Contents

Section 1: Introduction

Scope and purpose of this publication

The OMM is a reference for messages that are output on the DMS-10 terminal or, CPU pack display. The OMM contains three types of messages: BUG, CPU pack display, and miscellaneous messages. BUG messages pertain only to software and firmware and indicate an interruption in the normal flow of software operation or describe a problem that can be solved only by changing software source code. CPU pack display codes are output by DMS-10 start-up or recovery firmware and software procedures to provide information when the DMS-10 may not be able to access a terminal. Miscellaneous messages provide information or describe a hardware fault or an input error. The OMM contains a separate section for each message type. All messages are in alphanumeric order within each section. The information contained within each section is described below.

As TTY output messages are printed, they are often prefixed with headers or followed by sequence numbers and time stamps. For instance, if the office is part of a cluster configuration, then for all TTY messages received from another switch, the message will be prefixed with a field identifying the originating switch. For more detail on actual format of these TTY output messages, See NTP 297-3601-300.

BUG Messages

BUG messages, which are output on a terminal, consist of the word 'BUG' followed by a five-digit field and a three-digit field. The five-digit field is the number of the global procedure that outputs the message. The three-digit field is the number of the message within that procedure. For example, 'BUG 00872 001' and 'BUG 00872 002' are BUG messages 001 and 002 in global procedure 00872. (If the global procedure that outputs the message is an overlay, the overlay mnemonic may appear in place of the global number. For example 'BUG LED 001' would be BUG message 001 in overlay LED.)

Each BUG message entry in the OMM consists of the text that describes the message, the name of the global procedure that outputs the message, the name of the software source file that contains the global procedure, and the source file line number where the message is defined.

BUG messages normally do not occur because they indicate a problem that can be solved only by changing software source code. If a BUG message is output, retain a copy of the message output and contact Northern Telecom Technical Support to ensure that the cause of the BUG message is determined and corrected.

CPU pack display messages

The CPU pack display message section contains information to help the craftsperson respond to a CPU pack display code. These codes, which are output on the hexadecimal display of the CPU Miscellaneous pack or Central Processor pack, consist of a three-digit message number.

Each CPU pack display message entry in the OMM consists of the text that describes the message, the name of the global procedure that outputs the message, the name of the software source file that contains the global procedure, and the source file line number where the message is defined. (The global procedure name will not appear for CPU pack display messages that are issued from firmware code that is not a part of a global procedure.

If a specific procedure should be followed in response to the message, the TP (Trouble Procedure) or MP (Maintenance Procedure) number is provided in the 'PROC NO' field which is located to the right of the 'DESCRIPTION' field. All of the referenced TPs are in the Maintenance and Test Manual NTP (297-3601-511). If the message is for information only or if a TP reference is not necessary, 'NA' (not applicable) is provided in place of a procedure number.

Miscellaneous messages

The miscellaneous message section contains information to help the craftsperson respond to a miscellaneous message. If an alarm is associated with the miscellaneous message, an alarm indicator is provided (***, **, OR *, for catastrophic, major or minor alarms, respectively).

Miscellaneous messages, which are output on a terminal, consist of six or seven-character fields that contain a three or four-letter message mnemonic to indicate the type of message followed by a three- digit message number. For example, 'ALM024' is message 024 that contains ALM (alarm) information.

Each miscellaneous message entry in the OMM consists of the text that describes the message, the name of the global procedure that outputs the message, the name of the software source file that contains the global procedure, and the source file line number where the message is defined.

If a specific procedure should be followed in response to the message, the TP (Trouble Procedure) or MP (Maintenance Procedure) number is provided in the 'PROC NO' field which is located to the right of the 'DESCRIPTION' field. All of the referenced TPs are in the Maintenance and Test Manual NTP (297-3601-511). If the message is

for information only or if a TP reference is not necessary, 'NA' (Not Applicable) is provided in place of a procedure number.

BUG 00000 000   LOADSYSTEM   1121   LOADOFFICEDATA

    THERE ARE 8 FORMATS THAT BUG MESSAGES CAN PRINTOUT IN:

  1) BUG2 FORMAT TYPE A (MOST COMMON):

  BUG   X Y V T Z W

                        X= GLOBAL # OR OVERLAY MNEMONIC (LOOK UP 0 Y Z W)
                        Y= THE BUG ERROR CODE
                        V= VERSION.ISSUE.WORK_ISSUE
                        T= TIME
                        Z= CURRENT VALUE OF CR_PTR
                        W= CURRENT VALUE OF DR_PTR
                        Z & W CAN BE UNIQUE DATA, THIS WILL BE
                            SPECIFIED WITHIN THE MESSAGE CONTENTS

  2) BUG2 FORMAT TYPE B USED FOR DEBUGGING STACK INFORMATION:

  BUG X Y V T Z W RAS A B C . . .

     X Y V T Z & W SAME AS ABOVE
     RAS INFORMS US THE RETURN ADDRESS STACK IS ON
    A B C . . . CAN BE FROM 7, 16 OR A COMPLETE RETURN ADDRESS STACK

  3) BUG3 FORMAT: 4) BUG4 FORMAT:

  BUG   X Y V T P1 P2 P3   BUG X Y V T P1 P2 P3 P4

  5) BUG6 FORMAT:

  BUG X Y V T P1 P2 P3 P4 P5 P6

       X Y V & T AS ABOVE
       P1 P2 P3 P4 P5 & P6 ARE PASSED DATA FIELDS,
                          AND ARE SPELLED OUT WITHIN THE BUG MSG

  THESE CALL PROCESSING PARAMETERS CAN FOLLOW ALL BUG MESSAGES
  UNDER THE SPECIFIED CONDITIONS.

  IF THE DEVICE REGISTER POINTER AND THE CALL REGISTER POINTER ARE
  BOTH NOT NIL THEN THE FOLLOWING LINE IS OUTPUT:
    CR STATE = <#> CR SUB_PM = <#> EVENT = <#> DEVID = <#>

For Generic 602.20

IF THE DEVICE REGISTER POINTER IS NOT NIL THE FOLLOWING IS OUTPUT:
   <EQUIPMENT LOCATION> DR PM = <#> DR SUB_PM = <#>

THESE ARE DEFINITIONS OF PARAMETERS USED FOR CALL PROCESSING
DEBUGGING.
   CR STATE   = THE CURRENT CALL PROCESSING STATE (PROGRAM) OF THE CALL
   CR SUB_PM = THE PROGRESS MARK OF THE CURRENT CALL PROCESSING
                  PROGRAM
   EVENT   = IDENTIFIES THE CURRENT CALL PROCESSING EVENT
   DEVID   = THE ID OF THE CURRENT DEVICE
   EQUIPMENT LOCATION = THE LOCATION OF THE HARDWARE ASSOCIATED WITH
                     THIS CALL REGISTER
   DR PM   = THE STATE OF THE DEVICE
   DR SUB_PM = THE PROGRESS MARK OF THE CURRENT DEVICE HANDLING
                  PROGRAM

6) [-BUG DDEVNT] <DEVICE> <DEVICE STATE> <DEVICE SUB PM> ...
          ... <DEVICE SRC> <CR> <DR> (FIRST LINE)
           <EQUIPMENT LOCATION> (SECOND LINE)

   THE BUG DDEVNT MESSAGE MAY OCCASIONALLY BE OUTPUT DURING THE
   PROCESSING OF MAINTENANCE COMMANDS SUCH AS BUSY (IMED), SWCH,
   AND RTS -- WHEN A WARM ACTIVITY SWITCH OF CALLS IS TRIGGERED. AT
   THESE TIMES AND THESE TIMES ONLY, THE BUG DDEVNT MESSAGES SHOULD
   BE CONSIDERED NORMAL; EACH MESSAGE CORRESPONDS TO AN EVENT
   TEMPORARILY BUFFERED FOR THE ORIGINAL DEVICE OR ITS MATE FOR A
   NON-STABLE CALL DURING THE SWITCH. SUCH CALLS ARE DROPPED BY
   DESIGN. IF THESE MESSAGES OCCUR AT OTHER TIMES, THEY ARE MORE
   LIKELY TO BE THE SYMPTOM OF A REAL HARDWARE OR SOFTWARE PROBLEM.

7) [-BUG INVLD] <TYPE><CR><STATE><SUB STATE><TRUNK PM>[<SLE PM>] ....
          .... <DEVICE><EVENT> (FIRST LINE)
           [<DEVICE LOCATION><DR><DR STATE><DR SUB STATE>]
           (SECOND LINE - OPTIONAL)

8) [-BUG IGNR] .... (SAME DATA AS ABOVE)

   ALL "BUG INVALID/IGNORE/DDEVENT" MESSAGES HAVE THE ABOVE FORMAT.
   THE FIELDS HAVE THE FOLLOWING SIGNIFICANCE.

   <TYPE>   EVNT   UNEXPECTED EVENT FROM THE DEVICE

```
                    DEV      EVENT FROM AN UNEXPECTED DEVICE

<CR>            .XXXXXXX  CALL REGISTER ADDRESS (IN HEX).

<STATE>          AAAA    MNEMONIC INDICATING THE CALL PROCESSING
                         STATE (PM) BEING EXECUTED WHEN THE EVENT
                         OCCURRED.

                         IF <STATE> IS "RTE", THEN THE ROUTE TYPE
                         MNEMONIC WILL ALSO BE DISPLAYED.

                         LOOK UP THE MNEMONIC IN THE SYSDATA LISTING
                         UNDER THE SYMBOLS_CR_PM TABLE. COUNT DOWN
                         TO THE MNEMONIC. THEN GO TO THE CPEVENT
                         LISTING UNDER THE CASE FOR PM:CR_PTR AND
                         COUNT DOWN SAME NUMBER. THIS WILL GIVE YOU
                         THE GLOBAL PROCEDURE.

<SUB STATE>      XX      DECIMAL NUMBER INDICATING THE CALL
                         PROCESSING SUB-STATE (CR_SUB_PM) WITHIN
                         THE MAIN CALL PROCESSING STATE BEING
                         EXECUTED WHEN THE EVENT OCCURRED.

<TRUNK PM>       XX      DECIMAL NUMBER INDICATING THE TRUNK
                         PROGRESS MARK.

<SLE PM>         XX      DECIMAL NUMBER INDICATING THE SLE PROGRESS
                         MARK - ONLY OUTPUT IF <STATE> IS "SLE".

<DEVICE>         AAAA    MNEMONIC INDICATING THE DEVICE INVOLVED IN
                         THE EVENT.

<DEVICE STATE>   AAAA    MNEMONIC INDICATING THE DEVICE STATE.

<DEVICE SUB PM>  XX      DECIMAL NUMBER INDICATING THE DEVICE SUB
                         PROGRESS MARK.

<DEVICE SRC>     AAAA    MNEMONIC INDICATING THE DEVICE SOURCE.

<EVENT>          AAAA X  MNEMONIC INDICATING THE EVENT THAT OCCURRED
                         AND THE PARM VALUE.
```

```
    IF THE DEV_ID FROM ABOVE IS .SRCE OR .DEST AND LINKED TO
    THE CALL REGISTER THEN THE FOLLOWING IS ALSO OUTPUT:

    <DEVICE LOCATION>        FOR DEV_ID DEVICE

    <DR>            .XXXXXXXX  DEVICE REGISTER ADDRESS (IN HEX)

    <DR STATE>       XX     DEVICE REGISTER STATE (DEVICE_PM)

    <DR SUB STATE>  XX      DEVICE REGISTER SUB STATE (DEVICE_SUB_PM)
```

600	NA	INITIALIZE	961	INITIALIZE

SYSTEM INITIALIZATION COMPLETE.

601	NA	INITIALIZE	16149	INITIALIZE

THE IO INTERRUPT IS STUCK ON THE ACTIVE CPU SHELF.
TTY MESSAGES CANNOT BE DISPLAYED.

605	NA	INITIALIZE	17439	INITIALIZE

CALL STORE ALLOCATION FAILED DURING THE LAST SYSTEM
INITIALIZATION. THIS MEANS THAT THERE IS INSUFFICIENT
PHYSICAL MEMORY CONFIGURED TO ALLOCATE THE REQUIRED
CALL STORE FOR THE CURRENT SYSTEM CONFIGURATION.

A MAJOR ALARM IS RAISED. TO CLEAR IT, SYSTEM
MEMORY MUST BE RELEASED OR PHYSICAL MEMORY MUST BE ADDED.
TO ADD PHYSICAL MEMORY, REFER TO SOP 0011 IN THE
"DMS-10 DATA MODIFICATION MANUAL" NTP 297-3401-311.
THIS ALARM WILL BE CLEARED DURING THE NEXT SYSTEM
INITIALIZATION IF ALL REQUIRED CALL STORE MEMORY IS
SUCCESSFULLY ALLOCATED.

800	NA	EXT_ALARM_MSG	640	EXT_ALARM_MSG

AN ALARM REQUEST FOR AN SCCS INIT HAS BEEN RECEIVED, BUT THE
REQUEST IS NOT BEING HONORED SINCE IT IS TOO CLOSE TO THE LAST
INITIALIZATION TO BE CONSIDERED VALID. IF THIS WAS MEANT TO BE
CONSIDERED A VALID REQUEST FOR AN INITIALIZATION, IT MUST BE
CLEARED AND RE-ASSERTED LATER TO BE RECOGNIZED. IF THIS WAS NOT
A VALID REQUEST, THEN VERIFY THAT THE FOLLOWING ARE FUNCTIONING
PROPERLY: ALARM PROCESSOR, DAS UNIT, WIRING, ETC.

DMS-10 Family

600-Series Generics
