**MOSCOW STILL BEAMING  
MICROWAVES, U.S. SAYS**

WASHINGTON, June 27 (AP)—The Russian are still beaming microwave radiation at the United States Embassy in Moscow, but tests of Americans who used to work there have shown no harmful health effects, the State Department said today.

Dr. Herbert Pollack, a physician and Government consultant, said, however, that about a third of one group of State Department employees studied showed a slight, apparently harmless, change in their blood composition.

"There have been no medical ill effects observed in individuals whose lymphocyte counts have been elevated," Dr. Pollack said in testimony before a Senate Commerce subcommittee. "The condition disappears after departure from Moscow."

The Russians have been aiming mi-

crowave radiation at the United States Embassy since the early 1950's, Dr. Pollack said, but in 1975 the signal was intensified and there were fears that the radiation might reach clearly harmful levels. Since then the beaming has declined, he said, but the radiation at the embassy measures above the standard the Russians have set for themselves as being safe. The U.S. standard is many times higher.
