABORTED, refer to 'b' to determine the cause of the failure and the necessary corrections to be made. To continue the software update expansion process, enter the UPD:EXPAND input message.

5. ALARMS

None.

UPD:FLASH-DFC

Software Release: 5E14 and later
Message Class: DSKUTL
Application: 5,3B
Type: Output

1. FORMAT

[1] UPD FLASH DFC a [CHECKSUM] NOT STARTED b c

[2] UPD FLASH DFC a [CHECKSUM] STOPPED b c

[3] UPD FLASH DFC a [CHECKSUM] ERROR b c

[5] UPD FLASH DFC a [CHECKSUM] COMPLETED {VALID PUMPCODE | INVALID PUMPCODE}

2. REASON FOR OUTPUT

To report the result of a UPD:FLASH-DFC input message.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the disk file controller (DFC).

b = Process step or reason code. Valid value(s):
   f03 = Failed to open the equipment configuration database (ECD).
   f04 = Refer to the disk driver (DKDRV) report on the receive-only printer (ROP).
   f06 = Failed to get unit control block (UCB) by name.
   f07 = Invalid disk file controller (DFC) model.
   f08 = Unable to open the pumpfile..
   f09 = Failed to open pumpcode file.
   f0c = Failed to allocate buffer.
   f0e = Failed to read the pumpfile header.
   f13 = Failed to reserve the UCB.
   f16 = Failed to assign special device file (SDF) name for DFC.
   f19 = Failed to open SDF for DFC.
   f1b = Failed to enable message reception.
   f20 = Invalid pumpcode file.
   f25 = Unable to lseek() to beginning of file.
   f2a = DFC auto pump failed.
   f2e = DFC pump failed.
   f31 = DFC pump failed notification.
   f34 = Process timed out.
   f37 = Failed to close special device file.
   f3a = Failed to release special device file.
   f3c = Failed to un-reserve UCB.
f3e = Failed to close ECD.
f3f = Failed to close pumpfile.
f41 = Unable to read pumpfile.
f44 = Message to port failure.
f47 = Message reception failure.
f4c = Terminated externally with signal.
f4e = Invalid header magic number.
f51 = Invalid pump header.
f54 = Unused portion of the pump header is not zero.
f61 = Failed to read the pumpfile header.
f63 = Invalid header magic number.
f65 = Unable to open pumpfile.
f67 = FW and pumpfile are incompatible - issue.
f69 = FW and pumpfile are incompatible - generic.

c = System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.

4. **ACTION TO BE TAKEN**

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried. The pump failure can also be caused by the incompatibility between the pumpcode and firmware. The pump can also fail due to a corrupted pumpcode file. A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

5. **ALARMS**

None. This alarm is a manually-requested report.

6. **REFERENCES**

Input Message(s):

UPD:FLASH-DFC

Output Appendix(es):

APP:SYSERR
APP:SYSERR
UPD:FLASH

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] UPD FLASH MEMORY a b c

__________________________________________________________________
[2] UPD FLASH NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS
__________________________________________________________________

2. REASON FOR OUTPUT

To report the result of executing the UPD:FLASH input message. Flash is a device designed to be programmed in a system with a standard 5V or 12V supply required for write or erase operations.

3. VARIABLE FIELD DEFINITIONS

a = Member name. Valid value(s):
   HSDC
   MTTYC
   SCSDC
   SDLC
   TTYC

b = Member number (0-255).

c = Result or status of input message. Valid value(s):
   ABORTED = The input message failed because of an equipment configuration database (ECD) failure, or communication failure with the input/output driver (IODRV) process.
   COMPLETED = Update of flash random access memory (RAM) completed.
   FAILED = Update of flash RAM could not be completed by the IODRV process.
   IN PROGRESS = Flash RAM is in the process of being updated by the IODRV process.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>'d' =</th>
<th>Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED or FAILED</td>
<td>Check the ECD for correct settings.</td>
</tr>
<tr>
<td>COMPLETED or IN PROGRESS</td>
<td>No action is required.</td>
</tr>
</tbody>
</table>

For Format 2, verify that the PC is in the out-of-service (OOS) state and its peripheral interface controller (IOP) is in the active (ACT) state. The receive-only printer (ROP) output and IODRV log files can be helpful in determining the problem. IODRV log files are /etc/log/IODRVLOG0 and /etc/log/IODRVLOG1. If necessary, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS
None. This is a manually-requested report. Refer to the APP:OMXB-X-REF appendix in the Appendixes section of the Output Messages manual.

Output Appendix(es):

APP:OMDB-X-REF
UPD:FTRC-3B

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] UPD FTRC REPT
   a
   [b]

[2] UPD FTRC c

2. REASON FOR OUTPUT

To report the result of executing a UPD:FTRC input message.

Format 1 reports the progress of the function trace or reports an error encountered while processing the function trace.

Format 2 reports the termination of the process.

3. VARIABLE FIELD DEFINITIONS

a = Information about the progress of a function trace, or report of an error encountered while processing the function trace. Error messages may be one of the following six categories. Valid value(s):
   COFF = reports an error in the internal format of a file
   database = reports an error in the database
   filesys = reports an error in the file system.
   internal = reports an error found by the field update code
   system = reports a system error that occurred
   usage = reports an error using filed update

A number may follow the error category as in, for example, 'DATABASE ERROR -1'.

This error value is simply the value passed to exit() upon termination. It will always be non-zero to show the process’s parent that an error has occurred.

Refer to the APP:ERRCODE-FU appendix in the Appendixes section of the Output Messages manual for explanations of error codes that may appear in error messages.

b = Information about the error. A field update error code may also be printed. Refer to the APP:ERRCODE-FU appendix in the Appendixes section of the Output Messages manual for explanations of error codes which may appear with these error messages.

c = Termination mode of the input message UPD:FTRC. The mode will be either COMPLETED for successful completion, or ABORTED for termination with errors.

4. ACTION TO BE TAKEN
None. If a command aborts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

   ------- -------- ----- -------------- --------
   f       h i   j     k
   UPD FTRC COMPLETED

[2] UPD FTRC REPT
   SM=b, CONFIG=c, ENV=d, EVENT=e
   OBJECT_FILE=a

   FUNCTION NAME
   -------------------------------------
   ADDR  START SIZE   OFFSET TV       FILE      SYMINDEX
   ------- ------ -------- ------ ----- -------------- --------
   f       l     h      m   i j    k
   UPD FTRC COMPLETED

[3] UPD FTRC REPT
   FTRC ERROR:
   EVENT "e" NOT FOUND IN LOGFILE FOR ENVIRONMENT "d"
   UPD FTRC STOPPED

2. REASON FOR OUTPUT

To report the results of the UPD:FTRC input message.

Format 1 shows the output received when the UPD:FTRC input message is invoked with the function name parameter. The addresses of the functions listed on the input message are reported.

Format 2 shows the output received when the UPD:FTRC input message is invoked with either the address or event parameter. The functions names of the addresses listed on the input message are reported.

Format 3 shows the output received when the UPD:FTRC input message is invoked with the event parameter and the event is not found in the log file.

3. VARIABLE FIELD DEFINITIONS
a = Path name of the object file specified in the UPD:FTRC input message file name parameter, or the one calculated by FTRC from the switching module and temporary update input parameters, or the environment parameter.

b = Switching module number. Output only if the switching module input parameter was specified in the UPD:FTRC input message.

c = Indicates the configuration of the switching module specified in the UPD:FTRC input message. Valid value(s):

    BASIC
    LOADED
    SIGNALING
    SM-2000
    STANDARD

d = Message environment. Output when the environment parameter is specified in the UPD:FTRC input message or when format 3 is received. The default environment is OSDSM, the switching module environment.

e = Event number specified in the UPD:FTRC input message.

f = Function names from the symbol table of the specified object file.

g = Addresses of functions from the symbol table of the specified object file. Note that switching module addresses are physical addresses, whereas, all other addresses are virtual. All addresses are reported in hexadecimal.

h = Size in bytes of the function. All sizes are reported in hexadecimal.

i = Transfer vector (TV) slot number of the function. If the function is not called with transfer vectors, the value will be zero. All TV values are reported in decimal.

j = Filename that the function's source code resides in.

k = Symbol table index for the function. All symbol table indices are reported in decimal. If the temporary update parameter of the UPD:FTRC input message is used, an index surrounded by curly brackets "{}" indicates the symbol was updated in an SU.

l = Starting address of the function. Note that switching module addresses are physical addresses, whereas, all other addresses are virtual. All starting addresses are reported in hexadecimal.

m = Offset in bytes between the address reported and the function's start address reported. All offsets are reported in hexadecimal.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES
Input Message(s):

UPD:FTRC
UPD:GEN-APPL
Software Release: 5E14 and later
Message Class: GENR

[9] ERROR: NO ARGUMENT ASSIGNED FOR UPD:GEN:APPLPROC COMMAND

[10] ERROR: UPD:GEN:APPLPROC,c FAILED TO EXECUTE AN INPUT MESSAGE

2. REASON FOR OUTPUT

To report the execution status of the application process and to report any output generated by a retrofit tool.

For Format 1, the process failed to get the terminal name where the input message was entered. If the error persists try executing the input message from another terminal.
For Format 2, the APPLPROC input message is executing the specified input message.

For Format 3, the APPLPROC input message is executing the specified retrofit tool.

For Format 4, the APPLPROC input message received a non-zero exit code from the retrofit tool.

For Format 5, the output generated from the retrofit tool is printed.

For Format 6, the APPLPROC input message completed successfully.

For Format 7, an error was detected during the execution of the APPLPROC input message.

For Format 8, the argument specified was not found in the APPLPROC input message table.

For Format 9, a null argument was passed to the APPLPROC input message.

For Format 10, the APPLPROC input message received an error while executing the input message.

For Format 11, the print of the APPLPROC input message summary failed when the summary file could not be opened.

For Format 12, the input message could not be executed because the APPLPROC input message could not be forked.

For Format 13, the input message could not be executed because the APPLPROC input message could not change working directories to /cft/shl.

3. VARIABLE FIELD DEFINITIONS

a = Input message being executed by APPLPROC.

b = Name of tool being executed by APPLPROC.

c = Argument being processed by APPLPROC.

d = Exit code returned from the retrofit tool. Refer to the Generic Retrofit manual for more information.

e = The output generated by the retrofit tool. Refer to the Generic Retrofit manual for more information.

4. ACTION TO BE TAKEN

User execution errors can be corrected by examining the procedures used for execution of the message. If any other errors occur, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[15] UPD GEN BACKOUT COMPLETED SMS IN TRANSIENT STATE

[16] UPD GEN BACKOUT COMPLETED SMS IN TRANSIENT STATE
   **** PERFORM GENERIC RETROFIT INITIALIZATION OF AM ****
2. REASON FOR OUTPUT

To report the result of executing a UPD:G-BACKOUT input message, and to provide status information and instructions concerning the software release transition such as AM off-line boot status or to inform the user which boot options to use when booting the old software release without AM off-line boot.

For Format 1, the APPLHOOK process has started administrative module (AM) off-line boot.

For Format 2, the APPLHOOK process has successfully completed AM off-line boot.

For Format 3, the APPLHOOK process reports that AM off-line boot has failed.

For Format 4, the APPLHOOK process reports that AM off-line boot has been stopped. Off-line booted AM units are returned to their ROOT ECD state.

For Format 5, the BACKOUT process has started switching to the off-line booted AM.

For Format 6, the BACKOUT process has completed switching the AM to the off-line booted side.

For Format 7, the BACKOUT process has failed to switch the AM to the off-line booted side.

For Format 8, the BACKOUT process completed successfully.

For Format 9, the BACKOUT process terminated with an error.

For Format 10, instruction for moving head disk (MHD) reconfiguration before initialization.

For Format 11, the APPLHOOK process has been called.

For Format 12, the APPLHOOK process will be complete within the amount of time specified.

For Format 13, the BACKOUT process has completed, the status of the switching modules (SM) shows all SMs have switched to the old software release side. Since an AM off-line boot AM side switch completed successfully no additional boot information is provided.

For Format 14, the BACKOUT has completed, the status of the SMs did not show all SMs were cycling on the old software release. This indication can either mean an SM is initializing, the SM status was slow in updating due to excessive message traffic or processor overload, or the SM did not switch to the old software release. An AM off-line boot AM side switch has been performed. Verify that the switched SMs are cycling on the old software release at the completion of the AM off-line boot AM side switch.

For Format 15, the BACKOUT process has completed, but the status of the SMs did not show that all SMs were cycling on the old software release. This indication can either mean the SM is initializing, the SM status was slow in updating due to excessive message traffic or processor overload, or the SM did not switch to the old software release. If the AM has not yet been booted on the old software release, the boot should be performed now. The SMs should be
verified they are cycling on the old software release at the completion of the AM initialization.

For Format 17, an automatic OP:SYSSTAT,SM=1&&192; has been input by the BACKOUT command.

For Format 18, the BACKOUT stage could not be set completed in data delivery. This means that the BACKOUT field on Master Control Center (MCC)i page 124 may not be backlit.

3. VARIABLE FIELD DEFINITIONS

a = Error code causing the process to stop. Consult the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information.

b = Boot options. Valid value(s):
   BACKUP_ROOT = Backup root was selected on EAI page.
   MHD {0|1} = Force MHD specified on EAI (off-line disk method only).
   PRIMARY_ROOT = Primary root was selected on emergency action interface (EAI) page.

c = Number of seconds available for application processing.

4. ACTION TO BE TAKEN

Comply with instructions given. (The force for MHD should be left in effect until instructions to remove it are output by UPD:GEN-COMMIT or UPD:GEN-RESTORE.) User execution errors can be corrected by following the procedures used for execution of the message. If any other error occurs, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

UPD:GEN-BEGIN
Software Release: 5E14 and later
Message Class: GENR
Application: 5
Type: Output

1. FORMAT

[1] UPD GEN BEGIN COMPLETED SUCCESSFULLY

[2] UPD GEN BEGIN STOPPED WITH ERROR CODE a

[3] UPD GEN BEGIN RECENT CHANGE IS INHIBITED

[4] UPD GEN BEGIN REX INHIBIT SENT

[6] UPD GEN BEGIN CRAFT ACSR ENQUEUEING/DEQUEUEING INHIBIT SENT

[7] UPD GEN BEGIN AUTO SPARE DISK OFF

[8] UPD GEN BEGIN APP EXECUTING BGNHOOK

[9] UPD GEN BEGIN APP EXECUTING BGNHOOK FAILED WITH EXIT CODE b

[10] UPD GEN BEGIN APP BGNHOOK REPORT c

2. REASON FOR OUTPUT

To report the result of executing a UPD:G-BEGIN input message. This begins the retrofit interval and sets the retrofit in progress indicator on the Master Control Center (MCC) MISC page 116.

Format 1 indicates that the BEGIN is complete.

Format 2 indicates that the BEGIN terminated with an error.

Format 3 indicates that the BEGIN has automatically inhibited recent change.

Format 4 indicates that the BEGIN has automatically inhibited the routine exerciser.

Format 5 indicates that the BEGIN has automatically inhibited automatic office dependent data (ODD) reorganization.
Format 6 indicates that the BEGIN has automatically inhibited automatic customer station rearrangement (ACSR) enqueueing and dequeueing.

Format 7 indicates that the BEGIN has automatically turned off the auto spare disk feature.

Format 8 indicates that the APPLHOOK process is executing the BGNHOOK retrofit tool.

Format 9 indicates that the BGNHOOK retrofit tool terminated with a non-zero exit code.

Format 10 indicates that the output from the BGNHOOK retrofit tool is displayed.

Format 11 indicates that the BEGIN stage could not be set completed in data delivery. This means that the BEGIN field on Master Control Center (MCC) page 124 may not be backlit. The next retrofit stage may need to be executed unconditionally.

3. VARIABLE FIELD DEFINITIONS
   
   a = Error code causing the process to stop. Consult the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information.
   
   b = Exit code the retrofit tool BGNHOOK failed with. Consult the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information.
   
   c = The standard output of the BGNHOOK retrofit tool. Consult the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information.

4. ACTION TO BE TAKEN

Comply with instructions given in the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information. User execution errors can be corrected by following the software release transition procedures used for execution of the message.

5. ALARMS

None.

[12] UPD GEN COMMIT APP WARNING CMP(S) NOT DUPLEX

[13] UPD GEN COMMIT APP WARNING CMP(S) IN GENERIC DIFFERENCE

[14] UPD GEN COMMIT APP WARNING COULD NOT SET STAGE COMPLETION FLAG

2. REASON FOR OUTPUT

To report the result of executing a UPD:G-COMMIT input message.

Format 1 indicates that the COMMIT input message has completed successfully.
Format 2 and 3 indicates that the COMMIT input message has terminated with error.

Format 4 indicates that the APPLHOOK process has been called.

Format 5 indicates that the APPLHOOK process will be complete within the amount of time specified.

Format 6 indicates that the APPLHOOK process is executing the CMTHOOK retrofit tool.

Format 7 indicates that the CMTHOOK retrofit tool terminated with a non-zero exit code.

Format 8 indicates that the output from the CMTHOOK retrofit tool is displayed.

Format 9 indicates that the APPLHOOK process is restoring the moving head disk (MHD) specified.

Format 10 indicates that the status of the switching modules (SMs) indicates that the peripherals are still offline pumped.

Format 11 indicates that some SMs are not duplex.

Format 12 indicates that the communications module processors (CMPs) are not duplex.

Format 13 indicates that the CMPs are still offline-pumped.

Format 14 indicates that the COMMIT stage could not be set completed in data delivery, the next retrofit stage may need to be executed unconditionally.

3. VARIABLE FIELD DEFINITIONS

a = Error code causing the process to stop. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

b = Error code causing the process to stop. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

c = Maximum time in seconds for application processing by the APPLHOOK process.

d = Exit code the retrofit tool CMTHOOK failed with. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

e = The standard output of the CMTHOOK retrofit tool. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

f = The MHD is being changed from OFFLINE to out of service (OOS) and then to ACTIVE.

4. ACTION TO BE TAKEN

Comply with instructions given. User execution errors can be corrected by following the procedures used for execution of the message. If any other errors occur, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the result of executing a UPD:G-END input message. This ends the retrofit interval and clears the retrofit in progress indicator on the Master Control Center (MCC) MISC page 116.

Format 1 indicates that the END command is complete.

Format 2 indicates that the END command terminated with an error.

Format 3 indicates that the END command has automatically allowed automatic customer station rearrangement...
(ACSR) enqueuing and dequeuing.

Format 4 indicates that the END command has automatically turned on the auto spare disk feature.

Format 5 indicates that the END command has automatically allowed recent change (RC).

Format 6 indicates that the END command has automatically allowed the routine exerciser (REX).

Format 7 indicates that the END command has automatically allowed automatic office-dependent data (ODD) reorganization (REORG).

Format 8 indicates that the APPLHOOK process is executing the ENDHOOK retrofit tool.

Format 9 indicates that the ENDHOOK retrofit tool terminated with a non-zero exit code.

Format 10 indicates that the output from the ENDHOOK retrofit tool is displayed.

Format 11 indicates that the contents of the APPLLOG are printed. Refer to the output manual page OP:GEN:APPLLOG for detailed information.

Format 12 indicates that the END stage could not be set completed in data delivery. The BEGIN, ENTER, PROCEED, or COMMIT field on MCC page 124 may still be backlit.

3. VARIABLE FIELD DEFINITIONS

\[ a \] = Error code causing the process to stop. Consult the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information.

\[ b \] = Exit code the retrofit tool ENDHOOK failed with. Consult the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information.

\[ c \] = The standard output of the retrofit tool. Consult the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information.

\[ d \] = The contents of the APPLLOG. Refer to the output manual page OP:GEN:APPLLOG for detailed information.

4. ACTION TO BE TAKEN

Comply with instructions given in the software release transition procedures. Refer to the REFERENCES section of this manual page for additional information. User execution errors can be corrected by following the software release transition procedures used for execution of the command.

5. ALARMS

None.

2. REASON FOR OUTPUT

To report the result of executing a UPD:G-ENTER input message, and to provide status information and instructions concerning the update.

Format 1 indicate that the ENTER command has completed successfully.

Formats 2 and 3 indicate that the ENTER command has terminated with error.

Format 4 indicate that instruction for loading tapes during the retrofit.

Format 5 indicate that information on the progress of disk blocks written from tape.

Format 6 and 7 indicate that the status of the moving head disks (MHDs) as they are taken OFFLINE.

Format 8 indicate that the APPLHOOK process has been called.

Format 9 indicate that the APPLHOOK process will be complete within the amount of time specified.

Format 10 indicate that the ENTER command is copying the specified primary partition to its backup partition.

Format 11 and 12 indicate that the status of the MHD as APPLHOOK takes it from ACTIVE to OFFLINE.

Format 13 indicate that the APPLHOOK process is executing the ENTRHOOK retrofit tool.

Format 14 indicate that the ENTRHOOK retrofit tool terminated with a non-zero exit code.

Format 15 indicate that the output from the ENTRHOOK retrofit tool is displayed.

Format 16 indicate that the ENTER stage could not be set completed in data delivery, the next retrofit stage may need to be executed unconditionally.

3. VARIABLE FIELD DEFINITIONS

a = Error code causing the process to stop. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

b = Number of additional blocks of data written since last output message of this type.

c = Member number of disk to be forced offline for data entry.

d = Maximum time in seconds for application processing by the APPLHOOK process.

e = Number of a backup partition that needs to be updated from its primary.

f = Error code causing the process to stop. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

f = Exit code the retrofit tool ENTRHOOK failed with. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

h = The standard output of the retrofit tool. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.
4. ACTION TO BE TAKEN

Comply with instructions given. Continuation should be done using the UPD:G-CONTINUE input message. User execution errors can be corrected by following the procedures used for execution of the input message. If any other errors occur, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

UPD:GEN-PCC
Software Release: 5E14 and later
Message Class: GENR
Application: 5
Type: Output

1. FORMAT

UPD GEN PROCEED COPYING COMPLETE, PROCEEDING TO SWITCH IMS

2. REASON FOR OUTPUT

To report that the interface modules (IMs) or switching modules (SMs) in the office are about to be sent a request to switch sides in the MCTSIs and perform a retrofit initialization on that side. When this message is printed out the office can expect to lose call processing in the office. This should only be seen during a retrofit situation.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTION TO BE TAKEN

The office is expected to lose call processing soon after this message is printed out. The action expected is to comply with the instructions given in the Generic Retrofit Procedures manual. Refer to the REFERENCES section of this manual page for additional information.

5. ALARMS

None.

[14] UPD GEN PROCEED APP EXECUTING CORCFLUSH

[15] UPD GEN PROCEED APP CORCFLUSH FAILED WITH EXIT CODE g

[16] UPD GEN PROCEED CORCS ARE INHIBITED
2. REASON FOR OUTPUT

To report the result of executing an UPD:G-PROCEED input message, and to provide status information and instructions concerning the software release transition such as AM off-line boot status or the boot options to use when booting the new software release without AM off-line boot.

For Format 1, the PROCEED has completed successfully.

For Format 2, the APPLHOOK process has started AM off-line boot.

For Format 3, the APPLHOOK process has successfully completed AM off-line boot.

For Format 4, the APPLHOOK process reports that AM off-line boot has failed.

For Format 5, the APPLHOOK process reports that AM off-line boot has been stopped. Off-line booted AM units are returned to their ROOT ECD state.

For Formats 6 and 7, the PROCEED has terminated with error.

For Format 8, instruction for moving head disk (MHD) reconfiguration before administrative module (AM) initialization. For Format 9, the APPLHOOK process has been called.

For Format 10, the APPLHOOK process will be complete within the amount of time specified.

For Format 11, the APPLHOOK process is executing the PRCDHOOK retrofit tool.

For Format 12, the PRCDHOOK retrofit tool terminated with a non-zero exit code.

For Format 13, the output from the PRCDHOOK retrofit tool is displayed.

For Format 14, the APPLHOOK process is executing the CORCFLUSH process.

For Format 15, the CORCFLUSH process terminated with a non-zero exit code.

For Format 16, the APPLHOOK process has inhibited customer-originated recent changes (CORCs).

For Format 17, the PROCEED stage could not be set completed in data delivery. The next retrofit stage may need to be executed unconditionally.

3. VARIABLE FIELD DEFINITIONS

a = Error code causing the process to stop. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

b = Error code causing the process to stop. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

c = Boot options. Valid value(s):
BACKUP ROOT = Backup root, was selected on emergency action interface (EAI).
MHD {0|1} = Moving head disk (MHD) force specified on EAI (off-line disk method only).
PRIMARY ROOT = Primary root was selected on an EAI.
d = Maximum time in seconds for application processing by the APPLHOOK process.

e = Exit code the retrofit tool PRCDHOOK failed with. Consult the appropriate software release transition procedures for more information.

f = The standard output of the retrofit tool. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

g = The exit code from the CORCFLUSH process. Consult the appropriate retrofit procedures (refer to the REFERENCES section) for more information.

4. ACTION TO BE TAKEN

Comply with instructions given. (The force for MHD should be left in effect until instructions to remove it are output by UPD:GEN-COMMIT or UPD:GEN-RESTORE.) User execution errors can be corrected by following the procedures used for execution of the message.

If any other errors occur, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

Message Class: GENR
Application: 5,3B
Type: Output

1. FORMAT

[1] UPD GEN RESTORE COMPLETED

[2] UPD GEN RESTORE STOPPED WITH ERROR CODE a

[3] UPD GEN RESTORE APP STOPPED WITH ERROR CODE b

[4] UPD GEN RESTORE TRANSFERRING CONTROL TO APPLICATION

[5] UPD GEN RESTORE APPLICATION COMPLETION WITHIN c SECONDS

[6] UPD GEN RESTORE CORCS ARE ALLOWED

[7] UPD GEN RESTORE APP EXECUTING RSTHOOK

[8] UPD GEN RESTORE APP EXECUTING RSTHOOK FAILED WITH EXIT CODE d

[9] UPD GEN RESTORE APP RSTHOOK REPORT e

[10] UPD GEN RESTORE APP MHD f BEING RESTORED

[11] UPD GEN RESTORE APP WARNING SM OFFLINE PUMP STATUS NOT IN EXPECTED STATE

[12] UPD GEN RESTORE APP WARNING SM(S) NOT IN EXPECTED DUPLEX STATE

[13] UPD GEN RESTORE APP WARNING CMP(S) NOT DUPLEX

[14] UPD GEN RESTORE APP WARNING CMP(S) IN GENERIC DIFFERENCE

[15] UPD GEN RESTORE APP WARNING COULD NOT SET STAGE COMPLETION FLAG

2. REASON FOR OUTPUT
To report the result of executing a UPD:G-RESTORE input message. Format 1 indicates that the RESTORE has completed successfully.

Format 2 and 3 indicates that the RESTORE has terminated with error.

Format 4 indicates that the APPLHOOK process has been called.

Format 5 indicates that the APPLHOOK process will be complete within the amount of time specified.

Format 6 indicates that the APPLHOOK process has allowed customer-originated recent changes (CORCs).

Format 7 indicates that the APPLHOOK process is executing the RSTHOOK retrofit tool.

Format 8 indicates that the RSTHOOK retrofit tool terminated with a non-zero exit code.

Format 9 indicates that the output from the RSTHOOK retrofit tool is displayed.

Format 10 indicates that the APPLHOOK process is restoring the moving head disk (MHD) specified.

Format 11 indicates that the status of the switching modules (SMs) indicates that the peripherals are still offline pumped.

Format 12 indicates that some SMs are not duplex.

Format 13 indicates that the communication module processors (CMPs) are not duplex.

Format 14 indicates that the CMPs are still offline pumped.

Format 15 indicates that the RESTORE stage could not be set completed in data delivery; the next retrofit stage may need to be executed unconditionally.

3. VARIABLE FIELD DEFINITIONS

a  = Error code causing the process to stop. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

b  = Error code causing the process to stop. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

c  = Maximum time in seconds for application processing by the APPLHOOK process.

d  = Exit code the retrofit tool RSTHOOK failed with. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

e  = The standard output of the retrofit RSTHOOK tool. Consult the appropriate software release transition procedures (refer to the REFERENCES section) for more information.

f  = The number of the MHD that is being changed from OFFLINE to OOS and then to ACTIVE.

4. ACTION TO BE TAKEN

Comply with instructions given. User execution errors can be corrected by following the procedures used for execution of the message. If any other errors occur, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Message Class: GENR
Application: 5
Type: Output

1. FORMAT

[1] UPD GEN SWITCHBCK AM SWITCH STARTED

[2] UPD GEN SWITCHBCK AM SWITCH COMPLETED

[3] UPD GEN SWITCHBCK AM SWITCH FAILED

[4] UPD GEN SWITCHBCK COMPLETED SUCCESSFULLY

[5] UPD GEN SWITCHBCK COMPLETED SUCCESSFULLY
   **** PERFORM GENERIC RETROFIT INITIALIZATION OF AM ****

[6] UPD GEN SWITCHBCK COMPLETED SMS IN TRANSIENT STATE

[7] UPD GEN SWITCHBCK COMPLETED SMS IN TRANSIENT STATE
   **** PERFORM GENERIC RETROFIT INITIALIZATION OF AM ****

[8] UPD GEN SWITCHBCK APP SM STATUS REQUESTED

[9] UPD GEN SWITCHBCK STOPPED WITH ERROR CODE a

[10] UPD GEN SWITCHBCK APP WARNING COULD NOT SET STAGE COMPLETION FLAG

2. REASON FOR OUTPUT

To report the result of executing a UPD:G-SWITCHBCK input message, and to provide status information and instructions concerning the software release transition.

Format 1 indicates that the SWITCHBCK has started switching to the off-line booted AM.

Format 2 indicates that the SWITCHBCK has completed switching the AM to the off-line booted software release side.

Format 3 indicates that the SWITCHBCK has failed to switch the AM to the off-line booted side.

Format 4 indicates that the SWITCHBCK has completed, the status of the switching modules (SM) shows all SMs have switched to the old software release side. Since an AM off-line boot AM side switch completed successfully no additional boot information is provided.
Format 5 indicates that the SWITCHBCK has completed, the status of the switching modules (SM) shows all SMs have switched to the old software release side. If the administrative module (AM) has not yet been booted on the old software release, the boot should be performed now.

Format 6 indicates that the SWITCHBCK has completed, the status of the SMs did not show all SMs were cycling on the old software release. This indication can either mean an SM is initializing, an SM status was slow in updating due to excessive message traffic or processor overload, or the SM did not switch to the old software release. An AM off-line boot AM side switch has been performed. Verify that the switched SMs are cycling on the old software release at the completion of the AM off-line boot AM side switch.

Format 7 indicates that the SWITCHBCK has completed, the status of the SMs did not show all SMs were cycling on the old software release. This indication can either mean the SM is initializing, the SM status was slow in updating due to excessive message traffic or processor overload, or the SM did not switch to the old software release. If the AM has not yet been booted on the old software release, the boot should be performed now. Verify that the SMs are cycling on the old software release at the completion of the AM software release retrofit initialization.

Format 8 indicates that an automatic OP:SYSSTAT,SM=1&192; has been input by the SWITCHBCK command.

Format 9 indicates that the SWITCHBCK process terminated with an error.

Format 10 indicates that the SWITCHBCK stage could not be set completed in data delivery. The SWITCHBCK field on Master Control Center (MCC) page 124 may not be backlit.

3. VARIABLE FIELD DEFINITIONS

\[ a \] = Error code causing the process to stop. Consult the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information.

4. ACTION TO BE TAKEN

Comply with instructions given in Software Release Retrofit for the appropriate software release. User execution errors can be corrected by examining the software release transition procedures used for execution of the command.

5. ALARMS

None.

[10] UPD GEN SWITCHFWD APP WARNING COULD NOT SET STAGE COMPLETION FLAG

2. REASON FOR OUTPUT

To report the result of executing a UPD:G-SWITCHFWD input message, and to provide status information and instructions concerning the software release transition.

Format 1 indicates that the SWITCHFWD has started switching to the off-line booted AM.

Format 2 indicates that the SWITCHFWD has completed switching the AM to the off-line booted software release side.

Format 3 indicates that the SWITCHFWD has failed to switch the AM to the off-line booted side.

Format 4 indicates that the SWITCHFWD has completed, the status of the switching modules (SM) shows all SMs have switched to the new software release side. Since an AM off-line boot AM side switch completed successfully no additional boot information is provided.
Format 5 indicates that the SWITCHFWD has completed, the status of the switching modules (SM) shows all SMs have switched to the new software release side. If the administrative module (AM) has not yet been booted on the new software release, the boot should be performed now.

Format 6 indicates that the SWITCHFWD has completed, the status of the SMs did not show all SMs were cycling on the new software release. This indication can either mean an SM is initializing, an SM status was slow in updating due to excessive message traffic or processor overload, or the SM did not switch to the new software release. An AM off-line boot AM side switch has been performed. Verify that the switched SMs are cycling on the new software release at the completion of the AM off-line boot AM side switch.

Format 7 indicates that the SWITCHFWD has completed, the status of the SMs did not show all SMs were cycling on the new software release. This indication can either mean the SM is initializing, the SM status was slow in updating due to excessive message traffic or processor overload, or the SM did not switch to the new software release. If the AM has not yet been booted on the new software release, the boot should be performed now. Verify that the SMs are cycling on the new software release at the completion of the AM software release retrofit initialization.

Format 8 indicates that an automatic OP:SYSSTAT,SM=1&&192; has been input by the SWITCHFWD command.

Format 9 indicates that the SWITCHFWD process terminated with an error.

Format 10 indicates that the SWITCHFWD stage could not be set completed in data delivery. The SWITCHFWD field on MCC Display Page 124 may not be backlit.

3. VARIABLE FIELD DEFINITIONS

a = Error code causing the process to stop. Consult the appropriate software release transition procedures Refer to the REFERENCES section of this manual page for more information.

4. ACTION TO BE TAKEN

Comply with instructions given in Software Release Retrofit for the appropriate software release. User execution errors can be corrected by following the software release transition procedures used for execution of the command.

[6] UPD GEN TSM  STOPPED WITH ERROR CODE t

[7] UPD GEN TSM  (OOS | CADN) SUMMARY  v MISMATCHES DETECTED

[8] UPD GEN TSM  w TRUNKS TO BE REMOVED FROM SERVICE

2. REASON FOR OUTPUT

To report the result of executing a UPD:G-TSM input message.

A report will be output if necessary. The report, if long, will be broken into segments as described by Format 5. The end of the list and termination report is indicated by a trailer message described in Format 4.

Format 1 indicates that reports that the trunk status mapping (TSM) command has completed successfully.

Format 2 indicates that reports that the TSM command has failed.

Format 3 indicates that reports that the TSM command is in progress and has logged/not logged trunks.

Format 4 indicates that reports that the TSM report has completed.

Format 5 indicates that prints the TSM status report.

Format 6 indicates that reports that the TSM command has stopped with an error.
Format 7 indicates that reports the number of out-of-service (OOS) or circuit administration (CADN) mismatches detected.

Format 8 indicates that reports the number of OOS trunks to be removed from service.

3. VARIABLE FIELD DEFINITIONS

DEN = The digital equipment number (DEN) of a digital trunk, if available.

DSLG = The digital subscriber line (DSL) group (DSLG).

LTP = Logical test port.

RAF = Recorded announcement function equipment number associated with the announcement port.

SLEN = SLC® line equipment number (SLEN), if available.

TEN = The trunk equipment number (TEN) of an analog trunk.

TKGMN = Trunk group and member number for a port if available.

a = Number of trunk records logged in the appropriate TSM log file.

b = Total number of segments in the status report.

c = Segment number of status report.

d = Status of report. Valid value(s):

STARTED = Indicates the first segment in the list. This does not necessarily imply that additional segments will be required. The list will be terminated by an 'end-of-list' message.

CONTINUED = Second and subsequent segments of a list too long to be printed in a single segment.

f = The primary status for the trunk. This is the most restrictive status currently on the port. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a detailed explanation of the status.

g = SM number.

h = Digital line and trunk unit (DLTU) number.

i = Digital facility interface (DFI) number.

j = DFI channel number.

k = RAF unit number.

l = RAF announcement channel number.
m = Digital carrier line unit number.

n = Remote terminal number.

o = Remote terminal line number.

p = Trunk unit number.

q = Service group number.

r = Channel board number.

s = Channel circuit number.

t = Exit code number with which TSM failed. Consult the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information.

u = Exit code definition that caused the TSM process to stop. Consult the appropriate software release transition procedures. Refer to the REFERENCES section of this manual page for more information.

v = Number of trunk mismatches detected. For the OOS summary, this indicates the number of trunks which were OOS on the old software release but are in-service on the new software release. For the CADN summary, this indicates the number of trunks which are OOS CADN on the new software release but were in-service on the old software release.

w = Number of trunks which will be taken OOS.

x = Trunk group number.

y = Trunk member number.

z = Channel group number.

a1 = Logical test port number.

4. ACTION TO BE TAKEN

Comply with instructions given in Software Release Retrofit for the appropriate software release. User execution errors can be corrected by following the software release transition procedures used for execution of the message. If any other errors occur, check the Recovery section in Software Release Retrofit for the appropriate software release and perform the actions for the given error code.

5. ALARMS

UPD:GENPCC
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

UPD GENPCC a [b]

2. REASON FOR OUTPUT

To report errors that occurred during the UPgenpcc process.

3. VARIABLE FIELD DEFINITIONS

a = Text string describing error. Valid value(s):
   CALLOC SYSTEM CALL FAILED
   COULD NOT UN-BLOCK FILESYS AUDITS
   CUD READ/OPEN FAILED
   EXEC SYSTEM CALL FAILED
   FAILED ON CLOSE OF /etc/.pfstat
   FAILED ON READ OF /etc/.pfstat
   FAILED ON SEEK OF /etc/.pfstat
   FAILED ON WRITE OF /etc/.pfstat
   FAILED TO INHIBIT FILESYS AUDITS
   FAILED TO OPEN/CREATE /etc/.pfstat
   FAILED TO SEND A MESSAGE
   FORK SYSTEM CALL FAILED
   HISTORY FILE READ/OPEN FAILED
   INTERNAL STATE ERROR
   INVALID BWMNAME REQUESTED
   INVALID MESSAGE FROM UCNTL
   OILD CHILD TERMINATED ABNORMALLY
   RECEIVED UNIX SIGNAL

b = Additional data, for example an errno or pathname.

4. ACTION TO BE TAKEN

The specific action required depends on the type of error that occurred. In the case of INVALID MESSAGE FROM UCNTL, re-enter the 9330 poke on MCC Display Page 1960 to make official. If any other error conditions are printed or if the before mentioned procedures do not correct the situation, obtain technical assistance.

2. REASON FOR OUTPUT

To report the status of hash sum checking in response to a UPD:HSCHK input message or in response to a routine hash sum verification.

Format 1 is printed to report a hash sum mismatch between the disk text image and the disk hash sum image. The comparison with core memory is not done if an error is found in the disk image. A maximum of five errors per target is printed in an output message of this type.

Format 2 is printed to report a hash sum mismatch between the disk hash sum file and the hash sums that are stored in core memory. Each output message of this type contains only one error due to the amount of data. A maximum of five error messages of this type are printed per target.

Format 3 is printed only if the UPD:HSCHK is entered with the REPT option and there were errors found from a previous run of the hash sum check. If UPD:HSCHK is run with the report option it DOES NOT DO HASH SUM CHECKING. It only reports on the status of the last run of the hash sum check.

Format 4 is printed to report status or provide additional information for the hash sum check.

Format 5 is printed to report an error in the use of the hash sum check. This is usually due to incorrect data being specified on the command line.

Format 6 is printed to report an error that occurred while the hash sum audit was running that is attributed to internal or system problems.

3. VARIABLE FIELD DEFINITIONS

a = Target that the hash sum checking was done on. Valid value(s):

- **CMP** = Communication module processor.
- **DDMA** = Diagnostic direct memory access
- **DNUSCC** = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
- **DNUSTMX** = Transmission multiplexer.
- **DSC3** = Digital service circuit - model 3.
- **DSP13K** = 8K digital signal processor for CDMA protocol handler for voice.
- **DSP8K** = 8K digital signal processor for CDMA protocol handler for voice.
- **DSPEVRC** = EVRC digital signal processor for CDMA protocol handler for voice.
- **GDSF** = Global digital services function - model 3.
- **HDSU** = Hardware digital service unit.
- **HSAS** = Service announcement system diagnostic image.
- **IDCUCCP** = Integrated digital carrier unit (IDCU) common control processor.
IDCUDLP  = IDCU data link processor.
IDCULSI  = IDCU loop side interface.
IP3S     = Protocol handler 3 CCS OIP image.
IP4F     = Frame relay protocol handler version 4 I/O processor.
IP4I     = PH4I operational input/output processor.
IP4IF    = ISDN Frame Relay protocol handler version 4 I/O processor.
ISLU     = Integrated services line unit.
ISLU2    = Integrated services line unit 2.
ISTF     = Integrated services test function.
LDSU     = Local digital service unit.
LDSF     = Local digital services function - model 3.
MSGH     = Message handler.
ODMA     = Operational direct memory access.
OIOPI    = Operational input/output processor.
PH2A     = Protocol handler 2 (PH2) with ACCESS application processor image.
PH2G     = PH2 with GATEWAY application processor image.
PH3C     = Protocol handler 3 (PH3) with COMMON application processor image.
PH3S     = PH3 CCS AP image.
PH4A     = Protocol handler 4 (PH4) access image.
PH4G     = PH4 gateway image.
PH4I     = PH4 with integrated services digital network (ISDN) application processor image.
PHA1A    = Protocol handler for ATM (asynchronous transfer mode).
PI       = Packet interface.
PI2      = Packet interface unit 2.
PHV1C    = Protocol handler for voice for CDMA (code division multiple access).
PHV3C    = Protocol handler for voice version 3 for CDMA application.
PHV4C    = Protocol handler for voice version 4 for CDMA application.
RAF      = Recorded announcement function.
SAS      = Service announcement system operational image.

b = Full switch path name to a targets text image or hash sum image.

b = Number of errors to be printed in the table below. If more than five errors were found, only the first
five errors are printed in the table and the message "USE 'OUTFILE' OPTION FOR A
COMPLETE LIST" is printed.

d = A 4 byte address value whose meaning is indicated by the corresponding label or column header.

e = A 2 byte hash sum value whose meaning is indicated by the corresponding label or column
header.

f = A COFF section name associated with the mismatch being printed.

g = The starting disk physical address where the mismatch occurred.

h = The ending address of the mismatch. If the mismatch overlaps a 2048 memory block boundary,
then the ending address will be the ending address of the mismatched block. If the error continues
into the next block, it will show up as the next error with a starting address of the next 2048 byte
block.

i = Up to five words from the disk text file starting at the mismatch address.

j = Up to five words from core memory starting at the mismatch address.

k = SM/CMP number.

l = The number of hash sum mismatches or hash sum errors that were found.

m = A text string providing hash sum check status. Valid value(s):

   AFFECTED SM/CMP(S):  
   k
2. REASON FOR OUTPUT

To report the status of hash sum checking in response to a UPD:HSCHK input message or in response to a routine hash sum verification.

Format 1 is printed to report a hash sum mismatch between the disk text image and the disk hash sum image. The comparison with core memory is not done if an error is found in the disk image. A maximum of five errors per target is printed in an output message of this type.

Format 2 is printed to report a hash sum mismatch between the disk hash sum file and the hash sums that are stored in core memory. Each output message of this type contains only one error due to the amount of data. A maximum of five error messages of this type are printed per target.

Format 3 is printed only if the UPD:HSCHK is entered with the REPT option and there were errors found from a previous run of the hash sum check. If UPD:HSCHK is run with the report option it DOES NOT DO HASH SUM CHECKING. It only reports on the status of the last run of the hash sum check.

Format 4 is printed to report status or provide additional information for the hash sum check.

Format 5 is printed to report an error in the use of the hash sum check. This is usually due to incorrect data being specified on the command line.

Format 6 is printed to report an error that occurred while the hash sum audit was running that is attributed to internal or system problems.

3. VARIABLE FIELD DEFINITIONS

a = Target that the hash sum checking was done on. Valid value(s):
CMP = Communication module processor.
DDMA = Diagnostic direct memory access

V5DVSP = VSELP DSP, for TDMA for PHV5.
V5DISL = ISLP DSP, for IS41 TDMA PHV5 for data circuit.

b = Full switch path name to a targets text image or hash sum image.
c = Number of errors to be printed in the table below. If more than five errors were found, only the first five errors are printed in the table and the message "USE 'OUTFILE' OPTION FOR A COMPLETE LIST" is printed.
d = A 4 byte address value whose meaning is indicated by the corresponding label or column header.
e = A 2 byte hash sum value whose meaning is indicated by the corresponding label or column header.
f = A COFF section name associated with the mismatch being printed.
g = The starting disk physical address where the mismatch occurred.
h = The ending address of the mismatch. If the mismatch overlaps a 2048 memory block boundary, then the ending address will be the ending address of the mismatched block. If the error continues into the next block, it will show up as the next error with a starting address of the next 2048 byte block.
i = Up to five words from the disk text file starting at the mismatch address.
j = Up to five words from core memory starting at the mismatch address.
k = SM/CMP number.
l = The number of hash sum mismatches or hash sum errors that were found.
m

= A text string providing hash sum check status. Valid value(s):

p = Failure code.
q = The output file name.
r = The error number that the UNIX® system call failed with. Refer to the APP:SYSERR appendix for an explanation of the error codes.
s = The process ID.
t = The number of bytes.

4. ACTIONS TO BE TAKEN

Hash sum verification is scheduled to run routinely or it can be run manually in response to an input message. In either case, if an error is detected, corrective action should be taken immediately to prevent potential service impacting problems. Detailed procedures for correcting hash sum error problems are given in the Corrective Maintenance Manual. However, these should only be performed by trained and qualified personnel.

5. ALARMS
If the hash sum check finds errors, maintenance personnel will be notified by the above messages on the ROP. If a hash sum error was found in either the disk image, or in the comparison of disk hash sums with the incore hash sums, then a major alarm will be set and the SM/CMP FILE indicator on MCC Display Page 116 will be changed from NORMAL to HASHERR. In addition, if there is a mismatch between disk and core memory, MCC Display Pages 1800 and 141-144 will show a D/C HASH status.

The only way to clear the off-normal indicator on MCC Display Page 116 is run the check with the ‘ALL’ option and not find any errors.

[2] UPD INFO: THE c AUDIT TIMED OUT FOR a. UPDATE CONTINUES....

[3] UPD INFO: THE c AUDIT WAS NOT RUN ON a BECAUSE IT IS (BLOCKED|INHIBITED)

[4] UPD INFO: THE c AUDIT WAS NOT RUN ON a BECAUSE IT WAS ALREADY RUNNING

[6] UPD INFO: PROGRAM UPDATE WAITING FOR MOUNTING

[7] UPD INFO: TEMPORARY AM UPDATES ARE RECORDED AS INCONSISTENT

[8] UPD INFO: CANNOT REMOVE TEMPORARY FILE d

[9] UPD INFO: FILE PARTITION WITH FILE d IS NOT MOUNTED READ/WRITE

[10] UPD INFO: CUD/HISTORY FILE MODIFICATION COMPLETED

[12] UPD INFO: REALLOWING c AUDIT

[13] UPD INFO: UPDATE WAS ON DISK ONLY, NO PROCESS INSTANCE OF d EXISTS

[14] UPD INFO: PROCESS PID=e DIED DURING f

[15] UPD INFO: NO PROCESS FOUND WITH UTILITY ID=g
2. REASON FOR OUTPUT

To report that file system audits are being scheduled or that a problem was encountered while running the file system audits. This message also gives miscellaneous information during abnormal events which are not error conditions.

Format 1 indicates that a file system audit is being run on the file system indicated by \textit{a}.

Format 2 indicates that the audit indicated by \textit{c} has timed out. The file system is indicated by \textit{a}.

Format 3 indicates that the audit indicated by \textit{c} failed to run on the file system indicated by \textit{a} because the file system is blocked or inhibited.

Format 4 indicates that the audit indicated by \textit{c} failed to run on the file system indicated by \textit{a} because it was already running.

Format 5 through 10 indicate audit instances that occur during an administration module (AM) reboot.

Format 11 indicates that files needed for the official section of the software update process are being built. The official section will begin as soon as the files have completed.

Format 13 indicates that an AM killable process whose disk image path is \textit{d} was not running.

Format 14 indicates that an AM killable process whose process identifier (PID) was \textit{e} died while being updated in stage \textit{f}. This is not an error because any new invocations will be loaded with the updated image.

Format 15 indicates that the process checker called during memory reclamation found no AM process with utility ID of \textit{g}. This means that the update will be to disk only.

Format 16 indicates that the software update application process has been manually stopped.

Format 17 indicates that the soak timer has been changed using Easy BWM. The new soak timer information will be printed immediately after this message prints.
Format 18 indicates that the offline pump is in progress.

Format 19 indicates that new current update database (CUD) and history files are being created as a result of a UPD:REDUCE input message. This can take several minutes if the existing CUD and history files are large.

Format 20 indicates that a request to initialize the administrative workstation is needed to activate or deactivate an update. This message will be printed following the apply or backout of an EMULATOR type update.

Format 21 indicates one possible corrective action for a failed directory switch attempt. This message is preceded by a REPT:FMGR-DIR message. The UNIX® file manager will report that a file system's inode is busy when a user is located on that file system's mount point. The most likely cause of this message is due to a user who has changed directory to the /no5text/im directory. The user can correct this problem, within a certain window, by executing a change directory command to move off the directory.

### 3. VARIABLE FIELD DEFINITIONS

| a | = Name of file system. |
| b | = Number of passes. |
| c | = Type of file system audit. Valid value(s):
|   |  FSCMPT = File system compaction. |
|   |  FSLINK |
| d | = File path name. |
| e | = Process ID. |
| f | = Various update scenarios: Valid value(s):
|   |  APPLY |
|   |  BACKOUT |
|   |  BACKOUT LAST OFFICIAL |
|   |  RECLAIM |
| g | = Unique utility ID identifier. |
| h | = Switching module (SM) number. |

### 4. ACTION TO BE TAKEN

These messages will not cause the process running to abort.

### 5. ALARMS

None.

1. **FORMAT**

   [1] `UPD INITPW {COMPLETED|ABORTED}`

   [2] `UPD INITPW ERROR a`

2. **REASON FOR OUTPUT**

   To report the progress of the UPD:INITPW input message.

   Format 1 indicates when the UPD:INITPW has completed or aborted.

   Format 2 indicates the reason that the UPD:INITPW aborted.

3. **VARIABLE FIELD DEFINITIONS**

   a = The cause of failure. Valid value(s):

   - A NEW KEY REQUIRES A NEW PASSWORD
   - FIRST INITIALIZATION REQUIRES A KEY
   - IN UPDATING PASSWORD FILE
   - INVALID CHAR IN KEY b
   - INVALID CHAR IN PASSWORD b
   - INVALID KEY LENGTH
   - INVALID NUMBER FOR LOGIN ATTEMPTS
   - INVALID OPTION
   - INVALID PASSWORD LENGTH
   - MUST SPECIFY AT LEAST ONE PARAMETER
   - PASSWORD REQUIRES AT LEAST 2 ALPHA AND 1 SPECIAL CHAR

   b = The invalid character in the key or password.

4. **ACTION TO BE TAKEN**

   If Format 1 prints `ABORTED`, refer to a to determine the cause of the failure. To continue the password initialization procedure, enter the UPD:INITPW input message.

5. **ALARMS**

   None.

UPD:INTERNAL
Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

UPD INTERNAL ERROR a

2. REASON FOR OUTPUT

To specify internal errors that occurred as a result of performing a field update activity.

3. VARIABLE FIELD DEFINITIONS

a = Text string describing error: Valid value(s):

- BAD CMP CONFIGURATION TYPE
- BAD DSU2 TARGET TYPE
- BAD TARGET TYPE
- BAD TEMPLATE NAME
- BAD TYPE
- BAD TYPE ARGUMENT
- BAD UPDATE TRANSACTION REQUEST
- BAD UPDATE TYPE
- BAD UPDATE TYPE FOR BACKOUT
- MORE THAN ONE INVOCATION OF UCNTL
- MORE THAN ONE INVOCATION OF UPPMPSTOP
- PMPSTOP TIMED OUT BEFORE PMPPERF TERMINATION
- PUMPBWM/PUMPOFC CALLED WITH TYPE:b
- UNABLE TO CONNECT TO PT_PMPPERF
- UNKNOWN RECOVERY TYPE

b = Additional data provided by the UPD:PUMPBWM or UPD:PUMPOFC input message.

4. ACTION TO BE TAKEN

The specific action required depends on the type of error that occurs. If more than one invocation of ucntl, UPPmpstop and PMPSTOP timed out before PMPPERF termination, there could have been process restrictions. In these cases, the input message can be re-entered immediately. Otherwise, obtain technical assistance.

UPD:OFC

Software Release: 5E14 - 5E16(1)
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

[1] UPD OFC UPNM a
   FN b FINISHED

[2] UPD OFC CONTINUES

[3] UPD OFC UPNM a
   FN b
   DF c FINISHED

[4] UPD OFC {COMPLETED|ABORTED}

[5] UPD OFC BWM = a OFFICIAL SECTION COMPLETED

2. REASON FOR OUTPUT

To report progression of the UPD:OFC input message.

Format 1 indicates the "make official" section has completed for the software update indicated in 'a' for the file name indicated in 'b'.

Format 2 indicates that there are more files being made official and update (UPD) official (OFC) is in progress.

Format 3 indicates the OFC has completed for the software update indicated in 'a' for the file name indicated in 'b' and the dependent file name indicated in 'c'.

Format 4 indicates that the UPD:OFC process has completed or aborted for an update.

Format 5 indicates that the entire UPD:OFC section has completed.

3. VARIABLE FIELD DEFINITIONS

a = Software update name.

b = File path.

C = Dependent file path. Valid value(s):
   ABORTED = Requested action was terminated before completion and the termination was immediate.
   COMPLETED = Request has successfully completed.
4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

UPD: USRERR

MCC Display Page(s):

1950 (BWM MAINTENANCE)
1960 (BWM INSTALLATION)
UPD:OMDB

Software Release: 5E14 and later
Message Class: MTCE
Application: 5.3B
Type: Output

1. FORMAT

[1] UPD OMDB COMPLETED FOR THE FOLLOWING KEYS:
   a

[2] UPD OMDB NO DATABASE ENTRY FOUND FOR
   THE FOLLOWING KEYS:
   b

[3] UPD OMDB FAILED
   UNABLE TO ACCESS /cft/spl/omdb

[4] UPD OMDB COMPLETED

[5] UPD OMDB CANNOT OPEN OR CREATE LOGFILE
   UPDATE NOT LOGGED

[6] UPD OMDB ABORTED
   UNABLE TO SEND REQUEST TO CSOP

[7] UPD OMDB NOT STARTED
   CONFLICT WITH CURRENT SYSTEM STATUS c

2. REASON FOR OUTPUT

To report the result of executing a UPD:OMDB input message.

3. VARIABLE FIELD DEFINITIONS

a = List of message keys for which the UPD:OMDB completed successfully.
b = List of message keys for which the UPD:OMDB failed.
c = Further explanation of error. Valid value(s):
   INVALID ALARM
   INVALID KEY
   INVALID MSGCLS
   SYNTAX ERROR
   TOO MANY KEYS
4. **ACTION TO BE TAKEN**

For Format 2, verify that the key(s) was entered correctly.

For Format 3, determine if the disk is available. If the disk is available, verify the status of the OMDB disk file by using the OP-ST-LISTDIR input message for /cft/spl/omdb.

Format 5 indicates a possible file system problem, such as lack of available disk space. The update being processed is not saved in the OMDB logfile (/cft/spl/OMDB_LOG).

For Format 6, verify that the coordinator of spooler output process (CSOP) is running.

For Format 7, verify that the input message was entered correctly.

5. **ALARMS**

None. Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

2. REASON FOR OUTPUT

To report the status of the UPD:PMPPERF request, in response to a UPD:PMPPERF input message. To report any
switching modules or target peripheral units for which the remove/restore attempt failed or was stopped. Switching
modules (SMs) that are isolated or out-of-service are identified, but do not impact the completion status of the
UPD:PMPPERF input message.

Format 1 is printed to report the overall status of the UPD:PMPPERF input message.

Format 2 is printed when the UPNM input option was used and UPD:PMPPERF has successfully completed in all
SMs not appearing in the offnormal SM list.

Format 3 is printed when the UPNM and OFC input options were used and UPD:PMPPERF has successfully
completed in all SMs not appearing in the offnormal SM list.

Format 4 is printed when the TARGET input option was used and UPD:PMPPERF has successfully completed in all
SMs not appearing in the offnormal SM list.

Format 5 is printed when UPD:PMPPERF has completed with one or more failing SMs, and begins to run a
consistency check on the failing targets.

Format 6 is printed when the Software Update affects a mix of peripherals as discussed in the Format 18
explanation, and UPD:PMPPERF fails for the first set of peripherals. The fact that the error occurred is printed but
UPD:PMPPERF will then proceed on the other set of peripherals.

Format 7 is printed when the list of inconsistencies is printed. Refer to the UPD:VFYCON output manual page for
the format of the inconsistency report.
Format 8 is printed every 10 minutes for each iteration of UPD:PMPPERF. Any SMs which are still in progress, or have yet to start UPD:PMPPERF, are listed.

Format 9 is printed when UPD:PMPPERF has failed for one or more SMs but a consistency check detects no inconsistencies. One case where this can happen is when the remove/restore of a peripheral unit fails such that it is left out-of-service. Therefore use op:cfgstat to look for any out-of-service units. Another case that can cause this condition is that a failing SM has become off-normal.

Format 10 is printed when the UPNM input option was used and the MSGS file in the indicated Software Update package contains no UPD:APPLY input messages for any SM pummable peripheral targets (refer to variable 'c'). This does not cause UPD:PMPPERF to fail.

Format 11 is printed when the UPNM and OFC input options were used and the MSGS file in the indicated Software Update package contains no UPD:APPLY input messages for any SM pummable peripheral targets which require a remove/restore after the UPD:OFC input message. The only targets which require this are ISLU, IDCUCCP, IDCULDP, IDCULSI, DNUSCC and DNUSTMX. This does not cause UPD:PMPPERF to fail.

Format 12 is printed when the UPD:PMPPERF input message was unable to communicate with the offnormal affected SMs identified in the output.

Format 13 is printed when the UPNM input option was used. The SM pummable peripheral targets found in the Software Update package are listed.

Format 14 is printed when the UPNM and OFC input options were used. The subset of SM pummable peripheral targets listed in Format 11 found in the Software Update package are listed.

Format 15 is printed when a failure is detected in an SM but UPD:PMPPERF will continue in that SM. The targets which will still be removed/restore is printed.

If inconsistent resident images are detected for at least one of the UPD:PMPPERF targets, those targets are printed.

If a failure was encountered during the remove/restore of a specific peripheral, that peripheral is printed. Any other peripherals which will not be removed/restored because of that failure are printed next as 'NOT ATTEMPTED'. If the number of peripherals to be printed exceeds an internal limit (54), the word PARTIAL is printed. It is possible that the target which experienced the failure will still be in progress. This will happen if UPD:PMPPERF will proceed on other units of the target type, or if there are any outstanding remove/restore requests in progress for that target.

In the case of protocol handlers (PHs), the integrated digital carrier unit (IDCU) targets, or digital networking unit - synchronous optical network (SONET) (DNU-S) targets, certain failures for one target can cause other targets to be aborted. Therefore more than one target may be listed as having a failure.

If the failure encountered was the inability to remove a PH, the anticipation is that it was caused by the lack of a spare PH on that PSU shelf. All targets for that PH hardware type are aborted for that PSU shelf. PHs on other packet switch unit (PSU) shelves will still be removed/restored. In this case, the failing shelf numbers are printed.

Format 16 prints the completion status of UPD:PMPPERF in a specific SM.

Format 17 is similar to Format 15, but the failure has cause UPD:PMPPERF to abort in that SM.

If inconsistent resident images are detected for at least one of the UPD:PMPPERF targets, those targets are printed. Some targets are interdependent, so an inconsistent resident image of one type will cause UPD:PMPPERF to abort for other targets. If this happens, the 'OTHER TARGETS ABORTED AS A RESULT' phrase is printed.

If a failure was encountered during the remove/restore of a specific peripheral, that peripheral is printed. Any other
peripherals which will not be removed/restored because of that failure are printed next as 'NOT ATTEMPTED'. If the number of peripherals to be printed exceeds an internal limit (54), the word PARTIAL is printed.

In the case of protocol handlers (PHs), the integrated digital carrier unit (IDCU) targets, or digital networking unit - SONET (DNU-S) targets, certain failures for one target can cause other targets to be aborted. Therefore more than one target may be listed as having a failure.

Format 18 is printed when the UPNM input option was used and not all of the targets can be removed/restored together. For most targets, UPD:PMPPERF is run concurrently on all SMs. For the ISTF, RAF, and SAS targets, UPD:PMPPERF is run to completion one SM at a time. This message will print if the software update affects both ISTF and/or RAF as well as some other SM pumpable peripheral target.

Format 19 is printed when the affected SMs are directed to start remove/restores.

Format 20 prints the list of SMs where UPD:PMPPERF failed.

Format 21 prints a warning relating to routine exercise (REX).

3. VARIABLE FIELD DEFINITIONS

a = Overall UPD:PMPPERF status. Valid value(s):
   ABORTED = UPD:PMPPERF has aborted due to a fatal error. Refer to other UPD:PMPPERF or UPD:SYSERR output messages to determine why.
   COMPLETED = UPD:PMPPERF has completed successfully.
   CONTINUES = This is printed after timing out for an SM if UPD:PMPPERF is still in progress for other SMs.
   STOPPED = UPD:PMPPERF was stopped by the UPD:PMPSTOP input message.

b = Software update name (the UPNM input option was entered).

c = Pumpable SM peripheral target or list of targets. Valid value(s):
   DDMA = Diagnostic direct memory access
   DNUSCC = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
   DNUSTMX = Transmission multiplexer.
   DSC3 = Digital service circuit - model 3.
   DSP13K = 8K digital signal processor for CDMA protocol handler for voice.
   DSP8K = 8K digital signal processor for CDMA protocol handler for voice.
   DSPEVRC = EVRC digital signal processor for CDMA protocol handler for voice.
   GDSF = Global digital services function - model 3.
   HDSU = Hardware digital service unit.
   HSAS = Service announcement system diagnostic image.
IDCUCP = Integrated digital carrier unit (IDCU) common control processor.
IDCUDLP = IDCU data link processor.
IDCULSI = IDCU loop side interface.
IP3S = Protocol handler 3 CCS OIP image.
IP4F = Frame relay protocol handler version 4 I/O processor.
IP4I = PH4I operational input/output processor.
IP4IF = ISDN Frame Relay protocol handler version 4 I/O processor.
ISLU = Integrated services line unit.
ISLU2 = Integrated services line unit 2.
ISTF = Integrated services test function.
LDSU = Local digital service unit.
LDSF = Local digital services function - model 3.
MSGH = Message handler.
ODMA = Operational direct memory access.
OIOP = Operational input/output processor.
PH2A = Protocol handler 2 (PH2) with ACCESS application processor image.
PH2G = PH2 with GATEWAY application processor image.
PH3C = Protocol handler 3 (PH3) with COMMON application processor image.
PH3S = PH3 CCS AP image.
PH4A = Protocol handler 4 (PH4) access image.
PH4G = PH4 gateway image.
PH4I = PH4 with integrated services digital network (ISDN) application processor image.
PHA1A = Protocol handler for ATM (asynchronous transfer mode).
PI = Packet interface.
PI2 = Packet interface unit 2.
PHV1C = Protocol handler for voice for CDMA (code division multiple access).
PHV3C = Protocol handler for voice version 3 for CDMA application.
PHV4C = Protocol handler for voice version 4 for CDMA application.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
SM = Switching module.
SMPMH = Switching module processor message handler (MH) operational image.
SMPMHLB = Switching module processor MH little boot image.
V3DACP = ACELP digital signal processor, for TDMA protocol handler for voice.
V4D13K = 13K DSP, for CDMA protocol handler for voice version 4.
V4D8K = 8K DSP, for CDMA protocol handler for voice version 4.
V4DACP = ACELP DSP, for TDMA protocol handler for voice version 4.
V4DEVR1 = EVRC1 DSP, for CDMA protocol handler for voice version 4.
V4DEVR2 = EVRC2 DSP, for CDMA protocol handler for voice version 4.
V4DEVR3 = EVRC3 DSP, for CDMA protocol handler for voice version 4.
V4DVSP = VSELP DSP, for TDMA protocol handler for voice version 4.
V4DISL = ISLP DSP, for IS41 TDMA protocol handler for data circuit.

d = SM number or list of SM numbers.

e = Offnormal SM status. This is the status of the indicated SM when UPD:PMPPERF was started.
Valid value(s):
   ISOLATED = The SM is isolated.
   NOT OPERATIONAL = The SM is not operational, or is in the special growth state.

f = UPD:PMPPERF final SM status report. Valid value(s):
   COMPLETED = The indicated switching module has successfully completed the remove/restore of inconsistent peripherals, if any.
   COMPLETED WITH FAILURE = The indicated switching module has successfully completed the remove/restore of some inconsistent peripherals, but there was a prior failure.
   NOT ACKNOWLEDGED = The indicated SM has not completed and has not reported any progress for a reasonable amount of time. The amount of time allowed is approximately 20 minutes. UPD:PMPPERF will continue if other SMs are still in progress.
   HALTED = Refer to Format 17.
   STOPPED = The indicated SM has stopped the remove/restore process because the UPD:PMPSTOP input message was received. This message will not print until the
SM has completed any remove/restore requests which were in progress at the time the SM received the UPD:PMPSTOP notification.

- **g** = A list of PSU shelf numbers that experienced a failure. This is printed only if remove/restores will proceed on other shelves.

- **h** = Reason why the peripheral failed. In some cases this is a best guess. Search for other remove (RMV) or restore (RST) messages for additional information.

- **ABORTED** = A maintenance request administrator (MRA) remove/restore job aborted at some point.

- **DATABASE FAILURE** = Some database problem was detected. Any required audits will automatically be scheduled.

- **INTERNAL ERROR** = An internal error was detected. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

- **NOT ATTEMPTED** = The remove/restore of this peripheral will not be requested because of the failure(s) cited earlier in the list of failing peripherals.

- **NOT STARTED** = An MRA job which UPD:PMPPERF requested did not start the remove/restore operation.

- **PUMP FAILED** = The pump of the unit failed.

- **REMOVE FAILED** = The remove portion of the remove/restore operation failed.

- **RESOURCE FAILURE** = A resource failure was encountered.

- **RESTORE FAILED** = The restore portion of the remove/restore operation failed.

- **STOPPED** = An MRA remove/restore job was stopped at some point.

- **TIMED OUT** = UPD:PMPPERF timed out waiting for MRA to complete the remove/restore request.

- **PARALLEL PUMP FAILURE** = A DNU-S CC was successfully removed/restored but the associated broadcast TMUX pump failed on at least one TMUX.

- **SOFT SWITCH FAILURE** = A DNU-S CC was successfully removed/pumped but restored to STBY as opposed to the requested ACT. The associated broadcast TMUX pump may have failed on at least one TMUX.

- **FLASH UPDATE FAILURE** = A DNU-S CC was successfully removed but stopped at restore due to a FLASH update failure. The associated broadcast TMUX pump was not attempted.

- **HARD SWITCHED** = A DNU-S CC was successfully pumped and hard-switched to ACT. The old ACT side ("switch-from" side) is being removed to OOS. The associated broadcast TMUX pump may have failed on at least one TMUX.

- **i** = The unit name of the peripheral. Valid value(s):
DNUSCC=SM-UNIT-CC
TMUX=SM-UNIT-DG-TMUX
GDSF=SM-UNIT
IDCU=SM-UNIT-SG
ISLUCC=SM-UNIT-CC
ISLU2CC=SM-UNIT-CC
ISTF=SM-UNIT
LDSF=SM-UNIT
LDSU=SM-UNIT-SG
PSUPH=SM-0-SHELF-PH
RAF=SM-UNIT
SAS=SM-UNIT

j = Which set of targets. Valid value(s):

FIRST = This is the first set of targets. This set will contain any pumpable targets except RAF, ISTF, and SAS. This is the first phase or iteration of UPD:PMPPERF.

LAST = This is the second (last) set of targets. The set will always contain the SAS, RAF or ISTF peripherals, in any combination. This is the last phase or iteration of UPD:PMPPERF.

k = Failing SM status. Valid value(s):

NO REPLY = The indicated SM was operational and not isolated when UPD:PMPPERF started, but did not reply to the UPD:PMPPERF request.

PMPPERF FAILED = UPD:PMPPERF encountered some type of failure(s) in the indicated SM. Refer to other output messages for details.

PMPPERF STOPPED = Notification of the UPD:PMPSTOP input messages reached the indicated SM while UPD:PMPPERF was in progress. The SM scheduled no more requests to remove/restore peripherals, but waited for any requests that were in progress at the time.

PMPPERF STOPPED - REQUEST NOT SENT = The UPD:PMPSTOP input message was detected so the UPD:PMPPERF request was not sent to the indicated SM.

l = Information message about the status of routine exerciser (REX). REX is automatically inhibited by UPD:PMPPERF for all SMs affected by UPD:PMPPERF. This is done because REX can interfere with UPD:PMPPERF and possibly cause it to fail. Inhibiting REX will prevent REX from starting, but will not stop REX if it has already started. Valid value(s):

REX HAS BEEN RE-INHIBITED ON SM c = While UPD:PMPPERF was running in an SM, it was discovered that REX is allowed in that SM. UPD:PMPPERF then automatically re-inhibited REX for that SM.

REX NOT INHIBITED = Error encountered when trying to inhibit REX on affected SMs at the start of UPD:PMPPERF.

UNABLE TO RE-INHIBIT REX ON SM c = While UPD:PMPPERF was running in an SM, it was discovered that REX is allowed in that SM. UPD:PMPPERF then automatically tried to re-inhibit REX for that SM but encountered an error.
4. ACTIONS TO BE TAKEN

If **UPD:PMPPERF COMPLETED** prints and no SMs were identified as not acknowledging the request, then all inconsistent target peripherals were pumped successfully and are now consistent. No action need be taken.

Otherwise, some recovery action should be taken. If the **UPD:PMPPERF** input message aborted due to an inconsistent resident image, the **UPD:RCVRY** input message may be used to recover the resident image inconsistency, and the **UPD:PMPPERF** input message may be retried.

If the **UPD:PMPPERF** input message aborted due to failed peripherals, the units may be removed and restored manually, or the **UPD:PMPPERF** input message may be retried. The consistency check which **UPD:PMPPERF** automatically runs may be used to identify inconsistent peripherals remaining in the system.

If all peripherals of one or more target type fail to pump or restore, especially if the problem occurs in multiple switching modules, the software update should be suspected as the source of the problem. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

If some SM(s) were identified as offnormal, some action must be taken to determine why the SM(s) are offnormal. Additionally, if an SM had timed out, make sure that the SM is not isolated or experiencing some type of overload.

It should be noted that **UPD:PMPPERF** will not proceed on duplex units (IDCU, ISLU, ISLU2, LDSU, GDSF, LDSF, and DNU-S CC) if one service group is out-of-service. If this is the case, restore the service group and retry **UPD:PMPPERF**.

For ISLU and ISLU2, if it is not possible to get both ISLUCCs in service, force the remove/restore either using the input message **RST:ISLUCC** with the **x-y-z, UCL** option, where **x** is the SM number, **y** is the ISLU or ISLU2 number and **z** is the CC number, or by entering the input message **UPD:PMPPERF** with the **TARGET=ISLU, UCL** option. This will cause a temporary loss of call processing in the ISLU and ISLU2, but no stable calls will be lost.

For IDCU, if it is not possible to get both service groups in service, the remove/restore may be forced either using the input message **RST:IDCU** with the **x-y-z, UCL** option, where **x** is the SM number, **y** is the IDCU number and **z** is the CC number, or the input message **UPD:PMPPERF** with the **TARGET=c, UCL** option. This will cause a temporary loss of call processing in the IDCU, and stable calls will be lost.

For DNU-S CC units, if it is not possible to get both CC in service, the remove/restore may be forced using either the input message **RST:DNUSSCC** with the **x-y-z, UCL** option, where **x** is the SM number, **y** is the DNU-S number and **z** is the CC number, or the input message **UPD:PMPPERF** with the **TARGET=c, UCL** option, where **TARGET** can be either **DNUSCC** or **DNUSTMX**. This will cause a temporary loss of call processing in the DNU-S, a loss of performance monitor (PM) data (that is, current day intervals and previous day totals), but no stable calls will be lost.

Also, with TMUX being the subtending unit, end user maintenance requests such as **RST:DNUSSCC**, **RMV:DNUSSCC**, and **SW:DNUSSCC** may result in different software update levels between DNU-S CC and TMUX. Therefore the use of end user maintenance requests to DNU-S CC and TMUX between **UPD:APPLY** and **UPD:OFC** is strongly discouraged.

If a **RST:CC**, **RMV:CC**, or **SW:CC** request would result in different update levels between the active CC and the TMUXs, it will be denied. However, there is one exception. If a CC restore from duplex failure would result in level-mismatch between active CC and the TMUXs, **RST:CC** will still be allowed. In addition, TMUXs will be broadcast-pumped as part of **RST:CC**.
UPD:PMPPERF will not proceed for protocol handlers if there are no standby spare PH(s) of the affected hardware type on a given PSU shelf. The PH2A, PH2G, and ODMA images reside on the PH2 hardware type, while the PH3C and OIOP images reside on the PH3 hardware type and the PH4I and IP4I images reside on the PH4 hardware type. If the standby PHs are out-of-service, restore them and retry UPD:PMPPERF. If it is not possible to get a spare PH in service, force the pumping manually using either the input message RST:PSUPH with the x-0-y-z,UCL option, where x is the SM number, y is the shelf number and z is the PH number, or using the input message UPD:PMPPERF with the TARGET=x,UCL option.

WARNING: Either alternative will result in a temporary loss of call processing and lost stable circuit-switched and packet-switched calls.

5. ALARMS

None.

    ----------- END OF OFFNORMAL SM STATUS -----------

[13] UPD PMPPERF - PUMPABLE PERIPHERALS IN MSGS FILE FOR UPNM=b
2. REASON FOR OUTPUT

To report the status of the UPD:PMPPERF request, in response to a UPD:PMPPERF input message. To report any switching modules or target peripheral units for which the remove/restore attempt failed or was stopped. Switching modules (SMs) that are isolated or out-of-service are identified, but do not impact the completion status of the
UPD:PMPPERF input message.

Format 1 is printed to report the overall status of the UPD:PMPPERF input message.

Format 2 is printed when the UPNM input option was used and UPD:PMPPERF has successfully completed in all SMs not appearing in the offnormal SM list.

Format 3 is printed when the UPNM and OFC input options were used and UPD:PMPPERF has successfully completed in all SMs not appearing in the offnormal SM list.

Format 4 is printed when the TARGET input option was used and UPD:PMPPERF has successfully completed in all SMs not appearing in the offnormal SM list.

Format 5 is printed when UPD:PMPPERF has completed with one or more failing SMs, and begins to run a consistency check on the failing targets.

Format 6 is printed when the Software Update affects a mix of peripherals as discussed in the Format 18 explanation, and UPD:PMPPERF fails for the first set of peripherals. The fact that the error occurred is printed but UPD:PMPPERF will then proceed on the other set of peripherals.

Format 7 is printed when the list of inconsistencies is printed. Refer to the UPD:VFYCON output manual page for the format of the inconsistency report.

Format 8 is printed every 10 minutes for each iteration of UPD:PMPPERF. Any SMs which are still in progress, or have yet to start UPD:PMPPERF, are listed.

Format 9 is printed when UPD:PMPPERF has failed for one or more SMs but a consistency check detects no inconsistencies. One case where this can happen is when the remove/restore of a peripheral unit fails such that it is left out-of-service. Therefore use op:cfgstat to look for any out-of-service units. Another case that can cause this condition is that a failing SM has become off-normal.

Format 10 is printed when the UPNM input option was used and the MSGS file in the indicated software update package contains no UPD:APPLY input messages for any SM pumpable peripheral targets (refer to variable 'c'). This does not cause UPD:PMPPERF to fail.

Format 11 is printed when the UPNM and OFC input options were used and the MSGS file in the indicated software update package contains no UPD:APPLY input messages for any SM pumpable peripheral targets which require a remove/restore after the UPD:OFC input message. The only targets which require this are ISLU, IDCUCCP, IDCUDLP, IDCULSI, DNUSCC, and DNUSTMX. This does not cause UPD:PMPPERF to fail.

Format 12 is printed when the UPD:PMPPERF input message was unable to communicate with the offnormal affected SMs identified in the output.

Format 13 is printed when the UPNM input option was used. The SM pumpable peripheral targets found in the software update package are listed.

Format 14 is printed when the UPNM and OFC input options were used. The subset of SM pumpable peripheral targets listed in
Format 11 found in the software update package are listed.

Format 15 is printed when a failure is detected in an SM but UPD:PMPPERF will continue in that SM. The targets which will still be removed/restore is printed.

If inconsistent resident images are detected for at least one of the UPD:PMPPERF targets, those targets are printed.
If a failure was encountered during the remove/restore of a specific peripheral, that peripheral is printed. Any other peripherals which will not be removed/restored because of that failure are printed next as ‘NOT ATTEMPTED’. If the number of peripherals to be printed exceeds an internal limit (54), the word PARTIAL is printed. It is possible that the target which experienced the failure will still be in progress. This will happen if UPD:PMPPERF will proceed on other units of the target type, or if there are any outstanding remove/restore requests in progress for that target.

In the case of protocol handlers (PHs), the integrated digital carrier unit (IDCU) targets, or digital networking unit -synchronous optical network (SONET) (DNU-S) targets, certain failures for one target can cause other targets to be aborted. Therefore more than one target may be listed as having a failure.

If the failure encountered was the inability to remove a PH, the anticipation is that it was caused by the lack of a spare PH on that PSU shelf. All targets for that PH hardware type are aborted for that PSU shelf. PHs on other packet switch unit (PSU) shelves will still be removed/restored. In this case, the failing shelf numbers are printed.

Format 16 prints the completion status of UPD:PMPPERF in a specific SM.

Format 17 is similar to Format 15, but the failure has cause UPD:PMPPERF to abort in that SM.

If inconsistent resident images are detected for at least one of the UPD:PMPPERF targets, those targets are printed. Some targets are interdependent, so an inconsistent resident image of one type will cause UPD:PMPPERF to abort for other targets. If this happens, the ‘OTHER TARGETS ABORTED AS A RESULT’ phrase is printed.

If a failure was encountered during the remove/restore of a specific peripheral, that peripheral is printed. Any other peripherals which will not be removed/restored because of that failure are printed next as ‘NOT ATTEMPTED’. If the number of peripherals to be printed exceeds an internal limit (54), the word PARTIAL is printed.

In the case of protocol handlers (PHs), the integrated digital carrier unit (IDCU) targets, or digital networking unit -SONET (DNU-S) targets, certain failures for one target can cause other targets to be aborted. Therefore more than one target may be listed as having a failure.

Format 18 is printed when the UPNM input option was used and not all of the targets can be removed/restored together. For most targets, UPD:PMPPERF is run concurrently on all SMs. For the ISTF, RAF, and SAS targets, UPD:PMPPERF is run to completion one SM at a time. This message will print if the software update affects both ISTF and/or RAF as well as some other SM pumpable peripheral target.

Format 19 is printed when the affected SMs are directed to start remove/restores.

Format 20 prints the list of SMs where UPD:PMPPERF failed.

Format 21 prints a warning relating to routine exercise (REX).

3. VARIABLE FIELD DEFINITIONS

a = Overall UPD:PMPPERF status. Valid value(s):
ABORTED = UPD:PMPPERF has aborted due to a fatal error. Refer to other UPD:PMPPERF or UPD:SYSERR output messages to determine why.
COMPLETED = UPD:PMPPERF has completed successfully.
CONTINUES = This is printed after timing out for an SM if UPD:PMPPERF is still in progress for other SMs.
STOPPED = UPD:PMPPERF was stopped by the UPD:PMPSTOP input message.

b = Software update name (the UPNM input option was entered).

c = Pumpable SM peripheral target or list of targets. Valid value(s):

V5DISL = ISLP DSP, for IS41 TDMA protocol handler for data circuit.

d = SM number or list of SM numbers.
e = Offnormal SM status. This is the status of the indicated SM when UPD:PMPPERF was started.
Valid value(s):
ISOLATED = The SM is isolated.
NOT OPERATIONAL = The SM is not operational, or is in the special growth state.

f = UPD:PMPPERF final SM status report. Valid value(s):
COMPLETED = The indicated switching module has successfully completed the remove/restore of inconsistent peripherals, if any.
COMPLETED WITH FAILURE = The indicated switching module has successfully completed the remove/restore of some inconsistent peripherals, but there was a prior failure.
NOT ACKNOWLEDGED = The indicated SM has not completed and has not reported any progress for a reasonable amount of time. The amount of time allowed is approximately 20 minutes. UPD:PMPPERF will continue if other SMs are still in progress.
HALTED = Refer to Format 17.
STOPPED = The indicated SM has stopped the remove/restore process because the UPD:PMPSTOP input message was received. This message will not print until the SM has completed any remove/restore requests which were in progress at the time the SM received the UPD:PMPSTOP notification.

g = A list of PSU shelf numbers that experienced a failure. This is printed only if remove/restores will proceed on other shelves.
h = Reason why the peripheral failed. In some cases this is a best guess. Search for other remove (RMV) or restore (RST) messages for additional information.
ABORTED = A maintenance request administrator (MRA) remove/restore job aborted at some point.
DATABASE FAILURE = Some database problem was detected. Any required audits will automatically be scheduled.
INTERNAL ERROR = An internal error was detected. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
NOT ATTEMPTED = The remove/restore of this peripheral will not be requested because of the failure(s) cited earlier in the list of failing peripherals.
NOT STARTED = An MRA job which UPD:PMPPERF requested did not start the remove/restore operation.
PUMP FAILED = The pump of the unit failed.
REMOVE FAILED = The remove portion of the remove/restore operation failed.
RESOURCE FAILURE = A resource failure was encountered.

RESTORE FAILED = The restore portion of the remove/restore operation failed.

STOPPED = An MRA remove/restore job was stopped at some point.

TIMED OUT = UPD:PMPPERF timed out waiting for MRA to complete the remove/restore request.

PARALLEL PUMP FAILURE = A DNU-S CC was successfully removed/restored but the associated broadcast TMUX pump failed on at least one TMUX.

SOFT SWITCH FAILURE = A DNU-S CC was successfully removed/pumped but restored to STBY as opposed to the requested ACT. The associated broadcast TMUX pump may have failed on at least one TMUX.

FLASH UPDATE FAILURE = A DNU-S CC was successfully removed but stopped at restore due to a FLASH update failure. The associated broadcast TMUX pump was not attempted.

HARD SWITCHED = A DNU-S CC was successfully pumped and hard-switched to ACT. The old ACT side ("switch-from" side) is being removed to OOS. The associated broadcast TMUX pump may have failed on at least one TMUX.

= The unit name of the peripheral. Valid value(s):

DNUSCC=SM-UNIT-CC
TMUX=SM-UNIT-DG-TMUX
GDSF=SM-UNIT
IDCU=SM-UNIT-SG
ISLUCC=SM-UNIT-CC
ISLU2CC=SM-UNIT-CC
ISTF=SM-UNIT
LDSF=SM-UNIT
LDSU=SM-UNIT-SG
PSUPH=SM-0-SHELF-PH
RAF=SM-UNIT
SAS=SM-UNIT

= Which set of targets. Valid value(s):

FIRST = This is the first set of targets. This set will contain any pumpable targets except RAF, ISTF, and SAS. This is the first phase or iteration of UPD:PMPPERF.

LAST = This is the second (last) set of targets. The set will always contain the SAS, RAF or ISTF peripherals, in any combination. This is the last phase or iteration of UPD:PMPPERF.

= Failing SM status. Valid value(s):

NO REPLY = The indicated SM was operational and not isolated when UPD:PMPPERF started, but did not reply to the UPD:PMPPERF request.

PMPPERF FAILED = UPD:PMPPERF encountered some type of failure(s) in the indicated SM. Refer to other output messages for details.

PMPPERF STOPPED = Notification of the UPD:PMPSTOP input messages reached the indicated SM while UPD:PMPPERF was in progress. The SM scheduled no more requests to remove/restore peripherals, but waited for any requests that were in progress at the time.

PMPPERF STOPPED - REQUEST NOT SENT = The UPD:PMPSTOP input message was detected so the UPD:PMPPERF request was not sent to the indicated SM.
= Information message about the status of routine exerciser (REX). REX is automatically inhibited by UPD:PMPPERF for all SMs affected by UPD:PMPPERF. This is done because REX can interfere with UPD:PMPPERF and possibly cause it to fail. Inhibiting REX will prevent REX from starting, but will not stop REX if it has already started. Valid value(s):

**REX HAS BEEN RE-INHIBITED ON SM c** = While UPD:PMPPERF was running in an SM, it was discovered that REX is allowed in that SM. UPD:PMPPERF then automatically re-inhibited REX for that SM.

**REX NOT INHIBITED** = Error encountered when trying to inhibit REX on affected SMs at the start of UPD:PMPPERF.

**UNABLE TO RE-INHIBIT REX ON SM c** = While UPD:PMPPERF was running in an SM, it was discovered that REX is allowed in that SM. UPD:PMPPERF then automatically tried to re-inhibit REX for that SM but encountered an error.

**UNABLE TO REMOVE REX INHIBITS** = When UPD:PMPPERF was complete in all SMs, it was unable to remove the REX inhibits placed on the affected SMs when UPD:PMPPERF started.

### 4. ACTIONS TO BE TAKEN

If **UPD PMPPERF COMPLETED** prints and no SMs were identified as not acknowledging the request, then all inconsistent target peripherals were pumped successfully and are now consistent. No action need be taken.

Otherwise, some recovery action should be taken. If the UPD:PMPPERF input message aborted due to an inconsistent resident image, the UPD:RCVRY input message may be used to recover the resident image inconsistency, and the UPD:PMPPERF input message may be retried.

If the UPD:PMPPERF input message aborted due to failed peripherals, the units may be removed and restored manually, or the UPD:PMPPERF input message may be retried. The consistency check which UPD:PMPPERF automatically runs may be used to identify inconsistent peripherals remaining in the system.

If all peripherals of one or more target type fail to pump or restore, especially if the problem occurs in multiple switching modules, the software update should be suspected as the source of the problem. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

If some SM(s) were identified as offnormal, some action must be taken to determine why the SM(s) are offnormal. Additionally, if an SM had timed out, make sure that the SM is not isolated or experiencing some type of overload.

It should be noted that UPD:PMPPERF will not proceed on duplex units (IDCU, ISLU, ISLU2, LDSU, GDSF, LDSF, and DNU-S CC) if one service group is out-of-service. If this is the case, restore the service group and retry UPD:PMPPERF.

For ISLU and ISLU2, if it is not possible to get both ISLUCCs in service, force the remove/restore either using the input message RST:ISLUCC with the x-y-z,UCL option, where x is the SM number, y is the ISLU or ISLU2 number and z is the CC number, or by entering the input message UPD:PMPPERF with the **TARGET=ISLU,UCL** option. This will cause a temporary loss of call processing in the ISLU and ISLU2, but no stable calls will be lost.

For IDCU, if it is not possible to get both service groups in service, the remove/restore may be forced either using the input message RST:IDCU with the x-y-z,UCL option, where x is the SM number, y is the IDCU number and z is the CC number, or the input message UPD:PMPPERF with the **TARGET=c,UCL** option. This will cause a temporary loss of call processing in the IDCU, and stable calls will be lost.

For DNU-S CC units, if it is not possible to get both CC in service, the remove/restore may be forced using either the input message RST:DNUSSCC with the x-y-z,UCL option, where x is the SM number, y is the DNU-S number and z is the CC number, or the input message UPD:PMPPERF with the **TARGET=c,UCL** option, where **TARGET** can be
either DNUSCC or DNUSTMX. This will cause a temporary loss of call processing in the DNU-S, a loss of performance monitor (PM) data (that is, current day intervals and previous day totals), but no stable calls will be lost.

Also, with TMUX being the subtending unit, end user maintenance requests such as RST:DNUSCC, RMV:DNUSCC, and SW:DNUSCC may result in different software update levels between DNU-S CC and TMUX. Therefore the use of end user maintenance requests to DNU-S CC and TMUX between UPD:APPLY and UPD:OFC is strongly discouraged.

If a RST:CC, RMV:CC, or SW:CC request would result in different update levels between the active CC and the TMUXs, it will be denied. However, there is one exception. If a CC restore from duplex failure would result in level-mismatch between active CC and the TMUXs, RST:CC will still be allowed. In addition, TMUXs will be broadcast-pumped as part of RST:CC.

UPD:PMPPERF will not proceed for protocol handlers if there are no standby spare PH(s) of the affected hardware type on a given PSU shelf. The PH2A, PH2G, and ODMA images reside on the PH2 hardware type, while the PH3C and OIOP images reside on the PH3 hardware type and the PH4I and IP4I images reside on the PH4 hardware type. If the standby PHs are out-of-service, restore them and retry UPD:PMPPERF. If it is not possible to get a spare PH in service, force the pumping manually using either the input message RST:PSUPH with the x-0-y-z,UCL option, where x is the SM number, y is the shelf number and z is the PH number, or using the input message UPD:PMPPERF with the TARGET=x,UCL option.

**WARNING:** Either alternative will result in a temporary loss of call processing and lost stable circuit-switched and packet-switched calls.

SM No. STATUS
d e
----------- END OF OFFNORMAL SM STATUS -----------

[13] UPD PMPPERF - PUMPABLE PERIPHERALS IN MSGS FILE FOR UPNM=b
2. REASON FOR OUTPUT

To report the status of the UPD:PMPPERF request, in response to a UPD:PMPPERF input message. To report any switching modules or target peripheral units for which the remove/restore attempt failed or was stopped. Switching modules (SMs) that are isolated or out-of-service are identified, but do not impact the completion status of the
UPD:PMPPERF input message.

Format 1 is printed to report the overall status of the UPD:PMPPERF input message.

Format 2 is printed when the UPNM input option was used and UPD:PMPPERF has successfully completed in all SMs not appearing in the offnormal SM list.

Format 3 is printed when the UPNM and OFC input options were used and UPD:PMPPERF has successfully completed in all SMs not appearing in the offnormal SM list.

Format 4 is printed when the TARGET input option was used and UPD:PMPPERF has successfully completed in all SMs not appearing in the offnormal SM list.

Format 5 is printed when UPD:PMPPERF has completed with one or more failing SMs, and begins to run a consistency check on the failing targets.

Format 6 is printed when the Software Update affects a mix of peripherals as discussed in the Format 18 explanation, and UPD:PMPPERF fails for the first set of peripherals. The fact that the error occurred is printed but UPD:PMPPERF will then proceed on the other set of peripherals.

Format 7 is printed when the list of inconsistencies is printed. Refer to the UPD:VFYCON output manual page for the format of the inconsistency report.

Format 8 is printed every 10 minutes for each iteration of UPD:PMPPERF. Any SMs which are still in progress, or have yet to start UPD:PMPPERF, are listed.

Format 9 is printed when UPD:PMPPERF has failed for one or more SMs but a consistency check detects no inconsistencies. One case where this can happen is when the remove/restore of a peripheral unit fails such that it is left out-of-service. Therefore use OP:CFGSTAT-AM, OP:CFGSTAT-CM, and OP:CFGSTAT-SM to look for any out-of-service units. Another case that can cause this condition is that a failing SM has become off-normal.

Format 10 is printed when the UPNM input option was used and the MSGS file in the indicated software update package contains no UPD:APPLY input messages for any SM pumpable peripheral targets (refer to variable 'c'). This does not cause UPD:PMPPERF to fail.

Format 11 is printed when the UPNM and OFC input options were used and the MSGS file in the indicated software update package contains no UPD:APPLY input messages for any SM pumpable peripheral targets which require a remove/restore after the UPD:OFC input message. The only targets which require this are ISLU, IDCUCCP, IDCUDLP, IDCULSI, DNUSCC, and DNUSTMX. This does not cause UPD:PMPPERF to fail.

Format 12 is printed when the UPD:PMPPERF input message was unable to communicate with the offnormal affected SMs identified in the output.

Format 13 is printed when the UPNM input option was used. The SM pumpable peripheral targets found in the software update package are listed.

Format 14 is printed when the UPNM and OFC input options were used. The subset of SM pumpable peripheral targets listed in Format 11 found in the software update package are listed.

Format 15 is printed when a failure is detected in an SM but UPD:PMPPERF will continue in that SM. The targets which will still be removed/restore is printed.

If inconsistent resident images are detected for at least one of the UPD:PMPPERF targets, those targets are printed.

If a failure was encountered during the remove/restore of a specific peripheral, that peripheral is printed. Any other
peripherals which will not be removed/restored because of that failure are printed next as 'NOT ATTEMPTED'. If the number of peripherals to be printed exceeds an internal limit (54), the word PARTIAL is printed. It is possible that the target which experienced the failure will still be in progress. This will happen if UPD:PMPPERF will proceed on other units of the target type, or if there are any outstanding remove/restore requests in progress for that target.

In the case of protocol handlers (PHs), the integrated digital carrier unit (IDCU) targets, or digital networking unit -synchronous optical network (SONET) (DNU-S) targets, certain failures for one target can cause other targets to be aborted. Therefore more than one target may be listed as having a failure.

If the failure encountered was the inability to remove a PH, the anticipation is that it was caused by the lack of a spare PH on that PSU shelf. All targets for that PH hardware type are aborted for that PSU shelf. PHs on other packet switch unit (PSU) shelves will still be removed/restored. In this case, the failing shelf numbers are printed.

Format 16 prints the completion status of UPD:PMPPERF in a specific SM.

Format 17 is similar to Format 15, but the failure has cause UPD:PMPPERF to abort in that SM.

If inconsistent resident images are detected for at least one of the UPD:PMPPERF targets, those targets are printed. Some targets are interdependent, so an inconsistent resident image of one type will cause UPD:PMPPERF to abort for other targets. If this happens, the 'OTHER TARGETS ABORTED AS A RESULT' phrase is printed.

If a failure was encountered during the remove/restore of a specific peripheral, that peripheral is printed. Any other peripherals which will not be removed/restored because of that failure are printed next as 'NOT ATTEMPTED'. If the number of peripherals to be printed exceeds an internal limit (54), the word PARTIAL is printed.

In the case of protocol handlers (PHs), the integrated digital carrier unit (IDCU) targets, or digital networking unit -SONET (DNU-S) targets, certain failures for one target can cause other targets to be aborted. Therefore more than one target may be listed as having a failure.

Format 18 is printed when the UPNM input option was used and not all of the targets can be removed/restored together. For most targets, UPD:PMPPERF is run concurrently on all SMs. For the ISTF, RAF, and SAS targets, UPD:PMPPERF is run to completion one SM at a time. This message will print if the software update affects both ISTF and/or RAF as well as some other SM pumpable peripheral target.

Format 19 is printed when the affected SMs are directed to start remove/restores.

Format 20 prints the list of SMs where UPD:PMPPERF failed.

Format 21 prints a warning relating to routine exercise (REX).

3. VARIABLE FIELD DEFINITIONS

a = Overall UPD:PMPPERF status. Valid value(s):
   ABORTED = UPD:PMPPERF has aborted due to a fatal error. Refer to other UPD:PMPPERF or UPD:SYSERR output messages to determine why.
   COMPLETED = UPD:PMPPERF has completed successfully.
   CONTINES = This is printed after timing out for an SM if UPD:PMPPERF is still in progress for other SMs.
   STOPPED = UPD:PMPPERF was stopped by the UPD:PMPSTOP input message.

b = Software update name (the UPNM input option was entered).

c = Pumpable SM peripheral target or list of targets. Valid value(s):
   CCP = Common control processor.

V5DVSP = VSELP DSP, for TDMA protocol handler for voice version 5.
V5DISL = ISL DSP, for IS41 TDMA protocol handler for data circuit.

\( d \) = SM number or list of SM numbers.
\( e \) = Offnormal SM status. This is the status of the indicated SM when UPD:PMPPERF was started.
Valid value(s):
  ISOLATED = The SM is isolated.
  NOT OPERATIONAL = The SM is not operational, or is in the special growth state.

\( f \) = UPD:PMPPERF final SM status report. Valid value(s):
  COMPLETED = The indicated switching module has successfully completed the remove/restore of inconsistent peripherals, if any.
  COMPLETED WITH FAILURE = The indicated switching module has successfully completed the remove/restore of some inconsistent peripherals, but there was a prior failure.
  NOT ACKNOWLEDGED = The indicated SM has not completed and has not reported any progress for a reasonable amount of time. The amount of time allowed is approximately 20 minutes. UPD:PMPPERF will continue if other SMs are still in progress.
  HALTED = Refer to Format 17.
  STOPPED = The indicated SM has stopped the remove/restore process because the UPD:PMPSTOP input message was received. This message will not print until the SM has completed any remove/restore requests which were in progress at the time the SM received the UPD:PMPSTOP notification.

\( g \) = A list of PSU shelf numbers that experienced a failure. This is printed only if remove/restores will proceed on other shelves.

\( h \) = Reason why the peripheral failed. In some cases this is a best guess. Search for other remove (RMV) or restore (RST) messages for additional information. Valid value(s):
  ABORTED = A maintenance request administrator (MRA) remove/restore job aborted at some point.
  DATABASE FAILURE = Some database problem was detected. Any required audits will automatically be scheduled.
  INTERNAL ERROR = An internal error was detected. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
  NOT ATTEMPTED = The remove/restore of this peripheral will not be requested because of the failure(s) cited earlier in the list of failing peripherals.
  NOT STARTED = An MRA job which UPD:PMPPERF requested did not start the remove/restore operation.
  PUMP FAILED = The pump of the unit failed.
REMOVE FAILED = The remove portion of the remove/restore operation failed.
RESOURCE FAILURE = A resource failure was encountered.
RESTORE FAILED = The restore portion of the remove/restore operation failed.
STOPPED = An MRA remove/restore job was stopped at some point.
TIMED OUT = UPD:PMPPERF timed out waiting for MRA to complete the remove/restore request.
PARALLEL PUMP FAILURE = A DNU-S CC was successfully removed/restored but the associated broadcast TMUX pump failed on at least one TMUX.
SOFT SWITCH FAILURE = A DNU-S CC was successfully removed/pumped but restored to STBY as opposed to the requested ACT. The associated broadcast TMUX pump may have failed on at least one TMUX.
FLASH UPDATE FAILURE = A DNU-S CC was successfully removed but stopped at restore due to a FLASH update failure. The associated broadcast TMUX pump was not attempted.
HARD SWITCHED = A DNU-S CC was successfully pumped and hard-switched to ACT. The old ACT side ("switch-from" side) is being removed to OOS. The associated broadcast TMUX pump may have failed on at least one TMUX.

\[ \text{unit name} \]

= The unit name of the peripheral. Valid value(s):

DNUSCC=SM-UNIT-CC
GDSF=SM-UNIT
IDCU=SM-UNIT-SG
ISLUCC=SM-UNIT-CC
ISLU2CC=SM-UNIT-CC
ISTF=SM-UNIT
LDSF=SM-UNIT
LDSU=SM-UNIT-SG
PSUPH=SM-0-SHELF-PH
RAF=SM-UNIT
SAS=SM-UNIT
TMUX=SM-UNIT-DG-TMUX

\[ \text{set} \]

= Which set of targets. Valid value(s):
FIRST = This is the first set of targets. This set will contain any pumpable targets except RAF, ISTF, and SAS. This is the first phase or iteration of UPD:PMPPERF.
LAST = This is the second (last) set of targets. The set will always contain the SAS, RAF or ISTF peripherals, in any combination. This is the last phase or iteration of UPD:PMPPERF.

\[ \text{status} \]

= Failing SM status. Valid value(s):
NO REPLY = The indicated SM was operational and not isolated when UPD:PMPPERF started, but did not reply to the UPD:PMPPERF request.
PMPPERF FAILED = UPD:PMPPERF encountered some type of failure(s) in the indicated SM. Refer to other output messages for details.
PMPPERF STOPPED = Notification of the UPD:PMPSTOP input messages reached the indicated SM while UPD:PMPPERF was in progress. The SM scheduled no more requests to remove/restore peripherals, but waited for any requests that were in progress at the time.
PMPPERF STOPPED - REQUEST NOT SENT = The UPD:PMPSTOP input message was detected so the UPD:PMPPERF request was not sent to the indicated SM.
= Information message about the status of routine exerciser (REX). REX is automatically inhibited
by UPD:PMPPERF for all SMs affected by UPD:PMPPERF. This is done because REX can
interfere with UPD:PMPPERF and possibly cause it to fail. Inhibiting REX will prevent REX from
starting, but will not stop REX if it has already started. Valid value(s):
REX HAS BEEN RE-INHIBITED ON SM c = While UPD:PMPPERF was running in an SM, it was
discovered that REX is allowed in that SM. UPD:PMPPERF then automatically
re-inhibited REX for that SM.
REX NOT INHIBITED = Error encountered when trying to inhibit REX on affected SMs at the start
of UPD:PMPPERF.
UNABLE TO RE-INHIBIT REX ON SM c = While UPD:PMPPERF was running in an SM, it was
discovered that REX is allowed in that SM. UPD:PMPPERF then automatically tried
to re-inhibit REX for that SM but encountered an error.
UNABLE TO REMOVE REX INHIBITS = When UPD:PMPPERF was complete in all SMs, it was
unable to remove the REX inhibits placed on the affected SMs when
UPD:PMPPERF started.

4. ACTIONS TO BE TAKEN

If UPD PMPPERF COMPLETED prints and no SMs were identified as not acknowledging the request, then all
inconsistent target peripherals were pumped successfully and are now consistent. No action need be taken.

Otherwise, some recovery action should be taken. If the UPD:PMPPERF input message aborted due to an
inconsistent resident image, the UPD:RCVRY input message may be used to recover the resident image
inconsistency, and the UPD:PMPPERF input message may be retried.

If the UPD:PMPPERF input message aborted due to failed peripherals, the units may be removed and restored
manually, or the UPD:PMPPERF input message may be retried. The consistency check which UPD:PMPPERF
automatically runs may be used to identify inconsistent peripherals remaining in the system.

If all peripherals of one or more target type fail to pump or restore, especially if the problem occurs in multiple
switching modules, the software update should be suspected as the source of the problem. Refer to the
TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

If some SM(s) were identified as offnormal, some action must be taken to determine why the SM(s) are offnormal.
Additionally, if an SM had timed out, make sure that the SM is not isolated or experiencing some type of overload.

It should be noted that UPD:PMPPERF will not proceed on duplex units (IDCU, ISLU, ISLU2, LDSU, GDSF, LDSF,
and DNU-S CC) if one service group is out-of-service. If this is the case, restore the service group and retry
UPD:PMPPERF.

For ISLU and ISLU2, if it is not possible to get both ISLUCCs in service, force the remove/restore either using the
input message RST:ISLUCC with the x-y-z,UCL option, where x is the SM number, y is the ISLU or ISLU2
number and z is the CC number, or by entering the input message UPD:PMPPERF with the TARGET=ISLU,UCL
option. This will cause a temporary loss of call processing in the ISLU and ISLU2, but no stable calls will be lost.

For IDCU, if it is not possible to get both service groups in service, the remove/restore may be forced either using
the input message RST:IDCU with the x-y-z,UCL option, where x is the SM number, y is the IDCU number and z
is the CC number, or the input message UPD:PMPPERF with the TARGET=IDCU,UCL option. This will cause a
temporary loss of call processing in the IDCU, and stable calls will be lost.

For DNU-S CC units, if it is not possible to get both CC in service, the remove/restore may be forced using either the
input message RST:DNUSCC with the x-y-z,UCL option, where x is the SM number, y is the DNU-S number and z
is the CC number, or the input message UPD:PMPPERF with the TARGET=DNUS CC,UCL option, where TARGET can be
either DNUSCC or DNUSTMX. This will cause a temporary loss of call processing in the DNU-S, a loss of performance monitor (PM) data (that is, current day intervals and previous day totals), but no stable calls will be lost.

Also, with TMUX being the subtending unit, end user maintenance requests such as RST:DNUSCC, RMV:DNUSCC, and SW:DNUSCC may result in different software update levels between DNU-S CC and TMUX. Therefore the use of end user maintenance requests to DNU-S CC and TMUX between UPD:APPLY and UPD:OFC is strongly discouraged.

If a RST:CC, RMV:CC, or SW:CC request would result in different update levels between the active CC and the TMUXs, it will be denied. However, there is one exception. If a CC restore from duplex failure would result in level-mismatch between active CC and the TMUXs, RST:CC will still be allowed. In addition, TMUXs will be broadcast-pumped as part of RST:CC.

UPD:PMPPERF will not proceed for protocol handlers if there are no standby spare PH(s) of the affected hardware type on a given PSU shelf. The PH2A, PH2G, and ODMA images reside on the PH2 hardware type, while the PH3C and OIOP images reside on the PH3 hardware type and the PH4I and IP4I images reside on the PH4 hardware type. If the standby PHs are out-of-service, restore them and retry UPD:PMPPERF. If it is not possible to get a spare PH in service, force the pumping manually using either the input message RST:PSUPH with the x-0-y-z,UCL option, where x is the SM number, y is the shelf number and z is the PH number, or using the input message UPD:PMPPERF with the TARGET=x,UCL option.

**WARNING:** Either alternative will result in a temporary loss of call processing and lost stable circuit-switched and packet-switched calls.

   SM No. STATUS
   a   b
   ---------- END OF OFFNORMAL SM STATUS ----------
____________________________________________________________________

[3] UPD PMPSTOP COMPLETED
____________________________________________________________________

[4] UPD PMPSTOP ABORTED
____________________________________________________________________

[5] UPD PMPSTOP WARNING - UNABLE TO CONFIRM STOP OF UPD:PMPPERF
____________________________________________________________________

2. REASON FOR OUTPUT

To report the start or completion status of the UPD:PMPSTOP input message. Switching modules (SMs) that are
isolated, out of service, or do not acknowledge the PMPSTOP request are identified. Those SMs do not impact the
completion status of the UPD:PMPSTOP input message.

Format 1 is printed when UPD:PMPSTOP starts notifying the SMs that they should stop UPD:PMPPERF.

Format 2 is printed when the UPD:PMPSTOP input message was unable to communicate with the offnormal SMs
identified in the output, but completed successfully for all normal SMs.

Format 3 is printed when the UPD:PMPSTOP input message completes successfully.

Format 4 is printed when UPD:PMPPERF aborts.

Format 5 is printed when it appears that UPD:PMPPERF is not running.

3. VARIABLE FIELD DEFINITIONS

a = Offnormal switching module number.
b = Offnormal SM status. Valid value(s):
   ISOLATED = The SM is isolated.
   NO REPLY = The SM is operational and not isolated, but did not reply to the UPD:PMPSTOP
               request.
   NOT OPERATIONAL = The SM is not operational, or it is in the special growth state.
4. ACTION TO BE TAKEN

If **UPD: PMPSTOP COMPLETED** prints and no SMs were identified as not acknowledging the request, no action need be taken. If the in-progress UPD:PMPPERF command completes, no matter if successful or not, no action need be taken.

Otherwise, some recovery action should be taken to identify why the input message aborted, or why the SM(s) did not acknowledge. The UPD:PMPSTOP input message may be re-executed.

UPD:PUPCI

**Software Release:** 5E15 and later  
**Message Class:** MTCE  
**Application:** 5,3B  
**Type:** Output

1. **FORMAT**

UPD PUPCI a [b]

2. **REASON FOR OUTPUT**

To report communication status and error messages between a 5ESS® UPpuci process and an administration service module (ASM) UPstatmon process.

For an ASM office, whenever a back out last official (BOLO) BWM is performed, it is necessary to check the BWM level between the 5ESS® switch and the distance reliable module (DRM). It is also necessary to check the software dependency between the 5ESS® switch and the ASM. If a BOLO BWM is required by another unit, then the software between 5ESS®, ASM and DRM could stop functioning.

3. **VARIABLE FIELD DEFINITIONS**

   a  Reason for termination. Valid value(s):
      — MEMORY ALLOCATION FAILED  
      — PASSED TWO LEVEL CHECK  
      — ERROR CANNOT SEND TWO LEVEL CHECK MESSAGE b  
      — ERROR FAILED TWO LEVEL CHECK FROM UPSTATMON b  
      — ERROR CANNOT RECEIVE TWO LEVEL CHECK MESSAGE b  
      — ERROR FAILED TWO LEVEL CHECK b  
      — ERROR CANNOT SEND DEPENDENCY CHECK MESSAGE b  
      — ERROR FAILED TO SEND DEPENDENCY CHECK MESSAGE  
      — ERROR CANNOT RECEIVE DEPENDENCY CHECK MESSAGE b

   b  The system error number. Valid value(s):
      1  Time out waiting to receive message.  
      -20  Failed to send or receive message.  
      -22  Time out waiting for a message of the desired type.  
      -30  Unexpected message size.  
      -32  No message to be received.  
      -33  Not connected to port.  
      -36  No message in queue.  
      -38  Signal interrupted a DMERT system call.  
      -39  Process ID out of range.  
      -45  Specified port number is out of range.

4. **ACTIONS TO BE TAKEN**

Verify BWM dependency between the 5ESS® switch and the ASM. Verify the difference of BWM level between the 5ESS® switch and the DRM is no more than two BWM levels. Verify each unit is up and runing and communication links are established. Correct all inconsistences and re_enter the BOLO poke on MCC 1950 page. If the BOLO
process still aborts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

   **UPNM** *a* **UPD NUMBER** *c* **TYPE** *d* **PROCESSOR** *e*

5. **UPD RCVRY FRWD SOME AFFECTED** *(CMPs|SMs)* **ARE NOT UPDATED**

6. **UPD RCVRY** *[FRWD|BKWD]* **UPD:INIT:EMULATOR REQUIRED TO ACTIVATE RCVRY**

### 2. REASON FOR OUTPUT

To report the results of executing a UPD:RCVRY input command and to report the steps taken in the specified recovery: backouts for a roll backward and installs for a roll forward.

In the backout case, some UPD:BKOUT output messages will report the progression of recovery backward. For more information, refer to the UPD:BKOUT output message.

Format 1 indicates that recovery forward or backward has successfully finished.

Format 2 indicates that recovery forward or backward for software update indicated in *'a'* for the file pathname indicated in *'b'* has completed successfully, been aborted, or is continuing.

Format 3 indicates that a REMOVE/RESTORE is necessary for all processor units of the type indicated in *'f'* to activate the recovery forward or backward.

Format 4 reports a list of inconsistencies that UPD:RCVRY cannot recover from. There may also be a list of new inconsistencies if they exist. If the message is UPD RCVRY FRWD, there may be a list of inconsistencies in reverse order.

Format 5 indicates that some of the affected communications module processors (CMPs) or switching modules (SMs) have not been updated.

Format 6 indicates that an inconsistency exists in an update to the EMULATOR that requires an initialization for activation.
3. VARIABLE FIELD DEFINITIONS

a = Name of software update currently being recovered from.

b = Pathname of FN specified in the update install command.

c = Update number.

d = Type of inconsistency. Valid value(s):
1 = The indicated processor does not contain the indicated temporary update even though it is shown in the update records as having been applied.
3 = A temporary SM update has been installed but at least one of the associated temporary files in /update is missing.
4 = An entry in the update records has been garbled or is missing history file entries.
5 = The resident switching module processor (SMP) image associated with the indicated pumpable peripheral type does not contain the indicated update, even though it is shown in the update records as having been applied.
6 = The resident SMP image AND the pumpable peripheral(s) associated with the indicated processor type do not contain the indicated update, even though it is shown in the update records as having been applied.
7 = The pumpable peripheral(s) associated with the indicated processor type do not contain the indicated update, even though it is shown in the update records as having been applied, and the peripheral's SMP resident image contains the update.
8 = The update file or product file needed to back out an official software update is missing. It is not possible to recover from this type of inconsistency and the official software update cannot be backed out using the 9900 poke on the 1950 menu page. This inconsistency type does not prevent recovery from other types of inconsistencies and does not prevent subsequent software updates from being made official. Once a subsequent software update is made official and all the files needed to back out that software update are available, the inconsistency is removed by default.

e = Affected processor. Valid value(s):
AM = Administrative module.
CMP [=x-y, z] = CMP, where ‘x’ is the message switch side, y is the CMP number and ‘z’ is either primary processor (PRIM) or mate processor (MATE) when the indicated inconsistency applies to a specific CMP.
DNUSSC:SM[x] = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control function, where ‘x’ is the SM number, when the indicated inconsistency applies to a specific SM’s DNU-S(s) or an SM’s DNU-S CC resident image.
DSC3-DSC3:SM[x] = Digital service circuit - model 3 (DSC3) hardware digital service circuit diagnostic image, where ‘x’ is the SM number when the indicated inconsistency applies to a specific SM’s LDSF or global digital services function (GDSF).
DSC3-GDSF:SM[x] = DSC3 GDSF image, where ‘x’ is the SM number when the indicated inconsistency applies to a specific SM’s GDSF.
DSC3-LDSF:SM[x] = Digital service circuit - model 3 (DSC3) local digital services function (LDSF) image, where ‘x’ is the SM number when the indicated inconsistency applies to a specific SM’s LDSF.
DSU2-HDSU:SM[x] = Digital service unit model 2 (DSU2) - hardware digital service unit (HDSU) diagnostic (DGN) image, where ‘x’ is the SM number, when the indicated inconsistency applies to a specific SM’s HDSU-resident image.
DSU2-HSAS:SM[x] = DSU2 - service announcement system diagnostic image (HSAS), where ‘x’
is the SM number, when the indicated inconsistency applies to a specific SM's HSAS-resident image.

DSU2-ISTF:SM[x] = DSU2 - integrated services test function (ISTF), where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's ISTF(s) or ISTF-resident image.

DSU2-LDSU:SM[x] = DSU2 - local digital service unit (LDSU) function, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's LDSU(s) or LDSU-resident image.

DSU2-RAF:SM[x] = DSU2 - recorded announcement function (RAF), where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's RAF(s) or RAF-resident image.

DSU2-SAS:SM[x] = DSU2 - service announcement system operational image (SAS), where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's SAS(s) or SAS-resident image.

IDCU-CCP:SM[x] = Integrated digital carrier unit (IDCU) common control processor (CCP), where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's IDCU CCP(s) or the SM's IDCU CCP resident image.

IDCU-DLP:SM[x] = IDCU data link processor (DLP), where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's IDCU DLP(s) or the SM's IDCU CCP resident image.

IDCU-LSI:SM[x] = IDCU loop side interface (LSI), where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's IDCU LSI(s) or the SM's IDCU CCP resident image.

ISLU-CC:SM[x] = Integrated services line unit (ISLU) common controller (CC), where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's ISLU CC(s) or ISLU-resident image.

ISLU2-CC:SM[x] = Integrated services line unit 2 (ISLU2) CC, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's ISLU2 CC(s) or ISLU2-resident image.

MCTSI-MH32:SM[x] = MCTSI switching module processor message handler 32 (MH32) operational image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's MH32 or an SM's SMP-resident MH32 image.

MCTSI-MHEIB:SM[x] = MCTSI switching module processor message handler EIB (MHEIB) operational image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's MHEIB or an SM's SMP-resident MHEIB image.

MCTSI-MHLB:SM[x] = MCTSI switching module processor message handler little boot (MHLB) image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's SMP-resident MHLB image.

MCTSI-MHPPC:SM[x] = MCTSI switching module processor message handler power PC operational (MHPPC) image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's MHPPC or an SM's SMP-resident MHPPC image.

MCTSI-MHPPCLB:SM[x] = MCTSI switching module processor message handler power PC little boot (MHPPCLB) image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's SMP-resident MHPPCLB image.

MCTSI-PI:SM[x] = Module controller time slot interchange (MCTSI) packet interface (PI), where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's PI or PI-resident image.

MSGH[=x-y,z] = CMP message handler, where 'x' is the message switch side, 'y' is the CMP number and 'z' is either PRIME or MATE when the indicated inconsistency applies to a specific CMP.

PSU-PH3C:SM[x] = Packet switch unit (PSU) protocol handler 3 (PH3) loaded with the PH3
COMMON application processor image, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's PH3(s) or PH3C-resident image.

PSU-PH4I:SM[x] = PSU protocol handler 4 (PH4) loaded with the PH4 integrated services digital network (ISDN) application processor image, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's PH4(s) or PH4I-resident image.

PSU-PH2A:SM[x] = PSU protocol handler 2 (PH2) loaded with the PH2 ACCESS application processor image, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's PH2(s) or PH2A-resident image.

PSU-PH2G:SM[x] = PSU PH2 loaded with the PH2 GATEWAY application processor image, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's PH2(s) or PH2G-resident image.

PSU-OIOP:SM[x] = PSU PH3 operational input/output processor (OIOP) image, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's PH3(s) or OIOP-resident image.

PSU-IP4I:SM[x] = PSU PH4 operational input/output processor (IP4I) image, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's PH4(s) or IP4I-resident image.

PSU-ODMA:SM[x] = PSU PH2 operational direct memory access (ODMA) processor image, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's PH2(s) or ODMA-resident image.

PSU-DDMA:SM[x] = PSU PH2 diagnostic direct memory access (DDMA) processor image, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's resident DDMA image.

SM[x] = Switching module, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM.

TMUX:SM[x] = Transmission multiplexer function, where 'x' is the SM number, when the indicated inconsistency applies to a specific SM's TMUX(s) or and SM's TMUX resident image.

PSU-IP4F:SM[x] = Operational image for the input/output processor on the PSU PH4 frame relay protocol handler, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's PH2(s) or an SM's SMP-resident IP4F image.

PSU-PHV1C:SM[x] = Protocol handler for voice, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's PH2(s) or an SM's SMP-resident PHV1C image.

PSU-PHA1A:SM[x] = Protocol handler for asynchronous transfer mode (ATM), where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident PHA1A image.

PSU-PHA2A:SM[x] = Protocol handler for ATM. where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident PHA2A image.

PSU-PHE2E:SM[x] = Protocol handler for Ethernet. where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident PHE2E image.

ISLU-CC2:SM[x] = ISLU CC, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident CC2 image.

PSU-IP4IF:SM[x] = The operational image for the input/output processor on the PSU PH4 ISDN, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident IP4IF image.

PSU-PH3S:SM[x] = PSU protocol handler 3 (PH3) where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident PH3S image.

PSU-IP3S:SM[x] = The operational image for the input/output processor on the PSU PH3 ISDN
for common channel signalling, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident CC2 image.

PSU-DSP8K:SM[x] = 8k digital signal processor (DSP) on PHV3. where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident DSP8K image.

PSU-DSP13K:SM[x] = 13K DSP on PHV3, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident DSP13K image.

PSU-PHV3C:SM[x] = PSU protocol handler for voice 3 (PHV3) loaded with the COMMON image. where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident PHV3C image.

PSU-PHV4C:SM[x] = PSU protocol handler for voice 4 (PHV) loaded with the COMMON image, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident PHV4C image.

PSU-V4D8K:SM[x] = 8K DSP on PHV4C, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident V4D8K image.

PSU-V4D13K:SM[x] = 13K DSP on PHV4C, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident V4D13K image.

PSU-DDMA:SM[1] = Diagnostic image for the direct-memory-access processor on the PSU PH2. When the indicated inconsistency applies to a specific SM's or an SMP - resident DDMA image.

PSU-DSPEVRC:SM[x] = EVRC DSP for code division multiple access (CDMA) protocol handler for voice, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM or an SMP - resident V3DACP image.

PSU-V3DVSP:SM[x] = VSELP DSP for TDMA protocol handler for voice, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident V3DVSP image.

PSU-D4VDVERC:SM[x] = EVRC DSP, for CDMA protocol handler for voice version 4. where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident V4DVERC image.

PSU-V4DACP:SM[x] = ACELP DSP, for TDMA protocol handler for voice version 4, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident V4DACP image.

PSU-V4DVSP:SM[x] = VSELP, DSP, for TDMA protocol handler for voice version 4, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident V4DVSP image.

DSU2-HSAS:SM[x] = DSU2 service announcement system (SAS). where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident HSAS image.

DSC4-LDSF:SM[x] = DSC4 local digital service function (LDSF). where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident LDSF image.

DSU2-DGN:SM[x] = DSU2 diagnostic image, where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident DGN image.

f = The pumpable peripheral which must be removed/restored to obtain consistency. Valid value(s):
  ALL PH2 = All PH2s.
  ALL PH3 = All PH3s.
  ALL PH4 = All PH4s.
  GDSF = Global digital services function - model 3.
  IDCU = Integrated digital carrier unit.
  ISLU = Integrated services line unit.
  ISLU2 = Integrated services line unit 2.
ISTF = Integrated services test function.
LDSF = Local digital services function - model 3.
LDSU = Local digital service unit.
PH2A = Protocol handler 2 (PH2) with ACCESS application processor image.
PH2G = PH2 with GATEWAY application processor image.
PH3C = PH3 with COMMON application processor image.
PH4I = PH4 with ISDN application processor image.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
PHV1C = Protocol handler for voice for CDMA.
PHA1A = Protocol handler for ATM.
PHA2A = Protocol handler for ATM model 2 AP image.
PHE2E = Protocol handler for ethernet.
CC2 = Common controller
IP4IF = ISDN frame relay protocol handler version 4 I/O processor.
PH3S = Protocol handler version 3
IP3S = operational image for I/O processor.
DSP8K = 8K DSP for CDMA protocol handler for voice.
DSP13K = 1313K DSP for CDMA protocol handler for voice.
PHV3C = Protocol handler for voice version 3 for CDMA application
PHV4C = Protocol handler for voice version 4 for CDMA application.
V4D8K = 8K DSP, for CDMA protocol handler for voice version 4.
V4D13K = 13K DSP, for CDMA protocol handler for voice version 4.
DDMA = Diagnostic image for the Direct-Memory-Access
DSPEVRC = EVRC DSP for CDMA
V3DACP = ACELP DSP for TDMA protocol handler for voice.
V3DVSP = VSELP DSP for TDMA protocol handler for voice.
D4DVVERC = EVRC DSP, for CDMA protocol handler for voice.
V4DACP = ACELP DSP, for TDMA protocol handler for voice version 4.
V4DVSP = VSELP, DSP, for TDMA protocol handler for voice version 4.
DGN = Diagnostic image.
DLP = Data link processor.
LSI

\( g \) = Update recovery status. Valid value(s):

   ABORTED
   COMPLETED
   CONTINUES

4. ACTIONS TO BE TAKEN

If updates were backed out in a roll backward recovery, some may have to be re-installed. If the update was
ABORTED, a verify of update consistency (UPD:VFYCON) will report any remaining inconsistencies. Reentering the
same UPD:RCVRY input message will continue the recovery action. This action will not recover from type 7 or 8
inconsistencies. For a type 7 inconsistency, remove and restore the inconsistent peripherals manually or refer to the
UPD:PPMPERF input manual page. If the recovery continues to be aborted, refer to the TECHNICAL ASSISTANCE
portion of the INTRODUCTION section of the Output Messages manual.
5. ALARMS

None.

UPD:RDTA-A

Software Release: 5E14 only
Message Class: TM
Application: 5
Type: Output

1. FORMAT

[1] UPD RDTA SESSION=a b
   [b] [c] [l] [w] [y]
   [INDN=z ITAP=a1-b1] [OUTDN=c1 OTAP=d1-e1]
   MODE=f1 [QTS=g1] DURATION=h1 TIME REMAINING=i1

[2] UPD RDTA SESSION=a b FP=j1

2. REASON FOR OUTPUT

To respond to a manual request to reinitialize the termination timer for the specified remote digital test access (RDTA) session. To inform the end user that the termination timer will expire and the technician has 30 minutes to respond with a message to keep the active RDTA connection. To send a session reminder to the technician every 24 hours when a session duration (DUR) parameter is longer than 1 day.

Format 1 states that a successful initialization of the termination timer for the requested RDTA session has been accomplished and gives all status information about the updated session. The first line shows the session number and the completion notification of the requested session. The second line describes the port under test (PUT) in the various port identifications which are applicable to the PUT. The third line shows the output facility information defining routing for the RDTA connection and where the protocol analysis equipment is located. The fourth line shows the type of connection and quarter time-slot, if applicable, along with the total session duration and remaining session time. Format 2 is used to give a failure response pertaining to the input request of updating or resetting the termination timer for the requested RDTA session. The information, as seen by the input message, will be returned along with the reason for failure and a failure point number, used to identify the point in software where failure occurred.

3. VARIABLE FIELD DEFINITIONS

+ = Assigned to a multipoint interface.

a = Session number given to the requested session. Sessions are numbered sequentially from 1 through 99. At 99, the numbers will be recycled starting from 1 again.

b = Response to UPD:RDTA input message. Valid value(s):
   COMPLETED = The termination timer was successfully reset. The time remaining as displayed on the output may be used as verification.
   CORRUPTED DYNAMIC DATA = Dynamic data has been corrupted. Look at the read-only printer (ROP) for a related assert to give assistance toward correcting the office dependent data (ODD) problem. Audits will correct any RDTA session/data inconsistency.
   IS STILL ACTIVE 24 HOUR REMINDER = A reminder that a session has been active for 24 hours, resources are being utilized by the RDTA session.
   SESSION NOT ACTIVE = The requested RDTA session is not active.
   SM UNAVAILABLE = The SM containing the PUT, which is needed to retrieve/translate port names,
is isolated. This restricts the administrative module (AM) from printing the PUT external identifiers on line 2 of the Format 1 output message. Therefore, this message may also be seen on line 2 of the Format 1 output message in place of these external identifiers.

**SYSTEM ERROR** = Internal system error occurred while attempting to update the termination timer for the requested RDTA session.

**WARNING** = The termination timer will expire in approximately 30 minutes. If the RDTA session is to be continued beyond the next 30 minutes, then the UPD:RDTA input message should be used.

```
c

m
  = SM number.

n
  = Digital line and trunk unit (DLTU) number.

o
  = Digital facility interface number.

p
  = Digital channel.

q
  = Integrated digital carrier unit number.
```
r = Remote terminal number.
s = Channel unit number.
t = Integrated services line unit (ISLU) or access interface unit (AIU) number.
u = Line group controller number.
v = Line card number.
w = Directory number. Valid value(s):
DN=u[+]
PKTDN=u[+]
x = Seven-digit directory number.
y = Channel type (for basic rate interface (BRI)). Valid value(s):
B1 = B1-Channel.
D = D-Channel (default).
z = DN of the output facility where the protocol analyzer is connected to access the test data sent over the PUT to the switch. This direction will be known as incoming. Data sent from the analysis equipment for interaction with the PUT will therefore originate from INDN for all interactive mode connections excepting the SPLITPH connection.
a = SM number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.
b = Logical port number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.
c = DN of the output facility where the protocol analyzer is connected to access the test data sent from the switch to the PUT. This direction will be known as outgoing. Data sent from the analysis equipment for interaction with the switch will therefore originate from OUTDN for the SPLIT and SPLITPH connections.
d = SM number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.
e = Logical port number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.
f = Connection mode of the RDTA session. Valid value(s):
DTAC = Direct test access connection (DTAC). This is an interactive connection on a port which does not have a path set up on it. The PUT is seized and directly connected to an outgoing port terminating at the protocol analysis equipment.
MON = Monitor. This is a receive-only connection on a busy circuit. A copy of the transmit and receive data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.
SPLIT = Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the
original path.

**SPLITPH**

- Simplex split protocol handler (PH) side. This is an interactive connection up on an integrated services digital network (ISDN) channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.

**SPLITPUT**

- Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

\[\text{g}^1\]

- The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the PH. The valid range is 0,1,2 or 3.

\[\text{h}^1\]

- This is the total time for which the session has been active in its present state (that is, the time since the start or conversion of the session). The output form, for this length of time, on the output is days (with a space between) hours:minutes:seconds.

\[\text{i}^1\]

- This is the remaining time for which the session will continue operating before the session will be automatically terminated, in the form days (with a space between) hours:minutes:seconds. If the session has been set for an infinite duration, the time field will be printed as INFINITE. The session may be extended by using the UPD:RDTA input message.

\[\text{j}^1\]

- This is a fail point number used to relay the specific point in the software at which a failure occurred. This is used purely for debugging purposes.

\[\text{k}^1\]

- Line group number.

\[\text{l}^1\]

- Line board number.

\[\text{m}^1\]

- Line circuit number.

\[\text{n}^1\]

- Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

\[\text{o}^1\]

- Data group (DG) number.

\[\text{p}^1\]

- SONET termination equipment (STE) facility number.

\[\text{q}^1\]

- Synchronous transport signal (STS) facility number.

\[\text{r}^1\]

- Virtual tributary group (VTG) number.

\[\text{s}^1\]

- Virtual tributary member (VTM) number.

\[\text{t}^1\]

- Digital signal level 0 (DS0) number.

**4. ACTIONS TO BE TAKEN**

If the completion code indicates a failure in initializing the termination timer, due to an internal software/hardware error, save the printer output. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**5. ALARMS**
None.

z = DN of the output facility where the protocol analyzer is connected to access the test data sent over the PUT to the switch. This direction will be known as incoming. Data sent from the analysis equipment for interaction with the PUT will therefore originate from INDN for all interactive mode connections excepting the SPLITPH connection.

a1 = SM number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

b1 = Logical port number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

cl = DN of the output facility where the protocol analyzer is connected to access the test data sent from the switch to the PUT. This direction will be known as outgoing. Data sent from the analysis equipment for interaction with the switch will therefore originate from OUTDN for the SPLIT and SPLITPH connections.

d1 = SM number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

e1 = Logical port number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

f1 = Connection mode of the RDTA session. Valid value(s):

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DTAC</td>
<td>Direct test access connection (DTAC). This is an interactive connection on a port which does not have a path set up on it. The PUT is seized and directly connected to an outgoing port terminating at the protocol analysis equipment.</td>
</tr>
<tr>
<td>MON</td>
<td>Monitor. This is a receive-only connection on a busy circuit. A copy of the transmit and receive data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.</td>
</tr>
<tr>
<td>SPLIT</td>
<td>Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.</td>
</tr>
</tbody>
</table>
| SPLITPH| Simplex split protocol handler (PH) side. This is an interactive connection up on an integrated services digital network (ISDN) channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the
The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the PH. The valid range is 0,1,2 or 3.

This is the total time for which the session has been active in its present state (that is, the time since the start or conversion of the session). The output form, for this length of time, on the output is days (with a space between) hours:minutes:seconds.

This is the remaining time for which the session will continue operating before the session will be automatically terminated, in the form days (with a space between) hours:minutes:seconds. If the session has been set for an infinite duration, the time field will be printed as INFINITE. The session may be extended by using the UPD:RDTA input message.

This is a fail point number used to relay the specific point in the software at which a failure occurred. This is used purely for debugging purposes.

Line group number.

Line board number.

Line circuit number.

Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

Data group (DG) number.

SONET termination equipment (STE) facility number.

Synchronous transport signal (STS) facility number.

Virtual tributary group (VTG) number.

Virtual tributary member (VTM) number.

Digital signal level 0 (DS0) number.

Peripheral control and timing (PCT) line and trunk unit (PLTU) number.

PCT facility interface (PCTFI) number.

Tributary number.

Channel number.

4. ACTIONS TO BE TAKEN

If the completion code indicates a failure in initializing the termination timer, due to an internal software/hardware error, save the printer output. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
5. ALARMS

None.

Message Class: TM
Application: 5
Type: Output

1. FORMAT

[1] UPD RDTA SESSION=a  b
[b]  [c]  [l]  [w]  [y]
{INDN=z ITAP=a\textsuperscript{1}-b\textsuperscript{1}} {OUTDN=c\textsuperscript{1} OTAP=d\textsuperscript{1}-e\textsuperscript{1}}
MODE=f\textsuperscript{1} [QTS=g\textsuperscript{1}] DURATION=h\textsuperscript{1} TIME REMAINING=i\textsuperscript{1}

[2] UPD RDTA SESSION=a  b  FP=j\textsuperscript{1}

2. REASON FOR OUTPUT

To respond to a manual request to reinitialize the termination timer for the specified remote digital test access (RDTA) session. To inform the end user that the termination timer will expire and the technician has 30 minutes to respond with a message to keep the active RDTA connection. To send a session reminder to the technician every 24 hours when a session duration parameter is longer than 1 day.

Format 1 states that a successful initialization of the termination timer for the requested RDTA session has been accomplished and gives all status information about the updated session. The first line shows the session number and the completion notification of the requested session. The second line describes the port under test (PUT) in the various port identifications which are applicable to the PUT. The third line shows the output facility information defining routing for the RDTA connection and where the protocol analysis equipment is located. The fourth line shows the type of connection and quarter time-slot, if applicable, along with the total session duration and remaining session time.

Format 2 is used to give a failure response pertaining to the input request of updating or resetting the termination timer for the requested RDTA session. The information, as seen by the input message, will be returned along with the reason for failure and a failure point number, used to identify the point in software where failure occurred.

3. VARIABLE FIELD DEFINITIONS

\[+\] = Assigned to a multipoint interface.

\[a\] = Session number given to the requested session. Sessions are numbered sequentially from 1 through 99. At 99, the numbers will be recycled starting from 1 again.

\[b\] = Response to UPD:RDTA input message. Valid value(s):

COMPLETED = The termination timer was successfully reset. The time remaining as displayed on the output may be used as verification.

CORRUPTED DYNAMIC DATA = Dynamic data has been corrupted. Look at the ROP for a related assert to give assistance toward correcting the office dependent data (ODD) problem. Audits will correct any RDTA session/data inconsistency.

IS STILL ACTIVE 24 HOUR REMINDER = A reminder that a session has been active for 24 hours, resources are being utilized by the RDTA session.
SESSION NOT ACTIVE = The requested RDTA session is not active.

SM UNAVAILABLE = The SM containing the PUT, which is needed to retrieve/translate port names, is isolated. This restricts the administrative module (AM) from printing the PUT external identifiers on line 2 of the Format 1 output message. Therefore, this message may also be seen on line 2 of the Format 1 output message in place of these external identifiers.

SYSTEM ERROR = Internal system error occurred while attempting to update the termination timer for the requested RDTA session.

WARNING**SESSION ABORT IN 30 MIN = The termination timer will expire in approximately 30 minutes. If the RDTA session is to be continued beyond the next 30 minutes, then the UPD:RDTA input message should be used.

c = Service group and member numbers. Valid value(s):
   BST=d-e
   MLHG=f-g
   OAPO=d
   OPT=d-e
   RTRS=h-i
   TKMN=j-k

d = Operator service center number.

e = Relative position number.

f = Multi-line hunt group number.

g = Multi-line hunt group member number.

h = Data link relative group number of the RTRS.

i = Data link relative member number of the RTRS.

j = Trunk group number.

k = Trunk group member number.

l = Equipment number. Valid value(s):
   AIUEN=m-t-1^1-m^1
   DEN=m-n-o-p
   ILEN=m-q-r-s
   LCEN=m-t-u-v
   LCKEN=m-t-k^1-1^1-m^1
   NEN=m-n^1-o^1-p^1-q^1-r^1-s^1-t^1
   INEN=m-n^1-r-s
   PLTEN=d-u^1-v^1-w^1-x^1
   OIUEN=m-y^1-z^1-p^1-q^1-r^1-s^1-t^1

m = SM number.
= Digital line and trunk unit (DLTU) number.

o = Digital facility interface number.

p = Digital channel.

q = Integrated digital carrier unit number.

r = Remote terminal number.

s = Channel unit number.

t = Integrated services line unit (ISLU) or access interface unit (AIU) number.

u = Line group controller number.

v = Line card number.

w = Directory number. Valid value(s):

\[ \text{DN}=u[+] \]
\[ \text{PKTDN}=u[+] \]

x = Seven-digit directory number.

y = Channel type [for basic rate interface (BRI)]. Valid value(s):

\[ B1 = \text{B1-Channel.} \]
\[ B2 = \text{B2-Channel.} \]
\[ D = \text{D-Channel (default).} \]

z = DN of the output facility where the protocol analyzer is connected to access the test data sent over the PUT to the switch. This direction will be known as incoming. Data sent from the analysis equipment for interaction with the PUT will therefore originate from INDN for all interactive mode connections excepting the SPLITPH connection.

a\textsuperscript{1} = SM number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

b\textsuperscript{1} = Logical port number of the port which corresponds to the INDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

c\textsuperscript{1} = DN of the output facility where the protocol analyzer is connected to access the test data sent from the switch to the PUT. This direction will be known as outgoing. Data sent from the analysis equipment for interaction with the switch will therefore originate from OUTDN for the SPLIT and SPLITPH connections.

d\textsuperscript{1} = SM number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.

e\textsuperscript{1} = Logical port number of the port which corresponds to the OUTDN for local access or of the port which connects the session switch (where the session is set up) to the network for remote access.
f
- Connection mode of the RDTA session. Valid value(s):

  DTAC = Direct test access connection (DTAC). This is an interactive connection on a port which does not have a path set up on it. The PUT is seized and directly connected to a outgoing port terminating at the protocol analysis equipment.

  MON = Monitor. This is a receive-only connection on a busy circuit. A copy of the transmit and receive data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.

  SPLIT = Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.

  SPLITPH = Simplex split protocol handler (PH) side. This is an interactive connection up on an integrated services digital network (ISDN) channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.

  SPLITPUT = Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

g
- The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the PH. The valid range is 0,1,2 or 3.

h
- Total time for which the session has been active in its present state (that is, the time since the start or conversion of the session). The output form, for this length of time, on the output is days (with a space between) hours:minutes:seconds.

i
- This is the remaining time for which the session will continue operating before the session will be automatically terminated, in the form days (with a space between) hours:minutes:seconds. If the session has been set for an infinite duration, the time field will be printed as INFINITE. The session may be extended by using the UPD:RDTA input message.

j
- This is a fail point number used to relay the specific point in the software at which a failure occurred. This is used purely for debugging purposes.

k
- Line group number.

l
- Line board number.

m
- Line circuit number.

n
- Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

o
- Data group (DG) number.

p
- SONET termination equipment (STE) facility number. For OIU-NAR, it is OC-3.

q
- Synchronous transport signal (STS) facility number.
4. ACTIONS TO BE TAKEN

If the completion code indicates a failure in initializing the termination timer, due to an internal software/hardware error, save the printer output. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

UPD:REDUCE

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] UPD REDUCE {COMPLETED|ABORTED|STOPPED}

[2] UPD REDUCE UNLINK FAILED ON a

[3] UPD REDUCE MOVE THE FOLLOWING FILE(S) TO b MANUALLY
   c
   .
   .

[4] UPD REDUCE MOVE HISTORY FILES FROM d TO b MANUALLY

2. REASON FOR OUTPUT

To report the result of executing the UPD:REDUCE input message. The input message reduces the amount of space needed to maintain field update record keeping files in /etc.

Format 1 is printed to indicate status of command at termination time.

Format 2 is printed to indicate files not removed by command.

Format 3 is printed to indicate some of the files were not moved.

Format 4 is printed when some of the files are not moved and a complete list of the files can not be printed.

3. VARIABLE FIELD DEFINITIONS

a = Name of file that must be manually removed.
b = Name of the destination directory.
c = Name(s) of the files that must be moved manually to the destination directory.
d = Name of the source directory.

4. ACTION TO BE TAKEN

If the message reads ABORTED or STOPPED, obtain technical assistance.

If Format 3 is printed, move all the files listed to the destination directory manually.

If Format 4 is printed, determine names of the files in the source directory and manually move them to the destination directory.
5. ALARMS

None.

Output Message(s):

  UPD : SYSERR
  UPD : USRERR
UPD:REPT

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

UPD REPT  a
          b
          [c]
          [PATHNAME: f]
          [VALUES g]
          [TAG=d ERRNO=e]

2. REASON FOR OUTPUT

To specify errors or events that occurred as a result of performing a software update activity.

3. VARIABLE FIELD DEFINITIONS

a  = Category of the report message. Valid value(s):
    INFORMATION = Information message associated with a software update activity.
    SYSTEM ERROR = System error encountered during a software update activity.
    USER ERROR = User error encountered attempting to execute a software update command. Most
                  often the result of bad input to the command.
    WARNING = A non-fatal problem was encountered while executing a software update activity
              that did not cause the command to abort, but may require attention.

b  = A brief text phrase describing an error or providing information associated with a software update
    activity.

c  = The SU name associated with the report message.

d  = A tag value which indicates the location where the error message originated from.

e  = A UNIX® system error number.

f  = Pathnames of the files associated with this report. There is one pathname per line.

g  = Values associated with the text message in variable 'a'. There are four values per line. These
    provide the data which caused the text message to be printed.

4. ACTIONS TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>Action =</th>
</tr>
</thead>
<tbody>
<tr>
<td>INFORMATION</td>
<td>No action is necessary.</td>
</tr>
<tr>
<td>SYSTEM ERROR, USER</td>
<td>The specific action required</td>
</tr>
<tr>
<td>ERROR, OR WARNING</td>
<td>depends on variable 'b' in</td>
</tr>
<tr>
<td></td>
<td>the message. Most of these</td>
</tr>
<tr>
<td></td>
<td>reports require technical</td>
</tr>
<tr>
<td></td>
<td>assistance, however some can</td>
</tr>
<tr>

<tr>
<td></td>
<td>corrected a retry of the</td>
</tr>
<tr>
<td></td>
<td>failed command will usually</td>
</tr>
<tr>
<td></td>
<td>succeed.</td>
</tr>
</tbody>
</table>
MULTIPLE INVOCATIONS OF SUcmd NOT ALLOWED = There is already a SU command running which must be completed before another command is given. Retry the command at a later time.
NOT ENOUGH FREE SPACE TO INSTALL FILE = Check the filesystem referred to by f for unnecessary files which may be using up all of the space.
PREVIOUS SU HAS TEMPORARY UPDATE ON THIS FILE = The previous SU 'c' must be made official before the current SU can be applied because they have overlapping updates.
THIS IS NOT THE LATEST SU THAT CAN BE BACKED OUT = Use the display commands on 1950 MCC page to determine which SU needs to be backed out first.
UPDATE ITEM IS IN OFFICIAL STATUS = The SU in 'c' has at least one update made official. That means that a SU must be backed out using the back out last official (BOLO) SU mechanism on the 1950 MCC page.

If these actions do not succeed then, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Software Release: 5E14 and later  
Message Class: LINE  
Application: AEWNC  
Type: Output

1. FORMAT

UPD SSD DN=a b  
[c]

2. REASON FOR OUTPUT

To report the results from the UPD:SSD input message.

3. VARIABLE FIELD DEFINITIONS

a  
= Wireless directory number.

b  
= Status. Valid value(s):

ALREADY IN PROGRESS = A request to update a wireless subscriber's shared secret data (SSD) is already in progress. The SSD update will not occur until the wireless phone attempts to access the system.

DATA BASE ERROR = An error occurred in accessing the system's database. Retry the request. If the problem persists, check for any associated asserts and contact a higher level of support.

IN PROGRESS = The request to update a wireless subscriber's SSD has been accepted and will be processed when the wireless phone attempts to access the system (that is, register, originate a call). Any system access attempt by the wireless phone following this output message will generate a REPT:AUTH output message, which will indicate if the SSD update succeeded or failed.

INPUT ERROR = The wireless directory number (DN) was not entered correctly in the UPD:SSD input message. All 10 digits of a wireless DN must be specified. Verify that a valid ten digit wireless DN was specified in the UPD:SSD input message and retry the request.

INVALID DN = The DN specified in the UPD:SSD input message is unknown to the system. Verify that a valid ten digit wireless DN was specified in the UPD:SSD input message and retry the request.

INVALID PORT TYPE = The DN specified in the UPD:SSD input message is a valid DN for the system but is not a wireless DN. Verify that a valid ten digit wireless DN was specified in the UPD:SSD input message and retry the request.

PROCESS TIMEOUT = The request failed because an internal process timed-out waiting for a response. The system may be too busy to process the request. Retry the request at a later time. If the problem persists, check for any associated asserts and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

SM UNAVAILABLE = A switching module (SM) required to update the wireless subscriber's SSD is unavailable. Retry the request at a later time.

SYSTEM ERROR = The request failed because of a system error. The system may be too busy to process the request. Retry the request at a later time. If the problem persists, check for any associated asserts and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNASSIGNED PORT = The DN specified in the UPD:SSD input message is associated with a port in
the unassigned state. Verify that a valid ten digit wireless DN was specified in the UPD:SSD input message and retry the request.

c = Comment. Valid value(s):
Wireless Subscriber DN Must Be Specified = Only a wireless subscriber DN may be specified in the UPD:SSD input message.
10 Digit Wireless DN Must Be Specified = All ten digits of a wireless subscriber's DN must be specified in the UPD:SSD input message. It is possible for the WNC to be provisioned with multiple wireless subscribers having DNs with the same last seven digits.

Completion Report -Rept Auth Management- Pending Handset Registration = The result of the SSD update request will be indicated by the REPT:AUTH output message when the wireless phone attempts to access the system (that is, register, originate a call).

4. ACTION TO BE TAKEN

No action is required. The actual update of the wireless subscriber's SSD will be processed when the wireless phone attempts to access the system. At that time, a REPT:AUTH output message will be generated to indicate if the SSD update succeeded or failed. If the status of an SSD update is unknown because the REPT:AUTH has not been observed, the OP:WCPE input message may be used in some cases to determine if the SSD update has occurred and if it succeeded or failed. Refer to the complete SSD update procedure in the Air ExtensionSM Reference Guide.

5. ALARMS

UPD: SUPERPOKE-FB

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

UPD SUPERPOKE FAILED BWM=a STATE=b

2. REASON FOR OUTPUT

To report a failure in the execution of the software update superpoke process.

3. VARIABLE FIELD DEFINITIONS

a = The name of the software update that superpoke failed on.
b = The state that superpoke was in when the failure occurred. Valid value(s):
   APPAPP = Execute all the apply section for the apply software update. This is equal to the 9310 poke on page 1960.
   APPIN = Execute all the apply section for the install software update. This is equal to the 9310 poke on page 1960.
   BKOUT = Backout the software update that is indicated by the backout software update name. This is equal to the 9340 poke on page 1960.
   OFCIN = Execute all the official section for the install software update. This is equal to the 9330 poke on page 1960.
   SKAPP = Execute all the soak section for the apply software update. This is equal to the 9320 poke on page 1960.
   SOAKIN = Execute all the soak section for the install software update. This is equal to the 9320 poke on page 1960.
   STAPP = Start the apply software update for the software update name in the apply software update field. This is equal to the 9000 poke on page 1960.
   STIN = Start the install software update for the software update name in the install software update field. This is equal to the 9000 poke on page 1960.

4. ACTION TO BE TAKEN

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Something has failed in the application of a software update. Give the state of superpoke and the software update name to the person assisting. This will greatly help them.

5. ALARMS

None.

   - INVALID ACTION RECEIVED FROM UPSUXFER IN SU TRANSFER MESSAGE g
   - INVALID MESSAGE TYPE RECEIVED FROM PROCESS c h
   - INVALID STATUS RECEIVED FROM UPEXPAND IN SU EXPANSION MESSAGE i
   - MEMORY ALLOCATION FAILED
   - MSGS FILE HAS BAD FORMAT
   - UNABLE TO RECEIVE A MESSAGE j

Warning message. Valid value(s):
   - STATUS FILE REINITIALIZED
   - SU a IN PROGRESS ABORTING TRANSFER

4. ACTIONS TO BE TAKEN

If the abort is associated with the BWM package, re-download the BWM, otherwise refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

UPD:VFY
UPD:SYNTAX-CHECK

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

UPD SYNTAX CHECK COMPLETED FOR THE PREVIOUS COMMAND

***************************************************
>>> THIS UPDATE WAS NOT PROCESSED ON THE SWITCH <<<

2. REASON FOR OUTPUT

To report that the syntax check mode is activated. The syntax check mode is used to verify the syntax of the command lines in the messages (MSGS) file.

This capability is designed for use in the laboratory testing environment only.

3. VARIABLE FIELD DEFINITIONS

No variables.

4. ACTION TO BE TAKEN

To de-activate the syntax check mode, remove /tmp/.UPsynchk and the status file in the software update directory. Any UNIX® commands existing in the MSGS file that may have been run during the syntax check will have to be rectified by the user. If this message appears on the receive-only printer (ROP) in a non-laboratory environment, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

1960 (PROGRAM UPDATE INSTALLATION)
1. **FORMAT**

   UPD SYSERR {a|b}

2. **REASON FOR OUTPUT**

   To report system errors that occurred as a result of performing a field-update activity.

   In many cases, the problem cannot be fixed without more sophisticated diagnostics or technical assistance. However, in a few cases, a field site may be able to correct the problem locally. The system errors are described here with these few cases in mind.

   Since the errors can result from executing any of several field-update input messages, the input message is identified by a specific UPD message following one or more UPD:SYSERR output messages.

3. **VARIABLE FIELD DEFINITIONS**

   a = Error code: 1-1960. Refer to Exhibit A.

   b = Text string describing outcome. Valid value(s):

   - AFFECTED PERIPHERAL LIST FAILED DUE TO INTERNAL ERROR.
   - AUDIT REPLY MESSAGE RECEIVED WAS NOT FROM SIM.
   - All \( \{\text{CMP} | \text{SM}\} \) (s) ARE NOT OPERATIONAL, BUT SOME \( \{\text{CMP} | \text{SM}\}'s \) UPDATE FLAG HAS BEEN SET BY THE SYSTEM.

c-f = Additional data.
g = Result code. Valid value(s):
1   = Request completed.
2   = Request started - printout follows.
3   = Audit system initialization in progress.
4   = Audit system initialization failed.
5   = Access to audit record in equipment configuration database (ECD) failed.
6   = Requested audit is running.
7   = Another kernel process (KP) requested audit is running.
8   = Maximum number of supervisor audits is running.
9   = Requested audit is blocked.
10  = Attempt to initialize or dispatch audit failed.
11  = An audit with the same name is running.
12  = Audit running in demand mode. Cannot block.
13  = Audit running requested. Cannot stop or block.
14  = Requested audit or instance is inhibited.
15  = System integrity output formatter (SIOF) is dead.
19  = Invalid audit specified.
20  = Invalid audit instance specified.
21  = Mode of request not permitted.
22  = Cannot stop an audit that is not running.
23  = Cannot stop a non-segmented kernel audit.
30  = Request resulted in no change.
4. ACTIONS TO BE TAKEN

The specific action required depends on the type of error that occurred. An invalid update name (UPNM) or pathname [update file (UF) or file name (FN)] may be the result of an input error. Reenter the input message with the correct update name or pathname. Otherwise, refer to the TECHNICAL ASSISTANCE section of the INTRODUCTION section for additional information.

Explanations of the error codes and any additional data are shown in Table 1.

Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual for explanations of error codes listed in columns 'i' and 'j' in Table 1.

| One of the following OGEN return codes:
0 = Normal end.
1 = Bad arguments passed to internal function.
2 = Can not find name in passwd file.
3 = Bad magic number in aouthdr.
4 = First source file not brnch.tbl in library.
5 = Unknown storage class.
6 = Inconsistent magic number in mfiles.
7 = Illegal mark state.
8 = Illegal build transaction.
9 = Scoping inconsistencies.
10 = Bad dotype in stclass.
11 = Can not reopen stdout.
12 = Duplicate function symbols.
13 = Duplicate file name in mfiles.
14 = Duplicate .file symbols.
15 = Duplicate transfer vector (TV) reservations.
16 = Illegal scn parity.
17 = Illegal reloc type. |
18 = Illegal reloc size.
19 = Illegal state in close.
20 = Can not allocate memory.
21 = Can not ldopen library.
22 = Illegal transaction.
23 = Illegal transaction.
24 = Error transition.
25 = Function maximum exceeded for one
UPD message.
26 = Can not close mfie.
27 = Can not read mfie section header.
28 = Can not read mfie linenum.
29 = Can not "seek" to mfie linenum.
30 = Can not find symbol in mfie.
31 = Can not read mfie segment.
32 = Can not ldopen mfie.
33 = Can not open mfie for relocation.
34 = Can not read aux reloc.
35 = Can not read mscn for reloc.
36 = Can not "seek" to mcontent.
37 = Can not read mfie auxent.
38 = Added function present. The mfie
marks the added function. If OGEN finds
that the function already exists, it figures
that the mfie was not meant for this pfie.
39 = Can not find function in branch table.
40 = Inconsistent F_NODF flags. An
update that suppresses the installation of
decision functions must be consistent
throughout.
41 = Not enough patch space.
42 = Not enough spare slots.
43 = F_AR32W flag is not set in the
filehdr. On the AM, ogen expects the file to
look as if it were built on a 32-bit machine
with left to right byte ordering.
44 = Can not find text section.
45 = Can not read authdr.
46 = Unknown option on command line.
47 = Can not read patch block count.
48 = Can not "seek" to pfie header.
49 = Can not read pfie scn header.
50 = Can not read pfie linenum.
51 = Can not "seek" to pfie linenum.
52 = Missing pfie name; no -p argument.
53 = Can not read pfie segment.
54 = Can not open pfie.
55 = Can not read pfie optional header.
56 = Can not "seek" to pfie optional
header.
57 = Can not read patch entry.
58 = Can not "seek" to patch list.
59 = Can not open pfie for relocation.
60 = Can not read pfie reloc.

</table>

18 Dynamic update function replacer (DUFR) failed.

One of the following DUFR return codes:

2 = Bad return from KOP.
3 = More than one segment needs attaching in order to perform overwrite.
4 = DUFR encountered an error when opening or reading the absolute overwrite file, or there is an error in the format of the absolute overwrite file.
5 = More than 50 words need writing in order to perform update.
6 = More than one segment needs attaching in order to perform overwrite.
7 = KOP is unable to attach to one of the segments to be overwritten.
8 = DUFR could not grow the patch segment to write the replacement function.
9 = KOP is unable to release to one of the segments that was overwritten.
10 = DUFR is unable to attach one or more segments to be overwritten.
12 = DUFR discovered a mismatch between the old data in the absolute overwrite file and the old data in the core image of the process. This error is most likely a user error. It can result from incorrect old data in a .m file, pfie, 3ba.out, or object file.
14 = More than 50 words need writing in
order to perform update.

16 = DUF R encountered an internal error.

18 = DUF R is unable to release one or more segments that were overwritten. No action needs to be taken, since the link to the attached segments will be broken when DUF R terminates.

20 = Overwrite attempts to a reference address not in the address space of the process. This error is most likely a user error. It can result from an incorrect pfile, 3ba.out, or object file, or an invalid utility ID.

22 = The address of a transfer vector is not aligned to a full word boundary.

24 = Error in obtaining process ID from the utility manager. This error can be a user error resulting from an incorrect pfile, 3ba.out, or object file, or treating a killable process that is not in core as a nonkillable update.

26 = Error in processing overwrite for multiple invocations of a process. At least one instance of the process was updated correctly.

28 = Error in p_creating kopf process.

30 = The KOPF process did not send a kopf-init event to KOP.

32 = The KOPF and KOP processes were faulted due to a system-initialization (phase 1), the overwrite has been backed out.

33 = Missing temped file.

34 = The KOP process was faulted, the overwrite/backout was not performed.

36 = DUF R process faulted.

38 = DUF R process externally terminated.

40 = Bad processing sequence attempted by DUF R.

42 = PFCLRERR segment name has failed. System reasons.

44 = DFPTERM target process died (for KP update).

19

Overwrite incremental loader (OILD) failed.

One of the following OILD return codes:

1 = Missing or unknown argument in the OILD call.

2 = Duplicate flags in the OILD call.

3 = UNIX® RTR operating system signal caused a program interrupt.

4 = Bad version of OILD being used.

5 = Product built with TV only can be processed.

20 = No input pfile, 3ba.out, or object
22 = Cannot open the input pfile, 3ba.out, or object file.
23 = UNIX® RTR operating system memory-allocation failure while building internal data structures.
24 = UNIX® RTR operating system read failure for the input pfile, 3ba.out, or object file.
25 = Bad input pfile, 3ba.out, or object file: no header structures present.
26 = Bad input pfile, 3ba.out, or object file: invalid magic number; file is of unknown type.
27 = There are 2 possible instances of this error code.

   Bad input pfile, 3ba.out, or object file: not in common object file format.

   Missing pad section.
28 = UNIX® RTR operating system file positioning failure for the input pfile, 3ba.out, or object file.
40 = No output pfile, 3ba.out, or object filename given.
41 = Output pfile, 3ba.out, or object file already exists.
42 = Cannot open the output pfile, 3ba.out, or object file.
43 = Same as 23.
44 = UNIX® RTR operating system read failure for the output pfile, 3ba.out, or object file.
45 = UNIX® RTR operating system write failure for the output pfile, 3ba.out, or object file.
48 = UNIX® RTR operating system file positioning failure for the output pfile, 3ba.out, or object file.
58 = UNIX® RTR operating system file close failure for the output pfile, 3ba.out, or object file.
60 = No absolute overwrite filename given.
62 = Cannot open absolute overwrite file.
63 = Same as 23.
64 = UNIX® RTR operating system read failure for the absolute overwrite file.
65 = Bad absolute overwrite file: no header structure present.
66 = Bad magic number: absolute overwrite file is of unknown type.
68 = UNIX® RTR operating system file positioning failure for the absolute overwrite file.
69 = Bad overwrite.
73 = Bad overwrite: old/new data mismatch.
74 = Bad overwrite: unknown .filename.
77 = Bad overwrite: relocation entries not allowed.
83 = Same as 23.
86 = Bad overwrite: absolute overwrite file - input pfile mismatch.
90 = Same as 86.
95 = During official back out, patch list could not be restored to its previous state.
100 = No patch list.
103 = Same as 23.
111 = Bad absolute overwrite file.
116 = Same as 111.
120 = Missing or duplicate .file symbol.
123 = Same as 23.
124 = Same as 44.
125 = Same as 45.
129 = Missing or duplicate function name.
132 = Bad symbol table entry in absolute overwrite file.
134 = Bad symbol table entry in input pfile, 3ba.out, or object file.
135 = Same as 134.
136 = Same as 134.
143 = Same as 23.
163 = Same as 23.
177 = Same as 111.

20
Incremental system generation (ISGEN) failed.

One of the following ISGEN return codes:
1 = Reason for error found at beginning of output file /tmp/sgdump.
2 = bf_init: cannot open output file j.
3 = bf_fchk: cannot open file j.
4 = bf_fchk: file j is not a single extent contiguous file.
5 = bf_write: insufficient space on output file to build system.
6 = bh_put: write failed.
7 = bt_pr_seg: too many segments in boot image.
8 = bt_ovrwrt: unable to overwrite bootab.
9 = bt_ovrwrt: unable to open output file j.
10 = bt_ovrwrt: unable to write to file j.

---

21

The file or process that is being updated has the incorrect byte ordering internally. The ordering of the most significant and least significant bytes or words is reversed.

---

22

Pcreat of DUFR failed.

Pathname used to pcreat DUFR.

If \(a\) = 22.15, 28-30, 40-43, or 101-108, \(j\) equals one of the following UNIX® RTR operating system error codes:

2 = This error occurs when a filename is specified and the file should exist but doesn't, or when one of the directories in a pathname does not exist.
3 = A system call was given an invalid
<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process ID.</td>
<td>A process ID.</td>
</tr>
<tr>
<td>4</td>
<td>An asynchronous signal (such as interrupt or quit), which the user has elected to catch, occurred during a system call. If execution is resumed after processing the signal, it will appear as if the interrupted system call returned this error condition.</td>
</tr>
<tr>
<td>5</td>
<td>Some physical I/O error occurred during a read or write. This error may in some cases occur on a call following the one to which it actually applies.</td>
</tr>
<tr>
<td>6</td>
<td>I/O on a special file refers to a subdevice which does not exist, or beyond the limits of the device. It may also occur when, for example, a tape drive is not online or no disk pack is loaded on a drive.</td>
</tr>
<tr>
<td>7</td>
<td>An argument list longer than 5,120 bytes is presented to a member of the exec family.</td>
</tr>
<tr>
<td>8</td>
<td>A request is made to execute a file which, although it has the appropriate permissions, does not start with a valid magic number.</td>
</tr>
<tr>
<td>9</td>
<td>Either a file descriptor refers to no open file, or a read (respectively writing) request is made to a file which is open only for writing (respectively reading).</td>
</tr>
<tr>
<td>10</td>
<td>A wait was executed by a process that had no existing or unwaited-for child process.</td>
</tr>
<tr>
<td>11</td>
<td>A fork failed because the system’s process table is full or the user is not allowed to create any more processes.</td>
</tr>
<tr>
<td>12</td>
<td>During an exec, a program asks for more space than the system is able to supply. This is not a temporary condition; the maximum space size is a system parameter. The error may also occur if the arrangement of text, data, and stack segments requires too many segmentation registers, or if there is not enough swap space during a fork.</td>
</tr>
<tr>
<td>13</td>
<td>An attempt was made to access a file in a way forbidden by the protection system.</td>
</tr>
<tr>
<td>14</td>
<td>The system encountered a hardware fault in attempting to use an argument of a system call.</td>
</tr>
<tr>
<td>15</td>
<td>Valid block device required for system call.</td>
</tr>
<tr>
<td>16</td>
<td>The requested mount device is busy.</td>
</tr>
<tr>
<td>17</td>
<td>An existing file was mentioned in an...</td>
</tr>
</tbody>
</table>
inappropriate context, such as, link.
18 = An attempt was made to do a link across file systems.
19 = Bad device name for system call.
20 = A nondirectory file was specified where a directory is required, for example, in a path prefix or as an argument to chdir.
21 = An attempt to write on a directory.
22 = Some invalid argument (such as, dismounting a nonmounted device; mentioning an undefined signal in signal or kill; reading or writing a file for which lseek has generated a negative pointer).
23 = The system's table of open files is full, and temporarily no more opens can be accepted.
24 = No process may have more than 20 file descriptors open at a time.
25 = An attempt was made to do a tty type read from a non tty device.
26 = An attempt to execute a pure-procedure program which is currently open for writing (or reading). Also an attempt to open for writing a pure-procedure program that is being executed.
27 = The size of a file exceeded the maximum file size.
28 = During a write to an ordinary file, there is no free space left on the device.
29 = An lseek was issued to a pipe.
30 = An attempt to modify a file or directory was made on a device mounted read-only.
31 = An attempt to make more than the maximum number of links (1000) to a file.
32 = A write on a pipe for which there is no process to read the data. This condition normally generates a signal; the error is returned if the signal is ignored.
33 = A file was left in the "temped" state.
39 = The first access of a block not in a file. This is not an error on writes for regular files but there is for reads.
41 = No more extents exist for an extent file.
42 = A pathname component is too long. The maximum size of a pathname component is 14 characters (not including null character).
43 = No entries left in system tables.
44 = A request for service was made from a driver which does not perform that request.

505 = TV addr is not in the pumpable image.
510 = Text mismatch. Failed SM or CMP module number. This error can also be caused by generic utility breakpoints being in a SM of this type (loaded, standard and basic). Remove all generic utility breakpoints from all SMs (with the CLR:UT, SM=x, UTIL; command) before trying any other program update command. After all breakpoints are removed, re-enter the command that failed with this error message.

515 = TX addr is not in the pumpable image.

520 = Data mismatch.

525 = DATA addr is not in the pumpable image.

530 = This error can be caused by generic utility breakpoints being in a SM of this type (loaded, standard and basic). Remove all generic utility breakpoints from all SMs (with the CLR:UT, SM=x, UTIL; command) before trying any other program update command. After all breakpoints are removed, re-enter the command that failed with this error message.

535 = HASH addr is not in the pumpable image.

540 = Block length in msg is bad.

550 = Lub destination not within buffer.

560 = Activity not consistent with program state.

570 = Hash check of memory returned error.

580 = pusv not consistent with program state.

590 = Transfer vector overwrite complete.

600 = Unexpected data block present for reclaim check.

610 = hashsum address outside of hash table.

620 = Address is not updatable by UP.

625 = Fail to copy text bytes from SMP to DMA type perf.

630 = Not acknowledgment to be returned.

635 = Fail to move bytes from SMP to DMA type perf.

640 = The SM or CMP took a recovery action.

645 = Fail to move bytes SMP to perf - internal error.

650 = Corrupt lub.

660 = Invalid mode.
665 = Failure to communicate with MSGH.
670 = Invalid peripheral update target.
671 = Image not loaded in SM (not an error).
675 = The correct addr map not found.
680 = The SMP addr is not in the pumpable image.
681 = WARNING: POSSIBLE SU PH IMAGE CONTENT PROBLEM. Subset of affected PH(s) went OOS during the APPLY-SOAK interval. BACKOUT of the SU is recommended.
682 = Fail to open a Large Packet Connection.
683 = Fail to send a Large Packet from SMP to PH.
685 = Failure to move bytes from SMP to PI.
686 = The MH is in a degraded state and cannot be updated.
687 = Invalid state encountered during MH update.
688 = Fail to move packet from SMP to PHV/PHA.
690 = No match found in FAT.
695 = Feature not loaded.
696 = Failed to lock optional data region (ODR) for the peripheral image resident in SMP.
697 = ODR lock failed, bad parameters.
700 = Transaction completed only in some SMs or CMPs.
710 = Transaction failed in all SMs or CMPs.
720 = DDswrite() call error.
730 = DDsread() call error.
740 = SM or CMP is operational and not isolated.
741 = Module is operational but skip update.
750 = SM or CMP is operational, but isolated.
752 = CMP is operational but in INIT state.
754 = CMP is operational but in OOS state.
755 = CMP is undergoing a soft switch.
760 = SM or CMP is not operational, such as, growth SM.
765 = IM is in hash error.
770 = Bad MOD ID in module status.
780 = DDstat() return failed.

UPD:UPNM

Software Release: 5E14 and later
Message Class: MAINT
Application: 5,3B
Type: Output

1. FORMAT

[1] UPD UPNM - AUTO BACK-OUT DELAY STARTED

DATA SEGMENT

NAMES CLEARED

2. REASON FOR OUTPUT

To specify an action or provide information outside of the normal field update reporting scheme (through UPD).

Format 1 indicates that the in-core copy of the target process has been overwritten, and the automatic backout delay has started (default is five minutes). Should a phase 1 occur before the delay period completes, the update will be backed out, leaving the update in a pending temp state. A continue may be requested.

Format 2 is provided when a killable kernel processes (KPUPDATE) feature is the target process and a named data segment has been encountered (the name is included in the SDE for the segment, located in the kernel’s address space). Normally, any (text) segment DUFR attaches to will have its name cleared to prevent inconsistencies should the target process die. For named data segments, DUFR will attach to the segment and see that it is overwritten, but the name will NOT be cleared.

Format 3 is given to inform the user that during an update on a KPUPDATE type process, one or more (text) segment names were cleared.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTION TO BE TAKEN

Format 1 tells the user to begin any sanity testing before the update is made temporary, in case sanity degrades to the point where a backout cannot be made manually.

Format 2 informs the user of the named data segments, as there now is added risk of data inconsistencies if the target process dies and is recreated during update.

For Format 3, the user should be aware of the situation in case the target process’ segment name is important to other application programming. Otherwise, the warning may be ignored.

Input Message(s):

UPD: APPLY-BYTER

UPD: APPLY-FUNCR
UPD:UPREPT

Software Release: 5E14 and later
Message Class: MAINT
Application: 5
Type: Output

1. FORMAT

UPD UPREPT a
b
[c]
[PATHNAME: f]
[VALUES g]
[TAG=d ERRNO=e]

2. REASON FOR OUTPUT

To specify errors or events that occurred as a result of performing a software update activity.

3. VARIABLE FIELD DEFINITIONS

a = Category of the report message. Valid value(s):
INFORMATION = Informational message associated with a software update activity.
SYSTEM ERROR = System error encountered during a software update activity.
USER ERROR = User error encountered attempting to execute a software update command. Most often the result of bad input to the command.
WARNING = A non-fatal problem was encountered while executing a software update activity that did not cause the command to abort, but may require attention.

b = A brief text phrase describing an error or providing information associated with a software update activity.

c = The SU name associated with the report message.

d = A tag value which indicates the location where the error message originated from.

e = A UNIX® system error number.

f = Pathnames of the files associated with this report. There is one pathname per line.

g = Values associated with the text message in variable 'a'. There are four values per line. These provide the data which caused the text message to be printed.

4. ACTION TO BE TAKEN

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>INFORMATION</td>
<td>No action is necessary.</td>
</tr>
<tr>
<td>SYSTEM ERROR, USER ERROR, or WARNING</td>
<td>The specific action required depends on variable 'b' in the message. Most of these reports require technical assistance, however, some can be corrected and are listed below alphabetically. If these actions do not succeed, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
</tbody>
</table>
If PUMP IS ACTIVE CANNOT PERFORM UPDATE is output, retry command again once all SM and CMP pumps have completed.

6. REFERENCES

Input Message(s):

- UPD:APPLY-BYTER
- UPD:APPLY-FILER
- UPD:APPLY-FUNCR

Other Manual(s):
235-105-210  Routine Operations and Maintenance
UPD: UPSURECV

Software Release: 5E14 and later
Message Class: MTCE
Application: 5,3B
Type: Output

1. FORMAT

[1] UPD UPSURECV a
______________________________
[2] UPD UPSURECV ERROR b
______________________________

2. REASON FOR OUTPUT

To report status and error messages from the 5ESS® switch UPsurecv process when trying to communicate with an administration service module (ASM) UPsuxfer process. For an ASM office, a BWM may be delivered from a 5ESS® switch to an ASM.

3. VARIABLE FIELD DEFINITIONS

a = Error message. Valid value(s):
   — BWM c ABORTED
   — BWM c COMPLETED
   — MEMORY ALLOCATION FAILED

b = Error message. Valid value(s):
   — CANNOT ENABLE MESSAGE RECEPTION
   — CANNOT RECEIVE MESSAGE FROM UPSUXFER d
   — CANNOT SEND MESSAGE TO UPSUXFER d
   — SEND MESSAGE TO e FAILED d

c = Name of BWM.

d = The system error number. Valid value(s):
   1 = Time out waiting to receive message.
   -20 = Failed to send or receive message.
   -22 = Time out waiting for a message of the desired type.
   -30 = Unexpected message size.
   -32 = No message to be received.
   -33 = Not connected to port.
   -36 = No message in queue.
   -38 = Signal interrupted a DMERT system call.
   -39 = Process ID (PCRID) out of range.
   -45 = Specified port number is out of range.

e = Process name. Valid name(s):
   — SUFILERCV
   — UPFILERCV
   — UPVERIFY
4. ACTIONS TO BE TAKEN

If the process aborts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

6. REFERENCES

Input Message(s):

UPD:VFY
UPD:USRERR

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

UPD USRERR={a|b} [c] [d]

2. REASON FOR OUTPUT

To indicate that the user has made an error in a field update input. These errors are always the result of an invalid parameter on a UPD message. The invalid input message is identified by a specific UPD output message following one or more UPD:USRERR output messages.

3. VARIABLE FIELD DEFINITIONS

a = Error code. Refer to Exhibit A.
b = Text string describing outcome. Valid value(s):
   94XX, UCL or 9310, UCL ONLY
   ALL OPTION IS NOT PERMITTED FOR OFFICIAL BWMS
   BACK OUT OF OFFICIAL UPDATES REQUIRES OFLTAG FOR BWM
   BACK OUT SECTION COMPLETED
   BACK OUT SECTION HAS NO EXECUTABLE COMMANDS
   BAD DISPLAY TYPE c
   BAD TYPE ARGUMENT c
   BWM c DOES NOT EXIST
   BWM DIRECTORY DOES NOT EXIST
   BWM NAME REQUIRES 10 CHARACTERS
   COMMAND INPUT NAME DOES NOT MATCH A BOLO NAME
   Cud DOES NOT NEED TO BE REDUCED / PTLD TAG WILL RESET SEQUENCE NUMBER TO ZERO
   Cud DOES NOT NEED TO BE REDUCED
   DEPENDENT FILE MUST BE GIVEN ON COMMAND LINE
   EMULATOR UPDATE HAS BEEN APPLIED WITHOUT AN INITIALIZATION
   DF c IS OFFICIAL, FN d IS STILL TEMPORARY
   INVALID TARGET NAME c
   MAXIMUM NUMBER OF ADDRESS-DATA COUPLETS EXCEEDED
   MAXIMUM NUMBER OF UPDATE FILES EXCEEDED
   MISMATCH OF NEW/OLD ADDRESS-DATA COUPLETS
   MISMATCH OF PERIPHERAL TARGET AND DF FILE
   NO MSGS FILE FOUND FOR UPNM=c
   NOT ENOUGH SPACE ON DEVICE c REQUESTED d
   PACKINFO FILE NEEDED
   PUMPbwm/PumpOFC CALLED WITH ILLEGAL TARGET:c
   THE FOLLOWING COMMAND IS INCONSISTENT
   THE FOLLOWING COMMAND IS NOT COMPLETELY INSTALLED
   THE NEXT BWM THAT CAN BE BACKED OUT IS c
   THERE ARE NO OFFICIAL UPDATES

c, d = Additional data; can be a path name, software update name, address, etc., used to help more...
clearly identify the problem indicated by the error code. Refer to Exhibit A.

4. ACTIONS TO BE TAKEN

The specific action required depends on the type of the error that occurred. An invalid update name (UPNM) or pathname [update file (UF) or file name (FN)] will most often be the cause. When applying a temporary software update, if the UPNM or pathname is invalid, refer to data field 135. In such a case, reapplying the input message with the correct update name or pathname will solve the problem; otherwise, obtain technical assistance.

In some cases (codes 9, 11, and 12), re-specifying the input message with the new release (NREL) keyword will override the file consistency checks that caused the UPD message to be STOPPED.

Table 1  Exhibit A
ERROR CODES AND THEIR MEANINGS

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>Explanation:</th>
<th>c' =/d' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>No updates exist in the system.</td>

<tr>
<td>2</td>
<td>No updates with the specified update name (UPNM) exist in the system.</td>
<td>c = unknown UPNM name</td>
</tr>
<tr>
<td>3</td>
<td>No updates to the specified file name (FN) path exist in the system.</td>
<td>c = FN path</td>
</tr>
<tr>
<td>4</td>
<td>No temporary updates exist in the system.</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>No temporary updates with the specified UPNM name exist in the system.</td>
<td>c = the UPNM name</td>
</tr>
<tr>
<td>6</td>
<td>No permanent updates exist in the system.</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>A pathname for a file that does not exist was supplied in the FN keyword field of an input message.</td>
<td>c = the erroneous pathname</td>
</tr>
<tr>
<td>8</td>
<td>A pathname for a file that does not exist was supplied in the update file (UF) keyword field of an input message.</td>
<td>c = the erroneous pathname</td>
</tr>
<tr>
<td>9</td>
<td>The name of an existing UPNM was supplied on a UPD:APPLY input message after a UPD:APPLY input message naming another UPNM name was entered. Refer to the UPD:UPNM input message description.</td>
<td>c = the erroneous UPNM name</td>
</tr>
<tr>
<td></td>
<td>Error occurred when closing the history file while checking the temp updates.</td>
<td>c = the filename</td>
</tr>
<tr>
<td>10</td>
<td>There are temporary updates still outstanding for the new release (NREL) process.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Can't open file for reading.</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>No pfiles are ready for auditing.</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>The UPNM named is not the next UPNM that can (and therefore must) be made permanent. Refer to the UPD:DISPLAY input message for information on how to determine the UPNM of the oldest temporary update outstanding.</td>
<td></td>
</tr>
<tr>
<td>13</td>
<td>The file named by the FN keyword is a killable file and already has a temporary update applied to it. Therefore, the old temporary update must either be backed out or made permanent before this new update may be applied.</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td>The FN filename 'c' must be different from the UF filename.</td>
<td></td>
</tr>
<tr>
<td>15</td>
<td>Common object file format (COFF)/ non-COFF file mismatch encountered during an attempt to do file replacement, where 'c' names the non-COFF file. If no spelling error occurred, the NREL keyword may be used to override this restriction.</td>
<td></td>
</tr>
<tr>
<td>16</td>
<td>The file named 'c' either doesn't exist, has a bad pathname component, or doesn't provide access permission.</td>
<td></td>
</tr>
<tr>
<td>17</td>
<td>There was an attempt to do function replacement on a nonexistent file 'c'.</td>
<td></td>
</tr>
<tr>
<td>18</td>
<td>Magic number (signifying processor type) mismatch</td>
<td>c = FN in hex notation</td>
</tr>
</tbody>
</table>
encountered during attempt to do file replacement or function replacement. The magic numbers of the FN and UF, respectively, are shown in hexadecimal notation in variable ‘c’ and variable ‘d’. An NREL keyword override may be used.

19 There was an attempt to do function replacement on a non-COFF file named ‘c’.

20 The software update name ‘c’ has been used; a permanent update already exists on the system with that name.

21 The software update name ‘c’ is smaller than the last software update name used ‘d’.

22 Updates applied using the general form of the Software update name - TMPyy-xxxx cannot be made permanent.

23 No update inconsistencies found while using UPD:RCVRY(BKWD|FRWD).

24 Previous update is at temporary state; make it official first.

25 Previous patch space reclamation failed.

26 Inconsistencies found while using the UPD:RCVRY (BKWD|FRWD) message cannot be recovered from.

30 Software update ‘c’ is out of sequence ‘d’, where ‘d’ is either HDR or SEQ, and indicates the source of the sequencing error.

31 Cannot use manual input messages for software update ‘c’.

32 User requested temporary pump map to be used by pump during an SM initialization when a temporary pump map didn’t exist.

34 Bad PACKINFO file format.

35 Bad loadable package name in the PACKINFO file.

36 The number of minimal files (.m) exceeds the maximum number allowed.

37 Configuration number in the CMP ODD relation SMCONF is incorrect.

38 The number of byte replacements exceeds the maximum number allowed.

39 Bad configuration name in the PACKINFO file.

40 A request was made to print, change or abort the soak timer for a software update that does not exist or has completed the SOAK section. If software update equals 75, the soak section must be executed before the soak timer is set.

41 Soak period not complete.

42 The software update displayed on the 1960 page is not the same software update that is being soaked. On the 1960 page enter 9000,<soak-bwmname> then re-execute the previous poke.

43 A request to change the soak timer is within 30 seconds of the soaking software update’s completion.

50 The software update name on the input message line for backing out an official software update does not match the software update name which is permitted to be backed out. Use the 9103 poke on the 1950 page to determine if any temporary software updates are in the system or the 9102 poke to determine the last official software update name which is permitted to be backed out. Back out any temporary software updates before backing out the official software update.

51 The last official software update ‘c’ does not match the software update ‘d’ supplied on the input message line. Follow the same procedure in 50 to determine the last official software update which is permitted to be backed out.

52 The software update is still temporary. None of the update transactions have been made official. Use the 9340 poke on the 1960 page to back out temporary software updates.

53 A reclamation of patch space has failed for file ‘c’. The patch
space reclamation must be completed for file 'c' before the official software update can be backed out.

75  File .status does not exist in /etc/bwm/.....
80  Bad software update name.
105 Invalid temp file format 'c'.
135 Message file has a BAD or unexpected format.
165 Software update is not made official.
170 The Program Updates data base does not list any official software updates which are permitted to be backed out. Use the 1950 page to display current software updates in the system.
175 The .status file used to update the 1960 page indicates that the software update is official or back out status is not correct for backing the software update out.

307  File replacement class is too large.
318  Bad input file.
1000 Activation failed for target file because it is not in the correct state.
1001 Could not find fn path in Cud to activate.
1003 Could not deactivate target file because it is not in the correct state.
1005 Software Update cannot be deactivated while pumpbwm is active. Run the pumpofc command and then retry deactivation.
1006 pumpbwm cannot be executed while some SU targets are not fully active.
1011 History status field indicates a temp file is inconsistent.
1012 A stat of the file indicates that the file is not temp'ed.
1013 A ufile needed to activate or deactivate a target is missing.
1014 A make official transaction requires all Cud item to be active. The fnpath indicates that this target is NOT active.
1015 SU was requested to be backed out, but it is not the last SU which was installed. SU's must be backed out in the reverse order in which they were applied.
1025 A general purpose failure code followed by a text string identifying the problem.

5. ALARMS
None.

Type: Output

1. FORMAT

UPD VERSION {APPLY|BKOUT} [MISMATCH]
PARTITION VERSION BW M
a b c
. . .
. . .
. . .

2. REASON FOR OUTPUT

To respond to the input message UPD:VERSION.

3. VARIABLE FIELD DEFINITIONS

APPLY = The input message used the APPLY keyword.
BKOUT = The input message used the BKOUT keyword.
MISMATCH = The applied or backed out generic text version and/or software update level does not logically follow from the current generic text versions and/or software update levels.

a = Partition name. The pseudo-partition name APPLY or BKOUT refers to the generic text string specified in the UPD:VERSION input message. The pseudo-partition ECD refers to the 'systype' and 'genid' items from the 'eaiopt' form in the equipment configuration database.
b = Generic text version of this partition.
c = Software update level of this partition. The ECD partition does not have a software update level.

4. ACTION TO BE TAKEN

If a mismatch was indicated, check that the generic text specified on the last UPD:VERSION input message was correct. If incorrect, re-enter with correct information. If it was correct, then check and correct, if need be, the items 'systype' and 'genid' on the 'eaiopt' form using ECD recent change. The key is 'option_name: eaiop0'.

    SEEK TECHNICAL ASSISTANCE

    i
    [j]
    k
    UPD VFY j
2. REASON FOR OUTPUT

To report the progress of the UPD:VFYBWM input message.

Format 1 is printed to indicate the status indicated in 'c' of the verify process for the software update indicated in 'b' with the sequence number indicated in 'a' or the software update range indicated in 'g'.

Format 2 is printed to indicate that the vexpand process is running to recreate product files using the delta file and the official product file. This process can be timely depending on the size and the number of products files to be recreated.

Format 3 is printed to indicate the status of the command at termination time.

Format 4 is printed to indicate an error in the system call indicated in 'd' with the error number indicated in 'e'.

Format 5 is printed to indicate that the software update indicated in 'b' is not completely expanded and the return code is indicated 'f' could not be fully expanded.

Format 6 is printed to indicate that the process failed to send or receive a message from the UPexpand process with the failure code indicated in 'f'.

Format 7 is printed to indicate a failure due to the message reception.

Format 8 is printed to indicate that the software update either has no .office file included with the software update package or it has more that one such file. The .office file indicates the specific office that the update should be applied to.

Format 9 is printed to indicate that an office specific software update is being applied to the wrong office.

Format 10 is printed to indicate that the file indicated in 'h' incurred a failure during the VEXPAND process. The software update package includes some delta files that are to be expanded as a part of the verify process. This portion of verify runs the vexpand process which recreates the update product using the delta file and the official product on the switch.

3. VARIABLE FIELD DEFINITIONS

a = Sequence number found in the header file of the software update.

b = Software update name.

c = Error code. Valid value(s):
  0 = The software update has passed all tests and is considered valid.
  1 = Either the software update given as an input parameter or the source directory is inaccessible.
  2 = The software update specified does not have a HDR file within it's directory.
  3 = An error was found within the header (HDR) file (that is, missing keyword or invalid data field).
  4 = One of the update files within the software update directory was calculated to have a byte size or check sum value different from the values stated in the HDR file.
  5 = An error occurred during the UPvlymsgs process. The name of the file being processed at the time is stored in BadFile.
  6 = This is a special case used with unofficial software updates (that is, the name does not begin with BWM). This does not indicate that an error has occurred, only that there will be no HDR file check.
7. The release information read from the HDR file does not match the information read from the equipment configuration database (ECD).

d. Failed system call or text string. Valid value(s):
   - CALLOC
   - CREATE
   - ERROR COUNT EXCEEDED
   - FFLUSH
   - FOPEN
   - I/O
   - OPEN
   - SYSTEM

e. System error code number. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual for definitions.

f. The return code of the failed library function call.

g. The official software update range in the form of 000000-999999, where this software update must be greater than 000000 and less than 999999.

h. The full path name of the product to be vexpanded.

i. Messages from the field update processes. These messages may contain information about the progress of an update or report an error encountered while processing the update. Error messages fall into six categories. Valid value(s):
   - COFF ERROR = An error occurred in the internal format of a file.
   - DATABASE ERROR = An error occurred in the data base.
   - FILESYS ERROR = An error occurred in the file system.
   - INTERNAL ERROR = An error was found by the field update code.
   - SYSTEM ERROR = A system error occurred.
   - USAGE ERROR = An error occurred using field update.

j. UNIX® system error call number.

k. Termination mode of the input message. Valid value(s):
   - ABORTED = The request terminated with errors.
   - COMPLETED = The request was fulfilled successfully.

4. ACTIONS TO BE TAKEN

If OK is printed along with error code 0 or 6, no action is to be taken. However, if NG (no good) is printed, take action according to the error code listing in variable 'c'. If a product was corrupted during the vexpand process, more information about the failure can be obtained by reading the .chksum file in the software update directory. For all other error indications or if a message aborts, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

[REMOVE/RESTORE INCONSISTENT PERIPHERALS]

[3] UPD VFYCON h

2. REASON FOR OUTPUT

To report all update inconsistencies in response to a UPD:VFYCON input message. Inconsistencies, as a rule, are associated with temporary updates in the system. In the case of SM pumpable peripherals, however, inconsistencies can be associated with the official file when there are no temporary updates for that peripheral.

Format 1 is printed when inconsistencies exist to list information on each inconsistency.

Format 2 is printed if there are no inconsistencies in the system.

Format 3 is printed to report the status of the UPD:VFYCON input message.

3. VARIABLE FIELD DEFINITIONS

a = The target, if the target option was used. Valid value(s):
   AM = Administrative module.
   CMP = Communications module processor (CMP) application processor.
   DDMA = The diagnostic image for the PH2 direct memory access processor.
   DNUSCC = Digital networking unit - SONET (DNU-S) common control (CC).
   DNUSTMX = Transmission multiplexer image.
   DSC3 = Digital service circuit - model 3 diagnostic image.
   GDSF = Global digital services function - model 3.
   HDSU = Digital service unit 2 (DSU2) hardware digital service unit (HDSU) diagnostic (DGN) image.
   HSAS = DSU2 service announcement system (SAS) diagnostic image.
   IDCUCCP = Integrated digital carrier unit (IDCU) common control processor (CCP).
   IDCUDLP = IDCU data link processor (DLP).
   IDCULSI = IDCU loop side interface (LSI).
   IP4I = The operational image for the PH4 integrated services digital network (ISDN) input/output processor.
   ISLU = Integrated services line unit (ISLU) CC.
ISLU2 = Integrated services line unit 2 (ISLU2) CC.
ISTF = DSU2 integrated services test function (ISTF).
LDSF = Local digital services function - model 3.
LDSU = DSU2 local digital service unit (LDSU) function.
MSGH = CMP message handler.
ODMA = The operational image for the PH2 direct memory access processor.
OIOP = The operational image for the PH3 input/output processor.
PI = Module control time slot interchange (MCTSI) packet interface (PI).
PH3C = Packet switching unit (PSU) protocol handler 3 (PH3) with COMMON application processor image.
PH2A = PSU PH2 with ACCESS application processor image.
PH2G = PSU PH2 with GATEWAY application processor image.
PH4I = Packet switching unit (PSU) protocol handler 4 (PH4) with ISDN application processor image.
RAF = DSU2 recorded announcement function (RAF).
SAS = DSU2 SAS operational image.
SM = Switching module
SMPMH32 = Switching module processor (SMP) message handler 32 (MH32) operational image.
SMPMHEIB = SMP message handler EIB (MHEIB) operational image.
SMPMHLPB = SMP MH little boot (LB) image.
SMPMHPPC = SMP message handler power PC (MHPPC) operational image.
SMPMHPPCLB = SMP MHPPC little boot (MHPPCLB) image.

b = Software update name (that is, UPNM=update name), or official file name (such as, LDSU.out) if a pumpable peripheral inconsistency has been generated against the official file rather than a software update in the temporary state.
c = Update number.
d = Type of inconsistency. Valid value(s):
1 = The indicated processor does not contain the indicated temporary update even though it is shown in the update records as having been applied.
3 = A temporary switching module (SM) update has been installed but at least one of the associated temporary files in /update is missing.
4 = An entry in the update records has been garbled or is missing history file entries.
5 = The resident switching module processor (SMP) image associated with the indicated pumpable peripheral type does not contain the indicated update, even though it is shown in the update records as having been applied.
6 = The resident SMP image AND the pumpable peripheral(s) associated with the indicated processor type do not contain the indicated update, even though it is shown in the update records as having been applied.
7 = The pumpable peripheral(s) associated with the indicated processor type do not contain the indicated update, even though it is shown in the update records as having been applied, and the peripheral's SMP resident image contains the update.
8 = The update file or product file needed to back out an official software update is missing. It is not possible to recover from this type of inconsistency and the official software update can not be backed out using the 9900 poke on the 1950 menu page. This inconsistency type does not prevent recovery from other types of inconsistencies and does not prevent subsequent software updates from being made official. Once a subsequent software update is made official and all the files needed to back out that software update are available, the inconsistency is
removed by default.
9  = The patch count values in the text optioned images with temporary updates do not match.
10 = The patch count values in the text optioned images do not match. This type of inconsistency is not recoverable.
14 = Unable to lock the peripheral resident image in optional data regions (ODR).
15 = Attempts to communicate with the administrative workstation was not successful. This type of inconsistency is not recoverable.

= Affected processor. Valid value(s):
   AM = Administrative module.
   CMP [=x-y, z] = CMP application processor, where 'x' is the message switch side, 'y' is the CMP number and 'z' is either PRIME or MATE when the indicated inconsistency applies to a specific CMP.
   DNUSCC:SM[x] = DNU-S CC image where 'x' is the SM number when the indicated inconsistency applies to a specific SM's DNU-S(s) or an SM's SMP-resident DNU-S CC image.
   DSC3-DSC3:SM[x] = Digital service circuit - model 3 (DSC3) hardware digital service circuit (DSC3) diagnostic image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's LDSF or global digital services function (GDSF).
   DSC3-GDSF:SM[x] = DSC3 GDSF image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's GDSF.
   DSC3-LDSF:SM[x] = DSC3 local digital services function (LDSF) image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's LDSF.
   DSC4-LDSF:SM[x] = DSC4 local digital service function (LDSF). Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident LDSF image.
   DSU2-DGN:SM[x] = DSU2 diagnostic image. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident DGN image.
   DSU2-HDSU:SM[x] = DSU2 HDSU diagnostic image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's SMP-resident HDSU image.
   DSU2-HSAS:SM[x] = DSU2 service announcement system (HSAS) diagnostic image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's or an SM's SMP-resident HSAS image.
   DSU2-ISTF:SM[x] = DSU2 ISTF, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's ISTF(s) or an SM's SMP-resident ISTF image.
   DSU2-LDSU:SM[x] = DSU2 local digital service unit (LDSU) function, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's LDSU(s) or an SM's SMP-resident LDSU image.
   DSU2-RAF:SM[x] = DSU2 recorded announcement function (RAF), where 'x' is the SM number when the indicated inconsistency applies to a specific SM's RAF(s) or an SM's SMP-resident RAF image.
   DSU2-SAS:SM[x] = DSU2 SAS operational image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's SAS(s) or an SMP-resident SAS image.
   IDCU-CCP:SM[x] = IDCU CCP, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's IDCU CCP(s) or an SM's SMP-resident IDCU CCP image.
   IDCU-DLP:SM[x] = IDCU DLP, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's IDCU DLP(s) or an SM's SMP-resident IDCU DLP image.
   IDCU-LSI:SM[x] = IDCU loop side interface (LSI), where 'x' is the SM number when the indicated inconsistency applies to a specific SM's IDCU LSI(s) or an SM's SMP-resident
ISLU-CC:SM[x] = ISLU CC, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's ISLUCC(s) or an SM's SMP-resident ISLU image.

ISLU2-CC:SM[x] = ISLU2 CC, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's ISLU2CC(s) or an SM's SMP-resident ISLU2 image.

MCTSI-MH32:SM[x] = MCTSI switching module processor message handler 32 operational image (MH32), where 'x' is the SM number when the indicated inconsistency applies to a specific SM's MH32 or an SM's SMP-resident MH32 image.

MCTSI-MHEIB:SM[x] = MCTSI switching module processor message handler EIB operational image (MHEIB), where 'x' is the SM number when the indicated inconsistency applies to a specific SM's MHEIB or an SM's SMP-resident MHEIB image.

MCTSI-MHLB:SM[x] = MCTSI switching module processor MHLB image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's SMP-resident MHLB image.

MCTSI-MHPPC:SM[x] = MCTSI switching module processor message handler power PC operational image (MHPPC), where 'x' is the SM number when the indicated inconsistency applies to a specific SM's MHPPC or an SM's SMP-resident MHPPC image.

MCTSI-MHPPCLB:SM[x] = MCTSI switching module processor MHPPCLB image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's SMP-resident MHPPCLB image.

MCTSI-PI:SM[x] = MCTSI PI, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's PI or an SM's SMP-resident PI image.

MSGH[=x-y,z] = CMP message handler, where 'x' is the message switch side, 'y' is the CMP number and 'z' is either PRIME or MATE when the indicated inconsistency applies to a specific CMP.

PSU-PH3C:SM[x] = PSU PH3 with COMMON application processor image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's PH3(s) or an SM's SMP-resident PH3C image.

PSU-PH2A:SM[x] = PSU PH2 with ACCESS application processor image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's PH2(s) or an SM's SMP-resident PH2A image.

PSU-PH2G:SM[x] = PSU PH2 with GATEWAY application processor image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's PH2(s) or an SM's SMP-resident PH2G image.

PSU-PH4I:SM[x] = PSU PH4 with ISDN application processor image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's PH4(s) or an SM's SMP-resident PH4I image.

PSU-IP4I:SM[x] = The operational image for the PH4 input/output processor, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's PH4(s) or an SM's SMP-resident IP4I image.

PSU-OIOP:SM[x] = The operational image for the PH3 input/output processor, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's PH3(s) or an SM's SMP-resident OIOP image.

PSU-ODMA:SM[x] = The operational image for the PH2 direct memory access processor, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's PH2(s) or an SM's SMP-resident ODMA image.

PSU-DDMA:SM[x] = The diagnostic image for the PH2 direct memory access processor, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's SMP-resident DDMA image.

PSU-IP4F:SM[x] = Operational image for the input/output processor on the PSU PH4 frame relay protocol handler. Where 'x' is the SM number. When the indicated inconsistency
applies to a specific SM's PH2(s) or an SM's SMP-resident IP4F image.

PSU-PHV1C:SM[x] = Protocol handler for voice, where 'x' is the SM number When the indicated inconsistency applies to a specific SM's or an SMP-resident PHV1C image.

PSU-PHA1A:SM[x] = Protocol handler for asynchronous transfer mode (ATM). Where 'x' is the SM number When the indicated inconsistency applies to a specific SM's or an SMP-resident PHA1A image.

PSU-PHA2A:SM[x] = Protocol handler for ATM model 2. Where 'x' is the SM number When the indicated inconsistency applies to a specific SM's or an SMP-resident PHA2A image.

PSU-PHE2E:SM[x] = Protocol handler for ethernet. Where 'x' is the SM number When the indicated inconsistency applies to a specific SM's or an SMP-resident PHE2E image.

PSU-IP4IF:SM[x] = The operational image for the input/output processor on the PSU PH4 ISDN. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident IP4IF image.

PSU-PH3S:SM[x] = Packet switching unit (PSU) protocol handler 3 (PH3) Where 'x' is the SM number When the indicated inconsistency applies to a specific SM's or an SMP-resident PH3S image.

PSU-IP3S:SM[x] = The operational image for the input/output processor on the PSU PH3 ISDN for common channel signalling. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident CC2 image.

PSU-DSP8K:SM[x] = 8k digital signal processor (DSP) on PHV3. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident DSP8K image.

PSU-DSP13K:SM[x] = 13K DSP on PHV3. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident DSP13K image.

PSU-PHV3C:SM[x] = Packet switching unit (PSU) protocol handler for voice 3 (PHV3) loaded with the COMMON image. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident PHV3C image.

PSU-PHV4C:SM[x] = Packet switching unit (PSU) protocol handler for voice 4 (PHV) loaded with the COMMON image. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident PHV4C image.

PSU-V4D8K:SM[x] = 8K DSP on PHV4C. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident PHV4C image.

PSU-V4D13K:SM[x] = 13K DSP on PHV4C. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident PHV4C image.

PSU-DDMA:SM[1] = Diagnostic image for the direct-memory-access processor on the PSU PH2. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident DDMA image.

PSU-DSPEVRC:SM[x] = EVRC DSP for CDMA protocol handler for voice. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident DSPEVRC image.

PSU-V3DACF:SM[x] = ACELP DSP for TDMA protocol handler for voice. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident V3DACF image.

PSU-V3DVSP:SM[x] = VSELP DSP for TDMA protocol handler for voice. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP-resident V3DVSP image.

PSU-D4VDVERC:SM[x] = EVRC DSP, for CDMA protocol handler for voice version 4. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an
SMP - resident V3DVSP image.

PSU-D4VDVERC:SM[x] = EVRC DSP, for CDMA protocol handler for voice version 4. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident D4VDVERC image.

PSU-V4DACP:SM[x] = ACELP DSP, for TDMA protocol handler for voice version 4. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident V4DACP image.

PSU-V4DVSP:SM[x] = VSELP, DSP, for TDMA protocol handler for voice version 4. Where 'x' is the SM number. When the indicated inconsistency applies to a specific SM's or an SMP - resident V4DVSP image.

SM[x] = Switching module, where 'x' is the SM number when the indicated inconsistency applies to a specific SM.

TMUX:SM[x] = TMUX image, where 'x' is the SM number when the indicated inconsistency applies to a specific SM's TMUX(s) or an SM's SMP-resident TMUX image.

f = Pumpable peripheral status. Valid value(s):
   INCONSISTENT = The indicated pumpable peripheral image is inconsistent with the updated disk image.
   NO REPLY = Failure to communicate with the indicated pumpable peripheral. Consistency status uncertain.
   NO RESOURCE = Failure to acquire the resource necessary to perform the consistency check. Consistency status uncertain.

g = Unit name of the peripheral. Valid value(s):
   DNUSCC=i-j-o
   GDSF=i-j
   IDCU=i-j-k
   ISLUCC=i-j-l
   ISLU2CC=i-j-l
   ISTF=i-j
   LDSU=i-j-k
   LDSF=i-j
   PSUPH=i-0-m-n
   RAF=i-j
   SAS=i-j
   TMUX=i-j-p-q

h = Message status. Valid value(s):
   ABORTED = The UPD:VFYCON input message aborted prematurely.
   COMPLETED = The UPD:VFYCON input message has completed normally.
   IN PROGRESS = The UPD:VFYCON input message is starting.

i = SM number.

j = Unit number.

k = Service group.

l = ISLU CC number.
4. ACTIONS TO BE TAKEN

If UPD_VFYCON COMPLETED—NO INCONSISTENCIES FOUND IN THE SYSTEM prints, the system has been verified to be completely consistent and no action need be taken.

If ‘d’ equals 1, 3, ... 15, take action to restore consistency. The normal recovery actions are to roll forward or roll backward the current temporary updates using a UPD:RCVRY input message. This action will not recover from type 7, 8, 10 or 15 inconsistencies.

For a type 7 inconsistency, remove and restore the inconsistent peripherals manually, or refer to the UPD:PMPPERF input manual page.

5. ALARMS

None.

2. REASON FOR OUTPUT

To alert the operations personnel of abnormal situations within the switch. The presence of a warning message
does not halt the software update application process.

Format 1 is printed to indicate backup update database (BUD) file corruption. This can cause the UPD:DISPLAY
output message to print incorrect information. Technical support should be consulted in any instance of this
message.

Format 2 is printed when the switching modules (SMs) are being pumped or the office is undergoing initialization.
Database primitives listed in 'a' have returned with the error code listed in 'b'.

Format 3 is printed when there is a failure operation as indicated in 'c' for the SM or communications module
processor (CMP) listed in 'd'.

Format 4 is printed when the file listed in e should be created as a contiguous file, but the file system cannot allocate
the space required to make this file contiguous.

Format 5 is printed when there is a failure to allocate all the space requested.

Format 6 is printed when inconsistencies exist that could cause generic program mismatches.

Format 7 or 8 is printed when inconsistencies exist that could cause generic program mismatches.

Format 9 is printed when an error as indicated in 'e' is encountered during an attempt to remove a file as indicated in
'e'. This file has to be manually removed.

Format 10 is printed when file space is critically overloaded. Refer to the UPD:REDUCE input message.

Format 11 is printed when an inconsistency is detected with the error as indicated in 'f' for the file indicated in 'e'
and dependent file indicated in 'g'.

Format 12 is printed when some or all of the affected SMs or communication module processors (CMPs) were not
updated.

Format 13 is printed when the mate module control time slot interchanger (MCTSI) is not in a stable state to be
forced. This usually occurs when the SM is in a transient state. A later re-try usually will succeed.

Format 14 is printed when the mate MCTSI is in a state other than standby, for example out-of-service (OOS).

Format 15 is printed when the software update process detects that an SM is already in the forced state and
therefore does not attempt further processing with that SM.

Format 16 is printed when the software update process detects that an SM has a hash sum error and therefore
does not attempt further processing with that SM.

Format 17 is printed when a software update is being verified, and the check sum value in the HDR file differs from
the check sum value that was calculated when the file was being uncompressed.

3. VARIABLE FIELD DEFINITIONS
a = Name of faulted function. Valid value(s):
   DBlopnrel
   DB1rdfst
   DB1rdnxt
   DBluplinmsg
   DB1xbgtrn

b = Error code returned from the database relation listed above.

c = Failed operation. Valid value(s):
   OPEN AN ENTRY
   READ AN ENTRY
   RECEIVE MESSAGE FROM
   SEND A MESSAGE TO

d = SM or CMP number.

e = File pathname.

f = Error number.

g = Dependent file pathname.

4. ACTION TO BE TAKEN

The specific action required depends on the type of warning message printed.

If UPD OFC IGNORING INCONSISTENCIES is printed, the UPD:VFYCON input message should be used. Refer to the UPD:VFYCON output manual page for the appropriate action to be taken.

If a warning is printed that indicates that the check sum values are being recalculated, no action is to be taken.

For all other warnings follow the instructions given. If no instructions are given, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

None.

Type: Output

1. FORMAT

VFY AUTH
TERM: a       AUTHORITY LEVEL: b       [USER: c]
[d] [d] [d] [d] [d]
.    .    .    .    .
.    .    .    .    .
.    .    .    .    .

2. REASON FOR OUTPUT

To report the result of a VFY:AUTH input message.

The following authority information for the current terminal session is provided: authority level, terminal identity, person (user) identity, and command groups permitted. If a user identity and password was not required for system access, then a user identity is not available and therefore not displayed. If the authority level is 'n' (none), then open permission is implied and no command groups are displayed.

This output message is associated with maintenance interface security. Refer to the Routine Operations and Maintenance manual for further information.

3. VARIABLE FIELD DEFINITIONS

a = Terminal identity as defined by the ADD:TAUTH input message.

b = Authority checking level. Valid value(s):
n = Authority checking is not in effect
t = Terminal level authority checking is in effect
u = User level authority checking is in effect

c = Person identity as defined by the ADD:PAUTH input message. This is displayed only if the user provided a login and password for system access.

d = Permitted command group. Valid value(s):

### 2. REASON FOR OUTPUT

To indicate the results of a VFY:CPU input request for reporting all the lines associated with either directed call pickup with and without “barge-in” or all lines with a specific call pickup group. Each group report is dedicated to listing lines having a single group number. If other CPU groups are found for the line, the additional group information will also be provided on the report line.

Formats 1 and 2 are call pickup group reports and Formats 3 and 4 are directed call pickup reports. Formats 1 and 3 are sorted by MLHG member number while Formats 2 and 4 are sorted by TN. Only one format is used per query.

### 3. VARIABLE FIELD DEFINITIONS

- **a**  
  = MLHG member number.

- **b**  
  = Telephone number (TN).
4. ACTION TO BE TAKEN

The purpose of this message is to report the result of the action requested by the corresponding manually requested input message. No specific action is indicated.

5. ALARMS

None.

[31] VFY FILE CANNOT OPEN PIPE TO a
2. REASON FOR OUTPUT

Formats 1 through 5 are printed to inform the user of the message’s status.

Formats 6 through 37 are printed to inform the user of various problems which the VFY:FILE message has encountered.

3. VARIABLE FIELD DEFINITIONS

a = Name of the file for which the message is printed.
b = The size of the essential file (modulo $2^1 R$).
c = The calculated cyclic redundancy check (CRC) value for the essential file. For files that contain their own CRC information, this value should match the size of the file.
d = The number of files verified. This count includes files that failed verification.
e = The number of errors encountered during processing.
f = The error message reported by /usr/bin/mop.
g = The name of the file being used for global CRC values. Normally this is /.crcvalues. This name will be /.crcvalues if the pfile currently being processed is in a temporary state, the /.crclock directory exits, and there is no lock file for the pfile in the /.crclock directory.
h = The line number in the specfile that contains the formatting error.
i = The off-line disk number specified as the argument to the directory number (DN) keyword on the VFY:FILE message line.
j = The stored CRC value for the current file. If the CRC information is stored in /.crcvalues, this field contains both the size of file and the CRC.
k = The calculated CRC value for the current file. If the stored CRC information for this file is kept in /.crcvalues, this field contains both the calculated size of the file and the CRC.
4. ACTION TO BE TAKEN

If the error count for Formats 3 or 5 is non-zero, examine the receive-only printer (ROP) for other message formats to determine the cause of the error. Otherwise, no user action is necessary for Formats 1-5.

For Format 6, VFY:FILE has terminated.

For Format 7, the mount off-line partition (MOP) process (MOPP) has failed. Examine the MOP error message and take appropriate action.

For Format 8, the user has selected a database partition that does not represent a file system. Find the correct partition number and reenter the input message.

Format 9 is generally printed because the user is attempting to use the GEN option on a file that is not administrative module (AM)-executable and trying to store the CRC internally. These files must have their CRC information stored in /.crcvalues. If this is not the case, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Formats 10, 12, 13, 15, 16, 22, or 30, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 11, a file is missing or does not have execute permission.

For Format 14, a warning message is generated that may be ignored if CRC information is being generated for the first time. If this is not the case, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 17, VFY:FILE cannot find CRC information that is supposed to be in /.crcvalues. If the CRC information was present and has been lost, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 18, VFY:FILE cannot open the file. This is usually an input error. If this is not the case, Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Formats 19 and 20, the specification file supplied to the FLIST parameter. Verify the correctness of the input message and the contents of the specification file.

For Format 21, a field update is in progress for the current file. VFY:FILE will not run the CRC algorithm against this file until the update is made permanent. If this message reoccurs for several days in a row, check the software update status of the file to determine why it has not been made official.

For Format 23, MOP has been terminated unexpectedly and has left the off-line partition mounted. VFY:FILE has attempted to unmount the file system unsuccessfully. Use "mop -u" to unmount the file system.

For Format 24, VFY:FILE is unable to verify /dev/boot, /dev/lboot, and /dev/vtoc from the off-line disk. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 25, the path name of the file to be verified is too long for searching /.crcvalues. Although the maximum allowed length for the arguments to either of the FN or OLMP options is 63 characters, their combined length must not exceed 63 characters.

For Format 26, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Refer to the Corrective Maintenance manual for help in analyzing and correcting this error.
For Format 27, VFY:FILE cannot get status of the file. This is usually an input error. If this is not the case, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 28, the specified file's actual file type is different than the expected file type. Use the OP:ST-LISTDIR message to examine the existing file type. If the specified file's existing file type does not match the expected file type, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. Otherwise, verify the correctness of the input message.

For Format 29, execute permission is not set for the owner. Use the ALW:FSYS-ACCESS input message to set the appropriate bit.

For Formats 31, 32, and 34, there are problems with accessing an off partition volume table of contents (VTOC); refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 34, the user has requested that a CRC value be generated for a file and stored in that file. The file is not suitable for storing the CRC value internally. The user should store the generated value globally, that is, use the ‘g’ character when specifying the checking type.

For Format 35, the user may be attempting to process a file that is being updated. If file update is in progress, the user must wait until it is completed before attempting to run the VFY:FILE input message, otherwise the user needs to go into the crclock directory and remove the file that has the same name as the file that the VFY:FILE input message will not process.

For Format 36, VFY:FILE is unable to allocate sufficient space to read the specification file into memory. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

For Format 37, VFY:FILE is unable to read the specification into memory. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

5. ALARMS

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

[3] VFY MHD a EARLY TERM VFY FAILED d BLOCKS BLOCKS BLOCKS BLOCKS i [i] [i] [i]

[4] VFY MHD a ABORTED b ERROR DATA j k l m n

2. REASON FOR OUTPUT

To report the result of executing an VFY:MHD input message. If the format process was invoked using the VFY MHD poke on the data file system access (DFSA) display page during disk independent operation (DIOP) mode, a REPT:DKDIP output message will precede this one.

Format 4 provides additional error information when an explicit small computer system interface (SCSI) command fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

a = Member number of the moving head disk (MHD) drive.
b = Process step or reason code. Valid value(s):

</table>

- **c** = System error code. Refer to the APP:SYSERR appendix in the Appendixes section of the Output Messages manual.
- **d** = Number of failures (bad sectors for storage module drive (SMD) MHD or bad disk blocks for SCSI MHD) found during the verify step.
- **e** = Relative track number of the indicated bad sector. The track number is relative to the beginning of the disk. It is calculated using all tracks of the disk excluding those tracks mapped out by defect management. This variable field applies only to an SMD MHD.
- **f** = Physical cylinder number of the indicated bad sector. This number is calculated using all tracks of
the disk including those mapped out by defect management. This variable field applies only to an SMD MHD.

g = Physical head number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field applies only to an SMD MHD.

h = Sector number in use when the failure occurred. It is a relative number. This variable applies only to an SMD MHD.

i = Logical disk block number of the bad disk block found on the SCSI disk driver during the verify stage.

j = Eight hexadecimal digits in the form: AAAABBCC. Valid value(s):
   AAAA = SCSI job block(SJB) completion code. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.
   BB = Status byte. Refer to the APP:DFC-K appendix in the Appendixes section of the Output Messages manual.
   CC = Not used.

k = First word of extended sense data (ESD); eight hexadecimal digits in the form: AABBCCDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.
   AA = Byte 0 of ESD.
   BB = Byte 1 of ESD.
   CC = Byte 2 of ESD.
   DD = Byte 3 of ESD.

l = Second word of ESD; eight hexadecimal digits in the form: AABBCCDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.
   AA = Byte 4 of ESD.
   BB = Byte 5 of ESD.
   CC = Byte 6 of ESD.
   DD = Byte 7 of ESD.

m = Third word of ESD; eight hexadecimal digits in the form: AABBCCDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.
   AA = Byte 8 of ESD.
   BB = Byte 9 of ESD.
   CC = Byte 10 of ESD.
   DD = Byte 11 of ESD.

n = Fourth word of ESD; eight hexadecimal digits in the form: AABBCCDD. Refer to the APP:DFC-J appendix in the Appendixes section of the Output Messages manual.
   AA = Byte 12 of ESD.
   BB = Byte 13 of ESD.
   CC = Byte 14 of ESD.
   DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN
A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and retry the input request.

A termination report specifying a verification failure means that the indicated disk sectors had uncorrectable data errors or that the format information contained in the sector headers was not as expected. This disk media should NOT be used until the problem is corrected.

For an SMD MHD, the HEAD and TRACK information is output to provide data to help determine if the problem is in the MHD (head alignment) or in the disk media (bad surface).

For an SMD MHD, the CYL, HEAD, and SECT information can be used as input to the LOAD:MHD input message. For a SCSI MHD, the BLOCK information can be used as input to the LOAD:MHD input message.

If Format 4 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data and contact the next level of technical support to aid in determining the cause of the error condition.

5. ALARMS

<table>
<thead>
<tr>
<th>OMDB Keys:</th>
<th>Alarm type:</th>
</tr>
</thead>
<tbody>
<tr>
<td>177, 666</td>
<td>Manual alarm.</td>
</tr>
<tr>
<td>148</td>
<td>Information alarm.</td>
</tr>
<tr>
<td>146, 149, 569</td>
<td>Major alarm.</td>
</tr>
</tbody>
</table>

If a major alarm occurs, it may not be service affecting, but take immediate action as indicated in the report.

Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual.

**[5] VFY MLHG=a MEMBER REPORT PAGE #p1**
### 2. REASON FOR OUTPUT

To report the results of a VFY:MLHG input request for reporting all the lines associated with the specified multi-line hunt group (MLHG).

Formats 1 and 2 are analog MLHG reports and Formats 3 and 4 are integrated services digital network (ISDN) MLHG reports. Formats 1 and 3 are sorted by MLHG while Formats 2 and 4 are sorted by term number.

### 3. VARIABLE FIELD DEFINITIONS

- **a**: Multi-line hunt group (MLHG) number.
- **b**: MLHG feature name as defined on RC/V View 12.18.
- **c**: Listed directory number (10 digit number).
- **d**: Subgroup directory number 1 (10 digit number).
- **e**: Subgroup directory number 2 (10 digit number).
- **f**: Subgroup directory number 3 (10 digit number).
g = Subgroup directory number 4 (10 digit number).

h = Subgroup directory number 5 (10 digit number).

i = Subgroup directory number 6 (10 digit number).

j = Subgroup directory number 7 (10 digit number).

k = Subgroup directory number 8 (10 digit number).

l = Local or global group (L or G).

m = Group size (the highest term number in the MLHG).

n = Actual size (the actual number of terminals assigned to the MLHG).

o = Hunting module.

p = Monitored. Valid value(s):
N = No
Y = Yes

q = ISDN attendant (ISAT) group monitoring this MLHG.

r = Group make busy. Valid value(s):
N = No
Y = Yes

s = Group make busy scan point number.

t = Position 1 make busy scan point number.

u = Position 2 make busy scan point number.

v = Position 3 make busy scan point number.

w = Position 4 make busy scan point number.

x = Position 5 make busy scan point number.

y = Position 6 make busy scan point number.

z = Position 7 make busy scan point number.

a = Position 8 make busy scan point number.

b = Position 9 make busy scan point number.

c = Position 10 make busy scan point number.

d = Position 11 make busy scan point number.

e = Position 12 make busy scan point number.
f¹ = Position 13 make busy scan point number.
g¹ = Position 14 make busy scan point number.
h¹ = Position 15 make busy scan point number.
i¹ = Position 16 make busy scan point number.
j¹ = Queuing active. Valid value(s):
    N = No
    Y = Yes

k¹ = Queuing feature 8 character feature name as defined on RC/V View 12.40.
l¹ = Queuing module.
m¹ = Queue basic size (number of calls to queue for this group).
n¹ = Queue extended size [number of additional calls to queue when associated with the incoming side of a foreign exchange (FX) trunk].

o¹ = Overflow message register number.
p¹ = Page number of the report.
q¹ = MLHG terminal number.
r¹ = Member directory number (10 digit number).
s¹ = Office equipment number.
t¹ = Line class code.
u¹ = Primary inter-exchange carrier.
v¹ = Billing directory number (10 digit number).
w¹ = Member make busy scan point number.
x¹ = Stop-hunt scan point number.
y¹ = Terminal type (for example, B or D).
z¹ = Last listed directory number.
a² = Local or global group (L or G).
b² = User type (PPB, PPD, or XAT).
c² = Channel configuration (PPD, PPB1, PPB2 or XAT).
d² = Suspend termination (SUST).
e² = Suspend origination (SUSO).
f² = INTERCEPT (this is member on intercept).
= NONHUNT (this is a nonhunt member).

= Ground start (GST).

= Touch tone (TTONE).

= SHARED (this is member shared).

= MULTIDN.

= BRCS (BRCS features assigned).

= MULTIPORT.

= Linear hunt TN (assigned to allow linear hunting).

= Linear count (number of members in the group that have linear hunt TNs assigned).

= Packet business (PB) group.

= Protocol handler (PH) type (PH1, PH2, or PH3).

= DEACTIVE.

4. ACTION TO BE TAKEN

None.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print the routing translations results of an VFY:OFC input request. The output may be presented in multiple messages. The last line of each message indicates if verify office has completed or if additional messages are expected. The messages will be in one of the seven output formats.

Format 1 echoes the input message parameters and provides digit analysis results.

Format 2 provides LNP trigger information (if available), SCP query related information and status, and indication on the existence of the terminating directory numbers’ translation. Format 2 will not be used to provide data pertaining to ASP or network services triggers since only LNP triggers are supported by verify office.

Formats 3, 4, and 5 provide information on errors which result in an assert message output to the read only printer (ROP). Assert activity will cause termination of the verify office request. Assert activity encountered during processing of a verify office request is not suppressed by brevity control.

Format 6 provides additional information related to the request processing. The additional information may be useful information about a successful request, or describe an error condition which does not result in an assert message output.

Format 7 provides additional digit analysis results and routing information for LDP processing. This format is always preceded by the format one output, and will never output of its own.

3. VARIABLE FIELD DEFINITIONS
= The originator for which the call is being verified. Valid value(s):

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DN=x</td>
<td></td>
</tr>
<tr>
<td>MLHG=y-a</td>
<td></td>
</tr>
<tr>
<td>PORT_ENTERED</td>
<td></td>
</tr>
<tr>
<td>TG=y-a</td>
<td></td>
</tr>
</tbody>
</table>

= Verified digits that were specified in the input message. A value of NONE will be returned if no digits were specified in the input message.

= Event number of the request.

= Number of the switching module (SM) on which the originator is located.

= Port member number of the originator, in hexadecimal.

= Specific party associated with the originating directory number. For an explanation of the specific values, refer to the Translations Data manual.

= Digit analysis selector, used for digit analysis. Refer to variable 'z' for the source of the DAS value.

= Screening index; post query screening, automatic route selection (ARS) screening, simulated facilities group (SFG) screening, or the originator's screening found in the office data.

= Class of service for the originator. Refer to the Translations Data manual for definitions.

= The digits used to determine routing data after deleting and prefixing by digit analysis, but prior to any deleting and prefixing resulting from routing to a trunk to leave the office. Refer to RC/V View 10.2.

= Prefix dialed. Valid value(s):

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL or BLANK</td>
<td>No prefix was dialed.</td>
</tr>
<tr>
<td>NONE</td>
<td>entered &quot;0&quot; plus prefix</td>
</tr>
<tr>
<td>0(0+)</td>
<td>entered &quot;0&quot; plus prefix</td>
</tr>
<tr>
<td>1+</td>
<td>entered &quot;1&quot; plus prefix</td>
</tr>
<tr>
<td>01+</td>
<td>entered &quot;01&quot; international prefix</td>
</tr>
<tr>
<td>011+</td>
<td>entered &quot;011&quot; international prefix</td>
</tr>
</tbody>
</table>

= Destination index or code index found in the office data for this call.

= Destination type found in the office data for this call. Refer to the Recent Change Procedures manual, Digit Analysis Views, for a definition of the values.

= Specific action defined in the office data for the dialed feature code. This is null unless the value of variable 'n' is FEATURE. Refer to the Recent Change Procedures manual for definitions.

= Charge index found in the office data for this call.

= Carrier used for the call. If no carrier was specified or if the specified carrier was not used, this field will be blank.

= Termination of the call with respect to this office (if blank, call termination is not determined). Valid value(s):
DIALCODE = The customer feature dial code was entered.
DR_ALT_RI=1
MCRI=a
NOC=c
RI=b
TRUNK=d

r = Facility restriction level of the originating port (line or trunk). This is for automatic route selection, if applicable.
s = SFG group number.
t = Information field. Valid value(s):
ADNPAS ANNOUNCEMENT ENCOUNTERED = Dialing sequence may invoke a NPA Split Announcement.
ADVANCED SERVICES PLATFORM FEATURE DETECTED = Call originator has advanced services platform active (ASP) or has encountered an ASP route in an ARS route list. Neither are supported by verify office feature.
ANI CANNOT BE ENTERED WITH LINE ORIGINATOR = ANI can only be entered for trunk origination.
ANI COLLECTION NOT SUPPORTED = Automatic number identification (ANI) is needed for the SCP query. ANI collection is not supported by VFY:OFC.
ANI IS REQUIRED FOR LDP LATA TRUNKS
ANNOUNCEMENT ON ALTERNATE CODE TREATMENT = An alternate code treatment (ACT) with error treatment of announcement encountered.
ARS CALL OVERFLOWED TO DDD = The ARS digits analyzed overflowed to direct distance dialing (DDD) on the office dialing plan.
ASI_CF DATABASE READ FAILED = The advanced service interface feature information cannot be found. Check the feature assigned to the port.
ASI_GP DATABASE READ FAILED = The advanced service interface group information cannot be found. Check the group assigned to the port.
ASI FEATURE NOT ASSIGNED OR NOT ACTIVE = An advanced service interface feature dialed code was entered but the originating port does not have an active ASI feature assigned.
ASI_PORT DATABASE READ FAILED = The advanced service interface port information cannot be found. Check the port parameters.
ASP TRIGGER ENCOUNTERED, NO FURTHER VERIFICATION = ASP (non-LNP) triggers are not supported by VFY:OFC.
ASSERT 911 OCCURRED = An error occurred while getting E911 data. VFY:OFC does not support E911 queries.
AUTHORIZATION CODE OR ACCOUNT CODE REQUIRED = An authorization code or account code is required for this call or was entered in the input message. Authorization or account codes are not support by VFY:OFC.
AUTO ARS FOR CSD IS NOT SUPPORTED FOR VFY:OFC = Automatic route selection is not supported for circuit switched data by VFY:OFC.
AUTOMATIC ROUTE SELECTION CALL ROUTED TO ANNOUNCEMENT = An ARS call was routed to the designated MC route type of announcement.
AUTOMATIC ROUTE SELECTION CALL ROUTED TO REORDER = An ARS call was routed to reorder because the designated route type was REORDER or because an error was encountered while processing the ARS call.
BAD DIALING STATE = An invalid dialing state was encountered during digit analysis. Digit analysis translations should be examined.
BAD ROUTE TYPE IN RLARSCRN = An illegal route type was found in the base relation RLARSCRN.
BAD ROUTE TYPE IN RLRT_MCRT = An illegal route type was found in the base relation RLRT_MCRT. The tuple key is the printed modular constructed route index (MCRI).
BAD ROUTE TYPE IN RLRT_ROUTING = An illegal route type was found in the base relation RLRT_ROUTING. The tuple key is the printed route index (RI).
BEARER CAPABILITY NOT SUPPORTED = The LNP trigger does not support bearer capability for VFY:OFC. For example, the trigger is marked to allow only voice and this is a circuit switched data request.
CALL IS BEING ROUTED TO TONE OR ANNOUNCEMENT = An error has been encountered which will cause a route to reorder, tone, or an error announcement.
CALL NOT ALLOWED FOR CHARGE A CALL LINE = Call has been routed to tone or announcement. Refer to variable 'n' for the type of treatment.
CALL ROUTED TO AN ATTENDANT = The call was routed to the specified terminal group attendant. Refer to variable 'j' for the attendant directory number.
CALLTYPE CANNOT BE ENTERED WITH LINE ORIGINATOR = CALLTYPE can only be entered for trunk origination.
CALLTYPE IS 011 OR 01P - CIC OR CC MISSING = For an MF international 011 or 01P call, both CIC and CC are required.
CALLTYPE IS 1P, 0P, OR 01M - CC MUST NOT BE SPECIFIED = For an MF world zone 1 (1P, 0P) or international 01M call, specifying CC is an error.
CANNOT SEND ACM AND PLAY TONE OR ANNOUNCEMENT = The call is terminated because of network control point (NCP) action.
CARRIER DIALED TWICE NOT ALLOWED = A carrier access code is may not be entered twice.
CC CANNOT BE ENTERED WITH LINE ORIGINATOR = CC can only be entered for trunk origination.
CIC CANNOT BE ENTERED WITH LINE ORIGINATOR = CIC can only be entered for trunk origination.
CIC PARAMETER REQUIRED FOR MF WORLD ZONE 1 CALLS (CALLTYPE=1P/0P) = For CALLTYPE=1P or 0P, CIC has to be entered for MF world zone 1 calls.
CI TYPE IS INTERLATA BUT NO RPOA WAS RECEIVED = The carrier interconnect type returned by digit analysis is inter-lata. This means that a carrier is required to complete the packet call. RPOA should be entered as the carrier in the VFY:OFC input message.
CI TYPE RETURNED BY DA NOT APPLICABLE TO PKT = The carrier interconnect type returned by digit analysis is not applicable to a packet.
CMP UNAVAILABLE = During processing of the VFY:OFC input message, it was determined that the CMP was not linked to the AM and processing could not continue.
COS NOT ALLOWED IDP AND SC1 = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan and a 1-digit speed calling feature; but, these options were found in relation RLTRM_FEATS.
COS NOT ALLOWED IDP AND SC2 = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan and a 2-digit speed calling feature; but, these options were found in relation RLTRM_FEATS.
COS NOT ALLOWED ID feature = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan (IDP) feature; but, this option was found in relation RLTRMFEATS.
COS NOT ALLOWED ID, SC1, AND SC2 = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an
individualized dialing plan, a 1-digit speed calling, and a 2-digit speed calling feature; but, these options were found in relation RLTRM_FEATS.

**COS NOT ALLOWED SC1 AND SC2** = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have a 1-digit speed calling and a 2-digit speed calling feature; but, one of these options was found in relation RLTRM_FEATS.

**COS NOT ALLOWED SC1 FEATURE** = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have a 1-digit speed calling feature; but, this option was found in relation RLTRM_FEATS.

**COS NOT ALLOWED SC2 FEATURE** = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have a 2-digit speed calling feature; but, this option was found in relation RLTRM_FEATS.

**CUTTHRU CALL NOT SUPPORTED FOR VFY:OFC** = For FGD cutthrough calls, no output information is provided.

**CUTTHRU TRIGGER ENCOUNTERED, NO FURTHER VERIFICATION** = This is warning message to indicate that no further verification will be done when a CUTTHRU trigger is encountered. The trigger number and trigger type are output.

**DATABASE ERROR OR SOFTWARE INCONSISTENCY DETECTED** = Some data or code has detected an inconsistent result. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**DEDICATED SDN TRUNKS ARE NOT SUPPORTED** = Attempted to access the software defined network (SDN) that is not supported.

**DEST SWITCH MUST BE DIFFERENT FROM ORIG SWITCH** = The PSN cannot be the packet switch number of the originator.

**DEST TYPE RETURNED BY DA NOT APPLICABLE TO PKT** = The destination type returned by digit analysis is not applicable to a packet.

**DIAL PLAN ACCESS TREATMENT (DPAT) ERROR** = A DPAT error was detected during IDP digit analysis. The call was routed to announcement or reorder tone.

**DIG IS OPTIONAL OR 9500000 FOR CALLTYPE=FGB/FGBPS ON MF TRUNK** = An invalid digit string is entered for CALLTYPE FGB or FGBPS on MF Trunk. DIG is not required for MF FGB/FGBPS. If entered, digit string must be 9500000.

**DIG HAS TO BE 950xxxx FOR CALLTYPE=FGB/FGBPS ON ISUP TRUNK** = This occurs when digits other than 950xxxx are entered for CALLTYPE=FGB/FGBPS for an ISUP trunk.

**DIGIT ANALYSIS FAILED** = A failure occurred while analyzing the digits.

**DIGIT ANALYSIS RETURNED VACANT** = Digit Analysis returned vacant code treatment for the packet call.

**DIGIT STRING CANNOT BE LONGER THAN 18 FOR SS7 TRUNKS** = Trunks that use ISUP7 signaling cannot have more than 18 digits in variable ‘b’.

**DIGITS ANALYZED ROUTE TO IDP ERROR TREATMENT** = IDP error treatment will route the call to tone or announcement.

**DN ASSOCIATED WITH UCD OR MUPH MLHG, NO PORT** = The directory number (DN) associated with the uniform call distribution (UCD) or multiposition hunt (MUPH) multi line hunt group (MLHG) was identified to have no port. These are not supported by VFY:OFC.

**EMERGENCY STAND ALONE REROUTING FAILURE** = There was a stand alone test line failure during the attempt to route. Some reasons could be:
- The digits entered in variable ‘b’ are not the specified emergency number
- There is a feature assigned that is not supported for test lines.

Check the test line attributes and/or the entered VFY:OFC input message.
EMERGENCY STAND ALONE REROUTING TO LINE = The stand alone test line routing went to the emergency line specified on RC/V View 4.9.

EMERGENCY STAND ALONE REROUTING TO TRUNK = The stand alone test line routing went to the emergency trunk specified on RC/V View 4.9.

EXCEEDED MAXIMUM IDP INTERPRETATIONS = The digits being analyzed has exceeded the maximum of 5 IDP interpretations. Call was routed to a reorder tone.

EXTRA DIGITS DETECTED BY DIGIT ANALYSIS = Digit analysis tables were populated for an expected number of digits. More digits appeared in variable 'b' or were analyzed as a result of a query response.

FAILED TO GET TERMINAL PARAMETERS = The trunk or line data could not be read to get digit analysis information. Check the originating port.

FAILURE RETURNED FROM TCAP = A failure occurred when sending a TCAP message.

FEATURE GROUP B CALLS ARE NOT SUPPORTED = Feature Group B calls not supported on ISUP trunks.

FEATURE INVOKED IS NOT SUPPORTED FOR VFY:OFC CSD = No features are being supported for CSD calls.

FEATURE IS NOT ACTIVATED = Refer to variable 'h3' for an explanation.

FOR ISUP FGB CALLS, WHEN ANI=NULL THEN OLI=NULL HAS TO BE ENTERED = When ANI=NULL, then OLI=NULL has to be entered for ISUP FGB calls.

FOR MF FGB CALLS, WHEN ANI=NULL THEN II=NULL HAS TO BE ENTERED = When ANI=NULL, then II=NULL has to be entered for MF FGB calls.

FUNCTIONALITY NOT SUPPORTED = An attempt was made to send a route request from a function that has not been modified to support VFY:OFC. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

FX/TIE TRUNK ERROR ENCOUNTERED = Refer to variable 'h3' for an explanation.

ICPI REQUIRED BUT NOT INPUT = This X.75/X.75' trunk originated call is an inter-lata call that requires an interexchange carrier preselect indication (ICPI). The ICPI was not entered in the VFY:OFC input message.

IDDD CALLS REQUIRE A CARRIER; DA RETURNED NO CARRIER REQUIRED = Packet inter station to station calls require a carrier but digit analysis indicated that no carrier is required.

IDDD OVER OUTWATS BLOCKED = An ARS call attempted to go IDDD over an OUTWATS trunk.

IDP ASSIGNED WHILE PROCESSING SPEED CALL = Speed calling from plain old telephone service (POTS) is only valid if the port has no IDP.

IF ICPI IS SPECIFIED, ORIGINATOR MUST BE X.75 OR X.75' TRUNK = The packet trunk specified as the originator must be an X.75 or X.75' trunk if ICPI is specified.

IF PSN IS SPECIFIED, THE ORIGINATOR MUST BE AN IP TRUNK = The packet trunk specified as the originator must be an IP trunk if PSN is specified as the destination.

II CANNOT BE ENTERED FOR ISUP TRUNK = Invalid input combination. II can only be entered for MF trunk.

II CANNOT BE ENTERED WITH LINE ORIGINATOR = II can only be entered for MF trunk origination.

ILLEGAL DA SAC CALL TYPE = A service access code (SAC) type carrier interconnect (CI) call is present in digit analysis relation, but the call type does not allow this feature.

IMPLIED NPA COULD NOT BE DERIVED = The implied NPA for the packet called address could not be derived because of a database error.

INCOMING FACILITY MUST BE SS7 TRUNK GROUP = LNP error. When an LRN is entered without a DIG argument, the incoming facility must be a SS7 trunk group.

INSUFFICIENT FRL DETECTED BY ROUTING = The ARS facility restriction level (FRL) of the call was less than the facility restriction level of the route.
INTERCOM CALL RESTRICTION DETECTED = ICR simulated facilities group is not supported by VFY:OFC.
INTERNAL FAILURE DETECTED = A failure condition was detected. Refer to variable ‘h\3’ for more details. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
INVALID ACTION TYPE FOUND = An invalid action was encountered during digit analysis by the IDP.
INVALID AUTHORIZATION CODE = Authorization code is not supported in VFY:OFC.
INVALID CALLED ADDRESS = The packet called address entered in the VFY:OFC input message is invalid. The length of the packet called address is invalid or for international E.164 calls, 0110 cannot be the specified as the first four digits of the packet called address.
INVALID CALLING ADDRESS = The calling address specified in the VFY:OFC input message was found to be invalid. Some reasons could be:
- Invalid address length.
- If this is MLHG, the specified MLHG number does not match the dd_number in RLpsx25ln calling address.
- The specified NOC is invalid.
- The calling address does not match the MLHG linear DN of the MLHG group.
INVALID COS FOR TYPE OF CALL = The originator has a class of service that is supported for VFY:OFC but is invalid for CSD or PKT.
INVALID DATA IN TUPLE = Invalid data was found in an existing tuple in the ODD. Refer to rest of message for details.
INVALID DATARATE = The data rate requested is either not supported or not valid. This could also occur when the data rate entered is incompatible with the data rate of the destination trunk.
INVALID ID RELATION = An invalid IDP relation was found when expanding a speed call code.
INVALID RPOA = The RPOA entered in the input message is not valid RPOA in the ODD. A tuple with the specified RPOA as key was not found during the read operation of the RLPSDNICRI relation.
INVALID WIDEBAND RATE = The wideband rate entered is incompatible with the wideband rate of destination trunk.
LDP LATA TRUNKS ARE NOT SUPPORTED = The VFY:OFC for LDP is not active so LDP on LATA trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
LDP MINT TRUNKS ARE NOT SUPPORTED = The VFY:OFC for LDP is not active so LDP on MINT trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
LEAD ACCOUNT CODE DETECTED = A lead account code was detected during uniform number plan (UNP) digit analysis. This is not supported by VFY:OFC.
LEASED NETWORK QUERY NOT SUPPORTED = LN TCAP queries are not supported by VFY:OFC and an LN query is required to complete routing.
LNP on LDP NOT PURCHASED = LNP on LDP is not activated. LNP processing can not be done for this VFY:OFC request.
LRN, PORTEDDN OR NONPORTED ARE INVALID FOR ISUP INTERNATIONAL CALL MDII OCCURRED = The value of the MDII code is shown. Refer to rest of message for details.
MODEM POOL ACCESS DN ENTERED, MP NOT SUPPORTED FOR VFY:OFC PKT = The specified originator is a modem pooling access DN. Modem pooling is not supported by packet VFY:OFC.
MORE DIGITS REQUIRED TO GET ROUTING INFORMATION = Not enough digits were entered in the input message to determine routing information.

MSG FORMAT IS INCORRECT = The format of the input message is not correct. Refer to the VFY:OFC input message.

NETWORK CALL DENIAL IS SET, CALL IS DENIED = Network call denial (NCD) indicator is set to "Y" in theANI table. The VFY:OFC request is denied.

NETWORK SERVICES TRIGGER NOT SUPPORTED = Network services triggers are not supported by VFY:OFC.

NO DIAL CODE IN DA = A dial code was not detected by digit analysis. If the destination type is not a dialed code or this is not a BRCS line, the input originating port is restricted from use.

NO DIGITS SPECIFIED OR FOUND = No dialed digits were specified and the originator does not have any default ones in the database.

NO DIRECTORY NUMBER TRANSLATION, HUNDREDS GROUP ROUTING APPLIES = The DN is not assigned in this office; however, routing using hundreds group applies.

NO ERROR TREATMENT FOR ACT = Alternate code treatment (ACT) was encountered with no error treatment specified.

NO ERROR TREATMENT FOR DPAT = Dialing plan access treatment (DPAT) was encountered with no error treatment specified.

NO IECP FACILITY SUBSCRIBED WHEN NEEDED = The packet line specified as the originator is not provisioned with an interexchange carrier preselect (IECP) although digit analysis has returned that this is an inter-lata call requiring a carrier. In this case, RPOA has also not been entered. The IECP should be provisioned in the ODD for this call or RPOA should be specified.

NON-DNT ORIGINATION = The originating port is not allowed to access ASP triggers.

NON-UNIQUE NXX DN ENTERED = The entered originator DN is ambiguous because of the increased number of NXX's. Reenter the input message using a 10-digit originator DN.

NOT ALLOWED TO ORIGINATE = The originator may not dial calls.

NOT SUPPORTED, SEE CUSTOMER DOCUMENTATION = The originator COS or destination type is not supported by VFY:OFC.

The following originator COS values are supported for voice:

LINES

FC_2PTY = Two party, multifrequency ringing.
FC_4PFS = Four-party fully selective line.
FC_4PSS = Four-party semiselective line.
FC_4WIRE_INDIV = 4 wire subscriber line.
FC_5PTY = Five party, multifrequency ringing.
FC_8PSS = Multiparty line.
FC_10PTY = MFR multiparty line.
FC_ATTENDANT = Attendant line (similar to individual).
FC_CHGACALL = Charge-a-call origination.
FC_COIN = Coin line.
FC_HOTMOTL = Special termination at motel equipment.
FC_INDIVDL = Individual line.
FC_ISDN = ISDN Line, allowed for analog lines.
FC_PBX = PBX line origination.
FC_SATSTLN = Stand alone test line.
FC_TWOPTY = Two-party line.
PXB_X_HOTMOT = Special termination to a motel.
TRUNKS

FC_BSYVFY  = Busy verify trunk.
FC_IEC     = Carrier trunk.
FC_LATA_CONN = Toll end of LATA connecting trunk.
FC_LTOLL_CONN = Local end of toll connect trunk.
FC_PF     = Private facility trunk.
FC_PFITT  = Private facility trunk intertandem tie trunk.
FC_PFLASH = Private facility trunk with flash repeating.
FC_PRI_INTOLL = Primary intertoll trunk.
FC_SEC_INTOLL = Secondary intertoll trunk.
FC_SPAMEG = Special access MEGACOM trunk.
FC_SPAWATS = Special access WATS trunk.
FC_TTOLL_CONN = Toll end of toll connecting trunk.
FCEDSL   = PRI trunk.
FCEDSLHM = Hotel/motel PRI trunk.

The following originator COS values are supported for CSD:

LINES

FC_ISDN     = ISDN line.
PSX25_T1    = X25 access on a T1 facility.

TRUNKS

FC_IEC     = Carrier trunk.
FC_LATA_CONN = Toll end of LATA connecting trunk.
FC_LTOLL_CONN = Local end of toll connect trunk.
FC_PF     = Private facility trunk.
FC_PFITT  = Private facility trunk intertandem tie trunk.
FC_PFLASH = Private facility trunk with flash repeating.
FC_PRI_INTOLL = Primary intertoll trunk.
FC_SEC_INTOLL = Secondary intertoll trunk.
FC_TTOLL_CONN = Toll end of toll connecting trunk.
FCEDSL   = PRI trunk.
FCEDSLHM = Hotel/motel PRI trunk.
PSX75_TK  = Packet Switching on X.75.
PSX75P_TK = Packet Switching on X.75'.
PSPKT_TRK = Packet Switching on Inter-Switch Trunks.

The following destination types are not supported:

FCNS800   = Number services (800) type call.
FCSTG1FCA = Dial 011+PCC or 18X - fully coded addressing.
FCIDDFCA  = Dial CC+NN - fully coded addressing.
FCAPSDN   = Software defined network at an action point.
FCSPAM800 = MEGACOM 800 (special access).
OAD2VDT   = DA call to VDT.
OAOPNIT    = Non-ISP call to VDT.

OLI CANNOT BE ENTERED FOR MF TRUNK = Invalid input combination. OLI can only be entered for an ISUP trunk.
OLI CANNOT BE ENTERED WITH LINE ORIGINATOR = OLI can only be entered for a ISUP
trunk origination.

**PARTIAL DIAL TREATMENT** = The call will route to tone or announcement. Refer to variable ‘m’ for the type of treatment.

**PFA FEATURE NOT SUPPORTED** = The input digits contained a private facilities access code that is not supported by VFY:OFC.

**PFA MC ROUTING IS NOT SUPPORTED** = Private facilities access is not supported by VFY:OFC.

**PORT IS NOT ASSIGNED** = The originating port is not assigned.

**PORTED NUMBER ROUTING ERROR** = The number was expected to be ported into the switch but no directory number translations exist for this DN. Possible problems are the SCP query response, the directory number assignment, or digit analysis ported-in flag.

**PRECEDENCE AND PREEMPTION CALL DETECTED** = Precedence and preemption calls are not supported by VFY:OFC.

**PRESUBSC CANNOT BE ENTERED WITH LINE** = PRESUBSC can only be entered for trunk origination.

**QUERY TIMEOUT** = A query was sent to the SCP and the response was not received before timing out.

**QUERY/RESPONSE SIMULATION FAILURE** = An LRN was entered on the input message line which has not been processed correctly. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**REORDER ON ALTERNATE CODE TREATMENT** = Individualized dialing plan, alternate code treatment (ACT) with error treatment of reorder encountered.

**REORDER ON INSUFFICIENT FRL** = The facility restriction level (FRL) of the call was less than the required FRL indicated in the dialing plan. Error treatment is reorder tone.

**RESPONSE NOT SUPPORTED** = The SCP responded with a message that is not supported by VFY:OFC. Verify processing stopped when this message was received.

**RLRTDNMOD: Routing Module and Route Index are 0** = Retrieved the rlRTDNMOD tuple, but the routing module is set to zero and hundreds group routing does not apply.

**ROUTE FAILURE ENCOUNTERED** = The route request resulted in a failure. Refer to variable ‘h3’ to determine the cause of the failure. Not all routing failure cases are supported by VFY:OFC and additional data would not be available in those cases.

**ROUTING ERROR** = A non-HOME LRN was detected and a route index must be defined for this condition. Check digit analysis data.

**ROUTING SP MAXED OUT, DATA MAY BE INCORRECT** = The routing system process reached a maximum running limit or state limit before completion of the routing process. The output reflects the information gathered up to that point. However, it does not show the completed routing information and is not guaranteed to be correct.

**ROUTING TO TONE OR ANNOUNCEMENT** = The call will route to tone or announcement. Refer to variable ‘m’ for the type of treatment.

**RPOA INPUT BUT INTRA-LATA COMPETITION NOT ALLOWED** = Inter-lata competition is not allowed in this office. The packet call cannot be routed by the RPOA entered in the VFY:OFC input message.

**SAT CANNOT BE ENTERED WITH LINE ORIGINATOR** = SAT can only be entered for a trunk origination.

**SAT (SATELLITE) IS INVALID FOR NON-MINT MF TRUNKS**

**SCREENING FAILURE** = This error can indicate carrier blocking (CBLK) is active for the screening (charging) from RC/V View 10.10. The call will route to reorder if RTI=REGL on the row entry that is marked for carrier blocking.

**SEND TO RESOURCE NOT SUPPORTED** = Verify does not support send-to-resource responses from the SCP. Verify processing was stopped when this message was received.

**SENDING RELEASE MESSAGE** = Call processing encountered an error event and populated a RELEASE message for the ISUP7 trunk. This signaling message is not actually sent but contains a cause code which is displayed in variable ‘i3’.
SERVICE TYPE NOT SUPPORTED = Number services type not supported by VFY:OFC. Refer to variable ‘h3’ for more details.

SM IS NOT EQUIPPED OR OPERATIONAL = An SM is not available for examination.

SPEED CALL FEATURE NOT ASSIGNED = A speed call code was entered but no speed call feature is assigned.

TDX DATA CALLS FEATURE NOT ACTIVE = TDX data calls feature is not active. The VFY:OFC request for the LDP trunk is denied.

TG IS NOT EQUIPPED TO HANDLE DATARATE = The trunk specified as the originator does not have the DATARATE field on RC/V 5.1 set or the trunk’s DATARATE is set but the trunk cannot support the data rate requested.

TG IS NOT EQUIPPED TO HANDLE VOICE CALL = This trunk group is equipped for data calls instead of voice calls.

TIMEOUT IN AM WAITING FOR SM RESULTS = No verify results have been received from the SM on which the originator resides. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TNS AND CIC CANNOT BE ENTERED AT SAME TIME FOR DOMESTIC ISUP CALL = For a VFY:OFC request on ISUP trunk, TNS and CIC can not be entered at the same time when CALLTYPE=DOM.

TNS CANNOT BE ENTERED WITH LINE ORIGINATOR = TNS can only be entered for a trunk origination.

TNS IS INVALID FOR MF TRUNKS = TNS is valid only for an ISUP trunk.

TNSC CANNOT BE ENTERED WITH LINE ORIGINATOR = TNSC can only be entered for a trunk origination.

TNSC CAN BE SPECIFIED ONLY FOR MINT TRUNKS = TNSC is invalid for the specified trunk if MINT_SIG=NULL.

TNSC VALUE ON MINT BETA TRUNK EXCEEDED THE VALID RANGE = TNSC value should be in the range of 0-15 for MINT beta trunk. If MINT expansion feature is on, then the range should be 0-63.

TOO FEW DIGITS IN CALLED ADDRESS = Digit analysis tables were populated for an expected number of digits. Fewer digits appeared in variable 'b' or were analyzed as a result of a query response.

TRIGGER NUMBER NOT FOUND IN NS_TRIG = The trigger number was not populated in the RLNS_TRIG relation. Check the data associated with trigger numbers. The output message contains the trigger number.

TRIGGER TYPE NOT SUPPORTED = An invalid trigger type has been encountered.

TRY LATER, CAN NOT CREATE PROCESS IN SM = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TRY LATER, CAN NOT SEND MESSAGE IN SM = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TRY LATER, RESOURCES FOR FEATURE EXECUTION ENVIRONMENT UNAVAILABLE = When trying to start a FEX environment, the necessary data blocks (MDB, CLDB) were not available. Try again later.

TUPLE MISSING OR DATABASE ERROR DETECTED = The base relation and the tuple keys follow.

UNABLE TO DELETE SPECIFIED DIGITS = During digit conversion, a request was made to delete more digits than dialed. The relation identified should be checked.

UNABLE TO SEND MESSAGE FROM AM = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
UNEXPECTED DESTINATION TYPE FOUND = An unexpected destination type was encountered by the IDP during feature transition processing.

UNEXPECTED ERROR TREATMENT FOR ACT DETECTED = An unexpected error treatment was detected for the alternate code treatment (ACT).

UNEXPECTED ERROR TREATMENT FOR DPAT DETECTED = An unexpected error treatment was detected for the dialing plan access treatment (DPAT).

UNEXPECTED RESULTS FOR DEDICATED E911 TRUNK = The input port or trunk group is a dedicated E911 trunk and an MDII occurred. The MDII value has also been output.

UNKNOWN DA ROW ENCOUNTERED = An illegal value for the row attribute was found in the indicated tuple.

UNKNOWN ERROR = An undefined error was present. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNKNOWN ROUTE TYPE = The route type found in RT_SCRNING or RT_ROUTING is not expected by packet routing.

UNSUCCESSFUL CONVERSION TO PORT = The originator specification does not identify a valid port.

USER NOT ALLOWED TO USE EXPLICIT ASI SERVICE CODE = The advanced service interface assigned to the port is for implicit service only and an explicit dialed code was entered.

USER NOT ALLOWED TO USE IMPLICIT ASI SERVICE CODE = The advanced service interface assigned to the port is for explicit service only and an implicit dialed code was entered.

WBCHANNEL CANNOT BE ENTERED WITH LINE ORIGINATOR = WBCHANNEL can only be entered for a trunk origination.

WBRATE CANNOT BE ENTERED WITH LINE ORIGINATOR = WBRATE can only be entered for a trunk origination.

WIDEBAND DATARATE IS NOT VALID FOR NON-ISUP TRUNKS = WBRATE and WBCHANNEL are valid only for an ISUP trunks. An error is output if they are entered for other signal types.

u = Relation name and key fields, in the format:

RELATION_NAME KEY1 KEY2 ...

The relation keys are shown as either a field name printed in this output message or an attribute name and value. For example, "DEST_TYP" or "PREVIOUS 5". Refer to the Translations Data manual for definitions.

v = Additional key to relation in variable 'u'.

w = Additional key to relation in variable 'u'.

x = Directory number (DN) of a line. For packet call type, if the calling address in the input message is an international E.164 address, the DN= variable will contain the expanded full E.164 address (country code + NPA + NXX + XXXX).

y = Group number.

z = Location routing number (LRN).

a¹ = Member number.

b¹ = Route index (RI) number or automatic route selection index (ARSIDX). RI for a call that leaves the
office or ARSIDX in the case of an ARS call. The ARSIDX can be replaced by a route index value if the call is directed to an announcement trunk.

c = Normalized office code (NOC) for a local line termination.

d = Trunk group.

e = Carrier feature group indicator. Valid value(s):
B = Feature group B plus carrier identifier.
D = Feature group D plus carrier identifier.
(blank) = None. A carrier was not used to route the call.

f = Call type for this verification request. Valid value(s):
CSV = Circuit switched voice (default).
CSD = Circuit switched data.
PKT = Packet switched data.

h = Datarate for a circuit switched data call and its corresponding CSD bearer capability. Valid value(s):
56 = 56-kbps, unrestricted digital information, circuit-mode, rate adapted from 56-kbps.
64 = 64-kbps, unrestricted digital information, circuit-mode.
R64 = 64-kbps, restricted digital information, circuit-mode, rate adapted from 56-kbps.

i = Registered private operating agency, a four-digit data network interexchange carrier (DNIC) used with packet routing.

j = Interexchange carrier preselect.

k = Packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

l = Datarate alternate route index for a CSD call that leaves the office.

m = Packet switch number. Valid value(s):
D_PSN=o
N_PSN=n

n = Next packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

o = Destination packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

p = Interexchange carrier preselect.

q = The LRN returned is home to this switch. Valid value(s):
HOMELRN=N
HOMELRN=Y

r1 = Local number portability trigger number.

s1 = Existence indicator. This provides information on the existence of the DN translation and assignment of the "non-conditional 10-digit trigger for LRN". Valid value(s):
DIRECTORY NUMBER TRANSLATIONS EXIST
DIRECTORY NUMBER TRANSLATIONS EXIST WITH NON COND TRIG
NO DIRECTORY NUMBER TRANSLATIONS EXIST

t1 = Destination numbering plan area code. For packet VFY:OFC input messages, this variable will contain the implied numbering plan area (such as, the area code) used to route the call. The area code is derived for line originated calls. The NPA can be provisioned on RC/V View 8.1 or RC/V View 9.3.

u1 = Output can occur as one message or multiple messages. Each output message is referred to as a segment and marked with an event number and a segment indicator. All messages associated with one request will have the same event number. Segment numbers are used to represent a sequence.

For example: VFY OFC EVENT 3 SEGMENT 1

At the end of each segment, a marker is printed showing if another segment is expected.
VFY OFC: CONTINUING = Another segment will be printed.
VFY OFC: COMPLETED = No more segments are expected.

v1 = Generic address parameter (SS7 ISUP).

w1 = The location routing number digits.

x1 = The value for ASP default routing. Valid value(s):
ANNNC = Default Route to 13A Terminating Announcement.
DLDN = Default Route to Dialed DN.
NONE = No default routing to be applied.

y1 = Geographic portability. Valid value(s):
GEOPORT=N
GEOPORT=Y

z1 = This field indicates the proper text to represent the source of the DAS in the variable 'g'. Valid value(s):
ORIGINATORS_DAS = The DAS assigned to the originating port will be used for digit analysis.
POST_QUERY_DAS = The DAS associated with the trigger number will be used for digit analysis.
CURRENT_DAS = Indicates that the current DAS will be used for digit analysis.
SCP_DAS = The office defined SCP DAS will be used for digit analysis.
LRN_DAS = The LRN DAS assigned to the originating trunk will be used for digit analysis.
SFG_DAS = The DAS defined for the accessed simulated facilities group will be used for digit analysis.
SDN_DAS = The call has requested SDN and the DAS assigned to the EDSL trunk will be used for digit analysis.
IDDDTC_DAS = The DAS defined for international outbound will be used for digit analysis.
ANI_DAS = The ANI table DAS will be used for digit analysis for LDP processing.
II_DAS = The II table DAS will be used for digit analysis for LDP processing.
CIC_DAS = The CIC table DAS will be used for digit analysis for LDP processing.
DEFAULT_ANI_DAS = The default ANI table DAS will be used for digit analysis for LDP processing.
DEFAULT_CIC_DAS = The default CIC table DAS will be used for digit analysis for LDP processing.

a^2 = Route index used for automatic route selection private network.
b^2 = Type of carrier interconnect call.
c^2 = Inhibit dialed number trigger (DNT), indicates whether to look for DNTs following LRN analysis. Valid value(s):
  INHDNT=N
  INHDNT=Y
d^2 = Location routing number screening. Valid value(s):
  LRNSCR=N
  LRNSCR=Y
e^2 = Trigger type. Used to define variable 'e^2'. Valid value(s):
  LNPTRIG = Local number portability trigger.
  TRIG = Non-LNP trigger.
f^2 = A number between 1 and 255 associated with the trigger type in variable 'e^2'.
g^2 = The administrative state code state. Valid value(s):
  LOCKED
  UNLOCKED
h^2 = Defines the signaling transfer point translation type number associated with the trigger.
i^2 = The trigger is allowed for voice calls, data calls or both. Valid value(s):
  BOTH
  CSD
  VOICE
j^2 = Virtual private network (VPN) trigger. Valid value(s):
  N
  Y
k^2 = Application type. Valid value(s)
  800
  ASP
  E911
l^2 = Advanced intelligent network release. Valid value(s):
m² = Source of the service key for query formulation. It is only valid for R0 protocol. Valid value(s):  
ANI  
CDPN

n² = Advance intelligent network (AIN) toll-free service allowed. Valid value(s):  
N  
Y

o² = The bearer capability associated with the call that encountered the trigger. Valid value(s):  
3.1 KHZ AUDIO  
56 KBPS  
64 KBPS  
SPEECH

p² = Global title number, a unique 10 digit number used by the SCP.

q² = Local routing number index assigned to the directory number translation.

r² = Destination point code number. A unique 9 digit number that identifies the receiving entity of the SCP query.

s² = The signaling transfer point translation type number used in the query of the SCP. This will be the value assigned to the trigger or the office (if one is not assigned to the trigger).

t² = The event that caused the trigger to occur. Valid value(s):  
CHANNEL SETUP PRI  
COUNTRY CODE NPA–NXX–XXXX  
CUSTOMIZED ACCESS  
FEATURE ACTIVATOR  
N11  
NETWORK BUSY  
NPA  
NPA–N  
NPA–NXX  
NPA–NXX–X  
NPA–NXX–XX  
NPA–NXX–XXX  
NPA–NXX–XXXX  
OFF HOOK DELAY  
OFF HOOK IMMEDIATE  
ORIG CALLED PARTY BUSY  
ORIG NO ANSWER  
SHARED INTER OFFICE TRUNK  
TERMINATION ATTEMPT  
VERTICAL SERVICE CODE
u² = Query status. Used to indicate result of SCP query. Valid value(s):
NO DATA POPULATED, FEATURE NOT ACTIVATED
NO QUERY PERFORMED
NO QUERY PERFORMED, OVERRIDING HRI FOUND
QUERY BLOCKED
QUERY FAILED
QUERY SUCCEEDED

v² = Type of number returned by the SCP. Valid value(s):
LRN = The DN has been ported to another switch identified by this location routing number.
NON_PORTED_DN = The DN has not been ported.

w² = The called party directory number returned by the SCP. This number may be the original called number which has not been ported or an LRN. It is associated with variable 'v²'.

x² = Switch module (SM). Identifies where the failing (also called asserting) code resides.

y² = The assert number. Refer to the Asserts manual for additional information.

z² = Event number associated with the assert. This allows a correlation of the summary output provided by VFY:OFC with the assert output provided on the ROP.

a³ = Name of the source file where the defensive check failed.

b³ = Indicates the scope of variable c³. Valid value(s):
If b³ = then c³ =
LINE = A source file line number indicating the location where the assert was called or printed.
REF = A programmer defined reference number.

c³ = Line or reference number.

d³ = A brief description of the problem that caused the assert failure.

e³ = The assert error code. Refer to the Asserts manual for additional information.

f³ = Failing address. The virtual address of execution at the time the assert failed.

g³ = Two column output consisting of data and an associated descriptive string.

h³ = Additional information. Multiple comments may be concatenated together.

To determine the meaning of the output comment field, start at the beginning of the comment string and find the matching string below. If there are additional characters, start from that point and find the next matching string. Continue until there are no more characters in the comment field. There is a limit on the total number of characters which means that the last comment may be truncated.

Valid value(s):
Account Code override of toll diversion possible. = The user has an account code feature assigned. This can be used to override the user's screening index (SI) used for RC/V View 10.10. VFY:OFC does not support entry of an ACCT code.
ACVT not supported = Attendant control of voice terminals is not supported by VFY:OFC.
ACCESS OR USER INFO IE DISCARDED = Refer to the cause value definition in the ISUP/TCAP Related Feature Description.
ANI NEEDED FOR FEATURE USE = The two party class of service is not allowed the entered feature if the two-party line does not have ANI or if the calling party number presentation (CPNP) is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
ARS CARRIER SELECTION ERROR. = An error has occurred while processing the carrier access for an ARS call. An example of an error is the specified automatic route selection (ARS) SFG carrier is a LEC carrier and the digits are INTERLATA. Examine the attributes associated with the output CARRIER= and the DIG= string.
ARS ERRRTRT ANNCE USED = An automatic route selection (ARS) uniform number plan dialing error was encountered and the ARS group error treatment is announcement. This error is also used when an ARS call is made with the ODP, an ARS filtering error occurs, and FLTRERR is set to ANN for the ARS.
ARS ERRRTRT ATDN USED = An ARS uniform number plan dialing error was encountered and the ARS group error treatment is route to attendant. This error is also used when an ARS call is made with the ODP, an ARS filtering error occurs, and FLTRERR is set to ATDN for the ARS.
ARS ERRRTRT TONE USED = An ARS uniform number plan dialing error was encountered and the ARS group error treatment is reorder tone. This error is also used when an ARS call is made with the ODP, ARS filtering occurs, and FLTRERR is set to REORD for the ARS.
ARS UNEXPECTED INVLD PORT = This type of port is not supported by ARS. The call will route to reorder.
ARS UNEXPECTED RTE TYPE FROM DIGANAL = An unexpected route type was returned from digit analysis for ARS. The call will route to reorder.
ASP R0D1 feature has not been purchased. = The indicated ASP release is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
ASP Release 0 is inactive. = The indicated ASP release is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
ATNDS CANNOT ACCESS FEATURE ENTERED = An attendant that is not assigned features cannot access the generally available feature that was entered.
Authorization and Account Code override of toll diversion possible. = The user has an authorization code feature and an account code feature assigned. Either one of these features can be used to override the user's screening index (SI) used for RC/V View 10.10. VFY:OFC does not support entry of these codes.
Authorization Code override of toll diversion possible. = The user has an authorization code feature assigned. This feature can be used to override the user's automatic route selection facility restriction level (FRL). VFY:OFC does not support entry of an authorization code.
Authorization Code override possible. = The user has an authorization code feature assigned. This feature can be used to override the user's automatic route selection facility restriction level (FRL). VFY:OFC does not support entry of an authorization code.
Bad Data found during ARS routing. = Bad data was encountered while getting the routing information on an automatic route selection call.
Bad Data found during routing. = Bad data was encountered while getting the routing information.
Basic LRN feature has not been purchased = Encountered an LNP trigger. However, number portability-LRN is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Bearcap data incorrect. = In setting up for a BRI request, the bearer capability was not set up correctly in an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Bearcap data not setup. = In setting up for a BRI request, the bearer capability was not set up in an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

BEARER CAPABILITY INCOMPATIBLE WITH SERVICE REQUEST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BEARER CAPABILITY NOT AUTHORIZED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BEARER CAPABILITY NOT PRESENTLY AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BEARER SERVICE NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BFG TRMFEATS TUPLE MISSING. = The port is in a BFG but the expected rTRMFEATS tuple was not found.

BRI Keypad invalid. = The keypad area of an internal message was not setup correctly. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

BRI setup msg bad. = An error has occurred setting up an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Bypassing LDP Account code Collection for VFY:OFC = If it is determined that Account code digits have to be collected for a MF trunk for LDP processing, verify office will skip collecting and processing account code digits and continue.

CALL AWARDED AND DELIVERED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

CALL HAS BEEN QUEUED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Call is being Toll Diverted (TDV). = The user's screening index (SI), the code index (CDI) of the entered digits, and the prefix value of the entered digits used from RC/V 10.10 are set up to toll divert to the attendant.

CALL REJECTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

CARRIER ACCESS DENIED BY BLK 1PLUS. = Call will route to DEST_TYP NO10xx error treatment because the user is not allowed to access a carrier as dialed. The user is assigned either SPLIT or FULL BLOCKING with the BLK 1PLUS feature.

CHANNEL CONGESTION OR UNAVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

CHANNEL TYPE NOT AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

CHANNEL UNACCEPTABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

COS NOT ALLOWED TO ACCESS FEATURE. = This class of service is not allowed to access the entered feature.

CPNP SFID 50 NOT PURCHASED = The calling party number presentation is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

DATABASE READ FAILURE IN MCidprel = An IDP digit analysis tuple is missing.
Dial Plan Access Treatment (DPAT) error. = A DPAT error was encountered which requires an authorization code to continue. VFY:OFC does not support authorization codes.

DESTINATION OUT OF ORDER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

DIRECT ACCESS LINK. = Indicates that direct access links (DAL) access is allowed for this trunk group.

EXCESSIVE DIGITS RECEIVED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Expected FEX environment not found. = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Facility number should be specified for FX trunk origination. = FACILITY NBR in RC/V View 5.1 needs to be set for the origination trunk.

FAILED TO FIND FEX CC MODEL FOR ARS = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Failed To Get Data Pointers = Failed to retrieve pointers to structures within the routing message.

Failed To Populate BEARER CAPABILITY Parameter = Failed to populate the mandatory BEARER CAPABILITY parameter in the query message.

Failed To Populate GLOBAL TITLE ADDRESS = Failed to populate the mandatory GLOBAL TITLE ADDRESS parameter in the query message.

Failed To Populate USERID Parameter = Failed to populate the mandatory USERID parameter in the query message.

FAILED TO REPLACE TO FEX FOR ARS = Internal error. Try again later. If it still doesn't work, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual for additional assistance.

Failed To Send Message To TCAP = The attempt to send the query message to the TCAP system process failed.

FC_create() ERR1 = An error occurred while trying to get the head of the CLDB list.
FC_create() ERR2 = An error occurred while trying to get an idle CLDB.
FC_create() ERR3 = An error occurred while trying to get and link an MDB to the CLDB.
FCfex_init() ERR1 = An error occurred while trying to get an idle CLDB.
FCfex_init() ERR2 = An error occurred while trying to get an idle MDB.
FCto_fs: Internal error = VFY:OFC processing encountered unexpected code. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

FEATURE 228 NOT PURCHASED. = ISDN personal communication is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

IDENTIFIED CHANNEL DOES NOT EXIST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

IE NONEXISTENT OR NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INCOMING CALLS BARRED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INCOMPATIBLE DESTINATION DIRECT CALL NOT SUBSCRIBED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INTERCEPT TREATMENT ON. = Originating line is on intercept service and is denied origination.

INTERNAL ERROR: FEX COMING DOWN UNEXPECTEDLY. = An internal error has occurred in the feature execution environment interface with verify office. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INTERCEPT TREATMENT ON. = Originating line is on intercept service and is denied origination.

INTERCOM RANGE HAD NO DIGITS TO PREFIX. = An IDP intercom (extension) was entered and the range accessed has no digits to prefix as expected.

Interrupt Message Received = An MGINTERRUPT message was received while waiting for the SCP to respond.

INTERWORKING-UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID ACTION IN MCspicarr = Expected dialed code action was for carrier access but a non-carrier access code was received.

Invalid Assert Message Type Detected By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INVALID CALL REFERENCE VALUE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid Data Collection State Detected By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Invalid Digits Encountered = LNP queries are only allowed to contain dialed digits in the range of 0-9.

INVALID DIGIT VALUE FOR NUMBER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid Error Code Received By RTvfy_rpt() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Invalid Error Code Received By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INVALID INFO ELEMENT CONTENTS = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID NUMBER FORMAT = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID OR UNSPECIFIED MESSAGE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid two-party party value = Expected either TIP or RING but neither was found. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

ISDNFAIL Message Received = An MGISDNFAIL message was received while waiting for the SCP to respond.

ISDN PODS CANNOT USE FEATURES = ISDN PODS terminals do not have access to any BRCS features.

ISDN CANNOT ACCESS USTWC = Usage sensitive three-way calling is not allowed on ISDN terminals.

LASS NOT LOADED = Custom local area signaling services (CLASS) is not loaded on the switch.

CLASS features cannot be used.

LDP ACCOUNT CODE PROCESSING SKIPPED FOR VERIFY OFFICE = If it is determined that account code digits have to be collected for an ISUP trunk for LDP processing, verify office will skip collecting and processing account code digits and continue.

LRN was not entered on command line = This VFY:OFC request is attempting to do an LNP query. NP-verify office for LRN is not activated. NP-test query for LRN is activated but requires an LRN to be specified on the input message line. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual.
Messages manual for additional information.

LTSB CANNOT DEACT MAN EXCLUSION = Deactivation of manual exclusion is not available for LTSB lines.

MANDATORY IE MISSING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Message could not be sent to routing process = The route request message could not be sent. Try again later.

MESSAGE NOT COMPATIBLE WITH CALL STATE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

MESSAGE TYPE NONEXISTENT OR NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

MGRT_FAIL REASON NOT HANDLED BY VFYOF = Route failure reason invalid for VFY:OFC processing. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

NETWORK CONGESTION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO ASSOCIATED DIGITS FOR SPEED CALL DIGIT(S) = A speed call digit(s) was entered and there are no associated digits to analyze.

NON SELECTED USER CLEARING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NORMAL CALL CLEARING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Normalized Office Code Must Be Defined for Home LRNs = LNP error - An NPA and OFFCODE must be populated on the LDIT/RDIT view when HOMELRN=Y.

NORMAL-UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO ROUTE TO DESTINATION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO ROUTE TO SPECIFIED TRANSIT NET = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO USER RESPONDING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NUMBER CHANGED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

OSPS not supported. = Request will be treated as if non-OSPS.

OSREPLACE Is Not supported By RTvfy_rpt() = Entry into RTvfy_rpt() using an OSREPLACE is not currently supported.

OUTGOING_CALLS BARRED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

OVLP attempted on non-ovlp route. = Overlap outpulsing would be attempted on a trunk that does not support overlap outpulsing.

PKT keyword must be entered for the originator specified = The port identified from the input message is used for packet switch data (PSD), so the keyword PKT needs to be included in the input message line.

PORTEDDN or NONPORTED parameter is not supported with non-CCS trunk = PORTEDDN or NONPORTED are only supported for ISUP trunks.

PORT NOT ALLOWED FEATURE = The input originating port is not allowed to access the entered feature.

PORT NOT ASSIGNED FEATURE = The input originating port is not assigned the entered feature.

PORT TRMFEATS TUPLE MISSING. = Port has terminal features assigned but expected TRMFEATS tuple not found.

Pots access not allowed = Access to the office dialing plan is not allowed for this type of call.
PRECEDENCE CALL BLOCKED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
PREEMPTION—CIRCUIT RESERVED FOR REUSE/PREFIX 1 DIALED IN ERROR = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
PREEMPTION/PREFIX 0 DIALED IN ERROR = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
PREFIX 1 NOT DIALED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
PROTOCOL ERROR—UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
RECOVERY UPON TIMER EXPIRATION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
REQUESTED CHANNEL NOT AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
REQUESTED FACILITY NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
REQUESTED FACILITY NOT SUBSCRIBED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
REQUESTED FACILITY REJECTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
RESOURCE UNAVAILABLE OR UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
RESPONSE TO STATUS ENQUIRY = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
Route Index Must Be Defined for Non-Home LRNs = LNP error - A route index must be populated on the LDIT/RDIT view when HOMELRN=N.
Routing Module Tuple Missing. = Unable to retrieve the riRTDNMOD tuple. The accompanying data provides the key information.
ROUTING TO REORDER = A route failure has occurred with the general reason of REORDER. The failure reason is not more specific. If there was an assert output, the error can be determined from the assert failure indicated. The call will route to reorder.
RTvfyasi entered with invalid ASI action. Internal error. = Advanced services interface function expected either action ASITOG or ASIUSE. A different action was encountered. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
RTv_brichks() BRI_ERR1. = Unable to get the TDB.
RTv_brichks() BRI_ERR2. = TDB contains invalid information.
RTv_brichks() BRI_ERR3. = Unable to access the DALB.
RTv_brichks() BRI_ERR4. = Cannot link DALB to TDB.
RTv_brichks() BRI_ERR5. = Could not link the BRCSDB to the DALB.
RTv_brichks() BRI_ERR6. = Could not link DALB to DPB.
RTv_brichks() BRI_ERR7. = Could not link DALB to PCBLA.
RTvdalb_init() PRI_ERR1. = Failed to get a PRISTAT pointer.
RTvdalb_init() PRI_ERR2. = Could not get a DALB.
RTvdalb_init() PRI_ERR3. = Could not link DALB to PRISTAT.
RTvdalb_init() PRI_ERR4. = Could not link DALB to PCBLA.
RTvfy_rsp() Was Entered With Unknown Reason = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
RTvfy_rsp() Specified An Invalid Maxtime. = An internal error was encountered while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
RTvfy_rsp() Received An Invalid Return Value. = An internal error was encountered while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTvfy_rsp() Received a Truncated Message. = An internal error was encountered while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTvfy_rsp() Timed Out Waiting For RSP. = A timeout occurred while waiting for the routing data. Try again later.

SEGMENTATION ERROR = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE DENIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE OPERATION VIOLATED-W/DIAG = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE OR OPTION NOT AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE OR OPTION NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Signal type of the trunk is not supported by Verify Office = The signal type for this trunk on RC view 5.1 is not supported for VFY:OFC.

TEMPORARY FAILURE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

TG IS NOT EQUIPPED TO HANDLE DATARATE = The trunk specified as the originator does not have the DATARATE field on RC/V View 5.1 set or the trunk’s DATARATE is set but the trunk cannot support the data rate requested.

The class of service of the originator is not supported by verify office. = Refer to variable ‘t’ for supported classes of service.

The Finite State Machine Failed = An attempt to query the SCP has failed for an unknown reason.

The tone or announcement type is X. = Where X is the type of tone or announcement that the call would be routed to.

This type of trunk can't be used for FX or Tie service = The class of service of the trunk is not proper for FX/TIE services.

TOO MANY STORED DIGITS = There are too many digits for digit analysis to handle. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TRANSIT NETWORK DOES NOT EXIST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

UCR SFID 47 NOT PURCHASED = Unidentified call rejection is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Unable To Communicate With The Routing Module. = Need to retrieve the riRTDN_TRAN tuple from the routing module; however, the routing module is not operational.

UNALLOCATED NUMBER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

UNASSIGNED DN, NO LRN = An unallocated directory number has been encountered and there was not an location routing number.

UNASSIGNED DN, LRN PRESENT = An unallocated directory number has been encountered and there was an location routing number.

Unexpected Data Collection State In RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
Unexpected Message = Attempting to access a message with an invalid message type.

UNEXPECTED RETURN CODE FROM MCgetdig IN MCidprel. = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNEXPECTED RETURN CODE FROM MCgetdig IN MCidcont. = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNEXPECTED ROUTE FAILURE REASON = Code for route failure unexpectedly entered for a reason that VFY:OFC does not handle. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

Unknown Message Was received By RTvfy_rsp(). = An unknown message was received while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

USER ALERTING NO ANSWER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

USER BUSY = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

User Has Authorization Code First feature. Continuing VFYOFC = The user has an authorization code feature assigned that has ATH FIRST Y. This is being ignored and the verify is continuing. VFY:OFC does not support an authorization Code.

WARNING: Ignoring the authorization code data may result in invalid routing information if the authorization code data overrides, for example, the screening index (SI) to be used, the facility restriction level (FRL) to be used, etc. Check the user's feature and group information to determine if the results of the verify are valid.

Utility Telemetry Service is not activated = UTT feature is not active but the originating port is marked for UTT service. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

VACANT CODE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Verify Office for LRN feature is inactive = This VFY:OFC request is attempting to do an LNP query; however, both NP-test query for LRN and NP-verify office for LRN are inactive. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

VFYOFC ARS NOT SUPPORTED FOR CCS. = Verify of ARS feature is not supported on ISUP/CCS trunks.

VFYOFC ARS NOT SUPPORTED FOR SERVICE CLASS. = The input port has a class of service that cannot have ARS.

VIRTUAL PRIVATE NETWORK CALL. = Indicates that this is an origination virtual private network (VPN) call.

WIRELESS CALL ORIGINATION = Wireless call originsations are not supported by VFY:OFC.

\( i^3 \) = Value type. Used to define type of value indicated in variable ‘\( j^3 \).’ Valid value(s):

CAUSE = Cause code value. Refer to the ISUP/TCAP Related Feature Description for a complete list of cause codes and their meanings.

MDII CODE = Number mapped internally in the DMMDII domain. Refer to the APP:MDII appendix in the Appendixes section of the Output Messages manual.
**ASSERT NUMBER** = Assert number.
**TRIGGER TYPE** = Trigger type.
**TRIGGER NUMBER** = Trigger number.
**SERVICE TYPE** = Service type.
**MESSAGE TYPE** = Message type.
**ERROR CODE** = Error code.
**DCSTATE** = The data collection state.
**REASON** = Reason.
**RETURN CODE** = Return code.
**ROUTE INDEX** = Route index.

\[ j \] = Value definition associated with value type as indicated in variable \( i \).

\[ k \] = Context identifier. This field is associated with the AMA recording for unbundled and resold feature. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information. Valid value(s):
- **NATIVE** = This is the default value if the SFID is inactive. This port is native to the switch.
- **UNBUNDLED** = This port has been unbundled from the switch.
- **RESOLD** = This port has been resold.

\[ l \] = LNP trigger number.

\[ m \] = The dialed digits are a number that may have been ported into, or out of the office. Valid value(s):
- **PORTED_IN** = Y
- **PORTED_IN** = N

\[ n \] = Automatic number identification (ANI) digits. ANI contains the calling party number or charge number. Used for LDP ANI processing. ANI is a required field for LDP LATA trunks. Valid value(s):
- 10 digit NPA-NXX-XXXX
- 3 digit NPA
- **NULL** = The NULL value shall be valid only when DIG=950-XXXX The trigger number and trigger type are output. for CALLTYPE=FGB or FGBPS calls.

\[ o \] = For a MF trunk this field represents the ANI information digits (II). Valid value(s):
- 00 = Identified line with no special treatment.
- 01 = Operator number identified (multiparty).
- 02 = ANI failure.
- 06 = Hotel without room identification.
- 07 = Coinless, hospital, or inmate call.
- 08 = Interlata restricted.
- 10 = Test call.
- 20 = Automatic input/output dialing (AIOD) listed directory number sent.
- 23 = Identified line (coin or noncoin).
- 24 = Translated 800 call.
- 27 = Coin line.
- 34 = Operator handled.
- 52 = Outbound wide area transport (OUTWATS) line.
- 68 = Interlata restricted hotel line.
- 78 = Interlata restricted coinless line.
93 = Virtual private network line.
NULL = NULL input, valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS calls.

p3 = Originating line information (OLI) for a CCS7 trunk. Valid value(s):
   IDLINE = Identified line with no special treatment.
   01 = Operator number identified (multiparty).
   02 = ANI failure.
   06 = Hotel without room identification.
   07 = Coinless, hospital, or inmate call.
   08 = Interlata restricted.
   10 = Test call.
   20 = Automatic input/output dialing (AIOD) listed directory number sent.
   23 = Identified line (coin or noncoin).
   24 = Translated 800 call.
   27 = Coin line.
   34 = Operator handled.
   52 = Outbound wide area transport (OUTWATS) line.
   68 = Interlata restricted hotel line.
   78 = Interlata restricted coinless line.
   93 = Virtual private network line.
NULL = NULL input, valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS calls.

q3 = This field represents the first table matched in LDP processing. Valid value(s):
   LDP_ANI = The ANI type tuple was matched with a tuple in the LDP ANI table (LDP index table).
   LDP_CAR = The ANI type tuple was matched with a tuple in the LDP CARRIER table.
   DEFAULT_ANI = The ANI type tuple was matched with a tuple in the DEFAULT ANI table.
   DEFAULT_CIC = The ANI type tuple was matched with a tuple in the DEFAULT LDP CARRIER table.

r3 = Calltype prefix of the dialed number. This also corresponds to the nature of number value for
    CCS7 signaling. Valid value(s):
   1P = World zone 1, non-operator.
   0P = World zone 1, zero plus.
   011 = International, non-operator.
   01P = International 01 plus (dialed as 01+CC+NN).
   01M = International 01 minus.
   DOM = Domestic (United States).
   FGB = FGB (950-xxxx) calls from transition EAEO/AT.
   FGBPS = FGB (950-xxxx) calls from public station during and after the transition.
   FGDCT = Feature group D cut through calls.

s3 = Carrier identification code (CIC).

t3 = Transit network selector (TNS) circuit code.

u3 = Carrier code for TNS.
v³ = Country code (CC) for the called number.

w³ = Terminating network selection code (TNSC). This is relevant only for specified MINT trunks.

x³ = Terminating network selection code sent out with the call. This is relevant only if outgoing trunk is MINT.

y³ = Wide band (WB) data rate for CSD calls. Valid values(s):
   384 = 384 kbps.
   384_1536 = 384 or 1536 kbps.
   1536 = 1536 kbps.

z³ = WB data rate channel for CSD calls. Wideband channel specifies the number of DS0s requested for the call. The number of DS0s is the information transfer rate multiplier value.

A³ = WB data rate alternate route index for a CSD call that leaves the office.

b³ = ASP trigger type. Valid values(s):
    DIALED_NUMBER_TRIGGER
    OFF_HOOK_DELAY

c³ = ASP trigger number.

d³ = Destination index for FGD tandem cutthrough calls.

e³ = Route index for FGD tandem cutthrough calls.

NONPORTED = Presence of this key indicates that variable 'b' value is known to be non-ported.

PRESUBSC = Keyword to indicate if the calling party is presubscribed to the carrier associated with this call.

SAT = Keyword to indicate if the call has been routed using a satellite.

4. ACTIONS TO BE TAKEN

In the cases where an explicit translations error is found, or if the call routes to an incorrect line or trunk, follow local provisioning procedures to correct the situation.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print the routing translations results of an VFY:OFC input request. The output may be presented in multiple messages. The last line of each message indicates if verify office has completed or if additional messages are expected. The messages will be in one of the seven output formats.

Format 1 echoes the input message parameters and provides digit analysis results.

Format 2 provides LNP trigger information (if available), SCP query related information and status, and indication on the existence of the terminating directory numbers' translation. Format 2 will not be used to provide data pertaining to ASP or network services triggers since only LNP triggers are supported by verify office.

Formats 3, 4, and 5 provide information on errors which result in an assert message output to the read only printer (ROP). Assert activity will cause termination of the verify office request. Assert activity encountered during processing of a verify office request is not suppressed by brevity control.

Format 6 provides additional information related to the request processing. The additional information may be useful information about a successful request, or describe an error condition which does not result in an assert message output.

Format 7 provides additional digit analysis results and routing information for LDP processing. This format is always preceded by the format one output, and will never output of its own.

3. VARIABLE FIELD DEFINITIONS
a = The originator for which the call is being verified. Valid value(s):

DN=x  MLHG=y-a  PORT_ENTERED  TG=y-a

The value of PORT_ENTERED is output when a specific port was specified in the input message.

b = Verified digits that were specified in the input message. A value of NONE will be returned if no
digits were specified in the input message.

c = Event number of the request.

d = Number of the switching module (SM) on which the originator is located.

e = Port member number of the originator, in hexadecimal. The port member will be blank if the
originator specified is a Bearer Independent Call Control trunk group.

f = Specific party associated with the originating directory number. For an explanation of the specific
values, refer to the Translations Data manual.

g = Digit analysis selector, used for digit analysis. Refer to variable 'z' for the source of the DAS
value.

h = Screening index; post query screening, automatic route selection (ARS) screening, simulated
facilities group (SFG) screening, or the originator's screening found in the office data.

i = Class of service for the originator. Refer to the Translations Data manual for definitions.

j = The digits used to determine routing data after deleting and prefixing by digit analysis, but prior to
any deleting and prefixing resulting from routing to a trunk to leave the office. Refer to RC/V View
10.2.

k = Prefix dialed. Valid value(s):

NULL or BLANK
NONE = No prefix was dialed.
0 (0+) = entered "0" plus prefix
1+ = entered "1" plus prefix
01+ = entered "01" international prefix
011+ = entered "011" international prefix

l = Destination index or code index found in the office data for this call.

m = Destination type found in the office data for this call. Refer to the Recent Change Procedures
manual, Digit Analysis Views, for a definition of the values.

n = Specific action defined in the office data for the dialed feature code. This is null unless the value
of variable 'm' is FEATURE. Refer to the Recent Change Procedures manual for definitions.

o = Charge index found in the office data for this call.

p = Carrier used for the call. If no carrier was specified or if the specified carrier was not used, this
field will be blank.

q = Termination of the call with respect to this office (if blank, call termination is not determined). Valid
value(s):
DIALCODE

DR_ALT RI=1
MCRI=a
NOC=c
RI=b
TRUNK=d

r = Facility restriction level of the originating port (line or trunk). This is for automatic route selection, if applicable.
s = SFG group number.
t = Information field. Valid value(s):

ADVANCED SERVICES PLATFORM FEATURE DETECTED = Call originator has advanced services platform active (ASP) or has encountered an ASP route in an ARS route list. Neither are supported by verify office feature.

ANI CANNOT BE ENTERED WITH LINE ORIGINATOR = ANI can only be entered for trunk origination.

ANI COLLECTION NOT SUPPORTED = Automatic number identification (ANI) is needed for the SCP query. ANI collection is not supported by VFY:OFC.

ANI IS REQUIRED FOR LDP LATA TRUNKS

ANNOUNCEMENT ON ALTERNATE CODE TREATMENT = An alternate code treatment (ACT) with error treatment of announcement encountered.

ARS CALL OVERFLOWED TO DDD = The ARS digits analyzed overflowed to direct distance dialing (DDD) on the office dialing plan.

ASI_CF DATABASE READ FAILED = The advanced service interface feature information cannot be found. Check the feature assigned to the port.

ASI_GP DATABASE READ FAILED = The advanced service interface group information cannot be found. Check the group assigned to the port.

ASI FEATURE NOT ASSIGNED OR NOT ACTIVE = An advanced service interface feature dialed code was entered but the originating port does not have an active ASI feature assigned.

ASI_PORT DATABASE READ FAILED = The advanced service interface port information cannot be found. Check the port parameters.

ASP TRIGGER ENCOUNTERED, NO FURTHER VERIFICATION = ASP (non-LNP) triggers are not supported by VFY:OFC.

ASSERT 911 OCCURRED = An error occurred while getting E911 data. VFY:OFC does not support E911 queries.

AUTHORIZATION CODE OR ACCOUNT CODE REQUIRED = An authorization code or account code is required for this call or was entered in the input message. Authorization or account codes are not support by VFY:OFC.

AUTO ARS FOR CSD IS NOT SUPPORTED FOR VFY:OFC = Automatic route selection is not supported for circuit switched data by VFY:OFC.

AUTOMATIC ROUTE SELECTION CALL ROUTED TO ANNOUNCEMENT = An ARS call was routed to the designated MC route type of announcement.

AUTOMATIC ROUTE SELECTION CALL ROUTED TO REORDER = An ARS call was routed to reorder because the designated route type was REORDER or because an error was encountered while processing the ARS call.

BAD DIALING STATE = An invalid dialing state was encountered during digit analysis. Digit analysis translations should be examined.

BAD ROUTE TYPE IN RLARSCRN = An illegal route type was found in the base relation RLARSCRN.
BAD ROUTE TYPE IN RLRT_MCRT = An illegal route type was found in the base relation RLRT_MCRT. The tuple key is the printed modular constructed route index (MCRI).

BAD ROUTE TYPE IN RLRT_ROUTING = An illegal route type was found in the base relation RLRT_ROUTING. The tuple key is the printed route index (RI).

BEARER CAPABILITY NOT SUPPORTED = The LNP trigger does not support bearer capability for VFY:OF. For example, the trigger is marked to allow only voice and this is a circuit switched data request.

CALL IS BEING ROUTED TO TONE OR ANNOUNCEMENT = An error has been encountered which will cause a route to reorder, tone, or an error announcement.

CALL NOT ALLOWED FOR CHARGE A CALL LINE = Call has been routed to tone or announcement. Refer to variable 'n' for the type of treatment.

CALL ROUTED TO AN ATTENDANT = The call was routed to the specified terminal group attendant. Refer to variable 'j' for the attendant directory number.

CALLTYPE CANNOT BE ENTERED WITH LINE ORIGINATOR = CALLTYPE can only be entered for trunk origination.

CALLTYPE IS 011 OR 01P - CIC OR CC MISSING = For an MF international 011 or 01P call, both CIC and CC are required.

CALLTYPE IS 1P, 0P, OR 01M - CC MUST NOT BE SPECIFIED = For an MF world zone 1 (1P, 0P) or international 01M call, specifying CC is an error.

CANNOT SEND ACM AND PLAY TONE OR ANNOUNCEMENT = The call is terminated because of network control point (NCP) action.

CARRIER DIALED TWICE NOT ALLOWED = A carrier access code is not be entered twice.

CC CANNOT BE ENTERED WITH LINE ORIGINATOR = CC can only be entered for trunk origination.

CIC CANNOT BE ENTERED WITH LINE ORIGINATOR = CIC can only be entered for trunk origination.

CI TYPE IS INTERLATA BUT NO RPOA WAS RECEIVED = The carrier interconnect type returned by digit analysis is inter-lata. This means that a carrier is required to complete the packet call. RPOA should be entered as the carrier in the VFY:OF input message.

CI TYPE RETURNED BY DA NOT APPLICABLE TO PKT = The carrier interconnect type returned by digit analysis is not applicable to a packet.

CMP UNAVAILABLE = During processing of the VFY:OF input message, it was determined that the CMP was not linked to the AM and processing could not continue.

COS NOT ALLOWED IDP AND SC1 = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan and a 1-digit speed calling feature; but, these options were found in relation RLTRM_FEATS.

COS NOT ALLOWED IDP AND SC2 = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan and a 2-digit speed calling feature; but, these options were found in relation RLTRM_FEATS.

COS NOT ALLOWED ID FEATURE = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan (IDP) feature; but, this option was found in relation RLTRM_FEATS.

COS NOT ALLOWED IDP, SC1, AND SC2 = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan, a 1-digit speed calling, and a 2-digit speed calling feature; but, these options were found in relation RLTRM_FEATS.

COS NOT ALLOWED SC1 AND SC2 = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have a 1-digit speed calling and a
2-digit speed calling feature; but, one of these options was found in relation RLTRM_FEATS.

COS NOT ALLOWED SC1 FEATURE = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have a 1-digit speed calling feature; but, this option was found in relation RLTRM_FEATS.

COS NOT ALLOWED SC2 FEATURE = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have a 2-digit speed calling feature; but, this option was found in relation RLTRM_FEATS.

CSD or PKT KEYWORD CANNOT BE ENTERED WITH BICC TRUNK GROUP = The call originator specified is a Bearer Independent Call Control (BICC) trunk group which only supports Circuit Switched Voice (CSV) calls.

CUTTHRU CALL NOT SUPPORTED FOR VFY:OFC = For FGD cutthrough calls, no output information is provided.

CUTTHRU TRIGGER ENCOUNTERED, NO FURTHER VERIFICATION = This is a warning message to indicate that no further verification will be done when a CUTTHRU trigger is encountered. The trigger number and trigger type are output.

DATABASE ERROR OR SOFTWARE INCONSISTENCY DETECTED = Some data or code has detected an inconsistent result. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

DEDICATED SDN TRUNKS ARE NOT SUPPORTED = Attempted to access the software defined network (SDN) that is not supported.

DEST SWITCH MUST BE DIFFERENT FROM ORIG SWITCH = The PSN cannot be the packet switch number of the originator.

DEST TYPE RETURNED BY DA NOT APPLICABLE TO PKT = The destination type returned by digit analysis is not applicable to a packet.

DIAL PLAN ACCESS TREATMENT (DPAT) ERROR = A DPAT error was detected during IDP digit analysis. The call was routed to announcement or reorder tone.

DIG IS OPTIONAL OR 9500000 FOR CALLTYPE=FGB/FGBPS ON MF TRUNK = An invalid digit string is entered for CALLTYPE FGB or FGBPS on MF Trunk. DIG is not required for MF FGB/FGBPS. If entered, digit string must be 9500000.

DIG HAS TO BE 950xxxx FOR CALLTYPE=FGB/FGBPS ON ISUP TRUNK = This occurs when digits other than 950xxxx are entered for CALLTYPE=FGB/FGBPS for an ISUP trunk.

DIGIT ANALYSIS FAILED = A failure occurred while analyzing the digits.

DIGIT ANALYSIS RETURNED VACANT = Digit Analysis returned vacant code treatment for the packet call.

DIGIT STRING CANNOT BE LONGER THAN 18 FOR SS7 TRUNKS = Trunks that use ISUP7 signaling cannot have more than 18 digits in variable 'b'.

DIGITS ANALYZED ROUTE TO IDP ERROR TREATMENT = IDP error treatment will route the call to tone or announcement.

DN ASSOCIATED WITH UCD OR MUPH MLHG, NO PORT = The directory number (DN) associated with the uniform call distribution (UCD) or multiposition hunt (MUPH) multi line hunt group (MLHG) was identified to have no port. These are not supported by VFY:OFC.

EMERGENCY STAND ALONE REROUTING FAILURE = There was a stand alone test line failure during the attempt to route. Some reasons could be:
- The digits entered in variable 'b' are not the specified emergency number
- There is a feature assigned that is not supported for test lines.

Check the test line attributes and/or the entered VFY:OFC input message.

EMERGENCY STAND ALONE REROUTING TO LINE = The stand alone test line routing went to the
emergency line specified on RC/V View 4.9.
EMERGENCY STAND ALONE REROUTING TO TRUNK = The stand alone test line routing went to the emergency trunk specified on RC/V View 4.9.
EXCEEDED MAXIMUM IDP INTERPRETATIONS = The digits being analyzed has exceeded the maximum of 5 IDP interpretations. Call was routed to a reorder tone.
EXTRA DIGITS DETECTED BY DIGIT ANALYSIS = Digit analysis tables were populated for an expected number of digits. More digits appeared in variable ‘b’ or were analyzed as a result of a query response.
FAILED TO GET TERMINAL PARAMETERS = The trunk or line data could not be read to get digit analysis information. Check the originating port.
FAILURE RETURNED FROM TCAP = A failure occurred when sending a TCAP message.
FEATURE GROUP B CALLS ARE NOT SUPPORTED = Feature Group B calls not supported on ISUP trunks.
FEATURE INVOKED IS NOT SUPPORTED FOR VFY:OFC CSD = No features are being supported for CSD calls.
FEATURE IS NOT ACTIVATED = Refer to variable ‘h3’ for an explanation.
FUNCTIONALITY NOT SUPPORTED = An attempt was made to send a route request from a function that has not been modified to support VFY:OFC. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
FX/TIE TRUNK ERROR ENCOUNTERED = Refer to variable ‘h3’ for an explanation.
ICPI REQUIRED BUT NOT INPUT = This X.75/X.75 trunk originated call is an inter-lata call that requires an interexchange carrier preselect indication (ICPI). The ICPI was not entered in the VFY:OFC input message.
IDDD CALLS REQUIRE A CARRIER; DA RETURNED NO CARRIER REQUIRED = Packet interstation to station calls require a carrier but digit analysis indicated that no carrier is required.
IDDD OVER OUTWATS BLOCKED = An ARS call attempted to go IDDD over an OUTWATS trunk.
IDP ASSIGNED WHILE PROCESSING SPEED CALL = Speed calling from plain old telephone service (POTS) is only valid if the port has no IDP.
IF ICPI IS SPECIFIED, ORIGINATOR MUST BE X.75 OR X.75' TRUNK = The packet trunk specified as the originator must be an X.75 or X.75 trunk if ICPI is specified.
IF PSN IS SPECIFIED, THE ORIGINATOR MUST BE AN IP TRUNK = The packet trunk specified as the originator must be an IP trunk if PSN is specified as the destination.
II CANNOT BE ENTERED FOR ISUP TRUNK = Invalid input combination. II can only be entered for MF trunk.
II CANNOT BE ENTERED WITH LINE ORIGINATOR = II can only be entered for MF trunk origination.
ILLEGAL DA SAC CALL TYPE = A service access code (SAC) type carrier interconnect (CI) call is present in digit analysis relation, but the call type does not allow this feature.
IMPLIED NPA COULD NOT BE DERIVED = The implied NPA for the packet called address could not be derived because of a database error.
INCOMING FACILITY MUST BE SS7 TRUNK GROUP = LNP error. When an LRN is entered without a DIG argument, the incoming facility must be a SS7 trunk group.
INSUFFICIENT FRL DETECTED BY ROUTING = The ARS facility restriction level (FRL) of the call was less than the facility restriction level of the route.
INTERCOM CALL RESTRICTION DETECTED = ICR simulated facilities group is not supported by VFY:OFC.
INTERNAL FAILURE DETECTED = A failure condition was detected. Refer to variable ‘h3’ for more details. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
INVALID ACTION TYPE FOUND = An invalid action was encountered during digit analysis by the IDP.
INVALID AUTHORIZATION CODE = Authorization code is not supported in VFY:OFC.
INVALID CALLED ADDRESS = The packet called address entered in the VFY:OFC input message is invalid. The length of the packet called address is invalid or for international E.164 calls, 0110 cannot be the specified as the first four digits of the packet called address.
INVALID CALLING ADDRESS = The calling address specified in the VFY:OFC input message was found to be invalid. Some reasons could be:
   - Invalid address length.
   - If this is MLHG, the specified MLHG number does not match the dd_number in RLpx25ln calling address.
   - The specified NOC is invalid.
   - The calling address does not match the MLHG linear DN of the MLHG group.
INVALID COS FOR TYPE OF CALL = The originator has a class of service that is supported for VFY:OFC but is invalid for CSD or PTK.
INVALID DATA IN TUPLE = Invalid data was found in an existing tuple in the ODD. Refer to rest of message for details.
INVALID DATARATE = The data rate requested is either not supported or not valid. This could also occur when the data rate entered is incompatible with the data rate of the destination trunk.
INVALID ID RELATION = An invalid IDP relation was found when expanding a speed call code.
INVALID RPOA = The RPOA entered in the input message is not valid RPOA in the ODD. A tuple with the specified RPOA as key was not found during the read operation of the RLPSDNICRI relation.
INVALID WIDEBAND RATE = The wideband rate entered is incompatible with the wideband rate of destination trunk.
LDP LATA TRUNKS ARE NOT SUPPORTED = The VFY:OFC for LDP is not active so LDP on LATA trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
LDP MINT TRUNKS ARE NOT SUPPORTED = The VFY:OFC for LDP is not active so LDP on MINT trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
LDP DAL TRUNKS ARE NOT SUPPORTED = TheVFY:OFC for LDP is not active so LDP on DAL trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
LEAD ACCOUNT CODE DETECTED = A lead account code was detected during uniform number plan (UNP) digit analysis. This is not supported by VFY:OFC.
LEASED NETWORK QUERY NOT SUPPORTED = LN TCAP queries are not supported by VFY:OFC and an LN query is required to complete routing.
LNP on LDP NOT PURCHASED = LNP on LDP is not activated. LNP processing can not be done for this VFY:OFC request.
LRN, PORTEDDN OR NONPORTED ARE INVALID FOR ISUP INTERNATIONAL CALL MDII OCCURRED = The value of the MDII code is shown. Refer to rest of message for details.
MEMBER VALUE CANNOT BE ENTERED WITH BICC TRUNK GROUP = The specified call originator is a BICC trunk group. BICC trunk groups cannot have members assigned. Therefore no member can be specified on the command line. The member field cannot be used to specify a CIC. The base CIC is used to process all
BICC requests.

MODM POOL ACCESS DN ENTERED, MP NOT SUPPORTED FOR VFY:OFC PKT = The specified originator is a modem pooling access DN. Modem pooling is not supported by packet VFY:OFC.

MORE DIGITS REQUIRED TO GET ROUTING INFORMATION = Not enough digits were entered in the input message to determine routing information.

MSG FORMAT IS INCORRECT = The format of the input message is not correct. Refer to the VFY:OFC input message.

NETWORK CALL DENIAL IS SET, CALL IS DENIED = Network call denial (NCD) indicator is set to “Y” in the ANI table. The VFY:OFC request is denied.

NETWORK SERVICES TRIGGER NOT SUPPORTED = Network services triggers are not supported by VFY:OFC.

NO DIAL CODE IN DA = A dial code was not detected by digit analysis. If the destination type is not a dialed code or this is not a BRCS line, the input originating port is restricted from use.

NO DIGITS SPECIFIED OR FOUND = No dialed digits were specified and the originator does not have any default ones in the database.

NO DIRECTOY NUMBER TRANSLATION, HUNDREDS GROUP ROUTING APPLIES = The DN is not assigned in this office; however, routing using hundreds group applies.

NO ERROR TREATMENT FOR ACT = Alternate code treatment (ACT) was encountered with no error treatment specified.

NO ERROR TREATMENT FOR DPAT = Dialing plan access treatment (DPAT) was encountered with no error treatment specified.

NO IECP FACILITY SUBSCRIBED WHEN NEEDED = The packet line specified as the originator is not provisioned with an interexchange carrier preselect (IECP) although digit analysis has returned that this is an inter-lata call requiring a carrier. In this case, RPOA has also not been entered. The IECP should be provisioned in the ODD for this call or RPOA should be specified.

NON-DNT ORIGINATION = The originating port is not allowed to access ASP triggers.

NON-UNIQUE NXX DN ENTERED = The entered originator DN is ambiguous because of the increased number of NXX's. Reenter the input message using a 10-digit originator DN.

NOT ALLOWED TO ORIGINATE = The originator may not dial calls.

NOT SUPPORTED, SEE CUSTOMER DOCUMENTATION = The originator COS or destination type is not supported by VFY:OFC. The following originator COS values are supported for voice:

LINES

FC_2PTY = Two party, multifrequency ringing.
FC_4PFS = Four-party fully selective line.
FC_4PSS = Four-party semiselective line.
FC_4WIRE_INDV = 4 wire subscriber line.
FC_5PTY = Five party, multifrequency ringing.
FC_8PSS = Multiparty line.
FC_10PTY = MFR multiparty line.
FC_ATTENDANT = Attendant line (similar to individual).
FC_CHGACALL = Charge-a-call origination.
FC_COIN = Coin line.
FC_HOTMOTL = Special termination at motel equipment.
FC_INDIVD = Individual line.
FC_ISDN = ISDN Line, allowed for analog lines.
FC_PBX = PBX line origination.
FC_SATSTLN = Stand alone test line.
FC_TWOPTY = Two-party line.
PBXHOTMOT = Special termination to a motel.

TRUNKS

FC_BSYVFY = Busy verify trunk.
FC_IEC = Carrier trunk.
FC_LATA_CONN = Toll end of LATA connecting trunk.
FC_LTOLL_CONN = Local end of toll connect trunk.
FC_PF = Private facility trunk.
FC_PFITT = Private facility trunk intertandem tie trunk.
FC_PFLASH = Private facility trunk with flash repeating.
FC_PRI_INTOLL = Primary intertoll trunk.
FC_SEC_INTOLL = Secondary intertoll trunk.
FC_SPAMEG = Special access MEGACOM trunk.
FC_SPAWATS = Special access WATS trunk.
FC_TTOLL_CONN = Toll end of toll connecting trunk.
FCEDSL = PRI trunk.
FCEDSLHM = Hotel/motel PRI trunk.

The following originator COS values are supported for CSD:

LINES

FC_ISDN = ISDN line.
PSX25_T1 = X25 access on a T1 facility.

TRUNKS

FC_IEC = Carrier trunk.
FC_LATA_CONN = Toll end of LATA connecting trunk.
FC_LTOLL_CONN = Local end of toll connect trunk.
FC_PF = Private facility trunk.
FC_PFITT = Private facility trunk intertandem tie trunk.
FC_PFLASH = Private facility trunk with flash repeating.
FC_PRI_INTOLL = Primary intertoll trunk.
FC_SEC_INTOLL = Secondary intertoll trunk.
FC_TTOLL_CONN = Toll end of toll connecting trunk.
FCEDSL = PRI trunk.
FCEDSLHM = Hotel/motel PRI trunk.
PSX75_TK = Packet Switching on X.75.
PSX75P_TK = Packet Switching on X.75'.
PSPKT_TRK = Packet Switching on Inter-Switch Trunks.

The following destination types are not supported:

FCNS800 = Number services (800) type call.
FCSTG1FCA = Dial 011+PCC or 18X - fully coded addressing.
FCIDDFCA = Dial CC+NN - fully coded addressing.
FCAPSDN = Software defined network at an action point.
FCSPAM800 = MEGACOM 800 (special access).
OAD2VDT = DA call to VDT.
OAOPNIT = Non-ISP call to VDT.
OLI CANNOT BE ENTERED FOR MF TRUNK = Invalid input combination. OLI can only be entered for an ISUP trunk.

OLI CANNOT BE ENTERED WITH LINE ORIGINATOR = OLI can only be entered for a ISUP trunk origination.

PARTIAL DIAL TREATMENT = The call will route to tone or announcement. Refer to variable 'm' for the type of treatment.

PFA FEATURE NOT SUPPORTED = The input digits contained a private facilities access code that is not supported by VFY:OFC.

PFA MC ROUTING IS NOT SUPPORTED = Private facilities access is not supported by VFY:OFC.

PORT IS NOT ASSIGNED = The originating port is not assigned.

PORTED NUMBER ROUTING ERROR = The number was expected to be ported into the switch but no directory number translations exist for this DN. Possible problems are the SCP query response, the directory number assignment, or digit analysis ported-in flag.

PRECEDEANCE AND PREEMPTION CALL DETECTED = Precedence and preemption calls are not supported by VFY:OFC.

PRESUBSC CANNOT BE ENTERED WITH LINE = PRESUBSC can only be entered for trunk origination.

QUERY TIMEOUT = A query was sent to the SCP and the response was not received before timing out.

QUERY/RESPONSE SIMULATION FAILURE = An LRN was entered on the input message line which has not been processed correctly. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

REORDER ON ALTERNATE CODE TREATMENT = Individualized dialing plan, alternate code treatment (ACT) with error treatment of reorder encountered.

REORDER ON INSUFFICIENT FRL = The facility restriction level (FRL) of the call was less than the required FRL indicated in the dialing plan. Error treatment is reorder tone.

RESPONSE NOT SUPPORTED = The SCP responded with a message that is not supported by VFY:OFC. Verify processing stopped when this message was received.

RLRTDNMOD: Routing Module and Route Index are 0 = Retrieved the rlRTDNMOD tuple, but the routing module is set to zero and hundreds group routing does not apply.

ROUTE FAILURE ENCOUNTERED = The route request resulted in a failure. Refer to variable 'h3' to determine the cause of the failure. Not all routing failure cases are supported by VFY:OFC. and additional data would not be available in those cases.

ROUTING ERROR = A non-HOME LRN was detected and a route index must be defined for this condition. Check digit analysis data.

ROUTING SP MAXED OUT, DATA MAY BE INCORRECT = The routing system process reached a maximum running limit or state limit before completion of the routing process. The output reflects the information gathered up to that point. However, it does not show the completed routing information and is not guaranteed to be correct.

ROUTING TO TONE OR ANNOUNCEMENT = The call will route to tone or announcement. Refer to variable 'm' for the type of treatment.

RPOA INPUT BUT INTRA-LATA COMPETITION NOT ALLOWED = Inter-lata competition is not allowed in this office. The packet call cannot be routed by the RPOA entered in the VFY:OFC input message.

SAT CANNOT BE ENTERED WITH LINE ORIGINATOR = SAT can only be entered for a trunk origination.

SAT(SATELLITE) IS INVAILDL FOR NON-MINT MF TRUNKS

SCREENING FAILURE = This error can indicate carrier blocking (CBLK) is active for the screening (charging) from RC/V View 10.10. The call will route to reorder if RTI=REGL on the row entry that is marked for carrier blocking.

SECURED FEATURE NOT PURCHASED = A Secured Feature Id needed to process the verify office request has not been purchased. See 'h3' for more information.
SEND TO RESOURCE NOT SUPPORTED = Verify does not support send-to-resource responses from the SCP. Verify processing was stopped when this message was received.

SENDING RELEASE MESSAGE = Call processing encountered an error event and populated a RELEASE message for the ISUP7 trunk. This signaling message is not actually sent but contains a cause code which is displayed in variable ‘i’.

SERVICE TRUNK GROUP NOT SUPPORTED = The call originator specified is a Service Trunk Group. BICC originations are not allowed on a Service Trunk Group. A BICC group must be specified to process BICC calls.

SERVICE TYPE NOT SUPPORTED = Number services type not supported by VFY:OFC. Refer to variable ‘h’ for more details.

SM IS NOT EQUIPPED OR OPERATIONAL = An SM is not available for examination.

SPEED CALL FEATURE NOT ASSIGNED = A speed call code was entered but no speed call feature is assigned.

TDX DATA CALLS FEATURE NOT ACTIVE = TDX data calls feature is not active. The VFY:OFC request for the LDP trunk is denied.

TG IS NOT EQUIPPED TO HANDLE DATARATE = The trunk specified as the originator does not have the DATARATE field on RC/V 5.1 set or the trunk’s DATARATE is set but the trunk cannot support the data rate requested.

TG IS NOT EQUIPPED TO HANDLE VOICE CALL = This trunk group is equipped for data calls instead of voice calls.

TIMEOUT IN AM WAITING FOR SM RESULTS = No verify results have been received from the SM on which the originator resides. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TNS AND CIC CANNOT BE ENTERED AT SAME TIME FOR DOMESTIC ISUP CALL = For a VFY:OFC request on ISUP trunk, TNS and CIC can not be entered at the same time when CALLTYPE=DOM.

TNS CANNOT BE ENTERED WITH LINE ORIGINATOR = TNS can only be entered for a trunk origination.

TNS IS INVALID FOR MF TRUNKS = TNS is valid only for an ISUP trunk.

TNSC CANNOT BE ENTERED WITH LINE ORIGINATOR = TNSC can only be entered for a trunk origination.

TNSC CAN BE SPECIFIED ONLY FOR MINT TRUNKS = TNSC is invalid for the specified trunk if MINT_SIG=NULL.

TOO FEW DIGITS IN CALLED ADDRESS = Digit analysis tables were populated for an expected number of digits. Fewer digits appeared in variable ‘b’ or were analyzed as a result of a query response.

TRIGGER NUMBER NOT FOUND IN NS_TRIG = The trigger number was not populated in the RLNS_TRIG relation. Check the data associated with trigger numbers. The output message contains the trigger number.

TRIGGER TYPE NOT SUPPORTED = An invalid trigger type has been encountered.

TRY LATER, CAN NOT CREATE PROCESS IN SM = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TRY LATER, CAN NOT SEND MESSAGE IN SM = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TRY LATER, RESOURCES FOR FEATURE EXECUTION ENVIRONMENT UNAVAILABLE = When trying to start a FEX environment, the necessary data blocks (MDB, CLDB) were not available. Try again later.

TUPLE MISSING OR DATABASE ERROR DETECTED = The base relation and the tuple keys follow.
UNABLE TO DELETE SPECIFIED DIGITS = During digit conversion, a request was made to delete more digits than dialed. The relation identified should be checked.

UNABLE TO SEND MESSAGE FROM AM = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNEXPECTED DESTINATION TYPE FOUND = An unexpected destination type was encountered by the IDP during feature transition processing.

UNEXPECTED ERROR TREATMENT FOR ACT DETECTED = An unexpected error treatment was detected for the alternate code treatment (ACT).

UNEXPECTED ERROR TREATMENT FOR DPAT DETECTED = An unexpected error treatment was detected for the dialing plan access treatment (DPAT).

UNEXPECTED RESULTS FOR DEDICATED E911 TRUNK = The input port or trunk group is a dedicated E911 trunk and an MDII occurred. The MDII value has also been output.

UNKNOWN DA ROW ENCOUNTERED = An illegal value for the row attribute was found in the indicated tuple.

UNKNOWN ERROR = An undefined error was present. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNKNOWN ROUTE TYPE = The route type found in RT_SCRNING or RT_ROUTING is not expected by packet routing.

UNSUCCESSFUL CONVERSION TO PORT = The originator specification does not identify a valid port.

USER NOT ALLOWED TO USE EXPLICIT ASI SERVICE CODE = The advanced service interface assigned to the port is for implicit service only and an explicit dialed code was entered.

USER NOT ALLOWED TO USE IMPLICIT ASI SERVICE CODE = The advanced service interface assigned to the port is for explicit service only and an implicit dialed code was entered.

WBCHANNEL CANNOT BE ENTERED WITH LINE ORIGINATOR = WBCHANNEL can only be entered for a trunk origination.

WBRATE CANNOT BE ENTERED WITH LINE ORIGINATOR = WBRATE can only be entered for a trunk origination.

WIDEBAND DATARATE IS NOT VALID FOR NON-ISUP TRUNKS = WBRATE and WBCHANNEL are valid only for an ISUP trunks. An error is output if they are entered for other signal types.

u = Relation name and key fields, in the format:

RELATION_NAME   KEY1   KEY2 ...

The relation keys are shown as either a field name printed in this output message or an attribute name and value. For example, "DEST_TYP" or "PREVIOUS 5". Refer to the Translations Data manual for definitions.

v = Additional key to relation in variable 'u'.

w = Additional key to relation in variable 'u'.

x = Directory number (DN) of a line. For packet call type, if the calling address in the input message is an international E.164 address, the DN= variable will contain the expanded full E.164 address (country code + NPA + NXX + XXXX).

y = Group number.
z  = Location routing number (LRN).

a  = Member number. The member number will be blank if the trunk group specified is a Bearer Independent Call Control trunk group.

b  = Route index (RI) number or automatic route selection index (ARSIDX). RI for a call that leaves the office or ARSIDX in the case of an ARS call. The ARSIDX can be replaced by a route index value if the call is directed to an announcement trunk.

c  = Normalized office code (NOC) for a local line termination.

d  = Trunk group.

e  = Carrier feature group indicator. Valid value(s):
   B       = Feature group B plus carrier identifier.
   D       = Feature group D plus carrier identifier.
   (blank) = None. A carrier was not used to route the call.

f  = Call type for this verification request. Valid value(s):
   CSV     = Circuit switched voice (default).
   CSD     = Circuit switched data.
   PKT     = Packet switched data.

g  = Datarate for a circuit switched data call and its corresponding CSD bearer capability. Valid value(s):
   56      = 56-kbps, unrestricted digital information, circuit-mode, rate adapted from 56-kbps.
   64      = 64-kbps, unrestricted digital information, circuit-mode.
   R64     = 64-kbps, restricted digital information, circuit-mode, rate adapted from 56-kbps.

h  = Data network interexchange carrier. Valid value(s):
   RPOA=i  
   ICPI=j

i  = Registered private operating agency, a four-digit data network interexchange carrier (DNIC) used with packet routing.

j  = Interexchange carrier preselect.

k  = Packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

l  = Datarate alternate route index for a CSD call that leaves the office.

m  = Packet switch number. Valid value(s):
   D_PSN=o
   N_PSN=n

n  = Next packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

o  = Destination packet switch number, a number between 1 and 255, inclusive, used in internal
protocol packet routing as the destination of the call.

\[ p^{1} = \text{Interexchange carrier preselect.} \]

\[ q^{1} = \text{The LRN returned is home to this switch. Valid value(s):} \]
\[ \text{HOMELRN}=N \]
\[ \text{HOMELRN}=Y \]

\[ r^{1} = \text{Local number portability trigger number.} \]

\[ s^{1} = \text{Existence indicator. This provides information on the existence of the DN translation and assignment of the "non-conditional 10-digit trigger for LRN". Valid value(s):} \]
\[ \text{DIRECTORY NUMBER TRANSLATIONS EXIST} \]
\[ \text{DIRECTORY NUMBER TRANSLATIONS EXIST WITH NON COND TRIG} \]
\[ \text{NO DIRECTORY NUMBER TRANSLATIONS EXIST} \]

\[ t^{1} = \text{Destination numbering plan area code. For packet VFY:OFC input messages, this variable will contain the implied numbering plan area (such as, the area code) used to route the call. The area code is derived for line originated calls. The NPA can be provisioned on RC/V View 8.1 or RC/V View 9.3.} \]

\[ u^{1} = \text{Output can occur as one message or multiple messages. Each output message is referred to as a segment and marked with an event number and a segment indicator. All messages associated with one request will have the same event number. Segment numbers are used to represent a sequence.} \]

For example: \text{VFY OFC EVENT 3 SEGMENT 1}

At the end of each segment, a marker is printed showing if another segment is expected.
\[ \text{VFY OFC: CONTINUING} = \text{Another segment will be printed.} \]
\[ \text{VFY OFC: COMPLETED} = \text{No more segments are expected.} \]

\[ v^{1} = \text{Generic address parameter (SS7 ISUP).} \]

\[ w^{1} = \text{The location routing number digits.} \]

\[ x^{1} = \text{The value for ASP default routing. Valid value(s):} \]
\[ \text{ANNC} = \text{Default Route to 13A Terminating Announcement.} \]
\[ \text{DLDN} = \text{Default Route to Dialed DN.} \]
\[ \text{NONE} = \text{No default routing to be applied.} \]

\[ y^{1} = \text{Geographic portability. Valid value(s):} \]
\[ \text{GEOPORT}=N \]
\[ \text{GEOPORT}=Y \]

\[ z^{1} = \text{This field indicates the proper text to represent the source of the DAS in the variable 'g'. Valid value(s):} \]
\[ \text{ORIGINATORS_DAS} = \text{The DAS assigned to the originating port will be used for digit analysis.} \]
\[ \text{POST_QUERY_DAS} = \text{The DAS associated with the trigger number will be used for digit analysis.} \]
\[ \text{CURRENT_DAS} = \text{Indicates that the current DAS will be used for digit analysis.} \]
SCP_DAS = The office defined SCP DAS will be used for digit analysis.
LRN_DAS = The LRN DAS assigned to the originating trunk will be used for digit analysis.
SFG_DAS = The DAS defined for the accessed simulated facilities group will be used for digit analysis.
SDN_DAS = The call has requested SDN and the DAS assigned to the EDSL trunk will be used for digit analysis.
IDDDTC_DAS = The DAS defined for international outbound will be used for digit analysis.
ANI_DAS = The ANI table DAS will be used for digit analysis for LDP processing.
II_DAS = The II table DAS will be used for digit analysis for LDP processing.
CIC_DAS = The CIC table DAS will be used for digit analysis for LDP processing.
DEFAULT_ANI_DAS = The default ANI table DAS will be used for digit analysis for LDP processing.
DEFAULT_CIC_DAS = The default CIC table DAS will be used for digit analysis for LDP processing.

a² = Route index used for automatic route selection private network.
b² = Type of carrier interconnect call.
c² = Inhibit dialed number trigger (DNT), indicates whether to look for DNTs following LRN analysis. Valid value(s):
INHDNT=N
INHDNT=Y
d² = Location routing number screening. Valid value(s):
LRNSCR=N
LRNSCR=Y
e² = Trigger type. Used to define variable ‘ê²’. Valid value(s):
LNPTTRIG = Local number portability trigger.
TRIG = Non-LNP trigger.
f² = A number between 1 and 255 associated with the trigger type in variable ‘ê²’.
g² = The administrative state code state. Valid value(s):
LOCKED
UNLOCKED
h² = Defines the signaling transfer point translation type number associated with the trigger.
i² = The trigger is allowed for voice calls, data calls or both. Valid value(s):
BOTH
CSD
VOICE
j² = Virtual private network (VPN) trigger. Valid value(s):
N
Y
k² = Application type. Valid value(s)
l\^2 \quad \text{= Advanced intelligent network release. Valid value(s):} \\
\hspace{1cm} \text{R0} \\
\hspace{1cm} \text{R0D1} \\
\\m\^2 \quad \text{= Source of the service key for query formulation. It is only valid for R0 protocol. Valid value(s):} \\
\hspace{1cm} \text{ANI} \\
\hspace{1cm} \text{CDPN} \\
\\n\^2 \quad \text{= Advance intelligent network (AIN) toll-free service allowed. Valid value(s):} \\
\hspace{1cm} \text{N} \\
\hspace{1cm} \text{Y} \\
\\o\^2 \quad \text{= The bearer capability associated with the call that encountered the trigger. Valid value(s):} \\
\hspace{1cm} \text{3.1 KHZ AUDIO} \\
\hspace{1cm} \text{56 KBPS} \\
\hspace{1cm} \text{64 KBPS} \\
\hspace{1cm} \text{SPEECH} \\
\\p\^2 \quad \text{= Global title number, a unique 10 digit number used by the SCP.} \\
\\q\^2 \quad \text{= Local routing number index assigned to the directory number translation.} \\
\\r\^2 \quad \text{= Destination point code number. A unique 9 digit number that identifies the receiving entity of the SCP query.} \\
\\s\^2 \quad \text{= The signaling transfer point translation type number used in the query of the SCP. This will be the value assigned to the trigger or the office (if one is not assigned to the trigger).} \\
\\t\^2 \quad \text{= The event that caused the trigger to occur. Valid value(s):} \\
\hspace{1cm} \text{CHANNEL SETUP PRI} \\
\hspace{1cm} \text{COUNTRY CODE NPA-NXX-XXXX} \\
\hspace{1cm} \text{CUSTOMIZED ACCESS} \\
\hspace{1cm} \text{FEATURE ACTIVATOR} \\
\hspace{1cm} \text{N11} \\
\hspace{1cm} \text{NETWORK BUSY} \\
\hspace{1cm} \text{NPA} \\
\hspace{1cm} \text{NPA-N} \\
\hspace{1cm} \text{NPA-NXX} \\
\hspace{1cm} \text{NPA-NXX-X} \\
\hspace{1cm} \text{NPA-NXX-XX} \\
\hspace{1cm} \text{NPA-NXX-XXX} \\
\hspace{1cm} \text{NPA-NXX-XXXX} \\
\hspace{1cm} \text{OFF HOOK DELAY} \\
\hspace{1cm} \text{OFF HOOK IMMEDIATE} \\
\hspace{1cm} \text{ORIG CALLED PARTY BUSY}
ORIG NO ANSWER
SHARED INTER OFFICE TRUNK
TERMINATION ATTEMPT
VERTICAL SERVICE CODE

\(u^2\) = Query status. Used to indicate result of SCP query. Valid value(s):
- NO DATA POPULATED, FEATURE NOT ACTIVATED
- NO QUERY PERFORMED
- NO QUERY PERFORMED, OVERRIDING HRI FOUND
- QUERY BLOCKED
- QUERY FAILED
- QUERY SUCCEEDED

\(v^2\) = Type of number returned by the SCP. Valid value(s):
- LRN = The DN has been ported to another switch identified by this location routing number.
- NON_PORTED_DN = The DN has not been ported.

\(w^2\) = The called party directory number returned by the SCP. This number may be the original called number which has not been ported or an LRN. It is associated with variable \(v^2\).

\(x^2\) = Switch module (SM). Identifies where the failing (also called asserting) code resides.

\(y^2\) = The assert number. Refer to the Asserts manual for additional information.

\(z^2\) = Event number associated with the assert. This allows a correlation of the summary output provided by VFY:OFC with the assert output provided on the ROP.

\(a^3\) = Name of the source file where the defensive check failed.

\(b^3\) = Indicates the scope of variable \(c^3\). Valid value(s):
- If \(b^3 = \text{LINE}\), then \(c^3 = \text{LINE}\) A source file line number indicating the location where the assert was called or printed.
- \(b^3 = \text{REF}\) A programmer defined reference number.

\(c^3\) = Line or reference number.

\(d^3\) = A brief description of the problem that caused the assert failure.

\(e^3\) = The assert error code. Refer to the Asserts manual for additional information.

\(f^3\) = Failing address. The virtual address of execution at the time the assert failed.

\(g^3\) = Two column output consisting of data and an associated descriptive string.

\(h^3\) = Additional information. Multiple comments may be concatenated together.

To determine the meaning of the output comment field, start at the beginning of the comment string and find the matching string below. If there are additional characters, start from that point and find the next matching string. Continue until there are no more characters in the comment field. There is
a limit on the total number of characters which means that the last comment may be truncated.

Valid value(s):

Account Code override of toll diversion possible. = The user has an account code feature assigned. This can be used to override the user's screening index (SI) used for RC/V View 10.10. VFY:OFC does not support entry of an ACCT code.

BAD DESTINATION TYPE FOR N11 CONVERSION DN = The destination type for the conversion dn on a 711 relay call is FCRELAY711, which is invalid. FCRELAY711 cannot be the destination type on the conversion dn.

ACVT not supported = Attendant control of voice terminals is not supported by VFY:OFC.

ACCESS OR USER INFO IE DISCARDED = Refer to the cause value definition in the ISUP/TCAP Related Feature Description.

ALL UNRESTRICTED FCD CODES ARE BLOCKED = The user dialed a unrestricted FCD Code, but all unrestricted FCD Codes are restricted to the user.

ANI NEEDED FOR FEATURE USE = The two party class of service is not allowed the entered feature if the two-party line does not have ANI or if the calling party number presentation (CPNP) is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

ARS CARRIER SELECTION ERROR. = An error has occurred while processing the carrier access for an ARS call. An example of an error is the specified automatic route selection (ARS) SFG carrier is a LEC carrier and the digits are INTERLATA. Examine the attributes associated with the output CARRIER= and the DIG= string.

ARS ERRTRT ANNCE USED = An automatic route selection (ARS) uniform number plan dialing error was encountered and the ARS group error treatment is announcement. This error is also used when an ARS call is made with the ODP, an ARS filtering error occurs, and FLTRERR is set to ANN for the ARS.

ARS ERRTRT ATDN USED = An ARS uniform number plan dialing error was encountered and the ARS group error treatment is route to attendant. This error is also used when an ARS call is made with the ODP, an ARS filtering error occurs, and FLTRERR is set to ATDN for the ARS.

ARS ERRTRT TONE USED = An ARS uniform number plan dialing error was encountered and the ARS group error treatment is reorder tone. This error is also used when an ARS call is made with the ODP, ARS filtering occurs, and FLTRERR is set to REORD for the ARS.

ARS UNEXPECTED INVLD PORT = This type of port is not supported by ARS. The call will route to reorder.

ARS UNEXPECTED RTE TYPE FROM DIGANAL = An unexpected route type was returned from digit analysis for ARS. The call will route to reorder.

ASP R0D1 feature has not been purchased. = The indicated ASP release is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

ASP Release 0 is inactive. = The indicated ASP release is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

ATNDS CANNOT ACCESS FEATURE ENTERED = An attendant that is not assigned features cannot access the generally available feature that was entered.

Authorization and Account Code override of toll diversion possible. = The user has an authorization code feature and an account code feature assigned. Either one of these features can be used to override the user's screening index (SI) used for RC/V View 10.10. VFY:OFC does not support entry of these codes.

Authorization Code override of toll diversion possible. = The user has an authorization code feature assigned. This feature can be used to override the
user's screening index (SI) used for RC/V View 10.10. VFY:OFC does not support entry of an authorization code.

Authorization Code override possible. = The user has an authorization code feature assigned. This feature can be used to override the user's automatic route selection facility restriction level (FRL). VFY:OFC does not support entry of an authorization code.

Bad Data found during ARS routing. = Bad data was encountered while getting the routing information on an automatic route selection call.

Bad Data found during routing. = Bad data was encountered while getting the routing information.

Basic LRN feature has not been purchased = Encountered an LNP trigger. However, number portability-LRN is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Bearcap data incorrect. = In setting up for a BRI request, the bearer capability was not set up correctly in an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Bearcap data not setup. = In setting up for a BRI request, the bearer capability was not set up in an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

BEARER CAPABILITY INCOMPATIBLE WITH SERVICE REQUEST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BEARER CAPABILITY NOT AUTHORIZED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BEARER CAPABILITY NOT PRESENTLY AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BEARER SERVICE NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BFG TRMFEATS TUPLE MISSING. = The port is in a BFG but the expected rlTRMFEATS tuple was not found.

BRI Keypad invalid. = The keypad area of an internal message was not setup correctly. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

BRI setup msg bad. = An error has occurred setting up an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Bypassing LDP Account code Collection for VFY:OFC = If it is determined that Account code digits have to be collected for a MF trunk for LDP processing, verify office will skip collecting and processing account code digits and continue.

CALL AWARDED AND DELIVERED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

CALL HAS BEEN QUEUED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Call is being Toll Diverted (TDV). = The user's screening index (SI), the code index (CDI) of the entered digits, and the prefix value of the entered digits used from RC/V 10.10 are set up to toll divert to the attendant.

CALL REJECTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

CALL SCREENING FEATURE NOT PURCHASED. = The call screening feature has not be purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

CALL SCREENING ENHANCEMENT FEATURE NOT PURCHASED. = The call screening enhancement feature has not be purchased. Refer to the SECURED FEATURES
portion of the INTRODUCTION section of the Output Messages manual for additional information.

**CARRIER ACCESS DENIED BY BLK 1PLUS.** = Call will route to DEST_TYP NO10xx error treatment because the user is not allowed to access a carrier as dialed. The user is assigned either SPLIT or FULL BLOCKING with the BLK 1PLUS feature.

**CHANNEL CONGESTION OR UNAVAILABLE** = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**CHANNEL TYPE NOT AVAILABLE** = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**CHANNEL UNACCEPTABLE** = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**COS NOT ALLOWED TO ACCESS FEATURE.** = This class of service is not allowed to access the entered feature.

**CPNP SFID 50 NOT PURCHASED** = The calling party number presentation is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

**DATABASE READ FAILURE IN Mcidprel** = An IDP digit analysis tuple is missing.

**DC MKB SFID NOT PURCHASED** = The Dial Code Make Busy is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

**Dial Plan Access Treatment (DPAT) error.** = A DPAT error was encountered which requires an authorization code to continue. VFY:OFC does not support authorization codes.

**DESTINATION OUT OF ORDER** = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**DIRECT ACCESS LINK.** = Indicates that direct access links (DAL) access is allowed for this trunk group.

**EAVM DID NOT FIND ACTIVE CF** = When Easy Access to Voice Mail (EAVM) dial code was dialed, at least one of the following conditions was found: neither Call Forwarding Don't Answer (CFDA) nor Call Forwarding Busy Line (CFBL) is assigned and active in the line, or, neither CFDA nor CFBL have a Forward-to DN assigned on the line.

**EAVM NOT ALLOWED FOR PORT** = Easy Access to Voice Mail (EAVM) feature is not allowed for the port.

**EAVM NOT PURCHASED** = Easy Access to Voice Mail (EAVM) feature is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

**EXCESSIVE DIGITS RECEIVED** = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**Expected FEX environment not found.** = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**Facility number should be specified for FX trunk origination.** = FACILITY NBR in RC/V View 5.1 needs to be set for the origination trunk.

**FAILED TO FIND FEX CC MODEL FOR ARS** = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**Failed To Get Data Pointers** = Failed to retrieve pointers to structures within the routing message.

**Failed To Populate BEARER CAPABILITY Parameter** = Failed to populate the mandatory BEARER CAPABILITY parameter in the query message.

**Failed To Populate GLOBAL TITLE ADDRESS** = Failed to populate the mandatory GLOBAL TITLE ADDRESS parameter in the query message.
Failed To Populate USERID Parameter = Failed to populate the mandatory USERID parameter in the query message.

FAILED TO REPLACE TO FEX FOR ARS = Internal error. Try again later. If it still doesn't work, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual for additional assistance.

Failed To Send Message To TCAP = The attempt to send the query message to the TCAP system process failed.

FC_create() ERR1 = An error occurred while trying to get the head of the CLDB list.
FC_create() ERR2 = An error occurred while trying to get an idle CLDB.
FC_create() ERR3 = An error occurred while trying to get and link an MDB to the CLDB.

FEATURE ALREADY ACTIVE. = The dialed code action entered is to activate a feature which is already active for this port. It cannot be entered successfully on the port unless the feature is first deactivated.

FEATURE ALREADY INACTIVE. = The dialed code action entered is to deactivate a feature which is already inactive for this port. It cannot be entered successfully on the port unless the feature is first activated.

FEATURE INACTIVE OR SWITCHED OFF. = For features assigned to the port, this means that either the active flag is N or the master switch for the feature is off. For features that can be accessed through general availability or subscription, this means that the feature is not set to allow either mode of access. Therefore, the input feature dialed code cannot be used.

FEATURE NOT ACTIVE = The dialed code action entered is not allowed, as the office option is not enabled for this feature.

FEATURE NOT ALLOWED ACTION ENTERED. = The feature assigned to the port is not set up to allow the dialed code action entered. This may be due to the feature options, port options, or office options associated with this feature.

FCfex_init() ERR1 = An error occurred while trying to get an idle CLDB.
FCfex_init() ERR2 = An error occurred while trying to get an idle MDB.
FCto_fs: Internal error = VFY:OFC processing encountered unexpected code. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

FEATURE 228 NOT PURCHASED. = ISDN personal communication is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

IDENTIFIED CHANNEL DOES NOT EXIST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

IE NONEXISTENT OR NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INCOMING CALLS BARRED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INCOMPATIBLE DESTINATION DIRECT CALL NOT SUBSCRIBED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INTERCEPT TREATMENT ON. = Originating line is on intercept service and is denied origination.
INTERNAL ERROR: FEX COMING DOWN UNEXPECTEDLY. = An internal error has occurred in the feature execution environment interface with verify office. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INTERCEPT TREATMENT ON. = Originating line is on intercept service and is denied origination.
INTERCOM RANGE HAD NO DIGITS TO PREFIX. = An IDP intercom (extension) was entered and the range accessed has no digits to prefix as expected.

Interrupt Message Received = An MGINTERRUPT message was received while waiting for the SCP to respond.
INTERWORKING-UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID ACTION FOR FEATURE. = The feature that is being processed has encountered an unexpected action value. Report the problem.

INVALID ACTION FOR NON-WILD CARD (MAGIC) FEATURE. = The feature that is being processed has encountered an action that is allowed only for wild card features. Wild card (magic) features are the matching /XX* features. For example, for an Individualized Dialing feature, the wild card feature is /ID*. Update the action or feature associated with the input dialed code.

INVALID ACTION FOR WILD CARD (MAGIC) FEATURE. = The wild card (magic) feature that is being processed has encountered an action that is not allowed for wild card features. Wild card (magic) features are the matching /XX* features. For example, for an Individualized Dialing feature, the wild card feature is /ID*. Update the action or feature associated with the input dialed code.

INVALID ACTION IN MCspicarr = Expected dialed code action was for carrier access but a non-carrier access code was received.

Invalid Assert Message Type Detected By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INVALID CALL REFERENCE VALUE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid Data Collection State Detected By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Invalid Digits Encountered = LNP queries are only allowed to contain dialed digits in the range of 0-9.

INVALID DIGIT VALUE FOR NUMBER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid Error Code Received By RTvfy_rpt() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Invalid Error Code Received By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INVALID INFO ELEMENT CONTENTS = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID MODULAR FEATURE TYPE. = The feature being processed is not a valid modular feature type. This is an unexpected error. Report the problem.

INVALID NUMBER FORMAT = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID OR UNSPECIFIED MESSAGE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid two-party party value = Expected either TIP or RING but neither was found. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

ISDNFAIL Message Received = An MGISDNFAIL message was received while waiting for the SCP to respond.

ISDN PODS CANNOT USE FEATURES = ISDN PODS terminals do not have access to any BRCS features.

ISDN CANNOT ACCESS USTWC = Usage sensitive three-way calling is not allowed on ISDN terminals.

LASS NOT LOADED = Custom local area signaling services (CLASS) is not loaded on the switch. CLASS features cannot be used.
LDP ACCOUNT CODE PROCESSING SKIPPED FOR VERIFY OFFICE = If it is determined that account code digits have to be collected for an ISUP trunk for LDP processing, verify office will skip collecting and processing account code digits and continue.

LRN was not entered on command line = This VFY:OFC request is attempting to do an LNP query. NP-verify office for LRN is not activated. NP-test query for LRN is activated but requires an LRN to be specified on the input message line. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

LTSB CANNOT DEACT MAN EXCLUSION = Deactivation of manual exclusion is not available for LTSB lines.

MANDATORY IE MISSING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

MCCpystrd unexpected return = VFY:OFC processing encountered unexpected return code. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Message could not be sent to routing process = The route request message could not be sent. Try again later.

MESSAGE NOT COMPATIBLE WITH CALL STATE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

MESSAGE TYPE NONEXISTENT OR NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

MGRT_FAIL REASON NOT HANDLED BY VFYOFC = Route failure reason invalid for VFY:OFC processing. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

NETWORK CONGESTION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO ASSOCIATED DIGITS FOR SPEED CALL DIGIT(S) = A speed call digit(s) was entered and there are no associated digits to analyze.

NON SELECTED USER CLEARING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NORMAL CALL CLEARING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Normalized Office Code Must Be Defined for Home LRNs = LNP error - An NPA and OFFCODE must be populated on the LDIT/RDIT view when HOMELRN=Y.

NORMAL-UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO ROUTE TO DESTINATION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO ROUTE TO SPECIFIED TRANSIT NET = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO USER RESPONDING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NUMBER CHANGED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

OSPS not supported. = Request will be treated as if non-OSPS.

OSREPLACE Is Not supported By RTvfy_rpt() = Entry into RTvfy_rpt() using an OSREPLACE is not currently supported.

OUTGOING CALLS BARRED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

OVLP attempted on non-ovlp route. = Overlap outpulsing would be attempted on a trunk that does not support overlap outpulsing.

PKT keyword must be entered for the originator specified = The port identified
from the input message is used for packet switch data (PSD), so the keyword PKT needs to be included in the input message line.

PORTEDDN or NONPORTED parameter is not supported with non-CCS trunk = PORTEDDN or NONPORTED are only supported for ISUP trunks.

PORT NOT ALLOWED FEATURE = The input originating port is not allowed to access the entered feature.

PORT NOT ASSIGNED ARMED, ACTIVE FEATURE. = At least one of the following conditions is true: the port is not assigned the feature associated with the input dialed code, the feature that is assigned is not armed through the master switch flag, or the feature that is assigned is not active but should be to use the input action.

PORT NOT ASSIGNED ARMED, ACTIVE FEATURE OR USAGE SENSITIVE FEATURE NOT AVAILABLE. = At least one of the following conditions is true: the port is not assigned the feature associated with the input dialed code, the feature that is assigned is not armed through the master switch flag, the feature that is assigned is not active but should be to use the input action, or the port does not have an assigned armed, active feature and the usage sensitive feature of the type entered is not available for use because it has not been purchased or is not active.

PORT NOT ASSIGNED FEATURE = No feature is assigned to the port.

PORT TRMFEATS TUPLE MISSING = Port has terminal features assigned but expected TRMFEATS tuple not found.

Pots access not allowed = Access to the office dialing plan is not allowed for this type of call.

PRECEDENCE CALL BLOCKED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

PREEMPTION–CIRCUIT RESERVED FOR REUSE/PREFIX 1 DIALED IN ERROR = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

PREEMPTION/PREFIX 0 DIALED IN ERROR = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

PREFIX 1 NOT DIALED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

PROTOCOL ERROR–UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

RECOVERY UPON TIMER EXPIRATION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

REQUESTED CHANNEL NOT AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

REQUESTED FACILITY NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

REQUESTED FACILITY NOT SUBSCRIBED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

REQUESTED FACILITY REJECTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

RESOURCE UNAVAILABLE OR UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

RESPONSE TO STATUS ENQUIRY = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Route Index Must Be Defined for Non-Home LRNs = LNP error - A route index must be populated on the LDIT/RDIT view when HOMELRN=N.

Routing Module Tuple Missing. = Unable to retrieve the rRTDNMOD tuple. The accompanying data provides the key information.

ROUTING TO REORDER = A route failure has occurred with the general reason of REORDER. The failure reason is not more specific. If there was an assert output, the error can be determined from the assert failure indicated. The call will route to reorder.
RTvfyasi entered with invalid ASI action. Internal error. = Advanced services interface function expected either action ASITOG or ASIUSE. A different action was encountered. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTv_brichks() BRI_ERR1. = Unable to get the TEDB.
RTv_brichks() BRI_ERR2. = TEDB contains invalid information.
RTv_brichks() BRI_ERR3. = Unable to access the DALB.
RTv_brichks() BRI_ERR4. = Cannot link DALB to TEDB.
RTv_brichks() BRI_ERR5. = Could not link the RBCSDB to the DALB.
RTv_brichks() BRI_ERR6. = Could not link DALB to DPB.
RTv_brichks() BRI_ERR7. = Could not link DALB to PCBLA.
RTvdalb_init() PRI_ERR1. = Failed to get a PRISTAT pointer.
RTvdalb_init() PRI_ERR2. = Could not get a DALB.
RTvdalb_init() PRI_ERR3. = Could not link DALB to PRISTAT.
RTvdalb_init() PRI_ERR4. = Could not link DALB to PCBLA.

RTvfy_rpt() Was Entered With Unknown Reason = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTvfy_rsp() Specified An Invalid Maxtime. = An internal error was encountered while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTvfy_rsp() Received An Invalid Return Value. = An internal error was encountered while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTvfy_rsp() Received a Truncated Message. = An internal error was encountered while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTvfy_rsp() Timed Out Waiting For RSP. = A timeout occurred while waiting for the routing data. Try again later.

SEGMENTATION ERROR = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE DENIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE OPERATION VIOLATED-W/DIAG = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE OR OPTION NOT AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE OR OPTION NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Signal type of the trunk is not supported by Verify Office = The signal type for this trunk on RC view 5.1 is not supported for VFY:OFC.

TEMPORARY FAILURE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

TG IS NOT EQUIPPED TO HANDLE DATARATE = The trunk specified as the originator does not have the DATARATE field on RC/V View 5.1 set or the trunk's DATARATE is set but the trunk cannot support the data rate requested.

The class of service of the originator is not supported by verify office. = Refer to variable 't' for supported classes of service.

The Finite State Machine Failed = An attempt to query the SCP has failed for an unknown reason.

The tone or announcement type is X. = Where X is the type of tone or announcement that the call would be routed to.
This type of trunk can't be used for FX or Tie service = The class of service of the trunk is not proper for FX/TIE services.

THIS UNRESTRICTED FCD CODE IS BLOCKED = The user dialed a unrestricted FCD Code, but this unrestricted FCD Code is restricted to the user.

TOO MANY STORED DIGITS = There are too many digits for digit analysis to handle. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TRANSIT NETWORK DOES NOT EXIST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

TRANSFER TO ACD FROM ARU NOT PURCHASED = This feature has not been purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

UCR SFID 47 NOT PURCHASED = Unidentified call rejection is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Unable To Communicate With The Routing Module = Need to retrieve the riRTDN_TRAN tuple from the routing module; however, the routing module is not operational.

UNALLOCATED NUMBER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

UNASSIGNED DN, NO LRN = An unallocated directory number has been encountered and there was not an location routing number.

UNASSIGNED DN, LRN PRESENT = An unallocated directory number has been encountered and there was an location routing number.

Unexpected Data Collection State In RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Unexpected Message = Attempting to access a message with an invalid message type.

UNEXPECTED RETURN CODE FROM MCgetdig IN MCidprel. = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNEXPECTED RETURN CODE FROM MCgetdig IN MCidcont. = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNEXPECTED ROUTE FAILURE REASON = Code for route failure unexpectedly entered for a reason that VFY:OFC does not handle. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

Unknown Message Was received By RTvfy_rsp() = An unknown message was received while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNRESTRICTED FCD CALL WILL STILL CONTINUE = Even though, TKBLKCOD or LNBLKCOD relation was unable to be read, unrestricted FCD call will continue.

UNRESTRICTED FCD NOT PURCHASED = This feature has not been purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

USER ALERTING NO ANSWER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

USER BUSY = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

User Has Authorization Code First feature. Continuing VFY:OFC = The user has an authorization code feature assigned that has ATH FIRST Y. This is being ignored and the verify is continuing. VFY:OFC does not support an authorization Code. WARNING: Ignoring the authorization code data may result in invalid routing
information if the authorization code data overrides, for example, the screening index (SI) to be used, the facility restriction level (FRL) to be used, etc. Check the user's feature and group information to determine if the results of the verify are valid.

**USTWC FEATURE NOT PURCHASED OR NOT ACTIVE.** = The usage sensitive three-way calling feature has not been purchased or has not been activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

**Utility Telemetry Service is not activated** = UTT feature is not active but the originating port is marked for UTT service. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

**VACANT CODE** = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**Verify Office for LRN feature is inactive** = This VFY:OFC request is attempting to do an LNP query; however, both NP-test query for LRN and NP-verify office for LRN are inactive. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

**VFYOFC ARS NOT SUPPORTED FOR CCS.** = Verify of ARS feature is not supported on ISUP/CCS trunks.

**VFYOFC ARS NOT SUPPORTED FOR SERVICE CLASS.** = The input port has a class of service that cannot have ARS.

**VIRTUAL PRIVATE NETWORK CALL.** = Indicates that this is an origination virtual private network (VPN) call.

**WIRELESS CALL ORIGINATION** = Wireless call originations are not supported by VFY:OFC.

---

\( ^i \) = Value type. Used to define type of value indicated in variable \( ^j 3 \). Valid value(s):

**CAUSE** = Cause code value. Refer to the ISUP/TCAP Related Feature Description for a complete list of cause codes and their meanings.

**MDII CODE** = Number mapped internally in the DMMDII domain. Refer to the APP:MDII appendix in the Appendixes section of the Output Messages manual.

**ASSERT NUMBER** = Assert number.

**TRIGGER TYPE** = Trigger type.

**TRIGGER NUMBER** = Trigger number.

**SERVICE TYPE** = Service type.

**MESSAGE TYPE** = Message type.

**ERROR CODE** = Error code.

**DCSTATE** = The data collection state.

**REASON** = Reason.

**RETURN CODE** = Return code.

**ROUTE INDEX** = Route index.

---

\( ^j \) = Value definition associated with value type as indicated in variable \( ^i 3 \).

---

\( ^k \) = Context identifier. This field is associated with the AMA recording for unbundled and resold feature. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information. Valid value(s):

**NATIVE** = This is the default value if the SFID is inactive. This port is native to the switch.

**UNBUNDLED** = This port has been unbundled from the switch.

**RESOLD** = This port has been resold.
l^3 = LNP trigger number.

m^3 = The dialed digits are a number that may have been ported into, or out of the office. Valid value(s):
PORTED_IN =Y
PORTED_IN =N

n^3 = Automatic number identification (ANI) digits. ANI contains the calling party number or charge number. Used for LDP ANI processing. ANI is a required field for LDP LATA trunks. Valid value(s):
10 digit NPA–NXX–XXXX
3 digit NPA
NULL
= The NULL value shall be valid only when DIG=950-XXXX The trigger number and trigger type are output. for CALLTYPE=FGB or FGBPS calls.

o^3 = For a MF trunk this field represents the ANI information digits (II). Valid value(s):
00 = Identified line with no special treatment.
01 = Operator number identified (multiparty).
02 = ANI failure.
06 = Hotel without room identification.
07 = Coinless, hospital, or inmate call.
08 = Interlata restricted.
10 = Test call.
20 = Automatic input/output dialing (AIOD) listed directory number sent.
23 = Identified line (coin or noncoin).
24 = Translated 800 call.
27 = Coin line.
34 = Operator handled.
52 = Outbound wide area transport (OUTWATS) line.
68 = Interlata restricted coinless line.
93 = Virtual private network line.
NULL
= NULL input, valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS calls.

p^3 = Originating line information (OLI) for a CCS7 trunk. Valid value(s):
IDLINE = Identified line with no special treatment.
01 = Operator number identified (multiparty).
02 = ANI failure.
06 = Hotel without room identification.
07 = Coinless, hospital, or inmate call.
08 = Interlata restricted.
10 = Test call.
20 = Automatic input/output dialing (AIOD) listed directory number sent.
23 = Identified line (coin or noncoin).
24 = Translated 800 call.
27 = Coin line.
34 = Operator handled.
52 = Outbound wide area transport (OUTWATS) line.
68 = Interlata restricted hotel line.
Interlata restricted coinless line.
Virtual private network line.
NULL input, valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS calls.

This field represents the first table matched in LDP processing. Valid value(s):
LDPANI = The ANI type tuple was matched with a tuple in the LDP ANI table (LDP index table).
LDPCAR = The ANI type tuple was matched with a tuple in the LDP CARRIER table.
DEFAULTANI = The ANI type tuple was matched with a tuple in the DEFAULT ANI table.
DEFAULTCIC = The ANI type tuple was matched with a tuple in the DEFAULT LDP CARRIER table.

calltype prefix of the dialed number. This also corresponds to the nature of number value for CCS7 signaling. Valid value(s):
1P = World zone 1, non-operator.
0P = World zone 1, zero plus.
011 = International, non-operator.
01P = International 01 plus (dialed as 01+CC+NN).
01M = International 01 minus.
DOM = Domestic (United States).
FGB = FGB (950-xxxx) calls from transition EAEO/AT.
FGBPS = FGB (950-xxxx) calls from public station during and after the transition.
FGDCT = Feature group D cut through calls.

carrier identification code (CIC).
transit network selector (TNS) circuit code.
carrier code for TNS.
country code (CC) for the called number.
terminating network selection code (TNSC). This is relevant only for specified MINT trunks.
terminating network selection code sent out with the call. This is relevant only if outgoing trunk is MINT.
wide band (WB) data rate for CSD calls. Valid values(s):
384 = 384 kbps.
384_1536 = 384 or 1536 kbps.
1536 = 1536 kbps.

WB data rate channel for CSD calls. Wideband channel specifies the number of DS0s requested for the call. The number of DS0s is the information transfer rate multiplier value.

WB data rate alternate route index for a CSD call that leaves the office.

= ASP trigger type. Valid values(s):
DIALED_NUMBER_TRIGGER
OFF_HOOK_DELAY
c^4 = ASP trigger number.
d^4 = Destination index for FGD tandem cutthrough calls.
e^4 = Route index for FGD tandem cutthrough calls.

NONPORTED = Presence of this key indicates that variable 'b' value is known to be non-ported.

"PRESUBSC = Keyword to indicate if the calling party is presubscribed to the carrier associated with this call.

"SAT = Keyword to indicate if the call has been routed using a satellite.

4. ACTIONS TO BE TAKEN

In the cases where an explicit translations error is found, or if the call routes to an incorrect line or trunk, follow local provisioning procedures to correct the situation.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print the routing translations results of an VFY:OFC input request. The output may be presented in multiple messages. The last line of each message indicates if verify office has completed or if additional messages are expected. The messages will be in one of the seven output formats.

Format 1 echoes the input message parameters and provides digit analysis results.

Format 2 provides LNP trigger information (if available), SCP query related information and status, and indication on the existence of the terminating directory numbers’ translation. Format 2 will not be used to provide data pertaining to ASP or network services triggers since only LNP triggers are supported by verify office.

Formats 3, 4, and 5 provide information on errors which result in an assert message output to the read only printer (ROP). Assert activity will cause termination of the verify office request. Assert activity encountered during processing of a verify office request is not suppressed by brevity control.

Format 6 provides additional information related to the request processing. The additional information may be useful information about a successful request, or describe an error condition which does not result in an assert message output.

Format 7 provides additional digit analysis results and routing information for LDP processing. This format is always preceded by the format one output, and will never output of its own.

3. VARIABLE FIELD DEFINITIONS
NONPORTED = Presence of this key indicates that variable 'b' value is known to be non-ported.

PRESUBSC = Keyword to indicate if the calling party is presubscribed to the carrier associated with this call.

SAT = Keyword to indicate if the call has been routed using a satellite.

a = The originator for which the call is being verified. Valid value(s):

DN=x  
MLHG=y-a  
PORT_ENTERED  
TG=y-a

The value of PORT_ENTERED is output when a specific port was specified in the input message.

b = Verified digits that were specified in the input message. A value of NONE will be returned if no digits were specified in the input message.

c = Event number of the request.

d = Number of the switching module (SM) on which the originator is located.

e = Port member number of the originator, in hexadecimal. The port member will be blank if the originator specified is a Bearer Independent Call Control trunk group.

f = Specific party associated with the originating directory number. For an explanation of the specific values, refer to the Translations Data manual.

g = Digit analysis selector, used for digit analysis. Refer to variable 'z' for the source of the DAS value.

h = Screening index; post query screening, automatic route selection (ARS) screening, simulated facilities group (SFG) screening, or the originator's screening found in the office data.

i = Class of service for the originator. Refer to the Translations Data manual for definitions.

j = The digits used to determine routing data after deleting and prefixing by digit analysis, but prior to any deleting and prefixing resulting from routing to a trunk to leave the office. Refer to RC/V View 10.2 [ROUTE INDEX (ROUTING)].

k = Prefix dialed. Valid value(s):

NULL or BLANK  
NONE = No prefix was dialed.
0 (0+) = entered "0" plus prefix
1+ = entered "1" plus prefix
01+ = entered "01" international prefix
011+ = entered "011" international prefix

l = Destination index or code index found in the office data for this call.

m = Destination type found in the office data for this call. Refer to the Recent Change Procedures manual, Digit Analysis Views, for a definition of the values.

n = Specific action defined in the office data for the dialed feature code. This is null unless the value
of variable 'm' is FEATURE. Refer to the Recent Change Procedures manual for definitions.

o = Charge index found in the office data for this call.

p = Carrier used for the call. If no carrier was specified or if the specified carrier was not used, this field will be blank.

q = Termination of the call with respect to this office (if blank, call termination is not determined). Valid value(s):
   DIALCODE = The customer feature dial code was entered.
   DR_ALT_RI=a
   MCRI=b
   NOC=c
   RI=d
   TRUNK=e

r = Facility restriction level of the originating port (line or trunk). This is for automatic route selection, if applicable.

s = SFG group number.

t = Information field. Valid value(s):
   ADVANCED SERVICES PLATFORM FEATURE DETECTED = Call originator has advanced services platform active (ASP) or has encountered an ASP route in an ARS route list. Neither are supported by verify office feature.
   ANI CANNOT BE ENTERED WITH LINE ORIGINATOR = Automatic number identification (ANI) can only be entered for trunk origination.
   ANI COLLECTION NOT SUPPORTED = ANI is needed for the SCP query. ANI collection is not supported by VFY:OFC.
   ANI IS REQUIRED FOR LDP LATA TRUNKS
   ANNOUNCEMENT ON ALTERNATE CODE TREATMENT = An alternate code treatment (ACT) with error treatment of announcement encountered.
   ARS CALL OVERFLOWED TO DDD = The ARS digits analyzed overflowed to direct distance dialing (DDD) on the office dialing plan.
   ASI_CF DATABASE READ FAILED = The advanced service interface feature information cannot be found. Check the feature assigned to the port.
   ASI_GP DATABASE READ FAILED = The advanced service interface group information cannot be found. Check the group assigned to the port.
   ASI FEATURE NOT ASSIGNED OR NOT ACTIVE = An advanced service interface feature dialed code was entered but the originating port does not have an active ASI feature assigned.
   ASI_PORT DATABASE READ FAILED = The advanced service interface port information cannot be found. Check the port parameters.
   ASP TRIGGER ENCOUNTERED, NO FURTHER VERIFICATION = ASP (non-LNP) triggers are not supported by VFY:OFC.
   ASSERT 911 OCCURRED = An error occurred while getting E911 data. VFY:OFC does not support E911 queries.
   AUTHORIZATION CODE OR ACCOUNT CODE REQUIRED = An authorization code or account code is required for this call or was entered in the input message. Authorization or account codes are not support by VFY:OFC.
   AUTO ARS FOR CSD IS NOT SUPPORTED FOR VFY:OFC = Automatic route selection is not supported for circuit switched data by VFY:OFC.
AUTOMATIC ROUTE SELECTION CALL ROUTED TO ANNOUNCEMENT = An ARS call was routed to the designated MC route type of announcement.

AUTOMATIC ROUTE SELECTION CALL ROUTED TO REORDER = An ARS call was routed to reorder because the designated route type was REORDER or because an error was encountered while processing the ARS call.

BAD DIALING STATE = An invalid dialing state was encountered during digit analysis. Digit analysis translations should be examined.

BAD ROUTE TYPE IN RLARSCRN = An illegal route type was found in the base relation RLARSCRN.

BAD ROUTE TYPE IN RLRT_MCRT = An illegal route type was found in the base relation RLRT_MCRT. The tuple key is the printed modular constructed route index (MCRI).

BAD ROUTE TYPE IN RLRT_ROUTING = An illegal route type was found in the base relation RLRT_ROUTING. The tuple key is the printed route index (RI).

BEARER CAPABILITY NOT SUPPORTED = The LNP trigger does not support bearer capability for VFY:OFC. For example, the trigger is marked to allow only voice and this is a circuit switched data request.

CALL IS BEING ROUTED TO TONE OR ANNOUNCEMENT = An error has been encountered which will cause a route to reorder, tone, or an error announcement.

CALL NOT ALLOWED FOR CHARGE A CALL LINE = Call has been routed to tone or announcement. Refer to variable ‘m’ for the type of treatment.

CALL ROUTED TO AN ATTENDANT = The call was routed to the specified terminal group attendant. Refer to variable ‘j’ for the attendant directory number.

CALLTYPE=APN NOT SUPPORTED ON THIS CLASS OF SERVICE = The calltype parameter with value APN is not allowed on this class of service.

CALLTYPE=APN NOT SUPPORTED ON THIS CLASS OF SERVICE UNLESS IT IS ISUP = The calltype parameter with value APN is not allowed on this class of service unless the signaling is ISUP.

CALLTYPE=APN NOT SUPPORTED ON PRI, FEATURE NOT PURCHASED = The calltype parameter with value APN is not allowed on PRI because the Network Capabilities to Support ATP and Adjunct Migration Edge Switch feature is not active.

CALLTYPE=APN NOT SUPPORTED ON PRI UNLESS IT IS A SERVICE NODE TRUNK = The calltype parameter with value APN is not allowed for this class of service because it is not a service node.

CALLTYPE CANNOT BE ENTERED WITH LINE ORIGINATOR = CALLTYPE can only be entered for trunk origination.

CALLTYPE IS 011 OR 01P - CIC OR CC MISSING = For an MF international 011 or 01P call, both CIC and CC are required.

CALLTYPE IS 1P, 0P, OR 01M - CC MUST NOT BE SPECIFIED = For an MF world zone 1 (1P, 0P) or international 01M call, specifying CC is an error.

CANNOT SEND ACM AND PLAY TONE OR ANNOUNCEMENT = The call is terminated because of network control point (NCP) action.

CARRIER DIALED TWICE NOT ALLOWED = A carrier access code may not be entered twice.

CC CANNOT BE ENTERED WITH LINE ORIGINATOR = CC can only be entered for trunk origination.

CIC CANNOT BE ENTERED WITH LINE ORIGINATOR = CIC can only be entered for trunk origination.

CI TYPE IS INTERLATA BUT NO RPOA WAS RECEIVED = The carrier interconnect type returned by digit analysis is inter-lata. This means that a carrier is required to complete the packet call. RPOA should be entered as the carrier in the VFY:OFC input message.

CI TYPE RETURNED BY DA NOT APPLICABLE TO PKT = The carrier interconnect type
returned by digit analysis is not applicable to a packet.

CMP UNAVAILABLE = During processing of the VFY:OFC input message, it was determined that the CMP was not linked to the AM and processing could not continue.

COS NOT ALLOWED IDP AND SC1 = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan and a 1-digit speed calling feature; but, these options were found in relation RLTRM_FEATS.

COS NOT ALLOWED IDP AND SC2 = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan and a 2-digit speed calling feature; but, these options were found in relation RLTRM_FEATS.

COS NOT ALLOWED ID FEATURE = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan (IDP) feature; but, this option was found in relation RLTRMFEATS.

COS NOT ALLOWED IDP, SC1, AND SC2 = The call originator is defined in relation RLFC_PORTTYP with a class of service which is not allowed to have an individualized dialing plan, a 1-digit speed calling, and a 2-digit speed calling feature; but, these options were found in relation RLTRM_FEATS.

CUTTHRU CALL NOT SUPPORTED FOR VFY:OFC = For FGD cutthrough calls, no output information is provided.

CUTTHRU TRIGGER ENCOUNTERED, NO FURTHER VERIFICATION = This is warning message to indicate that no further verification will be done when a CUTTHRU trigger is encountered. The trigger number and trigger type are output.

DATABASE ERROR OR SOFTWARE INCONSISTENCY DETECTED = Some data or code has detected an inconsistent result. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

DEDICATED SDN TRUNKS ARE NOT SUPPORTED = Attempted to access the software defined network (SDN) that is not supported.

DEST SWITCH MUST BE DIFFERENT FROM ORIG SWITCH = The PSN cannot be the packet switch number of the originator.

DEST TYPE RETURNED BY DA NOT APPLICABLE TO PKT = The destination type returned by digit analysis is not applicable to a packet.

DIAL PLAN ACCESS TREATMENT (DPAT) ERROR = A DPAT error was detected during IDP digit analysis. The call was routed to announcement or reorder tone.

DIG IS OPTIONAL OR 9500000 FOR CALLTYPE=FGB/FGBPS ON MF TRUNK = An invalid digit string is entered for CALLTYPE FGB or FGBPS on MF Trunk. DIG is not required for MF FGB/FGBPS. If entered, digit string must be 9500000.

DIG HAS TO BE 950xxxxx FOR CALLTYPE=FGB/FGBPS ON ISUP TRUNK = This occurs when digits other than 950xxxxx are entered for CALLTYPE=FGB/FGBPS for an ISUP trunk.
DIGIT ANALYSIS FAILED = A failure occurred while analyzing the digits.
DIGIT ANALYSIS RETURNED VACANT = Digit Analysis returned vacant code treatment for the packet call.
DIGIT STRING CANNOT BE LONGER THAN 18 FOR SS7 TRUNKS = Trunks that use ISUP7 signaling cannot have more than 18 digits in variable ‘b’.
DIGITS ANALYZED ROUTE TO IDP ERROR TREATMENT = IDP error treatment will route the call to tone or announcement.
DN ASSOCIATED WITH UCD OR MUPH MLHG, NO PORT = The directory number (DN) associated with the uniform call distribution (UCD) or multiposition hunt (MUPH) multi line hunt group (MLHG) was identified to have no port. These are not supported by VFY:OFC.
EMERGENCY STAND ALONE REROUTING FAILURE = There was a stand alone test line failure during the attempt to route. Some reasons could be:
   • The digits entered in variable ‘b’ are not the specified emergency number
   • There is a feature assigned that is not supported for test lines.

Check the test line attributes and/or the entered VFY:OFC input message.
EMERGENCY STAND ALONE REROUTING TO LINE = The stand alone test line routing went to the emergency line specified on RC/V View 4.9 [EMERGENCY TN (REMOTE SITELOCAL SM) ASSIGNMENT].
EMERGENCY STAND ALONE REROUTING TO TRUNK = The stand alone test line routing went to the emergency trunk specified on RC/V View 4.9.
EXCEEDED MAXIMUM IDP INTERPRETATIONS = The digits being analyzed has exceeded the maximum of 5 IDP interpretations. Call was routed to a reorder tone.
EXTRA DIGITS DETECTED BY DIGIT ANALYSIS = Digit analysis tables were populated for an expected number of digits. More digits appeared in variable ‘b’ or were analyzed as a result of a query response.
FAILED TO GET TERMINAL PARAMETERS = The trunk or line data could not be read to get digit analysis information. Check the originating port.
FAILURE RETURNED FROM TCAP = A failure occurred when sending a TCAP message.
FEATURE GROUP B CALLS ARE NOT SUPPORTED = Feature Group B calls not supported on ISUP trunks.
FEATURE INVOKED IS NOT SUPPORTED FOR VFY:OFC CSD = No features are being supported for CSD calls.
FEATURE IS NOT ACTIVATED = Refer to variable ‘h3’ for an explanation.
FUNCTIONALITY NOT SUPPORTED = An attempt was made to send a route request from a function that has not been modified to support VFY:OFC. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
FX/TIE TRUNK ERROR ENCOUNTERED = Refer to variable ‘h3’ for an explanation.
ICPI REQUIRED BUT NOT INPUT = This X.75/X.75 trunk originated call is an inter-lata call that requires an interexchange carrier preselect indication (ICPI). The ICPI was not entered in the VFY:OFC input message.
IDDD CALLS REQUIRE A CARRIER; DA RETURNED NO CARRIER REQUIRED = Packet inter station to station calls require a carrier but digit analysis indicated that no carrier is required.
IDDD OVER OUTWATS BLOCKED = An ARS call attempted to go IDDD over an OUTWATS trunk.
IF ICPI IS SPECIFIED, ORIGINATOR MUST BE X.75 OR X.75’ TRUNK = The packet trunk specified as the originator must be an X.75 or X.75’ trunk if ICPI is specified.
IF PSN IS SPECIFIED, THE ORIGINATOR MUST BE AN IP TRUNK = The packet trunk
specified as the originator must be an IP trunk if PSN is specified as the
destination.

II CANNOT BE ENTERED FOR ISUP TRUNK = Invalid input combination. II can only be entered
for MF trunk.

II CANNOT BE ENTERED WITH LINE ORIGINATOR = II can only be entered for MF trunk
origination.

ILLEGAL DA SAC CALL TYPE = A service access code (SAC) type carrier interconnect (CI) call
is present in digit analysis relation, but the call type does not allow this feature.

IMPLIED NPA COULD NOT BE DERIVED = The implied NPA for the packet called address could
not be derived because of a database error.

INCOMING FACILITY MUST BE SS7 TRUNK GROUP = LNP error. When an LRN is entered
without a DIG argument, the incoming facility must be a SS7 trunk group.

INSUFFICIENT FRL DETECTED BY ROUTING = The ARS facility restriction level (FRL) of the
call was less than the facility restriction level of the route.

INTERCOM CALL RESTRICTION DETECTED = ICR simulated facilities group is not supported by
VFY:OFC.

INTERNAL FAILURE DETECTED = A failure condition was detected. Refer to variable "h\3" for
more details. Refer to the TECHNICAL ASSISTANCE portion of the
INTRODUCTION section of the Output Messages manual.

INVALID ACTION TYPE FOUND = An invalid action was encountered during digit analysis by the
IDP.

INVALID AUTHORIZATION CODE = Authorization code is not supported in VFY:OFC.

INVALID CALLED ADDRESS = The packet called address entered in the VFY:OFC input message
is invalid. The length of the packet called address is invalid or for international
E.164 calls, 0110 cannot be the specified as the first four digits of the packet called
address.

INVALID CALLING ADDRESS = The calling address specified in the VFY:OFC input message was
found to be invalid. Some reasons could be:

• Invalid address length.
• If this is MLHG, the specified MLHG number does not match the dd_number in
  RLPSX25LN calling address.
• The specified NOC is invalid.
• The calling address does not match the MLHG linear DN of the MLHG group.

INVALID COS FOR TYPE OF CALL = The originator has a class of service that is supported for
VFY:OFC but is invalid for CSD or PKT.

INVALID DATA IN TUPLE = Invalid data was found in an existing tuple in the ODD. Refer to rest
of message for details.

INVALID DATARATE = The data rate requested is either not supported or not valid. This could also
occur when the data rate entered is incompatible with the data rate of the
destination trunk.

INVALID ID RELATION = An invalid IDP relation was found when expanding a speed call code.

INVALID RPOA = The RPOA entered in the input message is not valid RPOA in the ODD. A tuple
with the specified RPOA as key was not found during the read operation of the
RLPSDNICRI relation.

INVALID WIDEBAND RATE = The wideband rate entered is incompatible with the wideband rate of
destination trunk.

LDP LATA TRUNKS ARE NOT SUPPORTED = The VFY:OFC for LDP is not active so LDP on
LATA trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES
portion of the INTRODUCTION section of the Output Messages manual for
additional information.

LDP MINT TRUNKS ARE NOT SUPPORTED = The VFY:OFC for LDP is not active so LDP on
MINT trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES
LDP DAL TRUNKS ARE NOT SUPPORTED = The VFY:OFC for LDP is not active so LDP on DAL trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

LEAD ACCOUNT CODE DETECTED = A lead account code was detected during uniform number plan (UNP) digit analysis. This is not supported by VFY:OFC.

LEASED NETWORK QUERY NOT SUPPORTED = LN TCAP queries are not supported by VFY:OFC and an LN query is required to complete routing.

LNP on LDP NOT PURCHASED = LNP on LDP is not activated. LNP processing can not be done for this VFY:OFC request.

LRN, PORTEDDN OR NONPORTED ARE INVALID FOR ISUP INTERNATIONAL CALL

MAP-HLR TRIGGER ENCOUNTERED, NO FURTHER VERIFICATION = Mobile application part home location register (MAP-HLR) triggers are not supported by VFY:OFC.

MDII OCCURRED = The value of the MDII code is shown. Refer to rest of message for details.

MEMBER VALUE CANNOT BE ENTERED WITH BICC TRUNK GROUP = The specified call originator is a BICC trunk group. BICC trunk groups cannot have members assigned. Therefore no member can be specified on the command line. The member field cannot be used to specify a CIC. The base CIC is used to process all BICC requests.

MODEM POOL ACCESS DN ENTERED, MP NOT SUPPORTED FOR VFY:OFC PKT = The specified originator is a modem pooling access DN. Modem pooling is not supported by packet VFY:OFC.

MORE DIGITS REQUIRED TO GET ROUTING INFORMATION = Not enough digits were entered in the input message to determine routing information.

MSG FORMAT IS INCORRECT = The format of the input message is not correct. Refer to the VFY:OFC input message.

NETWORK CALL DENIAL IS SET, CALL IS DENIED = Network call denial (NCD) indicator is set to “Y” in the ANI table. The VFY:OFC request is denied.

NETWORK SERVICES TRIGGER NOT SUPPORTED = Network services triggers are not supported by VFY:OFC.

NO DIAL CODE IN DA = A dial code was not detected by digit analysis. If the destination type is not a dialed code or this is not a BRCS line, the input originating port is restricted from use.

NO DIGITS SPECIFIED OR FOUND = No dialed digits were specified and the originator does not have any default ones in the database.

NO DIRECTORY NUMBER TRANSLATION, HUNDREDS GROUP ROUTING APPLIES = The DN is not assigned in this office; however, routing using hundreds group applies.

NO ERROR TREATMENT FOR ACT = Alternate code treatment (ACT) was encountered with no error treatment specified.

NO ERROR TREATMENT FOR DPAT = Dialing plan access treatment (DPAT) was encountered with no error treatment specified.

NO IECP FACILITY SUBSCRIBED WHEN NEEDED = The packet line specified as the originator is not provisioned with an interexchange carrier preselect (IECP) although digit analysis has returned that this is an inter-lata call requiring a carrier. In this case, RPOA has also not been entered. The IECP should be provisioned in the ODD for this call or RPOA should be specified.

NON-DNT ORIGINATION = The originating port is not allowed to access ASP triggers.

NON-UNIQUE NXX DN ENTERED = The entered originator DN is ambiguous because of the increased number of NXX’s. Reenter the input message using a 10-digit originator DN.

NOT ALLOWED TO ORIGINATE = The originator may not dial calls.
NOT SUPPORTED, SEE CUSTOMER DOCUMENTATION = The originator COS or destination type is not supported by VFY:OFC.

The following originator COS values are supported for voice:

**LINES**

- **FC_2PTY** = Two party, multifrequency ringing.
- **FC_4PFS** = Four-party fully selective line.
- **FC_4PSS** = Four-party semiselective line.
- **FC_4WIRE_INDIV** = 4 wire subscriber line.
- **FC_5PTY** = Five party, multifrequency ringing.
- **FC_8PSS** = Multiparty line.
- **FC_10PTY** = MFR multiparty line.
- **FC_ATTENDANT** = Attendant line (similar to individual).
- **FC_CHGACALL** = Charge-a-call origination.
- **FC_COIN** = Coin line.
- **FC_HOTMOTL** = Special termination at motel equipment.
- **FC_INDIVDL** = Individual line.
- **FC_ISDN** = ISDN Line, allowed for analog lines.
- **FC_PBX** = PBX line origination.
- **FC_SATSTLN** = Stand alone test line.
- **FC_TWOPTY** = Two-party line.
- **PBXHOTMOT** = Special termination to a motel.

**TRUNKS**

- **FC_BSYVFY** = Busy verify trunk.
- **FC_IEC** = Carrier trunk.
- **FC_LATA_CONN** = Toll end of LATA connecting trunk.
- **FC_LTOLL_CONN** = Local end of toll connect trunk.
- **FC_PF** = Private facility trunk.
- **FC_PFITT** = Private facility trunk intertandem tie trunk.
- **FC_PFLASH** = Private facility trunk with flash repeating.
- **FC_PRI_INTOLL** = Primary intertoll trunk.
- **FC_SEC_INTOLL** = Secondary intertoll trunk.
- **FC_SPAMEG** = Special access MEGACOM trunk.
- **FC_SPAWATS** = Special access WATS trunk.
- **FC_TTOLL_CONN** = Toll end of toll connecting trunk.
- **FCEDSL** = PRI trunk.
- **FCEDSLHM** = Hotel/motel PRI trunk.

The following originator COS values are supported for CSD:

**LINES**

- **FC_ISDN** = ISDN line.
- **PSX25_T1** = X25 access on a T1 facility.

**TRUNKS**

- **FC_IEC** = Carrier trunk.
- **FC_LATA_CONN** = Toll end of LATA connecting trunk.
FC_LTOLL_CONN = Local end of toll connect trunk.
FC_PF = Private facility trunk.
FC_PFITT = Private facility trunk intertandem tie trunk.
FC_PFLASH = Private facility trunk with flash repeating.
FC_PRI_INTOLL = Primary intertoll trunk.
FC_SEC_INTOLL = Secondary intertoll trunk.
FC_TTOLL_CONN = Toll end of toll connecting trunk.
FCEDSL = PRI trunk.
FCEDSLHM = Hotel/motel PRI trunk.
PSX75_TK = Packet Switching on X.75.
PSX75P_TK = Packet Switching on X.75'.
PSPKT_TRK = Packet Switching on Inter-Switch Trunks.

The following destination types are not supported:
FCNS800 = Number services (800) type call.
FCSTG1FCA = Dial 011+PCC or 18X - fully coded addressing.
FCIDDFCN = Dial CC+NN - fully coded addressing.
FCAPSDN = Software defined network at an action point.
FCSAM800 = MEGACOM 800 (special access).
OAD2VDT = DA call to VDT.
OAOEPNIT = Non-ISP call to VDT.

OLI CANNOT BE ENTERED FOR MF TRUNK = Invalid input combination. OLI can only be entered for an ISUP trunk.
OLI CANNOT BE ENTERED WITH LINE ORIGINATOR = OLI can only be entered for a ISUP trunk origination.
PARTIAL DIAL TREATMENT = The call will route to tone or announcement. Refer to variable 'm' for the type of treatment.
PFA FEATURE NOT SUPPORTED = The input digits contained a private facilities access code that is not supported by VFY:OFC.
PFA MC ROUTING IS NOT SUPPORTED = Private facilities access is not supported by VFY:OFC.
PORT IS NOT ASSIGNED = The originating port is not assigned.
PORTED NUMBER ROUTING ERROR = The number was expected to be ported into the switch but no directory number translations exist for this DN. Possible problems are the SCP query response, the directory number assignment, or digit analysis ported-in flag.
PRECEDENCE AND PREEMPTION CALL DETECTED = Precedence and preemption calls are not supported by VFY:OFC.
PRESUBSC CANNOT BE ENTERED WITH LINE = PRESUBSC can only be entered for trunk origination.
QUERY TIMEOUT = A query was sent to the SCP and the response was not received before timing out.
QUERY/RESPONSE SIMULATION FAILURE = An LRN was entered on the input message line which has not been processed correctly. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
REORDER ON ALTERNATE CODE TREATMENT = Individualized dialing plan, alternate code treatment (ACT) with error treatment of reorder encountered.
REORDER ON INSUFFICIENT FRL = The facility restriction level (FRL) of the call was less than the required FRL indicated in the dialing plan. Error treatment is reorder tone.
RESPONSE NOT SUPPORTED = The SCP responded with a message that is not supported by VFY:OFC. Verify processing stopped when this message was received.
RLRTDNMOD: Routing Module and Route Index are 0 = Retrieved the rIRTDNMOD tuple,
but the routing module is set to zero and hundreds group routing does not apply.

ROUTE FAILURE ENCOUNTERED = The route request resulted in a failure. Refer to variable ‘h’s’ to determine the cause of the failure. Not all routing failure cases are supported by VFY:OFC, and additional data would not be available in those cases.

ROUTING ERROR = A non-HOME LRN was detected and a route index must be defined for this condition. Check digit analysis data.

ROUTING SP MAXED OUT, DATA MAY BE INCORRECT = The routing system process reached a maximum running limit or state limit before completion of the routing process. The output reflects the information gathered up to that point. However, it does not show the completed routing information and is not guaranteed to be correct.

ROUTING TO TONE OR ANNOUNCEMENT = The call will route to tone or announcement. Refer to variable ‘m’ for the type of treatment.

RPOA INPUT BUT INTRA-LATA COMPETITION NOT ALLOWED = Inter-lata competition is not allowed in this office. The packet call cannot be routed by the RPOA entered in the VFY:OFC input message.

SAT CANNOT BE ENTERED WITH LINE ORIGINATOR = SAT can only be entered for a trunk origination.

SAT (SATELLITE) IS INVAILD FOR NON-MINT MF TRUNKS

SCREENING FAILURE = This error can indicate carrier blocking (CBLK) is active for the screening (charging) from RC/V View 10.10 [SCREENING (CHARGING)]. The call will route to reorder if RTI=REGL on the row entry that is marked for carrier blocking.

SECURED FEATURE NOT PURCHASED = A Secured Feature Id needed to process the verify office request has not been purchased. Refer to variable ‘h’s’ for more information.

SEND TO RESOURCE NOT SUPPORTED = Verify does not support send-to-resource responses from the SCP. Verify processing was stopped when this message was received.

SENDING RELEASE MESSAGE = Call processing encountered an error event and populated a RELEASE message for the ISUP7 trunk. This signaling message is not actually sent but contains a cause code which is displayed in variable ‘i’s’.

SERVICE TRUNK GROUP NOT SUPPORTED = The call originator specified is a service trunk group. BICC originations are not allowed on a service trunk group. A BICC group must be specified to process BICC calls.

SERVICE TYPE NOT SUPPORTED = Number services type not supported by VFY:OFC. Refer to variable ‘h’s’ for more details.

SM IS NOT EQUIPPED OR OPERATIONAL = An SM is not available for examination.

SPEED CALL FEATURE NOT ASSIGNED = A speed call code was entered but no speed call feature is assigned.

TDX DATA CALLS FEATURE NOT ACTIVE = TDX data calls feature is not active. The VFY:OFC request for the LDP trunk is denied.

TG IS NOT EQUIPPED TO HANDLE DATARATE = The trunk specified as the originator does not have the DATARATE field on RC/V 5.1 (TRUNK GROUP) set or the trunk’s DATARATE is set but the trunk cannot support the data rate requested.

TG IS NOT EQUIPPED TO HANDLE VOICE CALL = This trunk group is equipped for data calls instead of voice calls.

TIMEOUT IN AM WAITING FOR SM RESULTS = No verify results have been received from the SM on which the originator resides. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portin of the INTRODUCTION section of the Output Messages manual.

TNS AND CIC CANNOT BE ENTERED AT SAME TIME FOR DOMESTIC ISUP CALL = For a VFY:OFC request on ISUP trunk, TNS and CIC can not be entered at the same time when CALLTYPE=DOM.

TNS CANNOT BE ENTERED WITH LINE ORIGINATOR = TNS can only be entered for a trunk origination.
TNS IS INVALID FOR MF TRUNKS = TNS is valid only for an ISUP trunk.

TNSC CANNOT BE ENTERED WITH LINE ORIGINATOR = TNSC can only be entered for a trunk origination.

TNSC CAN BE SPECIFIED ONLY FOR MINT TRUNKS = TNSC is invalid for the specified trunk if MINT_SIG=NULL.

TOO FEW DIGITS IN CALLED ADDRESS = Digit analysis tables were populated for an expected number of digits. Fewer digits appeared in variable 'b' or were analyzed as a result of a query response.

TRIGGER NUMBER NOT FOUND IN NS_TRIG = The trigger number was not populated in the RLNS_TRIG relation. Check the data associated with trigger numbers. The output message contains the trigger number.

TRIGGER TYPE NOT SUPPORTED = An invalid trigger type has been encountered.

TRY LATER, CAN NOT CREATE PROCESS IN SM = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TRY LATER, CAN NOT SEND MESSAGE IN SM = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TRY LATER, RESOURCES FOR FEATURE EXECUTION ENVIRONMENT UNAVAILABLE = When trying to start a FEX environment, the necessary data blocks (MDB, CLDB) were not available. Try again later.

TUPLE MISSING OR DATABASE ERROR DETECTED = The base relation and the tuple keys follow.

UNABLE TO DELETE SPECIFIED DIGITS = During digit conversion, a request was made to delete more digits than dialed. The relation identified should be checked.

UNABLE TO SEND MESSAGE FROM AM = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNEXPECTED DESTINATION TYPE FOUND = An unexpected destination type was encountered by the IDP during feature transition processing.

UNEXPECTED ERROR TREATMENT FOR ACT DETECTED = An unexpected error treatment was detected for the alternate code treatment (ACT).

UNEXPECTED ERROR TREATMENT FOR DPAT DETECTED = An unexpected error treatment was detected for the dialing plan access treatment (DPAT).

UNEXPECTED RESULTS FOR DEDICATED E911 TRUNK = The input port or trunk group is a dedicated E911 trunk and an MDII occurred. The MDII value has also been output.

UNKNOWN DA ROW ENCOUNTERED = An illegal value for the row attribute was found in the indicated tuple.

UNKNOWN ERROR = An undefined error was present. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNKNOWN ROUTE TYPE = The route type found in RT_SCRN or RT_ROUTING is not expected by packet routing.

UNSUCCESSFUL CONVERSION TO PORT = The originator specification does not identify a valid port.

USER NOT ALLOWED TO USE EXPLICIT ASI SERVICE CODE = The advanced service interface assigned to the port is for implicit service only and an explicit dialed code was entered.

USER NOT ALLOWED TO USE IMPLICIT ASI SERVICE CODE = The advanced service interface assigned to the port is for explicit service only and an implicit dialed code was entered.

WBCHANNEL CANNOT BE ENTERED WITH LINE ORIGINATOR = WBCHANNEL can only be entered for a trunk origination.
WBRATE CANNOT BE ENTERED WITH LINE ORIGINATOR = WBRATE can only be entered for a trunk origination.
WIDEBAND DATARATE IS NOT VALID FOR NON-ISUP TRUNKS = WBRATE and WBCHANNEL are valid only for an ISUP trunks. An error is output if they are entered for other signal types.

u = Relation name and key fields, in the format:
RELATION_NAME KEY1 KEY2 ...

The relation keys are shown as either a field name printed in this output message or an attribute name and value. For example, "DEST_TYP" or "PREVIOUS 5". Refer to the Translations Data manual for definitions.

v = Additional key to relation in variable 'u'.
w = Additional key to relation in variable 'u'.
x = Directory number (DN) of a line. For packet call type, if the calling address in the input message is an international E.164 address, the DN= variable will contain the expanded full E.164 address (country code + NPA + NXX + XXXX).
y = Group number.
z = Location routing number (LRN).
a = Member number. The member number will be blank if the trunk group specified is a Bearer Independent Call Control trunk group.
b = Route index (RI) number or automatic route selection index (ARSIDX). RI for a call that leaves the office or ARSIDX in the case of an ARS call. The ARSIDX can be replaced by a route index value if the call is directed to an announcement trunk.
c = Normalized office code (NOC) for a local line termination.
d = Trunk group.
e = Carrier feature group indicator. Valid value(s):
B = Feature group B plus carrier identifier.
D = Feature group D plus carrier identifier.
(blank) = None. A carrier was not used to route the call.
f = Call type for this verification request. Valid value(s):
CSV = Circuit switched voice (default).
CSD = Circuit switched data.
PKT = Packet switched data.

g = Datarate for a circuit switched data call and its corresponding CSD bearer capability. Valid value(s):
56 = 56-kbps, unrestricted digital information, circuit-mode, rate adapted from 56-kbps.
64 = 64-kbps, unrestricted digital information, circuit-mode.
R64 = 64-kbps, restricted digital information, circuit-mode, rate adapted from 56-kbps.
h^1 = Data network interexchange carrier. Valid value(s):
   RPOA=i^1
   ICPI=j^1

i^1 = Registered private operating agency, a four-digit data network interexchange carrier (DNIC) used with packet routing.

j^1 = Interexchange carrier preselect.

k^1 = Packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

l^1 = Datarate alternate route index for a CSD call that leaves the office.

m^1 = Packet switch number. Valid value(s):
   D_PSN=o^1
   N_PSN=n^1

n^1 = Next packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

o^1 = Destination packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

p^1 = Interexchange carrier preselect.

q^1 = The LRN returned is home to this switch. Valid value(s):
   HOMELRN=N
   HOMELRN=Y

r^1 = Local number portability trigger number.

s^1 = Existence indicator. This provides information on the existence of the DN translation and assignment of the "non-conditional 10-digit trigger for LRN". Valid value(s):
   DIRECTORY NUMBER TRANSLATIONS EXIST
   DIRECTORY NUMBER TRANSLATIONS EXIST WITH NON COND TRIG
   NO DIRECTORY NUMBER TRANSLATIONS EXIST

r^1 = Destination numbering plan area code. For packet VFY:OFC input messages, this variable will contain the implied numbering plan area (such as, the area code) used to route the call. The area code is derived for line originated calls. The NPA can be provisioned on RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)] or RC/V View 9.3 [LOCAL DIGIT (OFFICE DIALING)].

u^1 = Output can occur as one message or multiple messages. Each output message is referred to as a segment and marked with an event number and a segment indicator. All messages associated with one request will have the same event number. Segment numbers are used to represent a sequence.
For example: VFY OFC EVENT 3 SEGMENT 1

At the end of each segment, a marker is printed showing if another segment is expected.
VFY OFC: CONTINUING = Another segment will be printed.
VFY OFC: COMPLETED = No more segments are expected.

v¹ = Generic address parameter (SS7 ISUP).
w¹ = The location routing number digits.
x¹ = The value for ASP default routing. Valid value(s):
  ANNCD = Default route to 13A terminating announcement.
  DLDN  = Default route to dialed DN.
  NONE  = No default routing to be applied.

y¹ = Geographic portability. Valid value(s):
  GEOPORT=N
  GEOPORT=Y

z¹ = This field indicates the proper text to represent the source of the DAS in the variable 'g'. Valid value(s):
  ORIGINATORS_DAS  = The DAS assigned to the originating port will be used for digit analysis.
  POST_QUERY_DAS   = The DAS associated with the trigger number will be used for digit analysis.
  CURRENT_DAS      = Indicates that the current DAS will be used for digit analysis.
  SCP_DAS          = The office defined SCP DAS will be used for digit analysis.
  LRN_DAS          = The LRN DAS assigned to the originating trunk will be used for digit analysis.
  SFG_DAS          = The DAS defined for the accessed simulated facilities group will be used for digit analysis.
  SDN_DAS          = The call has requested SDN and the DAS assigned to the EDSL trunk will be used for digit analysis.
  IDDTC_DAS        = The DAS defined for international outbound will be used for digit analysis.
  ANI_DAS          = The ANI table DAS will be used for digit analysis for LDP processing.
  II_DAS           = The II table DAS will be used for digit analysis for LDP processing.
  CIC_DAS          = The CIC table DAS will be used for digit analysis for LDP processing.
  DEFAULT_ANI_DAS  = The default ANI table DAS will be used for digit analysis for LDP processing.
  DEFAULT_CIC_DAS  = The default CIC table DAS will be used for digit analysis for LDP processing.
  ISUP_APN_DAS     = The office ISUP APN DAS will be used for digit analysis.
  EON_APN_DAS      = The Advanced Services Platform EON APN DAS will be used for digit analysis.
  EON_LOCAL_DAS    = The Advanced Services Platform EON LOCAL DAS will be used for digit analysis.
  EON_TOLL_DAS     = The Advanced Services Platform EON TOLL DAS will be used for digit analysis.

a² = Route index used for automatic route selection private network.

b² = Type of carrier interconnect call.

c² = Inhibit dialed number trigger (DNT), indicates whether to look for DNTs following LRN analysis.
Valid value(s):
  INHDNT=N
INHDNT=Y

d2 = Location routing number screening. Valid value(s):
    LRNSCR=N
    LRNSCR=Y

e2 = Trigger type. Used to define variable 'f2'. Valid value(s):
    LNPTRIG = Local number portability trigger.
    TRIG = Non-LNP trigger.

f2 = A number between 1 and 255 associated with the trigger type in variable 'e2'.

g2 = The administrative state code state. Valid value(s):
    LOCKED
    UNLOCKED

h2 = Defines the signaling transfer point translation type number associated with the trigger.

i2 = The trigger is allowed for voice calls, data calls or both. Valid value(s):
    BOTH
    CSD
    VOICE

j2 = Virtual private network (VPN) trigger. Valid value(s):
    N
    Y

k2 = Application type. Valid value(s):
    800
    ASP
    E911

l2 = Advanced intelligent network release. Valid value(s):
    R0
    R0D1

m2 = Source of the service key for query formulation. It is only valid for R0 protocol. Valid value(s):
    ANI
    CDPN

n2 = Advance intelligent network (AIN) toll-free service allowed. Valid value(s):
N
Y

\( o^2 \) = The bearer capability associated with the call that encountered the trigger. Valid value(s):

- 3.1 KHZ AUDIO
- 56 KBPS
- 64 KBPS
- SPEECH

\( p^2 \) = Global title number, a unique 10 digit number used by the SCP.

\( q^2 \) = Local routing number index assigned to the directory number translation.

\( r^2 \) = Destination point code number. A unique 9 digit number that identifies the receiving entity of the SCP query.

\( s^2 \) = The signaling transfer point translation type number used in the query of the SCP. This will be the value assigned to the trigger or the office (if one is not assigned to the trigger).

\( t^2 \) = The event that caused the trigger to occur. Valid value(s):

- CHANNEL SETUP PRI
- COUNTRY CODE NPA-NXX-XXXX
- CUSTOMIZED ACCESS
- FEATURE ACTIVATOR
- N11
- NETWORK BUSY
- NPA
- NPA-N
- NPA-NXX
- NPA-NXX-X
- NPA-NXX-XX
- NPA-NXX-XXX
- NPA-NXX-XXXX
- OFF HOOK DELAY
- OFF HOOK IMMEDIATE
- ORIG CALLED PARTY BUSY
- ORIG NO ANSWER
- SHARED INTER OFFICE TRUNK
- TERMINATION ATTEMPT
- VERTICAL SERVICE CODE

\( u^2 \) = Query status. Used to indicate result of SCP query. Valid value(s):

- NO DATA POPULATED, FEATURE NOT ACTIVATED
- NO QUERY PERFORMED
- NO QUERY PERFORMED, OVERRIDING HRI FOUND
- QUERY BLOCKED
- QUERY FAILED
- QUERY SUCCEEDED

\( v^2 \) = Type of number returned by the SCP. Valid value(s):
LRN = The DN has been ported to another switch identified by this location routing number.

NON_PORTED_DN = The DN has not been ported.

\( \omega^2 \) = The called party directory number returned by the SCP. This number may be the original called number which has not been ported or an LRN. It is associated with variable \( \omega^2 \).

\( x^2 \) = Switch module (SM). Identifies where the failing (also called asserting) code resides.

\( y^2 \) = The assert number. Refer to the Asserts manual for additional information.

\( z^2 \) = Event number associated with the assert. This allows a correlation of the summary output provided by VFY:OFC with the assert output provided on the ROP.

\( a^3 \) = Name of the source file where the defensive check failed.

\( b^3 \) = Indicates the scope of variable \( c^3 \). Valid value(s):

<table>
<thead>
<tr>
<th>If ( b^3 ) =</th>
<th>then ( c^3 ) =</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINE</td>
<td>A source file line number indicating the location where the assert was called or printed.</td>
</tr>
<tr>
<td>REF</td>
<td>A programmer defined reference number.</td>
</tr>
</tbody>
</table>

\( c^3 \) = Line or reference number.

\( d^3 \) = A brief description of the problem that caused the assert failure.

\( e^3 \) = The assert error code. Refer to the Assert manual for additional information.

\( f^3 \) = Failing address. The virtual address of execution at the time the assert failed.

\( g^3 \) = Two column output consisting of data and an associated descriptive string.

\( h^3 \) = Additional information. Multiple comments may be concatenated together.

To determine the meaning of the output comment field, start at the beginning of the comment string and find the matching string below. If there are additional characters, start from that point and find the next matching string. Continue until there are no more characters in the comment field. There is a limit on the total number of characters which means that the last comment may be truncated.

Valid value(s):

Account Code override of toll diversion possible. = The user has an account code feature assigned. This can be used to override the user's screening index (SI) used for RC/V View 10.10. VFY:OFC does not support entry of an ACCT code.

BAD DESTINATION TYPE FOR N11 CONVERSION DN = The destination type for the conversion dn on a 711 relay call is FCRELAY711, which is invalid. FCRELAY711 cannot be the destination type on the conversion dn.

ACVT not supported = Attendant control of voice terminals is not supported by VFY:OFC.

ACCESS OR USER INFO IE DISCARDED = Refer to the cause value definition in the ISUP/TCAP Related Feature Description.

ANI NEEDED FOR FEATURE USE = The two party class of service is not allowed the entered feature if the two-party line does not have ANI or if the calling party number presentation (CPNP) is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

ARS CARRIER SELECTION ERROR = An error has occurred while processing the carrier access
for an ARS call. An example of an error is the specified automatic route selection (ARS) SFG carrier is a LEC carrier and the digits are INTERLATA. Examine the attributes associated with the output CARRIER= and the DIG= string.

ARS ERRTRT ANNCE USED = An ARS uniform number plan dialing error was encountered and the ARS group error treatment is announcement. This error is also used when an ARS call is made with the ODP, an ARS filtering error occurs, and FLTRERR is set to ANN for the ARS.

ARS ERRTRT ATDN USED = An ARS uniform number plan dialing error was encountered and the ARS group error treatment is route to attendant. This error is also used when an ARS call is made with the ODP, an ARS filtering error occurs, and FLTRERR is set to ATDN for the ARS.

ARS ERRTRT TONE USED = An ARS uniform number plan dialing error was encountered and the ARS group error treatment is reorder tone. This error is also used when an ARS call is made with the ODP, ARS filtering occurs, and FLTRERR is set to REORD for the ARS.

ARS UNEXPECTED INVLD PORT = This type of port is not supported by ARS. The call will route to reorder.

ARS UNEXPECTED RTE TYPE FROM DIGANAL = An unexpected route type was returned from digit analysis for ARS. The call will route to reorder.

ASP R0D1 feature has not been purchased. = The indicated ASP release is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

ASP Release 0 is inactive. = The indicated ASP release is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

ATNDS CANNOT ACCESS FEATURE ENTERED = An attendant that is not assigned features cannot access the generally available feature that was entered.

Authorization and Account Code override of toll diversion possible. = The user has an authorization code feature and an account code feature assigned. Either one of these features can be used to override the user's SI used for RC/V View 10.10. VFY:OFC does not support entry of these codes.

Authorization Code override of toll diversion possible. = The user has an authorization code feature assigned. This feature can be used to override the user's SI used for RC/V View 10.10. VFY:OFC does not support entry of an authorization code.

Authorization Code override possible. = The user has an authorization code feature assigned. This feature can be used to override the user's automatic route selection facility restriction level (FRL). VFY:OFC does not support entry of an authorization code.

Bad Data found during ARS routing. = Bad data was encountered while getting the routing information on an automatic route selection call.

Bad Data found during routing. = Bad data was encountered while getting the routing information.

Basic LRN feature has not been purchased = Encountered an LNP trigger. However, number portability-LRN is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Bearcap data incorrect. = In setting up for a BRI request, the bearer capability was not set up correctly in an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Bearcap data not setup. = In setting up for a BRI request, the bearer capability was not set up in an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
BEARER CAPABILITY INCOMPATIBLE WITH SERVICE REQUEST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
BEARER CAPABILITY NOT AUTHORIZED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
BEARER CAPABILITY NOT PRESENTLY AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
BEARER SERVICE NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
BFG TRMFEATS TUPLE MISSING. = The port is in a BFG but the expected rTRMFEATS tuple was not found.
BRI Keypad invalid. = The keypad area of an internal message was not setup correctly. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
BRI setup msg bad. = An error has occurred setting up an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
Bypassing LDP Account code Collection for VFY:OFC = If it is determined that Account code digits have to be collected for a MF trunk for LDP processing, verify office will skip collecting and processing account code digits and continue.
CALL AWARDED AND DELIVERED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
CALL HAS BEEN QUEUED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
Call is being Toll Diverted (TDV). = The user's SI, the code index (CDI) of the entered digits, and the prefix value of the entered digits used from RC/V 10.10 are set up to toll divert to the attendant.
CALL REJECTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
CALL SCREENING FEATURE NOT PURCHASED. = The call screening feature has not be purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
CALL SCREENING ENHANCEMENT FEATURE NOT PURCHASED. = The call screening enhancement feature has not be purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
CARRIER ACCESS DENIED BY BLK 1PLUS. = Call will route to DEST_TYP NO10xx error treatment because the user is not allowed to access a carrier as dialed. The user is assigned either SPLIT or FULL BLOCKING with the BLK 1PLUS feature.
CHANNEL CONGESTION OR UNAVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
CHANNEL TYPE NOT AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
CHANNEL UNACCEPTABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
COS NOT ALLOWED TO ACCESS FEATURE. = This class of service is not allowed to access the entered feature.
CPNP SFID 50 NOT PURCHASED = The calling party number presentation is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
DATABASE READ FAILURE IN MCidprel = An IDP digit analysis tuple is missing.
DC MKB SFID NOT PURCHASED = The dial code make busy is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
Messages manual for additional information.

Dial Plan Access Treatment (DPAT) error. = A DPAT error was encountered which requires an authorization code to continue. VFY:OFC does not support authorization codes.

DESTINATION OUT OF ORDER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

DIRECT ACCESS LINK. = Indicates that direct access links (DAL) access is allowed for this trunk group.

EAVM DID NOT FIND ACTIVE CF = When easy access to voice mail (EAVM) dial code was dialed, at least one of the following conditions was found: neither call forwarding don't answer (CFDA) nor call forwarding busy line (CFBL) is assigned and active in the line, or, neither CFDA nor CFBL have a Forward-to DN assigned on the line.

EAVM NOT ALLOWED FOR PORT = EAVM feature is not allowed for the port.

EAVM NOT PURCHASED = EAVM feature is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

EXCESSIVE DIGITS RECEIVED = Refer to the cause code value definition in the ISUP/TCAP related feature description.

Expected FEX environment not found. = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Facility number should be specified for FX trunk origination. = FACILITY NBR in RC/V View 5.1 needs to be set for the origination trunk.

FAILED TO FIND FEX CC MODEL FOR ARS = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Failed To Get Data Pointers = Failed to retrieve pointers to structures within the routing message.

Failed To Populate BEARER CAPABILITY Parameter = Failed to populate the mandatory BEARER CAPABILITY parameter in the query message.

Failed To Populate GLOBAL TITLE ADDRESS = Failed to populate the mandatory GLOBAL TITLE ADDRESS parameter in the query message.

Failed To Populate USERID Parameter = Failed to populate the mandatory USERID parameter in the query message.

FAILED TO REPLACE TO FEX FOR ARS = Internal error. Try again later. If it still doesn't work, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual for additional assistance.

Failed To Send Message To TCAP = The attempt to send the query message to the TCAP system process failed.

FC_create() ERR1 = An error occurred while trying to get the head of the CLDB list.

FC_create() ERR2 = An error occurred while trying to get an idle CLDB.

FC_create() ERR3 = An error occurred while trying to get and link an MDB to the CLDB.

FEATURE ALREADY ACTIVE. = The dialed code action entered is to activate a feature which is already active for this port. It cannot be entered successfully on the port unless the feature is first deactivated.

FEATURE ALREADY INACTIVE. = The dialed code action entered is to deactivate a feature which is already inactive for this port. It cannot be entered successfully on the port unless the feature is first activated.

FEATURE INACTIVE OR SWITCHED OFF. = For features assigned to the port, this means that either the active flag is N or the master switch for the feature is off. For features that can be accessed through general availability or subscription, this means that the feature is not set to allow either mode of access. Therefore, the input feature dialed code cannot be used.
FEATURE NOT ACTIVE = The dialed code action entered is not allowed, as the office option is not enabled for this feature.
FEATURE NOT ALLOWED ACTION ENTERED. = The feature assigned to the port is not set up to allow the dialed code action entered. This may be due to the feature options, port options, or office options associated with this feature.
FCfex_init() ERR1 = An error occurred while trying to get an idle CLDB.
FCfex_init() ERR2 = An error occurred while trying to get an idle MDB.
FCto_fs: Internal error = VFY:OFC processing encountered unexpected code. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
FEATURE 228 NOT PURCHASED. = ISDN personal communication is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.
IDENTIFIED CHANNEL DOES NOT EXIST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
IE NONEXISTENT OR NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
INCOMING CALLS BARRED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
INCOMPATIBLE DESTINATION DIRECT CALL NOT SUBSCRIBED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
INTERCEPT TREATMENT ON. = Originating line is on intercept service and is denied origination.
INTERNAL ERROR: FEX COMING DOWN UNEXPECTEDLY. = An internal error has occurred in the feature execution environment interface with verify office. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
INTERCEPT TREATMENT ON. = Originating line is on intercept service and is denied origination.
INTERCOM RANGE HAD NO DIGITS TO PREFIX. = An IDP intercom (extension) was entered and the range accessed has no digits to prefix as expected.
Interrupt Message Received = An MGINTERRUPT message was received while waiting for the SCP to respond.
INTERWORKING-UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
INVALID ACTION FOR FEATURE. = The feature that is being processed has encountered an unexpected action value. Report the problem.
INVALID ACTION FOR NON-WILD CARD (MAGIC) FEATURE. = The feature that is being processed has encountered an action that is allowed only for wild card features. Wild card (magic) features are the matching /XX* features. For example, for an Individualized Dialing feature, the wild card feature is /ID*. Update the action or feature associated with the input dialed code.
INVALID ACTION FOR WILD CARD (MAGIC) FEATURE. = The wild card (magic) feature that is being processed has encountered an action that is not allowed for wild card features. Wild card (magic) features are the matching /XX* features. For example, for an Individualized Dialing feature, the wild card feature is /ID*. Update the action or feature associated with the input dialed code.
INVALID ACTION IN MCspicarr = Expected dialed code action was for carrier access but a non-carrier access code was received.
Invalid Assert Message Type Detected By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
INVALID CALL REFERENCE VALUE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
Invalid Data Collection State Detected By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Invalid Digits Encountered = LNP queries are only allowed to contain dialed digits in the range of 0-9.

INVALID DIGIT VALUE FOR NUMBER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid Error Code Received By RTvfy_rpt() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Invalid Error Code Received By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INVALID INFO ELEMENT CONTENTS = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID MODULAR FEATURE TYPE = The feature being processed is not a valid modular feature type. This is an unexpected error. Report the problem.

INVALID NUMBER FORMAT = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID OR UNSPECIFIED MESSAGE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid two-party party value = Expected either TIP or RING but neither was found. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

ISDNFAIL Message Received = An MGISDNFAIL message was received while waiting for the SCP to respond.

ISDN PODS CANNOT USE FEATURES = ISDN PODS terminals do not have access to any BRCS features.

ISDN CANNOT ACCESS USTWC = Usage sensitive three-way calling is not allowed on ISDN terminals.

LASS NOT LOADED = Custom local area signaling services (CLASS) is not loaded on the switch. CLASS features cannot be used.

LDP ACCOUNT CODE PROCESSING SKIPPED FOR VERIFY OFFICE = If it is determined that account code digits have to be collected for an ISUP trunk for LDP processing, verify office will skip collecting and processing account code digits and continue.

LRN was not entered on command line = This VFY:OFC request is attempting to do an LNP query. NP-verify office for LRN is not activated. NP-test query for LRN is activated but requires an LRN to be specified on the input message line. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

LTSB CANNOT DEACT MAN EXCLUSION = Deactivation of manual exclusion is not available for LTSB lines.

MANDATORY IE MISSING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

MCcpystrd unexpected return = VFY:OFC processing encountered unexpected return code. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Message could not be sent to routing process = The route request message could not be sent. Try again later.

MESSAGE NOT COMPATIBLE WITH CALL STATE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

MESSAGE TYPE NONEXISTENT OR NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
MGRT_FAIL REASON NOT HANDLED BY VFYOFC = Route failure reason invalid for VFY:OFC processing. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

NETWORK CONGESTION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO ASSOCIATED DIGITS FOR SPEED CALL DIGIT(S) = A speed call digit(s) was entered and there are no associated digits to analyze.

NON SELECTED USER CLEARING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NORMAL CALL CLEARING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Normalized Office Code Must Be Defined for Home LRNs = LNP error - An NPA and OFFCODE must be populated on the LDIT/RDIT view when HOMELRN=Y.

NORMAL-UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO ROUTE TO DESTINATION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO ROUTE TO SPECIFIED TRANSIT NET = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NO USER RESPONDING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

NUMBER CHANGED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

OSPS not supported. = Request will be treated as if non-OSPS.

OSREPLACE Is Not supported By RTvfy_rpt() = Entry into RTvfy_rpt() using an OSREPLACE is not currently supported.

OUTGOING CALLS BARRED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

OVLP attempted on non-ovlp route. = Overlap outpulsing would be attempted on a trunk that does not support overlap outpulsing.

PKT keyword must be entered for the originator specified = The port identified from the input message is used for packet switch data (PSD), so the keyword PKT needs to be included in the input message line.

PORTEDDN or NONPORTED parameter is not supported with non-CCS trunk = PORTEDDN or NONPORTED are only supported for ISUP trunks.

PORT NOT ALLOWED FEATURE = The input originating port is not allowed to access the entered feature.

PORT NOT ASSIGNED ARMED, ACTIVE FEATURE = At least one of the following conditions is true: the port is not assigned the feature associated with the input dialed code, the feature that is assigned is not armed through the master switch flag, or the feature that is assigned is not active but should be to use the input action.

PORT NOT ASSIGNED ARMED, ACTIVE FEATURE OR USAGE SENSITIVE FEATURE NOT AVAILABLE. = At least one of the following conditions is true: the port is not assigned the feature associated with the input dialed code, the feature that is assigned is not armed through the master switch flag, the feature that is assigned is not active but should be to use the input action, or the port does not have an assigned armed, active feature and the usage sensitive feature of the type entered is not available for use because it has not been purchased or is not active.

PORT NOT ASSIGNED FEATURE = No feature is assigned to the port.

PORT TRMFEATS TUPLE MISSING = Port has terminal features assigned but expected TRMFEATS tuple not found.

Pots access not allowed = Access to the office dialing plan is not allowed for this type of call.
PRECEDENCE CALL BLOCKED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

PREEMPTION—CIRCUIT RESERVED FOR REUSE/PREFIX 1 DIALED IN ERROR = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

PREEMPTION/PREFIX 0 DIALED IN ERROR = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

PREFIX 1 NOT DIALED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

PROTOCOL ERROR—UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

RECOVERY UPON TIMER EXPIRATION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

REQUESTED CHANNEL NOT AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

REQUESTED FACILITY NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

REQUESTED FACILITY NOT SUBSCRIBED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

REQUESTED FACILITY REJECTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

RESOURCE UNAVAILABLE OR UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

RESPONSE TO STATUS ENQUIRY = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Route Index Must Be Defined for Non-Home LRNs = LNP error - A route index must be populated on the LDIT/RDIT view when HOMELRN=N.

Routing Module Tuple Missing. = Unable to retrieve the rRRTDNMOD tuple. The accompanying data provides the key information.

ROUTING TO REORDER = A route failure has occurred with the general reason of REORDER. The failure reason is not more specific. If there was an assert output, the error can be determined from the assert failure indicated. The call will route to reorder.

RTvfyasi entered with invalid ASI action. Internal error. = Advanced services interface function expected either action ASITOG or ASIUSE. A different action was encountered. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTv_brichks() BRI_ERR1. = Unable to get the TEDB.
RTv_brichks() BRI_ERR2. = TEDB contains invalid information.
RTv_brichks() BRI_ERR3. = Unable to access the DALB.
RTv_brichks() BRI_ERR4. = Cannot link DALB to TEDB.
RTv_brichks() BRI_ERR5. = Could not link the BRCSDB to the DALB.
RTv_brichks() BRI_ERR6. = Could not link DALB to DPB.
RTv_brichks() BRI_ERR7. = Could not link DALB to PCBLA.
RTvdalb_init() PRI_ERR1. = Failed to get a PRISTAT pointer.
RTvdalb_init() PRI_ERR2. = Could not get a DALB.
RTvdalb_init() PRI_ERR3. = Could not link DALB to PRISTAT.
RTvdalb_init() PRI_ERR4. = Could not link DALB to PCBLA.
RTvfy_rpt() Was Entered With Unknown Reason = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTvfy_rsp() Specified An Invalid Maxtime. = An internal error was encountered while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
RTvfy_rsp() Received An Invalid Return Value. = An internal error was encountered while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTvfy_rsp() Received a Truncated Message. = An internal error was encountered while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

RTvfy_rsp() Timed Out Waiting For RSP. = A timeout occurred while waiting for the routing data. Try again later.

SEGMENTATION ERROR = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE DENIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE OPERATION VIOLATED-W/DIAG = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE OR OPTION NOT AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

SERVICE OR OPTION NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Signal type of the trunk is not supported by Verify Office = The signal type for this trunk on RC view 5.1 is not supported for VFY:OFC.

SIMULTANEOUS RINGING FEATURE NOT PURCHASED. = The simultaneous ringing feature has not been purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

TEMPORARY FAILURE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

TG IS NOT EQUIPPED TO HANDLE DATARATE = The trunk specified as the originator does not have the DATARATE field on RC/V View 5.1 set or the trunk's DATARATE is set but the trunk cannot support the data rate requested.

The class of service of the originator is not supported by verify office. = Refer to variable 't' for supported classes of service.

The Finite State Machine Failed = An attempt to query the SCP has failed for an unknown reason.

The tone or announcement type is X. = Where X is the type of tone or announcement that the call would be routed to.

This type of trunk can't be used for FX or Tie service = The class of service of the trunk is not proper for FX/TIE services.

TOO MANY STORED DIGITS = There are too many digits for digit analysis to handle. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

TRANSIT NETWORK DOES NOT EXIST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

TRANSFER TO ACD FROM ARU NOT PURCHASED. = This feature has not been purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

UCR SFID 47 NOT PURCHASED = Unidentified call rejection is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Unable To Communicate With The Routing Module. = Need to retrieve the rIRTDN_TRAN tuple from the routing module; however, the routing module is not operational.

UNALLOCATED NUMBER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
Feature Description.

**UNASSIGNED DN, NO LRN** = An unallocated directory number has been encountered and there was not an location routing number.

**UNASSIGNED DN, LRN PRESENT** = An unallocated directory number has been encountered and there was an location routing number.

Unexpected Data Collection State In RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Unexpected Message = Attempting to access a message with an invalid message type.

UNEXPECTED RETURN CODE FROM MCgetdig IN MCidprel. = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNEXPECTED RETURN CODE FROM MCgetdig IN MCidcont. = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNEXPECTED ROUTE FAILURE REASON = Code for route failure unexpectedly entered for a reason that VFY:OFC does not handle. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

Unknown Message Was received By RTvfy_rsp(). = An unknown message was received while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

USER ALERTING NO ANSWER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

USER BUSY = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

User Has Authorization Code First feature. Continuing VFY:OFC = The user has an authorization code feature assigned that has ATH FIRST Y. This is being ignored and the verify is continuing. VFY:OFC does not support an authorization Code.

**WARNING:** Ignoring the authorization code data may result in invalid routing information if the authorization code data overrides, for example, the SI to be used, the facility restriction level (FRL) to be used, etc. Check the user's feature and group information to determine if the results of the verify are valid.

**USTWC FEATURE NOT PURCHASED OR NOT ACTIVE.** = The usage sensitive three-way calling feature has not been purchased or has not been activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Utility Telemetry Service is not activated = UTT feature is not active but the originating port is marked for UTT service. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

**VACANT CODE** = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Verify Office for LRN feature is inactive = This VFY:OFC request is attempting to do an LNP query; however, both NP-test query for LRN and NP-verify office for LRN are inactive. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

**VFY:OFC ARS NOT SUPPORTED FOR CCS.** = Verify of ARS feature is not supported on ISUP/CCS trunks.

**VFY:OFC ARS NOT SUPPORTED FOR SERVICE CLASS.** = The input port has a class of service that cannot have ARS.
VIRTUAL PRIVATE NETWORK CALL = Indicates that this is an origination virtual private network (VPN) call.

WIRELESS CALL ORIGINATION = Wireless call originations are not supported by VFY:OFC.

i^3 = Value type. Used to define type of value indicated in variable ‘j^3’. Valid value(s):
  CAUSE = Cause code value. Refer to the ISUP/TCAP Related Feature Description for a complete list of cause codes and their meanings.
  MDII CODE = Number mapped internally in the DMMDII domain. Refer to the APP:MDII appendix in the Appendixes section of the Output Messages manual.

j^3 = Value definition associated with value type as indicated in variable ‘i^3’.

k^3 = Context identifier. This field is associated with the AMA recording for unbundled and resold feature. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information. Valid value(s):
  NATIVE = This is the default value if the SFID is inactive. This port is native to the switch.
  UNBUNDLED = This port has been unbundled from the switch.
  RESOLD = This port has been resold.

l^3 = LNP trigger number.

m^3 = The dialed digits are a number that may have been ported into, or out of the office. Valid value(s):

  PORTED_IN =Y
  PORTED_IN =N

n^3 = ANI digits. ANI contains the calling party number or charge number. Used for LDP ANI processing. ANI is a required field for LDP LATA trunks. Valid value(s):

  10 digit NPA-NXX-XXXX
  3 digit NPA
  NULL = The NULL value shall be valid only when DIG=950-XXXX The trigger number and trigger type are output. for CALLTYPE=FGB or FGBPS calls.

o^3 = For a MF trunk this field represents the ANI information digits (II). Valid value(s):

  00 = Identified line with no special treatment.
  01 = Operator number identified (multiparty).
  02 = ANI failure.
  06 = Hotel without room identification.
  07 = Coinless, hospital, or inmate call.

**q**

= This field represents the first table matched in LDP processing. Valid value(s):

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDP_ANI</td>
<td>The ANI type tuple was matched with a tuple in the LDP ANI table (LDP index table).</td>
</tr>
<tr>
<td>LDP_CAR</td>
<td>The ANI type tuple was matched with a tuple in the LDP CARRIER table.</td>
</tr>
<tr>
<td>DEFAULT_ANI</td>
<td>The ANI type tuple was matched with a tuple in the DEFAULT ANI table.</td>
</tr>
<tr>
<td>DEFAULT_CIC</td>
<td>The ANI type tuple was matched with a tuple in the DEFAULT LDP CARRIER table.</td>
</tr>
</tbody>
</table>

**r**

= Calltype of the dialed number. Valid value(s):

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1P</td>
<td>World zone 1, non-operator.</td>
</tr>
<tr>
<td>0P</td>
<td>World zone 1, zero plus.</td>

<tr>
<td>DOM</td>
<td>Domestic (United States).</td>
</tr>
</tbody>
</table>
FGB = FGB (950-xxxx) calls from transition EAEO/AT.
FGBPS = FGB (950-xxxx) calls from public station during and after the transition.
FGDCT = Feature group D cut through calls.
APN = Action point numbers.

s³ = Carrier identification code (CIC).
t³ = Transit network selector (TNS) circuit code.
u³ = Carrier code for TNS.
v³ = Country code (CC) for the called number.
w³ = Terminating network selection code (TNSC). This is relevant only for specified MINT trunks.
x³ = Terminating network selection code sent out with the call. This is relevant only if outgoing trunk is MINT.

y³ = Wide band (WB) data rate for CSD calls. Valid value(s):

384 = 384 kbps.
384_1536 = 384 or 1536 kbps.
1536 = 1536 kbps.

z³ = WB data rate channel for CSD calls. Wideband channel specifies the number of DS0s requested for the call. The number of DS0s is the information transfer rate multiplier value.
a⁴ = WB data rate alternate route index for a CSD call that leaves the office.
b⁴ = ASP trigger type. Valid value(s):

DIALED_NUMBER_TRIGGER
OFF_HOOK_DELAY

c⁴ = ASP trigger number.
d⁴ = Destination index for FGD tandem cutthrough calls.
e⁴ = Route index for FGD tandem cutthrough calls.

4. ACTIONS TO BE TAKEN

In the cases where an explicit translations error is found, or if the call routes to an incorrect line or trunk, follow local provisioning procedures to correct the situation.

5. ALARMS

None.

2. REASON FOR OUTPUT

To print the routing translations results of an VFY:OFC input request. The output may be presented in multiple messages. The last line of each message indicates if verify office has completed or if additional messages are expected. The messages will be in one of the seven output formats.

Format 1 echoes the input message parameters and provides digit analysis results.

Format 2 provides LNP trigger information (if available), SCP query related information and status, and indication on the existence of the terminating directory numbers’ translation. Format 2 will not be used to provide data pertaining to ASP or network services triggers since only LNP triggers are supported by verify office.

Formats 3, 4, and 5 provide information on errors which result in an assert message output to the read-only printer (ROP). Assert activity will cause termination of the verify office request. Assert activity encountered during processing of a verify office request is not suppressed by brevity control.

Format 6 provides additional information related to the request processing. The additional information may be useful information about a successful request, or describe an error condition which does not result in an assert message output.

Format 7 provides additional digit analysis results and routing information for LDP processing. This format is always preceded by the format one output, and will never output of its own.

3. VARIABLE FIELD DEFINITIONS
NONPORTED  = Presence of this key indicates that variable 'b' value is known to be non-ported.

PRESUBSC  = Keyword to indicate if the calling party is presubscribed to the carrier associated with this call.

SAT  = Keyword to indicate if the call has been routed using a satellite.

a  = The originator for which the call is being verified. Valid value(s):

    - DN=x
    - MLHG=y-a
    - PORT_ENTERED
    - TG=y-a

The value of PORT_ENTERED is output when a specific port was specified in the input message.

b  = Verified digits that were specified in the input message. A value of NONE will be returned if no digits were specified in the input message.

c  = Event number of the request.

d  = Number of the switching module (SM) on which the originator is located.

e  = Port member number of the originator, in hexadecimal. The port member will be blank if the originator specified is a Bearer Independent Call Control trunk group.

f  = Specific party associated with the originating directory number. For an explanation of the specific values, refer to the Translations Data manual.

g  = Digit analysis selector, used for digit analysis. Refer to variable 'z' for the source of the DAS value.

h  = Screening index; post query screening, automatic route selection (ARS) screening, simulated facilities group (SFG) screening, or the originator's screening found in the office data.

i  = Class of service for the originator. Refer to the Translations Data manual for definitions.

j  = The digits used to determine routing data after deleting and prefixing by digit analysis, but prior to any deleting and prefixing resulting from routing to a trunk to leave the office. Refer to RC/V View 10.2 [ROUTE INDEX (ROUTING)].

k  = Prefix dialed. Valid value(s):

    - NULL or BLANK
    - NONE  = No prefix was dialed.
    - 0 (0+) = entered "0" plus prefix
    - 1+    = entered "1" plus prefix
    - 01+    = entered "01" international prefix
    - 011+    = entered "011" international prefix

l  = Destination index or code index found in the office data for this call.

m  = Destination type found in the office data for this call. Refer to the Recent Change Procedures manual, Digit Analysis Views, for a definition of the values.

n  = Specific action defined in the office data for the dialed feature code. This is null unless the value
of variable ‘n’ is FEATURE. Refer to the Recent Change Procedures manual for definitions.

_0_ = Charge index found in the office data for this call.

_1_ = Carrier used for the call. If no carrier was specified or if the specified carrier was not used, this field will be blank.

_2_ = Termination of the call with respect to this office (if blank, call termination is not determined). Valid value(s):

DIALCODE = The customer feature dial code was entered.

DR_ALT_RI = The alternate code treatment (ACT) with error treatment of announcement encountered.

MCRI = The multiple code routing (MCR) was used.

NOC = The no connection feature was used.

RI = The route indicator (RI) feature was used.

TRUNK = The trunk was used.

_3_ = Facility restriction level of the originating port (line or trunk). This is for automatic route selection, if applicable.

_4_ = SFG group number.

_5_ = Information field. Valid value(s):

ADVANCED SERVICES PLATFORM FEATURE DETECTED = Call originator has advanced services platform (ASP) active or has encountered an ASP route in an ARS route list. Neither are supported by verify office feature.

ANI CANNOT BE ENTERED WITH LINE ORIGINATOR = Automatic number identification (ANI) can only be entered for trunk origination.

ANI COLLECTION NOT SUPPORTED = ANI is needed for the SCP query. ANI collection is not supported by VFY:OFC.

ANI IS REQUIRED FOR LDP LATA TRUNKS

ANNOUNCEMENT ON ALTERNATE CODE TREATMENT = An alternate code treatment (ACT) with error treatment of announcement encountered.

ARS CALL OVERFLOWED TO DDD = The ARS digits analyzed overflowed to direct distance dialing (DDD) on the office dialing plan.

ASI_CF DATABASE READ FAILED = The advanced service interface feature information cannot be found. Check the feature assigned to the port.

ASI_GP DATABASE READ FAILED = The advanced service interface group information cannot be found. Check the group assigned to the port.

ASI FEATURE NOT ASSIGNED OR NOT ACTIVE = An advanced service interface feature dialed code was entered but the originating port does not have an active ASI feature assigned.

ASI_PORT DATABASE READ FAILED = The advanced service interface port information cannot be found. Check the port parameters.

ASP TRIGGER ENCOUNTERED, NO FURTHER VERIFICATION = ASP (non-LNP) triggers are not supported by VFY:OFC.

ASSERT 911 OCCURRED = An error occurred while getting E911 data. VFY:OFC does not support E911 queries.

AUTHORIZATION CODE OR ACCOUNT CODE REQUIRED = An authorization code or account code is required for this call or was entered in the input message. Authorization or account codes are not supported by VFY:OFC.

AUTO ARS FOR CSD IS NOT SUPPORTED FOR VFY:OFC = Automatic route selection is not supported for circuit switched data by VFY:OFC.
AUTOMATIC ROUTE SELECTION CALL ROUTED TO ANNOUNCEMENT = An ARS call was routed to the designated MC route type of announcement.

AUTOMATIC ROUTE SELECTION CALL ROUTED TO REORDER = An ARS call was routed to reorder because the designated route type was REORDER or because an error was encountered while processing the ARS call.

BAD DIALING STATE = An invalid dialing state was encountered during digit analysis. Digit analysis translations should be examined.

BAD ROUTE TYPE IN RLARSCRN = An illegal route type was found in the base relation RLARSCRN.

BAD ROUTE TYPE IN RLRT_MCRT = An illegal route type was found in the base relation RLRT_MCRT. The tuple key is the printed modular constructed route index (MCRI).

BAD ROUTE TYPE IN RLRT_ROUTING = An illegal route type was found in the base relation RLRT_ROUTING. The tuple key is the printed route index (RI).

BEARER CAPABILITY NOT SUPPORTED = The LNP trigger does not support bearer capability for VFY:OFC. For example, the trigger is marked to allow only voice and this is a circuit switched data request.

CALL IS BEING ROUTED TO TONE OR ANNOUNCEMENT = An error has been encountered which will cause a route to reorder, tone, or an error announcement.

CALL NOT ALLOWED FOR CHARGE A CALL LINE = Call has been routed to tone or announcement. Refer to variable ‘n’ for the type of treatment.

CALL ROUTED TO AN ATTENDANT = The call was routed to the specified terminal group attendant. Refer to variable ‘j’ for the attendant directory number.

CALLTYPE=APN NOT SUPPORTED ON THIS CLASS OF SERVICE = The calltype parameter with value APN is not allowed on this class of service.

CALLTYPE=APN NOT SUPPORTED ON THIS CLASS OF SERVICE UNLESS IT IS ISUP = The calltype parameter with value APN is not allowed on this class of service unless the signaling is ISUP.

CALLTYPE=APN NOT SUPPORTED ON PRI, FEATURE NOT PURCHASED = The calltype parameter with value APN is not allowed on PRI because the Network Capabilities to Support ATP and Adjunct Migration Edge Switch feature is not active.

CALLTYPE=APN NOT SUPPORTED ON PRI UNLESS IT IS A SERVICE NODE TRUNK = The calltype parameter with value APN is not allowed for this class of service because it is not a service node.

CALLTYPE CANNOT BE ENTERED WITH LINE ORIGINATOR = CALLTYPE can only be entered for trunk origination.

CALLTYPE IS 011 OR 01P - CIC OR CC MISSING = For an MF international 011 or 01P call, both CIC and CC are required.

CALLTYPE IS 1P, 0P, OR 01M - CC MUST NOT BE SPECIFIED = For an MF world zone 1 (1P, 0P) or international 01M call, specifying CC is an error.

CANNOT SEND ACM AND PLAY TONE OR ANNOUNCEMENT = The call is terminated because of network control point (NCP) action.

CARRIER DIALED TWICE NOT ALLOWED = A carrier access code may not be entered twice.

CC CANNOT BE ENTERED WITH LINE ORIGINATOR = CC can only be entered for trunk origination.

CIC CANNOT BE ENTERED WITH LINE ORIGINATOR = CIC can only be entered for trunk origination.

CI TYPE IS INTERLATA BUT NO RPOA WAS RECEIVED = The carrier interconnect type returned by digit analysis is inter-lata. This means that a carrier is required to complete the packet call. RPOA should be entered as the carrier in the VFY:OFC input message.

CI TYPE RETURNED BY DA NOT APPLICABLE TO PKT = The carrier interconnect type
returned by digit analysis is not applicable to a packet.

CMP UNAVAILABLE = During processing of the VFY:OFC input message, it was determined that
the CMP was not linked to the AM and processing could not continue.

COS NOT ALLOWED IDP AND SC1 = The call originator is defined in relation RLFC_PORTTYP
with a class of service which is not allowed to have an individualized dialing plan
and a 1-digit speed calling feature; but, these options were found in relation
RLTRM_FEATS.

COS NOT ALLOWED IDP AND SC2 = The call originator is defined in relation RLFC_PORTTYP
with a class of service which is not allowed to have an individualized dialing plan
and a 2-digit speed calling feature; but, these options were found in relation
RLTRM_FEATS.

COS NOT ALLOWED ID FEATURE = The call originator is defined in relation RLFC_PORTTYP with
a class of service which is not allowed to have an individualized dialing plan (IDP)
feature; but, this option was found in relation RLTRM_FEATS.

COS NOT ALLOWED SC1 AND SC2 = The call originator is defined in relation RLFC_PORTTYP
with a class of service which is not allowed to have a 1-digit speed calling and a
2-digit speed calling feature; but, one of these options was found in relation
RLTRM_FEATS.

COS NOT ALLOWED SC1 FEATURE = The call originator is defined in relation RLFC_PORTTYP with
a class of service which is not allowed to have a 1-digit speed calling feature; but,
this option was found in relation RLTRM_FEATS.

COS NOT ALLOWED SC2 FEATURE = The call originator is defined in relation RLFC_PORTTYP with
a class of service which is not allowed to have a 2-digit speed calling feature; but,
this option was found in relation RLTRM_FEATS.

CSD or PKT KEYWORD CANNOT BE ENTERED WITH BICC TRUNK GROUP = The call originator
specified is a bearer independent call control (BICC) trunk group which only
supports circuit switched voice (CSV) calls.

CSD OR PKT KEYWORD CANNOT BE ENTERED WITH SIP = The call originator specified is a
session initiation protocol (SIP) packet group which only supports CSV calls.

CUTTHRU CALL NOT SUPPORTED FOR VFY:OFC = For FGD cutthrough calls, no output
information is provided.

CUTTHRU TRIGGER ENCOUNTERED, NO FURTHER VERIFICATION = This is warning message
to indicate that no further verification will be done when a CUTTHRU trigger is
encountered. The trigger number and trigger type are output.

DATABASE ERROR OR SOFTWARE INCONSISTENCY DETECTED = Some data or code has
detected an inconsistent result. Refer to the TECHNICAL ASSISTANCE portion of
the INTRODUCTION section of the Output Messages manual.

DEDICATED SDN TRUNKS ARE NOT SUPPORTED = Attempted to access the software defined
network (SDN) that is not supported.

DEST SWITCH MUST BE DIFFERENT FROM ORIG SWITCH = The PSN cannot be the packet
switch number of the originator.

DEST TYPE RETURNED BY DA NOT APPLICABLE TO PKT = The destination type returned by
digit analysis is not applicable to a packet.

DIAL PLAN ACCESS TREATMENT ERROR = A dial plan access treatment (DPAT) error was
detected during IDP digit analysis. The call was routed to announcement or reorder
tone.

DIG IS OPTIONAL OR 9500000 FOR CALLTYPE=FGB/FGBPS ON MF TRUNK = An invalid
digit string is entered for CALLTYPE FGB or FGBPS on MF trunk. DIG is not
required for MF FGB/FGBPS. If entered, digit string must be 9500000.
DIG HAS TO BE 950xxxx FOR CALLTYPE=FGB/FGBPS ON ISUP TRUNK = This occurs when
digits other than 950xxxx are entered for CALLTYPE=FGB/FGBPS for an ISUP
trunk.
DIGIT ANALYSIS FAILED = A failure occurred while analyzing the digits.
DIGIT ANALYSIS RETURNED VACANT = Digit analysis returned vacant code treatment for the
packet call.
DIGIT STRING CANNOT BE LONGER THAN 18 FOR SS7 TRUNKS = Trunks that use ISUP7
signaling cannot have more that 18 digits in variable 'b'.
DIGITS ANALYZED ROUTE TO IDP ERROR TREATMENT = IDP error treatment will route the call
to tone or announcement.
DN ASSOCIATED WITH UCD OR MUPH MLHG, NO PORT = The directory number (DN)
associated with the uniform call distribution (UCD) or multiposition hunt (MUPH)
multi line hunt group (MLHG) was identified to have no port. These are not
supported by VFY:OFC.
EMERGENCY STAND ALONE REROUTING FAILURE = There was a stand alone test line failure
during the attempt to route. Some reasons could be:
 — The digits entered in variable 'b' are not the specified emergency number
 — There is a feature assigned that is not supported for test lines.

Check the test line attributes and/or the entered VFY:OFC input message.
EMERGENCY STAND ALONE REROUTING TO LINE = The stand alone test line routing went to the
emergency line specified on RC/V View 4.9 [EMERGENCY TN (REMOTE
SITE/LOCAL SM) ASSIGNMENT].
EMERGENCY STAND ALONE REROUTING TO TRUNK = The stand alone test line routing went to
the emergency trunk specified on RC/V View 4.9.
EXCEEDED MAXIMUM IDP INTERPRETATIONS = The digits being analyzed has exceeded the
maximum of 5 IDP interpretations. Call was routed to a reorder tone.
EXTRA DIGITS DETECTED BY DIGIT ANALYSIS = Digit analysis tables were populated for an
expected number of digits. More digits appeared in variable 'b' or were analyzed as
a result of a query response.
FAILED TO GET TERMINAL PARAMETERS = The trunk or line data could not be read to get digit
analysis information. Check the originating port.
FAILURE RETURNED FROM TCAP = A failure occurred when sending a TCAP message.
FEATURE GROUP B CALLS ARE NOT SUPPORTED = Feature group B calls not supported on
ISUP trunks.
FEATURE INVOKED IS NOT SUPPORTED FOR VFY:OFC CSD = No features are being
supported for CSD calls.
FEATURE IS NOT ACTIVATED = Refer to variable 'h3' for an explanation.
FUNCTIONALITY NOT SUPPORTED = An attempt was made to send a route request from a
function that has not been modified to support VFY:OFC. Refer to the TECHNICAL
ASSISTANCE portion of the INTRODUCTION section of the Output Messages
manual.
FX/TIE TRUNK ERROR ENCOUNTERED = Refer to variable 'h3' for an explanation.
ICPI REQUIRED BUT NOT INPUT = This X.75/X.75 trunk originated call is an inter-lata call that
requires an interexchange carrier preselect indication (ICPI). The ICPI was not
entered in the VFY:OFC input message.
IDDD CALLS REQUIRE A CARRIER; DA RETURNED NO CARRIER REQUIRED = Packet inter
station to station calls require a carrier but digit analysis indicated that no carrier is
required.
IDDD OVER OUTWATS BLOCKED = An ARS call attempted to go IDDD over an outward wide area
telecommunications service (OUTWATS) trunk.
IDP ASSIGNED WHILE PROCESSING SPEED CALL = Speed calling from plain old telephone
service (POTS) is only valid if the port has no IDP.

IF ICPI IS SPECIFIED, ORIGINATOR MUST BE X.75 OR X.75’ TRUNK = The packet trunk specified as the originator must be an X.75 or X.75’ trunk if ICPI is specified.

IF PSN IS SPECIFIED, THE ORIGINATOR MUST BE AN IP TRUNK = The packet trunk specified as the originator must be an IP trunk if PSN is specified as the destination.

II CANNOT BE ENTERED FOR ISUP TRUNK = Invalid input combination. II can only be entered for MF trunk.

II CANNOT BE ENTERED WITH LINE ORIGINATOR = II can only be entered for MF trunk origination.

ILLEGAL DA SAC CALL TYPE = A service access code (SAC) type carrier interconnect (CI) call is present in digit analysis relation, but the call type does not allow this feature.

IMPLIED NPA COULD NOT BE DERIVED = The implied NPA for the packet called address could not be derived because of a database error.

INCOMING FACILITY MUST BE SS7 TRUNK GROUP = LNP error. When an LRN is entered without a DIG argument, the incoming facility must be a SS7 trunk group.

INSUFFICIENT FRL DETECTED BY ROUTING = The ARS facility restriction level (FRL) of the call was less than the facility restriction level of the route.

INTERCOM CALL RESTRICTION DETECTED = ICR simulated facilities group is not supported by VFY:OFC.

INTERNAL FAILURE DETECTED = A failure condition was detected. Refer to variable 'h\3' for more details. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INVALID ACTION TYPE FOUND = An invalid action was encountered during digit analysis by the IDP.

INVALID AUTHORIZATION CODE = Authorization code is not supported in VFY:OFC.

INVALID CALLED ADDRESS = The packet called address entered in the VFY:OFC input message is invalid. The length of the packet called address is invalid or for international E.164 calls, 0110 cannot be the specified as the first four digits of the packet called address.

INVALID CALLING ADDRESS = The calling address specified in the VFY:OFC input message was found to be invalid. Some reasons could be:
   — Invalid address length.
   — If this is MLHG, the specified MLHG number does not match the dd_number in RLPSX25LN calling address.
   — The specified NOC is invalid.
   — The calling address does not match the MLHG linear DN of the MLHG group.

INVALID COS FOR TYPE OF CALL = The originator has a class of service that is supported for VFY:OFC but is invalid for CSD or PKT.

INVALID DATA IN TUPLE = Invalid data was found in an existing tuple in the ODD. Refer to rest of message for details.

INVALID DATARATE = The data rate requested is either not supported or not valid. This could also occur when the data rate entered is incompatible with the data rate of the destination trunk.

INVALID ID RELATION = An invalid IDP relation was found when expanding a speed call code.

INVALID RPOA = The RPOA entered in the input message is not valid RPOA in the ODD. A tuple with the specified RPOA as key was not found during the read operation of the RLPSDNICRI relation.

INVALID WIDEBAND RATE = The wideband rate entered is incompatible with the wideband rate of destination trunk.

LDP LATA TRUNKS ARE NOT SUPPORTED = The VFY:OFC for LDP is not active so LDP on LATA trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES
portion of the INTRODUCTION section of the Output Messages manual for additional information.

LDP MINT TRUNKS ARE NOT SUPPORTED = The VFY:OFC for LDP is not active so LDP on MINT trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

LDP DAL TRUNKS ARE NOT SUPPORTED = The VFY:OFC for LDP is not active so LDP on DAL trunks is not supported by VFY:OFC. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

LEAD ACCOUNT CODE DETECTED = A lead account code was detected during uniform number plan (UNP) digit analysis. This is not supported by VFY:OFC.

LEASED NETWORK QUERY NOT SUPPORTED = LN TCAP queries are not supported by VFY:OFC and an LN query is required to complete routing.

LNP on LDP NOT PURCHASED = LNP on LDP is not activated. LNP processing can not be done for this VFY:OFC request.

LRN, PORTEDDN OR NONPORTED ARE INVALID FOR ISUP INTERNATIONAL CALL MAP-HLR TRIGGER ENCOUNTERED, NO FURTHER VERIFICATION = Mobile application part home location register (MAP-HLR) triggers are not supported by VFY:OFC.

MDII OCCURRED = The value of the MDII code is shown. Refer to rest of message for details.

MEMBER NUMBER CANNOT BE ENTERED WITH SIP PACKET GROUP = The specified call originator is a SIP packet group. Packet groups cannot have members assigned. Therefore no member can be specified on the command line.

MEMBER VALUE CANNOT BE ENTERED WITH BICC TRUNK GROUP = The specified call originator is a BICC trunk group. BICC trunk groups cannot have members assigned. Therefore no member can be specified on the command line. The member field cannot be used to specify a CIC. The base CIC is used to process all BICC requests.

MODEM POOL ACCESS DN ENTERED, MP NOT SUPPORTED FOR VFY:OFC PKT = The specified originator is a modem pooling access DN. Modem pooling is not supported by packet VFY:OFC.

MORE DIGITS REQUIRED TO GET ROUTING INFORMATION = Not enough digits were entered in the input message to determine routing information.

MSG FORMAT IS INCORRECT = The format of the input message is not correct. Refer to the VFY:OFC input message.

NETWORK CALL DENIAL IS SET, CALL IS DENIED = Network call denial (NCD) indicator is set to "Y" in the ANI table. The VFY:OFC request is denied.

NETWORK SERVICES TRIGGER NOT SUPPORTED = Network services triggers are not supported by VFY:OFC.

NO DIAL CODE IN DA = A dial code was not detected by digit analysis. If the destination type is not a dialed code or this is not a BRCS line, the input originating port is restricted from use.

NO DIGITS SPECIFIED OR FOUND = No dialed digits were specified and the originator does not have any default ones in the database.

NO DIRECTORY NUMBER TRANSLATION, HUNDREDS GROUP ROUTING APPLIES = The DN is not assigned in this office; however, routing using hundreds group applies.

NO ERROR TREATMENT FOR ACT = ACT was encountered with no error treatment specified.

NO ERROR TREATMENT FOR DPAT = DPAT was encountered with no error treatment specified.

NO IECP FACILITY SUBSCRIBED WHEN NEEDED = The packet line specified as the originator is not provisioned with an interexchange carrier preselect (IECP) although digit analysis has returned that this is an inter-lata call requiring a carrier. In this case, RPOA has also not been entered. The IECP should be provisioned in the ODD for this call or RPOA should be specified.
NON-DNT ORIGINATION = The originating port is not allowed to access ASP triggers.
NON-UNIQUE NXX DN ENTERED = The entered originator DN is ambiguous because of the increased number of NXX's. Reenter the input message using a 10-digit originator DN.
NO SIP SM ASSIGNED = There are no switching modules assigned for call processing use for SIP packet group originations.
NOT ALLOWED TO ORIGINATE = The originator may not dial calls.
NOT SUPPORTED, SEE CUSTOMER DOCUMENTATION = The originator COS or destination type is not supported by VFY:OFC.

The following originator COS values are supported for voice:

LINES

FC_2PTY = Two party, multifrequency ringing.
FC_4PFS = Four-party fully selective line.
FC_4PSS = Four-party semiselective line.
FC_4WIRE_INDV = 4 wire subscriber line.
FC_5PTY = Five party, multifrequency ringing.
FC_8PSS = Multiparty line.
FC_10PTY = MFR multiparty line.
FC_ATTENDANT = Attendant line (similar to individual).
FC_CHGACALL = Charge-a-call origination.
FC_COIN = Coin line.
FC_HOTMOTL = Special termination at motel equipment.
FC_INDIVDL = Individual line.
FC_ISDN = ISDN line, allowed for analog lines.
FC_PBX = PBX line origination.
FC_SATSTLN = Stand alone test line.
FC_TWOPTY = Two-party line.
PBXHOTMOT = Special termination to a motel.

TRUNKS

FC_BSYVFY = Busy verify trunk.
FC_IEC = Carrier trunk.
FC_LATA_CONN = Toll end of LATA connecting trunk.
FC_LTOLL_CONN = Local end of toll connect trunk.
FC_PF = Private facility trunk.
FC_PFITT = Private facility trunk intertandem tie trunk.
FC_PFLASH = Private facility trunk with flash repeating.
FC_PRI_INTOLL = Primary intertoll trunk.
FC_SEC_INTOLL = Secondary intertoll trunk.
FC_SPAMEG = Special access MEGACOM trunk.
FC_SPAWATS = Special access WATS trunk.
FC_TTOLL_CONN = Toll end of toll connecting trunk.
FCEDSL = PRI trunk.
FCEDSLHM = Hotel/motel PRI trunk.

The following originator COS values are supported for CSD:

LINES

The following originator COS values are supported for CSD:
FC_ISDN = ISDN line.
PSX25_T1 = X25 access on a T1 facility.

TRUNKS

FC_IEC = Carrier trunk.
FC_LATA_CONN = Toll end of LATA connecting trunk.
FC_LTOLL_CONN = Local end of toll connect trunk.
FC_PF = Private facility trunk.
FC_PFITT = Private facility trunk intertandem tie trunk.
FC_PFLASH = Private facility trunk with flash repeating.
FC_PRI_INTOLL = Primary intertoll trunk.
FC_SEC_INTOLL = Secondary intertoll trunk.
FC_TTOLL_CONN = Toll end of toll connecting trunk.
FCEDSL = PRI trunk.
FCEDSLHM = Hotel/motel PRI trunk.
PSX75_TK = Packet switching on X.75.
PSX75P_TK = Packet switching on X.75'.
PSPKT_TRK = Packet switching on inter-switch trunks.

The following destination types are not supported:
FCNS800 = Number services (800) type call.
FCSTG1FCA = Dial 011+PCC or 18X - fully coded addressing.
FCIDDFFCA = Dial CC+NN - fully coded addressing.
FCAPSDN = Software defined network at an action point.
FCSPAM800 = MEGACOM 800 (special access).
OAD2VDT = DA call to VDT.
OAOPNIT = Non-ISP call to VDT.

OLI CANNOT BE ENTERED FOR MF TRUNK = Invalid input combination. OLI can only be entered for an ISUP trunk.
OLI CANNOT BE ENTERED WITH LINE ORIGINATOR = OLI can only be entered for a ISUP trunk origination.
PARTIAL DIAL TREATMENT = The call will route to tone or announcement. Refer to variable ‘m’ for the type of treatment.
PFA FEATURE NOT SUPPORTED = The input digits contained a private facilities access code that is not supported by VFY:OFC.
PFA MC ROUTING IS NOT SUPPORTED = Private facilities access is not supported by VFY:OFC.
PORT IS NOT ASSIGNED = The originating port is not assigned.
PORTED NUMBER ROUTING ERROR = The number was expected to be ported into the switch but no directory number translations exist for this DN. Possible problems are the SCP query response, the directory number assignment, or digit analysis ported-in flag.
PRECEDENCE AND PREEMPTION CALL DETECTED = Precedence and preemption calls are not supported by VFY:OFC.
PRESUBSC CANNOT BE ENTERED WITH LINE = PRESUBSC can only be entered for trunk origination.
QUERY TIMEOUT = A query was sent to the SCP and the response was not received before timing out.
QUERY/RESPONSE SIMULATION FAILURE = An LRN was entered on the input message line which has not been processed correctly. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
REORDER ON ALTERNATE CODE TREATMENT = Individualized dialing plan, ACT with error treatment of reorder encountered.

REORDER ON INSUFFICIENT FRL = The FRL of the call was less than the required FRL indicated in the dialing plan. Error treatment is reorder tone.

RESPONSE NOT SUPPORTED = The SCP responded with a message that is not supported by VFY:OFC. Verify processing stopped when this message was received.

RLRTDNMOD: Routing Module and Route Index are 0 = Retrieved the rlRTDNMOD tuple, but the routing module is set to zero and hundreds group routing does not apply.

ROUTE FAILURE ENCOUNTERED = The route request resulted in a failure. Refer to variable 'h3' to determine the cause of the failure. Not all routing failure cases are supported by VFY:OFC, and additional data would not be available in those cases.

ROUTING ERROR = A non-HOME LRN was detected and a route index must be defined for this condition. Check digit analysis data.

ROUTING SP MAXED OUT, DATA MAY BE INCORRECT = The routing system process reached a maximum running limit or state limit before completion of the routing process. The output reflects the information gathered up to that point. However, it does not show the completed routing information and is not guaranteed to be correct.

ROUTING TO TONE OR ANNOUNCEMENT = The call will route to tone or announcement. Refer to variable 'm' for the type of treatment.

RPOA INPUT BUT INTRA-LATA COMPETITION NOT ALLOWED = Inter-lata competition is not allowed in this office. The packet call cannot be routed by the RPOA entered in the VFY:OFC input message.

SAT CANNOT BE ENTERED WITH LINE ORIGINATOR = SAT can only be entered for a trunk origination.

SAT (SATELLITE) IS INVALID FOR NON-MINT MF TRUNKS

SCREENING FAILURE = This error can indicate carrier blocking (CBLK) is active for the screening (charging) from RC/V View 10.10 [SCREENING (CHARGING)]. The call will route to reorder if RTI=REGL on the row entry that is marked for carrier blocking.

SECURED FEATURE NOT PURCHASED = A Secured Feature ID needed to process the verify office request has not been purchased. Refer to variable 'h3' for more information.

SEND TO RESOURCE NOT SUPPORTED = Verify does not support send-to-resource responses from the SCP. Verify processing was stopped when this message was received.

SENDING RELEASE MESSAGE = Call processing encountered an error event and populated a RELEASE message for the ISUP trunk. This signaling message is not actually sent but contains a cause code which is displayed in variable 'i3'.

SERVICE TRUNK GROUP NOT SUPPORTED = The call originator specified is a service trunk group. Packet originations are not allowed on a service trunk group. A packet group must be specified to process packet calls.

SERVICE TYPE NOT SUPPORTED = Number services type not supported by VFY:OFC. Refer to variable 'h3' for more details.

SIP FEATURE NOT PURCHASED = The SIP feature has not be purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

SM IS NOT EQUIPPED OR OPERATIONAL = An SM is not available for examination.

SPEED CALL FEATURE NOT ASSIGNED = A speed call code was entered but no speed call feature is assigned.

TDX DATA CALLS FEATURE NOT ACTIVE = TDX data calls feature is not active. The VFY:OFC request for the LDP trunk is denied.

TG IS NOT EQUIPPED TO HANDLE DATARATE = The trunk specified as the originator does not have the DATARATE field on RC/V 5.1 (TRUNK GROUP) set or the trunk's DATARATE is set but the trunk cannot support the data rate requested.

TG IS NOT EQUIPPED TO HANDLE VOICE CALL = This trunk group is equipped for data calls.
instead of voice calls.

**TIMEOUT IN AM WAITING FOR SM RESULTS** = No verify results have been received from the SM on which the originator resides. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**TNS AND CIC CANNOT BE ENTERED AT SAME TIME FOR DOMESTIC ISUP CALL** = For a VFY:OFC request on ISUP trunk, TNS and CIC can not be entered at the same time when CALLTYPE=DOM.

**TNS CANNOT BE ENTERED WITH LINE ORIGINATOR** = TNS can only be entered for a trunk origination.

**TNS IS INVALID FOR MF TRUNKS** = TNS is valid only for an ISUP trunk.

**TNSC CANNOT BE ENTERED WITH LINE ORIGINATOR** = TNSC can only be entered for a trunk origination.

**TNSC CAN BE SPECIFIED ONLY FOR MINT TRUNKS** = TNSC is invalid for the specified trunk if MINT_SIG=NULL.

**TOO FEW DIGITS IN CALLED ADDRESS** = Digit analysis tables were populated for an expected number of digits. Fewer digits appeared in variable 'b' or were analyzed as a result of a query response.

**TRIGGER NUMBER NOT FOUND IN NS_TRIG** = The trigger number was not populated in the RLNS_TRIG relation. Check the data associated with trigger numbers. The output message contains the trigger number.

**TRIGGER TYPE NOT SUPPORTED** = An invalid trigger type has been encountered.

**TRY LATER, CAN NOT CREATE PROCESS IN SM** = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**TRY LATER, CAN NOT SEND MESSAGE IN SM** = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**TRY LATER, RESOURCES FOR FEATURE EXECUTION ENVIRONMENT UNAVAILABLE** = When trying to start a FEX environment, the necessary data blocks (MDB, CLDB) were not available. Try again later.

**TUPLE MISSING OR DATABASE ERROR DETECTED** = The base relation and the tuple keys follow.

**UNABLE TO DELETE SPECIFIED DIGITS** = During digit conversion, a request was made to delete more digits than dialed. The relation identified should be checked.

**UNABLE TO SEND MESSAGE FROM AM** = Switch resource problem. This is probably a temporary condition. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**UNEXPECTED DESTINATION TYPE FOUND** = An unexpected destination type was encountered by the IDP during feature transition processing.

**UNEXPECTED ERROR TREATMENT FOR ACT DETECTED** = An unexpected error treatment was detected for the ACT.

**UNEXPECTED ERROR TREATMENT FOR DPAT DETECTED** = An unexpected error treatment was detected for the DPAT.

**UNEXPECTED RESULTS FOR DEDICATED E911 TRUNK** = The input port or trunk group is a dedicated E911 trunk and an MDII occurred. The MDII value has also been output.

**UNKNOWN DA ROW ENCOUNTERED** = An illegal value for the row attribute was found in the indicated tuple.

**UNKNOWN ERROR** = An undefined error was present. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**UNKNOWN ROUTE TYPE** = The route type found in RT_SCRNING or RT_ROUTING is not expected by packet routing.
UNSUCCESSFUL CONVERSION TO PORT = The originator specification does not identify a valid port.
USER NOT ALLOWED TO USE EXPLICIT ASI SERVICE CODE = The advanced service interface assigned to the port is for implicit service only and an explicit dialed code was entered.
USER NOT ALLOWED TO USE IMPLICIT ASI SERVICE CODE = The advanced service interface assigned to the port is for explicit service only and an implicit dialed code was entered.
WBCHANNEL CANNOT BE ENTERED WITH LINE ORIGINATOR = WBCHANNEL can only be entered for a trunk origination.
WBRATE CANNOT BE ENTERED WITH LINE ORIGINATOR = WBRATE can only be entered for a trunk origination.
WIDEBAND DATARATE IS NOT VALID FOR NON-ISUP TRUNKS = WBRATE and WBCHANNEL are valid only for an ISUP trunks. An error is output if they are entered for other signal types.

u = Relation name and key fields, in the format:
RELATION_NAME  KEY1 KEY2 ... 

The relation keys are shown as either a field name printed in this output message or an attribute name and value. For example, "DEST_TYP" or "PREVIOUS 5". Refer to the Translations Data manual for definitions.

v = Additional key to relation in variable 'u'.
w = Additional key to relation in variable 'u'.

x = Directory number (DN) of a line. For packet call type, if the calling address in the input message is an international E.164 address, the DN= variable will contain the expanded full E.164 address (country code + NPA + NXX + XXXX).

y = Group number.

z = Location routing number (LRN).

a1 = Member number. The member number will be blank if the trunk group specified is a bearer independent call control trunk group.

b1 = Route index (RI) number or automatic route selection index (ARSIDX). RI for a call that leaves the office or ARSIDX in the case of an ARS call. The ARSIDX can be replaced by a route index value if the call is directed to an announcement trunk.

c1 = Normalized office code (NOC) for a local line termination.

d1 = Trunk group.

e1 = Carrier feature group indicator. Valid value(s):
B = Feature group B plus carrier identifier.
D = Feature group D plus carrier identifier.
(blank) = None. A carrier was not used to route the call.

f1 = Call type for this verification request. Valid value(s):
CSV = Circuit switched voice (default).
CSD = Circuit switched data.
PKT = Packet switched data.

g1 = Datarate for a circuit switched data call and its corresponding CSD bearer capability. Valid value(s):
   56 = 56-kbps, unrestricted digital information, circuit-mode, rate adapted from 56-kbps.
   64 = 64-kbps, unrestricted digital information, circuit-mode.
   R64 = 64-kbps, restricted digital information, circuit-mode, rate adapted from 56-kbps.

h1 = Data network interexchange carrier. Valid value(s):
   RPOA=i1
   ICPI=j1

i1 = Registered private operating agency, a four-digit data network interexchange carrier (DNIC) used with packet routing.

j1 = Interexchange carrier preselect.

k1 = Packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

l1 = Datarate alternate route index for a CSD call that leaves the office.

m1 = Packet switch number. Valid value(s):
   D_PSN=o1
   N_PSN=n1

n1 = Next packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

o1 = Destination packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

p1 = Interexchange carrier preselect.

q1 = The LRN returned is home to this switch. Valid value(s):
   HOMELRN=N
   HOMELRN=Y

r1 = Local number portability trigger number.

s1 = Existence indicator. This provides information on the existence of the DN translation and assignment of the "non-conditional 10-digit trigger for LRN". Valid value(s):
   DIRECTORY NUMBER TRANSLATIONS EXIST
   DIRECTORY NUMBER TRANSLATIONS EXIST WITH NON COND TRIG
   NO DIRECTORY NUMBER TRANSLATIONS EXIST
t = Destination numbering plan area code. For packet VFY:OFC input messages, this variable will contain the implied numbering plan area (such as, the area code) used to route the call. The area code is derived for line originated calls. The NPA can be provisioned on RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)] or RC/V View 9.3 [LOCAL DIGIT (OFFICE DIALING)].

u = Output can occur as one message or multiple messages. Each output message is referred to as a segment and marked with an event number and a segment indicator. All messages associated with one request will have the same event number. Segment numbers are used to represent a sequence.

For example: VFY OFC EVENT 3 SEGMENT 1

At the end of each segment, a marker is printed showing if another segment is expected.
VFY OFC: CONTINUING = Another segment will be printed.
VFY OFC: COMPLETED = No more segments are expected.

v = Generic address parameter (SS7 ISUP).

w = The location routing number digits.

x = The value for ASP default routing. Valid value(s):

- ANNCE = Default route to 13A terminating announcement.
- DLDN = Default route to dialed DN.
- NONE = No default routing to be applied.

y = Geographic portability. Valid value(s):

- GEOPORT=N
- GEOPORT=Y

z = This field indicates the proper text to represent the source of the DAS in the variable 'g'. Valid value(s):

- ANI_DAS = The ANI table DAS will be used for digit analysis for LDP processing.
- CIC_DAS = The CIC table DAS will be used for digit analysis for LDP processing.
- CURRENT_DAS = Indicates that the current DAS will be used for digit analysis.
- DEFAULT_ANI_DAS = The default ANI table DAS will be used for digit analysis for LDP processing.
- DEFAULT_CIC_DAS = The default CIC table DAS will be used for digit analysis for LDP processing.
- EON_APN_DAS = The advanced services platform EON APN DAS will be used for digit analysis.
- EON_LOCAL_DAS = The advanced services platform EON LOCAL DAS will be used for digit analysis.
- EON_TOLL_DAS = The advanced services platform EON TOLL DAS will be used for digit analysis.
- IDDDTC_DAS = The DAS defined for international outbound will be used for digit analysis.
- II_DAS = The II table DAS will be used for digit analysis for LDP processing.
- INWATS_DAS = The DAS assigned to the trunk to use for digit analysis on incoming toll free numbers found in the INWATS NPA TABLE.
- ISUP_APN_DAS = The office ISUP APN DAS will be used for digit analysis.
- LRN_DAS = The LRN DAS assigned to the originating trunk will be used for digit analysis.
- ORIGINATORS_DAS = The DAS assigned to the originating port will be used for digit analysis.
- POST_QUERY_DAS = The DAS associated with the trigger number will be used for digit analysis.
- SCP_DAS = The office defined SCP DAS will be used for digit analysis.
SDN_DAS = The call has requested SDN and the DAS assigned to the EDSL trunk will be used for digit analysis.

SFG_DAS = The DAS defined for the accessed simulated facilities group will be used for digit analysis.

\( a^2 \) = Route index used for automatic route selection private network.

\( b^2 \) = Type of carrier interconnect call.

\( c^2 \) = Inhibit dialed number trigger (DNT), indicates whether to look for DNTs following LRN analysis. Valid value(s):

\[
\text{INHDNT} = \begin{cases} 
N \\
Y 
\end{cases}
\]

\( d^2 \) = Location routing number screening. Valid value(s):

\[
\text{LRNSCR} = \begin{cases} 
N \\
Y 
\end{cases}
\]

\( e^2 \) = Trigger type. Used to define variable \( e^2 \). Valid value(s):

\[
\begin{align*}
\text{LNPTTIG} & = \text{Local number portability trigger} \\
\text{TRIG} & = \text{Non-LNP trigger}
\end{align*}
\]

\( f^2 \) = A number between 1 and 255 associated with the trigger type in variable \( e^2 \).

\( g^2 \) = The administrative state code state. Valid value(s):

\[
\begin{align*}
\text{LOCKED} \\
\text{UNLOCKED}
\end{align*}
\]

\( h^2 \) = Defines the signaling transfer point translation type number associated with the trigger.

\( i^2 \) = The trigger is allowed for voice calls, data calls or both. Valid value(s):

\[
\begin{align*}
\text{BOTH} \\
\text{CSD} \\
\text{VOICE}
\end{align*}
\]

\( j^2 \) = Virtual private network (VPN) trigger. Valid value(s):

\[
\begin{align*}
N \\
Y
\end{align*}
\]

\( k^2 \) = Application type. Valid value(s):

\[
\begin{align*}
800 \\
\text{ASP} \\
\text{E911}
\end{align*}
\]
1\textsuperscript{2} = Advanced intelligent network release. Valid value(s):

- R0
- R0D1

m\textsuperscript{2} = Source of the service key for query formulation. It is only valid for R0 protocol. Valid value(s):

- ANI
- CDPN

n\textsuperscript{2} = Advance intelligent network (AIN) toll-free service allowed. Valid value(s):

- N
- Y

o\textsuperscript{2} = The bearer capability associated with the call that encountered the trigger. Valid value(s):

- 3.1 KHZ AUDIO
- 56 KBPS
- 64 KBPS
- SPEECH

p\textsuperscript{2} = Global title number, a unique 10 digit number used by the SCP.

q\textsuperscript{2} = Local routing number index assigned to the directory number translation.

r\textsuperscript{2} = Destination point code number. A unique 9 digit number that identifies the receiving entity of the SCP query.

s\textsuperscript{2} = The signaling transfer point translation type number used in the query of the SCP. This will be the value assigned to the trigger or the office (if one is not assigned to the trigger).

t\textsuperscript{2} = The event that caused the trigger to occur. Valid value(s):

- CHANNEL SETUP PRI
- COUNTRY CODE NPA-NXX-XXXX
- CUSTOMIZED ACCESS
- FEATURE ACTIVATOR
- N11
- NETWORK BUSY
- NPA
- NPA-N
- NPA-NXX
- NPA-NXX-X
- NPA-NXX-XX
- NPA-NXX-XXX
- NPA-NXX-XXXX
- OFF HOOK DELAY
- OFF HOOK IMMEDIATE
- ORIG CALLED PARTY BUSY
- ORIG NO ANSWER
- SHARED INTER OFFICE TRUNK
- TERMINATION ATTEMPT
VERTICAL SERVICE CODE

\textit{u}^2 = \text{Query status. Used to indicate result of SCP query. Valid value(s):}

- NO DATA POPULATED, FEATURE NOT ACTIVATED
- NO QUERY PERFORMED
- NO QUERY PERFORMED, OVERRIDING HRI FOUND
- QUERY BLOCKED
- QUERY FAILED
- QUERY SUCCEEDED

\textit{v}^2 = \text{Type of number returned by the SCP. Valid value(s):}

- LRN = The DN has been ported to another switch identified by this location routing number.
- NON_PORTED_DN = The DN has not been ported.

\textit{w}^2 = \text{The called party directory number returned by the SCP. This number may be the original called number which has not been ported or an LRN. It is associated with variable 'v'.}

\textit{x}^2 = \text{Switch module (SM). Identifies where the failing (also called asserting) code resides.}

\textit{y}^2 = \text{The assert number. Refer to the Asserts manual for additional information.}

\textit{z}^2 = \text{Event number associated with the assert. This allows a correlation of the summary output provided by VFY:OFC with the assert output provided on the ROP.}

\textit{a}^3 = \text{Name of the source file where the defensive check failed.}

\textit{b}^3 = \text{Indicates the scope of variable c. Valid value(s):}

<table>
<thead>
<tr>
<th>\textbf{If} b^3 =</th>
<th>\textbf{then} c^3 =</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINE</td>
<td>A source file line number indicating the location where the assert was called or printed.</td>
</tr>
<tr>
<td>REF</td>
<td>A programmer defined reference number.</td>
</tr>
</tbody>
</table>

\textit{c}^3 = \text{Line or reference number.}

\textit{d}^3 = \text{A brief description of the problem that caused the assert failure.}

\textit{e}^3 = \text{The assert error code. Refer to the Assert manual for additional information.}

\textit{f}^3 = \text{Failing address. The virtual address of execution at the time the assert failed.}

\textit{g}^3 = \text{Two column output consisting of data and an associated descriptive string.}

\textit{h}^3 = \text{Additional information. Multiple comments may be concatenated together.}

To determine the meaning of the output comment field, start at the beginning of the comment string and find the matching string below. If there are additional characters, start from that point and find the next matching string. Continue until there are no more characters in the comment field. There is a limit on the total number of characters which means that the last comment may be truncated.

Valid value(s):

\text{Account Code override of toll diversion possible. = The user has an account code feature assigned. This can be used to override the user’s screening index (SI) used}
for RC/V View 10.10. VFY:OFC does not support entry of an ACCT code.

BAD DESTINATION TYPE FOR N11 CONVERSION DN = The destination type for the conversion dn on a 711 relay call is FCRELAY711, which is invalid. FCRELAY711 cannot be the destination type on the conversion dn.

ACVT not supported = Attendant control of voice terminals is not supported by VFY:OFC.

ACCESS OR USER INFO IE DISCARDED = Refer to the cause value definition in the ISUP/TCAP Related Feature Description.

ANI NEEDED FOR FEATURE USE = The two party class of service is not allowed the entered feature if the two-party line does not have ANI or if the calling party number presentation (CPNP) is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

ARS CARRIER SELECTION ERROR. = An error has occurred while processing the carrier access for an ARS call. An example of an error is the specified automatic route selection (ARS) SFG carrier is a LEC carrier and the digits are INTERLATA. Examine the attributes associated with the output CARRIER= and the DIG= string.

ARS ERRTRT ANNCE USED = An ARS uniform number plan dialing error was encountered and the ARS group error treatment is announcement. This error is also used when an ARS call is made with the ODP, an ARS filtering error occurs, and FLTRERR is set to ANN for the ARS.

ARS ERRTRT ATDN USED = An ARS uniform number plan dialing error was encountered and the ARS group error treatment is route to attendant. This error is also used when an ARS call is made with the ODP, an ARS filtering error occurs, and FLTRERR is set to ATDN for the ARS.

ARS ERRTRT TONE USED = An ARS uniform number plan dialing error was encountered and the ARS group error treatment is reorder tone. This error is also used when an ARS call is made with the ODP, ARS filtering occurs, and FLTRERR is set to REORD for the ARS.

ARS UNEXPECTED INVLD PORT = This type of port is not supported by ARS. The call will route to reorder.

ARS UNEXPECTED RTE TYPE FROM DIGANAL = An unexpected route type was returned from digit analysis for ARS. The call will route to reorder.

ASP R0D1 feature has not been purchased. = The indicated ASP release is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

ASP Release 0 is inactive. = The indicated ASP release is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

ATNDS CANNOT ACCESS FEATURE ENTERED = An attendant that is not assigned features cannot access the generally available feature that was entered.

Authorization and Account Code override of toll diversion possible. = The user has an authorization code feature and an account code feature assigned. Either one of these features can be used to override the user's SI used for RC/V View 10.10. VFY:OFC does not support entry of these codes.

Authorization Code override of toll diversion possible. = The user has an authorization code feature assigned. This feature can be used to override the user's SI used for RC/V View 10.10. VFY:OFC does not support entry of an authorization code.

Authorization Code override possible. = The user has an authorization code feature assigned. This feature can be used to override the user's automatic route selection FRL. VFY:OFC does not support entry of an authorization code.

Bad Data found during ARS routing. = Bad data was encountered while getting the
routing information on an automatic route selection call.

Bad Data found during routing. = Bad data was encountered while getting the routing information.

Basic LRN feature has not been purchased = Encountered an LNP trigger. However, number portability-LRN is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Bearcap data incorrect. = In setting up for a BRI request, the bearer capability was not set up correctly in an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Bearcap data not setup. = In setting up for a BRI request, the bearer capability was not set up in an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

BEARER CAPABILITY INCOMPATIBLE WITH SERVICE REQUEST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BEARER CAPABILITY NOT AUTHORIZED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BEARER CAPABILITY NOT PRESENTLY AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BEARER SERVICE NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

BFG TRMFEATS TUPLE MISSING. = The port is in a BFG but the expected rTRMFEATS tuple was not found.

BRI Keypad invalid. = The keypad area of an internal message was not setup correctly. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

BRI setup msg bad. = An error has occurred setting up an internal message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Bypassing LDP Account code Collection for VFY:OFC = If it is determined that Account code digits have to be collected for a MF trunk for LDP processing, verify office will skip collecting and processing account code digits and continue.

CALL AWARDED AND DELIVERED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

CALL HAS BEEN QUEUED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Call is being Toll Diverted (TDV). = The user's SI, the code index (CDI) of the entered digits, and the prefix value of the entered digits used from RC/V 10.10 are set up to toll divert to the attendant.

CALL REJECTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

CALL SCREENING FEATURE NOT PURCHASED. = The call screening feature has not be purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

CALL SCREENING ENHANCEMENT FEATURE NOT PURCHASED. = The call screening enhancement feature has not be purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

CARRIER ACCESS DENIED BY BLK 1PLUS. = Call will route to DEST_TYP NO10xx error treatment because the user is not allowed to access a carrier as dialed. The user is assigned either SPLIT or FULL BLOCKING with the BLK 1PLUS feature.

CHANNEL CONGESTION OR UNAVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
CHANNEL TYPE NOT AVAILABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

CHANNEL UNACCEPTABLE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

COS NOT ALLOWED TO ACCESS FEATURE. = This class of service is not allowed to access the entered feature.

CPNP SFID 50 NOT PURCHASED = The calling party number presentation is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

DATABASE READ FAILURE IN MCidprel = An IDP digit analysis tuple is missing.

DC MKB SFID NOT PURCHASED = The dial code make busy is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Dial Plan Access Treatment error. = A DPAT error was encountered which requires an authorization code to continue. VFY:OFC does not support authorization codes.

DESTINATION OUT OF ORDER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

DIRECT ACCESS LINK. = Indicates that direct access links (DAL) access is allowed for this trunk group.

EAVM DID NOT FIND ACTIVE CF = When easy access to voice mail (EAVM) dial code was dialed, at least one of the following conditions was found: neither call forwarding don’t answer (CFDA) nor call forwarding busy line (CFBL) is assigned and active in the line, or, neither CFDA nor CFBL have a Forward-to DN assigned on the line.

EAVM NOT ALLOWED FOR PORT = EAVM feature is not allowed for the port.

EAVM NOT PURCHASED = EAVM feature is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

EXCESSIVE DIGITS RECEIVED = Refer to the cause code value definition in the ISUP/TCAP related feature description.

Expected FEX environment not found. = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Facility number should be specified for FX trunk origination. = FACILITY NBR in RC/V View 5.1 needs to be set for the origination trunk.

FAILED TO FIND FEX CC MODEL FOR ARS = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Failed To Get Data Pointers = Failed to retrieve pointers to structures within the routing message.

Failed To Populate BEARER CAPABILITY Parameter = Failed to populate the mandatory BEARER CAPABILITY parameter in the query message.

Failed To Populate GLOBAL TITLE ADDRESS = Failed to populate the mandatory GLOBAL TITLE ADDRESS parameter in the query message.

Failed To Populate USERID Parameter = Failed to populate the mandatory USERID parameter in the query message.

FAILED TO REPLACE TO FEX FOR ARS = Internal error. Try again later. If it still doesn't work, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual for additional assistance.

Failed To Send Message To TCAP = The attempt to send the query message to the TCAP system process failed.

FC_create() ERR1 = An error occurred while trying to get the head of the CLDB list.

FC_create() ERR2 = An error occurred while trying to get an idle CLDB.
FC_create() ERR3 = An error occurred while trying to get and link an MDB to the CLDB.

FEATURE ALREADY ACTIVE. = The dialed code action entered is to activate a feature which is already active for this port. It cannot be entered successfully on the port unless the feature is first deactivated.

FEATURE ALREADY INACTIVE. = The dialed code action entered is to deactivate a feature which is already inactive for this port. It cannot be entered successfully on the port unless the feature is first activated.

FEATURE INACTIVE OR SWITCHED OFF. = For features assigned to the port, this means that either the active flag is N or the master switch for the feature is off. For features that can be accessed through general availability or subscription, this means that the feature is not set to allow either mode of access. Therefore, the input feature dialed code cannot be used.

FEATURE NOT ACTIVE = The dialed code action entered is not allowed, as the office option is not enabled for this feature.

FEATURE NOT ALLOWED ACTION ENTERED. = The feature assigned to the port is not set up to allow the dialed code action entered. This may be due to the feature options, port options, or office options associated with this feature.

FCfex_init() ERR1 = An error occurred while trying to get an idle CLDB.

FCfex_init() ERR2 = An error occurred while trying to get an idle MDB.

FCto_fs: Internal error = VFY:OFC processing encountered unexcepted code. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

FEATURE 228 NOT PURCHASED. = ISDN personal communication is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

IDENTIFIED CHANNEL DOES NOT EXIST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

IE NONEXISTENT OR NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INCOMING CALLS BARRED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INCOMPATIBLE DESTINATION DIRECT CALL NOT SUBSCRIBED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INTERCEPT TREATMENT ON. = Originating line is on intercept service and is denied origination.

INTERNAL ERROR: FEX COMING DOWN UNEXPECTEDLY. = An internal error has occurred in the feature execution environment interface with verify office. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INTERCEPT TREATMENT ON. = Originating line is on intercept service and is denied origination.

INTERCOM RANGE HAD NO DIGITS TO PREFIX. = An IDP intercom (extension) was entered and the range accessed has no digits to prefix as expected.

Interrupt Message Received = An MGINTERRUPT message was received while waiting for the SCP to respond.

INTERWORKING-UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID ACTION FOR FEATURE. = The feature that is being processed has encountered an unexpected action value. Report the problem.

INVALID ACTION FOR NON-WILD CARD (MAGIC) FEATURE. = The feature that is being processed has encountered an action that is allowed only for wild card features. Wild card (magic) features are the matching /XX* features. For example, for an Individualized Dialing feature, the wild card feature is /ID*. Update the action or feature associated with the input dialed code.
INVALID ACTION FOR WILD CARD (MAGIC) FEATURE = The wild card (magic) feature that is being processed has encountered an action that is not allowed for wild card features. Wild card (magic) features are the matching /XX* features. For example, for an Individualized Dialing feature, the wild card feature is /ID*. Update the action or feature associated with the input dialed code.

INVALID ACTION IN MCspicarr = Expected dialed code action was for carrier access but a non-carrier access code was received.

Invalid Assert Message Type Detected By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INVALID CALL REFERENCE VALUE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid Data Collection State Detected By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Invalid Digits Encountered = LNP queries are only allowed to contain dialed digits in the range of 0-9.

INVALID DIGIT VALUE FOR NUMBER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid Error Code Received By RTvfy_rpt() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Invalid Error Code Received By RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

INVALID INFO ELEMENT CONTENTS = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID MODULAR FEATURE TYPE = The feature being processed is not a valid modular feature type. This is an unexpected error. Report the problem.

INVALID NUMBER FORMAT = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

INVALID OR UNSPECIFIED MESSAGE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Invalid two-party party value = Expected either TIP or RING but neither was found. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

ISDNFAIL Message Received = An MGISDNFAIL message was received while waiting for the SCP to respond.

ISDN PODS CANNOT USE FEATURES = ISDN PODS terminals do not have access to any BRCS features.

ISDN CANNOT ACCESS USTWC = Usage sensitive three-way calling is not allowed on ISDN terminals.

LASS NOT LOADED = Custom local area signaling services (CLASS) is not loaded on the switch. CLASS features cannot be used.

LDP ACCOUNT CODE PROCESSING SKIPPED FOR VERIFY OFFICE = If it is determined that account code digits have to be collected for an ISUP trunk for LDP processing, verify office will skip collecting and processing account code digits and continue.

LRN was not entered on command line = This VFY:OFC request is attempting to do an LNP query. NP-verify office for LRN is not activated. NP-test query for LRN is activated but requires an LRN to be specified on the input message line. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

LTSB CANNOT DEACT MAN EXCLUSION = Deactivation of manual exclusion is not available for
LTSB lines.
MANDATORY IE MISSING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
MCcpystrd unexpected return = VFY:OFC processing encountered unexpected return code. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
Message could not be sent to routing process = The route request message could not be sent. Try again later.
MESSAGE NOT COMPATIBLE WITH CALL STATE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
MESSAGE TYPE NONEXISTENT OR NOT IMPLEMENTED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
MGRT_FAIL REASON NOT HANDLED BY VFYOFC = Route failure reason invalid for VFY:OFC processing. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.
NETWORK CONGESTION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
NO ASSOCIATED DIGITS FOR SPEED CALL DIGIT(S) = A speed call digit(s) was entered and there are no associated digits to analyze.
NON SELECTED USER CLEARING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
NORMAL CALL CLEARING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
Normalized Office Code Must Be Defined for Home LRNs = LNP error - An NPA and OFFCODE must be populated on the LDIT/RDIT view when HOMELRN=Y.
NORMAL-UNSPECIFIED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
NO ROUTE TO DESTINATION = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
NO ROUTE TO SPECIFIED TRANSIT NET = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
NO USER RESPONDING = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
NUMBER CHANGED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
OSPS not supported. = Request will be treated as if non-OSPS.
OSREPLACE Is Not supported By RTvfy_rpt() = Entry into RTvfy_rpt() using an OSREPLACE is not currently supported.
OUTGOING CALLS BARRED = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.
OVLP attempted on non-ovlp route. = Overlap outpulsing would be attempted on a trunk that does not support overlap outpulsing.
PKT keyword must be entered for the originator specified = The port identified from the input message is used for packet switch data (PSD), so the keyword PKT needs to be included in the input message line.
PORTEDDN or NONPORTED parameter is not supported with non-CCS trunk = PORTEDDN or NONPORTED are only supported for ISUP trunks.
PORT NOT ALLOWED FEATURE = The input originating port is not allowed to access the entered feature.
PORT NOT ASSIGNED ARMED, ACTIVE FEATURE. = At least one of the following conditions is true: the port is not assigned the feature associated with the input dialed code, the feature that is assigned is not armed through the master switch flag, or the feature
that is assigned is not active but should be to use the input action.

**PORT NOT ASSIGNED ARMED, ACTIVE FEATURE OR USAGE SENSITIVE FEATURE NOT AVAILABLE.**

- At least one of the following conditions is true: the port is not assigned the feature associated with the input dialed code, the feature that is assigned is not armed through the master switch flag, the feature that is assigned is not active but should be to use the input action, or the port does not have an assigned armed, active feature and the usage sensitive feature of the type entered is not available for use because it has not been purchased or is not active.

**PORT NOT ASSIGNED FEATURE =** No feature is assigned to the port.

**PORT TRMFENTS TUPLE MISSING =** Port has terminal features assigned but expected TRMFENTS tuple not found.

**Pots access not allowed =** Access to the office dialing plan is not allowed for this type of call.

**PRECEDENCE CALL BLOCKED =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**PREEMPTION—CIRCUIT RESERVED FOR REUSE/PREFIX 1 DIALED IN ERROR =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**PREEMPTION/PREFIX 0 DIALED IN ERROR =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**PREFIX 1 NOT DIALED =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**PROTOCOL ERROR—UNSPECIFIED =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**RECOVERY UPON TIMER EXPIRATION =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**REQUESTED CHANNEL NOT AVAILABLE =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**REQUESTED FACILITY NOT IMPLEMENTED =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**REQUESTED FACILITY NOT SUBSCRIBED =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**REQUESTED FACILITY REJECTED =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**RESOURCE UNAVAILABLE OR UNSPECIFIED =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**RESPONSE TO STATUS ENQUIRY =** Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

**Route Index Must Be Defined for Non-Home LRNs =** LNP error - A route index must be populated on the LDIT/RDIT view when HOMELRN=N.

**Routing Module Tuple Missing. =** Unable to retrieve the rltrdnmod tuple. The accompanying data provides the key information.

**ROUTING TO REORDER =** A route failure has occurred with the general reason of REORDER. The failure reason is not more specific. If there was an assert output, the error can be determined from the assert failure indicated. The call will route to reorder.

**RTvfyasi entered with invalid ASI action. Internal error. =** Advanced services interface function expected either action ASITOG or ASIUSE. A different action was encountered. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

**RTv_brichks()**

- **BRI_ERR1. =** Unable to get the TEDB.

**RTv_brichks()**

- **BRI_ERR2. =** TEDB contains invalid information.

**RTv_brichks()**

- **BRI_ERR3. =** Unable to access the DALB.

**RTv_brichks()**

- **BRI_ERR4. =** Cannot link DALB to TEDB.
RTv_brichks()  BRI_ERR5. = Could not link the BRCSDB to the DALB.
RTv_brichks()  BRI_ERR6. = Could not link DALB to DPB.
RTv_brichks()  BRI_ERR7. = Could not link DALB to PCBLA.
RTvdalb_init() PRI_ERR1. = Failed to get a PRISTAT pointer.
RTvdalb_init() PRI_ERR2. = Could not get a DALB.
RTvdalb_init() PRI_ERR3. = Could not link DALB to PRISTAT.
RTvdalb_init() PRI_ERR4. = Could not link DALB to PCBLA.
RTvfy_rpt() Was Entered With Unknown Reason = Internal error. Refer to the
TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output
Messages manual.
RTvfy_rsp() Specified An Invalid Maxtime. = An internal error was encountered while
waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the
INTRODUCTION section of the Output Messages manual.
RTvfy_rsp() Received An Invalid Return Value. = An internal error was encountered while
waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the
INTRODUCTION section of the Output Messages manual.
RTvfy_rsp() Received a Truncated Message. = An internal error was encountered while
waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the
INTRODUCTION section of the Output Messages manual.
RTvfy_rsp() Timed Out Waiting For RSP. = A timeout occurred while waiting for the
routing data. Try again later.
SEGMENTATION ERROR = Refer to the cause code value definition in the ISUP/TCAP Related
Feature Description.
SERVICE DENIED = Refer to the cause code value definition in the ISUP/TCAP Related
Feature Description.
SERVICE OPERATION VIOLATED-W/DIAG = Refer to the cause code value definition in the
ISUP/TCAP Related Feature Description.
SERVICE OR OPTION NOT AVAILABLE = Refer to the cause code value definition in the
ISUP/TCAP Related Feature Description.
SERVICE OR OPTION NOT IMPLEMENTED = Refer to the cause code value definition in the
ISUP/TCAP Related Feature Description.
Signal type of the trunk is not supported by Verify Office = The signal type
for this trunk on RC view 5.1 is not supported for VY:OFC.
SIMULTANEOUS RINGING FEATURE NOT PURCHASED. = The simultaneous ringing feature has
not been purchased. Refer to the SECURED FEATURES portion of the
INTRODUCTION section of the Output Messages manual for additional
information.
TEMPORARY FAILURE = Refer to the cause code value definition in the ISUP/TCAP Related
Feature Description.
TG IS NOT EQUIPPED TO HANDLE DATARATE = The trunk specified as the originator does not
have the DATARATE field on RC/V View 5.1 set or the trunk’s DATARATE is set
but the trunk cannot support the data rate requested.
The class of service of the originator is not supported by verify office.
= Refer to variable ‘t‘ for supported classes of service.
The Finite State Machine Failed = An attempt to query the SCP has failed for an unknown
reason.
The tone or announcement type is X. = Where X is the type of tone or announcement
that the call would be routed to.
This type of trunk can't be used for FX or Tie service = The class of service of
the trunk is not proper for FX/TIE services.
TOO MANY STORED DIGITS = There are too many digits for digit analysis to handle. Refer to the
TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output
Messages manual.

TRANSIT NETWORK DOES NOT EXIST = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

TRANSFER TO ACD FROM ARU NOT PURCHASED = This feature has not been purchased. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

UCR SFID 47 NOT PURCHASED = Unidentified call rejection is not activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Unable To Communicate With The Routing Module = Need to retrieve the riRTDN_TRAN tuple from the routing module; however, the routing module is not operational.

UNALLOCATED NUMBER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

UNASSIGNED DN, NO LRN = An unallocated directory number has been encountered and there was not an location routing number.

UNASSIGNED DN, LRN PRESENT = An unallocated directory number has been encountered and there was an location routing number.

Unexpected Data Collection State In RTvfy_send() = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Unexpected Message = Attempting to access a message with an invalid message type.

UNEXPECTED RETURN CODE FROM MCgetdig IN MCidprel = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNEXPECTED RETURN CODE FROM MCgetdig IN MCidcont = Internal error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

UNEXPECTED ROUTE FAILURE REASON = Code for route failure unexpectedly entered for a reason that VFY:OFC does not handle. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Message manual.

Unknown Message Was received By RTvfy_rsp() = An unknown message was received while waiting for routing data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

USER ALERTING NO ANSWER = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

USER BUSY = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

User Has Authorization Code First feature. Continuing VFY:OFC = The user has an authorization code feature assigned that has ATH FIRST Y. This is being ignored and the verify is continuing. VFY:OFC does not support an authorization Code.

WARNING: Ignoring the authorization code data may result in invalid routing information if the authorization code data overrides, for example, the SI to be used, the FRL to be used, and so forth. Check the user's feature and group information to determine if the results of the verify are valid.

USTWC FEATURE NOT PURCHASED OR NOT ACTIVE = The usage sensitive three-way calling feature has not been purchased or has not been activated. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

Utility Telemetry Service is not activated = UTT feature is not active but the originating port is marked for UTT service. Refer to the SECURED FEATURES
portion of the INTRODUCTION section of the Output Messages manual for additional information.

VACANT CODE = Refer to the cause code value definition in the ISUP/TCAP Related Feature Description.

Verify Office for LRN feature is inactive = This VFY:OFC request is attempting to do an LNP query; however, both NP-test query for LRN and NP-verify office for LRN are inactive. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information.

VFYOFC ARS NOT SUPPORTED FOR CCS. = Verify of ARS feature is not supported on ISUP/CCS trunks.

VFYOFC ARS NOT SUPPORTED FOR SERVICE CLASS. = The input port has a class of service that cannot have ARS.

VIRTUAL PRIVATE NETWORK CALL. = Indicates that this is an origination VPN call.

WIRELESS CALL ORIGINATION = Wireless call originations are not supported by VFY:OFC.

\( i^3 \) = Value type. Used to define type of value indicated in variable ‘\( i^3 \)’. Valid value(s):

CAUSE = Cause code value. Refer to the ISUP/TCAP Related Feature Description for a complete list of cause codes and their meanings.

MDII CODE = Number mapped internally in the DMMDII domain. Refer to the APP:MDII appendix in the Appendixes section of the Output Messages manual.

ASSERT NUMBER = Assert number.
TRIGGER TYPE = Trigger type.
TRIGGER NUMBER = Trigger number.
SERVICE TYPE = Service type.
MESSAGE TYPE = Message type.
ERROR CODE = Error code.
DCSTATE = The data collection state.
REASON = Reason.
RETURN CODE = Return code.
ROUTE INDEX = Route index.

\( j^3 \) = Value definition associated with value type as indicated in variable ‘\( j^3 \)’.

\( k^3 \) = Context identifier. This field is associated with the AMA recording for unbundled and resold feature. Refer to the SECURED FEATURES portion of the INTRODUCTION section of the Output Messages manual for additional information. Valid value(s):

NATIVE = This is the default value if the SFID is inactive. This port is native to the switch.
UNBUNDLED = This port has been unbundled from the switch.
RESOLD = This port has been resold.

\( l^3 \) = LNP trigger number.

\( m^3 \) = The dialed digits are a number that may have been ported into, or out of the office. Valid value(s):

PORTED_IN = Y
PORTED_IN = N

\( n^3 \) = ANI digits. ANI contains the calling party number or charge number. Used for LDP ANI processing. ANI is a required field for LDP LATA trunks. Valid value(s):
10 digit NPA-NXX-XXXX
3 digit NPA

NULL = The NULL value shall be valid only when DIG=950-XXXX The trigger number and trigger type are output. for CALLTYPE=FGB or FGBPS calls.

For a MF trunk this field represents the ANI information digits (II). Valid value(s):
00 = Identified line with no special treatment.
01 = Operator number identified (multiparty).
02 = ANI failure.
06 = Hotel without room identification.
07 = Coinless, hospital, or inmate call.
08 = Interlata restricted.
10 = Test call.
20 = Automatic input/output dialing (AIOD) listed directory number sent.
23 = Identified line (coin or noncoin).
24 = Translated 800 call.
27 = Coin line.
34 = Operator handled.
52 = OUTWATS line.
68 = Interlata restricted hotel line.
78 = Interlata restricted coinless line.
93 = Virtual private network line.
NULL = NULL input, valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS calls.

Originating line information (OLI) for a CCS7 trunk. Valid value(s):
IDLINE = Identified line with no special treatment.
01 = Operator number identified (multiparty).
02 = ANI failure.
06 = Hotel without room identification.
07 = Coinless, hospital, or inmate call.
08 = Interlata restricted.
10 = Test call.
20 = AIOD listed directory number sent.
23 = Identified line (coin or noncoin).
24 = Translated 800 call.
27 = Coin line.
34 = Operator handled.
52 = OUTWATS line.
68 = Interlata restricted hotel line.
78 = Interlata restricted coinless line.
93 = Virtual private network line.
NULL = NULL input, valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS calls.

This field represents the first table matched in LDP processing. Valid value(s):
LDP_ANI = The ANI type tuple was matched with a tuple in the LDP ANI table (LDP index table).
LDP_CAR = The ANI type tuple was matched with a tuple in the LDP CARRIER table.
DEFAULT_ANI = The ANI type tuple was matched with a tuple in the DEFAULT ANI table.
DEFAULT_CIC = The ANI type tuple was matched with a tuple in the DEFAULT LDP CARRIER table.

\[ r^3 \]
= Calltype of the dialed number. Valid value(s):
1P = World zone 1, non-operator.
0P = World zone 1, zero plus.
011 = International, non-operator.
01P = International 01 plus (dialed as 01+CC+NN).
01M = International 01 minus.
DOM = Domestic (United States).
FGB = FGB (950-xxxx) calls from transition EAO/AT.
FGBPS = FGB (950-xxxx) calls from public station during and after the transition.
FGDCT = Feature group D cut through calls.
APN = Action point numbers.

\[ s^3 \]
= Carrier identification code (CIC).

\[ t^3 \]
= Transit network selector (TNS) circuit code.

\[ u^3 \]
= Carrier code for TNS.

\[ v^3 \]
= Country code (CC) for the called number.

\[ w^3 \]
= Terminating network selection code (TNSC). This is relevant only for specified MINT trunks.

\[ x^3 \]
= Terminating network selection code sent out with the call. This is relevant only if outgoing trunk is MINT.

\[ y^3 \]
= Wide band (WB) data rate for CSD calls. Valid value(s):
384 = 384 kbps.
384_1536 = 384 or 1536 kbps.
1536 = 1536 kbps.

\[ z^3 \]
= WB data rate channel for CSD calls. Wideband channel specifies the number of DS0s requested for the call. The number of DS0s is the information transfer rate multiplier value.

\[ a^4 \]
= WB data rate alternate route index for a CSD call that leaves the office.

\[ b^4 \]
= ASP trigger type. Valid value(s):
DIALED_NUMBER_TRIGGER
OFF_HOOK_DELAY

\[ c^4 \]
= ASP trigger number.

\[ d^4 \]
= Destination index for FGD tandem cutthrough calls.

\[ e^4 \]
= Route index for FGD tandem cutthrough calls.

4. ACTIONS TO BE TAKEN
In the cases where an explicit translations error is found, or if the call routes to an incorrect line or trunk, follow local provisioning procedures to correct the situation.

5. ALARMS

None.

1. FORMAT

VFY PAUTH
IDENT        LAST LOGIN
  a            b
  .            .
  .            .
  .            .

2. REASON FOR OUTPUT

To report the result of a VFY:PAUTH input message.

If the requesting input message was VFY:PAUTH (no arguments), then the last login date and time for all person identities are listed.

If the requesting input message was VFY:PAUTH,IDENT=\"a\", then the last login date and time for person identity 'a' is listed.

If the requesting input message was VFY:PAUTH,DORMANT=a, then the last login date and time for all person identities with the following characteristics are listed:

- Those that surpass 'a' days since last logging in.
- Those that surpass 'a' days for a single login session. Those that have never logged in.

This output message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

3. VARIABLE FIELD DEFINITIONS

a = Person identity as defined by the ADD:PAUTH input message.

b = Date and time of last login, with format YY-MM-DDHH:MM.

2. REASON FOR OUTPUT

To report the result of entering a VFY:PCGRP input message. The person-command group (PCGRP) relation for the person identity (IDENT) is listed. The PCGRP for an IDENT consists of command groups (COMGRs) and/or profiles (PROFILEs) assigned to IDENT by the ADD:PCGRP input message.

This output message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

3. VARIABLE FIELD DEFINITIONS

a = Person identity as defined by the ADD:PAUTH input message.

b = A profile identity as defined by the ADD:PROFL and CHG:PROFL input messages and assigned to the person identity by the ADD:PCGRP input message.

c = Command group. Valid value(s):

- ADMIN = System administrator only activities.
- ALARM = Alarm manipulation.
- AM = Administrative module maintenance.
- AMA = Automatic message accounting.
- AUDIT = Audits.
- AUTH = Command and authority administration.
- CCS = Common channel signaling.
- CM = Communications module maintenance.
- FHADM = File handling and administration.
- MAINT = Routine maintenance activities.
- MEAS = Measurements.
- NMOC = Network management and overload control.
- ODD = Office dependent data activities.
- PASS = Personal password modification.
- RCV = Recent change and verify activities.
- SM = Switching module maintenance.
- SPECRCV = Special RC/V input messages.
- SFTMGТ = Software management (update, software release retrofit).
- SFTUTIL = Software utilities.
- SUPERUSR = Super user authority (bypass terminal authority).
- SYSRCVY = System recovery activities.
TRACE = Call trace.
TRKLN = Trunk and line maintenance.

Refer to the APP:COMMAND-GRP appendix in the Appendixes section of the Input Messages manual for more details.

4. ACTION TO BE TAKEN

2. REASON FOR OUTPUT

To report the result of a VFY:PROFL input message.

Format 1 outputs the list of all command profile names in the profile authority database (PROFL). This is the result of the VFY:PROFL input message.

Format 2 outputs the command groups (COMGRs) belonging to a particular command profile as defined in the profile authority (PROFL) database.

This is the result of the VFY:PROFL:IDENT input message. This output message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

3. VARIABLE FIELD DEFINITIONS

a = Profile identity as defined previously by the ADD:PROFL input message.

b = Command group. Valid value(s):

ADMIN = System administrator only activities.
ALARM = Alarm manipulation.
AM = Administrative module maintenance.
AMA = Automatic message accounting.
AUDIT = Audits.
AUTH = Command and authority administration.
CCS = Common channel signaling.
CM = Communications module maintenance.
FHADM = File handling and administration.
MAINT = Routine maintenance activities.

2. REASON FOR OUTPUT

To report that a session verification request has been processed for a remote digital test access (RDTA) session.

Format 1 is used to display a successful session verification. This means that the port specified in the input request is active as the port under test (PUT) in an RDTA session and that the administrative module (AM) data agrees completely with this physical RDTA connection. The first port identifier (line 1 of Format 1) echoes the PUT as given on the VFY:RDTA input request. The mode is provided as additional information to aid in representing the connection. The first port identifier of line two is the PUT as well, but is translated to print the equipment number with the exception of the PUT as a port on the protocol handler (PH). In this case, the PUT is identified by a digital subscriber line group and member (DSLGM) number. The second port identifier of line two is the test access port (connected to the output facility) which is monitoring or interacting with the PUT. This line two will always appear since there must be at least one connection for an RDTA session to exist. The first port identifier of line three is the secondary port (also identified by equipment number), which is indirectly involved in this session because it is (in the case of monitor) or was originally (in the case of duplex split) connected to the PUT. The second port identifier of line three then is the test access port (connected to the output facility) which is monitoring or interacting with this secondary PUT. This line will only appear for monitors and duplex splits where more than one output facility port is needed. Format 2 is used to represent a session verification failure. If there is a discrepancy between the physical RDTA connection and the AM RDTA session data an audit will be scheduled. An STP:RDTA output message will follow to notify the user of session termination. The PUT as given on the input request is echoed along with a failure reason and a failure point number to identify the point in software where failure occurred.

3. VARIABLE FIELD DEFINITIONS

+ = Assigned to a multipoint interface.

a = PUT identification as seen on the input request. Valid value(s):
   BST=b-c
   MLHG=d-e
   OAPO=b
   OPT=b-c
   RTRS=f-g
   TKGMN=h-i

b = Operator service center number.

c = Relative position number.
d = Multi-line hunt group number.

e = Multi-line hunt group member number.

f = Data link relative group number.

g = Data link relative member number.

h = Trunk group number.

i = Trunk group member number.

j = Equipment number. Valid value(s):

- AIUEN=k-s-f1-g1
- DEN=k-l-m-n
- ILEN=k-o-p-q
- LCEN=k-s-t-u
- LCKEN=k-s-o1-f1-g1
- NEN=k-h1-i1-j1-k1-l1-m1-n1
- INEN=k-h1-p-q

k = Switching module (SM) number.

l = Digital line and trunk unit (DLTU) number.

m = Digital facility interface number.

n = Digital channel.

o = Integrated digital carrier unit number.

p = Remote terminal number.

q = Channel unit number.

s = Integrated services line unit (ISLU) or access interface unit (AIU) number.

t = Line group controller number.

u = Line card number.

v = Directory number. Valid value(s):

- DN=v [+]
- PKTDN=v [+]

x = Channel type (for basic rate interface (BRI) ). Valid value(s):

- B1 = B1-Channel.
- D = D-Channel (default).

y = Connection mode of the RDTA session. Valid value(s):

- DTAC = Direct test access connection (DTAC). This is an interactive connection on a port which does not have a path set up on it. The PUT is seized and directly connected
to an outgoing port terminating at the protocol analysis equipment.

MON = Monitor. This is a receive-only connection on a busy circuit. A copy of the transmit and receive data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.

SPLIT = Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.

SPLITPH = Simplex split PH side. This is an interactive connection up on an integrated services digital network (ISDN) channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.

SPLITPUT = Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

z = Equipment number or PH identifier of PUT. Valid value(s):

AIUEN=k-s-f1-g1
DSLGM=k-a1-b1
DEN=k-l-m-n
LCEN=k-s-t-u
LCKEN=k-s-t-f1-g1
NEN=k-h1-i1-j1-k1-l1-m1-n1
INEN=k-h1-p-q

a1 = PH channel group number.
b1 = PH channel member number.
c1 = Response to VFY:RDTA input message. Valid value(s):

AM DATA BUT NO SM CONNECTION = There is no physical RDTA connection in the SM of the PUT but there is data in the AM describing an SM connection for the session described on the input request. An audit is being scheduled to clean up this AM data. An STP:RDTA message will follow describing this condition and that the session has been terminated.

CMP UNAVAILABLE = The communications module (CM) containing the PUT, which is need to verify the requested RDTA session, is isolated.

COMPLETED = The VFY:RDTA input message was accepted and a successful verification of an RDTA session has been completed. This is to say that the physical RDTA connection in the SM agrees with the AM data describing the connection.

CORRUPTED DYNAMIC DATA = Dynamic data has been corrupted. Look at read-only printer (ROP) for a related assert to give assistance toward correcting the office-dependent data (ODD) problem. Audits will correct any RDTA session/data inconsistency.

CORRUPTED STATIC DATA = Static data has been corrupted. Look at ROP for a related assert to give assistance toward correcting the ODD problem. Audits will correct any RDTA session/data inconsistency.

INVALID PUT = The port could not be located in the data base. The port identifier used in the input message was found to be invalid or incorrect.

NON-UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

PROCESS TIMEOUT- = An RDTA AM or SM process timed-out after waiting for an SM process to
respond. This condition has occurred because of an SM overload condition, an SM isolation, or an internal software error.

**SESSION NOT ACTIVE** = The requested RDTA session is not active. The AM and the SM of the PUT are in agreement with this.

**SM CONNECTION BUT NO AM DATA** = A physical RDTA connection has been found in the SM of the PUT but there is no data describing the SM connection within the AM. An audit is being scheduled to remove this physical RDTA connection in the SM. An STP:RDTA message will follow describing this condition and that the session has been terminated.

**SM UNAVAILABLE** = The SM containing the PUT, which is needed verify the requested RDTA session, is isolated.

**SYSTEM BUSY** = System resources are not available to verify the requested connection. The AM or SM may be in an overload condition.

**SYSTEM ERROR** = Internal system error occurred while attempting to verify the requested RDTA session.

d\(^1\) = This is a phrase that describes the relationship of the PUT or secondary PUT to its output facility. Valid value(s):
    - IS TRANSMITTING DATA TO = For a monitor.
    - IS INTERACTING WITH = For splits or a direct test access connection.

e\(^1\) = This is a fail point number used to relay the specific point in the software at which a failure occurred. This is used purely for debugging purposes.

f\(^1\) = Line board number.

g\(^1\) = Line circuit number.

h\(^1\) = Digital networking unit - synchronous optical network (SONET) (DNU-S) number.

i\(^1\) = Data group (DG) number.

j\(^1\) = SONET termination equipment (STE) facility number.

k\(^1\) = Synchronous transport signal (STS) facility number.

l\(^1\) = Virtual tributary group (VTG) number.

m\(^1\) = Virtual tributary member (VTM) number.

n\(^1\) = Digital signal level 0 (DS0) number.

o\(^1\) = Line group number.

4. ACTIONS TO BE TAKEN

If this message fails to print due to an internal software/hardware error, save the printer output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual further investigation.

5. ALARMS
None.

DSLM=k-t^1-a^1-b^1
DEN=k-l-m-n
LCEN=k-s-t-u
LCKEN=k-s-t-f^1-g^1
NEN=k-h^1-l^1-j^1-k^1-l^1-m^1-n^1
INEN=k-h^1-p-q
OIUEN=k-u^1-v^1-j^1-k^1-l^1-m^1-n^1

a^1 = PH channel group number.

b^1 = PH channel member number.

c^1 = Response to VFY:RDTA input message. Valid value(s):

AM DATA BUT NO SM CONNECTION = There is no physical RDTA connection in the SM of the PUT but there is data in the AM describing an SM connection for the session described on the input request. An audit is being scheduled to clean up this AM data. An STP:RDTA message will follow describing this condition and that the session has been terminated.
CMP UNAVAILABLE = The communications module (CM) containing the PUT, which is needed to verify the requested RDTA session, is isolated.

COMPLETED = The VFY:RDTA input message was accepted and a successful verification of an RDTA session has been completed. This is to say that the physical RDTA connection in the SM agrees with the AM data describing the connection.

CORRUPTED DYNAMIC DATA = Dynamic data has been corrupted. Look at read-only printer (ROP) for a related assert to give assistance toward correcting the office-dependent data (ODD) problem. Audits will correct any RDTA session/data inconsistency.

CORRUPTED STATIC DATA = Static data has been corrupted. Look at ROP for a related assert to give assistance toward correcting the ODD problem. Audits will correct any RDTA session/data inconsistency.

INVALID PUT = The port could not be located in the data base. The port identifier used in the input message was found to be invalid or incorrect.

NON–UNIQUE NXX DN = A non-unique NXX DN was entered. The NXX is in multiple NPAs. Reenter DN with NPA.

PROCESS TIMEOUT = An RDTA AM or SM process timed-out after waiting for an SM process to respond. This condition has occurred because of an SM overload condition, an SM isolation, or an internal software error.

SESSION NOT ACTIVE = The requested RDTA session is not active. The AM and the SM of the PUT are in agreement with this.

SM CONNECTION BUT NO AM DATA = A physical RDTA connection has been found in the SM of the PUT but there is no data describing the SM connection within the AM. An audit is being scheduled to remove this physical RDTA connection in the SM. An STP:RDTA message will follow describing this condition and that the session has been terminated.

SM UNAVAILABLE = The SM containing the PUT, which is needed to verify the requested RDTA session, is isolated.

SYSTEM BUSY = System resources are not available to verify the requested connection. The AM or SM may be in an overload condition.

SYSTEM ERROR = Internal system error occurred while attempting to verify the requested RDTA session.

d1 = This is a phrase that describes the relationship of the PUT or secondary PUT to its output facility. Valid value(s):

IS TRANSMITTING DATA TO = For a monitor.

IS INTERACTING WITH = For splits or a direct test access connection.

e1 = This is a fail point number used to relay the specific point in the software at which a failure occurred. This is used purely for debugging purposes.

f1 = Line board number.
4. ACTIONS TO BE TAKEN

If this message fails to print due to an internal software/hardware error, save the printer output and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual further investigation.

5. ALARMS

None.

[6] VFY TAPE IN PROGRESS
{HEADER HASH SUM MATCH - HEADER a IN SESSION g VOLUME h |
HEADER HASH SUM MISMATCH - HEADER a IN SESSION g VOLUME h |
DATA HASH SUM MISMATCH - HEADER a IN SESSION g VOLUME h |
2. REASON FOR OUTPUT

To output information concerning the condition of a system tape which is being verified in response to the VFY:TAPE input message.

3. VARIABLE FIELD DEFINITIONS

a = Number of header (a count that identifies the header within a logical volume).
b = Number of data record following a given header.
c = Number of retries needed to read successfully (0-9).
d = Total number of retries needed in reading system tape.
e = Total number of header hash sum mismatches found on tape.
f = Total number of data hash sum mismatches found on tape.
g = Number of backup session on tape (1-9).
h = Number of logical volume within a backup session (0-9).

4. ACTION TO BE TAKEN

A STOPPED output message indicates probable physical damage to the tape or an improper end of tape marker. A HASH SUM MISMATCH output messages indicate an inconsistency between the data being read and that which was originally written. A RETRIES NEEDED output message implies difficulty with reading a certain spot on the tape. An LSEEK FAILED output message indicates difficulty when trying to find the offset to re-read the tape when initial read has failed. All of these messages imply that the spot on the tape being read when the message occurred may be unusable.

For Format 6, a COMPLETED message with zero retries, zero header mismatches, and zero data mismatches indicates a completely verified tape.

5. ALARMS

None.

<table>
<thead>
<tr>
<th>TERM</th>
<th>PROFILE</th>
<th>COMGR</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>b</td>
<td>c</td>
</tr>
</tbody>
</table>

2. REASON FOR OUTPUT

To report the result of the VFY:TCGRP input message. The terminal-command group (TCGRP) relation for the terminal identity (TERM) is listed. The TCGRP for a TERm consists of command groups (COMGRs) and/or profiles (PROFILEs) assigned to TERM by the ADD:TCGRP input message.

This output message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

3. VARIABLE FIELD DEFINITIONS

a = Terminal identity in four characters as defined by the ADD:TAUTH input message.

b = A profile identity as defined by the ADD:PROFL and CHG:PROFL input messages and assigned to the terminal identity by the ADD:TCGRP input message.

c = Command group. Valid value(s):

- ADMIN = System administrator only activities.
- ALARM = Alarm manipulation.
- AM = Administrative module maintenance.
- AMA = Automatic message accounting.
- AUDIT = Audits.
- AUTH = Command and authority administration.
- CCS = Common channel signaling.
- CM = Communications module maintenance.
- FHADM = File handling and administration.
- MAINT = Routine maintenance activities.
- MEAS = Measurements.
- NMOC = Network management and overload control.
- ODD = Office dependent data activities.
- PASS = Personal password modification.
- RCV = Recent change and verify (RC/V) activities.
- SM = Switching module maintenance.
- SPECRCV = Special RCV commands.
- SFTMTG = Software management (update, software release retrofit).
- SFTUTIL = Software utilities.
- SUPERUSR = Super user authority (bypass terminal authority).
- SYSRCVY = System recovery activities.
TRACE = Call trace.
TRKLN = Trunk and line maintenance.

Refer to the APP:COMMAND-GRP appendix in the Appendixes section of the Input Messages manual for more details.

VFY:UPDT-MSGS

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

VFY UPDT MSGS

2. REASON FOR OUTPUT

To provide the input messages needed to install the software updates being verified. To obtain this report, the MSGS option must be included in the VFY:UPDT input message. If the software update is not correct, the VFY UPDT REPT message will be printed.

3. VARIABLE FIELD DEFINITIONS

= Commands to install updates. A maximum of 80 characters per line. These input messages must be entered exactly as is allowed. They are provided in this message.

4. ACTION TO BE TAKEN

If the message is missing, check the input message format and run the verification again. If there is a second failure, request the retransmission of the software update.

5. ALARMS

None.

VFYTXT:POKE

Software Release: 5E14 and later
Message Class: MTCE
Application: 5
Type: Output

1. FORMAT

VFYTXT POKE 193: a

2. REASON FOR OUTPUT

To report progress of a request for verification of tape or disk backups. These messages are printed only in response to the input message poke 193 from a display terminal.

3. VARIABLE FIELD DEFINITIONS

a

= A phrase reporting the progress or an error condition. It is usually self explanatory.

In the phrases below, "x" is a numeric expression and "<=>" denotes a variable string with a brief explanation inside the brackets.

Manual Action Required.

- MHD x MUST BE ACTIVE FOR THIS PROCEDURE = Restore moving head disk (MHD) x (RST:MHD=x).
- MHD x WAS NOT REMOVED SUCCESSFULLY! = Remove MHD x (RMV:MHD=x).
- MHD x IS NOT ACCESSIBLE AT THIS TIME = Select another MHD.
- ODD BACKUP IN PROGRESS. VFYTXT ABORTING = Retry when office-dependent data (ODD) backup is complete.
- ODD MEMORY GROWTH IN PROGRESS. VFYTXT ABORTING = Retry when memory growth process is complete.
- UNINTERPRETABLE ODIN TPREAD RETURN! = Retry entering last input.
- USAGE OF VFYTXT NOT ALLOWED FROM THE MCC = As vfytxt blocks other usages of the terminal. It must not be run from the Master Control Center (MCC). Use some other terminal.
- VFYTXT TIMED OUT WAITING FOR LAST CMD TO COMPLETE - CMD FOLLOWS = The vfytxt process was waiting for a message to complete, but did not receive the completion message within a specified time. This could be caused by the message taking longer than usual time in completing the task. Retry poke 193 input message later. If the same problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

Seek Technical Assistance.

The following messages may indicate serious system problems. If the following messages appear, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

- AN UNRECOGNIZED CMPR:DISK TO CORE COMMAND WAS ENCOUNTERED! VFYTXT ABORTING! = An input message for audit or for compare disk to core was issued by vfytxt, but it was not recognized by the system for some reason.
- CAN NOT CREATE LINKFILE. VFYTXT ABORTING! = Vfytxt cannot create linkfile (/tmp/.vfytxtLINK), which is used as a flag.
- CAN NOT CREATE LOCKFILE. VFYTXT ABORTING! = Vfytxt cannot create lockfile (/tmp/.vfytxtLOCK), which is used as a flag. Linkfile and lockfile are linked together (same file with different names).
- CAN NOT FOPEN LOCKFILE FOR APPENDING! VFYTXT ABORTING!! = Vfytxt cannot open lockfile for append mode.
- CAN NOT FOPEN LOCKFILE FOR WRITING! VFYTXT ABORTING!! = Vfytxt cannot open lockfile for write mode.
- CAN'T BYTE SEEK IN CURRENT MTCLOG! = Access to maintenance log failed. Maintenance log (named MTCLOG0 or MTCLOG1) is located in /etc/log or /log/log.
- CAN'T BYTE SEEK IN MTCLOG0!
- CAN'T BYTE SEEK IN MTCLOG1!
- CAN'T CHANGE DIRECTORY TO /cft/shl
- CAN'T CREATE TMP FILE FOR SCREEN DUMP! = Vfytxt cannot create a temporary file in /tmp.
- CAN'T STAT CURRENT MTCLOG! = Stat() of the current maintenance log failed.
- COULD NOT EXEC LAST CMD FROM UAexec_row()! = Vfytxt failed to execute the last message (refer to the last message on screen).
- LAST COMMAND ATTEMPTED WAS: = Vfytxt detected a problem while executing where 'x' is the specific input message.
- COULD NOT KILL CURRENT COPY:BKDISK RELIABLY!! = Vfytxt attempted to kill currently running COPY:BKDISK, but is unsure of the result due to unclear return code.
- CURRENT MTCLOG SIZE LESS THAN ZERO BYTES! = There is something wrong with the maintenance log.
- POSSIBLY SERIOUS CMPR:DISK:CORE OR VFY FILE INCONSISTENCIES! = There were inconsistencies in the results of audit and compare disk.
- PREVIOUS COPY:BKDISK MAY STILL BE RUNNING = Vfytxt was unable to identify the process identity of the currently running COPY:BKDISK.
- UAgreplog() ABORTED DUE TO ILLEGAL GREP TYPE! = Internal program error - vfytxt is looking for a message type that is not in the program.
- UNRECOVERABLE LOGIC ERROR IN UAsellog() = Possible internal program error.
- VFYTXT INTERNAL ERROR EXPRESSION -><- RETURNED ERROR: x = Possible internal program error.
- WRITE AT END OF LOCKFILE FAILED! VFYTXT ABORTING!! = Vfytxt cannot write to lockfile (/tmp/.vfytxtLOCK), which is used as a flag.
- WRITE AT START OF LOCKFILE FAILED! VFYTXT ABORTING!! = Vfytxt cannot write to lockfile (/tmp/.vfytxtLOCK), which is used as a flag.

For Information Only.
- ABORTED = Before this message appears, a message explaining the cause will appear. Look for that message and check the list above.
- ALLOWING OTHER VFYTXT PROCESS TO CONTINUE ( PID = x ON )!
- COMPLETED
- STARTING
4. ACTION TO BE TAKEN

When the process terminates normally, no action is required.

When the process terminates abnormally (for example, "ABORTED"), take the corrective action suggested in the list above for error state phrases or refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

   SEND2KERN KERNEL RETURNED ERROR l

[10] WHEN RUTIL ABT
    KERNEL RESPONSE TIMEOUT m

2. REASON FOR OUTPUT

Prints in response to the WHEN: RUTIL input message.
Format 1 indicates that the input message has been aborted.
Format 2 indicates that the input message has been rejected by the kernel or by the concerned node itself.
Format 3 indicates the successful setting of a break point.

Format 4 prints when the input message has been rejected by the craft process itself. There are too many instructions being attempted by the user.

Format 5 prints because input messages within an action-list must have consistent ring node addresses.

Format 6 prints because input messages within an action-list must have consistent node types.

Format 7 prints when creating the special file for the kernel has failed.

Format 8 prints when attempting to open the file for kernel processing has failed.

Format 9 indicates the kernel has returned a failing return code.

Format 10 indicates the kernel has not responded to the craft process.

</tbody>
</table>
= Explanatory message. Valid value(s):
  TOO MANY CMDS IN WHEN ACTION LIST = Currently the user is only allowed to specify a maximum of 24 action list items in total over all break points at a given node.
  UNSUPPORTED COMMAND = Currently this input message is unsupported.
  OP NOT ALLOWED = The OP:RUTIL input message is not allowed in an action-list.
  NESTED 'WHEN' NOT ALLOWED = Nested break point action lists are not permitted.
  RING NODE ADDRESS REQUIRED = A node address was expected.

4. ACTION TO BE TAKEN

For Formats 1 through 6, 11, and 12, review the current input message to determine the error.

For Formats 7 through 10, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

In addition to the actions already specified, refer to the individual output messages placed within the WHEN:RUTIL .

5. ALARMS

None.

OP:UTIL

Output Appendix(es):

APP:OMDB-X-REF
WHEN:UT-CMP-A
Software Release: 5E14 only
Message Class: UT
Application: 5
Type: Output

1. FORMAT

[1] WHEN UT CMP=a-b {MATE|PRIM} UTILFLAG c d
   ADDR e

[2] WHEN UT CMP=a-b {MATE|PRIM} UTILFLAG c d
   SYMIDX f FUNC g OFF h

[3] WHEN UT CMP=a-b {MATE|PRIM} UTILFLAG c d
   TIME i

2. REASON FOR OUTPUT

To report the status of the WHEN:UT-CMP input message in the communication module processor (CMP).

Format 1 reports the status of a WHEN breakpoint input message defined by a physical address.

Format 2 reports the status of a WHEN breakpoint input message defined by a symbolic reference and an optional offset.

Format 3 reports the status of a timed WHEN input message.

3. VARIABLE FIELD DEFINITIONS

MATE = Message was executed in the standby CMP.
PRIM = Message was executed in the active CMP.
UTILFLAG = Designates one specific WHEN clause in this processor.
a = Message switch side.
b = CMP number.
c = WHEN clause identification number. If an invalid input message is entered, the number is 255.
e = Absolute address specified in the input message.
f = Symbol index number of the specified symbol either specified in the input message or determined by the UT code based on the symbol name ‘g’. If an invalid input message is entered, the symbol index number will be "-1".
g = Symbolic name specified in the input message or determined by the UT code based on the
symbol index number `i`. The symbol name is limited to 15 characters in length. If the symbol is longer that 15 characters, the symbol name will be truncated to 14 characters and the 15th character will be replaced with a `*` to indicate this. The full name of these symbols can be determined by using the DUMP:UT-SYMID input message.

\[ h \] = Offset specified in the input message.

\[ i \] = Time specified in the input message (in milliseconds).

4. ACTION TO BE TAKEN

If appropriate, correct the specified input message and repeat.

5. ALARMS

None.

116. WRT
WRT:AMA-DATA  
**Software Release:** 5E14 and later  
**Message Class:** GENR  
**Application:** 5  
**Type:** Output

1. **FORMAT**

WRT AMA DATA HAS BEEN WRITTEN TO DISK  
READY TO TRANSFER DATA FROM DISK TO OUTPUT MEDIUM

2. **REASON FOR OUTPUT**

To indicate that internal billing data buffers have been written to disk. This message is a response to input message WRT:AMADATA.

3. **VARIABLE FIELD DEFINITIONS**

No variables.

4. **ACTION TO BE TAKEN**

The data on the disk can now be transferred.

5. **ALARMS**

This message itself does not cause any alarms, but is accompanied by critical and minor alarmed messages from the AMA disk writer. The purpose of the alarms is to alert the user that the AMA diskwriter has been killed as a result of the WRT:AMADATA input message. Since killing the AMA disk writer may result in a delay in writing AMA data to the disk, the user must be notified.
