FEATURES

- Fully compliant with SCSI, SCSI-2 and SCSI-3 standards
- Provides active termination for nine signal lines
- Laser-trimmed 110 ohm termination resistors have 2% tolerance
- Low dropout voltage regulator
- Fully supports actively negated SCSI signals
- Onboard thermal shutdown circuitry
- Narrow 16-pin plastic SOIC (DS2114Z)

DESCRIPTION

The SCSI-2 and SCSI-3 standards recommend the use of active terminations at both ends of every cable segment in a SCSI system with single-ended drivers and receivers. The DS2114 SCSI Terminator, which is fully compliant with these standards, enables the designer to gain the benefits of active termination: greater immunity to voltage drops on the TERMPWR (TERmination PoWeR) line, enhanced high-level noise immunity, intrinsic TERMPWR decoupling, and very low quiescent current consumption. The DS2114 integrates a regulator and nine precise 110 ohm termination resistors into a monolithic IC. The DS2114 is intended for cable end terminator assemblies and devices where the terminators do not need to be isolated from the SCSI bus.
FUNCTIONAL DESCRIPTION
The DS2114 consists of a bandgap reference, buffer amplifier, and nine termination resistors (Figure 1). The bandgap reference circuit produces a precise 2.55 volts level which is fed to a buffer amplifier. The buffer produces a 2.85 volts level and is capable of sourcing at least 24 mA into each of the termination resistors when the signal line is low (active). When the driver for a given signal line turns off, the terminator will pull the signal line to 2.85 volts (quiescent state). To handle actively negated SCSI signals, the buffer can sink at least 200 mA. When all lines settle in the quiescent state, the regulator will consume about 2.5 mA.

To ensure proper operation, both the TERMPWR1 and TERMPWR2 pins must be connected to the SCSI bus TERMPWR line and both the VREF1 and VREF2 pins must be tied together externally. Each DS2114 requires a 4.7 \( \mu \)F capacitor connected between the VREF pins and ground. Figure 2 details a typical SCSI bus configuration. In an 8-bit wide SCSI bus arrangement ("A" Cable), two DS2114's would be needed at each end of the SCSI cable in order to terminate the 18 active signal lines. In a 16-bit wide SCSI bus arrangement ("P" Cable), three DS2114's would be needed at each end of the SCSI cable in order to terminate the 27 active signal lines.

DS2114 BLOCK DIAGRAM  Figure 1
TYPICAL SCSI BUS CONFIGURATION  Figure 2

NOTES:
1. C1 = 4.7 µF tantalum
   C2 = 2.2 µF tantalum or 4.7 µF aluminum

2. If the DS2114 is to be embedded into a peripheral that will act as a target on a SCSI bus, it is recommended that TERMPWR be derived from the SCSI cable, not generated locally. In this configuration, if a power failure occurs in the peripheral, it will not affect the bus.

3. A high frequency bypass capacitor (0.1 µF recommended) can be added in parallel to C1 for applications using fast rise/fall time drivers.
