Notice

Every effort was made to ensure that the information in this information product was complete and accurate at the time of publication. However, information is subject to change.

This information product describes certain hardware, software, features, and capabilities of Lucent Technologies products. This information product is for information purposes; therefore, caution is advised that this information product may differ from any configuration currently installed.

This 5ESS® switch document may contain references to the 5ESS® switch, the 5ESS®-2000 switch, and the 5ESS® AnyMedia® Switch. The official name of the product has been changed back to the 5ESS® switch. The documentation will not be totally reissued to change these references. Instead, the changes will be made over time, as technical changes to the document are required. In the interim, assume that any reference to the 5ESS®-2000 switch or the 5ESS® AnyMedia® Switch is also applicable to the 5ESS® switch. It should be noted that this name change may not have been carried forward into software-influenced items such as input and output messages, master control center screens, and recent change/verify screens.

Mandatory Customer Information

Interference Information: Part 15 of FCC Rules - Refer to the 5ESS® Switch Product Specification information product.

Trademarks

4ESS is a trademark of Lucent Technologies in the United States and other countries.
5ESS is a registered trademark of Lucent Technologies in the United States and other countries.
Air Extension is a servicemark of Lucent Technologies in the United States and other countries.
AnyMedia is a registered trademark of Lucent Technologies in the United States and other countries.
AUTOPLEX is a registered trademark of Lucent Technologies in the United States and other countries.
BILLDATS is a registered trademark of Lucent Technologies in the United States and other countries.
MEGACOM is a registered trademark in the United States and other countries, licensed exclusively through AT&T.
OneLink Manager is a trademark of Lucent Technologies in the United States and other countries.
SLC is a registered trademark of Lucent Technologies in the United States and other countries.
True Choice is a registered trademark in the United States and other countries, licensed exclusively through AT&T.
UNIX is a registered trademark in the United States and other countries, licensed exclusively through X-Open Company Ltd.

Limited Warranty
Warranty information applicable to the 5ESS® switch may be obtained from the Lucent Technologies Account Management organization. Customer-modified hardware and/or software is not covered by this warranty.

Ordering Information

This information product is distributed by Lucent Technologies in Indianapolis, Indiana.

The order number for this information product is 235-600-750. To order, call:
1-888-LUCENT8 (1-888-582-3688) or fax to 1-800-566-9568 (from inside the continental United States)
1-317-322-6416 or fax to 1-317-322-6699 (from outside the continental United States).

Support Information

Information Product Support: To report errors or ask nontechnical questions about this or other information products produced by Lucent Technologies, contact Lucent Technologies by using one of the following methods:
Use the comment form at http://www.lucent-info.com/comments/
Send e-mail to comments@lucent.com

Please include with your comments the title, ordering number, issue number, and issue date of the information product, your complete mailing address, and your telephone number.

Technical Support Telephone Numbers: For technical assistance, call Technical Support Services (TSS) at:
1-866-LUCENT8 (1-866-582-3688) (from inside the continental United States)
1-630-224-4672 (from outside the continental United States).

Technical Support Services is staffed 24 hours a day, 7 days a week.

Acknowledgment

1. INTRODUCTION

1.1 PURPOSE

The 5ESS® Switch Output Messages document describes output messages (OMs) in the human-machine language (MML) that are printed through 5ESS® switch output channels. This document and the 5ESS® Switch Input Messages document are reference guides for switch support personnel. This document is available in electronic media only.

The messages in this document and its updates represent complete documentation for software releases 5E14 and later.

5ESS® switch output messages are generated either in response to input messages, or to inform support personnel of system conditions or automatic operations that have been performed by the system. Examples of the uses of information given in output messages include locating trouble, reporting subsystem status, or supplying information on audit results.

Because output messages vary in length and complexity, you must know how output messages are documented and what kind of information they contain. Become familiar with the structure and format rules discussed in the User Guidelines of this document. Pay particular attention to the priority of action field. This field indicates the importance of the message and, consequently, the urgency of the action to be taken.

1.1.1 UPDATE INFORMATION

This document is being updated to include documentation for the 5E17(1) software release of the 5ESS® switch and to remove the 5E12 and 5E13 releases.

It also includes numerous enhancements and responses to customer requests for more information.

The following messages/appendixes have been updated/added:

- APP:EVENT-HIST-D (no alarm)
- APP:MDII (no alarm)
- APP:MSGCLS (no alarm)
- APP:NVMEM-REASON (no alarm)
- ALW:FAC-C (no alarm)

Copyright ©2003 Lucent Technologies
1.1.1.1 SUPPORTED SOFTWARE RELEASES

In accordance with the 5ESS® Switch Software Support Plan, the 5E13 software release is rated Discontinued Availability (DA) as of August 30, 2002. The information supporting 5E13 and earlier is being removed over time, instead of concurrently, from all documentation.

If you are supporting offices that use a software release prior to 5E14 and you have a need for the information that is being removed, retain the associated pages as they are removed from the paper documents, or retain the earlier copy of the CD-ROM.

The purpose of this documentation is to facilitate early dissemination of information. Its contents are subject to change pursuant to the general non-disclosure agreements between Lucent Technologies and 5ESS® switch owners for the purpose of planning. To the best of Lucent Technologies's knowledge, the information contained in this document is accurate and complete as of the date of publication. HOWEVER, LUCENT TECHNOLOGIES EXPRESSLY DISCLAIMS ANY WARRANTY AS TO ACCURACY OR COMPLETENESS NOR DOES LUCENT TECHNOLOGIES ASSUME ANY RESPONSIBILITY FOR THE USE OF THE INFORMATION BY OTHERS. Lucent Technologies reserves the right to change or delete any portions of the document or to add information in the future.

1.1.1.2 TERMINOLOGY
1.1.1.2.1 Communication Module Name Change

Global Messaging Server (GMS) is the official name of the communication module, model 3 (CM3) hardware. Where the term GMS may be expected in software-influenced items such as input and output messages, master control center screens, and recent change/verify screens, the term CM3 may be found until such time as the term is changed in the software code.

1.1.1.2.2 Bellcore/Telcordia Name Change

As of March 18, 1999, Bellcore officially changed its name to Telcordia Technologies. Not all pages of this document are being reissued to reflect this change; instead, the pages will be reissued over time, as technical and other changes are required. Customers on standing order for this document may see that, on previous-issue pages, the Bellcore name is still exclusively used.

Customers receiving new orders for this document will see the Telcordia Technologies name used as appropriate throughout the document, and the Bellcore name used only to identify items that were produced under the Bellcore name. Exceptions may exist in software-influenced elements such as input/output messages, master control center screens, and recent change/verify screens. These elements will not be changed in this document until such time as they are changed in the software code. Document updates will not be made specifically to remove historical references to Bellcore.

1.1.1.2.3 5ESS®-2000 Switch Name Change

This 5ESS® switch document may contain references to the 5ESS® switch, the 5ESS-2000 switch, and the 5ESS® AnyMedia® Switch. The official name of the product has been changed back to the 5ESS® switch. The documentation will not be totally reissued to change these references. Instead, the changes will be made over time, as technical changes to the document are required. In the interim, assume that any reference to the 5ESS-2000 switch or the 5ESS® AnyMedia® Switch is also applicable to the 5ESS® switch. It should be noted that this name change may not have been carried forward into software-influenced items such as input and output messages, master control center screens, and recent change/verify screens.

1.1.1.2.4 Document Specific Terminology

National ISDN is an evolving platform in which new features will continue to be introduced for new revenue opportunities, improved operational efficiencies, and for support of specific applications. NI 1, NI 2, and NI 3 represent specific features as documented in Bellcore SRs 1937, 2120, and 2457. The industry is migrating to an additional terminology to more specifically denote the availability of National ISDN features: NI 95, NI 96, etc. A feature is included in a specific version (such as, NI 96) if it is available by the switch vendors by the first quarter of the year.

As a result of the World Telecommunications Standardization Conference held March 1-12, 1993, the International Telegraph and Telephone Consultative Committee (CCITT), no longer exists as an organization under the International Telecommunication Union (ITU). According to the ITU, the CCITT is now referred to as the International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS).

For new and revised Recommendations issued by the ITU-TS, the term “CCITT Recommendation X.xxx” will be replaced by the “ITU-T Recommendation X.xxx” designation. For a transition period from 1993 to 1997, if the Recommendation had a previous CCITT designation, the new name will include “(formerly CCITT Recommendation X.xxx)”. Names of existing CCITT Recommendations will not change unless revised.

1.1.1.3 HANDLE DATE AND TIME TRANSITION TO YEAR 2000

For any time-stamp data that occurs in 5ESS® switch operations after the time is transitioned to the year 2000 and beyond, the year 00 shall be interpreted as 2000 after 12/31/1999. The data (billing, log files, and so forth) shall
continue to work even right after transition to the year 2000 from midnight 12/31 1999.

1.1.2 ORGANIZATION

The Output Messages document contains the following helpful information:

Introduction - explains the purpose and organization of the document.

User Guidelines - contains information about the conventions used in documenting output messages. This section also discusses MML syntax, the structure and layout of the messages, naming and usage conventions, format notation, and the organization and content of the message descriptions.

Acronyms - defines acronyms and abbreviations used in the Input and Output Messages documents.

Appendixes - contains information that is referred to by two or more message descriptions, such as listings of message classes, audits, and error codes.

The rest of the Output Messages document contains the message descriptions, presented in alphabetical order by message ID.

1.2 USER COMMENTS

We are constantly striving to improve the quality and usability of this information product (IP). Please use one of the following options to provide us with your comments:

- You may use the on-line comment form at http://www.lucent-info.com/comments
- You may email your comments to ctiphotline@lucent.com

Please include with your comments the title, ordering number, issue number, and issue date of the information product, your complete mailing address, and your telephone number.

If you have questions or comments about the distribution of our information products, see Section 1.3, Distribution.

1.3 DISTRIBUTION

For distribution comments or questions, either contact your local Lucent Technologies Account Representative or send them directly to the Lucent Learning Organization.

A documentation coordinator has authorization from Lucent Technologies to purchase our information products at discounted prices. To find out whether your company has this authorization through a documentation coordinator, call 1-888-LUCENT8 (1-888-582-3688).

Customers who are not represented by a documentation coordinator and employees of Lucent Technologies should order 5ESS® switch information products directly from the Lucent Learning Organization.

To order, call the following telephone number:

- 1-888-LUCENT8 (1-888-582-3688) or fax to 1-800-566-9568; from inside the continental United States
- 1-317-322-6847 or fax to 1-317-322-6699; from outside the continental United States.

1.4 TECHNICAL ASSISTANCE
For technical assistance, call Technical Support Services (TSS) at:

- **1-866-LUCENT8 (1-866-582-3688)**; from inside the continental United States
- **1-630-224-4672**; from outside the continental United States.

Technical Support Services is staffed 24 hours a day, 7 days a week.

### 1.5 SECURED/PROPRIETARY FEATURES

For all secured features, a right to use (RTU) fee must be paid before enabling information is provided. There may be additional proprietary documentation needed to interpret information regarding these features. Contact your Account Team Representative for additional information.

For a complete list of secured feature identifiers (SFID), refer to the *Translation Guide (TG-5)* manual, 235-080-100.

### 1.6 REFERENCES

This is a standard 5ESS® switch document that is also applicable to the Compact Digital Exchange (CDX) and Very Compact Digital Exchange (VCDX) switching systems. Information applicable to only CDX or VCDX may be found in the following documents:

- 235-120-010 Compact Digital Exchange (CDX) Reference Guide

Additional references are given as needed, within individual message descriptions. An "x" or "x"s in the last three positions of a release specific document number indicate the digits that change from release to release. Refer to 235-001-001, Documentation Description and Ordering Guide for the document number associated with each software release.
2. USER GUIDELINES

2.1 INTRODUCTION

This section explains the rules to which 5ESS® switch output messages (OMs) must conform, and the conventions that are used in this manual to show how messages are constructed.

The term messages refers to the output given by the switch system.

Each switch system is set to accept only one message language, human-machine language (MML). MML is the human interface language developed by the International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT).

2.2 MESSAGE DESCRIPTIONS

The message descriptions form the bulk of the OM manual. Message descriptions are documented on manual pages.

The term “manual page” refers to the description of an OM without regard to how many physical sheets of paper or screens are used to complete the description.

Each OM manual page consists of several elements that form the message description.

2.3 MANUAL PAGE - GENERAL PARTS

This section gives a general description of each part of a manual page.

2.3.1 Page Headers (Paper Only)

The header consists of two lines across the top of each manual page. The header on the inside of the manual page identifies the document number and the issue date. The header on the outside of the manual page shows the name of the document (for example, Switch Output Messages), and the message name.

2.3.2 Message Name

The message name is made up of the command code and parameter names from the message format omitting any variables and optional values and has a maximum length of 20 characters. This is used like a dictionary heading to give a general idea of placement in the manual.

2.3.3 Page Footers (Paper Only)

The footer on the inside of the page contains the issue number. The outside footer shows the message ID and page number. The message ID is explained with the key block items.

2.3.4 The Key Block

The key block is the block of text in the upper right corner of the manual page. The key block includes:

- ID
- RELEASE
- MESSAGE CLASS
- APPLICATION

2.3.4.1 ID
The ID is the unique identifier of the OM. Every message ID is composed of two parts separated by a colon. The part to the left of the colon is the command code of the message. One or more parameter names from the format usually make up the remaining portion of the ID. If there is more than one parameter name to the right of the colon, these parameter names are separated by a hyphen. For example: REPT:PM-QLNK-QGP.

### 2.3.4.2 RELEASE

This was formerly labeled GENERIC. The switch software release or range of releases to which the message description applies. Here are some examples of possible software release entries:

<table>
<thead>
<tr>
<th>Release and Description</th>
<th>Message Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5E14 only</td>
<td>The message description applies only to release 14.</td>
</tr>
<tr>
<td>5E14 and later</td>
<td>The message description applies to release 14 and to all later releases.</td>
</tr>
<tr>
<td>5E14 - 5E15</td>
<td>The message description applies to release 14 through release 15.</td>
</tr>
</tbody>
</table>

If changes from one release to another have affected a format, two or more separate manual pages are provided. Such a split is indicated by the last character of the message ID. If separate manual pages exist for the same message, the ID for the first manual page is followed by "-A", the second by "-B", and so forth.

Please note that the "dash-letter" suffix is dynamic depending on the number of software releases being supported and the number of versions of a message.

### 2.3.4.3 MESSAGE CLASS

Message classes are used to determine the proper TTY device (also called the channel) to which the message is printed.

Message classes suffixed with "MON" are normally logged. Message classes suffixed with "RSP" are normally printed only at the originating terminal in response to an input message. Message classes with neither suffix are normally printed at the receive-only printer (ROP) and the Switching Center Control System (SCCS).

Refer to the APP:MSGCLS appendix in the Appendixes section of this manual for a complete list of all message classes and the messages belonging to each. (See output message APP:MSGCLS.)

### 2.3.4.4 APPLICATION

This specifies the application to which the message pertains.

<table>
<thead>
<tr>
<th>Application Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>USA 5ESS® switch.</td>
</tr>
<tr>
<td></td>
<td>May also apply to CDX, VCDX, or WNC. Refer to the help facility to verify applicability for these systems.</td>
</tr>
<tr>
<td>3B</td>
<td>administrative module (AM) software.</td>
</tr>
<tr>
<td>CNI</td>
<td>Common Network Interface.</td>
</tr>
<tr>
<td>CDX</td>
<td>Compact Digital Exchange only.</td>
</tr>
<tr>
<td>VCDX</td>
<td>Very Compact Digital Exchange.</td>
</tr>
<tr>
<td></td>
<td>May also apply to the AEWNC. Refer to the help facility to verify applicability for this system.</td>
</tr>
<tr>
<td>AEWNC</td>
<td>Air Extension™ Wireless Network Controller only.</td>
</tr>
</tbody>
</table>

This implies that a listing such as "5,3B" means that this message applies to both USA 5ESS® switch and the administrative module software.

### 2.3.5 FORMAT

Message formats are a kind of notation that is used in this document to show the possible ways in which OMs can appear. Formats are described in greater detail in the MANUAL PAGE-SECTION DETAILS section of the User
Guidelines.

2.3.6 REASON FOR OUTPUT

This section of the manual page contains a brief summary of why the message appeared.

2.3.7 VARIABLE FIELD DEFINITIONS

This section explains the meaning of the various keywords, arguments, and variables shown in the format.

2.3.8 ACTION TO BE TAKEN

This section is a brief summary of any actions that should be taken in response to the output message.

2.3.9 ALARMS

Any alarms that are associated with this output message are listed in this section. The alarm types are described in Table 2-1.

2.3.10 REFERENCES

This section lists all related input and output messages, documentation references, Master Control Center (MCC) display pages, recent change views, and OMDB keys.

2.4 MANUAL PAGE - SECTION DETAILS

2.4.1 FORMAT Section

The format is the most important part of every manual page. The FORMAT shows the syntax of the message (that is, the way the message must be constructed).

2.4.1.1 Example

Here is an example of how the FORMAT section of a typical manual page might look:

RST LUCHBD=a-b-c-d e [f]

When appropriate, distinct formats are shown separately and given a number (in square brackets).

2.4.1.2 Format Notation

The message formats shown in this document may include one or more types of format notation that are not part of the message itself. The purpose of this notation is to assist in interpreting the message as it is printed.

<table>
<thead>
<tr>
<th></th>
<th>Brackets enclose optional entries. Optional entries may be included in the message or may be omitted.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Braces enclose two or more entries where one entry, but only one, must be included in the message</td>
</tr>
<tr>
<td></td>
<td>OR bars separate a selection of entries enclosed by braces or brackets. One of the entries separated by OR bars, but only one, may be selected.</td>
</tr>
<tr>
<td></td>
<td>Vertical ellipsis marks (three vertical dots) following a format means that there may be more than one line when an OM is printed. These additional lines will conform to the same format, but may contain different data.</td>
</tr>
<tr>
<td></td>
<td>Horizontal ellipsis marks used within a format depict variable repetition.</td>
</tr>
<tr>
<td></td>
<td>Three ellipsis marks with embedded spaces, either at the beginning of a line or at the end of a line, indicate that a format string is divided into multiple lines in the manual page. This is for documentation purposes only.</td>
</tr>
</tbody>
</table>
2.4.1.3 Notation Examples

The following examples illustrate the use of brackets, braces, OR bars, and ellipsis.

<table>
<thead>
<tr>
<th>ENTRY1 ENTRY2</th>
<th>Both ENTRY1 and ENTRY2 must be used.</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ENTRY1][ENTRY2]</td>
<td>Both entries are optional. Both, either, or neither may be used.</td>
</tr>
<tr>
<td>(ENTRY1 ENTRY2)</td>
<td>Either ENTRY1 or ENTRY2 must be used. Using both is not permitted.</td>
</tr>
<tr>
<td>[ENTRY1 ENTRY2]</td>
<td>Either ENTRY1 or ENTRY2, but not both, may be used. Both entries may be omitted.</td>
</tr>
<tr>
<td>[ENTRY1 ENTRY2 ENTRY3]</td>
<td>All three entries may be omitted; however, if any of these entries is used, your options are: ENTRY1 and ENTRY2 or ENTRY1 and ENTRY3. It is not permissible to use both ENTRY2 and ENTRY3.</td>
</tr>
<tr>
<td>(ENTRY1 ENTRY2 ENTRY3)</td>
<td>One of these three entries must be used, but it is not permissible to use more than one.</td>
</tr>
<tr>
<td>[ENTRY1]...[ENTRY1]</td>
<td>Signifies repetition of ENTRY1.</td>
</tr>
<tr>
<td>a b c . . .</td>
<td>Signifies that there may be more than one line when an OM is printed.</td>
</tr>
<tr>
<td>. . . . . . . . .</td>
<td>Signifies that the line was too long to be shown as it actually appears on the ROP and was divided into multiple lines for documentation purposes.</td>
</tr>
</tbody>
</table>

2.4.1.4 Variables

The message format shows keywords in upper case. These keywords appear in the printed output message exactly as they are shown in the format. The keywords denote the action that is the subject of the report and the units, systems, or functions that are acted upon.

The lower case letters shown in the format are normally used to denote variables. When an output message is printed by the system, information appears in place of these variables. Do not confuse variables with text phrases containing lower case letters as part of the text.

2.4.1.5 Sample Output Message

The example below shows how a typical MML output message, together with its header information, might look when displayed.

S570-52 90-07-20 08:05:05 012033 PRFM C2 K26.1
The above message contains three elements:

<table>
<thead>
<tr>
<th>Header</th>
<th>Priority of action</th>
<th>Message body</th>
</tr>
</thead>
<tbody>
<tr>
<td>S570-52</td>
<td>90-07-20 08:05:05</td>
<td>012033 PRFM C2 K26.1</td>
</tr>
</tbody>
</table>

### 2.4.1.6 Header

The header has the following format:

\[ Saaa-bb cc/dd/ee ff:gg:hh i j k l \]

where:

- \( S \) = System.
- \( a \) = Utility ID of the sending process in hexadecimal.
- \( b \) = Process ID of the sending process in decimal.
- \( c \) = Year when the message was triggered for output.
- \( d \) = Month when the message was triggered for output.
- \( e \) = Day of the month when the message was triggered for output.
- \( f \) = Hour when the message was triggered for output.
- \( g \) = Minute when the message was triggered for output.
- \( h \) = Second when the message was triggered for output.
- \( i \) = Sequence number of message in decimal.
- \( j \) = Message class of the message.
- \( k \) = System name.
- \( l \) = Software release load number.

### 2.4.1.7 Priority of Action
This code indicates the relative importance of the message, and whether or not it was generated with an audible alarm. The code is composed of two-characters (In some cases, a space is used as one or both characters). See Table 2-1 for a listing of the meanings of the various priority of action codes.

2.4.1.8 Body of Message

This portion of the message contains the information that the message is intended to convey. This information includes the keywords of the message and the information that corresponds to the variables in the message format. A message may be printed as one line of information, several lines of information, or as blocks of data.

2.5 OUTPUT MESSAGE SEQUENCE/PRINTING

The sequence in which messages are printed depends on:
- The priority of action code associated with a message.
- The brevity control and log/print status of the output message class.

There is at least one blank line between each output message.

2.6 OUTPUT MESSAGE CONTROL

Because of the large number of output messages that may be generated by the system, it is important to control the printing of these messages. The volume of output messages can be controlled by three techniques:
- brevity control
- log/print control features
- throttling

2.6.1 Brevity Control

When brevity control is "allowed", repetitive, functionally similar messages are suppressed after a predefined threshold has been reached. Brevity control can be "allowed" or "inhibited" by message class or by processor. (See input messages ALW:BREVC and INH:BREVC.) Messages that carry an alarm or are generated in response to manual requests are not affected by brevity control. Alarmed and manually requested messages can be affected by brevity control by using a CHG:MSGCNTL input message. (See input messages CHG:MSGCNTL.)

2.6.2 Log/Print Control

The log/print control feature enables you to control the destination of output messages on the basis of output message class. You may choose to have certain messages:
- Logged (stored on disk in /log/DAYLOG).
- Sent to output devices.
- Both logged and output.
- Discarded.

The output device is not necessarily a receive-only printer (ROP). Each output message class has its own equipment configuration database (ECD) classdef form. The classdef form determines which output device is used for messages belonging to that class. You may change the classdef forms by using the recent change ECD facility.

The log/print status (LPS) of each message class can be changed by using the CHG:LPS-MSGCLS input message. The OP:LPS input message can be used to request a log/print status report. (See input messages CHG:LPS-MSGCLS and OP:LPS.)
In addition to the current log/print status of each message class, a record is also kept of a back-up status for that message class. By storing the previous status of a message class as the back-up status, you can make a temporary change in the log/print status and then easily change the log/print status back to what it was by restoring the back-up status, using the CHG:LPS-MSGCLS input message. (See input message CHG:LPS-MSGCLS.)

One application of log/print control is to temporarily restrict the output of messages while you are troubleshooting. If you desire, you can suppress all superfluous messages by changing the log/print status of the undesired messages to have those messages logged (or discarded) but not printed. Discarding messages takes much less time than printing. Logged messages can be retrieved by using the OP:LOG input message. Since the messages stored on disk can be overwritten (and destroyed) during periods of heavy message output, it is advisable to run OP:LOG as soon as possible. (See input message OP:LOG.)

The APP:MSGCLS appendix in the Appendixes section of the Output Messages document lists the default log/print statuses of all message classes. Input messages that affect logging and brevity control are listed under the headings Log, Off-Normal Status, and Brevity Control in the Functional Index for the Input Messages document. (See output message APP:MSGCLS.)

NOTE: Manually requested output messages and output messages that carry an alarm will always be printed regardless of their log/print status.

2.6.3 Throttling

Throttling controls the rate at which output messages are unloaded from the queue to the AM for printing. This is done to control the amount of system resources for output message processing and also to selectively discard low priority messages when the queue is full and there are high priority messages that must be printed. Throttling cannot be altered by the service provider.

2.7 OMDB KEYS

Output message database (OMDB) keys relate to the alarm level and message class for an output message. The alarm level indicates the severity of the output message. The message class defines a set of output devices (for example, receive-only printer, log file, or Switching Control Center System) to which an output message is reported or recorded. An output message format may have more than one OMDB key associated with it, because a message can be generated with different alarm levels or message classes.

2.8 MCC DISPLAY PAGES

Master Control Center (MCC) display pages are used to perform maintenance and administrative functions for the 5ESS® switch.

See the 235-105-110 System Maintenance Requirements and Tools manual for a further explanation of MCC pages.

2.9 DESCRIPTION OF ERROR REPORTS FOR THE ADMINISTRATIVE MODULE (AM)

There are three AM error log files:
- Memory history log file (MEMLOG).
- Error interrupt handler log file (ERLOG).
- Postmortem dump log file (PMLOG).

Error messages that pertain to the control unit (CU) are found in MEMLOG and ERLOG. The MEMLOG file contains the REPT:CU supplementary data particular to memory failures. (See output message REPT:CU.) The ERLOG file contains supplementary error interrupt data detected by the error interrupt handler (EIH).
2.9.1 Automatic Postmortem Dumps

This message is printed after a system initialization. It contains register and system data collected at the time the system reset occurred.

For more information and details on AM error reports, see the 235-105-210 Routine Operations and Maintenance manual.

2.9.2 Processor Recovery Messages

Processor recovery messages (PRMs) are generated at each critical step of an initialization and can, therefore, be used to monitor the progress of an initialization. Unlike normal system messages that are routed to the spooling process and require a stable operating environment, PRMs can be output even when the system is unable to achieve recovery. For this reason, they become invaluable in determining the causes of severe system problems.

Because of the severe circumstances under which PRMs become most valuable, the amount of data they provide is kept to a minimum. The purpose of the PRM is to provide indications of the problem in an expedient manner.

A PRM can provide much needed information in the analysis of system problems. It is, therefore, recommended that whenever a problem with the system develops, the entire ROP output, from the time preceding the onset of the problem until the system has fully recovered, be collected.

For more information about PRMs, see the 235-600-601 Processor Recovery Messages manual.

2.9.3 Protocol Error Record Messages

Protocol error record (PER) messages provide details of error events associated with switch-detected protocol errors.

For more information about PERs, see the 235-600-755 Protocol Error Record Descriptions manual.

2.10 BINARY-DECIMAL-HEXADECIMAL CONVERSIONS

Both input and output messages use values in hexadecimal (base 16), decimal (base 10), octal (base 8), and binary (base 2). To convert binary numbers to hexadecimal, do the following:

- Separate the binary number into groups of four, starting with the rightmost number.
- Convert each group of four into its hexadecimal equivalent. (See Table 2-3 of the User Guidelines.)
- Example:

<table>
<thead>
<tr>
<th>Binary number</th>
<th>Binary number in groups of four</th>
<th>Hexadecimal equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>0010 0001 1110</td>
<td>2 1 E</td>
<td></td>
</tr>
</tbody>
</table>

To convert hexadecimal numbers to binary, perform the above procedure in reverse order.

To convert numbers from hexadecimal to decimal or vice-versa, refer to Table 2-2 of the User Guidelines. The left column contains hexadecimal numbers without the units digits. The units digits are shown in the first row.

<table>
<thead>
<tr>
<th>Priority Code</th>
<th>Accompanying Alarm</th>
<th>Importance of Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>*C</td>
<td>Critical alarm</td>
<td>Critical trouble. Immediate action required.</td>
</tr>
<tr>
<td>**</td>
<td>Major alarm</td>
<td>Major trouble or power failure. Immediate action required.</td>
</tr>
<tr>
<td>M</td>
<td>No alarm</td>
<td>Response to a manual request.</td>
</tr>
</tbody>
</table>

4. APPENDIXES
1. ACKNOWLEDGMENT DATABASE APPENDIX

If an error is encountered with the acknowledgment database, an input message acknowledgment of the following format may appear.

NA BAD ACKDB (key 1) (key 2) (key 3) (key 4)

where key = a numerical value.

This appendix lists the text associated with each key.

To clear the condition where every message results in the NA BAD ACKDB acknowledgement, enter the CLR:ACKDB input message, followed by the 808 and 805 pokes on the 103 page.

The following list contains acknowledgements that print after an input indicator (; ! or ?) or delete message character (DEL or CAN) is entered. The ACKDB key assigned to each acknowledgement is also given.

1. COMMUNICATION MODULE (CM) UNITS RESPONSES APPENDIX

The following is a list of 'reason' text phrases that are used in many of the switch output messages for communication module (CM) units.

The 'reason' is additional information about why an action was performed or was denied. This information is especially helpful in understanding why a requested action could not complete as requested. Not all phrases apply to all messages.

The asterisk (*) means that the message is followed by an assert.

MESSAGES:A

<table>
<thead>
<tr>
<th>Message</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACT CMP RESTORE TIMEOUT</td>
<td>A sequencing timeout resulted due to an active (ACT) communication module processor (CMP) restore. This could be caused by insufficient administration module (AM) resources or a software problem.</td>
</tr>
<tr>
<td>ACT SIDE DEGRADED</td>
<td>The active major side of the office network and timing complex (ONTC) has one or more links to switching module(s) (SMs) out of service.</td>
</tr>
<tr>
<td>ACTION TO DISTRIBUT MSGS TRAFFIC</td>
<td>Action has been taken by CLNORM to balance message switch traffic.</td>
</tr>
<tr>
<td>ACTION TO INCREASE QGP ACCESS</td>
<td>Action has been taken by CLNORM to increase the unit's access to the quad-link gateway processor (QGP).</td>
</tr>
<tr>
<td>ACTION TO REDUCE MESSAGE HAIRPINNING</td>
<td>Action has been taken by CLNORM to reduce the message hairpinning.</td>
</tr>
<tr>
<td>ALL EXTERNAL REFERENCES OOS</td>
<td>Office network and timing complex (ONTC) switch tried when network clock (NCLK) 1 office had external references out-of-service (OOS).</td>
</tr>
<tr>
<td>AM DETECTED CMP LEVEL 3 ERROR</td>
<td>The administration module (AM) detected a failure to communicate with the communication module processor (CMP).</td>
</tr>
<tr>
<td>AM DISK ERROR</td>
<td>Failure to open an AM file on disk occurred.</td>
</tr>
<tr>
<td>ATP</td>
<td>The diagnostic result was 'all tests passed' (ATP).</td>
</tr>
<tr>
<td>AUTO PUMP REQUESTS ARE MANUALLY INHIBITED</td>
<td>See inhibits on Master Control Center (MCC) page 1850 or 1851.</td>
</tr>
<tr>
<td>AUTO REQUEST ON QGP</td>
<td>The request was denied due to pending fault recovery actions.</td>
</tr>
</tbody>
</table>

MESSAGES:B

<table>
<thead>
<tr>
<th>Message</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLOCKED BY SM PUMP</td>
<td>An &quot;in progress&quot; switching module (SM) pump has caused the queued mate CMP restore to time out, since CMP pumps are at a lower priority than SM pumps.</td>
</tr>
<tr>
<td>BLOCKED BY SM PUMP - RST RESCHEDULED</td>
<td>Since mate CMP pumps are at a lower priority than the SM pumps, mate CMP restores (RST) are scheduled periodically if SM pumps are currently in progress.</td>
</tr>
<tr>
<td>BLOCKED BY SM PUMP - RST SCHEDULE</td>
<td>Since mate CMP pumps are at a lower priority than the SM pumps, the manual initialization request of the CMP has been aborted and a CMP unconditional restore has been scheduled.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
The request was denied because the current maintenance state of the unit does not correspond with what is expected when the request occurs. This happens in the case where fault recovery aborts an in-progress diagnostic and restores the unit. When the cleanup actions occur the unit is already in an active state, but fault recovery expects the unit to be in an out-of-service (OOS) diagnose (DGN), or OOS temporary (TMP) state. Because the request was aborted and a higher priority action changed the state, the cleanup actions are denied with this message.

<tr>
<td>SMs FAILED TO ESTABLISH AT LEAST 1 CLNK</td>
<td>The off-line boot switch call processing timer expired, indicating failure to bring up CLNKS, to at least one SM within the expected interval.</td>
</tr>
<tr>
<td>STATE OOS, MAN, RMV</td>
<td>The final state of the unit was 'out-of-service manual removed.'</td>
</tr>
</tbody>
</table>
The final state of the unit was active.
The unit is in a growth state.
The final state of the CLNK was idle. The CLNK is ready to go into service if needed.
The final state of the CLNK was 'init'. CLNK was initializing. The CLNK will attempt to initialize as soon as a request to initialize is received from the SM.
The final state of the unit was 'out-of-service family of equipment.' This is due to some piece of hardware being out-of-service that is needed to complete the request.
The final state of the unit was 'out-of-service manual removed.'
The final state of the CLNK was 'remote switching module standby.'
The unit is unequipped.
The final state of the CLNK was 'out-of-service manual removed.'
Standby unit failed initial restore attempt. Upon a successful switch completion, the old, active unit must complete a restore to standby but this attempt failed.
The diagnostic result was 'some tests failed' (STF).
Subordinate CMP is active.
The requested action is not allowed when a subordinate unit is being diagnosed.
The requested action is not allowed when the superordinate unit is being diagnosed.
The unit's superordinate unit must be active for the requested action to be performed.
The requested action will not complete execution since the switch is operating with FPCs duplex failed.
The requested action is not valid in minimum configuration mode.

<td>Not used.</td>
</tr>
</tbody>
</table>
Node was unable to be configured into the active ring.
Diagnostic went ATP, but either the RI or NP node minor state (or both) was other than USBL. Verify that the UCB MV field is correct for the node being restored.
Same as 17 except diagnostic went CATP.
Diagnostic ran CATP with the ring down, but the NP minor state was not USBL.

**Phase table for IMS level 2 initialization sequence**

| ITL2 | Invoke level 3 initialization |

**Phase table for IMS level 3 initialization sequence**

| ITCT | Ensure initialization timer is stopped. |
| ITAB | Begin breaking after each phase. |
| CFIT | Write display page to LVL3 INIT. |
| DBIN | Initialize internal database from ECD. |
| RMD1 | Initialize DLN DMA data. |
| RGDT | Ring data initialization. |
| ARCD | Application redundancy control (ARC) data. |
| MESG | Generate data structures for measurements. |
| NPLD | Initialize 3BWRT data. |
| UNDT | IUN maintenance data in AM. |
| OPIN | Message switch data initialization. |
| PERF | Performance measurements of IMS driver. |
| IMPA | Open _MTCE channel - read/write IMS maintenance messages. |
| MIL | Open _DFLT channel - receive source match copies, and so forth. |
| RMLF | Initialize IMS load factor table. |
| RMIN | Restart OOS RPCs (if all fail request npp.p, UCL restore). |
| RGRI | Ring initialization. |
| RMRAR | Clean up RPC initialization after ring initialization. |
| RGSM | Set non-OOS, -IUN minor states. |
| UNH3 | Check IUN hardware, update states. |
| RGIS | Initialize isolated nodes states. |
| RGBI | Deal with BISO/EISO nodes if inactive. |
| IMSN | Notify AIM node states known. |
| RSM | Start measurements on OOS nodes. |
| TRMR | Set message switch ready flag for TRACE. |
| NPHB | Node recovery monitor start heartbeat timer. |
| IMNA | Start node audit. |
| ITUA | Start unblocking all IMS audits. |
| IMCL | Cease requiring high gear due to boot. |
| NPNR | Adjust the pump rate for 3BWRT. |
| IMFU | Start field update system. |
| XXX0 | Spare slot for field update. |
| XXX1 | Spare slot for field update. |
| XXX2 | Spare slot for field update. |
| ITAN | Stop breaking after each phase. |
| ITSC | Notify user of initialization complete. |
| CFCC | Write display page to CRIT SEQ complete. |

**Phase table for IMS level 4 initialization sequence**

| ITCT | Ensure initialization timer is stopped. |
| ITAB | Begin breaking after each phase. |
| CFIT | Write display page to LVL4 INIT. |
| DBIN | Initialize internal database from ECD. |
| RMD1 | Initialize DLN DMA data. |
| RGDT | Ring data initialization. |
| RGID | IUN test data initialization. |
MESG Generate data structures for measurements.
NPLD Initialize 3BWRT data.
UNDT IUN maintenance data in AM.
OPIN Message switch data initialization.
PERF Performance measurements of IMS driver.
IMPA Open MTCE channel - read/write IMS maintenance messages.
IMIL Open DFLT channel - receive source match copies, and so forth.
RMLF Initialize IMS load factor table.
NPPC dd npp.p to automatic creation/recovery list.
RMIN Restore all OOS RPCs without diagnostics.
RGRI Ring initialization.
RMAR Clean up RPC initialization after ring initialization.
RGTI Test IUN communications.
IMSN Notify AIM node states known.
UNH4 UCL restore IUNs by generic.
RGIS Initialize isolated nodes states.
RGET Enable IRN RPC lethal message trap.
RGBI Deal with BISO/EISO nodes if inactive.
IMSM Start measurements on OOS nodes.
ITMW Start periodic min-mode warning.
TRMR Set message switch ready flag for TRACE.
NPHB Node recovery monitor start heartbeat timer.
IMNA Start node audit.
ITUA Start unblocking all IMS audits.
IMCL Cease requiring high gear due to boot.
NPNR Adjust the pump rate for 3BWRT.
IMFU Start field update system.
XXX0 Spare slot for field update.
XXX1 Spare slot for field update.
XXX2 Spare slot for field update.
ITAN Stop breaking after each phase.
ITSC Notify user of initialization complete.
CFCC Write display page to CRIT SEQ complete.
ITCT Ensure initialization timer is stopped.
ITST Correct for stimuli lost in starting sequence.
CFRT Add imrsrt.p to automatic creation/recovery list.
MECR Add msdcp.p to automatic creation/recovery list.
NPFC If not done, add npp.p to automatic creation/recovery list.
CRTM Add op_rtm.p to automatic creation/recovery list.
ITPG Print generic and release ID.
XXX0 Spare slot for field update.
XXX1 Spare slot for field update.
XXX2 Spare slot for field update.
ITLP All permanent processes are on automatic creation/recovery list.
ITTT Terminate transient IMS processes.

Table 8 Codes Printed in REPT IMSDRV INIT Messages (FAILURE CODES)

<table>
<thead>
<tr>
<th>Failure Code</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Sequence was not started - startseq() failed.</td>
</tr>
<tr>
<td>1</td>
<td>Phase failed before break and requested sequence abort.</td>

<tr>
<td>4</td>
<td>Program bug - illegal phase termination code before break.</td>
</tr>
</tbody>
</table>
5 Program bug - couldn't start guard timer.

6 Program bug - requested guard timer recycle couldn’t cancel.

7 Program bug - requested guard timer recycle couldn’t restart.

8 Phase requested guard timer recycle too many times.

9 Phase failed after break and requested sequence abort.

10 Phase failed after break and requested IMS abort.

11 Phase failed after break and requested DMERT boot.

12 Program bug - illegal phase termination code after break.

13 Phase did not report termination within time limit requested.

14 The user of IMS was not found (not attached to its port, and so forth).

15 Program bug - phase retry couldn’t start pause timer.

16 Phase failed and requested retry too many times.

17 Escalation due to request (refer to the request code of the next such message indicating that a new sequence has STARTED)

18 No timer for real-time break between phases.

### Table 9  System Error Code Numbers

**Table 10** 3BI Status Word
The link monitor can output a large number of indicators. Output of these indicators, called "Events" in the table below, can be selected as "ON" or "OFF" by a mask field on the MON:SLK input message. Bits may be "ORed" together to various combinations of control for selecting monitor output. The monitor has a default mask value of 0xde7f. For some events output is enabled by this mask. For others, like CCS7 TFX, output is normally disabled. Caution should be exercised whenever the monitor is turned on. System availability may be affected. Special caution is suggested for those areas not covered by the default mask.

The following table shows what may appear for a link/node monitor output. The "Mask" field is the value that may be included in the mask if reports of that event are desired. Again caution is the word. Some events have variable data items. These data items are defined below:

- a = CCS6 band number in decimal.
- b = Incoming node identification in group-member number format, decimal numbers.
- c = A concerned point code (CPC), destination point code (DPC), or originating point code (OPC) in hexadecimal.
- d = Signaling link code (SLC) in decimal.
- e = Congestion level
- xx = Link state numbers,
- yy = Link events.

<tr>
<td>0x416</td>
<td>Local loop-back test failure.</td>
</tr>
</tbody>
</table>
0x0501 Invalid internal state transition.
0x0502 Null pointer found in re-transmit queue.
0x0503 Encryption trouble.
0x0506 Maintenance guard timer expired.
0x0507 Link blocked.
0x0508 Link abnormal.
0x0509 Level 2 demand restart.
0x0511 Unknown fail code.
0x0520 Link idle is detected.
0x0521 LI illegal interrupt detected.
0x0522 Link check failed, selfloop not set.
0x0523 Link check failed, data doesn't match.
0x0524 Bad parameters passed from NP to LI.
0x0525 Level 2 not started in time.
0x0526 Node processor detected bad PRO state.
0x0601 SIPOs sent.
0x0602 SIPOs received.
0x0603 Bad link parameters.
0x0604 Remote changeover.
0x0605 Bad message to LI.
0x0606 Periodic SLT failed.
0x0607 Far end bouncing SIPO.
0x0608 Unable to access AM/ring.
0x0609 BX25 error threshold exceeded.
0x0610 Link stuck at zero.
0x0611 Cannot execute LAPB.
0x0612 Data encryption standard (DES) test failed.
0x0613 Unexpected message during long key exchange.
0x0614 Stream check fails.
0x0615 Random number generation failed.
0x0616 Cannot execute PUBKEY process.
0x0617 Null key generated.
0x0618 Key = 1.
0x0619 All ones key.
0x0620 Cannot generate audit data.
0x0621 Unexpected message during short key exchange.
0x0622 Cannot initialize encryption, DES problem.
0x0623 DES key all zeroes.
0x0624 No sync report from key exchange.
0x0625 Encryption could not get started.
0x0626 Transmit buffer too small.
0x0627 Management inhibit.
0x0628 ISDN user part down.
0x0629 Excessive local RCV buffer congestion.
0x0630 All ones received on link.
0x0631 DSU RLSD lead indicates valid data not received.
0x0632 Sending SIPOs for off-line boot (OFLBOOT).

The fail codes are categorized as follows:

0x0aa = FIBR and BNSR failures.
0x1aa = Excessive acknowledgement delay.
0x2aa = Excessive error rate.
0x3aa = Excessive duration of congestion.
0x4aa = General hardware trouble.
0x5aa = General software trouble.
0x6aa = Other troubles.
The "aa" portion of the number ranges from 00 to 99 and is used to provide further resolution of the problem.

Table 14  States Printed in REPT SLMK INIT Messages

<tr>
<td>18</td>
<td>Recovery state of SLMK, shared library contents reused.</td>
</tr>
<tr>
<td>19</td>
<td>Start of internal level 1 initialization.</td>
</tr>
<tr>
<td>20</td>
<td>Received first IMS boot message (applin) during internal level 1 initialization.</td>
</tr>
<tr>
<td>21</td>
<td>Received second IMS boot message (start reports) from CNI application but remote data pump incomplete.</td>
</tr>
<tr>
<td>22</td>
<td>Remote data pump complete, waiting second IMS boot message (start reports) from CNI application.</td>
</tr>
</tbody>
</table>

**NOTE:** Each SLMK initialization sequence consists of a series of individual initialization states. This table shows these states, in chronological order, for each of the SLMK initialization sequences. The sequences do not progress in numerical order. State 14 is the normal steady state for the SLMK process, all other states are considered transient.

1. Autonomous Response Special Completion Code

This appendix contains an exhibit describing the DCI driver the special completion codes, which are applicable for autonomous response output messages.

<table>
<thead>
<tr>
<th>Code</th>
<th>Definition</th>
</tr>
</thead>
</table>
| 3    | SYSGEN message completed.  
      | The DCI is reporting the completion of a SYSGEN message. The job ID code for the SYSGEN message is zero by design. |
| 5    | DCI idle.  
      | This is in response to a UNIX® driver initiated ABORT sequence, simply indicating that the DCI was idle when the UNIX® driver sent abort message. |
| 6    | Illegal message.  
      | The DCI received a bit pattern in the message field which it could not decode. |
| 7    | DCI autonomous error.  
      | When BIC reports software error during data transfer, the UNIX® driver aborts the data transfer if it is in progress. |

**Application:** 5,3B  
**Type:** Output

### 1. DISK FILE CONTROLLER (DFC) APPENDIX

There are seven exhibits in this appendix. Exhibit 1 describes various disk file controller (DFC) error codes and the corrective actions which may be taken. Exhibit 2 describes several conditional success codes. Exhibit 3 explains the special completion codes, which are applicable for autonomous response output messages. Exhibit 4 contains the enhanced completion codes. Exhibits 5 and 6 contain the values of the firmware/pumpcode, driver communications register. Exhibit 7 contains job types pending.

The data in Exhibit 2 and Exhibit 3 are seen only by the disk driver. They are included here only to provide complete documentation on the DFC error codes.

Exhibit 1 lists the errors which can be detected by the DFC, explains the cause of the error, and shows any corrective actions which may be required. The DFC responds to all system-requested work with job completion codes. When the DFC detects errors on those jobs, it reports with the error information shown in Exhibit 1. In addition to running those jobs, the DFC can create its own internal work and can handle requests which do not have unique job identification codes.

All error codes are in hexadecimal.

#### Exhibit 1

<table>
<thead>
<tr>
<th>DFC Name</th>
<th>Code</th>
<th>Probable Cause and Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCOK</td>
<td>00</td>
<td>Job completed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This code implies successful completion, except in some autonomous responses. In the case of autonomous responses, the special completion code takes precedence over this code.</td>
</tr>
<tr>
<td>CCRAMWE</td>
<td>80,81</td>
<td>PIC ram read/write boundary error. If the DFC is a SMD-DFC:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The DFC was requested to write outside the address range of E00 to FFF (hexadecimal). This area is reserved for the diagnostics group and may be read and/or written by them. Addresses outside this range are reserved for the operational portion of the firmware and may not be written by anyone.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ACTION: This error should never occur since only the diagnostics group uses the write ram message.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the DFC is a SCSI-DFC:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The DFC was requested to write to write-protected ram. The DFC was requested to write to outside of allowed area of DFC RAM.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The DFC was requested to read non-existent memory.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ACTION: This error should never occur since only the diagnostics groups uses the ram read and write messages.</td>
</tr>
<tr>
<td>CCSEEKER</td>
<td>82,83</td>
<td>&quot;Seek&quot; error on disk.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The DFC issued a &quot;seek&quot; to an MHD and then detected an error in the MHD. The error</td>
</tr>
</tbody>
</table>
from the MHD indicates either that the "seek" did not complete within 75 milliseconds, or that the drive interpreted the address "seek" as beyond the last available cylinder on the disk.

**ACTION:** Check the cables to the MHDs for loose connections or perform preventive maintenance.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCNOINDEX</td>
<td>84,85</td>
<td>No index detected on disk.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The DFC could not find an 'index' mark from the disk after counting 33 sector marks.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>ACTION:</strong> Replace either the disk pack or the MHD in question.</td>
</tr>
<tr>
<td>CCErcMD</td>
<td>86,87</td>
<td>Invalid message from administrative module (AM).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The DFC received a message that was not valid for the state of the DFC.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>ACTION:</strong> There is no response for this error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.</td>
</tr>
<tr>
<td>CCSTATER</td>
<td>88,89</td>
<td>MHD status error.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>There is a problem with the drive which the DFC tried to access. One of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No unit ready = The drive is not powered up or the ID plug is missing.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No on cylinder indication = The drive has not been powered up or the disk pack is not spinning.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Fault = There is a hard fault on the drive, not the disk pack, which the firmware cannot correct.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>ACTION:</strong> Correct the problem and try again.</td>
</tr>
<tr>
<td>CCUCDE</td>
<td>8A,8B</td>
<td>Uncorrectable data error.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the DFC is a SMD-DFC, the DFC detected an error in the data on the disk which is beyond 11 bits long. The data which has been read cannot be used.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>ACTION:</strong> Use the VERIFY message to determine the location of the error and re-format the track on which the error is located. The data on that track is lost forever, and the whole disk pack may have to be re-populated with data from a mate disk.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 If the DFC is a SCSI-DFC, the target controller was not able to read a block of data from the disk.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>ACTION:</strong> Use the VERIFY message to determine the location of the error. Place the location of the error in a defect list and re-format the disk. The whole disk pack must be repopulated with data from a mate disk.</td>
</tr>
<tr>
<td>CCDBO</td>
<td>8C,8D</td>
<td>Disk boundary overflow.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>An attempt to read or write beyond the last block on a disk was made.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>ACTION:</strong> Run MHD diagnostics, and check the data cables. Another possibility is that the VTOC on the disk specifies a partition which exceeds the last available cylinder on the disk pack.</td>
</tr>
<tr>
<td>CCUHSM</td>
<td>8E,8F</td>
<td>Head - sector mismatch error.</td>
</tr>
</tbody>
</table>
The DFC read a sector off the disk and the header information, which contains the cylinder, head and sector number, did not agree with the value the DFC calculated for the head-sector number.

ACTION: Try the job again and if it fails, reformat that area of the disk.

**CCUWD** 90,91 Wrong disk selected.

A disk which the controller did not try to select answered to the poll of the disks.

ACTION: Check the id plug of the drive and then make sure that the data cable to the drive is properly placed on the backplane of the DFC.

**CCUND** 92,93 No disk selected.

There was no answer to the polling of the disks, but the DFC expected an answer.

ACTION: Insure that the disk to be selected is powered up, that its data cable is in the right place on the DFC backplane, and that the drive has an id plug.

**CCUHP** 94,95 Head positioning error.

The drive was requested to go to a given cylinder, but upon reading the header from the cylinder, the cylinder number there did not match the number that the DFC had calculated it should be. There was no "seek" error (82, 83) detected.

ACTION: Try the job again or reformat that area of the disk pack where the error occurred.

**CCUHSE** 96,97 Head selection error.

The head number read from the disk did not agree with what the DFC had calculated it should be.

ACTION: Retry the job, or reformat the area of the disk pack where the error occurred, or check the control cable to the MHD.

**CCUBPE** 98,99 BIC parity error.

There was a data parity error on a data transfer either to or from the BIC when the BIC was communicating with the processor.

ACTION: The DFC cannot cause this error, only report it. The BIC and/or the DDSBS should be diagnosed.

**CCUBPSE** 9A,9B BIC-PIC soft error.

ACTION: Run DFC diagnostics.

**CCPICE** 9C,9D PIC error.

The DFC tried to do a match against a known condition but could not detect a match condition. For example, if the DFC knows that there is a message to decode from BIC, the DFC tries to decode the message; if no match is found, this error is generated.

ACTION: Run DFC diagnostics.

**CCU3BE** 9E,9F DMA setup overwrite.

The BIC detects that the DMA has attempted to write to the BIC data FIFO while a setup
<table>
<thead>
<tr>
<th>Request</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Early EOT from DMA.</td>
<td>Run DFC and DMA diagnostics.</td>
</tr>
</tbody>
</table>

The error is detected in the BIC when the BIC receives an EOT signal from the DMA and the DFC has not set the EOT EXPECT flag in the BIC.

| No EOT from DMA. | Run BIC and DMA diagnostics. |

The error is detected in the BIC when the DFC has set the EOT EXPECT flag in the BIC and the DMA has responded to a transfer request with data rather than an EOT.

| Error detected in pumped data. | Run BIC and/or DMA diagnostics. |

The file containing the data to be pumped is not compatible with the firmware on the SCSI-DFC or there is an error in the contents of the pump file.

| PSDI first in/first out (FIFO) parity error. | Run DFC diagnostics. |

The parallel to serial data interface in the DFC has detected a parity error in the data stream which has been written on the disk.

| PSDI FIFO underflow. | Reformat the track where the error occurred and run DFC/MHD diagnostics. |

The PSDI has run out of data while trying to write data on the disk. This will cause a single sector on the disk to be scrambled, and a reformat of the track must be initiated.

| PSDI FIFO overflow. | Run DFC/MHD diagnostics. |

The PDSI FIFO received more data than it could hold while reading the disk.

| PSDI acknowledge failure. | Run DFC/MHD diagnostics. |

The DFC tried to start the PSDI in a read or write mode but the PSDI failed to respond.

| Extra data in PSDI. | The data format on the disk is not correct and must be reformatted. |

The DFC has finished reading what it thought was 512 data bytes from the disk, but data continued to arrive.

| Disk data buffer error. | |

</tbody>
</table>
CCPTO | E4,E5 | Pump job timed out.

**ACTION:** There is no user response for this error. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual.

CCDEVERR | FA,FB | Job failed due to medium error.

An error condition associated with the medium. At or beyond end of partition/medium (EOP/M). A check condition status was encountered by the DFC and the sense key indicated an error such as volume overflow or medium error.

**ACTION:** Try a different medium if possible; otherwise, contact support group.

CCDKDRV | FF | Reserved for disk driver use.

**Note:** Exhibit 2 describes the conditional success codes which are seen only by the disk driver.

### Exhibit 2 -- Conditional Success Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>02</td>
<td>The read disk job completed successfully but the DFC had to perform error correction to complete the job. This is an indication that the data are becoming somewhat marginal and that the disk pack may soon require reformatting.</td>
</tr>
<tr>
<td>04</td>
<td>In response to a VERIFY message, the DFC found that one or more sectors were not usable. The header information was incorrect or the data could not be corrected using ECC. The disk pack must be reformatted.</td>
</tr>
<tr>
<td>07</td>
<td>During a system phase one, the DFC was reset and could not continue a job that was in progress. This success code indicates that the job was reported to the disk driver for appropriate recovery actions.</td>
</tr>
<tr>
<td>08</td>
<td>There was a fault condition detected on the disk drive, the DFC was able to correct it and proceed to successful completion.</td>
</tr>
<tr>
<td>0A</td>
<td>The DFC detected a &quot;seek&quot; error on the disk, but was able to correct it and complete the job successfully.</td>
</tr>
<tr>
<td>0C</td>
<td>Job was early terminated by the DFC because a subsequent message was received for the same target device.</td>
</tr>
<tr>
<td>0E</td>
<td>The pump job was successful, but the DFC is expecting more data before the pump can be completed.</td>
</tr>
<tr>
<td>12</td>
<td>A &quot;check condition&quot; status was encountered by the DFC, but the sense key did not indicate a medium or hardware error. An early warning or a filemark may have been encountered.</td>
</tr>
</tbody>
</table>

**Note:** Exhibit 3 explains the special completion codes, which are only applicable for autonomous response output messages. The description of an error code in Exhibit 1 may be used to supplement Exhibit 3 code descriptions to give a more detailed reason for job failure.

### Exhibit 3 -- Autonomous Response Special Completion Code

<table>
<thead>
<tr>
<th>Code</th>
<th>Definition</th>
</tr>
</thead>
</table>
| 0    | Special job.  

DFC information report. The DFC is letting the disk driver know there is some enhanced information report (EIR) information available. |
| 1    | On-board diagnostic error.  

The on-board diagnostic of the DFC has detected an error, and the DFC should be removed and diagnosed as soon as possible. |
| 2    | On-board exerciser error.  

The disk exerciser has detected an error. The error may be an uncorrectable data error, or a head/sector mismatch, the error should be analyzed using the DFC enhanced error data (REPT DFCE), if available.
SYSGEN message completed.

The DFC is reporting the completion of a SYSGEN message. The job id code for the SYSGEN message is zero by design.

Boot message completed.

The DFC is reporting the completion of a BOOT message. The job id code for the BOOT message is zero by design. Since the disk driver does not issue a BOOT message, this is regarded as an error.

DFC idle.

This is in response to a DFC driver initiated ABORT sequence, simply indicating that the DFC was not sending any data for a particular job to the administrative module (AM) using the AM DMAC.

Illegal message.

The DFC received a bit pattern in the message field which it could not decode.

Hitemp warning.

The disk exerciser has detected a high temperature condition in a disk drive and is giving warning that the air flow may be becoming insufficient to continue to allow the heads to fly over the disk pack.

---

APP: DFC-I

Software Release: 5E14 and later
Message Class: N/A
Application: 5,3B
Type: Output

1. FAULT CODES APPENDIX

Note: The codes are in hexadecimal.

No fault:
00 = No fault (normal).

Peripheral faults with accompanying message:
b1 = Device reported error - device implicated - pio in progress.
b2 = Parity divert error - device implicated - pio in progress.
b3 = Channel error - device not implicated but possibly affected - pio in progress.
b4 = Device reported error - device implicated.
b5 = Direct memory access (DMA) addressing error - device implicated.
b6 = DMA used out of range (OOR) address - device implicated.
b7 = Channel error - device not implicated but possibly affected.

Peripheral faults without accompanying message:
b8 = Device reported error - cannot identify unit.
b9 = Parity divert error - cannot identify unit.
ba = Addressing error - cannot identify unit.

Configuration manager fault codes with accompanying message:
c3 = Informative - excessive recoverable errors.
c4 = Remove directive - excessive errors.
c5 = Remove request - attempt restoration of OOS usable unit.
c6 = Limp mode - attempt restoration of oos unusable unit.
c7 = Limp mode - no replacement avail.
c8 = Manual remove.
c9 = Unconditional remove.

Not seen by DRIVER; no accompanying message.
cb = Routine soft switch - pcpeih only.

Software errors without accompanying message:
d1 = Memory management - page invalid or not in memory.
d2 = Memory management - page index too large.
d3 = Memory management - segment invalid.
d4 = Memory management - segment index too large.
d5 = Illegal ost (from kernel).
d6 = Protection violation.
d7 = Byte or halfword addressing violation.
d8 = Instruction privilege violation.
d9 = Illegal op code.

System initialization without accompanying message:
e1 = Substantial system recovery has occurred.
e2 = System initialization critical.
1. EXTENDED SENSE LAYOUT APPENDIX

</table>

The "valid" bit indicates whether the information bytes contain valid data. If the valid bit is zero, the information bytes are not defined. If the valid bit is one, the information bytes contain valid information.

An error code of 70 (hex 0 specifies that the sense data is for a current condition. An error code value of 71 (hex) specifies that the sense data is for a deferred condition. Error code values 72 (hex) to 7E (hex) are reserved. Error code value 7F (hex) is for vendor-specific data formats. All other error code values are undefined.

The segment number contains the number of the current segment descriptor if extended sense is in response to a COPY, COMPARE, or COPY AND VERIFY messages. Up to 256 segments are supported beginning with segment zero.

The filemark (FM) bit indicates that the current message has read a filemark. This bit is only used for sequential-access devices.

The end-of-medium (EOM) bit indicates that an end-of-medium condition (end-of-tape, beginning-of-tape, out-of-paper, and so forth) exists on a sequential-access device or printer device. For sequential access devices, this bit indicates that the unit is at or past the early-warning end-of-tape if the direction was forward or that the message could not be completed because beginning-of-tape was encountered if the direction was reverse. Direct-access devices do not use this bit; instead, these devices report attempts to access beyond the end-of-medium as ILLEGAL REQUEST sense key [refer to Sense Keys 0 - 7 (hex) in the sense key listing].

The incorrect length indicator (ILI) bit indicates that the requested logical block length did not match the logical block length of the data on the medium.

R indicates reserved.

Exhibit B -- Sense Key Descriptions
<table>
<thead>
<tr>
<th>Sense Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0</td>
<td>NO SENSE. Indicates that there is no specific sense key information to be reported for the designated logical unit. This is the case for a successful message or a message that received a CHECK CONDITION status because one of the FM, EOM, or ILL bits is set to one.</td>
</tr>
<tr>
<td>0x1</td>
<td>RECOVERED ERROR. Indicates that the last message completed successfully with some recovery action performed by the target controller. Details may be determined by examining the additional sense bytes and the information bytes.</td>
</tr>
<tr>
<td>0x2</td>
<td>NOT READY. Indicates that the logical unit addressed cannot be accessed. Operator intervention may be required to correct this condition.</td>
</tr>
<tr>
<td>0x3</td>
<td>MEDIUM ERROR. Indicates that the message terminated with a nonrecovered error condition that was probably caused by a flaw in the medium or an error in the recorded data.</td>
</tr>
<tr>
<td>0x4</td>
<td>HARDWARE ERROR. Indicates that the target controller detected a nonrecoverable hardware failure (for example, controller failure, device failure, parity error, etc.) while performing the message or during a self-test.</td>
</tr>
<tr>
<td>0x5</td>
<td>ILLEGAL REQUEST. Indicates that there was an illegal parameter in the message descriptor block or in the additional parameters supplied as data for some messages (FORMAT UNIT, SEARCH DATA, and so forth). If the target controller detects an invalid parameter in the message descriptor block, then it terminates the message without altering the medium. If the target controller detects an invalid parameter in the additional parameters supplied as data, then the target controller may have already altered the medium.</td>
</tr>
<tr>
<td>0x6</td>
<td>UNIT ATTENTION. Indicates that the removable medium may have been changed or the target controller has been reset.</td>
</tr>
<tr>
<td>0x7</td>
<td>DATA PROTECT. Indicates that a message that reads or writes the medium was attempted on a block that is protected from this operation. The read or write operation is not performed.</td>
</tr>
<tr>
<td>0x8</td>
<td>BLANK CHECK. Indicates that a write-once read-multiple device or a sequential-access device encountered a blank block while reading or a write-once read-multiple device encountered a nonblank block while writing.</td>
</tr>
<tr>
<td>0x9</td>
<td>Vendor specific. This sense key is available for reporting vendor specific conditions.</td>
</tr>
<tr>
<td>0xa</td>
<td>COPY ABORTED. Indicates a COPY, COMPARE, or COPY AND VERIFY message was aborted due to an error condition on the source device, the destination device, or both. (Refer to the COPY message for additional information about this sense key.)</td>
</tr>
<tr>
<td>0xb</td>
<td>ABORTED COMMAND. Indicates that the target controller aborted the message. The initiator may be able to recover by trying the message again.</td>
</tr>
<tr>
<td>0xc</td>
<td>EQUAL. Indicates a SEARCH DATA message has satisfied an equal comparison.</td>
</tr>
<tr>
<td>0xd</td>
<td>VOLUME OVERFLOW. Indicates that a buffered peripheral device has reached the end-of-medium and data remains in the buffer that has not been written to the medium. A RECOVER BUFFERED DATA message(s) may be issued to read the unwritten data from the buffer.</td>
</tr>
<tr>
<td>0xe</td>
<td>MISCOMPARE. Indicates that the source data did not match the data read from the medium.</td>
</tr>
<tr>
<td>0xf</td>
<td>This sense key is reserved.</td>
</tr>
</tbody>
</table>

The information bytes are device-type or message specific. If the valid bit is one, the information bytes contain information as follows:

A  The unsigned logical block address associated with the sense key for direct-access devices (Type 0), write-once read-multiple devices (Type 4), and read-only direct-access devices (Type 5).
B  The difference (residue) of the requested length minus the actual length in either bytes or blocks, determined by the message for sequential-access devices (Type 1), printer devices (Type 2), and processor devices (Type 3). (Negative values are indicated by two's complement notation.)
C  The difference (residue) of the requested number of blocks minus the actual number of blocks copied or compared for the current segment descriptor of a COPY, COMPARE, or COPY and VERIFY message.
D  For sequential-access devices operating in buffered modes 1 or 2 that detect unrecoverable write errors when unwritten data blocks, filemarks, or setmarks remain in the buffer, the value of the information field for all messages shall be:
   a  The total number of data blocks, filemarks, and setmarks in the buffer if the device is in fixed block mode (block length field of the MODE SENSE block descriptor is non-zero and the fixed bit of the WRITE message is one).
   b  The number of bytes in the buffer, including filemarks and setmarks, if the device is
in variable mode (the fixed bit of the WRITE message is zero).

The additional sense length specifies the number of additional sense bytes to follow. If the allocation length of the message descriptor block is too small to transfer all of the additional sense bytes, the additional sense length is not adjusted to reflect the truncation.

The message-specific information bytes contain message specific data, peripheral device specific data, or both kinds of data that further define the nature of the CHECK CONDITION status. The COPY, COMPARE, COPY AND VERIFY, and SEARCH DATA messages define a standard purpose for some of these bytes. Except as described in these messages, the additional sense bytes are vendor unique.

The additional sense code (byte 12) may be applied with the same code by the target controller to extended and nonextended sense formats. The additional sense code 00 (hex) indicates that the target controller does not support any additional sense code for the related sense key or does not have any appropriate additional sense to return for the CHECK CONDITION status that it created. The additional sense codes are either defined, reserved, or vendor unique. The codes are allocated to the peripheral device type returned by the INQUIRY message. Some additional sense codes may be shared among various device types.

The additional sense code qualifier (byte 13) indicates detailed information related to the additional sense code. The additional sense code qualifier is optional.

Field replaceable unit code is used to define a device-specific mechanism or unit that has failed. A value of zero indicates that no specific mechanism or unit has been identified to have failed or that the data is not available. The field replacement unit code field is optional.

1. SMALL COMPUTER SYSTEM INTERFACE (SCSI) JOB BLOCK (SJB) STRUCTURE LAYOUT
APPENDIX

AABBCCDD EEEEEEEE FFFFFFFF GGGGGGGG HHHHHHHH IJIJIJIJI JJJJJJJJ J---LLLL
MMMMMMMM NNNNNNNN OOOOOOOO PPPPPPPP

General Notations:
In = Input that is entered by firmware/pumpcode.
Out = Output that is returned by small computer system interface (SCSI) protocol controller (SPC) code.
Res = Reserved for SPC code usage.

Device ID Information:
A = SCSI bus number: 0 or 1.
B = SCSI target controller number: 0 - 7.

General job information:
C = In. Job state - initiated by spc_job(), but updated by firmware/pumpcode. Valid value(s):
   0 = Initial state of job when spc_job() returns.
   1 = Job has been retried once.
   2 = SCSI request sense message has been issued.
   3 = Job has been retried twice.
   4 = Job has completed successfully.
   5 = Job has failed.

D = Out. Miscellaneous flags - used by the SPC to convey additional information to firmware/pumpcode Valid value(s):
   1 = One or more RESTORE POINTERS messages received after host adapter (HA) direct memory access (DMA) was begun for this job.

E = In. Job ID code (optional).
F = Out. Function to be performed. Valid value(s):
   0 = SCSI message.
   !0 = Function code.

G = In. Time limit for job, in milliseconds.
   !0 = Time limit.
   0 = No time limit.

H = Out. Job completion code. Valid value(s):
   0x00 = Job completed normally.
   0x01 = Command was aborted.
   0x02 = Reset was detected on the bus and was probably not caused by this job; it may or may not have been caused by this HA.
   0x03 = Check the status byte.
   0x04 = This HA reset the bus due to an unrecoverable error while processing this job.
0x05 = Job in progress.
0x06 = SCSI job block (SJB) contents error.
0x07 = Memory fault.
0x08 = The bus appears to be unterminated.
0x09 = The SCSI bus device select failed.
0x0a = Job was flushed.
0x0b = Target controller did not transfer all of the data.
0x0c = Job timed out.
0x0d = Insufficient DMA chain links.
0x0e = Insufficient logical unit (LU) queue nodes.
0x0f = The SCSI bus is off-line.
0x10 = HA detected SCSI bus parity error and terminated the job.

I = Res. Value returned from function timeout().

SCSI message information:
J = Out. Bytes of data not transferred.
K = Out. Target SCSI status byte. Valid value(s):
   0x00 = Successful message completion.
   0x02 = Check condition.
   0x04 = Condition met good status.
   0x08 = Busy.
   0x10 = Intermediate good status.
   0x14 = Intermediate condition met good.
   0x18 = Reservation conflict.
   0x22 = Command terminated.
   0x28 = Queue full.
   0xff = Status not available.

L = In. Mode flags for current job. Valid value(s):
   0x00 = Non-read message.
   0x01 = Read message.
   0x02 = External chaining.
   0x04 = Read overlap is active.
   0x80 = Immediate message.

M = In. Pointer to SCSI message.
N = In. Size of SCSI message in bytes.
O = In. Pointer to data buffer, or pointer to memory and 32104 DMA chain control node.
P = In. Size of data.

</table>

The peripheral qualifier and peripheral device-type fields identify the device currently connected to the logical unit. If the target is not capable of supporting a device on this logical unit, this field will be set to 7F hex (peripheral qualifier set to 011 binary and peripheral device type set to 1F hex).

Exhibit B -- Peripheral Qualifier

<table>
<thead>
<tr>
<th>Qualifier (binary)</th>
<th>Description</th>
</tr>
</thead>
</table>
| 000                | The specified peripheral device is currently connected to this logical unit. If the target cannot determine whether or not a physical device is currently connected, it will also use this peripheral qualifier when returning the INQUIRY data.  
|                   | **NOTE:** This peripheral qualifier does not imply that the device is ready for access by the initiator. |
| 001                | The target is capable of supporting the specified peripheral device type on this logical unit; however, the physical device is not currently connected to this logical unit. |
| 010                | Reserved. |
| 011                | The target is not capable of supporting a physical device on this logical unit. For this peripheral qualifier, the peripheral device type will be set to 1Fh to provide compatibility with previous versions of SCSI. All other peripheral device type values are reserved for this peripheral qualifier. |
| 1XX                | Vendor specific. |

</tbody>
</table>
A removable medium (RMB) bit of zero indicates that the medium is not removable. An RMB bit of one indicates that the medium is removable.

The gdevice-type qualifier field was defined in SCSI-1 to permit vendor-specific qualification codes of the device type. This field contains a g7-bit user-specified code, which may be set with switches or by some other means by the target controller or peripheral device. SCSI controllers that do not support this feature return all zero bits. This feature allows each user to assign unique codes to each specific type of peripheral device that is supported on the system being used. These codes may then be used by gself-configuring software to determine what specific peripheral device is at each logical unit number. This is especially valuable for systems that support multiple types of removable medium.

The usage of nonzero code values in the international standards organization (ISO) version and European computer manufacturers (ECMA) version fields are defined by the ISO and the ECMA, respectively. A zero code value in these fields indicates that the target controller does not claim compliance to the ISO or ECMA versions of SCSI. Note that it is possible to claim compliance to more than one of these SCSI standards.

The ANSI® version indicates the implemented version of the ANSI® standard and is defined in the following ANSI® version listing.

Exhibit D -- ANSI®-Approved Version

<table>
<thead>
<tr>
<th>Code (hex)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>This device might or might not comply to an ANSI®-approved standard.</td>
</tr>
<tr>
<td>1</td>
<td>The device complies to ANSI® X3.131-1986 (SCSI-1).</td>
</tr>
<tr>
<td>2</td>
<td>This code is reserved to designate the SCSI-2 standard upon approval by ANSI®.</td>
</tr>
<tr>
<td>3 - 7</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The asynchronous event notification capability (AENC) bit indicates that the device supports the asynchronous event notification capability:

A Processor device-type definition: An AENC bit of one indicates that the processor device is capable of accepting asynchronous event notifications. An AENC bit of zero indicates that the processor device does not support asynchronous event notifications.

B All other device types: This bit is reserved.

A terminate I/O process (TrmIOP) bit of one indicates that the device supports the TERMINATE I/O PROCESS message. A value of zero indicates that the device does not support the TERMINATE I/O PROCESS message.

The response data formats are given in the response data format exhibit that follows. Target controllers conforming to at least conformance level 2 and conforming to ANSI® X3.131-1986 (SCSI-1) set the common message set code (1 hex) in the response data format field.

Exhibit E -- Response Data Format

<table>
<thead>
<tr>
<th>Code (hex)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SCSI-1</td>
</tr>
<tr>
<td>1</td>
<td>Common command set (CCS)</td>
</tr>
<tr>
<td>2</td>
<td>SCSI-2</td>
</tr>
<tr>
<td>3 - F</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The additional length byte specifies the length in bytes of the parameters. If the allocation length of the message
A relative addressing (RelAdr) bit of one indicates that the device supports the relative addressing mode for this logical unit. If this bit is set to one, the linked message (Linked) bit will also be set to one since relative addressing can only be used with linked messages. A RelAdr bit of zero indicates the device does not support relative addressing for this logical unit.

A wide bus 32 (WBus32) bit of one indicates that the device supports 32-bit wide data transfers. A value of zero indicates that the device does not support 32-bit wide data transfers.

A wide bus 16 (WBus16) bit of one indicates that the device supports 16-bit wide data transfers. A value of zero indicates that the device does not support 16-bit wide data transfers.

If the values of both the WBus16 and WBus32 bits are zero, the device only supports 8-bit wide data transfers.

A synchronous transfer (Sync) bit of one indicates that the device supports synchronous data transfer. A value of zero indicates that the device does not support synchronous data transfer.

A linked message (Linked) bit of one indicates that the device supports linked messages for this logical unit. A value of zero indicates the device does not support linked messages for this logical unit.

A message queuing (CmdQue) bit of one indicates that the device supports tagged message queuing for this logical unit. A value of zero indicates the device does not support tagged message queuing for this logical unit.

A soft reset (SftRe) bit of zero indicates that the device responds to the RESET condition with the hard RESET alternative. A SftRe bit of one indicates that the device responds to the RESET condition with the soft RESET alternative.

SCSI devices that implement the hard reset alternative upon detection of the reset condition will:

A. Clear all I/O processes including queued I/O processes.
B. Release all SCSI device reservations.
C. Return any SCSI device operating modes to their appropriate initial conditions, similar to those conditions that would be found after normal power-on reset. MODE SELECT conditions will be restored to their last saved values if saved values have been established. MODE SELECT conditions for which no values have been saved will be returned to their default values.

SCSI devices that implement the soft reset alternative upon detection of the reset condition will:

A. Attempt to complete any I/O processes which have not completed and that were fully identified.
B. Preserve all SCSI device reservations.
C. Preserve any SCSI device operating modes (MODE SELECT, PREVENT/ALLOW MEDIUM REMOVAL messages, and so forth).
D. Preserve all the information required to continue normal dispatching of I/O processes queued prior to the reset condition.

ASCII data fields contain only graphic codes (that is, code values 20 hex through 7E hex). Left-aligned fields will place any unused bytes at the end of the field (highest offset) and the unused bytes are filled with the space characters (20 hex). Right-aligned fields will place any unused bytes at the start of the field (lowest offset) and the
unused bytes will be filled with space characters (20 hex).

The vendor identification field contains eight bytes of ASCII data identifying the vendor of the product. The data is left-aligned within this field.

The product identification field contains sixteen bytes of ASCII data as defined by the vendor. The data is lift-aligned within this field.

The product revision level field contains four bytes of ASCII data as defined by the vendor. The data is left-aligned within this field.

1. HOST ADAPTER COMMAND DEFINITIONS APPENDIX

This appendix provides the definitions of the messages sent from the administrative module (AM) to the host adapter (HA). The messages are either one word or four words in size. If the message is a one-word message, the last three words in the output are unknown and undefined. Only those words which are used are defined in this document.

The leftmost five bits of the first word of each message is the message operation code (opcode). Apply the following bit-field template to the first word of the message to determine the message opcode, then find that opcode in Exhibit A to determine which format should be used to decipher the remainder of the message.

Sample:

aaaa axxx xxxx xxxx xxxx xxxx xxxx xxxx

Where:

a = Operation code (opcode).
x = Command specific.

</table>

The HA central processing unit (CPU) can read this register a byte at a time and write to each bit individually with each bit having a unique address. The HA status register bits are also controlled by individual jam sets derived from asynchronous events on the HA board. All the bits are cleared on the "Power On" reset or the "HA Reset". The detailed description of each bit is given below.

Bit 31 (Power on reset) = This bit is set after the power on reset. This bit differentiates between the two resets, the power on reset and the HA reset.

Bit 30 (HA waiting for AM DMAC) = This bit is set using software when the HA is waiting for the AM DMAC to complete a transfer of data between the AM and the HA. After the HA detects completion of the transfer, the bit is cleared using software.

Bit 29 (Power disconnect one) = This bit is reserved for use by the HA CPU to disconnect SCSI bus 1.

Bit 28 (Power disconnect zero) = This bit is reserved for use by the HA CPU to disconnect SCSI bus 0.

Bit 27 (Over temperature one) = This bit is reserved for a possible future application.

Bit 26 (Over temperature zero) = This bit is reserved for a possible future application.
Bit 25 (Mask interrupt level 9) = When this bit is set by the software control, level 9 interrupt to the HA CPU is selectively masked regardless of the interrupt priority level (IPL) of the HA CPU in the processor status word (PSW). In a special case, when this bit is set after the interrupt occurs but before it is recognized by the HA CPU, the interrupt will be negated and will not be recognized by the HA CPU (unless the interrupt is still present after the mask bit is cleared).

Bit 24 (Mask interrupt level 10) = Same as bit 25 except the interrupt level is 10.

Bit 23 (DMAC channel 1 flush) = When '0', the DMAC channel operates normally. When '1', any incoming bytes from SCSI bus that are buffered in the DMAC are flushed and channel operation is terminated.

Bit 22 (SCSI bus 1 enable) = Enables SCSI bus 1. When '0', SCSI bus drivers and receivers are disabled. When '1', drivers and receivers are enabled.

Bit 21 (SCSI bus 1 receive bad parity) = When this bit is set by the software, a bad parity is received on the SCSI bus 1. This bit is cleared on the RESET.

Bit 20 (SCSI bus 1 send bad parity) = When this bit is set, a bad parity is sent to the SCSI bus 1 for diagnostic purposes. This bit is cleared on the RESET.

Bit 19 (DMAC channel 0 flush) = Same as bit 23 but for SCSI bus 0.

Bit 18 (SCSI bus 0 enable) = Same as bit 22 but for SCSI bus 0.

Bit 17 (SCSI bus 0 receive bad parity) = Same as bit 21 but for SCSI bus 0.

Bit 16 (SCSI bus 0 send bad parity) = Same as bit 20 but for SCSI bus 0.

Bit 15 (Address overlap inactive) = This bit is set or cleared by the software writing a '1' or '0' in the HASR bit 15 respectively. When this bit is set, address overlap is inactive. This bit is cleared on the RESET or after interrupt 15 to the HA CPU, so that just after the HA reset or memory fault, the address overlap is active and the system operates through EPROM.

Bit 14 (Mask interrupt level 11) = When this bit is set by the software, level 11 interrupt (information present in BIC message register) is selectively masked regardless of the IPL value of the PSW in the HA CPU. This bit functions similar to the bit 25 in the HASR.

Bit 13 (Mask interrupt level 13) = Same as bit 25 except the interrupt level is 13.

Bit 12 (DMAC channel 1 high priority) = This bit selects which SCSI bus has higher HA DMAC priority.

Bit 11 (Diagnostics passed) This bit is set or cleared by the software writing a ‘1’ or ‘0’, respectively, in the HASR bit 11. When this bit is set, it indicates that the diagnostics have passed. This bit is cleared on a RESET.

Bit 10 (Fault caused by diagnostics) = This bit is set or cleared by the software by writing ‘1’ or ‘0’, respectively, in the HASR bit 10. Diagnostics set this bit before initiating an error on the board to distinguish between an actual error and an error caused by the diagnostic test.

Bit 9 (Spare) = Spare bit.

Bit 8 (Diagnostics in progress) = This bit is set or cleared by the software writing a ‘1’ or ‘0’, respectively, in the HASR bit 8. When set, it indicates that the diagnostics are in progress.

Bit 7 (Force bad parity on byte 3) = When this bit is set, a bad parity is generated on byte 3 of HA SRAM during a write operation. This bit is set or cleared by the software by writing a ‘1’ or ‘0’, respectively, in the HASR bit 7. This bit is cleared on a RESET.
Bit 6 (Force bad parity on byte 2) = When this bit is set, in the HASR, a bad parity is generated on byte 2 of HA SRAM during the write operation. This bit is set or cleared by the software by writing a ‘1’ or ‘0’, respectively, in the HASR bit 6. This bit is cleared on a RESET.

Bit 5 (Force bad parity on byte 1) = When this bit is set, a bad parity is generated on byte 1 of HA SRAM during a write operation. This bit is set or cleared by the software by writing a ‘1’ or ‘0’, respectively, in the HASR bit 5. This bit is cleared on a RESET.

Bit 4 (Force bad parity on byte 0) = When this bit is set, a bad parity is forced on the byte 0 of the HA SRAM during a write operation. This bit is set or cleared by the software by writing a ‘1’ or ‘0’, respectively, in the HASR bit 4. This bit is cleared on a RESET.

Bit 3 (BIC access error) = This bit is set when the HA CPU or the HA DMAC tries to access the FIFO or BIC registers when the access is inhibited (the status bit “BIC - HA CPU interface enabled” in the BIC status register is not set). It also generates an interrupt (level 13) to the HA CPU if it is not masked.

Bit 2 (Parity error) = This bit is set by the parity checker/generator when the parity error is detected while reading the HA SRAM. This bit can also be set or cleared by the software. It is cleared on RESET. A level 15 interrupt is also generated when the parity error is detected on the read operation on the HA SRAM.

Bit 1 (Write protect violation) = This bit is set when the microbus master tries to write in to the write protected area of the HA SRAM. A level 15 interrupt is generated to the HA CPU when this bit is set. This bit can also be set or cleared by the software.

Bit 0 (Sanity failure) = This bit is set when the sanity timer times out. A non-maskable interrupt is generated when the sanity failure occurs. This bit can also be set or cleared by the software.

The HA central processing unit (CPU) can read this register a byte at a time and write to each bit individually with each bit having a unique address. The HA status register bits are also controlled by individual jam sets derived from asynchronous events on the HA board. All the bits are cleared on the "Power On" reset or the "HA Reset".

Bit 31 = Spare bit.

Bit 30 - (AM DMA transfer in progress) = This bit is set to '1' by HA software to indicate that a 3B21D DMA transfer is in progress.

Note: There are cases when AM DMA is in progress and the bit is not set.

Bit 29 = Spare bit.

Bit 28 = Spare bit.

Bit 27 = Spare bit.

Bit 26 = Spare bit.

Bit 25 [Mask (hide) SPC-B interrupt] = This bit is set to '1' by software to block interrupts from SPC-B. The output from this bit is used by the interrupt logic inside the FPGA.

Bit 24 [Mask (hide) SPC-A interrupt] = This bit is set to '1' by software to inhibit interrupts from SPC-A. The output from this bit is used by the interrupt logic inside the FPGA.

Bit 23 = Spare bit.

Bit 22 (Enable SCSI Bus-B drivers) = The SCSI bus drivers are enabled when this bit is set to '1' and disabled when this bit is '0' (that is, tri-stated).

Bit 21 = Spare bit.

Bit 20 = Spare bit.

Bit 19 = Spare bit.

Bit 18 (Enable SCSI Bus-A drivers) = The SCSI bus drivers are enabled when this bit is set to '1' and disabled when this bit is inactive '0' (that is, tri-stated).

Bit 17 = Spare bit.

Bit 16 [Mask (inhibit) setting the QUICC bus clear bit] = This bit is always set to '1' by HA software to prevent the HA CPU interrupt pending output from setting QUICC bus clear HASR bit.

Bit 15 (Write protect violation) = This bit is set to '1' by software when the bus master attempts to write into a protected area of SRAM.

Bit 14 [Mask (hide) message present interrupt level 4] = This bit is set to '1' by HA software to inhibit the BIC message interrupt. This masking is independent of the interrupt priority mask in the HA CPU's status register.

Bit 13 [Swap QUICC-1 and SPC interrupt levels (3/2 to 2/3)] = This bit is set to '1' by HA software to make the QUICC-1 interrupt a level 2 interrupt and the SPC interrupt a level 3 interrupt. When this bit is not set '0', the QUICC-1 interrupt is level 3 and the SPC interrupt is level 2.
Bit 12 (QUICC-0 IDMA has high priority than QUICC-1) = This bit is set to ‘1’ by HA software to give bus requests from the QUICC-0 IDMA channels higher priority than the request from the QUICC-1 IDMA channels. HA software can only change the state for this bit when the IDMAs are idle.

Bit 11 (Diagnostics passed) = This bit is set to ‘1’ by HA diagnostic software to indicate that diagnostics have passed.

Bit 10 (Fault caused by diagnostics) = This bit is set to ‘1’ by HA diagnostics software before it causes an error to distinguish between an operational error and an error caused by a diagnostic test.

Bit 9 (Enable EOT signal as interrupt source) = This bit is set to ‘1’ by HA software to enable the EOT signal as level 3 interrupt source in place of the AM read/write complete interrupt source from QUICC-1 timer 4. Note that software must disable the AM read/write complete interrupt as as separate operation. This bit is used in the interrupt logic inside the FPGA.

Bit 8 (Diagnostics in progress) = This bit is set to ‘1’ by HA diagnostic software to indicate when diagnostic execution is in progress.

Bit 7 [Force bad parity - microbus byte 3 (07-00)] = This bit is set to '1' by the HA diagnostic software to force bad parity onto the HA CPU data bus and write bad parity into the SRAM or BIC FIFO. This bit is not set by hardware.

Bit 6 [Force bad parity - microbus byte 2 (15-00)] = This bit is set to '1' by the HA diagnostic software to force bad parity onto the HA CPU data bus and write bad parity into the SRAM or BIC FIFO. This bit is not set by hardware.

Bit 5 [Force bad parity - microbus byte 1 (23-16)] = This bit is set to '1' by the HA diagnostic software to force bad parity onto the HA CPU data bus and write bad parity into the SRAM or BIC FIFO. This bit is not set by hardware.

Bit 4 [Forced bad parity - microbus byte 0 (31-24)] = This bit is set to '1' by the HA diagnostic software to force bad parity onto the HA CPU data bus and write bad parity into the SRAM or BIC FIFO. This bit is not set by hardware.

Bit 3 (BIC access error) = This bit is set to '1' using hardware when the bus master attempts to access the BIC FIFO when the access is inhibited. The output of this bit triggers a level 6 interrupt to the HA CPU.

Bit 2 (Parity error on SRAM) = This bit is set to '1' using hardware when a parity error is detected during an SRAM read. The output of this bit triggers a level 6 interrupt to the HA CPU.

Bit 1 (QUICC bus clear) = This bit is set to '1' using hardware by the interrupt pending output from the HA CPU. Can also be set to '1' and cleared '0' by HA software. The output from this register bit goes to the bus clear inputs of QUICC-0 and QUICC-1.

Bit 0 (Sanity failure) = This bit is set to '1' using hardware when the HA sanity timer times out.

c = HA software point issue number.
d = HA software EDI tens digit number.
e = HA software EDI units digit number.
f = HA software EDI character in American Standard Code for Information Interchange (ASCII).

Note: If all of the bits in the version structure layout are "1", the information is not obtainable.

For firmware version 7.1.0-04A, the values in the version number, issue number, and EDI fields must be identical to the values in the same fields in the pumpcode version in order for the firmware and pumpcode to be compatible.

For all other firmware versions, the values in the version number and issue number fields must be identical to the values in the same fields in the pumpcode version in order for the firmware and pumpcode to be compatible.
1. HOST ADAPTER SHADOW REGISTER APPENDIX

The host adapter (HA) shadow register provides information about the HA status at the time of the HA's last reset. All fields except the last field provide a snapshot of HA status immediately prior to the last HA reset. The last field provides a snapshot of HA status immediately after the last HA reset. The HA status register is known as the HASR.

HA shadow register layout:

abcd efgh i jkl mnop qqqq qqqq rrrr rrrr

1. EQUIPMENT FORM APPENDIX

Equipment form represents minimal operating level of replacement equipment.

Example of CODE/FORM contents:

<table>
<thead>
<tr>
<th>CODE</th>
<th>FORM</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>Inter-field delimiter if necessary.</td>
</tr>
<tr>
<td>A</td>
<td>Current minimal accepted equipment code.</td>
</tr>
<tr>
<td>B</td>
<td>Current production equipment code (substitutable equipment for code 'A').</td>
</tr>
<tr>
<td>C</td>
<td>Additional compatible equipment code(s) (added as space permits).</td>
</tr>
<tr>
<td>D</td>
<td>Current minimal approved operating level for equipment code 'A'.</td>
</tr>
<tr>
<td>E</td>
<td>Current minimal approved operating level for equipment code 'B'.</td>
</tr>
<tr>
<td>F</td>
<td>Current minimal approved operating level(s) for equipment code(s) 'C'.</td>
</tr>
</tbody>
</table>

Codes A, B, and C may independently represent apparatus code(s), microcode identifier(s) or text identifier(s) as applicable.

Forms D, E, and F may represent the series number for a corresponding apparatus code, or the issue level for a corresponding microcode identifier or text identifier(s) as applicable.
1. FIELD UPDATE ERROR CODES

1.1 Introduction

Field Update error messages are categorized into one of the following error types:

Internal = The error occurred due to incorrect processing within a Field Update process.

System = A system call (malloc(), realloc(), fork(), and so forth) failed.

Database = The process failed to access or update the Field Update database (/etc/bwm/fudb), the BWM database (/etc/bwm/bwmdb) or the system generation (SG) database.

Usage = The process was invoked with incorrect or missing arguments.

Coff = Common object file format errors were found.

Filesys = Errors occurred in file system functions (open(), close(), read(), lseek(), fopen(), and so forth).

A number may follow the error category as in, for example, "DATABASE ERROR -1". This error value is simply the value passed to exit() upon termination. It will always be non-zero to show the process's parent that an error has occurred.

The error category message is followed by additional information about the error and may contain Field Update error codes. Error messages of type "System" or "Filesys" sometimes contain their own error codes.

Error messages of type "Database" generally occur as a result of a function call which accesses or updates the Field Update database, the BWM database, or the SG database and are printed as "Field Update Database Errors" (FUBERRNO or ERRNO). They are described in the following exhibit.

Error messages specific to the Field Update DUFR process are described after the Field Update database errors.

1.2 Field Update Error Codes

ERROR CODE EXPLANATION

<table>

Copyright ©2003 Lucent Technologies
52 Incompatible database versions: %d versus %d
The correct version of the database is not being used.

53 BWM name (%s) does not match that of update (%s)
A mismatch between BWM names occurred.

54 %s cannot be made official before %s
The record the user is trying to make official is out of order.

55 For %s, expecting update record for %s
The process expects a record of the update.

56 Could not malloc space for reclaimable RIDs
The system call malloc() is failed.

57 Unexpected end of sequence for reclaimable loop
RECLAIM processing ended before it should.

58 UNABLE TO REFRESH
The call to lla library function lla_refresh() failed.

59 Could not attach to port for %s
The process failed to attach to the port it was supposed to. Most likely, another process (perhaps another instance of the same process) has already attached to it.

60 Inconsistent attaches to update databases
The process did not attach to the Field Update database correctly.

61 Basedir %s does not match record %s
There is a mismatch between the user's base directory and the record being updated.

62 Unknown status: %s
The state of the BWM is not known (examples of known states are PENDOFC, PENDBKOUT, and so forth).

63 Unknown type: %s
The type of the BWM is not known (examples of known types are FILER, FUNCR, BYTE, DMRT, ADMRT, and BOOTBOTH).

64 CANNOT ATTACH TO %s
The process failed to attach to the database.

65 CANNOT RELEASE %s
The process failed to release the database.

66 RID %x IS IN TOO MANY SETS (%d)
The return value from lla library function lla_numset() was greater than 3.

67 CANNOT Purge %s: STILL (HAS UNRECLAIMED UPDATES | TEMPORARY)
An attempt was made to purge a BWM which still has unreclaimed updates or is still in a temporary state.

68 UNKNOWN NAME FOR RID %x
The database does not have a name for the RID.

69 NO UPDATE PENDING
An attempt was made to omit a field update which wasn't in a pending state.

70 BWM PENDING
An attempt was made to omit a BWM which was in the pending reclaim state.

71 CANNOT CONDENSE RECLAIMED RECORDS FOR %s
The call to function condrecl() failed.

72 NO BWM PENDING
An attempt was made to omit a BWM which was not in a pending state (pending temp, pending bkout, or pending ofc).

73 UNKNOWN STATE (%d) FOR %s
The BWM was found to be in an unknown state in the database.

74 UNABLE TO PERM BWM RECORD FOR %s
In trying to omit the BWM, the perm_bwm() function failed.

1. INTERPRETING SWITCHING MODULE (SM), QUAD-LINK GATEWAY PROCESSOR (QGP), MESSAGE HANDLER (MH), AND COMMUNICATIONS MODULE PROCESSOR (CMP) EVENT LOGS

APPENDIX

Event histories are data dumps of the latest events for the switching module (SM), communications module processor (CMP), message handler (MH), and the quad-link gateway processor (QGP). SM event histories are printed on the receive-only printer (ROP) after selective initializations or full initializations of the SM, or when manually requested using the input command 'op:postmort,sm=a,event', where 'a' is the SM number. A limited SM event history dump is also printed when escalation of errors in the SM reaches the point where an initialization of the SM is triggered. CMP event histories are printed on the ROP after selective initializations or full initializations of the CMP, or when escalation of errors in the CMP reaches the point where an initialization is requested in order to recover. CMP event histories can also be manually requested using the input command 'op:postmort,cmp=0,prim/mate,event'. Event histories from the MH or QGP are printed on the ROP when escalation has occurred to the point where an initialization is requested to recover the unit.

This appendix describes how to read the event log and is partitioned into three sections. The first section describes the SM event log, the second describes the CMP event log, and the third describes the MH/QGP event logs.

1.1 Analyzing the SM event log

If the SM is an SM-2000, up to 544 events are printed in up to 34 message blocks, with each message block containing 16 events. If the SM is not an SM-2000, up to 240 events are printed in up to 15 message blocks, with each message block containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the SM have the format shown in the diagram below. The letters in the following list and table refer to the letters in this template.

1.1.1 Format

```
1.1.2 Explanation of Variables

= Report trigger. Valid value(s):
A = Automatically generated.
M = Manually requested.

= SM number.

= Type of dump. Valid value(s):
OFFLINE = If the dump is during a retrofit.
ONLINE = If the dump is during normal operation.
```
d = Sequence number of event history message, 1-34.

e = Event number of first event in the message.

The values of the \texttt{ffff}, \texttt{gggg}, and \texttt{hhhhhhh} fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the \texttt{jjjjjjj} field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the \texttt{ffff}, \texttt{gggg}, and \texttt{hhhhhhh} fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x1</td>
<td>Asserts.</td>
</tr>
</tbody>
</table>
| 0x2      | Manual action asserts. Valid value(s):
|          | \texttt{ffff} = Hexadecimal assert code found in the Asserts Manual.
|          | \texttt{gggg} = Hexadecimal process number (PN)
|          | \texttt{hhhhhhh} = Failing address |
| 0x3      | User requested single process purge. Valid value(s):
|          | \texttt{ffff} = Reason for purge request: typedef enum DMSI_REAS, hdr/db/DMsi_reas.h.
|          | \texttt{gggg} = Hexadecimal process number.
|          | \texttt{hhhhhhh} = Address in the function INtty_prge(). |
| 0x4      | Generic retrofit. |
|          | All fields are dependent on the actual use; fields may contain circuit indices or port names and addresses. They may also be used to provide more data for an assert which would use the previous event number. |
| 0x5      | MH error. Valid value(s):
|          | \texttt{ffff} = MH event number.
|          | \texttt{gggg} = MH number.
|          | \texttt{hhhhhhh} = Failing address. |
| 0x6      | MH failure. Valid value(s):
|          | \texttt{ffff} = xxyy, where:
|          | \texttt{xx} = Initialization type requested: typedef enum INMHTYPE, hdr/si/INmhvars.h.
|          | \texttt{yy} = Error code: typedef enum INMHSTAT, hdr/si/INmhvars.h.
|          | \texttt{gggg} = MH number.
|          | \texttt{hhhhhhh} = Failing address. |
| 0x7      | Processor fault. Valid value(s):
|          | \texttt{ffff} = Interrupt source: If the value of interrupt source is less than 450, typedef enum DMSMER_SRS, hdr/db/DMsmer_srs.h. Otherwise, typedef enum DMSI_REAS, hdr/db/DMsi_reas.h
|          | \texttt{gggg} = Hexadecimal process number.
|          | \texttt{hhhhhhh} = Failing address. |
| 0x8      | Peripheral fault. Valid value(s):
|          | \texttt{ffff} = Circuit name.
|          | \texttt{gggg} = Hexadecimal process number.
|          | \texttt{hhhhhhh} = xxyyzzzz, where:
|          | \texttt{xx} = Unit type: typedef enum DMUNITTYPE, hdr/db/DMunittype.h
|          | \texttt{yy} = Recovery action: typedef enum DMRCVYACT, hdr/db/DMrcvyact.h
|          | \texttt{zzzz} = Error type: typedef enum DMERRTYPE, hdr/db/DMerrtype.h
|          | Note: Before forwarding information related to peripheral fault recovery please execute the opaque message for each circuit ID according to the table “OP:CONV Commands For Peripheral Faults” at the end of this subsection, and also pass this information on to technical support. |
### 0x9 Segmented audit error. Valid value(s):

- **fff** = If the address in hhhhhhhh points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the address in hhhhhhhh points to AUfail(), this field contains an audit failure code: hdr/au/DMauf_code.h.
- **gggg** = Audit identifier: hdr/au/DMauid.h.
- **hhhhhhhh** = Address in the function AUaer() or AUfail().

### 0xa Directed audit error. Valid value(s):

- **fff** = If the address in hhhhhhhh points to AUdaud(), this field contains the process number that executed the directed audit. If the address in hhhhhhhh points to AUfail(), this field contains an audit failure code: hdr/au/DMauf_code.h.
- **gggg** = Audit identifier: hdr/au/DMauid.h.
- **hhhhhhhh** = Address in the function AUdaud() or AUfail().

### 0xc Single process purge requested by audits or by ASSERTC/D. Valid value(s):

- **fff** = wxxx, where:
  - *w* = Audit mode: hdr/au/AUem.h
  - *xxx* = Audit identifier: hdr/au/DMauid.h. (The value AUDCF is used for ASSERTC/D requests.)
- **gggg** = Process number being purged.
- **hhhhhhhh** = yyyyzzzz, where:
  - *yyyy* = Program ID of process being purged.
  - *zzzz* = Original event number that this additional information is related to.

### 0xd Hardware init error. Valid value(s):

- **fff** = 16-bit quantity, with the following breakdown:
  - Bits8-6 = SM init level.
  - Bits5-0 = Error type: typedef enum INHWERR, hdr/si/SIrpterr.h.

  The Init stage and SM init level fields are not specified for all error types.

  For Unit type SMAIU, SMRAIU, and SMXAIU, the value for Init stage is defined in typedef enum INIT_AIU, si/hdr/INit_aiu.h. For Unit type SMPSIU, the value for Init stage is defined in typedef enum INIT_PSIU, si/hdr/INit_com.h. For Unit type SMPLTU and SMDNU_S, the value for Init stage is defined in typedef enum INIT_PCT, si/hdr/INit_pct.h. For all other Unit types, the value for Init stage is defined in typedef INIT_CC, si/INit_pu/INit_cc.h.

- **gggg** = xxxyy, where:
  - *xx* = Unit type: typedef enum DMUNITTYPE, hdr/db/DMunittype.h.
  - *yy* = Unit number.
- **hhhhhhhh** = Unused or extra data unique to each error case.

### 0xe Miscellaneous error. Valid value(s):

- **fff** = Unused or extra data unique to each error case.
- **gggg** = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h.
- **hhhhhhhh** = Failing address.

### 0x10 Overload Control event. Valid value(s):

- **fff** = Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
- **gggg** = Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload status conditions are levels of real time overload:
0 = NORMAL
1 = MINOR
2 = MAJOR
3 = CRITICAL

Otherwise, the valid overload status conditions for all other resources are:
0 = NORMAL
1 = OVERLOAD

hhhhhhhh = Indicates the process where this Overload Control event was detected. If hhhhhhh = 1, then this Overload Control event was triggered in the SM Overload Control system process. If hhhhhhh = 2, then this Overload Control event was triggered directly from QLPS Fault Recovery (QLFR).

Otherwise, hhhhhhh = yyyyzzzz, where
yyyy = Associated event number of the Software Resource Exhaustion event type (0x11) that triggered the Overload Control event.
zzzz = Program ID of the process that triggered the Overload Control event.

0x11 Software Resource Exhaustion event. Valid value(s):
rrrr = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
gggg = Internal Overload Control level (OCmaxriar[]) for the resource.

hhhhhhhh = Process information for this Software Resource Exhaustion event. For example, the process (process number and program ID) that requested a resource when there were no idle resources available.

= yyyyzzzz, where
yyyy = The process number of the process that triggered the event.
zzzz = The program ID of the process that triggered the event.

i = Value of the hardware reset counter.
jjjjjjjj = This is a 28-bit quantity, broken down as follows:
bit 27 = SM MCTSI side that the event occurred on.
bits 21 - 26 = Seconds field of the time when the event occurred.
bits 16 - 20 = Indicates the format used for this event history entry. Possible values are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.
bits 11 - 15 = Day of the month when the event occurred.
bits 6 - 10  = Hours field of the time when the event occurred.
bits 0 - 5   = Minutes field of the time when the event occurred.

OP:CONV Commands for Peripheral Faults Table

<table>
<thead>

</tbody>
</table>

* Where xx is unit type associated with line unit (such as, SMLU, SMC1LU, SMLU3)
** Where yy is recovery action associated with removal (such as, SMPRRMV)
*** Where zzzz is error type associated with per call test failure (such as, SMHLEXTCUR, SMLUSCON, SMLU1XPC, SMLUCUTOFF, SMPRPCTO)
1.1.3 Examples

SM initialization example:

01c20001 004410f6 85677b1f
01c2 = The phase trigger reason is a program loop.
0001 = Process number.
004410f6 = Address where event occurred.
8 = Hardware level.
5677b1f = MCTSI side was 0.

Format for this event is ‘Processor fault’.
Event occurred on the 15th day of the month at 12:31 and 43 seconds.

Peripheral interrupt example:

a034000a 30170007 0ec88460
1429 = Logical circuit name.
000a = Process number.
30 = Integrated service line unit (ISLU).
17 = Pump of peripheral.
0007 = Software bad address.
0 = Hardware level.
ec88460 = MCTSI side was 1.

Format for this event is ‘Peripheral fault’.
Event occurred on the 16th day of the month at 17:32 and 54 seconds.

1.2 Analyzing the CMP event log

Up to 240 events can be stored in the CMP event log. These events are printed in up to 15 separate message blocks, each containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the CMP have the format shown in the diagram below. The letters in the following list refer to the letters in this template.

1.2.1 Format

a REPT EVENTHIST CMP=b,c,d DATA=ONLINE,e EVENT=f gggghhhh iiiiiiii jkkkkkkk
ggghhhhh iiiiiiii jkkkkkkk gggghhh iiiiiiii jkkkkkkk gggghhh iiiiiiii jkkkkkkk
ggghhhhh iiiiiiii jkkkkkkk gggghhh iiiiiiii jkkkkkkk gggghhh iiiiiiii jkkkkkkk
ggghhhhh iiiiiiii jkkkkkkk gggghhh iiiiiiii jkkkkkkk gggghhh iiiiiiii jkkkkkkk

1.2.2 Explanation of Variables

a = Report trigger. Valid value(s):
A = Automatically generated.
M = Manually requested.
= Messages switch side (MSGS).

= Physical CMP number.

= Processor being reported on. Valid value(s):
  PRIM = Primary CMP.
  MATE = Mate CMP.

= Sequence number of event history message (1-15).

= Event number of first event in the message.

The values of the gggg, hhhh, and iiiiiiiii fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the kkkkkkkk field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the gggg, hhhh, and iiiiiiiii fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x1</td>
<td>manual action asserts. Valid value(s):</td>
</tr>
<tr>
<td></td>
<td>gggg = Hexadecimal assert code found in the Asserts manual.</td>

<td>iiiiiiiii = Failing address</td>
</tr>
<tr>
<td>0x4</td>
<td>Directed audit error. Valid value(s):</td>
</tr>
<tr>
<td></td>
<td>gggg = If the address in iiiiiiiii points to AUaer(), this field contains the process ID that executed the directed audit. If the address in iiiiiiiii points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.</td>
</tr>
<tr>
<td></td>
<td>hhhh = Audit identifier: hdr/au/DMauid.h</td>
</tr>
<tr>
<td></td>
<td>iiiiiiiii = Address in the function AUdaud() or AUfail().</td>
</tr>
<tr>
<td>0x9</td>
<td>Overload Control event. Valid value(s):</td>
</tr>
<tr>
<td></td>
<td>gggg = Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.</td>
</tr>
<tr>
<td></td>
<td>hhhh = Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload status conditions are levels of real time overload:</td>
</tr>
<tr>
<td></td>
<td>0 = NORMAL</td>
</tr>
<tr>
<td></td>
<td>1 = MINOR</td>
</tr>
</tbody>
</table>
2 = MAJOR

Otherwise, the valid overload status conditions for all other resources are:
0 = NORMAL
1 = OVERLOAD

Indicates the process where this Overload Control event was detected. For the CMP, this value will always equal 1.

0x11 Software Resource Exhaustion event. Valid value(s):

gggg = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.

hhhh = Internal Overload Control level (OCmaxrrr[]) for the resource.

Process information for this Software Resource Exhaustion event. For example, the process (process number and program ID) that requested a resource when there were no idle resources available.

= yyyyzzzz, where

yyy = The process number of the process that triggered the event.
zzz = The program ID of the process that triggered the event.

j = Software initialization level: hdr/si/Slinlevs.h.

kkkkkkk = This is a 28-bit quantity, broken down as follows:

bit 27 = CMP active/standby status: ACTIVE (1) or STANDBY (0).
bits 21 - 26 = Seconds field of the time when the event occurred.
bits 16 - 20 = Indicates the format used for this event history entry. Possible values are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.
bits 11 - 15 = Day of the month when the event occurred.
bits 6 - 10 = Hours field of the time when the event occurred.
bits 0 - 5 = Minutes field of the time when the event occurred.

1.2.3 Examples

CMP manual action assert example:

5ea9ffff 0b06ada2 0802aaf7

5ea9 = Assert code (24233).
ffff = Process number.
0b06ada2 = Failing address.
0 = Software init level: return to point of interrupt.
802aaf7 = CMP status: ACTIVE(0).

Format for this event is 'manual action assert'.
Event occurred on the 21st day of the month at 11:55 and 00 seconds.

CMP fault example:

01c40009 0b06c592 1a479aa7

01c4 = Interrupt source (INAMREQ).
0009 = Process number.
0b06c592 = Failing address.
1 = Software init level: single process purge.
a479aa7 = CMP status: ACTIVE (1)

Format for this event is 'Peripheral fault'.

Copyright ©2003 Lucent Technologies
Event occurred on the 19th day of the month at 10:39 and 18 seconds.

1.3 Analyzing the MH/QGP event log

The MH/QGP can print up to 240 events in up to 15 separate message blocks. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

MH/QGP event histories have the format shown in the diagram below. The letters in the following list and following table refer to the letters in this template.

1.3.1 Format

a REPT EVENTHIST b=c-d e DATA=f g EVENT=h  iiiijjjj kkkkkkkk lmmnooop iiiijjjj kkkkkkkk lmmnooop
kkkkkkkk lmmnooop iiiijjjj kkkkkkkk lmmnooop iiiijjjj kkkkkkkk lmmnooop

1.3.2 Explanation of Variables

a = Report trigger. Valid value(s):
   A = Automatically generated.

b = Reporting processor. Valid value(s):
   MCTSI = Module controller/time slot interchange unit.
   QGP = Quad-link gateway processor.

c = SM number for processor MCTSI or for QGP it is the MSGS (message switch) side.

d = MCTSI side (0 or 1) or QGP number.

e = Reporting message handler identifier. Valid value(s):
   MH0 = Message handler 0.
   MH1 = Message handler 1.
   MH2 = Message handler 2.

f = Type of dump. Valid value(s):
   ONLINE = If dump is during normal operation

   g = Sequence number of event history message (1-4).

   h = Event number of first event in the message.

The values of the iiiii, jjjjj, and kkkkkkkk fields are dependent on the event format being used. The event format is indicated by bits 0-4 of the nn field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the iiiii, jjjjj, and kkkkkkkk fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| 0x1      | Asserts. Valid value(s):
          | iiiii = Hexadecimal assert code found in the Asserts Manual.
          | jjjjj = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
          | kkkkkkkk = Failing address. |
| 0x7      | Processor fault. Valid value(s): |

Copyright ©2003 Lucent Technologies
= Interrupt source: If the value of interrupt source is less than or equal to 5, typedef enum SIMQTRIG, hdr/si/SImqtrig.h. Otherwise, typedef enum PPERRTY, hdr/sim/PPerrty.h.

= Operational software job number: typedef enum SMRUNNING, hdr/sim/SMmgdefs.h

= Failing address.

0x9 = Segmented audit error. Valid value(s):

= If the address in points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the address in points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.

= Audit identifier: hdr/au/DMauid.h

= Address in the function AUaer or AUfail().

0xa = Directed audit error. Valid value(s):

= If the address in points to AUdaud(), this field contains the process id that executed the directed audit. If the address in points to AUfail(), this field contains an audit failure:

= Audit identifier: hdr/au/DMauid.h

= Address in the function AUaer or AUfail().

0xb = Processor initialization event. Valid value(s):

= The initialization type requested: hdr/sim/SMmhmbox.h

= Operational software job number: typedef enum SMRUNNING, hdr/sim/SMmgdefs.h

= Address in the MH/QGP initialization function.

0x10 = Overload Control event (QGP-only). Valid value(s):

= Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.

= Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload status conditions are levels of real time overload:

  0 = NORMAL
  1 = MINOR
  2 = MAJOR

  Otherwise, the valid overload status conditions for all other resources are:

  0 = NORMAL
  1 = OVERLOAD

= Indicates the process where this Overload Control event was detected. For QGPs, this value will always equal 1.

= Requested recovery level: hdr/si/SIinlevs.h

= For MH events, this field indicates the side of the SM MCTSI that the event occurred on. This is a 4-bit quantity - bit 3 indicates the MCTSI side, bits 0-2 are unused. For QGP events, this field is not used.

= This is an 8-bit quantity. Bits 5-7 are not used. Bits 0-4 indicate the format used for the event history entry. Possible values are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.

= Unused.

= Escalation trigger reason: typedef enum SIMQTRIG, hdr/si/SImqtrig.h.

1.3.3 Examples

MH/QGP initialization example:

80000002 000172ea 000b0000
8000 = The initialization trigger reason is a full initialization.
0002 = Operational software job which was running at time of initialization.
000172ea = Address where event occurred.
0 = Recovery level unused for initialization event.
0 = For MH events, MCTSI side was 0. Not used for QGP.
0b = Format for this event is 'Processor initialization'.
000 = Fill bits.
0 = Phase trigger reason (unused for initialization event).

Fault example:
01060002 00043000 58070002
0106 = Fault code (which is MMU write protect error for this example).
0002 = Operational software job communications package.
00043000 = Address where event occurred.
5 = Recovery level requested - full initialization.
8 = For MH events, MCTSI side was 1. Not used for QGP.
07 = Format for this event is 'Processor fault'.
000 = Fill bits.
2 = Phase trigger reason - excessive processor faults.

1.4 Analyzing the PSUPH event log

For the PSUPH, up to 80 events are printed in up to 6 message blocks, with each message block containing 14 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the PSUPH have the format shown in the diagram below. The letters in the following list and table refer to the letters in this template.

1.4.1 Format

```
a  REPT PP EVENTHIST PSUPH=b-c-d-e [CHNG=b-c-d-f] EVENT=g      BLOCK-NO=h
MESSAGE-NO=i      jjjjkkkk llllllll mmmmmmmm jjjjkkkk llllllll mmmmmmmm jjjjkkkk llllllll mmmmmmmm

llllllll mmmmmmmm jjjjkkkk llllllll mmmmmmmm jjjjkkkk llllllll mmmmmmmm jjjjkkkk llllllll mmmmmmmm
llllllll mmmmmmmm jjjjkkkk llllllll mmmmmmmm jjjjkkkk llllllll mmmmmmmm jjjjkkkk llllllll mmmmmmmm
```

1.4.2 Explanation of Variables

- **a** = Report trigger. Valid value(s):
  - A = Automatically generated.
  - M = Manually requested.

- **b** = SM number.
- **c** = Packet switching unit (PSU) number.
- **d** = PSU shelf number.
- **e** = Physical protocol handler (PH) slot number.
- **f** = Channel group (CHNG) number.
- **g** = Number of first event for which data is dumped in this message.
- **h** = Number of this data block in the sequence of data blocks needed to dump the entire PH event history.
The values of the \texttt{jjjj}, \texttt{kkkk}, and \texttt{llllllll} fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the \texttt{mmmmmm} field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the \texttt{jjjj}, \texttt{kkkk}, and \texttt{llllllll} fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>

</thead>
<tbody>
<tr>
<td>0x1</td>
<td>Asserts.</td>
</tr>
</tbody>
</table>
| 0x2      | manual action asserts. Valid value(s):  
|          | \texttt{jjjj} = Hexadecimal assert code found in the Asserts Manual.  
|          | \texttt{kkkk} = Hexadecimal process number (PN)  
|          | \texttt{llllllll} = Failing address |
| 0x3      | Intentional single process purge. Valid value(s):  
|          | \texttt{ffff} = Reason for purge request: typedef enum INSPPREASON, hdr/si/SIrpterr.h.  
|          | \texttt{gggg} = Hexadecimal process number purged.  
|          | \texttt{hhhhhhhh} = Address in the function Slmd_m_spp(). |
| 0x7      | Processor fault. Valid value(s):  
|          | \texttt{jjjj} = Interrupt source: typedef enum PPERRTY, hdr/smim/PPerty.h.  
|          | \texttt{kkkk} = Hexadecimal process number.  
|          | \texttt{llllllll} = Failing address. |
| 0x9      | Segmented audit error. Valid value(s):  
|          | \texttt{jjjj} = If the address in \texttt{llllllll} points to \texttt{AUaer}(), this field contains an audit error: hdr/au/DMauerc.h. If the address in \texttt{llllllll} points to \texttt{AUfail}(), this field contains an audit failure code: hdr/au/DMauf_code.h.  
|          | \texttt{kkkk} = Audit identifier: hdr/au/DMauid.h.  
|          | \texttt{llllllll} = Address in the function \texttt{AUaer}() or \texttt{AUfail}(). |
| 0xa      | Directed audit error. Valid value(s):  
|          | \texttt{jjjj} = If the address in \texttt{llllllll} points to \texttt{AUdaud}(), this field contains the process number that executed the directed audit. If the address in \texttt{llllllll} points to \texttt{AUfail}(), this field contains an audit failure code: hdr/au/DMauf_code.h.  
|          | \texttt{kkkk} = Audit identifier: hdr/au/DMauid.h  
|          | \texttt{llllllll} = Address in the function \texttt{AUdaud}() or \texttt{AUfail}(). |
| 0xb      | Processor initialization event. Valid value(s):  
|          | \texttt{jjjj} = xxyy, where  
|          | \texttt{xx} = Initialization level requested: typedef enum SIPPINIT, hdr/si/Sippinit.h.  
|          | If the initialization level requested is INOPERSI, then  
|          | \texttt{yy} = Selective initialization type:  
|          | 0x52 = Data preserving.  
|          | 0x00 = Non-data preserving. |
|          | Otherwise,  
|          | \texttt{yy} = Image type: typedef enum SMPHIMGTY, hdr/smim/SMphtype.h. |
|          | \texttt{kkkk} = Additional information. If the initialization level requested is INOPERSI, then \texttt{kkkk} contains the process number of the running process. Otherwise, \texttt{kkkk} = zzaa, where  
|          | \texttt{zz} = Debug flag. |
aa = Debug stage: typedef enum INPHSTAGE, si/hdr/INphdebug.h.

llllllll = Address in the PSUPH initialization function.

0xe Miscellaneous error. Valid value(s):
jjjj = Unused or extra data unique to each error case.
kkkk = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h
llllllll = Failing address.

0xf Processor pre-initialization event. Valid value(s):
jjjj = xxyy, where
xx = Old initialization level: typedef enum SIPPINIT, hdr/si/SIppinit.h.
yy = Old image type: typedef enum SMPHIMGTYP, hdr/smim/SMphtype.h.
kkkk = zzzaa, where
zz = Debug flag.
aa = Debug stage: typedef enum INPHSTAGE, si/hdr/INphdebug.h.
llllllll = Address in the PSUPH initialization function.

0x10 Overload Control event. Valid value(s):
jjjj = Resource(s) in overload: typedef struct OCPPSTAT, hdr/si/OCovlvl.h. A bit set in bits 0-5 indicates that the following resource(s) are in overload:
  bit0 = PHGPBD.
  bit1 = PHSTFD.
  bit2 = PHSRFD.
  bit3 = PHLRFD.
  bit4 = PHCELL.
  bit5 = PHRT.
kkkk = Overload status condition:
  0 = NORM
  1 = MIN
  2 = MAJ
  3 = CRIT
llllllll = Indicates the process where this Overload Control event was detected. For PSUPH, this value will always be 1.

0x11 Software Resource Exhaustion event. Valid value(s):
jjjj = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
kkkk = Unused.
llllllll = Process information for this Software Resource Exhaustion event. For example, the process number (and its program ID) that requested a resource when there were no idle resources available.
  = yyyyzzzz, where
  yyyy = The process number of the process that triggered the event, or 0xffff if interject was running when the event was triggered.
  zzzz = The program ID of the process that triggered the event. If the event was triggered during interject processing (i.e., yyyy = 0xffff), then zzzz indicates the interject task that was running: typedef enum OSIJSTATE, hdr/os/OSinjenv.h.

MMMMMMMM = This is a 32-bit quantity, broken down as follows:
bits29-31 = PSUPH initialization level at the time of the event: typedef enum SIPPINIT, hdr/si/SIppinit.h.
bit28 = Active packet bus (0 or 1).
bit27 = Side selected in PSUPH (0 or 1).
bit26 = Indicates if PSUPH is out-of-service.
bit25 = Indicates if PSUPH is assigned as spare.
bits21-24 = Indicates channel group on shelf
bits16-20 = Indicates the format used for this event history entry: typedef enum INEVNTFORM, hdr/si/Slrpterr.h. Also, refer to the table above.
bits11-15 = Day of the month when the event occurred.
bits6-10 = Hours field of the time when the event occurred.
bits0-5 = Minutes field of the time when the event occurred.

1.4.3 Examples

PSUPH initialization example:

01520000 0bc19f1a 21cb72ea
01 = Init level specified (INOPERSI).
52 = Init type: data preserving selective init.
0000 = Process number.
0bc19f1a = Address where event occurred.
21cb72ea = Init Level On Entry = 1 (INOPERSI)
Active packet bus = 0
Side selected in PSUPH = 0
OOS = 0
Standby = 0
Channel group on shelf = 14
Format for this event is 'Processor initialization'.
Event occurred on the 14th day of the month at 11:42

Processor fault example:

00ce0000 0bc157a4 81c772ea
00ce = Interrupt source.
0000 = Process number.
0bc157a4 = Failing address.
81c772ea = Init Level On Entry = 4 (INNORMAL)
Active packet bus = 0
Side selected in PSUPH = 0
OOS = 0
Standby = 0
Channel group on shelf = 14
Format for this event is 'Processor fault'.
Event occurred on the 14th day of the month at 11:42

1.5 Analyzing the PI2 event log

For the PI2, up to 80 events are printed in up to 6 message blocks, with each message block containing 14 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the PI2 have the format shown in the diagram below. The letters in the following list and table
refer to the letters in this template.

1.5.1 Format

a REPT PP EVENTHIST MCTSI=b-c PI EVENT=d BLOCK-NO=e MESSAGE-NO=f gggghhhh
iiiiiiii jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj gggghhhh
iiiiiiii jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj gggghhhh
iiiiiiii jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj gggghhhh
iiiiiiii jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj gggghhhh
iiiiiiii jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj gggghhhh

1.5.2 Explanation of Variables

a = Report trigger. Valid value(s):
   A = Automatically generated.
   M = Manually requested.
   b = SM number.
   c = MCTSI side (0 or 1)
   d = Number of first event for which data is dumped in this message.
   e = Number of this data block in the sequence of data blocks needed to dump the entire PI2 event history.
   f = Number of this message in the sequence of all output messages generated by this PI2.

The values of the gggg, hhhh, and iiiiiiiii fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the jjjjjjjj field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the gggg, hhhh, and iiiiiiiii fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x1</td>
<td>Asserts.</td>
</tr>
</tbody>
</table>
| 0x2      | Manual action asserts. Valid value(s):  
            gggg = Hexadecimal assert code found in the Asserts Manual.  
            hhhh = Hexadecimal process number (PN)  
            iiiiiiiii = Failing address. |
| 0x7      | Processor fault. Valid value(s):  
            gggg = Interrupt source: typedef enum PPERRTY, hdr/smim/PPerrty.h.  
            hhhh = Hexadecimal process number.  
            iiiiiiiii = Failing address. |
| 0x9      | Segmented audit error. Valid value(s):  
            gggg = If the address in iiiiiiiii points to AUaer(), this field contains an audit error:  
            hdr/au/DAuer(). If the address in iiiiiiiii to AUfail(), this field contains an audit failure code:  
            hdr/au/DMauf_code.h.  
            hhhh = Audit identifier:  
            hdr/au/DMauid.h.  
            iiiiiiiii = Address in the function AUaer() or AUfail(). |
| 0xa      | Directed audit error. Valid value(s):  
            gggg = If the address in iiiiiiiii points to AUdaud(), this field contains the process number that executed the directed audit. If the address in iiiiiiiii to AUfail(), this field contains an audit failure code:  
            hdr/au/DMauf_code.h.  
            hhhh = Audit identifier:  
            hdr/au/DMauid.h  
            iiiiiiiii = Address in the function AUdaud() or AUfail(). |
| 0xb      | Processor initialization event. Valid value(s): |
### 0xe Miscellaneous error. Valid value(s):

- **gggg** = Unused or extra data unique to each error case.
- **hhhh** = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h
- **iiiiiiii** = Failing address.

### Overload Control event. Valid value(s):

- **gggg** = Resource(s) in overload: typedef struct OCPISTAT, hdr/si/OCovlvl.h. A bit set in bits 0-5 indicates that the following resource(s) are in overload:
  - bit0 = Unused.
  - bit1 = PIGPBD.
  - bit2 = PILRFD.
  - bit3 = PIFIFO.
  - bits4-5 = PIRT.
- **hhhh** = Overload status condition:
  - 0 = NORM
  - 1 = MIN
  - 2 = MAJ
  - 3 = CRIT
- **iiiiiiii** = Indicates the process where this Overload Control event was detected. For PI2, this value will always be 1.

### Software Resource Exhaustion event. Valid value(s):

- **gggg** = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
- **hhhh** = Unused.
- **iiiiiiii** = Process information for this Software Resource Exhaustion event. For example, the process number (and its program ID) that requested a resource when there were no idle resources available.
  
  = yyyyzzzz, where
  - yyyy = The process number of the process that triggered the event, or 0xffff if interject was running when the event was triggered.
  - zzzz = The program ID of the process that triggered the event. If the event was triggered during interject processing (i.e., yyyy = 0xffff), then zzzz indicates the interject task that was running: typedef enum OSIJSTATE, hdr/os/OSinjenv.h.

### This is a 32-bit quantity, broken down as follows:

- **bits29-31** = PI2 initialization level at the time of the event: typedef enum SIPPINIT, hdr/si/SIppinit.h.
- **bit28** = Active packet bus (0 or 1).
- **bits25-27** = Unused
- **bits21-24** = Active/Standby status: ACT (1) or STBY (0)
- **bits16-20** = Indicates the format used for this event history entry: typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.
- **bits11-15** = Day of the month when the event occurred.
- **bits6-10** = Hours field of the time when the event occurred.
- **bits0-5** = Minutes field of the time when the event occurred.
1.5.3 Examples

PI2 initialization example:

00020000 18016bd2 002bffff
00 = Init level specified (INUNSPEC).
02 = Init type.
18016bd2 = Address where event occurred.
002bffff = Init Level On Entry = 0 (INUNSPEC)
Active packet bus = 0
Active/Standby = 1 (ACT)
Format for this event is 'Processor initialization'.
Time event occurred is invalid.

Application: 5
Type: Output

1. INTERPRETING SWITCHING MODULE (SM), QUAD-LINK GATEWAY PROCESSOR (QGP), MESSAGE HANDLER (MH), AND COMMUNICATIONS MODULE PROCESSOR (CMP) EVENT LOGS

APPENDIX

Event histories are data dumps of the latest events for the switching module (SM), communications module processor (CMP), message handler (MH), quad-link gateway processor (QGP), the packet switch unit protocol handler (PSUPH), and the packet interface 2 (PI2). SM event histories are printed on the ROP after selective initializations or full initializations of the SM, or when manually requested using the input command

'op:postmort,sm=a,event', where 'a' is the SM number. A limited SM event history dump is also printed when escalation of errors in the SM reaches the point where an initialization of the SM is triggered. CMP event histories are printed on the ROP after selective initializations or full initializations of the CMP, or when escalation of errors in the CMP reaches the point where an initialization is requested in order to recover. CMP event histories can also be manually requested using the input command 'op:postmort,cmp=0,prim/mate,event'. Event histories from the MH or QGP are printed on the ROP when escalation has occurred to the point where an initialization is requested to recover the unit. A limited PSUPH or PI2 event history dump is printed on the ROP after unexpected Packet Services subsystem initializations, selective initializations, or full initializations of the PSUPH or PI2. A full PSUPH event history dump is printed when manually requested using the input command 'op:history,psuph=a-b-c-d,event', where 'a' is the SM number, 'b' is the PSU unit number (always 0), 'c' is the PSU shelf number, and 'd' is the physical protocol handler (PH) slot number. A full PI2 event history dump is printed when manually requested using the input command 'op:history,mctsi=a-b,pi,event', where 'a' is the SM number, and 'b' is the MCTSI side number.

This appendix describes how to read the event log and is partitioned into specific sections:

- SM event log
- CMP event log
- MH event log
- QGP event log
- PSUPH event log
- PI2 event log

1.1 Analyzing the SM event log

Up to 544 events are printed in up to 34 message blocks, with each message block containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the SM have the format shown in the diagram below. The letters in the following list and table refer to the letters in this template.

1.2 Format

```
a  REPT EVENTHIST SM=b DATA=c,d EVENT=e
   fffgggg hhhhhhh hjjjjjjjj fffgggg hhhhhhh hjjjjjjjj
   fffgggg hhhhhhh hjjjjjjjj fffgggg hhhhhhh hjjjjjjjj
   fffgggg hhhhhhh hjjjjjjjj fffgggg hhhhhhh hjjjjjjjj
   fffgggg hhhhhhh hjjjjjjjj fffgggg hhhhhhh hjjjjjjjj
   fffgggg hhhhhhh hjjjjjjjj fffgggg hhhhhhh hjjjjjjjj
```
# 1.3 Explanation of Variables

**a**  
= Report trigger. Valid value(s):
A  = Automatically generated.
M  = Manually requested.

**b**  
= SM number.

**c**  
= Type of dump. Valid value(s):
OFFLINE  = If the dump is during a retrofit.
ONLINE  = If the dump is during normal operation.

**d**  
= Sequence number of event history message, 1-34.

**e**  
= Event number of first event in the message.

The values of the `ffff`, `gggg`, and `hhhhhhhh` fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the `jjjjjjj` field. The values used in the event format field are defined in `typedef enum INEVNTFORM`, `hdr/si/SIrpterr.h`. The following table shows how the `ffff`, `gggg`, and `hhhhhhhh` fields are populated for each of those event format types.

<table>
<thead>
<tr>

<tr>
<td>zzzz</td>
<td>Original event number that this additional information is related to.</td>
</tr>
</tbody>
</table>

0xd  Hardware init error. Valid value(s):

<table>
<thead>
<tr>
<th>ffff</th>
<th>16-bit quantity, with the following breakdown:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits 8 - 6</td>
<td>SM init level.</td>
</tr>
<tr>
<td>Bits 5 - 0</td>
<td>Error type: typedef enum INHWERR, hdr/si/SIrpterr.h.</td>
</tr>
</tbody>
</table>

The Init stage and SM init level fields are not specified for all error types.

For Unit type SMAIU, SMRAIU, and SMXAIU, the value for Init stage is defined in typedef enum INIT_AIU, si/hdr/INIt_aiu.h. For Unit type SMPSIU, the value for Init stage is defined in typedef enum INIT_PSIU, si/hdr/INIt_com.h. For Unit type SMPLTU and SMDNU_S, the value for Init stage is defined in typedef enum INIT_PCT, si/hdr/INIt_pct.h.

For all other Unit types, the value for Init stage is defined in typedef INIT_CC, si/INItPu/INIt_cc.h.
**0xe** Miscellaneous error. Valid value(s):
- **ff** = Unused or extra data unique to each error case.
- **gg** = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/Slrpterr.h

**0x10** Overload control event. Valid value(s):
- **ff** = Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
- **gg** = Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload status conditions are levels of real time overload:
  - 0 = NORMAL
  - 1 = MINOR
  - 2 = MAJOR
  - 3 = CRITICAL

Otherwise, the valid overload status conditions for all other resources are:
  - 0 = NORMAL
  - 1 = OVERLOAD

- **hh** = Indicates the process where this overload control event was detected. If **hh** = 1, then this overload control event was triggered in the SM overload control system process. If **hh** = 2, then this overload control event was triggered directly from QLPS fault recovery (QLFR).

Otherwise, **hh** = yyyyzzzz, where
  - yyyy = Associated event number of the software resource exhaustion event type (0x11) that triggered the overload control event.
  - zzzz = Program ID of the process that triggered the overload control event.

**0x11** Software resource exhaustion event. Valid value(s):
- **ff** = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
- **gg** = Internal overload control level (OCmaxiar[]) for the resource.
- **hh** = Process information for this software resource exhaustion event. For example, the process (process number and program ID) that requested a resource when there were no idle resources available.

= yyyyzzzz, where
  - yyyy = The process number of the process that triggered the event.
  - zzzz = The program ID of the process that triggered the event.

**0x16** Critical circuit failure and recovery event. Valid value(s):
- **ff** = Circuit name.
- **gg** = xxyy, where:
  - **xx** = Circuit base state: typedef enum DMMRASTATE, hdr/db/DMmrastate.h.
  - **yy** = Circuit base state second qualifier: typedef enum DMMRASTATE, hdr/db/DMmrastate.h.

- **hh** = 32-bit quantity.

If the request type, bit 31, is set (1), the request type is fast unit reconfiguration/fault recovery and the following breakdown applies:
Bits 30 - 23 = Unused.
Bits 22 - 16 = High-level error type: typedef enum DMREPTERR, hdr/db/DMrepterr.h.
Bits 15 - 10 = Recovery action: typedef enum DMRCVYACT, hdr/db/DMrcvyact.h.
Bits 9 - 0 = Low-level error type: typedef enum DMERRTYPE, hdr/db/DMerrtype.h.

If the request type, bit 31, is not set (0), the request type is maintenance request administrator, and the following breakdown applies:
Bits 30 - 25 = Queue reason: typedef enum SMQREASN, hdr/smim/SMq2mra.h.
Bits 24 - 15 = Requested circuit type: typedef enum DMCKTTYPE, hdr/db/DMckttype.h.
Bit 14 = DNU-S RSW auto-recovered: typedef enum DMBOOL, hdr/db/DMbool.h.
Bit 13 = DNU-S CD control switch: typedef enum DMBOOL, hdr/db/DMbool.h.
Bit 12 = Restore priority: typedef enum DMMRAPRIOR, hr/db/DMmrarior.h.
Bit 11 = Request priority: typedef enum DMMRAPRIOR, hr/db/DMmrarior.h.
Bits 10 - 5 = Requested state: typedef enum DMMRASTAT, hdr/db/DMmrastat.h.
Bits 4 - 0 = Requested action: typedef enum DMMRAVERB, hdr/db/DMmraver.h.

\[i\] = Value of the hardware reset counter.
\[jjjjjjjj\] = This is a 28-bit quantity, broken down as follows:
\[\text{bit 27}\] = SM MCTSI side that the event occurred on.
\[\text{bits 21 - 26}\] = Seconds field of the time when the event occurred.
\[\text{bits 16 - 20}\] = Indicates the format used for this event history entry. Possible values are defined in typedef enum IENVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.
\[\text{bits 11 - 15}\] = Day of the month when the event occurred.
\[\text{bits 6 - 10}\] = Hours field of the time when the event occurred.
\[\text{bits 0 - 5}\] = Minutes field of the time when the event occurred.

**OP:CONV Commands for Peripheral Faults Table**

<table>
<thead>
<tr>
<th>Unit Type</th>
<th>Recovery Action</th>
<th>Error Type</th>
<th>Message(s)</th>
</tr>
</thead>

</tbody>
</table>

* Where xx is unit type associated with line unit (such as, SMLU, SMC1LU, SMLU3)
** Where yy is recovery action associated with removal (such as, SMPRRMV)
*** Where zzzz is error type associated with per call test failure (such as, SMHLEXTCUR, SMLUSCON, SMLU1XPC, SMLUCUTOFF, SMPRPCTO)

**1.4 Examples**

SM initialization example:

01c20001 004410f6 85677b1f
01c2 = The phase trigger reason is a program loop.
0001 = Process number.
004410f6 = Address where event occurred.
8 = Hardware level.
5677b1f = MCTSI side was 0.

Format for this event is 'processor fault'.
Event occurred on the 15th day of the month at 12:31 and 43 seconds.

Peripheral interrupt example:

```
a034000a 30170007 0ec88460
1429 = Logical circuit name.
000a = Process number.
30 = Integrated service line unit (ISLU).
17 = Pump of peripheral.
0007 = Software bad address.
0 = Hardware level.
ec88460 = MCTSI side was 1.
```

Format for this event is 'peripheral fault'.
Event occurred on the 16th day of the month at 17:32 and 54 seconds.

2. Analyzing the CMP event log

Up to 240 events can be stored in the CMP event log. These events are printed in up to 15 separate message blocks, each containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the CMP have the format shown in the diagram below. The letters in the following list refer to the letters in this template.

2.1 Format

```
a REPT EVENTHIST CMP=b,c d DATA=ONLINE,e EVENT=f
gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk

gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk
gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk
gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk
```

2.2 Explanation of Variables

a = Report trigger. Valid value(s):
  A = Automatically generated.
  M = Manually requested.

b = Messages switch side (MSGS).

= Physical CMP number.

c = Processor being reported on. Valid value(s):
  PRIM = Primary CMP.
  MATE = Mate CMP.

= Sequence number of event history message (1-15).

= Event number of first event in the message.

The values of the gggg, hhhh, and iiiiiiiii fields are dependent on the event format being used.
The event format is indicated by bits 16-20 of the field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the $gggg$, $hhhh$, and $iiiiiiii$ fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x1</td>
<td>Asserts</td>
</tr>
</tbody>
</table>
| 0x2      | manual action asserts. Valid value(s):  
$gggg$ = Hexadecimal assert code found in the Asserts Manual.  
$hhhh$ = Hexadecimal process number (PN).  
$iiiiiiii$ = Failing address |
| 0x3      | User requested single process purge. Valid value(s):  
$gggg$ = Reason for purge request: typedef enum DMSI_REAS, hdr/db/DMsi_reas.h.  
$hhhh$ = Hexadecimal process number.  
$iiiiiiii$ = Address in the function INtty_spp(). |
| 0x4      | Generic retrofit. |
| 0x7      | Processor fault. Valid value(s):  
$gggg$ = Interrupt source: If the value of interrupt source is less than 450, typedef enum PPERRTY, hdr/smim/PPerrty.h. Otherwise, typedef enum SICMPTRIG, hdr/si/Sicmtrig.h.  
$hhhh$ = Hexadecimal process number.  
$iiiiiiii$ = Failing address. |
| 0x9      | Segmented audit error. Valid value(s):  
$gggg$ = If the address in $iiiiiiii$ points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the address in $iiiiiiii$ points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.  
$hhhh$ = Audit identifier: hdr/au/DMauid.h  
$iiiiiiii$ = Address in the function AUaer() or AUfail(). |
| 0xa      | Directed audit error. Valid value(s):  
$gggg$ = If the address in $iiiiiiii$ points to AUdaud(), this field contains the process ID that executed the directed audit. If the address in $iiiiiiii$ points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.  
$hhhh$ = Audit identifier: hdr/au/DMauid.h  
$iiiiiiii$ = Address in the function AUdaud() or AUfail(). |
| 0xe      | Miscellaneous error. Valid value(s):  
$ffffff$ = Unused or extra data unique to each error case.  
$gggg$ = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h  
$hhhhhhhh$ = Failing address. |
| 0x10     | Overload control event. Valid value(s):  
$gggg$ = Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.  
$hhhh$ = Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload status conditions are levels of real time overload:  
0 = NORMAL  
1 = MINOR  
2 = MAJOR  

Otherwise, the valid overload status conditions for all other resources are:  
0 = NORMAL  
1 = OVERLOAD |
### 0x11

Software resource exhaustion event. Valid value(s):

<table>
<thead>
<tr>
<th>gggg</th>
<th>Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.</th>
</tr>
</thead>
<tbody>
<tr>
<td>hhhh</td>
<td>Internal overload control level (OCmaxrrr[]) for the resource.</td>
</tr>
</tbody>
</table>

**i** = Process information for this software resource exhaustion event. For example, the process (process number and program ID) that requested a resource when there were no idle resources available.

\[ \text{yyyyzzzz, where} \]

<table>
<thead>
<tr>
<th>yyyy</th>
<th>The process number of the process that triggered the event.</th>
</tr>
</thead>
<tbody>
<tr>
<td>zzzz</td>
<td>The program ID of the process that triggered the event.</td>
</tr>
</tbody>
</table>

---

### 2.3 Examples

**CMP manual action assert example:**

\[ 5ea9ffff 0b06ada2 0802aaf7 \]

- 5ea9 = Assert code (24233).
- ffff = Process number.
- 0b06ada2 = Failing address.
- 0 = Software init level: return to point of interrupt.
- 0802aaf7 = CMP status: ACTIVE (0).

Format for this event is 'manual action assert'.
Event occurred on the 21st day of the month at 11:55 and 00 seconds.

**CMP fault example:**

\[ 01c40009 0b06c592 1a479aa7 \]

- 01c4 = Interrupt source (INAMREQ).
- 0009 = Process number.
- 0b06c592 = Failing address.
- 1 = Software init level: single process purge.
- 1a479aa7 = CMP status: ACTIVE (1)

Format for this event is 'Peripheral fault'.
Event occurred on the 19th day of the month at 10:39 and 18 seconds.

---

### 3. Analyzing the MH event log
Up to 240 events can be stored in the MH event log. These events are printed in up to 15 separate message blocks, each containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

MH event histories have the format shown in the diagram below. The letters in the following list and following table refer to the letters in this template.

### 3.1 Format

a REPT EVENTHIST MCTSI=b-c d DATA=e,f EVENT=g

```
hhhhiiii jjjjjjjj jjj j klllllll hhhhi j j k kllllll
hhhhiiii jjjjjjjj jjj j klllllll hhhhi j j k kllllll
hhhiiiii jjjjjjjj jjj j klllllll hhhhi j j k kllllll
hhhiiiii jjjjjjjj jjj j klllllll hhhhi j j k kllllll
hhhiiiii jjjjjjjj jjj j klllllll hhhhi j j k kllllll
hhhiiiii jjjjjjjj jjj j klllllll hhhhi j j k kllllll
hhhiiiii jjjjjjjj jjj j klllllll hhhhi j j k kllllll
```

### 3.2 Explanation of Variables

- **a** = Report trigger. Valid value(s):
  - A = Automatically generated.

- **b** = SM number.

- **c** = MCTSI (module controller/time slot interchange unit) side (0 or 1).

- **d** = Reporting message handler identifier. Valid value(s):
  - MH0 = Message handler 0.
  - MH1 = Message handler 1.
  - MH2 = Message handler 2.

- **e** = Type of dump. Valid value(s):
  - ONLINE = If dump is during normal operation

- **f** = Sequence number of event history message (1-15).

- **g** = Event number of first event in the message.

The values of the hhhhi, iiii, and jjjjjjjjjjjj fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the klllllll field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the hhhhi, iiii, and jjjjjjjjjjjj fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| 0x1      | Asserts. Valid value(s):
  - hhhh = Hexadecimal assert code found in the Asserts Manual.
  - iiii = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
  - jjjjjjjjj = Failing address. |
| 0x7      | Processor fault. Valid value(s):
  - hhhh = Interrupt source: If the value of interrupt source is less than or equal to 5, typedef enum SIMQTRIG, hdr/si/SImqtrig.h. Otherwise, typedef enum PPERRTY, hdr/smim/PPerrty.h.
  - iiii = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
  - jjjjjjjjj = Failing address. |
### 3.3 Examples

**Initialization example:**

```
40000002 00064046 0c0b9060
```

**0000** = The initialization trigger reason is a full initialization.

**0002** = Operational software job which was running at time of initialization.

**00064046** = Address where event occurred.

**0** = Recovery level (unused for initialization event).

**c0b9060** = MCTSI side 1

Format for this event is 'processor initialization'.

Event occurred on an Odd day of the month at 04:06 and 32 seconds.

Escalation trigger reason (unused for initialization event).

**Fault example:**

```
01060002 00043000 58c72a02
```

**0106** = Fault code (which is MMU write protect error for this example).

**0002** = Operational software job communications package.

**00043000** = Address where event occurred.
= Recovery level requested - full initialization.
8c72a02 = MCTSI side 1.
Format for this event is 'Processor fault'.
Event occurred on an Even day of the month at 10:32 and 06 seconds.
Escalation trigger reason - excessive processor faults.

4. Analyzing the QGP event log

Up to 240 events can be stored in the QGP event log. These events are printed in up to 15 separate message blocks, each containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

QGP event histories have the format shown in the diagram below. The letters in the following list and following table refer to the letters in this template.

4.1 Format

a REPT EVENTHIST QGP=b-c DATA=d,e EVENT=f
   gggghhhh iiiiiiiii jkllmmmn gggghhhh iiiiiiiii jkllmmmn
   gggghhhh iiiiiiiii jkllmmmn gggghhhh iiiiiiiii jkllmmmn
   gggghhhh iiiiiiiii jkllmmmn gggghhhh iiiiiiiii jkllmmmn
   gggghhhh iiiiiiiii jkllmmmn gggghhhh iiiiiiiii jkllmmmn
   gggghhhh iiiiiiiii jkllmmmn gggghhhh iiiiiiiii jkllmmmn
   gggghhhh iiiiiiiii jkllmmmn gggghhhh iiiiiiiii jkllmmmn
   gggghhhh iiiiiiiii jkllmmmn gggghhhh iiiiiiiii jkllmmmn

4.2 Explanation of Variables

a = Report trigger. Valid value(s):
   A = Automatically generated.

b = MSGS (message switch) side (0 or 1).

c = QGP number (0-3).

d = Type of dump. Valid value(s):
   ONLINE = If dump is during normal operation

 e = Sequence number of event history message (1-15).

 f = Event number of first event in the message.

The values of the gggg, hhhh, and iiiiiiiiiii fields are dependent on the event format being used. The event format is indicated by bits 0-4 of the ll field. The values used in the event format field are defined in typedef enum INEVTFORM, hdr/si/SIrpterr.h. The following table shows how the gggg, hhhh, and iiiiiiiiiii fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| 0x1      | Asserts. Valid value(s):
|          | gggg = Hexadecimal assert code found in the Asserts Manual.
|          | hhhh = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
|          | iiiiiiiiiii = Failing address. |
| 0x7      | Processor fault. Valid value(s):
|          | gggg = Interrupt source: If the value of interrupt source is less than or equal to 5, typedef enum SIMQTRIG, hdr/si/SImqtrig.h. Otherwise, typedef enum PPERRTY, hdr/smim/PPerrty.h. |
hhhh = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
iiiiiiii = Failing address.

0x9  Segmented audit error. Valid value(s):
gggg = If the address iiiiiiiiiii points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the
       address iiiiiiiiiii points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.
hhhh = Audit identifier: hdr/au/DMauid.h
iiiiiiii = Address in the function AUaer or AUfail().

0xa  Directed audit error. Valid value(s):
gggg = If the address iiiiiiiiiii points to AUdaud(), this field contains the process id that executed the
       directed audit. If the address iiiiiiiiiii points to AUfail(), this field contains an audit failure:
       hdr/au/DMauf_code.h.
hhhh = Audit identifier: hdr/au/DMauid.h
iiiiiiii = Address in the function AUdaud or AUfail().

0xe  Miscellaneous error. Valid value(s):
gggg = Unused or extra data unique to each error case.
hhhh = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h
iiiiiiii = Failing address.

0x10 Overload control event. Valid value(s):
gggg = Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
hhhh = Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload
       status conditions are levels of real time overload:
       0 = NORMAL
       1 = MINOR
       2 = MAJOR

       Otherwise, the valid overload status conditions for all other resources are:
       0 = NORMAL
       1 = OVERLOAD

iiiiiiii = Indicates the process where this overload control event was detected. For QGPs, this value will
         always equal 1.

j = Requested recovery level: hdr/si/SInlevs.h. This field is only valid for event format types "Asserts"
   and "Processor fault".
k = Unused.
ll = This is an 8-bit quantity. Bits 5-7 are not used. Bits 0-4 indicate the format used for the event
    history entry. Possible values are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to
    the table above.
mmm = Unused.
n = Escalation trigger reason: typedef enum SIMQTRIG, hdr/si/SImqtrig.h. This field is only valid for
    event format types "Asserts" and "Processor fault".

4.3 Examples

Miscellaneous error example:

0003 0005 1c02254e 000e0000
0003  = Additional data.
0005  = Specific miscellaneous error type (which is "QLPS event type" for this example).
1c02254e = Address where event occurred.
0 = Recovery level (unused for 'Miscellaneous error' event).
0 = Fill bits.
0e = Format for this event is 'Miscellaneous error'.
000 = Fill bits.
0 = Escalation trigger reason (unused for 'Miscellaneous error' event).

Fault example:

000100c1 1c0211ca 00070000
0001 = Interrupt source (which is "Escalation due to excessive faults" for this example).
00c1 = Operational software job communications package.
1c0211ca = Address where event occurred.
0 = Recovery level - return to point of interrupt.
0 = Fill bits.
07 = Format for this event is 'Processor fault'.
000 = Fill bits.
0 = Escalation trigger reason (which is "null" for this example).

5. Analyzing the PSUPH event log

For the PSUPH, up to 80 events are printed in up to 6 message blocks, with each message block containing 14 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the PSUPH have the format shown in the diagram below. The letters in the following list and table refer to the letters in this template.

5.1 Format

```
a REPT PP EVENTHIST PSUPH=b-c-d-e [CHNG=b-c-d-f] EVENT=g
  BLOCK-NO=h MESSAGE-NO=i
  jjjjkkkk 11111111 mmmmmmmm jjjjkkkk 11111111 mmmmmmmm
  jjjjkkkk 11111111 mmmmmmmm jjjjkkkk 11111111 mmmmmmmm
  jjjjkkkk 11111111 mmmmmmmm jjjjkkkk 11111111 mmmmmmmm
  jjjjkkkk 11111111 mmmmmmmm jjjjkkkk 11111111 mmmmmmmm
  jjjjkkkk 11111111 mmmmmmmm jjjjkkkk 11111111 mmmmmmmm
  jjjjkkkk 11111111 mmmmmmmm jjjjkkkk 11111111 mmmmmmmm
```

5.2 Explanation of Variables

```
a = Report trigger. Valid value(s):
  A = Automatically generated.
  M = Manually requested.

b = SM number.
c = Packet switching unit (PSU) number.
d = PSU shelf number.
e = Physical protocol handler (PH) slot number.
f = Channel group (CHNG) number.
g = Number of first event for which data is dumped in this message.
h = Number of this data block in the sequence of data blocks needed to dump the entire PH event history.
```
The values of the \texttt{jjjj,kkkk, lllllll} fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the \texttt{mmmmmm} field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the \texttt{jjjj,kkkk, lllllll} fields are populated for each of those event format types.

<table>

|         | 3 = CRIT  
|         | l l l l l l l l = Indicates the process where this overload control event was detected. For PSUPH, this value will always be 1. |
| 0x11    | Software resource exhaustion event. Valid value(s): | j j j j = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.  
|         | kk k k = Unused.  
|         | l l l l l l l l = Process information for this software resource exhaustion event. For example, the process number (and its program ID) that requested a resource when there were no idle resources available.  
|         | = y y y y z z z z, where  
|         | yyyy = The process number of the process that triggered the event, or 0xffff if interject was running when the event was triggered.  
|         | z z z z = The program ID of the process that triggered the event. If the event was triggered during interject processing (i.e., yyyy= 0xffff), then z z z z indicates the interject task that was running: typedef enum OSIJSTATE, hdr/os/OSinjenv.h. |
| 0x15    | Message signaling unit recovery event. Valid value(s): | j j j j = Number of Message signaling units (MSUs) discarded.  
|         | kk k k = Process number that initiated MSU recovery.  
|         | l l l l l l l l = Number of MSU discard requests. |
This is a 32-bit quantity, broken down as follows:

- **bits 29 - 31** = PSUPH initialization level at the time of the event: typedef enum SIPPINIT, hdr/si/Sippinit.h.
- **bit 28** = Active packet bus (0 or 1).
- **bit 27** = Side selected in PSUPH (0 or 1).
- **bit 26** = Indicates if PSUPH is out-of-service.
- **bit 25** = Indicates if PSUPH is assigned as spare.
- **bits 21 - 24** = Indicates channel group on shelf.
- **bits 16 - 20** = Indicates the format used for this event history entry: typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.
- **bits 11 - 15** = Day of the month when the event occurred.
- **bits 6 - 10** = Hours field of the time when the event occurred.
- **bits 0 - 5** = Minutes field of the time when the event occurred.

### 5.3 Examples

**PSUPH initialization example:**

```
01520000 0bc19f1a 21cb72ea
01 = Init level specified (INOPERSI).
52 = Init type: data preserving selective init.
0000 = Process number.
0bc19f1a = Address where event occurred.
21cb72ea = Init Level On Entry = 1 (INOPERSI)
Active packet bus = 0
Side selected in PSUPH = 0
OOS = 0
Standby = 0
Channel group on shelf = 14
Format for this event is 'processor initialization'.
Event occurred on the 14th day of the month at 11:42
```

**Processor fault example:**

```
00ce0000 0bc157a4 81c772ea
00ce = Interrupt source.
0000 = Process number.
0bc157a4 = Failing address.
81c772ea = Init Level On Entry = 4 (INNORMAL)
Active packet bus = 0
Side selected in PSUPH = 0
OOS = 0
Standby = 0
Channel group on shelf = 14
Format for this event is 'processor fault'.
Event occurred on the 14th day of the month at 11:42
```

### 6. Analyzing the PI2 event log

For the PI2, up to 80 events are printed in up to 6 message blocks, with each message block containing 14 events.
The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the PI2 have the format shown in the diagram below. The letters in the following list and table refer to the letters in this template.

### 6.1 Format

```plaintext
REPT PP EVENTHIST MCTSI=b-c PI EVENT=d
  BLOCK-NO=e MESSAGE-NO=f
  gggghhhh iiiiiiiiii jjjjjjjjjj jjjjjjjjjj jjjjjjjjjj
  gggghhhh iiiiiiiiii jjjjjjjjjj jjjjjjjjjj jjjjjjjjjj
  gggghhhh iiiiiiiiii jjjjjjjjjj jjjjjjjjjj jjjjjjjjjj
  gggghhhh iiiiiiiiii jjjjjjjjjj jjjjjjjjjj jjjjjjjjjj
  gggghhhh iiiiiiiiii jjjjjjjjjj jjjjjjjjjj jjjjjjjjjj
  gggghhhh iiiiiiiiii jjjjjjjjjj jjjjjjjjjj jjjjjjjjjj
  gggghhhh iiiiiiiiii jjjjjjjjjj jjjjjjjjjj jjjjjjjjjj
```

### 6.2 Explanation of Variables

- **a** = Report trigger. Valid value(s):
  - A = Automatically generated.
  - M = Manually requested.

- **b** = SM number.

- **c** = MCTSI side (0 or 1)

- **d** = Number of first event for which data is dumped in this message.

- **e** = Number of this data block in the sequence of data blocks needed to dump the entire PI2 event history.

- **f** = Number of this message in the sequence of all output messages generated by this PI2.

The values of the `gggg`, `hhhh`, and `iiiiiiii` fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the `jjjjjjjj` field. The values used in the event format field are defined in `typedef enum INEVNTFORM, hdr/si/SIrpterr.h`. The following table shows how the `gggg`, `hhhh`, and `iiiiiiii` fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| 0x1      | manual action asserts. Valid value(s):
|          | gggg = Hexadecimal assert code found in the Asserts Manual.
|          | hhhh = Hexadecimal process number (PN)
|          | iiiiiiiii = Failing address |
| 0x2      | Processor fault. Valid value(s):
|          | gggg = Interrupt source: typedef enum PPERRTY, hdr/smim/PPerrty.h.
|          | hhhh = Hexadecimal process number.
|          | iiiiiiiii = Failing address |
| 0x7      | Segmented audit error. Valid value(s):
|          | gggg = If the address in iiiiiiiiiiiiiiiii points to AUaer(), this field contains an audit error:  hdr/au/DMauerc.h. If the address in iiiiiiiiiiiiiiiii points to AUfail(), this field contains an audit failure code:  hdr/au/DMauf_code.h.
|          | hhhh = Audit identifier:  hdr/au/DMauid.h.
|          | iiiiiiiiiiiiiiiii = Address in the function AUaer() or AUfail(). |
| 0x9      | Directed audit error. Valid value(s):
|          | gggg = If the address in iiiiiiiiiiiiiiiii points to AUnau(), this field contains the process number that executed the
directed audit. If the address in iiiiiii points to AUfail(), this field contains an audit failure code:
  hdr/au/DMauf_code.h.
  hhhh = Audit identifier: hdr/au/DMauid.h
  iiiiiiiii = Address in the function AUdaud() or AUfail().

0xb  Processor initialization event. Valid value(s):
  gggg = Initialization level requested: typedef enum SIPPINIT, hdr/si/SIppinit.h.
  hhhh = Unused
  iiiiiiiii = Address in the PI2 initialization function.

0xe  Miscellaneous error. Valid value(s):
  gggg = Unused or extra data unique to each error case.
  hhhh = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h
  iiiiiiiii = Failing address.

0x10 Overload control event. Valid value(s):
  gggg = Resource(s) in overload: typedef struct OCPISTAT, hdr/si/OCovlvl.h. A bit set in bits 0-13 indicates that
  the following resource(s) are in overload:
    bits 0- 8 = Unused.
    bit 9 = PIGPBD.
    bit 10 = PILRFD.
    bit 11 = PIFIFO.
    bits 12 - 13 = PIRT.
  hhhh = Overload status condition:
    0 = NORM
    1 = MIN
    2 = MAJ
    3 = CRIT
  iiiiiiiii = Indicates the process where this overload control event was detected. For PI2, this value will
  always be 1.

0x11 Software resource exhaustion event. Valid value(s):
  gggg = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
  hhhh = Unused.
  iiiiiiiii = Process information for this software resource exhaustion event. For example, the process number
  (and its program ID) that requested a resource when there were no idle resources available.
    = yyyyzzzz, where
    yyyy = The process number of the process that triggered the event, or 0xffff if interject was
       running when the event was triggered.
    zzzz = The program ID of the process that triggered the event. If the event was triggered
       during interject processing (i.e., yyyy = 0xffff), then zzzz indicates the interject task that was
       running: typedef enum OSIJSTATE, hdr/os/OSinjenv.h.

 = This is a 32-bit quantity, broken down as follows:
  bits 29 - 31 = PI2 initialization level at the time of the event: typedef enum SIPPINIT,
                 hdr/si/SIppinit.h.
  bit  28 = Active packet bus (0 or 1).
  bits 25 - 27 = Unused
  bits 21 - 24 = Active/Standby status: ACT (1) or STBY (0)
  bits 16 - 20 = Indicates the format used for this event history entry: typedef enum
                 INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.
  bits 11 - 15 = Day of the month when the event occurred.
6.3 Examples

PI2 initialization example:

00020000 18016bd2 002bffff

00 = Init level specified (INUNSPEC).
02 = Init type.
18016bd2 = Address where event occurred.
002bffff = Init Level On Entry = 0 (INUNSPEC)

Active packet bus = 0
Active/Standby = 1 (ACT)
Format for this event is 'processor initialization'.
Time event occurred is invalid.
1. INTERPRETING SWITCHING MODULE (SM), QUAD-LINK GATEWAY PROCESSOR (QGP),
MESSAGE HANDLER (MH), AND COMMUNICATIONS MODULE PROCESSOR (CMP) EVENT LOGS
APPENDIX

Event histories are data dumps of the latest events for the switching module (SM), communications module
processor (CMP), message handler (MH), quad-link gateway processor (QGP), the packet switch unit protocol
handler (PSUPH), and the packet interface 2 (PI2). SM event histories are printed on the ROP after selective
initializations or full initializations of the SM, or when manually requested using the input command
'op:postmort,sm=a,event', where 'a' is the SM number. A limited SM event history dump is also printed when
escalation of errors in the SM reaches the point where an initialization of the SM is triggered. CMP event histories
are printed on the ROP after selective initializations or full initializations of the CMP, or when escalation of errors in
the CMP reaches the point where an initialization is requested in order to recover. CMP event histories can also be
manually requested using the input command 'op:postmort,camp=0,prim/mate,event'. Event histories from
the MH or QGP are printed on the ROP when escalation has occurred to the point where an initialization is
requested to recover the unit. A limited PSUPH or PI2 event history dump is printed on the ROP after unexpected
Packet Services subsystem initializations, selective initializations, or full initializations of the PSUPH or PI2. A full
PSUPH event history dump is printed when manually requested using the input command
'op:history,psuph=a-b-c-d,event', where 'a' is the SM number, 'b' is the PSU unit number (always 0), 'c' is
the PSU shelf number, and 'd' is the physical protocol handler (PH) slot number. A full PI2 event history dump is
printed when manually requested using the input command 'op:history,mctsi=a-b,pi,event', where 'a' is
the SM number, and 'b' is the MCTSI side number.

This appendix describes how to read the event log and is partitioned into specific sections:
- SM event log
- CMP event log
- MH event log
- QGP event log
- PSUPH event log
- PI2 event log

1.1 Analyzing the SM event log

Up to 544 events are printed in up to 34 message blocks, with each message block containing 16 events. The most
recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of
events, the message block which contains the oldest event will be the last one printed.

Event histories for the SM have the format shown in the diagram below. The letters in the following list and table
refer to the letters in this template.

1.2 Format

```plaintext
a  REPT EVENTHIST SM=b DATA=c,d EVENT=e
    ffffgggg hhhhhhhh ijjjjjjj ffffgggg hhhhhhhh ijjjjjjj
    ffffgggg hhhhhhhh ijjjjjjj ffffgggg hhhhhhhh ijjjjjjj
    ffffgggg hhhhhhhh ijjjjjjj ffffgggg hhhhhhhh ijjjjjjj
    ffffgggg hhhhhhhh ijjjjjjj ffffgggg hhhhhhhh ijjjjjjj
    ffffgggg hhhhhhhh ijjjjjjj ffffgggg hhhhhhhh ijjjjjjj
```
**1.3 Explanation of Variables**

- **a** = Report trigger. Valid value(s):
  - A = Automatically generated.
  - M = Manually requested.

- **b** = SM number.

- **c** = Type of dump. Valid value(s):
  - OFFLINE = If the dump is during a retrofit.
  - ONLINE = If the dump is during normal operation.

- **d** = Sequence number of event history message, 1-34.

- **e** = Event number of first event in the message.

The values of the `ffffff`, `gggg`, and `hhhhhhhh` fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the `jjjjjjj` field. The values used in the event format field are defined in the `INEVNTFORM` typedef enum, `hdr/si/SIrpterr.h`. The following table shows how the `ffffff`, `gggg`, and `hhhhhhhh` fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x1</td>
<td>Asserts</td>
</tr>
</tbody>
</table>
| 0x2      | Manual action asserts. Valid value(s):  
   - `ffffff` = Hexadecimal assert code found in the Asserts Manual.  
   - `gggg` = Hexadecimal process number (PN)  
   - `hhhhhhhh` = Failing address  
| 0x3      | User requested single process purge. Valid value(s):  
   - `ffffff` = Reason for purge request: typedef enum DMSI_REAS, `hdr/db/DMsi_reas.h`.  
   - `gggg` = Hexadecimal process number.  
   - `hhhhhhhh` = Address in the function INtty_prge().  
| 0x4      | Generic retrofit.  
   - All fields are dependent on the actual use; fields may contain circuit indices or port names and addresses. They may also be used to provide more data for an assert which would use the previous event number.  
| 0x5      | MH error. Valid value(s):  
   - `ffffff` = MH event number.  
   - `gggg` = MH number.  
   - `hhhhhhhh` = Failing address.  
| 0x6      | MH failure. Valid value(s):  
   - `ffffff` = `xxyy`, where:  
     - `xx` = Initialization type requested: typedef enum INMHTYPE, `hdr/si/INmhvars.h`.  
     - `yy` = Error code: typedef enum INMHSTAT, `hdr/si/INmhvars.h`.  
   - `gggg` = MH number.  
   - `hhhhhhhh` = Failing address.  
| 0x7      | Processor fault. Valid value(s):  
   - `ffffff` = Interrupt source: If the value of interrupt source is less than 450, typedef enum DMSMER_SRS, `hdr/db/DMsmer_srs.h`. Otherwise, typedef enum DMSI_REAS, `hdr/db/DMsi_reas.h`.  
   - `gggg` = Hexadecimal process number.  

hhhhhhhh = Failing address.

0x8 Peripheral fault. Valid value(s):
  ffff = Circuit name.
  gggg = Hexadecimal process number.
  hhhhhhhh = xxyyzzzz, where:
      xx = Unit type: typedef enum DMUNITTYPE, hdr/db/DMunittype.h
      yy = Recovery action: typedef enum DMRCVYACT, hdr/db/DMrcvyact.h
      zzzz = Error type: typedef enum DMERRTYPE, hdr/db/DMerrtype.h
    Note: Before forwarding information related to peripheral fault recovery please execute the
          opcnv message for each circuit ID according to the table "OP:CONV Commands For
          Peripheral Faults" at the end of this subsection, and also pass this information on to
          technical support.

0x9 Segmented audit error. Valid value(s):
  ffff = If the address in hhhhhhhh points to AUaer(), this field contains an audit error:  hdr/au/DMauerc.h. If the
            address in hhhhhhhh points to AUfail(), this field contains an audit failure code:  hdr/au/DMauf_code.h.
  gggg = Audit identifier:  hdr/au/DMauid.h.
  hhhhhhhh = Address in the function AUaer() or AUfail().

0xa Directed audit error. Valid value(s):
  ffff = If the address in hhhhhhhh points to AUdaud(), this field contains the process number that executed the
            directed audit. If the address in hhhhhhhh points to AUfail(), this field contains an audit failure code:
            hdr/au/DMauf_code.h.
  gggg = Audit identifier:  hdr/au/DMauid.h
  hhhhhhhh = Address in the function AUdaud() or AUfail().

0xc Single process purge requested by audits or by ASSERTC/D. Valid value(s):
  ffff=wxxx, where:
      w = Audit mode:  hdr/au/AUem.h
      xxx = Audit identifier:  hdr/au/DMauid.h. (The value AUDCF is used for ASSERTC/D
            requests.)
  gggg = Process number being purged.
  hhhhhhhh =yyyyzzzz, where:
      yyyy = Program ID of process being purged.
      zzzz = Original event number that this additional information is related to.

0xd Hardware init error. Valid value(s):
  ffff =16-bit quantity, with the following breakdown:
        Bits  8 - 6 = SM init level.
        Bits  5 - 0 = Error type:  typedef enum INHWERR, hdr/si/SIrpterr.h.

    The Init stage and SM init level fields are not specified for all error types.

    For Unit type SMAIU, SMRAIU, and SMXAIU, the value for Init stage is defined in typedef
    enum INIT_AIU, si/hdr/INIT_aiu.h. For Unit type SMPSIU, the value for Init stage is defined in
    typedef enum INIT_PSIU, si/hdr/INIT_com.h. For Unit type SMPLTU and SMDNU_S, the
    value for Init stage is defined in typedef enum INIT_PCT, si/hdr/INIT_pct.h.

    For all other Unit types, the value for Init stage is defined in typedef INIT_CC,
    si/INIT_pu/INIT_cc.h.
  gggg =xxyy, where:
<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Valid value(s):</th>

SMHLEXTCUR, SMLUSCON, SMLU1XPC, SMLUCUTOFF, SMPRPCTO)

### 1.4 Examples

SM initialization example:

01c20001 004410f6 85677b1f
01c2 = The phase trigger reason is a program loop.
0001 = Process number.
004410f6 = Address where event occurred.
8 = Hardware level.
5677b1f = MCTSI side was 0.

Format for this event is 'processor fault'.

---

Copyright ©2003 Lucent Technologies
Peripheral interrupt example:

```
a034000a 30170007 0ec88460
1429 = Logical circuit name.
000a = Process number.
30 = Integrated service line unit (ISLU).
17 = Pump of peripheral.
0007 = Software bad address.
0 = Hardware level.
ec88460 = MCTSI side was 1.
```

Event format for this event is 'Peripheral fault'.

Event occurred on the 16th day of the month at 17:32 and 54 seconds.

2. Analyzing the CMP event log

Up to 240 events can be stored in the CMP event log. These events are printed in up to 15 separate message blocks, each containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the CMP have the format shown in the diagram below. The letters in the following list refer to the letters in this template.

2.1 Format

```
a REPT EVENTHIST CMP=b, c, d DATA=ONLINE, e, EVENT=f
  gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk
  gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk
  gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk
  gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk
  gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk
  gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk
  gggghhhh iiiiiiiii jkkkkkkk gggghhhh iiiiiiiii jkkkkkkk
```

2.2 Explanation of Variables

- **a**: Report trigger. Valid value(s):
  - A = Automatically generated.
  - M = Manually requested.

- **b**: Messages switch side (MSGS).

- **c**: Physical CMP number.

- **d**: Processor being reported on. Valid value(s):
  - PRIM = Primary CMP.
  - MATE = Mate CMP.

- **e**: Sequence number of event history message (1-15).

- **f**: Event number of first event in the message.

The values of the **gggg, hhhh, and iiiiiiiii** fields are dependent on the event format being used.
The event format is indicated by bits 16-20 of the kkkkk field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrperr.h. The following table shows how the gggg, hhhh, and iiiiiiiifields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x1</td>
<td>Asserts</td>
</tr>
</tbody>
</table>
| 0x2      | manual action asserts. Valid value(s):  
gggg = Hexadecimal assert code found in the Asserts Manual.  
hhhh = Hexadecimal process number (PN).  
iiiiiiiii = Failing address |
| 0x3      | User requested single process purge. Valid value(s):  
gggg = Reason for purge request: typedef enum DMSI_REAS, hdr/db/DMsi_reas.h.  
hhhh = Hexadecimal process number.  
iiiiiiiii = Address in the function INtty_spp(). |
| 0x4      | Generic retrofit.  
All fields are dependent on the actual use; fields may contain circuit indices or port names and addresses. They may also be used to provide more data for an assert which would use the previous event number. |
| 0x7      | Processor fault. Valid value(s):  
gggg = Interrupt source: If the value of interrupt source is less than 450, typedef enum PPERRTY, hdr/smid/PPerty.h. Otherwise, typedef enum SICMPTRIG, hdr/si/Sicmtrig.h.  
hhhh = Hexadecimal process number.  
iiiiiiiii = Failing address. |
| 0x9      | Segmented audit error. Valid value(s):  
gggg = If the address iniiiiiiiiii points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the address iniiiiiiiiii points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.  
hhhh = Audit identifier: hdr/au/DMauid.h  
iiiiiiiiiii = Address in the function AUaer() or AUfail(). |
| 0xa      | Directed audit error. Valid value(s):  
gggg = If the address iniiiiiiiiii points to AUdaud(), this field contains the process ID that executed the directed audit. If the address iniiiiiiiiii points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.  
hhhh = Audit identifier: hdr/au/DMauid.h.  
iiiiiiiiiii = Address in the function AUdaud() or AUfail(). |
| 0xe      | Miscellaneous error. Valid value(s):  
ffff = Unused or extra data unique to each error case.  
gggg = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrperr.h  
iiiiiiiiiiii = Failing address. |
| 0x10     | Overload control event. Valid value(s):  
gggg = Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.  
iiiiiiiiii = Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload status conditions are levels of real time overload:  
0 = NORMAL  
1 = MINOR  
2 = MAJOR  
Otherwise, the valid overload status conditions for all other resources are:  
0 = NORMAL  
1 = OVERLOAD |

Copyright ©2003 Lucent Technologies
= Indicates the process where this overload control event was detected. For the CMP, this value will always equal 1.

0x11  Software resource exhaustion event. Valid value(s):

gggg = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.

hhhh = Internal overload control level (OCmaxrrr[]) for the resource.

iiiiiiii = Process information for this software resource exhaustion event. For example, the process (process number and program ID) that requested a resource when there were no idle resources available.

= yyyyzzzz, where

  yyyy = The process number of the process that triggered the event.

  zzzz = The program ID of the process that triggered the event.

j  = Software initialization level: hdr/si/Slinlevs.h.

kkkkkkk = This is a 28-bit quantity, broken down as follows:

  bit 27 = CMP active/standby status: ACTIVE (1) or STANDBY (0).

  bits 21 - 26 = Seconds field of the time when the event occurred.

  bits 16 - 20 = Indicates the format used for this event history entry. Possible values are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.

  bits 11 - 15 = Day of the month when the event occurred.

  bits 6 - 10 = Hours field of the time when the event occurred.

  bits 0 - 5 = Minutes field of the time when the event occurred.

2.3 Examples

CMP manual action assert example:

5ea9ffff 0b06ada2 0802aaf7

5ea9 = Assert code (24233).

ffff = Process number.

0b06ada2 = Failing address.

0 = Software init level: return to point of interrupt.

802aaf7 = CMP status: ACTIVE(0).

Format for this event is 'manual action assert'.

Event occurred on the 21st day of the month at 11:55 and 00 seconds.

CMP fault example:

01c40009 0b06c592 1a479aa7

01c4 = Interrupt source (INAMREQ).

0009 = Process number.

0b06c592 = Failing address.

1 = Software init level: single process purge.

a479aa7 = CMP status: ACTIVE (1)

Format for this event is 'Peripheral fault'.

Event occurred on the 19th day of the month at 10:39 and 18 seconds.

3. Analyzing the MH event log
Up to 240 events can be stored in the MH event log. These events are printed in up to 15 separate message blocks, each containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

MH event histories have the format shown in the diagram below. The letters in the following list and following table refer to the letters in this template.

### 3.1 Format

<table>
<thead>
<tr>
<th>REPT EVENTHIST MCTSI=b-c d DATA=e,f EVENT=g</th>
</tr>

</tbody>
</table>

### 3.2 Explanation of Variables

- **a** = Report trigger. Valid value(s): A = Automatically generated.
- **b** = SM number.
- **c** = MCTSI (module controller/time slot interchange unit) side (0 or 1).
- **d** = Reporting message handler identifier. Valid value(s):
  - MH0 = Message handler 0.
  - MH1 = Message handler 1.
  - MH2 = Message handler 2.
- **e** = Type of dump. Valid value(s):
  - ONLINE = If dump is during normal operation
- **f** = Sequence number of event history message (1-15).
- **g** = Event number of first event in the message.

The values of the hhhhh, iiii, and jjjjjjjjjj fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the k1111111 field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the hhhhh, iiii, and jjjjjjjjjj fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| 0x1      | Asserts. Valid value(s):
|          | hhhh = Hexadecimal assert code found in the Asserts Manual.
|          | iiii = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
|          | jjjjjjjjjj = Failing address. |
| 0x7      | Processor fault. Valid value(s):
|          | hhhh = Interrupt source: If the value of interrupt source is less than or equal to 5, typedef enum SIMQTRIG, hdr/si/SImqtrig.h. Otherwise, typedef enum PPERRTY, hdr/smim/PPerrty.h.
|          | iiii = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
|          | jjjjjjjjjj = Failing address. |
0x9  Segmented audit error. Valid value(s):

    hhhh = If the address in j j j j j j j j points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the
            address in j j j j j j j j points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.
    i i i i = Audit identifier: hdr/au/DMauid.h
    j j j j j j j = Address in the function AUaer or AUfail().

0xa  Directed audit error. Valid value(s):

    hhhh = If the address in j j j j j j j j points to AUdaud(), this field contains the process id that executed the
            directed audit. If the address in j j j j j j j j points to AUfail(), this field contains an audit failure:
            hdr/au/DMauf_code.h.
    i i i i = Audit identifier: hdr/au/DMauid.h
    j j j j j j j = Address in the function AUdaud or AUfail().

0xb  Processor initialization event. Valid value(s):

    hhhh = The initialization type requested: hdr/smim/SMmhmbox.h
    i i i i = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
    j j j j j j j = Address in the MH initialization function.

k    = Requested recovery level: hdr/si/SIinlevs.h. This field is only valid for event format types "Asserts"
        and "Processor fault".
1111111 = This is a 28-bit quantity, broken down as follows:
bit 27    = The side of the SM MCTSI that the event occurred on.
bits 21 - 26  = Seconds field of the time when the event occurred.
bits 16 - 20  = Indicates the format used for this event history entry. Possible values are defined
                in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.
bit 15    = Even or odd day indicator for when the event occurred. The only valid values are
            0 (even) and 1 (odd).
bits 10 - 14  = Hours field of the time when the event occurred.
bits 4 - 9   = Minutes field of the time when the event occurred.
bits 0 - 3   = Escalation trigger reason: typedef enum SIMQTRIG, hdr/si/SImqtrig.h. This field
                is only valid for event format types "Asserts" and "Processor fault".

3.3 Examples

Initialization example:

40000002 00064046 0c0b9060
4000    = The initialization trigger reason is a full initialization.
0002    = Operational software job which was running at time of initialization.
00064046 = Address where event occurred.
0        = Recovery level (unused for initialization event).
c0b9060 = MCTSI side 1
Format for this event is 'processor initialization'.
Event occurred on an Odd day of the month at 04:06 and 32 seconds.
Escalation trigger reason (unused for initialization event).

Fault example:

01060002 00043000 58c72a02
0106    = Fault code (which is MMU write protect error for this example).
0002    = Operational software job communications package.
00043000 = Address where event occurred.
5 = Recovery level requested - full initialization.
8c72a02 = MCTSI side 1.

Format for this event is 'Processor fault'.
Event occurred on an Even day of the month at 10:32 and 06 seconds.
Escalation trigger reason - excessive processor faults.

4. Analyzing the QGP event log

Up to 240 events can be stored in the QGP event log. These events are printed in up to 15 separate message blocks, each containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

QGP event histories have the format shown in the diagram below. The letters in the following list and following table refer to the letters in this template.

4.1 Format

a REPT EVENTHIST QGP=b-c DATA=d,e EVENT=f
  gggghhhh iiiiiiiii jkllmmnn gggghhhh iiiiiiiii jkllmmnn
  gggghhhh iiiiiiiii jkllmmnn gggghhhh iiiiiiiii jkllmmnn
  gggghhhh iiiiiiiii jkllmmnn gggghhhh iiiiiiiii jkllmmnn
  gggghhhh iiiiiiiii jkllmmnn gggghhhh iiiiiiiii jkllmmnn
  gggghhhh iiiiiiiii jkllmmnn gggghhhh iiiiiiiii jkllmmnn
  gggghhhh iiiiiiiii jkllmmnn gggghhhh iiiiiiiii jkllmmnn
  gggghhhh iiiiiiiii jkllmmnn gggghhhh iiiiiiiii jkllmmnn

4.2 Explanation of Variables

a = Report trigger. Valid value(s):
  A = Automatically generated.

b = MSGS (message switch) side (0 or 1).

c = QGP number (0-3).

d = Type of dump. Valid value(s):
  ONLINE = If dump is during normal operation

ede = Sequence number of event history message (1-15).

f = Event number of first event in the message.

The values of the gggg, hhhh, and iiiiiiiii fields are dependent on the event format being used. The event format is indicated by bits 0-4 of the ll field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SImqtrig.h. The following table shows how the gggg, hhhh, and iiiiiiiii fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex Code</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| 0x1      | Asserts. Valid value(s):
  gggg = Hexadecimal assert code found in the Asserts Manual.
  hhhh = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
  iiiiiiiii = Failing address. |
| 0x7      | Processor fault. Valid value(s):
  gggg = Interrupt source: If the value of interrupt source is less than or equal to 5, typedef enum SIMQTRIG, hdr/si/SImqtrig.h. Otherwise, typedef enum PPERRTY, hdr/smim/PPerrty.h. |
hhhh = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
iiiiiiii = Failing address.

| 0x9 | Segmented audit error. Valid value(s):
|     | gggg = If the address iiii points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the address iiii points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.
|     | hhhh = Audit identifier: hdr/au/DMauid.h
|     | iiiiiiiii = Address in the function AUaer or AUfail(). |

| 0xa | Directed audit error. Valid value(s):
|     | gggg = If the address iiii points to AUdaud(), this field contains the process id that executed the directed audit. If the address iiii points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.
|     | hhhh = Audit identifier: hdr/au/DMauid.h
|     | iiiiiiiii = Address in the function AUdaud or AUfail(). |

| 0xe | Miscellaneous error. Valid value(s):
|     | gggg = Unused or extra data unique to each error case.
|     | hhhh = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h
|     | iiiiiiiii = Address in the function AUaer or AUfail(). |

| 0x10 | Overload control event. Valid value(s):
|     | gggg = Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
|     | hhhh = Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload status conditions are levels of real time overload:
|     | 0 = NORMAL
|     | 1 = MINOR
|     | 2 = MAJOR
|     | Otherwise, the valid overload status conditions for all other resources are:
|     | 0 = NORMAL
|     | 1 = OVERLOAD
|     | iiiiiiiii = Indicates the process where this overload control event was detected. For QGPs, this value will always equal 1. |

j = Requested recovery level: hdr/si/SInlevs.h. This field is only valid for event format types “Asserts” and “Processor fault”.

k = Unused.

ll = This is an 8-bit quantity. Bits 5-7 are not used. Bits 0-4 indicate the format used for the event history entry. Possible values are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.

mmm = Unused.

n = Escalation trigger reason: typedef enum SIMQTRIG, hdr/si/SImqtrig.h. This field is only valid for event format types “Asserts” and “Processor fault”.

### 4.3 Examples

Miscellaneous error example:

```
00030005 1c02254e 000e0000
0003      = Additional data.
0005      = Specific miscellaneous error type (which is "QLPS event type" for this example).
1c02254e  = Address where event occurred.
```
Fault example:

000100c1 1c0211ca 00070000
0001    = Interrupt source (which is "Escalation due to excessive faults" for this example).
00c1    = Operational software job communications package.
1c0211ca = Address where event occurred.
0       = Recovery level - return to point of interrupt.
0       = Fill bits.
07      = Format for this event is 'Processor fault'.
000     = Fill bits.
0       = Escalation trigger reason (which is "null" for this example).

5. Analyzing the PSUPH event log

For the PSUPH, up to 80 events are printed in up to 6 message blocks, with each message block containing 14 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the PSUPH have the format shown in the diagram below. The letters in the following list and table refer to the letters in this template.

5.1 Format

a REPT PP EVENTHIST PSUPH=b-c-d-e [CHNG=b-c-d-f] EVENT=g
   BLOCK-NO=h MESSAGE-NO=i
   jjjjkkkk 11111111 mmmmmmmmm jjjjkkkk 11111111 mmmmmmmmm
   jjjjkkkk 11111111 mmmmmmmmm jjjjkkkk 11111111 mmmmmmmmm
   jjjjkkkk 11111111 mmmmmmmmm jjjjkkkk 11111111 mmmmmmmmm

   jjjjkkkk 11111111 mmmmmmmmm jjjjkkkk 11111111 mmmmmmmmm
   jjjjkkkk 11111111 mmmmmmmmm jjjjkkkk 11111111 mmmmmmmmm

5.2 Explanation of Variables

a        = Report trigger. Valid value(s):
          A          = Automatically generated.
          M          = Manually requested.

b        = SM number.
c        = Packet switching unit (PSU) number.
d        = PSU shelf number.
e        = Physical protocol handler (PH) slot number.
f        = Channel group (CHNG) number.
g        = Number of first event for which data is dumped in this message.
h        = Number of this data block in the sequence of data blocks needed to dump the entire PH event history.
The values of the $j_{jjjj}, k_{kkkk}, l_{llllllll}$ fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the $m_{mmmmmm}$ field. The values used in the event format field are defined in typedef enum INEVENTFORM, hdr/si/SIrpterr.h. The following table shows how the $j_{jjjj}, k_{kkkk}, l_{llllllll}$ fields are populated for each of those event format types.

<table>

</tbody>
</table>
0xe Miscellaneous error. Valid value(s):

\[ jjjj \] = Unused or extra data unique to each error case.
\[ kkkk \] = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h
\[ 11111111 \] = Failing address.

0xf Processor pre-initialization event. Valid value(s):

\[ jjjj \] = xxyy, where
\[ xx \] = Old initialization level: typedef enum SIPPINIT, hdr/si/SIppinit.h.
\[ yy \] = Old image type: typedef enum SMPHIMGTYP, hdr/smim/SMphtype.h.

\[ kkkk \] = zzaa, where
\[ zz \] = Debug flag.
\[ aa \] = Debug stage: typedef enum INPHSTAGE, si/hdr/INphdebug.h.

\[ 11111111 \] = Address in the PSUPH initialization function.

0x10 Overload control event. Valid value(s):

\[ jjjj \] = Resource(s) in overload: typedef struct OCPPSTAT, hdr/si/OCovlvl.h. A bit set in bits 0-13 indicates that the following resource(s) are in overload:
- bits 0 - 6 = Unused.
- bit 7 = PHGPBD.
- bit 8 = PHSTFD.
- bit 9 = PHSRFD.
- bit 10 = PHLRFD.
- bit 11 = PHCELL.
- bits 12 - 13 = PHRT.

\[ kkkk \] = Overload status condition:
\[ 0 \] = NORM
\[ 1 \] = MIN
\[ 2 \] = MAJ
\[ 3 \] = CRIT

\[ 11111111 \] = Indicates the process where this overload control event was detected. For PSUPH, this value will always be 1.

0x11 Software resource exhaustion event. Valid value(s):

\[ jjjj \] = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.

\[ kkkk \] = Unused.

\[ 11111111 \] = Process information for this software resource exhaustion event. For example, the process number (and its program ID) that requested a resource when there were no idle resources available.

\[ yyyyzzzz \] = The process number of the process that triggered the event, or 0xffff if interject was running when the event was triggered.
\[ yyyy \] = The program ID of the process that triggered the event. If the event was triggered during interject processing (i.e., \[ yyyy=0xffff \]), then \[ zzzz \] indicates the interject task that was running: typedef enum OSIJSTATE, hdr/os/OSinjenv.h.

0x15 Message signaling unit recovery event. Valid value(s):

\[ jjjj \] = Number of Message signaling units (MSUs) discarded.
\[ kkkk \] = Process number that initiated MSU recovery.
\[ 11111111 \] = Number of MSU discard requests.
This is a 32-bit quantity, broken down as follows:

- **bits 29 - 31** = PSUPH initialization level at the time of the event: typedef enum SIPPINIT,
  hdr/si/SIppinit.h.
- **bit 28** = Active packet bus (0 or 1).
- **bit 27** = Side selected in PSUPH (0 or 1).
- **bit 26** = Indicates if PSUPH is out-of-service.
- **bit 25** = Indicates if PSUPH is assigned as spare.
- **bits 21 - 24** = Indicates channel group on shelf
- **bits 16 - 20** = Indicates the format used for this event history entry: typedef enum
  INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.
- **bits 11 - 15** = Day of the month when the event occurred.
- **bits 6 - 10** = Hours field of the time when the event occurred.
- **bits 0 - 5** = Minutes field of the time when the event occurred.

### 5.3 Examples

**PSUPH initialization example:**

01520000 0bc19f1a 21cb72ea

- **01** = Init level specified (INOPERSI).
- **52** = Init type: data preserving selective init.
- **0000** = Process number.
- **0bc19f1a** = Address where event occurred.
- **21cb72ea** = Init Level On Entry = 1 (INOPERSI)
  - Active packet bus = 0
  - Side selected in PSUPH = 0
  - OOS = 0
  - Standby = 0
  - Channel group on shelf = 14
  - Format for this event is 'processor initialization'.
  - Event occurred on the 14th day of the month at 11:42

**Processor fault example:**

00ce0000 0bc157a4 81c772ea

- **00ce** = Interrupt source.
- **0000** = Process number.
- **0bc157a4** = Failing address.
- **81c772ea** = Init Level On Entry = 4 (INNORMAL)
  - Active packet bus = 0
  - Side selected in PSUPH = 0
  - OOS = 0
  - Standby = 0
  - Channel group on shelf = 14
  - Format for this event is 'processor fault'.
  - Event occurred on the 14th day of the month at 11:42

### 6. Analyzing the PI2 event log

For the PI2, up to 80 events are printed in up to 6 message blocks, with each message block containing 14 events.
The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the PI2 have the format shown in the diagram below. The letters in the following list and table refer to the letters in this template.

### 6.1 Format

```plaintext
a    REPT PP EVENTHIST MCTSI=b-c PI EVENT=d
     BLOCK-NO=e MESSAGE-NO=f
     gggg hhhh iiiiiiii jjjjjjjj
     gggg hhhh iiiiiiii jjjjjjjj
     gggg hhhh iiiiiiii jjjjjjjj
     gggg hhhh iiiiiiii jjjjjjjj
     gggg hhhh iiiiiiii jjjjjjjj
     gggg hhhh iiiiiiii jjjjjjjj
     gggg hhhh iiiiiiii jjjjjjjj
```

### 6.2 Explanation of Variables

- **a** = Report trigger. Valid value(s):
  - A = Automatically generated.
  - M = Manually requested.

- **b** = SM number.
- **c** = MCTSI side (0 or 1)
- **d** = Number of first event for which data is dumped in this message.
- **e** = Number of this data block in the sequence of data blocks needed to dump the entire PI2 event history.
- **f** = Number of this message in the sequence of all output messages generated by this PI2.

The values of the `gggg`, `hhhh`, and `iiiiiii` fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the `jjjjjjjj` field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the `gggg`, `hhhh`, and `iiiiiii` fields are populated for each of those event format types.

<table>
<thead>

### 6.3 Examples

PI2 initialization example:

```
00020000 18016bd2 002bffff
00 = Init level specified (INUNSPEC).
02 = Init type.
18016bd2 = Address where event occurred.
002bffff = Init Level On Entry = 0 (INUNSPEC)
  Active packet bus PSU 0 = 0
  Active packet bus PSU 1 = 0
  Active/Standby = 1 (ACT)
Format for this event is 'processor initialization'.
Time event occurred is invalid.
```
1. INTERPRETING PROCESSOR EVENT HISTORY LOGS APPENDIX

Event histories are data dumps of the latest events for the switching module (SM), communications module processor (CMP), message handler (MH), quad-link gateway processor (QGP), the packet switch unit protocol handler (PSUPH), the packet interface 2 (PI2), and the packet switch unit common (PSUCOM) which resides on the enhanced packet switch unit (PSU2E).

SM event histories are printed on the ROP after selective initializations or full initializations of the SM, or when manually requested using the input message ‘op:postmort, sm=a, event’, where ‘a’ is the SM number. A limited SM event history dump is also printed when escalation of errors in the SM reaches the point where an initialization of the SM is triggered.

CMP event histories are printed on the ROP after selective initializations or full initializations of the CMP, or when escalation of errors in the CMP reaches the point where an initialization is requested in order to recover. CMP event histories can also be manually requested using the input message ‘op:postmort, cmp=0, prim/mate, event’.

Event histories from the MH or QGP are printed on the ROP when escalation has occurred to the point where an initialization is requested to recover the unit.

A limited PSUPH or PI2 event history dump is printed on the ROP after unexpected packet services subsystem initializations, selective initializations, or full initializations of the PSUPH or PI2. A full PSUPH event history dump is printed when manually requested using the input message ‘op:history, psuph=a-b-c-d, event’, where ‘a’ is the SM number, ‘b’ is the packet switching unit (PSU) number, ‘c’ is the PSU shelf number, and ‘d’ is the physical protocol handler (PH) slot number. A full PI2 event history dump is printed when manually requested using the input message ‘op:history, mctsi=a-b, pi, event’, where ‘a’ is the SM number, and ‘b’ is the MCTSI side number.

The PSUCOM event history dump can be invoked/printed only when manually requested, using the input message ‘op:history, psucom=a-b-c, {cf|pf=d} | evcnt=e’, where ‘a’ is the SM number, ‘b’ is the PSU2E number, ‘c’ is the PSUCOM side, ‘d’ is the PF shelf number, and ‘e’ is the number of requested events. The control fanout (CF) unit has no shelf number associated with it (though physically resides on shelf 0), and the packet fanout (PF) unit shelf number is equivalent to the PSU shelf number.

It is important to note that even though the PSUCOM output message format is common with the other output message types, the data format and content is drastically different. Each PSUCOM event correlates to 24 bytes of data (compared to 12 for others), thus one can have only 7 events worth of data (as compared to 14 for others) per output report block.

This appendix describes how to read the event log and is partitioned into specific sections:

(1) SM event log
(2) CMP event log
(3) MH event log
(4) QGP event log
(5) PSUPH event log
(6) PI2 event log
(7) PSUCOM event log

1.1 Analyzing the SM event log

Up to 544 events are printed in up to 34 message blocks, with each message block containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the SM have the format shown in the diagram below. The letters in the following list and table refer to the letters in this template.

1.1.1 Format

```
a  REPT EVENTHIST SM=b DATA=c,d EVENT=e

ffffgggg hhhhhhhh ijjjjjjjj ffffgggg hhhhhhhh ijjjjjjjj
ffffgggg hhhhhhhh ijjjjjjjj ffffgggg hhhhhhhh ijjjjjjjj
ffffgggg hhhhhhhh ijjjjjjjj ffffgggg hhhhhhhh ijjjjjjjj
```  

1.1.2 Explanation of Variables

<table>
<thead>
<tr>
<th>Hex code</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x1</td>
<td>Asserts.</td>
</tr>
</tbody>
</table>
| 0x2      | manual action asserts. Valid value(s):  
|          | fff = Hexadecimal assert code found in the Asserts Manual.  
<p>|          | gggg = Hexadecimal process number (PN) |</p>
<table>
<thead>
<tr>
<th>Address</th>
<th>Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Failing address</td>
<td>hh = Failing address</td>
<td></td>
</tr>
</tbody>
</table>

**0x3** User requested single process purge. Valid value(s):
- `fff` = Reason for purge request: typedef enum DMSI_REAS, hdr/db/DMsi_reas.h.
- `ggg` = Hexadecimal process number.
- `hhh` = Address in the function INtty_prge().

**0x4** Generic retrofit.
All fields are dependent on the actual use; fields may contain circuit indices or port names and addresses. They may also be used to provide more data for an assert which would use the previous event number.

**0x5** MH error. Valid value(s):
- `fff` = MH event number.
- `ggg` = MH number.
- `hhh` = Failing address.

**0x6** MH failure. Valid value(s):
- `fff` = `xxyy`, where:
  - `xx` = Initialization type requested: typedef enum INMHTYPE, hdr/si/INmhvars.h.
  - `yy` = Error code: typedef enum INMHSTAT, hdr/si/INmhvars.h.
- `ggg` = MH number.
- `hhh` = Failing address.

**0x7** Processor fault. Valid value(s):
- `fff` = Interrupt source: If the value of interrupt source is less than 450, typedef enum DMSMER_SRS, hdr/db/DMsmer_srs.h. Otherwise, typedef enum DMSI_REAS, hdr/db/DMsi_reas.h
- `ggg` = Hexadecimal process number.
- `hhh` = Failing address.

**0x8** Peripheral fault. Valid value(s):
- `fff` = Circuit name.
- `ggg` = Hexadecimal process number.
- `hhh` = `xxyyzzzz`, where:
  - `xx` = Unit type: typedef enum DMUNITTYPE, hdr/db/DMunittype.h
  - `yy` = Recovery action: typedef enum DMRCVYACT, hdr/db/DMrcvyact.h
  - `zzzz` = Error type: typedef enum DMERRTYPE, hdr/db/DMerrtype.h

**NOTE:** Before forwarding information related to peripheral fault recovery please execute the opcnv message for each circuit ID according to Table 1 at the end of this subsection, and also pass this information on to technical support.

**0x9** Segmented audit error. Valid value(s):
- `fff` = If the address in `hhh` points to AUaer(), this field contains an audit error: hdr/au/DMaueurc.h. If the address in `hhh` points to AUfail(), this field contains an audit failure code: hdr/au/DMauf_code.h.
- `ggg` = Audit identifier: hdr/au/DMauid.h.
- `hhh` = Address in the function AUaer() or AUfail().

**0xa** Directed audit error. Valid value(s):
- `fff` = If the address in `hhh` points to AUdaud(), this field contains the process number that executed the directed audit. If the address in `hhh` points to AUfail(), this field contains an audit failure code: hdr/au/DMauf_code.h.
- `ggg` = Audit identifier: hdr/au/DMauid.h
- `hhh` = Address in the function AUdaud() or AUfail().
0xc  Single process purge requested by audits or by ASSERTC/D. Valid value(s):

\[ ffff = wxxx, \text{ where:} \]

- \( w = \) Audit mode: hdr/au/AUem.h
- \( xxx = \) Audit identifier: hdr/au/DMauid.h. (The value AUDCF is used for ASSERTC/D requests.)

\[ gggg = \text{Process number being purged.} \]

\[ hhhhhh = yyyzzzz, \text{ where:} \]

- \( yyy = \) Program ID of process being purged.
- \( zzzz = \) Original event number that this additional information is related to.

0xD  Hardware init error. Valid value(s):

\[ ffff = 16\text{-bit quantity, with the following breakdown:} \]

- Bits 15 - 9 = Init stage, specific to hardware type.
- Bits 8 - 6 = SM init level.
- Bits 5 - 0 = Error type: typedef enum INHWERR, hdr/si/SIrpterr.h.

The Init stage and SM init level fields are not specified for all error types.

For Unit type SMAIU, SMRAIU, and SMXAIU, the value for Init stage is defined in typedef enum INIT_AIU, si/hdr/INit_aiu.h. For Unit type SMPSIU, the value for Init stage is defined in typedef enum INIT_PSIU, si/hdr/INit_com.h. For Unit type SMPLTU and SMDNU_S, the value for Init stage is defined in typedef enum INIT_PCT, si/hdr/INit_pct.h.

For all other Unit types, the value for Init stage is defined in typedef INIT_CC, si/INit_pu/INit_cc.h.

\[ gggg = xxyy, \text{ where:} \]

- \( xx = \) Unit type: typedef enum DMUNITTYPE, hdr/db/DMunittype.h.
- \( yy = \) Unit number.

\[ hhhhhh = \text{Unused or extra data unique to each error case.} \]

0xE  Miscellaneous error. Valid value(s):

\[ ffff = \text{Unused or extra data unique to each error case.} \]

\[ gggg = \text{Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h} \]

\[ hhhhhh = \text{Failing address.} \]

0x10 Overload control event. Valid value(s):

\[ ffff = \text{Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.} \]

\[ gggg = \text{Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload status conditions are levels of real time overload:} \]

- \( 0 = \text{NORMAL} \)
- \( 1 = \text{MINOR} \)
- \( 2 = \text{MAJOR} \)
- \( 3 = \text{CRITICAL} \)

Otherwise, the valid overload status conditions for all other resources are:

- \( 0 = \text{NORMAL} \)
- \( 1 = \text{OVERLOAD} \)

\[ hhhhhh = \text{Indicates the process where this overload control event was detected. If } hhhhhh = 1, \text{ then this overload control event was triggered in the SM overload control system process. If } hhhhhh = 2, \text{ then this overload control event was triggered directly from QLPS fault recovery (QLFR).} \]
Otherwise, hhhhhhhh = yyyyzzzz, where:

<table>
<thead>
<tr>
<th>yyyy</th>
<th>Associated event number of the software resource exhaustion event type (0x11) that triggered the overload control event.</th>
</tr>
</thead>
<tbody>
<tr>
<td>zzzz</td>
<td>Program ID of the process that triggered the overload control event.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>0x11</th>
<th>Software resource exhaustion event. Valid value(s):</th>
</tr>
</thead>
<tbody>
<tr>
<td>ffff</td>
<td>Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.</td>

</table>

* Where xx is unit type associated with line unit (such as, SMLU, SMC1LU, SMLU3)
** Where yy is recovery action associated with removal (such as, SMPRRMV)
*** Where zzzz is error type associated with per call test failure (such as, SMHLEXTCUR, SMLUSCON, SMLU1XPC, SMLUCUTOFF, SMPRPCTO)

#### 1.1.3 Examples

**SM initialization example:**

```
01c20001 004410f6 85677b1f
```

01c2 = The phase trigger reason is a program loop.
0001 = Process number.
004410f6 = Address where event occurred.
8 = Hardware level.
5677b1f = MCTSI side was 0.

Format for this event is 'processor fault'.

Event occurred on the 15th day of the month at 12:31 and 43 seconds.

**Peripheral interrupt example:**

```
a034000a 30170007 0ec88460
```

1429 = Logical circuit name.
000a = Process number.
30 = Integrated service line unit (ISLU).
17 = Pump of peripheral.
0007 = Software bad address.
0 = Hardware level.
e88460 = MCTSI side was 1.

Format for this event is 'peripheral fault'.

Event occurred on the 16th day of the month at 17:32 and 54 seconds.
1.2 Analyzing the CMP event log

Up to 240 events can be stored in the CMP event log. These events are printed in up to 15 separate message blocks, each containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the CMP have the format shown in the diagram below. The letters in the following list refer to the letters in this template.

1.2.1 Format

a REPT EVENTHIST CMP=b, c d DATA=ONLINE, e EVENT=f

\[
\begin{align*}
&\text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \quad \text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \\
&\text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \quad \text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \\
&\text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \quad \text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \\
&\text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \quad \text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \\
&\text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \quad \text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \\
&\text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \quad \text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \\
&\text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \quad \text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \\
&\text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \quad \text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \\
&\text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk} \quad \text{gggghhhh} \quad \text{iiiiiiii} \quad \text{jkkkkkkk}
\end{align*}
\]

1.2.2 Explanation of Variables

- **a** = Report trigger. Valid value(s):
  - A = Automatically generated.
  - M = Manually requested.

- **b** = Messages switch side (MSGS).

- **c** = Physical CMP number.

- **d** = Processor being reported on. Valid value(s):
  - PRIM = Primary CMP.
  - MATE = Mate CMP.

- **e** = Sequence number of event history message (1-15).

- **f** = Event number of first event in the message.

The values of the ggg, hhhh, and iiiiiiiii fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the kkkkkkkk field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the gggg, hhhh, and iiiiiiiii fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x1</td>
<td>Asserts</td>
</tr>
<tr>
<td>0x2</td>
<td>manual action asserts. Valid value(s): \n</td>
</tr>
</tbody>
</table>
0x3  User requested single process purge. Valid value(s):
  gggg = Reason for purge request: typedef enum DMSI_REAS, hdr/db/DMsi_reas.h.
  hhhh = Hexadecimal process number.
  iiiiiii = Address in the function INTty_spp().

0x4  Generic retrofit.

All fields are dependent on the actual use; fields may contain circuit indices or port names and addresses. They
may also be used to provide more data for an assert which would use the previous event number.

0x7  Processor fault. Valid value(s):
  gggg = Interrupt source: If the value of interrupt source is less than 450, typedef enum PPERTTY,
       hdr/smim/PPerrty.h. Otherwise, typedef enum SICMPTRIG, hdr/si/Sicmptrig.h.
  hhhh = Hexadecimal process number.
  iiiiiii = Failing address.

0x9  Segmented audit error. Valid value(s):
  gggg = If the address in iiiiiii points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the
       address in iiiiiii points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.
  hhhh = Audit identifier: hdr/au/DMauid.h
  iiiiiii = Address in the function AUaer() or AUfail().

0xa  Directed audit error. Valid value(s):
  gggg = If the address in iiiiiii points to AUdaud(), this field contains the process ID that executed the
       directed audit. If the address in iiiiiii points to AUfail(), this field contains an audit failure:
       hdr/au/DMauf_code.h.
  hhhh = Audit identifier: hdr/au/DMauid.h.
  iiiiiii = Address in the function AUaer() or AUfail().

0xe  Miscellaneous error. Valid value(s):
  ffff = Unused or extra data unique to each error case.
  gggg = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h.
  hhhhhh = Failing address.

0x10 Overload control event. Valid value(s):
  gggg = Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
  hhhh = Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload
       status conditions are levels of real time overload:
       0 = NORMAL
       1 = MINOR
       2 = MAJOR

       Otherwise, the valid overload status conditions for all other resources are:
       0 = NORMAL
       1 = OVERLOAD

  iiiiiii = Indicates the process where this overload control event was detected. For the CMP, this value will
          always equal 1.

0x11 Software resource exhaustion event. Valid value(s):
  gggg = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.
  hhhh = Internal overload control level (OCmaxrrr[]) for the resource.
  iiiiiii = Process information for this software resource exhaustion event. For example, the process (process
           number and program ID) that requested a resource when there were no idle resources available.

         iiiiiii = yyyyyzzz, where:
\[ \text{yyyy} = \text{The process number of the process that triggered the event.} \\
\text{zzzz} = \text{The program ID of the process that triggered the event.} \]

\[ j = \text{Software initialization level: hdr/si/SIinlevs.h.} \]

\[ kkkkkkk = \text{This is a 28-bit quantity, broken down as follows:} \]
\[ \begin{align*}
\text{bit 27} & = \text{CMP active/standby status: ACTIVE (1) or STANDBY (0).} \\
\text{bits 21 - 26} & = \text{Seconds field of the time when the event occurred.} \\
\text{bits 16 - 20} & = \text{Indicates the format used for this event history entry. Possible values are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.} \\
\text{bits 11 - 15} & = \text{Day of the month when the event occurred.} \\
\text{bits 6 - 10} & = \text{Hours field of the time when the event occurred.} \\
\text{bits 0 - 5} & = \text{Minutes field of the time when the event occurred.}
\end{align*} \]

### 1.2.3 Examples

**CMP manual action assert example:**

5ea9ffff 0b06ada2 0802aaf7

5ea9 = Assert code (24233).

ffff = Process number.

0b06ada2 = Failing address.

0 = Software init level: return to point of interrupt.

802aaf7 = CMP status: ACTIVE(0).

Format for this event is 'manual action assert'.

Event occurred on the 21st day of the month at 11:55 and 00 seconds.

**CMP fault example:**

01c40009 0b06c592 1a479aa7

01c4 = Interrupt source (INAMREQ).

0009 = Process number.

0b06c592 = Failing address.

1 = Software init level: single process purge.

a479aa7 = CMP status: ACTIVE (1)

Format for this event is 'Peripheral fault'.

Event occurred on the 19th day of the month at 10:39 and 18 seconds.

### 1.3 Analyzing the MH event log

Up to 240 events can be stored in the MH event log. These events are printed in up to 15 separate message blocks, each containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

MH event histories have the format shown in the diagram below. The letters in the following list and following table
refer to the letters in this template.

1.3.1 Format

```
a REPT EVENTHIST MCTSI=b-c d DATA=e,f EVENT=g
```

```
11111111 jjjjjjjjj 11111111 hhhiiiiii jjjjjjjjj 11111111
11111111 jjjjjjjjj 11111111 hhhiiiiii jjjjjjjjj 11111111
11111111 jjjjjjjjj 11111111 hhhiiiiii jjjjjjjjj 11111111
11111111 jjjjjjjjj 11111111 hhhiiiiii jjjjjjjjj 11111111
```

1.3.2 Explanation of Variables

```
a = Report trigger. Valid value(s):
   A = Automatically generated.
```

```
b = SM number.
```

```
c = MCTSI (module controller/time slot interchange unit) side (0 or 1).
```

```
d = Reporting message handler identifier. Valid value(s):
   MH0 = Message handler 0.
   MH1 = Message handler 1.
   MH2 = Message handler 2.
```

```
e = Type of dump. Valid value(s):
   ONLINE = If dump is during normal operation
```

```
f = Sequence number of event history message (1-15).
```

```
g = Event number of first event in the message.
```

The values of the hhhh, iiii, and jjjjjjjjj fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the lllllll field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the hhhh, iiii, and jjjjjjjjj fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex code</th>
<th>Explanation:</th>
</tr>
</thead>
</table>
| 0x1      | **Asserts. Valid value(s):**  
           hhhh = Hexadecimal assert code found in the Asserts Manual.  
           iiii = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h  
           jjjjjjjjj = Failing address. |
| 0x7      | **Processor fault. Valid value(s):**  
           hhhh = Interrupt source: If the value of interrupt source is less than or equal to 5, typedef enum SIMQTRIG, hdr/si/Slmqtrig.h. Otherwise, typedef enum PPERRTY, hdr/smim/PPerrty.h.  
           iiii = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h  
           jjjjjjjjj = Failing address. |
0x9  Segmented audit error. Valid value(s):

- hhhhh = If the address in jjjjjjjj points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the address in jjjjjjjj points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.
- iiii = Audit identifier: hdr/au/DMauid.h
- jjjjjjjj = Address in the function AUaer or AUfail().

0xa  Directed audit error. Valid value(s):

- hhhhh = If the address in jjjjjjjj points to AUdaud(), this field contains the process id that executed the directed audit. If the address in jjjjjjjj points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.
- iiii = Audit identifier: hdr/au/DMauid.h
- jjjjjjjj = Address in the function AUdaud or AUfail().

0xb  Processor initialization event. Valid value(s):

- hhhhh = The initialization type requested: hdr/smim/SMmhbox.h
- iiii = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h
- jjjjjjjj = Address in the MH initialization function.

k = Requested recovery level: hdr/si/SInlevs.h. This field is only valid for event format types "Asserts" and "Processor fault".

1111111 = This is a 28-bit quantity, broken down as follows:

- bit 27 = The side of the SM MCTSI that the event occurred on.
- bits 21 - 26 = Seconds field of the time when the event occurred.
- bits 16 - 20 = Indicates the format used for this event history entry. Possible values are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.
- bit 15 = Even or odd day indicator for when the event occurred. The only valid values are 0 (even) and 1 (odd).
- bits 10 - 14 = Hours field of the time when the event occurred.
- bits 4 - 9 = Minutes field of the time when the event occurred.
- bits 0 - 3 = Escalation trigger reason: typedef enum SIMQTRIG, hdr/si/SImqtrig.h. This field is only valid for event format types "Asserts" and "Processor fault".

1.3.3 Examples

Initialization example:

```
40000002 00064046 0c0b9060
4000 = The initialization trigger reason is a full initialization.
0002 = Operational software job which was running at time of initialization.
00064046 = Address where event occurred.
0 = Recovery level (unused for initialization event).
c0b9060 = MCTSI side 1
```

Format for this event is 'processor initialization'.

Event occurred on an Odd day of the month at 04:06 and 32 seconds.

Escalation trigger reason (unused for initialization event).

Fault example:
01060002 00043000 58c72a02
0106 = Fault code (which is MMU write protect error for this example).
0002 = Operational software job communications package.
00043000 = Address where event occurred.
5 = Recovery level requested - full initialization.
8c72a02 = MCTSI side 1.

Format for this event is 'Processor fault'.

Event occurred on an Even day of the month at 10:32 and 06 seconds.

Escalation trigger reason - excessive processor faults.

1.4 Analyzing the QGP event log

Up to 240 events can be stored in the QGP event log. These events are printed in up to 15 separate message blocks, each containing 16 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

QGP event histories have the format shown in the diagram below. The letters in the following list and following table refer to the letters in this template.

1.4.1 Format

a = Report trigger. Valid value(s):
   A = Automatically generated.

b = MSGS (message switch) side (0 or 1).

c = QGP number (0-3).

d = Type of dump. Valid value(s):
   ONLINE = If dump is during normal operation

e = Sequence number of event history message (1-15).

f = Event number of first event in the message.

The values of the gggg, hhhh, and iiiiiiiii fields are dependent on the event format being
used. The event format is indicated by bits 0-4 of the field. The values used in the event format field are defined in typedef enum INEVTFORM, hdr/si/SIrpterr.h. The following table shows how the gggg, hhhh, and iiii fields are populated for each of those event format types.

<table>
<thead>
<tr>
<th>Hex code</th>
<th>Explanation:</th>
</tr>
</thead>
</table>
| 0x1      | Asserts. Valid value(s):  
gggg = Hexadecimal assert code found in the Asserts Manual.  
hhhh = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h  
iiiiiii = Failing address. |
| 0x7      | Processor fault. Valid value(s):  
gggg = Interrupt source: If the value of interrupt source is less than or equal to 5, typedef enum SIMQTRIG, hdr/si/SImqtrig.h. Otherwise, typedef enum PPERRTY, hdr/smim/PPerrty.h.  
hhhh = Operational software job number: typedef enum SMRUNNING, hdr/smim/SMmgdefs.h  
iiiiiii = Failing address. |
| 0x9      | Segmented audit error. Valid value(s):  
gggg = If the address in iiii points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the address in iiii points to AUfail(), this field contains an audit failure: hdr/au/DMauf_code.h.  
hhhh = Audit identifier: hdr/au/DMauid.h  
iiiiiii = Address in the function AUaer or AUfail(). |
| 0xa      | Directed audit error. Valid value(s):  
gggg = If the address in iiii points to AUdaud(), this field contains the process id that executed the directed audit. If the address in iiii points to AUfail(), this field contains an audit failure:  
hdr/au/DMauf_code.h.  
hhhh = Audit identifier: hdr/au/DMauid.h  
iiiiiii = Address in the function AUaer or AUfail(). |
| 0xe      | Miscellaneous error. Valid value(s):  
gggg = Unused or extra data unique to each error case.  
hhhh = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h  
iiiiiii = Failing address. |
| 0x10     | Overload control event. Valid value(s):  
gggg = Resource in overload: typedef enum DMOCRSC, hdr/si/DMocrsc.h.  
hhhh = Overload status condition. If the resource in overload has a value OC_REALTIME, then valid overload status conditions are levels of real time overload:  
0 = NORMAL  
1 = MINOR  
2 = MAJOR  

Otherwise, the valid overload status conditions for all other resources are:  
0 = NORMAL  
1 = OVERLOAD  

iiiiiiii = Indicates the process where this overload control event was detected. For QGPs, this value will always equal 1. |

j = Requested recovery level: hdr/si/SInlevs.h. This field is only valid for event format types "Asserts" and "Processor fault".  
k = Unused.
This is an 8-bit quantity. Bits 5-7 are not used. Bits 0-4 indicate the format used for the event history entry. Possible values are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.

Unused.

Escalation trigger reason: typedef enum SIMQTRIG, hdr/si/SImqtrig.h. This field is only valid for event format types "Asserts" and "Processor fault".

Miscellaneous error example:

```
00030005 1c02254e 000e0000
0003      = Additional data.
0005      = Specific miscellaneous error type (which is "QLPS event type" for this example).
1c02254e  = Address where event occurred.
0          = Recovery level (unused for 'Miscellaneous error' event).
0          = Fill bits.
0e         = Format for this event is 'Miscellaneous error'.
0000       = Fill bits.
0          = Escalation trigger reason (unused for 'Miscellaneous error' event).
```

Fault example:

```
000100c1 1c0211ca 00070000
0001      = Interrupt source (which is "Escalation due to excessive faults" for this example).
00c1      = Operational software job communications package.
1c0211ca  = Address where event occurred.
0          = Recovery level - return to point of interrupt.
0          = Fill bits.
07         = Format for this event is 'Processor fault'.
000        = Fill bits.
0          = Escalation trigger reason (which is "null" for this example).
```

1.5 Analyzing the PSUPH event log

For the PSUPH, up to 80 events are printed in up to 6 message blocks, with each message block containing 14 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the PSUPH have the format shown in the diagram below. The letters in the following list and table refer to the letters in this template.

1.5.1 Format

```
a  REPT PP EVENTHIST PSUPH=b-c-d-e [CHNG=b-c-d-f] EVENT=g
BLOCK-NO=h MESSAGE-NO=i
jjjjkkkk 11111111 mmmmmmmmm jjjjjkkkk 11111111 mmmmmmmmm
jjjjkkkk 11111111 mmmmmmmmm jjjjjkkkk 11111111 mmmmmmmmm
jjjjkkkk 11111111 mmmmmmmmm jjjjjkkkk 11111111 mmmmmmmmm
jjjjkkkk 11111111 mmmmmmmmm jjjjjkkkk 11111111 mmmmmmmmm
jjjjkkkk 11111111 mmmmmmmmm jjjjjkkkk 11111111 mmmmmmmmm
jjjjkkkk 11111111 mmmmmmmmm jjjjjkkkk 11111111 mmmmmmmmm
```
**1.5.2 Explanation of Variables**

- **a** = Report trigger. Valid value(s):
  - A = Automatically generated.
  - M = Manually requested.

- **b** = SM number.

- **c** = Packet switching unit (PSU) number.

- **d** = PSU shelf number.

- **e** = Physical protocol handler (PH) slot number.

- **f** = Channel group (CHNG) number.

- **g** = Number of first event for which data is dumped in this message.

- **h** = Number of this data block in the sequence of data blocks needed to dump the entire PH event history.

- **i** = Number of this message in the sequence of all output messages generated by this PH.

The values of the **jjjj, kkkk, and lllllllll** fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the **mmmmmmmm** field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the **jjjj, kkkk, and lllllllll** fields are populated for each of those event format types.

</tr>
</tbody>
</table>

`mmmmmmmm` = This is a 32-bit quantity, broken down as follows:

- bits 29 - 31 = PSUPH initialization level at the time of the event: typedef enum SIPPINIT, hdr/si/SIppinit.h.
- bit 28 = Active packet bus (0 or 1).
- bit 27 = Side selected in PSUPH (0 or 1).
- bit 26 = Indicates if PSUPH is out-of-service.
- bit 25 = Indicates if PSUPH is assigned as spare.
- bits 21 - 24 = Indicates channel group on shelf
- bits 16 - 20 = Indicates the format used for this event history entry: typedef enum INEVNTFORM, hdr/si/SIrpterr.h. Also, refer to the table above.
- bits 11 - 15 = Day of the month when the event occurred.
- bits 6 - 10 = Hours field of the time when the event occurred.
- bits 0 - 5 = Minutes field of the time when the event occurred.

### 1.5.3 Examples

**PSUPH initialization example:**

```
01520000 0bc19fla 21cb72ea
01 = Init level specified (INOPERSI).
52 = Init type: data preserving selective init.
0000 = Process number.
0bc19fla = Address where event occurred.
21cb72ea = Valid value(s):
Init Level On Entry = 1 (INOPERSI)
Active packet bus = 0
```
Processor fault example:

```
00ce0000 0bc157a4 81c772ea
00ce = Interrupt source.
0000 = Process number.
0bc157a4 = Failing address.
81c772ea = Valid value(s):
         Init Level On Entry = 4 (INNORMAL)
         Active packet bus = 0
         Side selected in PSUPH = 0
         OOS = 0
         Standby = 0
         Channel group on shelf = 14
```

Format for this event is 'processor fault'.
Event occurred on the 14th day of the month at 11:42

1.6 Analyzing the PI2 event log

For the PI2, up to 80 events are printed in up to 6 message blocks, with each message block containing 14 events. The most recent event is printed first and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the PI2 have the format shown in the diagram below. The letters in the following list and table refer to the letters in this template.

1.6.1 Format

```
a  REPT PP EVENTHIST MCTSI=b-c PI EVENT=d
   BLOCK-NO=e MESSAGE-NO=f
   gggghhhh iiiiiiiii jjjjjjjj jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj
   gggghhhh iiiiiiiii jjjjjjjj jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj
   gggghhhh iiiiiiiii jjjjjjjj jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj
   gggghhhh iiiiiiiii jjjjjjjj jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj
   gggghhhh iiiiiiiii jjjjjjjj jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj
   gggghhhh iiiiiiiii jjjjjjjj jjjjjjjj gggghhhh iiiiiiiii jjjjjjjj
```

1.6.2 Explanation of Variables

```
a = Report trigger. Valid value(s):
```
A = Automatically generated.
M = Manually requested.

b = SM number.
c = MCTSI side (0 or 1)
d = Number of first event for which data is dumped in this message.
e = Number of this data block in the sequence of data blocks needed to dump the entire PI2 event history.
f = Number of this message in the sequence of all output messages generated by this PI2.

The values of the gggg, hhhh, and iiiiiniiii fields are dependent on the event format being used. The event format is indicated by bits 16-20 of the jjjjjjjjjjj field. The values used in the event format field are defined in typedef enum INEVNTFORM, hdr/si/SIrpterr.h. The following table shows how the gggg, hhhh, and iiiiiniiii fields are populated for each of those event format types.

<table>
<thead>
<tr>

|          | iiiiiniiii = Failing address |
| 0x7      | Processor fault. Valid value(s):
|          | gggg = Interrupt source: typedef enum PPERTTY, hdr/smim/PPernty.h.
|          | hhhh = Hexadecimal process number.
|          | iiiiiniiii = Failing address. |
| 0x9      | Segmented audit error. Valid value(s):
|          | gggg = If the address in iiii in points to AUaer(), this field contains an audit error: hdr/au/DMauerc.h. If the address in iiii in points to AUfail(), this field contains an audit failure code: hdr/au/DMauf_code.h.
|          | hhhh = Audit identifier: hdr/au/DMauid.h.
|          | iiiiiniiii = Address in the function AUaer() or AUfail(). |
| 0xa      | Directed audit error. Valid value(s):
|          | gggg = If the address in iiii in points to AUdaud(), this field contains the process number that executed the directed audit. If the address in iiii in points to AUfail(), this field contains an audit failure code: hdr/au/DMauf_code.h.
|          | hhhh = Audit identifier: hdr/au/DMauid.h
|          | iiiiiniiii = Address in the function AUdaud() or AUfail(). |
| 0xb      | Processor initialization event. Valid value(s):
|          | gggg = Initialization level requested: typedef enum SIPPINIT, hdr/si/SIppinit.h.
|          | hhhh = Unused
|          | iiiiiniiii = Address in the PI2 initialization function. |
| 0xe      | Miscellaneous error. Valid value(s):
|          | gggg = Unused or extra data unique to each error case.
|          | hhhh = Miscellaneous error type: typedef enum INMISCTYPE, hdr/si/SIrpterr.h
|          | iiiiiniiii = Failing address. |
| 0x10     | Overload control event. Valid value(s): |
gggg = Resource(s) in overload: typedef struct OCPISTAT, hdr/si/OCoavl.h. A bit set in bits 0-13 indicates that the following resource(s) are in overload:

- bits 0 - 7 = Unused.
- bit 8 = PLRFD1.
- bit 9 = PIGPBD.
- bit 10 = PILRFD.
- bit 11 = PIFIFO.
- bits 12 - 13 = PIRT.

hhhh = Overload status condition:

- 0 = NORM
- 1 = MIN
- 2 = MAJ
- 3 = CRIT

iiiiiiii = Indicates the process where this overload control event was detected. For PI2, this value will always be 1.

Software resource exhaustion event. Valid value(s):

gggg = Resource that has experienced exhaustion: typedef enum DMOCRSC, hdr/si/DMocrsc.h.

hhhh = Unused.

iiiiiiii = Process information for this software resource exhaustion event. For example, the process number (and its program ID) that requested a resource when there were no idle resources available.

- iiiiiii = yyyyzzzz, where:
  - yyyy = The process number of the process that triggered the event, or 0xffff if interject was running when the event was triggered.
  - zzzz = The program ID of the process that triggered the event. If the event was triggered during interject processing (that is, yyyy = 0xffff), then zzzz indicates the interject task that was running: typedef enum OSIJSTATE, hdr/os/OSinjenv.h.

jjjjjjjj = This is a 32-bit quantity, broken down as follows:

- bits 29 - 31 = PI2 initialization level at the time of the event: typedef enum SIPPINIT, hdr/si/Sippinit.h.
- bit 28 = Active packet bus (0 or 1) for PSU 0.
- bit 27 = Active packet bus (0 or 1) for PSU 1.
- bits 25 - 26 = Unused
- bits 21 - 24 = Active/Standby status: ACT (1) or STBY (0)
- bits 16 - 20 = Indicates the format used for this event history entry: typedef enum INEVNTFORM, hdr/si/Sirpterr.h. Also, refer to the table above.
- bits 11 - 15 = Day of the month when the event occurred.
- bits 6 - 10 = Hours field of the time when the event occurred.
- bits 0 - 5 = Minutes field of the time when the event occurred.

1.6.3 Examples

PI2 initialization example:

00020000 18016bd2 002bffff
00 = Init level specified (INUNSPEC).
02 = Init type.
18016bd2 = Address where event occurred.
002bffff = Valid value(s):
  Init Level On Entry = 0 (INUNSPEC)
  Active packet bus PSU 0 = 0
  Active packet bus PSU 1 = 0
  Active/Standby = 1 (ACT)

Format for this event is 'processor initialization'.
Time event occurred is invalid.

1.7 Analyzing the PSUCOM event log

For the PSUCOM, up to 256 events can be printed in up to 37 message blocks, with each message block containing 7 events. The most recent event is printed first, and the oldest event is printed last. If there are fewer than the maximum number of events, the message block which contains the oldest event will be the last one printed.

Event histories for the PSUCOM have the format shown in the following diagram. The peripheral of interest will be either the CF or the PF on the PSU2E. The letters in the following list and the table refer to the letters in this template.

1.7.1 Format

a REPT PP EVENTHIST PSUCOM=b–c–d {CF | PF=e} EVENT=f
  BLOCK–NO=g MESSAGE–NO=h
  i i i i i i i j j j j j j j  k k k k k k k k l l l l l l l l m m m m m m m m m m m m

  i i i i i i i j j j j j j j  k k k k k k k k l l l l l l l l m m m m m m m m m m m m
  i i i i i i i j j j j j j j  k k k k k k k k l l l l l l l l m m m m m m m m m m m m

1.7.2 Explanation of Variables

a = Report trigger. Valid value(s):
  A = Automatically generated.
  M = Manually requested.

b = SM number.

c = PSU number.

d = PSU side number.

e = PF shelf number.

f = Number of first event for which data is dumped in this message.

g = Number of this data block in the sequence of data blocks needed to dump the entire CF or PF event history.
h = Number of this message in the sequence of all output messages generated by the CF or PF.

**iiiiiiii** = This is a 32-bit quantity, broken down as follows:
- bits 27 - 31 = Format used for this event history entry. Refer to the hex code in the following table.
- bits 16 - 26 = Error number as defined in ERH_NAME typedef enum in hdr/hw/HWps2errnm.h file.
- bits 0 - 15 = Error count.

**jjjjjjjj** = This is a 32-bit quantity, representing the error log event memory address location.

**kkkkkkkk** = This is a 32-bit quantity, as defined in the following table, on a per event format type basis.

**llllllll** = This is a 32-bit quantity, as defined in the following table, on a per event format type basis.

**mmmmmmmm** = This is a 32-bit quantity, as defined in the following table, on a per event format type basis.

The **iiiiiiii**, **jjjjjjjj**, and **mmmmmmmm** fields are invariant. The values of the **kkkkkkkk**, **llllllll**, and **mmmmmmmm** fields are variant and dependent on the event format field being used.

The event format is indicated by bits 27-31 (Bit 31 is MSB) of the **iiiiiiii** field. The values used in the event format field are defined in typedef enum ERH_EHIST_FMT, and represented in the following table as the hex code. The error numbers are represented by bits 16-26 of the **iiiiiiii** field, and are defined in one large typedef enum ERH_NAME. Both of those enums are defined in hdr/hw/HWps2errnm.h header file.

1. HARDWARE AND SOFTWARE FAULTS APPENDIX

There are two types of faults, software and hardware. Each fault is classified with a code as shown in Exhibits 1 and 2.

Conditions leading to a software fault are recognized only by UNIX® RTR hardware and software facilities. The affected process (the process that was running at the time the error occurred) is faulted with one of the codes listed in Exhibit 2. When message switch kernel process (MSKP) faulted, the fault handling software will internally fault only the logical entity that was running at the time of the error [such as, message switch control unit (MSCU) handler, foundation peripheral controller (FPC) handler, pump peripheral controller (PPC) handler, module message processor (MMP) handler, communication module processor (CMP) handler, diagnostic handler, or one of several areas within the MSKP environment]. For internal faulting, MSKP collapses all UNIX® RTR software faults into the SMFLT._29 code in Exhibit 1. Handlers, upon detecting a software fault (with a hardware ID, if available), will initiate hardware recovery in an attempt to isolate the problem. If this fails, the level of recovery will escalate. Software faults in the diagnostic handler will cause the diagnostic to be aborted. Software faults in the MSKP environment will result in loss of continuity in the activity in progress at the time of the error. Depending on the level of disruption this will soon result in a higher level of recovery.

Hardware errors in the message switch can be recognized by UNIX® RTR hardware/software facilities, by the MSKP environment, or by a handler within MSKP. UNIX® RTR-detected hardware faults are passed to MSKP as one of the codes listed in Exhibit 2. These faults, along with faults initially detected by the environment (Exhibit 1), are passed to the appropriate handler.

The following faults are detected by the MSKP environment and passed to the MSCU handler, FPC handler, PPC handler, MMP handler, CMP handler, diagnostic handler, or MSKP environment.

1. HANDLER ERROR CODES APPENDIX

Errors (software or hardware) are recognized by the message switch kernel process (MSKP) environment, the message switch control unit (MSCU) handler, the foundation peripheral controller (FPC) handler, the module message processor (MMP) handler, the pump peripheral controller (PPC) handler, the communication module processor (CMP) handler, the diagnostic handler (DIAGH), the 3B communication module simulator (3BCMSIM) handler, or the automatic workstation message switch kernel process (AWMSKP).

An error code is assigned for each point of detection. Error code ranges are assigned as follows:

- 0 - 1999 = MSKP environment.
- 2000 - 2999 = FPC handler.
- 3000 - 3999 = MMP handler.
- 4000 - 4999 = PPC handler.
- 5000 - 5999 = DIAG handler.
- 6000 - 6999 = MSCU handler.
- 7000 - 7999 = CMP handler.
- 8000 - 8999 = QGP handler.
- 9000 - 9999 = 3BCMSIM handler.
- 10000 - 10999 = AWMSKP handler.

Often the error code will be printed along with one or two supplemental values. The description with each error code would be sufficient to trouble shoot the problem. However, the supplemental information can also be used, in conjunction with source listings, for additional input to the problem.

APP:HANDLER-ERR-B

Software Release: 5E15 and later
Message Class: N/A
Application: 5
Type: Output

1. APPENDIX: TRAFFIC SECTIONS

Errors (software or hardware) are recognized by the:
MSKP - Message Switch Kernel Process environment.
FPC - Foundation Peripheral Controller handler.
MMP - Module Message Processor handler.
PPC - Pump Peripheral Controller handler.
DIAG - Diagnostic handler.
MSCU - Message Switch Control Unit handler.
CMP - Communications Module Processor handler.
QGP - Quad-link Gateway Processor handler.
3BCMSIM - 3B/CM Simulator environment.
AWMSKP - Administrative Workstation for Message Switch Kernel Process handler.

An error code is assigned for each point of detection. Error code ranges are assigned as follows:

<table>
<thead>
<tr>
<th>Error Code Ranges</th>

</table>

Often the error code will be printed along with one or two supplemental values. The description, herein, with each error code should be sufficient to trouble shoot the problem. However, if the technical support organization is required to resolve the problem, the supplemental information can be used in conjunction with source listings for additional input to the problem.

PROB. CAUSE Software problem.

LOC SMkpim.c - SMimrecv() - Initialize MSGS receive function
DESC Timeout on MSCU ASW (all seems well) firmware response.
PROB. CAUSE AM/MSGS related hardware problem or reset level is too low. For an MSGS level 2 reset requests, this error may occur because the MSGS actually performed a level reset 3 (which takes longer). This error normally happens when an MSGS is power cycled before an AM initialization. If this is the case, this error should be ignored, since the AM initialization retries the MSGS initialization with a level 3 reset. The first supplementary data of this error report contains the requested reset level. The second supplementary data of this error report contains the requested pump level (no pump (1), pump from AM memory (2), pump for AM disk (3)).

Software Release: 5E14 and later
Message Class: N/A
Application: 5,3B
Type: Output

1. INPUT/OUTPUT DRIVER (IODRV) JOB COMPLETION ERROR CODES APPENDIX

Job completion reports have the same format as messages except for the addition of a completion code field.

For peripheral interface controller (PIC) reports the completion field size is 16 bits.

For peripheral controller (PC) and peripheral controller subdevice (PCSD) reports the completion field size is 12 bits.

Note: The codes are in hexadecimal.

Errors reported by the PC or PCSD (rejected messages):

<tr>
<td>0006</td>
<td>PC community power failure.</td>
</tr>
<tr>
<td>aaf7</td>
<td>PC error detected by the PIC; (aa = PC error type); codes f8-ff reserved.</td>
</tr>
</tbody>
</table>

PC errors detected by the PIC (asynchronous reports - aaf7 format):

Upon detection of a PC error, the PIC will isolate the faulty PC from the common community busses, mark the PC out-of-service, flush all outstanding requests for PIC service by the faulty PC, and issue a HP autonomous error report to the driver. The completion report field includes one of the following error types:

LD/ULD = Load/unload.
DAM = Dual access memory.
CSA = Control signal acknowledgment.
IR = Interrupt request.
SR = Service request.
ER = Error report.

Software Release: 5E14 and later
Message Class: N/A
Application: 5,3B
Type: Output

1. FAULT CODES RECOGNIZED BY INPUT/OUTPUT DRIVER (IODRV)

Note: The codes are in hexadecimal.

No Fault
00 No fault (normal).

Peripheral Faults - With Accompanying Message
b1 Device reported error - IOPn (PIC or PCm) implicated - IOPn had pio in progress.
b2 Parity divert error - IOPn (PIC) implicated - IOPn had pio in progress.
b3 Channel error - IOPn not implicated but possibly affected - IOPn had pio in progress.
b4 Device reported error - IOPn (PIC or PCm) implicated.
b5 DMA addressing error - IOPn (PIC or PCm) implicated.
b6 DMA used OOR address - IOPn (PIC) implicated.
b7 Channel error - IOPn not implicated but possibly affected.

Peripheral Faults - No Accompanying Message
b8 Device reported error - cannot identify unit.
b9 Parity divert error - cannot identify unit.
ba Addressing error - cannot identify unit.

Message Buffer Audit Faults
bc Old or new queued audit messages (with accompanying message).
bd Old non-queued audit messages (no accompanying message).

Configuration Manager Fault Codes - With Accompanying Message
c3 Config. manager - excessive recoverable errors.
c4 Config. manager remove directive - excessive errors.
c5 Config. manager remove request - attempt restoration of oos usable unit.
c6 Config. manager limp mode - attempt restoration of oos unusable unit.
c7  Config. manager limp mode - no replacement avail.
c8  Config. manager manual remove.
c9  Unconditional remove - not used by IODRV.

Not Seen By IODRV - No Accompanying Message

cb  Routine soft switch - pcpeih only.

Software Errors - No Accompanying Message

d1  Memory management - page invalid or not in memory.
d2  Memory management - page index too large.
d3  Memory management - segment invalid.
d4  Memory management - segment index too large.
d5  Illegal ost (from kernel).
d6  Protection violation.
d7  Byte or halfword addressing violation.
d8  Instruction privilege violation.
d9  Illegal op code.

System Initialization - No Accompanying Messages

e1  Substantial system recovery has occurred IOPn might be affected.
e2  System initialization - critical.
1. ERROR CODES GENERATED BY INPUT/OUTPUT DRIVER (IODRV)

The codes are in hexadecimal notation.

s_i_size_check_md() d567  SPDU header too long for input buffer; SPDU type is GT.
s_i_size_check_md() d568  Unknown SPDU type header.
s_i_last_norm_data_md() d569  Invalid return code from t_receive().
s_i_last_norm_data_md() d56a  Illegal state - receive data.
s_i_more_norm_data_md() d56b  Invalid return code from t_receive().
s_i_more_norm_data_md() d56c  Illegal state - receive data.
s_i_rec_norm_data_md() d56d  Invalid return code from t_receive().
s_i_rec_norm_data_md() d56e Invalid return code from t_receive().

s_i_rec_norm_data_md() d56f Illegal state - receive data.

s_i_process_spdu_md() d570 Bad byte count from t_receive().

s_i_process_spdu_md() d571 Unknown SPDU type.

s_i_process_spdu_md() d572 Unknown SPDU type.

s_i_process_spdu_md() d573 Illegal length of AB SPDU.

s_i_process_spdu_md() d574 Illegal SPDU header length.

s_i_process_spdu_md() d575 Failed while reading parameter groups of SPDU header.

s_i_process_spdu_md() d576 Illegal concatenation.

s_i_process_spdu_md() d577 Invalid return from s_i_PI_buf_get_md().

s_i_process_spdu_md() d578 Illegal state - receive SPDU header.

s_i_concat_check_md() d579 Illegal concatenation.

s_i_trc_md() d57a Illegal concatenation.

s_i_trc_md() d57b Invalid length of AB SPDU.

s_i_trc_md() d57c Invalid return code from t_receive().

s_i_trc_md() d57d Bad byte count while reading AB SPDU.

s_i_trc_md() d57e Invalid return from t_receive_complete() while reading AB SPDU.

s_i_process_spdu_md() d57f Invalid return code while reading AB SPDU.

s_i_process_spdu_md() d580 Bad byte count from t_receive().

s_i_trc_md() d581 Bad state for orderly release.

s_i_rec_norm_data_md() d582 Bad state for orderly release.

s_i_concat_check_md() d583 Improper concatenation - RS SPDU must be concatenated with meaningless GT SPDU.

s_i_concat_check_md() d584 Improper concatenation - RA SPDU must be concatenated with a PT SPDU.

s_i_trc_md() d585 Failure to discard remainder of SPDU.

s_i_trc_md() d586 Invalid return code from t_receive() when in the discard receive state.

s_i_type_spdu_decode_md() d587 RS/RA SPDU must be concatenated with GT/PT SPDU.

s_i_trc_md() d588 Bad state for orderly release.

s_i_ac_spdu_mi() d601 Session protocol machine in (illegal) state STA01C.

s_i_ac_spdu_mi() d602 Parsing of SPDU failed.

s_i_ac_spdu_mi() d603 No transport connection exists.

s_i_ac_spdu_mi() d604 Expected t_connect_confirm.

s_i_ac_spdu_mi() d605 Invalid session protocol machine state.

s_ac_parse_mi() d606 Invalid token setting in AC SPDU.

s_ac_parse_mi() d607 Invalid parameter group in AC SPDU.

s_ac_parse_mi() d608 Parsing of AC SPDU failed.

s_ac_parse_mi() d609 AC SPDU functional units specified incorrectly.

s_cn_spdu_mi() d60a Expected abort accept or transport disconnect indication.

s_cn_spdu_mi() d60b Receiving side not transport acceptor.

s_cn_spdu_mi() d60c Expected t_connect_confirm.

s_cn_spdu_mi() d60d No transport connection exists.

s_cn_spdu_mi() d60e Invalid session protocol machine state.

s_cn_parse_mi() d60f Invalid token setting in CN SPDU.

s_cn_parse_mi() d610 Invalid duplex/half duplex choice in CN SPDU.

s_cn_parse_mi() d611 SSAP length exceeds S_MAX_SSAP_ID_LEN.

s_cn_parse_mi() d612 Invalid parameter group in CN SPDU.

s_cn_parse_mi() d613 Parsing of CN SPDU failed.

s_i_rf_spdu_mi() d614 Session protocol machine in illegal state (STA01C).

s_i_rf_spdu_mi() d615 Session protocol machine in illegal state (STA01).

s_i_rf_spdu_mi() d616 Expected t_connect_confirm.

s_i_rf_spdu_mi() d617 Session protocol machine in invalid state.

s_rf_parse_mi() d618 Duplex/half duplex option not specified in RF SPDU.

s_rf_parse_mi() d619 Invalid parameter group in RF SPDU.

s_rf_parse_mi() d61a Parsing of RF SPDU failed.

s_i_c_req_mi() d61b User data length exceeds S_U_512_LEN.

s_i_c_req_mi() d61c Failed attempt to construct CN SPDU.

s_i_c_req_mi() d61d Failed attempt to get a transport connection.

s_i_c_req_mi() d61e User data length exceeds S_U_512_LEN.

s_i_c_req_mi() d61f Failed attempt to send CN SPDU.

s_i_c_req_mi() d620 Failed attempt to construct CN SPDU.

s_i_c_req_mi() d621 Sender not transport connection initiator.

s_i_c_req_mi() d622 Session protocol machine in invalid state to receive connection request.

build_cn_spdu_mi() d623 Failed attempt to add the connection ID parameter field to CN spdu.

build_cn_spdu_mi() d624 Invalid token setting in building CN SPDU.
s_i_ab_spdu_mi() d911 Failed attempt to send abort accept SPDU.
s_i_ab_spdu_mi() d912 Failed attempt to send abort accept SPDU.
s_i_ab_spdu_mi() d913 Illegal/invalid state to receive AB SPDU.
s_ab_parse_mi() d914 Missing transport disconnect parameter.
s_ab_parse_mi() d915 Illegal parameter group or length.
s_ab_parse_mi() d916 Illegal user data in AB SPDU.
s_ab_parse_mi() d917 REFLCT parameter not allowed.
s_ab_parse_mi() d918 Illegal parameter identifier.
s_ab_parse_mi() d919 AB SPDU parsing failed.
s_i_aa_spdu_mi() d91a Illegal state (STA01C) to receive AA SPDU.
s_i_aa_spdu_mi() d91b Expected TDisconnect indication.
s_i_aa_spdu_mi() d91c Illegal state to receive AA SPDU.
s_i_req_mi() d91d Expected abort accept, got release request.
s_i_req_mi() d91e User data length > S_U_512_LEN.
s_i_req_mi() d91f Failed attempt to send FN, no reuse, SPDU.
s_i_req_mi() d920 Data token not available.
s_i_req_mi() d921 User data length > S_U_512_LEN.
s_i_req_mi() d922 Failed attempt to send FN SPDU, no reuse.
s_i_req_mi() d923 Failed attempt to send FN SPDU, with reuse.
s_i_req_mi() d924 Data token error.
s_i_req_mi() d925 Illegal state to receive release request.
s_i_racc_rsp_release_mi() d926 Expected abort accept, got release accept request.
s_i_racc_rsp_release_mi() d927 Illegal value for finish request response.
s_i_racc_rsp_release_mi() d928 User data length > S_U_512_LEN.
s_i_racc_rsp_release_mi() d929 Failed attempt to send DN SPDU.
s_i_racc_rsp_release_mi() d92a Failed attempt to send DN SPDU.
s_i_racc_rsp_release_mi() d92b Failed attempt to send DN SPDU.
s_i_racc_rsp_release_mi() d92c Illegal state to receive release accept request.
s_i_racc_rsp_release_mi() d92d Null connection data structure pointer.
s_i_racc_rsp_release_mi() d92e Null connection data structure pointer.
s_i_u_abort_mi() d92f User data length > S_U_512_LEN.
s_i_t_ind_md() d933 Illegal state to receive TDisconnect indication.
s_i_t_ind_md() d934 Illegal state for abort timer to expire.
s_i_u_abort_mi() d935 Illegal state.
s_i_frn_req_mi() d936 Failed to get buffer for FN SPDU.
s_i_frn_req_mi() d937 Failed to get buffer for FN SPDU.
s_i_frn_req_mi() d938 Failed to get buffer for FN SPDU.
s_i_frn_spdu_mi() d939 Parse of FN SPDU failed due to implementation restriction.
s_i_frn_spdu_mi() d93a Enclosure item not supported on FN SPDU.
s_i_frn_spdu_mi() d93b Parse of FN SPDU failed due to implementation restriction.
s_i_frn_spdu_mi() d93c Enclosure item not supported on DN SPDU.
s_i_frn_spdu_mi() d93d Enclosure item not supported on AB SPDU.

1.13 PP HANDLER

Each error code is of the form \texttt{SNN}, where \texttt{S} is the severity of the error and \texttt{NN} is an error identifier unique within the given severity level.

The severity of an error will be one of the following:

0 = Minor error. Either a resource was exhausted, a procedural error was committed, or a minor software error was encountered. In the second two cases, the user may proceed normally, though if a software error occurred, some resources may have been lost.

These messages print at level 2.

1 = Association fatal error. An application association has gone insane. PPH will fail all send or receive requests from the user of the association until PPH is reinitialized, and any indication received by the association will result in an abort. Since the damage was limited to only the single association, other associations may proceed normally, though some resources may have been lost. Note that the affected user process may hang when errors of this sort occur. Each process will receive an \texttt{E_ABORT} event if the PPH is reinitialized. It is the process’ responsibility to clean up and exit when this event is received.

These messages print at level 1.

2 = PPH fatal error. PPH’s global data structures have become inconsistent or corrupted. All associations will be locked up, and PPH will fail all send and receive requests from any user until PPH is reinitialized. An indication received for any association will result in an abort. Note that some or all user processes may hang when errors of this sort occur. Each process will receive an \texttt{E_ABORT} event if the PPH is reinitialized. It is the process’ responsibility to clean up and exit when this event is received.

These messages print at level 1.

If a severity 1 or 2 error is encountered, contact the first level of technical support for instructions on how to reinitialize the PPH.

the major model are given. Format of additional string information is defined as:

\[ m4: p \quad q \quad r \quad s \]

- \( p \) = Output model control function's program address in hexadecimal.
- \( q \) = Output model control block's state in decimal.
- \( r \) = Model control function's program address in hexadecimal.
- \( s \) = Model control block's state in decimal.

**modglob.c**

1. **f5**

Idle\_model() was called and the auxiliary input buffer has not been released. Address and state of the model are given. Format of additional string information is defined as:

\[ m4: p \quad q \]

- \( p \) = Model control function's program address in hexadecimal.
- \( q \) = Model control block's state in decimal.

2. **f6**

Idle\_model() was called and a timer is still running. The timer type, address and state of the model are given. Format of additional string information is defined as:

\[ m4: p \quad q \quad r \]

- \( p \) = Session control block's timer type in hexadecimal.
- \( q \) = Output model control function's program address in hexadecimal.
- \( r \) = Output model control block's state in decimal.

**modglob.c**

3. **f7**

Idle\_model() was called and the session control block is still on the list of created processes. Address of the model and state of the model are given. Format of additional string information is defined as:

\[ m4: p \quad q \]

- \( p \) = Model control function's program address in hexadecimal.
- \( q \) = Model control block's state in decimal.

**sltime.C**

4. **7**

Current timer index in SCB is not the same as the time-out index. Format of additional string information is defined as:

\[ \text{TIM: } p \quad q \]

- \( p \) = Current timer index in hexadecimal.
q = Time-out index in hexadecimal.

1 Connect ID mapping failed. Format of additional string information is defined as:

Tmapfail:p

p = Session connect ID in hexadecimal.

1.15 SPECIAL WARNING MESSAGES

1. LLA AUDIT OUTPUT MESSAGES APPENDIX

The LLA audit output messages come in three types:

- **DIAG** = Diagnostic only.
- **RCVY** = Error detection and associated recovery actions.
- **UNRCVY** = Detection of an unrecoverable error.

**Note:** A percent character, "%", followed by a \( x \), \( lx \), \( d \), and \( ld \) in an error message means that the appropriate value is substituted into the output message at this point.

- \( lx \) = Long (four byte) hexadecimal number.
- \( x \) = Integer hexadecimal number.
- \( d \) = Long (four bytes) decimal number.
- \( d \) = Integer decimal number.

APP:MAINT-RESP
Software Release: 5E14 and later
Message Class: N/A
Application: 5
Type: Output

1. MAINTENANCE RESPONSES APPENDIX

The following is a list of 'responses' error code strings that are used in many of the output messages for switch maintenance activities. The 'response' is additional information on the completion status of the requested action. This information is helpful in understanding why an action could not complete as requested.

ABORTED BY FAULT RECOVERY
An action has been aborted by fault recovery. The action requested by fault recovery will take precedence. This normally means that the circuit is marked to ACT-PROOS and will soon be removed from service.

ALL HDW MAY NOT BE ALLOWED
Some part of an allow request did not work properly and some of the hardware may not have been allowed.

ALL HDW MAY NOT BE INHIBITED
Some part of an inhibit request did not work properly and some of the hardware may not have been inhibited.

ALL RETROFIT-DEFERRED PHS RESTORED
All PHs that had been initialized at the conclusion of a generic retrofit have been restored to service.

AML EXCEEDED
The automatic maintenance limit (AML) for number of out-of-service (OOS) circuits has been exceeded.

AML NOT EXCEEDED
AML on this circuit can not be exceeded because no trunk group is defined for circuit.

APPLICATION IS NOT OPERATIONAL
A transport facility restore request was rejected because the corresponding application circuit is in either the unequipped or growth equipage state. The application must be updated to the operational equipage state before the transport may be restored.

APS RC/V INHIBITED
A manual SET (LP, FS, or MS) request was rejected because APS has been inhibited using RC/V. APS must be allowed using RC/V before a manual SET request can be accepted.

ASSOCIATED CIRCUITS OOS
Hardware required for operation is OOS and must be restored first.

ASSOCIATED UNIT NOT OPERATIONAL
Hardware required for operation is in the growth state.
ATP
All tests or phases have passed while running diagnostics on the circuit.

BAD ARGUMENT IN OPERATE CALL
During resource checks for integrated services line unit (ISLU) line card sparing usage, a non-ISLU circuit was passed to the check function.

BAD BOARD DATA
The request was terminated because bad board data was specified in the trouble locating procedure (TLP).

BAD CIRCUIT TYPE
Bad circuit type was found while performing a removal or restoration of the circuit.

BAD DATA ON REQUEST
The request was terminated because illegal data was received on the initial request.

BAD DDL RECEIVED FROM HSM
The connectivity exercise (performed during restorations of digital facility interface (DFI) and facilities of remote-to-host at links failed due to bad derived data link (DDL) received at the remote switching module (RSM) end.

BAD MEMBER NUMBER
The request was terminated because a bad member number was specified in a resource or path request.

BAD PHASE COMPLETION CODE
The request was terminated because an illegal phase completion code was received.

BAD PHASE NUM IN BGNPHASE
The request was terminated because of incorrect phase number in bgnphase.

BAD PORT FOUND
A port name of zero for a full time slot was found which is an error.

BAD VERB IN REQUEST
Bad verb has been received by maintenance request administration (MRA) (that is, RMV, RST ABT, STP, and so forth).

BEGINNING CAMPON
A camp-on for resources for the requested circuit has started.

BOARD LIST OVERFLOW
The request was terminated because the number of boards on the TLP list exceeded the board limit.

BUT INHIBIT ON
A request to switch to the SLC® 96 protection line was denied because the switch to the P-line is inhibited.

**BY REQUEST**

The request has been requested to stop.

**CALL PROCESSING BLOCKED**

Call processing has been blocked on a particular service group of a line unit as a result of an automatic action.

**CALL PROCESSING RESTORED**

Call processing has been restored on a particular service group of a line unit as a result of an automatic action.

**CAMPON SUCCESSFUL, ALL LINES REMOVED**

During removals of integrated services line unit common data (ISLUCDs) or integrated services line group controllers (ISLULGCs) the subtending line cards have all been removed.

**CAMPON TIMEOUT**

The camp-on of a circuit has timed out.

**CAMPON TIMEOUT, LESS THAN 16 LINES BUSY**

During ISLUCD removal attempts, some lines remained busy for the camp-on duration. Number indicates possible range of activity.

**CAMPON TIMEOUT, LESS THAN 32 LINES BUSY**

During ISLUCD removal attempts, some lines remained busy for the camp-on duration. Number indicates possible range of activity.

**CAMPON TIMEOUT, 32 OR MORE LINES BUSY**

During ISLUCD removal attempts, some lines remained busy for the camp-on duration. Number indicates possible range of activity.

**CAMPON TIMEOUT, SOME CKTS/PORTS MAY BE OOS**

Camp-on timed out waiting for the subtending circuits, and some portion of circuits/ports may have been removed.

**CAMPON TIMEOUT-X LINE BUSY, SOME CHILD CKTS OOS**

During removal of ISLUCDs or ISLULGCs not all of the subtending line cards were removed due to ownership's not being obtained due to call in progress. Those circuits obtained are left OOS. "X" number of lines were found busy and left active. The range of X is 1-10.

**CAMPON TIMEOUT-15 LINE BUSY, SOME CHILD CKTS OOS**

During removal of ISLUCDs or ISLULGCs not all of the subtending line cards were removed due to ownership's not being obtained due to call in progress. Those circuits obtained are left OOS. 10-15 lines were found busy and left active.

**CAMPON TIMEOUT-20 LINE BUSY, SOME CHILD CKTS OOS**

During removal of ISLUCDs or ISLULGCs not all of the subtending line cards were removed due to ownership's not
being obtained due to call in progress. Those circuits obtained are left OOS. 20-30 lines were found busy and left
active.

CAMPON TIMEOUT-30 LINE BUSY, SOME CHILD CKTS OOS

During removal of ISLUCDs or ISLULGCs not all of the subtending line cards were removed due to ownership's not
being obtained due to call in progress. Those circuits obtained are left OOS. 30-31 lines were found busy and left
active.

CAMPON TIMEOUT-32 LINE BUSY, SOME CHILD CKTS OOS

During removal of ISLUCDs or ISLULGCs not all of the subtending line cards were removed due to ownership's not
being obtained due to call in progress. Those circuits obtained are left OOS. 32 lines were found busy and left
active.

CAN NOT RESTORE RCL

RCL could not be restored due to one of the following reasons: 1) protocol failures, 2) parent circuit is out-of-service,
3) RCL is manually out-of-service and an automatic request attempted to restore it, 4) RCL is busy

CAN NOT RESTORE CHANNELS AT OTHER END

Timed out waiting for other end RSM to restore its channels to service.

CANNOT COMMUNICATE WITH MH

Message handler (MH) communication failure.

CANNOT REMOVE CHANNELS AT OTHER END

Channels at the other end of a facility being removed either timed out during the removal or were stopped from
being removed.

CANNOT REMOVE PH ASSIGNED TO INTRA SM MD PATH

Removal requests on MD/MDST7 PH3s assigned to intra-SM MD paths will be denied if no spare PH3 is available.
be BPHs.

CANNOT REMOVE RCL

The removal of the remote communication link (RCL) could not be performed for a variety of reasons.

CANNOT REMOVE CLOCK REFERENCE

The remote clock reference is busy due to other maintenance activity and cannot be removed.

CANT SEND MESSAGE

The request was not started because a message cannot be sent to the appropriate process.

CARRIER FAILURE

An automatic action has taken place because a carrier failure condition on an integrated digital carrier unit (IDCU)
facility has occurred.

CARRIER FAILURE CLEARED
An automatic action has taken place because a carrier failure condition on an IDCU facility has cleared.

**CATP**

Diagnostic was conditionally completed; not all tests could be run. Some problems may still be present in the circuit.

**CC CIRCUIT IS MRA BUSY**

The ISLUCC circuit request was rejected because it was busy with another maintenance request.

**CC COMMUNICATION FAILURE**

While attempting to complete the request, an error was encountered in communication with the CC. Therefore, the request could not be completed successfully.

**CC DUPLEX FAILURE - REMOVE MATE FIRST**

Both CCs in the unit are OOS.

**CC DUPLEX FAILURE**

The last CC in a unit has been removed and now no service can be provided by the unit.

**CC TEST TIMED OUT**

The peripheral diagnostic task timed out.

**CD CIRCUIT IS MRA BUSY**

The ISLUCD circuit request was rejected because it was busy with another maintenance request.

**CD DUPLEX FAILURE**

The last ISLUCD in a unit has been removed and now no service can be provided by the unit.

**CDFI_MAP READ FAILURE**

A database read of the relation RLCDFI_MAP failed. The failure can be due to database errors or to missing tuples in the relation.

**CGA NOT CLEARED**

A carrier group alarm (CGA) exists on a facility on which some configuration request is being attempted.

**CHANNEL GROUP WITHOUT SERVICE**

Unconditional removal of the PH completed successfully, resulting in loss of service.

**CIRCUIT DATA ERROR**

The requested action has encountered an error in the RLCKTDATA relation for the requested circuit/unit.

**CIRCUIT INVOLVED IN LINE SPARING**

Remove requests are denied due to the ISLU circuit's being actively involved in a spare path between two lines. Possible circuits are integrated services line unit metallic access network (ISLUMAN), integrated services line unit line card (ISLULC), or ISLULGC.
CIRCUIT MANUALLY REMOVED
A diagnostic requested by an automatic maintenance activity can not be completed on this circuit because it is manually removed.

CIRCUIT NOT IN GROWTH STATE
A diagnostic request specifying the growth option can not be completed because the circuit is not in the growth state.

CIRCUIT ON MRA RECOVERY QUEUE
The request circuit is on the MRA recovery queue, therefore no further action will be taken.

CKTDATA READ FAILURE
Software failed in read of static data relation RLCKTDATA. Could be caused by corrupt office-dependent data (ODD) or invalid input circuit name.

CLNK ON THIS T1FAC AND MATE OOS OR UNEQ
A configuration request was made that requires the common time slot (CTS) for the RSM to move. The mate T1 facility (T1FAC) is either OOS or unequipped. During the power down of the mate module controller/time slot interchange (MCTSI), the central processor intervention (CPI) force on the active MCTSI has been lost. The user should make an evaluation to see if the CPI force needs to be replied.

COMDAC REMOVE FAILURE
A request to remove a COMDAC did not complete successfully.

COMMON CIRCUIT BUSY
A remove/restore request for a subtending circuit, will be denied if the common circuit is busy. A switch request, of the common circuits, will also be denied if one of the common circuits are busy.

COMMON CIRCUIT DUPLEX FAILURE
The last common circuit in a unit has been removed and no service can be provided by the unit.

COMMON CIRCUIT OFF NORMAL
During a remove, diagnose, or restore of a child of a common circuit, the common circuit or both common circuits were found to be off normal.

CONTENTION CONTROL REQUEST FAILED
A request for a maintainable circuit failed to invoke the Infinite Contention Elimination process.

CONTENTION CONTROL REQUEST TIMEOUT
A request for a maintainable circuit timed out waiting for an acknowledgement from the Infinite Contention Elimination process.

CONTROL SWITCH FAILURE
An attempt to do a soft switch has failed.
COULD NOT ASSIGN TO REQUESTED GRP, ANOTHER GRP IS OOS
Request to restore a PH with "grp=" option is denied - there is at least one other currently OOS channel group that needs to be restored first.

COULD NOT ASSIGN TO REQUESTED GRP, ANOTHER GRP IS DEGRADED
Request to restore a PH with "grp=" option is denied - there is at least one other currently DEGRADED channel group that needs to be restored first.

COULD NOT GET TIMER
An action has been stopped due to the inability to obtain a machine-level timer.

COULD NOT OBTAIN CFC DATA BLOCK
The request has been stopped because a configuration control data block could not be obtained.

COULD NOT OBTAIN GLOBAL DIAGNOSTIC DATA BLOCK
The request has been denied because a global diagnostic data block could not be obtained.

COULD NOT OBTAIN QUEUE DATA BLOCK
The request has been denied because a queue data block could not be obtained.

COULD NOT OBTAIN SPARE DATA BLOCK
The request has been denied because a spare data block could not be obtained.

CPI FORCE ON THE MATE HAS BEEN LOST
CPI force on the mate MCTSI has been lost. The user needs to reapply the force if necessary.

CURRENT RINGING LOAD IS TOO HIGH
The total number of calls that are currently ringing is greater than the total number of ringing jobs that a single ring generator (RG) can support.

DATA BASE ERROR
A general database error occurred.

DATA DELIVERY READ FAILURE
An attempt to read data delivery keys resulted in a failure.

DCTU COMMUNICATION ERROR
There was a communication error with the requested directly connected test unit (DCTU) during the requested action.

DEFERRED MAINTENANCED QUEUE IS FULL
The request could not be completed because the deferred maintenance queue was full.

DEFERRED RESTORAL SCHEDULED
The unit is being put on the deferred queue to be restored later.

**DESIRED CFAC’S BUFFER IS BUSY**

The buffer for the cluster facility (CFAC) is currently in use (probably due to high message volume), so messages cannot be sent over the RCL. Try again later.

**DGN NOT ALLOWED DUE TO RECENT MCTSI MAINTENANCE ACTIVITY**

Diagnostics of the MCTSI is not allowed if recent MCTSI maintenance activities have occurred. The MCTSI diagnostics that are not allowed are those requested by REX or those that are due to a helper request as part of the DLI diagnostics. The recent maintenance activities that are used to determine if the current request is allowed could have been either automatic or manual. REX requested maintenance or use of the MCTSI as a helper circuit for DLI diagnostics do not count as recent MCTSI maintenance activities.

**DIAGNOSTIC CONTROL BLOCK CORRUPTED**

DGN request found corrupted dynamic data. Retry request.

**DIAGNOSTIC STOPPED BY CFT/MRA**

The requested diagnostic has been stopped either by a manual request from the user or by an automatic request from MRA.

**DID NOT RECEIVE RMV FAC COMPLETION MSG**

Timed out while waiting for a facility (FAC) remove response (7 minute timer).

**DRIVER ERROR**

The request was rejected because message switch kernel process (MSKP) error occurred.

**DUE TO LEVEL 2 ERROR**

Action completed due to errors detected during level 2 communication for the embedded operations channel (EOC) and the time management channel (TMC).

**DUE TO LEVEL 3 ERROR**

Action completed due to errors detected during level 3 communication for the EOC and the TMC.

**DUE TO LINE SPARING CONFLICT**

The requested action was rejected because there was a line sparing conflict.

**DUE TO LOSS OF LEVEL 2**

Action completed due to loss of level 2 protocol for the EOC and the TMC.

**DUE TO RELATION RLACT_SPR POPULATION OR READ ERROR**

Unable to verify if ISLU line card sparing is active as static relation RLACT_SPR read failed.

**DUPLEX FAILURE**

Recovery on the unit can not be performed because the unit has duplex failed.
DUPLEX FAILURE FOR UPD:PMPPERF, UNIT NOW BEING PUMPED

This message is to inform the user that a duplex failure has occurred on the unit that was being updated. The unit is now being pumped.

DUPLEX FAILURE, DIAGNOSTIC IN PROGRESS

A duplex failure of this unit has occurred, and an automatic diagnostic is scheduled.

DUPLEX FAILURE, MANUAL ACTION REQUIRED

A duplex failure of this unit has occurred, and some manual intervention is needed to restore this unit.

DUPLEX FAILED RINGING GENERATORS

Both integrated services line unit ringing generators (ISLURG) are now out-of-service. Ringing is now sourced only from the high-level service circuit (HLSC).

EARLY TERMINATION

Early termination of diagnostics was requested by peripheral fault recovery.

ESCALATED TO HARD SW: ACT UNIT DEGRADED

Fault recovery actions were initiated during an ISLUCC operation to cause forced switch. The circuit has been marked degraded.

ESCALATED TO HARD SW: ACT UNIT PRE-OOS

Fault recovery actions were initiated during an ISLUCC operation to cause forced switch. The circuit has been marked PRE-OOS and recovery actions have begun.

EX COMMANDS NOT SUPPORTED ON POWERPC BASED SM

Exercise commands are not supported on SMs equipped with a PowerPC®-based core microprocessor circuit pack, such as CORE700.

EXTERNAL RG VOLTAGE CHECK FAIL

The voltage of the external ring generator is outside a specified range.

FAC OOS-CGA NOT CLEARED

During the restoration of a digital facility, a carrier group alarm was seen on the facility, and it was left OOS.

FAC OOS-SPARE UNAVAILABLE

The subtending facility was removed because the spare transmission multiplexer (TMUX) was unavailable.

FAC SOFT SPARED

The subtending facility was successfully moved to the spare TMUX.

FAC SOFT UNSPARED

The subtending facility was successfully moved to the restored TMUX.
**FAC SPARED**
The subtending facility was successfully moved to the spare TMUX but internal performance monitoring or alarm data may have been lost.

**FAC UNSPARED**
The subtending facility was successfully moved to the restored TMUX but internal performance monitoring or alarm data may have been lost.

**FAILED HASH SUMS**
The requested action was stopped because the unit failed its hash sum checks.

**FAILED TO GET CONTROL OF CIRCUIT**
The request was stopped due to the inability to get control of the circuit.

**FAILED TO STOP ALL SUBTENDING CIRCUITS**
An attempt to stop all busy subtending circuits has failed.

**FAILURE TO OPEN A FILE**
The request was terminated because there was failure to open a pump file from the disk.

**FAILURE TO RETRIEVE NEXT REQUEST FROM QUEUE**
The request timed out while waiting on the deferred maintenance queue. The request continues to be blocked by some previous request.

**FAILURE TO SEIZE RESOURCE**
An attempt to obtain an essential resource, such as ownership of a circuit, failed. The resource may be busy with another job, busy with a stable call, unavailable due to a generally high level of resource usage, etc.

**FAR-END LOOP SET**
A far end loop around has been set on an IDCU facility due to an automatic request.

**FAR-END LOOP CLEARED**
A far end loop around has been cleared on an IDCU facility due to an automatic request.

**FAULT-STATUS UNKNOWN**
A fault has occurred during the requested action, and the status of the circuit is unknown.

**FEATURE PACKAGE NOT LOADED**
The request was rejected for the specified unit because the feature package is not loaded.

**FLASH MEMORY FAILURE**
The CC was not restored due to a failure to update FLASH memory.

**FORCE RELEASE FAILED**
A request to unconditionally clear protection on an IDCU facility has failed to complete. However, if the pinjack was set, it has been cleared. The release could eventually occur automatically.

FOREIGN VOLTAGE ON RG BUS

A request to restore an access interface unit (AIU) ring generator (RG) has failed because a significant foreign voltage was detected on the RG bus.

GENERIC DIFFERENCE CURRENTLY TRUE

The request was not honored because the module owning the requested circuit is currently running a different software issue than in running on the administrative module (AM).

HARDWARE ERROR DURING SWITCH

During the reconfiguration of the remote clock (RCLK) an internal hardware error was detected.

HARDWARE INCONSISTENCY DETECTED

Request to restore a PH is denied - the requested channel group's hardware type is incompatible with the PH hardware type.

HARDWARE INIT FAILURE

The request has stopped because hardware initialization of the circuit has failed.

HASHUM ERROR

Pump of a PH failed due to hash errors.

HDW IS SET TO INHIBIT SWITCH STATE

A request to switch hardware has failed. The software switch flag for the hardware has been set to "inhibit switch".

HIGHER NUMBERED PIDB NOT IN APPROPRIATE STATE

The remove request has been rejected due to a higher numbered PIDB not being in the OOS-RMVD state.

HIGHER PRIORITY ACTION INTERVENED

Request aborted due to a higher priority recovery action.

IDCU COMMUNICATION FAILURE

An action has been stopped due to the inability to communicate with the integrated digital carrier unit (IDCU) hardware.

IN PROGRESS

The requested action is currently in progress.

INCONSISTENT DATA

An inconsistency had been detected in the data during the requested action on the circuit.

INCONSISTENT DATA FOUND DURING SWITCH ATTEMPT

Software detected data inconsistency while trying to switch PHs. Either PHs are not on the same shelves or data has
been set up incorrectly.

**INHIBIT ALREADY OFF**
Switch to protection inhibits are already off.

**INHIBIT ALREADY ON**
Switch to protection inhibits are already on.

**INHIBIT FAILURE**
An attempt to inhibit interrupts on a circuit has failed.

**INTERNAL ERROR**
Internal inconsistencies and/or other errors found.

**INTERNAL SYSTEM FAILURE**
Internal inconsistencies were found.

**INSUFFICIENT MEMORY**
The restoration of the unit has been stopped because there is insufficient memory available for this unit to execute properly.

**INTERNAL HARDWARE ERROR**
During the reconfiguration of the RCLK an internal hardware error was detected.

**INVALID RESPONSE FROM TST OF FAC**
While waiting for the result of the TST:FAC input request, an unexpected message type was received.

**ISPA FAILURE: SOME CIRCUITS LEFT ACT**
The Integrated Services Port Administrator has failed to remove all of the requested ports, so some of the circuits may have been left active.

**ISPA FAILURE: SOME CIRCUITS MAY BE OOS**
The Integrated Services Port Administrator has failed to restore all of the requested ports, so some of the circuits may have been left out-of-service.

**LINE SPARING RELEASED**
The message is to inform that a line that was spared has now been released.

**LOSS OF MULTI FRAME ESTABLISH**
The request was rejected because multi-frame establish was lost before the switch request could be processed.

**LOWER NUMBERED PIDB NOT IN APPROPRIATE STATE**
The restore request was rejected due to a lower position PIDB being in the OOS-RMVD state.

**MAINTENANCE PERFORMED VIA ELEMENT MANAGER**
Maintenance operations on this application pack are performed by the Element Manager.

**MANUAL ACTION REQUIRED**

A failure of this unit has occurred, and some manual intervention is needed to restore this unit.

**MANUAL SEPARATION IN EFFECT**

The RSMs have been manually separated. Certain operations are not allowed during this condition.

**MANUALLY OR AUTOMATICALLY STOPPED**

The requested message has been stopped either by a manual request from the user or by an automatic request from MRA.

**MATE CIRCUIT IS MRA BUSY**

The request is denied - the mate circuit is in the process of being removed or restored by MRA.

**MATE COMDAC MRA BUSY**

The request was rejected because the mate COMDAC is MRA busy.

**MATE COMDAC OOS**

The request was rejected because the mate COMDAC is out of service.

**MATE COMMON CIRCUIT OFF NORMAL**

During a remove, diagnose, and restore of a common circuit, the mate common circuit was found to be off normal or degraded. The diagnostics were skipped and an unconditional restore of the requested common circuit was performed.

**MATE ERRORS DURING UPDATE**

While performing the requested action on the mate circuit, errors were detected on that mate circuit.

**MATE EXTERNAL CACHE FAILED**

The built in self test (BIST) on the mate's external cache failed during mate update preventing the mate MCTSI from being restored to service.

**MATE FAILED WHILE INITIALIZING A SUBUNIT**

Mate update failed while initializing a subunit of the unit.

**MATE IS ACT_FRCD**

The request has been rejected because the mate circuit is active forced.

**MATE IS ACT RESTRICTED**

A request is currently in progress on the MATE digital carrier line unit (DCLU).

**MATE IS OOS**

The request has been rejected because the mate of the circuit is OOS.
MATE IS POWERED OFF
The requested action for the unit was rejected because the mate is powered off.

MATE IS UNAVAILABLE
A mate communication path loopback failure occurred.

MATE NOT EQUIPPED
The request has been rejected because the mate circuit is not equipped on this unit.

MATE UPDATE FAILED WHILE UPDATING MESSAGE HANDLER
The request was terminated because a failure occurred while attempting to update the mate of an MH.

MELNK ALREADY IN SERVICE
Specified MELNK is not out-of-service.

MELNK ALREADY MANUALLY REMOVED
Specified MELNK is already in a manual out-of-service state.

MELNK UNEQUIPPED
Input command specified an unequipped MELNK number.

MEPIPE INITIALIZING
An MEPIPE initialization is in progress. If appropriate, the command should be re-tried.

MH COMMUNICATION FAILURE
The message handler failed to drain peripheral messages from the active communication path.

MH COMMUNICATION RESOURCE FAILURE
The message handler failed to send a peripheral diagnostic task due to unavailable MH resources.

MH1/MH2 PUMP FAILURE
A pump of the MH operational image to an MH1 or MH2 in growth failed during mate updating.

MSGTYPE UNDEFINED
The request was terminated because an unrecognized message type was received.

MUST RESTORE TO STANDBY
The circuit must be restored to standby.

NO ACKNOWLEDGEMENT FROM OTHER END
Timed out while waiting for a response from the far-end RSM.

NO ACKNOWLEDGEMENT
A handshake channel failure has occurred on the phase request.

**NO ISLUCC AVAIL FOR RG BUS SWITCHES**

Ringing generator (RG) BUS switch request is denied - ISLUCC is not available.

**NO ISLUMANs AVAILABLE FOR RG BUS CONNECTS**

An ISLURG was restored to service but there were no ISLUMANs in service to close output relays to.

**NO MELNK EQUIPPED ON ACCESSIBLE SMS**

No MELNK is equipped on any accessible SM in the specified SM range.

**NO MELNK FOUND TO RESTORE**

All MELNKS are in service.

**NO MELNK IN REQUESTED STATE**

No MEPIPE/MELNK is in the requested maintenance state.

**NO PHs FULLY PASSED PUMP AND INIT**

Concurrent PH tests were aborted because all pump/initializations failed for PHs.

**NO REQ IN PROGRESS**

The request has been rejected because the action on the requested circuit is not in progress.

**NO SPARE AVAILABLE, PH DEGRADED**

Conditional removal of a PH was denied because no spare PHs were available, PH left degraded.

**NO SPARE AVAILABLE**

Conditional removal of a PH was denied because no spare PHs were available.

**NO SWITCH, DGN IN PROGRESS ON ASSOC CKTS**

Switch request is denied - the mate circuit is currently being diagnosed.

**NO T1FAC MATCH FOR HFAC**

Could not find matching T1 facility (T1FAC) for the host facility (HFAC) given (uses RLRCB_HCB to associate HFAC and T1FAC).

**NOT ALL PSU PH UNITS RESTORED**

A packet switch unit (PSU) restoration from duplex failure completed but some PHs were left OOS.

**NOT ALL RETROFIT-DEFERRED PHS RESTORED**

One or more PHs that had been initialized at the conclusion of a generic retrofit have been left OOS.

**NTR**
No tests run. Circuit was unable to be tested.

**OOS THRESHOLD EXCEEDED**

The request has been denied because the maintenance threshold has been exceeded.

**OPERATING SYSTEM CALL FAILURE**

An unexpected failure of an operating system primitive occurred.

**OTHER END CHANNELS REMOVED**

The channels at the other end of a facility, which is being removed, were successfully removed in a previous attempt.

**OVERRIDDEN BY HIGHER REQUEST**

The request has been overridden by a higher priority request. This is normally seen when running in min-mode, which turns all automatic conditional restoration requests to removal request.

**PARENT CIRCUIT IS BUSY WITH ANOTHER MAINTENANCE REQUEST**

The request has been rejected because the parent circuit is busy with another maintenance request.

**PARENT CIRCUIT OOS**

The request has been rejected because the parent circuit is OOS.

**PARENT SCHEDULED FOR RECOVERY**

The fault detected on this circuit is believed to be caused by the circuit's parent. Therefore, the parent circuit will be scheduled for diagnosis.

**PC DATA PROBLEM**

The requested action was stopped because of a dynamic data problem in the peripheral control area.

**PENDING**

Facility is in service, FELP request pending. Only after facility is removed will FELP request be honored.

**PERIPHERAL PUMP FAILURE**

The peripheral image could not be pumped.

**PH AUXILIARY PROCESSOR PUMP FAILED**

The PH pumped successfully, but the pump of the auxiliary processor, which may also be referred to as the DMA, IO or NP processor, failed.

**PH INIT TIMED OUT**

The PH pumped successfully, but the PH software failed to initialize in the required time interval.

**PH HASH SUM CHECK TIMED OUT**

The PH did not respond to the HASH SUM check request in the required time interval.
PH PHDA INIT FAILED
The PH pumped successfully, but PH Data initialization failed.

PH SWITCH FAILED
A PH switch failed due to errors on the PH being switched to. The PH being switched to is believed to be faulty, therefore the PH has been put on a deferred maintenance queue and will be diagnosed and restored, dependent upon system load.

PH-DSLG HARDWARE INCONSISTENCY
User requested a restoration of a PH with a specific channel group to be assigned to the PH. The requests has been denied because the channel group is being assigned to the wrong PH hardware type, audit has been scheduled to correct the problem. The PH is left OOS.

PHASE TABLE ERROR
The request was rejected because a phase table error has occurred.

PIDB TIMESLOT REMOVAL FAILED
An attempt to remove a PIDB timeslot failed.

PIDB TIMESLOT REMOVAL TIMED OUT
Timed out awaiting PIDB timeslot removal.

PIDB TIMESLOT RESTORAL FAILED
An attempt to restore a PIDB timeslot failed.

PIDB TIMESLOT RESTORAL TIMED OUT
Timed out awaiting PIDB timeslot restoration.

PORT BUSY
Diagnostics were skipped on a circuit because the circuit is not in an out-of-service state. This is most likely due to the circuit's associated port being busy.

PORT NAILED UP
The requested action was stopped because the port(s) is/are nailed up.

PORT PROCESSOR COMPLETION CODE - ERROR IN MESSAGE RETURNED
The request was terminated because a message from the port processor was received with an unexpected data field.

PORT PROCESSOR MESSAGE VERIFY - TIMEOUT ERROR
The request was terminated because a timeout occurred while waiting to get a message back from PH.

PORT PROCESSOR SEND MESSAGE ERROR RETURN
The request was rejected because a message could not be sent to the port processor due to user input error.
PORT PROCESSOR SEQUENCE NUMBER - ERROR IN MESSAGE RETURNED
The request was terminated because an out-of-sequence message was received from the port processor.

PORT RESTORAL FAILED
Restoration of ports associated with a PH channel group failed. Since the restoration request for the PH was manual, the PH is marked OOS and will require manual action to recover.

PORT RESTORAL FAILED, DEFERRED RESTORAL WITH DGN REQUESTED
Restoration of ports associated with a PH channel group failed. Since the restoration request for the PH was automatic, the PH is marked OOS and put on a deferred maintenance queue, and will be diagnosed and restored in the near future.

PORTS STILL ASSIGNED TO DPIDB
During requests for directly connected peripheral interface data bus (DPIDB) removal (degrowth applications), some ports were found still assigned to DPIDB types. Need to unassign ports prior to removal and degrowth.

PREVIOUS REQUEST IN PROGRESS
The request was not accepted because a previous request was in progress on the requested circuit.

PREVIOUS SWITCH IN PROGRESS
The hardware switch request cannot be completed due to a previous switch in progress.

PROCESS LIMIT EXCEEDED
The request was not started because terminal process limit has been exceeded.

CRAFT REQUEST LIMIT EXCEEDED
The request was not started because the user request limit has been exceeded.

PROTECTION LINE NOT EQUIPPED
A request was denied because there is no SLC® 96 protection subscriber loop carrier digital facility interface (SDFI) [protection SDFI (P-SDFI)] for this remote terminal (RT). The P-SDFI is unequipped.

PROTECTION LINE UNAVAILABLE
Removal of a SLC® 96 DFI failed because the SLC® 96 protection SDFI was in use.

PROTECTION SWITCH FAILURE
An automatic request for a protection line switch of an IDCU facility has failed. This means that the facility has experienced a facility failure and has been removed.

PROTECTION SWITCH OK
An automatic request for a protection line switch of an IDCU facility was successful.

PROTECTION UN-SWITCH FAILURE
An automatic request to take an IDCU facility off protection has failed.
PROTECTION UN-SWITCH OK
An automatic request to take an IDCU facility off protection was successful.

PUMP RECEIVED STOP REQUEST
The restoration request was stopped because the pump software received a stop request from peripheral fault recovery (PFR).

QUEUE LIST OVERFLOW
The request has been stopped because the camp-on queue list has overflowed.

RCLK IS INHIBITED
If the RCLK is inhibited, subtending circuits cannot have hardware checks allowed.

RCOSC IN WARMUP
The remote clock oscillator (RCOSC) is in the WARMUP state and cannot be restored until the RCOSC is OOS.

RCXC MUST BE STBY
A conditional removal of active remote clock cross couple (RCXCs) was not allowed. Unconditional removals will remove an active RCXC but may affect the timing of the SM.

REFERENCE SOURCE UNAVAILABLE
The facility associated with the remote clock reference (RCREF) cannot provide a timing source.

RELEASE FAILED
The request was terminated because the release of the resource failed.

REMOTE DEFECT INDICATION FACILITY FAILURE
The specified circuit or the immediately connected transmission path is faulty, as indicated by the detection of a Remote Defect Indication (RDI) signal from the far end.

REMOVAL OF LAST ACTIVE PH ON CRITICAL PSU IS NOT ALLOWED
A packet switch unit (PSU) that is designated a critical unit PSU has to have at least one ACT PH. If you desire to remove the last ACT PH from service, in recent change set the CRIT PSU field on RC/V View 22.2 (EQUIPMENT UNIT -- PACKET SWITCH UNIT) to "N".

REQUEST DENIED - OSPS PORTS BUSY
Removal of an ISLU circuit containing Operator Service Position System (OSPS) is denied except for unconditional requests.

REQUEST DENIED - DGN IN PROGRESS ON ASSOC CKTS
The request is denied - at least one associate circuit is currently being diagnosed.

REQUEST DENIED-SOME PORTS BUSY
Unable to obtain ownership of ports on requested ISLU circuit. Usually caused by port status errors that prevent
control checks.

**REQUEST DENIED-AVOIDS CMT CONNECTIVITY LOSS**
The request has been denied - connectivity would be loss.

**REQUEST ALREADY PENDING**
A request to switch to the SLC® 96 protection line (P-Line) was denied because a previous request was in progress.

**REQUEST LIMIT EXCEEDED**
The request has been denied because the request limit has been exceeded.

**REQUEST MUST BE CONDITIONAL**
This message is not valid with the unconditional option.

**REQUEST MUST BE UNCONDITIONAL**
This message is valid only with the unconditional option.

**REQUEST NOT ALLOWED, CDI INTERRUPTS INHIBITED**
The request for the test access circuit (TAC) was not allowed because the control data interface (CDI) had inhibits on.

**REQUEST NOT ALLOWED**
The request was not allowed on the circuit. This is generally due to the state of a related circuit (such as, the parent circuit is OOS) or to the state of this circuit (such as, IDCU facilities in certain automatic OOS states must be manually removed before a manual restoration is allowed.)

**REQUEST NOT ALLOWED FOR CH GRP**
The request is not allowed for the channel group currently assigned to the PH. This is generally a response to a conditional request that can not be honored without losing calls.

**REQUEST NOT ALLOWED ON TIMESLOT GROUP 0**
Non-subtending manual removes of active TIMESLOT GROUP 0 and non-subtending manual conditional restores of TIMESLOT GROUP 0 are not allowed.

**REQUESTED BY AUDITS**
An automatic action has taken place due to a request by audits.

**REQUESTED BY TM**
An automatic action has taken place due to a request by terminal maintenance.

**REQUESTED GROUP IS MRA BUSY**
User requested a restoration of a PH with a specific channel group to be assigned to the PH. The request has been denied because the channel group was in the process of being restored to another PH.

**REQUESTED GROUP IS UNEQUIPPED**
User requested a restoration of a PH with a specific channel group to be assigned to the PH. The request has been denied because the channel group does not exist. The PH was left OOS.

**RESIDENT SPARE TASK FAILED**

The ISLU line card sparing activation task failed during internal ISLU operation. No sparing path was set up and static data changes will be backed out.

**RESOURCE NAME REUSED**

The requested was terminated because resource identifier was reused without releasing the circuit.

**RESOURCE UNAVAILABLE FOR SPARING**

The requested action was rejected because the sparing resources were unavailable.

**RESTORE OTHER CLNK AND TRY AGAIN**

A configuration request was made that affects the only communication link (CLNK). Two CLNKs must be active before such a configuration attempt can be made.

**RESTORED TO ACTIVE**

User requested restoration of a PH to standby, but the circuit was made active because some channel group was not assigned a PH.

**RESTORED TO STANDBY**

The requested circuit was restored to the standby state rather than the typical active state. For CCS channel groups, the standby state is the default.

**RESTORED FROM DUPLEX FAILURE**

The unit is now back in service from the duplex failure condition.

**RESTORED FROM SIMPLEX FAILURE**

The unit is now back in service from the simplex failure condition.

**RESTORED TO ACTIVE MINOR**

An ISLUCD has been returned to service from OOS state and status updated to ACT/MIN.

**RESTORED TO OOSFE**

If the parent ISLUCD is OOS, the PIDB status is updated to OOS/family of equipment and parent OOS is returned. If the AIU COMDACs are duplex failed, the line pack or ring generator is updated to OOS/family of equipment and parent OOS is returned. If the AIU COMDAC is OOS, the timeslot group status is updated to OOS/family of equipment and parent OOS is returned. If the AIU line pack is OOS, the line circuit is updated to OOS/family of equipment and parent OOS is returned.

**RESULT FROM TST FAC NEVER RECEIVED**

Time out while waiting for the result from the TST:FAC input request (10 or 15 seconds).

**REX NOT ALLOWED ON LAST CG OF THIS PHV TYPE**
REX request to remove the PHV is not allowed since the channel group (CG) currently assigned to the PHV is the last channel group type of this PHV hardware in the PSU. This is a response to a REX request that can not be honored without losing calls.

**RG BUS CONNECT FAILED, BUSES RETURNED TO MATE RG**

As part of ISLURG restoration, the mate ISLURG must be disconnected from bus and the new one connected. This message says that the new ringing generator (RG) failed and relays closed back to original configuration.

**RGBUS CONNECT FAILED, ALSO FAILED RECONNECT TO MATE RG, ISLUMAN DEGRADED**

During a restoration of an ISLURG, connection of outputs to available MAN boards failed and the mate (RG) could not be connected either. ISLUMAN was marked degraded to indicate that no ringing source from ISLURGs is possible.

**RGBUS CONNECT FAILED TO AN IN SERVICE RG, ISLUMAN DEGRADED**

During a restoration of an ISLUMAN, the connect attempt to an available ringing generator circuit failed so that ringing current was not supplied to this ISLUMAN.

**RG CANNOT BE SUBSEQUENTLY RESTORED**

The conditional remove of an active degraded ring generator was denied.

**RG ON RESIDING AIU MUST BE RESTORED**

Ring generator on the residing AIU must be restored.

**RG SOFT INIT FAILURE**

Ring generator software initialization failure.

**RMV FAC UNSUCCESSFUL**

While coordinating removal of the two facilities at each end of a communication link, the far end facility removal was stopped or not started.

**RTA ERROR**

A routing and terminal allocation (RTA) primitive failed on a port of the requested circuit.

**RUNNING ON BEST SIDE**

The request to switch sides of the RCLK can not be completed because currently used (ACTIVE) RCLK side is operating in a better mode than the the other side of the RCLK.

**SAVE AREA OVERFLOW**

The request was rejected because a save area (stack) overflow occurred while looping.

**SCAN ERROR**

The request was terminated because there was failure to get the value of a scan point.

**SEIZED RESOURCE UNAVAILAB**

An attempt to obtain ownership of a circuit failed due to the resources being unavailable.
SM ISOLATED OR BAD/MISSING PAGED PRODUCT

The diagnostic or conditional restore request was terminated because SM is temporarily isolated or the requested diagnostic product is missing (not on 3B disk) or corrupt.

SM TIMED OUT WAITING FOR PH

The request was rejected because the SM did not receive a response message from the allocated PH.

SM TIMED OUT WAITING FOR PI

The request was rejected because the SM did not receive a response message from the allocated PI.

SMEST READ FAILURE

Software failed in a read of the dynamic circuit status relation RLSMEST. This could be caused by corrupted memory or a bad circuit name passed to the database read primitive.

SOME SUBTENDING CIRCUITS ARE BUSY

Request was denied because one or more subtending or child circuits were busy.

SOME SUBTENDING CIRCUITS MAY BE OOS

Part of the request was denied because one or more subtending or child circuits were out-of-service.

SPARE PATH HAS BEEN RELEASED UCL, RC REQUIRED

An ISLU line card sparing operation has been interrupted due to an unconditional removal of an associated ISLUMAN, ISLULGC, ISLULC. Service is no longer provided to the line card that was spared. The recent change (RC) line card sparing view must be brought up and the line "un-spared" to clean up static data changes.

SRA FAILURE

An attempt to obtain ownership of a circuit failed due to the resource's being busy with another job or stable call.

SRA RESOURCE FAILURE

An attempt to obtain ownership of a switching resource allocator (SRA) resource failed due to the resource's being busy with another job or stable call.

STATUS UNKNOWN

The requested CPI message was sent to the SM but no acknowledgement was received.

STF SPARE OF LINE POSSIBLE, USE RCV

The message is to inform the user that a spare line can be added using recent change.

STF

Some tests have failed while running diagnostics on this circuit.

SUBTENDING CIRCUITS FAILED INITIALIZATION

During a restore, some subtending circuits failed initialization.

SUBTENDING FAC OOS-CGA NOT CLEARED
The subtending facility was left out-of-service due to a CGA.

**SW FAILED, RST SCHEDULED ON STBY UNIT**

Switch of ISLUCC controllers failed. The standby ISLUCC will now be scheduled for RMV/DGN/RST.

**SW SUCCEEDED, RST SCHEDULED ON STBY UNIT**

Switch of ISLUCC controllers was successful. The standby ISLUCC will now be scheduled for RMV/DGN/RST.

**SWITCH FAILED**

Active-standby states of the requested and mate circuits could not be switched, typically due to a hardware failure.

**SWITCH FAILED, DEFERRED DGN ON TARGET PH**

The PH switch failed - The PH, that was being switched to, will be put on the deferred queue to be diagnosed and restored.

**SWITCH NOT ATTEMPTED, DGN IN PROGRESS ON ASSOC CKTS**

A switch of ISLUCC or ISLUCD will not be allowed if diagnostics are in progress in the unit as false errors could occur. Wait for diagnostic requests to finish.

**SWITCH NOT ATTEMPTED, MATE CIRCUIT IS MRA BUSY**

The mate ISLU circuit already has some type of maintenance request in progress. Cannot switch to a busy circuit. Wait for mate request to finish.

**TASK FAILED FOR RGBUS CONNECTS FAILED FOR SIMPLEX RG**

Ringing current cannot be provided by ISLURGs due to connection failure. Probable hardware failure.

**TASK FAILED RGBUS DISCONNECT MATE RG, NO RGBUS CHANGES**

During ISLURG restoration, the mate RG would not let go of ringing buses, so the newly restored ISLURG could not be connected.

**TASK FAILED TO SWITCH CONNECTED ISLUMANs TO ACTIVE MATE RG, ISLUMAN DEGRADED**

During ISLURG removal, the available ISLUMANs that were connected to that RG were switched to mate ringing generator for ringing current. This message indicates the switch-over failed and ringing current cannot be provided from any generators.

**TERMINAL MAINTENANCE ERROR**

Terminal maintenance has encountered an error for a trunk group member of the requested circuit.

**TIMEOUT**

A timeout has occurred while waiting for a message or while waiting for a resource.

**TIMEOUT ON MH ACKNOWLEDGEMENT**

A timeout has occurred while waiting for an acknowledgement from the message handler (MH).

**TIMEOUT WAITING FOR DDL, MESSAGE FROM OTHER SM**
The connectivity exercise (performed during restorations of DFIs and facilities) of remote-to-host links or remote-to-remote links [for inter-cluster links (ICL)] timed out waiting for a DDL message from the other end of the communication link.

**TIMEOUT WAITING FOR RCL RESPONSE**
Timed out while waiting for a response from the cluster digital facility interface (CDFI) handler (10 seconds).

**TIMESLOT GROUP 0 NOT IN APPROPRIATE STATE**
The request was rejected because TIMESLOT GROUP 0 is not in the appropriate state of OOS-FE. TIMESLOT GROUP 0 is either OOS-RMVD or OOS-FLT.

**TIP-RING CABLE MISSING**
The initialization of a new unit will report if the tip/ring cable is missing.

**TO PREVENT CC/TMUX PROGRAM INCONSISTENCY**
Switch of a DNUSCC not allowed due to inconsistent images between DNUSCC circuits. Currently the active DNUSCC program update level matches the level of the TMUXs, and a DNUSCC switch would make the images inconsistent.

**TRANSPORT IS MRA BUSY**
A request on a remote application circuit is not allowed when the parent transport circuit is busy.

**TST OF FAC FAILED**
Periodic ICL connectivity exercise failed.

**ULP CONFIGURATION FAILURE**
An ISDN U line pack was not configured successfully.

**UNABLE TO CHANGE CLOCK MODE**
The RCLK could not have its mode changed. Either the RCOSC or the RCREFs are not in the state necessary for the requested mode.

**UNABLE TO GET CONTROL OF RGBUS DUE TO OOS ISLUMAN**
ISLUMAN was out-of-service and therefore the RG cannot be connected to it. When the ISLUMAN is restored, connection will be made.

**UNABLE TO GET CONTROL OF RGBUS FROM MATE RG**
Since RGBUS is shared between ISLURGs and only one can be connected at a time, the first one must be removed from the bus prior to connecting the other. Control of resources must be obtained first to prevent stepping on active jobs, and this control was not received in this case.

**UNABLE TO MATCH ON DG FEATURE ID**
Bad feature identification (FID) was received for software optioning.

**UNABLE TO PROTECTION LINE SWITCH**
An action has been stopped because a conditional request to remove an IDCU facility was unable to protection-line-switch.

**UNABLE TO RESTORE TO ACTIVE**

After the RCLK was restored to STBY, the attempt to switch RCLK sides failed.

**UNABLE TO RUN TST FAC**

Either the FAC to be tested was OOS, or the connectivity exercise returned an error.

**UNDEFINED COMMAND**

The requested was rejected because an undefined function was found in op-type statement.

**UNDEFINED TYPE IN GETDATA**

The request was rejected because undefined data type was found in getdata.

**UNEXPECTED ERROR RESPONSE MESSAGE FROM RT**

Maintenance request administrator (MRA) has received an error response message from a remote terminal which it cannot act upon. Subsequent action may be taken by other layer message handlers.

**UNEXPECTED MESSAGE RECEIVED**

While waiting for a message, an unexpected message was received (either illegal message type, or message relating to a different circuit).

**UNEXPECTED PIDB TIMESLOT ENCOUNTERED**

An error was encountered while attempting to move channels from the PIDB being removed to another PIDB.

**UNEXPECTED RESPONSE MSG FOR FAC RMV**

While waiting for the host FAC removal response, an unexpected message type was received.

**UNIT ALREADY OOS**

The request was rejected because the unit is already OOS.

**UNIT DOES NOT EXIST**

The request was rejected because the unit does not exist.

**UNIT IN GROWTH STATE**

The request was not allowed because the unit is in the growth state.

**UNIT IN REQ STATE**

The request was rejected because the circuit was in the requested state. Normally such requests are permitted if they include running diagnostics, and denied otherwise.

**UNIT IN TROUBLE ANALYSIS STATE**

The request has been stopped, and the circuit has been placed in the "Trouble Analysis" state, because automatic diagnostics have been run (and passed) too many times recently.
UNIT IS ACT_FRCD
The request has been rejected because the unit was forced to be active.

UNIT IS DEGRADED
The request has been rejected because the mate or one of its subtending circuits is not available and the unit has been put in a degraded state. Call processing may be degraded.

UNIT IS OUT-OF-SERVICE
The request has been rejected because the unit is OOS.

UNIT NOT EQUIPPED WITH SCAN PTS.
The request has been rejected because the unit is either not a SCAN board or the scan points are not equipped in the office-dependent data (ODD).

UNIT UNEQUIPPED
The requested action was rejected because the requested unit is unequipped.

UNKNOWN HANDLER RETURN
While waiting for a response from the DFI handler, an unknown return code was received.

USED RESOURCE NOT DEFINED
The request was rejected because resources being operated upon were not defined in the resource identifier.

WAIT FOR DGN TO FINISH
The request has been rejected because diagnostics were in progress for the circuit.

WAITING FOR DGN ON MATE TO COMPLETE
Requests on ISLUCC and ISLUCD was not permitted while the mate controller was busy with a DGN request.

WARNING: PORTS MAY STILL BE OOS
During the restoration of ISLU/ISLU2 or packet switching unit (PSU) circuit, some port control attempts failed but the associated circuit was restored back in service. Therefore the ISLU/ISLU2 or PSU circuit is left in service but some ports may still be out-of-service (OOS).

WARNING: PORTS MAY STILL BE IN SERVICE
During the removal of ISLUGCs, some port control attempts failed but the associated line card was removed from service anyway due to unconditional removal request.

WARNING - THE SM IS RUNNING SLOW
An inhibit hardware checks input message has inhibited the operation of cache on the MCTSI. The MCTSI may be running at only 60% to 65% of its normal speed.

WOULD REMOVE LAST MELNK
Attempting conditional removal of last MELNK on MEPIPE.

**XPC CHIPS NOT IN INFO TRANSFER STATE**

The X.25 protocol is not established over the ICL. Try the restoration again.
1. MACHINE-DETECTED INTEROFFICE IRREGULARITIES APPENDIX

1.1 Introduction

This appendix provides additional information about machine-detected interoffice irregularities (MDIIs) used throughout the switch. The term "MDII" refers to the identification of signaling problems between switching systems.

MDIIs are reported any time a signaling problem is detected on an incoming or outgoing trunk call. They are reported through the REPT:MDII output message.

MDIIs are generated for incoming, outgoing and two-way trunks and the MDII is based on the direction, incoming or outgoing, of the call being attempted at the time the signaling problem is detected. This appendix provides a list of the possible MDIIs and information as to:

- The direction the MDII can apply to, incoming (ICT) or outgoing (OGT) trunk calls.
- What traffic count can be affected.
- What the acronym means.
- What the MDII means from a call processing standpoint.
- What action the system took as a result of the MDII. This may include logical port removal or restoration, and traffic and/or plant measurements affected.
- Whether trunk error analysis (TERA) acts on the MDII
- What corrective action is needed to clear the problem.

Answers to these questions and other information is provided in the following sections and in the MDII tables (Tables 1, 2, and the MDII Table Descriptions) below.

1.2 General

MDIIs are not just reported, they can also result in the pegging of traffic counts, the removal of a trunk, and may have quick-check and/or peer group analysis performed by TERA. The traffic counts affected by a particular MDII are dependent upon the type of trunk, its direction (incoming, outgoing, two-way), and its service class.

To determine what traffic/plant counts are affected by MDIIs, refer to the traffic/plan count description table (Table 1). To determine which counts are pegged for a particular MDII, refer to the sections that follow and the MDII description table (Table 2). The counts reported in each of the traffic/plant reports are specified in the MDII Table Descriptions.

1.3 MDII Reports

There are times when a REPT:MDII message cannot be printed. Such a case is when the switching module (SM) in which the MDII occurred cannot send the MDII report to the administrative module (AM). In this case the number of the discarded MDII is maintained and reported the next time an MDII can be sent to the AM to be printed. When the MDII is successfully sent, the discarded MDII count is reset.

The reporting of MDIIs can be inhibited or allowed through the INH:MDII and ALW:MDII input messages. Refer to the individual manual pages of these messages for details.

1.4 MDII Counts
For all MDIs, whether the MDII is printed or not (throttled or inhibited), an incoming or outgoing MDII counter will be pegged depending upon the call direction. The incoming and outgoing MDII counters are INMDII and OUTMDII respectively.

For the following far-end classes of service, only the incoming and outgoing MDII counts are pegged. This is because these classes of service are reserved for test calls.

<table>

</tr>
<tr>
<td>TMLTPDCTU</td>
<td>LTP to control the directly connected test unit (DCTU).</td>
</tr>
</tbody>
</table>

1.5 MDII Trunk Group Measurements

As part of the PLNT24 report there is a section (part 24) that reports the number of MDIs that have occurred on each trunk group in the last 24 hour period. This report includes all the MDIs that have occurred on a trunk group whether or not an individual MDII was reported (throttled or inhibited) for that trunk group. The counts reported per trunk group are the number of incoming MDIs (TGMDINC) excluding partial dial timeouts, the number of partial dial timeouts (TGMDPDT), the number of outgoing trial 1 MDIs (TGMD1TR), and the number of outgoing trial 2 MDIs (TGMD2TR). Refer to Tables 1, 2, and the MDII Table Descriptions for more information.

The counts are printed as part of the PLNT24 report, and can also be printed on demand. The demand report outputs the most recent 24-hour plant report. The PLNT24 report is generated once a day.

1.6 Carrier Counts

If an MDII is on an incoming call from a directly connected carrier, the DINCST traffic count will be pegged in addition to the counts normally pegged for that MDII.

An MDII on an outgoing call to a directly connected carrier will peg the DOTGCST traffic count in addition to the counts normally pegged for that MDII. If in this case the outgoing MDII is a wink start, steady on-hook (WSN) or wink start, steady off-hook (WSR), the (DOTGSST) count will also be pegged.

In outgoing call on a tandem trunk to a carrier, all failures up to and including failure to receive an SSD wink will cause the (SOTGSSD) traffic count to be pegged. An MDII occurring during an outgoing call on a tandem trunk to a carrier will cause the (SOTGACK) traffic count to be pegged. This count will include all failures that occur after the receipt of a second start dial (SSD) wink, up to and including failure to receive the acknowledgment wink.

In addition to the MDII counts, all MDIs on integrated services digital network (ISDN) user part (ISUP) trunks and bearer independent call control (BICC) connections will also peg ISUP MDII counters. The incoming and outgoing ISUP counts are IMDII7 and OMDII7 respectively. These counts will be pegged for all ISUP and BICC MDIs unless the message transfer point (MTP) is down. On the switch equipped with a CNI ring, “MTP down” means that the CNI ring is not operational. When the CNI is down, no MDII counts (INMDII,OUTMDII,IMDII7,OMDII7) will be pegged for ISUP or BICC MDIs.

1.7 Exceptions

For an MDII on an incoming call, when the class of service on the trunk is FC_PF or PC_PFLASH and the MDII is PDA, PDT, PST or VCA, no errors will be pegged on any trunk for dialing irregularities because the entity on the other end of the trunk may be a digit-by-digit overlap outpulsing trunk which may not send all the digits needed due
to the caller’s going on-hook.

If the start signal type is dial-tone or immediate dial, or dial-tone with answer supervision (FCANSDTONE), no trunk errors for dialing irregularities will be pegged because the entity on the other end of the trunk is a person, not a machine. However, if the trunk has a revertive pulsing (RP) signaling type and there is an equipment failure, the MDII will be printed.

### 1.8 Logical Port Removal

The logical port associated with a trunk will be removed from service for the following MDIIs that occur on an outgoing trunk call (refer to Table 2).

<table>
<thead>
<tr>
<th>MDII</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABF</td>
<td>ICA</td>
</tr>
<tr>
<td>DDF</td>
<td>PFR</td>
</tr>
<tr>
<td>DSN</td>
<td>PST</td>
</tr>
</tbody>
</table>

The status of the port applied is dependent upon the type of outgoing trunk used. If the trunk is a one-way outgoing trunk, then the port status will be:

**OOS BLKD - PCTF AUTO**

If the trunk is a two-way trunk, then the port status will be:

**OOS MTCE HW PCTF AUTO**

Incoming trunks are generally not automatically removed from service. Refer to APP:PORT-STATUS appendix in the Output Messages Manual for details on port statuses.

### 1.9 TERA Action

The action taken by TERA is a function of the TERA recovery action specified for a trunk group and whether or not TERA is enabled for the switch.

TERA can be enabled or disabled for the entire switch using RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]. If TERA is disabled, the TERA recovery action specified for a trunk group has no affect. If enabled, then what TERA will do when MDIIs occur on a trunk is dependent on the recovery specified for that trunk group.

The TERA recovery option in effect on a trunk group can be obtained and altered using RC/V View 5.1 (TRUNK GROUP). The following list specifies the TERA recovery options available.

<table>
<thead>
<tr>

2. MDII TABLES

2.1 Overview

The following are guidelines for interpreting the information provided in Tables 1 and 2 and the MDII Table Descriptions section.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table 1</td>
<td>Specifies the traffic/plant reports that report counts affected by MDIs.</td>
</tr>
<tr>
<td></td>
<td>Specifies which counts are reported in that report.</td>
</tr>
<tr>
<td>Table 2</td>
<td>Specifies the counts affected by MDIs.</td>
</tr>
<tr>
<td></td>
<td>Specifies what the count means.</td>
</tr>
<tr>
<td></td>
<td>Specifies the reports in which that count is reported and under what name or title it can be found.</td>
</tr>
<tr>
<td>MDII Table Descriptions</td>
<td>Specifies all the MDIs that can be reported. Each is identified by the MDII acronym that will be printed for that MDII and the list is in alphanumeric order.</td>
</tr>
<tr>
<td></td>
<td>Specifies the direction in which the MDII can occur by a &quot;Yes&quot; indication in the appropriate column.</td>
</tr>
<tr>
<td></td>
<td>The direction column ICT indicates incoming. The direction column OGT indicates outgoing.</td>
</tr>
<tr>
<td></td>
<td>Specifies the traffic/plant counts pegged in addition to any general rule specified above in the sections on counts. When an MDII occurs, only the counts associated with the direction in which the MDII occurred may be pegged, even though counts for both directions may be listed.</td>
</tr>
<tr>
<td></td>
<td>Specifies not only the MDII description, but also provides action that can be taken to resolve the cause of the MDII.</td>
</tr>
<tr>
<td></td>
<td>Specifies a yes/no to indicate if any action will be taken by TERA for this MDII. The specific TERA action is dependent on what has been specified for the trunk group in which the MDII occurred.</td>
</tr>
</tbody>
</table>

</tbody>
</table>

**Description**  
Reported during digit collection and analysis of the second stage of a traditional two-stage international outbound call under one or more of the following conditions:

1. A time-out occurred while waiting for the next digit of the digit sequence and at least one valid digit had already been collected.
2. An unexpected digit was received from the far office.
3. During the translation of the digit sequence, the number of digits received was determined to be invalid.
4. For MF address signaling, an unexpected “null” sequence (KP + ST) was received.

**Corrective Action**

1. Verify the functionality of the trunk hardware and service circuit used for digit collection (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS. Verify that the attribute setting is compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
3. Verify that the partial-dial timing conditions at both offices are compatible. Check global parameter Gl2spdt (contains the partial-dial timing value for the collection of the digit sequence of the second stage) (refer to the Data Translations manual).
4. Check the translations data in RC/V Views 9.3 [LOCAL DIGIT (OFFICE DIALING)] and 9.5 [INCOMING TRUNK DIGITS (OFFICE DIALING)] for the expected number of incoming digits. Also, check forms 5309 and 5300-3 of the Office Records Manual for the incoming digits. If the incoming digits in the office records match the digits found in the recent change views, then have the far office check its data translations (refer to the Recent Change Reference manual).

#### 2.2.2 2SPST (MDII Description)

<table>
<thead>

<td>INMDII</td>
</tr>
</tbody>
</table>

**Description**  
During the collection of the digit sequence of the second stage of a traditional two-stage international outbound call, a time-out occurred while waiting for the arrival of the first digit from the far office.

**Corrective Action**

1. Verify the functionality of the trunk hardware and service circuit used for digit collection (refer to...
the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in
the Input Messages manual). If the hardware is functioning properly, have the far office check
its corresponding trunk hardware.

(2) Verify that the permanent-signal timing conditions at both offices are compatible. Check global
parameter Gl2pstmt (contains the permanent-signal timing value for the collection of the digit
sequence of the second stage) (refer to the Data Translations manual).

(3) Verify that the second start dial wink timing conditions at both offices are compatible.

### 2.2.3 2SVCA (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Second stage vacant code announcement</td>

<tr>
<td>Traffic/Plant Counts</td>
<td>TGMDINC, INCST, INMDII</td>
</tr>
</tbody>
</table>

**Description**

May occur during the collection and translation of the digit sequence of the second stage of a traditional
two-stage international outbound call that uses fully coded addressing (FCA). 2SVCA is reported under
one or more of the following conditions:

1. Translation of the second stage digit sequence did not result in a destination type indicating an
   international direct distance dialed call using FCA.

2. For CCS trunks, an invalid MF digit code was received during the collection of the second
   stage.

**Corrective Action**

1. Verify the functionality of the trunk hardware and service circuit used for digit collection (refer to
   the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in
   the Input Messages manual). If the hardware is functioning properly, have the far office check
   its corresponding trunk hardware.

2. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS. Verify that the attribute setting
   is compatible with the far office’s interpretation of the trunk’s operation (refer to the Recent
   Change Reference manual).

3. Check the translations data in RC/V Views 9.3 [LOCAL DIGIT (OFFICE DIALING)] and 9.5
   [INCOMING TRUNK DIGITS (OFFICE DIALING)] for the expected incoming digits. Also, check
   forms 5309 and 5300-3 of the Office Records Manual for the incoming
digits. If the incoming
digits in the office records match the digits found in the recent change views, then have the far
office check its data translations (refer to the Recent Change Reference manual).

### 2.2.4 ABF (MDII Descriptions)

<td>OUTMDII, OUTGCST, OTGCSPERF, TGMD1TR, TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**

An abandon handshake failure occurred for an outgoing call over a revertive pulsing trunk. This failure
may occur when the call has been abandoned during outpulsing. When a call is abandoned, a start
pulsing signal (loop closed) is sent to the far office to drive it to "telltale". When driven to telltale, the far
office is expected to return a reverse-battery condition to initiate the telltale signaling sequence. ABF is
reported when the far office fails to return the reverse-battery condition or if somewhere within the telltale
signaling sequence, a handshake failure occurs.

**Corrective Action**

1. Verify the functionality of the trunk hardware and revertive pulsing transceiver used for outpulsing (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.

2. Verify the compatibility of the trunk interface hardware at both offices.

3. Verify that the revertive pulse signaling electrical and timing conditions at both offices are compatible.

### 2.2.5 ACK (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>

<td>TERA Yes</td>
</tr>
<tr>
<td><strong>Traffic/Plant Counts</strong></td>
<td>OTGCSPERF, OUTGCST, OUTMDII, TGMD1TR, TGMD2TR</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>No acknowledgement wink received or unexpected acknowledgment wink received. An acknowledgment (ACK) wink (on-hook/off-hook/on-hook series of transitions) was not received from the far office over a trunk that uses equal access (EA) signaling protocol, or an ACK wink was received in place of a steady off-hook signal from the far office over a trunk that uses modified equal access signaling. The ACK wink is expected from the far office after all digits have been outpulsed using EA signaling, while a steady off-hook is expected when using modified EA signaling.</td>
</tr>
<tr>
<td><strong>Corrective Action</strong></td>
<td>(1) Verify the functionality of the trunk hardware (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware. (2) Verify the functionality of time slot interchange unit's signal processor hardware (refer to any appropriate diagnostic in the Input Messages manual). (3) Check RC/V View 5.1 (TRUNK GROUP) attributes TRK CLASS and INC TNDWNK. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual). (4) Verify that the timing conditions at both offices are compatible. The ACK wink timing conditions for the possible call connections are: (a) EA end office (EO) to interexchange carrier (IC), transition EO to IC, transition EO to access tandem (AT) to IC, EAOE to AT to IC, AT connecting non-EAOE to IC, AT to EAOE using CCS7 trunk and AT to IC using EAMF trunk: 100-600 ms wink pulse width, 8.6 seconds maximum wait time to receive ACK wink. (b) EAOE to international carrier (INC): 100-1500 ms wink pulse width, 9.5 seconds maximum wait time to receive ACK wink. (c) EAOE to AT to INC, AT to EAOE using CCS7 trunk and AT to INC using EAMF trunk: 100-1500 ms wink pulse width, 13.5 seconds maximum wait time to receive ACK wink. (5) For modified EA signaling, check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS and View 10.2 (ROUTING) attributes SIG PRO, PREF DIG, and RT DES TYP. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).</td>
</tr>
</tbody>
</table>

### 2.2.6 ANF (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Automatic number identification failure</td>
</tr>
</tbody>
</table>
Automatic number identification failure reported under one or more of the following conditions:

1. During the initiation of a software defined network (SDN) or leased network transaction, the calling sequence digit count retrieved from the call record was not equal to 10 (10 digits were expected). For this case, ANF is reported for toll-connecting, centralized automatic message accounting (CAMA) operator number identification (ONI) (SDN transaction only), and CAMA automatic number identification (ANI) trunks, and for trunks that use ISUP7 signaling.

2. During CAMA ANI digit collection and analysis, the "I" (information) digit within the ANI digit sequence received from the far-end indicated an identification failure (I = 2 or I = 5) in the originating end office. In this case, operator identification of the calling number was required.

3. During ANI digit collection over a toll-connecting trunk that uses equal access (EA) signaling and where ANI is requested, a null or invalid ANI sequence was received. The null or invalid ANI sequence is indicated by one of the following:
   a. A KP digit immediately followed by a ST digit.
   b. EA information read from ODD relation RLFCEAINFO (keyed on the first two digits received in the ANI sequence).

4. During the initiation of an OSPS SS7 signaled call, the signaled charge number parameter in the incoming IAM was received with less than 10 address digits, or the incoming IAM did not contain a charge number parameter.

Corrective Action

1. Verify the functionality of the trunk hardware and service circuit used for digit collection (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.

2. Check RC/V View 5.1 (TRUNK GROUP) attributes TRK CLASS, BLK NO ANI, and View 5.5 (TRUNK MEMBER) attribute ANI. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).

3. Check the RLFCEAINFO ODD tuples for the correct data (refer to the Data Translations manual).

4. Contact the originating 4ESS toll office and inform them of the ANI signaling error.

### 2.2.7 ANF2 (MDII Description)

<table>
<thead>
<tr>

</tr>
<tr>
<td>TERA</td>
<td>Yes</td>
</tr>
</tbody>
</table>
| Traffic/Plant Counts | OUTMDII  
TGMD1TR  
TGMD2TR |

**Description**
For calls over a trunk that uses the traditional, equal access, or modified equal access signaling protocol, a time-out occurred while waiting for an off-hook signal from the far office after the called digit sequence was successfully outpulsed. This off-hook signal is expected for outgoing trunk calls where ANI information is required. For trunks using the traditional or equal access signaling protocols, the off-hook indicates that the far office is ready to receive the ANI digit sequence. For trunks using the modified equal access signaling protocol, the off-hook indicates that the called number was received and that operator hold should now apply to the call.

**Corrective Action**
1. Verify the functionality of the trunk hardware (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Verify the functionality of the time slot interchange unit's signal processor hardware (refer to any appropriate diagnostics in the Input Messages manual).
3. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS, and View 5.5 (TRUNK MEMBER) attribute ANI. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
4. Verify that the timing conditions at both offices are compatible. The off-hook signal is expected from the far office within 20 seconds after the called digit sequence has been outpulsed for traditional and equal access signaling. For trunks using modified equal access signaling, the off-hook is expected from the far office within 9 seconds for a U.S. call, and within 14 seconds for an international call.
5. For modified EA signaling, check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS and View 10.2 (ROUTING) attributes SIG PRO, PREF DIG, and RT DES TYP. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).

### APMTO (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>APM message Timeout</td>
</tr>
<tr>
<td>Expansion</td>
<td>ICT, OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>No</td>
</tr>
</tbody>
</table>
| Traffic/Plant Counts | INMDII  
OUTMDII  
TGMDINC |

**Description**
This MDII is used exclusively for bearer independent call control (BICC) signaling for IP bearer Calls. This MDII can occur at the originating packet switch (OPS) - outgoing side of a packet BICC IP call or terminating packet switch (TPS) - incoming side of a packet BICC IP call.

At the OPS this occurs when switch has sent an initial address message (IAM) and has timed out waiting for an application transport message (APM) with TPS' bearer information. After the MDII fires, the call is released and no second attempt is made.

At the TPS this MDII occurs when the switch has sent an APM to the OPS with its bearer information and has timed out waiting for a response APM, which indicates the bearer path is connected. After the MDII fires, the call is released and there is no re-try.

**Corrective Action**
The problem may be from one or more of the following sources: signaling failure, long setup time, abnormal configuration at the far-end office.

1. If there is signaling failure, then some portion of the CCS network between the two offices has
a failure that did not allow the IAM to reach the far-end office. It is possible that the IAM did reach the far-end office, but the APM message sent back did not reach the originating office. If there is a signaling failure, several other CCS related MDIs would also be firing.

(2) If long setup delays is the problem, several APMTO MDIs will be seen. If the APMTO MDII is occurring on the outgoing side of the call, the user can fine-tune the wait period between the IAM sending and the APM reception by changing Gitapm_ops office parameter. Increase this value until the APMTO MDII stops. The range is from 1 to 30 seconds. If the APMTO MDII is occurring on incoming side of the call, the user can fine-tune the wait period between the APM sending and the APM reception by changing Gitapm_tps office parameter. Increase this value until the APMTO MDII stops. The range is from 1 to 30 seconds.

(3) If the ATO MDII occurs infrequently, then it is likely that the far-end is in a transient state. If this occurs there is no corrective action required. The situation should be self-correcting. However, if the trunks continue to fail call setup, then contact the far-end office.

### 2.2.10 AST (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Acknowledge seizure signal timeout</td>

</tr>
<tr>
<td></td>
<td>OUTMDII</td>
</tr>
<tr>
<td></td>
<td>TGMD1TR</td>
</tr>
<tr>
<td></td>
<td>TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**
Position acknowledged seizure timeout. May occur over a centralized automated message accounting (CAMA) operator keying/talking trunk pair where the operator number identification (ONI) function is used to collect the calling digit sequence. In this case, a time-out occurred while waiting for a position acknowledged seizure signal (PASS) (off-hook) from the far office over the keying trunk after an office seize position (OSP)(off-hook) signal was sent to the far office over the talking trunk.

**Corrective Action**

1. Verify the functionality of the trunk hardware (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Verify the functionality of the time slot interchange unit's signal processor hardware (refer to any appropriate diagnostic messages in the Input Messages manual).
3. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS. Verify that the attribute setting is compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
4. Check the RLKEY_TALK ODD tuple for the operator keying/talking trunk pair. Verify that this pair matches the pair recognized at the far office (refer to the Data Translations manual).
5. Verify that the timing conditions at both offices are compatible. The PASS is expected from the far office within 5 seconds after the OSP signal is sent to the far office.

### 2.2.11 ATO (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Address timeout</td>
</tr>
<tr>
<td>Expansion</td>
<td>OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>Yes</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>OMDII7</td>
</tr>
<tr>
<td></td>
<td>OTGCSPERF</td>
</tr>
<tr>
<td></td>
<td>OUTGCST</td>
</tr>
</tbody>
</table>
This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when the outgoing side of a CCS call has sent an initial address message (IAM) and has timed out waiting for a address complete message (ACM) which is needed to continue the call. After the MDII fires, the trunk is idled and no second attempt is made.

Release is sent to the far-end office. Since there is no re-try the outgoing trouble count is pegged on the first trial.

The problem may be from one or more of the following sources: signaling failure, long setup time, abnormal configuration at the far-end office.

1. If there is signaling failure, then some portion of the CCS network between the two offices has a failure that did not allow the IAM to reach the far-end office. It is possible that the IAM did reach the far-end office, but the ACM message sent back did not reach the originating office. If there is a signaling failure, several other CCS related MDII's will also be firing, that is, BAF and CAF.

2. If long setup delays is the problem, several ATO MDII's will be seen in a variety of trunks. The user can fine tune the wait period between the IAM sending and the ACM reception by changing Glacmtim office parameter. Increase this value until the ATO MDII's stop. The Range is from 20 to 30 seconds.

3. If the ATO MDII occurs infrequently, then it is likely that the far-end trunk is in a transient state that does not allow IAM reception, that is, initialization and audits. If this occurs there is no corrective action required. The situation should be self-correcting. However, if the trunks continue to fail call setup, then contact the far-end office.

### 2.2.12 BAF (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Blocking acknowledgment failure</td>
</tr>
<tr>
<td>Expansion</td>
<td></td>
</tr>
<tr>
<td>Direction</td>
<td>ICT</td>
</tr>
<tr>
<td>TERA</td>
<td>Yes</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>TGMDINC, INMDII, TGMD1TR, TGMD2TR</td>
</tr>
</tbody>
</table>

This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when a blocking (BLO) CCS message is sent for an ISUP trunk and the far-end office has not responded with a blocking acknowledgment (BLA) message. The BLA or CGBA reception indicates that the far-end office has blocked its trunk and inhibited call originations.

The detailed scenario is an ISUP trunk is taken out-of-service for either OOS,MTCE,DSBLD, OOS,MTCE,LKDO, or OOS,MTCE,FE status. This status transition stimulates a blocking message sent to the far-end office to inhibit traffic requests. BLO sending can also start because of an SM initialization. This BLO message has been sent every 4-15 seconds based on office parameter, BLO RSND for 1 minute without receiving a BLA message. At this point the BAF MDII is printed and no more BLO messages are sent.

The BAF MDII can also occur when a circuit group blocking (CGB) is sent for a set of ISUP trunks and the circuit group blocking acknowledgement (CGBA) is received indicating the ISUP trunk or CIC Blk was not successfully blocked.

The problem may be from one or more of the following sources: signaling failure, abnormal configuration at the far-end office.
If there is signaling failure, then some portion of the CCS network between the two offices has a failure that did not allow the BLO to reach the far-end office. It is possible that the BLO did reach the far-end office, but the BLA message sent back did not reach the originating office. If there is a signaling failure, several other CCS related MDIs will also be firing, that is, ATO, CAF, etc.

The BAF MDII may occur when the far-end trunk is in a transient state that does not allow remote blocking to occur, that is, initialization, SM inaccessible and audits. If this occurs there is no corrective action required. The situation should be self-correcting. The first call attempt from the far-end office (reception of an IAM) will be answered with a BLO message. This will block the far-end trunk. If however, the BAF MDIs continue to fire, contact the far-end office.

### 2.2.13 BLFCA (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Blocking a fully coded address</td>

<td>ICT, OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>No</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>TGMDINC, INMDII, OTGCSPERF, OUTMDII, TGMD1TR, TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**
Blocked a fully coded addressed international outbound call - reported for international outbound calls using fully coded addressing (FCA) under one of the following conditions:

1. For an incoming trunk, digit analysis determined that the call was an equal access (EA) three-stage international outbound call using FCA after translating the first stage digit sequence. In this case, the service class of the trunk did not indicate a LATA toll-connecting trunk. The call was blocked since billing of EA calls only takes place if the call arrives on a LATA toll-connecting trunk.
2. For an outgoing trunk, digit analysis determined that the call destination type was international direct distance dialing using FCA. In this case, global parameter Gloftyp did not indicate that this is a local office (toll office was indicated).

**Corrective Action**

1. Check RC/V View 5.1 [TRUNK GROUP] attribute TRK CLASS. Verify that the attribute setting is compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
2. Check the translations data in RC/V Views 9.3 [LOCAL DIGIT (OFFICE DIALING)] and 9.5 [INCOMING TRUNK DIGITS (OFFICE DIALING)] for the expected incoming digits. Also, check forms 5309 and 5300-3 of the Office Records Manual for the incoming digits. If the incoming digits in the office records match the digits found in the recent change views, then have the far office check its data translations (refer to the Recent Change Reference manual).
3. Check RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)] attribute OFFICE TYPE. Verify that it is set to the correct value (refer to the Recent Change Reference manual).

### 2.2.14 CAF (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Circuit reset acknowledgment failure</td>
</tr>
<tr>
<td>Expansion</td>
<td>ICT, OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>No</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>TGMDINC, INMDII, OUTMDII</td>
</tr>
</tbody>
</table>
TGMD1TR
TGMD2TR

Description
This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when a reset circuit (RSC) message for ISUP or BICC has been sent and the far-end office has not responded. The reception of a response message indicates that the far-end office has reset its trunk and the trunk is idle. The detailed scenario for ISUP trunks is an ISUP trunk has sent RSC for some reason and the far-end office does not respond with a UQL, RLC, REL, or RSC message. RSC is sent every 4-15 seconds based on office parameter RSC SHORT for 1 minute, without receiving a response. At this point the CAF MDII is printed.

The detailed scenario for BICC is actions on a BICC CIC block or individual CIC has sent RSC or GRS for some reason and the far-end office does not respond with a GRA, UCIC, or RLC message. RSC/GRS is sent every 4-15 seconds based on office parameter RSC SHORT for 1 minute, without receiving a response. At this point the CAF MDII is printed. RSC continues to be sent every 2-30 minutes based on office parameter RSC LONG until the far-end answers. The detailed scenario for CCIS6 trunks is a CCIS6 trunk has sent RST for some reason and the far-end office does not respond with a UQL, RLG, CLF, or RST message. RST is sent every 4-15 seconds based on office parameter RSC SHORT for 2-30 minutes, based on office parameter RSC LONG. When the long timer expires, RST will be sent at RSC LONG intervals until the far-end office answers.

Corrective Action
The problem may be from one or more of the following sources: signaling failure or abnormal configuration at the far-end office.

1. If there is signaling failure, then some portion of the CCS network between the two offices has a failure that did not allow the RSC/RST to reach the far-end office. It is possible that the RSC/RST did reach the far-end office, but the response message did not reach the originating office. If there is a signaling failure, several other CCS related MDIIs will also be firing, that is, ATO, BAF, etc.

2. If the CAF MDII occurs infrequently, then it is likely that the far-end trunk is in a transient state that does not allow RSC/RST reception, that is, initialization and audits. If this occurs there is no corrective action required. The situation should be self-correcting. The near-end office continues to send the RSC/RST message until the far-end answers. However, if the CAF MDIIs continue to fire, then contact the far-end office.

2.2.15 CAI (MDII Description)

<table>
<thead>

<td>TGMD1TR</td>
</tr>
<tr>
<td></td>
<td>TGMD2TR</td>
</tr>
</tbody>
</table>

Description
This MDII is used for common channel signaling (CCS) and session initial protocol (SIP). This MDII occurs when an outgoing CCS call has sent an initial address complete (IAM) to establish part of a call and has received an address incomplete indication rather than an address complete message (ACM). The address incomplete indication means that the address signal received in the IAM is not sufficient for setting up the call. For CCIS6, and address incomplete message is received. For ISUP or BICC, a release (REL) message with a cause field set to 28 is received before an ACM was received. The CAI MDII is generated on the receipt of one of these messages. There is no re-try. Since there is no re-try and a call is lost, the OUTGCST count is pegged on the first trial.

<tr>
<td>Traffic/Plant Counts</td>
<td>IMDII7</td>
</tr>
</tbody>
</table>
| Description | This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when an incoming CCS trunk has received an initial address message (IAM) containing mutilated or invalid digits. Reorder tone is provided to the caller or a release (REL) message with the cause field set to 41 is sent to the
far-end office for ISUP calls or BICC calls. The incoming trunk is idled.

**Corrective Action**

This problem could arise from the following situations: inconsistency of software release between offices or invalid digit detected during digit translation. Try VFY:OFC on the incoming trunk/BICC group with the digit string present in the IAM message. Observe the results and enhance the DAS until the incoming digit string is understood and the call can be routed.

### 2.2.20 CKF (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>

<tr>
<td><strong>Traffic/Plant Counts</strong></td>
<td>TGMDINC</td>
</tr>
<tr>
<td></td>
<td>INCST</td>
</tr>
<tr>
<td></td>
<td>INMDII</td>
</tr>
</tbody>
</table>

**Description**

This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when the per call voice path assurance (VPA) test and the subsequent retry fails for an ISUP call. After this MDII prints, the trunk status is changed to OOS,MTCE,CONT,INC. The call is retried on another trunk. In the OOS,MTCE,CONT,INC state, the VPA test is rerun every 1-3 minutes based on office parameter COT RETST until the test passes or the trunk is removed from the OOS,MTCE,CONT,INC state using an the RST:TRK input message. The repeated VPA test is controlled by the outgoing trunk and started by the reception of a continuity check request (CCR) CCS message. If no CCR is received within 5 minutes, then the OOS,MTCE,CONT,INC,AUTO status is removed and reset circuit (RSC) is sent to the far-end office.

**Corrective Action**

No corrective action is required. The VPA test will be run periodically until the test passes. When the test passes both ends of the trunk will be restored to service and a RST:TRK message will be printed. If the user does not want the VPA test to be run, then use the RMV:TRK input message to place the trunk in another out-of-service state or use the RST:TRK input message to put the trunk back in service. Also refer to CRF.

### 2.2.21 COF (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Confusion received</td>
</tr>
<tr>
<td><strong>Expansion</strong></td>

</tr>
<tr>
<td></td>
<td>OUTMDII</td>
</tr>
<tr>
<td></td>
<td>TGMD1TR</td>
</tr>
<tr>
<td></td>
<td>TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**

This MDII is used exclusively for common channel signaling. This MDII occurs when a confusion (COF) message is received from a succeeding exchange during the setup of a CCS outgoing call. The COF MDII is generated when a “Confusion” message is received on an outgoing CCS trunk or BICC connection. The call will be retried on another trunk. The outgoing trunk will be idled.

**Corrective Action**

Check the status of the associated signaling link with this call.

### 2.2.22 CQR (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Circuit query response timer expired</td>
</tr>
<tr>
<td><strong>Expansion</strong></td>
<td>OGT</td>

<tr>
<td><strong>Direction</strong></td>
<td>OGT</td>
</tr>
<tr>
<td><strong>TERA</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Traffic/Plant Counts</strong></td>
<td>None</td>
</tr>
</tbody>
</table>

**Description**

The circuit query timer expired and a CQR (circuit query response) message has not been received from the far end in response to two CQM (circuit query message) messages.

**Corrective Action**

This problem may be from one or more of the following sources: signaling failure, abnormal configuration.
If associated with an automatic office circuit query, and about the same number of MDIIs are seen each time the automatic office circuit query runs, consider changing the hour for the CQ START TIME on RCV 8.15. In this case the office CQ may be colliding with other CQM messages from another office, causing the CQR MDIIs.

If this is associated with a manual request, no action is needed. Attempt to re-run manual request. If MDIIs are produced every time, consider verifying network data and interoffice data (EXC:CCSXLATE).

### 2.2.23 CRA (MDII Description)

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td>TMPFAIL</td>
</tr>
<tr>
<td></td>
<td>TGMD1TR</td>
</tr>
<tr>
<td></td>
<td>TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**

This MDII is used exclusively for ISUP. This MDII occurs on an ISUP call that is interworking with equal access MF signaling after a circuit reservation message (CRM) has been sent which reserves a circuit and will initiate any required continuity checks, and has timed out waiting for a circuit reservation acknowledgment (CRA) message which links the trunk between the access tandem and the carrier. This is an MF - ISUP connection at the originating access tandem.

For an access tandem office to obtain required counts of the expiration of Tcra on an ISUP7 trunk group, use RC view 14.8 to add each IEC trunk group, that connects to an interexchange carrier, to the trunk error analysis study group. Up to 20 trunk groups can be entered on RC/V View 14.8 (TRUNK ERROR ANALYSIS). The existence of a trunk group on this view will enable counts of MDII's that occur on the trunk group. Observe the required count on the 24 hour measurement report, Part 5 (TERA report).

The trunk is idled. The call is retried on another trunk. The count TMPFAIL - “accumulating count of ISUP call failures” is also pegged if on the second trial a REL message is received with a cause code of temporary failure is sent or received.

**Corrective Action**

The problem may be from one or more of the following sources: signaling failure, or, abnormal configuration at the far-end office.

If there is signaling failure, then some portion of the CCS network between the two offices has a failure that did not allow the CRM to reach the far-end office. It is possible that the CRM did reach the far-end office, but the CRA message sent back did not reach the originating office. If there is a signaling failure, several other CCS related MDIIs will also be firing, that is, BAF, CAF, etc.

If the CRA MDII occurs infrequently, then it is likely that the far-end trunk is in a transient state that does not allow CRM reception, that is, initialization and audits. If this occurs there is no corrective action required. The situation should be self-correcting. However, if the trunks continue to fail call setup, then contact the far-end office.

### 2.2.24 CRR (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Common channel signaling reset received</td>
</tr>
</tbody>
</table>
Expansion
Direction ICT
TERA Yes
Traffic/Plant Counts IMDII7
          TGMDINC
          INCST
          INMDII

Description
This MDII is reported exclusively for common channel signaling (CCS). The CRR MDII will only be printed
if a circuit reset message is received for an incoming CCS trunk/BICC CIC or a group reset message is
received where any of the range of channels indicated in the GRS is part of a DS0 or wideband call and all
of the following conditions are met:
(A) The incoming CCS trunk is handling a call when the circuit reset is received.
(B) The call being handled by the CCS trunk is not a test call.
(C) The call is not waiting for the initial address message (IAM) to be sent from the previous office.
(D) The call is not waiting for the continuity (COT) message to be sent from the previous office.

If a GRS's range of channels includes channels of several calls, a CRR MDII will be printed for each
call.

The circuit reset message indicates that the far-end office is out of synchronization and is forcing a
re-initialization of the trunk. This loss of synchronization can be caused by SM initialization, unexpected
message reception, manual trunk removal, automatic fault recovery or lack of tone transceiver.

When associated with a wideband call, a CRR MDII fires because a reset circuit was received affecting
one of the channels of a wideband call or group reset was received and at least one of the channels in
the range of the group reset was involved in a wideband call. Like for narrowband (DS0) situations, the
reset will tear down the call. The coding of the trial field in the CRR MDII will depend upon the software
release of the switch and the state of the call.

Switches may report a value of one or three in the trial field depending upon whether an address
complete message (ACM) has been sent before receiving the circuit reset/circuit group reset message.
If an ACM has been sent before the circuit reset/circuit group reset message is received, a value of
three will be reported in the trial field. If an ACM has not been sent before the circuit reset/circuit group
reset message is received, a value of one will be reported in the trial field.

The events that trigger an MDII for wideband will have analogous events in DS0 calls. Only one MDII
message (REPT:MDII) will be printed per wideband call.

Corrective Action
CRR MDII reported situations are usually self-correcting. However, if they repeat contact the far end
offices and inquire about their status. Also check on the tone transceiver equipage status on the affected
SM.

2.2.25 CTO (MDII Description)

<table>
<thead>
<tr>

<tr>
<td>TERA</td>
<td>Yes</td>
</tr>
</tbody>
</table>
| Traffic/Plant Counts | COTTO
          | IMDII7
          | TGMDINC
          | INCST
          | INMDII |
| Description| This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when the incoming
          | side of a ISUP or BICC call has received an initial address message (IAM) and has not received an
          | expected continuity message (COT) in the appropriate interval. Also, no other message was received to
          | indicate a COT failure. For ISUP trunks or BICC CIC's, the trunk/CIC is idled. |
Corrective Action: The problem might be due to long set-up delays. If this is the problem, several CTO MDII's will be seen in a variety of trunks. The user can fine tune the wait period between the IAM sending and the COT reception by changing Glcottim office parameter.

### 2.2.26 CVN (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>CCS vacant number</td>
</tr>
<tr>
<td>Expansion</td>
<td>OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>Yes</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>BFMR, OMDII, OTGCSPERF, OUTGCST, OUTMDII, TGMD1TR, TGMD2TR</td>
</tr>
</tbody>
</table>

**Description:**

This MDII is used for common channel signaling (CCS) and session initial protocol (SIP). This MDII is printed when the initial address message (IAM) for a call is sent and an indication is received from the far office that the specified called party number is vacant. The indication is receipt of a release message (REL) with any of the following causes (the numeric cause values are shown in parentheses).

- 2 = No route to specified transit network.
- 3 = No route to destination.
- 57 = Bearer capability not authorized.
- 58 = Bearer capability presently not available.
- 63 = Service/Option not available-unspecified.
- 65 = Bearer capability not implemented.
- 70 = Only restricted digital information bearer capability is available.
- 79 = Service/option not implemented, unspecified.
- 81 = Invalid call reference value.
- 88 = Incompatible destination.
- 95 = Invalid message.

An additional requirement must be met for CCS7 trunks. The CVN MDII is only printed in the local network if the failure occurred in the same local network as the network that the office receiving the REL message is in. The failing network is identified by the location code in the ISUP/BICC REL message. If the office receiving the REL message is a local exchange office and the location code in the REL message indicates "local network", then the CVN MDII will be printed. The CVN MDII will not be printed in the local network for any other location code in the REL message. (This condition does not apply to test calls. CVN MDIIIs will be printed for test calls that receive a REL with one of the cause values specified above regardless of the location specified in the REL message).

Exchanges in the transit network will print the CVN MDII regardless of the location indicated in the REL message. After the CVN MDII is printed, the call is either routed to a vacant code announcement or an indication is returned to the previous office to notify it of the vacant number failure. (The indication will be through a REL message for ISUP/BICC.)

Corrective Action: Check the ODD against the far office. Depending on the dialing plan, it may be possible to change the ODD in this office so that the vacant code can be detected here, instead of routing the call to the far-end office and have them detect the vacant number condition.

### 2.2.27 DDF (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Delay dial, steady off-hook</td>
</tr>
<tr>
<td>Expansion</td>
<td></td>
</tr>
</tbody>
</table>
Description On a delay-dial-controlled trunk, a time-out occurred while waiting for the far office to return the start dial signal (off-hook/on-hook transition) after the trunk was seized. In this case, a steady off-hook state was returned by the far office for the entire duration of the start signal time-out interval.

Corrective Action
1. Verify the functionality of the trunk hardware (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Verify the functionality of time slot interchange unit’s signal processor hardware (refer to any appropriate diagnostic messages in the Input Messages manual).
3. Check RC/V 5.1 (TRUNK GROUP) attributes TRK CLASS and TRK DIR and View 5.5 (TRUNK MEMBER) attributes OUT START DIAL and IDLE STATE. Verify that the attribute settings are compatible with the far office’s interpretation of the trunk’s operation (refer to the Recent Change Reference manual).
4. Verify the compatibility of the trunk interface hardware at both offices.
5. Verify that the timing conditions at both offices are compatible.

<td>TGMDINC INCST INMDII</td>
</tr>
</tbody>
</table>

**Description**

Automatic number identification failure was reported under one or more of the following conditions:

(1) During ANI digit collection and analysis for an E911 call, the "I" (information) digit within the ANI digit sequence received from the far-end indicated an identification failure (I = 2 or I = 5) in the originating end office. In this case, operator identification of the calling number was required.

**Corrective Action**

(1) Verify the functionality of the trunk hardware and service circuit used for digit collection (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.

(2) Check RC/V View 5.1 (TRUNK GROUP) and View 5.5 (TRUNK MEMBER) attributes. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).

### 2.2.31  E9ANI (MDD Description)

<table>
<thead>
<tr>
<th>ITEM</th>

</tr>
<tr>
<td><strong>Traffic/Plant Counts</strong></td>
<td>TGMDINC INCST INMDII</td>
</tr>
</tbody>
</table>

**Description**

Automatic number identification (ANI) failure detected on an E911 call over a trunk using CAMA-ANI signaling protocol occurred for one of the following conditions:

(1) Too many digits were received.

(2) Extra pulse detected.

(3) No "I" digit present.

(4) Digit count less than 10 or ANI failure detected on an E911 call over a dedicated E911 (except tandem to tandem) CCS trunk (ISUP signaling) for the following reason:

- Charge parameter and calling party number equal 0.

**Corrective Action**

(1) Verify the functionality of the trunk hardware (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.

(2) Check RC/V View 5.1 (TRUNK GROUP) and View 5.5 (TRUNK MEMBER) attributes. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
### 2.2.32 E9ATO (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>E911 ANI timeout</td>
</tr>
<tr>
<td>Expansion</td>
<td>ICT</td>
</tr>
<tr>
<td>TERA</td>
<td>No</td>
</tr>
</tbody>
</table>
| Traffic/Plant Counts | INMDII  
INCST  
TGMDINC |

#### Description
For E911 calls over a trunk that uses CAMA-ANI-like signaling protocol, E9ATO MDII occurred for one of the following reasons:

1. Time-out occurred while waiting for an ANI digit during ANI collection.
2. Missing ST.

#### Corrective Action
1. Verify the functionality of the trunk hardware (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Verify the functionality of the time slot interchange unit's signal processor hardware (refer to any appropriate diagnostic messages in the Input Messages manual).
3. Check RC/V View 5.1 (TRUNK GROUP) and View 5.5 (TRUNK MEMBER) attributes. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
4. Verify that the timing conditions at both offices are compatible. The off-hook signal is expected from the far office within 20 seconds after the called digit sequence has been outpulsed.

### 2.2.33 E9BDN (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>

</tr>
</tbody>
</table>
| Traffic/Plant Counts | INCST  
INMDII  
TGMDINC |

#### Description
This MDII is reported exclusively for E911 calls received on an incoming dedicated E911 tandem to Tandem ISUP7 trunk. This MDII occurs when the directory number in the called party number (CPN) parameter of the incoming initial address message (IAM) either is not a 7 or 10 digit number, or is a 1 to 3 digit number that does not translate to the correct call destination type of EMER.

#### Corrective Action
1. Verify that the far-end office is sending the correct number of digits in the CdPN parameter of the IAM.
2. If the CdPN parameter does contain a 7 or 10 digit directory number, then there is a data problem in RC/V View 9.3 [LOCAL DIGIT (OFFICE DIALING)]. The NBR OF DIGITS field in RC/V View 9.3 should be set to 7 or 10.
3. If the CdPN parameter contains a 1 to 3 digit directory number (such as, 1, 11, or 911), verify that the CALL TYPE field in RC/V View 9.3 is set to EMER.

<td>TGMDINC INCST INMDII</td>
</tr>
</tbody>
</table>

Description
More than the expected number of digits were received from the far office for an incoming call during digit collection.

Corrective Action
(1) Verify the operation of the trunk hardware and service circuit used for digit collection (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
(2) Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS. Verify that the attribute setting is compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
(3) Check the translations data in RC/V Views 9.3 [LOCAL DIGIT (OFFICE DIALING)] and 9.5...
(4) For incoming equal access signaling at an access tandem this could indicate that the far end office is sending a four digit CIC and the RC/V View 5.1 (TRUNK GROUP) attribute, FGD/CICSZ, is provisioned to expect a three digit CIC. Verify that the attribute setting is compatible with the far office’s interpretation of the trunk’s operation (refer to the Recent Change Reference manual).

(5) For MINT trunks, use the T-NSC value, printed in the MDII message, to check the translation data on View 8.54 and View 8.53. Make sure that the proper DAS value is provisioned for the T-NSC (TERM NSC) value.

### 2.2.37 EXP (MDII Description)

<table>

</tr>
</tbody>
</table>

**Description**

Extra pulse reported under one of the following conditions:

1. For an incoming call over a trunk that uses dial-pulse address signaling, a series of eleven or more pulses representing a single digit was received from the far office during digit collection.
2. For an incoming call over a trunk that uses revertive-pulse address signaling, an invalid pulse count representing a revertive pulse selection was communicated.

**Corrective Action**

1. Verify the functionality of the trunk hardware and service circuit used for digit collection (if applicable) (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Message DGN). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. If no service circuit (for dial pulsing only) was used, then collection was done by the time slot interchange unit’s (TSIU) signal processor (SP). Verify the functionality of the TSIU’s SP hardware (refer to any appropriate diagnostic messages in the Input Messages manual).
3. Verify that the timing and electrical conditions for dial pulsing or revertive pulsing are compatible at both offices.

### 2.2.38 FCA (MDII Description)

ITEM | DETAIL
--- | ---
**Description** | False key pulse
**Expansion** | ICT
**Direction** | ICT
**TERA** | Yes
**Traffic/Plant Counts** | TGMDINC, INCST, INMDII

**Description**
Receipt of a false key pulse digit reported during digit collection under one of the following conditions:

1. For an incoming call over an intermediate switch point trunk, a direct international originsation trunk, or a CCS trunk (during the second stage of a traditional two-stage international outbound call), a KP digit was received when another KP digit was previously received within the same sequence of digits.
2. For the incoming calls not mentioned above, either two KP digits were received where the KP digits were not the first two digits in the sequence, or three KP digits were received within the same sequence of digits.

**Corrective Action**

1. Verify the functionality of the trunk hardware and service circuit used for digit collection (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Check RC/V View 5.1 (TRUNK GROUP) attributes TRK CLASS and INPLS. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
3. Verify that the electrical and timing conditions associated with MF address signaling are compatible at both offices.

**Traffic/Plant Counts** | DEACTOT, INCDMII, INMDII, TGMD1TR, TGMD2TR

**Description**
This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when a hardware group blocking (HGB) is sent for a collection of consecutive CIC ISUP trunk and the far-end office has not responded with a hardware group blocking acknowledge (HBA) message. HBA reception indicates that the far-end office has blocked the trunks and inhibited call originsations. The detailed scenario is a carrier group alarm (CGA) has occurred for a carrier of ISUP trunks which causes all trunks assigned to the carrier to be taken out-of-service by adding the OOS,MTCE,FAF,-,AUTO status. This status transition stimulates a HGB message sent to the far-end office. The HGB message is sent every 4-15 seconds based on office parameter GLBO RSND for 1 minute if no HBA message is received. At this point the
HGBAF MDII is printed and no more HGB messages are sent.

For this MDII, only the measurement counts for TOTAL OUTGOING MDIIs and TOTAL TERA DEACTIVATIONS of PART5 (1 of x) and OUTGOING of PART24 of PLNT 24 report will be pegged.

<table>
<thead>
<tr>
<th>Corrective Action</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>(1)</td>
<td>If there is signaling failure, then some portion of the CCS network between the two offices had a failure that did not allow the HGB to reach the far-end office. It is possible that the HGB did reach the far-end office, but the HBA message sent back did not reach the originating office. If there is a signaling failure, several other CCS related MDIIs may also be firing, that is, ATO, CAF, BAF, and so forth, or unequipped trunks.</td>

**Description**

This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when a hardware group unblocking (HGU) message is sent for a collection of consecutive CIC ISUP trunk and the far-end office has not responded with a hardware group unblocking acknowledge (HUA) message. HUA reception indicates that the far-end office unblocked the trunks and allowed call originations.

The detailed scenario is a carrier group alarm (CGA) has been retired for a carrier of ISUP trunks which causes all trunks assigned to the carrier to be placed back in service by removing the OOS, MTCE, FAF, AUTO status. This status transition stimulates a HGU message to be sent to the far-end office. The HGU message is sent every 4-15 seconds based on office parameter GUBL RSND for 1 min without receiving a HUA message. At this point the HGUAF MDII is printed and no more HGU messages are sent.

For this MDII, only the measurement counts for TOTAL OUTGOING MDIIs and TOTAL TERA DEACTIVATIONS of PART5 (1 of x) and OUTGOING of PART24 of PLNT 24 report will be pegged.

</tr>
<tr>
<td></td>
<td>TGMDINC</td>
</tr>
<tr>
<td></td>
<td>INCST</td>
</tr>
<tr>
<td></td>
<td>INMDII</td>
</tr>
</tbody>
</table>

**Description**

This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when an initial address message (IAM) is received containing not enough digits to continue the call. For ISUP/BICC calls, the IAM does not contain the expected number of digits. A release (REL) message is sent with a cause value of 28. The trunk/CIC is idled.

**Corrective Action**

Check the office dialing ODD against the far office dialing ODD. This MDII indicates an inconsistency.

For MINT trunks, use the T-NSC value, printed in the MDII message, to check the translation data on View 8.54 and View 8.53. Make sure that the proper DAS value is provisioned for the T-NSC (TERM NSC) value.

### 2.2.44 IAM (MDII Description)

<table>

<tr>
<td></td>
<td>INCST</td>
</tr>
<tr>
<td></td>
<td>INMDII</td>
</tr>
<tr>
<td></td>
<td>TMPFAIL</td>
</tr>
</tbody>
</table>

**Description**

This MDII is used exclusively for integrated ISUP. This MDII occurs during an ISUP network interconnect (NI) incoming call. The ISUP NI incoming call has received a circuit reservation message (CRM) and timed out at the originating toll office (OTO) while waiting for an initial address message (IAM). A release (REL) message with a cause of 41 is sent to the far-end office and the trunk is idled.

For a toll office to obtain required counts of the expiration of an IAM timeout on an ISUP7 trunk group, use RC/V View 14.8 (TRUNK ERROR ANALYSIS) to add each LATA trunk group, that connects to a local exchange carrier, to the trunk error analysis study group. Up to 20 trunk groups can be entered on RC/V View 14.8. The existence of a trunk group on this screen will enable counts of MDII's that occur on the trunk group. Observe the required count on the 24 hour measurement report, part 5 (TERA report).

**Corrective Action**

The problem may be from one or more of the following sources: signaling failure or abnormal configuration at the far-end office.

If there is signaling failure, then some portion of the CCS network between the two offices has a failure that did not allow the CRA to reach the far-end office. It is possible that the CRA did reach the far-end office, but the IAM message sent back did not reach the originating office. If there is a signaling failure, several other CCS related MDII's will also be firing, that is, BAF, CAF, etc. If the IAM MDII occurs infrequently, then it is likely that the far-end trunk is in a transient state that does not allow CRA reception, that is, initialization and audits. If this occurs there is no corrective action required. The situation should be self-correcting. However, if the trunks continue to fail call setup, then contact the far-end office.

</table>

**Description**

Automatic number identification failure reported under the following condition:

1. During ANI digit collection over a trunk with TRKCLASS of LATA (LATA connecting) that uses equal access (EA) signaling and where ANI is requested, a null ANI sequence was received. The null ANI sequence is indicated by:
   a. A KP digit immediately followed by a ST digit.

**Corrective Action**

1. Verify the functionality of the trunk hardware and service circuit used for digit collection (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware and associated data.

2. Check RC/V View 5.1 (TRUNK GROUP) attributes TRK CLASS, BLK NO ANI, and View 5.5 attribute ANI. Verify that the attribute settings are compatible with the far-end's interpretation of the trunk's operation (refer to the Recent Change Reference manual).

### 2.2.49 MCA (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Misrouted CAMA</td>
</tr>
<tr>
<td>Expansion</td>
<td>ICT, OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>Yes</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>CMONIIA, TGMD1INC, INMDII, OUTMDII, TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**

Misrouted CAMA reported for incoming CAMA tandem calls under one of the following conditions:

1. For a dialed sequence digit count of seven, the office code in the dialed digit sequence was equal to the office code of the originating local end office.

2. For a dialed sequence digit count of ten, the numbering plan area (NPA) code and the office code in the dialed digit sequence was equal to the NPA code and office code of the originating local end office. In both cases, the call could have been routed within the local end office.

**Corrective Action**

1. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS. Verify that the attribute setting
is compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).

(2) Check the translations data in RC/V Views 9.3 [LOCAL DIGIT (OFFICE DIALING)] and 9.5 [INCOMING TRUNK DIGITS (OFFICE DIALING)] for the expected incoming digits. Also, check forms 5309 and 5300:3 of the Office Records Manual for the incoming digits. If the incoming digits in the office records match the digits found in the recent change views, then have the far office check its data translations (refer to the Recent Change Reference manual).

(3) Check ODD FCCAVCTK tuple and verify that the office and NPA code attributes for the originating local end office are correct (refer to the Data Translations manual).

### MGBAF (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ITEM</strong></td>
<td><strong>DETAIL</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Maintenance group blocking acknowledgment failure</td>

<tr>
<td><strong>TERA</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Traffic/Plant Counts</strong></td>
<td>DEACTOT, TGMDINC, INMDII, OUTMDII, TGMD1TR, TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**

This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when a maintenance group blocking (MGB) message is sent for a BICC CIC block or a collection of consecutive CIC ISUP trunks and the far-end office has not responded with a maintenance group blocking acknowledge (MBA) message. Reception of the MBA message indicates that the far-end office has blocked the trunks and inhibited call originations.

For BICC, this may mean that this switch has had some kind of equipment outage and cannot process calls with these CIC values. The status of each affected CIC is OOS,MTCE,Automatic.

For ISUP, a collection of consecutive CIC ISUP trunks have been removed from service at approximately the same time causing each trunk status to be changed by adding the OOS,MTCE,FE,-, OOS,MTCE,DSBLD,- or OOS,MTCE,LKDO,- statuses. These status transition stimulates a MGB message to be sent to the far-end office. This MGB message has been sent every 4-15 seconds based on office parameter GBLO RSND for 1 minute without receiving a MBA message. At this point the MGBAF MDII is printed and no more MGB messages are sent.

For this MDII, only the measurement counts for TOTAL OUTGOING MDIIs and TOTAL TERA DEACTIVATIONS of PART5 (1 of x) and OUTGOING of PART24 of PLNT 24 report will be pegged.

**Corrective Action**

The problem may be from one or more of the following sources: signaling failure or abnormal configuration at the far-end office.

1. If there is signaling failure, then some portion of the CCS network between the two offices has a failure that did not allow the MGB to reach the far-end office. It is possible that the MGB did reach the far-end office, but the MBA message sent back did not reach the originating office. If there is a signaling failure, several other CCS related MDIIs will also be firing, that is, ATO, CAF, etc.

2. If the MGBAF MDII occurs infrequently, then it likely that the far-end trunk is in a transient state that does not allow MGB reception, that is, initialization and audits. If this occurs there is no corrective action required. The situation should be self-correcting. The first call attempt from the far-end office (reception of an IAM) will be answered with a BLO message. This will block the far-end trunk.

If the MGBAF MDII occurs frequently for BICC, it means that the far end switch does not have...
sufficient capacity to process the out-of-service status for lots of BICC CIC's or there are an excessive number of BICC CIC's affected by equipment outage.

### 2.2.51 MGUAF (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Maintenance group unblocking acknowledgment failure</td>
</tr>
<tr>
<td>Expansion</td>
<td>ICT, OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>No</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>TGMMD1TR, TGMMD2TR, INMDII, OUTMDII</td>
</tr>
</tbody>
</table>

**Description**

This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when a maintenance group unblocking (MGU) message is sent for a BICC CIC block or a collection of consecutive CIC ISUP trunks and the far-end office has not responded with a maintenance group unblocking acknowledge (MUA) message. Reception of MUA indicates that the far-end office unblocked the trunks and allowed call originations. For BICC, this may mean that this switch is coming out of some kind of equipment outage and can now process calls with these CIC values. The status of each affected CIC is in-service.

The detailed scenario is a collection of consecutive CIC ISUP trunks have been restored to service at approximately the same time causing each trunk to be placed back in service by removing the OOS,MTCE,FE-, OOS,MTCE,DSBLD-, or OOS,MTCE,LKDO,- status. These status transitions stimulate a MGU message to be sent to the far-end office. This MGU message has been sent every 4-15 seconds based on office parameter GUBL RSND for 1 minute without receiving a MUA message. At this point the MGUAF MDII is printed and no more MGU messages are sent.

For this MDII, only the measurement counts for TOTAL OUTGOING MDII and TOTAL TERA DEACTIVATIONS of PART5 (1 of x) and OUTGOING of PART24 of PLNT 24 report will be pegged.

**Corrective Action**

The problem may be from one or more of the following sources: signaling failure or abnormal configuration at the far-end office.

1. If there is signaling failure, then some portion of the CCS network between the two offices has a failure that did not allow the MGU to reach the far-end office. It is possible that the MGU did reach the far-end office, but the MUA message sent back did not reach the originating office. If there is a signaling failure, several other CCS related MDII's will also be firing, that is, ATO, CAF, etc.

2. If the MGUAF MDII occurs infrequently, then it is likely that the far-end trunk is in a transient state that does not allow MGU reception, that is, initialization and audits. If this occurs there is no corrective action required. The situation should be self-correcting. The first time the near-end office uses the trunk for a call (sends an IAM), the far-end office will unblock its trunk and allow the call.

If the MGUAF MDII occurs frequently for BICC, it means that the far end switch does not have sufficient capacity to remove the out-of-service status for lots of BICC CIC's or there has been an excessive number of BICC CIC's affected by equipment outage. Another CGU message has been sent for the affected CIC block.

<td>No acknowledgment</td>
</tr>
<tr>
<td>Expansion</td>
<td>OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>Yes</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>OTGCSPERF, OUTGCST, OUTMDII, TGMD1TR, TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**

No acknowledgment reported under one of the following conditions:

1. For a call over a trunk to an external audio response unit (ARU), a time-out occurred while waiting for an ACK (off-hook) signal to be returned from the ARU. The ACK signal is expected after the trunk is seized and an off-hook signal sent to the ARU.
2. For a call over a FX ground start (FX GS) trunk, no ground (off-hook) signal was returned from the far office after the trunk was seized.

**Corrective Action**

1. Verify the functionality of the trunk hardware (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Verify the functionality of the time slot interchange unit's signal processor hardware (refer to any appropriate diagnostic messages in the Input Messages manual).
3. Check RC/V View 5.1 (TRUNK GROUP) attributes TRK CLASS and View 5.5 (TRUNK MEMBER) attributes IDLE STATE and OUT START DIAL. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
4. Verify the compatibility of the trunk interface hardware at both offices.
5. Verify that the timing conditions at both offices are compatible. For the connection to an external ARU, the maximum wait time for the ACK signal from the ARU is 5 seconds. For FX GS trunks, there is a delay of 1500 ms between trunk seizure and the check for the ground start signal.

### 2.2.56 NCA (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>No Circuit Available</td>
</tr>
<tr>

<td>OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>No</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>INMDII, OUTMDII</td>
</tr>
</tbody>
</table>
**Description**

The system will print NCA MDII with the "No Circuit Available" MDII code when a no circuit/route available condition is reached. The "No Circuit Available" condition is met when reorder, busy or zero treatment is applied or there is no other route in the route chain or route list for outgoing MF, ISUP, BICC, PRI or DP call attempts.

The system will print NCA MDII when the following route descriptor types are encountered in a route chain.
- General or generic announcement (GEN ANN)
- Overflow on a direct trunk group (DTGOVFL)
- Overflow on a secondary trunk group (STGOVFL)
- All trunks busy (ALTRKBUSY)
- Network management failure (for example: no circuit) (NMFAIL)

The NCA MDII will be selectable through Optioned Featured ID (1014).

The system will not generate NCA MDII:
- For GETS calls.
- With DSN feature.

**Corrective Action**

To prevent this MDII, re-engineer the office to increase the trunk resources.

### 2.2.57 NKP (MDII Description)

<table>

</tr>
</tbody>
</table>

**Description**

No key pulse digit received reported under one of the following conditions:

1. For an incoming call over a CAMA trunk, a time-out occurred while waiting for the KP digit during the collection of the ANI digit sequence. This time-out occurs if the KP digit is not received within 10.5 seconds after the off-hook signal (used to request the ANI digit sequence) is sent to the far office.

2. For an incoming call over an intermediate switch point trunk or a direct international originations trunk, a time-out occurred while waiting for the KP digit during the collection of the ANI digit sequence. This time-out occurs if the KP digit is not received within 16 seconds after the off-hook signal is sent to the far office.

3. During the collection of a digit sequence, a ST digit was received when no KP digit was previously received.

**Corrective Action**

Refer to the FKP MDII Corrective Action.

### 2.2.58 NOANI (MDII Description)

<table>
<thead>

<tr>
<td>Traffic/Plant Counts</td>
<td>TGMDINC INCST INMDII</td>
</tr>
</tbody>
</table>

**Description**

Automatic number identification failure reported under the following condition:

1. During ANI digit collection over a trunk with TRKCLASS of LATA (LATA connecting) that uses
equal access (EA) signaling and where ANI is requested, no ANI sequence at all was received. That is, KP + dialed digits + ST was not preceded by KP + II + ANI + ST.

Corrective Action

(1) Verify the functionality of the trunk hardware and service circuit used for digit collection (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware and associated data.

(2) Check the RLFCEAINFO ODD tuples for the correct data (refer to the switch Data Translations manual).

nature of address coding of "national number operator requested".

(B) An OSPS SS7 Signaled call was signaled with a called party number parameter with a nature
of address coding of "no number present operator requested", "subscriber number operator
requested", "national number operator requested", or "international number operator
requested" but digit analysis identified the call as inward. Inward calls should never be signaled
with the above nature of address coding.

**Corrective Action**
Contact the originating 4ESS toll office and inform them of the signaling error.

**Description** Partial dial abandon.

**Corrective Action**

1. Verify the operation of the trunk hardware and service circuit used for digit collection (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS. Verify that the attribute setting is compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
3. Verify that the timing conditions at both offices are compatible.
   a. Check the partial dial timing values in RC/V View 8.5 [TIMING (MISCELLANEOUS)] (refer to the Recent Change Reference manual).
   b. For CAMA incoming trunks, collection of the ANI digit sequence must be done within 10.5 seconds after the ANI request (off-hook) is sent to the far office.
   c. Check the translations data in RC/V Views 9.3 [LOCAL DIGIT (OFFICE DIALING)] and 9.5 [INCOMING TRUNK DIGITS (OFFICE DIALING)] for the expected number of incoming digits. Also, check forms 5309 and 5300-3 of the Office Records Manual for the incoming digits. If the incoming digits in the office records match the digits found in the recent change views, then have the far office check its data translations (refer to the Recent Change Reference manual).
   d. For incoming equal access signaling at an access tandem this could indicate that the far end office is sending a three digit CIC and the RC/V View 5.1 (TRUNK GROUP)
attribute, FGDCICSZ, is provisioned to expect a four digit CIC. Verify that the attribute setting is compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).

2.2.66 PFR (MDII Description)

<table>
<thead>

<td>Yes</td>
</tr>
</tbody>
</table>
| Traffic/Plant Counts | OUTGCPERF
                  | OUTG CST
                  | OUT MD II
                  | TG MD 1 TR
                  | TG MD 2 TR

Description
Polarity failure reported for outgoing revertive pulsing trunks under one of the following conditions:

1. Trunk guard test failure. After the trunk circuit was seized, a trunk guard test was performed prior to sending the connect signal to the far office to check for an idle (on-hook) state. Following expiration of the trunk guard time interval, an on-hook supervisory state was not seen from the far office.

2. During outpulsing, an unexpected battery-reversal was seen from the far end. The battery reversal is detected by the revertive pulsing transceiver after it has been set up for outpulsing and indicates that an invalid selection was received or some other trouble condition occurred at the far office.

When using a TM ACJACK port during a trunk guard test prior to terminal maintenance tests, the trunk processing state was found to be incorrect. Valid states are:

- PCRPTBY = "idle state"
- PCNOSUPV = "cpe idle state"
- PCIGNORE = "OOS state"
- PCBYTM = "transient state"
- PCBYBL = "transient state"

Any other encountered states would be deemed a PFR.

Corrective Action

1. Verify the functionality of the trunk hardware and revertive pulsing transceiver (if applicable) (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.

2. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS and TRK DIR, and View 5.5 (TRUNK MEMBER) attributes SUPV and IDLE STATE. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).

3. Verify the compatibility of the trunk interface hardware at both offices.

4. Verify that the guard timing conditions at both offices are compatible. A guard time interval (required time between trunk seizures) of 300 ms is implemented for the revertive pulsing trunks.

5. Check port definition as defined in office-dependent data (ODD).

6. Check status of port (refer to any appropriate diagnostics in the Input Messages manual).

7. To restore out-of-service (OOS) port to in-service (IS) (refer to the Input Messages manual for execution of RST operation).
### 2.2.67 PST (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Permanent signal timeout</td>
</tr>
<tr>
<td>Expansion</td>
<td>ICT, OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>Yes</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>TGMDINC, INCST, INMDII, OUTGCPERF, OUTGCST, OUTMDII, TGMD1TR, TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**

PST is reported under one of the following conditions:

1. For an incoming call during digit collection, a time-out occurred while waiting for the first digit of a digit sequence from the far office after a start signal was sent to the far office.
2. For an outgoing call over a revertive pulsing trunk during outpulsing, a time-out occurred while waiting for the far office to send the revertive pulses after a start pulsing signal (loop closed) was sent to the far office, or the far office stopped pulsing before all selections were transmitted to the far office.

**Corrective Action**

1. Verify the functionality of the trunk hardware and service circuit used for digit collection or outpulsing (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Check RC/V View 5.1 (TRUNK GROUP) attributes TRK CLASS, INPLS, and OUTPLS, and View 5.5 (TRUNK MEMBER) attributes IN START DIAL and ANI. Verify that the attribute settings are compatible with the far office's operation for the trunk in question (refer to the Recent Change Reference manual).
3. Verify that the permanent signal timing conditions at both offices are compatible.
   a. Check the permanent signal timing values in RC/V View 8.5 [TIMING (MISCELLANEOUS)] (refer to the Recent Change Reference manual).
   b. For a traditional two-stage international outbound call, check global parameter Gl2spst. This parameter contains the permanent signal timing value for the collection of the digit sequence of the second stage (refer to the Data Translations manual).
   c. For an incoming intermediate switch point trunk, check the ODD relation RLFC_OPRTK tuple's attribute "mfj_sig" and verify that this setting is compatible with the far office. If this attribute indicates that the far office is a conforming end office, then a permanent signal timing value of 6 seconds is used for the collection of the ANI digit sequence (refer to the Data Translations manual 235-600-10X).

### 2.2.68 RST (MDII Description)

<table>

<td>OMDII7, OTGCSPERF, OUTGCST, OUTMDII, TGMD1TR</td>
</tr>
</tbody>
</table>

---

*Copyright ©2003 Lucent Technologies*
TGMD2TR

Description
This MDII is used exclusively for common channel signaling (CCS). The RST MDII occurs during an outgoing BICC or ISUP call when a reset (RSC) message or a group reset message is received where any of the range of channels indicated in the GRS is part of a DS0 or wideband call indicating the far-end of the trunk or range of far-end trunk members is out of synchronization and is forcing a re-initialization of the ISUP trunk or BICC CIC. This loss of synchronization can be caused by SM initialization, unexpected message reception, manual trunk removal, automatic fault recovery or lack of tone transceiver.

If a GRS’s range of channels includes channels of several calls, a RST MDII will be printed for each call.

For BICC or ISUP the RST message will be passed along. In the set-up stage of the call, the trunk is idled and a retry on another trunk is attempted. In post set-up stage of the call, the call is torn down. The RST MDII is reported when a reset message is received that aborts an outgoing call. If a reset message is received that does not cause a call to be aborted, then a RST MDII will not be reported.

The "TRIAL" field of the RST MDII indicates the post setup state of the call when the called/billing number cannot be displayed: A value of "3" indicates the "Waiting for Answer" state. A value of "4" indicates the "Talking" state.

When associated with a wideband call, an RST MDII fires because a reset circuit was received affecting one of the channels of a wideband call or group reset was received and at least one of the channels identified in the range of channels in the group reset was involved in a wideband call. As with narrowband (DS0) situations, the reset will tear down the call.

The events that trigger a RST MDII for wideband will have analogous events for DS0 calls. Only one MDII message (REPT:MDII) will be printed per wideband call.

Corrective Action
RST MDII reported situations are usually self-correcting. However, if they repeat contact the far end offices and inquire about their status. Also check on the tone transceiver equipage status on the affected SM.

<td></td>
</tr>
<tr>
<td>Direction</td>
<td>ICT</td>
</tr>
</tbody>
</table>
For an incoming call over a private facilities trunk, an expected SGD digit (to be put into the call record) was not received from the far office. When expected, the SGD digit should appear at the end of the dialed digit sequence. SGD is reported under one or more of the following conditions:

1. Partial dial time-out occurred when attempting to collect the SGD digit.
2. ST digit (marks the end of the digit sequence) had already been received when attempting to collect the SGD digit (for MF signaling only).

Corrective Action:

1. Verify the functionality of the trunk hardware and service circuit used for digit collection (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS and ODD RLFC_TRUNK tuple attribute “sgd”. Verify that the attribute settings are compatible with the far office’s interpretation of the trunk’s operation (refer to the Recent Change Reference manual or Data Translations manual).
3. Check RC/V View 8.5 [TIMING (MISCELLANEOUS)] for the partial dial timing data. Verify that the partial dial timing conditions are compatible at both offices (refer to the Recent Change Reference manual).

2.2.72 SIPTSD (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>

<tr>
<td>Expansion</td>
<td>ICT, OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>No</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>INMDII, OUTMDII</td>
</tr>
</tbody>
</table>

Description: This MDII is caused by one of the following:
- Message received in a wrong direction.
- Message received out of sequence or in the wrong transaction state.
- Unexpected message received, which is probably similar to out of sequence message.
- Unrecognized method was received.
- A response was received and we could not match it to a request, this MDII will be printed when a call terminates abnormally such as SPP. There should be other MDIIs or some other ROP noise to indicate the problem.
- Unexpected response was received.

Corrective Action: If this MDII comes out regularly, except for “No Matched Req.”, the far end needs to be contacted to find out what message sequencing they use.

2.2.73 SIPTSE (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>SIP-T Signaling Error</td>
</tr>
<tr>
<td>Expansion</td>
<td>ICT, OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>No</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>INMDII, OUTMDII</td>
</tr>
</tbody>
</table>

Description: This MDII is used exclusively for session initiation protocol for telephony (SIP-T) signaling for IP bearer calls. This MDII can occur at the originating packet switch (OPS) - outgoing side of a packet SIP-T IP call or terminating packet switch (TPS) - incoming side of a packet SIP-T IP call.
At the OPS this MDII occurs when an invalid ISUP message is embedded in the ISUP MIME portion of a SIP-T message. After the MDII fires, the call is released and no second attempt is made.

At the TPS this MDII occurs when receiving an INVITE which ISUP MIME does not indicate voice or 3.1 Khz audio. After the MDII fires, the call is released and no second attempt is made.

One of following cases also leads to this MDII:

- Unsupported response code was received (for 3XX INVITE).
- Message is too long.
- Bad SIP version - when there is no SIP version or it's other than "2.0".
- Incomplete request URI or some elements are missing.
- Bad URI scheme.
- The "MAX FORWARDS" header is missing.
- The "CONTENT-LENGTH" header is missing.
- Missing ISUP MIME.
- Missing SDP MIME.
- Missing CONTACT header.
- ALLOW message header is not formatted correctly.
- Missing "precondition" tag.
- Unsupported procedure listed in the "REQUIRE" header.
- ISUP MIME failed screening (various reasons).
- Bad content encoding in the SDP/ISUP MIME.
- Missing SDP MIME.
- Missing "TO" tag.

Corrective Action

1. If the MDII occurs frequently then contact far-end office to make sure they are populating SIP-T message correctly.
2. SIP-T trunks could only be used for voice call. Make sure SIP-T trunks are not being used for other than voice calls.
3. Far end probably has an incompatible SIP version or it doesn't support the same procedures.

### 2.2.74 SIPTTO (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>SIP-T Time Out</td>
</tr>
<tr>
<td>Expansion</td>
<td>ICT, OGT</td>
</tr>
<tr>
<td>Direction</td>
<td>ICT, OGT</td>
</tr>
<tr>
<td>TERA</td>
<td>No</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>INMDII</td>
</tr>
<tr>
<td></td>
<td>OUTMDII</td>
</tr>
<tr>
<td>Description</td>
<td>This MDII is used exclusively for session initiation protocol for telephony (SIP-T) signaling for IP bearer calls. This MDII can occur at the originating packet switch (OPS) - outgoing side of a packet SIP-T IP call or terminating packet switch (TPS) - incoming side of a packet SIP-T IP call. At the OPS this MDII occurs when the switch has sent an INVITE message and has timed out waiting for 183 SESSION PROGRESS message with TPS' bearer information or when the switch has sent an UPDATE message and has timed out waiting for 200 OK(UPDATE) message. After the MDII fires, the call is released and no second attempt is made. At the TPS this MDII occurs when the switch has sent a 183 SESSION PROGRESS message and has timed out waiting for an UPDATE message or the switch has sent a 200 OK(INVITE) and has timed out waiting for ACK message. After the MDII fires, the call is released and no second attempt is made.</td>
</tr>
<tr>
<td>Corrective Action</td>
<td>The problem may be from one or more of the following sources: signaling failure, long setup time, or abnormal configuration at the far-end office.</td>
</tr>
</tbody>
</table>
(1) If there is signaling failure, then some portion of the IP network between the two offices has a failure that did not allow the INVITE to reach the far-end office. It is possible that the INVITE message did reach the far-end office, but the 183 SESSION PROGRESS sent back did not reach the originating office.

(2) If long setup delays are the problem, several SIPTTO MDII's will be seen. If the SIPTTO MDII is occurring on the outgoing side of the call, office personnel can fine tune the wait period between the INVITE sending and the 183 reception by changing "INVITE TMR" field on RC/V View 5.82 (SIP-T PARAMETERS DEFINITION) or fine tune the wait period between the UPDATE sending and the 200 OK(UPDATE) reception by changing "NON INVITE TMR" field on RC/V View 5.82. Increase the value until the SIPTTO MDII's stop. The range is from 1 to 32 seconds. If the SIPTTO MDII is occurring on the incoming side of the call, office personnel can fine tune the wait period between the 183 sending and the UPDATE reception by changing "WAIT FOR UPD" field on RC/V View 5.82 or fine tune the wait period between the 200 OK(INVITE) sending and the ACK reception by changing "WAIT FOR ACK" field on RC/V View 5.82 Increase the value until the SIPTTO MDII's stop. The range is from 1 to 32 seconds.

(3) If the SIPTTO MDII occurs infrequently, then it is likely that the far-end office is in a transient state. If this occurs, there is no corrective action required. The situation should be self-correcting. However, if the trunks continue to fail call setup, then contact the far-end office.

### 2.2.75 SSD (MDII Description)

<td>OTGCSPERF, OUTGCST, OUTMDII, TGMD1TR, TGMD2TR</td>
</tr>
<tr>
<td>Description</td>
<td>For a call that requires two stages of outpulsing [calls originating from an equal access end office (EAO) through an access tandem (AT) or from an EAO to an international carrier (INC)], no second start dial (SSD) wink (on-hook/off-hook/on-hook series of transitions) was received from the far office after the first stage of outpulsing was completed.</td>
</tr>
<tr>
<td>Corrective Action</td>
<td>(1) Verify the functionality of the trunk hardware (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.</td>
</tr>
<tr>
<td></td>
<td>(2) Verify the functionality of time slot interchange unit's signal processor hardware (refer to any appropriate diagnostic message in the Input Messages manual).</td>
</tr>
<tr>
<td></td>
<td>(3) Check RC/V View 5.1 (TRUNK GROUP) attributes TRK CLASS and INC TNDWNK. Verify that the attribute settings are compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).</td>
</tr>
<tr>
<td></td>
<td>(4) Verify that the SSD wink timing conditions at both offices are compatible. The SSD wink timing conditions for the possible call connections are as follows:</td>
</tr>
<tr>
<td></td>
<td>(a) EAO to AT to IC, Transition EO to AT to IC: 100-500 ms wink pulse width, 12 second maximum wait time to receive SSD wink from far office after first stage outpulsing completed.</td>
</tr>
<tr>
<td></td>
<td>(b) EAO to AT to INC, EAO to INC: 100-1500 ms wink pulse width, 28 second maximum wait time to receive SSD wink from far office after first stage outpulsing completed.</td>
</tr>
<tr>
<td></td>
<td>(c) AT connecting EAO to INC: 100-1500 ms wink pulse width, 13.5 seconds maximum wait time to receive SSD wink from far office after the AT has completed outpulsing to the INC.</td>
</tr>
</tbody>
</table>
|                       | (d) EAO connecting another EAO to AT (this condition is only possible in an...
emergency situation): 100-1500 ms wink pulse width, 9.5 seconds maximum wait time to receive SSD wink from far office after outpulsing to the AT has completed.

<tr>
<td>Traffic/Plant Counts</td>
<td>TGMDINC, INMDII, OUTMDII, TGMD1TR, TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**

This MDII is used for ISUP. It occurs when a unblocking message (UBL) has been sent for an ISUP trunk and the far-end office has not responded with a unblocking acknowledgment (UBA) message. The reception of a UBA message indicates that the far-end office has unblocked its trunk and allowed to make call originations.

The detailed scenario is an ISUP trunk is returned to service from either the OOS,MTEC,DSBLD,-OOS,MTEC,LDKDO,- or OOS,MTEC,FE,- status. This status transition stimulates a UBL message sent to the far-end office. This UBL message has been sent every 4-15 seconds based on office parameter UBL RSND for 1 minute without receiving a UBA message. At this point the UAF MDII is printed and no more UBL messages are sent.

The UAF MDII can also occur when a circuit group unblocking (CGU) is sent for a set of ISUP trunks and the circuit group unblocking acknowledgement (CGUA) is received indicating the ISUP trunk was not successfully unblocked.

**Corrective Action**

The problem may be from one or more of the following sources: signaling failure or abnormal configuration at the far-end office.

If there is signaling failure, then some portion of the CCS network between the two offices had a failure that did not allow the UBL to reach the far-end office. It is possible that the UBL did reach the far-end office, but the UBA message sent back did not reach the originating office. If there is a signaling failure, several other CCS related MDIIs will also be firing, that is, ATO, CAF, etc. The UAF MDII may occur when the far-end trunk is in a transient state that does not allow remote blocking to be removed, that is, initialization, SM inaccessible and audits. If this occurs there is no corrective action required. The situation should be self-correcting. The first time the near-end office uses the trunk for a call (sends an IAM), the far-end office will unblock its trunk and allow the call.

### 2.2.79 UCA (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Unauthorized CAMA</td>

<td>Yes</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>CMONIIA, TGMDINC, INMDII, OUTMDII, TGMD1TR, TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**

Unauthorized CAMA reported for incoming CAMA calls under one or more of the following conditions:

1. The destination type determined by digit analysis on the dialed digit sequence was not valid for CAMA calls.
2. The number of digits in the dialed digit sequence was not equal to 7 or 10.

**Corrective Action**

1. Verify the functionality of the trunk hardware and service circuit used for digit collection (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in...
the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.

(2) Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS. Verify that the attribute setting is compatible with the far office’s interpretation of the trunk’s operation (refer to the Recent Change Reference manual).

(3) Check the translations data in RC/V Views 9.3 [LOCAL DIGIT (OFFICE DIALING)] and 9.5 [INCOMING TRUNK DIGITS (OFFICE DIALING)] for the expected number of incoming digits. Also, check forms 5309 and 5300-3 of Office Records Manual for the incoming digits. If the incoming digits in the office records match the digits found in the recent change views, then have the far office check its data translations (refer to the Recent Change Reference manual).

### 2.2.80 UQL (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Unequipped label message.</td>
</tr>
<tr>
<td>Expansion</td>
<td></td>
</tr>
<tr>

<tr>
<td>TERA</td>
<td>Yes</td>
</tr>
<tr>
<td>Traffic/Plant Counts</td>
<td>OMDII7 OTGCSPERF OUTGCST OUTMDII TGMD1TR TGMD2TR</td>
</tr>
</tbody>
</table>

Description

This MDII is used exclusively for common channel signaling (CCS). This MDII occurs when an unequipped label (UQL) message is received for a CCIS6 trunk or an unequipped circuit identification code (UCIC) message is received for an ISUP trunk. An unequipped label message is sent in response to a call processing request message like an initial address message (IAM) to tell the far-end that the trunk in the message is unequipped in the far-end office. If a UCIC message is received in response to a trunk maintenance message (such as, blocking), then a UQL MDII will not be reported. After the MDII fires the trunk status is changed to OOS,CADN,DSBLD,-,AUTO. This results in a RC/V action done without a back-up. No roll forward is possible. If the UQL was sent in response to an IAM the call is re-tried on another trunk. This will count as an IMA signaling network failure.

For BICC, an unequipped label message is sent in response to a call processing request message like an initial address message (IAM) to tell the far-end that the CIC value in the message is not defined in the far-end office. If a UCIC message is received in response to a trunk maintenance message (such as, blocking), then a UQL MDII will not be reported. After the MDII fires the CIC status is changed to OOS,CADN,DSBLD,-,AUTO. This results in a RC/V action done without a back-up. No roll forward is possible. If the UQL was sent in response to an IAM the call is re-tried on another CIC.

When associated with a wideband call, a UQL fires in response to the first UCIC message received on an ISUP trunk used in a wideband call meaning the channel identified in the UCIC is unequipped on the far-end. If additional UCICs are received for other channels of the wideband call, a UQL MDII is not printed for them but automatic RMV:TRK messages are generated for each UCIC received. Multiple UCICs may be sent and multiple UQLs will fire.

If all of the channels implied in the IAM are within one trunk group and one or more of the channels are unequipped, then only a UQL MDII enters into this scenario.

If at the far end office, the master channel (lowest channel) of the wideband call is unequipped, only a UCIC for the master channel is returned regardless of whether any of the slave channels are unequipped. If the master channel is equipped and one or more of the slaves is unequipped, a UCIC for each unequipped slave channel will be returned to the originating office.
If the channels implied in the IAM overflows trunk groups and/or facilities and one or more of the slave channels are unequipped, then only a UCIC is sent back to the originating office for each unequipped channel. No WBF is generated at the office receiving the IAM.

The events that trigger an MDII for a narrowband call have analogous events for wideband calls. Only one MDII message (REPT:MDII) will be printed per wideband call.

Corrective Action
Follow the CCS trunk turnup procedure to put the trunk in-service. Review all trunk group data to identify incompatibilities between the near and far end, including unequipped circuits and inconsistent trunk group data.

### 2.2.81 UXS (MDII Description)

<table>
<thead>
<tr>
<th>ITEM</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Unexpected stop</td>
</tr>
<tr>
<td>Expansion</td>

<tr>
<td></td>
<td>OUTGCST</td>
</tr>
<tr>
<td></td>
<td>OUTMDII</td>
</tr>
<tr>
<td></td>
<td>TGMD1TR</td>
</tr>
<tr>
<td></td>
<td>TGMD2TR</td>
</tr>
</tbody>
</table>

**Description**
An unexpected stop dial (off-hook) signal was received from the far office during outpulsing. UXS is reported under one or more of the following conditions:

1. Trunk being outpulsed on is not marked for stop-go signaling.
2. A second stop dial signal was received during the outpulsing of the same digit sequence.
3. The stop dial signal was received after outpulsing the third from the last digit of the digit sequence.

**Corrective Action**

1. Verify the functionality of the trunk hardware (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Verify the functionality of time slot interchange unit's signal processor hardware (refer to any appropriate diagnostic messages in the Input Messages manual).
3. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS and OUTPLS and View 5.5 (TRUNK MEMBER) attribute STOPGO. Verify that the attribute settings are compatible with the far office’s interpretation of the trunk’s operation (refer to the Recent Change Reference manual).
4. Check the translations data in RC/V Views 9.3 [LOCAL DIGIT (OFFICE DIALING)] and 9.5 [INCOMING TRUNK DIGITS (OFFICE DIALING)] for the expected number of incoming digits. Also, check forms 5309 and 5300-3 of the Office Records Manual for the incoming digits. If the incoming digits in the office records match the digits found in the recent change views, then have the far office check its data translations (refer to the Recent Change Reference manual).
5. The user may invoke MON:TRUNK which triggers on the occurrence of this MDII to return the Hardware (HW) talk path for analysis purposes. This tool will hold the trunk off hook and out-of-service. To invoke MON:TRUNK, refer to the Input Messages manual. Associated input messages are:
   a. CLR:TRUNK, will release any held trunk and terminate MON:TRUNK for the trunk group.
   b. RLS:TRUNK, will release the held trunk and continue to monitor the trunk group for the next occurrence.
   c. OP:TRUNK, will display the MON/HOLD status of each member of the group.

### 2.2.82 VCA (MDII Description)
### Item: Vacant Code Announcement

**Description**: This MDII can be used for integrated services digital network-user part (ISUP), for session initial protocol (SIP) and for BICC. Vacant code announcement is reported under one or more of the following conditions:

1. Translation of the dialed number detected an invalid digit sequence for the corresponding call and hence was unsuccessful in determining the call destination.
2. An INWATS database (IDB) query failed. Some calls require an IDB query to obtain a POTS number which is subsequently translated to determine the call destination. The IDB query uses the dialed digit sequence, the originating NPA, and the trunk member and group numbers for the current call in progress.
3. Translation of the POTS number retrieved through an IDB query detected an invalid digit sequence for the corresponding call and hence was unsuccessful in determining the call destination.
4. In ISUP or BICC, when a release message is received with a cause of 3 before the receipt of an address complete message.
5. An incorrect DAS was selected for digits translation. For MINT trunks T-NSC shown may have caused an unexpected DAS value to be selected.
6. For local number portability (LNP), the switch detected its own location routing number (LRN) but was unsuccessful in determining the call destination. In this case, the LRN, the LNP query indicator, and the jurisdiction information parameter (JIP) will be included in the report.

**Corrective Action**:

1. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS. Verify that the attribute setting is compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
2. Check the translations data in RC/V Views 9.3 [LOCAL DIGIT (OFFICE DIALING)] and 9.5 [INCOMING TRUNK DIGITS (OFFICE DIALING)] for the expected incoming digits. Also, check forms 5309 and 5300-3 of the Office Records Manual for the incoming digits. If the incoming digits in the office records match the digits found in the recent change views, then have the far office check its data translations (refer to the Recent Change Reference manual).
3. For carrier interconnect calls, check that a RLFC_CARR tuple exists for the given carrier ID and that it contains the correct information.
4. Check the INWATS database.
5. For the LNP case, check for a RLRT_DNTRAN tuple for the subscriber on this switch. If the subscriber is not on this switch, verify the LNP data received from the previous switch.
6. For MINT trunks, use the T-NSC value, printed in the MDII message, to check the translation data on View 8.54 and View 8.53. Make sure that the proper DAS value is provisioned for the T-NSC (TERM NSC) value.
7. For BICC, check RC/V View 5.71 (BICC GROUP) attribute TRK CLASS. Verify that the attribute setting is compatible with the far office's interpretation of the trunk's operation (refer to the Recent Change Reference manual).

</tr>
<tr>
<td></td>
<td>TGMDINC</td>
</tr>
<tr>
<td></td>
<td>INCST</td>
</tr>
<tr>
<td></td>
<td>INMDII</td>
</tr>
</tbody>
</table>

The switch, on an ISUP7 trunk, receives an incoming wideband call with information in the initial address message (IAM) that indicates incorrect channel usage for a wideband call; the outgoing circuits that were selected for the call are associated with trunks that are in different trunk groups on the incoming side. A wideband call must be carried on trunks within the same trunk group. The number of channels requested for the call is shown in the N field on the output. The number of the first channel assigned to the call is shown in the CIC field. Incorrect channel usage happens when not enough trunks remained in a trunk group to carry a wideband call (NxDS0) when CIC is the first channel. And on the far end, the trunk group is provisioned with more members.

Only one WBF MDII message (REPT:MDII) will be printed and the call will be released. Trunk error analysis (TERA) reports on the number of call failures per trunk group. A wideband call is identified by the controlling trunk (master trunk). TERA on the master trunk is required with RPT recovery action and trunks will not be taken out-of-service.

Reporting of the performance counts for this MDII will show up on the 24 hour plant report.

### Corrective Action

Notify the far end office of a potential trunk group assignment problem when provisioning wideband trunks on this facility. Either some trunk group members in the far switch which reside on the facility used by the master trunk, are assigned to the wrong trunk group or corresponding trunk group members in this switch are assigned to the wrong trunk group.

### 2.2.85 WSN (MDII Description)

Description
On a wink-start-controlled trunk, a time-out occurred while waiting for the far office to return a wink start signal (on-hook/off-hook/on-hook series of transitions). In this case, a steady on-hook state was returned from the far office for the entire duration of the start signal time-out interval.

Corrective Action
1. Verify the functionality of the trunk hardware (refer to the Corrective Maintenance Procedures manual and any appropriate diagnostic messages in the Input Messages manual). If the hardware is functioning properly, have the far office check its corresponding trunk hardware.
2. Verify the functionality of time slot interchange unit's signal processor hardware (refer to any appropriate diagnostic messages in the Input Messages manual).
3. Check RC/V View 5.1 (TRUNK GROUP) attribute TRK CLASS and View 5.5 (TRUNK MEMBER) attribute OUT START DIAL. Verify that the attribute settings are compatible with the far-end's interpretation of the trunk's operation (refer to the Recent Change Reference manual).
4. Verify that the timing conditions at both offices are compatible.
5. Verify the compatibility of the trunk interface hardware at both offices.
